The experiment offers five main findings. First, we observe that the mere receipt of the experimental "control," just months after the receipt of a first, similar, IRS reminder mailing, prompts 0.14 of the residual non-respondents to take-up (this compares to an initial notice response of 0.41). Second, the experiment suggests that informational complexity influences response. Relative to the control notice and worksheet (0.14), a notice with a simplified layout and less repetition improves take-up by 0.06 (p < .01), while a shorter worksheet, without the inclusion of criteria that does not substantively screen for eligibility, increases response by 0.04 (p < .01). Importantly, the basic information conveyed by the control notice and worksheet, and the complexity treatments, is equivalent. Third, providing benefit information also raises take-up. Displaying the upper bound of a potential benefit improves take-up by 0.08 relative to the 0.23 response of the baseline notice in which no benefit is displayed (p < .01). Fourth, we find that attempts to clarify the time and penalty costs associated with completing and returning the worksheet do not improve response. Finally, our attempts to reduce program stigma do not improve take-up.

By integrating the results from the experimental findings and randomized surveys of tax-filer beliefs, we can arbitrate between competing explanations for incomplete take-up in the literature. Our findings suggest that incomplete take-up in the specific context of EITC filers is due primarily to low program awareness, incomplete information regarding benefits and eligibility, as well as the high complexity of information. We do not find evidence to implicate direct transaction costs, the likelihood of an audit, or program stigma. A set of psychometric surveys offers additional insight into why take-up is so sensitive to modest changes in informational content and presentation. The evidence suggests that information, and informational complexity, may shape behavior by prompting both

direct and indirect inferences regarding program parameters, as well by, possibly, changing the degree to which readers attend to the information.

Overall, the potential policy impact of the tested interventions is large. We calculate that the most effective experimental treatments, if applied to the entire population of filing non-claimants, could re-duce incomplete take-up among filers from 10% to 7%, and overall incomplete take-up from an estimated 25% to 22%. The increase in response due to our context-based interventions is equivalent to that which would be produced by expanding benefits by up to 101% for this population.

Power and Decision Making: Exploring the Processes and Nuances

SESSION OVERVIEW

Power is arguably one of the most fundamental features of our social world. As such, it has been the focus of a substantial amount of academic inquiry in the past decade (e.g., Briñol et al. 2007; Galinsky, Gruenfeld, and Magee 2003), which identified a variety of important consequences of feeling powerful versus powerless. However, to date, examination of the consumption decisions of the powerful has been rather scarce (for notable exceptions see Rucker and Galinsky 2008, 2009). These omissions are somewhat surprising because consumers routinely find themselves in the position of power, like when a mother makes decisions for the family dinner, when a leader of a department chooses the locations of a retreat or when a graduating college student finally having the money to buy the computer she would like. As such, it is crucial to examine the consequences of feeling powerful and its effects on subsequent consumption decisions. The four papers in this session not only identify important consequences of power in the consumption domain, but also extend the current literature on power by identifying new processes, moderators and nuances that have not been previously proposed or demonstrated.

In particular, the first two papers in the session explore important outcomes of feeling powerful in the consumption domain by examining whether consumers who feel powerful make different choices (Mourali and Pons) and whether they are more or less likely to stick to their previous choices (Jiang et al). The remaining two papers introduce additional nuances above and beyond the dichotomy of powerful versus powerful, by distinguishing between personal and social power (Malkoc and Duguid) and experiences versus expectations of power (Hu et al).

The first paper by Mourali and Pons examines how the choices made by the powerful and powerless might be systematically different. To that end, they demonstrate that consumers who feel powerful are more likely to choose unconventional options. Their results indicate that this tendency is caused by the powerful wanting to signal their power to others. Accordingly, they show that if the choices are made in private or if the unconventional items are deemed popular, powerful consumers no longer prefer these options as they lose their signaling value.

The second paper by Jiang, Zhan and Rucker studies how consumers' likelihood to switch away from their current brands is influenced by their sense of power. They demonstrate that while powerless consumers stick with their brands more, powerful consumers opt to switch more frequently. They argue that this tendency is due to an increased inclination of the power holders to take action. Supporting this idea, they show that if consumers take physical action before the switch/stay choice, the effect of power is eliminated.

In the third paper, Malkoc and Duguid critically distinguish between social power (over others) and personal power (over the self) and show the important implications of this distinction on a variety of context effects. In particular, their results demonstrate that personal (vs. social) power holders defer choice more and compromise less, while showing no difference with respect to the attraction effect. Furthermore, they theorize and show that these effects can be accounted by the increased level of freedom experienced by personal power holders compared to social power holders.

Finally, the fourth paper by Hu, Rucker and Galinsky introduces the important distinction between the experience of power and the expectation of power. Replicating prior research, they show that when focused on the experience of power, those who lack it show increased preference for status and process information to a greater extent. However, shifting people's attention to what others expect of them in situations of power (vs. no power) reverses these findings by leading them to behave in a manner that meets those expectations.

Studying power across a variety of consumption contexts (unconventional choices, switching decisions, compromise and attraction effects, choice deferral and status products), the four papers in this session extend the boundaries of research on power by introducing previously unstudied consequences (unconventional choices (Mourali and Pons), switch/stay decision (Jiang et al), context effects (Malkoc and Duguid)), psychological mechanisms (signaling (Mourali and Pons), freedom (Malkoc and Duguid), expectation confirmation (Hu et al)) and moderators (private vs. public consumption (Mourali and Pons), physical actions (Jiang et al), personal vs. social nature of power (Malkoc and Duguid), experience vs. expectation of power (Hu et al)).

Taken together, these papers present new directions in power research. Given the growing impact of power in consumer research, we expect this session to generate a high level of interest among ACR attendees and spark future research directions, as well as engaging the audience to debate nuances of power in interpretation of its many consequences.

Power and Unconventional Choices

EXTENDED ABSTRACT

Despite a relatively late start, consumer researchers have recently shown considerable interest in the study of power and its influence on consumption behavior (see Rucker, Galinsky, and Dubois 2011 for a review). This follows a decade of extremely fertile psychological research on the consequences of having versus lacking power. At least three influential research streams currently describe power's influence on decision making. One stream (Guinote 2007, 2008) argues that power affects process-related aspects of information processing, which in turn affect behavior. According to the Situated Focus Theory of Power (Guinote 2007), power increases the ability to process information selectively. Selective processing in

turn increases the ability to behave in more focused and prioritized ways. A second stream of research focuses on content-based effects of power (Anderson and Berdahl 2002; Galinsky et al 2003; Keltner et al. 2003). The approach/inhibition theory of power (Keltner et al. 2003) maintains that elevated power increases sensitivity to certain contents such as rewards and positive features, and signals to the individual that the environment is benign. Low power increases sensitivity to other types of contents (e.g., punishments, threats in the environment, and negative features). As a result, high power activates the behavioral approach system, leading to more positive affect, automatic information processing, and disinhibited behavior, whereas low power activates the behavioral inhibition system, leading to more negative affect, controlled information processing, and inhibited social behavior (Keltner et al. 2003). A third stream of research emphasizes the motivational effects of power (e.g., Rucker and Galinsky 2008, 2009; Rucker et al. 2011). The compensatory consumption model suggests that powerlessness is an aversive state that people are motivated to alleviate. As a result, when consumers feel powerless, they tend to exhibit a strong preference for acquiring and displaying status-related products to compensate for their lack of power.

We propose a fourth way in which power may influence decision making. We offer that powerful consumers often make unconventional choices to signal their power to others. Our conceptualization draws on Berger and Heath's (2007) identity-signaling model, which posits that people often diverge in their choices to communicate a desired identity. We submit that high power is a desirable state that individuals feel compelled to communicate to others. One way to signal one's power is to show that one is not afraid to make bold, unconventional, choices. We examine the signaling hypothesis in decision contexts involving choices between extreme vs. compromise options, safe vs. risky options, and gambles with known vs. unknown (ambiguous) probabilities. Consider the choice between compromise and extreme options. Maimaran and Simonson (2011) reasoned that selecting a compromise option represents a conventional choice because compromise options are seen as safer and less likely to be criticized. In contrast, selecting an extreme option represents a bold and unconventional choice because it reflects a willingness to take a stand and express one's view. Similarly, selections of risky options and gambles with unknown probabilities reflect unconventional behavior to the extent that safe options and gambles with known probabilities are seen as the conventional defaults (Maimaran and Simonson 2011; Einhorn and Hogarth 1986).

We tested the signaling hypothesis in three experimental studies. Study 1 was designed to assess the general idea that power increases preference for unconventional options. We manipulated participants' power using a role-based procedure adapted from Galinsky et al. (2003). Participants then responded to a total of 6 choice scenarios reflecting decisions between compromise and extreme options; risky and safe options; and gambles with known vs. unknown probabilities. The results indicate that across all six scenarios, participants in the high power position selected the unconventional options significantly more frequently than those in the low power position.

Study 2 was designed to test an important implication of the signaling hypothesis, namely that the effect of power on choice of unconventional options should be stronger when choices are public than when they are private. Study 2 consisted of a 3 (low power vs. control vs. high power) x 2 (public choice vs. private choice) x 3 (extreme vs. risky vs. ambiguous scenarios) mixed design, with choice scenarios manipulated within subjects. Power was primed using a writing task (Galinsky et al. 2003). The results indicate that high power led to increased preference for unconventional options

when choices were public, but not when choices were private. There was no difference in choice patterns between the three scenarios, and between the low power and control groups.

Finally, study 3 was designed to test another important implication of the signaling hypothesis. We reasoned that power increases preference for unconventional options because of these options' signaling value not their inherent qualities. Thus, these options should become less attractive to powerful consumers if selecting them no longer reflects a bold, unconventional choice. We tested this hypothesis by presenting half of the respondents with information suggesting that risky and ambiguous options are in fact popular options (i.e., options that most people choose). Indeed, suggesting that risky and ambiguous options are chosen by most people makes selecting them a rather conventional and timid behavior because they may now seem safer and less likely to be criticized. Study 3 found that presenting nominally unconventional options as popular not only reduced their perceived attractiveness in the eyes of powerful consumers, but also made them seem more attractive to consumers with less power.

The Power Switch: How Psychological Power Influences Brand Switching Decisions

EXTENDED ABSTRACT

Consumers' brand switching is an inevitable, and represents a serious problem for most companies. Recent research finds that up to 33% of the unit sales increase is attributable to brand switching (Van Heerde, Gupta, and Wittink 2003). Surprisingly, there still remains much to understand with respect to consumers' behavioral motivations to switch to new brands. To add a novel perspective on switching behavior, the current research examines the impact that incidental states of power have on brand switching decisions.

Defined as an individual's ability to control own and others' resources (Galinsky, Gruenfeld, and Magee 2003), power is a force that touches on most social interactions. Power also shapes consumer values in a variety of consumption decisions (Rucker, Galinsky, and Dubois 2011). A finding particularly relevant to the current research is that states of high power increases individuals' action orientation. Keltner, Gruenfeld, and Anderson (2003) proposed that power activates a behavioral approach system. Specifically, high-power individuals possess more resources and pay more attention to rewards and opportunities in the environment, and thus show an approach-related tendency to pursue and obtain goals. Supporting this hypothesis, Galinsky, et al. (2003) showed that high-power participants were more likely to take an additional card in a simulated blackjack game, or to turn off an annoying fan in a room.

Sometimes consumers consider new options to replace the current product or service. For instance, an individual might think about changing their television provider when seeing an alternative cable package advertised. In this case, the consumer is facing two options involving different levels of action. Sticking with the current television provider requires minimal action, while changing to a new brand is associated with more action in the form of making a phone call, cancelling the current service, etc. Based on the linkage between power and action orientation, we propose that a state of high power will naturally lead to a tendency to engage in switching behavior as this allows people to fulfill the action orientation of a high-power state. We test this hypothesis in three experiments.

In experiment 1, participants were first asked to recall a past event during which they felt either powerful or powerless, a power-priming process used in past power literature (e.g. Galinsky et al. 2003). Participants then read a scenario and imagined that they just moved to a new apartment and needed to install internet service.

They were told that most residents in the building were using the default internet service provided by brand A and the residents were in general satisfied with brand A's service. There was also another company (brand B) available, but detailed information about brand B was unknown. Participants were then asked to indicate whether they would use brand A (the default) as the internet service provider, or reject brand A and consider switching to brand B. We found that more participants in the high-power condition (54%) considered switching to a new brand than in the low-power condition (40.6%; $p < .05$). Additional data showed that both perceptions of the current brand and expectation of the new brand did not differ across power conditions.

Experiment 2 replicated study 1's findings in a real behavior context. At the beginning of experiment 2, all participants received a new pen and were asked to answer all the questionnaires using the pen. They were also told that they could keep the pen after the study. Feeling of power was then manipulated using the same recall task as in experiment 1. After the recall task, participants were told to decide either to keep their current pen, or to exchange it for a different but equally-priced pen. Consistent with our hypothesis, more participants in the high-power condition (40%) switched the pen than in the low-power condition (20.4%; $p < .05$). Again, additional data confirmed that this effect was not caused by different perceptions of the two pens.

If the previously observed effect of power on brand switching is indeed caused by a heightened action orientation, we proposed that real physical actions taken prior to the brand switching decision might sate the action orientation, and thus mitigate the effect of power on brand switching. Participants in experiment 3 were randomly assigned to conditions in a 2 (power: high vs. low) × 2 (physical action: action vs. no action) between-subject design. Similar to experiment 2, participants first received a new pen upon arrival. After a short demographics questionnaire, we manipulated participants' feeling of power following the manager-subordinate role playing procedures adapted from Anderson and Berdahl (2002). While waiting for the task materials, participants completed an ostensibly unrelated task portrayed as evaluating a product, but in actuality introduced the manipulation of physical action. In the action conditions, each participant received a small rubber massage ball and was instructed to squeeze it for 30 seconds to test this product. In the control conditions, participants instead observed the same ball in a transparent, plastic box for 30 seconds without touching. After the squeezing/observing, participants evaluated the ball. Then as in experiment 2, participants were asked to indicate their intention of exchanging the current pen for another new and equally-priced pen by answering the question "how much do you want to change the current pen" using a 9-point scale. As shown in Figure 1, we found a significant interaction effect of power and physical action (F (1, 157) = 4.34, $p < .05$). Planned comparisons confirmed that high-power participants showed higher preferences for pen switching ($M_{high-power}$ = 4.95 vs. $M_{low-power}$ = 4.03; F (1, 157) = 4.65, $p < .05$) in the no-action control conditions. However, the effect disappeared in the physical action conditions ($M_{high-power}$ = 3.55; $M_{low-power}$ = 3.93; *n.s.*).

In summary, we examine a behavioral motivation that propels brand switching behavior in the form of psychological power. In doing so, we demonstrate that the action orientation associated with high power can be sated by a prior opportunity to engage in action. This has potentially important implications in better understanding psychological antecedents of brand switching.

Not All Power is Created Equal: Role of Social and Personal Power in Decision Making

EXTENDED ABSTRACT

Power has been the focus of much academic inquiry in the past decade (e.g., Briñol et. al., 2007; Galinsky et. al., 2003). Extant literature, however, primarily focuses on social power and overlooked personal power. In this paper, we empirically differentiate between personal and social power and examine its effects on commonly reported context effects.

Power is generally defined as the ability to control resources for oneself and others without interference. This definition has two distinct components: social and personal power. Social power is individuals' ability to exercise control over others (French & Raven, 1959). Alternatively, personal power is the ability to control one's own outcomes, without being influenced and constrained by others (Van Dijke & Poppe, 2006). Even though some researchers have acknowledged the existence of the social power and personal power distinction (Galinsky et al., 2003; Van Dijke & Poppe, 2006), most studies have treated power as a single construct (for an exception see Lammers, Stoker, & Stapel 2009).

We argue that one important distinction between social and personal power is the sense of freedom the power holder feels. High personal power individuals act independently, with little or no consideration of their social environment. As such, they have a high sense of freedom. Alternatively, social power is associated with interdependence (Fiske & Depret, 1996), which is associated with connection to others (Cross, Bacon & Morris, 2000), which presumably limits their sense of freedom. Therefore, we hypothesize that having personal power, compared to social power, leads to higher sense of freedom.

We further suggest that this sense of freedom (or lack thereof) has important implications for a host of context effects. We theorize that those who feel powerful have a desire to maintain this sense of freedom and they make decision that helps them achieve this goal. As such, we would expect feeling personal power to highlight a sense of freedom, making consumers wanting to maintain their freedom. Thus, we expect them to be more likely to choose extreme options that allow them to exercise their freedom, thus diminishing the compromise effect. One might suggest power, instead of operating through a need to maintain freedom, operates through an increased ability to cope with conflict. If this is the case, then we would expect those with personal (vs. social) power to also defer less and be less prone to the attraction effect. However, our theory predicts that since feeling personal (vs. social) power highlights freedom and the need to maintain it, those with personal power would be morel more likely to defer choice in an attempt to maintain their freedom. Similarly, since the choice of a dominating or dominated option does not allow for the maintenance of freedom, we would expect social versus personal power distinction to not influence the attraction effect.

A pilot study tested the basic premise our theory by having participants recall an event where they had social or personal power, and having an independent coder examining the written responses. We found that while those with personal power had more thoughts relating to freedom than those with social power, their responses did not differ in their stated confidence or mood.

Study 1 was designed to examine the compromise effect. Participants (N=113) first completed the power-inducing task. Next, they made a choice for a wine from three options. We varied the set composition so that option B would either be a compromise {ABC} or an extreme alternative {BCD}. We found that participants with social power chose option B more when it was the compromise op-

tion (79%) in set {ABC} than when it was the extreme option (38%) in set {BCD}. However, this compromise effect (difference of option B choice) was present only for those with high social power and not for those with personal power.

Study 2 examined the mediating role of experienced freedom. Participants (N = 89) completed the power-inducing task and then made a choice for an investment among three options, one of which was compromise. As predicted, we found that high personal power individuals chose the compromise option (57%) less than those with social power (77%). More importantly, we find that the feelings of elicited freedom mediated the effect of power type on the choice of compromise option.

Study 3 was designed to rule salience of others as an alternative explanation and examined the role of power type on attraction effect. Participants (N = 220) completed the power-inducing task and then made a choice between three cell phone plans. We varied the set composition so that the third option was either dominated by option A (A') or by option B (B'). As predicted, we found that choice share of option A was higher (82%) in set {A'AB} than set {ABB'} (47%). More importantly, power type did not interact with decoy location and attraction effect was observed for both for personal power ({A'AB} = 69%; {ABB'} = 54%) and for social power ({A'AB} = 67%; {ABB'} = 47%)

In Study 4, participants (N = 138) completed a power-inducing task. Next, they made a choice between two CDs and had the option to either choose one of these CDs or to defer choice and search more. As predicted, we found participants who recalled an incident of personal power chose to defer their choice more (41%) than those who recalled an incident of social power (19%) or those in the control condition (28%). An examination of the verbal protocols revealed that having personal power increased the thoughts relating to freedom and that this heightened sense of freedom mediated the effect of power type on deferral.

Five studies demonstrate that the effect of power on context effects depends on its type: while personal power attenuates the compromise effect, it augments the choice deferral, having no effect on the attraction effect. We further demonstrate that it is the heightened sense of freedom those with personal power feel that drives these effects.

Experience Versus Expectations of Power: A Recipe for Altering the Effects of Power

EXTENDED ABSTRACT

The current research explores how both consumers' state of power and a focus on the experience of power versus how others expect them to behave jointly influence their behavior in the forms of desire for status and information processing.

When focused on the experience of lacking power, as opposed to possessing power, consumers are known to exhibit an increased desire for status-related products (Rucker and Galinsky 2008, 2009) and greater information processing (Briñol et al. 2007). However, we put forth a novel hypothesis that, when focused on the expectations of power (i.e., characteristics and stereotypes associated with power), a state of high power may lead to a greater willingness to acquire status-related products. Similarly, when focused on the expectations of power, it is predicted that the powerful people might process information more carefully compared to powerless people.

An expectation-confirmation perspective is offered as the foundation of this novel prediction. Specifically, it seems that people develop and hold different expectations of people who have low versus high power (Magee and Galinsky 2008). Elsewhere it has been shown that expectations shape people's interpretation of social events and also people's behaviors to conform to existing expectations and stereotypes (Kipnis 1972). In a similar vein, we suggest that focusing people who are in a low or high power state on the expectations associated with the low- or high- power position might lead them to behave in a manner that meets those expectations. Five experiments test our novel hypotheses.

Experiment 1: The Expectations of Power. The first experiment assessed the expectations people naturally hold with respect to how power should affect people's behaviors. Participants saw descriptions of behaviors related to status consumption and information processing and were asked to identify if these behaviors were something they expected from either powerful or powerless people. Results showed that participants rated the behaviors of purchasing status products and processing information carefully as more consistent with powerful people compared to powerless people (*ps* < .01). Our remaining experiments examine whether focusing people on the expectations of others could shift their behavior to align with these expectations.

Experiment 2a and 2b: Power and Status Products. Experiment 2a adopted a 2 (level of power: high vs. low) × 2 (focus: experience vs. expectations) between-subject design. Participants' level of power and focus were manipulated through an episodic recall task adapted from Galinsky et al. (2003). Subsequently, participants were asked to evaluate two status-related products. Results revealed a significant power × focus interaction (*p* = .002) such that, when focused on the experience of power, low-power participants had a higher willingness to pay for the status products compared to high-power participants (*p* = .02). In contrast, when focused on the expectations of power, high-power participants had a higher willingness to pay compared to low-power participants (*p* < .001), consistent with people's expectations reported in experiment 1.

Experiment 2b adopted a 2 (level of power: high vs. low) × 2 (focus: experience vs. expectations) × 2 (brand status: high- vs. non- status) between subject design. Participants' level of power and focus were manipulated in a role-playing task (Dubois et al. 2010; Rucker et al. 2011). Subsequently, participants were asked to identify their purchase intentions for either a BMW or a Toyota. Results revealed a significant three-way interaction between power, focus, and brand status (*p* = .004). For participants evaluating a high-status brand (BMW), there was a significant two-way interaction between power and focus (*p* < .001) such that among participants focused on the experience of power, low-power participants showed a higher purchase intention compared to high-status participants (*p* = .009). In contrast, among participants who focused on the expectations of power, high-power participants had a higher purchase intention compared to low-power participants (*p* = .008). No effects were found for participants who evaluated a Toyota (*F* < 1).

Experiment 3a and 3b: Power and Information Processing. Experiment 3a adopted a 2 (level of power: high vs. low) × 2 (focus: experience vs. expectations) between-subject design in which power and focus were manipulated as in experiment 2a. After manipulating power and focus, participants rated two job candidates that differed in the strength of their profiles. A discrimination score was calculated by subtracting participant's evaluation of the weak candidate from that of the strong candidate. Results revealed a significant power × focus interaction (*p* < .001) such that when focused on the experience of power, low-power participants showed greater discrimination compared with high-power participants (*p* = .01). In contrast, when focused on the expectations of power, high-power participants showed greater discrimination than low-power participants (*p* = .03).

Experiment 3b adopted a 2 (power: high vs. low) × 2 (focus: experience vs. expectations) × 2 (argument strength: strong vs. weak) between-subject design in which power and focus were manipulated as in experiment 2b. Participants evaluated an ad for a snack that differed in argument strength. Results revealed a significant three-way interaction between power, focus, and argument strength ($p = .008$). In the experience conditions, low-power participants liked the snack more after receiving strong compared to weak arguments ($p < .001$) while high-power participants did not show any difference ($F < 1$). In the expectation conditions, high-power participants liked the snack more after strong compared to weak arguments ($p = .02$) while low-power participants showed no difference ($F < 1$).

Conclusion and Contributions. Across experiments, the focus associated with power created different effects on consumers' desire for status products and the depth of information processing. These findings add another important dimension to the research of power and consumption by suggest a new and critical moderator for understanding how states of power affect consumption.

SESSION OVERVIEW

More than half of purchase decisions are made at the retail place (Inman and Winer 1998) and manufacturers are aware of this. This phenomenon has spawned a new emphasis on "shopper marketing," which entails examining consumer's in-store decision making from the store back and identifying what might influence the shopper. One of the key ways a product can stand out from others is through its package or shape, as it has been shown that functional and aesthetic appearance is an imperative factor in determining a product's appeal (Bloch 1995). Despite the growing awareness of the importance of product packaging, it is only fairly recently that we as consumer researchers have begun to develop theory to understand how consumers respond to the appearance of a product or package (Patrick and Peracchio 2010). This session is designed to help fill that gap.

This session offers four research papers that study the area of packaging from four separate but complementary view points. All of these projects are in very advanced stages, as they combine for a total of 18 completed experiments. Three of these projects are either under review or being prepared for submission. The first paper in the session, "Transparent Packaging and Consumer Purchase Decisions," by Darron Billeter, Meng Zhu and J. JeffreyInman, shows that consumers prefer transparent packages as these enhance perceptions of product trustworthiness even in cases where product quality and freshness are controlled for. This finding clearly demonstrates how physical aspects of a product design can affect higher level perceptions such as consumer trust of the product and the manufacturer. Additionally this research reveals consumers to be extremely responsive to the environmental cues perceived in the retail environment, especially to those related to the physical aspects of the product.

Consistent with this notion, the second paper, "The Effect of Product Shape Closure on Perceptions of Quantity, Preference and Consumption," by Julio Sevilla and Barbara E. Kahn demonstrates how consumer perceptions of product size, purchase intentions, and actual consumption can be altered by another seemingly irrelevant external aspect of a product, such as the degree of closure or completeness evoked by its shape. In this research, the authors keep the size and weight of the products constant and found the effect to be so robust that it trumps other well documented packaging phenomena such as the primary dimension and the attention attraction effect, and can be extended to other aspects of a product such as its label.

The third paper of the session, "Aesthetics versus Humor in Product Packaging: Their Impact on Ownership Pride," by Gratiana Pol, C.W. Park and Martin Reimann, looks at the effect that more global aspects of a package's appearance, such as its aesthetic or humorous properties, can have on product preference. The authors go beyond the first two papers by showing that a product package can transmit its socially desirable or undesirable aspects to the consumer, which will in turn impact product preference through feelings of ownership pride.

The last paper of the session, "Where You Say It Matters: How Product Packaging Increases Message Believability," by Claudia Townsend, Tatiana Fajardo and Juliano Laran, reveals another important benefit that a product package may convey. Specifically, the authors show that product claims are perceived as more effective, more credible and psychologically closer when presented on a package than when present in an advertisement. The implication of this research is that findings related to advertisements cannot necessarily be applied to packages and therefore there is an entire area of important research on product packaging to be explored.

We believe that a special session on product packaging that deals with diverse, current, fresh and substantive topics such as the ones we propose, should draw a great deal of attention from a diverse group of researchers coming from areas such as marketing strategy, psychophysics and environmental cues, retailing, product design, nutrition and public policy, hedonic consumption, aesthetics, social psychology, advertising, among others. A session that could attract such a diverse crowd would be likely to spawn a synergic, unique and fruitful discussion that could potentially lead to collaboration among researchers from these different areas. Finally, the currently proposed session benefits from the unique and diverse insights of its authors, as three of them come from different countries of Latin America, two of them from different countries of Asia, and one from Europe, while the rest are from the United States.

Transparent Packaging and Consumer Purchase Decisions

EXTENDED ABSTRACT

Due to limited processing capacity, consumers are frequently uncertain about their own preferences and the value of product offerings (e.g. Bettman, Luce and Payne 1998), and they often make inferences and construct meaning based on information that is salient in the immediate purchase context, such as product packaging. Existing literature confirms that consumers make inferences about product unit cost, capacity and consumption norms based on packaging size (Wansink 1996), packaging shape (Wansink and van Ittersum 2003) and packaging servings (Geier, Rozin and Doros 2006, Cheema and Soman 2008, Scott, Nowlis, Mandel, and Morales 2008, Coelho do Vale, Pieters, and Zeelenberg 2008).

In the current work, we study the impact of packaging transparency on consumer purchase decisions. Firms can select to encase a product in many different levels of packaging transparency, yet firms

often choose to present their products in non-transparent packaging. We suggest that consumers will exhibit greater preference for products in transparent as compared non-transparent packaging even when explicitly controlling for product freshness and quality. We argue this is the case because that (1) people associate the notion of "transparent" with honesty, openness, candidness, and forthcoming behavior (2) they often make inferences and judgment about products based on non-diagnostic packaging cues that are salient in the purchase context (such as transparency) rather than diagnostic product information (such as ingredients) that is not salient in the local decision context (e.g. Wansink and Van Ittersum 1999; Zhu, Billeter and Inman 2012). Thus, products covered in transparent packaging will be viewed as more trustworthy as compared to the exact same products presented in non-transparent packaging, leading to greater purchase intention for and higher choice of transparent products.

Experiment 1a tests whether transparent packaging increases perceptions of the products trustworthiness. To do so, we first exposed participants to a picture of a bottle of orange juice in either a transparent or a non-transparent package. Then, we asked participants to rate the product's trustworthiness using the trustworthiness scale developed by De Wulf, Schroder, and Iacobucci (2001). Consistent with our theory, we find that consumer's perceive the orange juice as being more trustworthy when it is in a transparent as opposed to a non-transparent package.

The natural question that follows is how perceptions of freshness and quality are impacted by the transparent packaging. To address this, we conducted Experiment 1b. Participants were presented with a variety pack of well-known wrapped chocolate bars (Hershey's, Reeses, Kit Kats) that were altogether wrapped in either a transparent, cellophane wrapping or wrapped with a picture on the top of the packaging that depicted the exact same information shown through the transparent packaging. After viewing the variety pack, participants rated the product's trustworthiness (using the same scale from Experiment 1a) and find greater brand trust for the transparent packaging even after controlling for freshness (the expiration dates on the packages were highlighted and identical) and quality expectations (these are well known chocolate bars with consistent quality expectations). This test demonstrates that even when consumers know that the products are identical, consumers still rely on the non-diagnostic cue of transparent packaging in determining how much they trust the product.

In experiment 2, we investigate the next step in our conceptual framework by testing whether transparent packaging impacts purchase intention. In Experiment 2, participants view either a transparent or a non-transparent bottle of liquid laundry detergent. Then, participants rate their purchase intention for the laundry detergent on a scale developed by Baker and Churchill (1977). Confirming our hypothesis, we find greater purchase intention for the product in transparent packaging.

In Experiment 3, we return to the orange juice category and test the entire framework by testing whether transparent packaging increases purchase intention; and whether that increase in purchase intention is mediated by brand trust. Participants were shown either the transparent or non-transparent orange juice bottle (as in Experiment 1a). Then, they were asked to rate the product's trustworthiness (using the De Wulf, Schroder, and Iacobucci 2001 scale) and their purchase intention (using the Baker and Churchill 1977 scale). Consistent with our hypothesis we find greater purchase intention for the product in the transparent orange juice bottle. Additionally, we find that the relationship between transparent packaging and purchase intention is (complementary) mediated by brand trust (Preacher and

Hayes, 2004; Zhao, Lynch and Chen 2010). This result is consistent with our conceptual framework.

In Experiment 4 we investigated whether people prefer transparent to non-transparent packaging. 181 students were asked to choose between an actual transparent shampoo bottle and an actual non-transparent shampoo bottle of the same color as the shampoo. 77% of participants selected the transparent package confirming consumer preference for transparent packaging.

Finally, in Experiment 5, we propose and investigate a boundary condition for the effect. Unappealing products, rotting products, or products that do not meet consumer expectations would likely not benefit from transparent packaging. The inferences made about products in transparent packaging would likely not overcome the actual, observed negative attributes inherent in viewing rotting or unappetizing products or even icy, pale, frozen French fries. To test this, participants began Experiment 5 by looking at either a puke green transparent laundry detergent package or a non-transparent package. Then, participants rated the trustworthiness of the product. Consistent with the notion that inferences made about transparent packaging cannot overcome the judgments made when viewing unappealing products, we find that participants viewing the non-transparent laundry detergent have greater trust in the product than participants viewing the puke green transparent package.

To summarize, results from five experiments suggest that transparent (vs. non-transparent) leads to higher purchase intention and increased product choice, even when explicitly controlling for product freshness and quality. We identify perceptions of product trustworthiness as the mediator and physical appeal of products as an important boundary condition for this effect.

The Effect of Product Shape Closure on Perceptions of Quantity, Preference and Consumption

EXTENDED ABSTRACT

Consumers attend to environmental cues in the retail place in order to make inferences about the properties of a product (Zeithaml 1988). One of the most important indicators of a product's characteristics is its external aspect, including its shape. A product's shape has been shown to influence perceptions of size (Raghubir and Krishna 1999; Krider, Raghubir and Krishna 2001; Folkes and Matta 2004), preference (Raghubir and Krishna 1999; Krider, Raghubir and Krishna 2001; Folkes and Matta 2004) and consumption (Raghubir and Krishna 1999; Krider, Raghubir and Krishna 2001; Wansink and Van Ittersum 2003).

Past research on product shapes has demonstrated that people estimate products that have a longer (Raghubir and Krishna 1999) or more prominent primary dimension to be bigger (Krider, Raghubir and Krishna 2001). This is because consumers make effort-accuracy trade-offs that lead to heuristic processing of area estimations and size judgments biases. Moreover, research by Folkes and Matta (2004) has reversed this effect by showing that a product's ability to attract attention affects size perceptions due to mental contamination.

In this research, we introduce "product shape closure" as an even more robust determinant of perceptions of size judgments, preference and food consumption. Psychological closure refers to the feeling that a life experience is past or complete (Beike, Adams, and Wirth-Beaumont 2007). Past research has also defined need for closure as the desire to quickly reach firm answers that allow closing the door on a matter (Kardes et al. 2004, 2007; Kruglanski and Webster 1996). Reaching psychological closure allows individuals to pursue

other goals and avoid negative affect (Beike, Markman, and Karado-gan 2009; Beike and Wirth-Beaumont 2005).

In the current research, we tested if perceptions of the physical closure associated to the shape or the design of a package could have an effect on people size estimations and preference for a product. We manipulate product shape closure by keeping the size and weight of a product constant and by altering physical aspects of its design. For example, we compare cheese slices which surfaces include holes or not, sandwiches which are cut in halves or offered in their complete form, a shampoo bottle which possesses an overture on its package against one that does not, etc. Our results showed that products whose shapes evoked feelings of closure against those who did not were perceived as bigger and were preferred. This effect persisted in cases where the product that evoked the most feelings of closure and completeness did not have a larger primary dimension and did not attract more attention.

We ran seven studies to test the robustness and generalizability of this phenomenon, its underlying mechanism, and explore some boundary conditions for it. Study 1 was a field study held during a business lunch attended by medical doctors and healthcare executives. In this field experiment, subjects located in two different rooms ate equal weight snack sandwiches. Subjects in each group were invited to serve themselves snack size sandwiches which shape was complete (evoked closure) or incomplete (did not evoke closure). Despite the group that was assigned to the incomplete sandwiches condition had significantly less males (50%) than the other (70.7%), we found that subjects in that condition ate more sandwiches than those in the other group ($M_{unclosed}$ = 3.23 vs. M_{closed} = 2.38; t (44) = 3.96, p < .0001). As we expected, participants in the incomplete condition probably found the sandwiches to be smaller, which led them to eat more.

Study 2A demonstrated the phenomenon in a more controlled laboratory experiment and extended the findings from food consumption to size perceptions. This study showed that a bread bun and a cheese slice are considered to contain more quantity when their shape is closed or complete as opposed to unclosed or incomplete, even if the latter has a larger primary dimension. However, this effect will be reversed if the incomplete stimuli are assigned names of products for which an incomplete shape is representative of the product category (i.e. bagel and swiss cheese). In this case, the incompletely shaped products will be estimated to contain more quantity, as their incompleteness will not be used to adjust down consumer estimations, and instead participants will anchor on their prominent primary dimension and estimate them to be bigger. Study 2B used a similar design to demonstrate that the closure effect is mediated by the extent to which consumers perceive that a product corresponds to a full unit, as they will use this "unity heuristic" to estimate size perceptions and will ignore the fact that a product which is a fraction of a unit may be bigger than one which corresponds to a full unit, if the unit from which the former is a fraction is considerably larger. This bias is similar to the numerosity heuristic (Pelham, Sumarta and Myaskovsky 1994).

Studies 3A and 3B employed choice tasks to demonstrate that when participants compare products they will estimate that the completely shaped ones contain more quantity, are bigger, and will be more likely to be bought than the incomplete ones. Study 3A used sandwiches and packages of Babybel cheese to demonstrate that the effect will reverse the primary dimension heuristic, while Study 3B used bread buns and cheese slices to show that the phenomenon will also trump the attention attraction effect.

Study 4 used a similar design as the one used in Studies 3A and 3B to provided additional evidence in favor of the shape closure ef-

fect by showing that the phenomenon will be significantly stronger among participants who have high versus low Need for Cognitive Closure (NFCC). Finally, Study 5 demonstrated the robustness of the closure effect by showing that it can be extended to package labels and is not limited to package shapes. This experiment replicated the effect for cases where two products (juice galloons) have the same shape and size but one of them contains a more closure evoking label image than the other (i.e. a complete versus an incomplete apple picture).

Aesthetics versus Humor in Product Packaging: Their Impact on Ownership Pride

EXTENDED ABSTRACT

Product designers often strive to create designs whose sight elicits a positive emotional reaction in consumers (Desmet, 2003). To accomplish this, two of the most frequently used approaches consist in creating either an aesthetically appealing (Bloch, 1995; Coates, 2003) or a humorous-looking design (Doyle, 1998). Yet, while consumers' reactions to aesthetically appealing designs have garnered substantial attention in consumer research (Patrick & Peracchio, 2010), we know little to nothing about responses to humorous-looking designs. Aside from triggering a smile or a giggle, does a humorous-looking design provide any other value to consumers—most importantly, social value? Prior research has found aesthetically appealing designs to generate social value in the form of enhanced ownership pride (e.g., Townsend & Shu, 2010), but has not yet shown similar responses for humorous-looking designs. If such designs do indeed provide social value, how does it compare to that offered by a functionally equivalent, yet aesthetically appealing design? The present research will address these questions.

A visually attractive appearance represents a socially valued characteristic in interpersonal relationships (e.g., Sigall & Landy, 1993), but also in a consumption context, where aesthetically appealing products instill pride in their owners (Pol & Park, 2012; Townsend & Shu, 2010), who are often eager to display such products to the world (Bloch, 1995). Humor, on the other hand, while a highly socially desirable trait (Apte, 1978), can also evoke negative social connotations, such as impressions of inappropriateness or low source credibility (Eisend, 2008; Bressler & Balshine, 2006). In the context of a utilitarian product, such connotations may cause one to dismiss a humorous-looking product as a gimmick because of a perceived disconnect between its appearance and its functional purpose (Buchanan, 1989). This should, in turn, negatively affect the social benefits of owning such a product, potentially even triggering embarrassment rather than ownership pride in consumers. We hence propose that, between an aesthetically appealing and a humorous-looking product that are functionally equivalent and equally pleasant to look at, the humorous item should provide significantly lower social benefits to consumers, as evidenced through lower expectations of ownership pride. We tested this hypothesis in Study 1.

Visually appealing products have been associated with a host of desirable social connotations, most notably impressions of tastefulness (Cziksentmihalyi & Robinson, 1990; Wagner, 1999). Consistent with a self-signaling account (Bodner & Prelec, 2001), owning a visually attractive product should hence convey to oneself (and also to others) that one possess good taste, which in turn is conducive to instilling feelings of pride in consumers (Chang & Wu, 2007). A humorous-looking item, on the other hand, is unlikely to provide signals about one's level of taste (provided, of course, that the humor is not perceived as blatantly distasteful). It should, however, be perceived as interesting and original (Ludden, Schifferstein, & Hekkert,

2008), such that its ownership would convey that one possesses a unique and distinctive personality—a social signal that typically enhances individuals' sense of self-worth (Kim & Markus, 1999). We hence propose that aesthetically appealing products provide social value (i.e., elicit pride) because they signal that their owner has good taste, while humorous-looking products do so because they signal uniqueness. This second hypothesis was tested in Study 2.

In Study 1, we verified that humorous-looking product designs create less social value than humorous-looking ones do. The study employed a one-way (visual appearance: aesthetically appealing vs. humorous-looking vs. neutral-looking) within-subjects design. Each participant in the study saw a total of nine computer speakers (three in each category), which were described as identical in terms of price, manufacturer, quality, and functionality. Afterwards, participants indicated how proud they would be to own each item. The manipulation check confirmed that the aesthetically appealing products were significantly more attractive than all the other items, while the humorous products were perceived as the funniest. Respondents further reported the same degree of pleasure when looking at the attractive and the humorous-looking items. Consistent with our hypothesis, a repeated-measure ANOVA with planned contrasts revealed that the humorous-looking items did indeed trigger lower expectations of ownership pride compared to the aesthetically appealing products ($p < .05$). Interestingly, however, they elicited higher pride expectations than the neutral-looking ones (the latter of which served as a control group) ($p < .05$). These results show that, while an aesthetically appealing product offers stronger social benefits than a humorous-looking item does, humor may bring some social value to a product's design after all.

In Study 2, we examined whether aesthetically appealing and humorous-looking designs create social value through different mechanism. The study employed a one-way (visual appearance: aesthetically appealing vs. humorous-looking vs. neutral-looking) between-subjects design. We showed participants a range of household products (such as teapots, desk lamps, and alarm clocks) and asked them to the select three items they would best describe as beautiful, funny, and neutral-looking, respectively. Each participant was then presented with one of the three items based on the group he or she belonged to. We chose household items as stimuli because they are traditionally designed for private consumption, and would allow for a rather conservative replication of our previous results. In line with Study 1, we again found that the pride expectations elicited by the humorous-looking products were lower than those triggered by the aesthetically appealing products ($p < .05$), yet higher than those associated with the neutral-looking items ($p < .05$). Consistent with our hypothesis, two mediation analyses based on bootstrap further suggested that, while good taste best explained the impact of visual attractiveness on ownership pride, the relationship between humor and pride was explained by uniqueness ($p < .001$).

This research shows that a humorous-looking product design does provide social value to consumers, though to a lesser extent than an equally pleasant, yet aesthetically appealing design would. Moreover, aesthetics is socially valuable because it signals good taste, while humor providing social value because it connotes uniqueness. These findings provide initial evidence for how consumers' responses to hedonically appealing product designs vary across hedonic characteristics.

Where You Say It Matters:
How Product Packaging Increases Message Believability

EXTENDED ABSTRACT

For a message to have any effect it must be believed. Broadly speaking, persuasion research has identified three factors which influence message believability: source (Hovland and Weiss 1951), audience (Petty, Cacioppo, and Schumann 1983), and context (Oppenheimer 2006). In addition to this, proximity of the message to its audience may also influence believability (Latané et al. 1995). In effect, spatial distance can be considered part of a larger concept, that of psychological distance, the subjective experience of something being close or far away from the self. In the context of believability this is particularly relevant as there is a strong connection between psychological distance and construal level and moreover there is evidence to suggest construal level also influences believability (Wright et al. 2012).

Building on this work, we propose a new determinate of believability - psychological proximity of a message to its subject. Specifically we hypothesize that, all else equal, the closer a message seems to its object, the more believable it will be. We consider this in a consumer decision-making context by examining how product message placement (whether on a package versus in an advertisement) influences believability. Across three studies, we demonstrate that decision-makers consider product claims more (less) believable when presented on a package (advertisement) and that this effect is mediated by perceived proximity of the claim to the product.

Study 1a establishes the basic effect of presentation material on message believability and the moderating role of claim strength. Participants were shown a product description for an electric kettle with a claim that it boils water in either two or eighteen seconds. We manipulated whether the message was presented on a package or in an advertisement through introductory language and simple graphic variations. Analysis of believability ratings revealed a significant two-way interaction between claim strength and presentation material ($F(1, 159) = 7.73$, $p = .01$). When presented with a strong product claim, participants rated it as more believable if presented on a package than in an advertisement ($M_{strong\ claim,\ package} = 4.00$, $M_{strong\ claim,\ advertisement} = 3.23$, $F(1, 79) = 4.37$, $p = .04$). There was no effect of presentation material on message believability in the weak claim conditions ($F < 1$) suggesting that this effect is only relevant with strong claims where believability may be called into question.

Some consumers may be immune to the effect of presentation material; study 1b tested this possibility be examining the role of product knowledge. We used nail polish as our product category and gender as an indicator of product knowledge. All participants were shown either an advertisement or package for a nail polish top coat. Analysis of believability ratings revealed a significant two-way interaction between gender and presentation material ($F(1, 178) = 4.60$, $p = .03$). Men rated the product claim as more believable when presented on a package ($M_{male,\ package} = 4.06$, $M_{male,\ advertisement} = 3.22$, $F(1, 99) = 8.50$, $p < .01$). Presentation material did not influence the believability ratings of female participants ($F < 1$). We find, therefore, that the effect of claim placement, and presumably closeness, is stronger when participants have less knowledge of the product category.

Studies 2 and 3 examined the mechanism through which package messages seem more believable than those in advertisements. If the proximity of the product to the message is indeed the key difference between an advertisement and a package in terms of believability, then varying alternative forms of psychological distance should moderate our effect. In study 2 we primed different degrees of spa-

tial distance. Additionally, we tested our theory using a new product, digital video recorders (DVRs). We used current DVR ownership as an indicator of product knowledge. Analysis of believability ratings revealed a significant three-way interaction between presentation material, distance prime, and ownership ($F(2, 347) = 3.59$, $p = .03$). Under control conditions, presentation material did not influence perceived believability among participants who own a DVR ($F < 1$) but did affect believability among those who do not; these participants rated the product claim as more believable when presented on a package than in an advertisement ($M_{control, package, do not own} = 5.97$, $M_{control, advertisement, do not own} = 4.91$, $F(1, 347) = 4.92$, $p = .03$). Furthermore, among these participants there was an effect of distance prime on package claim believability; this effect was driven by decreased believability in the far distance conditions ($M_{control, package, do not own} = 5.97$, $M_{far, package, do not own} = 4.98$, $F(1, 76) = 4.46$, $p = .04$; $M_{near, package, do not own} = 5.75$, $M_{far, package, do not own} = 4.98$, $F(1, 80) = 2.93$, $p = .09$). There was no significant effect of the distance prime on advertisement claim believability, however we did see that the near prime slightly increased the believability of an advertisement claim ($M_{control, advertisement, do not own} = 4.91$, $M_{near, advertisement, do not own} = 5.68$, $F(1, 71) = 2.55$, $p = .12$).

In study 3 we considered varying psychological distance in a third manner, narrative voice. We found a significant three-way interaction between presentation material, narrative voice, and ownership ($F(2, 251) = 4.98$, $p < .01$). Results replicated prior findings and were mediated by perceptions of the proximity between the product and the product information. Once presented in a first-person (third-person) voice the claim was perceived as close to (far from) the product regardless of presentation material and thus relatively believable (unbelievable).

Across three operationalizations of psychological proximity we see that presenting a claim as closer to its subject will increase believability. These findings extend our knowledge of psychological distance and its effects on persuasion. Beyond the current context of advertisements and packages, our results are relevant in any situation where message-to-subject proximity may be manipulated and of particular use in situations where a claim appears improbable (e.g. fundraising campaigns where need is extreme) or where the consumer's best interest is in complying with the stated message (e.g. usage of OTC pharmaceuticals or public safety campaigns). Furthermore, our results challenge the implicit notion that consumer responses to advertisements and packaging are the same.

Disadoption

Chair: Donald R. Lehmann, Columbia University, USA

Paper #4: When Firms Disadopt Consumers: Exploring How Consumers Respond to Firm-Initiated Relationship Disengagement
Martin Mende, University of Kentucky, USA
Maura Scott, University of Kentucky, USA
Katherine Lemon, Boston College, USA
Scott Thompson, University of Georgia, USA

SESSION OVERVIEW

The purpose of this session is to focus attention on a fundamental and understudied area: disadoption. While considerable effort has been focused on the adoption of innovations (e.g., Rogers 1995), stopping doing something is an equally intriguing topic. While various specific disadoptions have been studied and or encouraged (e.g., churn /customer defection, health behaviors related to smoking and eating), little effort has been directed toward studying disadoption as a general topic and integrating perspectives into a unified "theory" of disadoption. The purpose of this session is to make progress in that direction.

The session will begin with a paper by Lehmann and Parker which discusses disadoption as a general phenomenon. Aspects discussed will include reasons for disadoption (including whether it is voluntary or forced and long or short term), which forces speed or retard it, how to model it, and what consequences arise (e.g., is it accepted or resisted?) Then three very different types of disadoption will be discussed.

Specifically, Min Ding will discuss cessation of behaviors that relate to sustainability. Susan Fournier will take a different tack, viewing disadoption from the lens of a relationship breakup. Finally, Kay Lemon will focus on modeling forced disadoptions in the area of customer defections, e.g., when companies decide to delete a customer and how the customer responds. The session will conclude with a general discussion aimed at integrating the talks and creating an agenda for future research.

Disadoption

EXTENDED ABSTRACT

The breadth of studies investigating diffusion and adoption processes is impressively extensive (for excellent reviews, see Majay, Muller, and Bass 1990; and Sultan, Farley, and Lehmann 1990). For instance, factors affecting product and/or innovation adoption that have been investigated include, but are not limited to, advertising (Dockner and Jorgensen 1988; Horsky and Simon 1983; Kalish 1985), word of mouth and social influence (Godes and Mayzlin 2009; Iyengar, Van den Bulte, and Valente 2011) consumer expertise (Moreau, Lehmann, and Markman 2001), product categorization (Moreau, Markman, and Lehmann 2001), product warranties
(Bearden and Shimp 1982), and price and product benefits (Horsky 1990).

Needless to say, product/innovation adoption has received a great deal of attention. While the variety of topics covered under the adoption umbrella has been vast, they have all contributed to a systematic investigation and understanding of when, why, and how fast individuals adopt products and innovations. In other words, adoption is considered a unified, unique, and general process with many inputs, moderators, and consequences.

By contrast, the opposite process, disadoption (i.e., the discontinuance of use of a product or behavior), has yet to be considered as a stand-alone, general phenomenon and has received relatively little systematic attention. While specific disadoption related behaviors have been studied (e.g., smoking cessation, dieting, product disposal, etc.), the focus has been on the specific activity rather than the general process of disadoption. The purpose of this paper is to consider disadoption as a general phenomenon and outline its antecedents, process, and consequences in the spirit of Greenleaf and Lehmann's (1995) analysis of reasons for decision delay. In contrast to that work, however, we consider a broader range of instances in our conceptualization and include a more diverse population in our experiments.

One perspective on disadoption is that stopping doing something is merely the adoption of a new (or non-) behavior, which suggests that disadoption and adoption can be characterized, conceptualized, and modeled in the same way (e.g., a Bass model can be used to model disadoption as well as adoption). From this perspective, choosing to quit smoking is identical to choosing to live a smoke free life functionally, behaviorally, and psychologically. At first glance, this seems to be a reasonable position. After all, given a choice between A and B, choosing "A" is equivalent to choosing "not B."

However, there are several aspects of disadoption which are unique. First, when a person disadopts something, there is relatively little uncertainty about what they are foregoing, in contrast to adoption processes where uncertainty in inherent. Second, while adoption is generally modeled in a binary fashion (yes or no), disadoption can be gradual and partial, occurring over time or in steps or stages. Third, whereas adopting a product requires taking possession of it, it is possible to disadopt a product without disposing of it. Fourth, giving something up brings into play several psychological processes such as loss aversion and possession utility which play less of a role in adoption decisions. Further, the psychology of choice has been shown to differ significantly from the psychology of rejection (Chernev 2009; Laran and Wilcox 2011; Park, Jun, and MacInnis 2000; Shafir 1993). Consequently, a broad examination of disadoption seems warranted.

Broadly described, we define disadoption as the process of cessation or substantial reduction in the use of a previously valued behavior or possession. This process can be fairly complex. Disadoption can occur either abruptly ("cold turkey") or over the course of a long period of time. It can be triggered by a variety of external (e.g., availability or social pressure) and internal (e.g., a new or increasingly salient goal) factors, whose effects may be cumulative. It may be a permanent or temporary change. And, importantly, the subsequent reaction to the disadoption may be positive and reinforcing or negative and regret inducing.

This paper takes four major steps toward formalizing the concept and investigation of disadoption. First, we propose a conceptual

model of the disadoption process. This model illustrates how a large variety of factors including (i) internal and external influences (triggers), (ii) the perceived ease and permanence of the disadoption, and (iii) the ultimate response to the disadoption can impact the likelihood that a consumer will consider (at all) and ultimately choose to disadopt.

Second, we draw from and integrate a wide array of literature that addresses impactful disadoption triggers. This conceptual analysis is supplemented with empirical data on disadoption triggers collected from over 600 student and non-student participants across two studies. Study 1 presents preliminary evidence that the reasons for disadoption are fairly consistent within subpopulations (e.g., students), but can vary significantly across different populations (e.g., students vs. a more diverse national sample). Study 2 factor analyzes consumers' reasons for disadoption and finds evidence that a wide variety of specific reasons for disadoption can be explained by five factors (general reasons): (i) life transitions, (ii) negative aspects/social pressure, (iii) irritation, (iv) variety seeking, and (v) future viability.

Third, we present an initial discussion on the opportunities and challenges of modeling disadoption. Fourth, and finally, we outline a research agenda for studying disadoption. It is our hope that this paper and session will stimulate conversation and research on the topic of disadoption, a largely ignored yet very important general phenomenon.

Disadopting Unsustainable Consumption

EXTENDED ABSTRACT

Sustainable development (SD) has now become a guiding force in policy making at various government levels, from township to city to state to country, and to inter-nation organizations. For example, many city governments now approve new development with sustainability in mind, and demand their contractors to practice sustainable development. Firms, in turn, have incorporate sustainable development in their strategic planning and daily operation, and further demand their own suppliers and distributors to practice sustainable development. Walmart, for example, asks its suppliers to complete a sustainability report and a supplier that fares badly on this report might lose their business with Walmart. Most importantly, citizens are demanding it and practicing it. In the words of a senior executive at a major consumer product company, "customers will punish us if we don't do it".

The modern definition of SD is proposed in the 1987 World Commission on Environment and Development (WCED, also known as the Brundtland Commission). This commission enriched the definition to include both social and environmental concerns and this modern definition is the most important contribution from its report, Our Common Future (a.k.a. the Brundtland Report). Specifically, it defines SD as "the kind of development that meets the needs of the present without compromising the ability of future generations to meet their own needs." In 1992, UN Conference of Environment and Development in Rio de Janeiro (also known as Earth Summit) published Agenda 21, in which almost all nations committed to implement specific items consistent with SD. In 2002, World Summit on Sustainable Development in Johannesburg, South Africa, heads of state agreed to implement Agenda 21. This year (2012), the United Nation Conference on Sustainable Development (also called Rio+20) will review the progress of SD and set agenda for the future.

The biggest challenge in SD is to change our behavior, change how we normally do things. Government needs to change their policies, firms need to change their practice, and individuals need to change their consumption habits. We study how individuals change their behavior in this paper.

The behavioral change involves disadoption of routines an individual is practicing now, even already habitualized. Such disadoption requires a different theoretical understanding of the process than adoption. To the best of our knowledge, there is no systematic study of disadoption behavior driven by concern on SD. The closest research to this is the disadoption of behaviors that are not healthy, such as smoking, drinking, or uncontrolled eating.

However, there are at least three major differences between the SD driven disadoption and existing disadoption behavior:
- Existing disadoption research studies behavior that will have an effect on oneself, for example, one's chance of dying of lung cancer will decrease substantially if he stops smoking. On the other hand, SD related disadoption research studies behavior that has no effect on oneself, instead, it studies behavior that will have an effect on future generation whom the individual will not even meet. For example, if one uses less energy now, the future generation will have more energy reserve (e.g., oil).
- Existing disadoption research studies behavior that will have an effect independent of what other people will do. Again, for smoking, if one stops smoking, the benefit of this disadoption is assured regardless of what other people do. On the other hand, SD related disadoption research studies behavior where the effect depends on other people doing the same thing. If only one person reduces energy use, and the other people do not, future generation will unlikely benefit from this person's action. Furthermore, there is a free riding concern. If enough people save energy, future generation will have enough reserve even if one doesn't do it.
- The third difference is that we study willingness to disadopt, in terms of quantitative measures ($). This will provide a more rigorous understanding of this behavior, and provide more actionable guidelines to managers and policy makers, in addition to individuals.

The types of SD related disadoption behavior we are interested in include the following examples (but not limited to). We will not study duel-purpose disadoption, where disadoption has benefit for SD as well as for oneself (e.g., reducing energy use can save money as well). Here are some examples in SD related disadoption:
- Disadoption of leather cloth/accessories (to contribute to biodiversity, and reduce animal cruelty).
- Disadoption of plastic bags as much as one can (to contribute to low landfill)
- Disadoption of disposable plastic water bottles (to contribute to low landfill)
- Disadoption of less SD friendly (to environment, to their employees, to the community they are in) business' products (to contribute to both environment and society)
- Disadoption of products with fancy packages (to reduce waste)
- Disadoption of eating unnecessary meat (it takes substantial environmental resource to produce meat)
- Disadoption of showering too long and too often

Our research should help understand how consumers make SD related disadoptions, and may help us develop more effective communication strategies to encourage individuals to disadopt such behavior.

Disadoption through the Relationship Lens

EXTENDED ABSTRACT

This presentation offers an expanded perspective on disadoption as viewed through the relationship theoretic lens. Our inquiry builds from three brand relationship tenets (Fournier 1998): relationships as processes; relationships as contextualized and meaning-laden experiences involving a person, his/her social networks, and a product, service, or brand; and relationships as multiplex phenomena that vary in strength and kind. These principles stand in stark contrast to the frame of diffusion theory typically applied to the disadoption problem and thus offer the potential to extend our understanding of disadoption in meaningful ways.

First, relationship theory forces us to move beyond popular conceptualizations of disadoption as a yes/no brand decision to consider the process aspects of the experience at hand. Relationships, at their core, are dynamic phenomena that evolve and change in response to reciprocating signals exchanged over time. The process of ending a relationship has been variously described as separation, termination, dissolution, withdrawal, disengagement, divorce, break-up, discontinuity, decline, exit, and rejection—each possessing a process phenomenology worthy of investigation in its own right (Duck 1982). While relationship discontinuity has received attention in consumer research (Aaker, Fournier and Brasel 2004; Aggarwal 2004; Fournier 1998), theory is limited by a focus on brand transgressions as precipitators of relationship decline. Clearly, the transgression-recovery process is important to an understanding of relationship dissolution, but this event-based and brand-centric framework far from exhausts the processes whereby consumers and brands are driven apart. Even within the transgression framework, certain frames have yet to be fully leveraged. Rich constructs from relationship contracting theory including opportunistic contracting (MacNeil 1985) or contract drift and misalignment (Rousseau and McLean Parks 1992) can help explain the deterioration of relationships between consumers and brands. Disadoption viewed through a relationship theory lens can shift basic conceptions of a process that is not always constituted as termination and dissolution, but rather gradual separation or a more liminal state of disengagement and detachment over time.

Second, relationship theory forces deeper acknowledgement of the person and how the experience of disadoption flows from and affects that person's life. One of the major criticisms of diffusion research concerns its source bias: the tendency to examine diffusion phenomena almost exclusively from the perspective of the change agency itself (Rogers 1995). Despite noteworthy exceptions (Johnson, Matear and Thomson 2011; Lastovicka and Fernandez 2005; Price, Arnould and Curasi 2000), not enough consumer research has explored what happens when something is dis-adopted: we lack a comprehensive exposition of the lived experience and consequences of disadoption through the person's eyes. Of interest is the implicit assumption that a discontinued relationship is a "failed" relationship, and that breakups are inherently bad. But dissolution may rescue a person from an abusive relationship or provide paths for growth not possible when a particular relationship is engaged. Recent approaches (Specher and Fehr 1998) treat dissolution holistically as an integral part of a person's life projects and activities, not as a separate process. Moreover, disadoption can be a very social process that implicates not only the person but also networks of family and friends. A relationship always takes place within a set of other relationships and yet we know little of the role, experience and influence of third parties on the disadoption process itself.

A third relationship principle highlights the diversity of relationships and the variability of processes relating to these different relationship forms. Although there are literally hundreds of types of relationships, consumer research applications of relationship theory designed to enrich our understanding of disadoption focus on but one relationship type: the marriage between consumer and brand. Within this implicit framing, our understanding of relationship dissolution is conceptualized metaphorically as divorce (Dwyer, Schurr and Oh 1987). Perrin-Martinenq (2004) depicts relationship dissolution as a multi-phased exit process similar to Duck's (1982) four-phased model of breakdown, decline, disengagement and dissolution in divorce (Perrin-Martinenq, 2004). Still, consumer researchers have yet to unpack the complexity of the divorce phenomenon as illuminated through relationships research (Baxter 1984; Duck 1982; Simpson 1987). Divorce is a messy, protracted, and embedded experience through which a relationship other becomes dis-integrated from a person and his/her social life.

Still, few brand engagements qualify as marriages (Miller, Fournier and Allen 2012), and emotionally-laden divorces are likely rare. Brand relationships research supports a range of valid templates (Fournier 1998) that are not yet accommodated in theories of disadoption of brands. The character of the dissolution experience will be fundamentally different depending on the type of brand relationship disengaged. For certain relationship types, disadoption plays a different role altogether. For example, separation of brand and person serve not as the ending of a given relationship, but rather as the qualifier for relationship initiation in the case of adversaries, brand enemies and former friends (Johnson, Matear and Thomson 2011).

This study uses findings from three qualitative datasets that collectively enliven the lived experience of disadoption as viewed through a relationship lens. First is a two-year longitudinal inquiry involving twenty-five consumers' experiences with an Internet grocery service, fifteen of whom eventually disadopt the service. A second database includes comments posted by consumers on blogs, discussion boards and social media sites in response to controversial brand decisions, and focuses on those who disengage from the brand. Lastly, we consider interview data from sixteen loyal, "best customers" whose relationships were terminated unexpectedly at the company's hands. Collectively these studies allow multiple perspectives on disadoption as manifest in different contexts, thereby addressing our exploratory research goals.

In this presentation we leverage the above theories of relationship deterioration and our data to present alternate conceptualizations of disadoption for five different brand relationships: marriages, flings, adversaries, abusive partnerships, and functional business exchange. Stress factors precipitating breakdown, patterns of break-up, processes of dissolution, and consumer responses to dissolution are considered as they vary by relationship type. We close with propositions intended to improve the accuracy of our disadoption predictions and stimulate research on disadoption through the relationships lens.

When Firms Disadopt Consumers: Exploring How Consumers Respond to Firm-Initiated Relationship Disengagement

EXTENDED ABSTRACT

Firm-initiated consumer disadoption (firms choosing to disengage from or end a relationship with a consumer) is increasingly common. For instance, in 2007, telecommunications firm Sprint terminated more than 1,000 consumers who called customer service ("too") frequently. Two studies reveal how mechanisms of blame attribution, judgments of deservingness, and social exclusion influence consumer responses to disadoption (e.g., in terms of perceived firm integrity, anger, negative attitude).

Because companies are concerned about their reputation and perceived integrity when abandoning consumers, Study 1 (field study) examines how *non-targeted, observing* consumers respond. Grounded in deservingness and attribution theories, this study shows that observers' responses to the firm (Sprint) are influenced by whether they believe targeted consumers deserve being disadopted.

Study 2 (experiment), examines how *targeted* consumers respond to distinct configurations of disadoption. Grounded in social exclusion theory, it shows that the interaction between how firms disadopt consumers (via direct dissolution vs. costly inclusion) and why firms disadopt them (via dispositional vs. non-dispositional blame) influences consumer response. This study suggests that consumer-perceived firm integrity and anger play mediating roles in consumer response to firm-initiated consumer disadoption.

Study 1

The study context is a popular consumer website which posted two stories on Sprint's decision to terminate consumers in July 2007. The stories described Sprint's actions and policies around the disadoption of some of its customers, and included a copy of Sprint's termination letter blaming those consumers for excessive complaining. Commenting on these stories, observing consumers posted a total of 173 comments. These consumer reactions were content analyzed. Coders rated each message from –3 to +3 based on two variables: the poster's portrayal of the firm's (Sprint's) integrity and the poster's emotional response. Scores at the extreme (-3, +3) indicate the message portrayed firm integrity negatively (-3, e.g., dishonest, unethical, greedy) or positively (+3, honest, ethical, not greedy).

The ANOVA on firm integrity revealed a significant main effect of blame attribution, $F(1, 172) = 168.80$, $p < .01$. When Sprint was blamed, perceived firm integrity was negative ($M = -1.46$). However, when observers blamed the fired consumers, firm integrity was portrayed positively ($M = .78$). An example posting: *"I think many people would disagree with me, but I think this is an honorable way for them [Sprint] to end this."*

The ANOVA on emotional responses revealed a significant blame main effect, $F(1, 172) = 86.97$, $p < .01$. Messages blaming Sprint contained negative emotional responses ($M = -1.20$). An example posting: *"Sprint sucks and I hope this idiotic decision hurts their bottom line."* However, when observers blamed the terminated consumers, the messages reflected a slightly positive emotional response ($M = .23$).

We conducted a bootstrapping analysis (Zhao, Lynch, and Chen 2010) with blame attributions as the IV, firm integrity as a potential mediator, and emotional response as the DV. Confidence intervals with 5000 bootstrap samples at the 95% level excluded zero ($a \times b = -1.24$; 95% CI = -1.60 to -.91), indicating an indirect effect of firm integrity.

Study 2

Study 2 was a 2(blame content: dispositional, non-dispositional) × 2(approach: direct dissolution, costly inclusion) between subjects experiment. We asked participants to imagine being a member of a bookstore discount club similar to a large U. S. bookstore. Participants were told they intended to renew their membership ($25 annual fee), but one month before the membership expiration the bookstore sent a letter informing them of the disadoption. In this letter, we manipulated two factors. Because excessive complaining and lack of profitability are major reasons for disadoption, we manipulated the (non-)dispositional *blame* accordingly. We manipulated the disadoption *approach* by specifying either direct dissolution or costly inclusion through a price increase. Participants then indicated their attitude toward the firm, their perception of the firm's integrity, and their feelings of anger.

Negative Attitude. ANOVA of negative attitude revealed a blame content main effect ($F(1, 177) = 13.44$, $p < .001$), qualified by its interaction with the disadoption approach ($F(1, 177) = 8.30$, $p < .005$), see Figure 1. The disadoption approach main effect was non-significant ($F<1$). Contrasts revealed that when the blame is dispositional, negative attitudes were greater under costly inclusion ($M_{CI} = 6.43$) than under direct dissolution ($M_{DD} = 5.94$; $F(1, 177) = 3.84$, $p < .05$). The reverse pattern was present when blame was non-dispositional; negative attitudes were greater for a direct dissolution ($M_{DD} = 5.80$) than costly inclusion ($M_{CI} = 5.23$; $F(1, 177) = 4.46$, $p < .05$).

Firm Integrity. ANOVA of firm integrity ($\alpha = .70$) revealed a blame content main effect ($F(1, 177) = 12.45$, $p < .001$), qualified by its interaction with the disadoption approach ($F(1, 177) = 11.96$, $p < .001$), see Figure 2. The disadoption approach main effect was non-significant ($F < 1$). Contrasts revealed that for dispositional blame, firm integrity was higher with direct dissolution ($M_{DD} = 1.90$) than costly inclusion ($M_{CI} = 1.38$; $F(1, 177) = 3.96$, $p < .05$); for non-dispositional blame, firm integrity was lower with direct dissolution ($M_{DD} = 1.91$) than costly inclusion ($M_{CI} = 2.71$; $F(1, 177) = 8.26$, $p < .005$).

Using a bootstrapping procedure (Preacher and Hayes 2008), our model included the blame-by-disadoption interaction as the independent variable, blame content and disadoption approach as covariates, and negative attitude as the dependent variable. Potential mediators were firm integrity and anger. Confidence intervals with 5000 resamples at the 95% level excluded zero for firm integrity ($a \times b = -.59$; 95% CI $= -1.10$ to $-.26$) and anger ($a \times b = -.15$; 95% CI $= -.44$ to $-.01$), indicating an indirect effect of firm integrity and anger.

Discussion:

Study 1 suggests that the allocation of blame and judgments of deservingness influence how non-targeted consumers respond to relationship dissolution. Observers who feel that targeted consumers deserved their firing tend to portray the firm positively. Study 2 suggests that the interaction between *why* and *how* firms disadopt consumers determines their response. The results show that costly inclusion – under certain circumstances – can be superior to direct dissolution for consumers and firms.

Through Which Mechanisms Does Ambient Scent Affect Purchase Intention in Retail Settings?

Silke Bambauer-Sachse, University of Fribourg, Switzerland

ABSTRACT

In this paper, the effect of ambient scent on purchase intention is examined in a retail setting. The theoretical arguments suggest and the empirical analysis confirms that this effect is mediated by variables such as mood, ambiance evaluation, salesperson evaluation, and assortment evaluation.

INTRODUCTION

Ambient scents that are often considered as extraneous environmental cues (Bosmans 2006) evoke more powerful reactions than does addressing the other senses (Hirsch 1992). Although individuals may have difficulty recognizing a scent, scent identification is not a necessary condition for scent effects to occur (Ellen and Bone 1998). Thus, scents can have effects on consumers even if they do not pay attention to scents as they do with regard to other environmental stimuli (Ward, Davies, and Kooijman 2007). Consequently, effects of ambient scents are interesting from a consumer research perspective.

This study consists of a detailed examination of the mechanisms by which ambient scent effects occur in a real retail environment. Thus, it is the objective of this study to integrate the variables derived from previous research that might play a role in the considered context into one research model and to examine the specific relations between these variables in terms of rather direct or indirect ambient scent effects. The variables derived from previous studies are: mood, ambiance evaluation, salesperson evaluation, assortment evaluation, and purchase intention. In order to create a research model containing these variables, two research streams are brought together: research on ambient scent effects and research on mood effects. Following the argument of Morrin and Ratneswar (2003) that unpleasant scents have little practical relevance in marketing efforts, this study focuses on pleasant scents. Furthermore, the product category studied here represents a high involvement product category because especially the purchase of high involvement products often requires the recommendation of a salesperson. Thus, choosing such a product category for the empirical study made it possible to examine effects of ambient scent on the evaluation of the salesperson.

The study presented here goes beyond previous research because previous studies only examined single effects of ambient scent, but did not consider the broader context of possible other effects. Furthermore, although there is a comparatively large body of research on effects of product scents (Gulas and Bloch 1995), much less research was conducted on effects of ambient scents on consumer response variables such as product evaluations (Bosmans 2006) or purchase intentions. In addition, the study presented here fills three further gaps of previous research. First, the study was conducted in a real retail store whereas most of the previous studies were conducted in a laboratory setting (e.g., Morrin and Ratneshwar 2000; Spangenberg, Crowley, and Henderson 1996). Second, this study is based on a real customer sample whereas previous studies often used student convenient samples (e.g., Morrin and Ratneshwar 2000). Third, many previous studies looked at direct effects of ambient scent on purchase intention without examining these effects and underlying processes in detail. This study will do so by analyzing the role of relevant mediator variables.

In addition, by providing insights in the processes underlying the effects of ambient scent on purchase intention, this study helps retailers to better understand the mechanisms by which they are able to motivate customers to purchase (Davies, Kooijman, and Ward 2003).

EMPIRICAL BACKGROUND

Despite the large number of studies on scents, the number of studies that examine effects of ambient scents in a consumer research context is limited. The existing studies often look at direct links between ambient scent and consumer response variables such as product evaluation and purchase intention, but do not examine several effect paths in detail. Table 1 gives a chronological overview of the objectives and most important findings of studies on effects of ambient scent on consumer response variables.

The studies summarized in table 1 point out variables that play a role in the context of ambient scent effects. The variables that were analyzed in different studies and that repeatedly proved to be important are ambient evaluation, assortment evaluation, mood, and purchase intention. Although single studies examined some of these variables, studies that integrate all of these variables in a holistic framework and analyze their effects simultaneously do not exist. This paper will fill this gap and present a model containing these variables that is developed by bringing together the partial relations that were identified in previous studies.

With regard to the variable mood it is important to note that although Morrin and Ratneshwar (2000) did not find an effect of ambient scent on mood, this variable will still be considered in the study presented below. A possible explanation why Morrin and Ratneshwar (2000) did not find effects might be associated with the fact that they conducted a laboratory experiment. In a laboratory experiment mood induction might be less authentic and thus, mood might have weaker effects than in a real purchase situation.

The studies presented in table 1 also suggest that ambient scent might have effects on consumer memory. However, in a real purchase situation where a retail store is scented, scent-induced memory does not play a role because the purchase decision is usually made before memory effects can occur.

In addition to the variables derived from research on ambient scent effects, another variable that has not been mentioned yet in this stream of research but that has proved to play an important role in the context of the effectiveness of sales conversations (DeShields, Kara, and Kaynak 1996; Gierl and Bambauer 2006; Woodside and Davenport 1974) and thus might be relevant for a study conducted in a real retail store, is the evaluation of the salesperson.

DEVELOPMENT OF THE RESEARCH HYPOTHESES

Below, the partial relations that can be derived from previous research will be looked at in detail and be brought together in order to build up a holistic framework that contains assumptions on direct and indirect relations between the considered variables.

Effect of Ambient Scent through Ambiance Evaluation on the Evaluation of the Salesperson

Prior research found that ambient scents work as affective and contextual cues that affect consumers' subsequent evaluations

Table 1
Empirical Background

Study	Objective	Major findings
Mitchell, Kahn, and Knasko (1995)	examining how the congruency of ambient scent affects brand choice, decision processes, and memory	when ambient scent is congruent, people spend more time processing the data, are more holistic in their processing, and are more likely to go beyond the information given, relying more on inferences and self-references
Spangenberg, Crowley, and Henderson (1996)	investigating whether the presence of an inoffensive ambient scent versus no ambient scent affects intentions to visit the store, purchase intentions, evaluations of the store, the store environment, the merchandise in general	the presence of an ambient scent consistently enhanced evaluations, behaviors, and the subjective experience for retail shoppers
Morrin and Ratneshwar (2000)	examining the impact of ambient scent on mood, evaluation, attention, and memory for familiar and unfamiliar brands	the presence of a pleasant ambient scent led to additional processing efforts and superior re-call of the unfamiliar brands (rather than for familiar brands); no effect of ambient scent on mood
Fiore, Yah, and Yoh (2000)	studying the impact of ambient scent on attitude toward the product and purchase intention	positive effects of ambient scent on attitude and purchase intention
Mattila and Wirtz (2001)	examining effects of ambient scent on consumers' perceptions of retail environments	scent led to descriptively (but not significantly) more positive evaluations of the store environment than no scent
Morrin and Ratneshwar (2003)	investigating effects of ambient scent on brand memory	positive effect of ambient scent on brand memory only at the brand encoding stage, but not at the brand retrieval stage
Chebat and Michon (2003)	examining the impact of ambient scent in shopping malls on perceptions of the shopping environment and product quality	a light and pleasing ambient scent positively affects consumers' perceptions of the shopping environment and of product quality
Spangenberg, Grohmann, and Sprott (2005)	studying interaction effects between scent and music on consumer evaluations of the store and the merchandise	consistency between ambient scent and music produces more favorable shop and merchandise evaluations
Bosmans (2006)	analyzing the impact of ambient scent on product evaluation	significant positive effect of ambient scent on product evaluation
Spangenberg, Sprott, Grohmann, and Tracy (2006)	exploring congruity between gender-based product offerings and perceived femininity/masculinity of ambient scents	positive effects of ambient scent on store and merchandise evaluation if the ambient scent is congruent with gender-based products
Ward, Davies, and Kooijman (2007)	examining effects of ambient scent on perceptions of the retail environment and mood	positive effects of ambient scent on perceptions of the retail environment and mood
Krishna, Lwin, and Morrin (2009)	exploring the relative effectiveness of product scent versus ambient scent at improving memory for product information	product scent is more effective than ambient scent at enhancing memory for product-related information

(Aggleton and Waskett 1999; Bosmans 2006; Cann and Ross 1989). More specifically, ambient scents have direct effects on customers' perception of the environment (Bone and Ellen 1999; Chebat and Michon, 2003). Thus, it can be assumed that pleasant ambient scents have positive effects on customers' evaluations of the store ambiance. This argument leads to the first hypothesis:

Hypothesis 1: *The evaluation of the store ambiance is more positive in the ambient scent condition than in the no scent condition.*

Furthermore, based on the finding of Sharma and Stafford (2000) that a "prestige store ambiance" leads to significantly higher salesperson credibility than a "discount store ambiance", it can be argued that a positive evaluation of the store ambiance that is caused by a pleasant ambient scent has positive effects on the evaluation of

the trustworthiness and the competence of the salesperson working in this store. Thus:

Hypothesis 2: *The more positive customers' evaluation of the store ambiance, the more positive is their evaluation of the salesperson.*

Note that the causality assumed in H2 specifically refers to the effect of store ambiance on the evaluation of a salesperson's *trustworthiness and competence* and is due to the following order effect. A customer entering a store forms an impression of the store ambiance first and then starts an interaction with a salesperson. After having talked to the salesperson, the customer is able to evaluate the salesperson's trustworthiness and competence (Bitner 1992). On the contrary, effects of the evaluation of a salesperson on the perception of store ambiance might occur if perceptions rather refer to the salesperson's appearance (e.g., well-dressed). Such effects are not considered here.

Effect of Ambient Scent through Mood on the Evaluation of the Salesperson

Studies conducted in several fields of research found positive effects of a pleasant ambient scent on mood (social sciences: Baron and Thomley 1994, chemistry: Knasko 1992, medical science: Lehrner, Eckerberger, Walla, Pötsch, and Deecke 2000). The qualitative findings of a study on effects of ambient scent in retail environments (Ward et al. 2007) also support the notion that a pleasant ambient scent can produce a more positive mood (compared to the no scent condition). These considerations lead to the next hypothesis:

Hypothesis 3: *Mood is more positive in the ambient scent condition than in the no scent condition.*

In their study on mood effects in personal sales conversations, Gierl and Bambauer (2006) showed that mood is positively related to the evaluation of a salesperson. Thus, a comparatively positive mood is supposed to lead to a comparatively positive evaluation of the salesperson. Two theoretical approaches can be used to explain such an effect. According to the affect priming mechanism (Fazio, Sanbonmatsu, Powell, and Kardes 1986; Klauer, Rossnagel, and Musch 1997) which postulates that an emotion produced by a context stimulus affects the evaluation of a subsequently perceived stimulus, a positive mood state which is generated by a pleasant ambient scent has a positive effect on the perception of the salesperson with whom a customer is interacting. In addition, the mood maintenance theory (Isen, Means, Patrick, and Nowicki 1982) suggests that people in a positive mood judge objects or other people less rigorously (Cunningham et al. 1990) and with less cognitive effort in order to maintain their positive mood (Bower 1991; Cunningham 1988; Forgas 1995; Forgas 1998, Greenberg and Pyszczynski 1986; Milberg and Clark 1988). Thus, positive mood induced by the ambient scent is supposed to influence customers' evaluations of the salesperson's competence and trustworthiness:

Hypothesis 4: *The more positive customers' mood, the more positive is their evaluation of the salesperson.*

Note that a customer's evaluation of the salesperson might in turn influence his mood. There are two plausible effects. First, the customer's mood that is positive due to the ambient scent becomes even more positive because the customer is delighted about the salesperson's competence and trustworthiness. From a retailer's perspective, this is the optimal case because positive effects of a positive mood are even intensified. The second effect is that the customer's disappointment about a lack of competence and trustworthiness of the salesperson might deteriorate the customer's initial positive mood. This effect is not considered here because retailers should have a high motivation to have highly competent and trustworthy salespeople.

Effects of Mood and Ambiance Evaluation on the Evaluation of the Assortment

Several studies show that mood has positive effects on attitudes and evaluations (Batra and Stayman 1990; Batra and Stephens 1994; Gorn, Goldberg, and Basu 1993; Groenland and Schoormans 1994; Holbrook and Batra 1987; Isen and Shalker 1982). In addition, studies in a retail context provide the notion that store-induced mood strongly influences customers' in-store responses (Donovan and Rossiter 1982; Sherman, Mathur, and Smith 1997). These arguments lead to the assumption that customers' mood induced by the ambient

scent has a positive effect on their evaluation of the store assortment. Thus:

Hypothesis 5: *The more positive customers' mood, the more positive is their evaluation of the assortment.*

The causality assumed in H5 is plausible because the mood induction takes place when entering the store and (un)consciously smelling the ambient scent, thus *before* forming an evaluation of the assortment which can only be done after having spent a while in the store. A negative evaluation of the assortment might in turn influence the initial positive mood, but this particular case is not considered here.

Direct effects of mood on purchase intention are not expected because the study presented here is on high involvement products and previous research has shown that direct mood effects on product evaluation are less important for high involvement products than for low involvement products (Bambauer-Sachse and Gierl 2009) and thus should have an even weaker effect on purchase intention which represents a consequence of product evaluation.

Regarding the effect of ambiance evaluation on assortment evaluation, previous research provides the notion that environmental elements affect consumer evaluations of merchandise quality (Baker, Grewal, and Parasuraman, 1994). More specifically, Sharma and Stafford (2000) found that product evaluation is more positive for "prestige ambiance" stores than for "discount ambiance" stores. Thus, it can be argued that the evaluation of the store ambiance has positive effects on the evaluation of the store assortment. Therefore:

Hypothesis 6: *The more positive customers' evaluation of the store ambiance, the more positive is their evaluation of the assortment.*

It can further be assumed that ambiance evaluation does not have any direct effects on purchase intention because ambiance represents a contextual cue that is not directly linked to the high involvement products offered in a store.

Effects of Salesperson and Assortment Evaluation on Purchase Intention

Findings of previous research provide the notion that customers' satisfaction with the salesperson positively influences satisfaction with the retailer (Goff, Boles, Bellenger, and Stojack 1997) as well as anticipation of future interaction with the salesperson and purchase intention (Ramsey and Sohi 1997). Furthermore, the studies of Swinyard (1993) as well as of Lam and Mukherjee (2005) provide the notion that merchandise evaluation positively influences purchase intention in retail settings. Thus:

Hypothesis 7: *The more positive customers' evaluations of the salesperson and the assortment, the higher are their purchase intentions.*

Research Model

The above presented theoretical considerations are summarized in the research model presented in figure 1. The paths shown in the model will be tested in the empirical study presented below.

Figure 1
Research Model
EMPIRICAL STUDY

Product category

As it was intended to conduct the empirical study in a real shopping environment, several stores selling high involvement products in a midsize town in the south of Germany were contacted. The stores were selected on the basis of the following criteria. They should not be too large because otherwise it would have been difficult to diffuse the ambience scent in a sufficient way. In addition, they should have a manageable number of customers per day so that it was possible to administer the questionnaires without disturbing the normal business activities too much. Moreover, it should be plausible to use ambient scent for the considered product category. Furthermore, it was important that the products sold in these stores were unscented so that it was possible to clearly isolate the effect of the ambient scent. Finally, the stores should have attractive assortments in order to avoid negative effects of assortment perceptions. Among the contacted stores, the owner of a jewelry store agreed to participate. Thus, this store, which was not an upscale, luxurious jewelry store, but rather a store offering affordable silver jewelry, was chosen as the test store. The choice of the test store is in line with the notion provided by Fiore, Yah, and Yoh (2000) that ambient scents work best for products that are associated with pleasure and that have moderate prices.

Pretest

A scent that is intended to have positive effects should be perceived as pleasant (Fiore et al. 2000) and should fit to the object studied (Bone and Ellen 1999; Bone and Jantrania 1992) because only in this case, ambient scents continue to affect product judgments, even when they become salient or when consumers are motivated to discount their potential influences (Bosmans 2006). Thus, the purpose of the pretest was to identify an ambient scent for the main study that was judged as likable by the majority of customers and that was characterized by a high fit to the product category chosen for the main study (jewelry). In the first step, six commonly used ambient scents were selected (lavender, rose, cedarwood, green tea, ocean breeze, jasmine). The high percentage of floral scents among the scents selected was in line with the notion provided by Spangenberg et al. (1996) that floral scents are generally perceived as inoffensive scents and thus are likely to generate positive affective responses, and are considered pleasant by most people.

Thirty pretest participants evaluated the first three scents and another 30 participants evaluated the remaining three scents. Thus, 30 evaluations resulted per scent. Following the procedure proposed by Bosmans (2006), small glass bottles that contained a cotton ball with some drops of the tested fragrances were presented to the pretest participants and the participants were asked to sniff the bottles and then to evaluate likeability and scent-store-fit of the fragrances. The order of the scents was varied from respondent to respondent to counterbalance possible order effects. The pretest participants evaluated the likeability of the scents on the basis of four items (pleasant, agreeable, attractive, stimulating, $\alpha = .82$) that were taken from previous literature (Bone and Jantrania 1992; Ellen and Bone 1998; Morrin and Ratneshwar 2000, Spangenberg et al. 1996). The fit of the respective scent to a jewelry store was measured using the single item "this ambient scent is appropriate for a jewelry store" following the recommendation of Bone and Jantrania (1992). The results of the pretest (mean values) that are summarized in table 2 show that the lavender scent was evaluated most positively and was at the same time characterized by the highest fit to the considered store type. Thus, lavender was chosen as ambient scent for the main study. This choice is also consistent with previous literature that characterizes lavender as having a pleasant smell (Bosmans 2006) as well as having positive effects on dwell time and money spent (Soars 2009).

Measures

In the main study, scent likeability and scent-store fit were measured again in order to do manipulation checks. The same items as in the pretest were used ($\alpha_{likeability} = .77$).

In addition, measures were needed for the following model variables: mood, evaluations of the ambiance, the store assortment, and the sales person as well as purchase intention. The mood measures were derived from the studies of Baron and Thomley (1994), Chebat and Michon (2003), Ellen and Bone (1998), Mehrabian and Russell (1974), and McGoldrick and Pieros (1998). The ambiance evaluation was measured following the recommendations of Chebat and Michon (2003) as well as of Spangenberg et al. (1996). The evaluation of the store assortment was operationalized based on statements similar to those used by Chebat and Michon (2003), Morrin and Ratneshwar (2000), and Spangenberg et al. (1996). The evaluation of the salesperson was measured using statements that were derived from the work of Gierl and Bambauer (2006), and purchase intention was measured using the item "I can imagine buying an item from this store". Table 3 gives an overview of the items used, the factor loadings, the corresponding *t*-values per item as well as the α-values per variable.

Table 2
Results of the Scent Pretest

Ambient scent	Lavender	Rose	Jasmine	Green tea	Ocean breeze	Cedarwood	ANOVA results
Likeability	4.99	4.02	4.28	4.68	3.31	3.61	$F = 7.51$ $(p < .001)$
scent-store fit	4.40	3.60	2.53	4.17	2.73	3.67	$F = 4.32$ $(p < .01)$

Table 3
Measures, Factor Loadings, and Reliability

Variable	Item	PLS factor loadings (t-values)	Alpha
Mood	feel good	.85 (*t* = 24.54)	.86
	happy	.56 (*t* = 6.74)	
	pleased	.87 (*t* = 32.74)	
	cheerful	.88 (*t* = 35.05)	
	aroused	.67 (*t* = 8.96)	
	energetic	.86 (*t* = 25.25)	
Ambiance evaluation	stimulating	.78 (*t* = 14.72)	.86
	lively	.76 (*t* = 16.20)	
	interesting	.79 (*t* = 16.10)	
	favorable	.76 (*t* = 17.49)	
	attractive	.75 (*t* = 15.04)	
	motivating	.79 (*t* = 16.70)	
Assortment evaluation	high quality	.79 (*t* = 18.03)	.83
	favorable	.78 (*t* = 19.45)	
	adequate selection	.82 (*t* = 19.99)	
	attractive	.77 (*t* = 9.31)	
Salesperson evaluation	much knowledge about the product	.74 (*t* = 10.75)	.84
	competent	.64 (*t* = 7.17)	
	qualified	.62 (*t* = 8.19)	
	provided helpful information	.74 (*t* = 16.52)	
	honest	.63 (*t* = 6.72)	
	straightforward	.82 (*t* = 22.48)	
	trustworthy	.79 (*t* = 16.77)	

Note: all items were measured on 7-point rating scales ranging from 1 (strongly disagree) to 7 (strongly agree)

The sufficiently high factor loadings, the highly significant *t*-values and the high *α*-values show that the chosen items are appropriate to reliably measure the model variables. Thus, for the data analyses, overall variable values were calculated as mean values of the single items that were intended to measure the respective variable.

Main Study

Sample, Experimental Design, and Procedure

Hundred twelve people who entered the jewelry store participated in the main study (participation rate: 75%). The sample consisted of 83% women and 17% men. The age of the participants ranged from 16 to 75 years, the average age was 35.1 years.

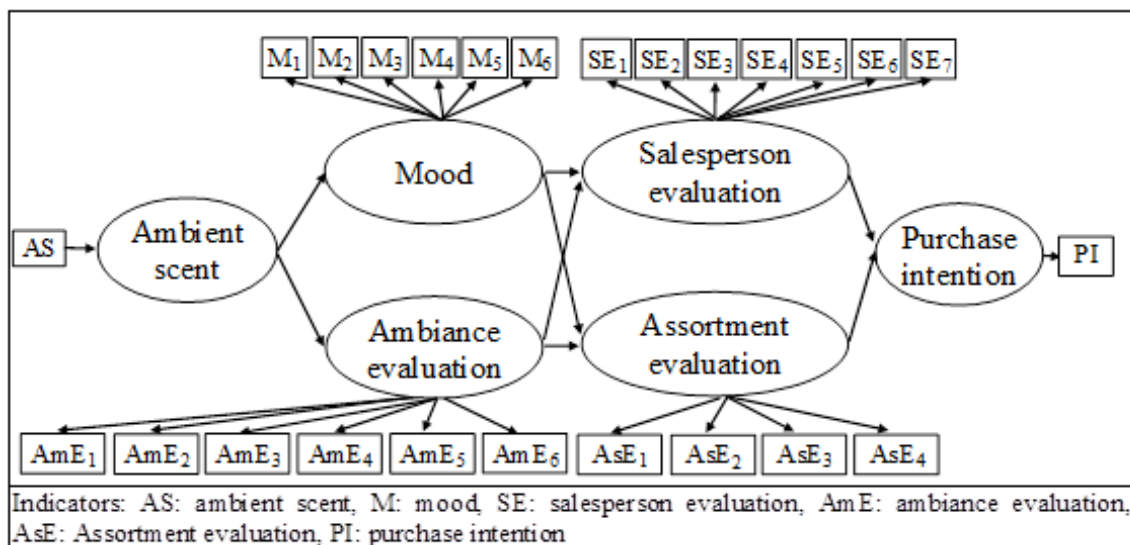
The study participants were assigned to two different groups (56 respondents per group) that were based on the ambience scent manipulation (lavender ambient scent vs. no ambient scent). During one month of the data collection period (April), there was no ambience scent in the jewelry store and during another month (May), lavender ambient scent was diffused. The test months were comparable with regard to weather conditions, outside temperature etc. The two groups resulting from the scent manipulation were comparable with regard to average age (group 1: 35.2, group 2: 34.8, $t = .44$, $p > .10$) as well as with regard to gender distribution (chi-square = .69, $p > .10$).

The procedure of the data collection was as follows. The people entered the store and were approached and assisted by a salesperson. Note that the salesperson was trained before the start of the experiment in order to behave in a competent and trustworthy way. After the sales conversation the customers were asked whether they would like to fill in a questionnaire. The questionnaire contained in the first place the measures for mood, than the measures for purchase intention, the evaluation of the salesperson, the assortment, and the store ambiance. At the end of the questionnaire, the respondents were asked to indicate their age and gender. Those respondents who were assigned to the ambient scent condition were additionally asked to evaluate the likeability of the scent and to judge the scent-store fit.

Data Analysis and Results

Before discussing the results of the main study, the results of manipulation checks for scent likeability and the scent-store fit that were conducted on the basis of the main study data will be presented. The results show that scent likeability and the fit between the lavender scent and the jewelry store are evaluated as significantly more positive than the scale midpoint (scent likeability: $M = 4.68$, $t = 8.66$, $p < .001$, scent-store fit: $M = 4.60$, $t = 2.62$, $p < .05$), which means that the manipulation was successful.

Figure 2
Pls Model

Indicators: AS: ambient scent, M: mood, SE: salesperson evaluation, AmE: ambiance evaluation, AsE: Assortment evaluation, PI: purchase intention


Now, the results of testing the research model presented in figure 1 will be presented. The research model was transformed into the structural model shown in figure 2 and the model structures were estimated using the SmartPLS procedure.

Possible direct effects of ambient scent on salesperson evaluation, assortment evaluation and purchase intention as well as of mood and ambiance evaluation on purchase intention or effects of mood on ambiance evaluation (or vice versa) were tested in the first step and proved to be non-significant. Therefore, in a second step, only the model paths shown in figure 2 were estimated. The path coefficients and the *t*-values estimated with the PLS procedure are summarized in table 4.

Table 4
PLS Path Coefficients and T-Values

Effect	Path coefficient	*T*-value (*p*-value)
Ambient scent → mood	.60	9.81 (*p* < .001)
Ambient scent → ambiance evaluation	.39	5.23 (*p* < .001)
Mood → salesperson evaluation	.55	4.38 (*p* < .001)
Mood → assortment evaluation	.47	3.97 (*p* < .001)
Ambiance evaluation → salesperson evaluation	.18	1.22 (*p* > .10)
Ambiance evaluation → assortment evaluation	.39	3.29 (*p* < .001)
Salesperson evaluation → purchase intention	.46	5.49 (*p* < .001)
Assortment evaluation → purchase intention	.45	5.37 (*p* < .001)

The path coefficients and the associated *t*-values show that the effect of ambiance evaluation on the evaluation of the salesperson is not significant whereas all other effects are significantly positive. Thus, hypotheses 1, 2, 3, 5, 6, and 7 are supported, whereas hypothesis 4 is not supported. In more detail, the results indicate that customers' mood and their evaluation of the general store ambiance are more positive when a likeable ambient scent that fits to the store assortment is diffused than in the case where no ambient scent is present. In addition, the results show that the more positive customers' mood, the more positive is their evaluation of the salesperson and of the assortment. Furthermore, a comparatively positive ambiance evaluation leads to a comparatively positive evaluation of the assortment, but does not affect the evaluation of the salesperson. Finally, customers' purchase intentions increase with an increasingly positive evaluation of the salesperson and the assortment.

CONCLUSION

The starting point of this paper was the observation that although there is a broad body of research on scent effects, research on effects of ambient scent on purchase intention in real retail settings is limited, and research looking at the detailed mechanisms underlying scent effects does not exist. Consequently, from both a retailer's and a consumer researcher's perspective, it stood to reason to develop an integrated research model reflecting possible mechanisms underlying effects of ambient scent and testing this model in a real retail setting.

The findings of the empirical study show that the effects of ambient scent on purchase intention in retail settings result from much more complex processes than previous research suggested. More specifically, the results provide the notion that ambient scent basically triggers two effects: one of them through mood and the other through ambiance evaluation. Mood in turn has effects through salesperson evaluation and assortment evaluation on purchase intention, whereas ambiance evaluation only has effects on purchase intention through assortment evaluation.

These findings do not only provide a valuable contribution to existing research in the field of ambient scent in retail settings but also suggest that retailers should profit from the diffusion of appropriate ambient scents to generate higher purchase intentions. Furthermore, the results provide a better understanding to retailers with regard to where the positive effects of ambient scent come from. Thus, the results indicate what retailers can do to enhance positive effects of ambient scent on purchase intention. For example, retailers could work with additional mood induction procedures beyond ambient scent (e.g., music, offering coupons etc.) to enhance the effect of ambient scent through mood on salesperson evaluation and assortment evaluation. In addition, retailers could hire well-trained, highly motivated, and professional salespeople to enhance effects of mood through salesperson evaluation on purchase intention. Finally, retailers could try to present their assortments in a way that is attractive from the perspective of potential customers in order to additionally support effects of ambient scent through ambiance and assortment evaluation on purchase intention.

For future research, it might be interesting to replicate the study presented here for other store types and product categories. In addition, effects of further variables, such as the gender of the salesperson, the influence of accompanying relatives or friends, or person-specific differences in mood states could be analyzed. Finally, it might be interesting to examine which specific measures might contribute to more positive perceptions of variables such as assortment or store ambiance in order to support effects of ambient scent.

Appalachian Mountain Men-of-Action: Nascar at Bristol

Elizabeth Hirschman, Rutgers University, USA
Ayalla Ruvio, Temple University, USA
Russell W. Belk, York University, Canada

ABSTRACT

Southern white masculinity is often said to be distinctive. Scholarly treatments of the subject attribute the characteristics of conservatism, patriotism, independence, racism, a disdain for centralized authority and a tendency toward violence to southern white men (see e.g., Friend 2009; Watts 2008). The crucible for these traits is usually said to be the Civil War and Reconstruction which (partially) emancipated black males, while shattering the foundation of white southern masculinity, leading to a "crisis in gender" (Whites 1992; Wyatt-Brown 1982). As Friend (2009, p. viii) observes "the war's outcome did not eradicate mastery and honor as the primary axes about which white southern manhood formed, but it did force a reconfiguration of how those ideals could be met."

Both E. Anthony Rotundo's (1994) *American_Manhood* and Michael Kimmel's *Manhood in America* (1996) largely ignored or disparaged white southern men as suitable cultural models of American masculinity, as did Gail Bederman's (1995) *Manliness and Civilization.* Across these treatises, white southern men are described as drinkers, brawlers and racists who are most comfortable hunting, fishing, and driving around in pick-up trucks. We are not going to quibble with this characterization, as in broad form, aspects of it are accurate. Even southern white male scholars describe their own regional masculine culture as one which is "beholden to a code of honor that... encouraged violence – martial, retributive or vigilante – gambling, blood sports, sowing wild oats, hunting and…by the early twentieth century, organized sports "(Creech, p. 25). What we do intend to argue, however, is that this same template has served as a model for masculinity since the region's origins, well prior to the Civil War, and indeed prior to the Revolutionary War.

Just as whiteness is typically positioned in opposition to "ethnicity" in scholarly treatises (see Burton 2009 a, b) and masculinity is positioned as counter to femininity (see e.g., Martin, Schouten and McAlexander 2006), southern white male culture is positioned in opposition to that of the southern white female (Watts 2008; Whites 1992; Wilson and Ferris 1989), though both are said to be grounded in Fundamentalist Christianity. Indeed, the Bible is often cited as an authoritative source justifying the secondary status of women within southern white culture, generally (Cash 1941; McPherson 1982). Southern white masculinity is also said to be strongly linked to activities evidencing independence and self-sufficiency (see e.g., Littlefield and Ozanne 2011 for a discussion of hunting in the rural south). According to Watts (2009, p. 10). "The ideal of independent, performative white manhood … continues in real and fictional varieties such as the rough frontiersman…moonshiners, many NASCAR drivers and fans, and pickup truck enthusiasts displaying gun racks and the Confederate flag".

To date, there have been two detailed studies of American masculinity put forward in consumer research – that of the Mountain Man, as developed by Belk and Costa (1998) and that of the Action-Hero Man, developed by Holt and Thompson (2004).Our intention is to compare the white southern masculine ideology, as described above, with these two prior models in order to identify similarities and discontinuities among these three different perspectives on masculinity. Further, our study will also survey *boundary conditions* for the more recent of these two studies (Holt and Thompson 2004).

SETTING AND METHOD

The setting for our study is the area in and around Bristol VA/TN -- a location referred to by MSNBC commentator Andrea Mitchell as the "Redneck Capital of the World" during the 2008 US presidential campaign (statement made on-air June 5, 2008). Bristol TN/VA was founded in the late 1800s as a railroad terminal for the Norfolk and Southern Railway. It was during this period of time that coal mining became central to the economy of the Southern Appalachian region and a freight train system was established linking Kentucky, Tennessee, Virginia and West Virginia in order to transport coal to the steel manufacturing centers of western Pennsylvania and the Great Lakes region (LaLone, 1997;Solomon and Yough 2009;). The entry of large-scale industrialization, organized labor and corporate businesses dramatically impacted the social ecology of the region, shifting men and machinery from working on the land to working in the mine and on the railroad (Bensel 2000; LaLone 1997 Solomon and Yough 2009).

For many men in the region, personal independence and self-reliance – which had sprung from their independent yeoman status -- became more difficult to maintain, as jobs and skills were increasingly dependent upon distant factories and external sources of capital (Lalone 1997; Williams 2002). As a result, personal expertise at activities such as hunting, fishing, carpentry, engine maintenance, sports and other outdoor activities became increasingly relied upon as signals of masculine competency (Watts 2008; Williams 2002; Wilson and Ferris 1989).

Despite its remote Appalachian location, Bristol VA/TN is the origin point for two significant events in Southeastern regional history. The first is that Bristol was the site of some of the earliest commercial country music recordings. The so-called "Bristol Sessions" recordings of the Carter Family were produced there in 1927; Jimmie Rodgers also made early recordings in Bristol during the 1920s, as did Tennessee Ernie Ford during the 1950s (Williams 2002). The entrepreneurism and willingness of the local people to re-shape their production activities to match external commercial and technological opportunities demonstrated by the country music business are also characteristic of the primary research site of our study; the Bristol Motor Speedway.

Bristol Motor Speedway As Belk (2004, p. 273) writes, "love of automobiles, motorcycles and trucks is an overwhelmingly male preoccupation [due to] … the association of such vehicles with power, danger, mobility, status competition, and industrial dominance over nature…" Belk (2004) further observes that male car enthusiasts will often undertake long distance pilgrimages to seek *communitas* with like-minded males in order to celebrate the power and glory that is the automobile. Perhaps no destination on Earth is more revered in these annual pilgrimages than the trio of August NASCAR races at Bristol Motor Speedway (BMS).

The week of August 16-21, 2010 was the fiftieth anniversary of the Bristol Motor Speedway and the 100th running of the NASCAR Sprint Cup Race. Thus it served as an ideal venue at which to observe southern white male culture in full flower. The primary researcher attended the three NASCAR-sponsored races during that week, taking photographs, making field notes, and collecting written materials available at the track and in the surrounding communities relevant to the races. A three person interpretive team with multi-

year ethnographic research experience was responsible for developing the collected materials into a comparative structure using *socio-semiotic analysis* (see Schroeder and Zwick, 2004, for a discussion of this method using advertising images of masculinity). Each document, individually, and the set as a whole was subjected to *close reading* by the three researchers using the two models of masculinity proposed in the consumer behavior literature (e.g., Belk and Costa 1998; Holt and Thompson 2004) and the southern white masculinity model described earlier. Thus, the methodology used in the present study is consistent with that of Belk and Costa (1998), but extends beyond ethnography to incorporate socio-semiotics (Schroeder and Zwick 2005). The present methodology differs from that of Holt and Thompson (2004). The latter study utilized experiential-phenomenological interviews – a method which has received recent criticism for its lack of cultural grounding (see e.g., Moisander, Valtonen and Hirsto 2009). We turn now to a detailed discussion of the two prior models of masculinity against which a comparison of the present data will be made.

MOUNTAIN MAN MASCULINITY

The Belk and Costa (1998) study focused upon modern-day mountain men who "adopt grooming, clothing and manners that appear strikingly countercultural, rustic and unique. They live for a time in … teepees or tents at a variety of remote locations near sites of original [mountain men] rendezvous. Clothing and conveniences that did not exist in 1840 are banished, including cars, plastics, prepared foods, flashlights, radios… (pp. 218-219)."

In their study, the authors found a form of white male masculinity intended to "invoke a mythic and heroicized past" (p. 219). "The original mountain men they seek to emulate engaged in dangerous, often violent, activities, struggling against wild animals and hostile Indians. Their present-day imitators desire to partake of this mythology, while also merry-making, trading, and consuming large quantities of alcohol." Notably though most of Belk and Costa's participants were working class, some were middle class. Yet external social status hierarchies were abandoned at the campsite to "form a communal, homogeneous social structure…."

Belk and Costa found that most mountain men participants have atypical personal appearances including long hair, pierced ears, and full beards and/or moustaches. They propose that these signal rebellion against prevailing cultural norms that continue into their everyday lives (Belk and Costa 1998). Meat is heavily consumed during the rendezvous, as is beer and liquor. Several of the men are overweight due to these dietary patterns. Belk and Costa (1998) interpret much of this as a "celebration of the power and passion of the primitive; because [the mountain men] believe these qualities have disappeared from contemporary urban life (p. 230)."

Man of Action Heroes The 2004 article by Holt and Thompson critiques contemporary scholarly writings on masculinity, e.g., Ehrenreich (1983) and Kimmel (1996), as well as earlier work on masculinity published in the consumer behavior literature (e.g., Belk and Costa 1998). They propose that a central thesis in this literature is the social emasculation of American men during the twentieth century brought about by the industrialization of the American workplace and the increasing economic independence and political emancipation of women. This drove American men to engage in compensatory consumption in order to reinforce their manhood.

Holt and Thompson propose that masculine cultural models such as the cowboy, Harley rider, and big game hunter are instantiated in mass media portrayals by actors such as Clint Eastwood, Bruce Willis and John Wayne. These circulating cultural icons are used as touchstones for a romantic model of masculinity which they

term the Rebel Model. This ideology of masculinity "harkens back to the settling of the American West….Hunters and trappers were represented as uncivilized, anarchic and fiercely independent men who survived through courage, physical skills and cunning… (p. 428)." The negative aspect of the Rebel Model is that such men can be viewed as "immature boys…men who refuse to grow up, taking flight from adult responsibility" (p. 428).

In contrast to this, Holt and Thompson describe the Breadwinner Model which is "grounded in the American myth of success… That America is a land of boundless opportunity…" (p. 427). As the country became professionalized and industrialized, men had to "soften the combative edges of individual achievement….[and] peaceably coexist within an ethos of teamwork and the rules of hierarchy…In the breadwinner model, men work hard and are dependable collaborators in a corporate environment…They are reserved, dependable, and devoid of self-aggrandizing flamboyance…" Holt and Thompson propose that "the most celebrated men in American culture are neither breadwinners nor rebels. Instead they draw from the best of both models…[They] embody the rugged individualism of the rebel, while maintaining their allegiance to collective interests… (p. 429)."

The sample Holt and Thompson used to construct their man-of-action hero model was "15 [heterosexual] white men from both working- and middle-class backgrounds…recruited from a Midwestern city of 250,000 and a small eastern city of 60,000 (p. 430)." Each respondent was interviewed in-depth using the existential-phenomenological method. Ultimately, two men, Robert and Donney, served as the middle-class and working class exemplars of how this model of masculinity is enacted in everyday consumption behavior. A shortcoming of this method is that, when used without supplemental cultural data, E-P interviews may render an overly mentalistic view of the subject of the inquiry (see Moisander, Valtonen and Hirsto 2009 for a review of these criticisms). We now turn to a historically-grounded evaluation of these models of masculinity vis a vis that of white southern manhood.

CONTINUITY, PERMEABILITY AND WHITE SOUTHERN MASCULINITY

The region surrounding Bristol TN/VA has a significant history not only with regard to the formation of southern white masculinity, but also that of American masculinity, generally. Daniel Boone and his extended family settled in the area in 1774. Violent confrontations with Native Americans in the Cumberland Gap area next to Bristol were a frequent occurrence for Boone and the other early settlers (Beeman 1984; Williams 2002). David Crockett, hero of the Texas militia at the Alamo, was born and raised in Limestone, TN, approximately 30 miles away. The direct descendants of these early settlers still live throughout the region (Kephardt 1976; Williams 2002).

Thus, we propose argue that this region was the primary cauldron within which American ideals of masculinity were first formed – and mythologized -- and that an undercurrent of this original masculine ideology has been present in the area since Colonial times (Watts 2008). We also propose that this southern white masculinity has existed symbiotically and comfortably with external sources of capital and has consistently participated in the larger U.S. economy and corporate structures, as they developed (see e.g., Bensel 2000; Solomon and Yough 2009).

This suggests that the out-of-bounds Rebel icon, which Holt and Thompson (2004) see Boone and Crockett representing as frontiersman, did not exist historically. This factual discrepancy brings into question the hybridized model which they present. For example,

Crockett and Boone both were family men whose historic exploits and expeditions were primarily undertaken to support their families (Williams 2002). Boone was employed by the Hendersons, a regionally powerful set of brothers who engaged in trading with the Indians and land speculation (Draper 1998). Together with other Long Hunters, Boone engaged in fur trading and land speculation (Draper 1998). The famous Wilderness Road, scouted and constructed by Boone and 35 other early settlers though the Cumberland Gap, was a commercial project whose purpose was to open up the area of Kain-tuck (Kentucky) for the lucrative fur trade and land speculation (Draper 1998; Williams 2002).

Analogously, Crockett's stand at the Alamo was intrinsically linked to a commercial venture. The initial American settlers in central Texas had journeyed there from eastern Tennessee during the early 1800s in search of agricultural and trading opportunities with Mexico (Williams 2002). They arrived and settled as extended families, engaging not only in agriculture, but also in trading and mercantile dealings with corporations "back East" (Williams 2002). Thus, the presentation of the Rebel ideal and the Family Man ideal as oppositional foundations of American masculinity would seem to be factually inaccurate, at least in the Appalachian region.

We propose that the present day Bristol NASCAR fans and drivers are cut from the same cloth as the region's early pioneer-breadwinner-entrepreneurs. We also document the fluidity and interchangeability between the drivers and fans/consumers. We propose that what is actually occurring is not compensatory consumption, rather it is *participatory consumption* in which fans/consumers participate as drivers/producers and driver/producers participate as fans/consumers. A common sense of Southern white masculinity, manhood and manliness is shared between them.

Stock Car Racing Origins Just as with early farming and hunting activities in the area, stock car racing was born of economic necessity and entrepreneurism During Prohibition and the Great Depression, the rural Southeastern U.S. region was one of the poorest areas of the country (much as it is now). Seeking to supplement their meager farming incomes, enterprising residents began turning a portion of their corn crops into distilled liquor (Hirschman, Brown and Maclaran 2006; Howell 1997: Kellner 1971). Such activities were illegal and "moonshiners" were targeted by Federal tax revenue agents (Miller 1991). To outrun these "revenuers", farmers used their ample mechanical skills to increase the speed and road handling ability of their family automobiles, using them to haul gallons of illicit corn liquor over the Appalachian mountains to central distribution points such as Atlanta, GA and Charlotte, NC (Hirschman, Brown and Maclaran 2006; Kellner 1971; Miller 1991)).

In support of the thesis that entrepeneurism and undertaking risky activities may form a nexus of cohering values within white southern masculinity is an advertisement appearing in the BMS race program, which shows one of the "winningest" drivers at the Bristol Motor Speedway, Junior Johnson. Born in North Carolina to a farming family, Johnson is (in)famous for beginning his racing career using cars that he "ran shine" in during the week. Notably, the body copy blends references to the authenticity and illicitness of Johnson's off-track activities, as well as those of the product, a mythologizing motif discussed by Tian and Thompson (2007) as characterizing the 'hillbilly'.

Direct entry to the sport of stock car racing is still available today, just as it was in Johnson's era of the 1940s and 1950s. For example, a full page newspaper advertisement (August 18, 2010) from the *Bristol Courier* invites residents to come to the Volunteer Speedway in Bull's Gap, TN to both watch and compete in local races. This speedway is about an hour's drive west of Bristol and serves as

an 'entry point' for local men to try their hand at racing. Additional documentation of apprenticeships enabling young local men entry to the sport is provided in a BMS press release (Bristol Motor Speedway, 2010). The narrative valorizes stockcar racing as a signal of manhood and masculine pride in the region. Also notable is another article in the BMS Program about Chase Elliott, son of local NASCAR veteran driver Bill Elliott, who is competing professionally in an "entry-level" race at the age of 14. In order to possess a Tennessee Driver's License, one must be at least age 17. Obviously, these requirements are being 'bent' to permit boys to pursue this career.

Other communications in the BMS Race Week program (Bristol Motor Speedway 2010) reiterate the message of fan/driver interchangeability and father/son legacy. For example, an article on rookie driver, Trevor Bayne, age 19 and from Knoxville, TN emphasizes his being a racing fan since childhood, having been taken from school on race days by his parents to watch the competitions. However, perhaps the most iconic exemplar of the fan/driver and father/son racing legacy is Dale Earnhardt, Jr., the son of Dale Earnhardt, one of NASCAR's most spectacular (and aggressive) drivers. A print advertisement appearing in the BMS program carries the headline "Real Men Let their Right Foot do the Talking"; it assumes the readers' knowledge of this father/son linkage and equates Earnhardt, Jr. with authentic manhood. Only Earnhardt Jr's face is used as an identity marker, there is deemed to be no need to use text to identify who is being pictured.

WARRIORS, WEAPONS AND PATRIOTISM

Historically, the region surrounding Bristol VA/TN was the origin point for the Overmountain Men (Williams 2002), a colonial-era paramilitary force composed of farmers and longhunters who won the Battle of King's Mountain, a critical turning point in the Revolutionary War (Alderman 1986). The specifics of the militia and the battle, itself, are valuable in creating a deeper understanding of the current ideology of masculinity within the region and its exhibition in the events observed at Bristol Motor Speedway in August 2010.

The Overmountain Men and their families had taken up residence on lands west of the Appalachian Mountains in areas now comprising northeastern Tennessee and Southwestern Virginia. Alderman (1986, p153), reports that, "they settled on land believed to be in Virginia, but which was actually issued to Lord Granville of North Carolina...., leaving the Watauga settlers without legal claim to the land..." Thus, the Watauga settlers, who included Daniel Boone and John Crockett, the ancestor of David Crocket, had only a tentative hold on their lands. With the assistance of the Hendersons (mentioned earlier), the settlers purchased a large tract of land from the Cherokee in 1775. Comprising a total of 20,000,000 acres, this was the largest land transaction in North America prior to the Revolutionary War (Alderman 1986); it was called the Watauga Settlement. Notably, the settlers chose *not* to declare themselves part of the British colonies and similarly refused to commit their allegiance to the nascent US colonial government, declaring themselves to be an independent nation (Alderman 1986).

In 1780, the British threatened to attack the area. The Watauga Settlement militia organized itself and a force of 1,000 men marched through North Carolina, picking up an additional 350 volunteers. Though largely untrained and completely unauthorized, the volunteer militia traveled overnight to arrive at King's Mountain. According to an eye-witness account, they "circled the mountain and then charged straight toward the British" (Alderson 1986, p. 217). An hour later, the British commander, Patrick Ferguson, and the majority of his British force lay dead on the battlefield. The Watauga men then returned home. This display of colonial-era American masculin-

ity did become the stuff of legend, being replayed most recently in Mel Gibson's 1999 film, *The Patriot*.

The commitment to patriotic sacrifice as a source of white southern masculine pride was very visible at the Bristol Motor Speedway during August race week. The opening ceremonies before each of the three races included displays of American military prowess and power: Honor guards accompanied by veterans, often disabled, from the current Iraq and Afghanistan conflicts marched onto the track and up to the ceremonial platform. The Pledge of Allegiance was recited by the entire audience of 165,000 persons, as 3 military jet fighters flew overhead. On Saturday night, the capstone of the week's events, six paratroopers were dropped by military aircraft onto the race track, as a giant American flag was unfurled in the stands. Fireworks went off and the Star Spangled Banner played.

Reinforcing this patriotic theme was an article in the BMS race program for the "Impact a Hero" public service program which provides financial and social support to disabled veterans. These soldiers were described as "fighting the War on Terror and keeping Americans safe:" Because self-sacrifice is seen within this worldview as one's *obligation* to the community, those who are killed or injured while fulfilling public service duties are considered heroes and martyrs.

The working man ethos was also given voice during the BMS race event through a Tradesman Challenge sponsored by Irwin Tools. This contest pits mechanics, welders, carpenters and other manual workers against one another in speed and performance competitions. The common thread across the races and these competitive events is *physical and mechanical competence*, combined with speed and withstanding challenges from others. A print ad for Irwin Tools found in the BMS race program depicts the mechanic in a heroic pose – competent and in control of a much larger machine.

THE CONFLUENCE OF MASCULINE HONOR, VIOLENCE AND CHRISTIANITY

We next consider a sermon to the mustered Watauga Overmountain men discussed earlier. The region, then as now, is viewed as the Bible Belt (Williams 2002), a bedrock of fundamentalist Christianity. Consistent with this characterization, the minister invokes a clear linkage between *God's will* and the *right to use violence*. This religious justification for aggressive actions has been – and continues to be – a core element of white southern masculinity.

> My countrymen, you are about to set out on an expedition which is full of hardships and dangers, but one in which the Almighty will attend you. The Mother Country {England} has her hand upon you…and takes that for which our fathers planted their homes in the wilderness – our liberty… The enemy is marching hither to destroy your homes. Brave men, you are not unacquainted with battle… You have wrested these beautiful valleys of the Holston and Watauga from the savage hand… Go forth in the strength of your manhood to the aid of your brethren, the defense of your liberty and the protection of your homes. Oh, God of Battle, arise in Thy might. Avenge the slaughter of Thy people… Help us as good soldiers to wield the sword of the Lord."

We additionally glimpse in this text strong ideological support for vigilantism and 'taking the law into one's hands', even to the extent of waging war against an existing government, if God's law is believed to differ from it. This value is very much in evidence in the contemporary politics of the region, with the area strongly supporting John McCain in 2008 and 'Tea Party' libertarian and conserva-

tive candidates in the 2010 elections. Regional residents remain both suspicious of the Federal Government and skeptical of its ability to improve their lives. Although the Civil War was the battleground where the ideological divide between white southern male honor and the Federal government played out most vividly (Wyatt-Brown 1982), the same sense of honor and retributive justice led to decades' long feuds between men in various family groups (e.g., the Hatfields and McCoy, see Waller 1988). In several of the documents we collected, honor was said to underlie on-track feuds between individual drivers. The same sense of "giving him what's coming to him" is felt among the fans, who boo and throw cups at drivers whom they believe act unfairly on the track, e.g., by cutting off other drivers, wrecking competitors' cars or pushing them against the wall.

On Friday night, a man-to-man conflict occurred between two drivers. This is described by BMS (Bristol Motor Speedway, August 2010) as follows: "Sparks flew, fenders crunched …A tangle between Brad Keselowski and Kyle Busch saw Keselowski spin off the nose of Busch's machine. Busch was welcomed with a shower of boos in Victory Lane". A discussion of the moral necessity created by the underlying white southern male ideology leading to such events is given below, taken from a local newspaper: "You know it when you see it…the right way and wrong way to get aggressive on the race track…Naked aggression, but done in a way that allows (the other driver) to stay on the race track; it comes down to racing somebody with respect" (Dave Ongie, *Kingsport Times News*, "Speaking in code", August 2010, p. B1)

WHITE SOUTHERN MALE STATUS: SUPREMACY OR SEPARATION?

We turn now to considering one of the key points said to differentiate white Southern masculinity from that found elsewhere in the country: do white southern males set themselves in dominant positions over women and non-whites, particularly blacks? Does the pre-Civil War tradition of white male supremacy continue? We propose that what is currently practiced is not so much an ideology of *supremacy*, but rather one of *separation*. In the photographic materials collected before, during and after NASCAR race week and from observations made of the spectators who attended the races, there was clearly a predominance of white men. The local sports writers covering the race were white males; the BMS executives whose photographs were shown in the program were white males. The CEO of the companies, e.g. Food City, Irwin Tools, sponsoring the races were white males. The pit crews were composed of white males. The race drivers – with *one* exception – were white males; (the sole exception being Juan Pablo Montoya, who is Hispanic).

However, comparing race and gender as separate bases for classification, racial separation seemed more marked than gender separation (and see Burton 2009 for a discussion of whiteness and social separation). For example, the spectators were virtually all white. However, the percentage of woman ranged between 20% to 30% across the three events. Similarly, an examination of the BMS employee photographs shown as a group in the race program found about 30% to be female, but only one non-white person (a black female) among the set of 109 BMS employees. Although the region around Bristol has only a 6% presence of blacks and a 2% Latino population, this would still suggest a lack of inter-racial representation at the raceway.

We believe this obvious disproportionality in race and gender grows more from the desire of Southern white males to *separate* or *distance* themselves from females and non-whites, than from an ideology of supremacy. Supremacy requires that the subordinate gender or race be present and publicly displayed in a subordinate

position to the master (Dollard 1937). Yet women and especially non-whites of either gender were neither highly visible nor placed in subordinate positions. The more justifiable interpretation would seem to be that BMS represents a refuge, haven or 'turf' in which southern white males can share ideological camaraderie. It is a place where "[white] boys can be [white] boys".

DISCUSSION

We now discuss the areas of agreement, disagreement and extension between the present study and the Belk and Costa (1998) and Holt and Thompson (2004) models of masculinity.

Belk and Costa 1998: The Mountain Man We found three points of overlap with the Mountain Man study. First, the dietary habits exhibited by the modern-day Mountain Men and the Bristol Motor Speedway NASCAR race fans are virtually identical. At BMS the commercial vendors supplied meat, especially pork, several brands of beer, hard liquor and tobacco products, including snuff, chewing tobacco and cigarettes. These were accompanied by white bread, cornbread, baked beans and French fries. Fans consumed large quantities of these foodstuffs; approximately half of the fans observed were overweight or obese.

However, although copious quantities of liquor and beer were consumed, most attendees did not appear intoxicated. Drunkenness would have made climbing up the steep concrete steps to one's seat very difficult, and some who had over-imbibed did fall down in the attempt. Personal coolers and foods were allowed in the stands and occasionally empty cans would be thrown toward the race track to express displeasure at a driver's performance, but this behavior was not

Typical

Extending Belk and Costa's recounting of these dietary practices, we suggest that they evidence a celebration of masculine food ways. 'Real men' are expected to eat large quantities of meat (i.e., the muscles of prey animals) in order to construct their own body muscle mass. They are also expected in the southeastern U.S. to be able to drink large amounts of alcohol, but not to lose control or become ill while doing so. The notion that a real man can 'hold his liquor' is embedded in the regional culture (see e.g., Miller 1991; Watts 2008). Consistent with prior findings on gendered meanings of foods, virtually no green vegetables or dairy products were available for consumption at the track. This is consistent with our interpretation of the events as representing a gender-segregated site.

A second consistency with Belk and Costa was the suspension of status hierarchies at the race track, especially with regard to apparel display. No one was dressed in business attire or even 'business casual'. There was a virtual absence of prestige brands. Instead, attendees wore shorts and t-shirts, jeans and tank tops. Both men and women wore trucker-style caps. Footwear included sneakers, flip flops, and sandals. The only apparent status identifiers were shirts and jackets emblazoned with a specific driver's image or car number. There were several men wearing Dale Earnhardt's image on their apparel, Earnhardt being viewed as a heroic martyr to the sport

A third similarity with the work of Belk and Costa is a strong sense of community and comaraderie among the BMS fans. There is a large and mobile 'NASCAR nation' which travels from race to race across the country by camper as the season progresses. This 'nation' was strongly in evidence at Bristol, stretching for miles along all access roads near the Speedway.

There were two major *dissimilarities* between the expressions of masculinity we found, as compared to the study by Belk and Costa. First, their study noted a consistent preference among the Moun-

tain Men for items dating from the Native American cultures of the late 1800s. The Mountain Men typically construct their own clothing, equipment and camp housing, and spurn modern commercial manufactured items. Almost the complete reversal is found among the male attendees, drivers and pit crews at BMS.

Technological advantage is avidly sought in the racetrack setting. Male fans often wear radio-receiver headgear which permits them to listen to communications between each driver and his pit-crew chief. Prior to each race, a sheet of radio frequencies is distributed to the fans and those equipped with ear phone receivers (which can be purchased or rented on-site) are able to listen to drivers' conversations throughout the race. The drivers and crew also display a high level of technological competence, discussing turning and banking ratios, wear levels on brakes and tires, steering stability and other aspects of performance. Military/police style language is used and communications between driver and pit crew are unemotional and pragmatic. We propose that this is an outgrowth of the manual labor-based entrepreneurism of the region. Men of the region are comfortable with and competent at operating machines and employing technologies to achieve their goals (Hirschman, Brown and Maclaren 2006).

A second dissimilarity between the present study and that of Belk and Costa is one identified as well by Holt and Thompson. The performance-consumption model does not appear to be compensatory, but rather woven into everyday life practice. It is a safe bet that most of the men attending the BMS race can and do conduct primary maintenance on their own vehicles (Williams 2002). Observations made around the Bristol area indicate that local men can change oil, change tires, adjust brakes, fix headlights, tune engines, replace spark plugs and windshield wipers, and some are capable of rebuilding entire engines. Thus it is not surprising that they may closely identify with the drivers and crew on the track. However, male competence at manual labor in the region extends well beyond automobiles. Most local men can also perform electrical, carpentry and plumbing tasks, repair washers and dryers, replace gutters and repair lawnmowers, motorcycles and farm equipment. It is accurate to say these would be among the *culturally-expected* competencies for a man living in or around Bristol.

Thus when these same men arrive at BMS to watch the races, they come with a mindset and skill set largely comparable to the men driving the cars around the track and those re-fueling and re-tiring them when they come in for a pit-stop. It is this *overlap between producer and consumer competencies* that enables permeability between these roles for individual men. Fans can and do become drivers or pit crew members; drivers and pit crew members can and do begin their interest in the sport as fans.

Let the Circle be Unbroken: Holt and Thompson (2004)

In "Man of Action Heroes" (2004), Holt and Thompson challenge the masculinity as-compensatory-consumption thesis and critique as inadequate two models of American manhood, labeled the Rebel and the Breadwinner. Our study strongly supports Holt and Thompson's assertion that much of contemporary American masculinity does not represent *compensatory consumption*, but rather *participatory consumption*. That is, significant aspects of masculine ideology are enacted daily in men's lives. Their consumption choices and attitudes incorporate both the Rebel and Breadwinner models of manhood, as described by Holt and Thompson.

Where our analysis differs from the Holt and Thompson study is that we present historical documentation challenging the notion that the Rebel and Breadwinner models were *separate* ideologies within the southeastern United States. In our analysis, these two

ways of being men were *always* intrinsically interwoven. When the ancestors of the men now living in Bristol and environs arrived in the mid-1700s, they were competent to hunt, shoot, fight, make liquor, skin animals, fell trees, build houses, cure meat, plant and harvest crops, ride horses, forge iron and herd cattle and hogs (Hirschman et al, 2006; Williams 2002).

Further, while they did not seem to exhibit the negative traits Holt and Thompson ascribe to Rebels (e.g., being selfish, juvenile), they often did rebel against authority, as witness their participation in both the Revolutionary and Civil Wars. The point we wish to make is that their behaviors may indeed be the stuff of which myth was (and is) made, but their actions were genuine, not fictional. More recently, the stockcar racing-moonshining mythos has been used to add dramatic flair to Southern speedways such as Bristol (see e.g., Thompson and Tian 2008), but these activities too have authentic, historical roots in the region. Though this may now be used as an advertising motif to sell liquor, the foundations are factual.

A second lacuna between the present study and that of Holt and Thompson is that the "Man of Action Hero" analysis takes as its initial foundation earlier social theorist treatises on masculinity, e.g. Kimmel, which are themselves culturally-constructed narratives about macro-cultural phenomena such as industrialization, economic stratification, and mass media products.. While this approach is quite appropriate when addressing socio-cultural trends on a national level, it risks glossing over vital specifics at a regional and local level. For example, although the majority of contemporary American men learned of Daniel Boone, Davy Crockett, the Revolutionary War, the Civil War, moon-shining and stockcar racing from films and TV shows, the men of the southeastern region *additionally* learned about them through family histories and direct personal experience. Roadsides in the region are dotted with topographical and human reference points; e.g., here is Crockett Tavern, here is Boone's Creek, here is the Overmountain Men mustering site, here is the cemetery for the Civil War dead. This is an altogether different form of 'grounding' than images received via digital media. These constitute the tangible, familiar markers that give rise to an in-the-blood and in-the-soul sense of regional manhood. Factors such as these suggest that there is a strong need to address masculinity at a more organic, local level, rather than to rely solely upon grand-scale analyses that may mute regional differences.

A final variation found in the present study is the seemingly self-contradictory notion of blue collar entrepreneurism, which was not detected either by Holt and Thompson (2004) or Belk and Costa (1998). Perhaps the central performative feature of the southeastern region's white male culture is its unique form of yeoman labor. Virtually all social theories of working class labor view it as a non-hegemonic mode of production (Bensel 2000). Craftsmen and laborers are depicted as interchangeable cogs in a much larger productive machine. For many industries in the Northeast, this was historically true (Bensel 2000).

However, the Appalachian region is the site of only one large-scale industrialized labor context, coal mining (Caudill 1963; LaLone 1997). Yet with the exception of men employed full-time as miners, the majority of southeastern regional male residents work either on their own farms or as skilled laborers, e.g., as mechanics, carpenters, electricians, plumbers, and truck drivers. Though most of these men do not earn incomes in any way approaching affluent, they are financially independent.

Many grow their own vegetables, raise hogs and chickens for meat, hunt and fish, and maintain their own cars (and see Williams 2002). This provides a sense of self-sufficiency, dignity and personal worth that serves as a significant reservoir of manhood and masculinity.

We believe this sense of individual self-worth may be what men in many other parts of the country – whether factory workers or upper middle class service professionals – are seeking.

Do Price Promotions Lead to a Reduction of Consumers' Internal Reference Price and If So, under Which Conditions Is this Effect Less Strong?

Silke Bambauer-Sachse, University of Fribourg, Switzerland
Angélique Dupuy, University of Fribourg, Switzerland

ABSTRACT

This paper examines effects of price promotions on changes of internal reference prices by analyzing moderator effects of price confidence, involvement, and the saving presentation. The results of the empirical study show how marketers should communicate price promotions to avoid strong reductions of consumers' internal reference prices.

INTRODUCTION

In recent time, an increase of price-related advertising campaigns, specifically price promotions or price comparisons, can be observed (Chandrashekaran and Grewal 2006; DelVecchio, Krishnan, and Smith 2007; Howard and Kerin 2006; Tsiros and Hardesty 2010). Such advertising campaigns aim to positively influence consumers' purchase intentions and many studies provide empirical support for this effect (Ailawadi and Neslin 1998; Chen, Monroe, and Lou 1998; Grewal et al. 1998; Gupta 1988; Gupta and Cooper 1992; Kumar and Leone 1988; Sun 2005). However, these studies only look at positive effects of price-related advertising and neglect the fact that intensively highlighting information about reduced prices can at the same time have negative effects through other paths. One such negative effect could be that providing people with information about reduced prices might lead to a reduction of consumers' internal reference prices which in turn could lead to a lower willingness to pay as well as to a lower willingness to purchase products at the regular price. Such effects have not yet been covered by many studies. In addition, the existing studies analyzed rather basic effects and did not look at conditions under which a reduction of consumers' internal reference prices might be more or less strong.

Thus, the first objective of this study is to examine effects of price promotions (displaying the amount of the saving and the reduced price) on consumers' internal reference prices. The second objective is to identify conditions under which the reduction of the internal reference price is less strong. In this study, three variables, which represent such conditions and proved to play an important role in the formation of internal reference prices in previous studies (Chandrashekaran and Grewal 2003, 2006; Grewal et al. 1998; Thomas and Menon 2007), are analyzed: involvement, price confidence, and the saving presentation format ("% off" vs. "amount off").

Product involvement refers to the consumers' degree of personal interest into or personal relevance of a product category (McQuarrie and Munson 1992). Consumers have a higher motivation to process product-related information (e.g., price information) about high-involvement products than about low-involvement products (Laurent and Kapferer 1985). Price confidence refers to the idea that consumers are more or less confident with their price estimates and as a consequence, such consumers are more or less likely to use these estimates in order to evaluate an actual price (Mazumdar and Monroe 1992).

These conceptualizations suggest that price confidence and involvement are independent constructs. Whereas price confidence is a rather person-specific variable, product involvement is a rather product category-specific variable. Furthermore, independently of the extent of information processing, consumers can be more or less confident about the result of the information processing. Thus, with regard to the context considered here, it can be argued that more or less intensive processing of price information in the case of high or low involvement can result in the formation of a reference price the consumers are more or less confident about.

The study presented here adds to the existing body of research by analyzing interaction effects that were not examined in the context of effects of price promotions on changes of internal reference prices before. From a consumer research perspective, such a simultaneous analysis of these interaction effects is important because the results of such an analysis enable consumer researchers to better understand consumers' adaptions of their internal reference prices depending on their individual level of price confidence as well as depending on product category-related involvement under the alternative conditions of being faced with a "% off" versus an "amount off" saving presentation format.

In addition to covering research gaps left by previous studies, the paper addresses marketers by showing which saving presentation format ("% off" vs. "amount off") should be used under which involvement and price confidence conditions in price promotion ads in order to avoid a strong reduction of consumers' internal reference prices.

EMPIRICAL BACKGROUND

Despite the considerable number of studies on internal reference prices, the number of studies that examine moderator effects of price confidence, involvement, and saving presentation format in the context of effects of price promotions on changes of the internal reference price is limited.

Previous studies rather examined the formation or the type of the internal reference price (Briesch et al. 1997; Rajendran and Tellis 1994), the use of the internal or external reference prices (Chandrashekaran and Jagpal 1995; Liefeld and Heslop 1985; Mayhew and Winer 1992; Moon, Russell, and Duvvuri 2006), the impact of the level of the external reference price (Biswas and Blair 1991; Biswas et al. 1999; Burman and Biswas 2004; Compeau and Grewal 1998; Frankenberger and Liu 1994; Lichtenstein and Bearden 1989; Urbany, Bearden, and Weilbaker 1988), or the impact of semantic cues (Lichtenstein, Burton, and Karson 1991).

There are only a few studies that analyzed effects of price promotions on internal reference prices. Table 1 gives an overview of the objectives and most important findings of these studies in a chronological order.

Most of the studies summarized in table 1 support well the assumption that price promotions lead to a reduction of internal reference prices. However, these studies focused on very few variables and did not examine conditions (e.g., consumers' price confidence and involvement) under which price promotions with different saving presentation formats have more or less strong effects on internal reference prices. Furthermore, only a few studies (Chandrashekaran and Grewal 2003, 2006; Sinha and Smith 2000) measured the internal reference price before and after exposure to the price promotion, thus the change of the internal reference price that can be unambiguously assigned to the examined independent variable. These research gaps will be closed by the new study presented below.

Three other studies examined the moderating role of involvement (see table 2), but in slightly different contexts.

Table 1
Studies on Effects of Price Promotions on Internal Reference Prices

Study	Objective	Major findings
Diamond and Campbell (1989)	Examined the effect of different types of promotions on reference prices (RP).	The monetary promotion (discount) reduces the RP while the non-monetary promotion (premium attached, extra product) does not.
Lattin and Bucklin (1989)	Analyzed, among other questions, the formation of consumers' reference prices after exposure to a brand promotion.	High exposure to a brand's promotional activity reduces the accordingly formed reference price.
Grewal et al. (1998)	Examined, among other aspects, effects of price discounts on consumers' internal reference prices.	The promotions reduce the consumers' internal reference price.
Sinha and Smith (2000)	Examined, among other questions, the effects of three deal types on internal reference prices.	Consumers' internal reference prices are not affected after seeing the deal once.

Table 2
Studies on the Moderating Role of Involvement

Study	Objective	Major findings
Chandrashekaran and Grewal (2003)	Examined effects of the advertised reference price (ARP) and the moderating role of involvement on the change of internal reference price.	Low involvement consumers show a stronger change of the internal reference price into the direction of the ARP than high involvement consumers.
Chandrashekaran (2004)	Examined, among other questions, effects of the advertised reference price (ARP) and the moderating role of involvement on consumer evaluations (transaction value, acquisition value and purchase intention).	Under high involvement, consumer evaluations are not influenced by the ARP. Under low involvement, consumer evaluations are positively influenced by the ARP.
Howard and Kerin (2006)	Examined, among other questions, effects of the advertised reference price (ARP) (absent vs. present) and the moderating role of involvement on price attitudes.	Under high involvement, consumers' price attitudes are more favourable if the ARP is present. Under low involvement, there is no difference in consumers' price attitudes depending on whether the ARP is present or absent.

Table 3
Studies on the Role of the Saving Presentation Format

Study	Objective	Major findings
Chandrashekaran and Grewal (2006)	Examined, among other effects, the impact of the saving presentation format on changes of the internal reference price (IRP).	The change of the IRP is stronger if the saving information is provided as "% off" than in the case where the saving presentation is provided as "amount off".
DelVecchio et al. (2007)	Examined, among other questions, the effect of promotion framing ("% off" vs. "amount off") on price expectations.	An "amount off" format leads to a stronger reduction of the price expectation than a "% off" format.

The first study presented in table 2 shows that, under low involvement, consumers' formation of reference prices is more strongly influenced by available price information than under high involvement. The other two studies show that the effects of reference prices on evaluations or attitudes are somehow mixed under different involvement conditions. The findings, specifically of the first study, provide support for the importance of the involvement in the context of the formation of reference prices. However, none of the previous studies specifically examined the role of involvement in the context of effects of price promotions on internal reference prices or interactions of involvement and other moderator variables. Thus, it is necessary to examine such effects in the new empirical study presented below.

In addition, two studies on effects of the saving presentation format can be found (see table 3).

The conclusion that can be drawn from the two studies summarized in table 3 is that the "% off" format leads to greater reduction of the internal reference price/the price expectation than the "amount off" format, whereas the opposite effect occurs when price expectation is considered as target variable. Thus, it will be interesting to examine the role of the saving presentation format, and more specifically, possible interactions between the saving presentation format, involvement, and price confidence in the more complex context of effects of price promotions on internal reference prices.

Up to our knowledge, no study has yet examined the moderating role of consumers' price confidence in the context of effects of price promotions on internal reference prices.

The gaps identified in the existing studies presented above will be addressed in the new study presented below. The research hypotheses that represent the basis of the empirical study will be developed in the next section.

DEVELOPMENT OF THE RESEARCH HYPOTHESES

For the situation of being faced with new price information, it can be assumed that consumers – consciously or unconsciously - revise their internal reference price by including the new price information (Yadav and Seiders 1998). More specifically, when faced with a reduced price and/or the amount of the saving, consumers are believed to incorporate the new price information into their internal reference price. As internal reference prices are usually formed through complex mechanisms considering several types of price information (Briesch et al. 1997; Mayhew and Winer 1992; Mazumdar and Papatla 2000; Rajendran and Tellis 1994; Winer 1986), it can be assumed that encountering one single piece or a few pieces of new price information leads to a rather heuristic incorporation into the internal reference price (Chandrashekaran and Grewal 2003; Frankenberger and Liu 1994; Yadav and Seiders 1998). A heuristic which is appropriate to explain how consumers incorporate a single/a few piece(s) of new price information into their internal reference price, is anchoring and adjustment. The new price information encountered serves as an anchor toward which the internal reference price is adjusted. As one single/a few piece(s) of price information is/are not able to change the internal reference price completely, this adjustment will be insufficient. The type of the price information that represents the anchor value and the extent of the adjustment of the internal reference price into the direction of the anchor are believed to depend on consumers' price confidence because price confidence plays an important role in price judgments (Mazumdar and Monroe 1992; Thomas and Menon 2007), on involvement (Chandrashekaran and Grewal 2003; Vaidyanathan and Aggarwal 2001) as well as on the saving presentation format (Chandreshekaran and Grewal 2006; DelVecchio et al. 2007).

Highly price-confident consumers are less influenced by price promotions (Bearden, Hardesty, and Rose 2001) and less likely to considerably change their internal reference price because of encountering a single piece of new price information (Yadav and Seiders 1998). *Less* price-confident consumers are more likely to be influenced by environmental information (Bearden et al. 2001; Yadav and Seiders 1998) and pay high attention to additional price information provided (Dutta 2011), such as the saving information and the reduced price in a price promotion ad and incorporate such information to a larger extent into their internal reference price than highly price confident consumers. These arguments lead to the first hypothesis:

Hypothesis 1: *Price promotions lead to stronger reductions of the internal reference for less than for highly price-confident consumers.*

Beyond the effect of price confidence, possible effects of involvement and the saving presentation format need to be explained theoretically. In the case of *low* involvement, consumers generally show an effortless and context-driven processing, and are open to promotional signals in ads (Chandrashekaran 2004; Howard and Kerin 2006; Petty, Cacioppo, and Schumann 1983). In the case of *high* involvement, consumers are motivated to spend a considerable effort to intensively process information (Petty et al. 1983). Consequently, consumers form internal reference prices on the basis of logically relevant facts (Lichtenstein, Bloch, and Black 1988; Zaichkowsky 1988) that they carefully process because, due to their high involvement, they are more skeptical of advertised price claims (Chandrashekaran and Grewal 2003).

If *less* involved consumers are faced with a price promotion ad that contains the saving information in the "% off" format, the only

clearly available price information that can be easily processed is the reduced price. As the "% off" information is more difficult to process than the "amount off" information (DelVecchio et al. 2007; Lee and Han 2002; Morwitz, Greenleaf, and Johnson 1998), less involved customers are not motivated to further process the percentage indicating the saving amount. Thus, in this case, the reduced price represents the anchor toward which the internal reference is adjusted.

If less involved consumers encounter a price promotion ad that contains the "amount off" saving presentation format, two types of price information are available: the reduced price and the amount of the saving. Although the saving amount represents irrelevant information with regard to the internal reference price, this price information is likely to be considered because even irrelevant anchors can have effects on consumers' judgments (Brewer and Chapman 2002; Switzer and Sniezek 1991; Wilson et al. 1996) and such effects might specifically exist in the case of low involvement. Particularly under these conditions, the so-called "illusion of knowledge effect" according to which additional information reduces the accuracy of the estimation (Hall, Ariss, and Todorov 2007) is likely to occur. Thus, less involved consumers being faced with two types of price information (saving amount, reduced price), tend to rely on all types of available information, even on less relevant information. When incorporating the two types of price information into their internal reference price, consumers perceive this price information in terms of a partitioned price. This phenomenon can be explained as follows: when forming internal reference prices, consumers try, if possible, to consider several regular prices. When faced with a price promotion ad that displays the amount of the saving and the reduced price, the regular price is provided in terms of a partitioned price that consists of a larger price component (the reduced price) and a smaller price component (the saving). Research on the processing of partitioned prices (Gierl and Bambauer-Sachse 2007) as well as research on willingness to pay for product bundles (Gaeth et al. 1990) suggests that consumers who are not motivated to engage in exact processing tend to come up with price estimates/levels of willingness to pay that result from an averaging procedure that assigns about equal weights to the components to be processed. Thus, for the case considered here, it can be argued that less involved consumers who are faced with the reduced price and the amount of the saving, are not motivated to fully process the partitioned price information and rather build an average value out of the two components that represents the anchor toward which they adjust their internal reference price. As the anchor value resulting in this case is lower than the anchor value used in the "low involvement, '% off'" condition, the reduction of the internal reference price is expected to be stronger in the "amount off" than in the "% off" condition. These arguments lead to the following hypothesis:

Hypothesis 2a: *In the case of low involvement, reductions of the internal reference price are stronger if the "amount off" format is used (compared to the "% off" format).*

If *highly* involved consumers are faced with a price promotion ad containing the reduced price and the "% off" saving information, it is, as already argued for low involvement, comparatively difficult to calculate the regular price (DelVecchio et al. 2007; Lee and Han 2002; Morwitz et al. 1998), even if highly involved consumers might be motivated to do so. Thus, the only available price information that can serve as an anchor toward which the internal reference price is adjusted is the reduced price.

If highly involved consumers encounter a price promotion ad displaying the reduced price and the amount of the saving, they are

highly motivated to calculate, based on the price information provided, the regular price because this is the most diagnostic type of price information they can use in order to modify their internal reference price. Thus, when incorporating the new price information into their internal reference price, consumers are likely to either use the calculated regular price or the range of plausible values from the reduced price to the regular price as an anchor. The latter is plausible because consumers generally tend to show a downward bias in their price estimates if faced with price promotions (Krishna et al. 2002). Note that highly involved consumers will not consider the amount of the saving as independent price information, but they will rather use it to calculate the regular price.

Thus, comparing the anchor used by highly involved consumers when faced with the "% off" saving format presentation to the anchor used when encountering the "amount off" saving format presentation, it can be concluded that the stronger reduction of the reference price can be expected for the "% off" condition. These arguments lead to the following hypothesis:

Hypothesis 2b: *In the case of high involvement, reductions of the internal reference price are stronger if the "% off" format is used (compared to the "amount off" format).*

The above derived hypotheses will be tested in the empirical study presented below.

EMPIRICAL STUDY

Product Category

In order to examine whether price promotions have different effects on consumers' internal reference prices for low and high involvement products, two appropriate test products had to be chosen. The products used were T-shirts and jeans which have the advantage that they differ with regard to product involvement, but can both be assigned to the same product category (clothing).

MEASURES

In order to make manipulation checks, product involvement was measured by four items such as "is important to me" (Alpha = 0.81) following the suggestions of Laurent and Kapferer (1985) as well as of McQuarrie and Munson (1992). The internal reference price was measured using eight dimensions (normal/fair/average/minimum/maximum/appropriate price, last price paid, price expected for the next purchase, Alpha = 0.97) recommended by Chandrashekaran and Grewal (2003) as well as Chandrashekaran (2004). Price confidence was measured using two statements such as "I am confident about my price estimation" ($r = 0.71$) following the recommendations of Biswas and Sherrell (1993) as well as of Thomas and Menon (2007).

The high α-values and the high correlation show that the chosen items are appropriate to reliably measure the model variables. Thus, the overall variable values used in the data analyses were calculated as mean values of the single items that were intended to measure the respective variable.

SAMPLE, EXPERIMENTAL DESIGN, AND PROCEDURE

The sample of the empirical study consisted of 240 respondents (54% women, 46% men). The age of the participants ranged from 16 to 61 years, the average age was 28.3 years.

The study was based on a 2 (saving presentation format: "% off" vs. "amount off") x 2 (product involvement: low vs. high) design. Note that the variable price confidence that was also considered in the data analyses was not manipulated, but measured. Table 4 gives an overview of the test ads that were used to implement the experimental design.

Table 4
Test Ads

The procedure of the data collection was as follows. The respondents were assigned to one of the four groups resulting from the experimental design and were asked to fill in the respective questionnaire. The questionnaire contained in the first place a battery of measures that aimed to capture the initial reference price. Afterwards, the respondents had to indicate their price confidence as well as their involvement in the respective product category. In the next step, the respondents were presented with an ad displaying the product and the price information and they were then asked to fill in the reference price measures a second time. At the end of the questionnaire, the respondents had to indicate their age and gender.

DATA ANALYSIS AND RESULTS

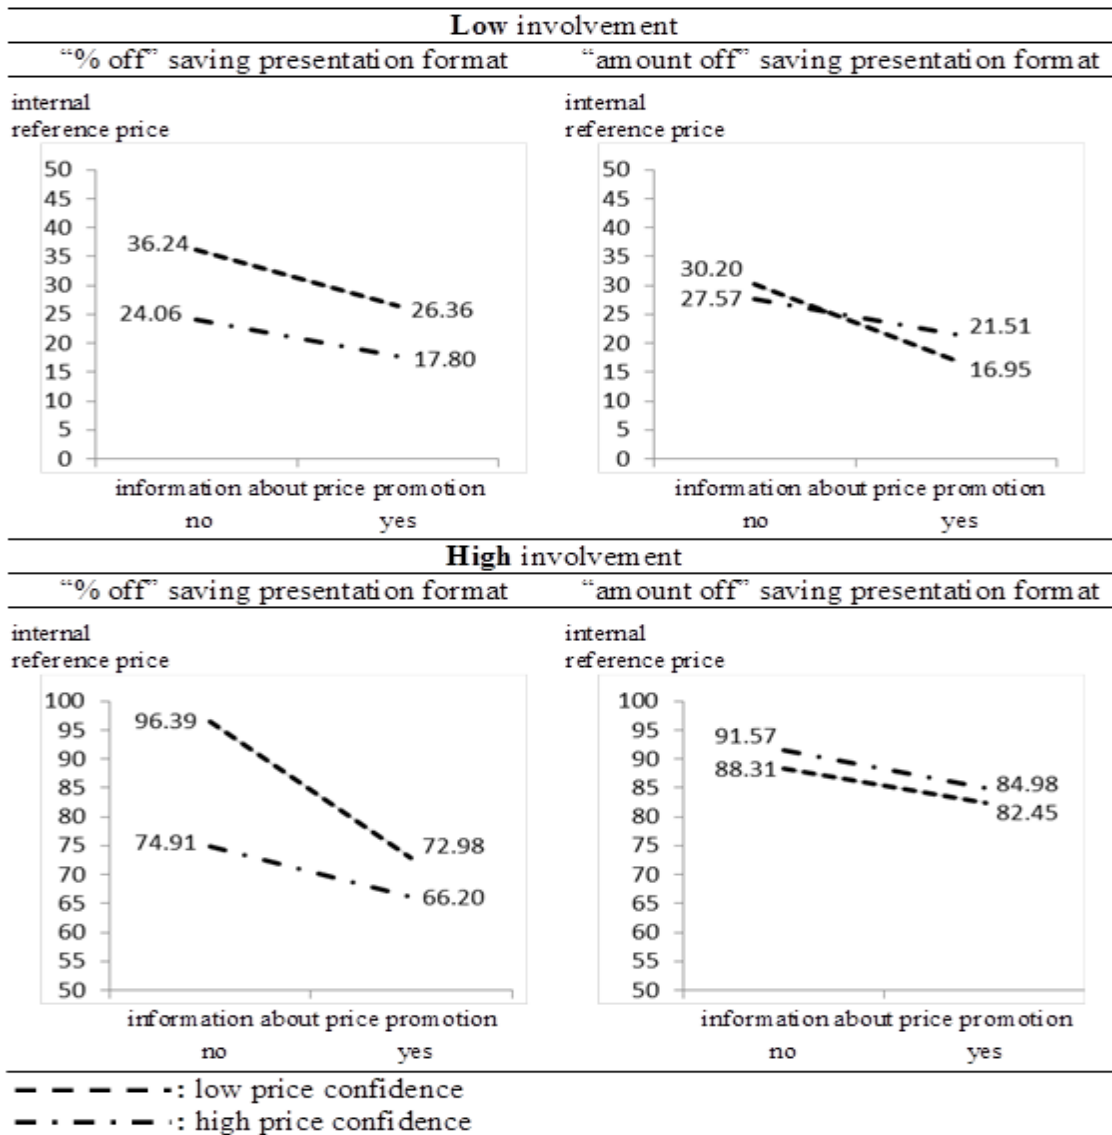
Before discussing the main results of the study, the results of the manipulation check for involvement will be presented. The results of a t-test show that the measured involvement is significantly higher for jeans ($M = 4.48$) than for T-shirts ($M = 3.81$; $t = 3.91$, $p < .001$). Thus, the involvement manipulation based on choosing jeans (T-shirts) as high (low) involvement products was successful. In addition, it is important to show that the variables involvement and price confidence are not too highly correlated because otherwise, it would not be possible to treat these variables as independent conditions. The correlation between these variables is rather low ($r = 0.34$).

Now, the main results will be presented. Figure 1 gives an overview of the changes of the reference prices depending on the saving presentation format, involvement, and consumers' price confidence. The results are simultaneously differentiated according to all variables because, on the basis of this type of result presentation, it is possible to test all hypotheses.

The results presented in figure 1 basically show that providing information about a price promotion leads to a considerable reduction of the internal reference price (main effect of the information about the price promotion: $F = 11.83$, $p < .01$). This result is consistent with the finding of Grewal, Monroe, and Krishnan (1998) that there is a positive relation between the advertised selling price and the internal reference price. This finding is specifically remarkable because the participants of the study were faced only once with this information.

In order to test the first hypothesis, the results for low and high price confidence are compared for all four experimental conditions. As assumed in hypothesis 1, the reduction of the reference price is stronger for less price-confident consumers in three out of the four cases (low involvement, "% off": $\Delta_{\text{low price confidence}} = 9.88$, $\Delta_{\text{high price confi-}}$

Figure 1
Effects of Saving Presentation Format, Product Involvement,
and Consumers' Price Confidence on Internal Reference Prices

_____


price confidence = 13.25, $\Delta_{high\ price\ confidence}$ = 6.06, t = 7.63, p < .001; high involvement, "% off": $\Delta_{low\ price\ confidence}$ = 23.41, $\Delta_{high\ price\ confidence}$ = 8.71, t = 4.96, p < .001). Only in the case of high involvement and the "amount off" format, there is no difference in the reduction of the reference price between more and less price-confident consumers (high involvement, "amount off": $\Delta_{low\ price\ confidence}$ = 5.86, $\Delta_{high\ price\ confidence}$ = 6.59; t = -0.24, p > .10). Thus, hypothesis 1 is widely supported. A possible explanation for the finding that the reference price is reduced to about the same extent in the "high involvement, 'amount off'" condition for more and less price confident consumers could be that in this condition, consumers are provided with the reduced price and the amount of the reduction so that they can estimate the total price comparatively easily. Thus, independently of their price confidence, consumers are motivated to process the information provided in order to get a price estimate that is close to the regular price. Consequently, in both conditions, they will use a similar anchor and thus end up with a similar reduction of the internal reference price.

Moreover, the findings indicate for less involved and less price-confident consumers that the reduction of the internal reference price (IRP) is stronger if the saving presentation format "amount off" is used ("amount off": Δ_{IRP} = 13.25 vs. "% off": Δ_{IRP} = 9.88; t = 3.52, p < .001). However, for less involved, but highly price-confident consumers, this result pattern cannot be observed ("amount off": Δ_{IRP} = 6.06 vs. "% off": Δ_{IRP} = 6.26; t = -0.19, p > .10). Thus, hypothesis 2a is only supported for less price-confident consumers. A possible explanation for the non-significant effect for highly price-confident consumers could be that these consumers are, due to their high price confidence, less influenced by price promotions and thus, assign a lower weight to the saving amount than to the reduced price when processing these pieces of price information through averaging in the "amount off" format condition. Consequently, the resulting anchor is not (much) different from the anchor in the "% off" condition and thus the reductions of the internal reference price are of about the same extent.

Furthermore, the results show for highly involved, but less price-confident consumers that the reduction of the internal reference price is stronger if the saving presentation format "% off" is used ("% off": $\Delta_{IRP} = 23.41$ vs. "amount off": $\Delta_{IRP} = 5.86$; $t = 5.57$, $p < .001$). Although the same pattern results for highly involved and highly price-confident consumers, this difference is not significant ("% off": $\Delta_{IRP} = 8.71$ vs. "amount off": $\Delta_{IRP} = 6.59$; $t = 0.74$, $p > .10$). Thus, hypothesis 2b is only supported for less price-confident consumers. A possible explanation for the non-significant effect for highly price-confident consumers could be that these consumers are generally less influenced by price promotions than less price-confident consumers. Thus, if they realize that it is not possible to calculate the regular price out of the price information provided, they might adjust their internal reference price to a lesser extent into the direction of the reduced price than less price-confident consumers.

CONCLUSION

The starting point of this paper was the observation that, due to an increasing competition in many consumer product categories, marketers increasingly promote price reductions with the intention to increase purchase intentions. This observation brought up the idea that beyond having such positive effects, advertising reduced prices might at the same time have negative effects through reducing consumers' internal reference prices. Such effects would be negative from the marketer's perspective because previous research has shown that the internal reference price is linked to the price people are willing to pay (Ranyard, Charlton, and Williamson 2001). Consequently, from both a consumer researcher's and a marketer's perspective, it stood to reason to examine effects of price promotions on consumers' internal reference price. In order to go beyond what was analyzed in previous studies, the study presented here looked in more detail at such effects by differentiating between low and high involvement, low and high price confidence and different presentation formats of the saving information ("% off" vs. "amount off").

The findings of the empirical study show that being faced with a price promotion leads to a downward correction of the internal reference price, even after only one contact with the information about the price reduction and even if consumers are highly price-confident. However, for highly price-confident consumers, the reduction of the reference price is less strong than for less price-confident consumers. In addition, the results show that if less price-confident consumers encounter a price promotion, the effects depend on involvement and the saving presentation format. If less involved consumers are addressed, the "amount off" saving presentation format has the most detrimental effects, whereas in the case where highly involved consumers are targeted, the reduction of the internal reference price is strongest when the "% off" format is used.

These findings do not only provide a valuable contribution to existing research in the field of effects of price promotions on reference prices, but also suggest that marketers should be aware of the fact that already one contact with a reduced price leads to a reduction of consumers' internal reference prices independently of their price confidence or the product category. Thus, marketers should carefully consider the advantages and disadvantages when deciding on a price promotion. Furthermore, the results provide a better understanding of how marketers should communicate saving information to consumers in a way that reduces the observed effects of price reductions on internal reference prices. Specifically if marketers of low (high) involvement products target less price-confident consumers, they should choose the "% off" ("amount off") saving presentation format in order to minimize negative effects on consumers' internal reference prices.

For future research, it might be interesting to examine effects of an increasing number of contacts with price promotions in order to know whether consumers could be desensitized to the price promotion information due to the repetition effect. Furthermore, it might be interesting to add willingness to pay and purchase intentions to the research model in order to know to what extent the change of internal reference price influences such typical consumer response variables. Moreover, it might be of interest to simultaneously examine positive and negative effects of price promotions through different paths. Finally, it could be interesting to examine whether a price promotion in combination with the comparison with a related or unrelated low- or high-price product can influence the internal reference price as it was examined for willingness to pay by Adaval and Wyer Jr. (2011) in a slightly different context.

How Relevant Is Marketing Scholarship? A Case History with a Prediction

Edward McQuarrie, Santa Clara University, USA
Barbara Phillips, University of Saskatchewan, Canada
Steven Andrews, Roger Williams University, USA

ABSTRACT

Debate over whether marketing scholarship ought to be more relevant has a long history. This paper takes a positive rather than a normative approach to the issue, and provides an empirical examination of the degree of relevance achieved in a sub-discipline of consumer behavior: marketing communications. A content analysis of 485 laboratory experiments published in six marketing journals over the last twelve years was conducted. Results show little concern for relevance in the design of advertising print experiments, and a longitudinal comparison suggests that relevance has decreased over time. The paper concludes by considering sociological explanations for why the relevance of marketing scholarship may not improve.

The online Oxford English dictionary defines 'academic' as "not of practical relevance." This definition squares poorly with the oft-heard injunction to marketing scholars that their research needs to become more relevant, an exhortation that has appeared regularly for more than thirty years (e.g., Ferber 1977; McQuarrie 1998; Preston 1985), and most recently in Reibstein, Day, and Wind (2009). In this paper, we do not attempt to resolve the normative issue of whether marketing scholarship ought to be relevant, or needs to become more relevant; rather, we aim at a positive account of the degree of relevance currently achieved. The goal is to document the extent to which laboratory work in one consumer behavior area of marketing scholarship—marketing communications—has or has not been relevant.

In what follows we define the criteria for relevance used in this paper and distinguish various aspects of relevance within the context of marketing communication research. We apply these criteria to twelve years of experimental research on print advertising published in six marketing journals from 1998 to 2009. This produces a tabulation of the number and proportion of published studies that are relevant to one or another causal factor characteristic of the real consumer behavior phenomenon. We find sustained low levels of relevance, and no difference in relevance across advertising, consumer behavior, or general marketing journals. We conclude, again in a positive rather than normative mode, by sketching out a theory that could explain why relevance has been minimal in this area of marketing scholarship and is likely to remain so, no matter how many exhortations in the vein of Reibstein et al. (2009) may appear.

CRITERA FOR RELEVANCE

Proximal Similarity

We define relevance in terms of Campbell's (1986) concept of proximal similarity. On this criterion, a marketing communication experiment may be judged relevant to the extent its stimuli and procedures reproduce the distinctive characteristics of consumer advertisements (McQuarrie 2004). Of course, similarity is never absolute, and laboratory experiments can never provide the same setting or the same event matrix as any particular advertising exposure in the field. Hence for Campbell, similarity functions as a threshold—that is the meaning of the modifier 'proximal'. The issue is whether experimental stimuli and procedures incorporate *enough* of those aspects of the phenomenon that are important for understanding cause and effect. That is, does the experiment go far enough to produce *ad-vertisements* and *consumer behavior*, or do its conditions actually capture some other kind of human behavior?

The power of Campbell's concept of proximal similarity can be illustrated by re-considering the hoary debate over the use of student subjects (Sears 1986). From Campbell's standpoint, use of student subjects is neither here nor there. If the purchase domain is potato chips and 20 year olds are substantially represented among the buying population for chips (as they are *not* among the population that rents cars or purchases fur coats), then an experiment that exposed students to ads for potato chips would not be irrelevant thereby.

But now suppose these students don't actually purchase any potato chips during the experiment. Suppose further they don't choose a brand; in fact, suppose there are no brands in the experiment at all, but only labels heading up a written description of a 'snack product'. Suppose that what these students do after reading these descriptive paragraphs is carefully examine a few additional sentences describing the object to which the labels refer, and check boxes in response. Is this checking of a box 'consumer behavior'? Is this picture-free text an 'ad'? Under Campbell's analysis, the answer in both cases probably would be no. The experiment does not reproduce 'buying behavior', nor does it reproduce 'magazine advertisement'; there is insufficient similarity. The stimuli used, and the nature of the responses gathered, are distal rather than proximal to the advertising domain.

The real issue for Campbell, in judging whether an advertising experiment is relevant, would not be whether the experimental subjects are students, but whether these students are exposed to *advertisements,* as that term is commonly understood, and then have the opportunity, after a suitable interval, to *choose* from among advertised brands and *buy*. Advertisements, within the larger domain of persuasive messages, are distinguished by being highly crafted amalgams of visual and verbal elements embedded in particular sorts of mass-media contexts, where consumers can (and often do) ignore those ads. A written paragraph whose scrutiny is mandated would lack most of these elements. Likewise, purchases involve choice, real monetary cost, the subtler loss of foregone alternatives, and the risk of remorse. Checking a box on a paper form need not involve any of these elements. Thus, by Campbell's criterion of proximal similarity, an experiment in which a written paragraph is administered and subjects check boxes on paper forms in response, may contribute to scientific knowledge of text comprehension or communication, but is not likely to be relevant to understanding cause and effect in the *advertising* domain of consumer behavior—the experimental set up is too dissimilar.

Conversely, if one was a political scientist concerned with the phenomenon of voting, that same experiment might be sufficiently proximal. Voting behavior *is* a matter of indicating a preference by checking a box on a form. Voters *do* learn about candidates by reading extended written text. The criteria for proximal similarity *are* met if the experiment seeks to understand how written communication influences voting behavior.

By necessity, laboratory experiments are highly artificial (Petty and Cacioppo 1996; Wells 1993), but this doesn't matter in Campbell's view, as long as the artifice reproduces elements important for determining how an advertisement can cause a desired effect. The real question, in determining whether an experiment is relevant to

the consumer behavior domain of advertising, is whether the stimulus exposed is something like an advertisement, and whether the reception environment is something like that in which ads are encountered, and whether the responses measured are something like purchase behavior.

Decomposition of Relevance

The goal of this paper is to examine published marketing scholarship and count the number of studies that address a set of causal factors prototypical of advertising and advertising reception environments. If it can be documented that numerous experiments exist that manipulate a particular factor as present or absent, or there exist numbers of experiments with the factor present and numerous others with it absent, then meta-analysis can ultimately reveal whether that factor is causal, and to what extent. But if a factor is excluded from most published experiments, then just that much of the domain of consumer behavior remains terra incognita (Armstrong 2010).

As a case in point, if there were no studies in which ad stimuli were repeated, then we could not know how level of repetition might alter the impact of a particular persuasive appeal. Absence of evidence concerning repetition effects is not evidence for the absence of repetition effects. We might assume that anything that is effective in a single repetition would be as effective, or more so, if repeated; but there would be no empirical foundation for this position. And to the extent there was any evidence that some appeals only work after wear-in, while others are vulnerable to wear-out, we would be on very thin ice in assuming that some other appeal that had failed (succeeded) in a single repetition would be just as (in)effective if repeated.

To focus the analysis, we examine experiments that use print advertisements, as discussed subsequently. In 2012 in North America, the typical magazine ad directed at consumers is dominated by its picture, containing few words; will be exposed repeatedly; will be embedded in a media vehicle whose articles are the primary focus for the consumer, who is in no way forced to look at the ad or dwell on it; and this consumer will, after a delay, have an opportunity to act in connection with the ad, often by making a choice between brands, with which s/he was already familiar, at some economic cost.

Almost any field experiment would include all of these factors, and any 'single source' data set would likewise include them all (e.g., Lodish et al. 1995). More important, it is feasible to reproduce any one of these conditions in an artificial laboratory experiment—or not. The balance of pictures and words in an ad, whether it is embedded in other material, whether exposure is forced, whether response is measured with a delay, and so on, are all choices that individual scholars make in the course of designing an experiment. An experimenter could instead type out a paragraph containing attribute claims and staple it to a sheaf of pages containing rating scales, with the overt or covert statement that experimental credit will not be given to participants unless the written paragraph is carefully attended to and the ratings diligently made (Allen 2004). Arguably, neither 'advertising' nor 'consumer behavior' are present in such a situation. The empirical question, then, is how many marketing scholars have chosen the written paragraph, check-a-box design, with forced exposure and immediate response, versus the number of scholars who chose to reproduce pictorial aspects, or unforced exposure, or any of the other prototypical elements of the advertising phenomenon.

Again, we do not contest the contribution of the written paragraph, check-a-box experiment to the rigorous testing of scientific theories of human persuasion (Calder, Phillips and Tybout 1981). A long stream of research in social psychology exactly fits this template. Rather, we set out to review twelve years of published marketing communications experiments in marketing journals and count how many laboratory experiments incorporate one of more relevance conditions, versus how many approximate the written paragraph, check-a-box template inherited from the older discipline of social psychology. There is no expectation that any given laboratory experiment will incorporate all the causal factors, and with at least 2^n possible combinations of factors, it might be impossible for any one experiment to vary all the factors simultaneously. But it is certainly fair to hold up twelve years of the *collective* product of marketing, consumer behavior, and advertising scholarship, and estimate the degree of relevance achieved, net. What do the facts show?

METHOD

Journal and Study Selection

From 1998 to 2009 inclusive, we examined each issue of the following leading journals: *Journal of Advertising*, *Journal of Advertising Research, Journal of Consumer Psychology, Journal of Consumer Research, Journal of Marketing,* and *Journal of Marketing Research.* These journals contained the majority of published research on advertising. The table of contents and abstracts were reviewed to identify articles containing laboratory experiments that purported to be about advertising, as indicated by title or abstract. 'Laboratory experiments' were defined broadly as non-field studies where a set of treatments were administered; hence a study in which subjects were recruited at a shopping mall or airport and randomly assigned to different treatments would be included. Any laboratory study where the authors referred to its stimuli or topic as 'ads' or 'advertising' was deemed admissible.

An initial perusal showed that print advertising stimuli dominated the population of studies (approximately 3:1 ratio), so only experiments using printed stimuli were retained for further examination[1]. The computer presentation of still images accompanied by text was accepted as 'print'. This focus on print ad studies had the further advantage of simplifying the set of relevance criteria, and also of maximizing the availability of stimuli for inspection (print stimuli are often reproduced in article appendices, while television and radio stimuli, before the age of Web appendices, could not be). A total of 485 laboratory experiments in 289 articles were identified, as described in Table 1. The 122 articles reporting multiple experiments accounted for 2/3 of the experiments in the dataset.

Scoring Criteria for Relevance

The authors scored each experiment for the presence or absence of: 1) a real (as opposed to fictitious brand; 2) embedded, non-focal exposure; 3) repeated exposure; 4) inclusions of competitive advertising; 5) measurement of responses after a delay or one day or more; 6) inclusion of choice as one of these responses. These six criteria allow for a longitudinal comparison to the analysis of pre-1998 experiments reported in McQuarrie (1998). The sum of these six dichotomous criteria will be referred to as the relevance score.

Experiments also were scored as to whether they manipulated the verbal element, the visual element, or both. Pollay (1985) and McQuarrie and Phillips (2008) show a drastic decrease in the number of words appearing in magazine ads over time. Increasingly, magazine ads no longer have any body copy, as traditionally defined.

---

[1] Of the ~150 excluded experiments, approximately half used television ads, a third used digital stimuli of some kind, and the remainder were scattered across other media. Hence, none of these would have produced a large enough sample to be meaningfully analyzed, especially at the journal or discipline level.

TABLE 1
Incidence of Individual Relevance Criteria in Advertising Experiments

	1998-2009 N = 485		1990-1997a N = 231
	N	%	%
Relevance Criterion			
Real brand	168	34.6	28
Embedded, non-focal exposure	39	8.0	17
Repeated exposure	30	6.2	16
Competitive advertising present	23	4.7	20
Delayed measurement	35	7.2	5
Choice measured	19	3.9	14
Frequency distribution			
Zero criteria present	249	51.3	40
One	174	35.9	32
Two	49	10.1	19
Three	10	2.1	9

Five	0	0.0	1
Manipulation of:			
Visual element	61	12.6	--
Verbal element	209	43.1	
Both	96	19.8	
Neither	119	24.5	
WIRIWS Incidence (written immediate response to isolated written stimulus)	316	65.2	--

[a] From Table 3 of McQuarrie (1998). The *Journal of Consumer Psychology* was not included in his study, nor was the manipulation of visual or verbal elements tabulated.

Do recent laboratory experiments reflect this ongoing de-emphasis on words?

Measured responses were also classified as behavioral (e.g., response latency, successful recognition) or written. Experiments with only written responses, measured immediately, in isolation, with no manipulation of visual elements, repetition or competitive interference, were coded as such. These will be referred to as 'WIRIWS' studies (written immediate responses to isolated written stimuli). Finally, when an article included the stimulus used, these were examined and compared to actual magazine ads for the same product, to get a sense of which components of actual magazine ads were being incorporated into lab stimuli.

RESULTS

Relevance

Real brands were not uncommon in academic experimental research on advertising during 1998-2009, appearing in about a third of all experiments. However, all of the other relevance criteria were conspicuous by their absence, omitted from between 92% and 96% of experiments (Table 1). Few researchers during this period felt it necessary to arrange unforced exposure to ads, or to study the effects of repetition, delay, or competitive interference, or to make subjects choose a brand following ad exposure, as opposed to completing rating scales.

In terms of a relevance score, just over half the experiments scored zero; the mean incidence of relevance criteria was .65 out of a possible 6.0. The overall results are measurably worse than those reported by McQuarrie (1998) for 154 print ad experiments published in 1990-97, which in turn he found to be measurably worse than those reported for pre-1990 print ad experiments. Some individual relevance criteria were more common in the present study (real brands), others less so (competition, choice); others stayed at the same low level as seen in both the earlier time periods studied by McQuarrie (unforced exposure).

Finally, studies that manipulate only verbal elements, unrepeated and without competitive interference, while taking an immediate written response, were the norm during these twelve years, accounting for 65% of these experiments. WIRIWS studies represent the modal print ad experiment. In summary, laboratory experiments currently reported in marketing journals appear not to be much concerned with relevance, defined in terms of proximal similarity to advertising and consumer behavior. The longitudinal data suggests that, if anything, relevance has declined over time.

Turning to other aspects of relevance, manipulation of visual elements of the advertising stimulus was half as common as manipulation of verbal elements (Table 1); whereas the nature of the verbal manipulations is extremely diverse, most of the visual manipulations consist of a change in the object depicted, rather than a change in the style or manner of depiction (for the distinction, see Scott and Vargas [2007]). The incidence of visual manipulations did not increase over

the twelve year period, in marked contrast to what was happening during this era to print advertisements outside the laboratory (McQuarrie and Phillips 2008).

Some sense of the gap that separates the verbal stimuli described as 'ads' within marketing scholarship, as compared to real and now primarily visual ads directed at consumers, can be gleaned from Figures 1 and 2. The left panel of Figure 1 reproduces the stimulus used in 1999 *JMR* paper, which purports to be an advertisement for toothpaste. In the right panel of Figure 1 an actual toothpaste ad is reproduced. The differences are stark. The Dazzle ad is almost entirely composed of words, with no visual element other than a border. The actual Crest ad contains few easily visible words, consisting otherwise of a highly stylized picture that fills the page. No actual toothpaste ad appearing in today's mass media would use such a densely packed volume of verbal text as the Dazzle stimulus; one has to go back over a century to find an era where such word-heavy, picture-light ads were the norm (Pollay 1985). Is the Dazzle stimulus really an instance of 'advertisement'—the everyday phenomenon to which consumers are exposed? A case can be made that the Dazzle experiments, however internally valid, lack construct validity—if proffered as research on *consumer response to advertising,* as opposed to comprehension of written text.

The same problem can be seen in Figure 2, where the experimental stimulus used in a 2007 *JA* paper appears in the left panel, and an actual ad for jeans appears in the right panel. This time the experimental ad does contain a large picture, but what is manipulated

and tested is the attribute list that appears in a large font at the lower left. For comparison, the actual jeans ad reproduced in the right panel of Figure 2 makes no verbal claim to possess any attribute, much less a list. In fact, the actual jeans ad has no headline or body text at all. Such an absence of verbal text is the norm in contemporary ads for fashion clothing (Phillips and McQuarrie 2011); it is difficult to see how the results of such marketing experiments can be relevant to a fashion advertiser who is constrained to accomplish his or her promotional purpose without the use of any verbally stated attribute claim.

Relevance by Discipline

It might be argued that consumer researchers, whose journals are sponsored by multiple disciplines outside of marketing, don't have the same obligation or opportunity for relevance as do marketing scholars publishing in AMA journals, who are taxed with providing managerial implications. Likewise, one might suppose that advertising researchers might be more oriented to reproducing the distinctive characteristics of advertising, relative to scholars concerned with more general questions of consumer behavior or marketing action. To this end, we grouped journals by discipline and compared relevance scores and WIRIWS scores across discipline. As Table 2 shows, there were no differences across journal discipline (χ^2 (2) = 2.86 and 1.21 for relevance and WIRIWS scores respectively, both *ns*). In sum, none of the three disciplines appears any

FIGURE 1
Academic Toothpaste Ad (Left) Versus an Actual Toothpaste Ad (Right)

FIGURE 2
Academic Jeans Ad (Left) Versus an Actual Jeans Ad (Right)
more or less concerned with relevance in the design of advertising experiments.

DISCUSSION

We examined one specific area within marketing scholarship where a high volume of publications and a lengthy history of publication exist: laboratory experiments on advertising. This consumer behavior sub-domain is also attractive because it features experimental design alternatives that are equally feasible (e.g., manipulate pictures or words, repeat or not repeat stimuli) along with straightforward criteria for judging any given design alternative as more or less relevant to actual marketing practice. What we found does not make us optimistic that the call for institutional change of Reibstein et al. (2009) will be answered anytime soon.

A tabulation of 485 published laboratory experiments on print advertising published in six journals over the preceding twelve years showed little concern with relevance. A majority of studies consisted of immediate paper-and pencil ratings taken in response to single forced exposures to written text. Measurement of purchase behavior was the exception, and even choice measurements were rare. Delayed response after incidental exposure was vanishingly rare. There were no significant differences across disciplines, and no evidence of improvement in relevance relative to earlier accounts (McQuarrie 1998; Preston 1985).

TABLE 2
Incidence of Relevance across Journals and Disciplines

	Zero Relevance		WIRIWS Design	
	N	*%*	*N*	*%*
Discipline				
AMA journals (*JM, JMR*)	38	45.2	59	70.2
Consumer (*JCP, JCR*)	119	50.2	153	64.6
Advertising (*JA, JAR*)	92	56.1	104	63.4

Note. See text for the definition and calculation of the relevance and WIRIWS scores. The percentages reflect the proportion of studies in a journal group that had zero relevance or used a WIRIWS design; e.g., 59 of 84 experiments in the AMA journals used this design.

Must Academic Scholarship Be Irrelevant?

It is traditional to lament findings of the sort presented in this paper. This tradition predates Preston (Ferber 1977) and continues to the present day (Reibstein et al. 2009). Often this lament issues in an exhortation: scholars could, and should, do better—should endeavor to make their research *more* relevant. We essay an alternative response, in order to understand why academic scholarship may never move in the direction of greater relevance. The idea is that any trend as strong and well-established as the trend to irrelevance, as documented by Preston (1985), McQuarrie (1998), and the present

effort, is likely underpinned by enduring philosophical, institutional and structural factors.

Within academia, the tradition of lamenting the lack of relevance is opposed by an alternative philosophical tradition, of equal age and diffusion, which explicitly denies the value of relevance (Calder et al. 1981). The formulation runs something like this: "the data don't generalize—it's the theory that generalizes" (Mook 1983). Because the scholar is not concerned with predicting some particular causal sequence outside the laboratory, the details of the causal sequence selected for use in the laboratory do not matter. On this reasoning, if one avoids using a familiar real brand, with all its troublesome specificity, the theoretical explanation can potentially be generalized to both real and fictitious brands. The emptier the data are of specifics—the more the causal sequences studied in the laboratory consist only of widespread, multi-context human behaviors such as reading and writing—the wider the span of contexts within which the theoretical explanation can be generalized. The rebuttal—that research conducted with diligent readers might only generalize to similar contexts, and not to advertising contexts, where diligent reading cannot be assumed—is not considered. Since diligence was not manipulated, there is no reason to suppose that theoretical predictions are limited to diligent readers (Lynch 1982). On this view, imposing a requirement of relevance—of proximal similarity— would restrict rather than enhance the generalizability of the research, and reduce the contribution to Theory. What makes some set of concepts a Theory, and potentially generalizable across contexts, is precisely their remoteness from any specific context.

The necessary separation of Theory from data, as laid out above, is the gold standard for academic rejection of the need for proximal similarity in experimental design. Unfortunately, decades ago the logician Quine (1953) put the kibosh to this argument. Quine's challenge, in simplified form, can be captured as follows: (1) if the theory generalizes but the data do not, then the theory must be fundamentally separate from the data; (2) but if the theory is really separate from the data, in what sense can it be said to explain that data, or be tested by it? An early response to this conundrum, associated with logical empiricism (see Hunt [2007] for an account), was that auxiliary concepts can be used to tie the theory to the 'plane of observation'. Quine's rebuttal was that any causal knowledge obtained empirically must then always take the form of a test of Theory + Auxiliaries, and its generalizability would accordingly be limited to circumstances where both the theoretical concept(s) and the auxiliary concept(s) are again conjoined. But since the auxiliary concepts are connected to the data—that's their purpose—then it cannot be true to say that the data don't generalize, only the theory. To close the loop, an example of an auxiliary concept would be whether a brand is familiar or unfamiliar, whether exposure is single or repeated, whether response is immediate or delayed—i.e., the sorts of things that were earlier described in terms of proximal similarity, or relevance.

Given the age of Quine's (1953) essay, one may reasonably ask why the phrase, 'the data don't generalize, it's the theory that generalizes' continues to be advanced as the rationale for ignoring considerations of proximal similarity. In the next section we advance a sociological explanation for why scholars in advertising, consumer and marketing have chosen to ignore Quine's debunking of the separateness of theory and data.

A Social Theory Perspective on Marketing Scholarship

Insights from the French social theorist, Pierre Bourdieu (1984), may help us to derive an explanation of what marketing scholarship is really about, if not the search for relevant, practical marketing knowledge. If we apply Bourdieu's perspective, marketing scholarship represents a social field in which participants compete to obtain elite status, and elites act to maintain their status by enforcing a distinction between elite and non-elite. More specifically, the elite maintains its distinction by valorizing success in difficult practices, and individual members of the elite maintain and improve their personal distinction by repeatedly demonstrating success in these practices—the more difficult and exclusive, the better.

Stepping back, a key mistake in the Reibstein et al. (2009) worldview was to assume that marketing academics as a group care much about acquiring knowledge of real marketing phenomena. There are some who certainly do; but the prediction from Bourdieu is that as a rule, individual marketing scholars will primarily care about publishing papers in journals perceived as elite by peers they esteem. Success in this difficult practice confers and sustains elite status. In a Bourdieusian world, obtaining and maintaining the regard of one's aspirational group would be the primary motivation governing the scholarship activities of marketing academics.

The prediction from Bourdieu, then, is that marketing academics will gravitate toward scholarship that gets published in the leading journals of the field. If these journals do not insist on relevance, and if arranging for relevance is in any way more costly than letting it slide, then marketing scholars as a group will dispense with relevance in their work. It isn't important to the goal of getting published.

There is a circularity here which is important to tease apart because it reflects the fact that elites are 'sticky'; that is, they are generally able to reproduce themselves through time. Thus, we may suppose that journals mostly publish articles that members of their Editorial Boards esteem; in turn, publishing enough such articles gets one appointed to Editorial Boards, where one tends to esteem the kind of articles that earned one that elite status. Since any elite journal will do, authors who publish in *JMR* may also publish in *JCR*, and vice versa, so that appointment to one Editorial Board may co-occur with appointment to the other, leading to a homogenization of journal acceptance criteria, despite the very different mandates of their sponsors. From this perspective, irrelevance in marketing scholarship becomes *self-sustaining,* despite being entirely contingent in historical terms.

There may be some readers who recoil from this Bourdeusian account as a grotesque parody of the collaborative, peer-reviewed quest for scientific knowledge to which they have devoted their lives and honor. Nevertheless, the Bourdeusian account has the virtue of predicting the facts on the ground. It explains why the relevance of advertising experiments hasn't improved despite decades of exhortation, and it explains why advertising experiments in consumer behavior journals aren't any more relevant than those in advertising journals.

It also makes falsifiable predictions about the future. A reasonable prediction from this study is that the Reibstein et al. (2009) initiative will slowly drop from view, as did each of its predecessors, and that a decade from now, and any number of decades from now, relevance will continue to be ignored in judging the merits of individual instances of academic marketing scholarship. That is, the alternative intellectual tradition laid out in Petty and Cacioppo (1996) will prevail and continue to govern the actual conduct of research. It also predicts that years from now there will be another editorial in a marketing journal, pursuing the same plaints, and similarly neglectful of the lengthy ancestry of such screeds, going back to Preston (1986) and Ferber (1977). The thrust of marketing scholarship isn't going to change in the direction of greater relevance until a critical mass of its elite, who gained their status when relevance was irrel-

evant, come to see the Calder et al. (1981) and Petty and Cacioppo (1996) position as untenable.

Mea Culpa and Ex Culpa

It is important to acknowledge that several of our own experiments appear in the data and, on the whole, do not score terrifically higher with respect to relevance. We acknowledge living in a glass house and can only plead that we wanted to be published, too. Second, although there was good reason to focus on laboratory experiments on advertising, the tables show these to be less numerous in the AMA marketing journals as compared to the consumer journals. A follow-up analysis also might show, for instance, that field experiments, with their automatic relevance, are more common in marketing than in consumer journals. In addition, marketing communication is only one small piece of marketing, and it may be that non-advertising articles appearing in marketing journals are rather more relevant on the whole than the experimental advertising studies examined here. But if that is so, why were Reibstein et al. (2009) and their predecessors motivated to write as they did? Regardless of relative frequency, why would a journal publish any article whose relevance to marketing phenomena was suspect?

The answer, of course, is that Editorial Boards are primarily concerned with maintaining standards of internal validity, and for vetting the caliber of the statistical analysis deployed. Again, for the record, we are not questioning the internal validity of any of the 485 experiments examined or the correctness of the statistical inferences made. Our concern is with the construct validity of the stimuli and procedures used. And ultimately that is the theoretical importance of relevance; for if relevance cannot be established, there can be no assurance that a theory of *advertising and consumer behavior* has been tested—as opposed to a theory of something else.

In conclusion, we sought to contribute to the ongoing discussion of the relevance of relevance to marketing scholarship by taking a positive rather than a normative approach. Regardless of how relevant marketing scholarship should be, how relevant is it and has it been? This required a focus on a specific sub-domain of consumer behavior, and a statement of the criteria to be applied in assessing relevance. This positive approach allowed us to show both the prevalence of irrelevance, and its stasis over time. These positive facts then provided the grounds for a theoretical account of marketing scholarship as a social practice, grounded in Bourdieu, which explains both the genesis and maintenance of irrelevance, and predicts its continuance.

The 'No Hard Feelings' Effect: Voters' Resolution of Ambivalence to Make a Choice Between Candidates

Robert D. Jewell, Kent State University, USA
Jennifer Wiggins Johnson, Kent State University, USA
Hyun Jung Lee, Kent State University, USA

ABSTRACT

This paper examines how voters resolve their ambivalence and polarize their attitudes in order to make a choice between candidates. These effects are tested with a longitudinal natural experiment examining voters' choices between candidates in the 2004 and 2008 presidential elections. The results show that voters reduce their ambivalence and polarize their attitudes toward the candidates as the deadline to make their choice becomes more imminent, while nonvoters do not exhibit this pattern over the same time frame. This research further examines the stability of these attitude changes after the vote has taken place and finds that attitudes and ambivalence toward the unchosen candidate exhibit a rebound pattern, the "no hard feelings effect," while attitudes toward the chosen candidate continue to become more positive after the choice has been made. Implications for communicating with voters during the 2012 presidential election campaign are considered.

> "In an election, you have to highlight the differences and minimize the commonalities so that people can make a choice."
> Former U.S. President Bill Clinton
> The Daily Show with John Stewart, September 21, 2009

Researchers have long understood that voters in an election make their decisions as to which candidate to vote for at different times leading up to the date of the election (Chaffee and Choe 1980). This has created a challenge for those who try to communicate with voters through political advertising, as they must adapt their messages to different voters at different times. To complicate matters, over the past twenty years, voters have been observed to be making their decisions later and later in the campaign season, with an increasing number of voters making their decisions at the last minute, on or right before Election Day (Nir and Druckman 2008). Voters who make their decisions later in the campaign season are more likely to consider information that they are exposed to during the campaign when making their decisions (Chaffee and Choe 1980). Late deciders have been found to be more heavily influenced by political advertising (Bowen 1994), campaign events such as conventions and debates (Hillygus and Jackman 2003; Fournier et al. 2004), and campaign media coverage (Fournier et al. 2004), making communications with last-minute deciders even more important to political campaigns. This has led to a need to better understand what leads voters to choose at the last minute and how they make their decision as Election Day approaches.

Nir (2005) finds that voters are more likely to delay their decision when their attitudes toward the candidates are more ambivalent. Nir measures ambivalence by examining voters' ratings of both leading candidates in a presidential election and classifying voters as low in ambivalence if their attitudes are one-sided, regardless of which of the candidates they prefer, and high in ambivalence if their attitudes toward the two candidates were mixed. Voters who were more ambivalent were found to make their decisions later in the campaign season than less ambivalent voters (Nir 2005). This effect was found to be particularly strong when highly ambivalent voters were facing an environment in which they were exposed to mixed information that included similar positive or negative information about both

candidates, as opposed to one-sided information that favored one candidate or the other (Nir and Druckman 2008).

Adding to the complexity of this decision is the likelihood that voters are not only ambivalent between the candidates in an election, but also hold mixed or conflicting beliefs and/or emotions toward each candidate as an individual. It is common for individuals to have a mix of positive and negative feelings towards each particular alternative in a choice, as well as mixed feelings between the alternatives (Kaplan 1972). The degree to which an individual's attitude toward a particular object is characterized by a mix of positive and negative components has been referred to as attitudinal ambivalence (Kaplan 1972; Priester and Petty 1996; Thompson, Zanna and Griffin 1995). This mix of positive and negative attitude components contributes to a sense of conflict or mixed emotions that has been termed subjective ambivalence (Kaplan 1972; Priester and Petty 1996). Voters who have a mix of positive and negative feelings toward each of the candidates in an election are likely to experience this type of emotional conflict.

Although holding ambivalent attitudes does not cause ongoing conflict in everyday life, such attitudes may create a problem for the individual when he or she has to make a choice, as when the individual must choose which candidate to vote for. The problem occurs because individuals are motivated to hold correct attitudes toward each of the candidates (Petty and Cacioppo 1986) and to make a correct choice that is consistent with their evaluations of and attitudes toward the candidates (Ajzen and Fishbein 1980; Fazio 1986). The voting task becomes difficult when an individual must select a candidate for whom he or she holds some negative evaluations or select against a candidate with some perceived positive aspects. Luce, Jia and Fischer (2003) suggest that a mix of positive and negative evaluations of a candidate could lead to an approach-avoidance conflict that would increase the individual's preference uncertainty. This feeling of uncertainty and mixed emotions has been linked to discomfort (Williams and Aaker 2002) and dissatisfaction (Olsen, Wilcox and Olsson 2005) with the choice.

Given the complex situation of a voter who may hold ambivalent attitudes toward each of the candidates, may be ambivalent between the candidates, and may be in an environment of mixed information about the candidates, how is a voter to come to a decision before Election Day? We suggest that an individual who intends to vote in an election will be motivated to resolve his or her conflicting attitudes in order to make the voting task easier, reduce his or her feelings of uncertainty, and avoid negative emotions. How the voter accomplishes this resolution in order to make a choice has not been examined in the literature.

This paper extends the research on voter decision-making by examining the way voters resolve their ambivalence to reduce their uncertainty and make a choice. We propose that voters will change their attitude structure by reducing their attitudinal and subjective ambivalence and polarizing their attitudes toward the candidates. These changes in attitude structure are expected to occur as the deadline to vote becomes imminent. Once the vote has passed, the motivation to resolve one's ambivalence and make a correct choice dissipates. In the absence of this motivational force, the voter's attitudes are expected to return to a more ambivalent state as the pres-

sure to polarize his or her attitudes recedes, which we term the "no hard feelings effect." Individuals who do not plan to vote are not expected to be motivated to modify their attitude structure over the same time frame.

IMMINENT DEADLINES AND AMBIVALENCE

One of the unique aspects of the voting decision is that voters have a deadline by which they must make their choice of candidates, as they must vote on the day of the election. Researchers have repeatedly found that individuals who must make a decision with a deadline are influenced by how far in the future the decision will take place. Individuals have been found to make more simple evaluations of alternatives for decisions that are temporally distant, and more specific and detailed evaluations of alternatives for decisions that are temporally imminent (Wright and Weitz 1977). Individuals become less concerned with the desirability of alternatives and more concerned with their feasibility and practicality as the decision grows temporally closer (Vallacher and Wegner 1989). Individuals have also been found to more easily comprehend and process abstract information about alternatives when a decision is temporally distant and concrete information about alternatives when a decision is temporally imminent (Reber, Schwarz and Winkielman 2004; Kim, Rao and Lee 2009). Temporal construal theory suggests that this is due to temporally distant events being conceptualized in more abstract terms and processed at a higher level of abstraction, while temporally imminent events are conceptualized in more concrete terms and processed at a lower level of abstraction (Trope and Lieberman 2000; 2003). As a result, individuals are likely to focus more on a concrete, detailed evaluation of alternatives when the decision is temporally imminent than when it is temporally distant.

In addition to processing information more concretely, individuals who are facing an imminent decision are likely to be more sensitive to negative information than individuals who are facing a temporally distant decision (Loewenstein and Prelec 1991; Wright and Weitz 1977). Individuals considering a decision in the future have been shown to be able to anticipate how they will feel if their decisions yield negative or positive results and the extent to which they will regret their choice (Simonson 1992). Individuals who anticipate future outcomes have also been found to be more sensitive to potential negative outcomes or losses than to positive outcomes or gains (Kahneman and Tversky 1984). These potential negative outcomes become more salient as the decision, and therefore the risk of regret, becomes more temporally imminent (Eyal, Liberman, Trope and Walther 2004; Shelley 1994). Individuals therefore become less optimistic about being able to fulfill their goals (Gilovich, Kerr and Medvec 1993; Nisan 1972; Sanna 1999; Savitsky, Medvec, Charlton and Gilovich 1998; Shepperd, Ouellette and Fernandez 1996) and more prevention-focused (Mogliner, Aaker and Pennington 2008) as the potential for making an incorrect choice grows closer. This should increase the individual's motivation to make a correct choice and avoid the potential negative feelings associated with making a choice that is based on mixed or ambivalent attitudes (Olsen et al. 2005; Williams and Aaker 2002).

This suggests that voters who hold both positive and negative evaluations of the candidates will not experience conflict when the vote is in the distant future due to the more abstract nature of evaluation versus choice. However, as the deadline for an election becomes temporally imminent, will likely become more sensitive to conflicts or ambivalence within the specific components of their evaluations. Therefore, unlike when the choice is temporally distant, the voter is likely to be motivated to resolve his or her ambivalence as the vote

grows more imminent and his or her processing and evaluation of the alternatives becomes more concrete.

As a result, individuals who anticipate voting in the election are expected to alter the positive and negative components of their attitude structures in order to reduce their attitudinal ambivalence and polarize their attitudes toward the candidates as the deadline for the vote becomes more imminent. Such polarization will make the candidates more distinct and thus the choice easier. Voters have been found to exhibit a pattern of attitude polarization as the date of the election approaches (Meffert et al. 2006; Taber and Lodge 2006). This has been attributed to voters' tendency to pay more attention to information about their preferred candidate and to focus on positive information about their preferred candidate and negative information about their non-preferred candidate (Meffert et al. 2006). In addition, voters have been found to seek out information that confirms their preexisting beliefs, uncritically accept information that supports their beliefs, and counterargue information that is contrary to their beliefs (Taber and Lodge 2006). This leads voters to develop more positive attitudes toward their preferred candidate and more negative attitudes toward their non-preferred candidate as the election approaches, thus reducing their ambivalence. This change in their attitude structure should contribute to reducing their feelings of mixed emotions or subjective ambivalence. Individuals who do not anticipate voting, however, will not be motivated to change their attitude structure and should be unaffected by the approaching deadline. This leads to Hypothesis 1:

Hypothesis 1a: *As the election approaches, voters will reduce their attitudinal ambivalence toward the candidates more than nonvoters.*

Hypothesis 1b: *As the election approaches, voters will polarize their attitudes toward the candidates, becoming more positive about their chosen candidate and more negative about their unchosen candidate, more than nonvoters.*

Hypothesis 1c: *As the election approaches, voters will reduce their subjective ambivalence toward the candidates more than those nonvoters.*

POST-CHOICE AMBIVALENCE

If it is the pressure of the imminent deadline that motivates the voter to resolve his or her ambivalence, then this motivation will no longer apply once the election has passed. This would suggest that the voter's attitudes and ambivalence would return to their pre-vote level. However, individuals have been repeatedly found to be motivated to believe that their behaviors are consistent with their attitudes (Azjen and Fishbein 1980; Fazio 1986). In a post-choice setting, the motivation to be consistent is still present, and can lead the voter to change his or her attitudes toward the candidates to be more consistent with the alternative that was chosen (see Petty, Unnava and Strathman 1998 for a review). This would suggest that the attitude polarization that occurs as the deadline for the election approaches would remain after the election has passed.

Which of these outcomes occurs may depend on whether the relevant attitude components are positive or negative. Previous research suggests that the negative components of an attitude may increase in salience as the individual approaches a choice setting (Eyal et al. 2004; Jewell 2003; Mogliner et al. 2008). This is consistent

the well-documented "positivity offset" and "negativity bias" that occur when individuals are in a choice setting (Cacioppo and Bernston 1999; Cacioppo, Gardner and Bernston 1997). The positivity offset effect suggests that when a goal is distant, individuals place more weight on positive aspects of a behavior and less weight on the negative aspects. However, as the goal becomes more imminent, the negative aspects of the behavior become more salient. The negativity bias predicts that in addition to this increase in salience as the goal approaches, individuals tend to give more weight to negative information in general than they do to positive information. This negativity bias has been found to influence voters' processing of political information during a campaign (Meffert et al. 2006).

If it is the negative components of voters' attitudes toward the candidates that are increasing in salience and being given more weight as the deadline for the election becomes more imminent, these changes are likely to be temporary increases in salience that do not persist after the election has passed. However, changes in the positive components of voters' attitudes toward the candidates are not likely to be subject to the positivity offset and negativity bias, suggesting that these changes may be more persistent than their negative counterparts. In order to polarize their attitudes to make a choice, voters need to increase the positive components of their attitudes toward the chosen candidate and the negative components of their attitudes toward the unchosen candidate. Thus, ambivalence and attitudes toward the unchosen candidate are expected to rebound after the choice has been made, returning to their pre-choice levels, while ambivalence and attitudes toward the chosen candidate should not exhibit this rebound effect. We term this the "no hard feelings" effect, as the voter is becoming less negative toward the unchosen candidate after the choice has been made. This leads to Hypotheses 2 and 3:

Hypothesis 2: *After the election passes, voters' (a) attitudinal ambivalence toward their unchosen candidate will increase, (b) attitudes toward their unchosen candidate will become less negative, and (c) subjective ambivalence toward their unchosen candidate will increase.*

Hypothesis 3: *After the election passes, voters' (a) attitudinal ambivalence toward their chosen candidate will continue to decrease, (b) attitudes toward their chosen candidate will continue to become more positive, and (c) subjective ambivalence toward their chosen candidate will continue to decrease.*

METHOD

These hypotheses were tested using a longitudinal natural experiment conducted during the 2004 and 2008 presidential elections. The same procedure was used for both elections. Participants completed a questionnaire about their election decision three times: the first, six weeks before the election, the second, one week before the election, and the third, one week after the election. In each questionnaire, participants' attitudes, attitudinal ambivalence, and subjective ambivalence were measured toward each of the two presidential candidates. In the first and second questionnaires, participants were then asked if they were registered to vote, if they intended to vote, and which of the candidates they intended to vote for in the upcoming election. In the third questionnaire, participants were asked if they

had voted and, if so, which of the candidates they had voted for in the recent election.

Participants were classified as voters if they participated in all three questionnaires, reported an intention to vote in the election in the pre-election questionnaires, and voted in the presidential election on Election Day. The nonvoter group was defined as individuals who participated in all three questionnaires and were eligible to vote (e.g. U.S. citizens over the age of eighteen), but did not vote in the election. Participants who voted via absentee ballot prior to Election Day were excluded because of the lack of a consistent deadline for their decision.

Each voter's chosen and unchosen candidate was coded based on his or her reported voting behavior. This analysis was only concerned with the two major party candidates (Republican and Democrat), and not with any third party candidates. The major party candidate for whom the participant voted was coded as the chosen candidate and the major party candidate for whom the participant did not vote was coded as the unchosen candidate. Measures of voting intention were used in place of actual voting behavior to code chosen and unchosen candidates for nonvoters. No participants reported voting for a candidate other than the major party candidates in either election.

Participants' attitudinal ambivalence toward each of the candidates was measured using the six-item measure developed by Thompson et al. (1995; see Appendix for items). Each item was measured on a 9-point scale. Three of the items capture the positive components of the individual's attitude, and three capture the negative components. The items were combined using the formula developed by Thompson et al. (1995), as follows:

$$\text{Ambivalence} = [(\text{Positive} + \text{Negative})/2] - |\text{Positive} - \text{Negative}|$$

This calculation is considered to be preferable to analyzing the positive and negative components of attitude separately because it captures both the magnitude (the first term) and the extremity (the second term) of the individual's positive and negative attitudinal components.

Participants' overall attitude toward each of the candidates was measured using four semantic differential items in response to the statement, "As President of the United States for the next four years, [*candidate*] would be…" with endpoints good/bad, desirable/undesirable, superior/inferior, and satisfactory/unsatisfactory. Participants' subjective ambivalence toward each of the candidates was measured using the three semantic differential items used by Priester and Petty (1996) and Thompson et al. (1995; see Appendix for items). All items were measured on a 9-point scale.

RESULTS

Sample Description

A total of two hundred ninety-one undergraduate students at a midwestern university completed all three parts of this study in exchange for course credit, one hundred forty-nine in 2004 and one hundred forty-two in 2008. All of the participants were old enough to vote in the upcoming presidential election. The participants were 58.3% female and had an average age of 21. One hundred seventy-eight (61.2%) of the participants were in their junior year of college, sixty-one (21.0%) were in their senior year, and fifty-one (17.5%) were in their sophomore year, with one participant not reporting his or her class. Two hundred fifty-five (87.6%) of the participants were Caucasian, nineteen (6.5%) were African-American, five (1.7%) were of Asian or Pacific descent, three (1.0%) were of Hispanic or

Latino descent, and eight (2.7%) had an ethnic background other than these four, with one participant not reporting his or her ethnic background.

Thirty participants (10.3%) considered themselves conservative republicans, forty-three (14.8%) were moderate republicans, forty (13.7%) were independent but leaned toward the republican party, forty-six (15.8%) considered themselves neither a republican nor a democrat, thirty-nine (13.4%) were independent but leaned toward the democratic party, forty-six (15.8%) were moderate democrats, and forty-five (15.5%) were liberal democrats with one participant not reporting his or her political affiliation.

Two hundred seventeen (74.6%) voted on Election Day and seventy-four (25.4%) did not vote in the election. This higher than average percentage of voters is likely due to the unusually high turn-out of young voters to support the Democratic candidates during both the 2004 and 2008 elections. Indeed, of the two hundred seventeen participants who voted in the election, one hundred thirty-six (62.7%) voted for the Democratic candidate (John Kerry or Barack Obama) and eighty-one (37.3%) voted for the Republican candidate (George W. Bush or John McCain). Since the candidates were coded as chosen and unchosen for each individual participant, this did not affect the results.

Measure Validation

The measures were checked for reliability before any further analysis was conducted. The six-item measure of attitudinal ambivalence contains three positively worded items and three negatively worded items that are not expected to correlate with each other (Thompson et al., 1995). Therefore, reliability coefficients were calculated for the positive and negative items separately. The positive items had acceptable reliability for both the chosen candidate (α = 0.91) and the unchosen candidate (α = 0.92), and the negative items had slightly lower but still acceptable reliability for both the chosen candidate (α = 0.82) and the unchosen candidate (α = 0.80). The formula developed by Thompson et al. (1995) was used to calculate participants' attitudinal ambivalence toward each of the candidates.

The four-item attitude measure had acceptable reliability for both attitude toward the chosen candidate (α = 0.94) and attitude toward the unchosen candidate (α = 0.97). The three-item subjective ambivalence measure also had slightly lower but acceptable reliability for both the chosen candidate (α = 0.82) and the unchosen candidate (α = 0.70). The attitude and subjective ambivalence measures were averaged to create composite measures. No differences across the 2004 and 2008 elections were found on any of the ambivalence and attitude measures.

Tests of Pre-Choice Hypotheses

Hypothesis 1 was tested using a 2 (voter status: voter, nonvoter) x 2 (time) doubly multivariate repeated measures ANOVA on participants' ambivalence and attitudes toward their chosen and unchosen candidates, as recommended by Stevens (1996). The multivariate analysis revealed a significant interaction effect between voter status and time (F (6, 275) = 2.52, p < .05), and significant main effects of both time (F (6, 275) = 5.29, p < .001) and voter status (F (6, 275) = 3.25, p < .005).

Participants' attitudinal ambivalence toward their chosen candidates did not produce a significant interaction effect (F (1, 280) = 0.01, p > .10), but the main effects of both time (F (1, 280) = 6.79, p = .01) and voter status (F (1, 280) = 6.99, p < .01) were significant. Separate analyses revealed that voters' attitudinal ambivalence toward their chosen candidates decreased significantly as the deadline for the election approached (M_1 = 4.63, M_2 = 4.12, F (1, 211) = 7.33,

p < .01), while nonvoters' attitudinal ambivalence did not decrease significantly (M_1 = 5.48, M_2 = 5.01, F (1, 69) = 2.17, p > .10). Participants' attitudinal ambivalence toward their unchosen candidates did reveal a significant interaction effect (F (1, 280) = 4.72, p < .05) and a significant main effect of voter status (F (1, 280) = 7.51, p < .01). The main effect of time, however, was not significant (F (1, 280) = 2.63, p > .10). Separate analyses again revealed that voters' attitudinal ambivalence toward their unchosen candidates decreased significantly as the deadline for the election approached (M_1 = 4.65, M_2 = 3.96, F (1, 211) = 14.27, p < .001), while nonvoters' ambivalence did not decrease significantly (M_1 = 5.17, M_2 = 5.27, F (1, 69) = 0.11, p > .10), providing support for Hypothesis 1a.

Univariate tests on participants' attitudes toward their chosen candidates found a significant interaction effect between voter status and time (F (1, 280) = 4.28, p < .05) as well as significant main effects of both time (F (1, 280) = 6.99, p < .01) and deadline (F (1, 280) = 17.36, p < .001). Separate analyses revealed that voters' attitudes toward their chosen candidates became significantly more positive as the deadline for the election approached (M_1 = 6.80, M_2 = 7.33, F (1, 211) = 42.52, p < .001), while nonvoters' attitudes toward their chosen candidates did not show a significant change (M_1 = 6.17, M_2 = 6.24, F (1, 69) = 0.05 p > .10), supporting Hypothesis 1b. The interaction effect for participants' attitudes toward their unchosen candidates was not significant (F (1, 280) = 2.14, p > .10), but the analysis revealed significant main effects of both time (F (1, 280) = 8.29, p < .005) and voter status (F (1, 280) = 9.45, p < .005). Although the interaction effect did not reach conventional levels of statistical significance, separate analyses revealed that voters' attitudes toward their unchosen candidates became significantly more negative as the deadline for the election approached (M_1 = 3.18, M_2 = 2.80, F (1, 211) = 17.30, p < .001), while nonvoters' attitudes toward their unchosen candidates did not change (M_1 = 3.74, M_2 = 3.61, F (1, 211) = 0.951, p > .10), supporting Hypothesis 1b.

Finally, participants' subjective ambivalence toward their chosen candidates also did not produce a significant interaction effect (F (1, 280) = 2.33, p > .10), but the main effects of both time (F (1, 280) = 20.43, p < .001) and voter status (F (1, 280) = 8.89, p < .005) were significant. Separate analyses revealed that voters' subjective ambivalence toward their chosen candidates decreased significantly as the deadline for the election approached (M_1 = 4.00, M_2 = 3.28, F (1, 211) = 34.63, p < .001), while nonvoters' ambivalence did not decrease significantly (M_1 = 4.50, M_2 = 5.01, F (1, 69) = 4.15, p > .05). Participants' subjective ambivalence toward their unchosen candidates did exhibit a significant interaction effect (F (1, 280) = 6.84, p < .01) as well as significant main effects of both time (F (1, 280) = 7.02, p < .01) and voter status (F (1, 280) = 4.38, p < .05). Separate analyses again revealed that voters' subjective ambivalence decreased significantly as the deadline for the election approached (M_1 = 4.35, M_2 = 3.65, F (1, 211) = 27.97, p < .001), while nonvoters' ambivalence did not decrease significantly (M_1 = 4.50, M_2 = 4.50, F (1, 69) = 0.00, p > .10). Overall, these findings provide support for Hypothesis 1c. These results are summarized in Table 1.

Tests of Post-Choice Hypotheses

Hypotheses 2 and 3 were tested using a multivariate repeated measures ANOVA on 2004 and 2008 voters' attitudinal ambiva-

Table 1
Pre-Election Results: Voters and Nonvoters

	Voters' Evaluations N = 217		Nonvoters' Evaluations N = 74	
	Time 1	Time 2	Time 1	Time 2
Attitudinal Ambivalence Toward the Chosen Candidate	4.63[a]	4.12[a]	5.48	5.01
Attitudinal Ambivalence Toward the Unchosen Candidate	4.65[b]	3.96[b]	5.17	5.27
Attitude Toward the Chosen Candidate	6.80[c]	7.33[c]	6.17	6.24
Attitude Toward the Unchosen Candidate	3.18[d]	2.80[d]	3.74	3.61
Subjective Ambivalence Toward the Chosen Candidate	4.00[e]	3.28[e]	4.50	5.01
Subjective Ambivalence Toward the Unchosen Candidate	4.35[f]	3.65[f]	4.50	4.50

Means with the same superscript are significantly different from each other at $p < .05$.

lence, attitude, and subjective ambivalence toward the chosen and unchosen candidates using data from all three questionnaires. Based on the hypothesized effects, participants' attitudes and ambivalence were expected to produce a linear effect for their chosen candidates and a quadratic effect for their unchosen candidates. Due to missing data, this analysis was performed on a sample of two hundred and eleven voters from the combined data set. The multivariate analysis revealed a significant main effect of time ($F (12, 199) = 10.73$, $p < .001$). Univariate tests revealed significant changes over time for all six variables: Attitudinal Ambivalence Chosen ($F (2, 420) = 21.30$, $p < .001$), Attitudinal Ambivalence Unchosen ($F (2, 420) = 10.88$, $p < .001$), Attitude Chosen ($F (2, 420) = 49.63$, $p < .001$), Attitude Unchosen ($F (2, 420) = 9.82$, $p < .001$), Subjective Ambivalence Chosen ($F (2, 420) = 35.53$, $p < .001$), and Subjective Ambivalence Unchosen ($F (2, 420) = 17.36$, $p < .001$).

Voters' attitudinal ambivalence toward the unchosen candidate exhibited both a significant linear effect ($F (1, 210) = 14.08$, $p < .001$) and a significant quadratic effect ($F (1, 210) = 5.53$, $p < .05$). It appears that rather than fully rebounding, voters' attitudinal ambivalence toward the unchosen candidate leveled off after the election had passed ($M_1 = 4.65$, $M_2 = 3.96$, $M_3 = 3.90$), so Hypothesis 2a is not supported. Voters' attitudes toward their unchosen candidates, however, exhibited a significant quadratic effect, becoming more negative as the election approached and less negative after the election passed ($M_1 = 3.18$, $M_2 = 2.80$, $M_3 = 2.93$, $F (1, 210) = 13.64$, $p < .001$), supporting Hypothesis 2b and demonstrating the "no hard feelings effect." Voters' subjective ambivalence toward the unchosen candidate also exhibited both a significant linear effect ($F (1, 210) = 20.03$, $p < .001$) and a significant quadratic effect ($F (1, 210) = 13.76$,

$p < .001$). Subjective ambivalence, however, did show the rebound effect, paralleling the results for attitude toward the unchosen candidate ($M_1 = 4.35$, $M_2 = 3.65$, $M_3 = 3.73$) and supporting Hypothesis 2c. This suggests that attitudinal and subjective ambivalence may exhibit different patterns after the deadline for the decision has passed.

As predicted, voters' attitudinal ambivalence toward their chosen candidates exhibited a significant linear effect, steadily decreasing as the election approached and then passed ($M_1 = 4.63$, $M_2 = 4.12$, $M_3 = 3.42$, $F (1, 210) = 35.64$, $p < .001$), supporting Hypothesis 3a. Voters' attitudes toward their chosen candidates also exhibited a significant linear effect, with attitudes steadily becoming more positive ($M_1 = 6.80$, $M_2 = 7.33$, $M_3 = 7.59$, $F (1, 210) = 76.34$, $p < .001$), supporting Hypothesis 3b. Voters' subjective ambivalence toward their chosen candidates also followed the predicted pattern ($M_1 = 4.00$, $M_2 = 3.28$, $M_3 = 3.05$, $F (1, 210) = 56.57$, $p < .001$), supporting Hypothesis 3c. These results are summarized in Table 2.

DISCUSSION

The analysis of the 2004 and 2008 presidential election data found that voters did reduce their attitudinal and subjective am-

Table 2
Post-Election Results: Voters Only

	Voters' Evaluations n = 217		
	Time 1	Time 2	Time 3
Attitudinal Ambivalence Toward the Chosen Candidate	4.63[a]	4.12[a]	3.42[a]
Attitudinal Ambivalence Toward the Unchosen Candidate	4.65[b]	3.96[b]	3.90[b]
Attitude Toward the Chosen Candidate	6.80[c]	7.33[c]	7.59[c]
Attitude Toward the Unchosen Candidate	3.18[d]	2.80[d]	2.93[d]
Subjective Ambivalence Toward the Chosen Candidate	4.00[e]	3.28[e]	3.05[e]
Subjective Ambivalence Toward the Unchosen Candidate	4.35[f]	3.65[f]	3.73[f]

Means with the superscripts a, c, and e exhibited a significant linear effect at p < .001. Means with the superscripts d and f exhibited a significant quadratic effect at p < .001. Means with the superscript b exhibited a significant quadratic effect at p < .05.

bivalence and polarize their attitudes toward the candidates as the election approached. The significant changes observed in voters' ambivalence and attitudes as the election approached were not observed among nonvoters over the same time period. This supports our prediction that voters reduced their ambivalence and polarized their attitudes due to the imminent deadline of the election.

The analysis also provided evidence that voters' attitudes and subjective ambivalence toward their unchosen candidates rebounded in the direction of their original levels after the election had passed. Interestingly, voters' attitudinal ambivalence did not rebound, but simply leveled off after the election had passed. This may suggest that the rebound effect is more of an affective response than an actual change in beliefs or attitudinal ambivalence. Voters' attitudes toward their chosen candidates, in contrast, continued to become more positive after the election had passed, while their attitudinal and subjective ambivalence toward their chosen candidates continued to decrease. This effectively preserves the gap between the chosen and unchosen alternatives after the election passes, which enables the individual to maintain an attitude that is consistent with his or her choice.

These findings contribute to our understanding of voter decision-making by demonstrating how ambivalent voters resolve the conflict in their attitudes in order to make a choice by the deadline of Election Day, beyond simply extending their decision time. We further show how voters adjust their attitudes and ambivalence toward the candidates after the election has passed in order to maintain attitudes that are consistent with their choice.

It is interesting to note that this effect holds not only across two elections with different results in terms of the winning candidate's party affiliation and incumbency, but also regardless of whether the voter's chosen candidate won the election. This was not a case of sympathy for the losing candidate or confirmation of the winner as the correct choice. Participants' attitudes toward the candidate they had voted for continued to become more positive and less ambivalent after the election had passed whether their chosen candidate had won or lost the election. Their attitudes toward the candidate they

had not voted for became more positive and *more* ambivalent after the election had passed whether that candidate had won or lost the election. This suggests that the continued change in ambivalence and attitude acts as a confirmation of the voter's decision, and is not a response to the result of the election.

These findings suggest several recommendations for the use of advertising to provide voters with information during the 2012 campaign season. First, since ambivalent voters are delaying their decisions and resolving their ambivalence so close to the date of the election, information communicated to voters during the last few weeks before the election is clearly very important. The need for voters to polarize their attitudes further suggests that candidates would benefit from providing voters with information that will help them to distinguish between the candidates and see the positive aspects of their preferred candidate and the negative aspects of their non-preferred candidate. Previous research has found that ads with a negatively framed message can lead to greater image discrimination between the candidates and greater attitude polarization among voters (Garramone et al. 1990). While negative political advertising has been associated with voters developing more negative attitudes toward political campaigns in general, Pinkleton, Um and Austin (2002) find that when negative ads are comparative in nature, they are perceived less negatively by voters. As comparative ads would also help to highlight the differences between the candidates, this suggests that candidates would be well served by using advertising that is negatively framed but emphasizes comparisons between the candidates during the last few weeks of the campaign season.

APPENDIX: AMBIVALENCE MEASURES

Attitudinal Ambivalence
1. Think about your overall impression and opinion about [*candidate*]. Considering only the favorable qualities of [*candidate*] and ignoring the unfavorable characteristics, how favorable is your evaluation of [*candidate*]? (endpoints not at all favorable/ very favorable)
2. Think about your feelings or emotions about [*candidate*]. Considering only your feelings of satisfaction with [*candidate*] and ignoring your feelings of dissatisfaction, how satisfied do you feel about [*candidate*]? (endpoints not at all satisfied/very satisfied)
3. Think about your thoughts or beliefs about [*candidate*]. Considering only the beneficial qualities of [*candidate*] and ignoring the harmful characteristics, how beneficial do you believe [*candidate*] would be as president? (endpoints not at all beneficial/very beneficial)
4. Think about your overall impression and opinion about [*candidate*]. Considering only the unfavorable qualities of [*candidate*] and ignoring the favorable characteristics, how unfavorable is your evaluation of [*candidate*]? (endpoints not at all unfavorable, very unfavorable)
5. Think about your feelings or emotions about [*candidate*]. Considering only your feelings of dissatisfaction with [*candidate*] and ignoring your feelings of satisfaction, how dissatisfied do you feel about [*candidate*]? (endpoints not at all dissatisfied/very dissatisfied)
6. Think about your thoughts or beliefs about [*candidate*]. Considering only the harmful qualities of [*candidate*] and ignoring the beneficial characteristics, how harmful do you believe [*candidate*] would be as president? (endpoints not at all harmful, very harmful)

Subjective Ambivalence
1. How conflicted (e.g. in conflict with each other) are your impressions and opinions regarding [candidate]? (endpoints feel no conflict at all/feel maximum conflict)
2. How indecisive (e.g. not that sure) are you about your impressions and opinions regarding [candidate]? (endpoints feel no indecision at all/feel maximum indecision)
3. How mixed (e.g. both good and bad) or one-sided (e.g. only good or bad) are your impressions and opinions regarding [candidate]? (endpoints completely one-sided/ completely mixed)

When Motherhood is too Hard To Face: Anti-Consumption in Difficult Pregnancy

Tonner Andrea, University of Strathclyde, UK

ABSTRACT

This paper presents a narrative study of pregnancy, considering anti-consumption as instrumental to liminal identity. Focussed upon pregnancies at odds with motherhood ideals it finds that avoiding consumption is central to managing women's resultant 'othered' state and therefore that anti-consumption must be considered within conceptualisations of liminal consumption.

INTRODUCTION

New motherhood has been considered to be a liminal (mid-transition) period in a woman's life (The Voice Group, 2010a and 2010b; Thomsen and Sorensen, 2006; Taylor et al, 2004; Prothero, 2002). One in which the liminar is particularly vulnerable since she must negotiate the establishment of her own 'mothering' identity and practices against the norms and expectations of 'motherhood' as an institutional form and define her "parenthood as a human construction and a social institution" Prothero (2002: 399). This negotiation of social norms and individual preference is suggested by the Voice Group (2010a) to give rise to ambivalence: "the simultaneous or sequential experience of multiple emotional states as a result or the interaction between internal factors and external objects" (Otnes et al, 1997:82). This paper considers that there is a need to understand consumption in liminality as a means of coping with this ambivalence; particularly it considers how liminars employ anti-consumption. It begins, therefore, by discussing the institution of motherhood; exploring how social dimensions of motherhood are derived; and exposing their complexity. It considers anti-consumption with a focus upon expressive anti-consumption and it relationship with consumer coping and asks how this may be understood particularly within the liminal context. The empirical findings seek to meet the research aim of exploring new mothers' ambivalence and how they employ anti-consumption as a means of consumer coping. They show the limited range of coping mechanism at women's disposal and identify the breadth of anti-consumption practices employed by women in this respect arguing for the inclusion of delay as an underexplored form of anti-consumption practice. They finally show that anti-consumption is not only a means of consumer coping but also achieves positive identity outcomes. The impact of these is then considered to both liminal and anti-consumption theory.

Motherhood ideals and realities

'Motherhood' is differentiated from 'mothering' as distinctive aspects of the same life stage phenomenon. Contemporary scholarship follow Rich's (1977) proposal that 'mothering' is the experience individuals have in their roles as mothers while 'motherhood' may be considered as the institutional expectation of how mothering may appropriately be done. The voice group (2010a) suggest that as these two aspects interact, women experience both vulnerability and ambivalence. Ambivalence is experienced when individuals are required to manage conflict between demands and expectations externally extant within 'motherhood' and their internal preferences of 'mothering'. Sevin and Ladwein (2007) discuss that this conflicted state is strongly felt by new mothers as they negotiate unfamiliar, liminal terrain.

Discourses have been classified into two types: life-project framing and culturally pervasive (Fischer et al. 2007). Considering these in the context of motherhood Banister et al (2010) argue that life-project discourse emphasizes mothers as natural and instinctive while the main culturally pervasive discourse relates to self-management with expectation that mother's become expert in responding to a multiplicity of expert (e.g. medical) discourses. Discourses of motherhood are suggested to emanate from multiple social institutions, the Voice Group (2010b) argue for four major sources: medical, legal and political, sociocultural, and media. Amplifying mothers' vulnerability these discourses are marked by both intra and inter-source conflict making 'motherhood' a difficult concept for mothers to deconstruct and perform against (Elvin-Nowak and Thomsson, 2001). Miller (2005) for example argues that medicalization of childbearing has given rise to appropriate ways of preparing to become a mother. Health professionals have the cultural authority for obstetrics and hospital births are dominant form of child birth in UK: only 2.5% of births in England and Wales are home births (Office of National Statistics, 2012). Against this context there is a strong cultural discourse of natural childbirth where mothers are expected to resist the medical interventions inherent within the system (Voice Group, 2010b) having a utopian pregnancy and birth devoid of the sullying influence of medics (Frost et al, 2006) .

Media discourses too provide evidence of the inherent complexity of motherhood definitions. These have been argued to show motherhood as biologically and socially simple; with well-paid women enjoying easily conceived children (Woodward, 1999), yet against this ideal there is recognition of the changing nature of contemporary motherhood (Goodwin & Huppatz, Porter & Kelso, 2006). Demographic trends, in western societies, show later motherhood is increasingly the norm, with a significant minority of teen mothers and of women remaining childless (Hadfield et al, 2007) therefore traditional conceptions of motherhood and family, as encompassing young nuclear families no longer fit many mothers experience (Finch, 2007). Yet within media the enduring moral discourses remains of the good mother (Gillespie, 2000) who is young, fertile and committed to full-time mothering: a powerful socio-cultural construction of motherhood against which individual women must interpret and understand their mothering choices (Voice Group, 2010a). Thus choices women make regarding pregnancy and motherhood involve negotiating many conflicting social expectations. This paper considers how as these discourses become more complex, more women find their circumstances place them at odds with the norms of motherhood.

Against this backdrop of institutional motherhood the embodied experience of becoming a mother and establishing a mothering identity is intrinsically one of vulnerability for women. This liminal state is agreed to be characterised by ambiguity and uncertainty (Voice Group, 2012b), an identity which is in flux: "liminal entities are neither here nor there; they are betwixt and between the [established] positions." (Turner, 1969: 95). Since such states of flux and uncertainty are contrary to human preference for stability and continuity, liminars are argued to engage in coping strategies to increase certainty (Duhachek and Kelting, 2009) and consumption activity has been theorised as part of this consumer coping (Sneath et al, 2009).

Consumption avoidance and anti-consumption

Kozinets et al (2010) argue that "whole area of anti-consumption is about as foggy as a November morning on the Scottish Moors." While encompassing a range of motivations and practices what binds its different forms together is a challenge the ideological primacy of consumption. They map the territory based upon the dimensions of

situational specificity and motivational frame giving rise to a suggestion of four anti-consumption types: activist, utopian, transformative and expressive. This paper bound as it is the situational specificity of pregnancy and personal context of mothering consumption it is perhaps best situated as expressive anti-consumption and consideration is given to it thus.

Anti-consumption is often associated with concepts of consumer resistance which question the current capitalistic system, reduce consumption and resist oppressive forces (Penaloza and Price, 1993) but Kozinets et al (2010) suggest neither is necessarily typified by active and collective action. Penaloza and Price (1993) identify that individual consumer resistance may be appropriate where benign motives drive consumers to appropriate and subvert symbols and practices in response to structures of domination. As a form of action anti-consumption can include behaviours such as rejecting a brand, organisation or resisting and entire marketplace (Lee et al, 2009) and minimization of consumption has also been considered an appropriate form of anti-consumption. The drivers of anti-consumption are considered to be based either in unsatisfactory consumer experience or incongruence based upon identity or ideology (Lee et al, 2009) though consumer coping (Luce, 1998) and identity creation (Kleine and Kleine, 2000) may also be appropriate.

Hogg et al (2009) reflect specifically upon identity relevant anti-consumption. Utilising a symbolic consumption frame they discuss how at a subordinate level consumers can engage in consumption avoidance associated with the disposition of old identities or construction of new ones (Kleine and Kleine, 2000). Anti-consumption of this type is argued by Hogg (1998) to be preceded by aversion (dislike, disgust, revulsion) leading either to avoidance or abandonment behavioural response. Lee et al. (2009) too have established disassociation with particular brands, products or services as associated with identity avoidance.

Yet anti-consumption at a micro-level need not only be situated in symbolic consumption, it is also identified as a means of consumer coping. It may be used to alleviate emotional or cognitive impacts of stress and as a means of solving associated problems (Luce, 1998). Lazarus and Folkman (1984) identify three main coping strategies: problem-focused coping; emotion-focused coping including distancing oneself from the threat or avoiding thinking about the threat; and cultivating, seeking and using social support. Duhachek and Kelting (2009) suggest that rather than employing only a single coping mechanism that consumers typically employ a coping repertoire integrating appropriate responses to their situation and that anti-consumption can incorporate aspects of all three coping strategies. Piacentini & Banister (2008) have shown anti-consumption as a means of coping with identity at odds with a heavy drinking culture encompassing cognitive, emotive and social coping strategies and Nuttall and Tinson (2009: 1726) in avoiding high-school prom attendance have reflected particularly upon anti-consumption during liminality encompassing motivations of: non-choice, risk aversion, passive disengagement and intentional disengagement.

METHOD

In recognising the existing scholarship suggesting the ambivalence creating nature of negotiating mothering identity and motherhood ideals and the role of consumption in negotiating the uncertainty of life transitions the aim of this study is to explore further the experience of new-mother's ambivalence and how anti-consumption is utilised as a means of consumer coping. It seeks to explore two research questions: how mothers situate their mothering experiences against expectations of motherhood; and how they use (anti)con-

sumption as a means of negotiating the terrain between motherhood and mothering.

For this study a purposive homogeneous sample allowing representativeness and comparability was recruited (Miles and Huberman, 1994). Cody (2012) discuss how in exploring liminal experiences one must select an instance in time "to capture lived experience of 'betwixt and between' at its most lucid". Therefore the researcher has worked with a sample of women, pregnant or with youngest children of no more than one year. Twenty women in total participated; they are all white, middle class, range in age from 25 to 40. The voice group (2010a) note that such women are relevant to consumer research because they have the greatest opportunity to determine their consumption activity. The group were recruited using snowballing methods, similar recruitment strategies are reported in other studies of motherhood (The Voice Group 2010a, Miller, 2005). While the women had a variety of pregnancy experiences ten of the women had pregnancies which they considered at odds with good 'motherhood' as discussed within the literature and it is their accounts which form the core data for this paper. These ten women were not recruited because their pregnancies were pre-established as difficult rather their accounts are demonstrative of the prevalence of mothers' ambivalence and the difficulty in meeting motherhood ideals.

The analysis presented in this article is based upon narrative interviews with informants of between one and two hours in-home and via Skype to suit the constraints of mothering. With permission the interviews were audio-recorded and later transcribed; the identity of the participants is protected by use of pseudonyms. The data was analyzed using Thompson's (1997:441) hermeneutic framework seeking to be "open to possibilities afforded by the text" in exploring anti-consumption.

FINDINGS

The findings of this paper are structured around its research questions and therefore it seeks to explore women's understanding of the ideals of 'motherhood' and the situation of their own mothering identity against these standards and how consumption is employed as a means of negotiating the terrain between.

Mothering experiences situated against expectations of motherhood

All the women in this study discussed awareness of motherhood ideals and difficulty in meeting the expectation inherent within them. The matters embraced by motherhood discourses were diverse and while Banister et al's (2010) forms (life-project discourse emphasizing mothers as natural and instinctive and culturally pervasive discourse relating to self-management) were evident, they were not sufficient to fully explore consumers understanding and experience of motherhood ideals. A comment by one of the respondents, Elaine, has been useful in extending Banister et al (2010) and conceptualizing motherhood within this paper, she said:

> R: Well there's the just accepted things that everyone does [culturally pervasive] and then the stuff you do depending on the kind of mum you want to be [life-project] and then the everyday stuff which folk still have opinions about [minutia]

While not all the women the women had segmented their accounts thus it proved a useful means of negotiating the diverse and multi-layered nature of 'motherhood' since such differentiations were implicit across accounts. (particularly when considering life-project discourses and their dichotomous nature). Half of the women interviewed considered that their pregnancy circumstances meant that many of these ideals became not only challenging but simply

unattainable. These women recounted pregnancies which were at odds with at least one and in some case multiple of the ideals of motherhood discussed above and as a result they felt excluded from the mainstream and 'other' than their peers. Othering has been defined as a process that identifies those that are thought to be different from the mainstream, and which produces positions of domination and subordination (Johnson et al, 2004).

In their accounts women drew upon a range of factors, which they considered to be, explanatory of their feelings that motherhood ideals were beyond their grasp. While not exhaustive in exploring potential othering factors this paper is reflective of the range of matters drawn upon by informants. These included physiological, psychological and social aspects. Many of the women's accounts focused upon the culturally pervasive motherhood ideal that pregnancy is joyful and planned. Ashley, whose sister Coleen has the genetic condition Down syndrome, discusses her pregnancies:

R: I don't know but I get the feeling other people do a pregnancy test and they're delighted. I can't really do that 'cause I know I've got quite a lot of worrying to do before things are all right. We've got to have the genetic counseling and tests and that does make things different.

Ashley's account contains specific issues and a relatively rare condition (Down's accounts for 1 of every 691 babies born in the United States each year (CDC, 2007) and 1.2 per 1000 births in the UK (Morris and Alberman, 2009) (in considering the prevalence of other factors considered by informants England and Wales data only will be utilized. While recognizing that whole UK and USA data will contain differences, the England and Wales data is demonstrative of the scale of the impact of these factors). This make her pregnancies a time of particular worry and isolation but other, much more common, factors made women feel equally removed from the culturally pervasive motherhood ideal of joy. Previous miscarriage, prenatal depression, being over 35 at conception and uncertain relationships were all cited as reasons why pregnancies were outside the mainstream. Marie's account contains perhaps the most widespread and benign of conditions to lead to this othered state:

R: I had a really rubbish pregnancy I was so worried all the way through. I was 36 when I got pregnant and right from the start it was just all about the risks of being an older mother. I've never felt so old.. We were getting all this advice to have tests and I was getting special monitoring …so stressful. I hear stories about other people's pregnancies and mine just wasn't like that.

Marie's condition (35+) is, of the othering factors cited by informants, perhaps the most prevalent within the population with 20% of births in England and Wales (Office for National Statistics, 2012) being among mothers 35 and older. Marie should therefore perhaps have a large cohort of peers providing support yet she characterizes her experience as isolated.

Two areas were evident as the matters of life project motherhood typologies with dichotomous schools within: medical vs. natural birthing and stay at home vs. working mothers, here too women related unresolvable ambivalence and othering. This was particularly evident where women considered circumstances had removed their individual control over their motherhood type. Lack of agency, they considered, had an isolating, othering effect. On the natural- medical motherhood antinomy Lorraine, who had experienced 3 previous miscarriages, discusses her lack of voice regarding her motherhood type:

R: I really liked the idea of being in the water during labour but it was just like no way… Most people in my hospital never even saw their consultant [senior doctor but I was consultant every visit. He was so clear "you'll be brought in early and it'll be a cesarean"… It was like there was no point in me going to the parenting classes bit 'cause when people were talking about how they'd like their birth I couldn't join in.

Miscarriage, like older motherhood, is relatively common; between 10 –25% of pregnancies end in miscarriage (NHS, 2012), yet both have clearly had wide ranging impacts upon the pregnancy experience of the Lorraine and Marie. Rather than their widespread nature opening supportive networks they are perhaps considered too commonplace to require special consideration.

Considering the other life-project antinomy of working vs. stay at home mothers, women also felt most othered from the mainstream when they lacked agency. Carrie talks about her pregnancy thus:

R: well it was really not ideal. Jack and I hadn't been together very long at all. I was still getting divorced. There was no way we could even talk about me giving up work, we weren't even living together… we had to have a big conversation about if we even had the baby. I mean I'm 33 I thought my life was past that but….no I had to plan that it might just be me and the baby..

Again Carrie's circumstances are prevalent with contemporary society, using England and Wales data, 46% of births are to parents living outside of marriage or civil partnership within which 16% are non-cohabiting (Office of National Statistics, 2012), yet she considers that as a result she is presented with a false-choice within this discourse. Staying at home would make her welfare dependent another potential good motherhood transgression, though this discourse wasn't widely reflected in informants narratives perhaps because of the middle class sample.

Motherhood ideals are not however limited to these relatively large matters, informants discussed how their tyranny is often inherent in the micro context; the minutia of daily practices which become laden with meaning about mothering status. While these ideals clustered around the topics of feeding, sleeping and soothing informants reflected that there was little that was not the subject of advice and controversy. Here too othering was evident emerging particularly as women sought communitas with other new mothers. The Voice Group's (2010a) have reflected upon the negative aspects of communitas, that camaraderie while potentially positive and supportive can also lead to the emergence of group norms among liminars and expectations at odds with women's experiences leaving them conflicted and othered. Valerie discusses her 'othered' feelings of attending a sling meet, where new mother socialize because of their use of sling carriers:

R: I don't know all those women and their chat can really get you down. You go along to these sling meets and I liked the sling when Maria was wee but they were all the 'knit your own lentils' kind and still breast feeding massive toddlers…. that's not me. I just liked using a sling so they weren't really my kind of folk.

Micro forms of othering were less impactful upon the women's mothering identities than the more encompassing motherhood discourses. Valerie's account however shows that in coping, even with this lesser form of othering, anti-consumption is employed. Having been othered in the sling meet setting she rejects this consumer cul-

ture group and distances herself from their expectations a form of anti-consumption noted by Hogg et al (2009).

The impact of the unresolvable ambivalence, evident in women's accounts of interactions with both culturally pervasive and life-project motherhood ideals, is evidenced in their resulting negative emotional states particularly of isolation and guilt. By characterizing their conflict as unresolvable women also considered themselves limited in their problem solving and coping strategies. As outlined, coping has been considered to contain three dimensions: problem-focused coping; emotion-focused coping; and cultivating, seeking and using social support (Lazarus and Folkman, 1984). Yet these women discussed an inability to access either the problem-focused or social support forms. Marie, whose account of being an older mother is considered above, discusses her inability to engage in problem focused coping:

R: Well there's so little you can do.. I mean my only risk is being over 35. I can lie I suppose but other than that what?... I mean I can't turn back time so I have to sort of accept that my pregnancy is risky.

Lack of agency inherent in many of the accounts, including Marie's, makes it difficult for informants to identify cognitive or behavioral approaches which may mitigate their ambivalence or its impact.

In considering themselves other than their peers and isolated from their social networks women also discussed an inability to engage in coping through social support. They discussed their liminal identity not as collegiate with those in a similar state but uniquely difficult. Elaine discusses the isolation of her infertility:

R: I know it's more common and people tell you about their own problems afterwards but never at the time….. you just feel like you're the only one, everyone else is just popping them out and then there's me injecting and what not.. just not the picture perfect way

Elaine's account also makes a point about the nature of social support among mothers, which all the informants reflected in their accounts. Only after pregnancy, and for these women successful births, did other mothers' experiences become readily shared. This is perhaps reflexive of other liminal rites such as hazing (Johnson, 2011) where liminars have an uncertain place within the hierarchical structure of the group and only successful completion brings membership and access to resultant support.

(Anti)-consumption which negotiates the terrain between motherhood and mothering.

In answering the first research question there is abundant evidence of ambivalence caused by irreconcilability between motherhood ideals and women's mothering identities and compelling accounts of the associated negative emotional consequences of isolation and guilt. Yet women also dismissed two identified coping strategies, cognitive and social support. This leaves informants reliant upon emotional forms of coping, which have been identified as: distancing oneself from the threat; and avoiding thinking about the threat (Lazarus and Folkman, 1984). These forms of coping have been associated with anti- consumption (Piacentini & Banister, 2008) yet anti-consumption is conceptually more dense that just a form of emotional coping. Some aspects of anti-consumption are not evident within the data of this study there are no accounts of collective action nor active rebellion. So, in considering this final research question, consideration is given to a form of anti-consumption which is: based upon individual action; which encompasses both single or-

ganization and whole market rejection; avoidance and minimizing behavior; and a combination of non-choice, passive and active disengagement, to explores women's accounts of consumer coping but also their positive construction of mothering identities.

Beginning in consumer coping all women discussed some form of anti-consumption in the uncertain early months of pregnancy; avoiding buying items for fear of 'jinxing' the pregnancy. For those women who considered themselves othered anti-consumption was more extensive. As Piacentini & Banister (2008) suggest, anti-consumption can both allow informants to avoiding thinking about the ideal which is unattainable and aid them in resisting the expectations of the ideal. In the first of these forms of coping informant showed clear cognitive and behavioral congruence; avoiding thinking about motherhood ideals and engaging in consumption avoidance behavior contemporaneously. Emily's account, while relatively extreme demonstrates this congruence. Emily identified herself as suffering from pre-natal depression which is estimated to affect up to 10% of pregnant women (Bennett et al, 2004) and says:

R: Well I wasn't in the best way at all… I couldn't think about buying anything.. seriously I had like my partner saying don't we need things and I was yeah yeah we will… We had nothing.. I was waiting to be let out of hospital while Chris went to and bought a car seat so we could take Kyla home (laughs).

This account of anti-consumption, which avoids the entire pregnancy marketplace, is routed within the psychologically othered nature of Emily's pregnancy. Unable to feel the socially pervasive motherhood ideal of joy Emily withdrew from all mothering domains including its associated consumer culture, this is akin to the passive disengagement Nuttall and Tinson (2011) found in their study with teens.

Implicit in Emily's account and evident in many women's stories was delay. This is form of anti-consumption not particularly evident in extant literature but relevant in liminal accounts because of the transient nature of liminal identity. Elaine's account of returning to work and her non-choice and lack of agency in this decision are considered above and here she considers her anti-consumption, in the form of delay, in this regard:

R: I think I said… I was always going to go back to work, no question but I left it really late to get a nursery. People kept saying you need to do these things really early and, I suppose, I thought I was.. I started phoning when she was 6 months and some places were, like, no chance we've got places for this time next year… so I had to keep looking

Elaine regains some agency through her anti-consumption while engaging in resistance of the working mother ideal she feel bound to. This form of coping is not without impact however and Elaine's account shows how in delaying consumption, so intrinsically linked to her inevitable identity, she limited her resultant market choices.

For most women these extremes of avoidance were neither reasonable nor desirable. Many discussed minimization of consumer culture interactions. Lorraine, whose account of miscarriage is considered above, discusses how ambivalence to the culturally pervasive motherhood ideals of maternal joy made her resistant to consumerist approaches to pregnancy and her disengagement from consumer culture:

R: I just thought about basics, so much can go wrong and I didn't want anything jinxing this pregnancy….. so we used this shop where you can buy your things but they don't deliver them

till your baby's born…. so god forbid…. You know you've not got all this stuff. Anyway I didn't want it, I just wanted this baby… here.

Lorraine employs the delay strategy and uses the structure of the marketplace to achieve this without the consequent marketplace limitation encountered by Elaine. Lorraine's account goes further however, beyond delay she also engages in market rejection. She questions the need for the pervasive consumer items of maternity and her othered nature leads her to reject some of the structures of consumerist domination (Penaloza and Price, 1993).

Women did not however only engage in whole market anti-consumption for some specific brands, organizations and consumer culture resources were singled out for rejection. This rejection was both as a result of their own brand experiences, as in Carrie's account of the NCT and Valerie's rejection of sling meets considered above, and because of the symbolic associations which women considered them to have. Lisa's experience in selecting and obstetrician has been considered earlier and another US informants Christine discussed her active rejection of an obstetrician based upon reputation:

R: my gynecologist had a list of local obstetricians she had worked with before, she didn't do both so I had to look around… so I started asking friends and researching on their websites and things.. I'd had a difficult birth with my first child and I wasn't doing all the hours of breathing again and there was one obstetrician that everyone said was really reluctant to intervene…so he was quickly off the list.

Christine's experience of having a previous child and her belonging in mother networks equipped her more than other informants to engage in rejection. Others such as Lisa found this process much more liminality inducing, as the voice group (2010b) suggest, engaging with unfamiliar consumer culture (selecting an obstetrician in this case) can be a source of considerable consumer vulnerability.

Finally many of the women discussed lack of agency in various forms, Elaine, Lorraine, Carrie and Marie's agency stories are within this paper, but for some of these women anti-consumption acted as a form of regaining control of their mothering identity. Marie, whose account of being an older mother (36) is contained above, discussed how through anti-consumption she created a positive dimension to her story:

R: I can't change my age but I can beat the stats… I've seen some pretty unhealthy 28 year olds so through my pregnancy I was just really as careful as I could be. I didn't drink at all (alcohol) and I cut out all the bad food, no junk – really none a really balanced diet, no hair colouring nothing which could cause a problem.

Marie's anti-consumption while minimizing risk, an established form of anti-consumption in its own right (Nuttall and Tinson, 2011), was also a form of positive identity creation through her consumer culture sacrifices. She was engaged in care-work of the type other disciplines have long associated with motherhood (DeVault, 1991).

THEORETICAL IMPLICATIONS

This paper adds to the small but dynamic body of work considering the potential 'dark' (Turner, 1969) side of maternity and motherhood. It makes specific contributions to scholarship upon consumer coping and anti-consumption applying these specifically to liminal transition. First it extends understanding the nature, matter and sources of motherhood discourses as proposed by Banister et al (2010) by considering emic interpretation of these typically etic forms. Specifically it considers minutia as an impactful motherhood discourse the tyranny of this discourse is in the seemingly infinite scope of its matter.

It agrees with the Voice Group (2010b) that motherhood is a time of particularly vulnerability for women. It considers too that consumer ambivalence is likely to become increasingly prevalent among contemporary mothers and supplements the conditions the Voice Group (2010a) suggest for this state. Perhaps women with rare complicating factors such as family genetic conditions have always been prone to isolation but as motherhood discourse fail to adapt to demographic and social changes in parenthood increasing numbers of ambivalent women emerge, driven by evermore commonplace transgression such as older maternity. The lack of agency women identified in determining their mothering is little discussed in extant literature and provides direction for further research since it impacts both progress through liminality and access to established cognitive and social coping mechanisms.

This paper develops understanding of consumption during transitions particularly within the 'dark' (Turner, 1969) matters of liminal identity. It shows that anti-consumption becomes central as women, through their lack of agency, are denied the traditional repertoire of coping strategies (Luce, 1998). Emotional coping, through anti-consumption which avoids consideration of the whole marketplace and which is resistant to consumerist ideals, is confirmed within liminars (Lazarus and Folkman, 1984). The paper also demonstrates the fuller scope of anti-consumption as means of coping, with evidence of rejection and minimisation alongside the underexplored anti-consumption form of delay which is particularly relevant in time-bound identities associated within transition. It considers that anti-consumption can be theorised beyond coping and symbolic rejection and demonstrates it to be positively identity creating. Sacrifice within consumption can act as a form of mothering identity; building agency and engaging in care-work (DeVault, 1991).

Finally by bringing distinct strands of scholarship together this paper identifies underexplore aspects of each. It proposes delay as a form of anti-consumption particularly relevant to transitions and demonstrates that the liminal experience may be impacted by consumer avoidance as much as consumer engagement.

Revisiting Aaker's (1997) Brand Personality Dimensions: Validation and Expansion

Renu Emile, Auckland University of Technology, New Zealand
Mike Lee, University of Auckland, New Zealand

ABSTRACT

Using qualitative data from 230 respondent descriptions of four consumers' auto-photographical product selections, this paper examines whether Aaker's model of brand personality should be expanded; and if the concept of brand personality is also transferable to products not clearly identified or presented to respondents as recognisable brands.

INTRODUCTION

Brand personality remains an important area of concern for marketing scholars and practitioners alike because of the impact on product evaluation and consumer choice (see, for e.g., Aaker, 1997; Batra, Lehman & Singh, 1993; Maehle, Ones & Supphellen, 2011; van Rekom, Jacobs & Verlegh, 2006). Though a number of studies share consensus upon Aaker's widely recognised brand personality model, scholars offer various perspectives on brand personality. Some studies attempt to define or refine and develop measures of brand personality (see, for e.g., Austin, Siguaw & Mattila, 2003; Azoulay & Kapferer, 2003; Geuens, Weijters & Wulf, 2009; Sung & Tinkham, 2005) or test the predictive role of brand personality in consumer behaviour (Chu & Sung, 2011; Freling & Forbes, 2005; Govers & Schoormans, 2005). Austin, Siguaw and Mattila (2003), for example, examine the potential boundary conditions to ascertain the generalisability of Aaker's (1997) framework. Freling and Forbes (2005) study the motivations and consequences characterising brand personality; consumers are likely to perceive a product with a strong, positive brand personality as more familiar and less risky compared to products with no distinct brand personality, or a negative brand personality. A few identify sources and specific product or brand characteristics that influence perceptions of brand personality (Maehle & Supphellen, 2008; Maehle, Otnes & Supphellen, 2011).

What is noticeable, however, is the relative lack of empirical investigation on consumers' perceptions of brand personality. Such investigation is important to gain an understanding of the different personality dimensions consumers perceive as typical of products. Aaker (1997, p. 347) defines brand personality as "the set of human characteristics associated with a brand". Aaker's definition takes anchor in McCracken's (1989) proposition that personality traits associated with product or brand users are transferred to the product or brand itself, and that consumers' choices of products or brands symbolise or communicate the same characteristics to others. Brands, thus, carry symbolic meaning (Arnould & Thompson, 2005; Belk, 1988; O'Cass & McEwen, 2004; Souiden & M'saad, 2011; Wang & Wallendorf, 2006).

Aaker's brand personality model takes root in the "Big Five" framework of human personality, namely extraversion or surgency (talkative, assertive, energetic, enthusiastic), agreeableness (good-natured, cooperative, trustful), conscientiousness (orderly, responsible, dependable, control, constraint), emotional stability versus neuroticism (calm, negative affectivity, or nervousness), and openness or intellect (intellectual, imaginative, independent minded) (Goldberg, 1992, 1993; John & Srivastava, 1999). Aaker's model encapsulates human characteristics in terms of five broad brand personality dimensions: sincerity, excitement, competence, sophistication, and ruggedness. While three dimensions - sincerity, excitement and competence relate with agreeableness, extroversion, and conscientiousness in the human personality framework; Aaker also introduces two additional dimensions - sophistication and ruggedness.

Personality traits associated with sincerity include down-to-earth, honest, wholesome, cheerful, genuine, domestic, warmth, acceptance; excitement is associated with daring, spirited, imaginative, up-to-date, sociability, energy and activity; competence with reliable, intelligent, responsible, dependable, and efficient; sophistication with upper class, charm; and ruggedness with outdoorsy, tough, strength (Aaker, 1997). Although Aaker (1997) recognizes demographics such as gender, age and class as relevant in personality constructs of scholars such as Levy (1959), she does not include these aspects in her own model as do some others (e.g., Grohmann, 2009) via explicit recognition of personality dimensions such as masculinity and femininity.

Taking Aaker's definition of brand personality model as a starting point, this paper examines the extent to which consumers' perceptions of product or brand personality accord with those identified by Aaker (1997). The study directed young adult consumers between the ages of 18 to 21 to take photographs of products or brands that communicated aspects of their selves to their peer groups. Four sets of photograph collages belonging to four participants were presented to a sample of 230 respondents (observers) who were instructed to infer characteristics associated with products/brands from the photograph collages they saw.

Specifically, this paper addresses two key questions - first, whether and to what extent respondents' inferences validate Aaker's model in terms of personality dimensions; and second, whether the concept of brand personality is also transferable to products not clearly identified or presented to respondents as recognisable brands.

METHOD

The study focuses on young adult consumers between the ages of 18 and 21 as they make a transition from adolescence to full-fledged adulthood, a period in which they are highly cognisant of the symbolic value of the products they consume and make active investments to construct or communicate their selves (e.g., Erikson, 1968, 1975; Galican, 2004; Johnson, Berg, & Sirotzki, 2007; Moschis & Churchill, 1978; Piacentini & Mailer, 2004; Stokes & Wyn, 2007). The study employed auto-photography (Noland, 2006; Ziller, 1988, 1990) and directed 28 young adults to photograph products that they considered said something about their self to their peers. Photograph sets belonging to four participants (Kate, John, Abby, and Peter, refer to Figure 1-4 in Appendix) were selected on the basis of gender, range of photographs, and the ability of participants to speak of their self-related characteristics in relation to selected products in sufficient depth. Data was collected via an online survey. Respondents were invited to view the four sets of photographs and then directed to write a paragraph to describe the characteristics of the person to whom the products or brands belonged. All respondents were residents of Auckland, New Zealand and between 18 to 21 years of age. A total of 230 receivers completed the survey. The study undertook a content analysis (Kassarjian, 1977; Kolbe & Burnett, 1991; Krippendorff, 2004; Sillars, 1986) of the entire set of receiver descriptions of the four profiles. The content analysis procedure involved identifying thought units (words or expressions) that communicated who or what the sender was like, or what the word or phrase said about the sender. Extracted words and phrases were studied to iden-

tify cluster themes. That is, those words or phrases that expressed a similar focus in thought or meaning were grouped together. The researcher conducted an initial content analysis of five sample paragraph descriptions for each sender, and checked on the same with experienced marketing academics and practitioners. Once there was consensus on the process, she proceeded with the remaining data set of observer descriptions for each sender.

FINDINGS AND DISCUSSION

This section provides an overview of photograph collages, where the results of the content analysis are discussed in terms of the key characteristics attributed to each sender by receivers. These are then compared across the four participants and conclusions drawn.

An overview of respondent descriptions of participants shows that respondents describe sender characteristics from the product portfolios they view, in two key ways - in a holistic story-like manner, or by relating characteristics attributed to senders with specific products. In holistic story-like descriptions, the focus tends to be on the conglomerate of products in each sender's portfolio rather than on any single product or brand. This is evident in representative quotes below (See, for example, Table 1, Quotes 1, 3 and 5).

On the other hand, when receivers relate specific products to senders, they tend to refer to specific self-related characteristics the products symbolise. (See, for example, Table 1, quotes 2, 4 and 6). In quote 2, for instance, the *scuba diving equipment* and *fishing gear* communicate that the owner is someone who is male, very fit and adventurous. The *alcohol* suggests that John likes to have a good time socialising. The design of the *shoes* in quote 4 communicates that Kate is fashion-conscious; the *fruit* clearly suggests health-consciousness, and this in turn is linked to her body figure. The *barbeque table* communicates that she is sociable, and possibly has a good amount of disposable income. The colour pink and products such as the *Yves Saint Laurent (YSL) Baby Doll perfume* and the *Sony Vaio* in quote 6 are associated with someone who is 18-25. The *Get Shaky Flyer* and *alcohol* (quote 6) communicate that the person is social and loves partying.

In both cases, in story-like descriptions and in the linkages of sender characteristics with specific products, respondents lend cre-

Table 1: Representative Quotes

(Quote 1 - Description of Kate) Mid 20s female, living in Auckland. Working in a good job, well off, probably from a wealthy family. Confident, very social, a lot of entertaining, eats healthy and most likely goes to the gym/works out.

(Quote 2 - Description of John) This person is male, very fit and very adventurous by scuba diving equipment, fishing gear... likes to have a good time socialising by the alcohol and look good and be clean while out referencing shampoo and deodorant...

(Quote 3 - Description of Abby) Very social, bubbly female, in her early 20s. Very social, likes to go out clubbing and drinking with friends. Girly and takes pride in appearance. Works out and tries to take care of her health/fitness. Organised and technology savvy.

(Quote 4 - Description of Kate) The choice of shoes being a very 'in' design suggests to me she's quite up to date in her fashion. The fruit tells me that she's quite healthy and likes to look after her body which can be supported by the size of clothing displayed. The barbeque table could mean she's social and likes to entertain people. Or it could be linked to her amount of disposable income which to afford a luxury item like that at that age would mean she's well paid.

(Quote 5 - Description of Peter) Brought up in Onehunga this young male has had an average upbringing. He is loyal to his family and background. He is possibly Maori or Pacific Islander. His interests are Rugby, working out, reggae music and cars.

(Quote 6 - Description of Abby) This person looks that they it's obviously a Woman who would be in the 18- 25 age range, this suggests that it is a woman because of the colour of the products such as Perfume Yves Saint Laurent (YSL) Baby Doll Pink and the Laptop (Sony Vaio) is pink...The Flyers such as Get Shaky dance party suggest she is young and is a party goer just loves partying and is suggested by the alcohol.

dence to the notion that products symbolise self-related characteristics and these in turn are transferred to product owners or senders.

The process of content analysis of receiver descriptions resulted in the identification of key characteristics as in Table 2.

A comparison across identified characteristics for all four senders (see Table 2) shows that receivers attribute senders with two characteristics (***gender*** and ***age or life stage***) relatively consistently, and with ***income, class, status and spending*** and ***role and profession*** to a lesser extent. For example, 93 phrases specifically identify Kate in terms of ***gender*** - as a *female, girl* or *woman;* 114 refer to John as a *male, guy* or a *boy;* 133 to Abby as a *female, woman, lady* or *girl.* Similarly, 82 expressions comment on the ***age and life stage*** of Kate. A majority of the receivers comment on the sender as *young*, with age estimates ranging from late teens, through the twenties. A total number of 139 words or phrases refer to John as someone in his *late teens or early 20s, in their early 20s,* and *early 20s to early 30s.* 126 expressions describe Abby as being *young; quite young* and *someone in her teenage years or early twenties*; similarly 89 refer to Peter as someone who is *young,* or a *teenager.* Most refer to the age group of late teens to early or late twenties. A total of 145 phrases relate to ***income, class, status and spending*** for Kate. The vast majority describe Kate as a person who is *upper middle class, relatively affluent*, *wealthy*, *has high income*, *high disposable income*, or *substantial income*, of *mid to high socio economic status*, and someone who *can afford to host parties*, *can afford things this expensive*, *doesn't mind spending lots of money on accessories* and has *earned a reasonable income in order to purchase some of the items*. However, in the case of John, only 21 expressions describe John as *would be middle class; has an average income; does not have enough money; not enough money to buy branded clothing.* Similarly, a small number of descriptions (19) refer to ***income, class, status and spending related*** characteristics for Abby. These include has *an average income; is a middle income person; not very rich; aren't very wealthy* and *not really affluent* dominate. 20 expressions such as *must be wealthy* to *aren't well to do; not too wealthy; belong to a middle to lower income family* and *mid-high income* are ***income, class, status and spending related*** in the case of Peter.

Some clusters refer to ***role and profession related*** aspects of senders. For example, 70 expressions refer to Abby's ***role and profession*** as *probably a university student; studies health care* and

Table 2: Key Characteristics Attributed to Each Sender and the Number of Times Identified by Receivers

Kate		John		Abby		Peter	
Income, class, status and spending related	145	Enjoys certain sports	147	Sociable	160	Gender	113

Loves the summer and the beach	6	Hygienic	18	Takes care of herself	7	Outgoing	7
Gender stereotypes	5	Gender or ethnicity related stereotypes	14			Image conscious	8
		Music and dancing as recreation	14			Residence or location related	8
		Humour and fun	13				

studying and following politics. A reasonable consensus (50 phrases) emerges on Peter's status as a student. Most describe Peter as a *secondary school student, college student, has just finished his college* or as *university student.*

Respondents also attribute **ethnicity and culture** related aspects to participants. For example, three expressions identify Kate as *Asian*, one as *someone from the Chinese/East Asian origin*, one as European, another as *Western in culture*, while still another said *should/would be a White person.* Two are open in terms of *any eth-*

nicity and *any New Zealand home owner.* 68 words/phrases refer to John's **ethnicity and culture** as someone of *Maori or Pacific Island heritage* (30), as *simply Kiwi or New Zealand guy* (16), or in terms of *cultural affiliations* (22). Expressions include *Maori ethnicity; possibly Maori; Maori heritage; Maori/Kiwi; New Zealander; most likely to be a Kiwi; takes pride in their culture and country of origin; likes cultural symbols; love for New Zealand culture* and *identifies with his culture well.* Similarly, 95 expressions refer to Peter as someone of New Zealand or Kiwi ethnicity (30), of Maori or Pacific

Island ethnicity (29), or as someone who is proud of their country, culture and ethnicity (36).

Clearly, there is general consensus amongst respondents on **gender, age and life stage, income, class, status and spending** and **role** related characteristics. In the case of **ethnicity and culture**, however, there is a range of comments. This means products/brands cannot be clearly linked to **ethnicity and culture** related aspects. A noticeable aspect is the differential attribution of meaning across participants. For example, receivers attribute **income, class, status and spending** more frequently to Kate than to the other three senders. Most descriptors in the **income, class, status and spending** category for Kate refer to high income, upper middle or upper class, and also high status; this suggests that Kate's choice of products communicates these aspects more strongly in comparison to others.

In sum, this study provides support and substantiates the inclusion of demographic related characteristics such as gender, age or life stage, income, class, status and spending, and role and profession as part of brand personality. Even though Aaker does not include the same in her model, this study provides evidence that respondents perceive products and brands in terms of such characteristics, in some cases, more saliently than classic 'personality' traits. Thus, from a consumer perspective, excluding these characteristics from the brand personality model may limit the validity of the concept.

Receivers also attribute some other self-related characteristics in relation to product choices to all four senders. These include the recognition of aspects relating to **sociability** and **outgoing nature, health consciousness, valuing sports and exercise, fashion and image conscious.** 83 expressions, for example, suggest the *sociable* nature of John. These include *enjoys socialising; enjoys going out and partying; social* and *enjoys hanging out with mates.* 20 refer to John as *outgoing*, for example, *very outgoing* and *outgoing person.* Several phrases describe Kate as a person who is **health conscious** (49), is someone who **eats healthy** (31), and also **pursues sport and exercise** (10). The range of comments include *healthy; healthy habits; healthy lifestyle; health conscious; most likely goes to the gym/works out; eats healthily;* and *quite petite who likes multi grain bread and enjoys tea rather than coffee.* 156 phrases refer to Peter as a **rugby player** (34), **likes sports, works out and goes to the gym** (88), **health conscious** (20) and **cares about appearance** (14). These include - *keeps fit to maintain his figure and to keep fit for rugby training; loves his rugby; probably very into rugby; goes to gym quite often; dedicated sports person; enjoys working out; cares about his health and body; takes care of his looks; health conscious person; tough and strong; fit and athletic* and *playing sports and the gym.*

Respondents also identify *fashion* and *image* related aspects in product portfolios. For example, 91 receivers describe Kate in terms of **fashion-related** expressions such as *fashion oriented; fashion conscious; all her clothes and accessories are up to date;* and *very into fashion.* Related to the **'fashion'** cluster is **image-conscious, cares about appearance** and **brand conscious**.

Clearly, there is general consensus amongst respondents on several characteristics such as sociability and outgoing nature, health conscious, values sports and exercise, fashion, and image conscious. This means products are communicating similar meanings in terms of personality characteristics to the respondents in this study. These aspects in turn relate with Aaker's dimensions of excitement, sophistication and ruggedness. For example, sociability and outgoing aspects relate with excitement; fashion and image related aspects with sophistication, and sports and exercise related aspects with ruggedness.

A significant category is that of **miscellaneous.** Most **miscellaneous** characteristics tend to be personal, inward oriented, and not strongly socially observable. For example, participants attribute a range of **miscellaneous** characteristics (75 terms) such as - *most likely a politically positioned citizen; loves cleanliness and tidiness; very cute and cool; and modern* to Kate. A relatively large number of characteristics (80) such as *laid back; balances out her youth party life with responsible things such as health care book, running and Labour Party meetings; not a get out in the mud and gumboots girl* and *quite innocent* are included under *miscellaneous* for Abby. A range of 104 characteristics appear on the **miscellaneous** list for Peter. These include *may have a slightly nerdy side; creative; down to earth; likes to be part of a team; not materialistic; has no fears but big dream; loyal to his family background; rasta man,* and *has experienced the tough times of life and has come through successfully.* 65 expressions refer to John's **miscellaneous** characteristics such as *eloquent* and *confident.*

Some clusters refer to participants' personal interests, likes and dislikes. These include expressions relating to interests such as those of technology, recreational activities, and love for alcohol. For example, 56 expressions refer to John in terms of **technology related** expressions; as someone who is **into technology (12), someone up to date with technology (16), someone who is techno savvy (3), and someone who enjoys technology (25).** Examples include *very much into technology; technology is what he lives on; up to date with the technology; keeps up with technology; catches up with technology; loves to surf the internet, texting; kind of tech savvy with the electronics,* and *enjoys accessing the internet.* 14 phrases such as *enjoys music and dancing* and *involved in music and jazz* refer to John's interests in **music and dance as recreation**; 46 expressions refer to John as someone who *likes to drink alcohol; loves drinking especially spirit and beer; enjoys drinking* and *drinks lover.* Several (43) expressions refer to John's **hobbies and personal interests** such as *likes to travel; might like lifestyle living; has many different hobbies and interests; all rounder;* and *has many sides to him.* A smaller number of phrases (22) such as *up to date on the latest electronics; likely to text frequently* and *likes technology* describe Abby as someone who is **technology friendly.** Some other clusters are - **music and dance as recreation** (26), **alcohol related** (24), and **politically conscious** (10). Some clusters refer to Peter's **car related interests** (34), and **guitar, music and art related interests** (103). These include *enjoys his toys; hobby for cars; enjoys working on cars; interested in cars, likes to jam reggae on his guitar; a Bob Marley fan; interested in music, the guitar, art; respects classic idols such as Bob Marley* and *likes to paint, listen to old school music as well as playing the guitar.* A cluster of **alcohol-related** expressions (38) such as *enjoys to drink; probably likes to have a drink; he is a drinker but not an alcoholic; social drinker* indicate that Peter enjoys drinking.

As noted above, receivers attribute a range of self-related characteristics to each sender in the miscellaneous category. There is meagre evidence of two dimensions in Aaker's brand personality model - sincerity and competence - as in expressions such as *down to earth; loyal to his family;* and *may have a slightly nerdy side.* Some characteristics such as *confident; modern; independent; has no fears but big dreams* seem to be close to Aaker's excitement dimension. Importantly, miscellaneous characteristics such as most *likely a politically positioned person; loves cleanliness and tidiness; very cute and cool; likes to be part of a team; not materialistic* do not seem to fit into any of the five dimensions identified by Aaker. Nor do those relating to demographics, personal interests, likes and dislikes such as those of technology, recreational activities and love for alcohol relate with any of the personality dimensions identified by Aaker.

Table 3: An Expanded Version of Aaker's (1997) Model

Aaker's Dimensions (1997)	Demographic Characteristics	Personal interests	Miscellaneous characteristics
Sincerity; excitement; competence; sophistication; ruggedness	E.g., Gender; Age or life stage; Role and profession; Income, class, status	E.g., Orientation towards technology; love for music and dance; love for travel; lifestyle living	E.g., most likely a politically positioned person; loves cleanliness and tidiness; likes to be part of a team; not materialistic

The findings of this study suggest that miscellaneous characteristics, demographic factors, personal interests, likes and dislikes are part of the brand personality gestalt and any arbitrary exclusion of the same may not be theoretically or practically reasonable. Accordingly, this study proposes a more expansive model as below:

CONCLUSION

This study set out to examine two key questions - first, whether respondents validate Aaker's model in terms of brand personality dimensions; and second, whether the concept of brand personality is also transferable to products not clearly identified or presented to respondents as recognisable brands.

The study provides strong evidence in favour of three of Aaker's brand personality dimensions - excitement, sophistication and ruggedness. However, there is limited evidence on the remaining two - sincerity and competence. Further, if brand personality is the set of human characteristics associated with a brand, then respondents identify a number of other characteristics as well. These include demographics such as gender, age or life stage, income, class, status and spending, and role and profession; miscellaneous characteristics such as personal interests, likes and dislikes such as those of technology, recreation activities, and love for alcohol. In part, this study supports previous assertions (e.g., Grohmann, 2009; Levy, 1959) that brand personality, similar to human personality, is multi-dimensional and should also include masculinity and femininity. It further suggests that consumers do indeed infer a range of characteristics from brands. From a consumer perspective, categorizations such as those noted in this study may well be included within the set of human characteristics associated with a brand. Accordingly, this paper calls for the recognition of the same especially in terms of impact on consumer behaviour, thereby proposing an extension and expansion of Aaker's brand personality model.

Further, as noted in the photo collages, some products are recognisable brands, yet others are not clearly identified as brands. Yet receivers/observers speak of both brands and products in similar ways. This means personality dimensions are equally applicable to products as they are to brands. In sum, brand personality dimensions do not generalise to individual brands alone, rather the same can be mapped on to both products and brands within and across product categories. This study suggests avenues for further research which include generating more inclusive personality frameworks and identifying key dimensions for differentiating competitive brands within product categories.

In closing, consumers use brands and products to express more about themselves than the established set of five personality traits. In order to truly appreciate the diversity of human characteristics that consumers communicate via their product or brand choice/s, consumer researchers need to revisit and expand the classic notions of brand personality in consumers' product or brand choices.

APPENDIX

Figure 1 Kate, the photo collage comprised of: a barbeque table, a bag (Louis Vuitton), a handbag, fruit, a pair of jeans (Ksubi), a pair of sunglasses (Gucci), perfumes (Lancome and Christian Dior), a pair of shoes, a pair of shorts (Ksubi), and a car (VW Golf).

Figure 2 Peter, photo collages comprised of: a soft toy (with motto "Born to Fly"), a painting, a perfume (Ralph Lauren), a T-shirt (Ralph Lauren), a belt (Bob Marley), a guitar, a car (Holden Commodore), another car (Honda), a Rugby jersey (De La Salle School), the New Zealand flag, and alcohol (42 below).

Figure 3 John, the photo collage comprised of: dance sports gear (dress, shirt, dance shoes, dance jacket and the Trombone), necklaces (with Maori symbols), a T-shirt (with Maori symbol), a pair of jandals (with Maori pattern), a bag (Billabong), a belt (QuickSilver), Shorts (Mossimo), shampoo, deodorant, asthma and hay fever pills, scuba tank for diving, diving watch, a fishing rod and a map of hits in Fiordland, Vodka (Smirnoff) and Beer (Tui), IPod, computer and a mobile phone, and two T-Shirts.

Figure 4 Abby, the photo collages comprised of: a health care book, a pair of running shoes (Nike), alcohol (Lindauer and Malibu), cellphones, a dress, a high waisted skirt, a wall planner, a pair of sunglasses, a pair of shoes, an Ipod, flyers, a pair of earrings, strawberries, and perfume (Yves Saint Laurent Baby Doll).

The Product Choices of Young Adult Consumers: Does Gender Matter?

Renu Emile, Auckland University of Technology, New Zealand
Kenneth F. Hyde, Auckland University of Technology, New Zealand
Mike Lee, University of Auckland, New Zealand

ABSTRACT

Through content analysis of 266 product photos from 28 participants, this paper aims to ascertain the influence of gender on the product choices that young adult consumers make, and whether females and males employ products to communicate aspects of the self in similar or different ways.

INTRODUCTION

The use of products and/or brands to communicate aspects of the self is well recognised in the consumer behaviour literature (Arnould & Thompson, 2005; Belk, 1988; McCracken, 1986). Consumers use products and/or brands to communicate a range of aspects such as class, status and lifestyle; ethnicity and culture; membership of reference groups or belongingness to communities; uniqueness; age; and cosmopolitanism or global affiliation (see, for e.g., Auty & Elliott, 1998; Crane, Hamilton, & Wilson, 2004; Elliott, 1994; Escalas & Bettman, 2005; Franke & Schreier, 2008; Fung, 2002; Hogg & Michell, 1996; Lamont & Molnar, 2001; Leigh & Gabel, 1992; Lindridge, Hogg, & Shah, 2004; O'Cass & Frost, 2002, O'Cass & McEwen, 2004; Tian, Bearden, & Hunter, 2001; Thompson & Tambyah, 1999; Wang & Wallendorf, 2006; Wattanasuwan, 2007; White & Dahl, 2006, 2007). Typically, studies tend to focus on researcher driven pre-selections of product categories or brands to examine how participants use the same to communicate specific aspects of the self. However, the empirical examination of consumers' self-selection of products, and their self-identification of self-related aspects these products communicate remains relatively unaddressed. This paper attempts to address this gap and specifically focuses on self-selected product choices of young adult consumers between the ages of 18 and 21. The aim of this paper is twofold - First, to specifically examine the nature and type of product choices young adult consumers make, and whether such choices are a function of gender. The question of the diverse product category or brand choices that consumers make, when given the opportunity to do so, in an undirected manner, has so far not been addressed in the literature, nor the role of gender in young adult consumers' product/brand choices, when given free rein to select products/brands that communicate aspects of their selves. Second, to identify aspects of the self these choices represent or emphasize and examine whether female and male participants employ products and/brands to communicate aspects of their selves in similar or different ways. So far, to the best of the authors' knowledge, no research has addressed these diverse self-related aspects in product selection together, within a single study. In doing so, the study endeavours to add new knowledge to the understanding of the role of gender in self-selected product or brand choices, and also contributes to the understanding of salient self-related aspects in young adult consumers' product or brand choices when communicating the self.

THE ROLE OF GENDER IN PRODUCT AND/OR BRAND CHOICE

Empirical literature suggests that gender can have an impact on the product and/or brand choices consumers make. Gender in the marketing and consumer behaviour literature tends to signify the biological sex, gender roles, or the degree to which an individual identifies with masculine or feminine personality traits (Caldwell, Kleppe, & Henry, 2007; Kolyesnikova, Dodd & Wilcox, 2009; Palan, 2011). Typically, studies investigate differences between males and females

on processes underlying judgment (Dube & Morgan, 1996; Myers-Levy & Sternthal, 1991); information search and processing (Barber, Dodd, & Kolyesnikova, 2009); product perception and self image (Gentry, Doering, & O'Brien, 1978) or gift giving (Garbarino & Strahilevitz, 2004; Laroche, Saad, Cleveland, & Browne, 2000; Thompson, 1996). A stream of literature examines female role portrayals and stereotypes in advertising (e.g., Lysonski, 1985; Plakoyiannaki & Zotos, 2009; Wiles, Charles, & Tjernlund, 1995). A more recent study by Tuncay, Sredl, Parmentier, and Coleman (2009) examines discourses of gender and consumption in the media, specifically in two television shows, 'Entourage' and 'Sex and the City'.

Only a few empirical studies outside the realm of advertising and media studies examine gender related aspects in consumers' product choices (e.g., Allison, Golden, Mullet, & Coogan, 1980; Dittmar, Beattie, & Friese, 1995; Fugate & Philips, 2010; Goulding & Saren, 2009; Morris & Cundiff, 1971; Patterson & Hogg, 2004; Vitz & Johnson, 1965), and the majority involve researcher selected products. A cluster of studies specifically examine gender related stereotypes in the symbolic value of products; such stereotypes are appropriated by consumers to communicate specific gender related aspects of the self. Vitz and Johnson (1965), for example, demonstrate the symbolic value of products to communicate masculinity or femininity. They found that males were likely to smoke cigarettes with masculine images; and females were likely to smoke cigarettes with feminine images. Similarly, Allison et al. (1980) observe that masculinity and femininity are separate constructs, that product images tend to be gendered, and these in turn have a bearing on consumer behaviour. Morris and Cundiff's (1971) study shows males are inhibited in buying hair spray because of the perceived feminine appeal of the product. In other words, they are reluctant to buy the product as it does not communicate desired gender related aspects of the self. Dittmar et al. (1995) suggest that men tend to buy items that are instrumental or leisure related to express independence and activity, whereas women tend to buy products that express appearance and emotional aspects of the self. Along similar lines, Fugate and Philips's (2010) study focuses on gender related aspects in product consumption. The researchers asked participants to indicate the masculinity or femininity of 41 pre-selected products. Items such as beer, cars, SUVs, coffee, athletic shoes, lawnmowers, and potato chips were considered masculine in nature, whereas other researcher selected products such as shampoo, bath soap, wine, digital cameras, facial tissue, food processors, frozen vegetables and hair spray were considered feminine. These studies suggest that consumers consider the gender images of their product choices to express gender related aspects of the self.

Along similar lines, Patterson and Hogg (2004), in a study with two males and females aged between 18 and 24, report that one male participant did not buy books by female authors because he perceived them as 'girly' books aimed at girls. Similarly, a female participant was particularly conscious of what her clothes symbolized in terms of her femininity. Gould and Stern (1989) used pre-selected items such as dresses, shoes, blouses, hats, hairstyle, jewellery in a fashion consciousness scale and note that women were more conscious of fashion related products in relation to gender than men. Goulding and Saren's (2009) study shows how participants, in the context of the Whitby Goth festival, express various gender related aspects. Straight men, for example, express their feminine side by wearing lace, ruffles, and velvet associated with the Gothic dandy. These studies, together,

suggest that gender has an impact on product or brand choice, that is, both males and females are conscious of the gender related stereotypes they communicate via the product choices they make. However, in the majority of previous work, researchers have selected or driven the product or brand selections, which may not necessarily be ideal representations of consumers' product choices to communicate their selves. Thus, by virtue of allowing participants the autonomy to self-select the products that communicate aspects of their selves, this study allows a more authentic and realistic view of young adult consumers' product or brand choices to communicate the self. Therefore, the intent of this study is twofold. First - when given free rein, are young adult consumers' product or brand choices indeed a function of gender? That is, whether there are noticeable differences in young adult consumers' product or brand choices, based on gender. Second, do the aspects of the self that young adult consumers choose to communicate, validate or confirm those identified in the literature (as discussed in the following section)?

Representation of aspects of the self in product choice: Proposition formulations

That consumers use products to communicate aspects of the self is well recognized in the consumer behavior literature. Based on a review of the literature on the use of products and/or brands to communicate aspects of the self, this paper formulates seven propositions (P1 to P7 - See Table 1) to examine whether and the extent to which these aspects are identified when consumers self-select products and brands to communicate aspects of the self. It is hoped that such examination of propositions would add to the current understanding of the relationship between product/brand choice and specific aspects of the self, and would also provide a commentary on the relative significance of specific self-related aspects in young adult consumers' product or brand choices. The study formulates propositions as follows:

Extant research indicates strong evidence for product choice to denote group membership or affiliation (e.g., Berger & Heath, 2007, 2008; Escalas & Bettman, 2005; Hogg & Michell, 1996; White & Dahl, 2006, 2007). It is expected that participants in this study would reflect this behaviour:

P1: Young adult discourses are characterised by evidence of the use of products to express affiliation, association, or belongingness with reference groups or community.

The literature provides evidence for individuals' use of products to denote status (e.g., Lamont & Molnar, 2001; O'Cass & Frost, 2002; O'Cass & McEwen, 2004; Vigneron & Johnson, 1999). It also provides evidence that consumers use products to indicate ethnicity (e.g., Chattaraman & Lennon, 2008; Lindridge et al., 2004; Oswald, 1999; Penaloza, 1994). It is expected that respondents in this study would reflect these behaviours, and accordingly Propositions Two and Three are set out:

P2: Young adult discourses are characterised by evidence of the use of products to indicate status.

P3: Young adult discourses are characterised by evidence of the use of products to indicate ethnicity.

There is some empirical evidence for the notion that individuals use products to establish differentiation from others in terms of uniqueness (e.g., Chan et al., 2009; Franke & Schreier, 2008). Accordingly, the following proposition is set out.

P4: Young adult discourses are characterised by evidence of the use of products to communicate uniqueness.

Existing studies suggest consumers' product choices indicate cosmopolitanism-related characteristics of the self (e.g., Caldwell et al., 2006; Wattanasuwan, 2007). The following proposition follows.

P5: Young adult discourses are characterised by evidence of the use of products to communicate cosmopolitanism related characteristics of the self.

Consumers' product choices reflect and support age and life stage related characteristics (e.g., Auty & Elliott, 1998; Elliott, 1994). It is expected that the same characteristics will be reflected in young adult consumer discourses.

P6: Young adult discourses are characterised by evidence of the use of products to communicate age and life stage related characteristics.

Empirical studies suggest the use of products to communicate gender related aspects of the self (e.g., Fugate & Philips, 2010; Goulding & Saren, 2009; Patterson & Hogg, 2004; Vitz and Johnson, 1965). Accordingly, this study sets out the following proposition:

P7: Young adult discourses are characterised by evidence of the use of products to communicate gender related characteristics.

METHOD

This paper comprises two parts. The first examines the types of products and/or brands young adults self-select to communicate aspects of their selves and whether and to what extent gender (male versus female) plays a role in such choices. The second, the aspects of the self these choices represent relative to aspects identified in the literature, and whether both female and male participants employ products and/or brands to communicate aspects of their selves in similar or different ways. Such understanding is relevant to scholars and practitioners with a specific interest in young adult consumers, their choices and behaviors, especially so to develop appropriate gender segmentation, targeting and promotional strategies.

SAMPLE

Twenty-eight young adults (18-21 years of age) participated in the study, 13 male and 15 female. All participants were university students at Auckland, New Zealand. Participants were instructed to take photographs of products and/or brands they owned and which said something about them to their peers.

PROCEDURE

The first part of the study involves identification of products selected by participants. Identification of the self-selected products and brands was undertaken by examining the contents of the photographs supplied. This was done in conjunction with the participants as an aspect of the interviews was the clarification of any ambiguity associated with the items selected for inclusion. Once each interview was transcribed, the researcher identified and listed all product categories (and brands) through two sample transcripts, and confirmed the findings with two independent judges who undertook the same task for the two sample transcripts. There was complete agreement on identified product categories (and brands), following which the researcher repeated the process for all 28 transcripts. This paper analyses 266 photographs taken by 28 participants and categorized into seven broad product groupings (see Table 2).

The second part of the study involved the use of content analysis techniques. In qualitative research, the term content analysis is used in two ways; as an umbrella term for both quantitative and qualitative approaches to text (words and/or pictures) analysis, or to only describe the process of quantifying data (Kassarjian, 1977; Krippendorff, 2004; Neuendorf, 2002; Smith, 1992). Where the term *content analysis* is used to denote qualitative content only, terms such as *words, phrases, thematic* or *discourse analysis* are used to denote the qualitative condition. In the case of quantified output, the researcher systematically assigns measurable codes to specific elements (e.g. words, phrases, objects) in the text; where applicable, descriptive statistics can be used to identify patterns in the data (Kassarjian, 1977; Krippendorff, 2004; Neuendorf, 2002; Smith, 1992). In this study, the data is subjected to both quantitative and qualitative content analysis. Inferences about the set of propositions are based on a quantitative content analysis of the themes and word frequencies linked to each photograph within each of the 28 transcribed interviews. This approach allows an indication of the scope and substance of the associations and provides indicative evidence.

The first step in the quantification process is the creation of key terms and operationalisations pertaining to specific propositions as described in Table 1. The essence of each proposition, key term and operationalisation was established by agreement and discussion between three judges.

As noted in Table 1, each proposition related to key terms, for e.g., P1 to affiliation, P2 to status, P3 to ethnicity, and so on. While specific procedures for analysing quantitative data are well-established and accepted, methods for analysis of qualitative data are diverse and often subject to variability (Holsti, 1969; Kassarjian, 1977; Krippendorff, 2004; Neuendorf, 2002; Smith, 1992). Analyses of qualitative data can also be ad-hoc and emergent, however, the use of measurement and formal tables can assist in pattern-identification. Analysis tables, summarizing and synthesizing information from diverse sources in a standardized format can also serve as reporting tools (Krippendorff, 2004; Neuendorf, 2002). Quantification in this study is based on unit counts and provides a basis for inference.

A unit was defined as "the specific segment of content that is characterised by placing it into a given category" (Holsti, 1969, p. 116). In this study, Holsti's use of the word *category* is also applicable to propositions. Categorisations of content could comprise of a single sentence or multiple sentences referring to a specific proposition in relation to one photograph. If a participant spoke of one or more propositions in relation to a photograph, then a count was recorded for all identified propositions. In other words, each of the

Table 1: Propositions and operationalisation

Propositions	Key term	Operational definition
P1: Young adult discourses are characterised by evidence of the use of products to express affiliation, association, or belongingness with reference groups or community (e.g., Berger and Heath 2007, 2008; Escalas and Bettman 2005; Hogg and Michell 1996; White and Dahl 2006, 2007).	Affiliation	Reference to an actual or imaginary group conceived of having significant direct or inverted relevance upon an individual's evaluations, aspirations, or behaviour (Park & Lessig, 1977).
P2: Young adult discourses are characterised by evidence of the use of products to indicate status (e.g., Lamont and Molnar 2001; O'Cass and Frost 2002; O'Cass and McEwen 2004; Vigneron and Johnson 1999)	Status	Reference to prestige, honour or deference accorded to an individual by others (Burn, 2004); reference to class, wealth or the lack of it (Coleman, 1983; Vigneron & Johnson, 1999).
P3: Young adult discourses are characterised by evidence of the use of products to indicate ethnicity (e.g., Chattaraman and Lennon 2008; Lindridge et al. 2004; Oswald 1999; Penaloza 1994).	Ethnicity	Reference to a sense of common ancestry based on shared individual characteristics and/or shared socio-cultural experiences (Driedger, 1978).
P4: Young adult discourses are characterised by evidence of the use of products to communicate uniqueness (e.g., Chan et al. 2009; Franke and Schreier 2008).	Uniqueness	Seeking to express difference through the purchase, use or display of original, novel or unique consumer goods; avoidance of similarity (Tian et al., 2001); references to product or brand choices in terms of not being particularly socially acceptable (Simonson & Nowlis, 2000; Snyder & Fromkin, 1977).
P5: Young adult discourses are characterised by evidence of the use of products to communicate cosmopolitanism related characteristics of the self (e.g., Caldwell et al. 2006; Wattanasuwan 2007)	Cosmopolitanism	Reference to notions of world citizenship (Cannon & Yaprak, 2002).
P6: Young adult discourses are characterised by evidence of the use of products to communicate age and life stage related characteristics (e.g., Auty and Elliott 1998; Elliott 1994)	Age & life stage	Reference to age, e.g., in terms of young, old or middle aged; life stage.
P7: Young adult discourses are characterised by evidence of the use of products to communicate gender related characteristics (e.g., Fugate and Philips 2010; Goulding and Saren 2009; Patterson and Hogg 2004; Vitz and Johnson 1965)	Gender	Reference to gender - male or female; masculine or feminine.

seven propositions could be counted only once for a given photograph, fulfilling the criteria of "existence (existent) or nonexistence (nonexistent)" (Kassarjian, 1977, p. 11), applicability or non-applicability of propositions. Further, if a participant referred collectively to a set of photographs in terms of one or more key terms, then the same proposition/s would apply to each photograph. For example, in this study, Participant 28 refers to two dresses, a Latin shirt, a pair of ballroom Latin shoes, and a sports jacket in terms of *uniqueness* (P4) and *age and life stage* (P6) - so both propositions (P4 and P6) were applied to each of the five photographs he referred to - a total of five counts for P4 and five counts for P6. All three judges (the researcher, J1 and J2) were requested to highlight and extract proposition related statement(s) in relation to each photograph for both sample transcripts (Participant 1 and Participant 28). They were to record if one or more propositions (coded as P1 to P7) were applicable to a photograph. They were to enter all data in columns - the first, noting the product or brand in photograph (or photographs if spoken of as a cluster); the second, noting the applicable proposition; the third, comprising of proposition related statements.

Following this task, comparisons were made on the bases of evidence identified in support of each proposition for each photograph. Comparisons amongst the three judges were made on the applicability or non-applicability of each of the seven propositions to each photograph. There was more than 90% agreement amongst the three judges. Where disagreements occurred, differences were resolved through discussion. A total count of 34 and 25 propositions applied, respectively, to sample transcript 1 and sample transcript 2. On the basis of the high figure of inter-coder reliability, the researcher proceeded to analyze the remaining 26 transcripts.

FINDINGS AND DISCUSSION

This paper analyses 266 photographs taken by 28 participants (see Table 2). The photographs were categorised into seven broad product groupings:

- **Clothing and accessories** (clothing, bags & wallets, hats & belts, shoes, jewellery, sunglasses and reading glasses, watches);
- **Cosmetics**: (make up, perfumes and deodorants, and personal cleaning and grooming products);
- **Electronics**: (cell phones, computers, iPods, domestic appliances, LCD TVs, hair straighteners, cameras, play station/X-box, music systems, CDs/DVDs, miscellaneous electronic/electrical (GPS, CD rewritable);
- **Food and Drinks (non-alcoholic);**
- **Drinks (alcoholic);**
- **Cars;**
- **Miscellaneous** (barbeque table, soft toy, painting, sporting equipment (chess & cards, gym equipment, scuba tank, diving watch, fishing rod, map of huts in Fiordland, hockey stick bag, cricket bat and soccer ball), trombone, books, magazines, books, stationery, wall planner, flyer for dance party (Get Shaky), flyer (Young Labour Party), flyer for entertainment show (Rhythm & Vines), movie posters, photograph wall, photograph frame, flat (door), computer tablet (to draw on), bus card, car keys, Kleenex tissues, items of cultural significance, Flag of NZ)

Table 2 shows the total number of photographs per product category. Both female and male participants most commonly link aspects of their self to clothing/ accessories (36% of photographs) and electronics (25% of photographs).

The dominance of the product categories of *clothing and accessories* and *electronics* may be explained in a number of reasons. It

could be young adult consumers find these product categories most relevant to their selves and that these product categories most readily assist them to communicate self-related characteristics. Interestingly, in this study young adult male consumers (43% of all male photos) use clothing and accessories to express themselves approximately 1.4 times more than young adult female consumers (30% of all female photos). It could be that young adult male consumers tend to place greater emphasis on clothing and accessory items such as bags and wallets, hats and belts, and watches as markers of the self compared to young adult female consumers.

The interest in *clothing and accessories* and *electronics* could also reflect a concern with aspects relating to self-image and status. As Wilska (2003) notes, information and communication technologies are a very important part of the everyday life of young people. Svoen's (2007) study suggests that young adults use technologies to construct self-directed identities.

Several reasons may explain the interest in the product categories of *magazines and books* and *sporting equipment* within the miscellaneous product category. It could be that such products help manage and communicate aspects of the self to others, for example, by communicating belongingness to a certain social set, supporting or contesting stereotypes of masculinity or femininity, and providing information on self-related aspects, such as the relative roles and attitudes of men and women (Kim & Ward, 2004; Moore, Earless, & Parsons, 1992; Shannon, 2004). Photographs of food and drinks suggest that these categories are of significance to young adult consumers as communicators of the self. However, the difference in percentage of photographs taken by young female (12% of all female photos) and male (7% of all male photos) adult consumers for the food and drinks category suggests that females emphasise food and drinks, as communicators of the self, 1.7 times more than males.

There is nearly double the percentage (1.86) of photographs taken by female participants (13% of all female photos) than by male participants (7% of all male photos) in the cosmetics product category. The same holds true for the miscellaneous product category which suggests that miscellaneous items are of much greater interest (1.67) to females (15% of all female photos) than males (9% of all male photos). It could be that cosmetics and miscellaneous products such as the barbeque table, soft toys, planners and flyers, photographs and items of cultural significance are of greater value as communicators of the self for young adult female consumers than they are for young adult male consumers. The sample for this study does not provide evidence of choices involving high investments such as real estate, luxury vehicles or top of the line luxury goods. This could be due to the life stage and financial constraints of the participant sample.

The next part of the study examines the use young adult consumers put the products and/or brands to, and whether both female and male participants employ products and/or brands to communicate aspects of their selves in similar ways. Table 3 presents the number of instances in support of the study propositions, with data presented separately for males and females by product category.

As seen in Table 3, *group affiliation* (P1), *status* (P2) and *age* (P6) are the dominant aspects of self that participants seek to communicate. It can be concluded that

Proposition 1 - Young adult discourses are characterised by evidence of the use of products to express affiliation, association, or belongingness with reference groups or community, and

Proposition 2 - Young adult discourses are characterised by evidence of the use of products to indicate status can be accepted.

Similarly, though not as substantial, there is some evidence across product categories that participants are interested in communicating that they are young. So

Table 2: Number of Photographs per Category per Gender

Product Category	Females	Males	% Difference	No. Photographs
Clothing & Accessories: clothing, bags & wallets, hats & belts, shoes, jewellery, sunglasses and reading glasses, watches	43(30%)	53(43%)	43/30=1.43	**96 = 36%**
Electronics: cell phones, computers, iPods, domestic appliances, LCD TVs, hair straighteners, cameras, play station/X-box, music systems, CDs/DVDs, miscellaneous electronic/electrical, GPS, CD rewritable	36(25%)	31(25%)	25/25=1	**67 = 25%**
Miscellaneous: barbeque table, soft toy, painting, sporting equipment (chess & cards, gym equipment, scuba tank, diving watch, fishing rod, map of huts in Fiordland, hockey stick bag, cricket bat and soccer ball), trombone, books, magazines, books, stationery, wall planner, flyer for dance party (Get Shaky), flyer (Young Labour Party), flyer for entertainment show (Rhythm & Vines), movie posters, photograph wall, photograph frame, flat (door), computer tablet (to draw on), bus card, car keys, Kleenex tissues, items of cultural significance, Flag of NZ.	**22(15%)**	**11(9%)**	**15/9=1.67**	33 = 12.5%
Cosmetics: make up, perfumes and deodorants, and personal cleaning and grooming products	**18(13%)**	**9(7%)**	**13/7=1.86**	27 = 10%
Food/Drink	**17(12%)**	**9(7%)**	**12/7=1.71**	26 = 9.7%
Cars	5(3%)	5(4%)	4/3=1.33	10 = 4%
Alcohol	3(2%)	4(3%)	3/2=1.5	7= 2.6%
	144 (100%)	122 (100%)		266 (100%)

Table 3: Evidence in Support of Propositions from each Product Category - Females (F) and Males (M)

Product categories	P1 Affiliation		P2 Status		P3 Ethnicity		P4 Uniqueness		P5 Cosmopolitanism		P6 Age		P7 Gender

Proposition 6 - Young adult discourses are characterised by evidence of the use of products to communicate age related characteristics,

can also be accepted.

Though some participants seek to communicate *ethnicity* (Proposition 3), *uniqueness* (Proposition 4) or *gender* (Proposition 7), the number of instances is fewer. Yet, even though weaker, each of the three propositions -

Proposition 3: Young adult discourses are characterised by evidence of the use of products to indicate ethnicity.

Proposition 4: Young adult discourses are characterised by evidence of the use of products to communicate uniqueness.

Proposition 7: Young adult discourses are characterised by evidence of the use of products to communicate gender related characteristics

is accepted.

There is no evidence for Proposition Five, that

Young adult discourses are characterised by evidence of the use of products to communicate cosmopolitanism related characteristics of the self.

This could be due to a number of reasons - for example, physical location, specific socio-cultural context, or insufficient global experience. The bulk of the cosmopolitan literature includes a sample population of adults (e.g., Caldwell et al., 2006; Thompson & Tambyah, 1999), although a few studies that involve young adults specifically examine the link between geographical location and cosmopolitanism (e.g., Kjeldgaard, 2003; Wattanasuwan, 2007).

Table 3 shows that (with the exception of cosmopolitanism) both male and female participants use products and brands to express affiliation, association, or belongingness with reference groups or community, status, age, ethnicity, uniqueness and gender.

The final part of this study compares female and male participants' use of products to communicate specific aspects of their selves. This paper restricts discussion to only those instances where one gender was seen to emphasise some aspect of the self at double (or more) the frequency of the other gender. We also refrain from drawing conclusions where incidences were coded less than two times for both females and males.

As Table 3 displays, for *Affiliation* (P1) there are no substantial overall differences between genders, nor are there any note worthy product level differences. For *Status* (P2), while there are no overall differences, females are three times more likely to use cosmetics and miscellaneous items to denote status, whereas males (in this study) prefer to use alcoholic drinks to express status. There are no marked gender differences at the overall or product level for *Ethnicity* (P3). *Uniqueness* (P4) seems to provide the most contrast. Here, females are three times more likely to use products to communicate uniqueness, with most of this difference stemming from the use of clothing and accessories. Females are also more likely to use cosmetics and miscellaneous items to communicate aspects of *Age* (P6). Last, although much literature espouses the influence of gender on product choice, we find no marked differences between male and female young adult consumers' use of products to convey *Gender* (P7).

The findings suggest that aspects of the selves that young female and male consumers intend to communicate seem to be associated with the nature of the products selected. The selection of common product categories by both female and male consumers and the emphases on specific aspects could also be attributed to the influence of social media. Over the past decade or so, social media has become increasingly popular in influencing consumers, especially from the standpoint of communicating the self (Kietzmann et al., 2012; Pan & Thomas, 2012; Utz, 2010). As consumers construct profiles, view and traverse connections in online environments, they share information about their interests and choices. Such sharing influences product selections as a basis for impression formation and identity construction. This paper suggests that social media may well stimulate the construction of the self in off-line environments too, and that it may be worthwhile to explore this aspect further in future research.

CONCLUSION

To conclude, this paper set out to examine the role of gender in the nature and types of product choices young adult consumers make, and whether females and males employ products and/or brands to communicate aspects of the self in similar or different ways. The paper extends current knowledge by focusing attention on specific product categories relevant to female and male young adult consumers, and aspects most salient in the use of products to communicate the self. Cosmetics, followed by food/drink, and then the miscel-

laneous category accounted for the main differences in product use based on gender. Females appear to use a variety of products to express themselves, more so than males. −However, more interesting, is the diversity in terms of how female and male participants use products to communicate aspects of their selves. Females are more conscious of communicating age, uniqueness and status compared to males. In view of the sample size for this study, while it may be inappropriate to generalise, some plausible implications for practitioners lie in focusing on aforementioned aspects of self representation when promoting specific products to women. For example, when directing advertising and promotional material to women, emphasizing more than chronology, age as a state of mind and heart, uniqueness as being special in some ways, status and affiliation in terms of roles or ways of thinking and perceiving the world.

The Before and After: A Study of Plastic Surgery Consumption with Young Women in Brazil

Fernanda Borelli, Universidade Federal do Rio de Janeiro, Brazil
Leticia Moreira Casotti, Universidade Federal do Rio de Janeiro, Brazil

ABSTRACT

As the body assumes a central dimension of identity, plastic surgery becomes increasingly common. Using in-depth interviews, this study extends the understanding of the relation between body-related consumption and identity construction by examining young women's decision and experience of transforming their identity and their body through plastic surgery.

INTRODUCTION

As Vigarello's (2006) historical account shows, the fascination with beauty is not a recent matter. Ideals of beauty have moved according to social, political and cultural shifts of each period. Vigarello (2006) points to the growing importance of the body and the act of beautification over the centuries.

Over the last century, beauty and wellbeing became related. Beauty came to mean to feel good about one's body. Wellbeing became a fundamental rule of beautification (Vigarello 2006).

The years 1950 and 1960 have witnessed the body becoming an object of consumption (Vigarello 2006). From the second half of the twentieth century on, the body cult gained a more important social dimension and entered the era of the masses. The body cult combines the esteem for youthfulness with the pursuit of bodily perfection, and brings in tow a range of bodily activities such as exercise and specialized treatments (Goldenberg 2002).

Body appearance became an essential dimension of contemporary identity (Askergaard et al. 2002; Goldenberg 2002; Lipovetsky 2000). Beautification has been diversifying and disseminating rapidly. The profusion of beautifying devices democratized beauty–until then merely the result of nature or exception. This becomes even stronger in a society in which individual wellbeing is an endless pursuit and an affordable and mandatory ideal. Since wellbeing and beauty are related, the idea of investing in one's individual image/body gained strength and became norm (Vigarello 2006).

It is in this context that the consumption of plastic surgery has grown and become increasingly commonplace (Askergaard et al. 2002). Malysse (2002), comparing individuals from Brazil (Rio de Janeiro) and France, indicated that Brazilians seemed more concerned with bodily aesthetics than Europeans. This high esteem of the body – attributed by some to the tropical climate and miles of beach that encourage the use of light clothing and exposed skin – seems to add to the professionalism of the school established by the recognized plastic surgeon Dr Pitanguy to favor the uptake of plastic surgery in Brazil (Goldenberg 2002; 2007; Malysse 2002).

Brazil is one of the largest plastic surgery markets in the world. Between September 2007 and August 2008, according to Brazilian Society for Plastic Surgery[1], 547,000 cosmetic plastic surgeries were performed; being the most common types the silicone prosthesis implants and the liposuction, and the major consumers, women. Those levels are not really surprising in a marketplace where firms advertise plastic surgery operations payable in up to 36 installments.

This exploratory study aims to extend the understanding of the relation between body-related consumption and identity construction by examining young women's decision and experience of transforming their identity and their body through plastic surgery – a phenomenon still overlooked by consumer research. To do that we gather together a range of interpretations and viewpoints that can help us better understand the phenomenon of plastic surgery consumption among young women. We chose to focus on young women in order to explore the consumption of plastic surgery that is unrelated to issues of aging or attenuation of the effects of pregnancy.

THEORETICAL BACKGROUND

Identity is based on difference and similarity, where neither can exist without the other. Identities are not given; rather, they are continually created and recreated by each individual in their interaction – and negotiation – with others; as such, the individual and the collective are interrelated and act jointly. Positive feedback of others belonging to the same social group of reference is essential for the successful expression of identity. Thus, identity is seen as a self-reflective process based on the monitoring of past actions and modification of future behavior (Giddens 2002; Jenkins 2005; Ransome 2005).

As Giddens (2002) points out, in modernity, the process of identity construction is influenced by the new type of relationship that emerges: the *pure relationship*. In it, there are no external anchors, such as moral obligations, social and economic issues. Thus, the *pure relationship* is maintained only while each of those involved views it as satisfying and rewarding and perceives its benefits. As such, the relationship has an open and reflective character and can end at any moment. This lack of permanence makes individuals more self-centered and preoccupied with their attractiveness in terms of aesthetic characteristics.

In the literature on consumer research, it's not uncommon to find identity treated from the perspective of personal narrative (Ahuvia 2005; Kleine, Kleine, and Allen 1995; Sirgy 1982). Such narrative has a reflexive nature (Giddens 2002) inasmuch as it assumes that the history of the consumer is built based on who the individual was, is, or wishes to become.

Thompson and Hirschman (1995) believe that whereas identity used to be defined by work activities, in postmodernity this occurs through consumption. The fluid and reflective nature of identity (Bauman 2005; Giddens 2002) seems to render the act of consumption a means of producing the desired self, based on images and styles transmitted through possessions (Thompson and Hirschman 1995). Consumption assists individuals in the acquisition, maintenance, alteration, reconstruction and disposal of the individual's identity or identities (Kleine et al. 1995; McAlexander 1991; Schouten 1991; Young 1991) – to the point that goods can even be considered our *extended-self* (Belk, 1988). Consumption also acts in reducing or resolving identity conflicts as, for example, tensions between the consumer's past identity and the person one wishes to become (Ahuvia 2005; Mittal 2006).

The concepts of identity and self-concept are bound to the concept of self-esteem. Banister and Hogg (2004) claim marketing managers recognize the pursuit of self-esteem as one of the most important motivational drivers of consumer behavior and decision making. Consumption activities have a major role in enhancing or protecting self-esteem (Sirgy, Grewal, Mangleburg, Park, Chon, Claiborne, Johar, and Berkman 1997). Self-esteem refers to the evaluation of a person in relation to oneself (James 1890 cited in Pyszczynski, Greenberg, Solomon, and Arndt 2004). Giddens (2002) stresses the social nature of self-esteem, which relates strongly with responses

by others. The non-conformance of the body to prevailing media and social standards tends to reduce the individual's self-esteem (Goldenberg and Ramos 2002).

Identity, consumption and body

There is no way to develop identity without embodiment (Mead 1934 cited in Jenkins 2005). Thus, the body can be seen as the continuation of the individual, as an element of identification with the collective and as a means of giving form to identity. Body appearance is, therefore, decisive in the acquisition of identity and socialization (Malysse 2002). For the self is exhibited to others via its embodiment (Giddens 2002). In a social context in which consumption gains strength as a definer of identity (Ransome 2005; Thompson and Hirschman 1995), the body – main billboard for expressing one's identity – assumes increasing importance. Its role is even exalted with the promotion of the body cult, from which appearance becomes a fundamental part of people's identity (Goldenberg 2002; 2007).

Vigarello (2006) suggests that the pursuit of body beauty is disguised as individual choice and self-realization, so that each one is responsible for one's own beauty. But this subjectivity or the idea of individual choice seems illusory. Normalization is still present, reinforced by the duality of wellbeing and malaise.

Individuals are bombarded by media images of the normalized body and, perceiving themselves as falling short of such a norm, come to be dissatisfied or reject their own appearance (Lipovetsky 2000). Thenceforth people who might be perfectly healthy start to see their body as defective, as needing improvements (Malysse 2002), and go on to develop extreme self-criticism in relation to their body. Any deviation from the idealized body becomes a problem, including low self-esteem, against which they must struggle (Thompson and Hirschman 1995).

The current array of *corrective treatments* for the body – from makeup or cosmetics to exercises, plastic surgery, hair/facial treatments, etc. – operates an apparent democratization of beauty (Vigarello 2006), getting the body *in shape*, young and beautiful for everyone, through hard work and willpower, rendering the individual as solely responsible for their own appearance. The body comes to symbolize the individual's moral character – it is not sufficient to merely maintain such continuous control; it is necessary to be noticed by others when so doing. Being *in shape* becomes an indicator of personal success, while a body that's *out of shape*, sickly or poorly looking becomes synonymous with lack of willpower, laziness, indiscipline or lack of control (Bouzón 2008; Goldenberg 2002; Goldenberg and Ramos 2002; Giddens 2002; Lipovetsky 2000; Thompson and Hirschman 1995).

But despite beauty being seen as the result of work and willpower, it is strongly related to purchasing power. In becoming an object of consumption (Baudrillard 1995), the body gains a classificatory, hierarchical function, communicating symbols and rendering differences between social groups visible (Bouzón 2008; Goldenberg 2002; Goldenberg and Ramos 2002). Thus, the physical appearance is actively changed in order to provide the other with the desired information (Malysse 2002).

The body cult brings in tow a sense of permanent dissatisfaction with one's figure (Sabino 2000) – that relates to the impossibility of satisfaction discussed by Bauman (2001) – which becomes evident when Edmonds (2002) shows that plastic surgery seems to transcend mere compliance with a standard, and becomes the endless pursuit of an ever-more elusive goal. Edmonds (2002) attributes the growing acceptance of plastic surgery to the democratization of beauty and the belief in a link between self-esteem and physical appearance. So,

plastic surgery appears both as a need for conformity with cultural mores and as a means of bridging the gap between how women are viewed, and how they actually are or feel.

Schouten (1991), in a study of men and women in the US, suggests one reason for plastic surgery is dissatisfaction with a particular feature or part of the body. Negative body self-images can appear during adolescence or be triggered by critical remarks of a child's body. He also finds evidence that plastic surgery led to improved self-esteem and feelings of enhanced physical attraction and self-confidence. Furthermore, plastic surgery appeared to act in the transition of roles. In the study by Askegaard et al. (2002), with women aged 30 to 60, the respondents are divided according to their goals as to the plastic surgery: some cited personal wellbeing; others cited the desire to become more attractive to others. The respondents demonstrated conflicts and contradictions when expressing their true motivations for surgery.

The quantitative study of Pentina et al. (2009) highlights the motivational role of perceived discrepancies between actual and ideal self in choosing cosmetic surgery by young women. The authors also point out to social support as a moderating effect in their decisions – being the support of friends an encouragement to the enhancement of the body. Mowen et al. (2009) investigated the trait predictors of cosmetic surgery. One of their findings is that individuals tending to plastic surgery may view their bodies as like any other resource – it can be molded in order to achieve their goals, as anticipated by Le Breton (2003).

METHODOLOGY

This study aims to extend the understanding of the relation between body-related consumption and identity construction by examining young women's decision and experience of transforming their identity and their body through plastic surgery. To do that, we seek to understand, among other things, how they use plastic surgery in order to make sense of themselves in their world; what they seek to get out of plastic surgery; how the cultural context influences their choice of transforming their body through plastic surgery.

Since the research topic required an understanding of "detailed individual experiences, choices and personal biographies," (Gaskell 2002, 78) and due to the sensitive nature of the subject matter, which could cause anxiety or discomfort in respondents (Gaskell 2002), we opted for semi-structured, in-depth individual interviews. The research objectives required a broader understanding of the women interviewed, of the decision-making process involving surgery, and of changes experienced by them post-surgery. So, we use a life-history narrative approach (Atkinson 1998; Woodruffe-Burton and Elliott 2005) in the script.

Fourteen interviews were conducted. Data collection was halted when it was deemed to be close to saturation point (Gaskell 2002). All interviews were conducted in Rio de Janeiro and were recorded, generating 912 minutes of material, the equivalent to 215 typed pages of transcripts. The interviewees were selected via personal recommendations. The selection criteria parameters were a) female gender; b) age between 20 and 35; c) underwent plastic surgery prior to having children. The option for exploring women's issues exclusively was due to differences regarding gender vis-à-vis motivations, needs and ways to use the body as a means of expression (Goldenberg and Ramos 2002; Sabino 2000). The age group and the issue of motherhood are related to the goal of understanding the consumption of plastic surgery separately from issues of aging and body changes caused by pregnancy. The option for residents of Rio de Janeiro was to be able to hear women inserted in the same context of

bodily esteem and subjected to similar aesthetic standards, as well as to facilitate the researchers' access to respondents.

The following figure profiles each of the young women interviewed:

The interview protocol was developed primarily based on the findings of Schouten (1991) and Askegaard et al. (2002). The interview script was used as a device for the analysis of transcripts (Gaskell 2002), dividing the interviews in major areas of analysis.

Data analysis was inspired by the technique of discourse analysis (Gill 2002).

In the next sections, we present the findings divided into three topics: *the before*, life stories influenced by the other and by the context; *the moment*, which deals primarily with the motivations and incentives behind the decision for surgery; and *the after*, which examines transformations experienced by the women after the surgery.

Table 1. Profile of women interviewed

Name	Age	Surgery
Alice	30	Liposuction + Breast implants
Ana	27	Breast implants
Angela	25	Breast Reduction
Antônia	31	Breast Reduction
Camila	30	Rhinoplasty + Breast implants
Carla	24	Liposuction + Breast implants
Celeste	32	Liposuction and Liposculpting + Breast implants

Name	Age	Surgery
Fátima	22	Breast implants
Ilda	30	Liposuction
Luana	23	Breast implants
Monica	28	Breast implants
Monique	26	Liposuction of the buttocks
Nadia	25	Liposuction
Tânia	26	Breast implants

The before: life stories influenced by the other and by the context

If identity is based on differences and similarities and depends on the validation of others (Jenkins 2005; Ransome 2005), and the body is the means of exhibiting one's identity, it follows that the body seems extremely susceptible to comparison and to influence of others' gazes. Examination of the life stories points to bodily changes experienced during adolescence as possible sources of dissatisfaction that somehow drove these women to plastic surgery (Schouten 1991). It seems possible to relate the requirements of body modification expressed by respondents to the reflective nature that the body assumes in modernity (Giddens 2002), that is, the constant questioning of one's own body, the medium through which identity is displayed. Body shape seems to have a decisive role in forging the identity of these young people: the absence of breasts during adolescence can lead them to resemble either the male gender or younger children; overly large breasts or excess weight may distance them from the female standard they seek to emulate and that the media pushes; finally, the others may be the mirror of their dissatisfactions, as the following accounts suggest:

"I looked like a little boy, completely flat-chested. I didn't feel feminine. Not just a little boy, also a kid." (Ana, 27)

"I was always a chubby child. And being chubby when you enter adolescence becomes annoying. Women don't like being chubby; woman want to be skinny. Even more so because of the stereotypes we see on television, in magazines." (Alice, 30)

Ana, Alice and Luana speak of adolescence and dissatisfaction with their bodies, perceiving them as different or outside the standard. They also speak of the influence of the vision of the body of the other on the perception that each has of her own body, and suggesting that the difference can lead to an inferiority complex, shamefulness, hate of one's own body (Lipovetsky 2000; Malysse 2002).

The importance of the body's appearance is described in the context of the socialization process, that is, to the other. Interestingly, the other appears in the narratives of interviewees' life stories

in several ways: as city, neighborhood, girl-friends, sisters, cousins, lovers, boys.

The concern with the gaze of others is evidenced, for instance, by the strategies of concealing/displaying (Thompson and Hirschman 1998) used by the interviewees to manage their image. They hide or disguise what made them unhappy with their body ("I'd wear looser clothes that wouldn't draw attention to my figure and a tight bra to try to make my bust appear smaller") and divert attention to their favorite parts using tricks such as clothing, hairstyles, or even making them the focus of the workout ("since my upper body bothered me, I always valued the lower part").

Monica's report exemplify how moving to another city changed the way she saw about her body. She reports on the difference of "aesthetic standards" between Porto Alegre, where it "was far more cool to be slim" and "uncool to have a big butt," and Rio de Janeiro, where the ideal is the woman to be "all babe." With her move to Rio, she relates how she became accustomed to the city's aesthetic standards and stopped thinking her "butt" was "so big."

Carla's story shows how a change of place of residence led her to seek aesthetic changes to adapt her body to fit in with the new social group. She moved from Nova Iguaçu to Barra da Tijuca. Nova Iguaçu is one of 13 municipalities in the Rio de Janeiro metropolitan area. It is a 830,000 inhabitants city densely populated and heavily dominated by low-income residents. During the interview, Carla explained that this neighborhood comprises a group of high-income residents to which his family belonged to, and that its members are well acquaintance to each other. Barra da Tijuca is a district of Rio de Janeiro that has undergone rapid urbanization starting in the 1980s, and is known for its influx of emerging social groups. Carla acknowledges that after moving to Barra da Tijuca she ceased to be herself ("I was me") in order to be the other in this new place with different aesthetic standards.

"My family is from Nova Iguaçu – I lived there until I was 16. In Nova Iguaçu I was *the* Carla Marques. Everybody knew my dad and my older brothers. Being chubby didn't bother me too much. Because I was *myself*. So, it was never a problem in that context. Perhaps it began to bother me [when I moved to Barra da Tijuca]. When you're off the curve, just go to the beach or

open up a magazine, you'll see: the standard of beauty is being thin, to work out. I was just another Carla. I'm not going to tell I do it [work out and diet] for other people. It's for me, but it's influenced by the environment I live in. I think if I lived some place where it was irrelevant, I don't really know if I'd find it so important" (Carla, 24)

Her report also suggests that in changing social context from Nova Iguaçu to Barra da Tijuca, her social capital lost its importance to her body capital (Bourdieu 1984: 194): she became just another Carla. At her new neighborhood, the body seems to strongly mark social position replacing social capital. In order to improve her position in social space, Carla needed to revise her identity, rebuilding her body.

The moment of plastic surgery: exploring motivations

The influence of the time of life of the interviewees in deciding to undergo surgery also appears in several accounts. Some reported they were having a difficult and stressful time. Difficulties with the marriage, in dating, in relationships and work, as well as personal problems, insecurity, heartness and sadness were also mentioned by interviewees. Thus, surgery appears as a kind of compensatory consumption (Woodruffe-Burton and Elliott 2005) in less-than-favorable life situations.

As pointed by Askegaard et al. (2002), it seems possible to associate some of these feelings to the anxieties caused by the lack of permanence of contemporary relationships (Giddens 2002). Fátima (22) associates plastic surgery with the fear of losing her far-away boyfriend, or even the fear of the fragile nature of her relationships, as the following testimony indicates:

"I don't think it [silicone implant surgery] was to try to hold on to him. It was to make me feel better, to value myself more. I think, when women lose the person they like, they believe they won't find anybody else. They think he's the last man in the world and they won't find anyone better. And it's exactly the contrary: you always find someone much better than him. So I think it wasn't at all a case of his thinking 'oh! she got implants, so I'm not going to cheat on her'. Rather, it was so that, if, by chance, he did not want me anymore, I would still be happy enough with myself to find someone else just as good or better."

In this report, Fátima suggests that a new body would render her a better position in a 'relationship' market, so that if her present relationship did not work out, her new boobs would enhance her chances to find a new (better) man.

In contexts described as difficult, that include the possibility of losses, fears and stress, plastic surgery seems to be driven by a consumer expectation to make peace with self-esteem or to boost self-confidence (Askegaard et al. 2002; Schouten 1991). Thus, the experience is described as a way to "value myself," to "feel more beautiful," as an "investment in me," a "self-compensation," a "self-indulgence," or even an "incentive" to overcome difficulties or to find someone "even better." These findings are consistent with Le Breton (2003), who pointed to the use of plastic surgery by individuals in crisis – those who sought the possibility of modifying the way people saw them, their life and their relationship with the world.

The bad or difficult time of interviewees life seem to put their identities in check, thus restoring feelings present since their adolescence, and demanding an urgent answer / attitude. The plastic surgery comes as a way to modify the shape of the body and thus, rebuilt their identities and transform how others see them, and therefore their life and their relations with the world.

Transition of roles or identity (Schouten 1991) also appears as another form of incentive in this study. Celeste (32), for example, living a process of separation and, therefore, ruling out the possibility of being a mother at that time, starts the review process of her self-concept through working out, massage, greater care with her appearance and, finally, liposuction, in order to incorporate a new identity: that of an unmarried woman "back into the market."

The incongruity between physical aspects and self-concept (Schouten 1991) also appears in the discourse of some interviewees when they talk about their life stories. Plastic surgery can mark the transition between childhood (child's body) and adult life (women's body) in some cases, and may be part of a larger process of transition, as the last stage of transformations sought. Antonia (31) explains:

"I was in the process of feeling better; I'd already completed my treatment [the medication she took for hormonal disorder during early adolescence]; I was already thinner; my hair looked great. But then I discovered that the shape and the size of my breasts were not what I wanted."

Most women interviewed made it clear that they had undergone plastic surgery for themselves, regardless of others' opinions. They needed to deny the concern with the gaze of others but tended to fall into contradiction during the interview. Tania (26), a good example, contradicts herself throughout the interview. She explains that "the average Brazilian" has no bust; so, her lack of breasts was seen as "normal" in the eyes of others. Yet, in other moments during the interview, she admits that her small breasts made her "the shame of the group." Shame, according to Giddens (2002), is a result of insecurity regarding social acceptability. Tania also reveals several suggestions from others before the surgery to insert silicone breast implants, but then seems oblivious to the shame revealed when attempting once again to explain that the surgery was for her only, denying the influence of others' gazes.

Contact with a girl friend who has recently undergone plastic surgery appears in the testimonies as another factor responsible for driving respondents to make a decision regarding surgery. Some of the women admit they were "scared to death" of the procedure. Thus, proximity with a successful plastic surgery served as encouragement, a "light shove," a "breath," a sign that what they wanted to achieve "was possible," as Camila (30) revealed:

"It was already something I had wanted to do, and then, just before I did, this friend got implants. I saw hers looked good, so then I got enthused and plucked up the courage to go ahead. It was just the smallest push I needed."

This may put some light on findings from Pentina et al. (2009) regarding the moderating role of peer support. A successful surgery patient, besides allaying fears related to the procedure, seems to operationalize plastic surgery within the realm of real possibilities and out of the field of dreams.

In addiction, the accounts indicate a sort of rule or hierarchy among the types of care and control of the body. Plastic surgery – in particular, liposuction – appears in the testimonies collected here as a "last resource," something you do after "having tried everything else:" "dieting," "working out," "eating healthy." For some interviewees, women seeking directly the last level of the hierarchy – plastic surgery – are seen in poor light and judged as lazy, since they failed to spend the energy required to get their bodies in shape. Control of the body is not sufficient; it is necessary that this fact be perceived by others (Giddens 2002).

"Before getting the lipo, after I had lost weight and so on, I still didn't go to the beach because there were still fat parts on my body that refused to go away. (…) I think [plastic surgery] is perfectly valid if something is bothering you like crazy, to the point where it prevents you from going to the beach, as was my case. And, when you've tried everything else, to no avail … I don't think plastic surgery should be used as a quick-fix for every little thing you don't like." (Carla, 24)

The interviewees also describe the behavior of other women with respect to plastic surgery as overkill. They relate this overkill with an "obsession with perfection," an "unhealthy" behavior, even the "loss of sense of danger." But, after all, where might the boundary lie between overkill and acceptable? Interestingly, the overkill mindset is always ascribed to others, never to themselves. This is the case even when it comes to those who show an almost obsessive preoccupation with their few extra kilos such as Carla (24) in the previous account.

The after: experienced transformations

When asked about others' reaction toward their post-surgery, the respondents show difficulties in claiming differences were indeed perceived in their appearance and, on occasions, would end up contradicting themselves during the interview. As in the case of the Tania (26), who initially said that "many people don't know because I put in very small implants"; however, later in the interview, she comments on how "several people" told her "Wow, aren't you the big sexy woman!" Such a contradiction seems to have something to do with the concern in affirming they had undergone surgery for themselves and not for others.

Many reported that expectations regarding the expected benefits of surgery are confirmed when they relate what happened *after*. They emphasize the effects of plastic surgery on their self-esteem and self-confidence, which was also found by previous works (Schouten 1991; Askegaard et al. 2002; Edmonds 2002). However, discrepancies were apparent in the testimonials. While some said they did not believe surgery had had any effect on their social relations (i.e., relations with others), other women spoke of changes in perceived self-esteem and self-confidence and reported profound changes in their social relations and even their sexuality after surgery: "I began to feel like socializing more"; "I stopped feeling shameful of getting close to men"; "I became much more comfortable sexually." The following account by Antonia (31) is quite illustrative of the benefits admitted to:

"My life has changed: I became more confident; I was no longer embarrassed about getting close to men. I got a boyfriend right away. I became more popular among my friends. I think people saw how I was prettier, more secure. I was no longer embarrassed about going out ... people would ask me out more, and I began socializing more, too. I started feeling more sociable than before. At work, the collateral effect of self-confidence from surgery was tremendous. Got a great job soon thereafter."

Those reports suggest that plastic surgery allowed an identity renegotiation. It seems to work as an "investment", improving body capital. Their improved body capital granted them a new and more valuable position in social space. For some, this identity and position change acquired through their body transformation was so vigorous that they even state that "the surgery has changed my life!" and report feeling "like another person after the surgery".

The interviewees also recount becoming vainer after surgery. This enhanced vanity intensifies previous body care and triggers a whole constellation of body and beauty-related consumption, such as buying clothing that displayed the new body; exercise and diets with specialized professionals; massage; lymphatic drainage; cosmetics to combat cellulite and sagging; pharmaceutical drugs (cellular nutrition).

Both new consumption and beauty treatments that were stepped up after surgery indicate an effort to maintain or leverage the investment made in their body capital. Plastic surgery enhances their body capital, however maintaining it requires continuing effort and investment.

Besides mentions to improved self-esteem and self-confidence, the interviewed women commonly used words such as happiness, enthusiasm, lively and excitement to describe feelings engendered by plastic surgery. It is interesting to notice that those psychological or emotional effects of surgery are far more frequent and more emphasized during the interviews than changes in physical appearance. However, when physical effects are mentioned, they appear as harmony, proportionality, a cool or great body. The interviewees seem to avoid words with overt links to beauty. This might allude to some fear of appearing futile (Casotti et al. 2008). The testimonials suggest that the quest for self-confidence would be more legitimate than the search for beauty, as exemplified by Angela (25):

"I think people are divided into two groups. The group of people who get it [plastic surgery] because they really do have something that calls attention, that really bothers them – then they do plastic surgery. And there are the people who want to have the perfect body, and then go overboard." (Angela, 25)

FINAL DISCUSSION

By exploring young women's decision and experience of transforming their identity and their body through plastic surgery, this work extends the understanding of the relation between body-related consumption and identity construction.

The decision of undergoing a plastic surgery by the interviewees seems the result of a conjunction of elements: a longtime deep dissatisfaction or discomfort with one's body or particular body parts; a specific stressful or difficult time of life; influence of someone who had experienced a successful plastic surgery; and, finally, having tried everything else unsuccessfully, exhausting any other way of *fixing* the body.

Some of the results support the findings of Schouten (1991) and Askegaard et al. (2002), pointing similarities in consumption of plastic surgery undergone by Brazilian – specifically residents of Rio de Janeiro – Danish and US women: adolescence as a source of dissatisfaction with the body that was sought to be corrected with surgery; the role of surgery in the transition of social roles, or as complementary agent or catalyst for change; the improving self-esteem and confidence; surgery as an act of self-determination (undergone for the sake of personal wellbeing).

However the accounts seem to put the body in a higher value place in the city of Rio de Janeiro, as suggested in other studies (Malysse 2002). In Rio, body capital seems to trump social capital. And that does not work only for the 'relationship' or "marriage market" (Bourdieu 1984: 126), enhanced body capital also grants a better position in the labor market and in friendships and other social relations. Plastic surgery thus works as an investment to enhance the value of body capital so as to gain better social standing.

But it does not exhaust the efforts for a body that contributes to a successful identity and a better social position. This new position requires continued investment and effort to be sustained. These be-

gin way before the surgery – with exercising, dieting and so on – and must be intensified and expanded after it.

The interviewees' narratives uncover the relation between plastic surgery and identity construction. The body, as part of identity and thus to its self-reflective project, is central to a successful expression of identity. But its construction depends upon interaction and negotiation with others so that, in order to create a successful expression of identity, body must conform to the reference group or the cultural norms. Although each of the interviewees has her own history regarding plastic surgery and explains the plastic as something done to herself, this body change seems fundamental to them as a means of negotiating their identities with others, as a fundamental part in the process of building a successful identity and conquering a improved position in their social space.

Interaction and negotiation with others appear repeatedly in the interviewees' narratives. They are clear in their feeling of being different and their wiliness to belong; in their concealing/displaying strategies; in their very attempt to adequate their bodies to standards through plastic surgery; when they announce their decision to peers and can access their opinions – even denying their worries about it; and, of course, when they consider their surgeon's opinion (as the girl who got a second rhinoplasty when intended to get only breast implants).

Their non-normalized body becomes a source of anxiety, dissatisfaction and reduced self-esteem. It seems they seek not for the body they dream of, but to the body cultural norms made them want to. However, this young, beautiful and *fit* body must be pursued through hard work and willpower, so as it becomes an indicator of personal success.

There's why the interviewees seem to identify the existence of a hierarchy of beauty treatments, where plastic surgery figures as a last resource. If personal success depends on a body achieved by hard work, the plastic body seems to reduce personal merit. So, the plastic surgery must be legitimized and justified! Otherwise it can be regarded as cheating and overkill, putting them in a poor light.

Legitimization is carried out through hard work previously to the surgery – as engaging in dieting, weight-loss programs and exercising. In other words, they must work hard to deserve the body in shape. But previous hard work is not enough. It's imperative to justify the plastic surgery. First of all, it's only justified only when nothing else seems to placate body dissatisfaction. But the real justification seems to occur when the interviewees describe their dissatisfactions. They present a long rationalization – that seemed aimed to themselves and to others, represented by the researchers – their "unbearable complex" or "trauma," "absolute shamefulness," and "unreasonable hassle" that can cause even a "psychological problem." It requires a lot of work to undergo plastic surgery and still cope with cultural prescriptions.

Cyborg as Commodity: Exploring Conception of Self-Identity, Body and Citizenship within the Context of Emerging Transplant Technologies

Ai-Ling Lai, University of Leicester, UK

ABSTRACT

This paper explores how advances in transplant technologies shape conceptions of self-identity, embodiment and citizenship. Drawing on the posthuman writing of Donna Haraway and from phenomenological interviews, I explore ambivalence towards the commodification of the cyborg-body, suggesting that biotechnology may potentially lead to a dystopian posthuman consumer society.

INTRODUCTION

Recent developments in transplant technologies open up exciting areas of study where the amalgamation of human, animal, and automaton spawn a proliferation of cyborgic couplings and chimeras. According to Haraway (1991: 149), a cyborg is a cybernetic organism, whose hybridity obfuscates Western conception of the body and selfhood. From *restorative* transplantation (i.e. the rejuvenation of lost bodily functions through organ replacements derived from xenotransplantation[1] and artificial organs) to *regenerative medicine* (e.g. the engineering of organs through stem cell therapy and cloning), the body are becoming increasingly *plastic* (Shilling 1993), *bionic* and *engineered* (Synnott 1993; Williams 1997). Consequently, we are "thrown into radical doubt" (Shilling 1993: 3) as to what the body is, who owns it, how we should treat it and what it might become (Williams 1997). The cyborg emerges as a socio-political battlefield where boundaries between the self and 'other', human and non-human, the automaton and the organism, nature and culture, subject and object are valiantly contested (Haraway 1991). Gray (2002) argues that cyborgs are political bodies, whose corporeal status dictates the extent to which they are granted civil rights, protection, equalities and freedom in a democratic posthuman society.

This paper seeks to explore how perceptions of emerging transplant technology are shaped by conceptions of self-identity, embodiment and citizenship among the British lay public. Specifically, I consider how individuals construct embodied meanings surrounding emerging transplant technologies. In addition, this paper analyses how individuals draw on cultural resources to help them negotiate meanings pertaining to (1) personhood (*what it means to be a person*), (2) technological embodiment (*what it means to have and be cyborg-bodies*), (3) posthuman citizenship (*how technology mediates social relations between human and non-human*) and (4) body commodification (*can the cyborg-body be reified as an object for consumption*).

In doing so, this paper endeavors to answer the call to theorize posthuman identity and body in consumer research (Venkatesh et al 2002; Giesler and Venkatesh 2005; Buchanan-Oliver 2008; Campbell et al 2005). This paper recognizes the need to embrace consumers as 'embodied cyborgs' (Giesler and Venkatesh 2005: 661), whose lifeworld and social existence is intricately woven with the materiality of technology (Giesler 2004). Following Featherstone and Burrow (1995), Venkatesh (2004) envisions posthuman consumer society as 'new cultures of technological embodiment' (pp. 400), which is constituted by 'a hybrid marketplace matrix' (Giesler and Venkatesh 2005: 1). This paper illustrates how marketplace myths and cultural metaphors are appropriated by individuals to help them make sense of the relationship between nature and

---

[1] Xenotransplantation involves the incorporation of living organs and tissues from a different species (usually animals such as pigs) to another (human beings).

technology (Thompson 2004). In doing so, I aim to contribute to previous writings by Johnson and Roberts (1997) and Belk (1990). Most notably, these scholars observe how the marketing of organ transplantation has previously been predicated on the 'mechanistic' metaphor of the body (Belk 1990). This metaphor is consistent with the 'technocratic' view, which presents technology as progressive and optimistic (Johnson and Roberts 1997). I now review the theoretical underpinning of cyborg embodiment and the slippery slope of its commodification within the context of emerging transplant technology.

Cyborg Embodiment and Commodification in Emerging Transplant Technology

Seale et al (2006) contend that body fragmentation and commodification are prominent themes in biomedicine, as it involves the disintegration of the body into isolated parts, which concurrently renders it susceptible to the process of objectification. Such mechanistic view of the body is grounded in the dualistic philosophy of Cartesianism, which privileges the mind over the body. For Descartes, the mind constitutes the seat of consciousness (*res cogitans*) that defines one's personhood (soul). Conversely, the body is a palpable material object that extends into space (*res extensa*) – and as such, is divisible and subjected to the laws of physics (Sawday 1996). As a machine that houses the conscious mind/soul, the body is deemed to be lacking in intentionality and intellect.

Elsewhere, Sharp (2000) argues that "commodification insists upon objectification in some form, transforming persons and their bodies from a human category into objects of economic desires" (pp. 293). According to Hogle (1995), advances in transplant technologies can potentially erase the cyborg-body of its personal history and cultural trappings; thereby objectifying it as a valuable commodity for exchange (Marx 1867/1976). As such, the medical cyborg is devoid of *intentionality* as a purposeful being (Heidegger 1927/1962). Instead, biomedicine transforms cyborg into a new category of species that are equipped with a new purpose or what Aristotle calls *telos* – i.e. "different categories of biological species has its own form of flourishing, of being true to itself" (Bowring 2003: 133). For Heidegger, treating a 'living organism' in an objectifying manner is tantamount to an act of depersonalization, which withdraws from them, their rights to dignity, mystery and humanity.

Fox and Swazey (1992) argue that the widening gap in the supply and demand of organs has fuelled medical and cultural fervour towards 'spare part pragmatism', which is predicated on the vision of the "replaceable body and limitless medical progress, and the escalating ardor about the life-saving goodness of repairing and remaking people in this fashion" (pp. xv). In *Human Body Shop: The Cloning, Engineering and Marketing of Life*, Kimbrell (1993) documented how the growing market for 'human products' (including blood, organs, tissues and reproductive cells) have alienated individuals from their bodies and from others, leading to disputes over ownership, distribution of profits and exploitations of the disenfranchised. As Bowring (2003) argues, the body is already a form of commodity in the modern world. Within the context of emerging transplant technology, the commodification of the body takes different forms – namely artificial organs, xenotransplantation and regenerative transplantation – which I will now discuss in turn.

The Bionic Body –
The Manufacturing of Artificial Organs

Langer and Vacanti (1995) advocate the need to close the gap in organ shortages by moving towards the 'manufacturing' of organs. Heart valves, pacemakers, artificial hip joints, prosthetic arms and legs, and synthetic lenses are now regularly implanted in human bodies (Sharp 2000: 311). As Haraway (1991) argues, "we *are* all hybrids of machine and organism, in short we are all *already* cyborgs" (pp. 150). More recently, the pioneering trial of AbioCor artificial heart in 2001 raises many ethical questions concerning its commodifying potentials. Fox and Swazey (2004) witness how an industry has mushroomed around the manufacturing and maintenance of mechanical hearts. Similarly, Gray (2002) contends that due to the mythological and metaphorical resonance of the heart (Manning-Steven 1997), promotion of artificial organ research by companies (usually established by researchers and medical corporations) is likely to generate profit due to its publicity alone.

Dumit and Davis-Floyd (1998) observe the paradoxical nature of cyborg as an *enhancer* as well as a *mutilator.* As cyborgs are potentially 'better than human', it holds great promises in enhancing our lives (life-saving) while at the same time harbouring destructive potential that threatens 'the loss of our identity' (pp. 13). The cyborg-as-machine invokes images of technological determination (Haraway 1991), in which man is rendered inert, dependent and de-skilled in relation to the powerful and self-regulating machine (Holland 1995). However, Haraway (1991) urges us to recognize the emancipatory potential of such fusion, claiming that how we define our relationship to cyborgs is predicated on an instinct for survival (pp. 153).

Chimera and Organ Pharming – Xenotransplantation

More recently, breakthroughs in genetic engineering has made possible the 'manufacturing' of body parts through organ 'pharming' – which involves the transfer of human genes into animal DNA to produce medically desirable substances (Bowring 2003). The hybrid genes are then inseminated into surrogate animals that carry the embryo to term, and in doing so, give birth to chimeric offspring known as transgenic animals. Gray (2002) suggests that the cloning of Dolly the Sheep has served as a factory prototype towards subsequent organ pharming. Clark (1999) warns that xenotransplantation can potentially lead to the production of organs on an industrial scale as it has the potential to reduce organ shortages by turning transgenic animals into a 'bioreactor' and 'pharmaceutical factory' of organs (Bowring 2003). The use of pig heart valves for transplantation has become common practice (Clark 1999). Indeed pigs are often regarded as ideal donors as their organs are of similar size to humans and more importantly, they can be bred on a larger scale and thus, providing an unlimited source of organs (Gallagher 2011). Gallaher postulates that there will be a shift from cadaveric transplantation towards 'growing your own organs'. The customizing of organs is a promising prospect as 'replacement' body parts can be 'pharmed' using personalized stem cells from the patient to reduce chances of organ rejection. In 1997, Dr. Jay Vacanti shocked the world by growing a human ear from cartilage cells on the back of a mouse (now famously known as the Vacanti Mouse). This leads scientists to believe that similar techniques can be applied to pave the way towards the tissue engineering of livers and hearts that are tailor-made to work with the patient's immune system (BBC News 2002).

Xenotransplantation is controversial because it destabilizes our conception of 'what is natural' (Williams 1997). According to Haraway (1991) "transgenic border-crossing signifies serious challenges to the 'sanctity of life' for many members of Western cultures" (pp.

217). This is not surprising as Douglas (1902/1966) argues; the solidarity of human society is modeled on corporeal solidarity and purity, which is impermeable by 'others'. Consequently, the violation of body boundaries signifies 'danger' since it "transgresses the symbolic boundaries of broader body politic" (Grosz 1994: 194). Haraway (1997) explains that Western culture has historically been preoccupied with racial purity, categories sanctioned by nature and the integrated self. She went on to explain that the distinction between nature and culture is sacred to Western society. The breaching of the human body by non-human species threatens to defile the purity of mankind (Douglas 1902/1966), disrupt the lineage of nature and potentially compromise the integrity of species (Haraway 1997). Following Deitch (1992), Featherstone and Burrows (1995) speculate that as genetic engineering and nanotechnology become routinized, "the next generation could very well be the last 'pure' human" (pp. 3). I now review the implications of genetic engineering in transplant technology.

The Engineered Body - Regenerative Transplantation

While the prospect of organ manufacturing and 'pharming' are fast becoming a reality, recent developments in genetic engineering, stem cell therapy and cloning push the frontier further towards the *engineering, regeneration* and *propagation* of bodies (Williams 1997). Stem cell research has created a possibility for cultivating tissues and organs from embryonic stem cells to be used for organ transplantation. More controversially, the propagation of embryonic stem cells may potentially lead to the cloning of human embryos for medical purposes. Therapeutic cloning has already been clinically trial to treat diabetes, Parkinson's and Alzheimer's disease. Therapeutic cloning involves the fusing of a human egg cell with the DNA of the person to be cloned. The fusion then cultivates embryonic stem cells that can then be used to generate transplant-ready tissues that are identical to the recipient's DNA, while the embryo is destroyed (Bowring 2003). Meanwhile reproductive cloning involves the implantation of a cloned embryo into a woman's uterus to facilitate the birth of a cloned child. The UK legislation has relaxed its rule concerning therapeutic cloning since 2001 but has maintained its prohibition against reproductive cloning (Human Fertilisation and Embryology Act 2008). However, Bowring doubts that such measures will be sustainable in the longer run as this involves global coalition against human cloning. He believes that therapeutic cloning will eventually lead down the slippery slope of reproductive cloning in countries where cloning for medical research is permitted. Bowring questions whether the eventual legalization of reproductive cloning may erupt in a political dispute over body ownership and create a 'monstrous caste system, one in which an entire category of persons, while perhaps labeled untouchable, is marginalized as not fully human." (pp. 203).

In addition, Gray (2002) is concerned that the trend toward human cloning may be perpetuated by reproductively challenged parents, who are already fervent advocates for *in vitro* fertilization and surrogacy. Most notably, he observes a worrying trend of parents attempting to conceive children in the hope that their newborn would be a compatible donor for their sick children. In a widely publicised case, the Ayala family made medical history for donating the bone marrow of their child Marissa, who was born to save the life of her sister Anissa. The Times Magazine featured the case in a cover story in June 1991, constructing it as a moral dilemma involving the 'tyranny of the gift-of-life' (Fox and Swazey 1992). The Times coverage generated outrage among the public who felt that the Ayala's case evoked 'baby farming, cannibalizing for spare parts' (Morrow 2001). The controversy surrounding the birth of Marissa

centres on concerns over the violation of the sanctity of life, where 'the baby was ordered up to serve a means, as a biological supply vehicle' (Morrow 2001). In 2000, a couple from Denver, Lisa and Jack Nash, gave birth to Baby Adam, who is genetically screened and conceived through IVF to ensure his tissues matches with that of his sister (BBC News 2000). Baby Adam is hailed as the world's first 'designer baby', whose story become popularised in Jodi Picoult's novel, My Sister's Keeper.

The genetic manipulation and cloning of cyborg-babies inadvertently evokes eugenic discourse among critics (Gray 2002; Bowring 2003). Bowring envisions a posthuman society that upholds the breeding and engineering of superior children (positive eugenics) while eliminating and destroying 'inferior' gene lines (negative eugenics). Western history is steeped in the anxiety of negative eugenics, which constitutes the central ideology of Nazism to preserve the purity of the Aryan race. Consequently, race and class prejudices become intensified through high technologies (Schmidt and Moore 1998). However, Kimbrell (1993) argues that the extermination of inferior embryos is likely to be executed through 'commercial eugenics'. He foresees the growth of a new industry specialising in the marketing of designing and selecting desirable genetic traits of children, thereby preventing the birth of those who do not fit the 'perfect baby' mold. Mentor (1998) contends that the marketisation of 'designer babies' is likely to emphasise consumer choice as a proponent to humanise the logic for 'wanting the best for my baby':

> "Contemporary moves to eugenics will look less like *Brave New World's* state control and more like niche marketing and consumer choice. Postmodern eugenics will involve boundary-shifting discourses that import breeding logic into medicine, cloaked in the language of technology that mediates and 'humanizes' this logic. This will happen partly because current discourses on pregnancy and birth already include elements of eugenics and market language, so that 'I want what's best for my baby' moves easily into a demand for medicalised versions of 'the best.'" (pp. 83)

In short, breakthroughs in emerging transplant technologies are redefining corporeal boundaries leading to a proliferation of cyborgs, chimeras and hybrids, whose liminality problematizes traditional meanings of personhood, embodiment and citizenship. It is therefore at the border that these meanings are being negotiated. As Haraway (1991) maintains, "the cyborg is a kind of disassembled and reassembled, postmodern collective and personal self" (pp. 163). She calls for the need to create a *politicoscietific community* as a mean to achieve participatory public action towards the democratization of technoscientific liberty (Haraway 1997). Similarly, Davies and Burgess (2004) argue that the legitimization of medical knowledge and public policy should be achieved through a deliberative dialogue that is inclusive of the citizens. This is important as public trust in medical knowledge relies on individuals actively reflecting on their perception of risks, which is "intimately bound up with cultural beliefs, moral values, personal feelings and the social and material circumstances of their lives" (Williams and Calnan 1996: 1614). Through a phenomenological perspective, this paper seeks to explore lay perceptions among the British Public by understanding how conceptions of self-identities, the body and citizenship are implicated in negotiating the paradox between the life-saving promises and commodifying potentials of emerging transplant technologies.

METHODOLOGY

A phenomenological approach (Thompson et al 1997) is adopted to explore how participants construct meanings of posthuman embodiment in the context of emerging transplant technologies. As Bates et al (2005) suggest public understanding and acceptance of scientific knowledge need to be translated into personally meaningful information. As such, a phenomenological approach is useful as it considers the multiplicity of participants' socio-cultural and historical frame of reference to reveal personal yet ethically complex meanings surrounding these technologies.

14 phenomenological active interviews were conducted with members recruited from the British public. Exploring lay perception is important as consumption of medical knowledge and technology are often legitimized and given credentials through citizen activity (Haraway 1997). This can be achieved using participatory dialogue (Davies and Burgess 2004). This study therefore adopted the active interviewing technique (Holstein and Gubrium 1995), which involves the researcher collaborating with the interviewee to develop a mutually engaging dialogue concerning a particular topic. Here, the interviewer acts as a co-author to facilitate participants' reflexivity on the socio-historical processes that shape their personal views on emerging transplant technology.

In order to derive a fine-grained analysis of participants' narratives, interview excerpts from 5 participants are presented in this paper. In particular, I analyse how participants use language to 'perform' and 'construct' meanings surrounding transplant technology and cyborg embodiment (Holstein and Gubrium 1995). I consider how these meanings are expressed through culturally familiar metaphors, myths, ideologies and common expressions/euphemisms, which reflect common sense beliefs as well as folk knowledge (Thompson 1997). This paper is derived from a broader study, which explores meanings and experiences of embodiment and organ donation among young adults (aged 21-30)[2]. As participants would be expected to discuss intimate experience of how they relate to their bodies, it was deemed more appropriate to interview only female participants as the researcher is also female.

ANALYSIS AND DISCUSSION

An analysis of participant's narratives reveals 3 emerging themes. The participants in this study recognize that the cyborg-body conceived through new transplant technologies is at once an *enhancer* and a *mutilator* (Dumit and Davis-Floyd 1998). While acknowledging the life-saving potential of emerging transplant technologies, the participants question the extent to which such developments (1) violate the purity of their humanness and self-identity that may in turn leads to the (2) objectification of the cyborg-body as a medical commodity. Consequently, they envisage how these new form of transplant technologies may bring about the (3) inclusion/exclusion of these posthuman cyborgs in posthuman society.

Theme 1: Violation of Human Purity - Embodying Integrated/Fragmented Identities

For the participants in this study, emerging transplant technologies challenges their assumption about what it means to be human, which is grounded in *having* and *being* a bounded body (Seale et al 2006; Douglas 1902/1966). They are perturbed by the hybridity of the human/machine/animal coupling, fearing that such union may eradicate their personhood and compromise their sense of humanity (Hallam et al 1999; Douglas 1902/1966; Haraway 1991). For ex-

---

[2] Young adults (aged 21-30) were interviewed because they are considered as a salient group to the marketing of organ donation. They are more likely to be confronted with the request to join the donor registry when obtaining their driving licence or registering with a GP when attending university (Prottas 1983; Thukral and Cummins 1987). Further research is now being conducted among wider members of the British public to include participants from different demographics.

ample, the cyborg is described as '*not a real person*', '*less human*' and '*degraded*', as Neve explains below:

> *There is a film. Can't remember what it is called now. He is a robot….well…it is a set in the future where he is basically a robot but I think that one day he gets a real organ put inside him. And cause he always felt like he is not a real person cause ….he is like 'I haven't got a real heart'…..So maybe if I have got a mechanical heart I'd feel that I wasn't a real person. Yeah I think I might feel like that. Yeah I wouldn't feel like I'm a real person maybe or like a less of a human or something was missing or something wasn't quite right.* (Neve, Interview 1)

Drawing on the popular genre of a cyborg film, Neve envisions how the merging of organism with machine has reinforced her conviction that the body, and specifically the heart, is the seat of one's humanness (Manning-Steven 1997). For Neve, the film romanticizes the supremacy of human beings over machines (robots), which are built as an inferior replica of the human body. The absence of a '*real human heart*' renders the robot 'incomplete' as '*he always felt like he is not a real person*'. The capacity to 'feel' is invoked as a signifier of humanness in cyborg films (Holland 1995: 162). Here, Neve depicts the emotional anguish of the robot as he laments that '*he hasn't got a real heart*' and thus euphemizes the monstrosity and callousness of the cyborg-machine. Hence, the transplantation of a human heart into the robotic body is significant as it humanizes the robot as a sentient machine, and concurrently, fetishizes the heart as an indubitable source of emotion (Manning-Steven 1997). This theme has consistently foregrounded cyborg films. Most notable of which is the 2009 movie, Terminator Salvation. In the film, Marcus Wright, the humanoid protagonist solemnly ponders, "*What is it that makes us human? It's not something you can program. You can't put it into a chip. It's the strength of the human heart. The difference between us and machines.*" Such a narrative privileges the materiality of the body over the immateriality of the mind (programmable consciousness), thus inverting the Cartesian dictum from '*I think therefore I am*' to '*I feel therefore I am*'. Such a view merely fortifies the boundary that separates the body from the mind instead of dissolving it. Haraway (1991) argues that as technology progressively encroaches on our body, we are recalled to embrace an imagined organic body as a form of resistance. By occupying an embodied perspective, Neve expresses her ambivalence towards the incorporation of a mechanical heart, claiming that this would dehumanize her (*like a less of a human)* and potentially lead to the mechanization of her body. Neve envisages that the 'replacement' of an organic heart with a mechanical device will render her incomplete (*something was missing*) and artificial (*I wouldn't feel like I'm a real person*). The view that the transplantation of a mechanical heart necessarily eradicates one's capacity for emotion is not shared by all participants, as epitomized by Willa below:

> *I don't like the idea of organs being …from somebody else's body. It is a sort of intrusion of somebody else's body part I suppose. It's not mine; it's not natural to my body. The idea of actually receiving somebody's blood, I don't like it. If they could sort of manufacture blood, in a laboratory, that would be much better than the idea of having out of some person. Um, you know, if they could sort of build them, you know, like a mechanical heart, I would rather have them, than either the human heart or the pig heart, um, yeah Mechanical organs? Yeah, absolutely no problem. Yes, I mean that would be my happiest option or the option that I would have...the least difficulty with. Although, I don't know how it would feel if it was a heart,*

> *you know, whether one would somehow at some level feel less of a human. I'm just thinking of the Tin Man from….erm…The Wizard of OZ..... when he said, "If I only had a heart". I think I'd feel fine about having a mechanical heart cos I know that my heart is not really where my feelings are coming from Erm…there's much for me there's much less emotional issue around mechanical organs. With a pig's heart…it's just like a very basic level feeling of rejection, you know, that it would be like I was somehow less human. And I think I wouldn't want anybody to know I had a pig's heart. I think I might feel ashamed on some level. You'd be the girl with the pig's heart, you know. Erm….. you'd be part pig. Pigs have always been a symbol of dirtiness and uncleanliness, unclean pigs. You dirty pig.* (Willa, Interview 1)

In her narrative, Willa espouses the optimistic promise afforded by the 'manufacturing' of body parts (Langer and Vacanti 1995), claiming that this will reduce the emotional resonance of sourcing organs from a 'living' being (human and animal/pig). Here, Willa adopts a technocratic viewpoint (Johnson and Roberts 1997) suggesting that the spare-part pragmatism (Fox and Swazey 1992) of '*manufacturing blood*' and '*building mechanical heart*' will resolve the need for '*intruding*' the bodies of '*others*'. For Willa, human and animals are 'living' organisms with intentionality or *telos* (Heidegger 1945/1962; Bowring 2003) and therefore are entitled to the ownership of their bodies. As such, the thought of incorporating a 'living' organ into her body is 'unnatural' as this constitutes an infringement of body ownership (*it's not mine*) and dissolves the 'natural' boundaries between the self and others (*somebody else's body*).

Like Neve, the heart occupies a metaphorical space as a signifier of personhood and humanness for Willa. When considering the prospect of receiving a mechanical heart, Willa enacts the cultural representation of the Tin Man (or Tin Woodman in the novel), a character created by Frank Baum, which was later popularized in the film The Wizard of Oz. According to Ritter (1997), the Tin Man is a symbolic allegory of a dehumanized industrial worker, who was transformed from a loving being into a 'heartless' machine by the Wicked Witch of the East. Baum depicts how the Tin Man was gradually divested of his body parts, which were then replaced by tin. His mechanical body increases the efficiency and productivity of his work. As such, Ritter suggests that the Tin Man's life is a cautionary tale depicting the mechanization of the body by technology. The tale warns of the 'dehumanizing effects of industrialism and the machine age' (pp. 181). More significantly, The Tin Man is deprived of a heart (*If I only had a heart*), which symbolizes 'the loss of soul' and his capacity to love (Ritter 1997). Drawing on these cultural meanings, Willa briefly entertains the possibility that receiving a mechanical heart may compromise her sense of humanness (*feel less of a human*). However she later shifts her interpretive standpoint, claiming that the heart is "*not really where my feelings are coming from.*"

For Willa, the thought of incorporating a pig's heart into her body is deemed more problematic as this does not only dehumanize her (*I was somehow less human*) but on symbolic level, it constitutes a degradation of her personhood. She does not only *own* a pig's heart (*having)* rather she *is* '*part pig*' (*being*). The prospect of embodying a 'pig/human' self (*chimera*) therefore evokes in her a feeling of '*shame*' as she feels '*rejected*' by a society that has symbolically demean pigs as '*dirty*' and '*unclean*'. Xenotransplantation therefore defiles the purity of her human lineage and reduced her to her animality (Haraway 1991).

Theme 2: Spare Parts Factory - Cyborg-Body as Medical Commodity

As evident in Theme 1, participants fear the dehumanizing aspect of emerging transplant technology. Specifically, they question whether the body will be stripped of its human trappings and thus renders it suitable for mass-production (Sharp 2000). In light of this, my participants are concerned with the social benefit and cost of emerging transplant technology, specifically with regards to issues of animal and human/cyborg welfare. Images of '*transgenic animal and robot factories*', '*spare parts industry*', '*stocked cupboard of body parts*' and '*organ farming*' dominate participants' imagination, as evident in Michaela's narrative below:

> *If you see kind of like….a pyramid, you know, animals being right at the bottom and then humans….Although I'm kind of …..believe in animal's rights….. like you shouldn't farm animals just to cut them up and put them in another people. I kind of take an overall belief I suppose. If it can feel pain…then I shouldn't do it. But you SHOULD if it's going to save our lives, you know. Obviously humans come as a priority over animals any day. And even though I am vegetarian, I still really appreciate that. When they farm animals especially for organ donation, I suppose, erm……they are not…..that's….that's their purpose….(it's) giving them a purpose….they are not….their only purpose in life is to be cut up and put inside us, if you see what I mean. Erm…..I suppose…this isn't particularly nice. But then again, I won't ever put the life of say, a pig over the life of a human even if I don't know them. You know, when it comes to weighing up your priorities, humans are much more important than say pigs or anything else.* (Michaela, Interview 1, emphasis by participant)

For Michaela, the relationship between human and animals are organized in a pyramidal hierarchy, whose social position is predicated on their moral status. Singer (1990) calls this 'moral hierarchy', where sentient animals (such as human and primate) are accorded higher moral consideration as they are conscious of their existence and demonstrate *intentionality* for living (Heidegger 1927/1962). Meanwhile, organisms which are not self-aware and lack the *intentionality* for living occupy a lower status within the hierarchy (Singer 1990). For Michaela, the consciousness and intentionality that define one's being is founded on one's ability to '*feel pain*'. For Singer (1990), the pain and suffering of farm animals outweigh the pleasure of meat-eating by human. Such a view is largely grounded in the consequentialist (teleological) paradigm of ethics (Bowring 2003). Michaela is careful when justifying her support for xenotransplantation. On the one hand, she adopts a consequentialist standpoint, explaining that the farming of animals for transplantation is unjustifiable as the indignity and pain inflicted on animals (*if it can feel pain*) are tantamount to their objectification as commodities (*to cut them up and put them in another people*). On the other hand, Michaela emphasizes that the life of a human 'should' take precedence over the lives of animals (*humans come as a priority over animals*). For her, the farming of animals for organ transplantation is in itself an ethical act since it ennobles transgenic animals with a new *telos* (Bowring 2003), whose purpose in life is to save the lives of human beings. Michaela express her view in a 'matter-of-fact' manner, acknowledging that though organ farming is '*not nice*', it is nevertheless fundamental to the preservation of the human species. However, such a view is contested by other participants, as Willa's narrative shows:

> *Oh yes, and my concern also is that the animals, that if that became a normal thing to do, you know, the animals would be bred for it. I mean to me that's similar to animals who are being bred for meat on a large scale….erm….and you know, I have an issues with that, and I would have an issue also really with….I don't think that humans should be living at the expense of a species like that. I think….to me that is unnatural. I hate the idea of factories of animals being bred to be taken apart. The pig hadn't chosen to be a donor. Erm…..and…I don't know, you know that…I don't like the idea of animals being bred just to be donors.* (Willa, Interview 2)

Willa fears that the routinization of xenotransplantation will lead to the '*breeding of animals*' on an industrial scale, which she contends is akin to the '*factory farming of animals*' in meat production. Unlike Michaela, Willa adhered strictly to the consequentialist paradigm of ethics, claiming that '*human should not live at the expense of animals*' as it disrespects the sanctity of other life forms (Haraway 1991). For Willa, animals (pigs) are living beings who has an inherent right to be free (Bowring 2003). The farming of animals for the purpose of transplantation is '*unnatural*' as it is a violation of their freedom since '*the pig hadn't chosen to be a donor.*' By reassigning their *telos* as organ donors (*just to be donors*), xenotransplantation potentially transforms animals into medical by-products or spare parts within the biomedical machine. This sentiment is shared by other participants, as Chloe's narrative demonstrates:

> *Well first when you hear cloning, it's like warning bells going off and you think, "No! That's all wrong." Yeah…erm…it does sound scary. I think there's like a taboo that goes with the word 'cloning' and the kind of like meaning that goes with it. Erm… yeah, it's tricky business, this cloning. If you can sort it out yourself like you say, can have a clone…erm…then you are probably more guaranteed obviously the match and you don't have to rely on somebody…somebody else's lost of life. So it's almost very BIZZARRE. Like a film where you can see these people kind of like, cloning themselves and fill in like a little stock cupboard of "just-in-case" you know, you need a spare parts (laugh). There was a case about parent wanting to clone one of their child to give life ….just to save the other one. And now that I really couldn't get my head around. There are a lot of moral questions that underpin it really. You just see people cloning themselves wholly or cloning their children because they want the child in a specific way. I don't really agree with that because I feel that you know, you are individual and you should be individual. Erm…but if…if there's a way of. Like when I said earlier, if I couldn't have children then I am not meant to have children. Sometimes people just aren't meant to live. And I don't know. Cloning babies and stuff like that just doesn't sound right to me. It sounds like we have taken it too far.* (Carmen, Interview 2)

Carmen's narrative can be considered as a cautionary tale against reproductive cloning. For her, the cloning of a human for the purpose of transplantation is a social '*taboo*' since it crosses the line (*taken it too far*) of what is 'natural' (Haraway 1991) or in Carmen's words '*meant to be*'. On the one hand, Carmen acknowledges the therapeutic promise of organ cloning, claiming that this will ensure a '*guaranteed match*' of tissues that will prevent the transplanted organs from being rejected by the patient's immune system. In addition, the cloning of organs circumvents the need for 'cannibalizing' on the death of another. However, Carmen remains perturbed by the absurdity of reproductive cloning as this conjures up '*bizarre*' images of cloned-body-parts being '*stocked up*' as '*spare parts*' ready

for the production line of organ transplantation. Though misguided, Carmen is aghast by stories of parents who opted to 'clone' their children to save the life of a sick sibling (Gray 2002). For her, this raises moral questions concerning the inherent value of the cloned child as a living being. More importantly, Carmen is concerned that the cloning of children for transplantation will lead to the creation of 'designer babies' (*because they want the child in a specific way*). For Carmen, such a practice is depersonalizing as it withdraws from the cloned-child, his *'individuality'* as a unique being (Haraway 1991; Mentor 1998). For Carmen, medical technology (such as reproductive cloning) disturbs the 'natural order of life' as '*sometimes people just aren't meant to live.'*

Theme 3: Cyborg Citizenship - Inclusion and Exclusion in Human Society

As demonstrated in Theme 2, most participants are adamant that the rights of posthuman cyborgs (eg. the cloned child and xeno-species/animals) should be respected as they are deemed as living 'subjects' with '*unique personality*' and '*human qualities*'. This leads participants to ponder the social ramification of transplant technologies as it has the potential to alter family dynamics and kinship. At its extreme, participants envisage that such technologies, in particular, organ cloning will inadvertently breed a new class of *'cloned race'*, whose social position is subordinated to the '*pure human race*'. Consequently, they will be marginalized as the '*underclass', 'half-bred'* or *'underdog.'* This is illustrated in Estelle's narrative below:

> *That's another debatable thing. Like the couple that had….was it a clone….a clone embryo inserted….so they had a baby that had the matching tissue for their son to cure him. Err…and it could be brilliantly… just the fact that it is brilliant the one son get to obviously live longer. And you celebrate….you'd worship the son where it came from cause they save your life and you would almost always think of them really fondly. But that could be really damaging. The fact that they could think, "Oh! I was just produced to help my brother. I wasn't born out of love."…like when a child was being born out of a one night stand. The whole idea of that is horrible… I think that could cause problems cause they really might be like, "oh what's the point of me being here if it was just for them." And then they would always possibly see themselves as the underdog to their siblings or something. That's a bit scary because erm… the fact with cloning ….one always just die early and it is just….the fact that they are being used for organ transplant rather than having just a great life as the person they were cloned from. The chances are that they do die or they have like…. a mutation and they are not…they are not quite right (laugh). I think that's a bit sad because you are producing something when you know the risks are really high that it's going to have a low quality of life.* (Estelle, Interview 1)

In this narrative, Estelle questions the gifting dynamics underpinning a clone-sibling donation, claiming that this will marginalize the cloned child to a secondary status as an '*underdog to his sick sibling.'* Fox and Swazey (1992) call this the 'tyranny of the gift'. In other words, the cloned child is 'obligated' to donate lifesaving tissues for his sibling, whose sickness brought about his conception in the first place. As such, the identity of the cloned child is inextricably bound to his sibling as they become entangled in each other's lives. Such a bond alters the dynamics of sibling relationships, where the cloned child may be *'worshipped'* and *'celebrated'* for his lifesaving sacrifice. However, Estelle argues that such sacrificial ideal also

reveals a '*damaging*' burden for the cloned child, whose purpose in life (*telos*) centres on being his brother's keeper (*I was just produced to help my brother*). As such, the inherent value of the cloned child as an individual becomes eclipsed by his sibling, whose well-being takes precedence over his (*oh what's the point of me being here if it was just for them*). Estelle equates the cyborgic conception of human clones to being '*born out of a one night stand*', a birth that is bereft of love. Here, the cloned child is depicted as a '*product*' of science, engineered by medical technology to provide valuable commodities that can be '*used*' for transplantation (Morrow 2001). Estelle further observes that reproductive cloning may produce new forms of risk, such as genetic mutation, that science has yet to have the capacity to deal with. Giddens (1991) calls this 'manufactured risks'. Not only will cloning compromise the life expectancy of these cloned children, they will also be deprived of a '*great quality of life*' enjoyed by the siblings they saved. As such, the cloned child is merely an 'inferior' copy of their 'original' siblings. The perceived 'inferior' status accorded to cloned children raises question as to whether the normalization of reproductive cloning may fuel society towards the practice of eugenics, as Willa's explains below:

> *There's this book that Kazuo Ishiguro's just written. It's called Never Let Me Go. Have you heard about that? There are these teenagers there, and it's about them and gradually you realise that they're clones, and that they've been bred to give organ transplant. Um, they've been reared to be clones, um specifically for organ transplants for humans. Basically um, by the time they're 40 most of them are dead, and this girl is in her 30's and she's looking back on her school days and most of her friends have died now because gradually they've had all their organs removed. Bit by bit they have to go and have operations, and give away a bit, and they become ill. But for some reason a state experiment is going on where they decide to give these people a good education, and um, I mean obviously the book is really about you know…dangers of cloning, but it really upset me. Perhaps, you know, I'd end up, in some sort of cloning test laboratory, um, I have a lot of theoretical doubts about… various sorts of genetic screening because throws up issues, um…you can't help think of the sort of Nazi camp experiments and things, and, the idea that some people you know could be screened out because of perceived irregularities or imperfections that actually make them themselves. I wouldn't particularly want my body to be used as a testing ground for those sorts of things. I don't know who is to decide which are the, you know, which is the perfect gene solution, and you know, who is to be preserved and who isn't…um. It would be impossible to preserve life indefinitely because we would then have to breed a clone, a clone race to take the organs out, because if nobody was going to die, where would we be getting the body parts, and the answer is we'd be breeding some unfortunate underclass of half-people. Um, it would be like the Ishiguro book.* (Willa, Interview 2)

Drawing on popular and historical discourses surrounding eugenics, Willa is concerned that the cloning of human may pave the way towards the elimination of '*imperfection*' through genetic screening. Willa foresees how the drive towards '*preserving*' human lives may necessitate the need to '*breed a clone race*' to supply body parts for organ transplantation. This reminded her of the dystopian novel by Kazuo Ishigoro, Never Let Me Go (2005), which poignantly depicts the lives of cloned children who are '*bred*' and '*reared*' to support the state-run organ donation programme. Willa is upset by

the powerlessness of these cloned children, who are compelled by the donation system (that has primarily brought them into existence) to gradually '*give away their organs*' in fulfillment of their moral duty as 'donor-citizen'. As such, the cloned-bodies are regarded as 'living vessels' containing valuable commodities, which effectively transforming these children into routine donor-cyborgs (Hogle 1995). Such a gifting system is 'tyrannical' (Fox and Swazey 1992) as the well-beings of these clones are grossly disregarded (*they become ill*), which often leads to their death (*most of her friends have died*). Indeed, their death is often euphemized in the novel as '*completion*', effectively masking the unspoken 'guilt' of society for capitalising on a 'living' source.

Despite being '*given an education*', these cloned children are disenfranchised as the '*underclass*'. Their hybridity as '*half-people*' renders them monstrous (Haraway 1991). They are at once promising (*life-saving*) yet potentially destructive (*loss of humanity*). In the novel, Ishigoro portrays how the existence of these cloned children is often shrouded in silence, signifying their exclusion from human society. Their exclusion hints at the widespread prejudice of human society to accept the 'cloned race' as fully human (Schmidt and Moore 1998). Such a dystopian view of posthuman culture reflects Gray's (2002) fear of a divided cyborgian society, which is made up of the underprivileged 'technopeasants' and the privileged 'technocrats'. For Willa, the cloned children are the '*unfortunate underclass of half-people*' whose enfeebled bodies (*weakened through organ removal*) enslave them as 'peasants' within the posthuman workforce. Indeed, Ishigoro seems to suggest that the career options open to these cloned children are limited to being a 'donor' or a 'carer'[3]. In turn, the cloned-donor nourishes the body of the human race, who are granted privilege access, control and knowledge to lifesaving technologies. In other words, human's ability to command medical technologies cement their social position as the powerful 'technocrats' (Gray 2002), hence, widening the gap between the '*have*' and the '*have not*'.

Willa also warns of '*the danger of cloning*', stating that this may manifest into the practice of eugenics akin to the Nazi's racial cleansing movement in World War II (Bowring 2003). She is cautious that the quest for the '*perfect gene solutions*' may culminate into negative eugenics, in which '*irregularities*' and '*imperfections*' that make up the uniqueness of individuals (*that actually make them themselves*) are eliminated (Mentor 1998). Willa is apprehensive that her body may be used as a '*testing ground*' for genetic experimentations. She is concerned that genetic coding may be used to '*screen out*' individuals who are socially perceived to be 'deficient' while '*preserving*' individuals that fit into the social mold of the '*perfect gene*'. She raises an interesting question as to who has the power to make decisions concerning genetic screening and eugenics. Considering the cultural significance of eugenics in Western history, Willa implies that the genome project may well lead us towards a dystopian posthuman society, where such genetic screening are governed by the state (Gray 2002). Meanwhile, other participants worry that the cloning of 'designer babies' may accentuates consumer 'choices' in a posthuman society, where individuals (couples) are free to exercise their decisions concerning the reproduction of 'desirable' genes (Mentor 1998).

CONCLUSION

The narratives my participants constructed around emerging transplant technologies demonstrate that conceptions of posthuman

identity, body and citizenship are complex and their meanings are often contested within the political, historical, cultural and moral framework that contains it. Emerging transplant technologies challenges Western understanding of the 'integrated self', which is predicated on the ideal of the 'bounded body'. For individuals to accept emerging transplant technologies as a legitimate practice in biomedicine, they need to come to terms with their joint kinship with machines, animals and their clones, and be comfortable with embracing the partiality of 'fractured identities' (Haraway 1991). Concurrently, individuals must contemplate embodying a *permeable* body, where boundaries are continuously shifting, collapsing, regenerating and fusing with collective 'others'. One must therefore envisage a posthuman society where technoscientific liberty is endorsed (Haraway 1997) to include a diversity of cyborgs, chimeras, transgenics, bionics and clones as equal citizens. Gray (2002) argues that this calls for a 'democratic technological order' (pp. 198) where cyborg citizens are empowered through freedom in accessing knowledge and technologies. For Gray, citizenship is grounded in our embodiment and ability to exercise constructive power, which enables individuals to control technologies for their own cyborgization.

Haraway (1991) contends that current political climate precludes such democracy so long as grand narratives pertaining to the 'integrity of the Western selves', 'the sanctity of human purity' and 'the sacred division between nature and culture' continue to dominate socio-cultural discourse. For the participants in this study, the cyborg is an embodiment of paradox, whose technocratic optimism (Johnson and Roberts 1997) is intertwined with the monstrosity of unimaginable and dangerous couplings (Gray 2002; Haraway 1991). Their liminality and transgression destabilize cultural understanding of 'naturally-sanctioned' categories. While acknowledging its transcendental value as life-enhancing and life-saving, the participants are concerned that emerging transplant technologies may alienates the organic body from its rootedness in humanity, which subsequently leads to its commodification. Market metaphors pertaining to the *'mechanization of the body'*, *'factory farming of spare parts'*, *'engineering of customized cyborgs'* are ubiquitous in their narratives.

Popular media (such as films and novels) and historical stories (e.g. Nazism) provide cultural resources for participants to construct dystopian narratives of (1) technological determinism (*destruction of humanity by medical technology*), (2) techno-slavery (*the subordination of animals and non-human species*) and (3) negative eugenics (*elimination of imperfections*). These narratives resonate with Thompson's (2004) observation of the Romantic Myth in the natural health marketplace. The *Romantic Mythos* is an allegorical tale depicting the alienation of human by modern technology. According to Thompson, such allegory is a critique of scientific progress on modern society, which culminates in the disenchantment and dehumanization of man. The 'Tin Man' epitomizes the tragic character of the Romantic Mythos, whose natural body is displaced by the mechanistic forces of industrialization. The 'heart' emerges as a potent symbol in romantic myth, signifying the return to the organic body and the articulation of emotion (Venkatesh et al 2002). By enacting the romantic myth of the 'organic' and 'emotive' body, my participants are able to articulate their ambivalent relationship with emerging transplant technologies. For them, cyborgs are illegitimate offsprings (clones, transgenic animals) born out of transplant technologies (Gray 2002). Their conception is not predicated on metaphors of *rebirth* but on cyborg *regeneration* (Haraway 1991). As such, the cyborg has no origin story (Edenic Myth) in a Western sense, as Haraway poignantly reflects:

---

[3] In Kazuo Ishigoro's Never Let Me Go, a carer is a clone who is temporarily relieved from their duty as donor to care and support other cloned-donors as they give up their organs.

"A cyborg is not innocent; it was not born in a garden; it does not seek unitary identity and so generate antagonistic dualisms without end; it takes irony for granted" (pp. 180).

The Meaning of Nature and its Implications for Individual Consumption Behavior

Vimala Kunchamboo, Monash University, Malaysia
Christina K.C Lee, Monash University, Malaysia

CONTRIBUTION STATEMENTS

There is a plethora of studies on nature related behavior from social psychology providing useful insights, especially on the impact of connectedness to nature in developing ecological behavior; however with minimum attempt to theorize why individuals engage with the natural world. This research presents a theoretical framework suggesting progress towards sustainability is only achievable if individuals see themselves as part or in total oneness with nature. Deeper insights into bloggers' thoughts, memories and experiences reflect their views of nature as extended self, their engagement with nature spirituality and their co-existence with nature as part of God's creation. This research has the potential to offer transformative insights on sustainable consumption behavior and contributes to consumer research by providing an avenue towards understanding individual experiences that may change sustainable consumption attitudes and behavior.

Nature may hold different meanings to different individuals. Therefore, each individual's experience with nature is unique and this translates into personal expression and meanings. Previous studies suggest connectedness to nature fosters ecological behavior, however, these studies lacked the theoretical foundation on *why* consumers engage with the natural world. This study explores what motivates consumers to be a part of nature. An interpretative approach is used and the data is based on an environmental blog over three years to explore the meaning of nature among those who are strongly inclined towards nature and its preservation. The results include the consideration of nature as an extension of self, spirituality and religion. Overall, the results suggest that viewing nature as one with self is a key motivational driver of ecological behavior and sustainable consumption. This article contributes to knowledge in consumer research by addressing the root-cause driving sustainable consumption behavior.

INTRODUCTION

Despite an overall increase in ecological awareness and concern, getting individuals to engage in actual conservation behavior is a major hurdle. Yet, there are individuals who are extreme lovers of nature, choosing to live differently by confirming to their ecological self and engaging in services to protect the environment (Craig-Lees and Hill 2002; Dobscha and Ozanne 2001). What makes these individuals unique and what drives them to be deeply involved with nature? An appropriate strategy to understand this unique relationship is to identify the root cause of individual ecological behavior by exploring their views and meanings attached to their personal experiences with nature. How individuals view nature and how we view our place within it has implications on nature related behavior (Hoffman and Sandelands 2005).When looking at the rainbow or the sunset, or feeling a drizzle of rain, what do individuals experience? Are there strong individual meanings attached to these experiences with nature?

Studies initiated to address our current environmental problems reveal that intimate contact with the natural world fosters ecological behavior and is critical to healthy human development (e.g. Beringer 2010; Gosling and Williams 2010; Mayer and Frantz 2004). Although fruitful, these studies only explored the extent individuals associate with nature without any theoretical foundation on *why* they engage with the natural world. Despite the emphasis given on developing nature-related behavior, only a small number of studies have attempted to theorize its findings. Therefore, differing from past studies, current research theorizes on the intense individual motivation towards nature, which is more consequential for sustainable behavior. Research on human-nature relationship would benefit from a more explicit understanding of reasons motivating humans to identify nature as part of their self. Therefore, if connection to nature influences our ecological behavior, it becomes critical to have an in-depth understanding on how humans view nature.

An interpretive approach, using grounded theory method is used to explore how individuals view nature based on their individual experiences, backgrounds and memories. The goal is to provide a more holistic and grounded perspectives on peoples' thoughts, feelings and images about nature to address "why people engage with nature and how their engagement with nature influences their consumption behavior". This study reveals the motivations for humans to connect with nature. The results contribute to the discussion on the root cause of ecological behavior. The study also provides an explanation on how an individual's motivation to connect with nature influences consumption behavior.

LITERATURE REVIEW

There are three world views encompassing human-nature relationship–anthropocentrism, ecocentrism and theocentrism. "Anthropocentrism considers the human as the most important life form, and other forms of life to be important only to the extent that they affect, or can be useful to humans" (Kortenkamp and Moore 2001, 262). This approach places human as central and is regarded as the most significant entity in the universe and places nature as an object for human to use and exploit. Hence the conclusion that "there is only man-the-subject and nature-the-object and between them, there is only the question of which of the two has priority" (Hoffman and Sandelands 2005, 147). Ecocentrism takes the opposite view of the world and promotes the idea of a living earth and nature is perceived as alive, sensitive and possessing intrinsic value thus nature can be, but ought not to be harmed (Brown 1995). Between these two views there is the question of dominance, that is, human over nature or nature over human.

Additionally, Hoffman and Sandelands (2005, 147) offer a modified view of nature called theocentrism, an environmentalism based on God, in which they argue;

> "Must the interest of human and nature be seen as separate and in conflict? Just as politicians are caught between the rock of meeting human needs for resources and the hard place of preserving nature's integrity and beauty, religious commentators are torn between the idea of man's God-given dominion over nature and the idea to respect God's creation of nature".

Theocentrism requires valuing what has been created by God by applying humility, selflessness, moderation and responsibility in every act human take towards nature (Hoffman and Sandelands 2005). The adoption of this theocentric paradigm shifts the environmental perspective to view nature and human as one.

Human-nature relationship is complex and can be viewed from many dimensions, such as, affective connection (Hinds and Sparks 2008; Mayer and Frantz 2004, Shultz et al. 2004), place identity (Fried 2000; Gosling and William 2010; Stedman 2002), spirituality

(Worthington et al. 2011) and well-being (Beringer 2010; Dobscha and Ozanne 2001). These studies have generally explored the effect of nature connection on ecological behavior. To promote sustainable behavior requires a fundamental understanding of an individual's psychologically driven personal relationship with the natural word.

In summary, the purpose of this study is to further understand how the meanings individuals attach to nature influence ecological behavior. The next section addresses the methodology used in this study, followed by the interpretative findings and discussion of the emergent themes. We conclude with implications for consumer research.

METHODOLOGY

An interpretivist approach, using grounded theory method is used to investigate how individuals view nature based on their experiences, backgrounds and memories. Data is collected from an eco-psycology blog called "Seeds for Thought" (http://thoughtoffering. blogs.com/ice_seeds/). The data compiled is grounded in the ideas and comments from the interaction between the bloggers. Bloggers share their thoughts, ideas and feelings using the "comment" function at the bottom of each post by the writer. Several studies have employed a similar method of collecting data from online communities such as Cova and Pace (2006) and Shaw et al. (2011). The ecopsychology blog "Seeds for Thought" was initiated in 1999 as an extension of public communication and is a collective blog by different members of the international community for ecopsychology. The blog addresses the idea of relationship between humans and the natural world. Data for this study is based on a period of three years, between 2005 to 2007, which includes 30 articles and 100 individual comments. This provides a deeper understanding on the evolution of human-nature relationship over the past three years. Although initial data collection was targeted up to 2010, data saturation was reached by the year 2007. The focus of the research is on understanding the meaning and interpretations of consumers towards nature and to understand their world from their points of view.

Data is interpreted using the following procedure. The codes were allowed to emerge from the data set. The comments of the bloggers were read as a whole to have a basic understanding of the essence of their thoughts. Additionally data was coded based on metaphors and key words in context. To generate initial categories, each article and comments were read and coded to generate as many themes as possible (Charmaz 2006; Strauss and Corbin 1998). These themes were later grouped to develop categories to understand the meanings individuals attach to nature and how these meanings implicate on their nature related behavior. Finally, the themes and emerging theoretical framework were weaved into the existing literature on environmental behavior.

It should be noted that the participants in the blog are particularly concerned about environmental and sustainability issues. Therefore, the insights provided by the blog members represent views of people who are genuinely concerned about nature. These insights provide a foundation to explore the extent ordinary consumers engage with nature and its influence on sustainable consumption. The focus on nature related behavior necessitates the importance of illustrating how nature is defined from the perspective of the participants and their relevant intentions to involve with nature. Therefore, the discussion of the themes generated from the data is organized into four sections below. We begin with (1) what is nature?; (2) categorizing nature-lovers; (3) nature and self; and finally (4) influence on sustainable consumption.

WHAT IS NATURE?

Human and all elements in nature are interconnected through a universal web. Similar to individuals, each element in nature has its own characteristics. Meaning is derived as an individual's traits intermingle with nature. Therefore, each individual's experience with nature is unique and this translates into personal expression and meanings. This personal experience with nature explains why some people feel relaxed as they walk through a willow, feel happy to hear the chirping of birds or delight in seeing the blooming of flowers. Interaction with nature opens the door to our inner self and we subconsciously interact to develop this intimate association and deeper meaning. To some, nature may simply mean a distant object, awesomely larger and more powerful than themselves, such as the ocean or mountains, and to others the meaning may run deeper, associated with elements of nature that is in proximate contact, for example a flower in their home garden. The data analysis reveals various places and things individuals classify as nature.

Participants in the blog addressed nature to resemble mountains, lakes, forest, sea, stars, sun, sky and to others nature simply means objects that is a part of their daily lives such as insects, pets, lawn, rocks, animals, yards, flowers, trees, parks, beach, potted plants, vegetable and flower garden. As nature lovers, these blog participants perceive nature as alive, real, sensitive and evolving. They voiced their disapproval on the usage of virtual reality as substitutes such as a simulated fire place instead of real fire;

> "It's sad to see people being so willing to settle for 'virtual reality' rather than natural reality". I know just what you mean about the blessings of the real thing".

> "Human artifacts and humanly created environments are just not complicated enough to provide the finely detailed, multisensory experience necessary for proper development".

CATEGORIES OF NATURE LOVERS

Additionally, the results show the intention to engage with nature is driven by the differing goals of individuals; the differing goals identified include, to seek, to honour or to nurture nature. The blog participants can be categorized into nature-seekers, nature-honours and nature-nurturers. Nature seekers are inclined to appreciate and enjoy nature as they hike, take walks in parks, or beaches. This exposure to nature nurtures a sense of belonging and contributes to knowledge building;

> "I have two nature aware kids, they have been exposed to nature since babies, they know that the birds are the eyes of the forest, and can tell you what is happening in our neighbourhood by listening to birds".

> "I just spend a long weekend on a mountain ridge in the middle of forest land and experienced some of this serenity and simplicity myself".

The nature-honors are moved by its beauty and power and they dwell in nature as a way to feel its wonders, accepting them as a part of universe. They acknowledge their co-existence with nature and its intrinsic value;

> "There's certainly something about the rose that reaches deep into the human heart and psyche with a healing grace. Just gazing at them, smelling them, talking with others about them is profoundly relaxing and delightful".

The nature-nurturers, through their deep involvement and strong compassion towards the natural world, are strongly motivated to protect and nurture it. These individuals engage in simple activities such as growing roses, feeding the ravens, growing organic food which they regard as contributing to the health of nature;

> "Having a garden alive with food for me and for other creatures is a profoundly satisfying feeling".

Individuals' affiliation with nature triggers their interest to know nature, leading to increased ecological awareness. This awareness gradually progresses to the next stage of higher involvement with nature, to admire, appreciate and eventually develop a strong compassion with their natural surroundings. In summary, through the process of evolving with nature, nature-seekers develop into nature-honors and ultimately into nature-nurturers accepting their well-being and nature's as one. This is represented by the following thoughts of this blogger;

> "Before taking up gardening seriously, I was a mainstream psychotherapist for many years. Like so many of us, I was oblivious to the larger context within which we live. I took up gardening as a "hobby"- a sort of exterior decoration. But soon my garden was "working" me even more than I was working my garden. Just kneeling on the earth, with sound of bees and birds in my ears as I touched plants started softening up some of the cultural armour that separates so many of us from our wild natures….so I understood that no individual exists in a vacuum… the ultimate context is the earth".

NATURE AND SELF

The notion of nature being viewed as self emerged from our data interpretation. The results reveal the intensity of the relationship between the individual and nature, to the extent that nature is seen as one with self. Three main themes that explained the relationship between human beings and the natural world were identified, that is, extended self, spirituality and religion. These themes are discussed next.

Nature as Extended Self

The self is a sense of who and what we are (Kleine, Kleine, and Kernan 1993). Accordingly Aron et al. (1991) argues that the extent to which one includes another person as part of the self is a core operationalization of relationship closeness. The term extended self refers to how human extend themselves to include their surroundings. Major categories of extended self includes body, internal process, ideas, experiences and those places to which one feels attached (Belk 1998). As such our perception towards nature as a distant object or as our extended self has implications to the way we treat nature.

Individuals who are deeply concerned with environmental and sustainability issues (that is the blog members) have a strong sense of self with nature, and perceive nature as part of the extended self. Belk suggests (1988) that external objects can be viewed as part of self when we are able to exercise power or control over them. "The more we believe we possess or are possessed by an object, the more a part of self it becomes. By claiming that something is mine we also come to believe that the object is me" (Belk 1988, 140). The concept of extended self has been applied to studies concerning sense of place (Stedman 2002), organizational self-identity (Tian and Belk 2005) and self-brand connection (Escalas and Bettman 2005). Additionally, Kuhn (2001, 13) states that individuals build psychological relationship with the environment through the process of self-actualization,

developing a "personal sense of self beyond one's encapsulated self to an extended larger self" incorporating nature. This deepening of one's ecological self brings forth sense of oneness with nature. This article explores the extent the self is viewed as one with nature.

Participants used phrases such as *"to allow the natural world into us"* to indicate the inclusion of nature into their self. Usage of metaphors describing nature as "*our womb", "our mother*" and "*our root*" denotes the sense of oneness with nature and to view it as their origin. The bonding experience with nature is described as having a sense of belonging. Hence the individuals view self as a part of a bigger pattern of life. The comment below from a participant clearly acknowledges the inclusion of nature as his/her extended self.

> "One might even say nature was our womb. We have been on planet Earth in our present form for one hundred thousand years. That's a long, long time! And throughout that time, we were immersed in living nature. It was there when we went to sleep, it was there all night, it was there when we awoke. We depended on living nature—and on each other as part of living nature—for everything".

Additionally, the more one experiences nature the higher the likelihood for it to become a part of themselves, thus strengthening the bond;

> "Every Friday I walk at the beach not far from my house. The water, birds, passing dolphins and whales have become like members of my family. Every time I stroll along this stretch of sand, I become more bonded with it".

Perceiving a strong bond with nature and accepting nature as self, the bloggers self-reflect the feeling of empathy through expressive words such as "*my heart breaks", "pain", "suffering"*, "*anger*" and "*guilt*", indicating hurting nature also means to hurt one's self. According to Kuhn (2001) empathy is experienced by individuals as they identify with the natural world through their sense of expanded ecological self.

> "What does it mean that my heart breaks every time I hear of another species becoming extinct, every time I see emaciated people across the world, see ugly buildings where healthy, wild places once stood? Surely it *means* something. It means, doesn't it, that something is wrong if everything we've been taught to do and believe leads us to more of these things that breaks my heart? Surely mine isn't the only heart breaking...?"

> "It was good to have a place to express my grief as well as my guilt in how I contribute to the pollution and contamination of the biosphere".

> "It's painful to see what we are doing to the place we love (humans are the only species that actively and consciously "fouls its nest") and to see the wholesale killing of rare and endangered mega fauna".

As such, in the study of environmental behavior, the role of extended self cannot be ignored. Our perception towards nature as our extended self has implications for the way we treat nature. This perception elicits the awareness of interdependency with nature, leading to an emotional bonding. This bonding develops the view that nature has an intrinsic value. The sense of inclusion encourages people to view nature as "being" in their self, thus developing a strong need to value and protect it. As such, viewing nature as extended self encour-

ages consumer ecological behavior which leads to a positive attitude towards sustainable consumption. However excluding it encourages the anthropocentric view that treats nature as an object and hence the tendency to exploit it. Therefore, the development of ecological behavior requires consumers to link themselves closely with nature.

Nature as Spirituality

The second theme that explains the participants' sense of oneness with nature is spirituality. Spirituality is defined as "a general feeling of closeness and connectedness to the sacred" (Worthington et al. 2011, 205). Krishnakumar and Neck (2002) referred spirituality as "an inner search for meaning or fulfillment that may be undertaken by anyone regardless of religion". "Individuals develop a sense of spiritual self in relation to a higher power or God and by recognizing the sacred and divine within them" (Klenke 2007, 82-83). It is a concept that originates from inside an individual. Spirituality, then, can be defined as the "core or inner life of the person and is found in all human societies through an individual experience of the divine, a connection to nature, and/or through religious practice" (Beverly 2010, 21). *Nature spirituality* involves "a sense of closeness and connection to the environment or to nature" (Worthington et al. 2011, 205). For example one's feeling of serenity and calmness while witnessing the wonders of nature. The potential importance of spirituality as a variable in explaining human-nature relationship is still neglected in the literature.

From the perspective of ecopsychology, individuals look towards nature as a source of nature-spirituality. It includes a sense of connectedness between the individual's inner self and the external world. This connectedness encourages the individual to identify self with nature and as an individual's nature-spirituality develops, their mind and body becomes one with nature.

The findings revealed close connection with spirituality and nature where many shared their views of experiencing a deeply moving and pleasurable sense with nature. Nature spirituality can be explained through shared thoughts of the blog members such as *" I became more what I call my 'authentic self' after experiencing with nature",* in which this particular blogger claims finding her true and genuine self as she experiences nature.

Spiritual engagement with nature awakens the individual's true-self and encourages behavior consistent with their belief of self. Klenke (2007, 85) introduced the concept of self-disclosure to mean "opening oneself to a higher power, admitting to spiritual needs and struggles". Hence, with nature spirituality people are deeply aware of how they think and behave towards nature. Members recount their experiences with nature as deeply moving and pleasurable suggesting a sense of spiritual connectedness.

"I only knew that I felt relief. During the period I went regularly to the creek and I can truly say that it felt as if I was going to visit a trusted and loving friend or beloved and wise teacher. Due to a shift in awareness away from my thoughts and towards a deeper sense of being that was free of mental process. There was a sense of being mute and I wanted no human interaction. The solace I received just by being there was truly astounding and there is no doubt this solace did indeed emanate from nature itself."

To this participant, the tree has meaning, symbolizing wisdom, hope, endurance and calmness. By connecting with the creek, the participant allowed the traits of the creek to flow into self, witnessing and accepting its calmness, comfort and wisdom leading to the experience of nature-spirituality.

An interesting area of discussion on spirituality relates to the role of sensory qualities of nature which aid the transfer of spiritual qualities from nature to individuals. The data reveals that nature's sensory qualities leads individuals to experience a deeply moving and pleasurable sense of oneness with nature which evokes a sense of spiritual wellbeing. "The smell of spring, sound of waves on the rock, sound of bees and humming birds, being caressed by a dewy overhanging willow, watching geese flying north for summer and seeing roses popping on bushes in the garden" inspires the individuals in this study to deepen their connection with their inner self and the external world. As highly involved individuals, bloggers are found to be highly sensitive to these sensory qualities in their surroundings;

"But what caught me off guard when I stopped the car in my driveway was the smell... the smell of the sea, that wonderful salty air which my nostrils had forgotten during a short vacation. I ran up to my deck, looked at the sea, breathing in all the air I could, listening for the sounds of the waves on the rocks. I could have stayed there forever".

"I gazed at the rugged coastline when I could, watched the exposed rocks at low-tide, observed formation of Canada geese flying north for the summer and wondered how my pile of snow was doing".

"I dropped to my knees and started tending my plants, touching the earth. Within a couple of minutes the anxiety drained away, absorbed into the rich, dark soil. I started to breathe deeply again. I had a sense of serenity".

Besides, the acceptance of nature as something larger and more powerful than human, its magnificence, miracles, timelessness and solitude encourages individuals to immerse in deeper thoughts, evolving an emotional dependence on nature and developing strong individually driven internally bonding which leads to nature spirituality.

"It's rare to find a person who hasn't experienced a deeply moving and pleasurable sense with something awesomely larger than themselves just through looking at the stars on a clear night"

"During my visits I would just sit on the boulders along the creek or walk in the water. There was a sense of being mute and I wanted no human interaction. I was aware of the creek and woods as having a very distinct and palpable presence. The solace I received just by being there was truly astounding and there is no doubt this solace did indeed emanate from nature itself".

Nature based spirituality plays an important role in developing human well-being. There is evidence from previous studies that human benefit emotionally and physically by connecting to nature (Martens, Gutscher, and Bauer 2011; Ryan et al. 2010), for example, experiencing more positive feelings by merely being around, relaxing or walking in natural favorite places (Korpela and Yle'n 2007). Our results resonate past studies, that those who are in-tuned with nature view it as an essential source of emotional and physical wellbeing;

"I still go to the mountain twice a week, the personal healing has been incredible".

"There are no words to describe what happens to people who start mixing mud with their feet, allows people to personally experience the earth in such a different way."

"Watching the endless subtle changes of the garden as the season passes grounds and relaxes me".

A spiritual connection with nature also leads to psychological and physical healing, this theme is conveyed through bloggers' comments of *"sense of serenity"*, *"happiness"*, *"inner peace"*, as they connect with nature.

Through nature-spirituality, individuals develop compassion, respect and inspiration to preserve and value nature. Embracing nature spiritually evokes emotional dependency, thus nature becomes a source of ecospirituality. Incorporating nature-spirituality into self alters the view that nature is an object and encourages the view that it is alive and therefore requires to be treated with care. It encourages viewing nature as a person to connect to where human finds solace and healing.

"We depended on living nature—and on each other as part of living nature—for everything. It is thus hardly surprising that we evolved an emotional dependence on nature, that it is our medicine, that we need it for our emotional well-being".

"By opening to spirit whenever we find it –in a forest, in art, in planting seeds in a garden, in meditation or prayers- we can let compassion and inspired action lend their strength to our fragile, small selves, empowering us to join with others to be part of Gaia's healing, not her destruction".

Nature as Religion

Anthropocentric view and ecocentric view involves the element of dominance. In the former view human is said to dominate nature, whereas the latter view encourages nature dominance over human. Hoffman and Sandelands (2005) argues that there is an alternative environmentalism, that is theocentric, which is an environmentalism centered on God. They argue that in the theocentric view, human do not dominate over nature or vice versa. On the contrary, it promotes the view that God rules over both human and nature thus human and nature are joined in God. This view joins human and nature as one and to perceive creation as a "totality of life" (Hoffman and Sandelands 2005, 152). This argument suggests the need to assess religion as a factor influencing individual behavior towards nature.

While spirituality is said to originate from within an individual and is more personal and private, religion tend to be more of an external connection with a higher being. Based on the Oxford definition, religion is a belief in supernatural power and involves a more structured form of belief, tradition and ritual. Spirituality can be said to emanate from religion. While spirituality preaches to love God and adopts the view that God is omnipresent and resides in oneself, religion engages believers to fear and obey God and that God is far from reach of human (Pettinger 2007). Theocentric view which argues the dominance of god over individual and nature, engages individuals to love and protect what has been created by the almighty.

Hence, theocentrism encourages sense of oneness with nature through eliminating the existence of dominance, that is, human over nature or nature over human. It signals the awareness of strong bonding, interconnection and oneness between human and nature. The awareness that both oneself as a human and nature is created by God emphasizes interdependency for mutual survival.

The blog data analysis captured religion as a theme in explaining our relationship with nature. This particular theme was derived through codes such as love, respect, beliefs, value and gratitude. Theocentric view is emphasized through expressions such as "to love what God loves" and "the farther we are separated from nature the farther we are separated from God".

'As we come to understand the interconnectedness of all things we realize that we share the earth, air, water and sunlight with a "web of life" on earth and in that realization is perhaps the most profound expression of our spiritual nature and the religious beliefs that give rise to that revelation".

"I have taken to a daily laying of my hand on the trunks of several trees in my apartment complex and speaking with them of my love and gratitude for what they are bringing to my life - strength, grace, beauty, wisdom. In the Holy Quran, we are encouraged to live in harmony with nature".

"But for the longest time my relationship with God was inversely proportional to the amount of steel around me. Inside the sanctuary, I heard but did not feel. Step outside and see the blue sky above me and I could "feel" the message take hold".

When an individual views oneself as embedded in nature and not separated from it, mistreating nature would mean to mistreat oneself. This encourages individuals to live in harmony with nature, using nature responsibly to satisfy individual needs and at the same time preserving it for future generation. Nature and human moves beyond merely coexisting, nature is viewed as human, as reflected in the following quote;

"A curious thing I've noticed about us rose nuts is that we always talk about roses as if they were people. Mostly "she" and sometimes "he" but never "it." I love this deep understanding that plants are relatives with whom we humans have shared the Cenozoic era".

"I understood that no individual exists in a vacuum, but within the context of family, community, culture. But why stop there? I began to understand that the ultimate context is the Earth".

INFLUENCE ON SUSTAINABLE CONSUMPTION

The deep realization of mutual existence through the incorporation of these views on nature encourages the development of positive attitude and intention to engage with nature. The more an individual relates to nature, believing in their coexistence and dependency for survival, the greater the intensity to engage in conservation behavior. It shifts the perspective that nature is an object whose resources are to be exploited by human to a paradigm that cultivates conservation. That is, the more meaningful nature is to an individual the stronger is the connection and intention to protect nature through consuming responsibly.

The intention to preserve nature is clearly indicated from the reported activities by bloggers such as engaging in organic gardening, simplifying diets and eating habits, using fireplace to heat their houses, cancelling cable TV and reducing paper printing. The bloggers intimate relationship with nature clearly translates into sustainable behavior as witnessed through the following comments from the bloggers;

"Some people don't realize how easy it is now to be more eco-friendly. Biodegradable cleaning products are the same price as beloved Hertel and Pinesol, clean just as well if not better, and with a much more refreshing smell. Plastic bags are wasteful.

Cars are useless when you have two legs, or even a bicycle. Use public transit or carpool. I sold my car last year and haven't really missed having it".

"The idea that energy conservation, recycling, car-pooling and other "sustainable" activities is an expression of one's religious values is an idea whose time has come".

Additionally, total self-engagement with nature impacts the level of appreciation and gratitude towards nature which was expressed through the act of saying grace, feelings of emotion (thankfulness) and appreciating blessings for nature's provision to human;

"Healthy foods are grown locally in tune with the seasons by people happy in their work. The simplicity of such meals is a form of the "abundance" that reflects the creativity of the cosmos and for which the word of "grace" is named".

"Once I sat down before this humble meal, I felt a surge of emotion. I paused and thanked the hare for this sustenance. I fought tears during the whole meal and it changed something in me with respect to this "free food" that is available in this community. I picked a few quarts of partridge berries last week and engaged in another "thanking" ritual".

In conclusion, individuals become highly sensitive of the actions towards nature as they attach meaningful connection with their surroundings.

DISCUSSION AND IMPLICATIONS

This article addresses a need for a revised theoretical framework that recognizes a deeper level of internally driven motivation as the key driving force of sustainable behavior. It alters the previous conception of human-nature relationship towards incorporating nature into self. Viewing self as one with nature has important implications which are discussed in the following sections; shift in focus and challenges in changing consumer views on nature.

Shift in Focus

This study suggests the need to rethink our strategies to encourage environmental friendly behavior. A pressing challenge facing NGOs, local governments and social marketers is how to encourage sustainable consumption as a step toward building a more sustainable society. Numerous policies and strategies have been developed and implemented; these, however, have had little impact on effectively changing existing environmental behavior. Current policies and strategies to encourage sustainability tend to focus on behavioral change through understanding and changing attitude, lifestyle and habits. These views are based on the assumption that consumers have to be encouraged, cajoled or coerce to look after our natural resources for the next generation. This article suggests that progress towards sustainability is only achievable if individuals see themselves as part of or in total oneness with nature. Viewing sustainability and consumption from this perspective suggests that policy makers and social marketers need to rethink their strategies to encourage sustainable behavior.

Mayer and Frantz (2004) emphasize that by connecting to nature, individuals experience subjective well-being and this sense of well-being increases the intention to engage in ecological behavior. While there is truth in this statement, our findings imply that mere connection does not necessarily engage individuals into actions of preservation. Consumers who merely express their ecological and societal concern may have different attitudes and may behave dif-

ferently to those who totally immersed in ecological living (Robert 1995). Additionally, Mayer and Frantz (2004) claim if an individual is unaware of their destructive action on the environment then increasing their connectedness to nature will have little impact. Hence, we argue that the motivation to connect to nature runs deeper than mere connection to nature, instead, it needs to be embedded in one's self. The ability to view self and nature as one is the central inspiration that leads a person to pay attention to nature. These meaningful connections to nature elicit an emotional attachment which drives the inner desire to protect and preserve nature. The results clearly demonstrate that the more one views self as one with nature, the stronger the intensity to engage with it. This type of motivation is intrinsically driven and has a deepening effect on the behavior of individuals, that is, individuals who view nature as self are more likely to engage in sustainable behavior. As such, pro-environmental behavior can be stimulated by encouraging the formation of a deeply rooted, internally and altruistically driven desire to be part of nature. Policies and strategies may be more effective in developing positive nature related behavior when supported by an aim to inspire people to embrace the co-existence of people and nature and the need to respect nature as a living resource. The present study demonstrates that understanding and addressing the root cause of individual behavior towards the environment is an essential step in developing nature-related behavior.

Thus, promoting sustainability requires changing the current view of individuals on nature as a distant object to be manipulated, towards viewing nature as being closer, as embedded in self. A deeper understanding of sustainable consumption behavior or the reasons for the apathy among some consumers can be gained from studying consumers' views on meaning of nature and their relationship with nature. Even as we now have some understanding of the motivation towards drawing closer to nature and its influence on consumption behavior, it is important to understand what repels others from avoiding nature and its effect on consumption behavior. The development of policies and strategies to encourage sustainability consumption are better informed with both sides of story.

Challenges in Changing Individual View on Nature

The aim to develop a sense of oneness with nature in individuals may prove to be a challenge. The internal desire to embrace nature as part of self is developed through unique individual psychological experiences, thoughts and emotional connections. For example nature-spirituality is exclusively an individual's experience. Individuals who regard themselves as part of nature are sensitive to its existence and clearly demonstrate selflessness as well as concern – these qualities reflected in their activities to nurture nature. Therefore, prompting such deeply rooted motivation requires a gradual process.

Past findings reveal individuals engage in conservation behavior by anticipating personal current benefits such as incentives (Stern 1999) or to avoid punishment (Sharp, Hoj, and Wheeler 2010). Individualistic behavior predominate care for the environment. For individuals with a hostile view of nature, changing their inner-self and stimulating altruistic behavior in their association with nature may not be easy. Nevertheless, this article uncovers the psychological root of understanding the reasons behind human disconnection from nature. An effective strategy may be to begin nature exposure at a young age with the goal of instilling a sense of ecological self, that is, "how we extend our sense of self in relationship to the world of nature"(Wilson 1996, 122). As such, social marketing and government policies may aim at the young minds, for example include nature exposure and interaction as part of the school curriculum.

The results of this study are based on bloggers who see themselves as lovers of nature and feel strongly connected to it. Hence, the interpreted data consist of views from extreme environmentalist and may not reflect the views of ordinary individuals. However, understanding these individuals' engagement with nature is necessary and provides a good starting point for future research to explore this notion with consumers who may be less extreme than these bloggers in their connection and bonding with nature.

For a deeper and more generalizable explanation of how an individual's view of nature affect sustainable consumption, future research should employ a broader study with additional data sources to examine various groups of participants with differing characteristics. This could be expanded to address whether the appreciation of nature experiences differ across diverse populations and cultures. A comparative study of different meanings of nature between urban and rural participants may provide guidelines in tackling the environmental problem. As we were unable to find support from the data to link the types of nature lovers to sustainable consumption behavior, future research may explore how the different categories of nature lovers (seekers, honors and nurturers) relationships with nature affect their consumption behavior. In addition, our understanding of nature-spirituality may be enriched by exploring the types of nature experiences sought by the different groups of nature lovers for spiritual renewal. Future studies may run experiments, using neuroscience to trace the impact of nature stimuli on the functioning of the brain. Another interesting avenue for research involves the exploration of the boundaries between nature and the virtual-nature constructed by the technological world.

This research has the potential to transform our perspective on sustainable consumption behavior by shifting the focus to explore people-nature relationship and nature connectedness. It contributes to consumer research by providing an avenue towards understanding individual experiences that may change sustainable consumption attitudes and behavior.

Correcting for Unconscious Experiential Processing

Francine Espinoza, ESMT, Germany

ABSTRACT

Previous research is inconclusive about whether consumers can correct their judgments for the influence of unconscious subjective experiences. We manipulated the subjective experience of certainty associated with a persuasive message using subliminal priming and found that participants corrected their judgments in opposite directions depending on whether they were subliminally primed with certainty or uncertainty. These results demonstrate that consumers can correct for unconscious experiential processing.

Previous research has shown that subjective experiences that remain outside the consumer's awareness (e.g., visual stimuli presented faster than eye perception levels or audio stimuli played below audible volumes) may influence judgments. For example, an individual's judgment of a condo in a magazine ad may be negatively influenced by pictures of a terrorist attack placed in the parafoveal vision area. If this person is prompted to correct her judgments about the product in ad, would she be able to account for a potential influence of the unconscious experiential processing?

The correction literature has focused on situations in which people are or can become aware of potential influences (Wegener and Petty 1995). If people are aware of an influence, they must have processed the information either systematically, when considerable resources and motivation are present, or heuristically, when at least moderate resources and motivation are available (Petty and Cacioppo 1986). Research has shown that correction may happen under both of these types of processing if enough cognitive resources are available for correction (Petty, Wegener, and White 1998). In such situations, the direction of the correction effect depends on the perceived initial influence. Thus, judgments that were perceived to be positively influenced by the stimulus should become more negative after correction, and judgments that were perceived to be negatively influenced by the stimulus should become more positive (Wegener and Petty 1995).

In a third type of processing, experiential processing, judgments are formed based on immediate sensations and feelings prompted by the situation and that are often outside of people's awareness (Meyers-Levy and Malaviya 1999). Experiential processing happens automatically, unconsciously, and independently from conscious resources. It occurs when exposure to stimuli is subliminal or extremely brief. For instance, people tend to like unknown stimuli (e.g., Chinese ideographs) more when these follow positive subliminal primes (e.g., smiling faces) than when they follow negative primes (e.g., frowning faces; Murphy and Zajonc 1993).

The literature suggests that judgments based on experiential processing are the result of two sequential processes (e.g., Jacoby, Kelley, and Dywan 1989; Strack 1992). First, general cues about the target are evaluated automatically and unconsciously to produce a global feeling. These cues include cognitive, affective, and/or bodily reactions to the stimulus, such as, for example, feelings of fluency (Schwarz 2004), positive affect (Zajonc and Markus 1982) or perceptions of smell (Lee and Schwarz 2012). Second, this subjective experience is used as the default basis for judgment and may remain outside of consumers' awareness (Strack 1992). Thus, in the previous example, people with familiar, more fluent faces are judged as famous, objects associated with positive affect are more liked, or an argument associated with a smell of fish is judged as suspicious. When subliminal priming produces an influence, this influence is represented by a change in judgments or behavior (Aarts, Custers, and Marien 2008; Clore and Parrott 1994; Winkielman and Berridge

2004). For example, Clore and Parrot (1994) manipulated the feeling of certainty unconsciously (through hypnosis) and found that certain people understood a poem better than uncertain people.

Although experiential processing and its influence on judgments has been extensively shown in the literature (Schwarz and Clore 1996; Winkielman and Berridge 2004; Zajonc 1994), current evidence suggests that people may not be able to correct for an unconscious influence. In a series of experiments involving subliminal priming, Winkielman, Zajonc, and Schwarz (1997) found no evidence for judgment correction as predicted. Although the authors listed several potential methodological limitations, they generally concluded that correction may not happen when the stimulus does not produce consciously experienced feelings even though it has produced measurable influences on judgments. We integrate literatures on correction and experiential processing to build our hypothesis.

We propose that people can correct for unconscious experiential processing. According to correction theories, when people are prompted to correct their judgments, they will think back of that situation and appraise their initial reactions (Wegener and Petty 1995). We posit that when people appraise their reactions, they may also take into consideration their global and subjective reactions towards the target, even if these are not completely accessible to consciousness. Consumers will evaluate their judgments for accuracy and adjust them if they believe their judgments were biased for some reason. Consistent with the correction literature, we predict that the direction of correction should be the opposite of that of the initial influence. Nevertheless, our perspective deviates from the traditional view in a key way. Whereas the traditional view implies that people must consciously perceive an influence, we argue that people may correct for the influence of an unconscious subjective experience.

Experiential processing may be mediated by low-level systems that do not produce any accompanying conscious feeling (Winkielman et al. 1997; Zajonc 1994) but increase the accessibility of prime-related mental content (Loersch and Payne 2011). When affect is primed subliminally, it generates a diffuse and nonspecific sensation whose origin is not accessible (Murphy and Zajonc 1993). Based on such previous research, we expect that when an affective stimulus is presented subliminally, the unconsciously elicited feelings will be automatically associated with and interpreted as nonspecific affective reactions to the target (Bargh et al. 1992; Fazio et al. 1986). Thus, although the subliminal stimulus cannot produce identifiable feelings, we expect that people should be able to intuitively access their global feelings or an overall subjective experience that is attributed to their reactions to the target, and correct for this experiential processing.

METHOD

Design and Participants

The study employed a 2 subliminal prime (certain vs. uncertain) x 2 correction (no-correction vs. correction) between-subjects design. We subliminally primed participants with certainty or uncertainty-related words during a lexical decision task. One hundred sixty-seven university students participated in the experiment as part of a one-hour session in exchange for extra credit.

PROCEDURE

Prime manipulation. To prime the feeling of (un)certainty, we subliminally exposed participants to certainty or uncertainty-related

words. Participants were told that they were participating in two unrelated studies. Participants completed a lexical decision task in which they had to identify as quickly and accurately as possible whether a stimulus presented on a desktop computer was a word (using the "z" and the "/" keys). Before the actual task, participants completed six practice trials with no prime. At the beginning of each trial, a fixation point ("***") appeared at the center of a white screen for 2 seconds to focus their attention. The fixation point was replaced by a 16-point-black-font prime word. Primes consisted of certainty or uncertainty-related words and were presented in randomized order. Certainty-related primes were: confident, sure, convinced, certain, positive, definite, correct, and decisive. Uncertainty-related primes were: insecure, unsure, doubtful, uncertain, hesitant, vague, wrong, ambivalent. The primes were presented for 50 ms and then were replaced by a masking letter string (xvxvxvxv) that did not convey any additional meaning and was at least equal in length to the prime to ensure that the prime would not reach the threshold of conscious perception. The mask was then replaced by the target word, which appeared in the same location after a very brief delay (SOA-Stimulus Onset Asynchrony) varying randomly in duration (from 250 to 750 ms) to avoid participants anticipating the target's appearance. Targets were neutral words (e.g., house, planet, carpet, river, building, hat, window, ranch) or non-words (e.g., blater, campure, dight, lench, measing, nesion, poit, reesy) and appeared until participants registered their response. A combination of two blocks, eight primes, four words and four non-words yielded 32 trials (each prime was presented twice, once with a word and once with a non-word).

After exposure to the certainty primes, participants proceeded to the next task and read a scenario in which they were looking for an apartment to rent. They were told that they had narrowed their options down to two apartments and that a realtor had recommended the nicer but more expensive apartment (Appendix).

A pretest was conducted to test the efficacy of the priming ($N = 32$). Consistent with previous research, given that certainty was induced subliminally we found no significant effect of the primes on a measure of reported certainty ($p > .48$; "how certain are you about your attitude towards the recommended apartment?"). Therefore, to test whether the certainty primes were effective, we looked at participants' reaction times in the lexical decision task. Previous research indicates that certainty is related to faster responses (Gross, Holtz, and Miller 1995). We found that participants primed with certainty (vs. uncertainty) related words responded faster in the lexical decision task ($M_{certainty} = 821.95$ ms, $SD = 317.34$ vs. $M_{uncertainty} = 1150.30$ ms, $SD = 536.47$; $F(1, 28) = 4.00$, $p = .05$, $\eta^2 = .12$), after accounting for outliers with an excessive number of error rates and cases with latencies faster than 300 ms or slower than 2000 ms (Bargh and Chartrand 2000). As an awareness check, we presented five of the subliminal stimuli again at the end of the pretest, told participants that words were being presented, and asked them to guess what those words were (Bargh and Chartrand 2000). None of the participants could identify any of the primed words, indicating that the subliminal priming was indeed subliminal.

Correction manipulation. In the no correction condition, participants answered the questions immediately after reading the scenario. In the correction condition, participants first read an instruction adapted from Wegener and Petty (1995): "In the next section, please be sure that the realtor's opinion will not influence your own opinion. It is very important that your answers be based on your own opinion of the apartments."

Measures. To capture judgments, we asked participants to rate their relative preference to the apartments ("1 = I prefer apartment one/ 7 = I prefer apartment two"). We did not measure certainty in

the study for two reasons. First, consistent with our pretest and with previous research (Winkielman and Berridge 2004), we did not expect an effect on a reported measure of certainty but on participants' judgments. Second, measuring certainty might affect the nature of the judgment process and create a demand for participants to respond according to their certainty judgments (Petrusic and Baranski 2003). If participants must be aware of their feelings for its effects on judgments to emerge, the generalizability of the findings would be limited and we could be observing a demand effect. By manipulating certainty subliminally and not including a reported measure of certainty, the study provides a compelling test of the effect with a clean manipulation. Finally, to help rule out participants' mood as an alternative explanation, we included thirteen mood measures adapted from the PANAS (Watson, Clark, and Tellegen 1988) ranging from 1 ("does not describe my current feeling at all") to 7 ("describes my current feelings very well").

RESULTS

After removing participants who had an exceptionally high error rate on the lexical decision task and the remaining cases with latencies faster than 300 ms or slower than 2000 ms (Bargh and Chartrand 2000), our final sample was one hundred twenty-three participants. Neither the error rate ($\chi^2 = .19$, $p > .4$) nor the latencies beyond acceptable speed ($\chi^2 = 5.00$, $p > .2$) were related to participants' assigned conditions, meaning that the removed cases were well distributed across conditions. Differences in degrees of freedom are due to missing values.

Manipulation check. Consistent with the pretest and confirming the efficacy of the certainty manipulation, a one-way (certainty vs. uncertainty) ANOVA ($F(1, 121) = 3.60$, $p < .06$, $\eta^2 = .03$) shows that participants primed with certainty-related words responded marginally faster to the lexical decision task than participants primed with uncertainty-related words ($M_{certainty} = 816.71$ ms, $SD = 221.73$; $M_{uncertainty} = 902.07$ ms, $SD = 276.20$).

Judgments. A 2 (subliminal prime) x 2 (correction) ANOVA shows a significant interaction between subliminal prime and correction ($F(1, 119) = 11.83$, $p < .001$, $\eta^2 = .09$). In the no-correction condition ($F(1, 119) = 9.64$, $p < .01$, $\eta^2 = .12$), participants primed with certainty words ($M_{certainty} = 5.13$, $SD = 1.50$) had more favorable judgments towards the recommended apartment than participants primed with uncertainty words ($M_{uncertainty} = 3.97$, $SD = 1.71$). Providing support for the predicted effect of correction on judgments (figure 1), planned contrasts show that correction decreased preferences for the recommended apartment when certainty was primed ($F(1, 119) = 6.53$, $p < .01$, $\eta^2 = .11$) but increased preferences for the recommended apartment when uncertainty was primed ($F(1, 119) = 5.31$, $p < .02$, $\eta^2 = .08$).

Mood. Based on a factor analysis we created indices of positive mood ($\alpha = .86$; happy, enthusiastic, excited, and proud), negative mood ($\alpha = .84$; afraid, sad, depressed, upset, and irritable), and anxiety ($\alpha = .83$; anxious, tense, distressed, and nervous). None of these indices showed significant effects (all $ps > .47$) when entered as dependent variables in a 2 (subliminal prime) x 2 (correction) ANOVA.

DISCUSSION

The results suggest that people can correct for the influence of stimuli that was presented subliminally and was not found to produce conscious feelings that participants could deliberately report even though we observe a subliminal priming effect on judgments. Our results suggest that changes in mood cannot explain the reported findings, and the fact that the effect of certainty on judgments was marginally reversed in the correction condition rules out regression

Figure 1. Judgements corrected for subliminal priming.
Note: Standard errors are represented in the figure by the error bars attached to each column.

to the mean as a potential explanation. This overcorrection suggests that individuals are adjusting their judgments based on their miscalibrated perceptions (Wilson and Brekke 1994) instead of simply reporting more moderate views.

GENERAL DISCUSSION

We present evidence for correction for unconscious experiential processing. Although most theories of correction assume that people will correct when they become aware that a given factor is influencing their judgments, we show that people can correct for the influence of a stimulus that was presented outside of their conscious awareness. In our study, there is no evidence that participants became aware of the influence. If anything, participants thought that the recommender was possibly influencing their opinion but they were neither aware of what about the recommender was influencing them nor were they told about the direction of the influence. Although the stimuli was primed subliminally and there was no evidence that participants were aware of them or of the feelings they convey, participants were able to intuitively access their global evaluation and correct in the direction opposite of their initial reactions, as correction models would predict.

Though the present study was not designed to test a specific explanation for the effect, it is useful to consider a few alternatives of processes underlying the effect. There are at least two explanatory accounts that could be explored in future research. Our results seem to be consistent with the feelings-as-information model for influence of consciously experienced affect on judgments (Schwarz 1990). This model predicts that judgments positively affected by, for example, positive mood, should become less favorable when people become aware that mood was influencing their judgments. Although unconscious, it is possible that the subliminally primed feelings were thought to be global reactions to the recommender, leading to discounting of these feelings from judgment.

It is also possible that the results here reported are not limited to affective priming but could be explained by semantic priming. One may wonder whether the effect would hold if the subliminal priming involves nonaffective stimuli. According to semantic priming findings people would discount the perceived influence according to the perceived meaning of the priming, which would lead to similar results. However, there is also evidence that affective and semantic priming involve different processes (Murphy and Zajonc 1993). If nonaffective semantic subliminal priming is less intuitively

accessible than affective priming, correction for subliminal semantic priming might be hindered.

A relevant agenda for future research includes not only to reveal what is driving the correction for experiential processing but also to determine when this effect is more or less prominent. Contrary to our results, Winkielman and colleagues (1997) did not find evidence for correction for subliminal affective priming as predicted by the correction literature, which raises the question of when we should observe persistence of subliminal priming and under what circumstances people should be able to correct for an influence they cannot consciously report. Perhaps key to obtain correction of unconscious experiential processing is the presence of an identifiable object to which the subjective experience can be attributed. Correction requires identification of a source of bias, which can be the recommender associated with the unconscious feelings.

Another possibility is that the way that correction is instigated matters. Winkielman and colleagues (1997) induced correction by making a potential source for the feelings salient and telling participants about the direction of influence. This manipulation has been proved successful in several studies using the feelings-as-information paradigm (Schwarz 1990). Our manipulation, on the other hand, was modeled closely after a traditional correction manipulation used in the correction literature (e.g., Wegener and Petty 1995). We have not explicitly told participants that there was an influence, but asked participants to not let the recommender influence their opinions. One key difference is that instead of calling attention to the source of feelings of which participants were unaware, our correction manipulation called attention to a potential (more general) influence by the recommender. The absence of correction in the predicted direction in Winkielman et al.'s (1997) study may have occurred because participants did not perceive the source of the feelings as a potential source of bias given that they were unaware of the feelings. Our manipulation, on the other hand, allows them to access their global reactions to the recommender and correct for that. Moreover, it is possible that telling participants about the source of the feeling (vs. prompting them to correct) did not motivate participants enough to correct.

A potential limitation of our study is that the primed feelings were accessible to consciousness somehow. This is still possible although we carefully developed the subliminal priming after methods used in previous research and the pretest has indicated that participants could not report conscious feelings consistent with the primes nor guess any of the words that were primed. To shed light on this

issue, future research could examine how feelings that are primed subliminally manifest consciously or behaviorally.

In conclusion, the present results suggest that awareness of a biasing factor and naïve theories about how this factor influences one's judgments may not be necessarily consciously present for correction to occur, unlike assumed by traditional correction models (Martin 1986; Schwarz and Bless 1992; Wegener et al. 2004; Wilson and Brekke 1994). Given the pervasiveness of the influence of factors of which consumers are unaware, these results call for further testing and for updating of correction theories to include correction for subjective experiences in addition to conscious assessments. From a consumer welfare perspective, it is interesting that correction may serve as a tool to defend consumers from the influence of marketing stimuli, given that consumers are often unaware of the stimulus and of its influence.

APPENDIX

Stimuli

Imagine that you are looking for an apartment to rent. You have looked at a few apartments, but haven't found what you really want. Although you have seen several different apartments, nothing has seemed just right. You head into an apartment rental agency.

Picture yourself walking into the agency and looking at pictures and ads of apartments. There are pictures of different styles of apartments in various sizes and locations. A realtor walks up to you and says, "Hi, my name is Chris. Let me know if I can answer any questions for you."

Imagine that after looking through the pictures of several apartments, you narrow it down to two choices. The first is a nice, fairly standard apartment. The second apartment looks a little nicer, but it costs quite a bit more than the first. You look over the pictures one more time, looking carefully at the floor plans of each apartment. As you look at the picture of the second apartment, the realtor walks up to you and says, "That's a great apartment. I think it's a better option than the other one. Besides, it is very attractive." You look at the pictures and the floor plans one more time, wondering whether you should get the second apartment.

Fooling Yourself:
The Role of Internal Defense Mechanisms in Unsustainable Consumption Behavior

Alexander Stich, WHU-Otto Beisheim School of Management, Germany
Tillmann Wagner, WHU-Otto Beisheim School of Management, Germany

ABSTRACT

Unsustainable consumption offers a fertile ground for the rise of intrapsychic conflicts. A series of 20 in-depth interviews was conducted to investigate people's inner conflicts in the field of sustainability and how consumers deal with them. After the development of a sustainability classification from a consumer's point of view, we led consumers to talk about their inner conflicts in the sustainability context. In particular, these conflicts emerge when long-term sustainability-related motives contrast with short-term motives. Results show that especially sustainability-oriented consumers show intrapsychic conflicts of varying degree when consuming unsustainably. Notably, consumers use a wide range of psychological defense mechanisms to continue unsustainable consumption behavior. Only in case of intense conflicts, actual behavior is modified. In general, this research proposes a theoretical framework of how consumers deal with their inner conflicts.

INTRODUCTION

The majority of consumers claim sustainability to be of high subjective importance. For instance, people state that it is essential to reduce waste and to be economical with natural resources like water, oil, or the tropical rain forest. Nevertheless, at the same time, many consumers also engage in unsustainable consumption behavior, for example taking the car instead of public transport or purchasing products based on a very resource-intensive production process. Therefore, the question arises why even sustainability-oriented consumers show unsustainable consumption behavior. Under the umbrella of the so-called attitude-behavior gap (Carrigan, Moraes, and Leek 2011) this question has been and still is controversially discussed in the area of consumer research (Eckhardt, Belk, and Devinney 2010). However, we speculate that there are also intrapsychic consumer conflicts involved. To the best of the authors' knowledge, the underlying psychological mechanisms of whether and how consumers solve the resulting inner conflicts have not yet been examined. Therefore, this approach tries to make a first step towards an understanding of how consumers solve their inner conflicts in the field of sustainability.

Due to the complex and explorative nature of the present research question, the authors decided to follow a qualitative approach using in-depth interviews (Bengtsson and Ostberg 2006). In-depth interviews are combined with pre-existing theoretical knowledge to propose a new theoretical framework, trying to explain how inner conflicts emerge and how different conflict types are resolved by consumers. This paper is structured as follows: First, a brief theoretical background about the concept of sustainability as well as about psychological defense mechanisms is provided. Second, method and findings of the conducted in-depth interviews are described. Finally, implications, limitations, and future research directions are discussed.

THEORETICAL BACKGROUND

Sustainability

Sustainability is an "emerging megatrend" (Lubin and Esty 2010, 44) which is also considered to be the essential and most important challenge for modern marketing (Kotler 2011; Sheth 2011). The common core of sustainability definitions is that a sustainable system is a "system [...] which survives or persists" (Costanza and Patten 1995, 193). However, there are many different definitions of sustainability.

Sustainability can, for example, be described as the use of resources in a way which enables future generations to live with the same or larger amount of resources (World Commission on Environment and Development 1987). Recent conceptual research proposes not only ecological and social aspects but also the importance of personal well-being in the context of consumer sustainability (Sheth, Sethia, and Srinivas 2011). Nevertheless, there is not much research about the consumer's understanding of the sustainability term and which facets it consists of. Therefore, this aspect will need to be explored first, thereby creating the basis for further investigation of inner conflicts in the field of unsustainable consumption.

But why do even sustainability-oriented consumers behave unsustainably? Recent studies investigate this issue by focusing on the gap between consumer attitudes and actual behavior (Bray, Johns, and Kilburn 2011). In doing so, current research systematizes the reasons consumers provide to justify unsustainable consumption (Banbury, Stinerock, and Subrahmanyan 2012; Eckhardt et al. 2010; Öberseder, Schlegelmilch, and Gruber 2011). One of these reasons is said to lie in local infrastructure (Banbury et al. 2012). Specifically, consumers who live in rural areas claim bad local infrastructure, in particular limited public transport opportunities, to account for an impossibility to live and consume sustainably. Consumers also state their own institutional dependency (Eckhardt et al. 2010), that is, they emphasize the responsibility of institutions such as the government to regulate which products are allowed to be sold or not. Furthermore, high prices of sustainable products are said to be a major reason for not buying them (Öberseder et al. 2011). To sum it up, there is a high need to know which reasons consumers point out regarding their unsustainable consumption behavior. However, it seems equally important to gain knowledge about the underlying psychological mechanisms of whether and how consumers solve their suspected inner conflicts when consuming unsustainably. Therefore, this paper focuses on the investigation of consumers' intrapsychic conflict resolution strategies.

Defense Mechanisms

The psychoanalytic concept of unconscious or semiconscious defense mechanisms is commonly used in everyday language. In particular, specific defense mechanisms like denial, suppression, repression, or projection are well-known terms for many people. These mechanisms enable individuals to encounter their inner conflicts (Freud 1936/1946). Although there are also voices who emphasize that some defense processes can be conscious to a certain degree (Erdelyi 2001), defense mechanisms are for the most part considered to be rather semiconscious or unconscious (Cramer 1998). However, it is important to note that individuals can use and elaborate on defense mechanisms without being conscious as to why they use them (Bond 1995).

In contrast to psychoanalysts, non-clinical researchers focused more on conscious processes like coping strategies so far (Cramer 2000), nevertheless, today there is a handful of empirical research outside the clinical context (Baumeister, Dale, and Sommer 1998). Defense mechanisms are also an emerging theme in marketing, but do not seem to have been investigated much (Homburg and Fürst 2007). Following this, our research takes a first step to empirically investigate defense mechanisms in consumer research. Building on in-depth interviews, this research develops a framework, revealing different types of

inner conflicts and corresponding mechanisms employed for conflict resolution in the context of unsustainable consumption.

METHOD

We conducted 20 in-depth interviews with German consumers in an open and unstructured way. Participants were chosen according to demographic criteria, thereby varying according to age, gender, occupation as well as levels of education (table 1). To get a picture of average German consumers, very ecologically-minded individuals were not part of the sample. Interviews were audio-taped and transcribed verbatim. The data analysis was executed by two researchers using the standard procedure of coding and clustering the codes into higher-order categories (Creswell 2009). Comments from interviews were double-back translated. A general framework was built combining the qualitative data with theoretical background knowledge (Workman, Homburg, and Gruner 1998).

FINDINGS

In a first step, it seems important to get a better understanding of consumer sustainability to identify areas of potential inner conflicts. Therefore, we asked participants to reflect on sustainability from a consumer's point of view. Building on Sheth et al. (2011), we also asked them about their self-understanding of personal sustainability. Altogether, results reveal ecological (economic conservation, environmental preservation), social (family protection, occupational justice, social justice), and also individual facets of sustainability (physical health, mental health, economic health). Most notably, our data contribute to a first classification of consumers' sustainability objectives and issues (table 2).

Afterwards, we directed consumers to talk about their inner conflicts in the sustainability context. Our research leads to a theoretical framework (figure 1). The results suggest that conflicts, varying in terms of strength, emerge from the simultaneous presence of opposing

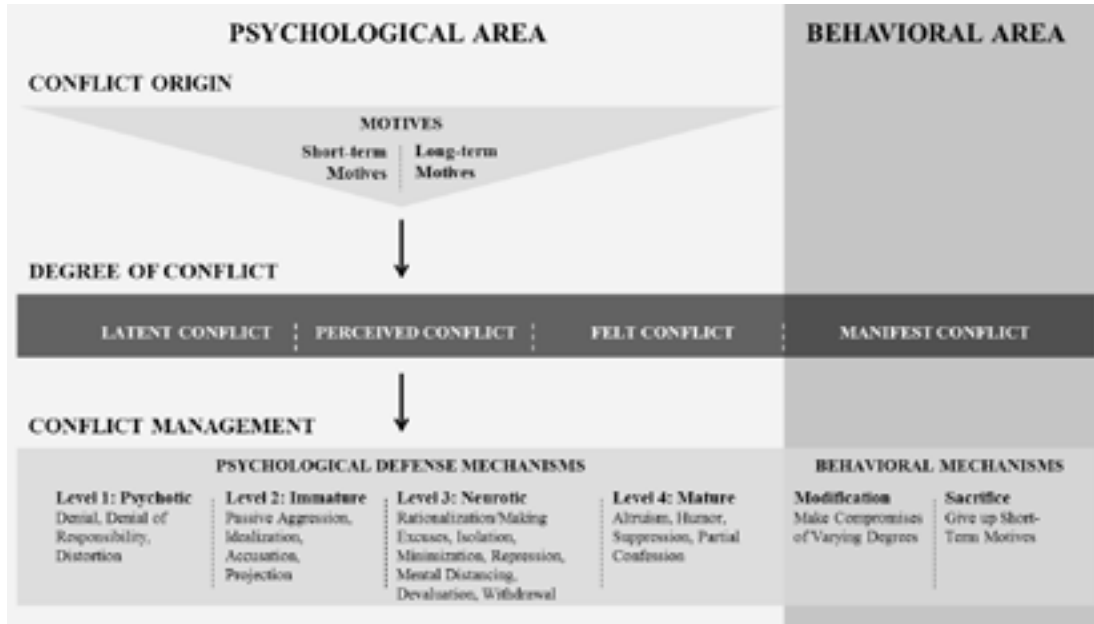
Table 2
Consumers' Sustainability Objectives and Issues: Examples from Interviews

Sustainability dimension	Sustainability objective	Most important issues
Ecological sustainability	Economic conservation	Resources, energy, consumption rate, waste, recycling, packaging, transport, organic food
	Environmental preservation	Climate, animals, pollution, damaging, mutilation
Individual sustainability	Economic health	Saving, debt, retirement provisions
	Mental health	Work-life balance, stress, recreation, spirituality
	Physical health	Balanced diet, exercise, sports, alcohol & cigarettes
Social sustainability	Family protection	Responsibility toward family, education, children's children
	Occupational justice	Working conditions, exploitation, minimum wages, child labor
	Social justice	Fairness, poverty, social engagement, peace

Figure 1
Framework for Inner Conflicts: Emergence, Types, and Management


consumption motives. Depending on the degree of conscious awareness, there is a tendency to use specific defense mechanisms to resolve conflicts for the sake of continuing unsustainable consumption behavior, or, if conflict resolution was not successful, change actual behavior. In the following, the nature of this framework will be elaborated in more detail.

Intrapsychic Conflicts

We draw on common motive, need, and goal classifications (Reiss 2004) as well as consumer research about people's conflicts (Bahl and Milne 2010; Lee and Shrum 2012; Ratneshwar, Pechmann, and Shocker 1996). Motives can be divided into short-term and long-term motives (Schweitzer 2005), whereby sustainability refers by definition to the long-term perspective (Costanza and Patten 1995). Basically, we find that conflicts emerge in situations where long-term sustainability-related motives contrast with short-term motives.

Depending on salience and severity of specific motives clusters, the type of inner conflict can vary. For classification purposes, we used the terms latent conflict (people are not aware of a conflict at all), perceived conflict (people recognize a conflict without having bad feelings about it), felt conflict (people recognize a conflict while having bad feelings about it), and manifest conflict (people recognize a strong conflict which has immediately to be resolved), which have been labeled in organizational conflict research (Pondy 1967, 1989; Maltz and Kohli 2001), introducing these labels to intrapsychic conflicts. Our study provides initial evidence of these different consumer conflicts (table 3). It is important to note that conflict types can overlap, for example containing both cognitive and emotional conflict aspects at the same time (Luce 1998).

An example for perceived conflict comes from Jessica. Her long-term motive idealism (in the form of human orientation) is opposed to the short-term motive well-being (in the form of enjoyment). In contrast, Bert has to deal with a more severe conflict (felt conflict), where his short-term motives financial security, personal well-being (in the form of comfort), and acceptance by others (in the form of self-expression) contrast with idealism.

Even though one rather should not eat chocolate, because I believe that cultivating chocolate heavily relies on child labor, but, unfortunately, I always melt at the sight of chocolate myself. (Jessica, 34)

Sometimes, when I'm conscious of [using unsustainable products] and I think that's mostly the case for clothes, then indeed, I have a bit of a bad conscience. This is crap, yes, I should really do better, but I don't. Because it's too demanding for me, because it's too expensive, because I would look stupid in such clothes. (Bert, 30)

These two examples illustrate different degrees of inner conflicts in the field of unsustainable consumption behavior. Especially when conflicts become more severe, people show a bad conscience and tend to feel guilty. Therefore, it seems obvious that people heavily rely on certain strategies to deal with their inner conflicts.

Defense Mechanisms

Furthermore, we investigated consumers' semiconscious or unconscious processes. There is much research about conscious processes (Levav, Kivetz, and Cho 2010; Ratneshwar, Mick, and Huffman 2000) and recently, consumer researchers have started to show interest in the examination of unconscious processes (Chartrand et al. 2008; Laran and Janiszewski 2009). In particular, unconscious internal defense mechanisms can help people, at least in the short term, to solve their inner conflicts (Freud 1936/1946). We find that people use a wide range of defense mechanisms to face their inner conflicts for the sake of continuing unsustainable consumption behavior. Vaillant (1977, 1992) proposes a hierarchical classification of defense mechanisms into psychotic (mainly altering reality), immature (mainly altering distress), neurotic (mainly mastering acute distress), and mature (mainly mastering general distress). In our research, we identify established mechanisms by prior researchers as well as new ones which we allocate to the aforementioned hierarchi-

Table 3
Consumers' Inner Conflicts: Citations from Interviews

Type/degree of conflict	Working definition	Excerpt from interviews
Latent conflict	People do not recognize a conflict at all, despite the presence of conflicting motives.	[Talking about her reasons for consuming sustainably] . . . sometimes I have a critical look at the whole economic development. Well, at school we have learned 'economy only works if there is a steady growth'. And well, I think, in terms of pure logic, this isn't possible without destroying the environment, too. And for me personally, this is actually important, that I do not mindlessly consume and that means I am maybe to a certain degree unproductive with regard to economic interests. Well, actually sustainability is of higher importance. . . . I do not feel bad [*emphasized*], no [talking about consuming or using unsustainable products, for example owning two cars which are both used every day]. . . . No [asked if having sometimes a bad conscience]. *(Monica, 48)*
Perceived conflict	People recognize a conflict which they can describe without having bad feelings about it.	Well, it happens, and this is how I make many of my decisions concerning consumption, that I buy something and consume it or use it, let it be food or something else, and that I think to myself 'well, practically it is not quite correct what I'm doing'. *(Jack, 50)*
Felt conflict	People recognize a conflict which they can describe while having bad feelings about it.	Erm, often I do not think anything of it, it just hits the spot. But sometimes I have a bad conscience as I said before. When I see such animals [*suffering*] which look so faithful and gentle and which are really innocent, doing no harm to anybody, and when I know that they are being slaughtered, that they get killed. *(George, 82)*
Manifest conflict	People recognize a strong conflict which has to be resolved immediately.	And in the end I really felt shitty in doing so [wasting of resources]. And in the end, now when I care more about it, I don't feel necessarily much better, but simply not much worse, either, because I worry about certain resources and I am economical with them. *(Todd, 29)*

cal classification. Table 4 outlines definitions and examples of all the defense mechanisms employed by the participants.

Although every defense mechanism serves the common goal to solve inner conflicts, the extracted mechanisms vary in nature and frequency of use. In our study, among the most used defense mechanisms are denial of responsibility, rationalization, and suppression. In the following examples, Todd uses denial of responsibility in order to avoid negative feelings, Ursula excuses or rationalizes her behavior by time pressure, and George admits that he is actively suppressing his negative feelings.

And well, sometimes I even think if I take care or not, in my opinion in the end the whole caboodle will go down the drain anyway, such being the case [*pauses*]. Now, this is my personal opinion. (Todd, 29)

To be honest, I do have these noble goals, in some areas I reach them and I act more consciously. On the other hand, I would have to inform myself a lot about every single product that I buy [*emphasized*]. And I would have to question every single product, erm, and this might also be a self-serving declaration, I do not like to completely reject this, this might be a self-serving declaration when I claim 'I don't have the time for this'. It's too bad when you have to say 'I don't have the time for this', maybe this does also mean 'I don't want to take the time'. (Ursula, 58)

Well, I can say that in this case I'll suppress this. . . . I'm not aware of this bad conscience all the time, well, then I block it out. . . . Once the bad conscience has disappeared, the feeling

has disappeared, too. Then I'm not thinking about it, I don't think about it all the time. Then the problem has disappeared for the moment. (George, 82)

Besides several new subcategories, our findings provide initial evidence of the mechanisms accusation, mental distancing, and partial confession. First, accusation encompasses a direct allegation of somebody. This is in contrast to projection, which depends on comparisons with other people (Baumeister et al. 1998). Second, mental distancing characterizes the dissociation from others without devaluing them, whilst the latter one is defined as the attribution of exaggerated negative characteristics to others (Kernberg 1967, 1987). Third, partial confession describes the confession of minor own weaknesses in order to mask more severe weaknesses or to preempt arguments against oneself. As shown below, Jonathan accuses others to be responsible for his own wrongdoing, whilst Sadie uses projection to whitewash her behavior by comparison with others. Bert relies on mental distancing and Thomas uses devaluation to strengthen his own position. Finally, Monica is confessing one of her minor weaknesses in order to distract from her total consumption level which can be suspected to be very high (her family owns two cars which are both used every day, lives in a huge mansion, and goes on vacation at least four times a year).

Then of course I am thinking 'why did you do this again [dumping a cigarette end]?'. But sometimes this happens, then I just dump it. Because [*loud*] there is no container where you can put this cork top when you are on your way, there is none! Where have you seen a cigarette container here in V. [city name] where

Table 4
Defense Mechanisms for Dealing with Inner Conflicts: Citations from Interviews

Defense mechanism (Level)	Short definition	Excerpt from interviews
Denial (Psychotic)	Refusal to admit certain aspects of reality (Bovey and Hede 2001)	. . . the long-term effects, I'm sure that is something no one could imagine 20 or 30 years before that we would have these problems with emissions and that actually the global warming would be coming. If global warming actually exists. There you have also, erm, reports saying the opposite. . . . And because of this uncertainty about the actual existence, it is absolutely no buying criterion for me so far. *(Peter, 25)*
Denial of responsibility* (Psychotic)	Refusal to admit own responsibility for sth. (Bierhoff, Klein, and Kramp 1991)	Yeah okay, in most cases they [clothes made through child labor] are 'made in Japan', when you have a close look, right? . . . Or China is the most frequent one. But what can I do against this here in Germany?! I cannot do anything against it any more [*emotional*]. *(Rebecca, 58)*
Distortion (Psychotic)	Reshaping of reality to meet inner needs (Vaillant 1992)	Yeah, well, but I would really not define coffee as semiluxury food but as a necessity. *(Thomas, 27)*
Passive aggression (Immature)	Indirect or passive aggression towards others (Vaillant 1992)	I don't have a bad conscience [*tricksy*]. I have not killed anyone, I treat the environment well, I treat my fellow men well. Why should I have a bad conscience [*without understanding/ aggressive*], eh?! If I can give something, I give it to someone who has less than me, so why do I have to have a bad conscience [*emotional/aggressive*]?! *(Rebecca, 58)*
Idealization (Immature) • General* • Comparative*	Attribution of exaggerated positive characteristics to the self or to others (Kernberg 1987; Pauchant and Mitroff 1988)	Well, if everyone would do this, just to say, somewhat living like me, myself, my husband, just to say, then we would live in an almost ideal world, here, right?! *(Rebecca, 58)*
Accusation** (Immature)	Direct allegation that someone is guilty of sth.	There are people who think they have to drive directly into the post office, who don't walk a single footstep. Some people, who live here in O. [village name], drive to the mailbox just a few houses down the street, post a letter, and drive back. Yeah, here I am thinking 'they are nuts'. Isn't it just possible to walk there?! First, this would have been good for them. And also these short distances are no good for the car and they would have prevented the environment from harm a little bit, too, right?! *(Rebecca, 58)*
Projection (Immature)	Refusal to accept own weaknesses by comparison with others' weaknesses (Baumeister, Dale, and Sommer 1998)	When it comes to electricity, there I also try to be economical. This is a product where I really try to behave appropriately. For example when I go out of the house, I take care that not all the lamps are turned on everywhere and that the TV is off, yeah, that I don't have electrical devices on standby. Here, I try to behave in a certain way, in order to assure this. Well, there are families in which I have friends who don't pay attention to this. . . . everyone has his own TV and his own computer, these things run around the clock, and everyone has his own car. *(Todd, 29)*
Rationalization/making excuses (Neurotic) Complexity* • History/education* • Opportunity* • Material pressure* • Mental pressure* • Temporal pressure*	Justification of impulses, motives, or behaviors in order to make them plausible and tolerable (Brown and Starkey 2000)	. . . one knows that a big part of the coffee is simply made under conditions of exploitation in the southern hemisphere, in South America. And after all, there is then also, so to say, the presence of the normative consciousness, that practically fair trade coffee, if any, would be the good solution, but I have also to admit that I normally reach for the normal coffee due to the limited budget. *(Thomas, 27)*

*New mechanism subcategory/categorization.
**Newly discovered mechanism (including own working definition).

Table 4 (*continued***)**

Defense mechanism (Level)	Short definition	Excerpt from interviews
Isolation (Neurotic)	Creation of a psychological distance between unpleasant issues and oneself (Homburg and Fürst 2007)	Erm, well, with cigarettes this is clearly an addiction. Here I'm totally fair and square, you can label this as addiction. . . . This is something, I would say, this is just an independent small issue, this addictive behavior. *(Ursula, 58)*
Minimization (Neurotic)	Trivialization of the wrongdoing (Hoyk and Hersey 2008)	Also, I sometimes think 'oh my God, another cancer stick'. This might be true. And I also think 'if I am smoking more and more now, I will die some day, I will die earlier'. . . . But I think 'as long as I can reduce it' [*pauses*]. For example, I can resist smoking a cigarette for 4 to 5 hours, I don't have to smoke then [*emphasized*]. *(Jonathan, 44)*
Repression (Neurotic)	Unconscious decision to exclude unpleasant thoughts or feelings (Vaillant 1977)	Well shit, actually this is shit. But well, that's just the way it is. *(Bert, 30)*
Mental distancing** (Neurotic)	Dissociate oneself from others' opinions, attitudes, or behaviors	I don't wanna be like that [extremely ecological], I cannot be like that, and maybe there's also no need for it. *(Thomas, 27)*
Devaluation (Neurotic) • Cynical* • Skeptical*	Attribution of exaggerated negative characteristics to the self or to others (Kernberg 1967, 1987)	Well, for example my girlfriend likes to watch consumer protection programs on TV. And this is again something to which I say ironically and cynically that this is 'the worst thing in the world, which I absolutely dislike'. *(Thomas, 27)*
Withdrawal (Neurotic)	Avoidance of threatening situations (Constantinides and Beck 2010)	Or take for example Takko Fashion [discount clothing store]: There, I don't go in that store as a matter of principle and for the purpose of not being tempted. *(Charlene, 27)*
Altruism (Mature)	Instinctively helping others in a constructive way (Vaillant 1992)	I don't know which country this was about, the one with the civil war problem, well there we have also donated something. . . . We are lucky to live in a country without suffering from hunger and now I have donated money for that. *(Clarissa, 43)*
Humor (Mature)	Outright expression of thoughts and feelings without discomfort (Vaillant 1992)	While eating, I don't think 'oh, this animal happily bounced around and has been slaughtered for me' [*travesties her words*]. *(Maria, 77)*
Suppression (Mature) • General* • Temporal*	Semiconscious or conscious decision to delay paying attention to sth. (Vaillant 1977)	But, so to say, then after all with the ulterior motive 'there are so many starting points where one should live sustainably', in a way, that it is always [*pauses*] difficult to say where to start and to condemn everything. Well, there I really caught myself how I totally suppressed this. *(Thomas, 27)*
Partial confession** (Mature)	To confess own weaknesses in order to mask more severe weaknesses or to preempt arguments against oneself	Sometimes if things are just incredibly cheap, then it doesn't matter to me. Well, there is a certain threshold, not for every product, but for some of them. If it falls below that threshold, I will just buy [*pauses*]. Okay, I know, that I do not always buy ecological and biological, this would be a lie, I cannot leave this behind me completely. *(Jessica, 34)*
*New mechanism subcategory/categorization. **Newly discovered mechanism (including own working definition).		

you can put the end, never [*pauses*]?! There the population has to intervene more, but that's not the case. Or the city government, it doesn't do anything either. (Jonathan, 44)

Okay, people always tell me 'you are way too posh'. I would spend so much money on clothes, everything, but when I see others compared to me, what a shoe cabinet or wardrobe they have, compared to them I am really modest [*pauses*]. This is nuts, when I have a look at my friends [*slightly bewildered*]. (Sadie, 20)

When it comes to clothes it is really difficult to get true healthy clothes. And then I would really walk around completely in eco-style, which is something that I don't like to do. (Bert, 30)

But at the same time, I sometimes realize that I'm not as consequent as I should be, and that I find myself sometimes provoking other people, who are very sustainable, a little . . . also that I sometimes realize that I take the opposite standpoint, and that I satirize so to say excessive sustainable thinking in a cynical way. (Thomas, 27)

Well, this is maybe impulse buying, which you do rather without thinking. That something in the shop is attracting you, let it be a T-shirt, there I don't have a look if it's 'made in Taiwan' or somewhere else. This can definitely happen, that in a certain moment I do not take care of sustainability. (Monica, 48)

In general, we find that more severe conflicts tend to be resolved by more advanced mechanisms. For example, participants with felt conflicts rely on mature rather than on psychotic defense mechanisms, while the latter suggest the existence of latent conflicts. Only when inner conflicts cannot be sufficiently resolved, people change actual consumption behavior. According to Ekins (1994), people use modification and/or sacrifice to feel like living a sustainable life. Indeed, participants report making minor compromises in order to resolve their manifest conflicts. As a consequence, they report having reduced their negative feelings or even produced positive ones.

I had ordered something for my kids, shipping order. And when I had the products [T-Shirts] later in my hands, I had a look at the label, then there was written 'made in Bangladesh'. There I wrapped them up and sent them back. . . . there I've thought 'no'. I've sent them back. This was a thing I somehow couldn't do, because I thought that there is child labor behind it, one-hundred percent. (Kristie, 38)

Kristie's example shows that she needed to change her actual behavior in order to overcome the underlying manifest conflict. To sum it up, participants sometimes tend to make compromises on behalf of sustainability issues, nonetheless in many cases psychological defense mechanisms prevent them from changing unsustainable consumption pattern.

DISCUSSION

This research tried to address the important question of why even sustainability-oriented consumers show unsustainable consumption behavior. We undertook a first step to develop a theoretical framework describing consumers' underlying psychological mechanisms. Notably, the concept of semiconscious defense mechanisms

was introduced as one possible explanation of the aforementioned phenomenon. In-depth interviews revealed that there is a wide range of different defense mechanisms which people use to continue unsustainable consumption behavior.

In addition to the specific results above, defense mechanisms show some general aspects which should be discussed. To begin with, defense mechanisms are often said to be rather unconscious (Cramer 1998). Indeed, there is a continuum between unconscious and semiconscious defenses. In particular, first level (psychotic) mechanisms like denial or distortion are mainly unconscious, that is, people use them to resist their bad conscience without being aware of using them. Therefore, it is sometimes difficult for researchers to detect psychotic defenses. Nevertheless, our research is indicative of some of these first level mechanisms. Second level (immature) mechanisms such as accusation or projection tend to be rather unconscious at the moment of their use, but under certain circumstances people might become aware of their utilization when reflecting about their own past behavior (Bond 1995). Mechanisms on the third level (neurotic) like rationalization or devaluation contain more semiconscious processes compared to immature mechanisms. Especially rationalization is a mechanism which participants use in different subtypes (complexity, history/education, opportunity, material pressure, mental pressure, temporal pressure). It is important to note that most of these rationalizations take the short-term, not sustainability-related, motive (personal comfort, enjoyment, acceptance by others etc.) as a default. In other words, participants are not willing to make any compromises at the cost of their short-term motives. This is why they start searching for arguments that justify their negligence of sustainability-related motives. Finally, fourth level (mature) mechanisms are used in a more semiconscious way (Vaillant 1992). For instance, general and temporal suppression constitute a promising way for consumers to overcome inner conflicts.

Furthermore, psychological defense mechanisms stem from psychoanalytic therapy and have often been connected with mentally ill individuals. However, mature defenses are common for healthy individuals to solve psychological conflicts (Vaillant 1992), as is supported by the conducted in-depth interviews. Moreover, neurotic defenses are well-established when healthy individuals have to master acute distress. Again, this seems obvious when having a look at the wide range of rationalizations used by our interview partners when being confronted with potential intrapsychic conflicts. Whilst clinicians consider immature (age 3 to 15) and psychotic defenses (age before 5) to be typical for children and adults in psychotherapy (Vaillant 1992), other researchers claim most defense mechanisms to have normal as well as pathological manifestations (Baumeister et al. 1998). Therefore, it is no surprise that people continue to use primitive defense mechanisms which they have learnt during childhood and adolescence. Our interviews indicate that individuals rather unconsciously rely on those mechanisms which have been successful for them in the past. Interestingly, results point in the direction that higher (vs. lower) levels of education are connected with more advanced defense mechanisms (neurotic, mature) and vice versa, therefore, individuals' intellectual age might play a role in this context.

Last but not least, there is some debate about the efficiency of specific defense mechanisms, building on the differentiation between adaptive and maladaptive defenses (Segal, Coolidge, and Mizuno 2007). Whilst adaptive mechanisms such as humor and suppression are said to help individuals solving their inner conflicts, maladaptive mechanisms like projection and withdrawal should even worsen the situation in the midterm. Even though we also found evidence that higher level defenses seem to be more helpful for individuals to reduce negative feelings in general, there is also a strong subjective

preference for the use of specific mechanisms. We speculate that this originates from the individual's successful use of these mechanisms in the past.

LIMITATIONS AND FUTURE RESEARCH

For the purpose of classifying participants' degree of inner conflict, we draw on Pondy's systematization into latent, perceived, felt, and manifest conflicts (Pondy 1967, 1989). It hardly needs mentioning that in reality there is no clear-cut differentiation including four separated conflict types, but rather a continuum of inner conflicts according to strength. Nevertheless, we regard the terms 'latent', 'perceived', 'felt', and 'manifest' to be appropriate reflections of conflict strength. In particular, 'latent' as an indicator that the individual is not yet aware of the conflict at all, 'perceived' as the unemotional recognition of the conflict, 'felt' as the emotionally laden conflict perception, and 'manifest' as a very strong and apparent conflict, seem to be helpful criteria to classify inner conflicts.

In this research, several previously identified defense mechanisms as well as three new mechanisms (accusation, mental distancing, partial confession) could be identified. However, there are several additional defense mechanisms (Vaillant 1992), for example anticipation, somatization, sublimation, acting out, hypochondriasis, or displacement, which have been found inside the clinical context but were not supported in the conducted in-depth interviews. The possible reasons for this are threefold. First, there are some defenses like sublimation which are very difficult to detect via in-depth interviews. Maybe projective techniques might be an additional method to address this shortcoming. Second, the framework of unsustainable consumption behavior might lead to certain preferences concerning the selection of specific defense mechanisms whilst other defenses might not be very appropriate in this context. Third, the reason might also lie in the specific sample.

Finally, the detailed results concerning the evolution of inner conflicts and its respective conflict resolution strategies cannot be generalized to every human in every country in the same way. Not only do individuals have an inconsistent understanding what sustainability means, they also show huge differences concerning the subjective importance of particular sustainability aspects. Especially preferences, personality characteristics, and cultural aspects might play a role. For instance, there might be individual differences in altruism, materialism, or long-term orientation. These factors might shape the intensity of an intrapsychic conflict or the frequency of use of certain psychological defense mechanisms. However, they should by no means change the general theoretical framework which has been developed in this research approach.

Our theoretical contribution may be a starting point for further research to explore the nature and effectiveness of several conflict reduction strategies. Especially, additional knowledge about different degrees of intrapsychic conflicts and the corresponding internal defense mechanisms would help to further understand why consumers can continue to consume unsustainably although at the same time realizing the importance of living a sustainable life. As a matter of fact, defense mechanisms vary in nature. Therefore, building on experimental designs, it might be difficult to investigate the complete range of defense mechanisms in a single study. We suggest that future experimental research should concentrate on the examination of discrete defense mechanisms. Most interestingly, the effectiveness of a specific defense mechanism (denial of responsibility, rationalization, accusation, partial confession, or suppression) could be tested.

Finally, social desirability is an issue of high relevance (Dalton and Ortegren 2011; Mick 1996), thereby being especially dangerous for biasing results in research dealing with issues of unsustainable consumption. Consequently, we strongly advise to control for this bias when further investigating psychological defense mechanisms in the field of sustainability.

Utilising Consumer Introspection Theory to place the Culture of Consumer Research into the Flow of Life

Tim Stone, Universty of Aberdeen, UK
Fuat Firat, University of Texas - Pan American, USA
Stephen J. Gould, Baruch College, USA

ABSTRACT

This article takes initial inspiration from the disciplinary pioneers of humanistic/cultural consumer research (especially Belk 1987, 1988; Belk, Wallendorf and Sherry 1989; Firat 1985; Firat and Dholakia 1982; Hirschmann and Holbrook 1982; Holbrook 1987; McCracken 1986; Mick 1986) who "encouraged investigation of the contextual, symbolic, and experiential aspects of consumption... from a macro, meso and micro theoretical perspective" (Arnould & Thompson 2005: 871). Such esteemed scholars often reflected insight from macroeconomics, microeconomics, psychology, sociology, anthropology, philosophy and the humanities into their accounts of consumer research. In this sense, and as Holbrook (1987) suggests, consumer researchers' have often adopted a multidisciplinary stance in attempting to view such constructs as acquisition, consumption, possession and disposition through different theoretical lenses. In this vein, and to paraphrase Belk (1987), *the aim of this paper is to reflexively examine the relationship between the culture of consumer research and the rest of life*. As Dholakia (2012: 221) suggests, this is important as it may allow us to better appreciate the "intertwined and not-so-visible rhizomes, linkages, influences, and flows" within our discipline.

With the preceding aim in mind, we specifically position ourselves alongside marketing and consumer researchers who have either attempted to provide a critical perspective (see Dholakia 2012, 2009; Dholakia and Firat 2006; Firat 2009; Firat and Dholakia 1982, 2003, 2006; Firat and Venkatesh 1995) or those scholars who have adopted an emotionally sensitised and close view of consumer research in relation to, for example; jazz consumption (e.g. Holbrook 1987), introspection (e.g. Gould 1991, 1995, 2008a, 2008b, 2012), place, technology and representation (e.g. Sherry 2000), poetry (e.g. Sherry and Schouten 2002), embodied imagination (e.g. Joy and Sherry 2003), videography (e.g. Belk and Kozinets 2005), post-humanism (e.g. Venkatesh, Karababa and Ger 2002) and transcendental consumption (e.g. Minowa 2011). Indeed, as Joy and Sherry (2003) in line with Pham, Cohen, Pracejus and Hughes (2001) suggest, feelings play a central role in consumers' (and consumer researchers) day-to-day lives and merit serious investigation. Following on from this, and as Joy and Sherry (2003) posit, studies of embodied realism (conscious and unconscious) have generated some of the most exciting consumer research as it allows us to get closer to the cultural context, atmospherics, texture and undercurrents that surround and permeate day-to-day life (Sherry and Schouten 2002).

THEORETICAL REFECTION (1) – HUMANISTIC CONSUMER RESEARCH AND CULTURAL DISCOURCE

Following Stone, Hewer and Brownlie (2011) we argue that, within the context of humanistic inspired consumer culture research, it has become relatively commonplace to draw upon, for example, the interpretive anthropology of Geertz (1973) to theoretically ground a broad range of empirical insight. Such scholarship as Stone et al. (2011) suggests, more often than not, either explicitly or implicitly, acknowledges that studies of "consumer culture" tend to fall in line with an anthropological tradition that views "culture" as a system of inherited conceptions and symbolic forms that enables men and

women to communicate and further develop their knowledge and attitudes toward life (Geertz 1973). Following on from this, culture, combined with genetic predisposition (Ingold 2011), can be seen to play an important role in continually enabling a coherent and intelligible system of symbols and material artefacts to emerge within and throughout day-to-day lived experience.

Such a theoretical proposition might enable a question to appear in the reader's mind: How do people inherit symbolic symbols within a cultural context? Geertz (1973) suggests that when human beings are very young; a gap exists between emerging bodily knowledge and meaningful day-to-day functioning. Commenting on this gap, Ingold (2011) forwards the proposition that the fundamental aspects of cultural systems are genetically passed from one generation to the next. From this perspective, some consumer researchers (either implicitly or explicitly) tend to acknowledge that culture is thereby acquired through observation learning and practice (Warde 2005) rather than being innate. As Stone et al. (2011), in line with Ingold (2011) further suggest, freshly encultured individuals are then subsequently faced with a diverse range of environmental conditions which ensure that knowledge is constructed in such a way that enables individualised expression and subtle variations in observed behaviour. Reflecting upon such a proposition, the notion emerges whereby culture can either be thought of as a relatively natural and subtle "system of inherited conceptions and semiotic signs" (Geertz 1973) or a "significant web of meaning" (ibid.) that organises a wide range of meaningful consumption practices (Warde 2005), individual and shared symbolic experiences and knowledge generation activities.

THEORETICAL REFLECTION (2) – ANTHROPOLOGY AND CULTURAL DISCOURCE

With such thoughts in mind, we attempt to add nuance to scholarly debate surrounding the theorisation of culture within consumer research by offering an alternative anthropological perspective which suggests that a perspective of culture that is based on an assumed, coherent and static cultural boundary is problematic (Ingold 2011, 1992; Kottak 2008; Palsson 1993; Rapport and Overing 2007; Stone et al. 2011). Such a school of thought, we argue, is problematic because these particular theoretical building blocks seem to have been constructed on the basis that beliefs about the external world are converted into attitudes and behaviour that, in turn, become manifest in terms of outward appearance and verbal expression. Such a distinctive process appears to be shaped (and shape) by a wide range of cognitive rules which situate the person within the world and subsequently enable them to identify differences between the "self" and "others". By "others" we also refer to material artefacts, the earth beneath our feet, animals, birds, insects and so on. From this perspective, people can't attend to the world directly but have to figure it out along cognitive pathways that reflect upon a wide and diverse variety of integrated patterns of semiotic signs and material artefacts that come to the attention of the body's senses (Kottak 2008; Ingold 1992). As a consequence of such embodied mindfulness it is not entirely surprising that people divide and enwrap their understandings of the external world into discrete and meaningful cognitive parcels of knowledge.

From such a dualistic perspective, people are philosophically framed in such a way that suggests that individual and/or communal meaningful activities come into being within inverted, closed and static cultural boundaries (Ingold 2011). However, in practice, "what we do *not* find are neatly bounded and mutually exclusive bodies of thought and custom, perfectly shared by all who subscribe to them, and in which their lives and works are fully encapsulated" (Ingold 2008: 330). In other words, contemporary society could be thought of in terms of the sheer messy complexity that seems to circumnavigate traditional cultural boundaries. As Rapport and Overing (2007: 298) state, "[t]here is no longer traditional, bounded cultural worlds in which to live – pure, integrated, cohesive, place rooted – from which to depart and which to return, for all is situated and all is moving." From this we argue that cultural life "does not begin here or end there, or connect a point of origin with a final destination, but rather it keeps on going, finding a way through the myriad of things that form, persist and break up its currents" (Ingold 2011: 4). Life, in short, as Ingold (ibid.) reveals, is a movement of opening, not of closure. We therefore argue, that there is significant value in trying to recover that original openness to the world within consumer research in an attempt to revive and recover the things that make cultural life less structured and more sublime (Lacoue-Labarthe 1986; Lyotard 1986), magical (Buck 1936), liberatory (Durkheim 1915; Firat and Venkatesh 1995), free (Marcuse 2002), rich (Midgley 2003), impetuous, refined and enjoyable (Nietzsche 1990). Such an open epistemological and ontological perspective may enable us, as consumer researchers, to probe the complexities and nuances of context and environment in a deeper sense, thereby allowing more "disciplined enquiry into the conditions and potentials of human life" (Ingold, 2011: xi).

METHODOLOGY: EMPLOYING CONSUMER INTROSPECTION THEORY (CIT) TO OPEN UP CULTURAL DISCOURCE

Reflecting upon the preceding text enables an interesting question to emerge; how do we, as consumer researchers, open ourselves up in order to better appreciate the conditions of human life? In order to address this question it is necessary to align this paper with the way of the contemplative philosopher to propose methods that can be shared in order to experience reflexive revelations. Gould (2012: 455) suggests that we should consider employing Consumer Introspection Theory (henceforth, CIT) to extend the reach of cultural theory "by "excavat[ing] the dynamic of self-culture liminality and co-creation." Such a methodological approach can help to map the gestalt of experience by sensitising like minded consumer researchers to reflect upon dominant ideologies, obfuscations and mystifications playing out within the discipline. Our proposed methodological approach is similar to central Buddhist meditational techniques that explore the realms of consciousness, mind and the phenomenal world (Gould 1995; Wilber 2001). More specifically, we offer you three engaging introspective exercises or thought experiments - (1) You; (2) You and Your Work; and (3) Culture:

Introspective Exercise (1) – You

Consider all that makes up you; body parts, mind, thoughts, your name, relationships, aspects of identity such as gender, ethnicity or age, or consciousness and unconsciousness. Are any of these you? If not, what is you? Are you the sum of the parts, more than the sum of the parts, or are you multiple, i.e. each part is you – there are many yous. This may strike you as strange at first though it is not unlike deconstructing the self in postmodern terms. This way digs down in very specific ways. How does it make you feel? Is there a you? Or are you empty of you are you-ness? Perhaps the metaphor

of the onion skin would be helpful here – you peel away layer after layer and in the end nothing remains. Is this true about you? How does this thought process make you feel? Are you empty or in emptiness? Continue by considering how you relate to your environment; physical, social and cultural. Are you part of it or separate from it? In any case, how are you connected to it? Is there a you that exists apart from it? Are you empty of existence with or without the environment?

This exercise should help you to think about and deconstruct theories of the self (e.g., extended and multiple selves; self-image and concept) in new and very personal ways. It can also help you to further engage with (your)self and your and our consumer research projects in new and stimulating ways. The next exercise is illustrative of one such further engagement with the self.

Introspective Exercise (2) – You and Your Work

Take a piece of your writing (it may be a current piece and at other times you may look retrospectively at your own published work) and read it through with special attention to the personal feelings and thoughts it brings up. Sometimes do this with more intention, that is, look for these things. Other times, let them arise spontaneously as you read and/or in other situations, such as post-reading. What do these feelings and thoughts tell you about the work and yourself? Does your work take a position and attempt to open up theoretical discourse or seek in some way to improve the world? Do these points matter to you? Does looking in this way change your understandings and perceptions? Certainly in literary criticism, we consider the idea of authorial intent. What were/are you as author intending in your writings? At the same time, you are a reader of your own work here – reader response. How do you respond to what you have said? How do you feel when you think of others reading your work? How have your views and therefore reading of any particular piece of yours changed? Read the work of others who cite/discuss your work. Do they get it? Does your authorial intent have any connection to their reader response, even to your own? (this exercise is adapted from Gould 2008b: 325).

Based on this reflexive introspection we attempt to suggest how various discursive inversions that present themselves to (and are used by) consumer researchers can be opened up. As such, we hope to sensitise you, the reader, to the role of boundaries in shaping you and your work though reflections that could relate (but necessarily be limited) to the following constructs; internal, external, introspective, extrospective, personal, cultural, narrative, meta-cognitive, objective, subjective, authorial intent, reader response and so on. Next, we provide an exercise which looks at and helps to deconstruct the boundaries of self and culture.

Introspective Exercise (3) – Culture

Is the self an outpost of culture? Watch your reactions to various manifestations of culture, such as everyday discourse; various practices in which you engage, especially as contrasted with those of others; and media use. Do you merely reproduce culture in these particular manifestations and expressions, i.e. being more produced than producing? Or do you actually produce culture, i.e. something new and different? Are your self and culture simultaneously produced, synchronously reflexive in relation to each other? Consider (cross)cultural phenomena such as hybridisation. When you encounter something new from another culture such as a new perspective or discourse, where does it go within you? Does it hybridize or does it somehow manifest as another of your multiple selves? Which selves express themselves when you critically access something? (this exercise is adapted from Gould: 2008b: 324).

As consumer researchers, we are all perhaps too familiar with the idea of cultural construction which indicates that meaning is produced by culture, that culture, itself, is produced and that there is no particular essence to be found, it would seem that the concept of personal cultural construction, allowing for the idea that there are such things as personal cultures, would be a parallel, if intermeshed universe. Our personal cultures consist of the meanings, discourse, rituals and practices we hold and engage in. They link to other levels of culture so seamlessly that we do not think of ourselves as 'a culture'.

THEORETICAL REFLECTION (3) – THE FLOW OF LIFE

Such introspective epistemological and ontological exercises have been carefully designed to sensitise you, the reader, to the proposition that cultural life issues forth through open, complex, dynamic, transformative, interdependent, never ending, cyclical currents of a world-in-formation that are never the same from one moment to the next (Ingold 2011; Stone et al. 2011). Such becomings bring forth the appearance of people as entangled beings that are ontologically incomplete (Minowa 2012). It is within such holistic, atmospheric, textured tangles, "continually ravelling here and unravelling there, that people grow or 'issue forth' along the lines of their relationships" (Ingold 2011: 71). Unbounded, people are united in shared and liberating beliefs of a way of knowing and being that is alive and open to a world in continuous birth. Life, seen in this way, flows though complex, fluid, textured atmospheric relationships. Moreover, and by way of clarification, we forward the proposition that our perspective goes beyond stressing the importance of beliefs and attitudes in shaping (and being shaped by) a particular worldview to warmly embrace the notion of dwelling (Ingold 2000) within a world of potential and possibility. Such a proposition is heightened by an increased sensitivity to a world in motion that continually changes from one moment to the next (Ingold 2011).

Lestel, Brunois and Gaunet (2006: 160) further develop this discussion by stating that "this is a shared complexity in the sense that a complex situation is complex in different ways for the different agents involved, whose representations of it are not reducible to those of other agents". Critical reflection of such a proposition enables what we would argue to be a worthy question to emerge: i.e. set within the context of such philosophical discussions, how can we attempt to gain yet deeper understandings of the culture of consumer research and the rest of life? A logical move might be to suggest that meaning is diluted everywhere and nowhere (ibid.) and that, perhaps to a greater or lesser extent, a kind of mutual affective co-operation exists between people and material artefacts, the earth beneath our feet, animals, birds, insects and soon. Thus, according to this perspective, an ontological position emerges in a complex, heterogeneous field of open connections that consist of continual and reciprocal relationships that are actively and constantly being (re)assembled, (trans)formed and (dis)placed within energetic flux (Bateson 1973).

From such an epistemological and ontological perspective, life in is not instantiated within a pre-ordained cultural framework, rather, as Ingold (2011: 83) poetically suggests, it is forever becoming, always moving like the "crest of a wave that overflows any boundaries that might be thrown around it, threading its way like the roots and runners of rhizome through whatever clefts and fissures leave room for growth and movement." From this perspective, people become meaningful as a consequence of their "patterns of activity and movement signatures" (ibid.) that can be found inscribed into particular identities, relationships, communities, sensitivities, things and so on (Stone et al. 2011 in line with Rapport and Overing 2007).

"As walking, talking and gesticulating creatures, human beings generate lines [of movement] wherever they go" (Ingold 2007: 1). From this nomothetic perspective, people can be thought of as being immersed in evolving patterns of atmospheric and dynamic movements along ways of life (Ingold 2011). Thus, bodily movement becomes a critical vista for enabling the world to endlessly renew itself (Ingold 2011, 2007; Stone et al. 2011). However, the complexities of movement cannot be simplified in our efforts to make them graspable. That is, expression may be simplified but not the nature of the complexity of the relationships that produce movement. In effect, there is a connection to the sublime-the evocation of that which is not representable (Lacoue-Labarthe 1986; Lyotard 1986)-here, in the sense that the unrepresentable completeness of the complexities of movement need to be represented in an imaginative (artistic?) way that triggers a sense of the whole.

Developing the emerging discussion still further, in line with Stone et al. (2011) the authors argue that bodily movement is responsible for the becoming, growth and reproduction of inter-place cultural knowledge. For example, the development of a knowledge system within consumer research is attributed to "the work that goes into moving its diverse components – including practitioners, their know-how and skills, technical devices and standards of evaluation – from one local site of knowledge production to another" (Turnbull 1993: 30 in Ingold 2000: 229). Ingold (2000: 227) further suggests that knowledge "comes from a history of previous flights, of take-offs and landings, and of incidents and encounters en-route. In other words it is forged in movement, in the passage from place-to-place and the changing horizons along the way". Thus, far from being copied, ready-made, into the mind in advance of its encounter with the world, knowledge is perpetually becoming within an open field of (sublime) relations established through the immersion of the sensitive actor-in-the-world (Minowa 2011). Knowledge, in this view, is not transmitted as a complex structure (Geertz 1973) but is the ever emergent product of a complex process of atmospherics and bodily movement.

In the light of the preceding discussion, the notion is forwarded that embodiment is a necessary condition of a natural, open, (sub) conscious, atmospheric life of movement. Moreover, we argue, embodiment is necessary and natural condition for sensuous life/lives of becoming (Turner 2008). Ingold (2011: 12) furthers this discussion by claiming that "since the living body is primordially and irrevocably stitched into the fabric of the world, our perception of the world is no more, and no less, than the world's perception of itself – in and through us." Or, in other words, the inhabited world is a sublime (Lacoue-Labarthe 1986; Lyotard 1986), unbounded (Ingold 2011, 2008, 1992; Kottak 2008; Palsson 1993; Rapport and Overing 2007), rich (Midgley 2003), magical (Buck 1936), liberatory (Firat and Venkatesh 1995), rhythmic, affective and sentient body. Viewed in this way, to be sensitive is to be open to the world, to yield to its embrace and to resonate in one's inner being to its illuminations, reverberations and to be aware of signifiers within, and throughout a world-of becoming (Ingold 2011). By utilising CIT to push back epistemological boundaries, consumer researchers can be thought of as being immersed in atmospherics of light and sound and that these fundamental aspects of day-to-day life are affectually experienced by sentient bodies along pathways of becoming that continually contribute to the ongoing renewal of the world (ibid.).

From this perspective, we argue, the cultural life of consumer research does not present itself (as any one truth) until it is encountered. Yet, every encounter is embodied and from a point of origin and at an angle. This means that as points of origin (or departure) and angles vary, so will the embodied truths that are encountered. That is,

if there is such a thing as reality, it is likely to reveal itself in different ways to different people. The truth that presents itself is therefore in the encounter and is accumulated through the bodies' senses (seeing, hearing, smelling, tasting, feeling-touch; including interoception, proprioception) and subsequently contributes to the ongoing renewal of the world. Set within this context, the centrality of the senses in human understanding, consciousness and bodily movement cannot be underestimated. If a human being where unable to move and/or lack all of her/his senses she/he would have no experience of existence as we know it, nor would there be any consciousness as we know it. Thus, bodily sensing and, by extension, making sense are indeed central to human existence as the body is in a constant state of cultural (re)construction. The distinction so thoroughly made in modern thought between the body and the mind, therefore, needs to be re-thought. Rather than build our insights on the basis of the mutual influences of the body and the conceptual world of humans upon each other, we have to recognize the complex unity of the body that dwells (Ingold 2000) within an atmospheric world in-formation which gives impulse to the desire for movement and the essential organisation of life.

While consumer research on embodiment provides some useful insight in this regard, our approach takes a more holistic perspective such that these particular manifestations of embodiment are embedded in the (re-)production of cultural practices and meaning. Thus, sensing and by extension, bodily knowledge, movement and atmospherics are central to existence within a world in constant formation. Moreover, when we, as consumer researchers, can sense that we are no longer impeded or constrained by inverted ideologies through a realization that no reality has presence without atmospheric encounters, movement and bodily knowledge; and that different atmospheric encounters, movements and bodily knowledge are possible, we are burdened with a greater responsibility than simply discovering the truth. There is no longer a fundamental to show the way once discovered; no ready formula for life pre-exists to be discovered; no responsibility can be shirked or attributed to something beyond how we encounter a world-in-formation. Whatever truth we encounter is normally (but not always) constituted by our inverted conventions and perspectives.

Following on from this, the purpose of our particular brand of holistic consumer research is to open up the possibility of enabling people to get a deep, yet (in)expressible, understanding of a world-in-formation, an insight into the rich constellation of multiple truths, and, similar to Eastern philosophical approaches, make possible a meaningful recognition of the (in)significance of humanity. That is not to deny humanity of its position or place, but to make a greater sense of it through combining insights from an ever unfolding world-in-formation.

CONCLUSION

By way of a contribution, we have tried to provide the reader with insight into how our introspectively derived view of the culture of consumer research relates to the atmospheric linkages, influences and flows of life (Dholakia 2012; Ingold 2011) within an order of multiple orders (Firat 2009). Our current journey has not only reified the importance of feelings in cultural life (Joy and Sherry 2003 in line with Pham et al. 2001) but has also shown that studies of embodied realism (ibid.) hold the potential to more deeply access the flow of life (Ingold 2011). Moreover, we argue that such fundamental issues should be studied alongside atmospherics of movement and bodily knowledge (ibid.) in order to enable more sublime/holistic and sensitive understandings of consumption to emerge. Thus, and in keeping with the spirit of this paper, we call open-minded people towards the study of more holistic consumer research. Such a movement could seek to further illuminate, for example, the generation of knowledge that relates to the search for the sublime (Lacoue-Labarthe 1986; Lyotard 1986), the weather world (Ingold 2010), earth energies and ley lines, the availability and use of personal energy (Bateson 1972; Gould 1991), states of consciousness, what constitutes personhood, cybernetics (see craphound.com for thought provoking insight) and so on and so forth...

Viewed from this more holistic, and arguably critical-radical perspective (Dholakia 2012; Firat 2009), consumer research becomes the eclectic, open-ended (sub)conscious study of intertwined trajectories of human becomings and doings as they unfold through an atmospheric world-in-formation. In this sense, "there are no insides or outsides, no enclosures or disclosures, only openings and ways through" (Ingold 2011: 168). In short, we argue that the aim of holistic consumer research should be to visualise, sense and reveal the emancipatory and transformative flows (Dholakia 2012) and movements that contribute toward our ongoing formation.

The Impact of Internet Search on Price/Quality Correlations

Ellen Garbarino, University of Sydney, Australia

Nelly Oromulu, Transystems, USA

ABSTRACT

The price-quality correlation is typically low, suggesting market inefficiency. Information is a necessary condition for market efficiency and the Internet has radically increased information. This should lead to improved p-q correlations, at least for searched goods. Using secondary and survey data, we demonstrate this improvement, but only for durable goods.

EXTENDED ABSTRACT

Background: In an efficient market, products with low quality should only be able to survive by offering low prices and products with high quality should be able to command a price premium. Therefore, there should be a positive correlation between price and quality. The numerous empirical studies in consumer markets, however, consistently find weak correlations between price and objective quality, inviting the conclusion that market efficiency is the exception rather than the norm (Oxenfeldt 1950; Morris and Bronson 1969; Curry and Fauld 1986; Kirchler, Fischer and Hölzl 2010). Access to information is one of the necessary conditions for market efficiency (Ratchford 1980, Ratchford and Gupta 1990, Kamakura, Ratchford and Agrawal 1988). In support of this notion, Tellis and Wernerfelt (1987) demonstrate that the correlation between price and quality generally increases with the level of information in the market. Access to information has been growing steadily with the growth in Internet resources and penetration. This reduced cost of search should increase market efficiency, which should be reflected in improved p-q correlations.

Based on the premise that the advent of the Internet decreased the cost of search, we hypothesize that the p-q correlation should have increased in the post-Internet marketplace relative to the pre-internet marketplace. Given the central role of search in the expected improvement in the post-Internet marketplace, we also hypothesize that the effects will be stronger for durable goods than for non-durables goods due to the more limited search that is typically done for non-durable goods. In addition, we test directly whether the improvements in p-q correlation are driven by increases in the amount of online and/or offline search. The above hypotheses are tested using a combination of secondary source data (drawn from Consumer Reports) and primary survey data (drawn from an online panel).

Methods: The Pearson correlation between price and quality was calculated using data from *Consumer Reports* (pre-internet data from 1995-1998, post-Internet data from 2002-2005). 14 categories were chosen that had reviews in both time periods (7 durable, 7 non-durables). The following categories were used: top-loading washing machines, upright vacuum cleaners, supermarket cheese pizza, blenders, raisin bran breakfast cereal, built-in dishwashers, laundry detergent, self-propelled lawn mowers, crunchy peanut butter, large countertop microwave ovens, canned chicken noodles soup, non-stick cookware, corded steam irons and tortilla chips.[1]

Search habits and the judgement of the searchability of the 14 categories were measured through an online survey. 206 subjects

from a US online research panel responded to a survey concerning their online and offline search time for the 14 product categories (various versions counterbalanced order and categories; only half the categories were asked of each respondent to avoid fatigue). Additional questions addressed whether info available online was sufficient to purchase, whether the product needed to be experienced physically to purchase, ability to evaluate product before purchase, ability to evaluate product after purchase, the importance of price in purchase decisions, and the importance of quality in purchase decisions. These measures were included as covariates in our analyses; only the importance of price showed a significant effect (B=.856, p<.04), the more important price was in the category, the more improvement was seen in the p-q correlation. Search time was collected in hours and minutes, while all other items were measured using 7-point rating scales.

Results: Pearson correlations between price and quality for each category were computed using the prices and quality ratings in the *Consumer Reports*. The change in the p-q correlation was computed as the difference between the correlation post-internet and pre-internet for that category. Category-level search was coded as the average amount of time (in minutes) spent searching based on the responses from the survey. As expected, durable goods were searched more (both online and offline) than non-durable goods (Online Search: Durable Mean = 106.06 vs. Non-durable Mean=41.96, p<.003; Offline Search: Durable Mean=144.41 vs. Non-durable Mean=58.90, p<.001).

Across all 14 categories, the p-q correlation went up in 9 and down in 5 categories (binominal test probability 21%). Further analysis showed that this improvement in correlation was evident only for durable goods (6 out of 7 durable categories show improvement vs. 3 out 7 non-durable categories show improvement; $\chi^2 = 2.80$ p<.094), which was consistent with our expectation that the improvement in p-q correlation would be greater for durable goods for which consumers searched more. Examination of the direct influence of search time on the change in the p-q correlation showed a significant interaction between online search and durability of good (p<.008). A further exploration of this interaction showed that time spent searching online drives the change in p-q correlation only for durable goods. Specifically, for durable goods the more time spent searching a category the larger the improvement in the correlation (B=.008, p<.012). However, for non-durable goods the time spent searching does not led to an improvement in p-q correlation (B=-.005; p>.48). Time spent searching the category offline shows a similar but weaker effect (Durables: B=.005, p<.10; Non-durables: B=-.014, p>.19).

Summary: Using a combination of secondary and survey data, we show that the increase in information search with the advent of the Internet has lead to an improvement in the price-quality correlations for durable goods, but has had no effect on the price-quality correlations for less commonly searched non-durable goods.

If a market is efficient, products with low quality should only be able to survive by offering lower prices and products with high quality should be able to command a price premium. As stated in Geistfeld review of the price-quality literature, "If the relationship between price and quality is poor, markets are not working well and consumers are not making efficient use of their resources" (1988, p.144). This logic implies that in well functioning markets, price should be positively related to quality. However, the numerous empirical studies

---

[1] Little research has examined the changes in p-q correlation over time, however, based on the product life cycle theory, Curry and Reisz (1988) argue that p-q correlation should decline as products mature due to price compression and reduced spending on quality improvements. To minimize the effect of product life cycle we examine only mature products.

in consumer markets consistently find only a weak correlation between price and objective quality, with the average correlations for durable goods ranging from 0.25-0.30 and closer to zero correlation for nondurable goods (Oxenfedlt (1950), Morris and Bronson (1969), Sproles (1977), Riesz (1978), Gerstner (1985), Curry and Fauld 1986; Kirchler, Fischer and Hölzl (2010)). While these studies show an amazing consistency across countries, categories and decades, it is worth noting that, with the exception of the Kirchler et al. paper, all of these findings come from the pre-Internet age.

One of the hallmarks of the Internet age has been the explosion in available information. As noted by the literature, access to information is one of the necessary conditions for market efficiency (Ratchford 1980, Ratchford and Gupta 1990, Kamakura, Ratchford and Agrawal 1988, Maynes 1992). In support of this idea, Tellis and Wernerfelt (1987) demonstrate analytically that the correlation between price and quality should increase as the amount of information acquired increases. As we are all well aware, access to information has been growing steadily with the growth and penetration of Internet resources. These resources are now cheaply and easily accessible to most consumers. This reduced cost of search should be reflected in improved price-quality correlations.

There has been little study of how the price-quality correlation changes over time. In one of the few longitudinal studies, Curry and Riesz (1988) argue, using the product life cycle theory, that over time real prices decline and tend to converge and this is what they find. They initially hypothesized the price-quality correlation to increase as the market matured due to rising information levels, but they actually found that the correspondence between price and quality tended to decline over time. They speculate that this is caused by a shift toward spending on advertising rather than quality improvements as the market matured, although it could also be caused by a narrowing of the range of price and/or quality across the category as the market matures. In a similar market growth explanation, Hjorth-Andersen (1992), argues that low or negative price-quality correlations could be due to product improvements leading to inexpensive but higher quality alternatives being introduce to markets that are still rapidly evolving. To minimize the potential influence of the product life cycle on the change in the price-quality correlation, we will examine only mature product categories.

Hence, using secondary measures of price and quality from Consumer Reports from 1995-1998 and 2002-2005 for a selections of 14 mature categories (7 durable and 7 nondurable), we explore whether the price-quality correlation has increased for both durables and non durable goods with the advent of the Internet as a search tool. In addition, we explore whether consumers' stated level of category search predicts the expected improvement in price-quality correlation.

HYPOTHESES

Based on the premise that the advent of the Internet has decreased the cost of search, along with the fact that the cost of search is an established determinant of market efficiency (Ratchford 1980, Ratchford and Gupta 1990, Kamakura et al. 1988, Manyes 1992) and that the price-quality correlation is at least a partial indicator of market efficiency (Ratchford et al. 1996), we hypothesize that the p-q correlation should have increased in the post-Internet marketplace relative to the pre-Internet marketplace.

Hypothesis 1: *Price-Quality correlations will increase in the post-Internet period relative to the correlations in the pre-Internet period.*

Stigler's (1961) model of the economics of information argues that the cost of search relative to its benefit will be lower for nondurable goods and hence one would expect lower search for nondurable goods. Given this more limited search for nondurables and the central role of search in the expected improvement in price-quality correlation in the post-Internet marketplace, we hypothesize that the increase in price-quality correlation will be more pronounced among durable goods than among non-durables goods.

Hypothesis 2: *A post-Internet increase in price-quality correlation will be more common for durable goods than nondurable goods.*

Based on information economics, the hypothesized mechanism underlying the predicted increase in the correlation of price and quality is that the decreased cost of search with the rise of the Internet has lead to increased search for goods where the benefits of search are higher (i.e., more involved and risky goods). Hence we will more directly test whether the amount of time spent searching positively predicts the increase in the price-quality correlation. Given that the Internet is the new channels of search, the expectation is that any improvement seen will be most strongly related to the increase in online searching. However, it is also interesting to explore the effects in regards to the amount of offline searching. It is possible that online searching is such a strong substitute for offline searching, that offline search might even have a negative correlation with an improvement in price-quality correlation. However, it is also possible that the two forms of search are complimentary and that both will show the predicted positive relationship.

Given their small ticket price and generally low risk, the benefits to search for nondurables are modest. Additionally, the low involvement and low value of most nondurables leads there to be less readily available information on the Internet. Hence, the smaller changes in the search costs and benefits due to the Internet for nondurables should lead to little or no increase in price-quality correlation for these goods.

Hypothesis 3: *The amount of search done (especially online search) should be positively related to the level of increase in the price-quality correlation.*

Hypothesis 4: *The role of search increase of the price-quality correlation should be larger for durable goods than nondurables goods.*

METHODS

The above hypotheses are tested using a combination of secondary source data for price and quality ratings (drawn from *Consumer Reports*) and primary survey data on category specific search habits and impressions based on a survey (drawn from an online panel). *Consumer Reports* data has been used in most studies of the price quality relationship (e.g. Tellis and Wernerfelt 1987; Gerstner 1985, Morris and Bronson 1969). While Consumer Reports data has been criticized for over-simplifying objective quality and not including many factors that consumers use in purchase valuation (Hjorth-Andersen 1984, 1992), it is still the common standard for studies of this kind (Boyle and Lathrop 2009) due to it objectivity and comparability cross studies. In addition, any bias would not have a differential impact on durable or nondurable goods.

The Pearson correlation between price and quality is calculated using data from *Consumer Reports Magazine*. Price was represented

by the dollar amount per unit of product and the overall satisfaction rating scaled from 0-100 was used as a measure of quality. The pre-Internet data was chosen from paperback issues between 1995-1998, while the post-Internet counterparts were selected from the online database from between 2002 and 2005.

The actual category selection was dictated by the availability of data on the same product categories and subcategories in both periods of time. To limit the influence of product life cycle stage on the price-quality correlation (Curry and Riesz, 1988), we examine only mature products. Hence, 14 mature categories were chosen that had reviews in both time periods (7 durable, 7 non-durables). The following categories were used: top-loading washing machines, upright vacuum cleaners, supermarket cheese pizza, blenders, raisin bran breakfast cereal, built-in dishwashers, laundry detergent, self-propelled lawn mowers, crunchy peanut butter, large countertop microwave ovens, canned chicken noodles soup, non-stick cookware, corded steam irons and tortilla chips.

The primary data consisted of a survey to assess category specific search habits and perceptions of each category. Pilot testing ascertained that judging 14 separate categories was too fatiguing for respondents, hence people were only asked to judge seven categories. Four versions were created that varied in the categories seen, order of the categories and balanced the number of durable and nondurable goods (the four versions showed no significant differences in evaluation and hence were collapsed across). A total of eight questions were asked for each category: time typically spent searching (in hours and minutes) online and offline, whether info available online was sufficient to purchase, whether the product needed to be experienced physically to purchase, ability to evaluate product before purchase, ability to evaluate product after purchase, the importance of price in purchase decisions, and the importance of quality in purchase decisions. Time searching was collected using open-ended questions about hours and minutes spent searching in

this category, while all other items were measured using 7-point rating scales ("agree very strongly" to "disagree very strongly"). 1400 requests were emailed out to an established commercial research panel designed to represent the US population, 206 valid responses were collected, for a response rate of 15%.

RESULTS

The dependent variable is the change in correlation between price and quality pre- and post-Internet. The change in the price quality correlation was computed as the difference between the Pearson correlations post-Internet and pre-Internet for that category using the prices and quality ratings in the *Consumer Reports*.[2] Category-level search was coded as the average amount of time (in minutes) spent searching online or offline aggregated from the responses to the survey. As expected, durable goods were searched more (both online and offline) than non-durable goods (Online Search: Durable Mean = 106.06 minutes vs. Non-durable Mean = 41.96 minutes, p<.003; Offline Search: Durable Mean = 144.41 minutes vs. Non-durable Mean = 58.90 minutes, p<.001). The scale items describing consumer beliefs about the characteristics of the categories were used as potential covariates. Analysis showed that only, the importance of price in category purchase showed a significant effect (B = .856, p<.04) on the change in the price-quality correlation; the more important price was in the category, the more increase was seen in the p-q correlation. Hence, only this covariate was retained.

Across all 14 categories, the price-quality correlation went up in nine and down in five categories (binominal test probability 21%), thus there is at least directional support for the expected improvement in price-quality correlation (H1, see Table 1). More detailed analysis showed that the hypothesized increase in correlation was evident only for durable goods (6 out of 7 durable categories show increased correlation vs. 3 out 7 non-durable categories show posi-

Table 1
Changes in Price-Quality Correlation

Category	Post-Internet Correlation	Pre-Internet Correlation	Change in Correlation
Nondurables:			
Canned Chicken Noodle Soup	.1974	.6234	-.4260
Raisin Bran Cereal	-.7835	-.4043	-.3792
Non-Stick Cookware	.3305	.6801	-.3496
Crunchy Peanut Butter	-.2941	-.0050	-.2891
Tortilla Chips	-.1860	-.2790	.0930
Laundry Detergent	.6473	.0145	.6328
Frozen Cheese Pizza	.3010	-.3617	.6627
Average Price-Quality Correlation	.0304	.0382	-.0079
Durables:			
Steam Iron	.2528	.7278	-.4750
Upright Vacuum	.3101	.2851	.0250
Large Counter-Top Microwave	-.0089	-.0505	.0416
Top Loader Washing Machine	.8318	.6356	.1962
Blender	.1143	-.0837	.1980
Self-Propelled Lawn Mower	.5849	.2135	.3714
Built-in Dishwasher	.5080	.1050	.4030
Average Price-Quality Correlation	.3704	.2618	.1086

tive change; χ^2 = 2.80 p<.094; supporting H2), which is consistent with our expectation that the increase in the post-Internet price-quality correlation would be more common for durable goods.

Table 1 shows the category specific correlations to assess not only the direction but magnitudes of the effects. Similar to prior studies (e.g., Gerstner 1985), the pre-Internet price-quality correlation for durables was .26 and nondurable was basically zero (r = .04). The average change in the correlation in the post-Internet period was an increase of .11 for durables and basically no change for nondurables (Δ = -.01). This improvement in the price-quality correlation for durables represents over a 40% increase in the price-quality correlation for durable goods on average. Thus, not only do almost all of durable categories show the hypothesized increase in correlation but also the magnitude of the change is quite substantial.

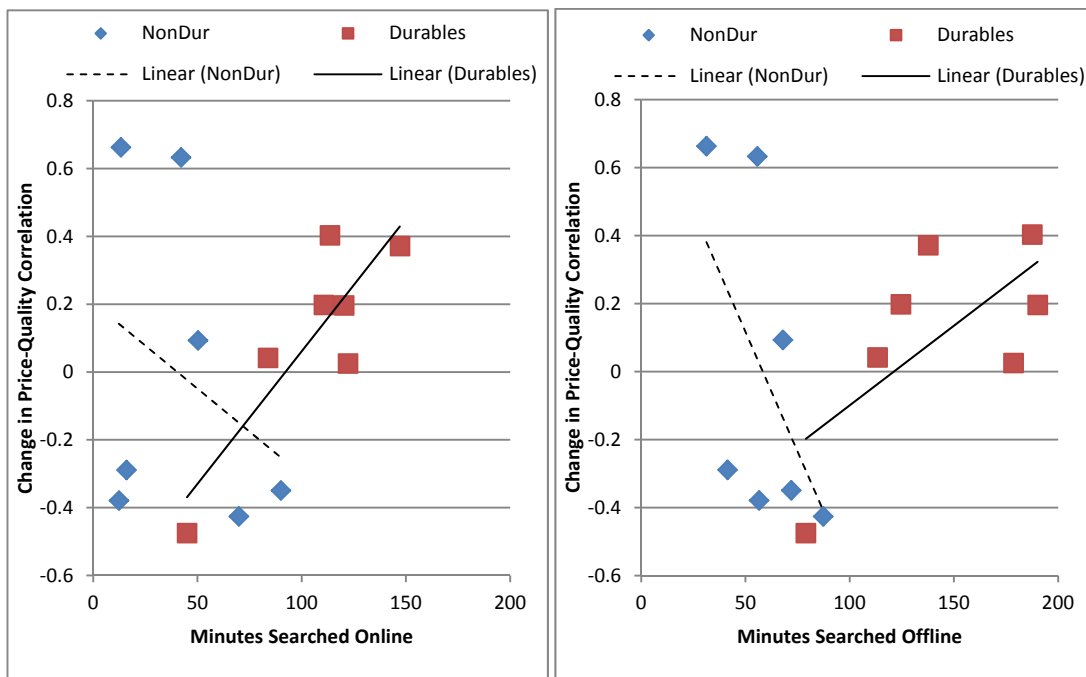
Examination of the direct influence of search time on the change in the price-quality correlation shows no significant main effect of search on the change in price-quality correlation for either online or offline search (Online: p>69; Offline p>.69; not supporting H3). However, the interaction between online (and offline) search and durability of good is significant (Online: p<.008; Offline p<.023; supporting H4). A further exploration of these interactions shows that the time spent searching drive the change in price-quality correlation but only for durable goods. Specifically (see Figure 1), for durable goods the more time spent searching a category online the larger the improvement in the correlation (B = .008, p<.012). However, for non-durable goods the time spent searching online does not led to a change in price-quality correlation (B = -.005; p>.48). Time spent searching the category offline shows a similar but weaker effect (Durables: B = .005, p<.10; Non-durables: B = -.014, p>.19).

DISCUSSION

Using a combination of secondary and survey data, we test whether the advent of the Internet with its much broader and easier access to product and price information has lead to improved market efficiency as proxied by an improvement in the price-quality correlation. Even with only 14 categories (7 durable and 7 nondurable), we find the post-Internet price-quality correlation has improved, but only for durable goods. Using survey data of category specific search habits, we further show that information search (both online and offline) is the driver of this improvement in correlation amongst durable goods. These findings are consistent with the premise that the Internet has made search less costly, allowing consumers to better monitor the markets, leading to a better correspondence between price, at least for durable goods.

Nondurable goods present a different picture. Although in our data the results are not significant, it is curious to note that the direction of change and the effect of search on nondurable goods tends to be negative. We are uncertain why this may be true, it is possible that the quality and/or amount of information in regards to nondurables is poor and hence search is not leading to improved outcomes. Alternatively, it could be that the higher benefits to be gained from searching durables crowds out the more modest benefits to be gained from searching nondurables and hence consumers are substituting durable search for nondurable search. The finding does suggest that further and more extensive testing maybe needed to ascertain whether it is generally true or just an artifact of this sample.

Like all studies, this one is not without significant limitations. First, we use only fourteen categories (and only 7 in each subtype) and these were chosen only somewhat randomly. The strong results even with the tiny sample, however, suggest it is well worth extending the sampling to see if this improvement in correlation for durables is widespread. A larger study with more rigorously chosen categories is called for. Secondly, we can only assess category specific search for the post-Internet period and this only from retrospective self-report of search. It would have been much stronger to have a real time search behavior measure for both pre- and post- Internet periods, however such measures are not readily available and would not likely be available for a wide range of categories for both time

Figure 1
Effects of Search on Change in Price-Quality Correlation


periods. Future research might use online search term frequency (e.g., Goolge trends) to better estimate category specific search. Our high search numbers across all categories suggest a strong upward bias in how much people claim to search, given that prior research finds actual search to be quite limited (Johnson et al. 2004). Thirdly, it is also possible that the product offerings have changed so much that comparison across the pre- and post- Internet periods are not valid. We consciously picked mature categories to minimize this concern, but it is still a limitation of any longitudinal study.

In sum, we demonstrate that the increase in information search with the advent of the Internet has lead to an increase in the price-quality correlations for durable goods, but has had no effect on the price-quality correlations for less commonly searched non-durable goods.

Living Diversity: Developing a Typology of Consumer Cultural Orientations in Culturally Diverse Marketplaces: Consequences for Consumption

Eva Kipnis, Coventry Business School, UK
Julie Emontspool, University of Southern Denmark
Amanda J Broderick, University of Salford, UK

ABSTRACT

This paper argues that in culturally diverse environments cultural identity transitions are more complex than conceptualized by previous research and pertain equally to locally-born (mainstream) and migrant populations. We conceptualize a Typology of Consumer Cultural Orientations as explanatory framework for ethnic consumption and subsequently apply it in an empirical study. The findings indicate that through differential deployment of local, global and foreign cultures affinities for identity negotiation, mainstream and migrant consumers alike can develop or maintain uni-, bi- and multicultural orientations and use these orientations as informants of their consumption choices. Our findings suggest that the study of consumption implications of cultural diversity should be extended beyond mainstream/migrant differentiation which loses its significance in today's globalized world.

Complexities of cultural identity have been identified in studies on mainstream (i.e., locally born) populations (Jamal 2003) and migrant groups (Askegaard, Arnould, and Kjeldgaard 2005). In today's global world, mainstream and migrant individuals can develop affinities (i.e., affective attachment) with cultures and lifestyles through direct (travel, co-residence) and indirect (media, trade) experiences with these cultures' representatives. These affinities can take form of attachment to specific foreign cultures (Oberecker and Diamantopoulous 2010; Luna, Rindberg and Perracchio 2008) or general openness to foreign experiences as representations of global living (Thompson and Tambyah 1999), positively affecting consumption decisions towards products associated with the affinity culture (Oberecker et al, 2008).

While previous studies provide valuable insights into how a specific type of culture (local, global or foreign) is internalized in identities of either mainstream or migrant consumers, we argue that to broaden our understanding of the cultural drivers of consumption, research needs to move away from a mainstream/migrant paradigm. In culturally diverse environments (i.e., societies where multiple cultures co-exist) a large diversity of cultural influences as lifestyle options is opened to and experienced simultaneously by both mainstream and migrant consumers alike. This leads individuals from both groups to negotiate their identities through concurrent evaluation of these options' plurality (Kjeldgaard and Askegaard 2006). Perceptions of the surrounding cultural experiences evolved through this evaluation transform cultural orientations such that one, two or more types of cultures can be internalized by individuals irrespective of their ethnic belonging and have a differential affect on their consumption choices (Cayla and Eckhardt, 2008; Askegaard et al 2005). Hence, a broader conceptualization of cultural identity development in culturally diverse environments is required to account for the multilateral nature of cultural adaptation (Luedicke 2011).

In this paper we explore what forms of cultural identities emerge through individuals' contacts with multiple cultures in culturally diverse environments, and whether the diversity of cultures internalized by individuals leads to differential effects in people's perception and interpretation of consumption experiences. We developed a Typology of Consumer Cultural Orientations integrating research on cultural identities of mainstream consumers with that on cultural identity transitions of migrant consumers. The typology posits seven hypothesized types of uni-, bi- and multicultural orientations individuals may develop through simultaneous evaluation of three main types of cultures (local, global and foreign) as distinct options of being in a marketplace. To support our theoretical extrapolations, we then conducted a multi-country exploratory study, which indicates that cultural orientations of individuals in culturally diverse environments may take forms that are different from and more complex than those identified by past research.

CONCEPTUAL FRAMEWORK

Local, Global, and Foreign cultures' affinities as components of cultural orientations

Before developing a typology of consumer cultural orientations, we engaged in clarifying the meanings of its three main components, local, global and foreign cultures, to ensure applicability to both mainstream and migrant consumer contexts. In societies with an increasingly heterogenic demographic make-up, the meaning of 'locality' and 'local' is difficult to grasp (Murray, 2007). A general understanding has evolved that the meaning of localness is required to be grounded with the culture originating from the locale of one's residence (Roudometof, 2005; Korff 2003). Consumption-wise, the meaning of 'localness' has been identified to derive either from a given brand being perceived as produced within the boundaries of a give locale, or as adopting cultural symbols that originate from and uniquely characterize a given locale (Kipnis et al., 2012).

Conceptions of 'foreignness' and 'globalness' also call for clarification. Whilst the meaning of 'global' takes its origins in *"Western imaginary"* (Cayla & Arnould, 2008, p.88), it evolved from Western cultural reality gaze into a truly-global gaze (Iwabuchi 2002), and is equally deployed by Western and non-Western entities. For example, Cayla and Eckhardt (2008) show that global culture referents are deployed by regional Asian brands, while Steenkamp et al. (2003) demonstrate that a Western-origin (Dutch) Frito-Lay changed the name of the *"leading potato chip brand from Smiths to Lay's"* (p.53) to generate the meaning of globalness. At the same time, Leclerc et al. (1994) give examples of Western brands that encapsulate meanings of particular 'foreignness' (i.e., Giorgio St. Angelo – Italian culture; Häagen Dazs – Danish culture). Individuals may consume a range of Western and non-Western foreign produce assigned with the meaning of 'globalness' to draw from global standards of lifestyle excellence and/or materialize attachment to a particular Western and non-Western foreign cultures through consumption of produce assigned with a meaning of particular 'foreignness' (Cannon and Yaprak 2002; Eckhardt and Mahi 2004). We argue that to understand how foreign and global culture(s) affinities are internalized as distinct facets of identity, it is important to clarify that in culturally diverse societies the meaning of 'foreignness' can encapsulate cultures which, although represented in a given locale by media, residing ethnic groups, brands, are distinctly different from the local culture originating from this locale. Thus, we define the focal types of cultural influences present in the culturally diverse environment as:

1. Global culture (GC) – a homogenic set of values, beliefs, lifestyle and symbols shared in a unified manner by individuals across countries.

2. Local culture (LC) – ways of life and systems of values, beliefs and symbols considered originating from, unique to and mainstream in the country of residence (for example, in France – French culture).

3. Foreign culture(s) (FC) – a system of values, beliefs and symbols that comes from a definable cultural source(s) (country or cultural group) and is different from local culture.

Conceptualizing a typology of Uni, Bi- and Multi Cultural Orientations

To account for consumers' interaction with a multitude of cultural influences while jointly considering mainstream and migrant consumers, we integrated the existing evidence on cultural affiliations of mainstream and migrant individuals from a perspective of all key cultural influences (Global, Local and Foreign) and developed a Typology of Consumer Cultural Orientations (CCO Typology presented in Table 1). The Typology posits uni-, bi- and multicultural orientations that may be developed by individuals that formed basis

of our empirical study. Our theoretical extrapolations through which orientations were hypothesized are briefly discussed below.

Unicultural orientations. Migrant consumption literature reports strong LC affinities as 'assimilation', the rejection of the culture of ethnic origin over the new culture of residence (Peñaloza, 1989; Palumbo & Teich, 2003). Strong LC affiliations of mainstream populations are also identified in the international marketing literature as 'localizm' (Crane, 2002; Reardon , Miller, Vida, & Kim, 2005). Hence, LC affinities are defined as Local Orientation in our Typology. Similarly, the Global Orientation encompasses GC affinities described by both streams of research (Alden et al., 2006; Strizhakova et al., 2008, Thompson & Tambyah, 1999). When considering affiliation with foreign culture(s), literature on mainstream groups notes that some individuals hold affinities with a culture of a particular foreign country due to this culture's positive, at times idealistic, stereotyping (Perlmutter, 1954; Kent & Burnight, 1951). Similarly, Jimenez (2010) identifies that individuals may develop affinities with a culture of a particular ethnic group that is not connected to one through heritage or ancestry. In parallel, literature on migrants refers to such processes as 'separation', individuals rejecting all other types of culture that surround them and maintaining a strong affiliation with the culture of their ethnic origin (Wallendorf and Reilly, 1983; Luna & Peracchio, 2005). Notably, many migrants, once established in a new country of residence, may be engaged in cultural exchange with non-heritage cultures similarly to mainstream population, through direct and indirect contact with these cultures'

Table 1 Consumer Cultural Orientations Typology

Type of Cultural Orientation	Definition	Literature sources	
		Mainstream (non-migrant) groups	Migrant and Ethnic groups
Local Orientation	Individual's affiliation with his mainstream culture of residence only, combined with no or low interest and involvement with other types of cultures.	Crane, 2002; Reardon , Miller, Vida, & Kim, 2005:	Peñaloza, 1989; Palumbo & Teich, 2003
Global Orientation	Individual's affiliation with global culture, as means to live 'global lifestyle' and feel citizen of the world.	Alden et al., 2006; Strizhakova et al., 2008	Thompson & Tambyah, 1999; Askegaard et al., 2005; Wamwara-Mbugua et al., 2008
Foreign Orientation	Individual's affiliation with specific foreign culture(s), combined with no or low interest and involvement with local and global cultures.	Perlmutter, 1954; Kent & Burnight, 1951	Wallendorf and Reilly, 1983; Luna & Peracchio, 2005
Local-Global Orientation	Individual's integrated affiliation with his culture of residence and global culture, combined with no or low interest and involvement in experiences with foreign cultures.	Kjeldgaard & Askegaard, 2006; Kjeldgaard & Ostberg, 2007	
Local-Foreign Orientation	Individual's integrated affiliation with his culture of residence and specific foreign culture(s), combined with no or low interest and involvement with global culture.	Luna & Peracchio, 2005; Luna et al., 2008; Oberecker et al., 2008; Jamal, 2003; Chattaraman et al. 2010; Sparrow, 2000; Sharma et al., 1995;	Cockburn, 2002; Peñaloza, 1994; Oswald, 1999; Askegaard et al., 2005
Global-Foreign Orientation	Individual's integrated affiliation with specific foreign culture(s) and global culture, combined with no or low interest and involvement with culture of residence.		
Full Integration	The individual internalizes all types of cultural influences (local, global and foreign) around him and integrates them in his lifestyle.	Holliday 2010; Sharma et al. 1995	Askegaard et al., 2005

representatives (travel, media, trade). Through participating in this exchange, migrants can develop liking of a particular foreign culture different from that of their origin, for the same reasons as the non-migrant mainstream populations (Oberecker and Diamantopoulos 2010). Therefore, we conceptualize Foreign Orientation as including FC affinities that evolve irrespectively of whether a given foreign culture is linked to an individual through heritage or not.

Bi-cultural Orientations. Less clarity and consistency can be found in the literature on bi- and multicultural orientations. While the body of literature focusing on non-migrants evidences that individuals can maintain affiliations with both local and global cultures (Kjeldgaard & Askegaard, 2006; Kjeldgaard & Ostberg, 2007), less is known about whether and how migrants integrate GC affiliations with their affiliation for culture of residence (LC). It is however reasonable to propose that such orientations are developed, as assimilated migrants exchange cultural knowledge with non-migrant individuals and are exposed to the global culture to the same extent and in the same environment as the non-migrants. Hence, the first type of bi-cultural orientation is identified as Local-Global Orientation in the Typology. The conceptualized Local-Foreign Orientation is grounded in the studies stemming from both bodies of literature whereby, similarly to glocalized individuals, individuals holding strong affiliations with local culture may develop/maintain affiliations with particular foreign cultures (Luna et al., 2008; Oberecker et al., 2008; Jamal, 2003; Chattaraman et al. 2010; Sparrow, 2000; Cockburn, 2002; Peñaloza, 1994). The final bicultural orientation type, Foreign-Global Orientation, conceptualizes individuals opposing or distancing themselves from their local culture on one hand, and distinguishing between Foreign and Global cultures on the other. Indeed, one may aspire to the global community and at the same time maintain a particular liking of a Foreign culture (for example, an individual residing in Poland may have a strong liking of Indian culture and at the same time identify with the Global culture). Similarly, one may be interested in participating in the global community and at the same time be eager to integrate authentic foreign cultural experiences in the lifestyle.

Multicultural Orientations. The final proposed orientation, Full Integration, stems from research on individuals within particular ethnocultural groups internalizing all three types of cultures (Local, Global, and 'other' Foreign) and integrating their elements in lifestyle (Wamwara-Mbugua et al. 2008; Askegaard et al. 2005). We apply the same reasoning to considering cultural orientations of the mainstream consumers, in line with authors like Holliday (2010) and Sharma et al (1995). For individuals in Full Integration, all types of cultures will be important, and they can be assumed to consciously integrate products and brands associated with Global, Local culture and specific Foreign culture(s).

METHOD

To add insight to our theoretical extrapolations, we conducted a multi-country study in Russia, Ukraine and Belgium. We sought to empirically test the uni-, bi- and multi-cultural orientations established in the CCO Typology and explore whether and how these orientations affect consumption choices. In view of the nature of the research objectives, a qualitative approach was deemed applicable. By sampling one Western country and two Eastern European countries, we aimed to supplement a predominantly Western body of knowledge on multi-cultural consumers with insights about multi-cultural orientations of consumers in emerging markets. In addition, all three sampled countries present an attractive field for research into cultural orientations in culturally-diverse environments as in all of them, mainstream (non-migrant) groups of population co-reside

with multiple sizeable ethnic migrant groups (Belgium Department of Federal Immigration 2009; All-Ukrainian Population Census 2001; All-Russian Census of Population 2002). Finally, all selected countries participate in the contemporary globalized consumption-scape (Ger and Ostergaard 1998; Appadurai 1996). The program of study was designed to comprise several steps and methods, in order to triangulate our research approach (Bryman 2003), and to provide a thorough understanding of both the respondents' attitude towards different cultures and of the consumption behavior that results from it. Specifically, data collection involved in-depth interviews complemented by accompanied shopping trips, which aided the respondents' reflections about cultural affiliations and consumption preferences. The interviews lasted on average 60 to 90 minutes, and were audio-recorded with the participants' consent. All participants' names used in this paper are pseudonyms to ensure their anonymity.

We selected 20 respondents of diverse ages, gender, and ethnic backgrounds for our study (8 in Russia, 8 in Ukraine and 4 in Belgium; full demographic characteristics of all respondents are presented in Table 2). The participants were selected based on the theoretical sampling method, which planned for each selected respondent to bring additional diversity and response elements to the study (Glaser and Strauss 1967). In order to take into account the concurring cultural influences and types of consumers, our selection was guided by our conceptualization: we ensured that both mainstream and migrant individuals were represented in the sample. To ensure participants' knowledge about the culture and product landscape in the country of residence, all solicited participants have been residing in the indicated country for no less than the last three years.

The interview transcripts and lists of participants' purchases formed the basis for data analysis. While prior coding structure was set by the CCO Typology, open coding was also allowed to inform analysis, as proposed by Strauss and Corbin (1998). To ensure within- and across-sample rigor (Miles & Huberman, 1994), two coders coded the data independently; the transcripts and coding structures were then cross-compared and analyzed following Berry's (1979) recommendation of combining single culture (emic) study with transcultural (etic).The findings for the different countries were therefore first analyzed separately following a meaning condensation approach (Kvale 1996), and subsequently combined to contrast the findings across countries.

FINDINGS

The CCO Typology hypothesizes that, along with 'glocal' cultural orientations adopted by individuals internalizing global and local cultures, other forms of bi-cultural (i.e., Local-Foreign and Global-Foreign) and multi-cultural (i.e., Full Integration) orientations exist. Our empirical findings support this proposition, indicating that multicultural orientations maintained by individuals take forms other than glocalizm. The findings are summarized in Table 3. The findings on uni-cultural orientations (Local Orientation, Foreign Orientation, and Global Orientation) and Local-Global Orientation are consistent with prior research (for details, see Oberecker et al. 2008; Alden et al. 2006; Kjeldgaard and Askegaard 2006). Due to space constraints, we focus on reporting the findings that shed new light on bi- and multi-cultural orientations.

Local-Foreign Orientation

As defined in the the typology, the Local-Foreign Orientation relates to joint affiliation with the local culture of residence and specific foreign culture(s), combined with no or low interest and involvement with global culture. Traditionally attributed to migrants negotiating between their culture of heritage and new culture of resi-

dence (see for example Abdel's quote in table 3), our findings demonstrate different forms of this orientation. The following excerpt indicates that Aniva, a Russian-origin citizen of Ukraine, considers US lifestyle desirable, less in order to migrate there permanently, but rather in order to take in this culture and then come back to Ukraine, while not displaying close links with her (Russian) heritage culture.

> *"Of course there is difference between global culture and foreign cultures... **I like how they live in America** (USA). I watch 'A window to the US' [a local Ukrainian television program] and I think that they in America have a very good culture: people there are more valued and protected than anywhere else... I would like to live there...to have a good look at and learn more about how they live but not live forever, you know [laughs], like a long visit and then **by all means come back home**."* (Aniva, Ukraine)

Nadia, a Flemish Belgian, similarly aims at integrating local with foreign culture. As opposed to Aniva however, her foreign orientation does not focus on one particular culture, but on multiple cultures.

> *"I have travelled a lot, and there are **good things everywhere**, or things that you think are strange, not like you expected, so there is positive and negative everywhere, but there is no country where I say 'that's it. [...] I think there is also a risk in it* [globalisation], *it's possible that certain things, which are very traditional and culturally important for people, will be suppressed [...] in fact it neutralizes everything, everything becomes the same, and I think we should keep the things that make a region special and typical, otherwise we are going to lose all these things."* (Nadia, Belgium)

Consumers distancing themselves from global culture while internalizing local and foreign culture(s) appeared to translate this likewise in their consumption experiences. Indeed, they integrate brands perceived to create local and specific 'foreign culture living', while rejecting brands assigned with 'global' meanings. Nick (Russia) for example, who projects affiliation with local (Russian) culture and also affective aspirations toward America and Japan, identifies his purchased brands as Russian and American, and offers the following explanation for his choice:

> *"I buy our [Russian] brands because it is important that they are grown or made here* [Interviewer: why is it important?] *Because they are **made in my country**, and now they are **as good as best brands from abroad**...I would not want products from abroad to disappear from our shops like it used to be, I think it is great we have them...America is a very developed country, I think they know how to make things pleasant for you...* [Interviewer: so how do you feel when you buy American products?] *...Don't know...*[thinks] *I suppose I like that I can now afford and access these nice things..."* (Nick, Russia)

Likewise, Nadia's orientation towards multiple foreign cultures is also manifested in what she considers important in driving her

Table 2. Summary demographics of all respondents

Name	Gender	Age	Country of Residence	Cultural Origin	Occupation
Alexandra	F	24	Ukraine	Ukrainian	Employee at estate agents
Aniva	F	57	Ukraine	Russian	Professional skilled worker but unemployed
Vebmart	M	21	Ukraine	Ukrainian	Manager in IT company
Alice	F	34	Ukraine	Ukrainian	Lecturer at a university and works for an MNC
Udana	F	21	Ukraine	Russian/Ukrainian	Student
Eveline	F	43	Ukraine	Russian	Music teacher
Dan	M	38	Ukraine	Russian	Artist
Max	M	65 + 1-5 years (uncomfortable giving his age)	Ukraine	Russian	Pensioner
Angela	F	60	Russia	Russian	Financial analyst
Erin	F	21	Russia	Russian	Student
Kate	F	40	Russia	Russian	Psychologist
Nick	M	20	Russia	Russian	Student
Tanie	F	23	Russia	Reports as mixed Eastern European origin but does not specify	Employee in multimedia company
Cancer	M	23	Russia	Russian	IT engineer
Dennis	M	31	Russia	Russian	Economist
Nikoo	M	49	Russia	Russian	Head of Innovation department in education software producing company
Nadia	F	36	Belgium	Flemish	Chemist
Thierry	M	29	Belgium	Walloon	Production manager
Abdel	M	30	Belgium	Malian	Designer/dressmaker
Christine	F	25	Belgium	French	Communication agent

Table 3 Summary table of findings on bi- and multi-cultural orientations

Type of cultural orientation[1]	Illustration	
	Example quotes - identity	Example quotes – consumption
Local-Global Orientation	*"Life is about change [...] I think we live when we change but other people may think differently. Personally, I find it **important to be part of the world culture** because we all live on one planet and the borders are historical givens [...] We [...] [Interviewer: Russia?] yes, can take good things from others but should **stay individual** and not become same as everyone else"* (Nikoo, Russia)	*"I either buy the **Ukrainian producer's brands or good big brands**. [...] It may be a stereotype but I think that the best brands come from the West...And I kind of like when our [Ukrainian] brands work to **Western technologies and standards**."* (Udana, Ukraine)
Local- Foreign Orientation	*"Thanks to my friends, I like it in Belgium, in Europe. But I always keep in mind Africa to see the other side"* (Abdel, Belgium) *"Of course there is difference between global culture and foreign cultures... **I like how they live in America** (USA). I watch 'A window to the US' [a local Ukrainian television program] and I think that they in America have a very good culture: people there are more valued and protected than anywhere else... I would like to live there...to have a good look at and learn more about how they live but not live forever, you know [laughs], like a long visit and then **by all means come back home**."* (Aniva, Ukraine) *"I have travelled a lot, and there are **good things everywhere**, or things that you think are strange, not like you expected, so there is positive and negative everywhere, but there is no country where I say 'that's it. [...] I think there is also a risk in it [globalisation], it's possible that certain things, which are very traditional and culturally important for people, will be suppressed [...] in fact it neutralizes everything, everything becomes the same, and I think we should keep the things that make a region special and typical, otherwise we are going to lose all these things."* (Nadia, Belgium)	*"I buy our [Russian] brands because it is important that they are grown or made here [Interviewer: why is it important?] Because they are **made in my country**, and now they are as **good as best brands from abroad**...I would not want products from abroad to disappear from our shops like it used to be, I think it is great we have them...America is a very developed country, I think they know how to make things pleasant for you... [Interviewer: so how do you feel when you buy American products?] ...Don't know...[thinks] I suppose I like that I can now afford and access these nice things..."* (Nick, Russia) *"When I arrived in Brussels I saw all those little shops, Tunisian, Moroccan, and they were full of vegetables and herbs I didn't know, so I went into the shops, bought these things, bought some cook books and I tried to see what I could do with this. I actually wanted to **taste the tastes of the world**, and I wanted to use what you could buy, and this opened me up to a bigger world"* (Nadia, Belgium)
Global-Foreign Orientation	*"I want to be in Europe [Interviewer: anywhere in Europe?] [thinks] Well, possibly not everywhere. Most likely not everywhere even [smiles]. If I could choose it would probably be **Germany or Great Britain**. [...] I think it is important to **be in touch with the rest of the world** these days, my daily routine is to check several websites to see what's going on. [Interviewer: what kind of websites you visit?] Several. News, business, product releases, others. I also look to see what kind of jobs abroad are on offer."* (Vebmart, Ukraine)	*"This is **the first Ukranian brand [Roshen chocolate] that is putting itself in one line with European brands**. It can be mistaken for Western or European brand: the name is foreign and the quality of packaging and design is far better than of other [Ukrainian] brands."* (Vebmart, Ukraine)
Full Integration	*"I think I should be a part of the **civilized global world**, my daughter is taught this at school. I like **Sweden**; I like monarchy, the way they live and the charitable deeds of their Queen, and also their developed economy... But I am also a patriot of my country, I even gave some money to a boy who was reciting the **Ukrainian national anthem** in a bus. **Russia is also an important part of my life, I think their culture is very close to mine**."* (Evelyne, Ukraine) *"**I feel close and comfortable with Italian culture**. It is terrible but the Italians' love for good food, good wine and good clothes got me hooked, it is more expensive to live like this and not always healthy (laughs).[…] I travel to visit friends in America [USA] a lot, they are very progressive with technology there. […] **I think I am a bit of a world person**, no everyone enjoys travelling in my age but I find it very stimulating. […] **I like the feeling of coming back home** [to Russia]."* (Angela, Russia)	*"Shall I show you what I carry around with me? [opens handbag and produces Hello! Magazine] I keep it because it has all the glamour, and this one also has pictures of the Queen [of Great Britain]".* *"I only buy the best and I have my collection of **favorites from around the world** [...] If you ask me, **the Italian brands are one of the best**, their cakes are divine! But at the moment **our [Russian] cakes are nice too**... My friend and I love to go to France, we try to go every year and we love go to a French patisserie here [in Russia], buy some nice cakes and then get a bottle of nice French wine – just wonderful!"* (Angela, Russia)

[1] Due to space constraints, we only report findings on bi- and multi-cultural orientations. We also identified participants of uni-cultural orientations (Local Orientation, Foreign Orientation, and Global Orientation), findings on these consumers are not reported in this paper as they were consistent with prior research.

consumption choices; she describes in the following quote her desire to *taste the tastes of the world*.

> *"When I arrived in Brussels I saw all those little shops, Tunisian, Moroccan, and they were full of vegetables and herbs I didn't know, so I went into the shops, bought these things, bought some cook books and I tried to see what I could do with this. I actually wanted to **taste the tastes of the world**, and I wanted to use what you could buy, and this opened me up to a bigger world"* (Nadia, Belgium)

Global-Foreign Orientation

Global-Foreign Orientation, defined in our Typology as "individual's integrated affiliation with specific foreign culture(s) and global culture, combined with no or low interest and involvement with culture of residence", has not been addressed in consumer research until now. We found this orientation extends beyond migrant groups. While among migrants Global-Foreign Orientation could have been expected due to the importance of global culture in migrant acculturation (Askegaard et al 2005), mainstream individuals also appeared to project this orientation, describing their local culture as of *'very low importance'*. In the following quote, Vebmart, a native Ukrainian, talks about his orientation towards particular foreign cultures, such as the German or British one, but also indicates that he wants to connect with the world.

> *"I want to be in Europe* [Interviewer: anywhere in Europe?] [thinks] *Well, possibly not everywhere. Most likely not everywhere even* [smiles]. *If I could choose it would probably be **Germany or Great Britain**.* [...] *I think it is important to **be in touch with the rest of the world** these days, my daily routine is to check several websites to see what's going on.* [Interviewer: what kind of websites you visit?] *Several. News, business, product releases, others. I also look to see what kind of jobs abroad are on offer."* (Vebmart, Ukraine)

Respondents reporting strong affiliations with Global and/or Foreign culture(s) but low affiliation with local culture predominantly base their consumption decisions on brand associations with these types of cultures and interestingly, while rejecting local-only perceived brands, favor local brands perceived to carry 'global' meanings and being of equal standard to 'truly-global' products. For example, Vebmart, while reporting a strong orientation toward the Western Europe and the global community, selected a local chocolate brand Roshen and explained his choice as follows:

> *"This is **the first Ukrainian brand** [Roshen chocolate] **that is putting itself in one line with European brands**. It can be mistaken for Western or European brand: the name is foreign and the quality of packaging and design is far better than of other* [Ukrainian] *brands."* (Vebmart, Ukraine)

Full integration

Individuals reporting orientations towards local, foreign and global culture, refer to global and nationalistic affiliations while also acknowledging strong links to particular foreign cultures. For instance, Evelyne, an ethnic Russian born in Ukraine, mentions the global world, her attachment to Sweden and its culture, her pride of Ukrainian culture as local culture of her country, as well as importance of Russian as her heritage culture in her discourse, attributing high importance to all of them.

> *"I think I should be a part of the **civilized global world**, my daughter is taught this at school. I like **Sweden**; I like monarchy, the way they live and the charitable deeds of their Queen, and also their developed economy… But I am also a patriot of my country, I even gave some money to a boy who was reciting the **Ukrainian national anthem** in a bus. **Russia is also an important part of my life, I think their culture is very close to mine**."* (Evelyne, Ukraine)

Consumption choices and brand perceptions of those respondents reporting orientation towards local, global and foreign cultures overall reflect their multi-cultural orientation and indicate that perceptions of consumed brands tend to differentiate between global-perceived brands and brands originating from favored foreign culture, a differentiation already highlighted in Nadia's quote earlier.

Similarly to glocalized consumers described earlier in the literature (Kjelgaard and Ostberg 2007; Kjelgaard and Askergaard 2006; Sandikci and Ger 2002), the multi-cultural individuals integrate both local and global brands in their consumption but also incorporate brands associated with favored foreign culture(s) that are of importance to them in their lifestyles. These consumers aim at maintaining a perceived balance of global and foreign brands in their consumption. Similarly to the "Best-of-both-worlders" described by Askegaard et al (2005), Angela, a native Russian reporting affinities with Italy, France and global culture, depicts her preference for the best products from the **whole** world, while also favoring products she places as local (Russian) and those associated with her foreign affinity cultures.

> *"I only buy the best and I have my collection of **favorites from around the world** [...] If you ask me, **the Italian brands are one of the best**, their cakes are divine! But at the moment **our** [Russian] **cakes are nice too**… My friend and I love to go to France, we try to go every year and we love go to a French patisserie here* [in Russia], *buy some nice cakes and then get a bottle of nice French wine – just wonderful!*" (Angela, Russia)

DISCUSSION

Our findings shed light on an important tendency; in culturally diverse environments, individuals may develop one or more cultural affiliations and integrate these cultures of importance in their lifestyles, mixing and combining objects and symbols perceived as representative of these cultures. Some of these tendencies were observed earlier in ethnic and/or migrant consumer behavior research (Askegaard et al. 2005; Penaloza 1989; Oswald 1999). However, our findings highlight that ethnic consumers can also develop affiliations with foreign cultures either in addition to, or instead of that of their heritage. Similarly, mainstream individuals presented with varying links to their local culture along with diverse and at times multiple links with cultures perceived external to their locale of origin (global and/or multiple foreign cultures). These insights have important implications for consumer behavior research: they showcase that the traditional divide in considering ethnic migrant consumers' identities within heritage-residence-global cultures milieu and mainstream consumers' identities within local(residence)-global milieu does not capture the complexity of cultural affinities within both these groups. These complexities subsequently elicit complexities in consumption, whereby individuals deploy their diverse cultural orientations as informing frames for interpreting and assigning meanings to brands, and other consumption choices.

In addition, our findings indicate that individuals clearly distinguish 'foreign' and 'global' meanings and differentially deploy them

in materializing identity projects. For instance, consumers in Global-Foreign orientation deploy both foreign and global cultures simultaneously but not interchangeably. On the contrary, Local-Foreign oriented persons, whilst remaining open to 'outside' cultural experiences display a tendency of distancing themselves from global culture as in their view it encompasses the risk of attenuating diversity and uniqueness of external cultural experiences, a tendency that is not captured by the 'glocal' orientation established by prior research (Kjeldgaard and Askeggard 2006).

These findings extend current knowledge on anti-global consumer attitudes and necessitate further scholarly research into such theories as cultural openness (Sharma et al. 1995), cosmopolitanism (Cannon and Yaprak, 2002) and world-mindedness (Hannerz 1990). A number of current conceptualizations in the field of international marketing suggest intrinsic links between these psychological traits and acceptance of global-perceived brands as material symbols of global culture (Cleveland and Laroche 2007; Alden et al. 2006).Our findings indicate however that while welcoming inter-cultural exchange and consumption experiences from different foreign cultures one may strongly resist global culture.

Such a differentiation may be explained by consumers' quest for authenticity, defined as "against modern, mass culture" (Pratt 2007 p.293). Not only indifference or frustration with global culture may lead to consumers to turn to their own traditional norms and products but it may also lead them to seek more "authentic" foreign brands that have a clear association with particular cultures. As these consumers view global culture and products as threat to the individuality of cultures all over the world that leads to traditions and norms becoming blurred and similar (or 'mass'), preference for products that are assigned with *foreign but not global* meanings is logical. Similarly to Thompson and Tambyah's (1999) depiction of expatriates 'trying to be cosmopolitan' by immersing in authentic cultural experiences beyond tourist sites, consumers' differentiation between foreign and global products in this article points thus to a desire to express cultural affinities in an authentic way, outside of globalised consumer culture. Therefore, further research is needed to differentiate consumption choices of global- and foreign-oriented individuals explore whether these choices are performed as authenticating acts or in order to affiliate to particular communities (Arnould and Price, 2000). Although both groups will display a positive disposition toward cultures from 'outside' the locale, products and brands assigned with 'global' meanings would only be favored by the first group while avoided by the second group due to a polar affiliation with global culture itself. In addition, unexpected findings of our study provide some initial indication that consumers opposing local culture per se may hold positive attitudes to selected locally-produced brands that demonstrate an openness and engagement with the 'outside' cultures favoured by consumers themselves.

To sum up, our findings clearly suggest that dramatic diversification of the cultural landscapes brings to the fore the need for new approaches to the analysis of culturally-informed consumption and to consumer segmentation. To advance our understanding of cultural drivers of diversity in consumption preferences and behaviors, it is critical to shift from selectively sampling consumer groups either on the basis of their ethnic heritage or on the basis of their willingness to engage with external cultures, to appreciating the full diversity of cultural affiliations consumers may develop and categorizing them on the basis of their cultural orientations.

CONCLUSIONS

Our study investigates how the multiple cultural influences present in modern culturally diverse environments affect consumer lifestyle choices. It argues that the exchange between multiple cultures leads to complexities of cultural orientations among ethnic migrants and mainstream consumers alike. The proposed Consumer Cultural Orientation Typology, brings together the findings on mainstream individuals developing varying affiliations with local, global and foreign cultures stemming from the body of international marketing research on one hand (Oberecker et al. 2008; Kjelgaard and Askergaard 2006; Alden et al. 2006; Sandikci and Ger 2002; Crane 2002; Perlmutter 1954; Kent and Burnight 1951) and the findings on individuals integrating multiple cultures in their identities emerging from the body of ethnic consumer behavior research on the other hand (Kim et al. 2009; Wamwara-Mbugua et al. 2008; Askegaard et al. 2005; Luna and Peracchio 2005). The CCO Typology distinguishes uni-, bi- and multi-cultural orientations that accounts for overlaps in these bodies of literature and contributes to knowledge by presenting a more complete picture of diverse multi-cultural identities developed by mainstream and migrant consumers. Our study therefore extends consumer behavior theory by proposing an alternative consumer segmentation framework that takes into account the increasing numbers of consumers with multiple ethnic, national and cultural affiliations, which cannot be captured by ethnicity and nationality.

Since our study is limited by its relatively small sample size and geo-demographic characteristics, further research is required that will extend the multi-cultural orientations' enquiry into larger and more diverse samples. Future studies should attempt to validate the findings presented in this paper in other countries and analyze whether demographic characteristics (such as age, gender, education etc) have an effect upon multiculturalism. The study of identity switching described by immigrant research (Oswald 1999; Luna et al., 2008) should also involve the mainstream multicultural consumers, to determine how multi-cultural mainstream individuals navigate their new reformed identities. Finally, it would also be of interest to apply the typology developed in this article to analyze how multi-cultural orientations inform consumer interpretations of cultural meanings of brands and their usage. A better understanding of the way multi-cultural identities are derived and expressed through consumption would particularly assist marketers when segmenting consumers and developing branding strategies targeting multicultural consumers. A more sophisticated and in-depth understanding of consumption consequences of uni-, bi- or multicultural orientations is pertinent for a successful adaptation of marketing theory and practice to the new multicultural world.

"Great Sleep" as a Form of Hedonic Consumption

Anu Valtonen, University of Lapland, Finland
Johanna Moisander, Aalto University, Finland

ABSTRACT

While hedonic and experiential consumption is an established area of research, the "great sleep" as a new form of hedonic consumption has been largely overlooked in this literature. We will address this gap by, firstly, bringing together existing literature on hedonic and experiential consumption and socio-cultural studies on sleep, and secondly, by developing a practice-based narrative perspective that enables us to conceptualize how "great sleep" is commodified within the field of practices that constitutes consumer culture. In this process, a specific mode of being, sleep-as-consumption, is constructed.

INTRODUCTION

The contemporary consumer culture offers a wide range of cultural and material resources for consumers pursuing for "great sleep", either as an experience in itself, or as an enabler for better wakeful experiences. One example is sleep tourism, a form of tourism in which sleeping takes place in extraordinary places like in ice hotels or caves (Keinan and Kivetz 2011; Valtonen and Veijola 2011). In an on-line page entitled "The world's best places to catch some shut-eye" (www.slate.com/id/2220293), one sleep tourist tells about his experiences. He had constructed an igloo with the help of the guide, and after having poked a small air in the roof, he wore a wool hat, climbed to a double sleeping bag – and had the best sleep he had ever had. In his words, it "was the mythical supersleep, deeper than any other, the Atlantis of the unconscious. It was a heavy dose of what scientists call slow-wave sleep". The sleep tracker provides another example (www.sleeptracker.com). The web-page of this gadget, which looks like a wrist watch, tells us that it "monitors your sleep stages throughout the night and then uses that data to determine the exact moment when you should be awoken helping you feel refreshed and energetic". At the same page, a customer writes about her user experiences saying that "My first night with it was great – I woke up completely fresh and rested".

These market-driven narratives about "great sleep" illuminate developments in the contemporary discursive and material landscape of sleeping (Valtonen and Veijola 2011; Williams 2005). Accordingly, sleeping is no longer, or not merely, aligned with laziness and passivity but rather with entertainment, excitement, and experience. It also is aligned with new kinds of physical devices, and symbolic repertoires of knowledge, that allow consumers to control, and perhaps even maximize, their attempts to sleep well, and to wake up rested and energized. We treat these narratives (Moisander and Eriksson 2006) as one way through which "great sleep" is constructed as a culturally acceptable and an attractive experience.

In this paper, our focus is on exploring how "great sleep", as a culturally regulated practice, is commodified within the field of practices that constitutes consumer culture. Thus, instead of providing a phenomenological account on consumers' experiences of "great sleep", we are interested in how the consumption and marketing practices of sleep-related products and services attach particular meanings and values, which are often complex and contradictory, to the notion of "great sleep", and thereby commodify it (Penaloza 2000,83). We argue that through this commodification (a) "great sleep" is rendered a legitimate object of consumer desire, and thus subsumed under the dynamics and logics of consumer culture, and b) a specific mode of being, sleep-as-consumption, is constructed. This

commodification structures and directs the way consumers enact their sleep, conceive of sleep and of themselves as sleeping consumers, and directs consumer desires toward new kinds of sleep-related fantasies, feelings and fun (Hirschman and Holbrook 1982).

On the level of theory, our aim is to work towards a new perspective on studying the commodification of sleep into an object of hedonic consumption. The practice-based narrative perspective that we here develop, draws upon cultural accounts on sleep (Mauss 1973; Taylor 1993; Valtonen and Veijola 2011; Williams 2005), theories of practice (Reckwitz 2002; Schatzki 2002; Schatzki et al. 2001; Warde 2005), and consumer culture theory discussing how cultural meanings and values are narrated in the marketplace (Penaloza 2000; Moisander and Eriksson 2006; Moisander and Valtonen 2006; Shankar, Elliott, and Goulding 2001). By way of conclusion, we suggest a tentative research agenda for studying sleeping as a form of hedonic consumption from this particular perspective.

The contributions of this paper are threefold. First, it extends the current understanding of the distinct 'states of being' involved in hedonic and experiential consumption. While previous studies have documented the way hedonic and experiential consumption practices bring about an alternative state of being – conceptualized, for instance, in terms of "flow", "liminality", or "losing it" – they have always assumed a waking subject in their investigations (Arnould and Price 1993; Belk and Costa 1998; Goulding, Shankar, Elliott, and Canniford 2009). We add the state of being asleep to these debates. By comparing it with the wakeful states we offer a fuller picture of the states of being associated to hedonic and experiential consumption. By drawing attention to the commodification of this state of being asleep, in turn, we provide one novel example of the way specific modes of being are constructed in the fields of practices that constitute consumer culture. Second, this paper articulates a practice-based narrative perspective on the commodification of sleeping into an object of hedonic and experiential consumption. This perspective provides one alternative to the recent anthropological (Tumbat and Belk 2011) and biosocial (Goulding et al. 2009) streams of research that have elaborated on the complex relationship between hedonic and experiential consumption and consumer and marketplace cultures. Third, this paper highlights the ways in which the practices of contemporary consumer culture shape and structure notions of sleep, rendering it an object of desire. In doing so, our study introduces sleeping, an under-researched yet burgeoning consumption phenomenon, to the research agenda of hedonic and experiential consumption, and suggests future directions for its theoretical and empirical exploration.

The paper starts by reviewing the key conceptual developments made in the research area of hedonic and pleasurable consumption. Then it turns to develop a practice-based narrative perspective on studying the commodification of sleep into an object of hedonic consumption. To conclude, the paper outlines areas for future research. While our exploratory paper is conceptual, it makes references to empirical examples for illustrative purposes.

Earlier research on hedonic and experiential consumption

In their seminal article Holbrook and Hirschman (1982) critiqued the then popular notion of the consumer as a rational and utilitarian decision-maker, and argued for an alternative perspective

that would better capture types of consumption in which experiences, aesthetic enjoyment and emotional responses are central. Since that a distinctive body of theoretical knowledge about this type of consumption has been generated. Consumers scholars have taken different theoretical perspectives – phenomenological (Celsi, Rose, and Leigh 1993), anthropological (Belk and Costa 1998; Tumbat and Belk 2011), and biosocial (Goulding et al. 2009) – and empirically explored this phenomenon in a range of consumption settings from leisure activities (Arnould and Price 1993; Celsi et al. 1993; Joy and Sherry 2003; Tumbat and Belk 2011), festivals and carnivals (Belk and Costa 1998; Kozinets 2002), commercially created thematized spaces (Maclaran and Brown 2005; Kozinets et al. 2004), to the context of passionate consumption (Belk, Ger, and Askegaard 2003), to mention a few.

While these studies differ in their theoretical assumptions and empirical foci, they nevertheless appear to share an idea that the pleasurable and experiential consumption practices bring about a distinctive *state of being* – commonly figured as liminal, euphoric, child-like, magical, fantastic, flow state, or communitas – that provides for consumers a temporarily disengage from the demands, rules and roles of the quotidian life. Contemporary consumer culture offers a wide range of virtual or non-virtual "alternative realities", such as clubs, theme parks, or games, where this disengage is facilitated, and where consumers are invited to throw for strangeness, novelty, and excitement, and to enjoy of their imaginative capacities - occasionally also with the help of substances such as drugs or alcohol. Consumers can thereby transcend the social categories that normally define them and move beyond mundane subjectivities. It is precisely this temporal transcendence of normal mundane life, facilitated by the co-creative consumption and marketing practices, that is thought to produce the re-vitalization of the self thus to be the key source of pleasurable and hedonic consumption. To illustrate, Goulding et al. describe their findings of the clubbing experience in the following way:

> We find that the effects of the deafening music, the ingestion of ecstasy, the energetic dancing, and the management and organization of space combine to produce a calculated, highly sought-after shared experience and a temporary suspension of the rules and norms of everyday life. (Goulding et al. 2009)

This existing literature has, nevertheless, focused almost exclusively on exploring the waking life of consumers, making only occasional references to the realm of sleeping. For instance, Belk and Costa (1998) and Arnould and Price (1993) in their seminal articles on consumer fantasies and extraordinary experiences – both taking place in the nature – start their ethnographic research when the research subjects crawl from their tents or tepees and leave them when they retire. What happens in between *that* time is unknown – only notes to the silence of the night or a wet sleeping bag are being made: 'sleep seeps in with the growing dark; the camp quiets, and the night's rest is the most beautiful of all' (House via Belk and Costa 1998, 238-9). Recent studies show, however, that sleeping outdoors, in tents, tepees or igloos, might be an experience in itself (Valtonen and Veijola 2011). As Keinan and Kivetz (2011, 948) point out, sleeping in places such as ice hotels provides an opportunity for contemporary consumers to collect novel, sometimes non-pleasurable, experiences to be added to their experiential CV.

We thus suggest that the existing literature on hedonic and experiential consumption remains inadequate if it keeps neglecting the phenomenon of sleeping. Sleeping is not only an emerging form of hedonic and experiential consumption whose on-going commodifi-

cation remains under-theorized, but also a theoretically intriguing case for developing the existing body of knowledge on the states of being associated to hedonic and experiential consumption. Therefore, we start to bring together the existing studies on hedonic and experiential consumption and the growing body of socio-cultural literature on sleep. This latter body of research, generated in various cultural disciplines such as anthropology, sociology, and history, provides us an important contextual basis for understanding sleeping as a culturally regulated practice. It offers insights into the cultural nature of the state of 'being asleep' as well as of the social, symbolic, corporeal and aesthetic standards, norms and criteria guiding the way the sleep is 'done' (Taylor 1993).

The human *state of 'being asleep'* has given ground for a range of cultural myths and beliefs, as anthropological and historical studies well illustrate (Steger and Brunt 2003; Tedlock 1987). In the West, it has commonly been conceived as an irrational and mystified sphere of life associated with the death and darkness. The phenomenological accounts, in turn, let us know how this state, involving distinct states of consciousness and will, provides a cyclical, momentary and partial withdrawal from the self and from the world (Bergson 1958; Merleau-Ponty 1962). During this state the sleeper passes through various stages – ones during which dreams are seen (the so call REM sleep, Aserinsky and Kleitman 1953) and not seen, 'deep sleep' representing the most inactive state (Härmä and Sallinen 2004).

The state of dreaming – the focus of many cultural inquiries (Tedlock 1987) – is commonly seen to liberate the mind from the ordinary world, though only partly, and to open up a fantasy world that might be experienced as enjoyable as such (Valtonen 2011). The 'deep sleep', thus the state during which dreams are not seen, has received less attention within cultural scholarship, the work of Paul Harrison (2009) representing one exception. For him, this state is a way to offer a critique for contemporary studies focused on studying (merely) the active part of human life. For us, this state – as well as other states involved in sleep – is of interest because they are targets in the commodification of "great sleep". For instance, there are packaged holidays whose core offering is based upon the appreciation of the world of dreams, and the state of 'deep sleep' is, in turn, referred to as *the* state essential for having "supersleep" (www.slate.com/id/2220293).

Moreover, although the past research has provided important insights into how specific states of being are involved, for instance, in daydreaming (Belk, Ger, and Askegaard 2003), contemplating of art (Sherry and Joy 2003), or use of ecstasy (Goulding et al. 2009), we suggest that the recognition of the state of being asleep complements this existing understanding. As we discussed above, 'being asleep', like the states identified earlier, represents an altered state of consciousness, a state in which the mind is "switched off", enabling consumers thus to "lose it", "it" referring to the mind (Greenfield 2000 via Goulding et al 2009, 767), and falling asleep provides, in a way, one way to throw to the "thrill of the unknown" (Arnould and Price 1993). Thus, in this sense the state of being asleep might enrich existing understanding, and point to the importance of other states such as vulnerability or drowsiness.

'Doing sleep' refers to the wide range of the social, symbolic, material, corporeal and aesthetic standards, norms and criteria that are related to human attempts fall asleep, to sleep, and to wake up. In every culture and society there is large repertoire of implicit and explicit rules and ideals that designate when, where, with whom, and how to sleep. For instance, the commonplace sleep pattern of today is to have an eight-hour unbroken nocturnal sleep, lying in a horizontal position in a private bed located in a bedroom. While

it is tempting to consider this prevalent Western sleep practice as 'natural', it is the result of long socio-historical civilization process (Elias 1978). In history, bi-phasic nocturnal sleep patterns have been common (Ekrich 2003), all sorts of techniques of sleep have been practiced (Mauss [1934] 1973, 80–81), and sleeping has taken place in public places with other people (Elias 1978).

The seminal article of Marcel Mauss (1973) "Techniques of the Body" – where he introduced the notion of "techniques of sleep" – offers us a fruitful basis for understanding these 'doings'. It leads us to conceive sleeping as an *embodied skill, habit and technique* bearing imprints of culture, society, and economy. This means that the way we sleep is an outcome of cultural and social education which, through time, becomes habituated and normalized. The embodied practice of sleeping provides one example. It is commonly held that this form of experience and pleasure calls for specific bodily techniques (such as breathing for relaxation), embodied postures of staying still and lying down, and a number of material and sensory affordances (Valtonen and Veijola 2011). The sociability of sleeping provides another example. The widely-spread cultural belief of the privatization of sleeping easily shadows the socio-pleasures of sleeping – sharing pleasures is commonly discussed as an essential part of the experiential and hedonic consumption (Goulding et al.2009) – and sleeping together, with the closest ones, may provide an significant source of enjoyment.

The culturally shaped skills, habits and techniques of sleep are subject to change. In the recent decade, some sort of change can be identified in the way the sleep is discussed and practiced in Western societies (Williams 2005, 2011). This is reflected, for instance, in the proliferation of sleep-related media talks. Contemporary consumers thus are surrounded by a discourse, in which the sleep, or the lack of it, is commonly casted either as a major crisis of our time, or alternatively as a vital opportunity to revitalize and energize people. The rapidly growing 'sleep aids market' (Williams 2011, 145) and the emerging products and services aiming at offering better sleep illustrate the case.

Moreover, the rapid increase of recent neuro-scientific and physiological research on sleep has expanded contemporary languages and knowledge pertaining to sleep, shaping thereby the way sleep is thought of, conceived and practiced. These discursive and material shifts together with the establishment of physical realities (see Humphreys 2010), such as sleep spas or hotels in trees, play a role in the creation of "great sleep" as a culturally acceptable means of seeking entertainment, excitement, and experiences.

Practice-based narrative approach to commodification of sleep as a form of hedonic consumption

In building our practice-based theoretical perspective on the commodification of sleep into a marketable entity, a practice of hedonic consumption, we draw primarily on the literature on practice theory (Reckwitz 2002; Schatzki 2002; Schatzki, Cetina, and Savigny 2001) and post-structuralist narrative approach to consumer culture theory (Davies 2003a; Davies and Harré 1990; Marion and Nairn 2011; Moisander and Eriksson 2006b; Shankar, Elliott, and Goulding 2001). From this perspective consumption is viewed and conceptualized as something that occurs within and is part of a field of practices (Schatzki et al. 2001) that are socially instituted and brought about in the marketplace through processes and practices of narration (Shankar, Elliott, and Fitchett 2009) and dialogue between marketers and consumers (Peñaloza and Gilly 1999). And it is this field of practices—the total nexus of interconnected consumption practices—that constitutes consumer culture (Moisander and Valtonen 2006).

By the term 'practice' we refer here to the "embodied, materially mediated arrays of human activity" that are centrally organized around a shared practical understanding" (Schatzki et al. 2001: 2). Practice is a "routinized type of behavior which consists of several elements, interconnected to one other: forms of bodily activities, forms of mental activities, 'things' and their use, a background knowledge in the form of understanding, know how, states of emotion and motivational knowledge" (Reckwitz 2002: 249). It thus consists of not only patterns of bodily behavior but also a set of particular routinized ways of understanding, knowing how, and desiring, which are essential elements of the practice in the sense that they constitute the "logic" of the practice through which the practice gets its meaning and purpose in the marketplace.

From this perspective, we conceptualize commodification in terms of the market-mediated processes and practices of narration through which sleep, as an everyday consumer experience and bodily practice, is transformed into a marketable entity with economic value. Economic value is assigned to sleep by endowing it with particular cultural meanings that have symbolic or sign value (Venkatesh and Peñaloza 2006) and by producing particular service-providing offerings that are designed to deliver this value as consumers use these offerings when engaging in their sleeping-related practices. Through these practices of commodification, sleep is thus transformed into a practice of consumption, in the sense that the activity of consumption—the appropriation and appreciation of goods, services, performances, information and ambiance (Warde 2005: 137)—becomes a constitutive element of the practice of sleeping.

As a result, sleeping becomes a culturally regulated practice that can be perfected with the help of particular products and services that are exchanged in the market. Through commodification, consumers are offered and encouraged to draw upon on particular socially instituted practices and cultural narratives about sleeping. By cultural narratives we refer to socially constructed storylines through which people make sense of their everyday lives and achieve social order (Davies 2003a, b). They are *cultural* in the sense that they emerge and are constructed out of a socio-cultural ensemble of stories, storytelling and reading practices that are embedded in a complex formation of discourse, knowledge and power (Nakagawa 1993; Rappaport 2000).

In the field of practices that constitutes consumer culture, these cultural narratives about great sleep that marketers construct and reproduce thus make available particular ways of making sense of the world and sanction particular behaviors as appropriate, worthwhile, and desirable in particulars contexts. In this sense, narratives are constitutive of social reality. As Shankar et al. (2009) argue, "the process of telling stories is an act of creation and construction and not simply an act of remembering or retelling (Shankar et al. 2009)"

To illustrate, the following story of "supersleep" – that we have already quoted in the introduction – is an act of creation and construction of sleep. The story is, thus, not only a way to share the sleeping experiences with other consumers (Keinan and Kivetz 2011), but plays a role in the creation of sleeping as an experience.

> A snow cave was a good place to start [the search for supersleep]. In retrospect, it combines several elements likely to lead to deep sleep. A full day of hard exercise. A firm bed (snow). The sense of being buried under several feet of insulation. And most of all, the cold. As Herman Melville wrote in *Moby Dick*, "a sleeping apartment should never be furnished with a fire, which is one of the luxurious discomforts of the rich." To find the best sleep, he said, you must "have nothing but the blanket between you and your snugness and the cold of the outer air.

Then there you lie like the one warm spark in the heart of an arctic crystal."

Science helps explain what we're looking for in the search for supersleep. Sleep researchers classify sleep into four different stages, including the well-known REM, or "rapid eye movement," stage, and three stages of non-REM sleep. During the night, you cycle down through the stages and back up to REM-sleep, which is actually the closest to being awake. Most writers and scientists seem interested in REM sleep, because that's when Freud-style dreams take place. But a sleep connoisseur seeks something different: the bottom of the cycle, known as "slow-wave," or N3, sleep. Slow-wave is the deepest and most dreamless of sleeps, a form of sleep that makes neurons shut down. How much slow-wave you actually get varies quite a bit. Hence the search for more of it.

In search of big doses of that slow wave, it's worth traveling to some places for the sleep alone—"sleep tourism." With a drowsy fondness I recall Turkey's Capadocia region, where you can rent a room carved out of stone—a cave really—to pass out in. It can make you start to think this whole house thing may have been a big mistake. There is something about lying in a cave that is hard to replicate in an urban apartment or even the suburbs. The Turkish caves form the ultimate bedroom community: darker than night, deliciously cold, with blankets that are thick and beds that are firm. (They are built, after all, on solid limestone.) No wonder cavemen always looked so vigorous.

Another recommendation for the sleep-tourist is the Japanese *onsen* inn. Imagine a day spent hiking through the Japanese countryside, climbing volcanoes, perhaps communing with the local monkeys. You return, change into Yukata robes, proceed to soak yourself in hot, sulfurous water for an hour or so, then retreat to your tatami room for a lavish meal of duck stew and fish. If, after that, you don't fall into a deep sleep, you might as well give up.

For most people, the American road trip is all about national parks and roadside kitsch, but it can also be a good opportunity for sleeping, if you take it slow. There is something about the wide-open landscape of the West that can lure you into a calm drowsiness. A brisk hike each day, dull stretches of driving, and quiet, empty roadside motels can add up to some good sleep. (www.slate.com/id/2220293)

This narrative indicates that the state of being asleep is created as knowable, and thereby consumable entity, by way of making references to the lexicon provided by the sleep science ("N3 sleep") and by the practice of wine tasting ("sleep connoisseur"). The 'doing of sleep' is in turn created by way of making references to various embodied activities preceding sleeping, material qualities of the surroundings of sleep (e.g. thick blankets, firm bed), and the sensory and affective qualities of the space of sleep (e.g. quietness, darkness, cold). Thereby the narrative offers cultural elements of "great sleep" as well as guidelines for their appropriate orchestration.

The practice-based narrative perspective that we develop here continues and complements the existing theorizations of hedonic and experiential consumption in a number of ways. Namely, while the phenomenological accounts – treating the subjective meanings as

determinant of experiences – have dominated this area of research, the recent studies have put more emphasis on understanding how the marketplace culture, and the various practices, rules and tensions it involves, frames and shapes the production and consumption of experiences. For instance, the bio-social perspective on pleasure developed in the context of clubbing by Goulding and her colleagues (2009), situates the use of drugs to the contemporary dynamics of marketplace. They thus analyze a marketplace culture that is legally sanctioned while supporting a range of illegal practices. Through the construct of contained illegality they offer new insights of the functioning and management of pleasure and the operation of marketplace cultures (ibid. 769). They conclude that through the marketplace processes and practices of 'contained illegality' the morally contentious pleasures are rendered more controllable – and economically valuable for club owners.

In a similar fashion, a recent anthropologically informed study of mountaineering conducted by Tumbat and Belk (2011) grounds its analysis of extraordinary experiences to the dynamics of marketplace culture. Their argue that the structure-antistructure dichotomy – originally offered by Victor Turner – that has become a widely accepted model for understanding extraordinary experiences in consumer research, is problematic due to its romantic and essentialist claims. Their analysis brings to the fore how commercialism and competition for uniqueness within individual performance ideology create numerous tensions that invert this standard dichotomy (Tumbat and Belk 2011, 43).

As we conceptualize commodification in terms of the market-mediated processes and practices of narration, through which the social reality is created, we are able to offer a better understanding of how the tensions, rules, moralities, and values – identified by the prior literature – are constructed and distributed through the marketplace by narratives within and as part of the field of practices that constitute consumer culture. By way of analyzing the commodification of an emerging, and under-researched, consumption and marketing phenomenon, sleeping, we are able to show how it is rendered legitimate object of consumer aspiration and desire, and thus subsumed under the dynamics and logics of consumer and marketplace culture (Humphreys 2010). Our approach also points to the way the practices and process of commodification construct not only a consumable and marketable entity, sleeping in our case, but a specific mode of being, sleep-as-consumption, that shapes the way consumers relate to, value, and conceive of, this part of human existence.

Concluding thoughts for building the research agenda

In this paper, we have begun to argue that the inclusion of sleeping into the research agenda of hedonic and experiential consumption has the potential to complement and extend the existing knowledge generated in this area of research. We thus promote an enlarged view that avoids the focusing on the sphere of the (active) waking life only when enjoyable and experiential aspects are theorized and empirically investigated. To develop this broadened agenda we have tried to bring together existing literature on hedonic and experiential consumption and socio-cultural studies on sleep. We also have worked toward a practice-based narrative perspective that enables us to conceptualize how "great sleep" is commodified within the field of practices that constitutes consumer culture. To conclude we point to the issues, or themes, that we find vital in studying the way "great sleep" is constructed as an attractive and sought-after experience.

(1) To expand on the points made in this paper, an empirical investigation of the production and consumption of "great sleep" in the emerging sleep market seems necessary. There is, thus, a need to collect a wide corpus of on-line and off-line narratives distributed by

the new services and products such as sleep spas, nap bars, and extraordinary hotels. This would help us to better understand how the commodification of sleeping occurs through a complex universe of competing meanings and practices, and resulting perhaps in various notions of what "great sleep" is all about.

(2) Focusing on analyzing the commodification of the state of 'being asleep' in these narratives, that is, how this state is represented and 'known', and thus created as a specific mode of being. Methodologically, such an analysis may employ the wide range of analytical tools and principles developed by cultural consumer scholars (Moisander and Valtonen 2006). Namely, while the phenomenological state of being asleep itself is not (necessarily) empirically accessible for a cultural scholar, the cultural aspects that surround this state, and thus assign meanings to it, can be analyzed by the existing narrative and discursive methods. The same concerns, obviously, the doings of sleep.

(3) Focusing on analyzing the commodification of 'doing sleep' in these narratives by way of identifying the range of social, material, sensory, embodied, and emotional elements that are offered as central in the pursuit of "great sleep". How these elements are weaved together in the implicit or explicit guidelines inscribed in the narratives? What kinds of fantasies and imagery are aligned with "great sleep"?

(4) Situating the analysis of "great sleep" to the contemporary marketplace dynamics in which socio-historically constructed sleep-related myths, beliefs and patterns meet and compete with the ongoing discursive and material shifts brought about by recent techno-scientification of sleeping.

The Forgotten Brand Personality Dimension

Iftakar Haji, Aston University, UK

Andrew Farrell, Aston University, UK

ABSTRACT

Aaker's (1997) brand personality framework has become influential across many streams of brand personality research, but it fails to capture an important dimension that reflects consumer's anxious feelings towards brands. Consumers are increasingly evaluating brands through expressions of negative emotive language. For example, the BP oil spillage in the Gulf of Mexico stimulated negative emotions among consumers. This paper is the first to thoroughly incorporate a brand personality dimension reflective of consumer anxious tense and frustrated feelings towards brands. From the extant literature we propose and define negative brand personality. Four adjacent studies were conducted to explore, purify and refine in what form negative brand personality traits exist among consumers. This paper concludes with a conceptual model detailing the antecedent constructs to negative brand personality and behavioral consequences.

INTRODUCTION

Building on the importance of self-expression through brands, Aaker (1997) developed the brand personality framework to understand brand-consumer relationships. This framework has become influential across many streams of brand personality research (Aaker, Benet-Martinez and Garolera 2001; Sung and Kim 2010; Geuen, Weijters and Wulf 2009; Grohmann 2009; Smith 2009; Lee and Back (2010); Venable et al. 2005; Freling and Forbes 2005) and is based on the big five-factor human personality model.

However, Aaker's (1997) current brand personality framework only offers a positively-framed approach to brand personality. To date, there has been neither conceptual nor empirical research which has thoroughly incorporated a dimension reflective of negative brand personality, despite the fact that almost all researchers are in agreement that dimensions akin to 'Extraversion' and 'Neuroticism' need to be included in a comprehensive personality scale (Cattell 1943; Allport 1961; Popkins 1998; Waller and Zavala 1993; Borgatta 1964; Conley 1985; Hakel 1974; John 1989; Lorr and Manning 1978; McCrae and Costa 1985; Noller, Law and Comrey 1987; Norman 1963; Smith 1967).

While the dimension 'Extraversion' has been accommodated to an extent in brand personality frameworks (Aaker 1997; Aaker et al. 2001; Smith 2009; Kaplan et al. 2010; Venable et al. 2005), no dimension reflects 'Neuroticism' in a branding context.

Importantly, the presence of negative feelings towards a brand is not the same as a mere absence of positive traits. Negative traits are expressions that capture the importance of consumers' interpretations that are susceptible to being influenced by emotions of anxiety or frustration, and are, therefore, more aligned with the 'Neuroticism' dimension of human personality. Hence, it is important to explore negative traits that reflect a dissonant state. To this end, we define negative brand personality as:

A set of characteristics ascribed to a brand by the consumer which reflect emotions associated with tension, anxiety or frustration.

The purpose of this paper is to address the importance of developing a better understanding of brand personality by introducing negative brand personality traits to the literature. More precisely, four adjacent studies were conducted to first develop a measure for negative brand personality traits and, secondly, to identify their antecedents as well as consequences. The proposed model will be discussed with implications for marketing management and theory.

LITERATURE REVIEW

A review of the extant brand personality literature reveals that the current conceptualization of brand personality focuses on a positively valenced approach to the concept. This is probably due to the fact that current knowledge of brand personality has been displayed in specific contexts where it has not been treated as a characteristic expressed by consumers; instead, it has often been used synonymously with, or to explain, desired attributes marketers want to project about their brand.

For example, Aaker's (1997) work, as well as subsequent research (Aaker 2000; Aaker, Bene-Martinez and Garolera 2001; Sung and Kim 2010; Grohmann 2009), acknowledges the brand-consumer relationship but stresses marketers desired attributes, such as a brand being 'exciting' or 'down to earth'. Other researchers have attempted to build on the existing brand personality framework and have developed new observations by looking at ways to provide a more reflective measure of the big five personality factors (Phau and Lau 2000; Caprara, Barbaranelli and Guido 2001; Venable et al. 2005; Grohmann 2009). For example, Geuen, Weijters and Wulf (2009) developed a brand personality measure in an attempt to embrace all big five personality dimensions. Although the five dimensions identified are relevant to brand personality, the model fails to capture consumers' negative emotions that are prone to causing a cognitive strain on their intuitive processes (See Table 1).

Apparently, existing brand personality frameworks fail to capture consumers' anxious and frustrated feelings towards brands. Consumers are often aware of their own predispositions to tension, anxiety and frustration in the same sense as they have an awareness of their own propensity for becoming anxious and frustrated in response to different situations. Consumers are likely to classify their anxious or angry emotions with expressions that reflect their resentment of, or their insecure feelings towards, a brand to resolve the internal conflict and anxious feelings they may be experiencing. Other researchers have indicated the importance of this observation (see, for example, Sweeney and Brandon 2006; Geuen, Weijters and Wulf 2009). Importantly, these expressions are not indicative of the absence of positive traits, such as 'undependable' or 'unsuccessful' - they are, in fact, expressions that capture the importance of consumers' interpretations that are susceptible to being influenced by emotions of anxiety or frustration and are more aligned with the 'Neuroticism' dimension of human personality. It is, therefore, important to explore the universally accepted personality dimensions within the brand personality framework to reflect characteristics of a dissonant state.

Therefore, this research acknowledges the importance of understanding brand personality from a consumer perspective; that is, consumers are provided with a vehicle for self-expression (Azoulay

Table 1: Reflection of how Aaker's (1997) and Geuens, Weijters and Wulf's (2009) brand personality framework corresponds to the Human Personality framework.

Human Personality	Aaker's (1997) Brand Personality framework	Geuens et al (2009) Brand Personality framework
Extraversion	Excitement	Simplicity
Agreeableness	Sincerity	Aggressive
Conscientiousness	Competence	Responsibility
Openness to Experience	-	Aggressive?
Neuroticism	-	-
Dimensions relevant to brand personality but not part of the Big Five Factors	Sophistication	Emotionality
	Ruggedness	Simplicity

and Kapferer 2003) which allows them to assign the brand personality traits based on the information received. This is unlike other research propositions that suggest brand personality is created by how marketers and advertisers intend to project a brand (Batra et al. 1993; Levy 1959; Plummer 1984).

Awareness and knowledge of negative brand personality traits is relevant to successful marketing because consumers that assign negative brand personality traits to brands are less likely to make rational buying decisions. The importance of negative brand personality traits to companies is based on the consequences and the economic impact that follows. For example, cognitive dissonance, dissatisfaction and negative word of mouth can negatively impact the economic performance of the company. Moreover, providing a measure that addresses negative brand personality traits will provide a more realistic and balanced view of the brand by increasing source credibility, which should, in turn, help retain consumer loyalty.

However, very little is known about negative brand personality as a construct as no research to date has empirically investigated in what form negative brand personality traits exist. This study, therefore, first concentrates on using interview data to explore in what form negative brand personality traits exist; it then purifies and refines the items explored through three subsequent studies. Based on the exploratory findings, a conceptual model is proposed and discussed by identifying the antecedents, potential moderators and behavioral consequences.

METHOD

It is likely that each consumer has an individual tension, anxiety and frustration proneness threshold, which when activated will lead consumers to express their emotions through negative brand personality traits. As with other multidimensional constructs of brand personality, such as Aaker (1997), that have been found to have separate but correlated factors, negative brand personality traits are expected to interrelate because negative expressions are likely to result from a dissonant state between the brand and the consumer (Festinger 1957). By adopting a four adjacent studies approach, a comprehensive foundation for negative brand personality was provided by means of the following: firstly, use of interview transcripts to explore in what form negative brand personality traits exist; secondly, use of a separate questionnaire to clarify and ascertain whether the traits identified are perceived in a negative light; thirdly, use of a free and a fixed sorting task to partition the interrelated negative brand personality traits into related dimensions to provide an insight into the underlying dimensions; and, fourthly, use of a substantive validity task to judge whether traits reflected the dimensions of interest.

A convenience sample of male and female consumers from a range of age groups was drawn to represent active consumer shoppers within the context of fashion and food retail brands. Under-

graduate students represented the majority of the sample within each study (Maehle and Supphellen 2011). Table 2 summarizes the procedure employed in each of the four studies to assess negative brand personality traits.

EXPLORATION OF NEGATIVE BRAND PERSONALITY TRAITS

Study 1

The initial study was contextualized to the fashion and food brand categories to provide a more holistic representation of brands that capture both symbolic and functional attributes of users' values and lifestyles (Ratchford 1987). The study consisted of a total of 52 in-depth interviews (42 of the respondents were presented with 12 fashion brands and 10 respondents were presented with seven food brands) to ensure data validation and saturation (Silverman 2004). Each respondent was presented with a stimulus in the form of a brand to activate their interpretations of brands in order to access the meanings they ascribe to brands. To eliminate subject fatigue and boredom, a male dominated brand was presented first and then followed by a neutral (unisexual) brand and a female dominated retail brand. Similarly, food brands were organized so that a confectionary brand was followed by a savory brand.

The interviews were conducted with students and non-students who were asked questions such as 'What is your perception of this brand?', 'What human characteristics would you assign to this brand?', 'Would you like to associate yourself with this brand?', and 'Do you hold any conflicting views towards the brand?' By identifying the conflicting views, respondents were given the opportunity to describe any negative traits the brand holds. This helped identify the personality traits and the rationale behind respondents' answers.

Negative traits were not only obtained from the interview text but further analysis was undertaken by assessing the content of the interviews (Krippendorff 2004). This was achieved by examining the interview transcripts and interpreting what negative characteristics are inferred through negative accounts of emotional distress. After developing the initial pool of items, 71 negative brand personality traits were obtained.

The traits were then cleaned systematically by deleting items that had a similar approximation of synonyms (Aaker 1997; Sung and Tinkham 2005). Following within-case and cross-case analysis, traits were grouped into emerging dimensions as an initial phase for the scale development. Such grouping was performed by the researcher to assist in item elimination (See Figure 1).

Eliminated items were validated using three expert judges (Bearden et al. 1989). The expert judges were carefully selected based on their education: they were either a PhD holder in human personality research or a PhD student in the Marketing field. Each

Table 2: A summary of the four adjacent studies conducted to investigate negative brand personality.

Study	Method	Objective	Data Sample	Gender	Analysis Method
Study 1.0	In-depth interview 12 Fashion retail brands 7 Food brands	To explore in what form negative traits exist and the antecedents behind the traits by analyzing data to provide a more integrative conceptual model of the negative brand personality traits, antecedents and behavioral consequences.	Consumers (N=42) interviewed with fashion retail brands. Consumers (N=10) interviewed with food brands.	Fashion Retail: Male: 45% Female : 55% Food Retail: Male: 60% Female : 40%	Content analysis Data cleaning by separating positive traits from negative traits and reading transcripts to identify the rationale for the traits assigned.
Study 1.1	Separation of positive traits from negative traits. Assessment task to ensure the traits were not just antonyms of Aaker's (1997) traits.	Ensure negative brand personality traits are distinguished from existing measures of positive brand personality traits.	The researcher and 3 independent consumer reviewers (N=4)		Content analysis with the aid of a Collins English Dictionary.
Study 1.2	Frequency count and eliminating traits that had similar approximate synonyms. 4 distinct negative dimensions were identified.	Capture, at the broad level of abstraction, the commonalities among the most frequent negative traits consumers can identify a brand with.	Three expert judges (N=3) Face Validity.		Content analysis
Study 2	Questionnaire	To assess the refined negative traits from the interview transcripts and see if they are perceived in a negative light by other consumers not involved in the initial interview study. Also, to enhance internal validity of the qualitative research.	37 Undergraduate students (N=37)	Male: 62% Female: 38%	Mean scores were assessed for the rate of significance.
Study 3	Free/Fixed Sorting task	To discover dimensions that are likely to result from the list of traits from a consumer's perspective without any contamination from the researcher's preconceptions.	Free Sorting Task: 9 consumers (N=9) Fixed Sorting task: 6 consumers	Free Sorting Task Male: 56% Female: 44% Fixed Sorting task Male: 33% Female: 66%	Sorting the brand personality traits into dimensions with an overall category name identified by the consumer.
Study 4	Substantive Validity task	The substantive validity assessment conducted for the purpose of pretesting of items (negative brand personality traits).	30 undergraduate students (N=30)		Filled out questionnaires to assess content validity of the dimensions obtained from the sorting task.

expert judge was provided with 71 negative brand personality traits; they were then given instructions to eliminate items with similar synonym approximations to other traits within the list, and to eliminate items that were not perceived as negative traits in light of branding. The list provided by the expert judges was then assessed against the traits eliminated by the researcher.   A review was then taken to assess which items were suggested to be in need of deletion due to the

approximation of traits. Twenty-one items to be deleted were agreed upon by at least two out of the three judges.

To further purify the items, an assessment was undertaken to ensure the remaining 50 items were not the direct antonyms of the positive traits established in Aaker's (1997) brand personality framework. The assessment was conducted by looking up the traits mentioned in the interview transcripts and looking up the direct ant-

Figure 1: Exploration of Negative Brand Personality traits represented in four dimensions.

Negative Traits

Ostentatious	**Standoffish**	**Instability**	**Counterfeit**
Flamboyant	Deviant	Fickle	Superficial
Selfish	Anti-Social	Confused	Vanity
Pompous	Tyrant	Flimsy	Vain
Aloof	Envious	Naive	Manipulative
Stubborn	Deceiving	Lonely	Immoral
Rebellious	Authoritative	Absurd	Unethical
Pretentious	Painful	Moody	Artificial
Superior	Intimidating	Lazy	Contradicting
Domineering	Old Fashioned	Vulnerable	Mischievous
Stupid	Boring	Sad	Remote
Flaunting	Resilient	Annoying	Monotonous
Egotistical	Barbarian	Contradicting	Dark
Ruthless	Unacceptable	Coarse	Outrageous
Eccentric	Traditional	Illogical	Cheat
Nostalgia	Basic	Weird	Cheap
Delusional	Bland	Inferior	Fake
Judgemental	Predictable		Irresponsible
	Dull		Obscene
			Dismissive
			Unhealthy

Aaker's Brand Personality Traits	Direct Antonyms from Collins English Dictionary and Word 2007
Down to Earth	Unreasonable, foolish
Honest	Dishonest
Wholesome	Unpleasant, Distasteful
Cheerful	Sad, Depressing
Daring	Cowardly
Spirited	Pathetic, Spineless
Imaginative	Unimaginative, Dull
Up to date	Old Fashioned, Out of Date
Reliable	Undependable
Intelligent	Stupid
Successful	Unsuccessful, Failure
Upper Class	Lower class, Working Class
Charming	Repulsive
Outdoorsy	Indoor activity
Tough	Weak

onyms of the trait (See Table 3). The list was then given to an independent expert judge to assess the face validity of the traits presented, which provided further purification of negative brand personality items. The findings provide a diversified and meaningful representation of brand personality through the assessment of negative traits. The negative brand personality traits that manifested in respondents' expressions reflect their tense or anxious emotions towards brands. By identifying the negative and inferred negative brand personality traits, a frequency count of the negative traits was undertaken to summarize the negative traits mentioned within the sampled popu-

lation; this also provided an indication of inferences regarding the construct (Berelson and Lazarsfeld 1948, 6).

A frequency count was conducted to ensure emphasis was placed on the importance of using simple, straightforward language that is appropriate for the reading level of the scales' target population and for avoiding colloquial expressions (DeVellis 2003). Some respondents inferred a trait but used another form of expression; for example, the statement 'I don't find the brand interesting' infers the trait 'Boring'. All expressions that did not explicitly mention the trait but were inferred through the syntactical analysis of the inter-

Table 4: Frequency count of Negative brand personality traits obtained from interview transcripts.

Negative Brand Personality	Frequency	Negative Brand Personality	Frequency
Absurd	10	Intimidating	8
Aloof	9	Judgmental	8
Annoying	2	Lonely	11

Flaunt	14	Unstable	9
Flimsy	13	Vain	24
Immoral	39	Vanity	13
Inferior	3	Weird	25

view transcripts were reviewed by an independent researcher in the marketing field to ensure consistency in assigning the implied traits. This is to further ensure that a clarified and appropriate list is distinct from existing measures of brand personality and, at the same time, reflects the negative brand personality dimension (See table 4).

A high frequency for a trait illustrates an agreement in item clarity and a common trend in traits expressed amongst the sampled population. However, few traits were scored relatively low in comparison to other traits such as 'Inferior' and 'Stupid'. A total of seven traits were eliminated at this stage as the items may be relevant to the study of brand personality but lack familiarity within the sampled population.

Study 2

Some traits mentioned by respondents from interviews were perceived in a positive light whilst other respondents perceived traits in a negative light. For example, some respondents referred to 'Flamboyant' as positive while others referred to it as negative. The perspective from which the traits were addressed was based on the syntactical rationale. Therefore, Study 2 sought to confirm whether traits assigned were perceived in a positive or a negative light. Structured questions were asked, such as 'Is this trait seen in a positive or negative light?', since traits were seen by some respondents as positive and by others as negative - these are referred to as 'ambiguous traits'. In order to clean the ambiguous traits obtained from the transcripts, a separate questionnaire was employed asking consumers to rate all perceived negative traits as either positive or negative by ticking a box. This questionnaire formed part of the triangulation

procedure to verify and strengthen the findings (Miles and Huberman 1994).

From the initial pool of 43 items, four items were predominantly perceived (i.e., by more than 50% of respondents) as positively associated rather than negative. These four traits are 'Flamboyant', 'Eccentric', 'Traditional' and 'Nostalgic', and were eliminated from the study of negative brand personality traits. No expert judgment was involved at this stage as this study investigated negative brand personality from a consumer perspective.

Study 3

The objective of Study 3 was to further purify and refine negative brand personality traits. The card sorting task conducted in this study is grounded in Kelly's personal construct theory that utilizes different types of objects or stimuli (for example, pictures, personality traits and colors) (Fincher and Tenenberg 2005; Green and Manzi 2002; Rosenberg and Kim 1975; Rugg and McGeorge 2005). "In a typical application of the sorting method, the respondent is asked to partition a set of inter-related objects or terms into different groups on the basis of their 'similarity,' 'relatedness,' or 'co-occurrence' depending on the particular application" (Rosenberg and Kim 1975, 489). In line with the application of the free card sorting task (Giguere 2006), stimuli in the form of traits and definitions of traits were presented in a card format to respondents.

The respondents were asked to partition the cards (each card contained one trait and its definition) into groups they felt they could be categorized into. No predefined categories or number of categories were given to respondents; instead, they were encouraged to

formulate as many categories as they felt were necessary (Giguere 2006). Respondents were instructed to categorize the cards by creating mutually exclusive piles comprised of conceptually similar statements. Thus, statements in the same pile were more conceptually similar to each other compared with those that made up the other piles. Participants were also encouraged to bind the cards with paper clips to ensure accurate recording of traits in each pile. Once categories were formulated, the respondents were encouraged to name the category. Traits which respondents were unable to categorize provided an indication of irrelevant (or potentially cross-loading) negative brand personality traits.

The purpose of the free sorting method is not to uncover underlying cognitive processes; rather, it serves as a means to discover dimensions likely to result from the list of traits from a consumer perspective without any contamination from the researcher's preconceptions (Rosenberg and Kim 1975). Therefore, the free sorting task helps identify relevant categories by investigating commonalities and differences between consumers in the use of categorization.

Five categories emerged based on what traits consumers put together in a single pile. However, the name of each pile differed from respondent to respondent. Table 5 details the category names that respondents created alongside the common negative brand personality traits. As a result, the traits in each category were collated to form a list of traits. The list of traits was formed on the basis of obtaining 50% or more agreement within each pile. The names of the piles were categorized together to assess the similarity of the category group names to reflect the respondents' group labels.

Although some traits are commonly categorized in each dimension, there still remains variance in some of the dimensions. For example, in Group One, nearly all consumers placed 'Pompous' as an important trait to be classified within the same pile as other similar traits such as 'Vain'. However, not all consumers agreed that 'Selfish' should be classified within the same pile as 'Pompous' and 'Vain'. As a result, further data cleaning was conducted by adopting a fixed sorting method (Giguere 2006). Giguere's (2006) fixed card sorting method is similar to the free associated task, except that a restricted number of groups are generated during the card sorting task.

For the fixed card sorting task, the names for each dimension were finalized. Therefore, the group labels identified by consumers were collated to form an overall group name by summing up what consumers initially labeled each group. Three independent expert judges reviewed the overall category names in light of each category label identified by consumers. Expert judges were a PhD holder in personality research, and two PhD students (one carrying out their PhD in English Language and one in Marketing). All three expert judges agreed on the overall category dimensions as: Group One 'Egotistical'; Group Two 'Boring'; Group Three 'Socially Irresponsible'; Group Four 'Critical'; and Group Five 'Lacking Logic'.

Six additional respondents were requested to group all 39 traits into the five established groups to assess consistency in traits within each group. Respondents were also given the opportunity to either create a new category or to omit traits if they felt trait(s) did not fall into the category or could not be seen in light of the branding. All other instructions were the same as the free card sorting task detailed above.

The card sorting task data was analyzed by visually assessing the frequency of traits occurring in each dimension[1]. Traits that achieved 80% or more in frequency by respondents were shortlisted

---

[1] Multidimensional scaling is one statistical technique that historically has been used to analyze card sort tasks. However, the focus of this research is on identifying common negative brand personality traits and potential dimensions; therefore, a visual-frequency-of-traits-occurrence technique was applied to analyze the data.

to reflect the common traits amongst respondents. Table 6 details the overall results that show some consistency with respondents' classification of traits within each of the five groups.

The results indicate that consistency in negative brand personality traits emerged from both the free sorting task and the fixed sorting task with high frequency loadings assigned by consumers. Overall, the results of the free and fixed card sorting methods provided an indication of negative brand personality dimensions and traits that are likely to result from a factor analysis. Subsequent to the sorting task, a further assessment was undertaken to assess the content validity of the negative brand personality dimensions.

Study 4

Study 4 was a content validity assessment which follows the procedure suggested by Anderson and Gerbing (1991), and complements the sorting task. The substantive validity measure is defined as the extent to which a measure is judged to reflect the construct of interest (Holden and Jackson 1979), and was applied in this study to reflect the traits and dimensions of negative brand personality. The substantive validity assessment is particularly suited for the pretesting of items due to the small-sample nature as opposed to "assessments involving correlations, which suffer from the obfuscating effects of sampling error in small samples" (Anderson and Gerbing 1991, 732).

Respondents were provided with a list of 39 items (negative brand personality traits) and the five dimensions obtained from the card sorting task (Egotistical, Boring, Socially Irresponsible, Critical, and Lacking Logic). The definitions of the five dimensions were also provided. The respondents were instructed to read each of the items (traits) and assign it to the most closely reflected construct (dimension). The items were then analyzed using the content validity ratio proposed by Anderson and Gerbing (1991).

The substantive validity assessment was first calculated by the proportion of substantive agreement (P_{sa}), which is defined as "the proportion of respondents who assign an item to its intended construct" (Anderson and Gerbing 1991, 734). The proportion of substantive agreement is calculated as:

$$(P_{sa} = n_c / N)$$

Here, n_c represents the number of respondents assigning an item to its posited construct and N represents the total number of respondents. The range of values for P_{sa} is between 0.0 and 1.0, where high values indicate greater substantive validity of the item.

The second index reflects the *substantive-validity coefficient*, which reflects the extent to which respondents assign an item to its posited construct more than to any other construct (Anderson and Gerbing 1991, 734). The calculation for this index is:

$$C_{sv} = (n_c - n_o) / N$$

Here, n_c and N are defined as before and n_o indicates the highest number of assignments of the item to any other construct. The values for this index range from -1.0 to 1.0, where high positive values indicate greater substantial validity. Negative values indicate that an item is perceived by respondents as better reflecting a construct different to that which was originally supposed. A recommended threshold for the C_{sv} index is 0.5 (Anderson and Gerbing 1991, 734). Once the P_{sa} and C_{sv} scores had been calculated for each item, they were then calculated for each of the negative brand personality dimensions.

It should also be noted that initially there was a sixth construct termed 'Does not fit in any of the dimensions'. This construct was

Table 5: Details of the five main categories that emerged from the sorting task alongside the names of each of the groups identified by respondents.

Name of Categories	Traits					
GROUP ONE (Egotistical)						
High Self Opinion	Pompous	Pretentious	Vain	Snobby	Stubborn	
Egotistical	Pompous	Brash	Vain	Judgmental	Flaunt	Tyrant
Resentment	Pompous	Immoral	Unethical	Antisocial	Snobby	Tyrant
	Selfish	Pretentious	Vain	Arrogant	Flaunt	Fake
	Aloof	Coarse	Stubborn			
Self-Centered	Pompous	Selfish	Vain	Judgmental	Snobby	Tyrant
	Flaunt	Brash	Pretentious	Superficial	Manipulative	Intimidating
	Stubborn	Arrogant				
Superior	Stubborn	Selfish	Vain	Arrogant	Snobby	Tyrant
	Pretentious	Judgmental	Manipulative	Intimidating		
Self-Important	Pompous	Selfish	Vain	Arrogant	Snobby	Aloof
	Aloof	Absurd	Flaunt	Intimidating		
GROUP TWO (Boring)						
Boring	Dull	Deviant	Anti-Social	Aloof	Lonely	Cheap
Boring	Dull	Boring	Monotonous	Cheap		
Lack of Spirit	Dull	Boring	Cheap			
Tedious	Dull	Boring	Monotonous	Cheap		
Sad	Dull	Boring	Monotonous	Superficial	Mischievous	Cheap
Unpredictable	Dull	Boring	Monotonous	Superficial	Predictable	Cheap
GROUP THREE (Socially Irresponsible)						
Low Minded	Deceiving	Unethical	Immoral	Rebellious	Snobby	Repulsive
	Selfish	Arrogant	Stubborn	Mischievous		
Bad Faith	Deceiving	Unethical	Immoral	Fake		
Resentment	Pompous	Immoral	Unethical	Antisocial	Snobby	Tyrant
	Selfish	Pretentious	Vain	Arrogant	Flaunt	Fake
	Aloof	Coarse				
Operating outside established code of conduct	Deceiving	Unethical	Immoral			
Wrong		Unethical	Immoral			
Without Task	Deceiving	Unethical	Immoral	Coarse	Brash	Repulsive
	Deviant	Manipulative	Anti-Social	Mischievous		
GROUP FOUR (Critical)						
Anti-Establishment	Barbarian	Rebellious	Deviant	Tyrant	Antisocial	Judgmental
Selfish	Repulsive	Rebellious	Mischievous	Predictable	Cheap	Coarse
	Confused	Judgmental				
Low minded	Repulsive	Rebellious	Mischievous	Stubborn	Arrogant	Snobby
	Immoral	Selfish	Judgmental			
Unclear	Immoral	Rebellious	Selfish	Mischievous	Vain	Weird
	Lonely	Confused	Unstable	Naive	Aloof	Judgmental
Forceful	Stubborn	Rebellious	Tyrant	Judgmental		
Envious	Repulsive	Selfish	Superficial	Unstable	Pretentious	Predictable
	Vain	Mischievous	Weird	Judgmental		
Critical	Repulsive	Stubborn	Rebellious	Judgmental		
GROUP FIVE (Lacking Logic)						
Irrational/lacking Logic	Weird	Delusional	Unstable	Absurd	Naive	Superficial
Unreal	Fake	Delusional	Predictable	Superficial		
Different	Weird	Delusional	Unstable	Absurd	Deviant	
Ingenious	Lonely	Delusional	Naive	Superficial		
Unusual	Weird	Rebellious	Mischievous	Absurd	Deviant	Superficial
Shallow Mindedness	Weird	Delusional	Unstable	Superficial	Naive	Pretentious
	Confused	Lonely	Monotonous			
Different	Brash	Coarse	Naive	Absurd		

not theorized by the researcher but was included to provide respondents the opportunity of not assigning an item to any of the five constructs. It is worth noting that the sixth construct 'Does not fit in any of the dimensions' is not the focus of this research and is constructed as a means to aid item elimination at a later stage. Some respondents gave an indication that they felt items such as 'Delusional' and 'Lonely' belonged to the construct 'Does not fit in any of the dimensions'. These items were eliminated from further analysis whereby the P_{sa} and C_{sv} results scores for the items were deleted. The results of this substantive validity test are referred to as Test One for the purposes of subsequent discussion.

In addition, some items were classified as ambiguous, which was indicated by a low C_{sv} score (i.e., between -0.1 and 0.1). A low C_{sv} means that there is considerable ambiguity among respondents regarding the construct the item best describes. For an item to provide a low C_{sv} value, respondents must have assigned it a similar number of times to two or more dimensions.

For example, the item 'Lonely', which was posited to be part of the 'Boring' dimension of negative brand personality, was assigned nine times to 'Boring' and nine times to 'Socially Irresponsible'. Another item that was dropped based on item ambiguity was 'Mischievous', which was posited to be 'Socially Irresponsible'. 'Mischievous' was assigned ten times to the 'Socially Irresponsible' construct and six times to 'Egotistical'. The high scores in both the 'Socially Irresponsible' and 'Egotistical' constructs resulted in a low C_{sv} value of 0.1 for the item 'Mischievous'. These items were dropped from the analysis between Test One and Test Two.

Items classified as ambiguous warrant further theoretical investigation and should be closely examined during later data analysis via, for example, exploratory factor analysis. For the purposes of the substantive validity test, items with a low C_{sv} value were excluded, and further calculations were done in an attempt to increase the validity of the items under review. The results of this second stage of substantive validity testing are referred to as Test Two for

the purposes of subsequent discussion. Test Two involved only 35 of the original 39 items. Table 7 illustrates the findings of Test One and Test Two.

This method of triangulation provided an insight into consumers' emotional expressions and their perceptions of brands. The systematic combination of various types of data collection/analysis for the study of negative brand personality is an important step in validating the negative brand personality traits. The preceding methods are likely to aid in the interpretation of trait elimination in subsequent quantitative phases.

THE CONCEPTUAL FRAMEWORK

The results from the initial study - the interviews - and associated literature identify four particular antecedent constructs for Negative Brand Personality: Corporate Social Irresponsibility, Self-Incongruence, Brand Confusion, and Price Unfairness (See Figure 2). Together, these four constructs summarize the dissonant state between corporate brand communication and consumers' interpretations. Each of these antecedent constructs are dominated through implicit perceptions that consumers formulate through cues in order to locate consumers' discrepant self-meaning (Lau and Phau 2007).

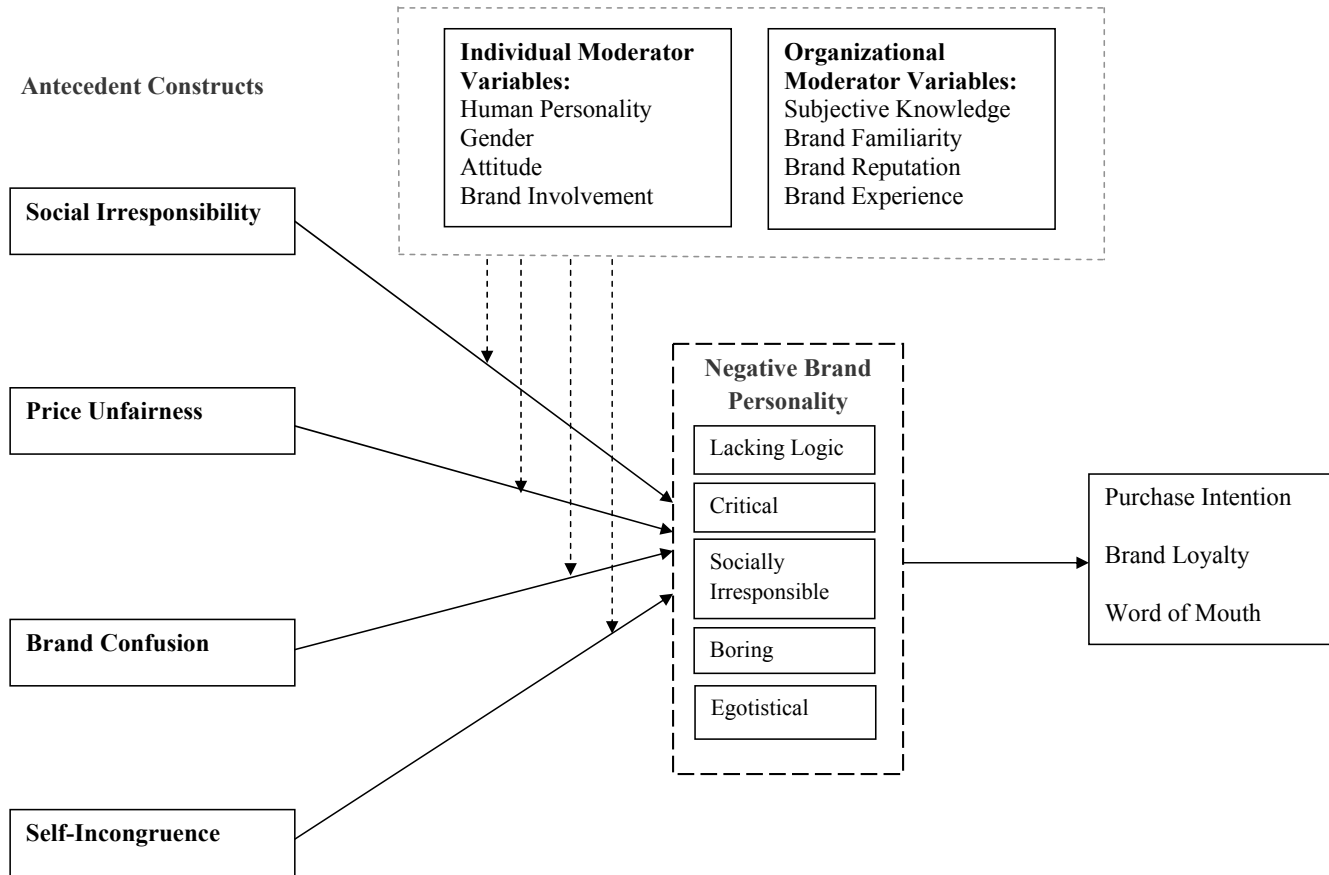
Corporate Social Irresponsibility underpins consumers' perceptions of the brands' moral values (Du Bhattacharya and Sen 2007). Hollenbeck and Zinkhan (2010) illustrated the importance of this observation by acknowledging that media reports of brands using child labor may hold consumers back from purchasing a company's products. This meta-knowledge, whether accurate or not, guides consumers' perceptions of moral practices by setting examples of corporate wrongdoing (Brown and Dacin 1997, 80). Such findings were also demonstrated in consumers' responses that were unforgiving of the socially irresponsible behavior of a company; as a result, the respondents evaluated the brand by assigning negative traits based on brand ethics.

Table 6: Details of the traits consumers assigned from the fixed card sorting task.

Name of Dimension	Traits				
Egotistical	Pompous	Snobby	Brash	Vain	Arrogant
	Pretentious	Flaunt	Stubborn		
Boring	Boring	Monotonous	Dull	Lonely	Anti-Social
	Cheap				
Socially Irresponsible	Immoral	Unethical	Deceiving	Deviant	Fake
	Manipulative				
Critical	Confused	Mischievous	Rebellious	Selfish	Barbaric
	Judgmental				
Lacking Logic	Delusional	Weird	Unstable	Naive	Superficial

Table7: Illustration of the overall findings of Test One and Test Two.

	Test One			Test Two		
	Item	P_{sa}	C_{sv}	Item	P_{sa}	C_{sv}
Lacking Logic	12	0.671	0.560	12	0.671	0.560
Critical	4	0.773	0.675	3	0.858	0.793
Socially Irresponsible	8	0.753	0.665	7	0.809	0.733
Boring	4	0.833	0.767	4	0.833	0.767
Egotistical	8	0.858	0.783	8	0.858	0.783
Does Not fit in Either of the Dimensions	2	0.516	0.323			
Total/Average	**38**	**0.734**	**0.629**	**34**	**0.806**	**0.727**

Figure 2: A conceptual framework summarizing the results of the four studies conducted so far.


The findings from the interviews, which are also in line with the self-identity literature, have shown that a non-matching advertising appeal is likely to conflict with consumers' brand schemas, causing a cognitive strain on consumers' intuitive processes when trying to assimilate the information with their self-concept (Sirgy et al. 1997; Helgeson and Supphellen 2004). However, the *incongruence* between the advertisement and the self-concept of an individual increases the dissonant state. Coupling incongruence with cognitive dissonance provides further rationalization for negative brand personality traits. As a result, respondents experience tension, guilt arousal, and anxiety and doubt (Menasco and Hawkins 1978; Ghingold 1981).

The findings from the interview transcripts also reveal consumers' proneness to brand *confusion*. This is in line with other researchers who show that brand confusion results from perceived similarity of the product through brand imitations, information overload, and ambiguity in consumers' tolerance for processing unclear or misleading product information (Walsh, Hennig-Thurau and Mitchell 2010). Information overload, similarity and ambiguity arise when the information supply, due to its volume, exceeds consumers' processing capability. Consequently, consumers begin to exhibit symptoms of anxiety and frustration due to their limited processing capacity (Hafstrom et al. 1992; Mitchell and Papavassiliou 1999; Sproles and Sproles 1990).

Furthermore, the findings show that consumers' psychological reactions to *price unfairness* (Campbell 1999) often leads them to punish the brand by looking at alternative brands (Kahneman et al. 1986a, 1986b), or to attack the brand by assigning a discrepant self-meaning. The psychological reaction to what is perceived as a fair price (Kamen and Toman 1970; Monroe 1973) is likely to stimulate anger, which is considered to be the strongest negative emotional response compared to disappointment and regret.

Significantly, the findings of the four antecedent constructs capture the multidimensionality of consumers' perceptions of negative brand personality.

Further potential moderating variables that are likely to affect the link between the antecedents and negative brand personality traits are broadly categorized into two groups - personal characteristics and organizational characteristics. Individual characteristics, such as gender, human personality traits, attitude and involvement (enduring and processing), are likely to exert a moderating influence because they are often linked to consumers' ability to rationalize and process brand stimuli.

Gender differences may be related to the experience framework since women tend to have more experiences of different brand products than men. Dimensions in *human personality* such as Consciousness and Neuroticism are more prone to negative emotions and are likely to strengthen the link between the antecedents' constructs and negative brand personality (Barick and Mount 1991). *Brand involvement* (enduring and processing) is likely to be associated with differences in sensitivity to brand stimuli, in that those who are highly motivated are interested and driven to evaluate brand cues (Zaichkowsky 1985; Kapferer and Laurent 1993). Similarly, consumers' overall *attitude* determines their beliefs (MacKenzie and Lutz 1986) and feelings (Olney, Halbrook and Batra 1991) towards brands. According to Day (1970), consumers' low confidence levels reflect uncertainty about the brand judgment or increase ambiguity about the meaning of the brand, thus increasing undesirable attributes.

The organizational characteristics consist of subjective brand knowledge, brand familiarity, brand reputation and brand experience. Each will be discussed briefly in turn.

Subjective knowledge is self-perceived knowledge based on pre-existing knowledge primarily accumulated through readily available information from media sources (Park, Jaworski and Maclnnis 1994). It is likely that consumers who are less confident about their subjective knowledge are more likely to assign negative brand personality traits due to low tolerance levels for processing new information. Similarly, consumers are likely to be more prone to negative reactions with low levels of *brand familiarity* as a result of the discrimination between brand choices (Campbell and Keller 2003). *Brand reputation* is the aggregate perceptions formulated by consumers based on the salient characteristics producers send to the market to establish their brands (Fombrun 1996). Therefore, a brand that fails to fulfill its stated intentions or marketing signals is likely to develop a negative reputation.

Brand experience is induced from exposure to attributes that result from consumer interaction with brands. Experienced consumers are likely to be more prone to discriminating on hedonic evaluations grounded in their direct or indirect consumption (Hirschman and Holbrook 1982; Laroche, Kim and Zhou 1996). Although no study has investigated the outcome of negative brand personality, it is likely to be associated with low purchase intention (Laroche, Kim and Zhou 1996), and low brand loyalty and negative word of mouth (Richins 1983). These are likely to relate to the immediate effect of negative brand personality.

CONCLUSION AND IMPLICATIONS

Key findings from this study provide strong support for the existence of negative brand personality, which is consistent with the interpersonal domain of the *Big Five* human personality dimension. Furthermore, by building on Aaker's (1997) current conceptualization of brand personality, the findings contribute to a more complete understanding of brand personality through acknowledgement of negative brand personality. It is not enough to interpret negative traits as the absence of positive traits. Negative traits are a reflection of consumers' anxious and frustrated feelings The findings further contribute to the brand relationship literature by capturing consumers' emotions of frustration and anxiety; these are emotions which can impact on brand dissolution and consequently dissolve the brand-self relationship, an area that has been relatively under researched. Furthermore, the conceptual model provides marketers with guidance on how to communicate their brand(s) to consumers by acknowledging a more balanced view of the brand. By acknowledging and reducing negative brand personality traits, cognitive clarity among consumers should increase, which could be a major source of competitive advantage.

Globalization in the Less Affluent World:
The Moroccan Consumers' Acculturation to Global Consumer Culture in Their Homeland

Delphine Godefroit-Winkel, Univ Lille Nord de France- SKEMA Business School, France

ABSTRACT

Studies have highlighted the difficulty to build a typology of LAW consumers' behaviors in their increasingly global environment. In this observational and interview based research, The authors identified four consumptions modes in Casablanca which are related to the postassimilationist model, suggesting that acculturation is not restricted to migrants' experience.

The global consumer culture is currently part of the global world (Arnould and Thompson 2005) and many studies have been devoted to understand the way it has emerged. However it impacts around the globe with significant differences. In the Less Affluent World (LAW), the global consumer culture increasingly affects local consumers who have to adapt to a new environment (Ger and Belk 1996; Varman and Belk 2008). Despite several interesting contributions in different countries (see, Wilk in Belize, Ger in Turkey or Arnould in Niger), building a general typology of LAW consumer behaviors seems to be difficult, due to the diversity of cultural settings (Arnould 2002). This paper aims to identify different consumption modes in a LAW, by using acculturation framework.

This research considers the global consumer culture as a new culture -one that inhabitants of an economically developing country are forced to affront. Such inhabitants are confronted to this new consumer culture in the same way as immigrants discovering another culture in their host country. To some extent, they can experience "acculturation" in their own homelands. This research is limited to Morocco: this country has experienced remarkable economic growth, an exponential increase in quantities of available products and international brands, and numbers of new retail channels have soared over the last ten years.

THEORETICAL ISSUES

The links between consumer culture and capitalism have long been investigated (e.g. Ritzer 2004) and consumer culture has been considered in very different ways, from a control mechanism aimed at reducing individual freedom (Marcuse 1964) to a emancipatory opportunity (Firat and Venkatesh 1995). During the last decades, attention has been directed to the spear of a global consumer culture. The global consumer culture is defined as a "cultural entity not associated with a single country, but rather a larger group generally recognized as international and transcending individual national cultures" (Alden, Steenkamp and Batra 1999, 80). The arising of this global consumer culture has suggested new directions of research. First the question of homogenization of consumption patterns all over the world has been addressed. According to the proponents of the homogenization thesis, local cultures are colonized by transnational corporations, through the spreading of global brands. As the global consumer culture is rooted in the Western consumer culture, the question of western values' implementation in all the other cultures has also been considered. This global culture was suspected to crush the local ones and to generate a new form of domination. However, it seems that global brands are producing diversity, as people from different cultures re-interpret them in different ways and incorporate them in their own lifestyle (Ger and Belk 1996; Miller 1998). According to Thompson and Arsel "the intersection of global brands and local cultures produces cultural heterogeneity" (2004, 631).

The increasing marketization and globalization of local economies have impacted on much consumers in the Less Affluent World (LAW). The consumption modes observed in the LAWs differ from Western patterns and they are considered numerous and hybrid (Sandikçi and Ger 2002). Results emphasize their differences from Western societies and suggest that any generalization of phenomena observed in the West must be carefully undertaken (Ger and Belk 1996). They also provide evidence of the major role played by the media, television in particular (Varman and Belk 2008) and advertising (Zhao and Belk 2008) in developing a new consumption ideology. However, if the forces that drive globalized consumerism and global consumption homogenization and the consequences on consumers have been investigated (Ger and Belk 1996), the way people in LAW live the global consumer culture as a new culture is not enough studied.

Considering the large differences between global consumer culture and local cultures in the LAW, we suggest to consider global consumer culture as a new culture, which inhabitants of an economically developing country are forced to affront. Inhabitants of a LAW are confronted to the global consumer culture in the same way than immigrants discovering another culture in their host country; they experience "acculturation" in their own homelands. Indeed, consumers who were raised in traditional societies discover consumer society, like immigrants discover host culture on reaching the host country. It may be hard for migrants to adapt, mainly because of differences between the host and original culture. This lens suggests to consider acculturation theories as a frame to approach people reactions to the global consumer culture in the LAW.

The works of Berry (1997) is considered as a starting point for the development of acculturation theories in consumer research. According to Berry, individuals in a multi-cultural society hold attitudes based on their orientation with regards to two central issues: cultural maintenance of own group, and desirability of intergroup contact. In his model, individuals choose one of four acculturation modes: assimilation, integration, separation, or marginalization. But assimilation is, more or less, the expected goal for migrants, who are supposed to adopt the host culture. Post-assimilationist theories have focus mostly on identity (*e.g.* Oswald 1999; Askegaard, Arnould and Kjeldgaard 2005). The focus is on individuals, and consumption is considered as a resource that helps migrants to build their identity project. Oswald (1999), for example, developed a model of hybrid identity and of swapping culture. Üstüner and Holt (2007) introduced the sociocultural context to explore the identity project of poor migrants in Turkey, far from a postmodern view. Practices are explored mostly in an instrumental way, in order to analyse how migrants use consumption to pursue their identity project with the exception of Peñaloza's work on Mexican migrants (Peñaloza 1994). Peñaloza sets up four consumer acculturation practices: assimilation (adopt the host practices), resistance (favor home practices over host practices), acculturation (adopt both host and home practices), and segregation (a spatial form of separation). Later, Askegaard et al. (2005) point out the rise of transnational consumer culture as a third acculturating agent. They also show with the case of Greenlanders of Danish nationality and their integration in Danish society that acculturation should not be limited to migration movements between two different countries.

DEVELOPMENT OF A GLOBAL CONSUMER CULTURE IN MOROCCO

Belk defined consumer culture as a "culture in which the majority of consumers avidly desire (and some noticeable portion pursue, acquire and display) goods and services that are valued for non-utilitarian reasons, such as status seeking, envy provocation, and novelty seeking" (Belk 1988, 105). Such a culture was not prevalent in Morocco thirty years ago, when Geertz explored the Moroccan souks and retail channels (Geertz 1978). A short presentation of the Moroccan recent history can highlight its evolution towards consumer culture and especially towards global consumer culture.

After the Independence in 1956, a protectionist policy was adopted with high trade tariffs - 45% in 1982 - and many state owned companies. In the 80s, the Moroccan authorities decided to be part of the global world and started slowly the economic liberalization. Over the last decade, the Moroccan openness increased drastically - from 43.5% in 1998 to 70% in 2008 - and the foreign investments doubled - 18 billions MAD in 1999 and 42 billions MAD in 2007. In the following, we describe factors that have assisted the development of global consumer culture: availability of many products in the market, sufficient purchase power to buy them, and actual purchase willingness among the targeted consumers.

Availability of products in the market: Moroccan inner supply and retailing

In addition to local products, the Moroccan market is currently provided with many imported products as a result of custom taxes. During late 1980s, the Moroccan government implemented reforms, including economical liberalization and privatization of several state-owned enterprises. The Moroccan financial sector was acutely reformed in 1993 to meet international standards. As investments were made in order to increase quality levels, Moroccan industries signed several contracts to supply well-known foreign brands with textile and leather products. Moroccan expertise in terms of luxury products spread to smaller workshops, raising quality standards. Even in less prestigious sectors, local products increased in quality and numbers. However, some Moroccan people still think that local products are synonymous with bad quality.

The Moroccan distribution experiences drastic changes since the first hypermarket in 1990. For instance, some specialized megastores such as Bricoma - for tools - or Kitea - for home furnishings - have opened their doors and the largest shopping mall in Africa was inaugurated in Casablanca in December 2011. But, like in other LAW - e.g. Tunisia (Mejri and Lajili 2007) - according to USAID (2006[1]) to the Moroccan retail environment is dominated by traditional forms - the average distribution channel counts 4 to 5 intermediaries; the small retailers represents 91% of the retail sector with 1,27 million stores. On the other hand, the retail industry is moved by a drastic growth - 11% per year while contributing to the global consumer culture spread in Morocco.

Purchasing power

The development policy was accompanied by a social dialogue, which resulted among others in an improvement of the average household income; meanwhile, relative poverty has decreased (from 15% in 2001 to 9% in 2007). But, only 3% of the households have a saving account. Besides, the purchasing power has increased through the availability of credit in the last ten. 3 Moroccans on 4 have a short term credit (HCP 2009[2]) and half of them are given in Casablanca and Rabat. The household expenses concern mainly food

- 80% of the Moroccan households still spend half of their income in food (HCP 2009).

Readiness to consume

30 years ago, the poor diversity of the Moroccan supply was constraining the Moroccan willingness to consume. Today, the Moroccan market experiences a remarkable growth in consumption. Three reasons are to be given. Firstly, food abundance within the home reflects wealth of the host. Secondly, consumption appears to be indelibly linked to modern society. Ever-increasing consumption has begun. Furthermore, mass communication nourishes consumption desire (Varman and Belk 2008). Many foreign TV-channels are now available through satellite dissemination . Viewers, restricted to two Moroccan channels until the 1990s - and to one TV-channel before 1989 -, learn about global consumer culture through multiple TV-programs; the press is another developing media.

Importance of global culture in Morocco

Global consumer culture can be conceptualized in terms of "the proliferation of transnational corporation producing and marketing consumer goods" (Ger and Belk 1996, 274). Before the 90s, shopping facilities were inaccessible because of Moroccan protectionism and geographical distances. Obtaining global products, required traveling abroad - e.g. the Moroccan elite - or waiting for migrants to 'come back home' in vehicles brimming with Western manufactured products. With economic liberalization, the Moroccan market welcomed introduction of global products - 40% of the consumption concerns imported products - and the openings of distribution channels such as supermarkets, hypermarkets and franchises. Global brands have sold in supermarket, competing Moroccan ones.

However, there is still much disparity between the global and the Moroccan consumer cultures. In Morocco, the swift market evolution is observed but this rapid evolution entails issues and trauma. Moroccan consumers experience acculturation within their home country. Therefore, we advocate considering the urban Moroccan consumers as migrants affronting a previously distant culture.

METHODOLOGY

Among our research objectives were: 1) understanding the contact between the local and the global consumer culture and the resulting change for consumers in consumption practices ; 2) addressing whether the acculturation frame is relevant to analyze consumers' reactions to global consumer culture in a LAW.

We conducted an interpretive study in Casablanca, the Moroccan economic capital because even if consumption has increased drastically, its growth is larger in Casablanca than in any other parts of the country. In order to gain meaningful understanding of settings, distinct cultural shopping contexts were chosen, ranging from traditional markets to modern super and hypermarkets for food represent the most important household expenses. We privileged data collection and recording of human experience in natural settings, with non participant and participant observation as it facilitates access to backstage areas (Goffman 1959).

The first author collected the data. She has been living in Casablanca during her childhood and she settled back in Casablanca 14 years ago. She has a privileged access to the field, an understanding of local languages and customs while she is aware of the danger of being too much insider (Arnould and Wallendorf 1994).

The notes were taken during the observations and enriched a few hours after the observations (Corbin and Strauss 2008). Thick descriptions (Geertz 1973) helped in describing observed phenomena in order to assure an holistic rendu. The first author paid attention

---

[1] http://pdf.usaid.gov/pdf_docs/PNADH519.pdf

[2] http://www.hcp.ma/

to her emotional responses and she noted down her own reactions and interpretations during observations in order to reveal personal biases (Wallendorf, Belk and Heisley 1988).

Observations were complemented with 35 in-depth interviews to gain deep emic understanding of the phenomenon under study. Informants' profiles were diversified according to several demographical and sociological characteristics including age and education level.

Interviews were conducted with informants living in Casablanca, and varied from 34 minutes to one hour 47 minutes. They took place in different places, the choice of location was dictated by convenience, in informants' living room or kitchen or in cafés. Interviews were conducted either in French or Moroccan dialect. The interviewer used both French to comfort informants, because Moroccans gain in identity assertion and negotiation while they use French (Sadiqi 2003) and dialect to ensure proximity. In order to give an emic perspective and credibility to the data, 6 cultural mediators helped in interviewing 6 informants. A participant list is presented in table 1. The interviews were integrally translated and transcribed. An expert in Moroccan dialect and French checked the translations for accuracy.

The first author's experience as a migrant ensured an analytical perspective. The second author, a French woman has observed the Moroccan market evolution, during her frequent visits in Morocco. The second and third author provided analytical distance for data collection, coding, and interpretation. The three authors analyzed the data using an interpretative approach, first separately and then together, according to the themes which had emerged. By alternating between the specific case of each interviewee and the interviews as a whole, and by making use of field notes, pictures and literature, as in the final stages of the analysis, we have attained findings showing the relation modes of Moroccan consumers to global consumer culture.

FINDINGS

Through the various stories told by respondents, four relation modes with global consumer culture were identified. Each mode can be related to one of the acculturation modes identified in post-assimilationist literature. The first mode, "Adoption", meaning acceptance of the new consumer culture, is similar to "Assimilation". "Rejection" is similar to the "Hyperculture" suggested by Askegaard et al. (2005). "Negotiation" is close to "Pendulum", as people sometimes accept some traditional consumption modes and, in other circumstances, adopt new behaviors. Finally, we found evidence of "Best of both worlders" who value the two cultures. The data presented below evinces the dialogue of rejection and acceptance, marking this acculturation.

Adoption

Consumers who adopt markets do not question market mechanisms: they accept market rules; they conform to and find benefits, such as self-expression. Majd, a single male informant, is excited when he tells about shopping in the supermarket.

> In supermarkets, you always end up with something that you did not need. You know what they call gondolas, it is treacherous! You end up being taken in! You always end up taken in! [Laugh]… They tell you 'Price was 40'; they cross it and write 38. So you tell yourself 'What a good deal!'. You don't count. It's only when you go out that you realize. It's after… But you come back… and you do it with pleasure. You do your shopping in good conditions (Majd, 54, high school teacher)

If Majd buys more than expected, he still has a good image of his shopping experience in the retail industry. The adaptation process may generate problems with regards to integrating market logic but Majd accepts market rules and he quickly acculturated. He likes the ambiance and the products supplied in the retail industry. For instance, he buys ready-to-cook chicken breasts and abandoned the whole warm just-killed chickens, which are sold in the traditional markets. He reminds without any regrets the time when he would go to the traditional sellers : "I don't have to sit anymore on an empty box [...] watching the cockroaches or the mice walking around the food [laughs]".

Besides, the Moroccan retail industry provides consumers with a new space where they can express their self. Saida is a female student in Arabic law at the public University of Casablanca. She feels "special", "posh", when she goes to the hypermarket with her mother every month. "The only fact of having a trolley and walking through the alleys, makes me feel different. It's not like at the hanout [small next-door shop] or the souk where it is crowded and you have to shout: give me that!". And she admits that hypermarkets are an arena where definition of one's group is negotiated.

> In our country, there are people with low incomes who go to Marjane [hypermarket] to have a walk. Some of them don't even buy. Others buy a single pack of cheese. They wait in line at the cashier and then they leave but they leave with a plastic bag! They carry Marjane plastic bags! This means that they were at Marjane! They want to show that they went to a supermarket, that they are able to shop in supermarkets! We, Moroccan folk, focus on appearances. It is like that! This is how we are. (Saïda, 20, student)

Being a hypermarket' client is a way to approach one's social reference group. Leila chooses the hypermarket regarding to the clients.

> People who go to Marjane Californie [hypermarket] are different from those who go to Marjane Derb Soltan [hypermarket]. In Marjane Californie, people are more civilized. They are better dressed. Some women are smart, they carry Louis Vuitton bags; in their hands, they have car keys. (Leila, 36, school teacher)

Market rejection

Some Moroccan consumers refuse to buy certain items in supermarkets or in contemporary shops; they cook instead of buying prepared dishes, and so on. Two causes have been identified for such market avoidance: faith in tradition and protection of Moroccan identity.

Time perception and orientation is one of the most salient characteristics of consumer action (Bergadaà 1990). Fatima, a young housewife, points out the difference in the value of time in the traditional distribution and in the retail industry.

> In a hypermarket, you don't enjoy it at all because it is like a duty that you have to do. That's it! You are supposed to know how long you will stay in each section. And don't forget how long it will take to scan all your products! And when it's going to be your turn! When you go to the [permanent] souk, you don't watch the clock: you wander, asking each seller the price of any product. You walk with your basket, chickens cackle, there is a nice atmosphere. (Fatima, 36, housewife)

Table 1: Informants' List

name	age	marital situation	household excluding informant	occupation	spouse or father's occupation	home rental cost	sex	education
Abdelhamid	54	married	3 (spouse, 2 children)	professor	manager	high	m	phd

Fatima perceives shopping in souks as a timeless leisure activity, whereas shopping in hypermarkets is a stressful pursuit where time is a valuable resource. She expresses the change between traditional Moroccan and modern day perception of consumption. She values interpersonal relations over time, showing her attachment to the traditional shopping mode.

In the Moroccan exchange tradition, personal relationships between sellers and buyers are very important. Forging relation of trust is a primary Moroccan market strategy (Kapchan 1996) while in global consumer culture, trust is inspired by brands (Holt 2002). As an example, trust in the vendor is highly important for meat and poultry purchase in Morocco. Most informants refuse to buy such products in supermarkets. "I have the feeling that they sell old cows, really!" says Naïma, 57, employee. Naïma goes to the same butcher for many years. Informants like Naima do not trust ready-to-cook chicken from supermarkets, even if it is sold under a slaughter-house's stamp and has a best before date printed on packaging.

Going to the hanout is also very important in the Moroccan everyday life, where people ties strong interpersonal relationships based on trust. Youssef enjoys his hanout, who allows him to buy on credit.

I have a notebook [at the hanout]. THE famous notebook, the one which permits to buy on credit and to pay at the end of the month. I wish that these hanouts don't disappear with all the supermarkets! They are friendly, and close to the people. We all have a souvenir with a hanout. I remember so well when we lived in the countryside: there was Hamid! .... then I moved to Casablanca... I wish that there will always be the hanouts. (Youssef, 50, merchant)

Youssef is deeply attached to the Moroccan traditions and to the hanouts which are socially rooted in the Moroccan identity. He perfectly knows that they don't represent the ideal stores which he would dream of: "they have warm yoghurts and flies on the bread". But, he is attached to them with their pros and cons and can't imagine a Morocco without them. The Moroccan culture is socially constructed through the stores.

Negotiation

The negotiation mode is an oscillation between cultures; assimilation with global consumer culture with simultaneous maintenance of Moroccan consumption behaviours. In the Moroccan retail industry, many consumers have traditional behaviours to proceed to shopping, at the cashier or during the decision making process.

A woman arrives at one express cashier, where "Fewer than 10 items" is written in French and in Arabic. She has a full trolley. In one plastic bag which is usually used for vegetables and fruits, she has put several yoghurts. She puts the plastic bag on the conveyer belt. The employee tells her in polite dialect that his cashier is limited to ten items maximum per client. The female client pouts and asks if the yoghurts in the plastic (of different brand and size) constitute one item. The employee explains slowly and gently to her the definition of an item. The woman doesn't move. A monologue begins: the employee tries to demonstrate that he cannot make any exception without the risk of being invaded by thousands of other packed trolleys. The female client doesn't answer, and doesn't look at him, no anger can be read on her face. The employee turns back and finishes to scan the former client's purchase. During that time, the female client empties her trolley on the conveyer belt. No more contestations: the employee scans her purchase and the next ten-item clients don't say anything.

The employee, who has total understanding of traditional culture, doesn't seem to show particular interest in forcing respect this specific hypermarket norm, which is a global norm. The express cash till is meant to save time, which is not a valued resource in traditional Moroccan culture. The cashier privileges harmonious interpersonal relations with the female client who is penetrated with the traditional habit of bargaining (Kapchan 1996). In this specific case, she negotiates the norm in order to be served.

Bargaining is in a traditional consumer behavior in the Moroccan souks (Geertz 1978). A Moroccan consumer always bargains in a souk to get a better offer. But Sarah has noticed that she can use her bargaining skills in the supermarket as well.

One day, I was watching the fishes on the shelf in the supermarket. The employee asked me if he could be of any help. I told him that I was hesitating, that I didn't know if I really wanted to have fish, that they were quite expensive fishes. After a while, he proposed me to trust him: he would give me a good fish for a good price. And you know what he did? He took a fish, cleaned it, emptied it and only then weighted it! In the supermarket, the prices that are for uncleaned fishes! [...] So of course, I gave him a good tip. He made me spare a huge amount of money: almost half of the price! Now, I always buy fish from him! (Sarah, 38, housewife)

Sarah, without any specific intention, has reproduced the traditional link which exists between a seller and a buyer in the traditional marketplace. She likes to shop in a supermarket, she has an accurate understanding of what can be and can't be done in the retail industry. But she doesn't want to get away from the traditional shopping behaviors and her home consumer culture.

The Best-of-both-world mode

The consumers take the best part of each culture. They value the positive side of their traditional culture while enjoying the incoming global culture. In our research, many informants consider shopping as a leisure activity (Tauber 1972). In the traditional Moroccan society, shopping is a masculine activity and the periodic souks are the best example of the male dominated Moroccan institutions (Kaplan 1996). Like many men in Casablanca, Hassan likes to go to the periodic souk every Sunday morning. He describes these shopping experiences as an important tradition. He leaves early in the morning with his father, his brother and his cousin. They buy several kilos of vegetables and meat to "feed the whole family" during a week. Then, they return back home, and give their wive the purchased goods. In the afternoon, Hassan goes to the hypermarket: he buys cans of tomato paste, oil, flour, sugar or green tea, which can't be found in the souk. In Hassan's family, the women have the duty to prepare meals with what the men have brought back. Women don't write any wishing list for their husband nor ask for special items. They conform with what is purchased. However, the opening of hyper and supermarkets offered an additional opportunity for Hassan's wife and children to participate more actively in the shopping activity.

We go [to the supermarket] with the kids, to please my wife. Otherwise, she is not happy. She claims that I go out and that she always stays at home. (Hassan, 42, delivery boy)

Hassan's wife doesn't work and doesn't drive. During the week, she is busy with their three sons and her in-laws who live next door. So, she wants to have "fresh air", to go out on week ends, and the retail industry is attractive to her. Hassan is happy to drive his wife and children to the hypermarket. He perfectly knows that she would be angry if he doesn't bring her.

In the hypermarket, the eldest children run and the baby sits in the caddie. Hassan's wife watches the novelties or buy a pair of slippers for her. It's like a mini-trip for the family.

Each informant has been affected to one of the four modes described in the post assimilationist literature, suggesting that acculturation is a relevant frame to analyze Casablanca consumption behaviors in their increasingly global environment.

DISCUSSION

Our results confirm some of the already known consequences of the spearing of the global consumer culture in LAW. For example, shopping and consuming provides pleasure and gratification to many individuals; but as conspicuous consumption is very important, keeping up with the Joneses leads people to compete and to increase inequalities and tensions (Ger and Belk 1996).

A less expended result concerns the shift in roles within the family. Traditionally, men were the sole breadwinners in the West (Falk and Campbell 1997) and in Morocco (Kapchan 1996). They were both the decision maker and the shopper, as they attempted souks on a regular basis. Cultural norms gave husbands the legitimacy to make the decision, even in the food and cooking sphere. Today, urban Moroccan women gain in power while having access to shopping and become an more active agent in the family decision making. The encounter between a traditional family model and a more modern one (to use Rodman's terms) could have given ride to tensions. But thanks to global consumer culture, it seems to happen without drastic tensions within the family. Supermarkets and new retail channels turned to be more female ones, or at least family retailing channels. They have become a place where a woman can buy by their own, or where the all family can have a ride on Saturday or Sunday afternoon. Males do not feel hurt by the lost power, as their own territory – souk- is not threatened. Contrary to previous results (Ger and Belk, 1996), there is no clash between traditional and modern models, the ideology underlying the global consumer culture helps husbands and wife adapting to this new model. And an acculturation mode such as " best of both world" – souks for men hegemony and supermarket for women freedom- facilitates the shift from one family model to another one. More generally, consumers in a LAW are embedded in their changing cultural context and construct their roles through adopting or rejecting the new context (Miller 1995). The relation modes to the global culture do not necessarily arise only out of historical trajectory nor from a local cultural context (Arnould 1989). Consumers in a LAW elaborate individually their relation modes to

the global culture while choosing to paste, to abandon or to negotiate their individual behaviors inherited from the traditional lifestyle.

Our results also contribute to the today debate about frontiers. Frontiers are at the heart of the first acculturation theories in social sciences, as their purpose was to understand how a migrant coming from a foreign county, crossing a physical frontier, could adapt to his host culture that involves crossing cultural ones. In post-assimilationist studies, the seminal work of Peñaloza about Mexican-Americans introduces in its title the notion of "frontiers" (Peñaloza 1994). Frontiers can be either tangible (a body, a country) or intangible (a social class, a category). They can fulfill a functional value (be a reference point) or a symbolic value (providing re-assurance) (Regany, Visconti and Fosse-Gomez 2012). More recently, the idea has been introduced that an acculturation process could occur inside the same country (internal migration of peasants to cities) without crossing any national border: Üstüner and Holt (2007) analyzed the identity project of poor migrant women leaving the countryside to settle in Istanbul. In this case the frontier lies between village and city. But in the case of global consumer culture spreading into a LAW as Morocco is, it seems to be no usual frontier at all. Using a frame as acculturation to analyze this case suggests some new uses of frontier. For some Moroccan people, frontiers do exist. People rejecting the global consumer culture, and the market ideology, build in their mind a clear frontier between traditional culture and this new one. Reifying such a frontier helps them to separate the two worlds and to manage their segregation. As Curtright (2012) pointed it recently, human individuals need to rely on boundaries, and sometime have to build them in their mind. For people using the three other modes – *adoption*, *negotiation* and *best-of-the both* modes- frontiers do exist but are more fluid. They have to be understood as in a world perceived as dominated by fluidity and global flows (Appadurai 1996).

CONCLUSION

Our work supports the use of the post assimilationist model as a relevant frame to analyze consumer culture in a LAW. Morocco appears to be a relevant county to conduct such a study. The retail industry creates a new space opportunity for LAW consumers to negotiate with the global culture while offering more choice in the sphere of everyday life (Holt 2002). LAW consumers benefit from the retail industry; they use consumption practices to negotiate differences between cultures. However, the actual fluid context gives LAW consumers no other choice than a creative activity of *bricolage* (Bouchet 1995). LAW consumers "bricolent" their behaviors to achieve their goals. They adopt, reject, negotiate or enjoy the global culture and the Moroccan culture to navigate in their increasingly globalized world. As a result, regular border boundary crossing dissolve clear-cut boundaries between Moroccan and global culture.

This work suffers from several limitations. One of the most prevalent one is the lack of socioeconomic perspective. We decided to focus on urban middle class consumers, as they were more concerned than any other ones by the spreading of a global consumer culture. Any generalization to another context must be carefully considered.

Understanding Sub-Cultural Identity and Consumption Among Indians in the United States: From Desis to Coconuts

Minita Sanghvi, University of North Carolina Greensboro, USA
Nancy Hodges, University of North Carolina Greensboro, USA

ABSTRACT

Much has been written regarding the multifaceted, fragmented relationship between ethnicity, identity and consumption (Burton, 2009), especially since Belk's (1988) seminal piece on possessions and the extended self. Consumption among wide-ranging subcultural groups has been investigated, including fundamental Christians (O'Guinn & Belk, 1989), Harley Davidson aficionados (Schouten & Alexander, 1995), gays (Kates, 2002), Burning Man constituents (Kozinets, 2005), and many others. Consumption is a critical piece in the formation of subcultural identities and a site where common values and meanings related to brands and products are shared (Kates, 2002; Mehta & Belk, 1991). Belk (1988) suggests that shared consumption helps identify group membership and define group self. Specific brands are intrinsically related to subcultural identities and help create boundaries from the dominant culture that foster group identity. However, consumption in contemporary subcultural contexts is often fraught with countervailing and ever shifting meanings (Kates, 2002).

Kates (2002 p. 384) defines a subculture "as a way of life expressing shared meanings and practices different from or oppositional to dominant, mainstream culture." Members share a common goal, an area of interest or band together because they are in minority to a dominant culture. There are voluntary subcultures based on interest or brand consumption as well as subcultures based on race, ethnicity or sexuality where the members group together because of lack of power or discrimination issues. Race and ethnicity, as cultural conditions play a pivotal role in the consumption practice of various individuals, and especially immigrants (Sekhon, 2007; Venkatesh, 1995). Immigrants often choose to hold on to certain patterns of culture and identity that connect them to their culture of origin through consumption (Sekhon, 2007).

This study looks at the interplay of ethnicity, identity and consumption within the Indian sub-culture living in the United States. While there have been some studies about the consumption habits of the Indian diaspora within the British-Indian milieu (Lindridge, 2010; Lindridge & Dhillon, 2005; Lindridge & Hogg, 2006; Sekhon, 2007; Sekhon & Szmigin, 2011), as well some among the American-Indian diaspora (Bhatia, 2007; Mehta & Belk, 1991) there is often a propensity among researchers to lump ethnic minorities having common ancestry as an analogous group (Lindridge, 2010). However, the Indian diaspora is diverse, comprised of a multitude of languages, religions, and ethnicities, making it difficult to combine them into one homogenous group. Thus, Lindridge (2010) suggests that it is critical to uncover and understand the various subcultures within a diaspora who have their own unique consumption habits and rituals. Our study identifies and explains the continuum of identities within subcultures of the Indian diaspora, specifically from *Desis* to *Coconuts*. *Desi* is a neutral term used by Indians to refer to their compatriots in the Indian diaspora. On the other end is the *Coconut,* a derogatory term used to describe Indian immigrants who act contrary to the parent culture's norms and group expectations by aligning themselves to the dominant, white culture. That is, they are brown on the outside but white on the inside.

Consumption is a critical aspect within the Indian diaspora and members often use consumption to showcase the degree of acceptance or rejection of cultural norms within the community (Lindridge

& Hogg, 2006; Sekhon, 2007). Our study reveals how consumption patterns are the primary mode of identifying and delineating *desis* and *coconuts*.

LITERATURE REVIEW

In this section, we begin with a historical analysis of the Indian diaspora, after which we analyze intersections of culture, ethnicity and identity as related to consumer culture to build a foundation for delving specifically into identity and consumption within the subculture of the Indian community residing in United States.

Indians in the United States

While the first known records of Indians entering the United States date back to 1820 most researchers have concluded it was that the Immigration and Nationality act in 1965 that brought a wave of Indian immigrants to the United States (Bhatia, 2007; Jacoby & Bal, 2007; Mehta & Belk, 1991). These individuals were mostly doctors, engineers, scientists, university professors or graduate students (Bhatia, 2007).

The Indian population's higher education levels and elevated job profiles afforded them a successful start (Mehta & Belk, 1991) and they have continued to succeed ever since. Indians account for less than 1% of the total US population yet they constitute 3% of engineers and 8% of physicians and surgeons in the U.S. (Richwine, 2009). They are considered the model minority for their academic, economic and social success as compared to the Latino and African-American minorities (Bhatia, 2007). It is no surprise that Indians consider achievement and success to be an intrinsic part of their identity and culture (Bhatia, 2007).

Identity, ethnicity and culture

Identity is a complex phenomenon that involves several parts of self. Factors such as culture, ethnicity, race, religion, sexuality, and language contribute towards a sense of self. To support the various parts of self, people consume an assortment of brands and products that they utilize to piece together and showcase their identity (Ahuvia, 2002; Belk, 1988). These products and brands are consumed not just for their functional value but also because they are symbolic and communicate cultural meaning (McCracken, 1986). The products and brands may represent different and sometimes even countervailing parts of the person's identity (Belk, 1988; Thompson & Haytko, 1997). Thus people may associate (or disassociate) with certain products and brands based on the cultural meanings they want to associate with. Consequently elements that contribute to a sense of self such as culture and ethnicity factor into a consumer's product and brand choices.

Identity is not a fixed construct, rather it is dynamic in nature, evolving continuously to integrate new possibilities and forms with old traditions and creating a dialogical model that is often conflicted, contested and countervailing (Bhatia, 2007; Lindridge, Hogg & Shah, 2004). There are several elements, both inherent and acquired, that influence identity. Among them race and ethnicity are inherent and unchangeable. However, culture is not inherent, rather it is acquired, often from family or members of society that the individual is attached to or inclined toward (Wallendorf & Reilly, 1983). Culture is a product of history as well as present day practices and evolves

constantly to combat and inculcate various aspects of old and new traditions simultaneously. Culture represents a critical context for identity formation as well as identification, and provides a framework for social life and consumption (Lindridge, Hogg & Shah, 2004). An individual's identity is a part of the culture in which the individual chooses to exist. However, for an immigrant that often involves spanning at least two or more cultures comprising often disjointed and conflicting expectations within one identity. It is no surprise then that Belk (1988) suggests not just one product, rather an ensemble of consumption objects, represent the various, protean and countervailing aspects of the self.

An individual's identification with a specific culture is also identifiable by ethnicity, where an individual organizes themselves and others into specific groups by using ethnic labels (Lindridge & Dhillon, 2005). In other words, sometimes culture and ethnicities are interchangeable. For example, an individual may be white (ethnicity), but being southern comprises his or her culture. The dominant society assumes that because one belongs to a certain race or ethnicity; one must emulate the culture and traditions associated with it (Kibria, 2002). Belonging to a certain ethnicity automatically associates an individual with the culture of that particular ethnicity. That is, the values, religion, etiquette, language and customs inherent to that ethnicity (Lindridge, Hogg & Shah, 2004; Venkatesh, 1995). While ethnicity encompasses several identifiers such as race, religion, nationality, and language and is used to define the social identity of a person or group, it is not just a summation, rather a complex interplay of identifiers, especially within sub-ethnic groups (Lindridge, Hogg & Shah, 2004; Venkatesh, 1995). Cultures are constantly negotiating the past and the present, as well as contemporary versus traditional values and particularly within diasporic communities (Lindridge & Hogg, 2006). Individuals, families and communities as a whole are involved in this process as they evolve and adapt to their surroundings.

Indian identity

India is an amalgamation of various religions, languages, traditions and customs with Persian, Arabic, Tibetan, Portuguese, and English influences enmeshed over several centuries. India encompasses over 22 official languages and is home to several religions such as Hinduism, Islam, Buddhism and Sikhism. Thus, the Indian immigrant comes from a land that is as varied as it is vast, making it difficult to establish a single, homogenous Indian identity.

For the Indian immigrant, the question of identity is directly related to how the nation is remembered in the minds of individuals within a diasporic community (Bhatia, 2007). Thus, what it means to be an Indian depends on what the population deems Indian behavior or Indian culture. However, identities are shaped by personal memories and connotations that are not necessarily universal. Moreover, identities are often in a state of constant flux as cultures mix and move creating a myriad of experiences, some of which may be conflicting (Bhatia, 2007; Meamber & Venkatesh, 2001).

Bhatia (2007) writes, "the migrant community imagines and stitches together diverse notions of 'Indianness,' which are shaped by the members' class positions back home, nostalgia, memories, emotions, and longing for the original *desi* nation and culture of their homeland" (emphasis in original) (p. 14). Moreover, there is significant variation within the Indian sub-culture based on language, religion, ethnicity, etc., and this variation is rarely addressed in research. For example, a south Indian's perspective of what it means to be an Indian may be drastically different from that of someone from the north (Cardon, 2010).

Being Indian is not based on skin color alone, but by the way a person talks or behaves. Being Indian is measured by others via the norms within the culture. Thus, the community decides how "Indian" someone is and can pass judgment on that person's "Indianness" regardless of whether or not the individual agrees. The person who embraces the group ideal of Indianness is known as a *desi*, while for someone who deviates from the norm, the term *coconut* is often applied. Indian migrants have a complicated relationship with their ethnic identity. Although they are proud of their Indian culture and heritage, many shy away from displaying their Indianness in the United States for fear of negative effects on their social and professional lives (Bhatia, 2007). This largely stems from a feeling of inferiority about being brown skinned after nearly two hundred years of British rule, when race was employed as a cultural product used to dominate people in colonies like India (Singh, 2007).

After studying the relationships between the White and Black races in French colonies, Fanon (1967) theorized that the White colonizers consider themselves superior to people of color and that the people of color "want to prove to White men, at all costs, the richness of their thought, the equal value of their intellect" (Fanon, 1967 p. 10). Gaining approval from colonizers often lead to economic success and social standing, for which one had to give up their original culture and act white (Fanon, 1967). Acting white meant, among other things, talking English instead of the native language, adopting white customs and habits such as eating with a fork and knife versus eating with hands or with a spoon as is popular in India, and so forth. According to Fanon, this leads to an inferiority complex, wherein one internalizes these values while suffering from dislocation with one's native culture, and results in a feeling of separation from one's compatriots (Fanon, 1967). Fanon (1967) suggests the inferiority complex is particularly intense among the most educated who have to deal with the perceived 'betrayal' to their race, culture and identity on a day-to-day basis.

Although India gained independence in 1947, traces of internalization after approximately two hundred years of being colonized still exist. For example, many Indians still use creams such as *Fair and Lovely* to lighten their skin in an attempt to improve social standing and marriage prospects in the community. Indian immigrants who choose to leave their country for the ways of the west have a more agitated sense of identity. They adopt western customs in the workplace in order to succeed but resist assimilating by creating close-knit ties to the *desi* community in the USA whereby they try to keep the native culture alive (Bhatia, 2007). A certain resistance to western culture is thus expected from all Indian immigrants. An Indian immigrant who adapts to western culture too easily is seen as someone who has betrayed their race and can be ostracized within the *desi* community.

Thus, there are values about what an Indian migrant must "be like" to remain Indian enough in the eyes of the other Indians. *Coconuts*, or Indians who do not act Indian enough, are usually rejected by the broader Indian community. Consequently, some *coconuts* seek to align themselves with the dominant culture. By embracing white culture, they effectively distance themselves from the Indian sub-culture. However, their acceptance in the mainstream culture is not necessarily guaranteed, and as Lindridge and Dhillon (2005) point out, marginalization, or the rejection of the individual by the dominant culture as well as their own ethnic sub-culture, can lead to self-destructive behaviors such as substance abuse or isolation.

Consumption in the Indian community

Our possessions help create and communicate our identity and are often linked to our past as well as our present (Belk, 1988; Lin-

dridge & Dhillon, 2005; Mehta & Belk, 1991). Objects produce a shared sense of belonging to a specific time, place or culture. Shared consumption defines group membership (Belk, 1988), and aids in ethnic group formation, as well as creating and maintaining boundaries, especially in the context of social interactions with other groups (Lindridge, Hogg & Shah, 2004). Moreover, consumption can be used as a symbolic marker providing instant non-verbal identification with a certain ethnic group and a mode of creating a culturally derived self-identity (Lindridge & Dhillon, 2005).

Within the diaspora, the Indian ethnic sub-culture uses consumption as a means of negotiating the multiple identities that an individual must use to traverse the various cultures he or she encounters on a daily basis. The relative variability of consumption within the sub-culture reflects the degree to which the individual relies on the group for identification (Belk, 1988). Thus an individual can use consumption to assimilate into, as well as disassociate from, the dominant culture as well as their own ethnic sub-culture (Lindridge & Dhillon, 2005).

Since the Indian community strongly values achievement and success, members often seek external validation within society through conspicuous consumption. Consumption is therefore used proactively as a tool to indicate rank and position, a way to gain respect, approval and even offers of marriage (Sekhon, 2007). For this reason the literature suggests that conspicuous consumption is important within the Indian community (Lindridge & Dhillon, 2005; Lindridge & Hogg, 2006; Sekhon, 2007). A person's cultural worth or status can often be deciphered through brands of clothes, cars, and so on (Lindridge & Dhillon, 2005; Lindridge & Hogg, 2006). Status is showcased and maintained via material possessions and is considered a natural part of being Indian (Sekhon, 2007). The opposite is also true wherein strong disassociations with certain brands are equally important.

An ideal balance of identity is difficult to achieve, as it is a moving target, created by the members of the sub-culture based on locally defined expectations and norms. As such, Indians who stray too far out of that ideal sub-cultural norm are deemed *coconuts* (not Indian enough) while people who identify themselves firmly with the ethnic sub-culture are considered too *desi* (too Indian).

METHOD

The goal of this study is to identify and understand the subcultures within the Indian diaspora by delving into the experiences of members of the Indian-American community and investigating their consumption patterns vis-à-vis the dominant Indian sub-culture. We use the ethno-consumerist methodology espoused by Meamber and Venkatesh (2001) as a basis for our research design in order to ensure that the various voices in this study are interpreted within their own multi-cultured context. Meamber and Venkatesh (2001) argue that it is imperative that culture be studied not as a backdrop to consumer behavior but rather to position consumption as a culturally constituted activity. The ethno-consumerist framework relies on the following tenets: (a) behavior is grounded in culture; (b) cultural categories are dependent upon both historical and socio-cultural forces as well as current practices; and (c) culture is constantly changing and, therefore so are the categories of culture (Lindridge & Hogg, 2006 p. 985).

The research was undertaken in two concurrent stages. The first consisted of review and analysis of relevant concepts in the literature providing a foundation for the study purpose. The second consisted of primary data collection in the form of focus groups and interviews with ten first generation immigrant men and women from India. Participants represent Indian immigrants in diverse regions across US

and differing socio-economic backgrounds, including working professionals, housewives, and students. Participants were from both large and small towns, with some having lived in the United States for several decades and others coming relatively "fresh off the boat" (also known as "FOB"). In as much as participants immigrated after the economic liberalization of India, they come from a rapidly developing economy, therefore their experiences and viewpoints are probably divergent from the Indians who left the impoverished third world country that India was in the 1960s. Participants come from both northern and southern India. Participants were recruited via a purposive sample approach to ensure a holistic study of identity, culture and consumption as experienced among the Indian community living in the United States.

Interviews were semi-structured to ensure that the participant had enough latitude to express him or herself while remaining on topic (Lindridge & Hogg, 2006). This approach allowed us to capture the participant's own viewpoints, understand the cultural nuances in their own words and glean insights from their particular experiences (Lindridge & Hogg, 2006). Interviews lasted from 1-2 hours each and were audio recorded with their consent. Once focus groups and interviews were complete, each was transcribed verbatim and the transcripts were read and re-read to establish preliminary codes. The process of coding, categorizing, and iteration as outlined by Spiggle (1994) was followed.

The following interpretation provides a window into the Indian immigrant's worldview. Excerpts from the data help illustrate the major findings. Pseudonyms are used to protect participant identity. As consumption is a critical aspect within the Indian diaspora and because members often use consumption to showcase the degree of acceptance or rejection of cultural norms within the community, we use consumption as the primary mode of identifying and delineating *coconuts* and *desis*. A thematic interpretation of the data resulted in the identification of four themes, (a) *bridging the gap*, (b) *communal influence*, (c) *breaking away*, and (d) *evolution of the immigrant identity*.

FINDINGS AND INTERPRETATION

Before we analyze the consumption patterns of *desis* and *coconuts*, we need to first understand how pre-immigration contact with the United States through word-of-mouth, media, and tourism affects the immigrant's worldview (Peñaloza, 1994). Shortly after economic liberalization in 1991 many Indians saw brisk economic growth in India and an influx of western brands. As one participant, Manpreet, explains, "And then mid-90's to late 90's the American brands started popping up (in India). I think Bollywood cinema was also influenced by that. You would see film stars were wearing designer shoes and big brands." Moreover, this generation grew up around movies such as *Kuch Kuch Hota Hai* (1997) and *Mohabbatein* (2000) in which Bollywood film stars portraying cool college kids were sporting brands such as Gap, Nike and Ralph Lauren Polo. Brands such as Levis and Nike, which had set up shop in India, quickly became the cool brands. Brands such as Gap and Ralph Lauren Polo gained prestige and status since they could be acquired on trips abroad by the wealthy and ultimately became aspirational brands for the middle-class urban Indian who did not have access to them in India. Beyond a few specific brands, knowledge of brands and brand culture remained fairly limited in India by the late 1990's.

Bridging the gap

Coming from this mind-set, when Indian immigrants land in the United States, they often feel overwhelmed in the American consumerscape. Suddenly they are exposed to a plethora of brands that they have never heard of and many participants indicated feeling lost

when they first arrived. They found that brands that were popular in India were not popular here. As Sanjana explains,

> After coming here, we face sometimes an identity conflict. You know, like Levis was my [favorite] product in India. Levis, I would wear Levis jeans. I would go to the store, buy Levis. But when I came here [there were] all these different brands. Levis, nobody wears Levis. Levis was like OK here. So first, it took me a while to actually explore what brands do people wear, what is higher, what is lower. Still I'm learning, because still I don't fit into that…In India you know what is good, what is bad, you just know what brands [are cool], but here brands have different meaning. You just get lost sometimes.

Newly arrived immigrants will often seek out brands that help to bridge the gap between the two cultures. Similar to Peñaloza's (1994) experience with Mexican immigrants, Indian immigrants also use brands to maintain ties to their previous cultures even as they work on building a new identity in the United States. They do so in different ways based on brands or styles, as Priyanka says, "When an Indian consumer comes to US they try to fit in between US and India…You try to be little modern as well as you have to maintain a little conservative culture of India. So like instead of deep [cut] neck [line], you will buy sleeveless but make sure it's not very deep. You know you just try to maintain a balance."

Some bought brands that had name recognition within the Indian diaspora. Nikita suggests, "Indians…often lean towards brands that are also prestigious/ recognizable in India…like Nike over Puma, Gap over Eddie Bauer." Nandini furthers the point, "Brands which are visible to others, Indians love. Like a Harvard degree! Those [brands] which are not visible, I think, they are less interested in." Manpreet adds, "When you wear these [well-known] brands or shop in certain places, you know, you're making a statement to others too. I guess they are trying to say, 'Hey look, I have arrived or look at the hard work I did and where I am.' And I think it is…an ego boost"

Respondents also pointed out that Indians are apathetic to the social or environmental policies of the manufacturers and retailers in their fervent search for a good deal. As Nikita says, "Most Indians will not give a damn about the social policies of a store." Words such as frugal, price sensitive, looking for deals, and bargain hunting, all surfaced frequently. Eesha discloses that she buys name brands, but only if she can get them at a significant discounted rate. "I don't mind spending a little extra time…I would only shop at TJ Maxx or Marshalls. A lot of Indians won't say it." It is important to keep up the appearances of conspicuous consumption within the Indian community but is often done "on the sly" through outlets or off-price retailers. As Eesha explains, "It's a prestige issue. They want to talk about Neiman Marcus or Louis Vuitton but they don't want to talk about how they got a good deal. They want to pose superior financially for their peers, with everybody. It's in the culture." When asked to contrast Indian consumption behavior with that of mainstream American, price was a fairly common distinction.

Communal influence

Frequently, new immigrants are taken under the wing of large Indian groups and 'tutored' on the ways of American life, including what and how to consume. This process may start even before they arrive in the USA. Nikita points out that "most Indian students abroad usually enroll in these Indian community groups" which offer pick-up services for Indian students from airports and accommodations with Indian students or families for the first week or two. Participants talk about how Indians tend to stick together, travelling

together, socializing frequently and even making communal buying decisions. This trend is reflected in movies such as *The Namesake,* where the main character Nikhil tells his American girlfriend about his communal family vacations involving various Bengali (a subgroup based on language within the Hindu religion) families, riding together in mini-vans, stopping for eight course Indian lunches at rest stops. Similarly, the book of the same name discusses how the Bengali families often confer with each other before making any major purchases. Manpreet adds, "Within your little community… there are collaborative decisions made about what you would buy or where you would shop…if you go shop [elsewhere]…in some ways your loyalty in that community is threatened. So you would conform more towards that.*"* As Rohan puts it, you are not pressured to conform to the group, "Instead of peer pressure [to conform to the group], it is peer influence." However, not everyone saw this influence in a positive light. For example, Manpreet felt forced to act "more Indian" to fit in among the Indian diaspora.

> When I came to (a particular city in US), I started socializing with all the Indians there. When I would go to all these parties and… the [elder Indians] were…shocked at what kind of clothes I was wearing. To the point that they said I should not be wearing such clothes. I was aghast. When I was in India, my parents were not so conservative, and then I went to school in Bombay and I wore all kinds of clothes. I'm sure when I came they expected me to be an Indian from India and to be and eat and wear a certain way. And I was forced to be more Indian than I ever was.

Faced with such pressure to conform, many decide to break away and choose their own path, often aligning themselves to the dominant white culture and as a result are typically referred to as *coconuts*.

Breaking away

Coconuts are those individuals viewed as betraying Indian culture by the larger Indian subculture. That is, someone who eschews expectations of the collectivist culture of a tightly knit Indian community to venture out on their own within the American consumption landscape. Manpreet explains that being a *coconut* is not about acting white as much as it is about rejecting the Indian community.

> I think it is more to do with the fact that you're not conforming to what you are first. Or dismissing your true identity to identify in the white culture. I think that for somebody, say for an Indian, it would mean maybe you're not proud to be an Indian or you're ashamed to be an Indian. You're trying your best to disassociate yourself from it. So that's why you would be termed a *coconut* by your community.

Sanjana adds, "[*Coconuts*] think Indians are inferior." *Coconuts* are seen as individuals who reject their Indian identity and embrace all things western, often white, and more specifically, liberal white. Nandini referred to the website and book, *Stuff White People Like* (SWPL) in her description of *coconuts,* "Every single thing on SWPL – I am. Camping in the woods? Check. Attending art exhibits and blithely discussing artists? Check. We are such a cliché, heading off to the farmer's market every week with our canvas bags and with our baby strapped to us"

According to the participants, *coconuts* prefer to hang out with Americans versus Indians and thus have more American friends than Indian friends. They are more brand conscious and less price conscious as compared to the average Indian immigrant. Moreover, they

are more embedded in American politics and often make buying decisions not based on price, but on the social policies or reputation of a retailer of manufacturer. As Nikita explains,

> I think coconuts in general are more likely to care about politics, which translates into policies on a micro scale. I think coconuts don't view America as a "foreign country." There is some involvement even if it's passive in the countries policies/ issues. And by default it trickles into how companies behave politically. For example, as a personal issue I care deeply about gay rights and will not enter a store that discriminates against gay people but most Indians I know will not give a damn because it is not something that affects them personally.

Both Nandini and Nikita have embraced the term *coconut,* however Sharmila sees it as a derogatory term. She feels that she is different from other Indians in that she focuses on "being independent…valuing privacy…not seeking out other Indians" as well as breaking away from stereotypical molds and expectations of Indian women such as pre-marital sex or going to bars, all of which makes her stand out among other Indian females.

Obviously there are several reasons why someone is labeled a *coconut* and why *coconut* behavior is understood as a contradiction to the more expected *desi*-like behavior. Indeed, there is a marked difference in consumption habits of *desis* and *coconuts*. From sports to music, language to travel, participants enumerated several examples of typical *desi* consumption habits vis-à-vis *coconuts*. These differences are illustrated in Table 1.

Evolution of an Indian immigrant's identity

Those participants who self-identify as *coconuts* also see themselves as Indians. As Nandini explains, "I still feel profoundly Indian. Carrying the baby close, shopping at an open air market with my own bags is so very Indian, when I think about it." Similarly Sharmila argued that even though she considered herself outside of the Indian community, "I don't consider myself less Indian." Manpreet says her brother was called a *coconut* by fellow Indian graduate students for playing soccer, including taking off his shirt on the field and having American friends. However, she attests that none of this was unusual behavior for her brother. "I've seen him play back in India. He would take his shirt off all the time." In the same vein, she explained that her brother made American friends while his roommates stuck to their own core Indian group and that this stems from their unique upbringing:

> The fact (is) that my father was in the army and we changed schools every two-years, we had to make new friends, new teachers, so you had to learn to adapt pretty quickly. That just became a part of life. And the fact is when you've travelled across India and don't grow up in a certain region; your level of comfort with new people is just there. So it makes it easier to blend in.

Allegations of being a *coconut* in such instances are a means of passing judgment on someone who is deemed not Indian enough. Nandini, Nikita, Manpreet, all lived in large cities in India and grew up in fairly liberal households which enabled them to blend in with the American fabric more easily once they immigrated.

Table 1: Consumption habits of Desis and Coconuts

	Desis	Coconuts
General Characteristics	Inquisitive. Share a lot of personal information within the Indian social circle.	Value privacy and independence
Food	Mostly Indian food. Sometimes they will eat other cuisines	Will eat various cuisines, will sometimes eat Indian food
Restaurants	Prefer restaurant chains	Prefer local restaurants and diners
Music	Indian music or mainstream American such as Kanye West and Lady Gaga	Indie or lesser known bands
Movies	Bollywood, Tollywood and mainstream American movies	Prefer indie movies, foreign films, documentaries
Retailers	Costco, Wal-Mart, TJ Maxx	Target, Thrift Stores, etc.
Friends	Mostly Indian friends	Mostly American friends
Ties to the community	Join Indian associations, go to temple/ Gurdwara/ mosque regularly, socialize mostly with Indians	Does not join Indian association, may go to the temple/ Gurdwara, mosque sometimes or never, doesn't socialize with Indians
Sports	Play carrom, chess, cricket or badminton	Play tennis, soccer or other American sports
Shopping	Care mainly about price	Care mainly about fashion and style
Grocery Shopping	Prefer mainstream grocery stores	Prefer stores like Whole Foods, Trader Joe's and farmers markets
Travel	Prefer going to India. When traveling within USA will travel with other Indian families.	Prefer traveling by themselves or with American friends. Often engage in outdoor activities and adventures such as camping and hiking.
Language	Will talk mostly in the regional language at home.	Will talk almost exclusively in English.

The process of integrating or "becoming Americanized," as Gayatri puts it, is a slow process for most Indian immigrants. However, in the case of a *coconut*, because of their background, culture, upbringing or general willingness, this process may be fast-forwarded several years, thus making them not Indian enough in the eyes of the general Indian diaspora.

All participants felt that some identity issues were common among the immigrant population. Likewise, the tension between their Indian identity and their American identity was prevalent among all participants. Many of the participants said that when they were newly arrived, they felt their compatriot's accent or way of talking was a bit different, and that there was a marked difference between the newly immigrated Indian's accent and that of someone who had lived here for a long time. However, as years went by, the participants realized that they too had picked up the slight accent necessary to be better understood by Americans. Gayatri explains that being an Indian immigrant is a constant process where one changes little by little while adapting to American culture.

Discussion

Among the Indian immigrant community it is expected that each individual will go through the integration process. However, the *desi* community in the United States, in an attempt to seek control in a non-native land, sets up narrowly defined expectations as to how much and how quickly an Indian immigrant must integrate. Consequently, people on either extreme are frowned upon.

However, participants believe that some do a better job of integrating in the American culture than others depending on the region that they come from in India . For example, Sanjana, who is from North India contends, "I'm not being biased here, but I personally think that North Indians, they adapt. They look better, they adapt [more] easily than girls from South India." In contrast, Gayatri, who is from South India, argues, "It is not about the state, it is about the place that they come from…if you compare someone from a small village…possibly the girl might not be exposed to the city life." Nikhil, on the other hand, suggests that men do a better job of acculturating to the western way of dressing than women. Thus we see a North-South divide, a gender divide or even a rural versus urban lifestyle divide playing pivotal roles in immigrants' consumption habits.

Being too *desi* is a sign of failure. It implies that the person is incapable of adapting to American culture. However, being a *coconut* is also considered a negative as it implies that the person suffers from an inferiority complex, having internalized western values and chosen to disassociate from his or her *desi* identity. However, as is indicated by the participant responses, the person may not be acting contrary to their culture at all, especially if they grew up in a liberal environment and/or adapt easily to diverse cultures.

The participants indicated that the *desi* community prefers an in-between stage, defined by an acceptable degree of assimilation while retaining significant aspects of the native identity. This stage is a mix of being assimilated, yet still Indian enough, thus being "Properly Americanized." Due to the cornucopia of identities and the varying degrees of integration and/or assimilation that can be found in the diaspora at any given time, we have represented them in a continuum shown in Figure 1. A continuum that spans the two poles helps reflect the journey and the varying transformations immigrants go through when they are away from their homeland.

**Figure 1. From *desis* to *coconuts* –
the continuum of varying degrees of Indianness**

Each newly immigrated Indian can be placed on the continuum based on past experiences, travels, culture, upbringing, and so on. Each individual makes his or her own journey and stops where he or she feels most comfortable with their culture and identity. Those who are "properly Americanized" will have Indian as well as American friends and eat Indian as well as American food, but the longer they stay in the country, the more they gravitate toward *coconut* side of the Indianness continuum.

CONCLUSION

From *desis* to *coconuts*, immigrant identities are wrought with conflicting desires, and consumption choices often help people stitch together an identity that represents the self to themselves and others (Ahuvia, 2005). Today, a consumer with a fragmented identity or sense of self does not have to reconcile contradictions but can incorporate them using products to signify association (Ahuvia, 2005). Yet, by choosing different paths of consumption, individuals can align with or be alienated from their ethnic culture.

This paper uses Fanon's perspective on race discrimination and internalization to frame an understanding of the *coconut* subculture and overlay the politics of identity in the consumption context for this particular immigrant community. In the United States immigrants play a pivotal role in the creation of the national culture (Peñaloza, 1994), and while culture is a product of history (Burton, 2002) power structures between races are also a part of that history and serve to complicate matters of identity, especially within the diaspora. *Coconuts* are not just an Indian diasporic phenomenon; similar terms are also used within other ethnic sub-cultures. Insights from this study open the door for further research to understand how race relations, power structures and culture affect identity and consumption within various sub-cultures in a diaspora. The study adds value to the current body of consumption research by showcasing the intricate dynamics of consumption within a diaspora used to control, create and communicate identities and group identification. Moreover it posits that immigrant identities are in a state of constant flux, thereby making it impossible to fit them neatly into boxes. Instead these identities are better represented on a continuum.

I Don't Need an Agreement on My Inconsistent Consumption Preferences: Multiple Selves and Consumption in Japan

Satoko Suzuki, Kyoto University, Japan
Akutsu Satoshi, Hitotsubashi University, Japan

ABSTRACT

This paper explores multiple selves and their inconsistent consumption preferences among East-Asians. The findings from 28 depth-interviews in Japan illustrate that East-Asians, contrary to Westerners, experience less psychological tension facing their inconsistent consumption preferences. They therefore have less need to find an agreement among inconsistencies. Dialectical thinking theory is employed to understand cultural differences towards contradictions. East Asian cultures tend to more tolerate psychological contradiction, whereas Western cultures are less comfortable with contradiction. Our research also suggests the absence of consumers' need for a coherent identity narrative in Japan, whereas in Western cultures, particularly in North America, consumers seek to reconcile identity contradictions. From the childhood, Japanese learn to shift between multiple selves. This norm is called *kejime*, the ability to make distinctions. Hence, Japanese consumers are culturally accustomed to shifting among multiple selves than to pursuing a consistent global self-concept.

Today, it has become common to view consumers' selves as involving multiplicity (Gergen 1981; Markus and Wurf 1987). We now have a great deal of information and choices about who we want to be. Multiple selves often involve inconsistent views and affect consumer behavior. Hence, many consumer studies have examined multiple selves and consumption (e.g., Ahuvia 2005; Bahl and Milne 2010; Firat and Shultz 2001; Firat and Venkatesh 1995; Schenk and Holman 1980; Schouten 1991; Tian and Belk 2005).

Yet, little attention has been focused on the issue of whether the findings apply to consumers around the globe. Although consumers from different cultures may vary in their response to inconsistent consumption preferences, the majority of research has been conducted in the U.S. Indeed, recent studies in cultural psychology have identified that cultures differ in the tolerance towards contradiction (Peng and Nisbett 1999). More particularly, East Asian cultures tend to more tolerate psychological contradiction (Spencer-Rodgers, Williams, and Peng 2010), whereas Western cultures are less comfortable with contradiction (Festinger 1957; Lewin 1951). In this article, we explore the various implications of multiple selves and consumption among Japanese.

This article is organized as follows. In the first section, we review the existing literature on the multiple selves and consumption; then we discuss synthetic versus dialectical thinking. In the second section, we describe our methodology used in this study. In the third section, based on the data gathered from the Japanese participants, we argue that Japanese consumers experience no significant psychological tension facing own inconsistent consumption preferences. In the fourth section, we discuss our findings. Finally in the fifth section, we provide limitations in our study and suggestions for future directions.

CONCEPTUAL FOUNDATIONS

Multiple Selves and Consumption

In the literature discussing multiple selves and consumption, the term 'conflict' has been used frequently. For example, Bahl and Milne (2010) state in their study on the dialogical self that navigates through inconsistent consumption preferences that "dialog is used to manage *conflict*…to avoid *conflict*" (190, emphasis added). Ahuvia

(2005) also states in his study on the role of loved objects in the construction of a coherent identity narrative that "consumers attempt to reconcile identity *conflicts*" (181, emphasis added). The researchers seem to implicitly presume that consumers' inconsistent consumption preferences or inconsistencies among multiple selves are in conflict with each other.

Bahl and Milne (2010) define conflict using Janis (1959) and Emmons and King (1988). Janis (1959) defines conflict as "opposing tendencies within an individual, which *interfere with the formulation, acceptance, or execution of a decision*" (as cited in Bahl and Milne 2010, emphasis added). Emmons and King (1988) define it as "a situation in which one goal striving is *seen by an individual as interfering* with the achievement of other strivings in the individual's striving system" (as cited in Bahl and Milne 2010, emphasis added). Both definitions consider that in conflict, an individual regards the situation as interfering. Based on these two definitions, Bahl and Milne (2010) provide more nuanced understanding of conflict; however, they consider conflict as one *hindering* the other. Hence, there is an implied meaning of confrontation among consumers' inconsistent consumption preferences or inconsistencies among multiple selves.

However, the term 'inconsistent' does not necessary imply confrontations. According to the *Merriam-Webster Online Dictionary*, inconsistent is defined as "lacking consistency: as a) not compatible with another fact or claim; b) containing incompatible elements; c) incoherent or illogical in thought or actions: changeable; d) not satisfiable by the same set of values for the unknowns." We feel that the view towards inconsistency as conflicting may be culturally limited. This will be further explained in the next section.

Another common trait identified in the existing literature on multiple selves and consumption is that consumers usually seek to reconcile differences and achieve coherence in their identity. Although Firat and Venkatesh (1995) see the postmodern consumers as possessing multiple selves with no need to reconcile identity contradictions, researchers have not found many examples of consumers abandoning the desire for a coherent identity narrative. Thompson and Hirschman (1995) deny Firat and Venkatesh's claim as an "optimistic theoretical construction" (151). Thompson and Haytko (1997) and Murray (2002) find that young adults experience a tension in their sense of identity as they strive to be both unique individuals and part of a group, and they use fashion to resolve this tension. The plurality of fashion discourses allows diverse interpretive positions, enabling consumers to find meaning by contrasting opposing values and beliefs. These "countervailing meanings" are used by consumers to moderate tensions arising from their efforts to develop a sense of individual agency (i.e., distinction) and perceptions of social prescription (i.e., social integration). The study by Ahuvia (2005) also shows that consumers attempt to reconcile identity conflicts using three strategies labeled "demarcating," "compromising," and "synthesizing" solutions. However, this need for coherence in self-identity may also be culturally specific.

In extending multiple selves and consumption theory beyond the Western cultural realm, we question the view of consumers' navigation of inconsistent consumption preferences as management or avoidance of identity conflicts. We also question the view of consumers as having the desire for the coherent identity narrative. Cultural differences in the tolerance towards contradictions will be discussed next.

Synthetic versus Dialectical Thinking

Culturally shared folk epistemologies influence people's reasoning about contradiction and their tolerance for ambiguity (Peng and Nisbett 1999). Western psychology has largely assumed that individuals are uncomfortable with incongruity and that they possess a basic need to synthesize contradictory information (Festinger 1957; Lewin 1951; Thompson, Zanna, and Griffin 1995). Western cultures tend to be more linear or synthetic in their cognitive orientation. They consider both sides of an opposing argument and then they search for synthesis and the resolution of incongruity (Lewin 1951; Peng and Nisbett 1999). Western folk epistemologies are rooted in Aristotelian traditions, which emphasize three basic principles (Peng and Nisbett 1999): the law of identity (if A is true, then A is always true), the law of noncontradiction (A cannot equal not A), and the law of the excluded middle (all propositions must be either true or false). As a result, Westerners are generally less comfortable with contradiction, and attitudinal ambivalence is associated with psychological tension and conflict (Festinger, 1957; Lewin, 1951).

On the other hand, East Asian epistemologies tend to tolerate psychological contradiction. East Asian cultures tend to be more dialectic in their cognitive orientation. Recognizing and accepting the duality in all things is regarded as normative in East Asian cultures. Two central features of dialectical ways of knowing are moderation and balance: good is counterbalanced by evil, happiness is offset by sadness, and self-criticism is tempered by sympathy for the self (Kitayama and Markus 1999; Peng and Nisbett 1999). Dialectical thinking is rooted in East Asian philosophical and religious traditions, and is based on three primary tenets: the principle of contradiction (two opposing propositions may both be true), the principle of change (the universe is in flux and is constantly changing), and the principle of holism (all things in the universe are interrelated). Dialecticism also discourages the adoption of extreme positions. A principal consequence of dialectical thinking is that East Asians more comfortably accept psychological contradiction (Spencer-Rodgers et al. 2009).

Consequently, the Western and East Asian views of contradiction are fundamentally different (Peng and Nisbett 1999). Hence, we argue that consumer attitude towards inconsistent consumption preferences and the consumers' desire for the coherent identity narrative may differ between the West and East Asia.

METHODOLOGY

This study employed a phenomenological interviewing (Thompson, Locander, and Pollio 1989). Because the concept of self is complex, the study required a research method with the ability to delve into the thoughts, feelings, and behaviors of informants and to capture the social and situational contexts of those phenomena (Schouten 1991). The study was conducted in Japan, one of Asia's leading countries. Since the Japanese consumer market is mature as the one in Western counterparts such as the U.S, the selection of Japan allows us to control confounding. In-depth interviews with 28 Japanese informants (14 females and 14 males) were conducted. Our sample was composed of various age groups, from twenties to fifties. The informants were recruited using the research agency. They were given 10,000 yen (about $100) for their participation. The interviews lasted three hours and were audiotaped. The data collection process took place between April 27 and May 13, 2009. All interviews were conducted in the local language (Japanese).

To obtain a first-person description of consumers' experience, the goal of the phenomenological interview, the interview was intended to yield a conversation with the informants. During the interview, a concerted effort was made to allow informants freely describe their experiences in detail. Respondents were assured of anonymity (names are all pseudonyms). The questions and probes were aimed at bringing about descriptions of experiences and were not intended to confirm theoretical hypotheses. Such attempts were important to capture the true feelings of informants because Japanese people have a tendency to value social harmony and not to reveal their true inner feelings. In fact, one of the informants commented that "I'm talking a lot today. I can't talk about it [the topic] normally."

The luxury consumption was chosen as the specified domain of experience for this study. Luxury is nonessential that is closely associated with indulgence and hedonics (Kivetz and Simonson 2002). Consumers often show ambivalent attitudes towards luxury (Dubois and Laurent 1994). Furthermore, it is often associated with consumers' self-concepts (Vigneron and Johnson 1999). Hence, we assumed that the luxury consumption would be a good context to study consumers' multiple selves and consumption.

We used a hermeneutic process to analyze the text, first completing an emic analysis for each informant with regard to his/her multiple selves and luxury consumption experiences and then moving to an etic analysis by comparing our findings across the informants (Bahl and Milne 2010; Thompson, Locander, and Pollio 1989). Findings were interpreted using an iterative process of going back and forth between our findings and those in the literature. Concepts from the literature were compared and contrasted with our findings to arrive at new insights.

CREATING A NARRATIVE: MULTIPLE SELVES AND CONSUMPTION IN JAPAN

Excerpts from an Interview with Erika: Worker-Self versus Private-Self

Erika is 24 years old OL (office lady) who lives with her parents and siblings. Now working at a bank, she has two selves – one as a banker (worker-self) and another as a private. As a banker, she invests in fashion to look professional. She comments about wearing a manicure:

Interviewer (*I*): Why do you think it's important to take care of your fingers?

Erika (*E*): Well… I wonder… My mother doesn't wear the manicure. So… My mother thinks I don't need to wear it. But… when I started to work, I felt that those who can take care even of their fingers appear to do well in their work. So, well… I began to wear the manicure.

Erika wears the manicure because she thinks that women wearing it portray the successful women. In her view, those who can pay careful attention to the details (as represented in wearing manicures on fingers) do well in the work. She also thinks it is important to look nice at work. Hence, she spends money on fashion including the manicure.

On a contrary, as a private-self, Erika has no interest in investing in fashion. She feels that fashion is a waste of money. She speaks with confidence that she will never spend money on a house dress.

E: I never experienced this [buying an expensive house dress], so I'm not sure, but I think this dress really addresses only me and not others. It's like I want to look nice even if there's no one around.

I: Do you think you'll purchase one in the future?

E: Well, I really doubt it. Even if I became to wear something nicer, I don't think I'll spend money on this [house dress].

I: Why is that?

E: Why? Well, let's see… I can't think of spending money on something that I'm not going to wear outside.

As the private-self, Erika has no concern to look nice. This is perhaps because her family admires the spirit of simplicity and frugality.

Although Erika has seemingly inconsistent preferences towards the fashion consumption, she seems to have no need to reconcile them. During the three hours interview, she told numerous episodes about her fashion consumption such as the manicure, lash extensions, depilation, and luxury brand wallet, but also told about her thoughts on fashion how it is not a necessity in life. At one side, she feels spending money on fashion is important and fun, whereas on the other side, she feels fashion is unnecessary and should be avoided. She has mixed emotions towards the fashion consumption. Although her fashion consumption preferences are inconsistent, she accepts them without any psychological tension. It seems that she simply makes distinction between outside (*soto*) and home (*uchi*). She says that "I can't think of spending money on something that I'm not going to wear outside," which indicates that she would spend money for public but not for private.

Excerpts from an Interview with Keiko: Duality of Japanese Self (*Omote* and *Ura* Dimensions)

Keiko is 23 years old OL working in the financial industry. She has just graduated from a highly reputables university in Japan. Like Erika, she now has the worker-self and private-self. In addition, she also has the friend-self which surfaces when she is with her former classmates.

Keiko also has two dimensions of self, *omote* (public-self that she shows to others) and *ura* (private, inner-self that she does not show to others). With *omote*-self, she adjusts consumption preference to fit with her friends. Such consumption preference is seemingly inconsistent with the one of her *ura*-self. To give an example, Keiko talks about drinking Dom Pérignon Rosé at the party with her friends:

Keiko (*K*): I don't like a carbonated drink, so I don't like champagne. I don't want to drink, but [others want to order. They say] 'let's order because it's expensive,' or 'we're going to order *pin-don* (abbreviated word for pink Dom Pérignon) today.' […] [People consider that *pin-don* is] a must-have item for the party. Speaking the truth, I don't understand its price […] I prefer *shochu* (Japanese spirits) or sake. […]

Interviewer (*I*): How do you feel when you're drinking *pin-don*?

K: […] it's not tasty at all. It's carbonated. I don't want it. […]

I: Why do you drink it if it's not tasty?

K: Well, I don't [want to] order it but others want to.

Keiko shows her *omote*-self to her friends and hides her *ura*-self. With the *omote*-self, she hides her real drinking preference and adjusts it to her friends. Although she does not like champagne, she orders it because her friends want it. She does not mention her dislike of champagne nor order the other preferred drink such as *shochu* or sake.

Keiko's two-tiered self is also apparent in her opinion towards possessions such as the luxury brand handbag and watch. She has the Chanel handbag and Piaget watch to which her *omote* and *ura* selves have different opinions.

K: To tell the truth, I'm not materialistic. For a watch, if I can tell the time, it's enough. In reality, I'm such person. Still, [I feel good] when people tell me 'Wow, you're wearing that watch [Piaget watch]! How nice!' It's really Japanese-like. So, I think it's better to have one. It's like wearing armor. […] It's same for a handbag. Really, I want to walk around empty-handed. If I have my cigarettes, wallet, and mobile phone, I'm fine. I want to put them in my pockets. But I'm a female [so I should carry around some kind of bag]. I can't be walking around with the supermarket's shopping bag. If I have the handbag of this sort [Chanel handbag], people tell me 'That's nice.' And I learnt. So I think it's better to have one. That's why I want it.

Keiko's *ura*-self has no interest towards the luxury brand goods; however, her *omote*-self needs them. She feels a need in order to fit in with society and survive (as reflected in her use of the armor metaphor).

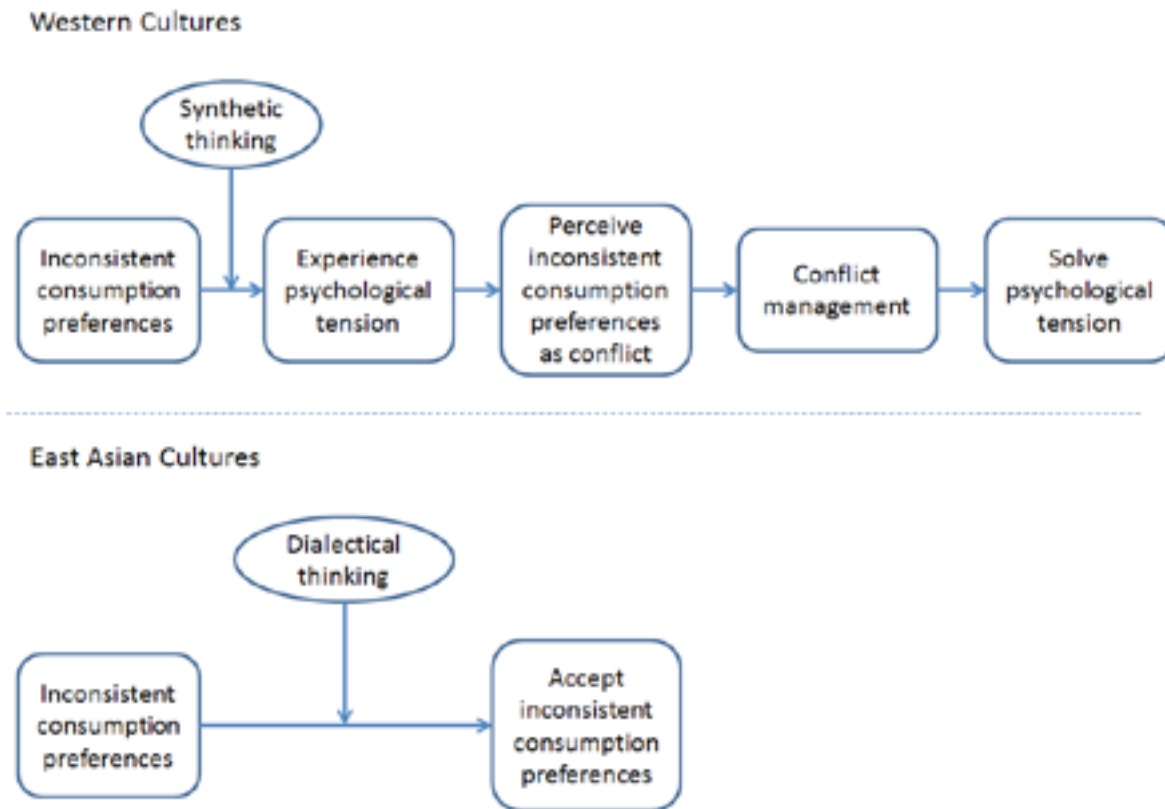
Like Erika, Keiko does not seem to feel psychological tension from these seemingly inconsistent opinions between her *omote* and *ura* selves. Rather, she accepts *omote* and *ura* as the characteristics of Japanese society. Comparing Japan and New York (from her experience of visiting NY), she recognizes that *omote* and *ura* do not exist at NY. She comments that people are more plain and natural at NY. Still, she does not have negative feelings towards Japan. When the interviewer asked Keiko where she prefers to live, she chose Japan without hesitation.

DISCUSSION

Western versus East Asian View towards Inconsistent Consumption Preferences

Erika and Keiko, like other informants, have multiple selves and inconsistent preferences towards consumption, but they don't seem to be uncomfortable with contradictions or attitudinal ambivalence. Is this uniquely Japanese? Westerners, like Japanese, also have multiple selves and are able to adjust to different social relationships and situations. The difference may be of the tolerance for holding apparently contradictory beliefs. Japanese, unlike Westerners, tend to tolerate psychological contradictions (Peng and Nisbett 1999). Whereas Westerners are uncomfortable with inconsistencies and perceive them as conflict (Ahuvia 2005; Bahl and Milne 2010), Japanese accept them without feeling much psychological tension. The model in figure 1 explains the differences between East Asia such as Japan and West on consumers' approach towards inconsistent consumption preferences.

We argue that the dialectical thinking allows East Asians to accept inconsistent consumption preferences without much psychological tension. Our informants show the tendency towards dialectical thinking. One of the characteristics of dialectical thinking is the acceptance of contradiction. For example, majority of participants speak about their contradicting view towards luxury consumption.

FIGURE 1
CULTURAL DIFFERENCES IN CONSUMER APPROACH TOWARDS INCONSISTENT CONSUMPTION PREFERENCES


On the one hand, they feel that luxury consumption is unnecessary. However, on the other hand, they consume luxury to fulfill their desire. They recognize that there is a contradiction; however, they simply accept it. Consider how Koji (male, age 44) speaks on this issue.

Koji: Under original Buddhism […], recognition itself brings perplexity. For example, we look at water; then we think is it tasty or not tasty. […] From the sense, all fantasies emerge. Well…when you come to think of it, various things including desire are evoked. So I deny it. […] I don't think about the unnecessary things, such as what I need to do tomorrow or about a beautiful lady. In a nutshell, I don't think about those noises; rather, I feel that just being there is of greatest happiness. Honestly speaking, I think such way of thinking is best for human beings. Then, there would be no perplexity. […] But having said that, I'm a vulgar person who lives in a secular world. So, I enjoy eating nice foods and talking with beautiful ladies. I was happy when I bought good things.

Koji speaks about how his beliefs and actions towards consumption are contradicting. He does not seem to be irritated by his contradictory thoughts, however. The tone of his voice remains calm. His comment 'I'm a vulgar person' suggests that he considers a vulgar person to be contradictory. Indeed, East Asians do possess more contradictory self-beliefs, attitudes, and values (Campbell et al. 1996; Choi and Choi 2002; Spencer-Rodgers et al. 2009; Wong, Rindfleisch, and Burroughs 2003), compared with Westerners.

Dialectical thinking is also characterized by the acceptance of changes. Consider how some of the informants have shown such changes in attitude and behavior. Ichiro (male, age 52) shows attitudinal change towards brands. He says that "I don't like brands. I

have a perverse opinion towards brands." Hence, when purchasing the condominium, he didn't choose the famous developer. Still, he now has a desire for Ferrari. He says that Ferrari is "an ideal. It's my aspiration." He admits that Ferrari's premium price includes the cost for its brand name; however, he still desires it. Shizue (female, age 36), like Erika and Keiko, show behavioral changes depending on the situation. Her behavior with friends is quite different from her behavior in private. Since marrying to the owner of game software company, she has friends who come from the rich background. However, she spent her childhood in poverty. Hence, when she is in the gorgeous places, she feels ashamed. She thus pays a careful attention and makes an extra effort when she is with her current friends. For example, when she goes to the restaurant with her friends, she matches her clothing and accessories to them. She says,

Shizue (*S*): I don't want to be rude to my friends when eating at a restaurant. My friends have very nice fashion goods, so when we go to the restaurant, I feel that I cannot take the 3,980 yen handbag.

Shizue feels that taking 3,980 yen handbag is improper when meeting her rich friends. So, she brings an expensive Hermès handbag. On the other hand, when she goes to casual, cheap restaurants such as fast food restaurants, most often alone, she feels that the Hermès handbag is improper. Depending on the situation, she drastically changes her behavior (i.e., dressing in this case) without any hesitation.

Multiplicity of Self for Japanese

We also argue that multiplicity of self for Japanese is culturally embedded; therefore, the Japanese consumers have less need

for the coherent identity narrative compared with Westerners. Anthropologists studying Japan have claimed that Japanese selves are multiple and changing (Rosenberger 1992). They demonstrate that the Japanese nurture multiple selves to reconcile what Westerners have viewed as oppositions in Japanese life such as public versus private life. The Japanese are multifaceted people who are subject to the influences that surround them, but shape selves creatively around a broad spectrum of social relationships and situations. They define and redefine themselves in relation to the social relationship. In addition to this shifting relational self, the Japanese also conceives the multiplicity of self in various dimensions such as in relation to objects, aspects of nature, and historical ideologies (Rosenberger 1992).

In the Japanese life, a series of antonyms, which include *soto* versus *uchi*, *omote* (in front; surface appearance) versus *ura* (in-back, what is hidden from others), and *tatemae* (the surface reality) versus *honne* (inner feelings), appears in every sphere (Bachnik 1992). The meanings of these sets of terms are related; aspects of public / social cluster at one pole (*soto*, *omote*, *tatemae*), while aspects of private / self cluster at one pole (*uchi*, *ura*, *honne*) (Doi 1986).

Japanese shift between two poles, adjusting their self to fit in a given social relationship and situation. From the childhood, Japanese learn to shift between two poles (Tobin 1992). Japanese select certain behavior, including choice, in consistency with social relationship and situation (Bachnik 1992). This is called *kejime*, the ability to make distinctions (Hendry 1986). *Kejime* indexes what kind of behavior or personality characteristic is appropriate; or how little emotion and self-expression is appropriate in a given situation (Bachnik 1992). Our informants also seem to be aware of *kejime*. For example, Keiko is very considerate of a social context. Consider the following comment that she speaks about living in a society:

> *K*: After all, I'm not living alone. To live in a society, it's not okay that only I'm satisfied. For example, when walking in the city, I'm comfortable wearing sweatshirts and sneakers with my hairs loose. This may be okay to me, but [there are other people in the city and it may not be okay for them]. I need to worry about what others think of me and I can't live alone. At work, it's impolite if I'm not wearing a make-up.

Hence, Keiko accepts *omote* and *ura* dimensions of self, and shifts between the two according to the situations. Similarly, other informants also shift between social contexts of work and private, between the social group and the family, among friends, children, husbands or wives, and in-laws; among boss and staff; between the outer dimensions of self and inner self. Japanese consumers shift among multiple selves, instead of attempting to reconcile multiple selves and to construct a coherent identity narrative.

CONCLUSIONS

This study emphasizes the importance of redefining our understanding of multiple selves and consumption through data gathered in Japan. We argue that consumer approach towards inconsistent consumption preferences and the consumers' desire for the coherent identity narrative may differ between West and East Asia such as Japan. Our findings suggest that Japanese consumers experience less psychological tension facing their seemingly inconsistent consumption preferences. They therefore are accepting inconsistencies and have a less need for solving them. We also argue that the difference in consumer approach towards inconsistent consumption preferences may be due to the difference in tolerance toward contradictions. East Asians (including Japanese) have dialectical thinking and are more tolerant toward contradictions, whereas Westerners have synthetic

thinking and are less tolerant toward contradictions (Peng and Nisbett 1999). Findings also suggest the absence of consumers' need for a coherent identity narrative in Japan. We argue that shift among multiple selves are culturally embedded in Japan as reflected in the paired antonyms such as *soto* versus *uchi*, *omote* versus *ura*, and *tatemae* versus *honne*.

Our findings suggest the absence of consumers' need for a coherent identity narrative in Japan. While consistency of the self-concept across different social relationships and situations may be less important in Japan than West, Japanese consumers may still have a need to maintain consistency within a specific social relationship and situation (English and Chen 2011). For example, Erika may seek consistency in her worker-self over time; and Keiko in her *omote*-self over time. As such, as English and Chen (2011) claim, pursuit of a consistent self-concept may be important in East Asian cultures such as Japanese as in Western cultures. However, we suspect that in the degree of consumers' consciousness about consistency may be much smaller in this case than in the case of maintaining consistency in self-image across different social relationships and situations. The reason is that while global self-concept is created and actively managed by the individual, social self (i.e., socially appropriate person image) is defined by the community like a cultural norm and shared by its members. Therefore, Western consumers who pursue the consistency in the global self-concept are more apt to be conscious about consistency as they define the attributes themselves. In contrast, East Asian consumers who pursue the consistency in the social self may be less conscious about consistency as they may be simply following cultural norms defined by the community.

In any case, none of our informants seem conscious about inconsistency across different social relationships and situations; therefore feeling no significant psychological tension facing own inconsistent consumption preferences. Future research could explore conceptual distinctions between different types of self-concept consistency and consumers' consciousness about consistency.

Furthermore, there are still some unanswered questions on East Asians' tolerance toward contradictions. For example, do East Asians have tolerance toward inconsistencies even within a specific social self and/or inner self? It could be argued that inconsistency of the self-concept across different social relationships and situations among East Asians can also be explained by the interdependent self-construal theory (Markus and Kitayama 1991) besides dialectical thinking. Since the principal goal of the interdependent self-construal is to maintain connectedness and harmony with others, it may be natural for the individuals with interdependent self-construal to change their attitudes across different social relationships. Thus, by examining the tolerance towards inconsistencies within a specific social relationship yet across varying situations (e.g., with a professor in classroom vs. in cafeteria) or within a varying situations not involving social relationships (i.e., inner-self) (e.g., consistency in brand preference of a yogurt at home or at office), it would be possible to disentangle the effects of dialectical thinking from that of interdependent self-construal. These questions require further exploration and examination.

Immersion in a New Commercial Virtual Environment:
The Role of the Avatar in the Appropriation Process

Ingrid Poncin, SKEMA - Univ Lille Nord de France, France
Marion Garnier, SKEMA - Univ Lille Nord de France, France

ABSTRACT

Building on the work by Carù and Cova (2003, 2006), we observe Internet users in front of a new virtual environment: a 3D commercial mall. A longitudinal study (4 visits on a 2-months period) allows studying the process that leads to the experience of immersion. Although individual differences are observed, the analysis of logbooks allow us to observe the realization of the three steps of the appropriation model (nesting, investigating and stamping) that lead to the experience of immersion. Our results also highlight the central role played by the avatar in the appropriation of that new commercial space.

INTRODUCTION

Since the seminal work of Hirshman and Holbrook (1982), consumer experience has been given great attention in literature. The postmodern approach considers that the consumer now looks for varied and if possible extraordinary experiences (Firat, 2001). The notion of experience has then become a key element in consumer behavior understanding (Carù and Cova, 2006). More specifically regarding online consumption, immersion (or flow as the ultimate immersion) is seen as fundamental outcome and stake for online consumption experiences (Hoffman and Novak, 1996; Tisseron, 2008). Developing enriching and immersive virtual experience is now a main issue for online marketers, be it on traditional 2D websites or in 3D life simulation, games or commercial virtual universes. Though being widely studied as a consequential state, immersion can also be presented as a process (Carù and Cova, 2003, 2006): these authors make the difference clear between the process of immersion and its result by proposing an appropriation operations model. Carù and Cova (2003) explored a specific context (artistic experience) and despite extended research on flow following Hoffman and Novak (1996)'s founding works, no research has studied this process of immersion in a virtual experience context from a longitudinal perspective yet.

Though, getting immerged on the Internet is not always easy, as for real. Among the various tools that may help creating an enriching and immersive experience online, the avatar has been identified as a key for immersion (Biocca, 1997; Taylor, 2002; Tisseron, 2009), as it reintroduces the body in a so-said "disembodied" experience (Vicdan and Ulusoy, 2008) and allows consumers to play an active role in the experience (Peng, 2008; Yee and Bailenson, 2009) that is favorable to immersion (Carù and Cova, 2003, 2006).

The first objective of this research is then to observe and analyze the process that leads to an immersion experience in a new virtual environment (a 3D shopping mall, see Appendix for illustrations). Moreover, our second aim is to assess the role the avatar can play in the appropriation operations process leading to immersion.

The conceptual framework first deepens the notion of experience and immersion on the web and presents the appropriation operations theory (Carù and Cova, 2003). The role the avatar might take in this experience and immersion process is then discussed. A longitudinal study, associating qualitative and quantitative data, allows analyzing and empirically validating the process that leads to immersion on the 3D shopping mall and the influence of the avatar. Results are presented and discussed and the paper concludes on contributions of the research and its perspectives.

CONCEPTUAL FRAMEWORK

Since Hoffman and Novak (1996)'s founding works, the experiential approach has be adopted by a great numbers of researchers to study what is lived by Internet users while visiting a website. Even if the Internet obviously offers wide utilitarian opportunities and value, some authors stated that the more immersive, hedonic aspects of Internet could play at least an equal role in predicting online attitudes and behaviours (Childers, Carr and Peck, 2001; Mathwick, Malhotra and Rigdon, 2001). Moreover, improving the experiential value of shopping on the Internet should lead to a better conversion rate, more satisfaction, stickiness and loyalty (Childers et al., 2001; Mathwick et al., 2001).

Pioneers in this area associated three main characteristics to the virtual experience: immersion, interactivity and possibility of real relationships (Tisseron, 2008). Regarding more specifically immersion, it is stated that as physical stores, commercial websites might induce emotional and affective reactions of Internet users, provoking immersion (Charfi and Volle, 2010).

The Immersion Process: The Appropriation Steps Theory

Immersion in computer-mediated environment is defined as "*the extent to which the computer displays are capable of delivering an illusion of reality to the senses of the human participant*" (Slater and Wilbur, 1997). On a broader scope, immersion appears in any case in which an individual is plunged, involved or absorbed in a totally different world (Fornerino, Helme-Guizon and Gotteland, 2006). This immersion - that can be partial or total, durable or temporary, wanted or undergone – or "feeling of" immersion of an individual in a physical or virtual universe consists in entering the universe and absorb/be absorbed by its atmosphere.

Nevertheless marketing literature, and especially in this experiential marketing area, is ambiguous toward the concept of immersion. Indeed, immersion is presented by some researchers as a process to reach the immersion experience (Ladwein, 2003; Carù and Cova, 2003, 2006) while for others, it is the final state itself, of being immerged in the environment or the experience (Sherry, 1998; Pine and Gilmore, 1998, 1999). This state of immersion is often related to the state of flow (Hoffman and Novak, 1996). Indeed, in computer-mediated environments, immersion is often considered through or seen as an antecedent of flow (Hoffman and Novak, 1996; Csikszentmihalyi, 1990; Novak, Hoffman and Yung, 2000). Flow is defined as "*the state occurring during network navigation which is characterized by a seamless sequence of responses facilitated by machine interactivity, intrinsically enjoyable, accompanied by a loss of self-consciousness and self-reinforcing*" (Novak et al. 2000). If immersion and flow share concentration and focus on the consumption object, flow also implies a high control of actions, due to a confrontation between high stakes and high skills (Fornerino et al., 2006) while this is not a basic condition for immersion to develop. Moreover, flow is a state and not a process.

On one hand, the idea of state of immersion relates to an immediate dive, abruptly going from a non-immerged state to an immerged final and ideal state (Firat, 2001; Goulding, Shankar and Elliot, 2002). On the other hand, the immersion process relates to and takes into account a series of steps that lead to the immersion experience. Carù et Cova (2003, 2006)'s works clearly separates the pro-

cess of immersion from its results by proposing an appropriation operations model, composed of three operations: nesting, investigating and stamping. Understanding means and methods by which the consumer accesses the experience is essential, as this access is neither evident nor systematic (Ladwein, 2002). For Ladwein (2003), there will then be immersion when the distance between the experience and the consumer is reduced by those appropriation operations. Appropriation can be defined as "*a fundamental psychological process of action and intervention on a space to transform and personalize it; this influence system on places entails all forms and interventions on the space that translate into possession and attachment relationships*" (Fischer, 1992, p.91).

According to Carù and Cova (2003) on the basis of Fischer (1983)'s work, the first step, Nesting, is characterized by the set of perceptions and sensations felt by the consumer, on the basis of which the consumer is going to look for rooting points, so to "*feel at home*". The individual isolates a part of the experience he's facing and sets into that part he's already familiar with. This step allows the individual to develop control on and stability within the experience, that are necessary for a forthcoming unwinding.

The second step, Investigating, is linked to observation of events and to the positive or negative evaluation of the experience. The individual will then develop his knowledge of the context he's facing and progressively extend his territory, by beginning to mark rooting and control points. According to that, the consumer will feel a more or less important distance toward the environment.

Finally, the third step, Stamping, is an imaginative activity characterized by the elaboration of impressions relative to the situation, the context and the attribution of a sense to that same situation. This sense will be specific according to the individual's own references and experiences.

The immersion will then be a "*strong moment that is felt by the consumer, and that results from a partial or complete appropriation process*" (Carù and Cova, 2003, p.80). Two important aspects should be given attention. First, the immersion is not necessarily total (unlike what is implied by the idea of an ideal final state): it can be partial and there can be ups and downs. Second, there can be a plurality of appropriation sequences within a single experience, like cyclic round-trips between the different operations, and sequences might not follow the presented hierarchy because of short-circuits between the operations.

Generating Immersion Online?

Experiential components of websites are then essential to reach the immersion experience and improving the virtual experience has become a major issue for e-marketers managing websites. Rich media technologies and web 2.0 concepts have considerably broadened the extent to which websites can be used in an experiential and entertaining way (Helme-Guizon, 2001; Jeandrain and Limbourg, 2002) and possibly generate immersion by going beyond the flat "inhuman" screen and display of traditional websites. Those techniques, such as high quality sound, video/audio streaming or 3D can lead to a decrease in the perception of the computer mediation. Jeandrain and Diesbach (2008) noticed that those technologies all follow the same pattern: reaching media transparency and generating immersion and so called feeling of (tele)presence (Steuer, 1992; Lombard and Ditton, 1997). As a matter of fact, virtual universes perfectly fit what consumers may look for to live extraordinary experiences, as Goulding et al. (2002, p.281) state that "*those immersions in hyperreal but reassuring settings contrast with everyday stress*". Such universes then provide the thematized, enclosed and reassuring setting (Goulding et al., 2002) that is necessary to favour immersion

experience. Nevertheless, creating immersion is not that easy, even more in a virtual environment. Among the various possibilities, two solutions caught our attention.

First, 3D technology, by creating a hyperreal setting (Baudrillard, 1981), should be appropriate to generate immersion of online consumers. Indeed it provides an enriching and interactive environment, high visual stimulation and potentially reduces the distance with reality by reproducing it. Though, Garnier and Poncin (2009) revealed difficulties that Internet users can meet to immerge during the first and only one visit, in their case on a 3D commercial website. This was mainly due to the lack of familiarity with this very innovative environment. The frontier between real and virtual and the search for a rooting into reality seemed determining in the experience lived in such a setting (Poncin and Garnier, 2010). As a matter of fact, very little attention has been given to 3D shopping malls, despite their development and how they challenge virtual worlds, retail marketing and consumer online behavior (Burke, 1996; Garnier and Poncin, 2009, 2011, 2012).

The second feature, the avatar, has been identified as essential (Biocca, 1997; Tisseron, 2009) for immersion, as it reintroduces the body in a situation where it is not much solicited, contrary to "real life" consumption (Vicdan and Ulusoy, 2008).

Toward Re-Embodiment of the Virtual Experience and the Immersion Process

Immersion as an Embodied Experience. Immersion is seen throughout literature as a fundamentally embodied experience (Joy and Sherry, 2003), which may first seem inconsistent with virtual experience. Any experience is indeed embodied (Niedenthal, Barsalou, Winkielman, Krauth-Gruber and Ric, 2005) with the body being a processor of sensory stimuli and information (Lakoff and Johnson, 1980).

But online experience is usually seen as disembodied, as the physical body is not highly mobilized (as staying sat down on a chair in front of a screen), while cyberspace allows to free oneself from the physical constraints and the finiteness of the bodily incarnation (Turkle, 1995).

Though, the avatar allows individuals to have an online digital body that might impact the immersion experience.

Avatar and Immersion. In a computer-mediated environment, an avatar is defined as "*a pictorial representation of a human in a chat environment*" (Bahorsky, Jeffrey and Mason, 1998), "*a representation of the user as an animated character in virtual worlds*" (Loos, 2003), or "*graphic personifications of computers or processes that run on computers*" (Halfhill, 1996). Researches related to avatar use and influences are widely spread in Psychology, Information Systems or Human-Computer Interactions, in relation with learning, life-simulation or gaming virtual universes. Though, in the study of Consumer Behavior and Marketing, the subject of avatars in a direct (commercial websites, virtual models, virtual goods purchase) or undirect (brand communities, virtual worlds) commercial settings is still in its infancy (Crete et al., 2008 ; Kym and Forsythe, 2008, 2009; Malter, Rosa and Garbarino, 2008; Ulusoy and Vicdan, 2008; Vicdan and Ulusoy, 2008; Merle, St Onge et Sénécal, 2009, 2011; Garnier and Poncin, 2009, 2010, 2011).

Beyond debates on body and relationships between body and mind[1], the use of avatars questions the idea of disembodiment and more globally the role of the body in a virtual experience (Turkle, 1995; Biocca, 1997; Ulusoy et Vicdan, 2008; Vicdan et Ulusoy, 2008; Yee et al., 2009; Schultze, 2010). A whole range of researches

[1] See for example Descartes (1649) or Merleau-Ponty (1962)'s philosophical works on the topic.

also show that, as a real body would, strong emotional and physical reactions can be provoked by an experience that is mediated by an avatar (Turkle, 1994 ; Von der Pütten et al., 2010, among others).

As stated by Taylor (2002), the digital body anchors the self in the virtual and social space and the virtual body is then key to the experience (Biocca, 1997; Taylor, 2002; Tisseron, 2009). Practically speaking, creating the avatar is the first thing a new user will do: as such, it is clearly the first contact with and the entrance point in the universe. It can be considered as a mediator (Kolko, 1999), reconciling Internet users with an inherent need for physicality in a virtual space (Meamber and Venkatesh 1999 ; Vicdan and Ulusoy 2008). Academic literature has then regularly demonstrated the positive effects of using an avatar on the virtual experience and its components, as a potential source of perceived presence, immersion and socialization (Taylor, 2002 ; Choi and Kim, 2004; Turkle, 2007; Smahel et al. 2008; Garnier and Poncin, 2009; Davis et al. 2009; Schultze, 2010). The digital body engages the individual in the virtual world (Biocca, 1997; Taylor, 2002; Tisseron, 2009), allow him/her to re-embody in the virtual experience and to engage in bodily practices (Schultze, 2010). The avatar also makes the individual producer and actor of the experience (Peng, 2008; Yee and Bailenson, 2009). Thanks to embodiment in the avatar, users can indeed play an active role, providing himself a nearly direct experience (enactive experience), more powerful than mere observation. This is particularly interesting as it has been demonstrated that being a producer and an actor favors an immersive experience (Carù and Cova, 2003, 2006).

In addition to the appropriation process study, this research then tackles the role an avatar can play to favor immersion by allowing embodiment, and more specifically how it could participate in the appropriation process leading to immersion (Carù and Cova, 2003).

METHODOLOGY

AuShopping 3D shopping mall

Access to Aushopping website can be found at the following URL: http://www.aushopping.com/galerie3d/aushopping/monde3D/login. This is the first integrally 3D shopping mall that is also associated with a price comparison website, a commercial social network and 3D apartments consumers can personalize with products from their purchases or wish lists. We focus on the main feature of the 3D shopping mall. As the website was a beta version when data were collected, some features, such as flats for example, were not accessible: they consequently do not appear in the data collection and are not dealt with in that study.

When using the 3D mall, the consumer enters a fully 3D commercial center (environment, shops, structures and shelves, product display) and is represented by an avatar he can personalize and uses it to navigate. He can also visualize (picture or 3D display) products and try them on, chat online with avatars of other consumers, participate to social or gaming activities within the virtual shopping mall and possibly ends his visit by purchasing. Again, it is to note that some features (such as gaming activities) were not accessible to participants when data were collected. Illustrations of Aushopping can be found in Appendix.

Sample and Data Collection

32 students (22 women and 10 men, aged 19 to 22) were recruited on a voluntary basis (following a previous broader data collection on a related topic) to participate to a longitudinal study over a 2-months period. They visited the website at least 4 times over the 2-months period, with instructions for each visit (V1: open visit; V2: product retrieval; V3: shopping in a specific shop; V4: open shopping).

Data regarding the appropriation operations were collected following the methodology recommended by Carù and Cova (2003, 2006): appropriation operations can be identified in individuals' introspective narratives of their experience using written logbooks (Carù and Cova, 2003), as this kind of subjective experience is difficultly accessible in itself. This method is a form of guided introspection (Wallendorf and Brucks, 1993), with the specificity of being executed without any presence of the researcher. Respondents were then to fill a logbook directly after each visit to describe their experience through a series of open questions related to their feelings and thoughts on the experience they had just lived during the visit.

In order to deepen our understanding of the phenomenon, an online questionnaire was associated to logbooks. Respondents had then to fill the questionnaire right after filling the logbook, with items measuring immersion (Fornerino et al., 2008) and identification to the avatar (Van Looy et al., 2010). It is to note that immersion and identification measures are reported for V1, V3 and V4 only, as the questionnaire for V2 did not include them for parsimony purposes (linked to the specific focus of V2).

DATA ANALYSIS

A content analysis was conducted on textual data from logbooks by two independent coders on NVIVO9, based on logbook themes and identical coding units. Content was categorized according to the characteristics of each appropriation operation, as described by Carù and Cova (2003). Codings were then compared and discussed so to reach consensus.

Quantitative data were analyzed on SPSS18. Measures demonstrate good reliability and validity across visits (see table 1).

RESULTS AND DISCUSSION

The immersion appropriation process

Analyses of textual data (vocabulary, described process, description of feelings and thoughts…) extracted from logbooks allowed us to pinpoint the three appropriation operations of the immersion process (Carù and Cova, 2003).

First, during the Nesting phase, the consumer uses all perceptions and sensations felt to look for rooting points and "feel at home". Respondents are then looking for elements of proximity and safety with regard to reality and familiar experiences:

Table 1. Psychographics qualities of quantitative measures

Variables	Identification toward the avatar	Immersion
Initial scale	Van Looy et al. (2010) ; 8-item scale ; Unidimensional	Fornerino et al. (2008) ; 6-item scale ; Unidimensional
Final scale	8-item scale - Unidimensional	6-item scale - Unidimensional
Explained variance	58% V1; 74% V3; 75% V4	56% V1; 83% V3 ;77% V4
Cronbach α	0.90 V1; 0.95 V3; 0,96 V4	0.82 V1; 0.96 V3; 0.94 V4

"I had the feeling to be as in a video game, except that I am more used to action games thus this world appeared more "peaceful" and monotonous." (M, V1)

"The shops display really looks like real shops display." (F, V1)

"First I was surprised because I hadn't the impression that I was in a shopping mall!" (F, V1)

Nesting mainly appears during V1 but also later, particularly when facing elements not investigated yet. For example, it appeared during V3, as participants were to visit a specific shop they had never entered previously (as it was not available until that moment):

"The Willemshop looks like a botanical garden" (M, V3)

The Nesting operation can then reappear regularly when new things are to be discovered: respondents keep on looking for rooting points, especially though analogies and comparisons with reality.

Second, during the Investigating phase, starting "from the nest", exploration is expressed through the observation of events and new activities in order to evaluate the experience:

"I wandered around in other places of the mall to see if there were more shops than before." (F, V2)

"I tried to put products in the basket for the first time: the feeling was ok, it was easy" (M, V2)

This might happen since V2, but also previously during V1 for some participants. As Carù and Cova (2003) stated, cycles of appropriation operations can be faster for some individuals, depending on their previous experiences and specific familiarity areas. In that stage, consumers often refer to previously described elements and how they explore the environment:

"I discover at every visit the different and surprising universes by their realistic appearance. The application is then more and more stimulating: urge to see everything, to make everything!" (F, V4)

Finally, the Stamping phase is an imaginative and creative activity characterized by the elaboration of impressions on the situation, the context and the attribution of a specific meaning to this experience or to a part thereof. It is characterized, in narratives, by the meaning given either to the experience itself or to the virtual environment:

"I liked the feeling of controlling everything and the easiness of tasks. Making my avatar walk and calmly visit the gallery is enough." (F, V1)

"According to me, it could be a kind of trade for tomorrow." (F, V4)

As a matter of fact, immersion can be felt since V1 or appear later:

"I felt a total freedom! You can do your shopping with no one bothering you, you can go where you want – you are free of your direction, of your needs…" (F, V1)

"I really had the feeling to do my shopping in a real garden which was very pleasant." (F, V3)

"I had the impression to make shopping for real, in a real shopping mall." (F, V4)

Those differences in the appropriation process pace can be explained as immersion can be facilitated by familiarity with the material of the experience (Aurier and Passebois, 2002): preliminary knowledge about playful universes or shopping can help individuals to immerge more quickly, by recognizing rites and referents that favour the appropriation operations.

Quantitatively speaking, immersion scores significantly progress between V1 and V3 (V1=2.2, V2=2.45, V3=2.68), confirming the process identified in logbooks. However, it does not evolve positively anymore at V4. This seems quite normal, as Carù and Cova (2003, 2006) indicate that immersion is not perfectly linear: there can be ups and downs, across visits or within a single visit, with more or less immersive moments. The experience of immersion can be composed of a succession of strong moments (called small conquests by Carù and Cova, 2003) intersected with numerous moments that are lived far less intensely. In that perspective the third visit, in the Willenshop garden, was an important conquest for most of the participants.

So the immersion process has been identified thanks to logbooks analysis and confirmed with our quantitative results. Our second aim was to assess the role the avatar might take to favor immersion.

The avatar in the appropriation process

First, it is to state that in order to identify to that virtual self (Suh et al., 2011), respondents tend to create an avatar that physically look like themselves (Suh et al., 2011) or at least project part of their identity in the avatar (Vicdan and Ulusoy, 2008; Vasalou and Joinson, 2009), creating a sort of idealized self in the virtual character. This process of avatar personalization helps individuals in the Nesting phase by enhancing a cognitive connection with the digital body that represents them and consequently becomes a strong rooting point related to reality:

"I find it nice to be able to move with an avatar that looks like me as much as possible, it makes things more real." (M, V1)

The avatar also allows individuals to keep control of their first experience, which helps them facing and nesting into the new virtual environment:

"I like the fact to totally control the visit: to be able to move, to go where we want" (F, V1)

The avatar might then intervene by being adapted to various situations (hedonic *vs* utilitarian shopping, socialization with friends or other consumers) and shops during the Investigating phase:

"I've adapted my clothes to the situation of buying a waffle iron. It's just a bit of shopping. I would have dressed in a more elegant way if I had been to pounce about in the shopping mall as during my previous visit." (F, V2)

The avatar can also help exploring the environment by acting as a mediator:

"It is very nice to be able to change the viewing angle of the avatar. It helps feeling more immersed in the virtual world" (F, V1)

"My avatar already knows the place and how it works." (M, V3)

Finally, the avatar becomes a source of meaning for individuals in the Stamping phase. More specifically, they give meaning to the avatar by recognizing it as themselves, consequently stamping the experience as their own experience:

"I've discovered the website with him and I think he has become a mark in that virtual universe, as a well-known person. It helps me to absorb the website even better and to make one with my avatar. He's become me in the virtual universe." (M, V4)

"There is a great pleasure to wander around myself (as an extension of the avatar) in the shopping mall. The character is not important anymore because I feel like being her. There is no distinction between her and me anymore." (F, V4)

The correlation is very significant between identification toward the avatar and immersion (V3: 0.88**; V4: 0.87**). Embodiment in and identification to the avatar is then strongly linked with the ability to fully live the immersion experience. This is line with literature highlighting that one salient element of an experience is the active role of the consumer (Carù and Cova, 2003). Then, we clearly assess that the avatar is really key to immersion by making consumers feel actor (Peng, 2008; Yee and Bailenson, 2009) of the navigation into the 3D website and by making the virtual experience fundamentally (re-)embodied, as any other experience (Joy and Sherry, 2003).

Interestingly, a recursive process is also observed: the user starts by identifying with his avatar to be able to start the process of immersion, but after some visits or achieving a certain level of immersion, the process seems to reverse: the more the consumer is immersed, the more he identifies to his avatar.

CONCLUSION

Building on Carù and Cova (2003, 2006)'s work, we observed consumers facing a new commercial environment, a virtual 3D shopping mall, and we studied the process leading to the immersion experience. This is key, as the immersive properties of a commercial website can be an important element of differentiation among the thousands commercial websites consumers have access to (Charfi and Volle, 2011). Thanks to a longitudinal study – that is to our knowledge the first on the immersion process in a virtual environment and the impact of the avatar, we effectively observed the three operations of Nesting, Investigating and Stamping that lead to immersion. We also identified, both qualitatively and quantitatively, the central role of the avatar in the appropriation of this new commercial environment. Embodiment in the avatar appears as a crucial point for the experience, as it allows the individual to be an actor in the experience and as it reintroduces the body and the self in the virtual environment. Our analysis clearly links the avatar to each appropriation step. Table 2 synthesizes those findings.

Furthermore, the relationship between immersion and avatar throughout time had never been shown previously. Other interesting results lie in identifying that appropriation leading to immersion can be more or less fast, varying between individuals and in confirming that immersion is not a static linear process, but can fluctuate over time. As a matter of fact, it now seems clear that immersion should definitely be considered as a process studied from a longitudinal perspective, and not as a one-shot state with a linear strength increase.

Managerial consequences are multiples. As already suggested by other authors (Filser, 2002; Carù and Cova, 2006), it is necessary for the individual to be accompanied by firms all along the process of immersion, so to facilitate it. Environment design with tight relations to reality enhancing rooting and nesting, poly-sensorial elements that facilitate feeling of telepresence and embodiment, effective personalization of the avatar are possible assets that can be used by firms in such environments, beyond the usual experiential theatralization of the offer.

Some limits to this research can be highlighted, as the relatively small numbers of respondents, the use of a single 3D environment, and the limits inherent to the website that was not fully

Table 2. Results from the qualitative data analyses synthesis

Appropriation step	Verbatims linked to the appropriation process	Verbatims linked to the avatar in the appropriation process
Nesting Looking for rooting points	**References to familiar materials:** *"I had the feeling to be as in a video game, except that I am more used to action games thus this world appeared "peaceful" and monotonous."* (M, V1) *"The display in shops looks like so much that of the real shops."* (F, V1) **New nesting process in a newly discovered environment:** *"The Willemshop looks like a botanical garden"* (M, V3)	**Identification to the avatar linked to reality and familiarity:** *"I find it nice to be able to move with an avatar that looks like me as much as possible, it makes things more real."* (M, V1) **The avatar as a source of control of the first experience:** *"I like the fact to totally control the visit: to be able to move, to go where we want"* (F, V1)
Investigating Exploring	**Exploration of new elements:** *"I wandered around in other places of the mall to see if there were more shops than before."* (F, V2) *"I tried to put products in the basket for the first time: the feeling was ok, it was easy"* (M, V2) **References to previously described elements:** *"I discover at every visit the different and surprising universes by their realistic appearance. The application is then more and more stimulating: urge to see everything, to make everything!"* (F, V4)	**Situational adaptation of the avatar :** *"I've adapted my clothes to the situation of buying a waffle iron. It's just a bit of shopping. I would have dressed in a more elegant way if I had been to ponce about in the shopping mall as during my previous visit."* (F, V2) **Avatar as a mediator to explore:** *"It is very nice to be able to change the viewing angle of the avatar. It helps feeling more immersed in the virtual world"* (F, V1) *"My avatar already knows the place and how it works."* (M, V3)
Stamping Giving meaning	**Attribution of a meaning to the experience:** *"I liked the feeling of controlling everything and the easiness of tasks. Making my avatar walk and calmly visit the gallery is enough."* (F, V1) **Attribution of a meaning to the virtual environment:** *"According to me, it could be a kind of trade for tomorrow."* (F, V4)	**Attribution of a meaning to the avatar: the avatar is me, I'm the avatar** *"I've discovered the website with him and I think he has become a mark in that virtual universe, as a well-known person. It helps me to absorb the website even better and to make one with my avatar. He's become me in the virtual universe."* (M, V4) *"There is a great pleasure to wander around myself (as an extension of the avatar) in the shopping mall. The character is not important anymore because I feel like being her. There is no distinction anymore between her and me."* (F, V4)

accessible to participants. Some features such as the apartment or social activities could have been very interesting materials to study the immersion process and could enhance (or change) our results. Regarding analyses that were conducted on textual data, we were not able to formally demonstrate any temporal pattern of appropriation operations cycles within a single visit or across visits, as done by Carù and Cova (2003). Finally, our quantitative measure of immersion is obviously apprehending a state in an *a posteriori* declarative approach, as there is no scale, up to now, that may quantitatively assess the appropriation process, if this could be possible.

Research perspectives cover a wide area of confirmatory researches. First, the study of the appropriation process leading to immersion should be studied more deeply, in various virtual settings such as online games, life simulation universes or commercial websites, settings in which immersion is generally considered in existing researches as a final abrupt state. A deeper application of Carù and Cova (2003)'s methodology on virtual universes experience, in order to identify temporal sequences and various paces according to individual charactics, should lead to a better understanding of the virtual experience. Confirmatory and longitudinal researches also lack on the use of an avatar and its role in the immersion process and more globally in any virtual experience related to a consumption context.

'Because I'm Worth It' - Luxury and the Construction of Consumers' Selves

Andrea Hemetsberger, University of Innsbruck, Austria

Martina Bauer, University of Innsbruck, Austria

ABSTRACT

This study inquires how consumers' experiences of luxury relate to consumers' selves. The objective is to broaden our contemporary understanding of luxury experiences by departing from the traditional view of conspicuous luxury consumption as a marker of social class. Consumer diaries provide fundamental insights into the complex nature of luxury experiences as *moments of luxury,* which are an integral part of consumers' everyday lives. Luxury experiences are inextricably linked with states and processes of self that revolve around multifaceted experiences of *having* (materialistic self), *doing* (liberating, oscillating, integrating, and relating self), *being* (harmony), and *becoming* (achievement-oriented and self-transformational). Our findings relate to and extend current self theory and fundamentally change our understanding of luxury from its groundings in status consumption towards a transient and abstract concept.

INTRODUCTION

Consumer behavior literature inextricably ties luxury to demonstrative and conspicuous consumption, assuming that luxury derives meaning primarily from the luxury object (Vickers and Renand 2003) and the social context (Brückner 2008). Based on Veblen's (1902) seminal work, traditional luxury literature has a strong focus on social affiliation and social comparison, stressing consumers' social identity needs (Stets and Burke 2000; Tajfel 1982). Traditionally, functional characteristics such as high price, outstanding quality, uniqueness/scarcity, unnecessity, and aesthetics characterize luxury goods and brands (e.g., Keller 2009) that are produced as means for social distinction (e.g., Han, Nunes, and Drèze 2010).

Recently, authors have portrayed luxury from a more individual and abstract angle, framing the essence of luxury as a special treat that is out of the ordinary (Hansen and Wänke 2011). Additionally, recent studies increasingly acknowledge the primacy of the luxury experience over object (e.g., Tynan, McKechnie, and Chhuon 2009), as well as the tendency to view luxury consumption as predominantly inner-directed and inconspicuous (Bauer, von Wallpach, and Hemetsberger 2011). The present study picks up the thread and focuses on meaningful objects and moments consumers might experience as luxury.

We propose that luxury is not experienced in enclaved luxurious spaces and contexts but integrated in consumers' everyday lives. Building on the widely held belief of products and brands as supporters of the self (e.g. Belk 1988; Kleine, Kleine III, and Allen 1995), this study contributes to previous literature by showing how luxury experiences are inextricably linked to the self. Building on narratives reported in consumer diaries, this study illuminates the contribution of consumers' lived experiences of luxury to the states and processes of having, doing, being, and becoming that underlie consumers' selves. Our radically constructivist view implies that any material thing, or any consumer experience might be perceived as luxurious, if consumers attach luxurious meaning to it. This article, therefore, departs from conceptual presumptions and aims to enrich our understanding of luxury with fundamental consumer insights.

The subsequent sections review current conceptualizations of luxury first, describe the emerging view of luxury experiences as part of the self-narrative of consumers, elaborate on the study findings, and discuss their implications.

THEORY

Luxury experiences

Traditionally, premium image, high price, outstanding quality, uniqueness/scarcity, unnecessity, and aesthetics characterize luxury goods and brands, which are produced as means for social distinction (e.g., Han et al. 2010). Berthon et al. (2009, 47) characterize luxury as "amalgam of the material, the social, and the individual". Postmodernity has radically altered contemporary definitions of luxury, adding pastiche and democratized forms of luxury for the masses (Atwal and Williams 2009; Tsai 2005; Yeoman and McMahon-Beattie 2006). Additionally, recent postmodern theorizations in the field of consumption practices argue that most action is not directed towards communication with others but towards the fulfillment of self-regarding purposive projects (Joy et al. 2010; Warde 2005). Accordingly, research acknowledges the individual meaning of luxury consumption, focusing on the measurement of luxury perception (e.g., Christodoulides, Michaelidou, and Li 2009), the value of luxury brands for individuals (e.g., Tsai 2005), and individual consumption practices (e.g., Atwal and Williams 2009; Gistri et al. 2009). However, despite the recent prominence of experiential marketing (e.g., Brakus, Schmitt, and Zarantonello 2009), only few studies stress the importance of consumer experiences in the context of luxury brands (e.g., Atwal and Williams 2009; Berthon et al. 2009). Tynan et al. (2009) lay the foundation for a distinct experiential approach, and extract three main types of value consumers derive from luxury—symbolic/expressive, experiential/hedonic, and relational. Yet, classifications of luxury experiences into taxonomies of value have serious conceptual shortcomings from a constructionist perspective as they predetermine experiential categories, instead of focusing on luxury's essential meaning for consumers' selves. Hansen and Wänke (2011) maintain that the majority of consumers cannot afford indulging in luxury every day. As a consequence, luxury goods are psychologically more abstract and distant than everyday necessities. We assume that consumers' desire for luxury is independent from accessibility, which necessitates a re-definition of the meaning of luxury on the side of consumers. Consumers might exclude inaccessible luxury goods and include other, more achievable domains of luxury consumption experiences in their everyday lives. Bauer et al. (2011) have introduced an interesting perspective on everyday luxuries that are situation-specific, individual, and narrated. First empirical evidence shows that luxury experiences are much more self-related, private, and less materialistic than previously assumed in the context of traditional views of luxury. The authors find that from a consumer-experiential perspective luxury can be characterized as transient, which is reflected in its situation-specific, escapist nature, and its integration in consumers' everyday lived experiences.

Luxury experiences and the self

Relationships between products, special possessions, brands and the consumer's self have been widely discussed in literature (e.g. Belk 1988; Berger and Heath 2007; Kleine et al. 1995; Sirgy 1982; Sprott, Czellar, and Spangenberg 2009). Existing studies provide ample evidence of the supportive function of products/brands for identity construction and consumers' self-understanding. In his seminal work, Sirgy (1982) suggests that individuals have an "actual

self"—a realistic view of how a person perceives herself—and an "ideal self", relating to how a person would like to be. The uncomfortable gaps between the real and the ideal selves respectively can be removed through consumption. As products and brands communicate symbolic meaning, their consumption potentially enriches a consumer's self-concept via the transfer of certain product or brand meanings to the self.

A more postmodern view has been introduced by Belk (1988), Ahuvia (2005), and Bahl and Milne (2010), who draw attention to the extended, fragmented and negotiable consumer self. Whereas Belk and others (1988; Tian and Belk 2005) introduce the deep meaning of possessions as part of individual's identity, Ahuvia (2005) supports a multiple selves view of consumers, who solve conflicting facets of their identities through consumption. Consumers appropriate specific objects for the purpose of self-transformation rather than self-extension as proclaimed by Belk (1988). In contrast to Ahuvia (2005), who discusses consumers' strategies in the formation of a coherent self-narrative, Bahl & Milne (2010) look at the constant dialogue of different selves to avoid or solve possible conflicts amongst them. Similarly, Obodaru (2012) emphasizes the importance of alternative selves for people's self-narratives, and the consequences for their lives. Studying self-representations of who a person could have been, she finds affective, self-knowledge, satisfaction and motivational effects on people's professional lives (Obodaru 2012). Other authors introduced the notion of transformative experiences and consciousness transformation to denote short-term and long-term self-changes that consumers undergo when consuming valued consumption objects (Hoppe et al. 2009; Mick 2006; Sussan, Hall, and Meamber 2012).

To sum up, the consumption of products/brands can help individuals to master their identity projects by transferring symbolic meaning to consumers' selves (Kleine and Schultz Kleine 2000). Identity construction through luxury consumption remained rather untouched, probably assuming that the conceptual underpinning of luxury is unambiguously related to social status, or remains a permanent desire (Belk, Ger, and Askegaard 2003) of the aspirational class. Following the assumption that consumers, themselves, define what they perceive as luxury, luxury might contribute in many ways to consumers' identity construction. This might encompass a broad array of actual, ideal, extended, multiple, alternative, and transformative self-experiences, eventually involving luxury products and brands. Luxury experiences help individuals to negotiate and construct their personal self-narrative (Bauer et al. 2011); luxury makes individuals feel unique and generates a multitude of potential self negotiations and constellations so as to create a coherent self-narrative. Our empirical study aims to contribute to this field of research and to uncover luxury experiences that go beyond traditional conceptualizations of luxury.

METHODOLOGY

This study applies an interpretative, exploratory approach to gain a detailed understanding of luxury experiences' contribution to consumers' selves. To achieve maximum variation of views on luxury experiences and the respective effect on the self, selected informants differed with regard to age group, job/educational background, and gender (Ritchie and Lewis 2003). We applied purposeful sampling, selecting German speaking informants who are in accord with our selection criteria. The number of informants amounts to 17 (7 male, 10 female; age range: 24-84, mean = 41; education: university degree: 8, high school degree: 4, no high school degree: 5; marital status: married: 7, in a relationship: 8, single: 2).

This study uses diary research for investigating consumers' personal luxury moments. Diaries are documents containing informants' regular records of events, observations, and thoughts as well as feelings, experiences and consequences (Bolger, Davis, and Rafaeli 2003, 580). Qualitative diary research is a method that enables the researcher to deeply understand processes, relationships and consumers in *their* world (Patterson 2005) and to gain intimate and personal insights in an unobtrusive way (Alaszewski 2006, 43). In the present research context, consumers wrote diaries on an everyday basis (Alaszewski 2006), providing introspective accounts of luxury moments, related experiences, and feelings (Bolger et al. 2003). The diaries provide in-depth insights into consumers' subjective perceptions of luxury experience and its contribution to consumers' selves. We analyzed consumer diaries, using an inductive categorization process (Kreiner, Hollensbe, and Sheep 2006; Spiggle 1994), and constant comparative method (Charmaz 2006).

FINDINGS

The findings of our diary study brought forward a myriad of everyday and 'grand' luxuries that range from materialistic, romantic notions of a life of luxury to metaphysical accounts of eudaimonic well-being and living a happy and fulfilling life. Consumers' perceptions of luxury embrace object- and experience-related, abstract and concrete notions of luxury. Our analysis of consumer diaries illustrates that consumers' luxury moments revolve around multifaceted experiences of *having* (materialistic self), *doing* (liberating, oscillating, integrating and relating self), *being* (harmony of selves), and *becoming* (achievement-oriented and self-transformational) (cf. Belk 1988). As Michael succinctly notes:

"There are little, everyday luxuries and the big ones, which is something extraordinary, something you have aspired to have, do, or be for a long time." (Michael, 28)

Having

Having strongly reflects traditional conceptualizations of luxury, highlighting the importance of luxury objects (Vickers and Renand 2003), and experiences (Tynan et al. 2009). Consumers define and express their materialistic self with strong accounts related to *precious possessions and places*, that is, luxury objects that are

Table 1: Sample characteristics

No.	Code Name	Gender	Age	Education	Marital Status
1	David	male	29	University	relationship
2	Michael	male	28	University	relationship
3	Eva	female	58	High school	single
4	Jennifer	female	26	University	relationship

14	Linda	female	32	No high school	married
15	Barbara	female	84	No high school	married
16	Elisabeth	female	27	High school	relationship
17	James	male	56	University	married

"mine" (Belk 1988; Goffman 1959; Mittal 2006). These special possessions and eventually multi-sensory experiences are typically related to convenience consumption of high-priced 'little luxuries'.

> *"I currently own a shampoo that I also used this morning. Whenever I use it I am excited because it smells so good, lasts much longer and I do only need tiny bits of it. And the bottles look really nice ☺. I should probably also mention that shampoo and conditioner cost around 80€ and that is pure luxury for me… but it is really good." (Elizabeth, 27)*

Traditional luxury objects often derive their value from the superfluous, or *unnecessity*. We do not need them but appreciate the fact that we can *indulge* whenever we want. Consuming these luxury objects reflects traditional luxury consumption at its best. It speaks to a "because I'm worth it" self, which is not to be confused neither with practices of "self-care", as discussed by Rindfleish (2005), nor with aesthetic consumption practices. As demonstrated in the diary excerpt of Patricia, the luxury of *having* reflects 'the special treat out of the ordinary', as suggested by Hansen and Wänke (2011).

> *"Today I bought a beautiful scarf in the berry colors that are currently en vogue. I saw it last week already and I really liked it. Even though it was not expensive I did not buy it because I actually own enough scarves. But then I could not stop thinking about it all week long and today I bought it – I was lucky that it was still there. I do not really need it but I treated myself and it feels great ☺!" (Patricia, 42)*

Doing

Apart from classical ownership of luxury goods, reports of luxury experiences comprise various states of a self released, liberated, and able to live out the most wanted facet of self. Consumers' narratives revolve around desires of *doing* and related moments of fulfillment. Diaries vividly illustrate how consumers pursue multiple selves that mutually co-exist, complement, or conflict with each other. Consumers constantly balance this multiplicity of selves through processes of self-negotiation (Bahl and Milne 2010). We found that these processes involve *liberating an aspired self* (i.e., striving for/ actually achieving a desirable state of self), *oscillating between selves* (i.e., processes of switching between selves), (unexpected) relieving states of *self integration*, and *self-others relations*. The goal of *doing* is the achievement of an ideal state of liberation and integration, which is typically experienced as luxury.

Liberating an aspired self. Consumers often describe states of suspense that precede luxury moments, whose dissolution is experienced as self-release. Liberating an aspired self reflects a consumer's striving for or actual achievement of a desirable, often rare state of self. This process eventually involves self-experiences that are perceived as luxury moments. The liberation of one's self can consist of *disposing of unwanted parts of a self*, for instance, by having the possibility to partially externalize or completely overcome certain aspects/duties that are typically associated with a specific role.

> *"With Ms. X as a part-time office manager I have the luxury to free myself from bothersome administrative tasks and to concentrate on activities that I am qualified for." (James, 56)*

Many narratives illustrate a strong urge to *escape* the profanity of everyday life. Luxury lies in the possibility to do so by transforming common everyday situations into special moments. Similar to Atwal and William's (2009) description of escapist qualities of luxury brands, these luxury moments show qualities of high intensity and high involvement with the experience.

> *"During the day, I really have hardly any time for me, but on days, when I don't get around doing anything, there is at least tea for me. A cup of tea is then on that day a little island, on which I am. It is so small that nobody else can be there. I'm sitting on it with my tea. As soon as I've finished the tea, a pirate ship docks with a three-headed crew at the age of 10 months, 3 years, and 5 years." (Sarah, 34)*

Liberating one's self is further associated with "doing what I want", that is, the *freedom* to define one's ideal state of self, for instance, by choosing between two selves one could or should reside in. Freedom can manifest itself through indulgence in *forbidden pleasures*. This type of self-liberation eventually involves struggles between conflicting selves, before an ultimate decision is made that liberates a self, which is not dominated by moral obligations or, as denoted by Cialdini, Reno and Kallgren (1990), by injunctive and descriptive norms of doing/not doing. These acts of liberation put the "happy self" in the foreground, the self that is not constrained by considerations of boundary setting "other" (Joy et al. 2010).

> *"While looking at the flowerage in front of me, some exceptionally big blossoms attracted my attention. 'Come on, pick them and put them in a vase'. In this moment I felt like split half: One part of me said: 'Take some of these beautiful, golden branches of this spring bush. It would look beautiful in your vase with some blue flowers'. The other part of me admonished me: 'Let them here. Here they look most beautiful … In your vase they are lovely but only for a short time and without fulfilling their actual purpose.' Guess what I did? My egotism won!" (Barbara, 84)*

Not all self-liberation can necessarily be attributed to an individual's free will. Self-liberation is in many cases only possible due to a force majeure, which *unleashes an aspired self* from social constraints and external circumstances. When externalities happen to liberate unexpected time for a more aspired self, these moments become like valuable gifts, experienced as moments of luxury.

> *"This afternoon I sat on my balcony for the first time this spring, although it was a workday. My customer cancelled the meeting and I had time for myself. I went cycling, had some coffee and was full of joy over the unexpected spare time—that's luxury." (Tina, 51)*

Oscillating between multiple selves. Oscillating between multiple selves denotes the process of switching between selves and accentuating different selves at different points in time. Both *factual oscillations* and related rituals, as well as *mental oscillations* are experienced as luxury. Factual oscillations involve actually switching between selves, that is, entering, residing in, and/or expressing a desirable self. Mental oscillations describe the process of imagining or mentally simulating to switch between selves.

> *"I love being with my family. I'm really looking forward to see my family and my cat every time I'm going home—it's like a safe haven for me. Yet, being with them all the time wouldn't be possible. I simply love being able to live in two worlds, my hometown and the town where I'm currently living." (David, 29)*

"Today I bought again the somewhat more expensive bio-bananas from the Dominican Republic. At home I ate them instantly with pleasure. Since my holidays in the Caribbean I do not eat bananas carelessly anymore. Whenever I eat them I'm mentally on the beach under palm trees enjoying the turquoise blue sea—pure endorphins!" (Patricia, 42)

Oscillation is not always based on a deliberate choice but dictated by external forces. While not being a voluntary endeavor, especially *oscillating with nature* is experienced as luxury. Consumers subordinate themselves to an external force that liberates them from the burden of making their own decision and allows them oscillating with a naturally recurring pattern.

"After the long winter, which was not really enjoyable, nature's awakening incited a need to stimulate my senses and to really pep myself up. And so I got started: first a thorough hot and cold shower with the bathroom window wide open. The prickling feeling of the stimulated blood circulation already generated a pleasant sensation. The ensuing extended body treatment added to this pleasant sensation. Finally also the choice of clothes had a touch of spring – I chose something extraordinary. Then I looked into the mirror and my smiling face told me that it was good". (Barbara, 84)

A phenomenon closely related to oscillation is the *integration of multiple selves*. Integration implies the temporary and often unexpected relieving state of *partial integration* of aspects appertaining to one self into another self, for instance, the integration of leisure aspects into a professional self. Integrated selves are not necessarily balanced. A specific facet of self dominates whereas another self—which is most wanted in a specific context—is permitted to squeeze in. These unexpected experiences are very much valued and perceived as luxury. On the other hand, consumers experience frustration and non-luxury when an aspired integration of selves fails, typically due to some external restriction.

"Today I was in our plant in Genk, Belgium, where the Mondeo, S-Max and Galaxy are built. This time my colleague had plenty of time and gave us a tour of the plant. Typically, plant visits are very stressful, since we have many problems to solve. But this time it was great." (Robert, 48)

Relations between one's self and others. Considering our self in relation to others indicates the relational value of luxury (Tynan et al. 2009). Others extend and complement our selves, evoking the feeling that they "are part of my self".

"It is a beautiful day. The sun is shining. We have a relaxed breakfast and decide to visit the zoo. Emma runs from time to time and sits on Christopher's shoulders. Her eyes are glowing with joy and she is laughing. It is so beautiful to see how she enjoys it." (Linda, 32)

Others also contribute to luxury experiences when consumers succeed to *demarcate* the 'I' (Mittal 2006) from the social self, for instance, by recognizing their current self's rareness and unattainability for others.

"My part-time job since October 2009 is a special luxury. It gives me the wonderful feeling of a new dimension of freedom and control over time. Having the time to enjoy a red traffic light and to consciously relax while other people are stressed out is quite luxurious". (James, 56)

Both, enjoying the social self and enjoying one's very personal self are luxury when we deliberately enact them.

Being

Unity of body, mind, and environment characterize being. Contrary to doing, being does not involve actions or activities but rather states of the self. Examples vary from simple bodily relaxations, realization of the state of health, stocking up energy or sensorial states of wholeness to feelings of unity with the natural or social environment. *Being* involves intense existential experiences, enjoying what consumers depict as pure existence, relating to what Belk (1988) and Mittal (2006) describe as the innermost core self. Here we find love, timelessness, and deep, intense feelings of wholeness that consumers describe as *Dasein* (Heidegger 1962), *harmony*, *the authentic self*, and *joy of living*. The luxury of *Dasein* (Heidegger 1962) is commonly portrayed as doing nothing but being.

"I meditated today. Being completely relaxed and the sense of delight afterwards is luxury to me." (Michael, 28)

Luxurious states of *harmony* can be reached if consumers are able to organize the interplay of selves and the extent to which they live out these selves freely; or when they feel perfect harmony of being and living. As harmony is a state of being it is independent of doing and merely a consciousness of self as enjoying, valuing what is. The harmonious self is not a category of its own but may be the sole self, the relational self, or the spiritual self amongst many others—all actual selves being harmoniously united. Consumers report states of harmony with themselves but also how enjoyable it is to share the joy of being with others:

"Today I'll stay in my apartment, and this is today's luxury: privacy. It's important for me to isolate myself and to enjoy time with myself from time to time. [...] sometimes I experience being alone as luxury, even though this may sound a bit strange." (Peter, 30)

"Desire, fun, amusement, recreation…and what's most important: To know and feel how great life can be! AND to be free to share this feeling!" (John, 25)

Authenticity is luxury for those consumers who sense the innermost need to simply be who they are and appreciate being free from role pressures. Consumer diaries portray the consciously contemplating individual, who is very aware of the emptiness of the materialistic self and the self being totally straitjacketed in societal constraints. Material consumption does not correlate with subjective well-being, nor does it capture consumers' spiritual motivations for consumption (Sussan et al. 2012). Consumer narratives illustrate that luxury is ultimately associated with *joy of living*, referring to pleasurable feelings, such as warmth, joy, amusement, and felicity.

"It's Sunday. The warm sun is shining through the window even though a cold borealis is blowing outside. I lie in my armchair and relax. I enjoy the 'dolce far niente' with all senses. As always, peace and satisfaction confirm that I'm really fine. Compared to politicians who depend on fighting and begging for everybody's favor to 'be someone' or better to 'appear to be someone' I have much more freedom. I enjoy this consciousness of being free and perceive it as luxury." (Barbara, 84)

Becoming

Becoming ultimately describes those moments when transformative processes, related to important life projects, are consciously perceived and valued as life achievements and self-realization.

"Being able to do a dissertation is luxury; it's hard work but definitely luxury; forget all about new fashion and other material goods. Simply knowing that you are getting closer to the great achievement feels great. What I mean is: being able to proof that I can do it. That's part of my self-realization process. And my company pays for it—that's luxury." (David, 29)

Becoming is a process rather than a state and relates to the goal-oriented achiever as well as to more spiritual processes of self-transformation, or self-transcendence. Becoming draws upon common imaginations of an ideal future self but is different from desire as it is more fulfilling the more it is close to its realization. Supporters of becoming, as for instance a financial sponsor, a supportive environment, family, or one's own capabilities are experienced as luxury.

DISCUSSION

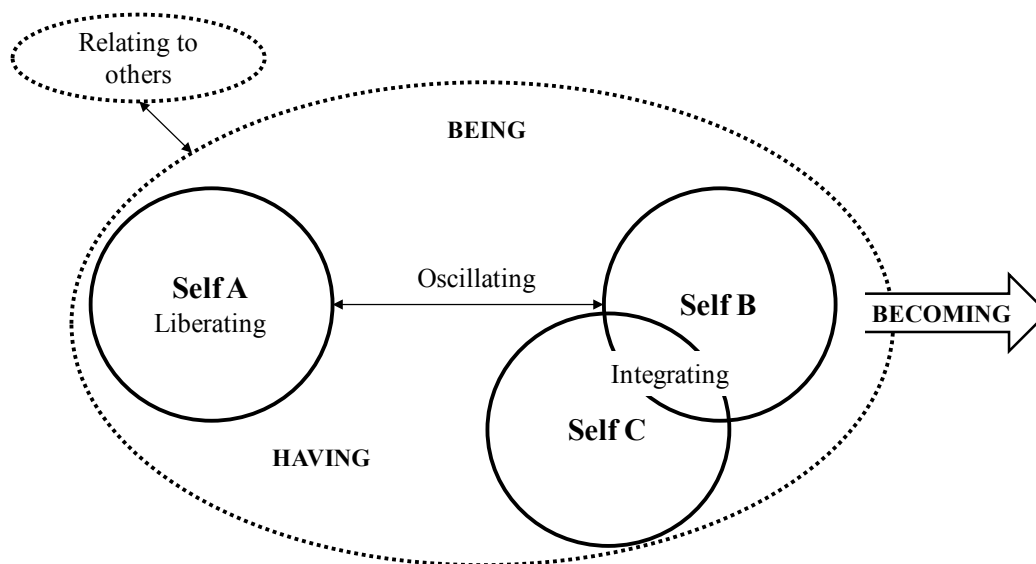
This article illuminates how consumers' perceptions and experiences of luxury contribute to consumers' selves. Luxury, from a consumer perspective, is not characterized through boldly exhibited products and brands but rather constitutes exceptionally valuable, potentially hidden moments of luxury that serve as supporters of self in everyday living. These luxury experiences are more intimately related to different states and processes of self than traditionally assumed: Luxury experiences are much more than just a perceived extension of consumers' selves (Belk 1988) but rather an opportunity to live out different selves, reflected by symbolic consumption, indulgence in special moments and activities, moments of harmony, self-enhancement and self-transcendence.

Our findings suggest that respondents do not privilege any of these luxury experiences. *Having* and owning is as valuable in providing luxury experiences as *doing*, *being* and *becoming*. Figure 1 portrays how luxury moments are related to self theory.

Belk's seminal work on special possessions (1988), Daniel Miller's study about the importance of things (2009), or Klein and Hill's study into forced dispossessions (2008) demonstrate the importance of material things, and why they potentially qualify for moments of luxury. Owning and having per se is not a luxury moment; but the deep symbolic of possessions and how they relate to our selves and lives is. Research into motivation theories and autotelic activities (Csikszentmihalyi 1997) provides ample evidence of the importance of *doing*. Csikszentmihalyi (2000, 271) emphasizes that "…trying to avoid the mental chaos of everyday life by resorting to acquisitions and passive entertainment does not work very well". Our study strongly supports this critical finding, and extends this research by relating *doing* to the transient self. Doing is active and qualifies as everyday luxury, when we can freely choose what we want to do most in a specific situation. We enjoy doing different things at different times. Our study shows that moments of luxury emanate from meaningful activities of relating, liberating, oscillating, and integration of selves at specific times.

Our findings partly corroborate Ahuvia's (2005) findings that consumers are looking for a synthesis of conflicting selves, or harmonious states of being, respectively. However, oscillation as a way to switch between worlds and selves extends Ahuvia's (2005) findings. Similar to what Tian and Belk (2005) have coined self-shifting and oscillation, we also find that consumers switch among selves yet, moments of luxury are experienced only when individuals actually enact different selves, purposefully, or unexpectedly. Oscillation is an important principle and demonstrates the volatile character of luxury moments. One day we long for solitude, the other day we experience togetherness as luxury. It is these contradictions and desires (Belk et al. 2003) which are never perfectly fulfilled in life that seem to make luxury moments precious, and our lives interesting.

Our findings also clearly extend Bahl and Milne's (2010) meta-self theory in that they show that consumers not only avoid or manage conflicting selves, or accord with a dominating meta-self, but also indulge themselves in luxurious states of perfect harmony. In many ways states of perfect harmony liken moments of happiness. Harmony is not described as a perfect integration of different facets of self but rather acknowledges its facets. Perfect harmony unfolds as a metaphysical experience of oneness with nature, or humanness with a *Dasein*-like quality. This is exactly what *becoming* is about, sometimes as an imperfect striving for achievement, sometimes as

Figure 1: Luxury experiences and self


a self-developmental and self-transcending endeavor. Becoming is about the possibility to realize the alternative self that I might have become (Obodaru 2012). These spiritual motivations for (non-)consumption have recently been described by Skousgaard (2006) and Sussan et al. (2012). Our study further illuminates the immanent spiritual quality of luxury experiences.

Overall, this study suggests that luxury is not a permanent state but seems to be a *transient* concept that manifests in moments of luxury and thus, is inherently experiential. Luxury moments include the rare and precious. It is the moment when we unwrap the little silver spoons, when we look at the wonderful new painting, or when we brush our leather shoes with the glossy toecap. Luxury experiences in many ways are preceded by moments of suspense before the many little dramas in people's lives dissolve, and the most aspired self is finally liberated. Moments of luxury then comprise experiences of something extraordinary in ordinary life, integrating the demands of different roles, escaping, and oscillating between different selves. Luxury experiences are also *abstract*. Postmodern reflexivity of individuals and practices of "self-care" —becoming someone you were not at the beginning—permeate our search for happiness in life (Rindfleish 2005). This search, however, needs some harmonious ending. Ultimately, human beings are striving for self-transcendence, self-transformation, and engage in conscious contemplation resulting in deep feelings of gratitude and harmony, reflecting processes of becoming, and perfect states of being. In that sense, moments of luxury liken concepts of consumer happiness, eudaimonic well-being (Bauer, McAdams, and Pals 2008), joy of life, and other related constructs. Is it luxury, then?…What else?

Social Curation in Consumer Communities
Consumers as Curators of Online Media Content

Mikko Villi, Aalto University, Finland
Johanna Moisander, Aalto University, Finland
Annamma Joy, University of British Columbia, Canada

INTRODUCTION

In contemporary consumer culture, the consumption of media content online is increasingly a shared social experience. In the US, for instance, as much as 75% of the online audience consumes news shared by peers (Purcell et al. 2010). As a result, the importance of consumer communities in distributing and marketing professional media content is growing (Newman and Dutton 2011). Online media and the particular applications designed for sharing media content enable and encourage the contemporary media consumers to share their media consumption experiences by providing links in e-mail messages or web pages, and increasingly by tweeting, using such social plugins as the Recommend Button on Facebook, or utilizing services like Pinterest and Storify. In the paper, our aim is to contribute to a better understanding of this phenomenon and Internet-based activity by theoretically elaborating on its nature as *social curation*.

In building our theoretical argument, we start from the idea that curation is essentially about people adding their qualitative judgement to whatever is being gathered and organized, as Rosenbaum (2011, 3-4) has argued. In the context of the media, curation is about consumers aggregating, sharing, ranking, juxtaposing and critiquing content on a variety of platforms (Clark and Aufderheide 2009, 6-7). In the literature on computer science (Ball, Whyte, and Donnelly 2010; Goble et al. 2010), curation is usually discussed in relation to data management. More explicitly, digital curation entails the management and preservation of digital material to ensure accessibility over the long-term (Higgins 2011, 79). We part ways with this data management approach in our study and rather focus on the aspects of sharing and dissemination when discussing social curation (Gaskill 2010; Liu 2010; Ammann 2011). More specifically, we set out to conceptualize social curation as a communal practice, similar to practices that characterize brand communities (Muniz and O'Guinn 2001; Schau, Muniz, and Arnould 2009). The discussion and elaboration of the concept of social curation enables to elucidate the role of consumer communities (Kozinets 1999, 259; Prahalad and Ramaswamy 2004, 8; Arvidsson 2005, 242) in the practices of distributing and marketing media content – imbuing media content with social significance – and to understand content sharing as consumption phenomena on the Internet (Belk 2010, 730).

From a technological perspective, social curation refers to the communication of media content (e.g. news and entertainment) in digital networks, in particular by using social media platforms and services. But since we are trying to contribute to a better conceptual understanding of social curation as consumption, we work towards a more sociological and cultural definition and conceptualization of social curation. On a very general level, we look into social curation as consumption of media content in online market environments. It can be viewed as a social and communicative activity through which people engage in appropriation, appreciation and mediation of digital media content, for various kinds of personal, social and political purposes (Warde 2005). Media content is put to use (appropriated and appreciated) in the course of engaging in the practice of social curation. In practice, this entails a set of sense-making and sense-giving activities that are grounded in individual and social activity (Weick 1995). These activities of the media consumers include browsing, reading, and watching interesting media content; making sense of the content by analyzing, evaluating, and categorizing; giving sense to the content by commenting, narrating, and tagging; and communicating and mediating the content by recommending, posting, and tweeting.

From the viewpoint of consumer research, the media audience cannot be regarded as a group of passive consumers, but as active participants in the processes through which value is created in the market (Potts et al. 2008; Cova and Dalli 2009, 315; Banks and Humphreys 2008; Merrin 2009). Personalized media consumption is experiencing a transition toward consumption as a networked practice (Jenkins 2006, 244). The transformations in the relationship between media producers and consumers may suggest a shift in which the frameworks of analysis and categories that worked well in the context of an industrial media economy are no longer helpful (Banks and Humphreys 2008, 402), as the consumption of media content is not restricted anymore to the reception of ready-made mass products (Chan-Olmstead 2006, 31; Livingstone 2008, 394; Merrin, 2009, 24). The industrial model of one-to-many mass consumption is giving way to an interactive model based on partnership and conversation with consumers (Hartley 2004, 6).

Despite the fact that social curation represents a strategically important change in the business environment for media companies, social curation as a phenomenon is currently inadequately understood and studied, particularly theoretically. Along with discussing the relevance and the implications of social curation for the media industry, we consider it to be important to critically refine and elaborate on social curation as a concept and a construct in consumer research. In the paper, we therefore set out to work towards a theoretically more sophisticated conceptualization of social curation, drawing firstly from the discussion on art curation.

ANALYSIS OF THE CONCEPT

The Element of Curation in Social Curation

In order to conceptualize social curation, it is necessary to pose two questions: (1) what is *curation* in social curation, and (2) what is *social* in social curation. Curation as a practice and concept has extended beyond galleries and museums into different fields of consumption in the creative industries, as the words curate and curator have become increasingly common in describing activities such as selecting and presenting (Schlatter 2010). In a sense, curation, both as a concept and practice, has gone viral.

We consider it to be important to question the rather loose use of the term curation. Conventionally, in the art world, curators have functioned as gate-keepers, as arbitrators of taste (Ames 1992), recognizing, and in some cases nurturing, emerging trends, celebrating a previously unknown artist as worthy of our attention, or delegating another to oblivion. As such, they carry a position of great trust and authority. Little wonder that the term curator, derived from the Latin word cuare, translates to *to care*. Curators care not only about a given art object, but also about how that object is perceived and experienced, and, equally important, whether and how it is remembered.

Through their exhibitions, collections, and catalogues (Lisus and Ericson 1999), art museums provide a particular vision of culture, one imbued with aesthetic value by the individual taste and

knowledge of their curators, the linchpins within the inner workings of the art world. Museums' primary mission, to bring art to the public, is carried out through the efforts of curators, who serve as mediators between the artist and the observer as they select, organize, and display art objects, siting them within a cultural and historical continuum. Through special exhibits and related educational activities, curators target a diverse audience, ranging from artists and fellow connoisseurs, to dilettantes in search of an afternoon's diversion, to tourists eager to pose before an important object, documenting their visit with a souvenir photograph.

The curators' drive to capture their audience's attention, and to leave a lasting impression, has long depended on an array of skills both broad and finely honed, with a strong emphasis on writing. Curation writing, whether a simple identifying label or a complex discussion of an object's embodiment of a specific trend, or a mirroring of social mores, offers a context crafted to pique and sustain interest. For many museum attendees, words matter: they can shape a museum experience, providing a means for understanding a given display. Is an object a variation on a theme, a continuous innovation, or a breakthrough into completely new territory? Is it a simple reflection of, or a heartfelt response to, the political realities of its time and place? The more complex the narrative, the greater the importance accorded the object, and the higher its value (Morgan 1996).

Much as research and development are critical to the strategic thrust of an organization, so is the work of curators critical to success within the art world (Joy and Sherry 2003). The heart of any art museum from a curatorial perspective is its permanent collection, with curators bearing primary responsibility for precisely what is collected, how it is classified and interpreted, and how and when it is exhibited. Curators are knowledge brokers of a specific nature, taking culture created by others, and interpreting and publicizing it for the public good.

Historically, curators have had the cultural cache to make unknown objects both known and valuable, serving as a link between art production and consumption. They have had personal and scholarly reputations to develop and sustain; as professionals, they have had to be objective in their evaluation of art, as well as of the artists and movements on which they choose to focus. Often authors in their own rights, curators have exerted a powerful influence within not only the art world, but also within the general public—one need look no farther than the scholarly, painstakingly produced catalogues, mementos of the equally scholarly and painstakingly produced shows that they chronicled, to appreciate the cultural impact curators have wielded over the years.

That curatorial role is changing rapidly, however, and concurrently diminishing in gravitas, as museums have increasingly (and, one might argue, unavoidably), become a highly theatrical hybrid form of art commingled with commerce. The once scholarly catalogues have been replaced by glossy brochures (Sandler 1996). Blockbuster exhibits, necessitated by the realities of museum finances, are becoming more common. The curators themselves, once armed with graduate degrees in the Fine Arts or related disciplines and active researchers in niche subjects, have been increasingly superseded by those more involved in overtly commercial endeavours. How to appeal to an audience with a less leisurely style of consumption, with an expectation of constantly refreshed imagery? The pull between high art and low commerce, while age-old, has escalated since the 1980s, as the art market welcomed art writers committed to research, conservation, publication, and art exhibition within a strong market orientation. As museums increasingly lack the funds to acquire new art, they often must sell objects from their permanent collections before acquiring new pieces in a bid to stay current. The

job of curators now, by necessity, includes assessing and monitoring the financial worth of museum holdings. While curators once typically were employed solely as permanent members of a museum staff, or as freelancers working with an assortment of museums, today many under-employed curators routinely also work for private investors, galleries, or auction houses to supplement their incomes. Where once a curator's job was to, in essence, protect an object from becoming a commodity, today their job is, in no small measure, to ensure that it does become a commodity, and more specifically a brand – one ideally with resale value in the museum gift shop.

There are many similarities between art curation and content curation in social media. According to Rohit Bhargava (2009), Senior Vice President of Strategy and Marketing for Ogilvy 360 Digital Influence, "a content curator is someone who continually finds, groups, organizes and shares the best and most relevant content on a specific issue online." The New York Times, which curates blog posts from outside sources, is a good example of a content curator. As Steve Rosenbaum (2009) of the Silicon Valley Insider comments about the New York Times, "what the Times knows is that content that they validate with their brand and redistribution becomes more valuable, both to readers and to the content curators." The same could be said of important curators in the Metropolitan Museum of Art, or the Smithsonian. The job of a content curator is not to create more content, but to make sense of the best and most relevant content and thereby to add a voice and point of view about existing material.

In principal, anyone who has an opinion about the value of a product and means to inform others about this and also to distribute the product itself can be a curator. However, when comparing the use of curation in the popular discourse to how it is conceived in the art context, we confront several problems with the somewhat inflated use of curation in describing content sharing online. Those who curate content in social media are not expected to use professional skills when curating content. They are not presumed to conduct research around the specific topics that they curate. In addition, they do not necessarily organize content into collections and structures, although such curation services as Storify offer the possibility to arrange online content into specific collections and create narratives that highlight the importance of the selected articles. On the Storify website (http://storify.com/tour) it is proclaimed that "Storify lets you curate social networks to build social stories, bringing together media scattered across the Web into a coherent narrative. We are building the story layer above social networks."

Professional art curation is more of a top-down process than a participatory activity. Gaskill (2010) ties social and curation explicitly together and defines the social curator as "a practitioner who seeks to contextualise fully the potential of exhibitions as structures of communication and exchange, and aims to maximise social interaction and intervention across curatorial approach, process and outcome." However, in this definition the social curator is still a (professional) practitioner, somebody who is trained to curate, not just a layperson who informs others in social media about interesting content.

According to Rosenbaum (2011, 3-4), there can be both amateur and professional curation. Social curation is about amateur curation, where the curators are ordinary consumers. Social curation is about choosing from a group of content possibilities, however not necessarily making the choices based on expert skills in, for example, art or journalism. Yet, ranking, juxtaposing and critiquing content requires some kind of knowledge, it is not an arbitrary practice. The amateurs might not be experts but they often have an educated and informed opinion, involving some accountability. However, it is

unclear what is the relevance of this element of selection and qualitative judgement in social curation from the perspective of media organizations. Does it matter if the choices made by the consumers on what to distribute entail knowledge and expertise or not? Do the media companies care, what of their content is curated as long as their content is distributed as extensively as possible? Do connections matter more than expertise? Put bluntly, a professional authority with 50 Facebook friends might be less valuable as a curator for a media company than a high school kid with 1000 Facebook friends.

Importantly, in an era of abundance of online content, amateur curation – the bottom-up or lay-curation – serves an important role in making contents both known and valuable, serving as a link between media production and consumption. Social curation is a vital filter in content consumption on the Internet. In art curation, the curator is the linchpin in a system that imbues art with aesthetic significance, and curatorial decisions can catapult an object from obscurity to public exposure (Joy and Sherry 2003, 163). In the same vein, social curation as a practice can imbue various kinds of online media content with social significance and extend the circulation of those contents.

Social curation shares characteristics with both sharing and word-of-mouth communication. According to Belk (2010, 715-720), sharing is a consumer behaviour that bears on a broad array of consumption issues ranging from sharing household resources to file sharing. In contrast to other acquisition and distribution mechanisms, such as gift giving and commodity exchange, which involve transfers of ownership, sharing is about joint ownership and mutuality of possession (ibid.). Similarly, social curation is not about the exchange or transfer of ownership, because the one who curates the digital content does not lose possession of it – she can still read the news article, for example, after having curated it. Importantly, and in contrast to sharing, social curation is pronouncedly about distribution. Curation is not about sharing the car with other family members, but distributing content forward. Curation does not represent the sharing of ownership but rather the provision of access to others.

Social curators are knowledge brokers that interpret, publicize and endorse content. Thus, there is always an aspect of recommendation involved. This links social curation with word-of-mouth (WOM) communication (Brown, Broderick, and Lee 2007; Kozinets et al. 2010). But again, the element of distribution marks the difference. In social curation, the access to the content itself is provided with the recommendation. In the online environment, it is much easier to share the (digital, Internet-based) content, not just provide verbal descriptions of it. By contrast, in WOM the content or product is not necessarily distributed, but rather only an awareness of its existence is acknowledged by means of expressing an opinion. This is comparable with how in the context of art the curator provides the content, as opposed to an art reviewer or art critic who only offers information about the content.

SOCIAL CURATION AS A SOCIAL PHENOMENON

Now we turn to discuss what is *social* in social curation. In a general sense, social curation is a social activity in that it entails communicative interactions and relationships between two or more individuals. People engage in social curation as members of particular social entities, that is, groups, communities and society, as part of a whole network of social relations. As such, social curation represents social action in the sense that it is intentional and rule governed: it is performed in order to achieve particular purposes and in conformity to some social rules, and it is this intentional content that specifies what sort of an action it is (Fay and Moon 1994, 21). Social curation becomes intelligible based on not only the intentions of the social agent who performs the activity (the intentional communica-

tion of the agent) but also based on the culturally shared or collective understandings (ideas, norms, and values) that give meaning to and thus regulate the activity (Moisander and Valtonen 2012).

As a result, the ways in which individuals engage in social curation always and inevitably reflect the social and cultural context in which they perform the activity. The cultural context in which social curation has emerged and is typically performed is the participatory media consumer culture. Social curation may thus be viewed as social and cultural practice. From this perspective, the analytical focus shifts from the particular activities and technologies to the symbolic significance and uses of social curation in consumers' everyday lives, as integral parts of consumers' everyday lives especially as members of the contemporary media culture.

As a social and communicative practice, social curation may be viewed as a discursive activity through which people make sense of themselves as individuals and members of groups, communities and society. Much like authoring personal blogs and status updates, social curation maybe be viewed as a self-defining and self-expressive behaviour: people share content that is self-relevant and help them to communicate particular ideas and images of themselves to their peers (Schau and Gilly 2003). This discursive activity may also be something that relates to people's civic engagement or political activity as citizens and members of the political society (Kozinets and Handelman 2004). The social curator thus engages in the activity of curation in the role of a consumer and citizen.

Social curation is a practice through which people construct their individual and collective identities: they engage in identity work and pursue their identity projects (Holt and Thompson 2004; Mikkonen, Moisander, and Firat 2011; Thompson and Tambyah 1999) using the complex repertoires of images, narratives, and accounts that the global mediascape (Appadurai 1990, 1996) offers as discursive resources. Through social curation, consumers thus author and elaborate on coherent "narratives of the self" both for themselves and also to their peers and social networks (Shankar 2001; Thompson 1997). Through this identity work, people not only make sense of themselves but also build and maintain their personal relationships and create a sense of belonging and community (companionship, friendship) as well as collective identity as members of their in-groups and communities (Cova 1997; Cova and Pace 2006; Muniz and O'Guinn 2001).

The purpose is to be social, in that by *curating content people maintain social contacts to other people*. Alike any form of sharing, social curation is a communal act that links people to others and creates feelings of solidarity and bonding; it is an expression of the desire for connection (Belk 2010, 716-717). In social curation, this personal connection plays an important part. It is significant that the curator is somebody familiar, with whom the audience has a personal relationship (e.g. by being friends). Alike word-of-mouth communication, social curation is based on interpersonal exchanges (Brown et al. 2007, 4). This idea is expressed well in the way Facebook stresses the social aspect of recommending: "Rather than seeing popular stories, products or reviews from people you don't know, you'll now see content that matters to you the most—from your friends" (Haugen 2010).

Recent research shows how the sharing of media content in communities leads often to the receivers actually reading, listening or watching that content (Purcell et al. 2010, 40). It can be assumed that the curated content is commonly consumed because of the personal connection between the curator and the receivers and not necessarily because of the significant content-related expertise possessed by the curating individual. As Kozinets (1999, 259) notes, in the online environment, consumers evaluate quality together and

place great weight on the judgments of their fellows. Therefore, a lot of the expertise involved in social curation is social in nature – it entails skills in maintaining relationships and nurturing the collective identity and the sense of belonging together.

IMPLICATIONS FOR THE MEDIA INDUSTRY

Our conceptualization of social curation opens up a number of research questions concerning the role of social curation in contemporary marketplace and consumer culture, in particular in the context of the media industry. Media consumers share media content, but they also share their media consumption experiences and especially the choices concerning which content they have decided to consume. In our research, we are especially interested in the implications of social curation for media organizations.

The backdrop for social curation is that, because of digital networks, media contents are in constant flux. Manovich (2008, 203) uses the term media mobility to describe a state where media contents never arrive at some final destination, as in the mass communication model. Instead, they continue to move between sites, people and devices, and as they move, they accumulate comments and discussions (ibid.). Similarly, Jenkins (2009) uses the term spreadable media to describe how the digital networks facilitate the sharing of contents (see also Terranova 2004, 2). What the Internet-based social networks have had an effect on are precisely the abilities of people to distribute content; because of the new communication platforms and services, the audience can now have an audience (Napoli 2009, 2010). Social curation is well attuned to the nature of the Internet as an environment that enables efficient horizontal communication between consumers (Lüders 2007, 194-195).

According to Marshall (2009, 81), the successful operation of the media industry is in fact as much about media production, as it is about facilitating the maintenance of social connections though content sharing and communication among its consumers. Pre-existing social networks are becoming fundamental to the sustenance of media, and therefore the media companies need to acknowledge the convergence of media and communication, where the social and communicative (interpersonal) dimensions have invaded, informed and mutated the media elements. When in the traditional model of mass communication, a newspaper or a television company created the value to the product without consumer involvement, the value is now increasingly created as consequence of the process of nurturing the activities of media consumer communities (Bowman and Willis 2005, 10) and the careful cultivation of consumers' narrative networks (Kozinets et al. 2010, 87). This outlook is characterized in how, instead of audiences, media businesses today, indeed, talk about networks (Deuze 2009, 152).

Also Jensen (2010, 14) proposes a shift of focus from media to communication when studying the media consumption – an agenda emphasising the recombination and reconfiguration of one-to-one, one-to-many and many-to-many communication. Media consumer studies should shed more light on the links between consumption of mass media, interpersonal communication and networked communication. The significance of media use does not remain on the individual level alone but it flows from the personal media consumption toward more collective experiences and social sharing. (Heikkilä et al. 2011.)

With this progression as a setting, our argument is that social curation is an important means for media organizations to a) connect with consumers and b) utilize the interpersonal networks in consumer communities in distributing and marketing their content. Available research indicates that social media is already an important channel for obtaining more readers, listeners and viewers for the online content produced by the media companies (Guo and Chan-Olmstead 2011; Hermida et al. 2012). For instance, in Britain the BBC, Financial Times, Guardian and the Economist have seen a sharp rise in the number of referrals from Facebook, Twitter and other social networks. In fact, search engines are being partly replaced by the social media as a portal to news and other information. (Newman and Dutton 2011.) Media scholars (Domingo et al. 2008; Thurman 2008; Wardle and Williams 2010; Qing and Hollifield 2011; Lewis 2011; Hermida et al. 2012) have argued that for contemporary media corporations, engaging, encouraging and assisting consumers in the circulation and distribution of media content is more important than having them participate in content production with or for the companies. Thus, a key challenge for the media industry consists of tapping into the social and community dimensions of the participatory media culture.

Cars for Sale! An Ethnography of the Collusion of Space and Consumption in Power and Agency Struggles

Helene de Burgh-Woodman, University of Notre Dame, Australia

INTRODUCTION

The importance of space and its "perception-shaping, behaviour-inducing properties" (Sherry 1998) has been long acknowledged by consumer researchers. Public spaces such as shopping malls (Sandicki and Holt, 1998), bridal salons (Otnes, 1998), and converted shopping centres (Maclaren and Brown, 2005) have all been investigated as spaces where meanings are unravelled, contested and entertained. Equally, spaces play out emotive experiences such as escape (Hewer, 2003), utopia and nostalgia (Maclaran and Brown, 2005). Adding to this important opus, the present paper investigates public space as a site of contested power and agency manifested through consumption. The use of public in this context means a "realm in which people define themselves as publics, through ongoing communication, definition and negotiation" (Sargeson 2002, 21).

Using the case of impromptu car yards where private cars for sale are illegally congregated in one space against local council laws and regulations, this paper theorises public space and consumption as interwoven in a larger discourse of power and agency (Visconti, Sherry Borghini and Anderson 2010). Space, in this instance, lays the ground for alternative consumption, sharing (Belk 2010) and exchange which defy the structures of the formal "marketplace" and contest the power held by legal and political entities (Campbell 2005; White 2007). While public space in modernity is ordered and managed by political and cultural entities such as councils, governments etc, space also "complicates the assumption of a collective experience of culture and its products" (de Burgh-Woodman and Brace-Govan 2010).

This paper uses the work of Henri Lefevbre (1974) to theorise the collusion of space and consumption to express power and agency struggles between people and formal structures. In this respect, the present study extends previous use of Lefebvre's (1974) work in consumer research (Houliez 2010a 2010b) and urban studies (McCann 1999, 1995). While previous work has illuminated the importance of spatial practices and negotiating processes by consumers, this paper advances on this use of Lefebvre by situating space and consumption as two collusive channels to agency and dissent. While space creates a context for an alternative site for consumption, more significantly it is the sense of political and social agency that space facilitates that concerns us here. In this respect, this paper draws on previous uses of Lefebvre's work in studies of the urban milieu and racial inequality (McCann 1999) where

> "abstract space", - space represented by elite social groups as homogeneous, instrumental, and ahistorical in order to facilitate the exercise of state power and the free flow of capital – lends itself to a discussion of the manner in which downtown business spaces in major U.S. cities are exclusionary territories dominated by White, middle-class male (McCann 1999: 164).

By contrast with concrete space (or everyday life), abstract space is a hegemonic space, a space loaded with representations of control, power and domination. In the same fashion that Lefebvre's work has been used to dissect this construction of space and subvert abstract space in favour of agency over space, this paper looks at power and agency struggle in space. This paper aims, through the study of these self-fashioned "car yards", to show how space both contests and is contested (Lefebvre 1974), how consumption outside

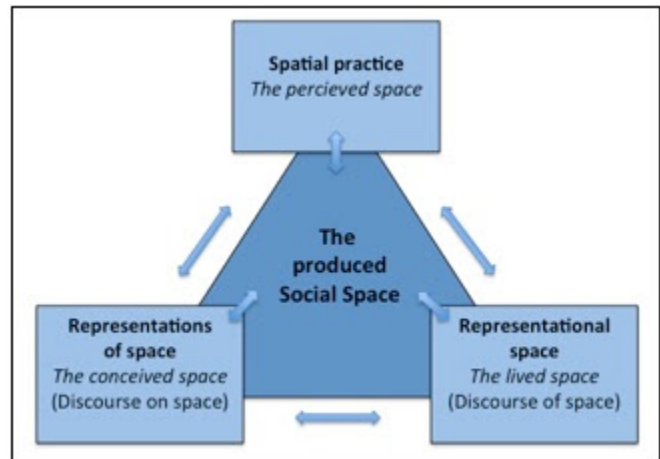
of the designated marketplace utilises space and finally what implications this has for embedded understandings of power and agency.

The paper commences with a conceptual framework that draws from Lefebvre's (1974) theorisation of space as an inhabited yet contested site which lays the ground for understanding how space is integral to consumption, contest and agency practices. This is followed by an outline of the method employed and a discussion of its implications. Finally, some concluding comments are made regarding how consumption and space collude to create the conditions for the expression of power and agency struggles.

CONCEPTUAL FRAMEWORK

The theoretical framework for this paper draws from the work of Henri Lefebvre (1974). Lefebvre's argument that space is socially constructed and thereby imbued with politically and socially meaningful values and symbolisms is resonant for the present study. As a French sociologist writing primarily in the mid-twentieth century, Lefebvre's identification with a Marxist perspective led to his conceptualisation of space as a social enactment of political and social ideologies (Stanek 2011) and thereby to his key distinctions between dominating (those with power) and dominated space (those over whom power is exerted). Echoing Marx's own distinction between the powerful and the powerless or bourgeois and worker, these categories of dominating and dominated found in social space are, Lefebvre argues, endemic to contemporary capitalist society.

Lefebvre outlines three different kinds of space operating in the contemporary environment. Implicit in his conceptualisation of space and his representational space triad of *perceived space* (spatial practice), *conceived space* (representations of space) and *lived space* (representational space) (Zhang 2006) is its positioning of space as a site of control and contestation (see Fig.1)

Fig. 1 The Spatial Triad Taken from Jensen 2011


These different kinds of space should not be seen as discrete but rather as merged, iterative and free-flowing where "it is necessary for the interactions between the triadic elements to be appropriate and in balance if an [spatial] event was to be persuasive and effective" (Watkins 2005 220). Space is not passive or latent. It is inhabited (itself a consequence of modernity), constructed and produced or " seen as the site of ongoing interactions of social relations rather than

the mere result of such interactions" (Zhang 2006 219). In the process, it is controlled, manipulated and politicised:

> (Social) space is a (social) product... the space thus produced also serves as a tool of thought and of action... in addition to being a means of production it is also a means of control, and hence of domination, of power (1974, 26)

In many ways, Lefebvre's concern with agency and "central planning's ensuing depoliticization, fragmentation and segregation of 'possible communities', in other words, the very denial of every citizen's right to the city as ongoing communal project of co-habitation" (Knoll 2012) finds increasing relevance in contemporary consumer research. While Lefebvre's own consideration of how the dominated might resist or find legitimacy in the face of the dominating stemmed from his experience of the WWII, the May 1968 demonstrations and the reality of communist Russia, his fundamental insights into everyday life as the real battleground for the dominated and their expression through space are echoed in consumer research studies.

While space is not always discussed in such studies, research into areas such as consumer resistance, anti-consumption and subcultural appropriation illuminate similar concerns with the agency of the consumer and the effort to subvert or avoid perceived power structures. For instance, anti-consumption is frequently understood as an active ethical, social critique of, and dissent from, exploitative or excessive aspects of the marketplace and its accompanying consumer culture (Cherrier, 2009, 2005; Penaloza and Price, 2003; Zavestoski, 2002) that result from the capitalist logic that frames our modern world (Jameson, 1991). The situation of a mainstream capitalist culture as the point of critique and dissent implies the same issues that Lefebvre plays out through the dialectic of space. They share in a wariness of cultural meta-narratives, a desire to reclaim the social sphere and highlight the importance of community over structures. Lefebvre sees this contest unfolding through and in space.

Thus far, the canon of consumer research has seen this contest unfold through consumption and, by extension, community (Arnould, Price and Otnes 1999; Belk and Costa 1998; Hewer and Brownlie 2007; Holbrook 1993; McRobbie 1995; Penaloza 1994; Thornton 1995). These two axes, consumption and community, have direct relevance here too. While space may be the site of contestation, it is at the level of community that dissent is enacted *in* space. Just as community also resides at the centre of Lefebvre's work (Stanek 2011), the consumer research canon has illuminated the fine detail of how communities, and the social networks that underpin them, enable active dissent. This paper endeavours to bring these threads of space and consumption through community together, showing them to be linked in a shared outlook and agenda.

While there are many variations of this critical negotiation between people and the marketplace (Etzioni, 1998; Kingsnorth, 2003), which have also linked to other issues such as environmental sustainability (Dobscha and Ozanne, 2001; Leonard-Barton, 1981), excessive consumption (Craig-Lees and Hill, 2002; Shaw and Newholm, 2002), class inequality (Tomolilo and Shaw, 2003),ethical consumption (Borgmann, 2000; Cherrier, 2004) and space itself (de Burgh-Woodman and Brace-Govan 2010), the common thread is a fundamental emphasis on critique of the status quo and divergence through defiance. Taking these significations of critique, agency and dissent as definition and praxis, space and consumption collude to become a mode of expression and the context through which critique (both of structure and capitalist logic) is spoken. These significations underpin the point of dissent for geneses of alternate (cultural) consumption discourses.

In following this structuring of space and consumption as a collusion of critique and

dissent from the logic of late capitalism (Jameson, 1991), we move again towards Lefebvre's work that positions space as something that structures the mode of expression of structural domination and everyday consumer resistance. Space, consumption and consumer defiance intercept, since one speaks to another, and thus consolidate their connection. To this extent, this paper suggests that this mutual re-enforcement of space and consumption can be a pervasive, subtle tool for agency interpolated with the lived experience.

METHOD

The site of the impromptu car yard is at Forrester's Beach on the Central Coast, one hour north of Sydney, Australia. Forresters forms the site of analysis although it should be noted that these impromptu car yards are also emerging in Sydney itself and at other locations around the Central Coast. The Coast's demographics range from low socio-economic suburbs such as Toukley and Umina Beach through to very wealthy areas such as Pearl Beach and Daleys Point where homes sell for several million dollars. To this extent, the practice of curbside car selling takes in a spectrum of social groups and a range of cars. The cars for sale are found on the side of the road with "for sale" signs hung on their windscreens (see photo 1 and 2). Occupying large stretches of road, these impromptu car yards can go for several hundred metres. The cars themselves reflect the diverse socio-economic scale of the area with everything from old vehicles through to new SUVs appearing on the side of the road.

The method adopted for this research was an ethnographic field diary documenting shifts in the composition of cars combined with a photographic record (Penaloza and Cayla 2006). The synergy between the field diary and the photographic record was designed to enable a thick description (Geertz 1973) of the car selling phenomenon. The research commenced with a three month long field diary in Summer 2011, noting the number, type and price range of the cars for sale at Forresters. Along each of these dimensions, significant growth was observed over this period, thus indicating a growing civic swell around the impromptu car yard see Fig 2.

A visual record was maintained through photographic material. Secondary material was also consulted including media coverage of the issue since there has been reportage driven by local council and law enforcement. The response by law enforcement and council in popular press is significant in that, from the perspective of authority, this is not a neutral practice that goes unseen. Further material including council regulations and laws were also consulted.

Once the visual and secondary data was collected, the interpretive framework derived from Lefebvre's theoretical distinction between dominating and dominated space (1974) was applied to sift the political, agentic and power struggles that emerge out of the use of space.

The possibility of gathering first hand qualitative data was compromised by the unwillingness of both buyers and sellers to be interviewed. Given that this practice is essentially illegal, neither group was willing to comment on their involvement in curbside car trading. This is significant in itself in that participants are aware of the political, legal and social dimensions of their acts, realising that they are participating in a subversive act of defiance as much as the act of buying/selling a car. Hence, this adds further strength to the argument that the practice of curbside buying/selling can be seen as a symbolically and politically inflammatory act played out as the nexus of consumption and space. However, some degree of insight was offered through an online forum. This forum is interpreted and

discussed below where the use of space and consumption to express agency and dissent are illuminated.

DISCUSSION

The use of a roadside to sell private cars seems an innocuous act but its political and cultural resonance is immense. In the first instance, the physical location of cars illegally placed on the roadside represents a being *in* space, an act of liminal physicality that locates objects in illicit space for exchange and consumption. The means of contacting the owner is by ringing the advertised phone number since being found on-site by police or council rangers would result in a fine. Sellers would also be required to remove their cars from the curb. The act of dissent against existing power structures is enacted physically - in space. But space also mediates, it acts as the intervening buffer between owner and authority and, in doing so, facilitates the dissenting act. To this extent, space is complicit in the contestation of power and agency.

Equally, space and consumption are linked where consumption occurs in space but also *through* space. The many acts of exchange that occur at the site are only made possible through a collective understanding and use of the space. By extension then, space makes possible an alternative marketplace that again challenges power and agency structures. The dynamics here are quite complex in that when space and consumption collude, this prompts commentary and reaction from councils and law enforcement. The New South Wales Government passed its Roadside Vehicle Sales Bill in 2011 outlawing the practice of roadside selling and imposing fines, removal and cautionary notes. Most local councils were quick to adopt the bill and galvanise it through local bylaws. This legislative act refracted an "official" responsiveness at the level of government (filtering down to local authorities), demonstrating an administrative or policy

action against a "social problem". Yet, at the level of real spatial practice or lived space, there is no human body, no face to prosecute and the "rule of law" is rendered inert in and by space.

While it was challenging to collect interview data for this study (precisely because the one protection consumers have in this battle between dominating and dominated space is invisibility), this one trace of an online discussion (that will remain unidentified) illuminates the self-constructed tactics that these consumers enact. The thread also reveals the almost subcultural or guerilla community of illicit car sellers and the common concern with dissent. The thread starts by a forum discussant asking:

> Is it legal to sell a car on the roadside in NSW? I am considering parking my car on a grassy verge beside a busy road (I'm guessing it is council land). Just checking to see if anyone else has experienced any issues doing this.

This initial inquiry releases a series of responses that show how the boundaries are tested, the parameters are deliberately left unclear and though forum members frequently advise one another to check with council, none of them do. The ambiguity of practice, ambiguity of governmental response in lived space and the latent tensions that underpin this practice propel dissent where to clarify the parameters potentially threatens action:

> There used to be quite a few regular spots people did it all around it seemed years ago but alot of those are now fenced and signed by Council telling you not to. It was my understanding it wasn't actually legal to sell your car on the side of the road anymore but alot of people still do, you just have to pick a spot

Fig 2. Trajectory of car numbers over a three-month period

Date	Car details
4.12.2011	16 cars (mainly priced under 10000AUD) majority are small to medium sedans
16.12.2011	14 cars (mainly priced under 10000AUD majority are small to medium sedans)
22.12.2011	14 cars (mainly priced under 10000AUD majority are small to medium sedans)
27.12.2011	21 cars (slight increase in cars over 100000AUD and a more noticeable number of SUV/ute)
	* In general, the calibre of cars was basic. While there were some newer cars SUV/ute and sports models, the majority during the month of December were slightly older small to medium sedans and hatchbacks. The most expensive was a relatively recent Commodore (GM) priced at 18000AUD.
3.1.1.2012	23 cars (mainly priced under 10000AUD but with a steady number of SUV/ute along with small to medium sedan)
9.1.2012	28 cars (mainly priced under 10000AUD but with a steady number of SUV/ute along with small to medium sedan)
14.1.2012	29 cars (mainly priced under 10000AUD but with a steady number of SUV/ute along with small to medium sedan)
25.1.2012	31 cars (more priced over 10000AUD with steady number of SUV/ute, more sports and small/medium sedans)
30.1.2012	32 cars (more priced over 10000AUD with steady number of SUV/ute, more sports and small/medium sedans)
	*In general, the calibre of cars improved in January with a greater number of more recent models, SUVs and sports cars being placed on the side of the road. The most expensive car for sale was 41000AUD for a Nissan convertible.
3.2.2012	36 cars (a steady number priced over 10000AUD with a greater number of SUV/ute and steady sedan numbers)
10.2.2012	31 cars (a steady number priced over 10000AUD with a greater number of SUV/ute and steady sedan numbers)
14.2.2012	31 cars (same 31 cars as 14.2.2012)
22.2.2012	28 cars a steady number priced over 10000AUD with a greater number of SUV/ute and steady sedan numbers)
27.2.2012	33 cars a steady number priced over 10000AUD with a greater number of SUV/ute and steady sedan numbers)
	*In general, the caliber of cars stayed the same for February. The most expensive car for sale was a Toyota Prado priced at 53000AUD but this was unusually expensive. Every other car was under 35000AUD.

Picture 1

Picture 2

that isn't going to end up in peoples or the councils way. I could be wrong but…

When one forum member directly asks another whether they have called council, the response deliberately perpetuates this ambiguity, noting "I've been busy travelling interstate over the past few days, when I get a chance I'll call the local council and ask them what their policy is. Cheers!" The thread goes for several more days but no report back on the call to council is recorded.

While this question of clarifying goes deliberately untreated in the thread, the conversation about dissent and which spaces best facilitate dissent dominates the discussion.

> my local councils dont like it, but pretty much can only do something about it if you illegally park – for that it means not parallel to the roadway. If there is a spot that people use regularly, then you can bet they are not fining people for doing it at that spot. I sold mine on the side of the rd – it was parked parallel to the roadway without a big sign (there are signage by laws for council too). because of the spot – it was clearly a for sale car, and anyone interested could walk up to it and get the details. (stood for 2 weekends – 2 test drives, then sold).

A similar theme is reflected in the comment of "Not sure of its legal implication but I see cars parked on the side of road regularly with for sale sign + prices attached to the inside of the windscreen. I have even seen trucks and trailers." In both of these comments, the authors demonstrate an awareness of their resistance to local authorities that "don't like" these impromptu caryards but use space to mitigate the risk of prosecution. Forum members are aware of the potential consequences with several mentions of fines, towing and cautionary notices but employ a spatial strategy to elude prosecution. The "side of the road" in both comments represents a safe space as long as the space is organised strategically against legal structures. The comment from another discussant also captures this strategic use of space:

> It will all depend on local council, some care others don't. If its a place where many cars are sold every weekend then its probably safe to assume that they aren't booking people for it. If there are no other cars being sold in the suburb then it probably means they give tickets.

This comment is more explicit in showing the game or contest played out through space where both dominated and dominating utilise space in their struggle. Interestingly, at no point in the thread are actual people ever discussed as present at the impromptu caryards. The cars, their location and their strategic arrangement are all mentioned but the only reference made to real people using this space is the comment "anyone interested could walk up to it and get the details". Even in this remark, the physical presence of the consumer is only required to gather details. The seller is absent, waiting for the buyer to create a second space in which the sale takes place. However, this transactional space is separate from the curbside space of contest and dissent.

So, the car yard is a guerilla space, an alternative market that trades on collective agency or, to borrow Lefevbre, a reclamation of dominated space. Space then operates at several levels – as a site, as a facilitator for consumption and a field for contest. Equally, consumption acts in space, through space and colludes with it to enact contest. In this respect, while this struggle between dominating and dominated does not tangibly occur in lived space (only the cars are present), this power struggle is enacted through both perceived and conceived space in that this struggle is represented in and through space.

CONCLUSION

The aim of this paper is to theorise the collusion of space and consumption as implicated elements of contest, agency and power. Space contextualises consumption, provides it with tangible form and, in this case, allows alternative consumption acts and exchanges to take place. Our consideration of impromptu caryards as a means of analysing agency and power struggles through consumption takes a step towards expanding our understanding of how space and consumption collude as a strategy of critique and divergence and a modality for consumer resistance is animated. The most salient point to be taken from this study is that while consumption itself can be situated as a discursive strategy and practical tactic of resistance, the role of space becomes implicated as the context for such resistance too.

This paper shows one instance in which space is enlisted to articulate a specific political critique or show of consumer defiance. In the introductory remarks, space and consumption were identified as collusive elements in an active defiance of laws and regulations. By way of extension, this paper concludes that space and consumption provide a modality of critique or resistance and a consequent point of divergence. Seen in this way, space and consumption can be strategically enlisted as a broader critique of modern capitalist culture and its attendant restrictions, controls and politics.

Here, consumption provides the language of critique, a referential discursive frame upon which communities call to articulate their specific form of critique, resistance and divergence. If we expand our understanding to apprehend space as a framing logic and as critique's ordering effect (or as Lefebvre suggests, society produces its own specific space) we might also come to see space and consumption as mutually implicated in the articulation of various cultural interactions in a modern capitalist world. This potential of consumption to mediate, and be mediated by, social space specific to the cultural conditions of modernity makes it an exciting site for marketing investigation.

In Pursuit of Being Different

Andrea Hemetsberger, University of Innsbruck, Austria
Ralf Weinberger, University of Innsbruck, Austria

ABSTRACT

This study assumes that individuals' desires for autonomy as well as concessions to conformity inform consumers' attempts to create consumption styles that are different. Our interpretive study investigates into male consumers' pursuit of being different and finds willful ignorance, non non-conformity (*provocative conformity, wearing the old and outdated, consuming the ugly*), and defamiliarization practices (*delocalization, delabeling, contrasting personal practice*) of individualization. We introduce the notion of *Anders-sein*—a hybrid but distinct form of identity construction via fashion and lifestyle that we interpret as existentialist.

INTRODUCTION

Consumers want to be unique. In seeking individuality, consumers use marketplace offers in various ways to pursue a distinct lifestyle (Arnould and Thompson 2005), including social status consumption (Thompson and Tambyah 1999; Bourdieu 1984,1986; Veblen 1899), uniqueness and counter-conformity (Nail 1986; Tian, Bearden and Hunter 2001), alternative (Arsel and Thompson 2011), and resistant forms of consumption (Thompson and Haytko 1997).

According to Tian et al. (2001) public recognition of taste drives the consumption of counter-conform items. Apart from demonstrating self-directedness, counter-conformity seeks to prevent pigeon-holing (Thompson and Haytko 1997), or marking as one of a kind (Tian et al. 2001). Further theorizations on uniqueness have portrayed anti-conform behavior as individual authenticating acts. Lipovetsky (1994) argues that a multitude of fashion consumption practices are informed by a 'taste for autonomy' rather than social differentiation.

However, in pursuit of differentness and uniqueness, consumers oftentimes conspicuously end up in sameness, or worse, conformity (Arsel and Thompson 2011). Literature offers several explanations. First, society rewards conformity more than differentiation (Snyder and Fromkin 1977). Transgressions of boundaries of legitimate consumption choices and behaviors (Rinallo 2007) might lead to social sanctions, which consumers try to evade (Ourahmoune and Nyeck 2008). Second, critics of consumer sovereignty uncover independence as a myth arguing that consumers are hardly free from market influences (Caruana, Crane and Fitchett 2008, Holt 2002, Thompson and Hirschman 1995), and unable to adjust to fragmented styles and rapid fashion cycles (Rocamora 2002).

In the context of fashion consumption, Chan, Berger and Boven (forthcoming 2012) recently showed in seven experimental studies that consumers can satisfy desires for assimilation and differentiation, both, within a single choice context by satisfying different motives on different choice dimensions. Previous research has typically studied these assimilation and differentiation motives in isolation, or from a one-dimensional perspective, Chan, Berger and Boven (forthcoming 2012) rightly criticize. This study picks up the thread, and extends their claims from a micro- towards a meso- and macro perspective of social conformity versus the pursuit of individual autonomy within mass-marketed domains of consumption. Consequently, we assume that both, concessions to conformity as well as individuals' desire for autonomy, inform consumers' attempts to create unique consumption styles.

To support our assumption, we first review current theory on conformity and uniqueness, and discuss it against the background of the philosophy of human existence. We investigate into consumers' pursuit of being different in the context of fashion consumption of male handbags, and interpret this consumption style as paradoxical, non non-conform. We introduce the notion of *Anders-sein* to denominate this phenomenon of a hybrid but distinct form of identity construction.

THEORY

Being different and being the same

Consumer attempts of differentiation and adapting to common fashion styles can be placed in a broader context of identity construction. In his seminal works on aesthetics, for instance, Simmel (1905/1995) asserted that people as social beings are driven by two oppositional forces—belongingness and differentiation. These sociological interpretations of identity construction are mirrored in social psychological concepts of conformity and uniqueness.

Literature differs in explanations of why individuals want to be unique. Berger and Heath (2008) succinctly summarize motives for divergence driven by low-status others, by disliked others, or even by similar others, when too much similarity leads to negative emotional reactions. Some people feel a stronger need for uniqueness than others, experience a decline in self esteem and feel bereft of their identity when similar to others (Tian et al., 2001; Snyder and Fromkin, 1980). Fromkin and Lipshitz (1976) characterized uniqueness prone people as independent, nonconforming, and inventive. In fashion contexts, particularly fashion innovators and opinion leaders rate high on uniqueness scales (Workman and Caldwell, 2007). Thompson and Haytko (1997) noted that the desire for consuming differing fashion items is rooted in the resistance to fashion conformity, which is deeply embedded in Western consumers' values of being a self-directed individual. Public recognition of taste drive the consumption of counter conform items. According to Tian et al. (2001) counter conformity relative to conventional behaviors, possessions and taste notions evince uniqueness and differentiation. The authors identified three dimensions of the pursuit of uniqueness—creative choice counter-conformity, unpopular counter-conformity, and avoidance of similarity. Creative choice counter-conformity refers to the consumption of novel, unique and original products to create social distinction. Such consumption bears comparatively low risk and is considered a good choice amongst others, eliciting positive evaluations by consumers' social environment (Snyder and Fromkin 1980). Unpopular choice counter-conformity, on the other hand, represents high risk consumption as it deviates from social norms and conventions. Consuming socially illegitimate objects may even elicit social sanctions. Nonetheless, consuming the unpopular also creates an enhanced self and social image. Avoidance of similarity refers to the discontinuation of items considered as mainstream or common on the account that these objects are no longer available to generating uniqueness. Fashion innovators dispose items attracting style copies or fashion followers as they violate their standards of individuality and uniqueness (Workman and Caldwell, 2007).

Further theorizations on uniqueness have portrayed anti-conform behavior as identity signaling and individual authenticating acts. Identity-signaling reflects individual's attempts to avoid sending undesired identity signal to others. People diverge from mainstream consumption patterns to ensure that others understand who they are (Berger and Heath 2007, 2008). Authenticity quests in con-

sumption refer to the generation of a genuine self. Strong quests result from authenticity threats emerging from a postmodern consumer society (Rose and Wood, 2005; Firat and Venkatesh, 1995). Thompson, Rindfleisch and Arsel (2006) assert that these threats for the authentic self are born out of the increasing homogenization of consumption in consumers' everyday lives. Authentication strategies in consumption thus reflect defense strategies against mass production and consumption, standardization, or popularization of consumption activities (Arsel and Thompson 2011, Beverland and Farelly 2010, Rose and Wood 2005). Arsel and Thompson (2011), for example, highlight how high status indie music consumers authenticate their music consumption through strategies of demythologization to protect themselves against popularization.

Counter-conform fashion consumption could also bear activist purposes of trying to change the moral and ethical conceptions of other consumers. Thompson and Haytko's study (1997), for example, shows that consumers resist particular fashion aesthetics and fashion brands so as to demonstrate what they are *not*. Goulding and Saren (2009)'s study exemplifies how self styling within the Goth subculture constructs individual aesthetic appearances through rebellious and provocative behavior as well as highlights differing individual aesthetic style projects within an aesthetic subculture.

Critics of consumer independence problematize independence as a myth arguing that consumers are hardly free from being subjected to any market influence, guidance, or control of other people (Caruana et al., 2008; Holt, 2002; Thompson and Hirschman, 1995). Consumers can only revert to the similar, limited, and increasingly globalized choice of market offerings in their consumption activities. Although independence from the market system is often thematized in the context of emancipatory and resistive consumer action (Kozinets and Handelman 2004, Kozinets 2002), researchers still assume only partial or temporal escapism until markets have re-conquered escapist consumptionscapes (Kozinets 2002, Holt 2002, Caruana et al. 2008). Caruana et al. (2008) and Schouten and McAlexander (1995) conclude that outcries for consumer autonomy and independence reflect market discourses, which, in the end, dictate how independence and differentiation from mainstream conventions need to be performed thus, contradicting independence.

Fromkin and Synder (1980) maintain that society, in general, rewards conformity and the refusal of differentiation more than differentiation and anti-conformity. On that account, conformity is the rule rather than the exception. Simmel (1905/1995) detects people's desire for being different relative to others in people's little, inconspicuous reworking and alterations of dresses to display the individual, differing character of personal fashion. Ourahmoune and Nyeck (2008) describe male's concealing and clandestine consumption of items considered as illegitimate for males. Males hide their boundary crossing consumption of lingerie due to fears of stigmatization. Rinallo (2007) discussed the oppression of individuality in favor of conformity and found that consumer's immediate environment sets boundaries of legitimate consumption choices and behaviors. Transgressing these boundaries leads to social sanctions from the immediate social environment, which consumers try to evade and mitigate by relapsing into conformity.

Human existence and individuality

When we critically review different strands of literature we necessarily come to the conclusion that what seems contradictory, might eventually be just two sides of a coin. While we see the importance for analytical distinctions and the need to investigate conformity as well as individuality, here we aim to re-integrate two theoretical concepts that belong together when viewed from a biographical perspective of identity construction. In our search for an integrated conceptualization, we review important philosophical notions of human existence and individuality.

Talking about identity construction necessitates an understanding of both, human identity, and how it is constructed. Sartre partly accords with Marx in that he views human creative acts as constituting element of human being (Sartre 1989/2011). In criticizing the traditional view of a single, coherent and stable individual subjectivity (the Cartesian cogito) in the 18th century, he accords with other existentialists (cf. Søren Kierkegaard, Karl Jaspers, Martin Heidegger, Friedrich Nietzsche, and Maurice Merleau-Ponty) on the superiority of existence (*Existenz*) over substance (*Wesen*). Hence, *becoming* is a life-long endeavor without end yet, accompanied by a never-ending search and pursuit of being (*Sein*). Whereas Merleau-Ponty (1945/1974), later, postulates that human existence is unthinkable without existence in the lifeworld (*Lebenswelt*), Sartre speaks of *pour-soi* of human consciousness, which is different from any notion of person or individual ego but simply *Sein*. The conscious being, as such, lives in a constant yearning for something which is not (yet) (Sartre 1943); human beings develop life projects, live for something to happen in the future or in relationship to their past. Human existence is everything that is possible; that I could eventually be. Human beings are never fully what they are and constantly desire for being. This is why and how we construct ourselves. Yet, human consciousness is not just *Sein* as *Sein* but radically complicated through the existence of the other (human being) through which the I becomes an object. We need the other existence in order to comprehend what we are. Similarly, Merleau-Ponty (1945/74) contends that we are in the world, there is no human existence except in the world around us, and we are as we perceive ourselves within the world.

For most people and for most of the time, people take for granted the conditions of their existence and their concomitant identities (Shankar, Elliott and Fitchett 2009). This implies that there are people and there are times when we consciously reflect on our existence, how the other views and influences our consciousness of being; we develop and pursue life projects, and different styles in an attempt to become what we aspire to be. Moving from Merleau-Ponty's Being-in-the-world to a Deleuzian Being-for-the-world, contemporary philosophers, such as for instance Schirmacher (1994) focus on the self-generative powers of the human being. His *homo generator* (the art of giving one's life a certain, distinct form) provides a model for the question of how the art of living could be envisioned; an art of living which makes use of different methods of self transformation and takes to heart Nietzsche's premonition that we need to "give style" to our existence (Koppensteiner 2009).

Based on these philosophical groundings two different explanations for the need of individuality permeate the literature. One is that we want others to understand who we are; the other is that we ourselves want to understand who we are (through ourselves and through others). Our main argument here is that we cannot pursue one without the other. We adopt a view that accepts the juxtaposition of both, the human existence and the other, not as a contradiction but as a paradox instead that needs no solution.

METHODOLOGY

In the present study we employed a variety of qualitative and interpretive methods. The data were collected with phenomenological interviewing (Thompson et al., 1989), participant observation, and diary research (Alazewski, 2006) among male fashion consumers in Central European cities. Our purposive sampling followed the principles of criterion sampling (Patton, 1991), which focused on the phenomenon of boundary-crossing male handbag consumption,

where handbags are reflective of the aesthetics of female handbags. Aesthetic phenomena in urban areas, particularly fashion related ones, are subject to certain contemporaneity and similar emergence across different locations (Eicher and Sumberg, 1995), which allowed us to sample in different urban locations. We sampled in several cities in order to level out local occurrences endemic to a particular urban environment, such as local trends or local fashionistas. Respondents were sampled in smaller (from 130.000 inhabitants) and larger European cities (up to 1.3.mio inhabitants). Theoretical saturation (Goulding, 2005) was achieved with 14 respondents. The sample yielded a wide range of different fashion appearances, aesthetic understandings, interests and occupations, ranging from company owners, students, employees, designers, editors to social workers and teachers, thus demonstrating the demographic heterogeneity of the limited number of consumers engaging in male handbag consumption. Despite these vast differences, an astounding similarity of self reflection and consumption patterns underlie their different styles.

We developed our study in a two step process. The first step involved observation of handbag consumption in different locations so as to understand why and how this would be different from common male bags. We, then, approached male consumers either online or directly on the streets in urban areas. People, who agreed to participate in our study, were provided with a diary. We asked them to freely write report not just about their particular handbag consumption but also their fashion experiences and related thoughts for a period of two and a half to three weeks. In addition, we asked participants to take pictures of items they evaluated as aesthetic, and characterize their style.

In a second step we conducted phenomenological interviews (Thompson et al., 1989) with the participants at their homes or in their offices. The long interviews and the trips through their homes and offices informed us about the respondent's life biographies, the different aesthetic styles they developed, and their consumption patterns. We further included questions focused on societal changes and general opinions, specifically with regard to boundary-crossing topics. Diaries were used to identify additional important topics and stimulated stories and narrations about respondents' reflections and developments of aesthetic styles. Photoelicitation (Heisley and Levy, 1991) additionally supported our attempts to gather a rich data set on boundary-crossing aesthetic consumption.

Interviews accumulated to a total of approximately 30 hours of recorded information. The interviews were transcribed and subject to a hermeneutical interpretation (Thompson and Haytko 1997). The hermeneutic analysis proceeded from idiographic analyses to cross-case analysis and the development of themes that permeate the stories of our informants (Goulding 2002). We applied constant comparative method of interpretation (Charmaz 2006), based on literature in the area of gender-related consumption, aesthetics, fash-

ion, uniqueness and conformity, and philosophy. Additionally, diary entries helped us with the development of our interpretations in a constant discursive interaction among researchers.

FINDINGS

Some consumers are *anders*. Their style irritates. We present our findings according to three paradoxical practices of *willful ignorance*, *non non-conformity* and *defamiliarization* that aim at distancing themselves from societal conventions in various consumption domains; they reflect personal life projects and convictions about how to make sense of these domains in life.

Willful ignorance

Willful ignorance depicts the deliberate avoidance of signifiers of prevailing tastes and ideologies (Gould et al. 1997). Whereas willful ignorance characterizes various consumption cultures (Schouten and McAlexander 1995, Goulding and Saren 2009, Muniz and O'Guinn 2001), we found that our respondents ignore mainstream on a broader scope, which surfaces in a plenitude of life aspects that are subject to boundaries of legitimate consumption. Ignorance manifests, for instance, in fleeing from societal blueprints of gender, family life, relationships, or profession. One of these societal blueprints concerns common gender concepts and traditional lifestyles, which respondents strongly criticized. Respondents claimed that imposed conventions aim at restricting people's freedom. Ignoring these lifestyles, for Nico, means liberation.

At the age of 23, this episode was over. I have been a little petty bourgeois, who thought at the age of 20 that something he needs to do is (.) to do it the way everyone else is doing it. Marry, having children, build a house, buy an apartment–like that. Now when I think of that, it is (...) stupid.

Interviewer: What was changing?

Well back then I thought that everything needs to be done away with. All the legacy of junk needed to be done away with. The beliefs and ah (...) expectations that I was talked into. All the suppression and the expectations of society, and the people, and so forth. I abandoned all and (.) what I also did was that I questioned all other things in my life. And set up new rules; one of these was not to wear what others want me to wear but to dress the way I want it. (Nico, 35, self employed)

Nico liberated himself from prevailing normative concepts through willfully ignoring them at a certain stage in life when he started questioning societal conventions. Nico's narrative also reveals that he applied willful ignorance in other life areas as well,

TABLE 1. Respondent characteristics

Interview 1: Daniel, teacher, 29	Interview 8: Patrick, designer, 30
Interview 2: Marcus, company owner, 28	Interview 9: Simon, editor, 31
Interview 3: Steve, student, 25	Interview 10: Marc, student, 25
Interview 4 : Robert, PhD student, 27	Interview 11: Oliver, make up artist, 24
Interview 5: Peter, hairdresser, 29	Interview 12: Richard, social worker, 27
Interview 6: Thomas, employee, 28	Interview 13: Nico, self employed, 35
Interview 7: Michael, employee, 42	Interview 14: Lukas, student/ marketer, 28

where he felt societal pressure. At the time of the interview, for instance, Nico reported being in an open relationship with a man, and living separately.

Ignorance frees consumers from predefined lifestyles and consumption patterns but requires elaborate consideration and critical reflection of own desires, needs and convictions that match the autonomous self. In doing that, consumers liberate themselves from societal blueprints, and localize themselves. Willful ignorance is commonly a first step in people's search for a self-determined identity and leaves consumers with a number of important decisions to be made in almost all areas of life. Yet, only after careful reflection—sometimes over years or even decades—when respondents found prevailing societal conventions not to fit their selves, they were apt to apply non non-conformity and defamiliarization practices.

Performing non non-conformity

Overall, respondents report about three main practices of non non-conformity, which is *provocative conformity*, *wearing the old and outdated*, and *consuming the ugly*. Whereas 'provocative conformity' displays fashion-consciousness, 'wearing the old and outdated', and 'consuming the ugly' is practiced in order to avoid being categorized as mainstream fashionable.

Provocative conformity. Respondents portray themselves as adjusted and as non-conformers at the same time. Although respondents clearly aim to set themselves apart from group think, they do however not construct themselves as oppositional to others. Such non non-conform behavior, which generally accords with contextual fashion rules, is commonly spiced with a provocative element, as for instance wearing a black suit and a pink baguette handbag in the opera, a suit with torn sneakers in a business meeting, or dressing in crème at a white party, as for instance Patrick reports.

> *" For example to a white party I won't go in white. Because I think it is stupid. Well I am not the revolutionary type, but it is stupid. I (...) I don't like white at all anyways and accordingly when I am invited to a white party I avoid that by simply wearing crème, ebony or similar and then some (.) something else, some other color. Yes." (Patrick, 30, designer)*

By using misplaced objects, respondents distance themselves from the conventional style of social contexts and at the same time exhibit their connoisseurship of these social settings to ensure that they are accepted as knowledgeable. All of these provocations exhibit sophisticated, playful boundary transgressions without putting social acceptance in danger. It is these boundaries; the other; that which is not me that is used by respondents to reflect about what they aspire to be. The other is always different; a moving target that demands sophisticated differentiating aesthetic styles for different social environments. Fashion items, or life concepts are taken out of the situational and/or time context so as to break consumption rules.

Wearing the old and outdated. Wearing the old and outdated is not to be confused with nostalgia or retro consumption (Brown, Sherry and Kozinets 2003). Respondents rather apply specific practices to render recently bought consumption items as old and outdated thus negating the act of purchasing. Informants withdraw from the gaze of others through commoditization of the shiny and new; recognition is not their purpose and still, they become exactly recognized for that; because it is peculiar in a world of conspicuousness and gaze. In order to conceal newness, respondents report that they wash their new clothing items several times until they look regular and worn. They wear new shoes in the rain to make them look muddy and old. "All that jazz" supports consumers in creating a personalized, distinctive appearance. The worn and the old have a history and

bear the hallmarks of the owner. The item has thus lost its characteristics as a mass-marketed fashion item; it has lost the sameness of the newly bought item that is bought fresh from the rack.

Wearing the old and outdated is non non-conformal because consumers do not break with fashion conformities at all. Practicing the old and outdated is not restricted to fashion items. Nico for example, reported that he only went to cafés and restaurants which were once trendy, but have now been abandoned by the in-crowds. He evades being part of a crowd of people who chases after new trends. Practicing the old and outdated thus inverts conceptions of what is generally conceived as trendy and fashionable. The untrendy becomes fashionable, different and, most importantly, a statement of who we are/want to be.

Consuming the ugly. Another practice of creating the self as non non-conformal is the appraisal of objects or behaviors despite other people's negative evaluations and reactions. This practice resembles Tian et al.'s (2001) behavioral category of unpopular counter conformity. However, in contrast to Tian et al.'s (2001) findings, respondents, in their consumption narratives, referred to well known and even popular brands and consumption objects . Oliver, for example, reports about using an eau de cologne, which a lot of people do not like.

> *"One I like a lot is from Dior "Fahrenheit" but ah (...) but a lot of people hate that. I really like it because of that. So many people said "Boah, Oliver you are really smelling bad, like rotten moss" or something. I really like it a lot when people talk like that about my eau de Cologne" (Oliver, 24, Make-up artist)*

Oliver's excerpt reveals that he uses a perfume, which produces social sanctions like ridicule. More accurately, for Oliver the appeal of wearing this eau de cologne results from its negative evaluation. Being a make-up artist and working with people in the aesthetic industries exposes Oliver to constant aesthetic evaluations. Being fashionably groomed yet, using objects that other people dislike sets Oliver apart from his peers, and even puts his own profession into question. Consuming the ugly very strongly resists common conventions of beauty and aesthetics. Therefore, it is non non-conformal. Respondents borrow from other people's negative evaluations. At the same time, respondents challenge others' conventional aesthetic evaluations. By turning things upside down, which is rendering ugly stuff beautiful, and vice versa, informants construct themselves as unconventional.

DEFAMILIARIZATION

Defamiliarization practices aim at altering popular consumption objects, behaviors and conventions in order to disguise their origin or primary purpose. Respondents report that they remove or add features to render consumption objects unusual. Similarly, familiar behavior is contrasted through its adoption in inappropriate contexts so as to render them unfamiliar. Defamiliarization practices comprise *delocalization*, *delabeling* and *contrasting personal practice*.

Delocalization. Delocalization strategies are related to the adoption of typical urban lifestyles which are unfamiliar to the places that respondents inhabit. These practices are straight forward attempts to consume the latest urban styles in small hometown contexts, and show dissent of local narrow-mindedness. Respondents report about their discontent with rural lifestyles and aesthetics:

> *"I am actually a country boy, who on the other hand is not. I have always been someone who (...) does not see [the respondent's home town] as the centre of the world and I am not like others (...) Last year in spring I have been to Hongkong for*

two months. My last relationship has been abroad, too. I orient myself on other things. For me [the respondent's home town] is nice, but it's not that I think that I should stay here; people are very provincial here. Like what the local magazine reports about styling, that is, yes, well, that is for people who want to blend in. Those are people who are satisfied with what society tells them to do. I am different. I think "I want to try this and that – different things". I simply try things out and I am the only one in my peer group who does that." (Robert, 27, student)

Respondents delocalize themselves primarily through the adoption of urban and cosmopolitan aesthetics. They adopted specific aesthetic styles, which they encountered in metropolitan areas like Paris, London, or Berlin. As these aesthetic styles are unknown in their home cities, they serve them to display their distinctiveness, which, in an urban context, would blend smoothly into contemporary urban lifestyles. Examples of such urban aesthetics are skinny jeans before they became stylish a couple of years ago, male handbags, specific hairstyles, color combinations, or particular shoes. Apart from aesthetics, respondents also engage in activities they connect with urbanism. They listen to particular music, prefer ethnic food and try to escape to urbanities whenever possible. Delocalization practices liken typical cosmopolitan lifestyles (Thompson and Tambyah 1999) and could therefore be straightforwardly be misinterpreted as cultural capital accumulation. In addition to that, the urban lifestyle also exposes respondents to resentments from their local environment, and confronts them with two paradoxical ways of living and being.

Delabeling. Delabeling aims at detaching consumption objects, and lifestyles from their sources so as to decontaminate them from their mainstream origins. Practices range from ripping off labels to transgressions of gender boundaries.

"When I see an item with something sewn on the back, which you can get rid of, then I would consider it. But when it is ahm (...) like Dolce & Gabbana there is a big logo imprint on it; well I would not spend money on that."

Interviewer: "Because?"

"Because the thing would be worn by like a million other people and everyone would see what label it is. I am my own person and therefore I don't like that." (Patrick, 30, designer)

Patrick is very clear about his attitude towards mainstream labels and mass consumption. The deep resentment against depersonalization through mass marketed brands is noticeable here. His resentment resembles Tian et al.'s (2001) avoidance of marking as one of a kind and expresses a deep desire for developing a distinct personality, keeping some mystique, undefined facet of self. Such authentication acts (Lipovetsky 1994) become even more pronounced through cross-gender consumption. Through consumption of opposite gender styles, respondents renegotiate typical societal gender blueprints (Tuncay and Otnes, 2008, Holt and Thompson, 2004, Firat and Venkatesh, 1995). They engage in male and female performances and situate their self gender in between the extremes of maleness and femaleness. Contrasting, blending, and altering male and female aesthetics and performances supports the accomplishment of a unique gender.

Contrasting personal practices. Contrary to delocalizing and delabeling, which is directed towards others, contrasting personal practices aim at altering own behaviors and personal consumption habits in order not to become a prototype of oneself. These findings, specifically, moved our interpretive frame from nonconformity and gender-crossing concepts towards Lipovetsky's (1994) argument of the authenticating self, existentialist notions of *Sein*, and psychological notions of individuation, and self-transformation (Koppensteiner 2009). Whereas previous findings strongly point towards respondents' attempts to differentiate from the aesthetics- and gender-illiterate crowd, here, respondents seek to render themselves unfamiliar through alterations of styles, genders and related practices. According to the respondents, such style reworking is independent of life transitions but pursued regularly so as to keep style imitators out, and

Anders-sein
quest for otherness in various life aspects

Conformity
embedding within subcultural/tribal/communal codes and conventions

Self-cultivation

Self-abandonment

Non-conformity
counterconformal acts against specific groups/communities → uniqueness

Non-Anders-sein
opposing otherness and differentiation → commonness, mainstream

Individuality

Belonging

Figure 1. Semiotic square of Anders-sein and conformity distinctions

experience how they themselves change as their styles and behaviors change. By doing that, respondents continuously alter their selves—including gender—, reflecting an inner desire to better understand who they are. Strict consumption rules provide structure; contrasting personal practices provide the means for self-transformation.

DISCUSSION

Our study investigated into the lifestyle of young males for making an important theoretical point. We describe and interpret a lifestyle which is neither conform, nor non-conform; which is unique, yet only within specific social contexts. We introduce the notion of *Anders-sein* for this paradoxical, yet coherent life project. The term *Anders-sein* is rooted in German philosophy and literature (cf. Nietzsche 1969/1983, 1989). *Anders* depicts differentness and deviating behavior, or conception, whereas *sein* is related to an existentialist notion of self. Figure 1 presents a semiotic square that depicts how *Anders-sein* is related to common conceptualizations of conformity and non-conformity.

Anders-sein refers to a general quest for being different, relative to what is common and typical, in an attempt to ultimately cultivate one's self. We understand its opposite, non-Anders-sein, as the lack of differentiation desires in favour of generally accepted behaviours and conventions. Whereas non-Anders-sein reflects a deliberate individual decision, conformity refers to the concepts of belongingness and identity construction through and within communities, tribes, or subcultures (Wooten 2006, Kates, 2004). Counter conformity as the opposite of conformity willingly and explicitly diverts from group behaviour, while *Anders-sein* lacks this turn against a particular, defined group, or notion. Rather it tries to contrast what is generally perceived as normal in society.

Anders-sein is a concept that informs our understanding of individuals' pursuit of differentness in at least two ways. First, *Anders-sein* transcends uniqueness and conformity and remains inconspicuous and un-ideological. While uniqueness is infused by counter conformity (Tian et al. 2001), *Anders-sein* embraces practices that may be indeed popular. Second, consumer's small scale boundary transgressions in important life domains through practices of provocative conformity are neither bold social signals, nor unimportant subtleties. They confront consumers with reactions from their environment, which they reflect upon vis-á-vis their own critical conviction.

Respondents' accounts are reminiscent of critical and liberal discourse of the intellectual elite, spiced with a pretentious undertone. Still, critique is not a matter of public discourse and, through practices of non non-conformity, remains within the aesthetic domain. Respondents' styles could be interpreted as aestheticism. Just as dandyism came up during the 19th century as style "entrepreneurship" so as to gain deference in a period of cultural decay (Smith 1974), *Anders-sein* likens dandyism's refined aesthetics as a form of disregard of social structure, and willful ignorance of social conventions. Yet, in stark contrast to dandyism, *Anders-sein* is far from conspicuousness, and social competition. Rather, *Anders-sein* seeks to contrast other, contemporary forms of social conventions, as for instance, common understandings of beauty, for instance through *wearing the old and outdated* and *consuming the ugly*; gender definitions, and the localism-cosmopolitan dualism through practices of *delocalization*, and *delabeling*.

Gender crossing practices of informants, which are not overtly homosexual, remind of Marcel Proust's famous modern novel A la recherche du temps perdu (*In Search of Lost Tim*e), and its use of feminized masculine names for the portrayal of the novel's main character's desires (O'Brien, 1949). The gender-crossing practices

found in our study remain widely uncontested and liken contemporary, everyday popular media representations of boundary crossings that are legitimized as popular arts form. Similarly, critique on provincialism in local communities rather remains a still expression of dissent through practicing of different styles hence is non non-conform. By mimicking normality, practices of *Anders-sein* remain apolitical and un-ideological. Still, as normality is transposed in other contexts, their pursuit of being different gains a slightly provocative touch, which is sufficiently *anders*.

Apart from the distinct but mostly unspectacular outer-directedness of *Anders-sein*, its pursuit has a strong inner-directedness. Through defamiliarization and *contrasting personal practices*, in particular, males permanently oscillate among styles, geographical locations, genders, habits, and selves, so as to find out what they like, dislike, what kind of gender understanding they have, and have not, thereby developing self-understanding. Although less radical and less public, *Anders-sein* practices liken the "constantly changing chameleon persona" (Kelley 2000:7) of 20th century popular music culture. We interpret this permanent search for self-understanding as existentialist. The self, while not unconscious, is impossible to conceptualize, nor directly accessible (Sartre 1964). Instead, individuals engage in gradual rapprochement to their self, which they will probably never be able to denominate. While we are cautious with the notion of the authentic self, we nevertheless could also interpret practices of *Anders-sein* as practices of authentication towards an unknown self. Still, *Anders-sein* strategies help getting a glimpse of inner desires, (dis)likes, tastes, and particularities that commonly remain inexplicable.

Cultural Brand Innovation within Emerging Economies:
A Tale of Two Campaigns from Modernising India

Sudipta Das, University of Strathclyde, UK
Paul Hewer, University of Strathclyde, UK

ABSTRACT

In this paper we extend Holt's (2004) seminal Cultural Branding Model within emerging economies, namely India. By studying the genealogy of an iconic Indian brand – Bajaj – we reveal how a transforming political and socio-economic infrastructure supplies opportunities for building iconic brands in the age of fast-moving consumer culture.

THEORETICAL UNDERPINNINGS

The recent conjugation of traditional brand management and consumer culture research has transformed the way we used to interpret the winning stories of some of the most powerful iconic brands in the history (McCracken 2009; Holt 2004; Holt and Cameron 2010). In 2004, Holt noted "Brands become iconic when they perform identity myths: simple fictions that addresses cultural anxieties from afar, from imaginary worlds…[that reflect] expression of [consumers'] aspired identities [within a nation]" (ibid, p. 8). Conventional branding models have largely misinterpreted identity values as cognitive resources for branding. Instead brands that enjoy success emerge from their ability to inspire identity values as products of a nation's cultural brief - something Holt identified as *The Principles of Cultural Branding.* Holt believes that targeting a nationwide ideological demand with an authentic story-telling (myth) capability supplies a brand with intensive and pervasive societal meanings and catapults them into iconic status. For example, think about how the historical fit between the populist world of outlaw biking and the counter-cultural texts of alternative American masculinities had paved the raw materials for Harley Davidson's iconic constituencies (Holt 2004; Schouten and McAlexander 1995).

In this paper we analyse the iconic constituencies of an Indian two-wheeler brand – Bajaj – and reveal how cultural innovation has been achieved and sustained by constant (re)innovation of myth markets addressing anxieties and orthodoxies hidden within socio-cultural spheres of a transforming post-colonial society. The inspiration for such debate comes in the form India's changing social, economical, and political agendas that supplied widespread ideological resources for identity construction as India moved from a post-colonial to a modern society (Varma 2007; Desouza et al. 2009), and Thompson's (2011) call for increased research, following CCT conference 6, into a nation's dominant political ideologies and it's impact on consumer culture and identity politics. Our analysis reveals what we like to think of as a tale of two campaigns, one rooted in a nostalgic impulse for the past and the glory days of yesteryear. The other, forward-looking, aspirational, clad if you like in new clothes and new styles of riding fit for New Times.

In the past century India has experienced two different kinds of economy - first suffocated by slothful growth, multiculturalism, genocides, civil wars, and a conservative form of modernity; second, economic liberalisation and a land of surging growth and optimism which brought a significant transformation in consumption culture, identity, and class politics. Today with a projected 34% of youth population of the world by 2020, today's India is young, vibrant and restless. Its growing aspirations we suggest are no longer limited within the postcolonial discourse of *Swadeshi*[1] or multicultur-

alism as expressed through Nehru's ideology to achieve modernity. Contemporary India is thus a context of significant change, and such changes can be distilled in the ways material objects are advertised – the representations which surround such objects of desire – more so – we can suggest that such changes can be explored at the level of consumption practices.

To express this transformation, **we coin the phrase FMCCs to characterise consumer culture within economies such as India, Brazil and China to name but three**, as **Fast-Moving-Consumer-Cultures**. Such economies require objects for movement and transportation, objects that are rich in expressive and *intensive* potential (Miller 2010). Objects which can transcend tradition, nationhood, generation and local community; objects which are full of richer promises initiated we believe at the level of representation (the changing forms of advertising imagery employed); but also which herald and bring in their wake changes at the level of practice – in this case how to ride a motorbike with sufficient glamour and allure to stand out.

METHOD

Our analysis takes the forms of a case examination of Brand Bajaj, we initiated by investigating the historical development (*brand genealogy*) of brand Bajaj within the Indian marketplace. In doing so we scrutinised a number of secondary sources, i.e., Market Intelligence reports by McKinsey, company reports and case studies produced by Bajaj, the official website of Bajaj two-wheelers, and a number of influential business magazines and biking gazettes (Forbes India, India Today, Business World, Bike India etc.). To complement this analysis the first author travelled across India to experience the socio-political situation within the context and to collect a number of Bajaj two-wheeler advertisements (printed and television) released within the Indian mass market. In our efforts to develop a *brand genealogy* of Bajaj we moved back and forth between Holt's (2004) suggested 'three levels'. During the primary analysis we scoured the managerial archives to trace the history of Bajaj's marketing practice, while we interpreted the advisements to understand the "resonate or disconnect" between the brand and a transforming postcolonial society (Holt 2004, p.227). Our systematic comparison of cases reveals how the brand Bajaj acted as a 'cultural activist' by emulating the postcolonial models of 'desired Indian manhood' since 1980s (Cayla and Koops-Elson, 2006).

Finally, to add nuance to this textual analysis the first author conducted in depth interviews with a number of influential personalities within the Indian advertising industry with connections to the brand (Cf. Appendix 1). We only chose to participate in those agencies who are actively engaged in the creation and promotion of Bajaj two-wheeler brands in India, i.e., Lowe-Lintas, Ogilvy & Mather, Leo Burnett etc. On average the interviews lasted between 40 minutes to an hour. The interviews were further supplemented by additional observations, photographs, and field notes collected throughout India.

---

[1] Swadeshi is an anticonsumption ideology evolved during India's independence movement against British colonial rule. The key construct of this ideology stated: "indigenous goods should be preferred by consumerseven if they were more expensive and inferior in quality to their imported substitutes." (Sarkar 1973, p. 92)

The first cut: Hamara Bajaj

The company Bajaj Auto Production was established most significantly in 1945, one of the iconic years when India was at its final stage of negotiation for independence from British colonial rule. In this instance, from the outset it must be understood as one of India's first local brands that came into existence by celebrating the 'spirit of national independence' (Cayla and Koops-Elson, forthcoming). Initially the company sustained their business by selling imported Italian Vespa scooters under the name of brand Bajaj. In the 1970s however the two-wheeler market in India started to become increasingly competitive and Bajaj was forced to move into its own production category. The importation of Japanese motorbikes and increasing popularity of the British-made *Royal Enfield* made it increasingly harder for Bajaj to sustain their image on technological grounds alone. This was the time in our view when Bajaj turned their back on a 'better mousetrap' strategy (Holt 2010) and started to compete on the grounds of culture. With the release of their landmark advertising campaign 'Hamara Bajaj' (our Bajaj) in the 1980's Bajaj became so popular that they achieved widespread appeal in the national consciousness. Owning a Bajaj in the '80s appeared to be "similar to owning a station wagon in 1950's and 1960's America" (Pyssler 1992). People were happy to remain on the waiting list for seven years for their chance to purchase a Bajaj scooter (ibid).

In understanding the logic for the campaign and it's connection with the Indian nation, we reflect on our analysis along with the ex-director of Lowe-Lintus India, Alyque Padamsee's interview – the man who acted as the head of creative for the campaign:

Our analysis reveals that Bajaj's first landmark campaign depicted a picture of peace, unity, and most importantly Indian men from different religious community (Hindu, Muslim, Sikh, Parsi etc.) in the time of social turmoil, when the nation was struggling to deal with its post-colonial diversity, multiculturalism, and consequent civil wars. In this context the 'Hamara Bajaj' campaign reinforced the secular idea of different communities existing peacefully and collaborating with each other (Cayla and Koops-Elson 2006). The campaign name - 'Hamara Bajaj' (our Bajaj) - itself depicted a collectivist theme, a sense of Indian citizenship, where as the theme song symbolised Bajaj as a symbol of the nation - "our past..our present…the stronger India has a stronger picture - Hamara Bajaj (our Bajaj)… Hamara Bajaj (our Bajaj)".

Images from the campaign express how such sentiments were encapsulated within the visual iconography of the brand to add resonance and meaningfulness to its appeal:

In their efforts to supply extraordinary identity value to the brand, Padamsee inscribed Bajaj within the nation by depicting it as an old, reliable, and hardworking individual, just like the majority of Indian men. More so, the phrase 'Hamara Bajaj' (or the message of collectivism) received a warm reception because of its strong sentimental association with colonial movements and wars.

Therefore, the 1980s Hamara Bajaj campaign presented the scooters as an object of national consciousness and togetherness, powerful seeds to lay as they served to remind Indians of golden times when the Indians congregated together to reclaim their identity from a foreign power.

The second cut: shifting tales of masculinity, power and performance

A rich stream of research has explored how economic prosperity and the flow of global knowledge have increasingly educated the Indian middle class about global consumption patterns (Mish 2007; Varma 2007; DeSouza et al. 2009; Rajagopal 1998). With discretionary buying power middle class Indians have crucially started to reinvent their identity and class affiliations (Fernandes 2006; Varma 2007). Bajaj has managed to survive this widespread cultural shift by renewing their ties with the emerging consumer class. In the most recent embodiment of the brand, Bajaj reinvented their image by, scrapping scooter production and, introducing a range of motorbikes. The earlier versions of national iconic names (Bajaj Chetak[2] Scooters) have been replaced by Western versions of motorbikes (Pulsar, Discovery, Avenger, Eliminator etc.). The names seek to signify associations with power, experience and driving desire as suggested through the shift from 'everyday' scooters to a new generation of faster and sleeker motorbikes.

Central to the new brand imaginary, as we suggest, is not only the shedding of the previous national and collectivist ethos, but also what, we believe, is championed imagery of modernity, individualism, and *risk consumption* (Celsi et al. 1993). An image for a rebellious and cosmopolitan Indian Youth who lives for the autonomy and free spirit of the open road; an image at one with the fast-moving zeitgeist of Contemporary India. In such images the emphasis is

[2] The 'Chetak' was named after the famous horse of the Hindu ruler Maharana Pratap. The heroic performance of Chetak in the battle of Haldighati and his contribution in saving his master's life made him a heroic and iconic symbol of carrier in Indian history. Eliminator was a name used by Kawasaki in 1984.

upon standing out from the crowd, rather than being at one with the crowd. In explaining the shift, the regional manager of Ogilvy & Mather India, Abhijit Avasthi suggested:

> "Hamara Bajaj was a different era. In this case we were very clear from the beginning that we should position the bikes somewhere in the lines of rawness...something that captures the macho effect of youth."

Essential to this new imaginary was the revalorisation of Indian Manhood, but not draped in the religious traditional whiteness of Nehru and Gandhi, rather a new style of riding which is encapsulated in considering masculinity as an expression of ways of movement, embodied in deed and action. Essential to these changes are not simply those of representation, but also how the object affords a new style of travel, confident in its status and future potential. Not nostalgic, but driving fast into its anticipated future of possibilities.

Signing Off

Our point of departure for this study was Holt's (2004) explanation of cultural branding strategies within American societies. The aim of this study was to examine the cultural branding principles operating within transforming India. Our analysis reveals that what we like to think of as a tale of two campaigns, one rooted in a nostalgic impulse for the past and the glory days of yesteryear. The other, forward-looking, aspirational, clad if you like in new clothes and new styles of riding fit for New Times. A new ethic of consumption which appears to fit more snuggly with the confident days of the *here and now* in contemporary India and thereby find broader appeal with the rootless, forward looking, thrill seekers of youth in India.

An Exploratory Study of Collective Nostalgia

Faye Kao, Eastern Michigan University, USA

ABSTRACT

Collective nostalgia refers to the nostalgia originating from emotional attachment to collective cultural identities without earlier personal experience. This study shows that *collective nostalgia* is independent of *personal nostalgia, the nostalgia* originating from personal earlier experience. These two types of nostalgia exert independent influences on the formation of identity preferences.

AN EXPLORATORY STUDY OF COLLECTIVE NOSTALGIA

Nostalgia Literature Review

Nostalgia is an individual's propensity to seek emotional comfort from a familiar past. Individuals in a transition period, such as relocation, are particularly likely to experience nostalgic sentiment (Davis, 1979). In nostalgia formation, the attachment of strong and subjective emotion to past objects is a necessary factor (Holbrook & Schindler, 2003).

In consumer research, nostalgia can be traced to two origins. *Personal nostalgia* originates from direct earlier experience. *Personal nostalgia* formation takes place through a nostalgic bonding process, in which strong personal emotion is attached to a past experience or treasured objects owned in the past. The experience is direct (Holbrook 1993; Schindler & Holbrook, 2003). Holbrook (1993) developed a Nostalgia Proneness Index to measure personal nostalgia. The consequences of the personal nostalgia are profound. For example, personal nostalgia proneness is found to shape aesthetic tastes for cultural products and influence consumption preferences (Holbrook & Schindler, 1994). Personal nostalgia also influences donors' intention to contribute to charitable organizations (Ford & Merchant, 2010), alumni giving, and alumni relations (Merkel 2010).

Collective nostalgia originates from a group experience, such as stories passed down within a family, or learning from books or mass media about one's cultural heritage. The emotional bonding is formed through exposure to culturally created events for a prolonged period of time (Holak, Havlena & Matveev, 2006).

Personal nostalgia is oriented toward internalized cultural identities associated with the past and subjectively defined by individuals; *collective nostalgia* is oriented toward external collective cultural identities associated with the past and shared among the group. While *personal nostalgia* tends to be richer and more distinctive, *collective nostalgia* tends to be abstract and more consistent among individuals within the same generation of the cultural group.

Little research has been dedicated to the study of *collective nostalgia*. This study is an exploratory investigation of *collective nostalgia* and its influences on consumption. This study is interested in the following questions:

Study 1: What is the content of *collective nostalgia*?

Study 2: Are *collective nostalgia* and *personal nostalgia* related?

Study 3: What possible psychological traits are related to *collective nostalgia*?

Study 4: What are the behavior consequences of *collective nostalgia*?

METHODOLOGY

Ypsilanti is a town in Michigan with a population of 22,362 (2010 Census). Since the 1970s, it has been famous for its cultural preservation movement. However, residents who were born in the 1980s did not personally participate in this movement. They only learned about Ypsilanti culture from their parents or from the media. They experience *collective nostalgia*. Therefore, Ypsilanti was used as the cultural context in the study. Seventy-three students in a Midwest university with Michigan origin were recruited to participate in this study. Their average age was twenty-five.

To identify the content of shared Ypsilanti cultural identities, a focus group of two experts on Ypsilanti culture was formed to compose an *Ypsilanti Culturescape*. Ten themes emerged, and were used to design a ten-item *Ypsilanti Culturescape,* the collective nostalgia questionnaire.

Seventy-three subjects were asked to rate their preferences toward the ten-item *Ypsilanti Culturescape*. In addition, to measure *personal nostalgia*, this study used nine items selected from *Nostalgia Proneness Index* (Holbrook, 1993). This study also included measurements of *Consumer Cosmopolitan Motivation* (Kao, 2007) to examine the possible psychographic trait that might be related to collective nostalgia. For the behavior consequence measurements, this study used a dichotomy scale: "*Have you ever participated in any Ypsilanti cultural events in the past twelve months?*"

Study 1: What is the content of *collective nostalgia*?

Factor analysis was performed on the ten-item *Ypsilanti Culturescape* preference scores. It resulted in two dimensions: Heritage-Ypsi (pre-1960s), and Transforming-Ypsi (post-1960s) (Table 1). It is consistent with previous studies in that time is a primary factor in defining nostalgia content (Holbrook, Morris, and Robert, 1994). Heritage-Ypsi is the major component of collective nostalgia in this context. Heritage-Ypsi includes Depot Town and its associated railroad culture, auto industry, and airplane industry development history in the Ypsilanti area, Native American history, French exploration and trading history, frontier community culture, and the Ypsilanti heritage preservation projects since 1970. The second dimension is Transforming-Ypsi, which includes immigrants from the south, the increasing African American population, the development of a suburban community in 1960-1990, and the globalization of Ypsilanti in the past few years.

The factor scores were then subjected to cluster analysis and produced three clusters: Modern-Ypsi-Goers, Ypsi-Culture-Sponsors, and Don't-Like (Figure 1). The Modern-Ypsi-Goers are characterized by their mediocre scores on both dimensions. These people are indifferent to traditional and transformative identities. Some of them, however, show a slightly higher preference for transformative Ypsilanti cultural identity. This segment comprises the largest percentage of the sample. The second largest segment is The Ypsi-Culture-Sponsors, characterized by high Heritage-Ypsi scores regardless of their Transforming-Ypsi scores. This group is the traditional value sponsors although they may agree or disagree with the transformation of local cultural heritage. They are proud of and are interested in Ypsilanti culture. The smallest segment is the Don't-Like, who are not interested in either traditional or in transformative cultural identities.

Based on the analyses, the two dimensions of *collective nostalgia* are meaningful. In addition, *collective nostalgia* is a valid base to segment consumers. The construct has criteria validity.

Study 2: Are *collective nostalgia* and *personal nostalgia* related?

Personal nostalgia and *collective nostalgia* are of different origins; therefore, it is hypothesized to result in lower correlation between these two types of nostalgia. However, since Heritage-Ypsi and Transforming-Ypsi are two aspects of *collective nostalgia*, it is hypothesized that the two dimensions of *collective nostalgia* should have a higher correlation within themselves than with *personal nostalgia*. Pearson correlation coefficients were calculated to examine these correlations.

The result shows that *personal nostalgia proneness* is correlated with Heritage-Ypsi with a correlation coefficient of .243, but not with Transforming-Ypsi. However, Transforming-Ypsil and Heritage-Ypsi, which are the two dimensions of *collective nostalgia*, are highly correlated, .532 (Table 2). This result supports that *personal nostalgia* and *collective nostalgia* are two separate constructs. The result supports discriminant and convergent validities.

Study 3: What possible psychological traits are related to *collective nostalgia*?

To further investigate discriminant and convergent validities, the two types of nostalgia were compared to a different construct: *consumer cosmopolitan motivation*. *Consumer cosmopolitan motivation* is the emotional attachment to an out-group cultural identity. Since nostalgia bonding involves a strong emotional attachment toward one's original culture, it is hypothesized that both types of nostalgia may negatively correlate with *consumer cosmopolitan motivation*. Pearson correlation coefficients were calculated to examine the relationship between types of nostalgia and consumer cosmopolitan motivation.

The results show that only *personal nostalgia* is negatively correlated with *consumer cosmopolitan motivation* with a correlation coefficient of -.256; but the correlation between *collective nostalgia* and *consumer cosmopolitan motivation* is not significant (Table 3). The result suggests that *personal nostalgia* and *consumer cosmopolitan motivation* are related constructs. However, these two constructs

oriented from consumers' preferences toward opposite cultural identities: in-group vs. out-group. A consumer who develops a strong emotional attachment to his or her cultural identity through direct personal participation experience tends to abhor other out-group cultural identities. At the same time, the result suggests that *collective nostalgia* and *consumer cosmopolitan motivation* are independent constructs. Each construct exerts its own influence on the formation of consumers' preferences. In other words, people who develop nostalgic sentiment through collective group experience can develop a preference for an out-group culture. It allows for the concomitant development of positive emotional attachment to both in- and out-group cultural identities.

ANOVA was performed to compare the *consumer cosmopolitan motivation* scores among the three *collective nostalgia* segments. The ANOVA result shows that Ypsi-Culture-Sponsors have significantly higher *consumer cosmopolitan motivation* score than Don't-Like segment (Table 4). In other words, those who have higher preferences toward in-group heritage cultural identity tend to have higher preferences for out-group cultural identities. However, people who are indifferent to their collective cultural identity also tend to be indifferent to any out-group cultural identities. This finding is worthy of future research.

Study 4: What are the behavior consequences of *collective nostalgia*?

Personal nostalgia results in in-group cultural consumption behavior. Will *collective nostalgia* have a similar characteristic? If *collective nostalgia* can predict behavior as *personal nostalgia* does, *collective nostalgia* should be correlated with in-group cultural events participation.

To investigate this relationship, respondents were asked to indicate on a dichotomy scale: "*Have you ever participated in any Ypsilanti cultural events in the past twelve months?*" ANOVA was conducted to compare the *collective nostalgia* scores of those who answered "yes" and those who said "no." The result shows that the models are not significant (Table 5). *Collective nostalgia* does not

b. The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

Table 5: ANOVA: Consequence of Collective Nostalgia

Have you ever participated in Ypsi cultural events? (Yes vs. No)		Sum of Squares	df	Mean Square	F	Sig.
Transforming Ypsi Preference Score	Between Groups	1.585	1	1.585	3.345	.072
	Within Groups	34.120	72	.474		
	Total	35.706	73			
Heritage Ypsi Preference Score	Between Groups	.301	1	.301	.682	.412
	Within Groups	31.290	71	.441		
	Total	31.591	72			

necessarily lead to in-group cultural event participation behavior as *personal nostalgia* does. The behavior consequences of *collective nostalgia* therefore merit further research.

CONCLUSION

This study shows that *collective nostalgia* and *personal nostalgia* are independent constructs that exert independent influences on consumers' culture consumption behavior. The nostalgia that is developed through personal participation tends to exert significant influence on consumers' preferences for their original culture, but has a negative impact on their preferences for out-group cultural identities. However, the nostalgia that emerges through a collective experience tends not to result in in-group cultural consumption behavior, nor does it prevent the development of preferences for out-group cultural identities. These two types of nostalgia exert independent influence on cultural consumption behavior and deserve additional research. Further study can investigate the interaction effects, and possible mediating or moderating factors that are involved in the formation of cultural identity preferences.

'Granny Would be Proud': On the Labours of Doing Vintage, Practices and Emergent Socialities

Katherine Duffy, University of Strathclyde, UK
Paul Hewer, University of Strathclyde, UK
Juliette Wilson, University of Strathclyde, UK

ABSTRACT

This paper unpacks the ways in which consumer and seller practices construct the vintage marketplace. In this discussion the role of material objects and practices, the way that they intersect in vintage consumption, and how these vintage fashion objects are (re) used in this second-hand marketplace are explored. Discussion is based on ethnographic observations over a ten-month period at a twice monthly vintage market, 'Granny Would be Proud' in Glasgow, Scotland UK and in-depth interviews with key market practitioners. This was combined with visual analysis to explore the staging of the marketplace and the context of such practices. Our findings are organised in a number of themes that are important in understanding the practices of the vintage marketplace: vintage as a social practice, practicing the 'vintage look' and vintage as a skilled practice. In exploring these emergent themes the centrality of the practices in the construction of the marketplace is also illustrated.

The first outward sign that there is anything taking place in this side street restaurant is the crochet sign that hangs above the entrance exclaiming 'Granny Would be Proud Vintage market'. On the second level of the restaurant, in the eaves of this converted cinema, is a mixture of vintage clothes, jewellery, bags & briefcases, china & crockery. Rails of vintage furs, denim shorts and tea dresses fill the space, with tables laid out for stallholders with memorable finds, suitcases brimming over with silk scarves & neckties. People move from stall to stall and back again, excitedly chattering with friends. Vendors smile politely as people enter their area & try to engage with the people for a minute or two before they move on. There is a busy, bustling atmosphere, food smells waft from the restaurant below, stallholders drink tea & coffee from vintage china from the restaurant, 1940s and 50s music plays in the background and people wander about the stalls, rummaging, lifting, inspecting, coveting, new found treasures. (Fieldnotes, January 29th 2012)

INTRODUCTION

Vintage is a global phenomenon, from Decades in Los Angeles, Rellik in London to the Saint-Ouen markets of Paris. Vintage is often held as being in stark contrast to the perceived homogenised culture of mainstream fashion (Tungate 2008; Palmer 2005; Entwistle 2000 a) however through the rise in popularity and accessibility in the marketplace, vintage is changing the consumption landscape. In this paper vintage is conceptualised as a set of practices, of the actions of consumers that are tied to notions of belonging (Warde, 2005: Murphy & Patterson, 2011), of in essence the performance of 'doing vintage'. There has been much discussion of how practitioners mobilise knowledge, but far less focus on how this knowledge is apportioned into their practices (Magaudda 2011). This paper acknowledges this gap and explores the practices involved in producing and sustaining the vintage marketplace. Coming from the Consumer Culture Theory (Arnould and Thompson 2005; Schau et al. 2008) approach in which markets are seen as social and cultural constructs, the marketplace is unpacked with a focus on the collective effort needed in constructing the vintage market. The paper begins with a theoretical exploration of vintage and how it links to prior consumption studies and the materiality of the practice, before outlining the ethnographic methods employed in the marketplace: observation, visual analysis and depth semi-structured interviews with consumers and sellers, and then pro-

vides an empirical account of the 'doing' of vintage. Our findings and discussion highlight the emergent themes of the practices of vintage: the social nature, the skill involved and the enactment of vintage. These are explored and related to existing consumption theory.

Vintage is not new as a concept: second-hand markets and the trading of clothing has been a constant presence. It is a concept that has been explored in the consumption literature from flea markets (Belk et al, 1988; Sherry, 1990), charity shops and car boot sales (Gregson & Crewe 2002), ideas of thrift shopping (Bardhi 2003; Bardhi & Arnold 2003), to alternative spaces of consumption (Belk et al. 1999; Roux & Korchia 2006; McGrath et al. 1993). The vintage turn in consumer culture cannot be explained in terms of simple nostalgia, it must be perceived in conjunction with aesthetics, style, fashion and social collectives. One way to conceptualise vintage is to anchor it in terms of the postmodern experience, of consumers who are alienated and desire to return to a romantic, creative past (Campbell 2005). Vintage could also be depicted as a form of consumer politics, of "virtuous consumption" (Chatzidakis et al. 2004) or could be considered as a form of consumer resistance (Brownlie and Hewer 2009). With regards to history, vintage could be anchored quite neatly in discussions of nostalgia and a yearning for an idealised past, however nostalgia here is unpacked not with regards to Holbrook and Schindler's (1994) 'real' or 'stimulated' debate, but nostalgia as a learned emotion, of Goulding's 'vicarious' nostalgia (Goulding, 2002:542.) McRobbie asserts that the retro phenomenon is part of the nostalgia enthusiasm for bringing history into an 'ahistorical present' (1988). Similarly, vintage must give a nod to its retro predecessors and finds it's footing clearly in Brown and Sherry's (2003) 'Retroscapes.' This synthesis of past and present, the 'retro revolution', highlights that retro and vintage are related, they are both strategic ways of employing the past in the fast paced consumer present.

This paper adopts a material culture approach to the exploration of consumption practices as it emphasizes the intersection of cultural and social practices around vintage objects. Building on Miller's (1998) material culture approach to shopping and Dant's (2005) sociological perspective which argues for a more in-depth focus on the 'material stuff of life', this approach suggests a consideration of the social and cultural meanings of the object, rather than considering the meaning as inextricably linked to the object (Miller, 1998). The framing and the performance of the consumption sphere have been previously explored in marketing and in particular in the service landscape. However in these accounts the literature fails to discuss the role that objects play in the staging of the marketplace. Parsons' (2009) work on antiques moves this argument forward by positing that value is staged and that the presentation of objects and the narrative built around them is a key communicator in achieving this framing. In applying this material culture perspective, it is argued that the narrative of the object cannot be separated from the vintage object itself.

METHODOLOGY

This study used an ethnographic approach to attempt to capture how the practices of vintage consumption were undertaken in a market space and the materials, meanings and competences of the actors within that space. The findings presented reflect ten months absorption by the researcher in the vintage scene, specifically a vintage mar-

ket titled 'Granny Would be Proud' in Glasgow, Scotland UK. The market runs twice monthly in the upstairs of a converted old cinema, which now functions as a restaurant in the west-end of Glasgow[1]. The restaurant below has 1940s music playing in the background and serves food on mismatched vintage china (See Figure 1). The wider venue of the west-end of the city acts as a cultural hub and has a high student population. The market has been running for three years, selling vintage clothes, homeware, accessories, upcycled vintage and independent craft. It was one of the first of this format of 'pop-up' markets in the city. The sellers differ at every market, with the exception of a couple of longstanding stallholders. The market is run by a young couple that promote the market through the use of social media (https://www.facebook.com/GrannyWouldBeProud) and flyering on market day (See Figure 2).

Figure 1 Hillhead Bookclub Interior & Exterior (February 26th 2012)

Figure 2: Granny Would be Proud Flyer (Aug – Nov 2011)

The ethnographic methods employed included observation over this ten-month period; photographic documentation, a research diary and six in-depth interviews with key practitioners in the vintage marketplace were conducted. As is discussed below, traditional market roles were less easy to define in this context, and this informs our understanding of the vintage practices and the market space. These approaches attempted to give an understanding of the practices of the vintage marketplace. Observation of the staging of the marketplace and of how the culture of vintage consumption was enacted in such spaces was central to the conduct and logic of the ethnographic research.

The researcher assumed a subjective position, being interested in the meanings and interpretations of vintage. These individual actors are assumed to have different cultural interpretations (Miles and Huberman 1994) within a 'shared social milieu' (Perren and Ram 2004: 90). All interviews were conducted in naturalistic contexts, either in situ at the market or in practitioners' homes. Discussions covered topics such as sourcing goods, the nature of vintage consumption, and the community around the vintage markets. All interviews were taped, transcribed and annotated with initial impressions and observations noted to crystallise the main themes emerging (Bryman and Bell 2007). Interpretation and analysis involved multiple iterations of coding, with the researcher repeatedly returning to the multiple forms of data to refine thematic codes. Three themes emerged as significant in highlighting the practices of the vintage collective: vintage as social practice, the practice of the vintage look and vintage as skilled practice.

The researcher gained access to the market through attending regularly and building relationships with key characters in the

Here the website constructs its other-worldly non-mainstream delights in the following terms: The "Granny Would Be Proud!" fairs started as a small vintage and retro venture in mid 2009 and has now grown into a twice a month event, each holding 25 colourful stalls from a repertoire of over 80 sellers. Taking place in the almighty Hillhead Bookclub, GWBP is one of the biggest fairs in Glasgow that brings together some of the finest vintage and retro fashion stalls, and arts and crafts lovers. Offering from clothing and accessories to the handmade and homemade to present a heaven of all kinds. To keep things interesting each fair guarantees to be a bit of a surprising delight for the eyes and the purse! It is a shopping experience you will definitely not forget! From having your picture taken in its very own retro photo-booth to treating yourself to tea and brunch in the old fashion laced tearoom, GWBP never disappoints, the proof? Go and check us out on Facebook: Granny Proud Glasgow Fairs and see for yourself.

marketplace. The participants were identified through a snowballing technique. This sample features three stallholders, two vintage consumers, who are regular market visitors and, one vintage clothing storeowner who is also a regular visitor at the market. The ethnographic interviews (McCracken, 1988 b) were used to gain an emic perspective of vintage behaviours and practices through their stories and descriptions of their own and others behaviour. The interview data supplemented the observational data and provided practitioner perspectives on the actions and practices of 'doing vintage' in the marketplace.

VINTAGE AS A SOCIAL PRACTICE

Building on Gregson and Crewe's (1998, 50) perspective of consumption as never purely an economic endeavour but as "eminently social, relational and active, rather than private, atomic or passive," in the marketplace of Granny Would be Proud, the vintage transaction was seen to be a highly personalised exchange. This was echoed in the interviews with notions of 'being in the club' and 'community' permeating them. Vintage consumption from the observations was both an individualistic and collective act that enlivened the market space. The development of practices in the marketplace, similarly to Schau et al's (2008) brand communities, led to the exchange of collectively valued goods. From the observations, the building of relationships and these sharing practices formed a large portion of the interaction between consumer and stallholder and through this dialogue could be seen to grant status in the marketplace to both. In this way it was seen as testing emotional practices, such as commitment to vintage as a lifestyle. Acceptance by the collective meant that these sharing practices benefitted individuals and also created consumption opportunities: stallholders kept stock to the side for consumers that they knew or mentioned other items that they had that may interest returning customers. These notions were highlighted in the interviews Jess explained how this relationship even encouraged her to buy more:

"It definitely makes me go back there because I know she is nice ...they will hold onto something while you go to the bank or they will give you advice or their opinion on something, they might be lying but you tend to feel like they are probably quite truthful."

This dynamic interaction seemed to aid both consumer and seller in the exchange. As Jess highlights the consumer receives personal attention adding to the experience of the exchange and the seller is able to sell their item and start to build a role of expert in the marketplace. The personal nature of this exchange was illuminated again by Louise who described how when selling her vintage homeware pieces she likes to "get a feel for the customer," and to "try and understand their vintage style and preferences" so as to make recommendations and know what they would be comfortable with. This role that is adopted in the exchange of expert and consumer unfolded across the interviews with the stallholders taking pride in this position of authority in the market. The building of a relationship between stallholders and consumers and the subsequent acceptance into the vintage community was marked by the time spend over the interactions around the exchange. This relationship and interaction of the stallholder and consumer were intrinsic as to how the objects would be viewed in their new lifecycle, as illustrated through our field notes:

"In most of the market stalls, the stallholder seems to acknowledge the consumer walking past or stopping to look at their items with a smile or a nod or looking up from what they are doing at least. Some don't look up or glance at consumers and it seems like unless the consumer has seen something that has caught their attention, they don't bother to stop." (Researcher field notes, March 25th 2012)

From this extract it is depicted that the interaction although apparently basic, seemed to set the norms for the possible exchange and group acceptance. Stallholders asked the consumer questions about their style and influences and where they normally find vintage objects. This dialogue provided a means for stallholders to present their objects to a consumer and enabled them to engage in a discussion around the object's history. This ultimately aided the stallholder in navigating a use value and potential in the mind of the consumer.

Stallholders often described their consumers as friends and these friendships seemed to be longstanding with some spanning years. They were relationships that although built around an exchange were spoken about in affectionate terms. This friendship in some instances seemed almost strategic, in that being friendly with a stallholder ensured that the consumer was able to find out about other stock that they had, when they would next be selling at the market and the stallholder acted as guide as to where to source the best vintage items. They appeared to be friendships based on a shared understanding of aesthetics and style similarities but also of gaining advantage and knowledge in the marketplace. In exploring this relationship with Tina, she spoke of building up almost familial relationships with the consumers she worked with:

"It is my business but I love working with people for months on creating something that will mean so much to them but it always shapes me as well…it is important that you have the same vision and share a vintage aesthetic…long afterwards I still like to have a drink with them as we have been so much part of each other's lives."

Tina conveys esteem around these relationships with consumers she highlights the time and involvement with each other, the idea that they both invest so much in each other around the exchange – in both a personal and a monetary way. She also illuminates the idea of the importance of the shared 'vintage aesthetic', that this similarity in how they view the world, their style preferences and appreciation of the vintage scene is key in the development of this relationship.

These basic exchanges in the marketplace were often followed up with encouragement to 'befriend' each other on Facebook. This move onto a further online connection enabled the consumer to obtain information about when the fairs were occurring, but it also more significantly represented a lasting, tangible social connection that resulted from this initial exchange. In this way the stallholders acted like gatekeepers to the vintage scene and community. Michael highlighted the idea that this online platform allowed for an interaction and acceptance of vintage tastes that was hard to find before the Internet provided ways of connecting with similar people:

"I think social networking has a lot to do with it, say you had a particular thing for vintage clothes, you would maybe meet other people who liked vintage clothes at the vintage clothes shop but the chances of hitting it off with them or going for a pint with them were pretty slim… because now people can express their interests up front on Facebook and places like that, there is more interaction with people, with groups that are like-minded…"

This extract conveys that social media acts as a coordinator of the marketplace; it connects tribes (Cova 2002) that may have been unable to connect without this medium. It also serves as a way to market the events of the marketplace to an interested audience. This is crucial as the 'Granny Would be Proud' market was not a permanent fixture: it occurred every two weeks. In this way social media facilitates the marketplace, this allows knowledge of the marketplace to reach a potentially interested audience. Molly comments on her use of social media to find out information about markets: *"Of a weekend I normally just look on Facebook to see what markets are on that day or I will have seen friends or the organisers posting about an event during the week and I will then remember to stop by."*

In this way, social media reaffirms the physical connection for Molly and also allows for the community to move online. It takes these notions of social exchanges and the desire to be part of 'the club' to a more visible, tangible state.

The importance placed on the practices of a shared aesthetic and the social demonstration of these practices around the exchange, portrayed a social investment in the object from both stallholder and consumer in which the value is constructed. The stallholder acts as gatekeeper to this vintage community and the friendliness of the interactions steers the exchange. Each practice encouraged deeper commitment to the vintage collective. The development of relationships and shared understandings suggested that the constitutive elements of vintage are social in character. In considering this, this paper demonstrates that 'vintage' in the Granny Would be Proud marketplace was a social construct. This can be seen in the meaning and subsequent value attached to individual possessions (Belk et al. 1988), the provision of this value and the concept of vintage could be argued to be a social practice.

PRACTICING THE 'VINTAGE LOOK'

The production of 'the look' of the vintage marketplace was seen to be key to practitioners and suggested concepts of authenticity, acceptance and stylisation. The marketplace was not permanent and the active process of creating the physical marketplace that took place every two weeks involved consideration of the staging of the event. The creation of 'the look' was produced critically as a way to create a feeling for the market. This well managed atmosphere was a mechanism for stallholders to show their own personality within the vintage context but also to act as a framing of their aesthetic vision. This striving for 'the look' also ties in with the consideration of the socialites of consumption, as the achievement of this was also crucial for the staging of the stall, but also significantly for both the stallholder and consumer. The creation of 'the look' was seen as key in gaining access and approval in the marketplace (see Figure 3).

Figure 3: 'Practicing the vintage look' in the marketplace

"*The sellers arrive and are greeted with a brown table and a lamp, on returning an hour later, they bring the space to life with ornate, embroidered table cloths, rose adorned cake stand holders overflowing with costume jewellery, tweed suits and silk scarves hanging over the walls, suitcases brimming with goods at the foot of the table...*" (Researcher notes, March 4th 2012)

Extending this notion further to the construction of the marketplace, the stall and the stallholder must also achieve a certain look

to gain credibility in the marketplace. The vintage look was seen to add to their reputation and either attracts or detracts consumers from engaging with them. This proposes that the personal nature of the transaction and the focus on the aesthetics was key and again stands in contrast to views of exchange as a simple process. This highly personal and social nature of the interaction can be seen to affect value construction as the excerpt above highlights, achieving acceptance and building a relationship, if even for the time that the interaction occurs, shapes both the consumer and the stallholder's views of vintage. Building on the idea that the object has a complex history or "social life" (Appadurai, 1986) that the consumer is not necessarily aware of but that through interaction with the exchange with the seller can be created, rather than diminishing potential value, appeared to add to the consumer desire for the object. The central concern of stylisation also highlights again the fluidity of vintage and that far from being fixed, the production of 'the look' can affect the way that the vintage objects are seen.

Practitioners spoke of the "camaraderie" and "community" of vintage, and this conveyed forms of sociality tied to their consumption practices. The vintage marketplace can be viewed therefore as a performance of community value, which is a collective and social undertaking and in which negotiations over objects, use and ultimately price, are intimately woven into the social. By this account, while appearing individualistic, vintage consumption must also be understood as a communal form of consumption whereby the reclamation of social relations and the enlivenment of social spaces are made possible through the marketplace. As expressed by Michael:

"*There is no doubt about it, there is a community thing going on, I think this is what will keep the thing going...*"

And further added to by Louise:

"*Vintage is a lifestyle and not just how you choose to shop: it is about a way of seeing the world but also I suppose how you see your friendships. Yes, I sell at markets as my job, but it is something that I love, when I am up at 4 am to go to a house clearance or car boot sale on a rainy Glasgow November morning, what I think about is selling that object, discussing with the customer about the item, building a relationship with them and thinking about what new lease of life they will give it... I love those interactions...I have made so many friends in this line of work and I always thought that I was alone in how I valued vintage stuff over new things...*"

Vintage here is considered as more than a consumption habit, it is a way of connecting and finding shared values in a busy consumer present. In this way it acts as a bridge to shared interests, values and practices. Consumption can therefore be viewed as a way to connect to others. In conceptualising consumption in this way it allows for an understanding of the complex emotional and social relations that unfold in the marketplace. The vintage marketplace can be perceived as a space for social relations and one in which the practices of 'self-fashioning' are used as a medium for self-differentiation and identification within the vintage collective (Rafferty, 2011).

Vintage as a skilled practice

The skills of vintage consumption have long lost their roots of necessity and the apparent stigmas of economic thrift. The act of vintage is tied to activities such as finding, examining, evaluating, haggling, socialising and interacting. In the vintage marketplace there was a cache and cultural capital in being able to uncover hidden 'treasures' that differed from the mass production approach of the high street. This talent for spotting potential treasures was heralded as a revered skill in the community. Sellers expressed the necessity of 'getting a feel for things', and of knowing what is wanted in the marketplace. Ideas of expertise and knowledge were mentioned fre-

quently with regards to negotiating the marketplace. One of the key resources in the stallholders achieving acceptance and subsequently success is in their knowledge of the marketplace. This includes both where to source the items and also an understanding of what will be desired by the current marketplace audience. This skill is revered as Alice illustrated:

"What I love doing is raking through all the crap and finding, I mean sometimes you don't, it is not always there, but it is like finding gold when you do."

This idea that Alice personally finds each individual object that she sells, gives her great pride and for her it played an important role in the creation of vintage. She observes that this ability to find comes from years of experience. She is disparaging of newcomers to the marketplace that think it will be an easy way to make money. This highlights elements of communities of practice (Wenger 1998) as knowledge of rules and procedures must be present for acceptance into the vintage community. Alice highlights emotional elements of practice as she values the time spent on finding vintage objects as representative of their commitment to the vintage aesthetic. Her extract also highlights some of the ways in which vintage is achieved, of the importance of being able to 'see' something in an object that has been abandoned as potential stock and a worthy commodity. It also illustrates the notion that her finding is not necessarily driven by market demand, but that through this active process and knowledge, the stallholders create market demand. This notion was echoed throughout the interviews as stallholders expressed the necessity in the active processes of vintage: of 'missions', 'rummaging' and 'finding', illustrating the physicality and labours of 'doing vintage':

"It is a lot of work sourcing, going to car boot sales, jumble sales, auctions, house clearances. I mean often bidding on whole lots at auction with the hope of finding a couple of good things that can be used." (Tina)

Tina's excerpt highlights the active nature of searching and trawling through items to find something that she thinks is useable. In considering the objects of these processes, in order to become a thing of value, a transition in how the object is viewed must be achieved. This is an important consideration when considering a marketplace that is constructed on the basis of items being re-seen and re-evaluated. DeLong et al.'s work (2005, 24) moved this proposition forward and assert that being 'hooked on vintage' is not a haphazard process, but rather it is a complex process that involves the consumer possessing the relevant "aesthetics, taste, clever dressing, historical curiosity, and an ability to discriminate the authentic product, and revalue it in a new setting." Many of the stallholders revealed that the way to learn about finding objects and unearthing value in objects was through the practice of buying and selling. In this way vintage can be conceptualised as a doing process, one in which over time the necessary skills and values are developed.

By the very nature of the vintage markets, objects were seen as rare and hard to find, this uncovering of objects added social capital to the finding process. In introducing the discarded objects back into the consumption sphere, the stallholders had to undertake the practice of ascribing a value to the objects. For stallholders in the Granny Would be Proud marketplace this act of placing a monetary price on objects was difficult for all the interviewees to put into words, with Louise commenting it was "like a black art". Unlike a traditional marketplace, monetary prices were not highly visible in the vintage market.

When discussing the idea of value in the vintage marketplace, Michael suggests that by its very nature, vintage was fundamentally elusive:

"I've stopped so much valuing them on the age of them, its not like antique value, its not that, it is intrinsic, the quality, rarity and the look of them…it is the how unique or individual they are…how irreplaceable they are" (See Figure 4).

Figure 4: The Transience of value - Michael and his vintage glasses that he selects before each market

Michael's excerpt demonstrates that vintage far from being a fixed construct is open to active negotiation based on skill and knowledge practices. As a skilled practitioner he is able to unpack the contained value in the objects and present them again to the marketplace. In this way value can be seen as an embodiment of capital. The stallholders also demonstrated knowledge both of the network in which they functioned but also of particular objects and their origins. Vintage goods by their nature have characteristics that have merited their inclusion in a second or third cycle of exchange. The meaning attributed and value constructed around the object are created and manipulated by marketplace practitioners. Vintage consumption can be seen as culturally and socially shaped through practices as the object's status is created through a process of being withdrawn and introduced in a new setting (DeLong et al, 2005). This transition in how the item is viewed requires the skill of being able to perceive its possibilities in a new setting. This mirrors notions in McCracken's (1988) early work of the possibility of objects, of the "combination and recombination take place until a concept and an aesthetic emerge that help give substance to a group's wish to differentiate itself from the mainstream" (1988, 136). Vintage objects have a history to them, which could potentially be seen to add or detract from their value. The stallholder to increase the value, for example through nostalgia or styling, could elaborate these histories of previous consumption cycles on. Conversely they may attempt to rid the object of its history

through rituals of mending and cleaning of the object (Parsons 2008, 2009). Vintage can be seen therefore not as an inherent characteristic of the object, but as a result of emotional and social relationship, in which consumption is the result of this engagement. In this way, vintage consumption is embedded within the objects and in the practices and also around being able to appreciate and see the potential in these objects which became key for acceptance in the collective.

CONCLUSIONS

As this paper sought to reveal, consumption spaces such as those devoted to vintage represent fields in which the conventions of the traditional marketplace are transformed and altered. Vintage here speaks of a form of making space: making space for oneself; making space for others; making space for *fun, fantasy and emotions* (Holbrook and Hirschmann 1982). Vintage social spaces speak of a longing for alternative worlds; alternative modes of consuming and exchanging. Drawing on the practice theory lens allowed a re-thinking of marketplace dynamics, comprehensions of knowledge application and understandings of vintage. This exploratory study of the vintage collective in Glasgow has depicted that the knowledge of the marketplace is central to in negotiating the boundaries of this marketplace. For a successful exchange there needs to exist a knowledge of the object, a competence on the part of the practitioners and also the performance of forms of intimacy with such objects and the social.

It is thus clear that the vintage marketplace is an intimate, personalised, lived experience that brings with it social and personal elements to the exchange. Vintage appeared to be a way of looking at objects, of interacting around these objects and building relationships based on shared appreciations for knowledge and skill. As demonstrated from the emergent themes, vintage consumption can be conceptualised as an embodied practice that is socially and contextually constructed.

Vintage is constructed as 'other', as an alternative to the mainstream, of being different and doing things differently. Vintage is thus the ultimate form of 'bricolage', of recycling styles; it allows the consumer to play with the stylistic norms, gender boundaries through fashion. Wearing vintage clothing can be seen as a way to escape the confines and dictates of the modern marketplace. Or as Reynolds (2011: 194) proclaims about vintage, the individual acts as a 'curator of their own life-in-style'. In accordance with Thompson and Haykto's (1997) work, vintage allows consumers to use fashion to self-define, to construct a personal discourse of their history and to negotiate the dynamics of the social. Finally, the concept of time and its appreciation is tied to vintage from the outset. By the very definition of vintage given at the start of the paper, the second-hand object is conceptualised as 'vintage' only through a certain amount of time passing. The discussion highlighted that the learning of 'doing vintage' is a social endeavour and is bound by the time commitment given to this learning. In this way vintage could be considered a form of 'learned nostalgia' (Goulding, 2003). Our analysis reveals that vintage must also be understood as a form of embodied practice. It is a preference for a time that has long since passed but that is brought back to the modern consumption sphere through the revival of interest around an object. Vintage in this way allows for an unlocking of an imagined past in every wear of an item. The marketplace has facilitated a community based on these shared ideals and aesthetics. It has created a consumption space in which the community's preference for the past, be it a 1950s china tea set or 1980s checked flannel shirt, has been cultivated through practices and their associated forms of understanding; that is a practice of finding and possessing a sensibility to the past and its elusive charms amidst a hectic and ever-changing consumer present.

Consumption-Related Values and Product Placement: The Effect of Cultivating Fashion Consciousness on the Appeal of Brands in Reality Television

Claire Sherman, Zayed University, UAE
Damien Arthur, Zayed University, UAE

ABSTRACT

By 2003, Baylor University's forensic science program had grown by ten times the 1999 intake and other universities across the US were scrambling to create forensic science courses to cater for new student demand (Johnston 2003). The reason? Since it aired on the 6th of October 2000, Crime Scene Investigation (CSI), a television (TV) series, had stimulated enormous interest in forensics and the science of solving crime. So much so that it was affecting student choice and behavior. These types of TV inspired phenomenon are not uncommon. Although much of the evidence is anecdotal, there are many instances where very specific consumption trends have been fueled by television programs. The Biggest Loser has generated an interest in boot camps, American Idol has created a resurgence of karaoke games and various home improvement programs have inspired their audience to renovate. These trends have become more acute with recent reality and lifestyle television focusing on particular behaviors that transform the real people on their programs. This paper examines how the cultivation of relevant consumption values generates these trends through increasing the viewer's desire for associated products and brands integrated within TV programs. Specifically, this longitudinal study explores the cultivation of fashion consciousness and its impact on the desire for brands that are implicitly endorsed within reality television programming.

LITERATURE REVIEW

Cultivation Theory

Cultivation theory suggests that increased exposure to television content creates a worldview, or a consistent picture of social behavior, norms, and structure, based on the stable view of society that television content portrays (Gerbner et al. 1994). Research in this area examines the idea that heavy television viewers will agree with the 'television view' more often than lighter television viewers. Studies of cultivation have examined a range of topics including the cultivation of violence, substance abuse, individualism, materialism and body image (Cohen and Weimann 2000; Harrison 2003; O'Guinn and Shrum 1997; Shrum, Burroughs, and Rindfleisch 2005), and, in general, have found cultivation effects exist. For example, women who watch more television perceive an ideal female body that is closer to the curvaceously thin woman depicted on television than females who do not watch as much television (Harrison 2003).

One notable consumer study by O'Guinn and Shrum (1997) explored the influence of television on peoples' perceptions of affluence. In particular, they studied consumers' perceptions of the prevalence of convertibles, car telephones, maids or servants, hot tubs/Jacuzzis and wine within the USA. One significant factor of this study, different to many other studies of cultivation effects, was the examination of direct experience with the product. As expected, direct experience enhanced estimates of affluence. That is, participants who had a maid, hot tub, sport car, etc, judged these items to be more prevalent in society than those who did not. This research found that both experience and television viewing were sources of information with which to build perceptions of affluence. In addition, it was posited, although not tested, that those who had no direct experience with the products would be more influenced by television as a source of information. This is interesting because it suggests that the level of television viewing influences consumer perceptions, particularly when there is no or little direct experience with the matter being cultivated.

O'Guinn and Shrum's (1997) study, like many of the early studies of cultivation effects focused on beliefs about the prevalence of phenomena within society (i.e. how much violence there is in society, how many people drive sports cars), however, more recent studies have focused on the cultivation of values, such as materialism (Shrum et al. 2005). The distinction is important, as cultivating beliefs of prevalence and cultivating values are inherently different processes that occur in different ways. Interestingly, unlike judgments of prevalence, which are formed at the time the judgment is made, consumer values are formed at the time of viewing. Known as online processing (Shrum et al. 2011), this formation of values may have particular implications for brands that are simultaneously presented within TV shows. If a relevant consumption value is formed during the viewing experience, when the brand is implicitly endorsed, desire for the brand should also be enhanced during viewing. However, this effect will depend on both the relatedness of the brand and value as well as the power of the television program to elicit a change in viewers' consumption-related values, a power reality television may hold.

The Power of Reality TV

In addition to being entertained, reality television viewers often examine the behavior of the participants and reflect on their own identity and whether they would behave in a similar way (Nabi et al. 2003). However, as the viewers observe how the various characters within the program approve and disapprove of certain behaviors, they are presented with opportunities to learn from these experiences. In this way, reality TV may shape viewer norms by allowing a vicarious experience of human interactions. This may be particularly relevant for what has been termed 'transformational' reality programming (Bratich 2006), where a transformation takes place during the program, such as the 'make-over' of a straight male on "Queer Eye for the Straight Guy" or the transformation of a participant's cars on "Pimp my Ride". The power of transformation was described by Bratich (2006) as a reason why reality television is more than a representation of society, but a mechanism through which society may be controlled or changed. Where a program is seen as an authority in transforming a participant from the everyday person to a desired self, those who identify or wishfully identify with the participants are likely to absorb the implications of certain behaviors, attitudes, reactions, styles and brands in achieving that aspirational goal, whether it be their inner self or their extended self, such as their home or car, that is enhanced. Hence, reality TV is a very powerful context for a brand to be promoted within since, on an individual level, the viewer is vicariously learning and changing. This individual connection to the program may be the mechanism that underpins the cultivation effect.

From a consumer behavior perspective reality television's ability to cultivate consumption values and instigate trends, such as fashion consciousness, is similar to stimulating primary demand. However, it may be one step removed, stimulating interest not in a specific product category (e.g. high heels) but in an area of interest (e.g. fashion). For example, a viewer of MasterChef, a competitive cooking show, may begin to value the art of home cooking and fine

cuisine as a result of watching ordinary people create culinary masterpieces. Subsequently, this will then enhance the viewer's motivation to process information about how to cook, for instance, which types of knives are best, what ingredients are fashionable and what type of utensils are desirable. If a brand is then presented at the very time that this value is being generated (via online processing) there is a greater likelihood that the brand will be noticed and ultimately desired. Thus, the closer the brand's proximity to the cultivation of related consumption values, the more likely the brand will be desired. Unlike a viewer who is already interested in cooking and deliberately watches the program to feed this interest, a viewer that simply watches due to their interest in human interactions and competition, or to negate boredom may be even more susceptible to influence, as they are a clean slate, with no pre-existing knowledge and experience with the product category and associated brands. With this in mind, it may be important to focus product placement research not solely on those with prior product involvement or particular consumption values but those who experience a change in their consumption values.

The Link Between Brand and Program

The cultivation of consumption values that stem from a reality television program will have flow on effects for relevant products and brands. For the flow-on effects to be realized, some relationship between the brand and the program's theme or content is required. A match between the context and the product aids the acceptance of the brand within the program or scene as well as ensures a particular target audience, likely to be interested in the product. This thematic congruence differs from 'natural integration' in that it relates to the match with the theme rather than whether it is naturally depicted within a particular scene. For example, a toddler tantrum within a Subway store may seem to be natural and well integrated within the reality program Super Nanny, yet the brand Subway is not necessarily congruent with the theme. Alternately, a scene depicting contestants on the Biggest Loser eating low-fat Subway sandwiches is a more thematically congruent placement. In addition to transferring meaning from the program to the brand, a thematically congruent placement will also provide meaning to the program (Karrh 1998). From the viewers' perspective they will gain value from this brand because it may help to fulfill a new consumption value generated via the theme of the program.

A Proposed Test of Cultivation Effects on Brand Appeal

Previous research has often cited a significant association between television viewing and any particular 'television view' as the result of cultivation (Cohen and Weimann 2000; Gerbner et al. 1994; O'Guinn and Shrum 1997). However, this may be the result of correlation or indeed the reverse relationship may be true, where a particular attitude may cause greater TV viewing of a particular genre (Cohen and Weimann 2000). Therefore, to resolve this issue this study will test whether the change in fashion consciousness, rather than the absolute level of fashion consciousness, affects the desire for a thematically congruent brand. This is not to say that there may not be a prior relationship between those who have a high level of fashion consciousness and a change in brand appeal. Marketing communications theory tells us that those that are more involved with a product category (or in this case the surrounding theme of fashion) may be more motivated to pay attention to a product message (Petty and Cacioppo 1986). However, this effect would not be due to the cultivation effect of TV viewing. For this reason, we capture and include prior product involvement within our model, yet the independent variable of focus is the change in fashion consciousness. Denoting

cultivation, this change may even occur for those who initially have low levels of fashion consciousness.

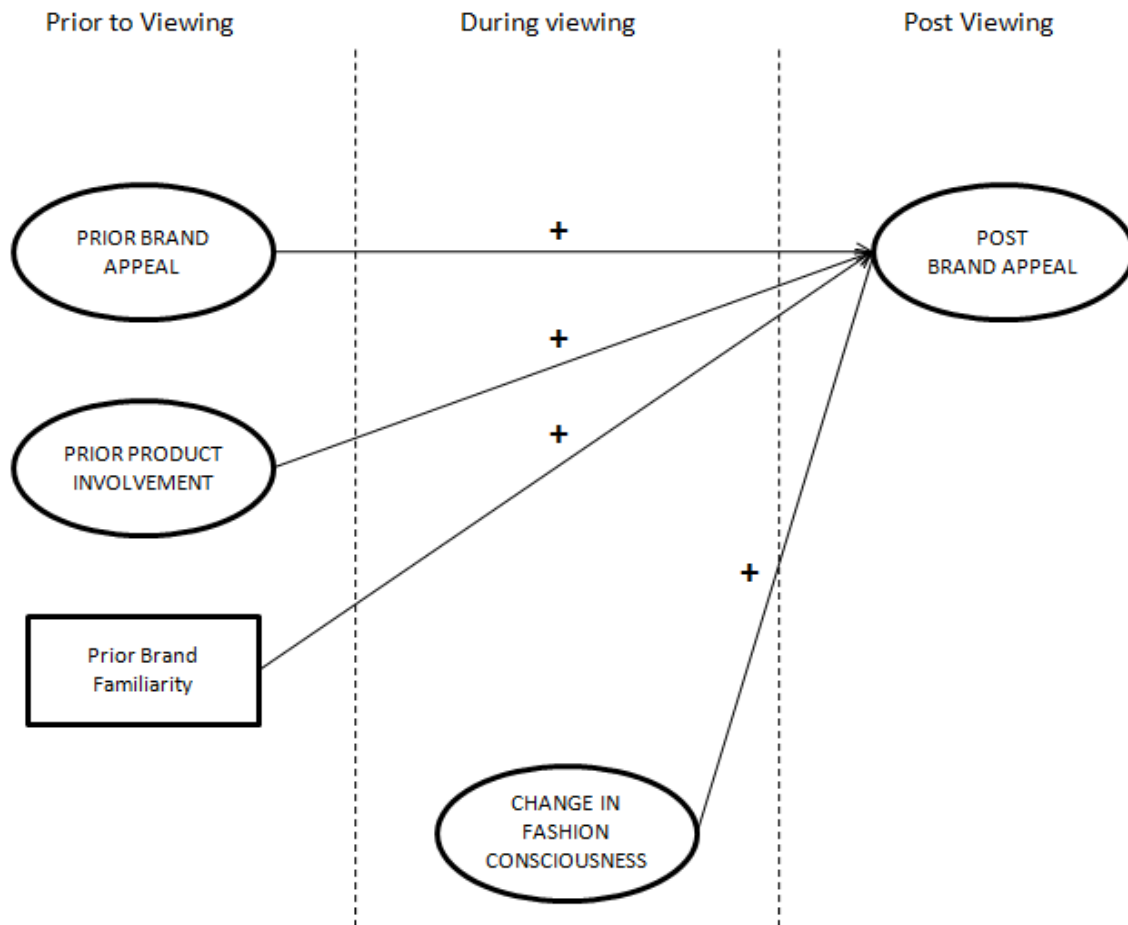
In addition to product involvement, brand familiarity is also included within the model to avoid further specification error. Brand familiarity has been found to affect product placement outcomes perhaps due to greater perceptual fluency (Brennan and Babin 2004), which is viewers' superior ability to process a brand due to prior familiarity with its shape, meaning and context. Finally, the model also needs to account for the audiences' level of desire for the brand prior to viewing. For this reason, prior brand appeal is included in the model so that its effect is captured and we can ensure that the resultant brand appeal is not simply a factor of the viewer's previous desire for the brand. The resultant proposed model is depicted in Figure 1.

METHODOLOGY

A challenge faced by many researchers of cultivation effects is discerning between correlation and causation (Hughes 1980). Although it may be argued that causation cannot be proven, a longitudinal design was used to enable the capture of a stimulus effect and allow causal inferences to be made (Rindfleisch et al. 2008). To test for viewing effects, a panel study was undertaken. The procedure allowed for viewers to watch six episodes of a target program on an advert-free DVD (totaling four hours and 15 minutes of screen time). This was done within their own homes over a three-week period. This design is notably different from previous studies of product placement effects due to the length of the viewing situation. In particular, this design might afford the necessary time and exposure for the cultivation of fashion consciousness to take place. Viewers were asked to fill in a self-administered online survey both before and after viewing. To test whether pre-measurement had a priming effect, a small post-test only control group (n=45) also undertook the study and tests of significant differences between the control and main group responses were carried out with no significant differences in post brand appeal found.

As a typical example of transformational reality television, the program, Australia's Next Top Model was used as stimuli. It promoted the value of fashion consciousness. Specifically, it was centered on the fashion industry and was closely aligned with well-known fashion designers and models. Several brand-program relationships were also already established. Four brands were initially assessed for the strength of congruence via a pilot study: a small car, a body spray, a magazine and a cosmetics brand. The cosmetics brand, Napoleon Perdis Cosmetics, exhibited the greatest level of fit and was used for the final analysis.

The specific target population would usually comprise individuals who watch the target program (Neuman 2003). However, for this study, the aim was to capture a sampling frame that would best replicate the natural viewing audience of the series, whilst excluding existing viewers to avoid any prior cultivation effects. On consultation with the producers and brand managers responsible for the placements, the target audience for the program and brands was confined to Australian females aged 16 to 35. Considering the nature and content of the program, as well as the use of a cosmetics brand, this all female sample was necessary to uphold the ecological validity of the study. To capture a qualified sample, a filtering process was undertaken, where the initial invitation for participation was sent to a wider population and those outside of the target sample were gradually filtered out via questioning. The panel of viewers was recruited via an email, with a link to the preliminary online survey. The initiating email was sent to all staff at a large, South Australian, vocational training college. This sample was not a student sample and, if passed

Figure 1:
Proposed Model of the Effect of the Cultivation of Fashion Consciousness on Brand Appeal


on to the college students, they would be a more generalisable, non-traditional student sample in any case (James and Sonner 2001). The email request outlined the television program to be viewed, the incentive of a $30 mall voucher, the necessary sample characteristics and encouraged forwarding of the email. Nineteen percent of the sample was recruited directly from the original email, whilst the remaining 80.7% were recruited via snowballing. From 663 responses, 234 eligible respondents were sent the DVD package. Of this, 203 completed the two surveys and viewing in full, yielding a retention rate of 86.76%.

Fashion consciousness was measured both before and after the viewing experience and a latent difference score model was developed (as outlined in Ferrer and McArdle 2003) that provided a three-item measure for change in fashion consciousness over the viewing experience. The measure for fashion consciousness was taken from the 'overall fashion consciousness' dimension of a 38 item 'fashion consciousness scale' developed by Gould and Stern (1989). Three of the dimension's items were deemed inappropriate and were removed as they related to specific behavioral changes that were unlikely to occur over a three-week period. The ten items included (see Table 1) were randomized and evaluated on seven-point Likert scales.

Confirmatory factor analysis was conducted on this dimension using AMOS software and three separate factors emerged, instead of the expected one (Gould and Stern 1989). These factors each related to slightly different aspects of fashion consciousness, specifically to reflections on the viewer's own fashion, their awareness of

fashion and how fashionable they are (see Table 1). Each of these factors were highly correlated (ρ = .86, .89, .91) and exhibited good fit as a three-factor higher order construct ($\chi2$ (78) =161.332, p=.056, GFI=.931). To reduce the item-to-subject ratio the composites of these factors were created and a three item higher-order factor was used to generate the difference score measuring the latent construct 'change in fashion consciousness'.

Brand appeal was measured both before and after the viewing experience. This enabled an evaluation of any resultant desirability for the brand to focus on the influence of a cultivation effect and not simply on a prior judgment of the brand. The 'brand appeal' construct was used rather than the possible alternatives (i.e. brand image) as it is a more universal measure and may apply to many different brand characteristics depending on what is appealing to the individual. Brand appeal was measured using a scale that has been validated in numerous studies investigating attitudes towards a brand (Bruner et al. 2001). The three particular items used in this study (see Table 1) were chosen for their generality and relatedness to appeal. Each of the items was randomized and measured on seven-point Likert scales. After several unprompted 'don't know' comments were reported during pre-testing, a 'don't know' response category was deemed necessary and included. This inclusion was especially important as the preexposure measure was taken at a time when viewers may not yet have been aware of the brand.

Both brand familiarity and product involvement were measured before the viewing experience to account for any intervening effects.

Table 1:
Measurement Scales and Items

Construct and Items	Factor
Fashion Consciousness (Gould and Stern 1989)	
1. I reflect about the fashions I wear a lot	Own Fashion
2. I am very involved with the clothes I wear	Own Fashion
3. I'm very conscious of the fashions related to my own gender	Fashion Awareness
4. I'm very alert to changes in fashion	Fashion Awareness
5. I would say I'm very fashion conscious	Fashion Awareness
6. I'm very involved with fashion	Fashionable
7. I'm more fashionable than the average person	Fashionable
8. I'm very fashionable	Fashionable
9. Other people think I'm very fashionable	Fashionable
10. Other people ask me what is fashionable	Fashionable
Brand Appeal (Bruner, James, and Hensel 2001)	
1. *Brand* is appealing	Brand Appeal
2. *Brand* is desirable	Brand Appeal
3. I like *Brand*	Brand Appeal
Brand Familiarity (Bruner et al. 2001)	
1. I am familiar with this brand	Brand Familiarity
Product Category Involvement (Bruner, James, and Hensel 2005)	
1. In general, I have a strong interest in *product category*	Product Involvement
2. This *product category* is important to me	Product Involvement
3. This *product category* is very relevant to me	Product Involvement

Brand familiarity was measured using a single-item seven-point Likert scale that has been validated in previous studies (Bruner et al. 2001) (see Table 1). Product involvement was measured similarly using three statements validated in previous studies with anchors of 'Not at all' to 'Very much', indicating the relevancy, importance and viewer interest in the product category (Bruner et al. 2001) (see Table 1).

Structural Equation Modeling (SEM) was used to test the effect of cultivation on brand appeal because it allows the impact of other variables to be accounted for, avoiding some of the specification error that may occur in single regressions. It also accounts for both measurement and structural error relating to latent variables (Kline 2005).

RESULTS AND DISCUSSION

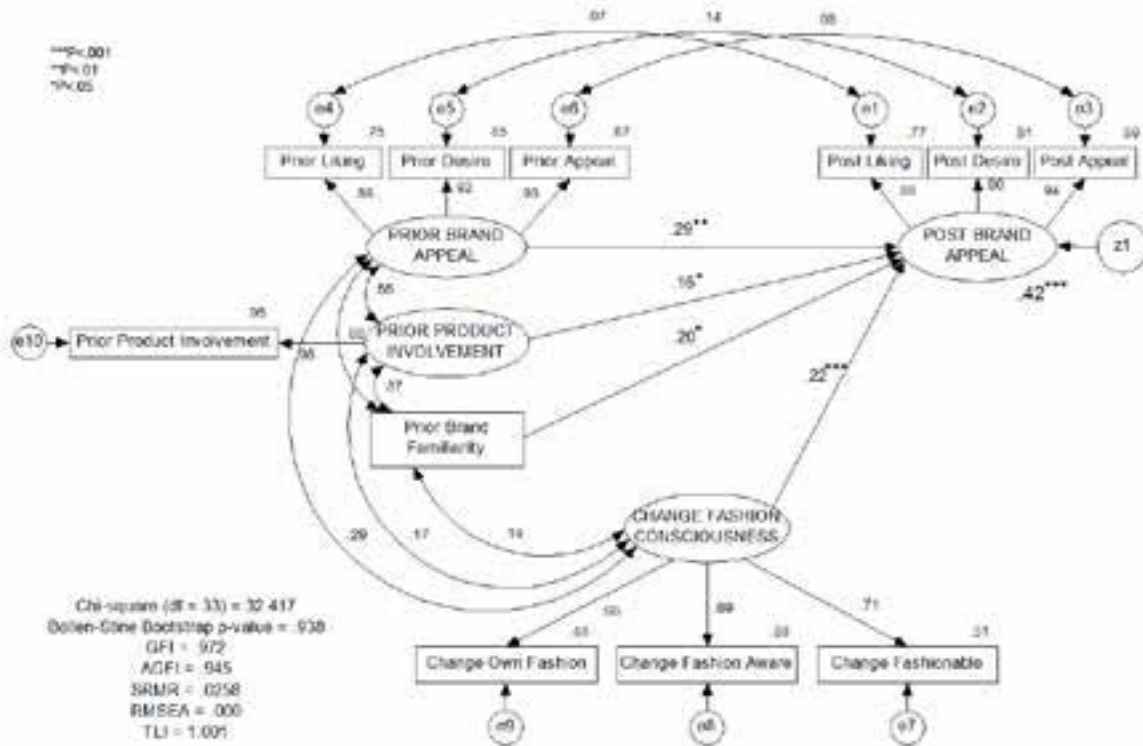
The final model was tested and exhibited excellent fit based on all fit indices (χ^2 (33) = 32.417, p=.938; GFI=.938) and explained a good proportion of the variance in brand appeal (R^2 = 42.1%) (see Figure 2). As hypothesized, both product involvement (β_{PI}=.16, p=.024) and brand familiarity (β_{BF}=0.20, p=.011) have a significant positive influence on brand appeal. In addition to these established effects, the change in fashion consciousness also had a significant positive effect on brand appeal as hypothesized (β_{FC}=0.22, p=.000). That is, viewers who experienced a greater change in fashion consciousness after watching the program, Australia's Next Top Model, reported a greater desire for the cosmetics brand Napoleon Perdis. Hence, through the cultivation of a specific consumption–related value, reality television programming was found to increase viewers'

desires for a thematically congruent brand. Importantly, this relationship was found to exist while controlling for the effects of prior product involvement and the viewers' original desire for the brand. This is an important contribution as it demonstrates that the simultaneous cultivation of consumption-related values has the power to directly affect consumers' attitudes towards integrated brands, thus providing a better understanding of how product placement operates.

In contrast to previous studies that have focused on whether an overall cultivation effect exists, this study extends the current literature by demonstrating that viewers who experience a greater cultivation effect develop a greater desire for the brand; a second-order effect. Importantly, these results indicate that it is not just prior interests and values that dictate individuals' desire for the brands placed within the TV programs they watch. Via online processing, the development of consumption-related values also contributes to a desire for the brand. This finding is a significant contribution to the marketing literature as it demonstrates the worth of a malleable viewer. Furthermore, this malleability pertains to values, which are generally considered an influential yet stable consumer variable within the communication situation. This notion should now be rethought given the prolonged viewing of many forms of entertainment.

IMPLICATIONS, LIMITATIONS AND CONCLUSIONS

The major findings of this study suggest that, when considering brand placements, marketers should look beyond programs with an audience that is already interested in the product category or surrounding interests, and consider the potential of programs capable

Figure 2:
The Effect of a Change In Fashion Consciousness on Brand Appeal


of cultivating a relevant consumption value. This notion challenges more traditional media planning techniques that use audience analytics, or even those that analyze the mood induced by various programs, and encourages analysis of a media vehicle's ability to cultivate relevant values. Product placement provides a benefit over traditional advertising through the embedded connection to viewers' online processing of consumption-related values. This provides marketers with an opportunity to increase their market share by gaining first access to new consumers at the moment they become interested, rather than attempting to steal existing customers from competitors.

Moreover, if brands realize this potential and fund the cultivation of particular consumption-related values through entertainment media, in particular reality TV, it may be possible for them to actively enhance the size of the entire market. If this occurs on a wide scale the entertainment landscape will be changed (or perhaps it already has). Based on the traditional funding model for entertainment, content may become skewed towards values that support consumption. For example, it would be highly useful for a cosmetics brand to fund shows on beautifying individuals or an SUV brand to fund programs that promote an outdoor lifestyle. In doing so, brand-funded programming has the ability to influence consumers by promoting a consumption agenda. Such directed or controlled agendas have been discussed in the media psychology literature, however, agenda-setting theory is most commonly based on the dissemination of information, rather than cultivating values, and it often focuses on the control that media has in influencing what society deems newsworthy (Weaver 2007). Nevertheless, this theory lends itself to the influence of advertiser-funded programming, where consumption related values are more likely to be at the centre of program content. This big picture view suggests a change in how society consumes television and has implications for debate regarding rational consumer choice.

A basic interpretation of brand-funded cultivation suggests that the viewer is a passive entity, however, critics may argue that viewers will not choose to watch a program if the content does not satisfy some underlying need. This is not disputed; however, viewers watch television programs to gratify many different needs simultaneously (Katz, Blumler, and Gurevitch 1974). While a viewer may be watching The Biggest Loser to fulfill their need for voyeurism, they may also come to value good exercise and a balanced diet, which in turn may generate a desire to attend a boot camp. Alternately, America's Next Top Model may be viewed because it satisfies the viewers' need for downward social comparison (Nabi et al. 2003). At the same time, the young women who watch it will begin to value appearance and materialism, which may fuel a desire to consume beyond their means. These examples suggest that a viewer may be both passive and active simultaneously: Active in pursing entertainment needs, yet passive to the cultivation of consumption values. These examples also highlight that cultivation of consumption values may have both positive and negative consequences for the viewer, raising questions regarding the responsibility of media and marketing practitioners who, while enhancing the desirability of brands, may change societal values.

It should be made clear that this study does not provide evidence of the dominance of cultivation over other effects on product placement. Furthermore, there is a need to reaffirm these results in a more controlled manner. In particular, including a control group of non-viewers would alleviate concerns of internal validity that may stem from the existence of external factors present over the extended viewing period. Despite these concerns, this study furthers our understanding of how cultivation affects more specific brand-related outcomes and the different ways in which individuals may be motivated to process product placements. Indeed, Petty and Cacioppo's (1986) Elaboration Likelihood Model purports that more lasting attitude change is enabled by a consumer's motivation to attend and

process brand information, however, this study advances this extant knowledge by demonstrating that motivation itself can be enhanced by cultivating the underlying value that fuels this motivation. While this finding may seem intuitive, this is the first time it has been empirically confirmed in this context and thus advances our understanding of how product placement operates. Hence, this study moves the research agenda beyond questions relating to the validity of the now well-established cultivation theory, to questions of its role in effecting identifiable brand outcomes.

Cyber-Jihad: Islamic Consumer Activism on the Web

Elif Izberk-Bilgin, University of Michigan-Dearborn, USA

ABSTRACT

This study explores Islamic cyber-activism and finds that activists pursue a virtual jihad against transnational brands as an economic and non-violent means of asserting Islamic values and identity in the marketplace. The study contributes to consumer activism literature by highlighting the role of religious discourse and authorities as market-structuring forces.

INTRODUCTION

While there is considerable research on religion and ideology in social sciences, consumer researchers have given little attention to how the interplay of these influential forces informs brand attitudes. Notably lacking are examinations of consumer activism fueled by religious ideology. This is concerning given that brand avoidance driven by fundamentalist beliefs is not always substantiated, unlike typical boycotting behavior (e.g., Nike protests following media exposes of labor abuse). Yet research shows that consumer activism, particularly in the form of boycotts, can have adverse effects on profits (Klein et al. 2004), tarnish brand image (Thompson et al. 2006), and may result in violent acts.

Compounding the dynamics of contemporary consumer activism is new media. Internet has changed the way individuals pursue social change, rendering activism convenient and, largely, anonymous. Further, viral activism has dramatically reduced the time in which boycott messages proliferate and reach mass audiences (Hollenbeck and Zinkhan 2006; Krishnamurthy and Kucuk 2009).

While the literature on consumer activism - also known as consumer resistance, anti-consumption, brand avoidance, political consumerism, and boycotting - is vast (Holt 2002; Kozinets 2002; Lee et al. 2009; Micheletti et al. 2004; Thompson and Arsel 2004; see special issues of *Consumption Markets and Culture* and *Journal of Business Research*), there is little theorizing on the interplays among religious ideology, activism, and new media. Considering that Internet is instrumental in social mobilization (e.g., Arab Spring, Occupy Wall Street) and dissemination of ideologies (Kahn and Kellner 2004), it is critical that consumer researchers explore the roles of religious ideology and new media on brand attitudes and consumer identity.

This study seeks to advance our theoretical understanding of these issues. Through a netnography of cyber-activism, this research investigates how Islamism informs consumption discourses. The data includes textual, visual, and audio material collected over two years on Islamic boycott websites, forums, and blogs in English. The study identifies two themes that underlie and distinguish Islamic consumer activism from other examinations of critical consumerism (Holt 2002; Kozinets 2002; Lee et al. 2009; Micheletti et al. 2004; Thompson and Arsel 2004): 1) tyrannization of the other – the discursive construction of non-Muslims as tyrants, and 2) formation of a cyber-*umma* (community of Muslims). The study also highlights religious authorities' role in mobilizing Islamic boycotts as unique to consumer activism driven by religious ideology.

THEORETICAL BACKGROUND

Consumer Activism

Recent research has identified a broad spectrum of contemporary forms of consumer activism. Consistent with a postmodern consumer culture, these newer forms of activism represent individualized quests for social change and range from consumer resistance (Holt 2002; Penaloza and Price 1993), culture jamming (Handelman 1999), anti-branding (Hollenbeck and Zinkhan 2010), brand avoidance (Lee 2007), anti-consumption (Lee et al. 2009) to political consumerism (Micheletti, Føllesdal, and Stolle 2004).

Among various forms of consumer activism, boycotting stands out as the oldest (Friedman 1999), the most prominent, and the most effective form of consumer expression of discontent (Pruitt and Friedman 1986). Friedman (1985, 87) defines a boycott as "an attempt by one or more parties to achieve certain objectives by urging individual consumers to refrain from making selected purchases in the marketplace." Often viewed as a 'vote in the marketplace,' or more dramatically as a 'weapon of resistance' in socio-political conflicts, boycotting commands powerless groups with authority to pursue social change. For example, consumer boycotts have played a fundamental role in labor unionization and the mobilization of the civil rights movements in America (Cohen 2003; Klein, Smith, and John 2004), while the Indian boycott of British salt and cloth propelled the British to withdraw from India.

While boycotting is a powerful tool consumers use to realize sociopolitical goals, recent research suggests that today's boycotts are less focused on political causes and civic objectives. For example, Klein, Smith, and John (2004, 93) state that contemporary boycotts "are more typically focused on corporate practices and marketing policy issues rather than on broader sociopolitical goals such as civil rights." Confirming this comment, a series of studies have identified brands' unethical business practices (Friedman 1985), 'hard-sell' tactics or overt commercialism (Micheletti et al. 2004), negative country of origin effects (Klein, Ettenson, and Morris 1998), and representation of undesired self-image (Hogg, Banister, and Stephenson 2009) as significant motivations underlying contemporary boycotts. While these studies highlight some of the important drivers of boycotting behavior, they inadvertently imply that contemporary consumer activism is divorced from ideology.

However, a close reading of the studies, particularly those emerging in the *Consumer Culture Theory* domain, suggests that consumers' anti-consumption (and consumption) practices are imbued with various ideological and moralistic narratives. For example, Thompson and Coskuner-Balli (2007, 150) find that a strong desire to redress "the ecological and socioeconomic problems fostered by economic globalization," while contesting the asymmetrical power relationships among transnational corporations, nations, and labor motivates some consumers to opt out of mainstream grocers and to participate in community supported agriculture (CSA) practices. In addition to these environmentalist, anti-industrialization, anti-globalization, and anti-corporate ideologies, Press and Arnould (2011) find that American pastoralist ideology is a prominent theme underlying CSA practices and discourses. Similar political and moral motives can also be found among the proponents of the fair-trade and green consumption movements (Connolly and Prothero 2008), not to mention the counter-cultural practices of high minded consumers concerned about the socio-economic and environmental implications of McDonaldization (Ritzer 1983) of global food production via agricultural bioengineering (Sassatelli and Davolio 2010). Lastly, Simon (2011) argues that consumers demand social justice and equality while demonstrating civic engagement through the politics of consumption. These examples show that boycotts, buycotts, or other articulations of consumer dissent, are not simply a contestation over "corporate practices and marketing policy issues" as Klein et

al. (2004, 93) suggest. Rather, these studies suggest that such acts of consumer activism remain deeply infused with personal and shared ideologies.

Consumer activism and religious ideology

While the latest literature has addressed the role of political, nationalist, and competing marketplace ideologies in structuring consumer choice and identity works (Crockett and Wallendorf 2004; Dobscha and Ozanne 2001; Holt 2002; Kozinets 2002; Kozinets and Handelman 2004; Luedicke, Thompson, and Giesler 2010; Thompson 2003; Thompson 2004; Thompson and Coskuner-Balli 2007; Varman and Belk 2009), there is little theorizing on how religious ideology might foster consumer activism (see Friedman 1999 for boycotts organized by religious groups on moral concerns). This is concerning given that religious beliefs, when coupled with socio-political tensions and economic conflicts, may become significant ideological resources with which activist consumers contest the marketplace. One good example is Islamic consumer activism. Recent boycotts of Danish goods (and of global retailers like Carrefour or Tesco that carry Danish goods) by Muslims in response to the ill-perceived cartoon depictions of Prophet Mohammed powerfully demonstrate how religious sentiments may mobilize consumer resistance and result in financial damage to the targeted businesses (Jensen 2008; Knudsen, Praveen Aggarwal, and Maamoun 2008). Far from a reflexive response to what is perceived as an offense to one's faith, the Danish boycott is a reflection of Muslim ideological views about Western powers that are deeply rooted in the colonial history and the recent Western involvement in Muslim-majority countries such as Iraq, Afghanistan, and Palestine.

Islamic activism has been extensively examined as a new social movement with a political and militant agenda (Ayoob 2008; Roy 1994), yet little research has explored marketplace articulations of Islamic ideology (Izberk-Bilgin 2012a; Rudnyckyj 2009; Sandikci and Ger 2010; Wong 2007). Particularly missing is an understanding of how Islamic beliefs, coupled with consumers' political ideology and the socio-historical structures, shape brand attitudes and consumer activism in light of consumers' identity projects. Considering that consumers increasingly pursue social change and perform identity goals through the marketplace and that new forms of media has propelled this trend, an interesting area of research lies at the intersection of new media, consumer activism, and religious ideology.

Islamic activism and new media

Evolving new media environment has led to a profound restructuring of societies by enabling an unprecedented degree of interconnectivity among various social groups, cultures, and nations. New media has provided an alternative platform for 'other' voices, which has fostered new interpretations of taken for granted ideas and practices. This, in turn, has gradually led to the fragmentation of political and religious authorities in not only the democratic societies of North America or Europe, but also countries under totalitarian regimes. These profound changes are perhaps nowhere more visible than in the Islamic world. The proliferation of media has played a crucial role in amplifying the exchange of ideas, discourses, and practices among the Islamic communities in diaspora, homeland-Muslims, and converts, which led to a wide range of emerging discourses about Islam from fundamentalist to reformist (Eickelman and Anderson 2003; Oncu 1995). Dialoguing with Islamic communities in other cultures allowed Muslims to not only discover alternative articulations of belief and practice, but more importantly, question the authority of the religious scholars, who have traditionally served as the spokespersons for Islam. Accordingly, new media has

transformed the public space into "a marketplace of ideas, identities, and discourses" (Eickelman and Anderson 2003, xii). Indeed, the expansion of Islamic public sphere and identity politics fueled by the Internet is quite visible in the global rise of the halal industry (Izberk-Bilgin 2012b) and the formation of Islamic consumptionscapes (Pink 2009). Paralleling the growth of Islamic consumerism, interestingly, is a proliferation of discourses and practices of Islamic consumer activism. Particularly, in the aftermath of 9/11, there has been a wave of Islamic cyber-activism protesting anti-Muslim discourses as well as American and Israeli foreign policies involving Muslim-majority countries. This cyber-activism is most evident in the increasing number of websites, Islamic forum threads, blogs, Facebook boycott pages, and tweets that target transnational brands. This paper examines why multinational companies become key targets of Islamic cyber-activism as well as how religious discourse and authorities, combined with socio-historical factors, influence Muslim consumers' motivation to boycott.

METHODOLOGY

This study draws from a netnographic analysis of online Islamic forums (e.g., ummah, shiachat, islamicawakenings, turntoislam, muslimvillage, and islamicity) as well as websites (e.g., islamicinsights, muslimmatters.org, altmuslim, radioislam, missionislam, inminds, alqudsday.org) and Facebook pages that address issues relevant to Muslim audiences. Islamic forums were initially chosen among those awarded the "Top 40 Muslim Forums Award," which ranks Muslim forums based on "the page rank of the Forum, the number of visitors, the number of post threads, the number of viewers, the quality of the topics debated,…" ([http://topmuslimforums. wordpress.com/](http://topmuslimforums.wordpress.com/)). A smaller sample was then identified for closer analysis based on the number of forum members; for example, the analysed sites ummah.com and turntoislam.com have more than 58,000 and 93,000 members, respectively, with close to 5 million posts combined. The forums were also carefully chosen to reflect the diversity of sectarian views; shiachat.com and shiasisters.net were included in the analysis despite having fewer members than predominantly Sunni forums in order to incorporate Shia perspectives. A similar approach was taken with the identification of Islamic websites. For example, islamicinsights, which started out as a print magazine and later added a web portal that features news and various Muslim lifestyle topics, has garnered more than 8,000 likes on Facebook and 5,000 followers on Twitter.

Most of the Islamic forums are structured in a similar way. The main categories of discussion include religious topics, political news concerning Muslims, Islamic marriage, events, and boycott campaigns. The narratives chosen for analysis were identified from links that contained key words such as 'boycott', 'campaign', 'protest' and 'activism'. A total of 120 posts were analysed. Data was interpreted by moving back and forth individual postings and the entire discussion threads as suggested by Kozinets (2010). The findings are presented below.

FINDINGS

Tyrannization of the other

The Islamic activist rhetoric found online parallels that of the many anti-corporate, anti-globalization movements'. Corporate commitment to fair-trade wages, use of non-genetically modified organisms, and environmental sustainability are of concern to Islamic cyber-activists. However, one critical discourse, namely, 'tyrannization of the other' stands out as unique. Islamic boycott materials con-

strue many multinational companies (MNCs) as tyrants and oppressors of Islamic faith and identity.

At the core of this criticism is the long standing Palestine-Israel conflict. A number of provocative images that mix corporate logos with rhetoric infused with religious ideology can be found on forums and blogs that appeal to a Muslim audience. One of these images (Figure 1) shows a Coca Cola bottle shaped like a missile with the texts "Where does our money go?" and "Don't buy your brother's blood".

Figure 1

Source: Islamicawakening.com

The image appears on one of a series of articles that Islamic Insights ran from January 2009 to November 2010 urging "god-conscious consumers" to boycott MNCs for allegedly providing financial support to Israel. The author of the article 'Boycotting for Justice' urges readers to reflect on the war in Gaza by evoking a verse from the Qur'an:

> Remember the time when joining hands in murdering innocent people seemed atrocious? The time when "To kill one soul is as though you have killed the whole of humanity" of the Holy Qur'an actually meant something to most of us?... Because

these days … murdering entire families and directing perfectly-targeted bullets in the chests of innocent babies in Gaza is habitually supported by Muslims… we continue to support those nations which take pride in the unwarranted death of the people of Palestine by purchasing and selling their products…

The author goes on to cite several *fatwa*s (religious decree) that have been issued by Muslim scholars such as Ayatollah Sayyid Ali Sistani and Khameni that deem the consumption of "any item which helps strengthen Zionism" impermissible. Based on these fatwas and other canonical evidence, the author then concludes that continuing to buy Coca Cola or other global brands would be "committing a great sin": "*For those of us who resent the boycott, news flash! We are not only committing a great sin, we are also helping the oppressors! In regards to the helpers of oppressors, the Messenger of Allah has said "On the Night of Ascension, I saw the following inscription on the doors of Hell: Do not be a helper of the oppressors."[emphasis original] … what would be wiser is for us to actually act upon this narration of the Holy Prophet…Who would have thought buying a Nestle chocolate bar would be committing a major sin, and the negative du'as [prayers] of the oppressed ones would be directed towards us, as aiders of oppressors?*"

The provocative image of the Coca-Cola missile along with the religious rhetoric has attracted several reader comments, which echo the views that MNCs are oppressors of Muslim faith and boycotting these companies is a religious duty. For example Ahmad, dismissing skeptical remarks about boycott effectiveness, comments that: "*…participating in a boycott of companies that support slaughter and oppression is for our own benefit. ..you read up on the guilty companies. You then print out a list of the guilty companies and post it on the fridge. Now every time you walk by the fridge, you've got a small reminder of what our brothers and sisters are going through. Every time we go to the grocery store or to a restaurant, we remember that there are certain products or chains to avoid. We have a DAILY and INTIMATE (in your own kitchen) REMINDER about what our brothers and sisters are going through.*" Next, Ahmad posts a link to a boycott list (Figure 2), which conveniently narrows down the number of targeted companies to three: Starbucks, McDonald's, and Coca-Cola. The list displays these three logos next to a picture of a group of people, including children, running for their lives as a tank chases them. Ahmad ends his remarks by emphasizing that standing up to oppressors is a religious duty for Muslims: "*we should remember that a consumer boycott is just one small aspect of fulfilling our obligation to support the oppressed and reject the oppressor.*" Likewise, HiddenSoldier angrily responds to another forum member, who suggests political participation as an alternative to boycotting, by reminding this religious duty: "*Just because those strategies may be considered "easier" than boycotting the companies which support zionism, it doesn't mean it's not WAJIB [religious duty] to boycott. In other words it is still haram [religiously unlawful] if we do not boycott! There's no point in taking party of a political rally in front of government offices if we purchase Fanta or Sprite when we get thirsty...*"

Similar sentiments can be found on Islamic forums such as ummah.com, turntoislam.com, and shiachat.com. For example, on ummah.com's forum, a user nicknamed lonerider evokes what seems to be a common analogy within the Muslim community (Figure 3) by likening the consumption of McDonald's and Coke products to drinking the blood of Palestinians as s/he sends a call for boycott through this provocative post: "*Do you go to Marks and Spencer's cos their salad is just too good? Do you do McD's fish fillet? Do you drink Coca-Cola? Have you tried the blood of a Palestinian? All of*

Figure 2

these products have one thing in common: Israel. So the question is do you?" It is noteworthy how these cyber-activists collaborate in strategically combining graphic pictures of baby corpses, culture-jammed images of brand logos, and religious rhetoric to link MNCs to the Palestine-Israel conflict and portray these companies as "child killers" or "murderers" draining "the blood of Palestinians." Activist consumers use many tactics to sustain this discourse and the boycott efforts. For example, cyber-activists routinely share greeting cards and boycott pamphlets with images reportedly of suffering Palestinians (Figure 4), use subverted logos as avatars or signatures (Figure 5), circulate boycott lists, share links to youtube clips about the Palestinian resistance movement and boycott organizations, as well as sharing fatwas and Israel's barcode information to discourage buying Israeli products.

Figure 5

Source: ummah.com

Notably, the Islamic scholars' fatwas (and e-fatwas) play a key role in motivating the activists, but more importantly, presenting boycotting as a religious duty, thus equating the consumption of global brands with committing sin. Also, organizations such as Innovative Minds (the prominent face of the Boycott Israel Campaign online), the BIG Campaign (Boycott Israeli Goods Campaign), Boycott, Divestment, and Sanctions Movement, and Friends of Al-Aqsa (a UK based NGO) are instrumental in providing discursive material and paraphernalia such as books, clothing, badges, pins, key chains, boycott lists, and greeting cards to consumer activists, who then share these materials to create a global consciousness about the boycott and construe global brands as tyrants.

The conflict between Palestine and Israel and the concomitant Arab League's boycott of Israeli goods date back to 1948; both have been well documented in the media and literature (Jevtic 2009). Rather interesting is how quintessentially American or Western brands that clearly do not have Israeli origins are enwrapped in this conflict to be construed as tyrants and become key targets of consumer protest. From a socio-historical perspective this is partly due to the transformation of the Israel boycott from a state-led policy with a secular, Pan-Arab rhetoric to a consumer-driven campaign infused with religious ideology. The Arab League boycott of 1948 primarily targeted products with Israeli origin and secondarily sought to discourage foreign countries to invest in Israel. The boycott was largely carried out at a diplomatic level through limited trade relations, however, participation gradually dropped after Egypt withdrew its support in 1979 as a result of the Egypt-Israel Peace Treaty and other states followed suit to seek membership in WTO.

In the late 1990s, as the state support for the boycott was dwindling, a grassroots campaign was in the making. Interestingly, this consumer driven phase of the boycott targeted American and Western MNCs more aggressively than the earlier phase which focused on non-branded Israeli produce like dates. This strategic shift can be attributed to the growing involvement of American and Western nations in the Middle East following the 1991 Gulf War. While Muslim majority nations such as Egypt and Saudi Arabia participated in the Western coalition against Iraq's invasion of Kuwait, for the masses,

Figure 4

Source: inminds.co.uk

the presence of foreign military forces on Arab lands was reminiscent of the colonial years. From the perspective of the consumer activists, adding to this bitter colonial past is a collective memory of perceived Western indifferences to Muslim suffering in Bosnia and Chechnya, not to mention the stigmatization of Muslim identity following the tragic events of 9/11 in the US and Europe (e.g., the minaret ban in Switzerland), the ensuing wars in Iraq and Afghanistan, and the Danish cartoon crisis.

Collectively, these developments are perceived as threats to Muslim identity and faith. From the cultural lenses of the cyber-activists examined in this study, MNCs with their ubiquity, immense financial power, and close ties to Western states, are viewed as the hallmarks of these threats to Islamic identity.

Cyber-ummah: forming a transnational Muslim community

Sharing the boycott discourse and paraphernalia is undoubtedly crucial for campaign success. To ensure that the boycott messages deeply resonate with the Muslim community, cyber-activists frequently borrow from the Quran and Sunnah (Prophet's practice) to urge fellow Muslims to demonstrate solidarity with the oppressed. Consider the religious referents used by the activists in the following quotes:

Our Prophet Muhammad (PBUH) was reported to have said, "The similitude of believers in regard to mutual love, affection,

fellow feeling is that of one body; when any limb of it aches, the whole body aches, because of sleeplessness and fever." In light of the above, I call you, all dear brothers and sisters to join hands with us in order to achieve our aims and to defend our main issues and primarily that of wronged and oppressed Palestine. It seems ironic and illogical that while Zionists in Israel and their supporters in the West are killing the innocent in Gaza we keep consuming the products of those aggressors and give them the price of the bullets they cold-bloodily use to kill our children in Palestine. Have our hearts turned into stone?! Have we stopped thinking?! (nosrat-sunna on Islamic-life.com)

…the Qur'an says, on the subject of trading/dealing with non-Muslims "you are not forbidden from trading fairly with those who do not seek to kill you or drive you from your lands"…well you can't say that for companies that support the occupation of Palestine, can you? So I'd question whether it's even halal [permissible] to buy from companies that support the state terrorism of Israel." (dhak1yya on ummah.com)

Interestingly, activists' highly emotional and religiously-laden language serve a more important purpose than merely summoning solidarity for the oppressed; such rhetoric latently allows consumer activists to pursue ummah, a global community of Muslims united around common causes. While the concept of ummah has been in-

terpreted as merely a community of believers by Western scholars, Saunders (2008, 303-307) argues that ummah has political connotations as "the nation of Islamic creed" and suggests that *ummahism* is "a new form of postnational, political identity which is as profound as any extent nationalism." Indeed, this utopia of an imagined community (Anderson 1991) of Islam is reflected in the works of Islamist ideologues such as Sayyid Qutb and engrained in the leading Islamist movements' agenda (Ayoob 2008). While the Islamist organizations like Muslim Brotherhood and Jemaah Islamiah pursue ummah through political platforms and armed struggle, at the microlevel, ordinary Muslims, who want to seek this ideal and demonstrate solidarity around Muslim causes in a non-violent way, do so through boycotts and other forms of activism against transnational companies. The internet undeniably has facilitated the everyday Muslim consumers' pursuit of ummah by offering a transnational space that is relatively free of sectarian divisions and confining local power dynamics. Consider how two users utilize this space to create and sustain this utopian Muslim community through referents of imagined kinship ties in the following quotes:

> In the absence of the possibility of Jihad, boycott has become in the opinions of many prestigious Muslim scholars, an obligation and not only a desirable action…boycott …helps us to prioritize and give more importance to the issues of our *ummah* [emphasis original] and forget our selfish desires. Let us always remember the pictures of the innocent being bombed brutally by the Zionists… Let us always remember that …, every Muslim has an obligation to support the Palestinian issue in every possible way until we free al-Madjid al-Aqsa [a Muslim holy site in Jerusalem] from the hands of the children-killing Zionists. (nosrat-sunna on Islamic-life.com)

> Dear brothers and sisters - …We urge the entire Ummah to desist from buying these "HARAM PRODUCTS" immediately. .. most of the profits from these large organizations are FUNDING The ISRAEL Military to MURDER & KILL the innocent Palestinians and ALSO to create chaos in this world. JUST Like you all made the DUTCH economy suffer by BOYCOTTING products from HOLLAND, NOW dear brothers and sisters be steadfast and committed and BOYCOTT ALL ISRAELI PRODUCTS. Dear Arab brothers, The Arab world is one of the BIGGEST MARKETS FOR THE FOLLOWING PRODUCTS: COKE, PEPSI, McDONALDS, STAR BUCKS, TOMMY HILFIGER, GIORGIO ARMANI, PERRIER WATER, JOHNSON & JOHNSON, MARKS & SPENCER, RALPH LAUREN, ARAMIS, CALVIN KLEIN, SPRITE…For the sake of your brother/sister/son/daughter/father/mother who are been [sic] SLAUGHTERED by the BLOOD THIRSTY KILLERS. PLEASE BOYCOTT NOW. !!! Please circulate this message all your contacts. (Murshid on Google Groups).

Noteworthy in the creation and performance of a virtual ummah is the role that Islamic scholars play. Among the prominent Muslim scholars is Sheikh Yousef Al-Qaradawi; his fatwas are widely circulated on Islamic forums, websites of Islamic organizations such as inminds.com, and even youtube. One of his fatwas that presents boycotting as an economic warfare encourages Muslims to unite in activism against transnational corporations by evoking the concept of ummah 18 times:

> We must all be united against the aggressors. We are united in Islam, …and also united in pain and hope. As Allah Almighty says: "Verily this Ummah of yours is one Ummah." (Qur'an, 21:92)…Now we see our brothers and children in Al-Aqsa and the blessed land of Palestine generously sacrificing their blood, giving their souls willingly in the way of Allah…If people ask in the name of religion we must help them. The vehicle of this support is a complete boycott...The time has come for the Islamic Ummah to say "NO" to America, "NO" to its companies, and "NO" to its goods, which swamp our markets…The boycott is a demonstration of Muslim brotherhood and unity of the Ummah. It is our duty to say we are not going to betray our brothers…Our sisters and daughters, who control the houses, have a role to play in this matter, which may be more important than the role of the man, because women supervise the needs of the house, and buy what must go inside the house. She is on hand to guide the boys and girls. She… educates them in what they must do for their Ummah and its causes, …especially in the area of boycott.

While many cyber-activists simply copy and paste the fatwa on discussion forums with no further input, it is also easy to find the fatwa's discursive motifs woven in users' personally crafted comments. For example, users allude to the notions of economic warfare and ummah as well as the role of 'sisters' or the 'fairer gender' in forging this economic crusade frequently: "*The economy is one of the major lifelines for this oppressive entity* [referring to Israel]. *Remember the Jahil* [ignorant/nonbeliever] *Quraish, with their trade routes to the north & south. The early Muslims cut the jugular of the northern markets, because the trade caravans had to pass Medina. It was this series of raids that led to the Jahil Quraish being bled white, thus curtailing their growing threat. As much as we are reasonably able, let us boycott the apartheid state & her major supporters. Even if it stops just one bullet being fired into the skull of a defenceless babe in arms on her way to school. Let's hit them where it hurts i.e. in the pocket! ... I know that the majority of the day to day household supplies are purchased by the female gender. It is important that the fairer gender is educated & made aware of their how the defence of the Ummah is in their hands as well...I feel it is incumbent on the more educated & aware of the fairer gender to gently proffer the pro-Ummah advice to their less aware peers." (*Ashfaq Bahman on hansot.com). Bibi's comments on onislam.net also resounds the discursive motifs of Sheikh's fatwa: "*Mothers, as you lovingly bathe your babies with Johnson & Johnson products, think of the Palestinian babies who died from Israeli bullets — courtesy of J & J, who support Israel. Next time we pop a Nestle's candy in our mouth, let us savor the taste of the pain of those who are oppressed by Israel, of those whose land was taken from them, of those who will never taste the olives they so lovingly grew.....It's important we don't ever forget. It's easy to become complacent and be seduced by the consumerist culture. Let this be our jihad. Let us strive in our efforts to speak out against oppression. Let us not fail in our duty toward our brothers and sisters. Let us boycott Israel.*"

As these examples demonstrate, cyber-activism is a means through which Muslims seek the imagined community of ummah. This quest for ummah can be more comprehensively understood as an exercise to reconfigure Islamic identity in light of modernization in the post-colonial era. In the years following independence, the modernization movements in Muslim majority countries like Turkey, Iran, and Egypt, led by a small, authoritarian, and pro-Western elite class left the Islamic identity sidelined to a great extent in the nation formation process. Most notably, the abolishment of the Caliphate (religious and political leader of all Muslims) institution marked the dissolution of the ummah, which had traditionally represented a unit-

ed Islamic society under the former Ottoman Empire. Losing their 'righteous' leader, seeing the erosion of ummah, falling behind Western powers in science and technology, and witnessing the incapacity of local regimes in finding a dignifying solution to the Palestinian conflict left the pious believing that they have fallen from grace for swaying away from Islam's path. Islamist movements' rhetoric of justice that promised to end Muslim suffering in the hands of 'infidel' powers, to reclaim Muslim dignity, and to revive the ummah fueled the perception that Islam was on assault, particularly among the economically disadvantaged and those discontent with the local regimes. Such sentiments were even more intense among the European Muslims who had difficulties assimilating to the host country and yearned for connecting with the ummah (Saunders 2008). This quest gained urgency as a crisis for unity among Muslims erupted post 9/11.

It is in this socio-historical context that many Muslims seek the ummah through the new platforms made possible by information and communication technologies. For many Muslims who do not want to associate with political or militant Islamist movements, waging a cyber-jihad against multinational brands through a rhetoric laden with religious ideology is the ideal means to forge an Islamic identity and connect with fellow Muslims on a global scale. Boycott websites and forums do not only provide a common cause around which a community of believers can be formed, but also offer a nonviolent and convenient form of ideological resistance, allowing users to create a space for Islamic identity and politics.

DISCUSSION

This study examines Islamic consumer activism at the nexus of religious ideology and new media. The findings suggest that the quest for a transnational community, coupled with the discursive construction of MNCs as icons of economic and social injustice, propels a cyber-jihad against transnational brands. Jihad, while generally associated with Islamist fanaticism, also means spiritual rejuvenation and self-defense (Ayoob 2008). In this sense, the cyber-jihad is an economic and non-violent means of asserting Islamic values and identity in the marketplace. These findings offer several interesting theoretical implications.

First of all, the study highlights the important role that religious discourse and authorities play as market-structuring forces. While prior studies have addressed how various ideologies motivate consumer activism (Varman and Belk 2009), the role of religious ideology in shaping consumption goals and brand attitudes has not been examined before. The findings indicate that transnational brands, which are perhaps the most conspicuous symbols of the secular, easily can get tangled in global webs of ideological conflicts and can be enwrapped in religious rhetoric to be construed as tyrants by consumer activists. The role of religious authorities such as Islamic scholars in this ideological construction of global brands is also noteworthy; sheiks and the fatwas they disseminate through the internet are instrumental in framing MNCs and Islamic activism as tyrants and a religious duty to defend sacrosanct values, respectively. In this sense, religious authorities represent a unique type of authority and market structuring force that previous consumer research literature has not sufficiently explored.

Secondly, this study contributes to our understanding of brands as symbolic devices by demonstrating the role that shared brand meanings inadvertently play in the formation of consumer identity projects and communities (Askegaard 2006; Cayla and Eckhardt 2008; Holt 2002; Muniz and O'Guinn 2001; Muñiz Jr. and Schau 2005). The cyber-jihad Muslim consumers discursively wage against tyrant brands facilitates virtual activists' assertion of a pan-Islamic

identity on a global scale. Moreover, cyber-activism allows these consumers to seek and perform a transnational community of Muslims. While this pursuit of ummah is similar to the postmodern quest for communal affiliation that has been addressed in detail in previous studies (Muniz and O'Guinn 2001; Muñiz Jr. and Schau 2005), it is important to note a few nuances. The ummah forged through cyber-activism against global brands, unlike other brand or anti-brand communities, is founded on a shared religious identity and ideological aspirations of Islam. As such, unlike the postmodern brand communities or evanescent hypercommunities, membership in the cyber-ummah cannot be established in an ad hoc fashion (Kozinets 2002; McAlexander, Schouten, and Koenig 2002; Muniz and O'Guinn 2001), purchased (Thompson and Coskuner-Balli 2007), or easily terminated. Future research should explore whether these types of market-mediated communities, in which religious identity is a sine qua non, are more effective in transforming the policies and practices of MNCs than other brand (anti-brand) communities.

The limitations of this study offer opportunities for future research. First, the study focuses on cyber-discourses of Islamic activism, however, to what extent, if any, these consumers practice the boycott remains unexplored. Also, non-boycotters views may not be equally represented in the forums since counter-boycott comments are effectively rebuffed and such commentators are stigmatized as "sinners" or "traitors" by fervent cyber-activists.

How Do Social Capital-Driven Consumption Communities Conceal Their Economic Interests?

Katharina C. Husemann, University of Innsbruck, Austria

ABSTRACT

Consumption communities face the challenge of dealing with economic influences while staying true to their community values. Building on Bourdieu's theory of capital, this interpretive study addresses the intersection of social and economic capital production within social capital-driven consumption communities. The study explores the concealment strategies that consumers use to protect their communities from contamination through economic influences. Drawing on two data sources, the study reveals four distinct concealment strategies–from total denial, through re-articulation and partial appropriation, to teleological alignment–that differ to the degree to which consumers conceal economic capital production within the community. The study contributes new theoretical insights into consumers' concealment strategies and documents how pursuing these strategies allows social capital-driven consumption communities for incorporating economic activities under the primacy of social capital production.

INTRODUCTION

Social capital is a key notion in consumer culture theory. Social capital concerns "the aggregate of the actual or potential resources which are linked to (…) membership in a group" (Bourdieu 1986, 248). Consumer researchers have used this influential notion to illuminate for instance, how brand community members build social capital as part of their value-creating practices (Schau, Muñiz, and Arnould 2009), how virtual problem-solving community members produce social capital on both individual and group levels (Mathwick, Wiertz, and Ruyter 2008), or how subcultural consumers defend their field-dependent social capital against pejorative stereotypes (Arsel and Thompson 2011).

For Bourdieu (1986), individuals build social capital by establishing, maintaining, and defending long-term social relations and mutual obligations with their social peers. One particular characteristic of social capital is that it is a "disguised" (252) form of economic capital that paradoxically produces its most influential effects to the extent to which it hides economic roots. Therefore, for individuals to build social capital requires proactive 'concealment' of potential economic calculations. How does this concealment of economic activities work for consumption communities such as brand communities (Muniz and O'Guinn 2001) and subcultures of consumption (Schouten and McAlexander 1995) that draw their consumer appeal predominantly from social (rather than economic) exchanges? Which (if any) concealment strategies do members of these social capital-driven consumption communities use to protect the 'innocence' of their social relations.

Prior consumer research has occasionally addressed the intersection of social and economic production within consumption communities. Bonsu and Darmody (2008), for instance, find the rhetoric of "well-intentioned commercialism" (363) which Second Life residents use to justify commercial success. Kozinets (2002a) documents anti-market strategies such as the reinforcement of a "No Vending Rule" (24) within the Burning Man community. In the context of community-supported agriculture (CSA), Thompson and Coskuner-Balli (2007) report on consumers who defy "commodity fetishism" (142) through "practices of decommodification" (142) as a response to corporate co-optation. And Weinberger and Wallendorf (2012) explain how intracommunity gifting serves the post-Katrina New Orleans' community to rebuff undesired commercial influences.

These studies have produced important insights into the intersection of social and economic capital production in consumer research. However, prior research has not yet systematically addressed the strategies through which consumers' conceal potential economic activities within social-capital driven consumption communities.

To address this gap in knowledge and to reveal a comprehensive range of concealment strategies within social capital-driven consumption communities, I conducted an interpretive study drawing on two data sources. The first data set consists of netnographic data (Kozinets 2002b) from two social capital-driven online communities–the outdoorseiten.net community (www.outdoorseiten.net) and the veganelinke.antispe community (www.veganelinke.antispe.org). The second data set consists of eight academic articles that explicitly or implicitly address the intersection of social and economic capital production within consumption communities. I analyzed these data using a qualitative content analysis (Mayring 2002), through which I inductively built and iteratively refined categories of how these communities conceal economic influences (aspects of economic capital production such as self-interest, profit maximization, competition, private ownership, or wage labor (see also Bourdieu 1986)).

The study reveals four concealment strategies that social capital-driven consumption communities tend to use when confronted with economic capital production. I differentiate the strategies by the degree to which consumers conceal economic capital production–from total denial, through re-articulation and partial appropriation, to teleological alignment.

To best reveal these findings, I first review the notion of social capital in sociology and existing consumer research studies that directly address the intersection of social and economic capital within social capital-driven consumption communities. Then, I present a set of four concealment strategies and show how consumers use these strategies to manage economic capital production within the confines of their communities. Finally, I discuss these theoretical insights and conclude with outlining paths for future research.

THEORY ON SOCIAL CAPITAL

Bourdieu (1986) offers the first and most deliberate analysis of social capital. For him, social capital is "the aggregate of the actual or potential resources which are linked to (…) membership in a group" (Bourdieu 1986, 248). In contrast to other forms of capital (e.g. economic or human) social capital possesses an intangible character that resonates in structures of relationships (Bourdieu 1986; Coleman 1988; Portes 1998). Consequently, social capital is an influential asset that individuals accumulate through continuous investments in relationships to family, friends and associates (Putnam and Goss 2001; Woolcock and Narayan 2000). For Bourdieu (1986), individuals build social capital by establishing, maintaining, and defending long-term social relations and mutual obligations with their social peers. Social capital investments are associated with a high degree of uncertainty because of indefinite obligations, vague time horizons, and the potential danger of ingratitude or noncompliance to reciprocity expectations (e.g. exchanges of gifts or mutual visits) (Bourdieu 1986).

However, according to Bourdieu (1986), the notion of social capital, its inner structure and way of functioning is inseparable from that of economic capital. Economic capital "is immediately and directly convertible into money" (monetary capital) (Bourdieu 1986, 243). Economic theory has devoted itself to this (one-sided) inter-

pretation of capital which constrains the universe of exchanges to commercial exchanges. Thus, today, economic capital is the most obvious and direct form of capital characterized by capitalist tenets such as self-interest, profit maximization, competition, private ownership, or wage labor (Bourdieu 1986).

Despite the ostensible independence between social and economic capital, Bourdieu systematically elaborates on the interplay between economic and social exchanges in appropriating capital. For Bourdieu (1986), all forms of capital, including economic, social and cultural, must be understood as "accumulated labor" (241). Thus, both forms of capital are highly related–even transferable into each other. Social capital, for instance, is converted into economic capital when members of a social network gain privileged access to special investment-tips or job offers by making use of previously established social obligations. Transferability is due to one particular characteristic of social capital–it is a "disguised" (Bourdieu 1986, 252) form of economic capital. Paradoxically, social capital produces its most influential effects only to the extent that it conceals its economic roots.

Although Bourdieu (1986) addresses the significance of 'concealment' in the accumulation social capital, he does not fully address how this dynamic unfolds.

CONSUMER RESEARCH ON THE INTERSECTION OF SOCIAL AND ECONOMIC CAPITAL WITHIN CONSUMPTION COMMUNITIES

Consumption community research also sheds a theoretical light on the intersection of social and economic capital, but with a focus on communal rhetorics and practices that protect the community from contamination through economic influences. Investigating the Web-based virtual world of Second Life, for instance, Bonsu and Darmody (2008) find evidence of residents that "traverse communal and commercial boundaries" (364) when they turn a communal idea of creating animal avatars into a commercial success story. However, facing the mingling of community-driven ideas and commercial agendas, Second Life residents frame commercial success as a communal enrichment. Bonsu and Darmody (2008) mark these rhetorical efforts as "well-intentioned commercialism" (363).

Kozinets (2002a) investigates the Burning Man festival, a community-oriented anti-market event which is specifically designed to offer participants a social space that is distanced from market logics. Burning Man's gift economy, the "No Vending Rule" (24) and the prohibition of brand names are illustrative mechanisms of how the Burning Man community frames the event as uncommercial. Although Kozinets concludes that the Burning Man community still "materially supports the market" (20), the set of communal-resistive practices and rhetorics demonstrates participants' perception of commercialism and economic exchanges as contaminating threat within the community.

Similarly, participants of the CSA market niche interpret commercialism, capitalist motifs, and modern "commodity fetishism" (Thompson and Coskuner-Balli 2007, 142) as threats that have the potential to pollute consumers' sacred alternative market system. Thus, CSA farmers and consumers jointly strive for controlling the commercial nature of their food products through decommodification practices which relate CSA food to "symbol[s] of natural splendor and ecological harmony" (142).

Weinberger and Wallendorf's (2012) multi-layered analysis within the context of the Mardi Gras festival reveals how intracommunity gifting serves the post-Katrina New Orleans' community to rebuff undesired commercial influences. The authors detail how post-Katrina New Orleans's geographic community repaves

the damaged "intersection of moral and market economies" (77) through traditional practices of intracommunity gifting. In particular they show how moral economy logics either harness or reject market economy logics in intracommunity gifting, depending on the giver's local cultural knowledge and community membership. The study reveals that commercial sponsorship–only to certain moral confines–is legitimated within communal boundaries.

Taken together, these studies suggest that the relationship between social and economic capital production is an important and delicate one for consumption communities. These consumption communities draw their appeal from social capital production (i.e. building relationships, pursuing social exchanges, freely sharing knowledge) and–to different degrees–from their denial of economic capital production. As the above authors show, consumers put much effort in protecting the community from contamination through economic influences. Seen through the lens of Bourdieuian capital theory, the appeal of such social capital-driven consumption communities largely thrives on the members' ability to conceal present and emerging economic interests and thus remain 'purely' social entities.

However, despite these important insights into the intersection of social and economic capital production in consumption communities, consumer researchers have not yet systematically explored the full range of consumers' concealment strategies–representing a potentially relevant endeavor for community perpetuation.

METHOD

This interpretive study draws on two data sources. The first data set comprises empirical data from an netnographic investigation (Kozinets 2002b) of two social capital-driven online communities - the outdoorseiten.net community (www.outdoorseiten.net) and the veganelinke.antispe community (www.veganelike.antispe.org). Online communities offer "a novel medium for social exchange between consumers" (Kozinets 2002b, 63) and allow unobtrusive access to consumers' discursive and interactive encounters at the intersections of social and economic capital production. Pursuing the goal of revealing a comprehensive range of communities' concealment strategies and assuming that online consumption communities with diverse (political-ideological) backgrounds might react differently to economic capital production, I searched for communities that have potentially divergent political orientations, but evolve particularly around social rather than exchanges.

The outdoorseiten.net community and the veganelinke.antispe community have different fields of interest and community goals, however, they both draw their appeal from social exchanges to experience and consume a "linking value" (Cova 1997, 297). Outdoorseiten.net has its roots in 1999 and since then the community has developed into a 20.000-member flourishing online community. It exhibits passionate discussions about nature, outdoor sports, and advances an independent and creative outdoor consumption. This community provides a fascinating environment to study the range of concealment strategies which consumers use to respond to economic influences since the community shows elements of both economic and social capital production. On the one hand, community members are engaged in testing commercial outdoor equipment, in jointly innovating and branding products; On the other hand, community members feel inspired by their social, communal network and their independence from corporate influence (Füller, Lüdicke, and Jawecki 2008). Veganelinke.antispe's 1,300 members are motivated to fighting capitalism. Since 2006, this forum has offered a dialogue platform for community members who discuss progressive movements against all sorts of oppressions such as capitalism, sexism, racism or speciesism. The official anti-capitalist orientation of

the veganelinke.antispe community promises a fascinating context to study consumers' strategies to conceal economic influences.

Data collection within the online communities proceeded through screening and observing the fora's archives and resulted in a data set of 4.008 posts from 47 threads. I particularly included those discussions in which community members were confronted with aspects of economic capital (i.e. self-interest, profit maximization, competition, private ownership, or wage labor).

The second data set consists of eight published academic articles. These articles, explicitly or implicitly, deal with the intersection of social and economic capital production within consumption communities. Consumers within these communities primarily draw their appeal from social rather than economic exchanges. With the exception of Bonsu and Darmody (2008) all articles were published in the Journal of Consumer Research (Giesler 2008; Kozinets 2001, 2002a; Mathwick et al. 2008; Schouten and McAlexander 1995; Thompson and Coskuner-Balli 2007; Weinberger and Wallendorf 2012). The combination of empirical netnographic data and data from journal articles provided fruitful grounds to reveal consumers' concealment strategies within consumption communities.

I analyzed these two data sources using a qualitative content analysis (Mayring 2002). I identified concealment strategies through isolating consumers' efforts to conceal economic influences within social capital-driven consumption communities. These influences refer to (aspects of) economic capital production such as self-interest, profit maximization, competition, private ownership, or wage labor (see also Bourdieu 1986). I moved back and forth between the two data sets and exposed the inductively emerging categories (concealment strategies) to iterative refinement.

FINDINGS

Four focal concealment strategies emerge from my analysis. I differentiate these strategies with respect to the degree to which consumption communities conceal economic capital production. The degree of concealment varies according to consumers' level of refusal and legitimization of economic influences within the community. Figure 1 summarizes the findings followed by a detailed description of each concealment strategy.

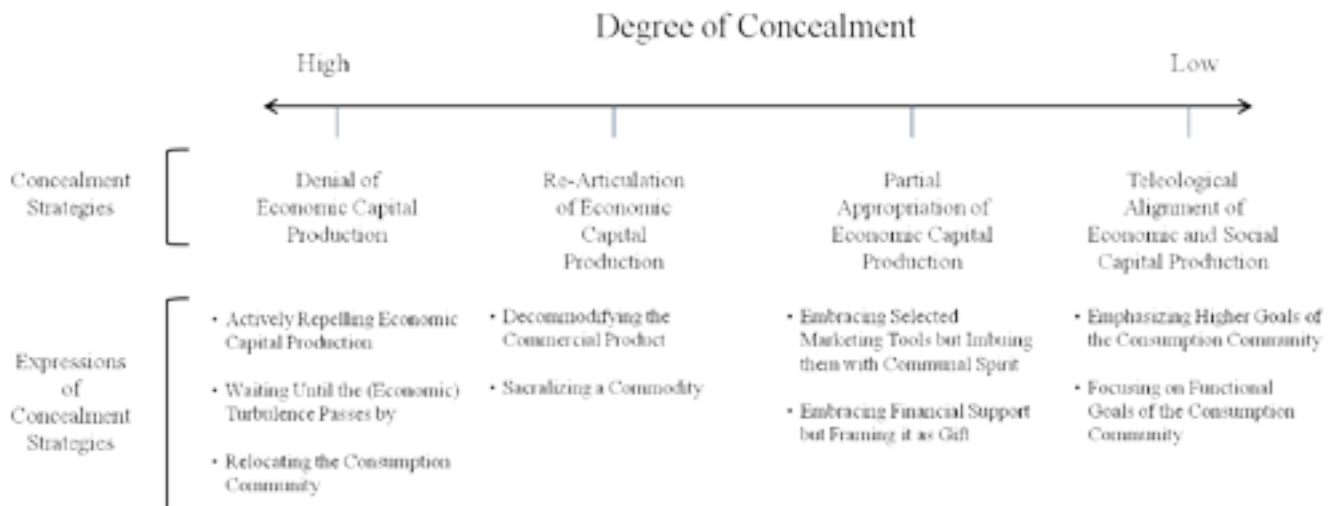
Concealment Strategy One: Denial of Economic Capital Production

The strategy of denial of economic capital production is the most direct form of concealment. Community members use this strategy to demonize economic capital production and rhetorically frame corporate players as "industrial monsters" (Giesler 2008, 747) or legal community owners as "demigods" or "wizards" (Bonsu and Darmody 2008, 362). In my data, community members use three expressions of denial: 1) Actively repelling economic capital production; 2) waiting until the (economic) turbulence passes by; and 3) relocating the community into a new, uncontaminated realm.

Actively Repelling Economic Capital Production. The outdoorseiten.net community actively repels the capitalization of a community project in which community members plan, organize, and design the construction of an outdoor-cooker. The project starts out without any economic agenda. However, when individual community members suggest the idea of cooperating with a commercial investor to sell the outdoor-cooker to the mass market, an emotional discussion emerged. Does the community betray its spirit when converting a community project into profit-opportunities? The initiator of the outdoor-cooker project finally holds an arousing plea for the social benefits of the project to the community.

> „I proposed a project herein, because of the idea of producing a low-priced and improved product that is currently not available in the market. And because I was convinced of the fact that one could even make this project better through challenging a community of enthusiast to develop a perfect product. With all the accumulated know-how and the ideas of a creative community…Beyond this original idea I had the idea that the community would profit from this product too: more members (product would serve as a promoter externally), more reputation for the community, more ideas… and so on and so on…Why do I write this? Because I perceive the idea of this project is endangered." (community member, outdoorseiten.net)

The initiator perceives the commercialization of the communal project as a threat ("endangered") to the community. Finally, the community refuses capitalizing on the marketability of an improved outdoor-product and thus actively repels economic capital production. The community upholds the primacy of social capital production and community spirit, and consequently, conceals economic

Figure 1: Concealment Continuum


capital production. In a more general tone, community members of the veganelinke.antispe community debate the possibilities of how to consume best in an exploitative capitalist system. In favor of social capital production within and beyond the confines of their community, participants propose to actively repel economic capital production of cooperations through boycotting.

> *"For sure, our togetherness is improvable and as long as it is improvable I strive for improvements. I make a small contribution through my consumer behavior and boycotts."* (community member, veganelinke.antispe)

Similarly, Giesler (2008), Bonsu and Darmody (2008), Mathwick et al. (2008), Kozinets (2001, 2002a) and Schouten and McAlexander (1995) report on communities actively repelling economic capital production.

Waiting Until the (Economic) Turbulence Passes by. Community members that wait until the (economic) turbulence passes by practice a less aggressive expression of the concealment strategy of denial of economic capital production. In his investigation of the war on music downloading in which downloaders and representatives of the music industry negotiate the price of music downloads, Giesler (2008) introduces the notion of "outpeacing" (747) as a graceful exercise of passive consumer resistance. A similar form of concealment appears within the Second Life community. Bonsu and Darmody (2008) report on the prevailing inequality and hierarchical structures between the regular residents ("creative consumer masses" (362)) and the Lindens (corporate owner) of the virtual platform.

> *"Even though they [the residents] recognized this inequality in the world, many residents pointed to the fluid nature of this structure, believing that it was only a matter of time before the tables turned in their favor"* (Bonsu and Darmody 2008, 362).

Again, community members appear suspicious about economic influences within their community and perceive corporate power as contaminating. However, the community does not deny economic capital production by actively resisting the economic influence, but by sitting it out peacefully.

Relocating the Consumption Community. A third expression of denying economic capital production implies the relocation of the consumption community into a new, uncontaminated realm. The case of community-supported (CSA) agriculture investigated by Thompson and Coskuner-Balli (2007) serves as the most illustrative example. Agents of the originally anticorporate organic food movement respond to the economic contamination of corporate co-optation through relocating the communal realm of social capital production into a new CSA market–an "emotionally and existentially engaging communal project" (Thompson and Coskuner Balli 2007, 139). Similar to idea of relocating a consumption community into a pure social realm, community members in the veganelinke.antispe community discuss the idea of moving to and living on self-sufficient farms in an attempt to escape from capitalist market exchanges. Patterns of relocation emerge in Kozinets' (2002a) Burning Man festival which can be read as a community-oriented anti-market event, staged remote from civilization, specifically designed to offer participants a social space that is distanced from market logics.

Concealment Strategy Two: Re-Articulation of Economic Capital Production

Second, community members using the strategy of re-articulation of economic capital production also perceive economic influences as threat to the community. Yet, consumers do not repel, but rhetorically re-articulate aspects of economic capital production that are indirectly supportive of community members' interests and morals. Consumers re-articulate external service providers or commodities by 1) decommodifying them as artisan, creative or performative, or 2) sacralizing them through endowing it with transcendent meaning.

Decommodifying the Commercial Product. Decommodifying commodities constitutes a well-known practice in consumer research (Wallendorf and Arnould 1991). Members of the outdoorseiten.net community, for instance, decommodify commercial products as artisan. Some members are particularly enthusiast about Mr. Geiger, a manufacturer of hand-crafted hiking boots. Although Mr. Geiger is a regular participant in the marketplace, community members portray him as a do-gooder and artisan that manufactures genuine and sensually superior hiking boots.

> *"Something is notably nice: The man who is producing your shoes individually customizes them. He looks at your feet and you directly feel that he has lots of experience. He does not want a quick deal, but he wants to do his trade how he thinks that it is right. It is an adventure to meet someone like him these days."* (community member, outdoorseiten.net)

Community members refer to Mr. Geiger as an "artist" who takes his artistic license to create and improve details of his hand-made hiking boots. In associating commercial commodities with arts, outdoorseiten.net community members deny market-players' commercial interest and conceal the transactions' economic character. Thus, community members prevent the community from economic contamination. Among the consumption communities analyzed patterns of decommodification are prevailing (Bonsu and Darmody 2008; Giesler 2008; Kozinets 2002a; Thompson and Coskuner-Balli 2007; Weinberger and Wallendorf 2012).

Sacralizing a Commodity. Sacralizing a product or service is a second expression of re-articulating economic capital production. Members of the Star Trek subculture, for example, identify with the anticapitalist nature of the Star Trek universe and appreciate its "utopian sense of the communalism" (Kozinets 2001, 72). However, the Star Trek universe is part of a multi-million dollar industry and Star Trek fen constitute active participants. In response to this overwhelming economic irritation which is, in effect, an inherent component of Star Treks subculture's existence, participants engage is sacralizing practices by framing Star Trek rhetorically as a religion. Kozinets (2001) reveals:

> "Legitimizing articulations of Star Trek as a religion or myth underscore fans' heavy investment of self in the text. These sacralizing articulations are used to distance the text from its superficial status as a commercial product."(Kozinets 2001, 67)

Kozinets' analysis of consumers that read Star Trek as religion or myth involves the idea of concealing an economic agenda that threatens to contaminate Star Treks subcultural "moral and inclusive community" (82). Members of the Harley-Davidson subculture of consumption are similarly engaged in sacralizing efforts as a response to economic influences.

Concealment Strategy Three: Partial Appropriation of Economic Capital Production

Consumers using the concealment strategy of partial appropriation of economic capital production deliberately embrace 1) selected marketing tools or 2) financial support to leverage their social capital production. Community members do not use tools and support un-

reflectedly, but take both out of their initial economic context and imbue them with communal spirit to conceal economic influences.

Embracing Selected Marketing Tools but Imbuing them with Communal Spirit. Consumption communities appropriate economic capital production through embracing and adjusting selected marketing tools. For instance, the outdoorseiten.net community organizes community competitions such as "best travel report", "wiki writing competition", and "best photo competition" or pursues a project in which community members design and create a community logo. Thus, the outdoorseiten.net community makes use of basic tools that are closely related to economic capital production, but appropriate them for the cohesive needs of their community. The playful competitions and logo development processes encourage social exchanges and foster bondings among community members. Following vignette from the logo development threat shows how community members within the outdoorseiten.net conceal the logo's economic character through imbuing it with communal spirit.

> "Hm, everything is initiated from users. Nonone is making profit with the logo batches; it is something that is done by and for the community. It is just nice when the forum is showed to the world." (community member, outdoorseiten.net)

The community does not conceal economic capital production in general as it draws on its equipment, however, community members cover the tools' inherent economic character and revitalize them with a social agenda. The embracement and adjustment of selected economic tools is empirically supported in the veganelinke.antispe community in which community members similarly discuss and organize the order of community stickers.

Embracing Financial Support but Framing it as Gift. Embracing financial support but framing it as gift constitutes a second expression of the strategy of partial appropriation of economic capital production. Communities take advantage of group members' financial resources accumulated in the external commercial market. Community members accept this economic encroachment in form of financial resources but rhetorically frame the financial support as gifts from insiders which provide opportunities to encourage social capital production. Thus, internal agents with financial resources, although strongly involved with commercialism, do not contaminate community. For instance, Kozinets (2002) reports on impressive art installations at the Burning Man festival which are essentially gifts from participating artists to the community:

> "My fieldnotes capture a fireside conversation with "Giovanni Maximi," an artist (a millionaire businessman in his life outside Burning Man), late one evening… It is worthwhile to note that, as indicated by Giovanni's personal wealth, status at Burning Man is often constructed from conditions requiring considerable economic standing in the outside commercial realm". (Kozinets 2002a, 28-29)

Empirical support of this concealment strategy can be found in Weinberger and Wallendorf's (2012) investigation of the Mardi Gras geographic community in which rich krewe members give - officially noncommercial - parades to the community. These gifts, although sponsored through crew members' real-life commercial involvements are not considered as stemming from the logic of economic capital production.

Concealment Strategy Four: Teleological Alignment of Economic and Social Capital Production

The strategy of teleological alignment of economic and social capital production shows the least degree of concealment. In these cases, community members show how certain economic activities are useful for relevant community goals and consequently for community perpetuation. Community members conceal detrimental side effects of such economic activities by 1) emphasizing the higher goals that they support (e.g. survival of the community) or by 2) focusing on functional goals (e.g. testing outdoor-material). Thus, the community conceals the flaring up of economic capital production through justifying it with a mutual goal-orientation.

Emphasizing Higher Goals of the Consumption Community. One expression of teleological alignment of economic and social capital production revolves around community members' effort to emphasize higher goals of the community. Goals are, for instance, the survival of the community or the maintenance of the community as a vibrant, inspiring and emotionally attracting space. If economic activities assist in accomplishing these goals, community members seem to refrain from framing them as threat. For instance, after Hurricane Katrina had destroyed parts of New Orleans in 2005, a public discussion emerged whether to hold or to skip the traditional Mardi Gras celebration that was set few month after the catastrophe. Local community members, personally strongly involved with the rituals and inherent meanings of the celebration, but generally skeptical towards commercial influences within the Mardi Gras, use the logic of social and economic capital to argue for the realization (survival) of the Mardi Gras communal festival:

> "[Mardi Gras] is essential for the spirit of New Orleans, because…" "Plus it pumps a lot of money into the economy, which they need. A lot of jobs, all the people who build the floats and make the costumes, and sell all the junk you throw." (Weinberger and Wallendorf 2012, 88)

Bonsu and Darmody (2008, 363) use the notion of "well-intentioned commercialism" to capture Second Life residents' rhetorical efforts to legitimize commercial success. Similarly, Burning Man participants justify high ticket fees through its contribution to the "good of the Burning Man community" (Kozintes 2002, 20).

Focusing on Functional Goals of the Consumption Community. Communities conceal economic capital production through teleologically aligning it with social capital production when they legitimize economic capital production efforts with functional goals of the community. They legitimize and even welcome the aspects economic capital production to the extent that it helps to reach functional goals of the community. For instance, members of the veganelinke.antispe community support an advertising campaign that follows the logic of economic capital production. However, community members conceal this economic influence by focusing on functional goals of the community–to spread the idea of vegan life and equality between humans and animals.

> „United Creations has created a really interesting and professional advertisement campaign, together with the Austrian vegan society. The basic idea is that not all people that eat vegan live according to clichés."(community member, veganeline.antispe)

Interestingly, the limits of unmolested concealment appear exhausted within the confines of this community. Some community members start reflecting on the campaign and complain about its lack of criticism on capitalism. Members of the outdoorseiten.net

community who are primarily engaged in discussing, testing, and improving outdoor products appear to positively evaluate the fact that profit-driven outdoor manufacturers might read their test reports. Community members perceive themselves as outdoor experts and being used by corporate manufactures as "beta tester" is a meaningful step toward the goal of creating improved outdoor products.

DISCUSSION

This study illuminates the strategies that consumers in social capital-driven consumption communities use to manage the intersection of social and economic capital production. Grounded in Bourdieu's (1986) notion of capital, I investigated how these consumption communities face the challenge of dealing with economic influences while staying true to their community values.

The study contributes three insights to consumer (culture) theory. First, this research uncovers a set of four concealment strategies that social capital-driven consumption communities tend to use when confronted with economic capital production. These strategies range from total denial of economic capital production, through re-articulation and partial appropriation of economic capital production, to teleological alignment of economic and social capital production. Each concealment strategy manifests through different expressions, and differentiates to the degree to which consumers conceal economic influences. The degree of concealment varies according to consumers' level of refusal and legitimization of economic capital production within their community.

This comprehensive range of four concealment strategies integrates prior findings of consumption community research dealing with the intersection of social and economic capital production. For instance, the "No Vending Rule" (Kozinets 2002a, 24) within the Burning Man community is an illustration of the first, most direct, concealment strategy. This official rule can be read as an institutionalized mechanism that helps the community to actively repel economic capital production. CSA participants that are jointly engaged in rhetorically decommodifying CSA food products (Thompson and Coskuner-Balli 2007) make use of the strategy of re-articulation of economic capital to conceal the market niche's commercial nature. And "well-intentioned commercialism" (Bonsu and Darmody 2008, 363), which serves Second Life residents to justify commercial success, illustrates the concealment strategy of teleological alignment of economic and social capital production.

Two expressions of the isolated concealment strategies emerged exclusively from empirical netnographic data. First, social capital-driven communities embrace selected marketing tools such as playful competitions or creative logo development processes, imbue those with a communal spirit, and thus leverage the community's social capital production. Second, social capital-driven consumption communities legitimize aspects of economic capital production to the extent that it helps the community to reach functional goals (e.g. spreading the word of vegan life, testing outdoor material, etc.).

Although this study proposes a first step towards a comprehensive range of concealment strategies, depending on the context, other social capital-driven consumption communities might use slightly different strategies (or expressions). Locating the strategies on a concealment continuum implies the potential existence of further concealment strategies that differ in the degree to which communities conceal economic influences.

Second, this research contributes consumption-specific empirical evidence to Bourdieu's (1986) theory of concealment of social capital. The diversity of four concealment strategies exhibiting multiple degrees of concealment suggests that concealment is a more nuanced concept than previously assumed.

Third, the study empirically supports the idea that concealment is one focal strategy for managing social capital-driven consumption communities' various interfaces with economic capital production. Building on Bourdieu (1986), the study shows that social capital-driven consumption communities conceal economic capital production through moving back and forth between repelling and–to certain extents–legitimizing economic capital. Thus, the study suggests that engaging these concealment strategies allows consumption communities for incorporating economic influences under the primacy of social capital production–yielding a potentially important dynamic for community perpetuation.

To conclude, these insights are of particular interest for Western society that is said to suffer from a loss of community spirit (Putnam and Goss 2001). The pluralization of lifestyles and attitudes available within society hampers a joint value creation among people. Thus, Western society faces the danger of social dissolution (Dubiel 1998; Heitmeyer 2004; Putnam and Goss 2001). However, societal cohesions (or 'social capital'), solidarity, community spirit, and the ability to build community are central resources of healthy societies (Weidenfeld 2001). This study implies that cohesive forces still permeate Western society. But today, social capital might prevail in micro socio-cultural spaces such as (online) consumption communities and might comprise potentially new consumption-specific dynamics such as the necessity of concealing economic capital production on behalf of community perpetuation. Future research should address these new consumption-specific aspects of social capital production–conceding potentially relevant insights into the social glue of Western society.

The Effect of Dual Anchors on Numeric Judgments:
The Moderating Effects of Anchor Order and Domain Knowledge

Devon DelVecchio, Miami University, USA
Timothy B. Heath, HEC Paris, France

ABSTRACT

Anchoring is typically forwarded to explain how available numeric instances alter beliefs. The anchoring literature typically focuses on exposure to either single anchors or lengthy numeric sequences. We fill in the gap between single-anchor and large-series studies by assessing the effect of dual anchors on target judgments. We do so since individuals are often exposed to two numeric representations from a domain and the features of dual anchors and, in turn, likely processing of associated information, differ from the features of both single-anchor and longer-sequence anchor scenarios. Results of Experiment 1 indicate the low-knowledge participants exhibit a recency effect in which estimates are lower when a high anchor is presented first than when a low anchor is first. Conversely, high-knowledge participants display a primacy effect as estimates are higher when a high anchor is presented first than when a low anchor is first. Experiment 2, indicates that the effects of target knowledge on anchor order are moderated by anchor extremity. Practical advice for managers as they consider how they communicate dual pieces of numeric information such prices or attributes is offered.

THE EFFECT OF DUAL ANCHORS ON NUMERIC JUDGMENTS

Anchoring (Tversky and Kahneman 1974) is the process that is typically forwarded to explain how available numeric instances alter beliefs. Anchoring holds that numeric estimates are assimilated toward available anchors. A classic example of the anchoring effect is the estimation task employed by Tversky and Kahneman (1974) which asked participants to estimate the number of African nations in the United Nations. Prior to providing their estimates, participants were informed that a randomly generated estimate suggests that the number is either 10% or 65% (manipulated between subjects). Participants who were exposed to the 10% anchor estimated the percentage of African nations in the UN to be 25% while participants who were exposed to the 65% anchor estimated that 45% of African nations are in the UN. The effect of single numeric anchors on target estimates has been widely studied. Results across domains such as height, age, and temperature judgments (Mussweiler and Strack 1999; Wegner, Petty, Detweiler-Bedell, and Jarvis 2001), product purchase decisions (Wansink, Kent, and Hoch 1998), and real estate valuation (Northcraft and Neale 1987) consistently demonstrate that a numeric anchor influences numerical judgments toward the anchor (see Ku, Gallinsky, and Murnnghan 2006 for an exception).

As is the case with the United Nations example above, much of the anchoring literature focuses on exposure to a single anchor. Single exposures to a numeric instance of a domain are frequently encountered. For instance, a motorist may be exposed to several domain-specific individual instances of numeric domains. For instance, when driving a motorist may pass a single speed limit sign, take one glance at the speed readout on the speedometer, or notice one price for gas. Lengthy numeric series are also frequently encountered. For instance, the same driver may be exposed to a series of street addresses, speed limits, or gas prices. Similarly, shoppers observe many prices while shopping in any grocery category. Investors are exposed to stock returns over a number days, quarters, and years. Sports tickers inform fans of the scores of dozens of games. Fittingly, the effect of numeric sequences on subsequent target judg-

ments has also been widely explored. Research across contexts such as pricing (Monroe 1971, Janiszewski and Lichtenstein, 1999; Niedrich, Sharma, and Wedell, 2001), exam scores (Wedell, Parducci, and Roman 1989), gambling options (Lim 1995), and salary allocations (Mellers 1986) has studied the effect of exposure to fairly lengthy numerical sequences (e.g., sequences of ten or more numerical occurrences) on subsequent target judgments. The results of this research stream indicate that judgments following exposure to numeric sequences are a function of the range, median, mode, and order of the sequence.

The frequency with which numbers are encountered decreases nearly monotonically from one (Dehaene and Mehler 1992). That is, the most frequently written and verbally stated number is one, followed by two, and three, etc. Similarly, the frequency with which a domain-specific anchor series are encountered is likely a monotonically decreasing from zero. Given the mind-boggling array of domains in the world, most people are likely to go unexposed to most numeric target objects. People are next most likely to be exposed to a single numeric instance in a domain, followed by two instances, etc. We attempt to fill in a gap in extant literature, a gap between single-anchor studies and large series studies, by studying the effect of dual anchors. We do so due to a) the likelihood that individuals are, relatively speaking, often exposed to two numeric representations from a domain and b) the fact that the features of dual anchors and, in turn, likely processing of associated information, differ from the features of both single-anchor and longer-sequence-anchor scenarios. Assuming dual anchors are not of the same numerical value (e.g., that a person is not given two sources both estimating the number of African countries in the UN at 30%), dual-anchor scenarios differ from single-anchor scenarios in terms offering higher and a lower anchor values that may be conveyed in two orders. Dual anchor situations differ from longer numerical sequences in that instance frequency and sequence mode are not relevant and that any one anchor is likely to carry greater weight thereby magnifying order effects.

LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

Despite their differences, the process by which single anchors affect such judgments sheds light on how dual anchors will likely affect numeric judgments. Evidence indicates that anchors affect target judgments via a selective accessibility process in which anchors prime anchor-consistent knowledge that is subsequently used to form the target judgment (e.g., Mussweiler and Strack 1999; Strack and Musswieler 1997). Thus, an anchor that suggests that 65% of African nations are in the UN may prompt thoughts of relatively large African Nations (South Africa, Egypt) and the role of such nations in international relations – information that is consistent with the high anchor. However, while this process explains reactions to a single anchor, perhaps of greater import when considering dual anchors is the relative effect of each anchor. On one hand, accessibility of information that is consistent with the first anchor may suppress access to information that is consistent with the second anchor. In such a case, judgments will be more aligned with the first of the two anchors and a primacy effect will emerge. Conversely, if information consistent with the second anchor is accessed, judgments should be

more aligned with this information and judgments should reflect the second anchor value thereby demonstrating a recency effect.

Research on the order in which non-numeric arguments are presented (e.g., Haugtvedt and Wegener 1994; Lana 1961, 1963) provides further insight into how dual numeric anchors will be processed. Such research assesses how individuals integrate conflicting written arguments into attitude structures. For instance, participants may see arguments in favor and against topics such as senior comprehensive exams for college students, nuclear power, or animal experimentation. As an example, Haugtvedt and Wegener (1994) manipulated argument valence for senior exams via statements such as "students graduating from schools with comprehensive exams were more likely to be accepted into very good graduate schools" and "capturing the benefits of a four-year program on a single standardized exam would be difficult." This line of research indicates that the effect of the order of conflicting arguments is a function of an individual's motivation and ability to elaborate on the arguments. When individuals are able and motivated to process message arguments, a primacy effect emerges (Haugtvedt and Wegener 1994; Lana 1961, 1963). This primacy effect is driven by elaboration of the initial message in the form of greater message consistent thinking. In turn, greater integration of the message into existing schema occurs, resulting in greater attitude change toward the initial argument, and subsequent attitude resistance to the conflicting second argument presented (Haugtvedt and Wegener 1994). This process is consistent with selective accessibility. When motivated to process the initial message, participants accessed argument-consistent information that swayed attitudes toward the argument and insulated the attitude from subsequent counter argumentation.

When less able and/or motivated to process arguments, a recency effect emerges (Haugtvedt and Wegener 1994; Lana 1961, 1963). The recency effect is driven by the lack of elaboration in response to the initial argument leading to weak attitudes. In turn, when prompted to indicate an attitude toward the focal object, reliance on available information (i.e., the second argument) biases attitudes toward the latter of the two arguments presented (Haugtvedt and Wegener 1994).

The results described above lead to the question of what will determine people's anchor elaboration. Although many factors may affect anchor elaboration, we focus on target knowledge for two reasons. First, as opposed to environmental factors such as time constraints, the issue of the respondent's knowledge is omnipresent in responses to anchors. Second, as evidenced by the title of one of the first articles on the anchoring heuristic ("Judgment under Uncertainly: Heuristics and Biases"), the anchoring phenomena explains judgment under uncertainty (Tversky and Kahneman, 1974). The level of uncertainty surrounding a numeric judgment task will depend on the level of knowledge of the target object of the individual making the estimate. In some instances, people will have complete knowledge and thus no uncertainty. For instance, exposure to an anchor or multiple anchors is unlikely to have a significant effect on judgments of one's own age. Conversely, someone with some, but less than perfect, knowledge will have anchor-consistent aspects of that knowledge primed and demonstrate a bias toward the anchor. Although even experts in a domain may exhibit anchoring effects when primed with domain specific anchors (e.g., Joyce and Biddle 1981; Northcraft and Neal 1987), consistent with the role of knowledge in determining uncertainty, knowledge has been shown to affect anchor-driven judgments such that greater knowledge (i.e., less uncertainty) is associated with smaller anchor effects (Mussweiler and Strack 1999).

The selective accessibility and elaboration-based accounts of dual anchors hold that initial exposure to the first anchor may prompt recall of anchor-consistent information that reinforces the anchor's legitimacy. For instance, when asked to estimate the number of students at the University of Rhode Island, someone exposed to a high anchor may access knowledge of the general size of flagship state schools, past basketball successes for the University, and noted alumni (e.g., Christian Amanpour, Lamar Odom). One the other hand, someone exposed to a low anchor may consider the diminutive size of the state, that URI's football team competes at the FCS level (a level below the top level of competition), and that the basketball team is in a conference with relatively small schools. Assuming the two anchors are fairly discrepant, but not so discrepant as for one or both to be summarily dismissed, a scenario we refer to as low anchor extremity, generating anchor-consistent thoughts in response to the first anchor should interfere with generating thoughts that are consistent with the second anchor. As a result, dual-anchors should be subject to a primacy effect in which the first anchor has a stronger effect on numeric estimates than does the second anchor. However, this expectation assumes that the respondent has anchor-consistent knowledge to be primed by the first anchor. For people with little knowledge of the target object, elaboration is unlikely and the second anchor should carry more weight simply due to its more recent encoding. Thus, the effect of dual anchors on target estimates will be a function of anchor order and target knowledge such that responses to dual anchors will demonstrate a primacy effect when target knowledge is high and a recency effect when target knowledge is low.

Hypothesis 1:   *Target estimates following exposure to dual anchors of low extremity will demonstrate a primacy effect when target knowledge is high and a recency effect when target knowledge is low.*

Given evidence that estimates display a greater anchoring effect in single anchor contexts when target knowledge is low than when it is high suggest the same might hold in a dual anchor scenario. If so, estimates of low-knowledge targets should display an overall greater anchoring effect than those of high-knowledge targets. As formalize in H2, a stronger anchoring effect for low-knowledge targets would result in estimates for such targets reflecting a larger recency effect than the corresponding primacy effect arising for high-knowledge targets.

Hypothesis 2:   *Target estimates following exposure to dual anchors of low extremity will demonstrate a greater recency effect when target knowledge is low than they will demonstrate a primacy effect when target knowledge is high.*

Hypothesis 1 in founded upon the expected effect of target knowledge on individuals' ability to access anchor-consistent knowledge in response to anchors that are of low extremity. Knowledge should also affect individuals' perceptions of anchors as the anchors become more extreme. When subjected to a numeric judgment task, individuals access a mental model of the range of plausible responses (Epley and Gilvich 2006; Mussweiler and Strack 2000; Quattrone et al. 1981). When an anchor is within the range of plausibility, respondents engage in the anchor-consistent accessibility process described above and, in turn, bias judgments toward the anchor. Conversely, anchors outside the range of plausibility are either ignored or met with counter-argumentation (Mussweiler and Strack 2000). As a result, more extreme anchors often produce less of an anchoring effect

than do less extreme anchors (e.g., Bochner and Inkso; Mussweiler and Strack 2000; Wegener et al. 2001).

Individuals with high target knowledge should produce a less variant range of plausible responses. As such, the likelihood that a given anchor value is judged to be outside the range of plausibility decreases. Thus, despite having more anchor-consistent knowledge to access, the likelihood that knowledgeable respondents access such knowledge decreases as anchor extremity increase. In turn, the failure to access anchor consistent information will mitigate the effect of extreme anchors. Conversely, individuals with lower knowledge of the target object will lack the ability to discern that an anchor is implausible and thus should produce more extreme target estimates in response to extreme anchors than in response to less extreme anchors. H3 reflects the resulting interaction between anchor extremity, anchor order, and target knowledge.

Hypothesis 3: Extreme anchor values a) attenuate dual-anchor order effects when target knowledge is high and b) magnify dual-anchor order effects when target knowledge is low.

EXPERIMENT 1

Method

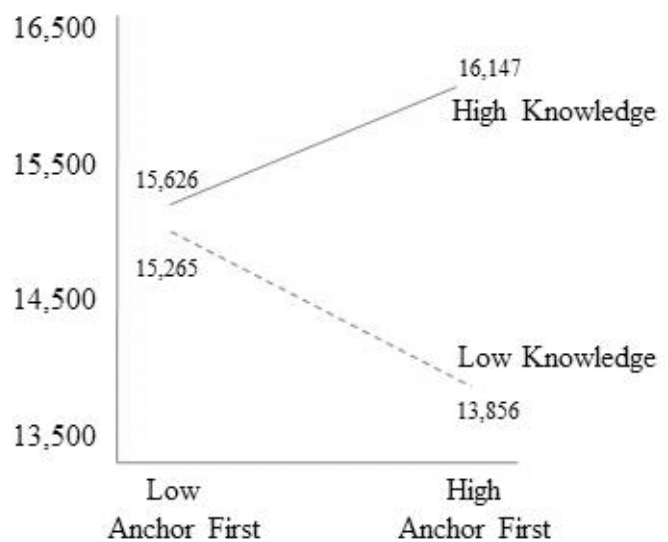
Experiment 1 is designed to test the effects of dual anchors across targets about which individuals have lower- and higher-knowledge (i.e., Hypotheses 1 and 2). Such a test may be undertaken in many ways. For instance, existing knowledge of a single target object can be measured or knowledge about the object may be imbued. In Experiment 1, we selected a pair of objects about which knowledge among the sample population differs. More specifically, the target objects are a pair of universities. The universities were selected via a pretest with participants (n = 25) from the same subject pool used to recruit subjects for Experiment 1. The pretest asked students to estimate the size of several universities and indicate their confidence that their estimate is within 20% of the actual enrollment. Confidence was measured on a one-to-ten scale in which 1 = not at all confident, 5 = moderately confident, and 10 = very confident. The two universities chosen as a result of the pretest are the university in which the participants are enrolled and the university of Rhode Island. The two universities differed as intended with respect to confidence with mean confidence of 2.64 for the University of Rhode Island and 8.52 for the participants' home university (t = 17.38, p < .001). Further, the pretest indicates that the two universities are perceived to be generally of the same size (Rhode Island mean = 14,100, home university mean = 15,483, t = 0.96, p > .30).

Experiment 1 called for participants (78 undergraduate students at a mid-sized Midwestern university) to estimate the number of students enrolled at either the high-knowledge target (i.e., the students' home university) or the low-knowledge target (i.e., University of Rhode Island) university. Experiment 1 features a 2 (anchor order – low first, high first) x 2 (target knowledge – low, high) design. Participants completed Experiment 2 via pencil and paper. On the cover page, participants were first informed of the general estimation task, and that to help them with the task, they would be provided two randomly selected estimates of student enrollment provided by students attending the target university. On the next page, participants were informed of the identity of the target university and were exposed to the first anchor. Participants then advanced to the second anchor. The low anchor was 13,600 and the high anchor was 18,400, values that are minus and plus 15% of a 16,000 midpoint. After viewing the

second anchor, participants advanced to a page that asked them to provide their estimate of the enrollment at the target university.

Results

Two focal estimates were in excess of three standard deviations of the mean and were removed from the analysis. ANOVA results of the remaining 76 data points Consistent with H1, a significant knowledge by anchor order interaction emerged ($F(1,75) = 5.15$, $p < .05$). As can be seen in Figure 1, when the low anchor is presented first, estimates do not differ across the high- and low-knowledge targets ($F(1,35) = 0.78$, $p > .35$). When the high anchor is presented first, estimates are higher when target knowledge is high and lower when target knowledge is low ($F(1,38) = 10.16$, $p < .01$); an outcome indicative of a recency effect when target knowledge is low and a primacy effect when target knowledge is high.

Figure 1
Target Estimates in Experiment 1


To test Hypothesis 2 we consider whether the change across anchor order conditions is greater for the lower-knowledge target than for the higher-knowledge target. Specifically, we created a variable that reflects the strength of anchor effect by subtracting the mean estimate in the high-knowledge, low anchor first task ($M = 15,626$) from participants' estimates of the high knowledge, high anchor first condition and by subtracting the mean estimate of the low-knowledge, high anchor first target (13,856) from participants' estimates of the low knowledge, low anchor first condition. While the result is directionally consistent with the belief that low-knowledge targets will be associated with greater differences across order conditions ($M = 1439$) than will high-knowledge targets ($M = 521$) the difference is not statistically significant ($F(1,38) = 1.63$, $p > .20$).

Discussion

Experiment 1 offers support for the belief that the effect of anchor order differentially affects estimates as a function of individuals' target knowledge. As noted, this hypothesis was based on the individuals assessing anchors that are of low extremity. Study 2 is designed to test the effect of more extreme anchors and the specific relationships between anchor order, target knowledge, and anchor extremity hypothesized in H3.

EXPERIMENT 2

Method

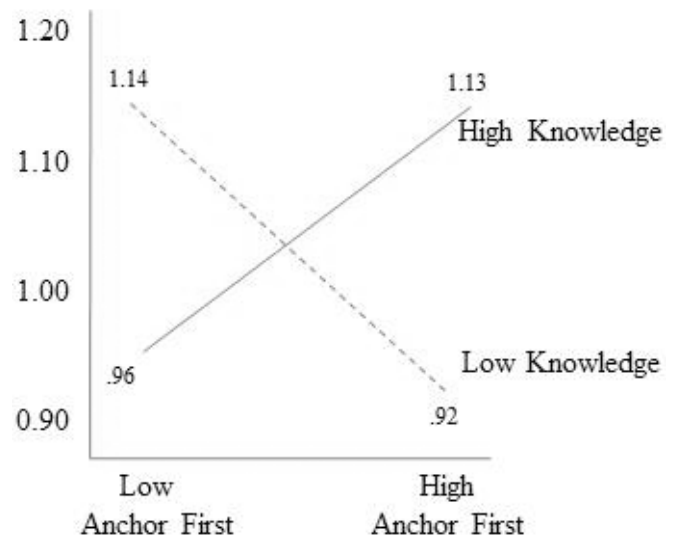
In Experiment 2, forty-four undergraduate students at a mid-sized Midwestern university provided estimates for nine target objects drawn from world events (states won by Barrack Obama in the 2008 election, deaths in the Mumbai terrorist attacks, closing Dow Jones average), pop culture (Grady Sizemore's career homerun total, number of Madonna studio albums, number of players in the World Series of Poker), and pricing (Honda Accord EL base price per honda.com, 8GB iPod Nano price on apple.com, 1.7 oz Obsession by Calvin Klein perfume price on calvinklein.com) domains. Anchor order (low first, high first) and anchor extremity (low, high) were randomized across questions. Question order was randomized across respondents. Anchor extremity was manipulated by varying the anchor distances from the correct response by either plus or minus 15% (low extremity, consistent with Study 1) or plus or minus 30% (high extremity). For example, anchor values for the number of homeruns hit by Grady Sizemore, who had hit 129 homeruns at the time of the study, were 110 and 148 in the low extremity condition and 90 and 168 in the high extremity condition.

The general method of Experiment 2 follows that of Experiment 1 except that anchors were supposedly the estimates of other students enrolled at the participants' university and participants responded to a set of four items measuring their subjective knowledge of the target objects (*alpha* = .854). The knowledge questions, which were tailored to each target object, asked participants the extent to which they a) know more about the topic than most people, b) know more about the topic than most students at their university, c) attend to the general domain (e.g., pop music, US politics, poker), and d) attend to the specific target object (e.g., Madonna, the 2008 election, the World Series of Poker).

Focal estimates were normed to the center of the anchor range (i.e., the actual value of the focal question). For instance, an estimate that is 5% above (below) the actual target value was coded as 1.05 (0.95). The effects of anchor order, anchor consistency, and target knowledge (median split) on normed estimates were assessed via mixed model ANOVA with the estimation task as a repeated factor.

Results

The mixed model ANOVA results indicate a significant three-way interaction between knowledge, anchor order, and anchor extremity ($F(1, 356) = 5.78, p < .05$). We investigate the nature of this relationship in two ways. First, looking at the data associated with the low anchor extremity condition allows us to retest Hypotheses 1 and 2. When anchors are less extreme, a significant anchor order by knowledge interaction emerges ($F(1, 93) = 12.11, p < .01$, see Figure 2). Consistent with H1, the form of the interaction is such that presenting the low anchor first is associated with higher estimates for lower-knowledge targets and lower estimates for higher-knowledge targets ($F(1, 21) = 5.41, p < .05$). This pattern reverses when the high anchor is presented first ($F(1, 62) = 7.40, p < .01$). Thus, in the case of low anchor extremity, estimates of low-knowledge targets display a recency effect while estimates of high- knowledge targets display a primacy effect.

Figure 2
Normed Target Estimates in the
Low Extremity Condition of Experiment 2


Value reflect estimates normed against the actual target value (e.g., an estimate 5% above the actual target value is coded as 1.05)

As with Study 1, we assess the possibility that the anchoring effects observed in the low extremity conditions of Study 2 are greater for low-knowledge than for high-knowledge targets (i.e., is the 0.22 difference across anchor orders in for low-knowledge targets greater than the .17 difference across anchor orders in the high-knowledge target?). Estimates were transformed as in Study 1 to form a measure of relative anchor strength. Subsequent mixed model ANOVA provides support for H2 as the difference in estimates across order conditions is greater for low-knowledge targets than for high-knowledge targets at $p < 001$ ($F(1,45) = 21.50$).

Testing Hypotheses 3 calls the inspection of estimates across levels of anchor extremity. As displayed in Figure 3, when target knowledge is high, anchor order and extremity interact ($F(1, 167) = 5.27, p < .05$). The form of the interaction is such that a primacy effect emerges for high-knowledge targets when there is low ($F(1, 45) = 6.89, p < .05$), but not high ($F(1, 54) = 0.22$), anchor extremity. This is consistent with H3a's prediction that anchor extremity will mitigate the effect of anchor order when target knowledge is high. For low-knowledge targets, there is a non-significant trend toward a recency effect in the low-extremity anchor condition that reverses toward a primacy effect for high-extremity anchors ($F(1,148) = 1.80, p > .15$). This outcome is inconsistent with H3b's prediction that greater anchor extremity will magnify the effect of anchor order when target knowledge is low. Thus, H3 is partially supported.

Normed Target Estimates in Experiment 2
Value reflect estimates normed against the actual target value (e.g., an estimate 5% above the actual target value is coded as 1.05)

Discussion

This research advances knowledge of general anchoring effects by evaluating the specific context of dual anchors. Some of the results add confirming evidence to existing beliefs regarding anchoring in general that arise from single anchor studies. For instance, that anchors differentially affect people of greater and lesser knowledge has been established (e.g., Mussweiler and Strack 1999). This research adds to this research by demonstrating that, in the context of dual outcomes, the difference in reactions to anchors across lower- and higher-knowledge contexts is one driven by the relative weight placed on the first versus the second anchor. Specifically, the results of the two experiments support the notion that anchors of moderate extremity exhibit a primacy effect when target knowledge is high, but a recency effect when target knowledge is low. The possibility that the recency effect associated with low-knowledge targets is stronger than the primacy effect observed for low-knowledge tasks received directional support in Study 1 and statistical support in Study 2.

Within a marketing context, consumers are often exposed to, and marketers can often control the order of, dual anchors. For instance, regular and sale prices may be conveyed in either order as can attributes such as highway and city miles per gallon. This research indicates that managers must consider their audience when ordering dual prices or numeric attributes. This suggests, for instance, that a retailer may reinforce the perception of low prices among its regular (high knowledge) customers by conveying sales prices before regular prices (i.e. "$2.99 was $4.09"). Conversely, an automobile company or salesperson would want to convey the lower city miles per gallon before the higher highway MPG when talking to an inexperienced car buyer. When in doubt, the possibility that anchor effects are stronger for lower-knowledge targets suggests erring on the side of presenting the less attractive numeric value first.

Limitations and Future Research

The effects of anchor order and anchor extremity were held to arise due to different levels of anchor elaboration across high- and low-knowledge targets. Although this is derived from existing research (e.g., Haugtvedt and Wegener 1994; Lana 1961, 1963), this process was not tested directly. This represents a theoretical limitation and the opportunity for additional research. In particular, one issue that arises from the current results that can benefit from process measurement involves the failure to find support for H3b. H3b hypothesized that more extreme anchors would magnify order effects when target knowledge is low. This expectation was based on the assumptions that (1) more extreme anchors would be viewed as falling within the bounds of reason when target knowledge is low, but (2) not be subject to diligent elaboration. The reason for the observed failure to support this hypothesis, which could be a function of a failure of either or both of the underlying assumptions, might be tested with process measures such as thought-listing tasks. Similarly, future research may want to investigate potential differences across targets low vs. high in need for cognition given that these groups have been found to differ in the care with which they process numerical information (Chatterjee et al. 2000). Moderation from need-for-cognition would be consistent with an elaboration-based explanation of H3's failure, but a lack of moderation would be consistent with a perceptual explanation.

While providing an initial look at basic effect of anchor order across lower- and higher-knowledge targets, this research tests only one additional moderator, anchor extremity, and this moderator was assessed at only two levels. Regarding anchor extremity, just as a more extreme anchor mitigated order effects, so too could less extreme anchors. For instance, anchors of +/-5% of the actual target could be interpreted as indicators of agreement and precision.

From a marketer's perspective, research has explored how consumer responses to numeric information are affected by framing the information as percentages versus raw numbers (e.g., DelVecchio, Krishnan, and Smith 2007), as round versus sharp numbers (e.g., King and Janiszewski 2011), and as gains versus losses (e.g., Heath, Chatterjee, and France 1995). Each of these could moderate the extent to which the extremity and order of dual anchors affect target judgments. For instance, employing dual anchors in percentage

terms (e.g., save 20% as opposed to save $2.00) or in sharp numbers (e.g., save $2.07 as opposed to save $2.00) makes the numeric information harder to interoperate. Greater difficulty in processing may mitigate elaboration and, in turn, magnify the effect of the second anchor. Similarly, potential gains may be scrutinized less than potential losses thereby exacerbating the effect of the second anchor value when dual anchors are framed as gains. Research on such moderators of dual anchor effects and the processes by which they occur is merited.

Collective Authentication

Sabrina Gabl, University of Innsbruck, Austria
Andrea Hemetsberger, University of Innsbruck, Austria

ABSTRACT

Our netnographic study of an open-source marketing community investigates collective practices of authentication. We find that the community embraces emerging contradictions—open closedness, professional amateurs, market logic of doing good, and a faceful mass—instead of solving them and thus constantly fuels collective authentication practices. Our study extends existing findings on authenticity in three ways: We see a high potential in the dynamic perspective of authenticity paradoxes, find additional paradoxes relevant to the marketing context, and point out the relevance of the individual, even against the backdrop of collective authentication.

INTRODUCTION

How come a collective that initially formed around a communal resentment to market hegemony is now so well integrated in the market that it becomes an award-winning brand? This is what happened to the online open-source community around Mozilla Firefox at the biggest computer fair in Germany in 2011, when they were elected brand of the year for their successful introduction of the Firefox brand ("Mozilla Awards" 2011).

In their beginnings, many consumer-producer communities followed a grassroots effort, distancing themselves from the profit motive, and, by thriving on values of openness and transparency, they were able to blur the boundaries between internal and external realities, granting consumers "the authority to walk backstage" (Holt 2002, 86). In doing so, they have been perceived and recognized as authentic, valuable cultural resources that were able to compensate for the perceived loss of a personalized self in mass society. Some well-established consumer-producer communities have given up parts of their anti-conformist and resistant aura and turned to gradual professionalization in favor of a more mainstream logic of market success. They have turned into "commercially viable" (Fitzgerald 2006, 587), entrepreneurial (Hemetsberger 2006, 2008) organizations and are so displaying characteristics of commercialization; factors which have been associated with a gradual loss of authenticity (Alexander 2009; Arsel and Thompson 2011; Baron 2004; Beverland 2005, 2006; Carroll and Swaminathan 2000; Holt 2002; Kozinets 2002a; Thompson and Arsel 2004).

A collision of two contradictory notions very often initiates a vast number of discussions displaying polarized either/or viewpoints (Lewis 2000). Likewise, researchers are raising concerns about the seeming commercialization of non-profit organizations, regarding it to be against a non-profit organization's nature to rely on commercial revenues (Child 2010).

This study wants to understand how entrepreneurial consumer-producer communities, which are similarly challenged by contradictory discourse, aim to balance the need to adapt to market conventions and, simultaneously, keep up their authenticity. In other words, this study aims to understand authentication practices of a collective. In the theory part, we aim to conceptualize the need for understanding collective authentication, drawing on authenticity and organization theory literature. Next, we present our specific research subject, the Mozilla marketing community, and provide details on our empirical study. We find four major contradictions arising from the community discourse that are enabling authentication—open closed-ness, professional amateurs, market logic of doing good, and a face-ful mass—and describe how the contradictions are fueling discourse and, simultaneously, authentication processes.

THEORY

Views on Authenticity

Authenticity has been discussed in various disciplines, grounding its relevance in the world's growing superficiality (Boyle 2004; Gilmore and Pine 2007; Grayson 2002; Leigh, Peters, and Shelton 2006). In conceptualizing authenticity, we identify three major viewpoints across disciplines; objective, constructivist, and existential views on authenticity (Wang 1999, Leigh et al. 2006, Alexander 2009).

According to an objective viewpoint, authenticity can be pinned down to absolute, objective criteria, leading to a definition of authenticity that is closest to genuineness and originality. While Grayson and Martinec's (2004) indexical authenticity can be compared to objective authenticity, the authors define an additional type, iconic authenticity, which denotes an authentic reproduction and is judged according to its similarity to something that is indexically authentic. Grayson and Martinec (2004) do not regard these two kinds of authenticity to be exclusive either and support the idea that authenticity is not inherent to an object, but rather a socially or individually constructed judgment. Rose and Wood (2005) further develop the constructivist understanding of authenticity by studying how the perception of reality television programming is negotiated. In line with Kozinets (2001) or Peñaloza (2001), Rose and Wood (2005) argue that—in postmodern times—consumers are blurring the boundaries between fiction and reality and so create their own "hyperreality" (Baudrillard 1983) in which they perceive a kind of "hyperauthenticity." Similar to Cohen (1988) and Arnould and Price (2000), Rose and Wood (2005) find that an "experience is not objectively real but rather endowed with authenticity by the individual" (295). Beverland's (2009) studies on brand authenticity follow a similar notion; however, he takes on a more management-oriented perspective when he suggests authenticity attributes (Beverland 2005, 2006) or habits of iconic brands (Beverland 2009) to contribute to authenticity claims.

Existential authenticity is deeply grounded in existential philosophy, with Kierkegaard, Sartre, and Heidegger among the representatives (Golomb 1995). In this tradition, authenticity takes a central role and describes the existential condition of being, in which an individual is "true to oneself, and acts as a counterdose to the loss of 'true self' in public roles and public spheres in modern Western society" (Berger 1973, as cited in Wang 1999, 359). The focus on the authentic self has been adapted in various other fields; management literature is vastly discussing the concept of the authentic leader (e.g., Special Issue of *The Leadership Quarterly*, 16, 2005) and tourism literature has recognized the potential of existential authenticity in tourism experiences (Wang 1999; Steiner and Reisinger 2006).

Although interested in self authentication, community research takes a quite different stance towards the self which is not existentialist but rather (social) constructivist. Subculture and community research identified means to authenticate the self within a collective (Arnould and Price 2000; Beverland, Farrelly, and Quester 2010; Widdicombe and Wooffitt 1990). Wang (1999) and Arnould and Price (2000) find as well individual and collective factors that influence the authentic self as a member of a group. Wang (1999) distinguishes between intra-personal authenticity, involving individual physical and psychological concerns, and inter-personal authenticity, which can only be reached in a social context and having relationships with others. Similarly, Taylor (1991) locates authenticity as part of a dia-

log between the individual and others of significance. Arnould and Price (2000) find self-authenticating acts, "self-referential behaviors actors feel reveal or produce the 'true' self" (138), and authoritative performances, "collective displays aimed at inventing or refashioning cultural traditions" (Arnould and Price 2000, 140) that situate the self within society.

These three literature streams leave us with diverging viewpoints and insights into various idiosyncratic research contexts, and the conclusion that authenticity can either be judged on objective/existential grounds, or is rather co-constructed based on a specific frame of reference. Whereas the objective view emphasizes genuineness and originality, the authentic self is either self-referential/existentialist, or other-referential, becoming an authentic group member through authoritative performances. An other-referential view implies that authenticity is not a question of being *true to self* for all time, but rather of being true to self-in-context or true to self-in-relationship (Erickson 1995), emphasizing the impossibility to *be* authentic but rather *act* authentically. Authenticity, then, is a transient concept, changing its system of reference across different situations, relationships, times, and places. Even historical objects can only be judged as authentic from the perspective of their origins; their use/display in museums is not authentic but rather constructed as appropriately authentic in a contemporary setting. For collectives representing social entities, their existence is inherently based on social institutionalization. As such, they are void of any essentialist character. The postmodern challenge of authenticity for collectives is that of many different possible authenticities that are contextually co-constructed.

But how do collectives cope with multiple possible authenticities? How can they authenticate their existence, not only vis-à-vis their members but also the "the outer world"? Authenticity literature offers insights into the role of the community as a means to authenticate the self; the authenticating collective remains an underresearched domain.

Authenticating Collectives

Some references to a collective form of authenticity are made in organizational theory. Authors like Carroll and Wheaton (2009), who take on an internal identity perspective, focus on the question of how authenticity can be effectively projected to an audience. Carroll and Wheaton do not regard authenticity construction as a collective endeavor but as features that are deeply grounded in the organization's identity. Similar to literature on authenticity, the authors back out of the perspective of the organization as an authenticating collective, and present authenticity as a bundle of characteristics, such as sincerity and "being true to one's self" and one's craft. Yet, the authors introduce an interesting perspective on authenticity as related to organizational identity.

Harrison and Corley (2011) offer a practice-oriented and more open attitude towards authenticity, when they employ an open-systems perspective. They define authenticity as a balancing act between practices of cultural infusing, importing and translating cultural material, and cultural seeding, exporting cultural material. In their model of cultural cultivation, the authors lay grounds for a circular view of organizational authentication. A circular view emphasizes the necessity to not just seed and propagate organizational ethos and style but simultaneously bring in new members, new knowledge, and ways of doing, thus keeping organizational structures flexible and open. Harrison and Corley's (2011) notion of authenticity as constructed through cultural cultivation explicitly integrates external parties as co-constructors of the organization. Through parallel processes of infusing and seeding, the authors claim, organizations

can solve the authenticity paradox of being unique as an organization and similar to interested external parties at the same time (Lewis 2000), thereby solving issues of authenticity with members, customers, and a larger social audience (Carroll and Swaminathan 2000). Similar to Harrison and Corley (2011), Driver (2006) argues that being connected is part of an authentic, relational organizational self-definition. Hence, collective authentication means connecting various actors and claims. By doing that, Driver (2006) and Liedtka (2008) argue, authentication also takes on a moral quality, exposing organizational action to public scrutiny.

In accordance with Driver (2006), Liedtka (2008), Harrison and Corley (2011), and other (social) constructivist approaches in authenticity literature (Beverland 2005; Leigh et al. 2006; Peterson 1997, 2002), we assume that authenticity is the result of an interplay between various actors and therefore, a dynamic process of authentication that resolves the paradox of multiple authenticity claims. We will focus on processes of authentication, thereby contributing to an understanding of the practices employed by actors involved in the authentication of a collective.

METHODOLOGY

Our investigation into collective authentication processes is based on the information-rich case of the Mozilla Foundation and Corporation. The Mozilla online marketing community is especially interesting, because it is the first one of its kind trying to combine all the contradictory assumptions of the open-source movement and marketing practice. In 2007, popular media was talking about the Mozilla paradox, praising Mozilla's successful way of operating (Freedman 2007). However, changes such as increasing market share and growing professionalization were perceived as a challenge for Mozilla's core values, thus endangering its claims of authenticity. The marketing community was identified as a kind of bottleneck where open-source collides with a business logic, and presumably leads to appropriation by the capitalist market system. The Mozilla Corporation is critically aware of these perils and therefore offers rich data on collective authentication discourses.

Our netnographic study (Kozinets 2002b, 2010) focuses on Mozilla's marketing community, taking into account data collected from the Mozilla mailing lists (the marketing and the community Drumbeat mailing list), respective Mozilla Wiki pages, 13 blogs, and eight interviews with key engagement staff and marketing volunteers. Before entering the online field, we tried to get to know more about how Mozilla is organized on- and offline. We, therefore, researched the web presence of Mozilla, tried to learn more about Mozilla's history and projects, and became familiar with the open-source phenomenon. We got into contact with local Mozillians (a common denomination of Mozilla community members) and attended two community meetings in Munich. We then entered the field by gathering data from the official Mozilla marketing mailing list. We selected posts for coding according to their relevance and the attention they attracted among community members (Kozinets 2010). The mailing lists and other central information websites helped us to identify key and most active participants within the field. Based on this observation, we gathered data from 13 blogs dealing with issues germane to our study—with a focus on blogs written by employees of the Mozilla Corporation or Foundation. Blogs hosted by well-known employees proved to be most relevant, as they were well frequented and most interactive. In many cases they served as information source for voluntary contributors, because staff reported on their projects and published professional or personal thoughts. In those first steps, we took a purely observational position (Kozinets 2006) and when necessary, checked the Mozilla Wiki for background in-

formation. The online observation covers a period of about one year, from August 2010 to August 2011—a time when tremendous changes, such as the hiring of a large number of new employees, were taking place within the Mozilla community. In order to complement the online data, we conducted four in-depth interviews with core engagement employees from different positions in the marketing field, one in-depth interview with a SUMO (Support Mozilla) employee, and three in-depth interviews with active volunteers selected according to their active participation on the marketing mailing list.

The transcript of more than eight hours of interview footage, the downloaded online material, and memos written during the data gathering and initial coding stages, were abstracted and coded according to grounded theory (Goulding 2002; Strauss and Corbin 1998) and constant comparative method (Charmaz 2006) by using open-source software for qualitative data analysis (TAMS analyzer). Most often, Mozillians referred to their mission and core values, towards the Mozillian way of doing things, and how to develop and safeguard it. We were able to gain a deeper understanding of the Mozilla community through the first author's attendance at a major European community meeting, MozCamp Europe 2011. This allowed her to meet some interview partners and bloggers face-to-face and engage in enlightening discussions with them.

FINDINGS

Our analytical journey from first categorization to an advanced understanding of Mozilla discourse around authenticity issues culminated in four fundamental contradictions—open closed-ness; professional amateurs; market logic of doing good, and a face-ful mass. These contradictory notions are not there to be resolved but are fueling discourse and initiate collective authentication processes. Figure 1 gives an overview of the various contradictions and respective authentication processes identified.

Figure 1: Collective Authentication Processes and Contradictions.
Open Closed-ness

The Mozilla marketing community translates its demands for openness and transparency, rooted in their open-source coding background, directly into the field of marketing. By doing so, they are often reaching the limitations of traditional marketing theories' assumptions of closed/internal development of marketing tactics. When openness and transparency is one of the key values, the surprise factor of a campaign launch can easily get lost. Pitt et al. (2006) refer to these opposing dimensions of brands, but predict that with rising demands of authentic brands traditionally closed brands will have to move along the continuum toward openness. Two authentication processes emerge from this contradiction and simultaneously expand the closed branding approach; *giving reasons and intentions* and *revealing the hidden agenda*.

Complete transparency within a community is difficult to accomplish, as communication among a large group of people increases complexity—even more so, if it is globally distributed as in the case of Mozilla. Despite a variety of communication tools available, information exclusivity is not unusual and can have different sources; though some information might be available, it does not necessarily mean that everyone receives it. Communication at Mozilla takes place on two levels. The first level conveys straightforward, informative content about what is done at Mozilla with regard to marketing efforts. The second level, which can be regarded as a kind of meta-level, serves to process this sober information content in a more subtle way and involves *giving reasons and intentions* and, sometimes, *revealing the hidden agenda*. Communication on this meta-level becomes essential when the marketing volunteers are not sufficiently integrated in a specific project, and thus, this kind of closed-ness needs to be balanced. The following passage taken from the Mozilla Wiki, illustrates best, how projects are presented to the whole community.

"Purpose

- Build on (and grow) brand affinity for Firefox: help people understand that we're about something bigger than just a browser.

- Grow a bigger base to back 50k Mozillians who donate time: millions of supporters backing our community.

- Raise funds for grants and programs like Mozilla Drumbeat that create new tools and drive innovation.

Anti-purpose

- *Join Mozilla is NOT a replacement for our existing contributor community*

  - *We already have programs to support Firefox and Thunderbird contributors, and plan to grow and improve them throughout 2011*

  - *We also have programs like Mozilla Drumbeat aimed at getting new kinds of contributors and projects into Mozilla…"*

("Join Mozilla" from the Mozilla Wiki)

The information provided by the initiators of this project, called "Join Mozilla," goes far beyond the key data that would usually be communicated to relevant stakeholders. Outlining the purpose, and even the anti-purpose, of the project, helps voluntary contributors to better understand why it is necessary to pursue this project—its existence becomes legitimated within a wider community and willingness to support it might rise.

Whenever the community still does not feel sufficiently enlightened and says so, it is critical that staff reacts, further explains the project, and *reveals* its *hidden agenda*. This goes even as far as laying marketing strategies completely bare. An extract from a discussion on one of the employee's blogs shows how such a hidden agenda might look like. This discussion was about whether a donator, without having contributed, should be able to become a Mozillian.

"All the best practices show that you need to give people a small and easy way to get involved first, and then slowly to help the most motivated amongst them dig into deeper contribution.

So, that's the thinking behind the $5 — based on what we've seen in other big nonprofits that use volunteers." (staff member, posted to his/her blog, January 6, 2011)

In this case, the employee reveals the hidden agenda by publicly stating online that the thought behind this idea was to drag more contributors into the project.

On other occasions, *closed-ness* is even created purposefully; when contributors need to sign up for project groups. This is how a voluntary contributor describes this situation:

"They have had you sign up for the launch campaigns. I have been too busy to sign up for those and those were purposely done secretly, so that... so anyone could be involved in the launch, but all the plans were happening close, so that it would be a surprise to people who weren't involved." (voluntary contributor, interview, June 23, 2011)

On the one hand, this quotation shows how easily community members feel excluded from the project, but on the other hand, the person is still aware of what is going on. Mozillians do not leave anyone in the dark. Though the contributor is not very happy about being excluded, he or she shows understanding. Within this exclusive group, however, unrestricted and targeted communication is possible. Interestingly, fully embracing the contradiction of open closed-ness, which means full information on demand but avoidance of complexity (Hemetsberger and Reinhardt 2009), leads to the highest level of transparency.

Professional amateurs

The contradiction of the professional amateurs derives from the heterogeneity within the marketing community consisting of both paid staff und voluntary contributors with different backgrounds and knowledge in marketing. Though this category might be reminiscent of what Beverland (2009, 63) refers to, when he writes about "appearing as artisanal amateurs," it is distinctive in several ways. It neither involves the element of "appearance" implying a kind of conceit, nor is it about downplaying their professionalism.

The question which arises in the context of Mozilla is who is the amateur and who the professional. Is it the fully trained and experienced marketer or is it the dedicatedly involved community member? Three processes transcending this contradiction of professional amateurs could be identified; *jointly reflecting*, *relativizing their roles,* and *educating.*

There are instances when the whole community is *jointly reflecting* on what Mozilla is and does, making concessions, *relativizing their roles*, and consequently embracing their disparities. The discussion forum but also blogs are vital sources for such discourses. Here an example where one of the basic qualities of Mozilla—openness—is revisited.

*"**Working open is a means to an end.** As [Ben] pointed out, the key question is not whether every itty bitty piece of communication or decision-making should be "open" or "closed." The key question is: **How does working in the open enable useful participation? How does it help us be more agile? How does it produce visible progress and momentum? How does it help us do good?"*** (staff member, posted to his/her blog, April 6, 2011)

Here, voluntary contributors and employees are reflecting on what working in the open means. By referring to another person and raising questions, the author of this passage suggests that there is a discussion on this central issue and that he would love others to join in on this discussion.

While marketing staff emphasizes that they are first and foremost community members, the distinct roles of staff and voluntary contributors become evident nevertheless. However, staff members are trying to work against such boundaries by giving each community member a voice and listening to these voices. Staff regularly asks the community for their feedback and so lessen power discrepancies. While staff might have a better knowledge about how marketing should look in theory, voluntary members are the acknowledged experts when it comes to localizing them. Voluntary contributors are explicitly consulted when it comes to local decisions; accordingly, their expert statuses are *relativized*. An interview partner, a Mozilla staff, put it best when he or she said that the voluntary contributors were their *"checks and balances"* (interview, June 16, 2011).

In another attempt, staff offers marketing tools to the whole community—*educating* them in doing marketing, enhancing their understanding of actions, and so helping them to digest marketing efforts. By doing so, they reduce knowledge differences and, at the same time, teach the community to spread Mozilla's message in a desirable way. One of the best examples for this is the Firefox Brand Toolkit, which, developed by marketing staff, should help the community to tell the Mozilla story as consistently as possible. By explaining theoretical marketing concepts, as shown in the following verbatim, professionalization of volunteer contribution is supported, too.

*"I've been asking myself recently: **what does effective social marketing look like in the internet era?** How could it improve internet literacy? The core of social marketing is extremely **simple messaging** that makes people care about seemingly hard to grok concepts. It's difficult to imagine millions of people getting excited about 'how to read a URL' — but this is what social marketing is about."* (staff member, posted to his/her blog, April 14, 2011)

Straightforwardly, this staff member explains the concept of *"social marketing"* in an easy language. The practice of asking for feedback and these processes of educating approve to the metaphor of infusing and seeding raised by Harrison and Corley (2011) and are signs for openness. The passage also implies that Mozilla staff does not aim to downplay or even hide its professional attitude towards marketing. Though the community is also striving for professionalism, their actions are still done in an amateurish style; especially local marketing efforts, aimed at spreading Mozilla's mission and gaining new community members, are organized by the local community, without following strict marketing rules. Neither are amateurs trying to mimic professionalism, nor are professionals mimicking amateurish action; Mozillians rather pursue both styles, depending on who is talking and who they are talking to. In order not to resolve this contradiction, it is crucial for Mozilla to keep up this element of amateurship which helps them to mitigate their alignment with the market and emphasizes their communal spirit.

Market logic of doing good

Though Mozilla does not base its decision-making on profit motives, as their corporation is fully owned by the foundation, its marketing is well-embedded in the market logic. This contradiction of working with means that are in line with the current market logic, but not striving for profit maximization, is balanced by the authentication process of *reminding themselves and others of their mission.*

Mozilla staff and volunteers *embrace the market logic* for pursuing their agenda and proudly discuss their marketing efforts and

achievements—though they might not support the market ideology entirely. The following example is part of a discussion among staff and volunteers about whether to use or not to use non-free services for their viral marketing efforts. This volunteer clearly argues for making use of such market logic tools.

> *"The main focus that convinced me into joining Drumbeat is involving people to jump into a wider garden. If we deliberately ignore or just don't use such media like the "walled/non- free etc..." to communicate our goals, ideas and approach, we are putting ourselves into another walled garden. Probably more pure, better and cleaner. But it's walled same way. Given the fact that ppl just use them, and we want to reach out for new people to join open web approach, I don't really see any other option rather than using nonfree services in other to spread our ideas, projects and results."* (voluntary contributor, message posted to the community Drumbeat mailing list, February 17, 2011)

What this contributor impressively argues is that, as long as it is for reaching their goals, it is okay to use methods that might be opposed to their values because if they were avoiding them, they would also act against their principles. Implicitly, this contributor already balances the contradiction of a market-based logic of doing good when he or she implicitly refers to Mozilla's mission by claiming that "*we want to reach out for new people to join open web approach.*" This process of *reminding themselves and others of their mission* to strive for the betterment of the Web is also visible in communication efforts. Here a quotation of what a Mozilla employee writes about the Mozilla Parks campaign, where Mozilla cooperated with several nature parks.

> *"Comparing the need to protect physical commons with the need to protect digital commons is showing promise as an effective way to talk about Mozilla's mission, so we wanted to refine the idea further with one more park (or in this case, beach) page."* (staff member, posted to his/her blog, April 9, 2010)

By cooperating with nature parks that aim to *"protect physical commons"* Mozilla wants to convey an impressive picture of their mission. As their Mozilla's mission is very much grounded in their history, reciting their evolution story and the reason the project came into existence is another powerful tool used to further legitimize Mozilla's actions, no matter how much they might be in line with the market logic. Only by embracing both ends of the continuum, Mozilla is able to balance this contradiction; a contradiction that reflects Holt's (2002) prediction that authenticity judgments will no longer depend on profit motives and simultaneously objects to current literature regarding commercialization to be a disauthenticating factor (Alexander 2009; Arsel and Thompson 2011; Baron 2004; Beverland 2005, 2006; Carroll and Swaminathan 2000; Holt 2002; Kozinets 2002a; Thompson and Arsel 2004).

A face-ful mass

Though it is the power of the community as a whole that empowers Mozilla, they nevertheless aim to single out the individual. This finding adds to Smith and Berg's (1987) notion that within successful groups, members must be able to express their individualities. Lewis (2000) lists three methods that help to manage such paradoxes: "maintaining a task focus, valuing differences, and reducing power discrepancies" (770). While the issue of power discrepancies supports our findings on professional amateurs, this study can add two processes at the Mozilla marketing community that are

transcending the contradiction of the face-ful mass: *sharing personal details* and *being visible and approachable*.

Staff members try not to be faceless decision makers responsible for a large number of people. They *share personal details* through various personal blogs, but also through social networks sites, where most Mozillians, both staff and volunteers, have signed up. Exhibit 1 shows a picture posted by a Mozilla employee on Facebook—a snapshot of a funny moment at the office. It reveals a lot about the character of both people in it and gives others a glimpse of how work life at Mozilla might sometimes look like.

Exhibit 1: Picture posted on Facebook (November 23, 2011)

Twitter is one of the main media in order to find out what is going on at Mozilla and has even been recommended as being the most effective tool in order to be up to date about Mozilla. On Flick'r, anyone can access pictures of community events and private, more intimate ones, as for example wedding photos. Mozilla even hosts an online video channel, Air Mozilla, where various videos and community meetings are aired. This format, which allows a globally dispersed community to get a feeling of intimacy and closeness, has been very well received. All those tools are basically there to foster practices of sharing—resembling Belk's (2010) concept of sharing in, thus "making extended self boundaries permeable to others" (726). Sharing in extends sheer expressions of individuality that differentiate the individual from the other (Smith and Berg 1987) and is more about letting others in. Simultaneously, sharing can lead to a higher visibility and a certain accountability of actors. An interviewee describes the importance of *being visible and approachable*:

> *"...assuming that you as an individual are close to the project's meaning and that you are accountable to the community and the people there… that they know you, that you're visible, that you are not faceless. That you are prepared to stand up for what you are doing."* (staff member, interview, June 8, 2011)

As staff and other community members "*stand up for what [they] are doing*," actions are always linked to a certain person who is personally made responsible for what is going on. This kind of personification is very important, because when there is something

wrong about a project, the person responsible can directly be addressed. However, personification at Mozilla goes even further, with a staff member describing Mozilla as a *"sea of smiling faces"* (staff member, interview, June 16, 2011) and a contributor who claims to think a lot about *"the Mozilla mission through [...] a person"* (voluntary contributor, interview, July 5, 2011). The extent of visibility and accessibility of Mozillians seems quite unmanageable to outsiders and paradoxical, considering their immense workload. Mozillians' solution to this paradox is quite counterintuitive. Visibility of the private side of Mozillians provides cultural and personal information, and accessibility increases trust, which both lead to less information needs. Again, contradictions are not tackled but naturalized through actions reviving their contradictory nature.

DISCUSSION

Contradictions are constructed (Lewis 2000). In the same manner as we accept harmony and consistency as being balanced and harmonious, we discursively construct contradictions and paradoxes as paradoxical and contradictory. The findings of our study not only show that we are able to find contradictory elements when we search for them, but that in successful producer-consumer communities contradictions fuel discourse in a positive way and so authenticate community action. Our study finds that authenticity is not plain and one-dimensional, but what is seemingly inauthentic is just the other side of the coin of authenticity. By showing that both sides can fruitfully complement each other instead of threatening authenticity, organizations can find positive paths of change without losing identity, hence authenticity.

Our findings also highlight in what ways contradictions contribute to authentication. We find nine collective authentication practices which constantly engage people in lively discourse. Yet, communication about tasks and daily activities is not sufficient. We found that community members engage in strategic thinking, formulating theses and anti-theses in accounts of *purposeful communication* and *revelations of the hidden agenda*. These findings also support the assumption that transparency is essential for authentication (Holt 2002). Similar to Harrison and Corley (2011), we also find a constant exchange of what they frame as ethos and style, however, we find no internal and external party but rather a flow of meta-communication among all members of the community. Infusing and seeding culture (Harrison and Corley 2011) comes from all members, facilitated by practices of *relativizing roles*. Relativizing roles critically depends on the paradox of professional amateurs that inspires the community to continuous *reflecting* and *educating* where it is not that professionals educate amateurs, but equally so vice versa (Hemetsberger and Reinhardt 2009; Kozinets, Hemetsberger, and Schau 2008; Schau, Muñiz, and Arnould 2009).

Embracing the market logic out of a former resentment against the hegemony of the market seems an adventurous, or at least a brave-hearted move. Yet, even marketers today claim that it is not the market logic that prevents positive and authentic organizational action but rather its misinterpretation as capitalism (Arnould 2007). The Mozilla case shows that producer-consumer communities ascribe a functional role to market mechanisms as enablers and multipliers of value-creating practices; value that is judged against the community's *mission*, which members constantly remind themselves of. The *market logic of doing good* reflects Holt's (2002) prediction that authenticity judgments will no longer depend on profit motives. Authentic consumer-producer brands seem to be prototypical citizen-artists, providing cultural resources for the community and beyond (Holt 2002).

These citizen artists have a face and share. Our findings underscore the importance of sharing (Belk 2010) as a collective authentication practice but also as an important theoretical concept for understanding producer-consumer communities. Community members impressively demonstrate that by *being visible and approachable*, they are able to reduce communication complexity and overload, corroborating findings from other open-source community research (Hemetsberger and Reinhardt 2009).

In order to enhance understanding of the functionality of collective authentication practices and its grounding in contradictions, we draw on organization theory and literature about paradoxes, in particular. Generally, organization literature maintains that we are used to think in a dialectical manner, and our language feeds the tendency to polarize (Lewis 2000). Westenholz (1993) juxtaposes the concept of paradox with other similar concepts, such as conflict, inconsistency, ambivalence, irony, or dialectic. "Paradoxes differ from…[*other*]…concepts in that no choice needs to be made (is possible) between the two contradictions constituting the paradox. The contradictory elements are present simultaneously and are accepted as such" (Westenholz 1993, 41). Westenholz (1993), Lewis (2000), Lüscher and Lewis (2008), and Smith and Lewis (2011) in their works on organizational change maintain that organizational change is at the same time hampered and enhanced by paradoxes, depending on how well organizations are able to reframe and reintegrate paradoxes into organizational processes. They outline three main paradoxes of learning, organizing, and belonging which liken our findings in many ways. Major commonalities in the resolution of these paradoxes are "open communications," "superordinate goals" (*reminding of mission*) (Lewis 2000, 765), and "reducing power discrepancies" (*relativizing roles*) (770). It seems that the majority of authenticity literature has largely overlooked this great potential to integrate inauthenticity into the authenticity paradox. Only Rose and Wood (2005) found that contradictions of reality television programming lead to the engagement of the consumer; an engagement which the authors interpreted as "a causal role for paradox in judgment of authenticity" (294). Harrison and Corley (2011) also recognize authenticating practices as a way of balancing organizational paradoxes such as the need to be similar and unique at the same time.

Our study contributes to a reframing of authenticity in three ways. Firstly, we see no positive end state of being authentic but rather high potential to learn from authenticity-inauthenticity paradoxes. Secondly, we contribute to organizational accounts of authenticity and organizational paradoxes in that we add two paradoxes that are relevant in a contemporary marketing context—the paradox of *professional amateurs* and *market logic of doing good*. Thirdly, we extend authenticity theorization beyond issues of the authenticating self (in society) and add a collective dimension of authentication practices. However, collective authentication does not go without inclusion of individual action, as demonstrated by our findings. Similarly, Liedtka (2008) and Driver (2006) argue that an organization is both an entity in and of itself and a collective of specific individuals, thus complicating the concept of organizational authenticity.

Collective authentication resembles the transcendence of paradoxes (Lewis 2000) as it implies the capacity to think and act paradoxically. It involves a leap in thinking and acting inauthentically authentic and authentically inauthentic.

"A Coke is a Coke?" Interpreting Social Media Anti-Brand Rhetoric and Resolution

E. Taçlı Yazıcıoğlu, Bogazici University, Turkey
Eser Borak, Bogazici University, Turkey

ABSTRACT

The study offers a rich non-Western context for theorizing about co-creation and the ideological role of social media for global brands. This paper is the result of a netnography of six social media communities in Turkey focusing on the Coca Cola brand. Our findings suggest that some local rituals integrate the brand with the traditions of the local culture. Each culture has its own way of dealing with such tensions by daily consumption experiences and rituals. Resolutions are not the province of those produce anti-Coke rhetoric, as Holt's (2002) study of resistant brand activists suggests, but rather of the average consumer. Thus, this study offers insights on how local and global social media and online discussions co-create the meanings surrounding a brand. Global-local social media-based brand co-creation can be understood as an ideological element of consumption processes in people's daily lives.

INTRODUCTION

Social media and online communities have transformed the world of marketing as a source of ideas and insights for more than a decade. This transformation has also made the cultural contexts that influence the ideological and political sides of consumption more visible. Ideologies in consumer narratives trigger tensions and stand as both a threat and an information source for global brands that have to face varying cultural contexts. Ironically, global brands can both be a source of such tensions but also become successful at the same time, as with Thompson and Arsel's (2004) study of Starbucks. Brand meaning is produced collectively. The brand value co-creation process is social and continuous, and is a highly dynamic and interactive process between the firm, the brand, the community and all stakeholders. Thus, consumer narratives from social media sources are useful data to study such processes. Despite the importance of the anti-branding, the literature does not offer us an adequate explanation about the role of the social media in how such contrasts and tensions are resolved in different cultural settings, and about how a brand still remains a global sweetheart. Coca Cola is one such context.

Thus, the purpose of this research is to explore the ideological and cultural bases of how such tensions are resolved through the social media. To explore these issues, our research includes locating richly textured venues in the extensive user-generated content on the internet (Kozinets 2010).

Theoretical Foundations

Co-Creation and (Online) Brand Communities

Consumers are acting as creative agents in the co-production of value that alters our understanding of consumers as merely users of the value provided by firms or other organizations. Both the consumer and the producer as (operant) resource integrators co-create value (Vargo and Lusch 2004). Given this result, value depends on the context of complex and dynamic networks (Venkatesh, Peñaloza, and Fırat 2006) that comprise not only firms and customers but also the circumstances involving their communities and the other stakeholders (Merz, He, and Vargo 2009).

Others examine online communities under the contexts of collective consumer creativity because social interactions can trigger new interpretations that consumers cannot generate alone (Hargadon and Bechy 2006; Szmigin and Reppel 2004). Online collective creativity not only provides researchers a new field for understanding

the social phenomena, but also adds an alternative, free resource that the industry can exploit (Kozinets, Hemetsberger and Schau 2008). This, in effect, realizes the value creation (Schau, Muñiz, and Arnould 2009). There are also ideologically oriented cultural exceptions that we explore in this study.

Coke as the Context

Coke has been chosen as the context as first it is a part of the daily lives both in the *online* and *offline* worlds, and second, it is among the few brands that promote the creativity motives in consumers (Ives 2004). Coca-Cola's branding history also reflects the history of marketing (e.g., Hartley 1998). Hence the literature and marketplace mythologies (Thompson 2004) about Coke are relatively richer than any other global commodity (Ger and Belk 1996). As consumer cultures are continuing to evolve, the branding culture of Coke is a part of this evolution, giving it a value in marketing research in a variety of fields. The dynamism of Coke contains contrasts and contradictions; that is, it has held the top spot in the global rankings for each of the past nine years (Interbrand 2011).

Among global brands, Coke is always the subject of successful branding that creates emotional bonds even in the area of childhood memories (LaTour, LaTour, and Zinkhan 2009 and many others). It is also a symbol of globalization and Coca-Colanization (Askegaard and Csaba 2000), of consumer resistance and anti-consumption movements (Varman and Belk 2009; Yazıcıoğlu and Fırat 2007; Krishnamurthy and Kucuk 2009) and as one of the few demonizing agents of imperialism (Klein 1999). Coke can even encourage a rhetoric of the West versus Islam (Özkan and Foster 2005; Sandıkçı and Ekici 2009) in non-Western contexts.

Schroder (2005) refers to one of Andy Warhol's most famous quotes, "A Coke is a Coke. You can't buy a better Coke," and argues that it captures the core strategy of the world's most successful brand – its distribution power, marketing activities and emotional bonds with the consumers. Indeed, Coca-Cola does not segment its market based on quality or price, but remains a psychological entity as much as a physical product; its brand equity goes beyond mere material ingredients. Miller (1998: 171) refers to an advertiser who claims, "I don't think Coca-Cola projects. I think that Coca-Cola reflects" in the pursuit to explore the underlying corporate strategies for globalization. Yet the literature is relatively silent on how this reflection really takes place, that is, through the cultural elements of a global brand (Askegaard 2006) and the place of mass communication (Borak 1986) due to its wide segmentation.

RESEARCH METHOD

Netnography

This research deploys netnography as the method that enables us to examine the multifarious and multiplicative nature of consumer cultures through a sphere of networked communications that the internet illuminates (Kozinets 2002; 2006; 2010).

Data Collection

The data collection has taken place in six online communities and social media in Turkey. To start with, Eksisozluk (www.eksisozluk.com) is currently one of the biggest online communities in Turkey. Established in 1999, it is a collaborative hypertext dictionary on the web (i.e., a wiki) with over 220,000 members contributing to it. The dictionary attracted the most crowded online traffic in

Turkey a couple of years ago. Due to its vast public influence, new online dictionaries emerged, each of which generally represents an ideological group. Eksisozluk deliberately avoids being associated with any ideology, but rather defends the freedom of speech. Hence, the online community enables us to compare and contrast conflicting views in the same space. Despite competition, its online traffic currently ranks twenty-second in the country – even when Yahoo! (the twenty-fifth) is considered (alexa.com 2012). Unlike Wikipedia, eksisozluk is a de facto encyclopedia because each entry has to be written as a dictionary item that reflects subjective views containing experiences, rituals, discussions and critiques. They are like mini-blogs, but there are a hierarchy and collective norms in the group that make it one of a kind as compared to other global practices. That is, it does not belong to any online community categorizations in Western cultures (e.g., the classification of online communities by Kozinets, Hemetsberger and Schau 2008). From eksisozluk the study includes all 516 definitions of Coke, entered between 1999 and June 2011 and all 427 definitions of Rock'n Coke, a rock festival that has been organized by Coke since 2003. The number of entries shows the involvement of consumers with a topic (e.g., people, brands, political events). For example the number of entries for Pepsi is 181 and Nike is 202 since 2000 (publicly open statistics of www.eksizsozluk.com by July 2011). Due to its both textual and contextual diversity when compared with other social media, eksisozluk represents the richest resource in our study.

The yahoogroup called Coca-Cola Collectors Club (which appears as Coca-Cola Koleksiyoncular Kulubu in Turkish) constitutes the second community in the study. The group was established in 2001. In this online community, there are 170 members with 4693 posts and 56 photographs about their experiences with Coke as the collectors. Like eksisozluk, this group represents the initial versions of the online communities in the sense that some of the members still use nicknames. The membership is restricted. Hence, the researchers had to disclose their identities and purposes due to the ethical issues involved.

The data collection have included four Facebook groups on Coke in Turkish. Turkey represents one of the most crowded Facebook countries in the world with more than thirty million users; this puts it in sixth place globally (socialbakers.com 2012). This popular social networking is also the second top website in the country (alexa.com 2012). Anybody can join and post these groups. The subentries sometimes point to the degree of interaction among the group. But sometimes instead of a response, a new post is an answer.

The first Facebook group in the study is one for Coca-Cola fans called Those Who Say That They Don't Drink Any Other Cola But Coca-Cola (it appears as "Coca-Cola'dan Baska Kola Icmem Diyenler" in Turkish). The group was established in February 2008, and had 961 Coke fan members, 139 posts, 14 responses and 26 photos. The focus of this group (Facebook Coke Fans hereafter) is mainly socialization under the brand and to share their experiences. There are only a few negative remarks about Coke among the discussions. The group is open to the public and not moderated.

The second Facebook group is for Rock'n Coke (it appears this way in Turkish). It was established in April 2008 and it has 3937 members. The data contains 181 posts and 228 photographs from this group. The members are either the participants of previous Rock'n Coke festivals or those who plan to participate in that year's festival. The discussion topics are mostly about the performing bands or camping area in the festival or the tickets for sale. It is not moderated. There are a few posts which criticize the festival.

The third Facebook group is Coke Collectors (it appears as: "Coca-Cola Koleksiyonculari" in Turkish). Established in October 2007, it had 89 members. The data contains 44 posts and 75 photographs from this group. This community counts as a subgroup of the yahoogroup because one finds the same people there who are members mainly for sharing, exchanging and trading the Coke collection items. The posts are generally either announcements of meeting dates and places or for exchanging and trading collectible items.

The fourth Facebook group -- Coca-Cola - Continue the Boycott (it appears as: "Coca-Cola Boykota Devam" in Turkish) -- is focused on anti-Islamic Coke boycott. The group started in February 2009. There are discussions regarding the unhealthiness and pro-military activities of Coke, but these are leitmotivs. The content of the discussions as well as its jargon describe the religiously oriented ideological standpoint of over 73,000 group members. The data contains 614 posts and 1835 responses to these entries from this group. As the Coke boycott represents only a logo to attract those with the same ideological tendencies and discourses, the discussions are mostly about tangential topics (e.g., radical religious propaganda). This group has shown how Coke, as a logo, can become instrumental in attracting many people and for providing condensed anti-Coke discourses in a non-Western context.

Analysis

The qualitative data analysis and interpretation that this study undertakes is in line with those that are adopted by the mainstream methods (Fischer and Otnes 2006; Kozinets, de Valck, Wojnicki and Wilner 2010). The data collection includes 6793 entries and posts that are coded and grouped in terms of consumption meanings, daily life events and co-creation as will be discussed in the findings. The researchers code the data into initial categories so as to analyze them for themes relevant to the research questions. In-person discussions by the researchers and reiteratively visiting the data enable the achievement of a grounded interpretation. Revisiting and comparing the data continuously through multiple rounds of analysis provide sufficient interpretive convergence. At this stage the researchers constantly check for the mismatching cases in the data. Due to the limitations of space in this article the contextual richness and originality of eksisozluk entries is used as the main source of the intra-thematically consistent excerpts.

FINDINGS

Coke not only satisfies the criteria of a brand community (Muñiz and O'Guinn 2001; Schau, Muñiz and Arnould 2009) but beyond this provides an umbrella value universe of a commodity (Askegaard 2006) that collects alternative communities. The multi-dimensionality of Coke branding enables observation of such a strategically produced and disseminated commercial set of signs from different perspectives. The social media discourses revealed a number of both theoretical and methodological contributions to the literature that focus on the co-creation of meanings as will be discussed below.

Brand Meanings Causing Social Tensions: The Anti-Brand Rhetoric

In some parts of the world, non-western countries in particular, when there is a social movement against globalization and consumption Coke is among the first to provide the symbol for an attack (e.g., Varman and Belk 2009; Sandıkçı and Ekici 2009). In line with Klein's arguments (1999) it is often described as an agent of globalization and imperialism that is anti-union and anti-labor. In Turkey, Coke is the main target of those who are radical Islamists, an uncommon theme in the western contexts. The activists often choose the brand (Krishnamurthy and Kucuk 2009) to attract anti-Coke community members who discuss various topics not necessarily under the heading of Coke. While including such data into the findings,

we were aware of the extreme emotions (Kozinets and Handelman 1998), that a brand triggers, particularly regarding anti-branding and addiction. Yet these play important roles in creating social tensions and in resolving them.

As the data suggests, those who oppose Coke describe it as a company capable of doing anything to promote the product, from murder to animal testing. The evolving constellation of such negative connotations seems to materialize in an *anti-Coke* rhetoric that not only activists who are against globalization, but also by those who ideologically belong to radical religious groups utilize:

> It is a company that sells sweetened water and makes millions of dollars by illegally treating workers in South America through anti-unionism and murderers. Because of this it is called "killer Coke" (www.killercoke.org). (tsan chan, posted on eksisozluk in 14.05. 2007)

The compulsion that Coke produces and the relevant health risks are among the favorite topics of the anti-Coke rhetoric as people often regard them as obvious facts that are not subject to discussion. Despite these, the pleasure it gives is also undeniable for many:

> It is a shitty drink whose formula is kept secret…It gives pleasure to everybody. If you ask me, with every sip, I only feel sorry remembering that the son of the pharmacist who invented it died of a morphine overdose. (melyus, posted on eksisozluk in 14.11.2009)

In a country where the majority of the population consists of Muslims (Izberk-Bilgin 2008; Sandıkçı and Ekici 2009), wherever necessary the theme of Israel under the leitmotiv of military action is used in the anti-Coke rhetoric. The perception of a pro-Israel company automatically implies opposing Islam and consequently, the Muslims in the local culture. Specifically, in the religiously oriented Facebook Coke Boycott group, such themes constitute one of the major topics that excite the group members:

> There cannot be anything dirtier. I got a friend who tells us not to drink it as they put cockroaches in it. The real purpose of my not drinking it is because of my Palestinian sisters. (Guher, posted in Facebook Coke Boycott group in 28.08. 2009)

> [Response] Oh, I don't believe that. Look at what we are drinking. Thank you very much for this information. (Filiz, posted in Facebook Coke Boycott group in 29.08. 2009)

The anti-Coke discourses contain comments on how the company is anti-union and anti-labor and against cultural values (i.e., including both local culture and rock culture). The narratives reveal the negative connotations with corporate communications like the sponsorship of a rock festival:

> [Rock'n Coke] is a festival where we see that the bands performing have nothing to do with rock. It is the organization that makes me furious because it qualifies rock'n roll as something governed by a power like Coca-Cola, like some cheap simulations. (kuyku, posted on eksisozluk in 06.07.2003)

Brand Meanings Potentially Resolving Social Tensions

The use of positive word-of-mouth techniques (Keller 1993) builds up brands by also providing a trustworthy resource for consumers. Yet it is rather difficult to capture all such processes due to the complexities of data collection in real-life settings. By using netnography as the methodology we have been able to observe these almost in vivo, yet in a condensed way.

This positive aspect is apparent in a number of discourse schemes that resolve the tensions from the anti-Coke rhetoric. First, some of them prefer to exemplify both the global and local corporate success and some act sarcastically on such negative claims so as to disparage the anti-Coke rhetoric. It seems that the corporate success is sufficient to prove that pro-religious discourses opposing Coke are wrong and to resolve tensions (Kozinets and Handelman 1998):

> I got a few words for those idiots who believe Coca-Cola is pro-Israel: Do you think the company is as stupid as you are?... Are those managers who are graduates of Harvard, Wharton as dumb as you are?… (vito Genovese, posted on eksisozluk in 03.01.2009)

Pointing to the company's employment rates, particularly in a country where unemployment represents a major social issue, also helps counter the anti-labor claims. Highly involved Coke fans focus on their personal experiences and tastes:

> When I look at these [anti-Coke] photos, I understand how ignorant a people we are once again. Just imagine how many people are being employed by them you idiots. If Coca-Cola offers you a job, you'll run to it. (yener, posted in Facebook Coke Fans in March 8, 2009)

Addictiveness is almost the only common theme that both Coke fans and adversaries accept. Interestingly, Coke fans convert this compulsion into a positive dependency, and the enjoyment of the consumption experience seems to override all other issues:

> Its only competitor is tap water. (jacqueline wilson, posted on eksisozluk in 31.10.2005)

> Let me also ask you. Have you ever seen anybody who got sick because of Coke????? Sugar, salt, fat, cigarettes, alcohol etc. etc. You must know lots of people who got sick because of these. I have always drunk it. I'll make my son drink it too. (Bernev, posted on Facebook Coke Fans in April 3, 2008)

Coke fans explicitly explain that they see Coke as a traditional/local soft drink by illustrating the consumption of it by the elderly and the poor segment of the society such as the construction workers. The local culture emphasizes the family values such as loyalty and respect for elderly people (Kağıtcıbaşı 1996). The poorer segment legitimizes the overall Coke experience because it does not constitute a consumption pattern that is privileged (like a luxury product), but rather is one that is accessible and democratized. It is the common people's drink:

> It is the official soft drink of construction workers. (orion ares, posted on eksisozluk in 23.01.2010)

> It is a soft drink that elderly people like my grandmother call 'black'. They call Fanta 'yellow'. (acme, posted on eksisozluk in 28.01.2010)

Despite the emergence of such local values that reinforce and legitimize Coke's presence, Coke fans also note how the global positioning of the brand seems to strengthen that of the local market.

Hence, both the global and local histories focus on the distinctiveness of the brand over time. Not only John Pemberton the founder, but also the first contractor of the Coca-Cola brand in Turkey are well-known within the brand community in Turkey. This retelling of history (Muñiz and O'Guinn 2001) completes the overall experience as it connects the Coke fans to both global and local brand cultures and their legacies:

> Its history is like this: In 1886, the pharmacist John Styth Pemberton starts selling a french coca wine he discovered with the slogan "the best tonic for the brain." (infe, posted on eksisozluk in 13.01.2003)

> It is a drink that first entered Turkey from the Incirlik base [a US military base]. At that time Kadir Has [a publicly known wealthy man] is a young guy and lives in Adana... Our young Kadir meets Coca-Cola there and buys cases to store at home... (alyoop, posted on eksisozluk in 11.11.2007)

Apparently, the mediation and developing use of commercial texts (Muñiz and O'Guinn 2001) and the advertisement of the products (i.e., brands, bottles, tastes, etc) and their rituals (McCracken 1987; Özkan and Foster 2005) play a part in transmitting such values of Coke branding. This will be further discussed in the next section.

Rituals, Collecting and Advertising: The Daily Co-creative Media of a Global Brand

Consumers can create possession rituals to relocate the brand in their daily lives (Rook 1985); to start collecting (Pearce 1999; Belk 2006) and even to create ads for the brand they are strongly attached to (Muñiz and Schau 2007). In other words they can act independently of marketers and advertisers. Among global brands, Coke stands at the center of such richly varied consumption experiences.

The role of advertising in the context of consumption puts it at the disposal of modern culture as an area of play, experimentation and innovation with which to fashion new cultural meanings. Consumers examine advertisements searching out meanings to use in their construction of new versions of the self, of the family, of a community (McCracken 1987). They even try to fill in the lack of advertising of a discontinued brand with the documents they write as Muñiz and Schau (2007) explore.

Other corporate communication schemes can work in line with that of advertising. McAlexander, Schouten, and Koenig (2002) show that participation in brandfests can lead to significant increases in feelings of integration into brand communities and to positive feelings about the brand and product category. Indeed, the opportunity to watch world-famous bands' performances enhanced Rock'n Coke's welcome. Despite the tensions coming from the ideological anti-Coke rhetoric that refuses to identify rock with Coke, there are people who enjoyed the festival experience and think that it has even criticized the system:

> It was a wonderful festival… I wished some of them [performing bands] would stay longer… We had fun. Let those who weren't able to come feel sad about it. (angelic purple, posted on eksisozluk in 08.09.2003)

> It is a festival that criticizes the existing system under the umbrella of Coca-Cola. (gothic evil, posted on eksisozluk in 29.11.2007)

Apparently, the community members created a variety of rituals such as exploring old and new ads, and collecting and sharing them with friends. These went beyond what the corporation had actually displayed and/or suggested. Despite a few studies (e.g., Mick and Buhl 1992; Muñiz and Schau 2007; Kozinets et al 2010) co-creative meanings involving advertising still expect different cases to fully capture the processes. Among the data sets, eksisozluk specifically showed how Coke fans share their consumption related rituals, even by referring to Milan Kundera:

> Coca-Cola Manifesto: …You shouldn't consume it light unless you are obese. It has to be drunk cold as ice. It is never the same when you drink those kept 3-5 minutes in the fridge… You should never drink Coke with a standard straw. Wide straws are acceptable. The burning potential of carbon dioxide can decrease… It has to be consumed very quickly. It's not Turkish coffee. (alha, posted on eksisozluk in 19.03.2006)

> After a football game, the unbearable happiness of sharing the 2.5lt version with my friends, that's enough for me. (hmmm, posted on eksisozluk in 12.02.2002 00:31)

Advertising emerges as a medium for displaying their creativity as well as resistance and the will to become self-appointed promoters of the brand (Muñiz and Schau 2007). The community members open-heartedly share their experiences without minding about the exploitation of their views by corporate marketing or advertising agencies. Eksisozluk acts as an open forum that offers everybody access for reading its content that sometimes offer suggestions to Coke:

> The jingle was great. The film was taken with the correct visual planning. The success of the creative team is so obvious. When I see such work, I'd like to be a part of these campaigns. Although we weren't in the creative team, this work is highly admirable. (sir erdoquan, posted on eksisozluk in 01.09.2006)

In addition to daily life themes, collection rituals also emerge as a way to express not only people's attachment to the brand, but also as a way to become a part of the brand (Belk 1995). Forming a community to exchange and share the Coke collectibles manifests an alternative ritual for co-creation specifically in mundane consumption (e.g., Schau, Muñiz and Arnould 2009). As Danet and Katriel (1994) suggest, if the Coca-Cola collector concentrates on bottles, for example, a collector will want exemplars of all the shapes and colors produced by different factories and in different countries, etc. Collectors socialize among themselves and mostly exchange their duplicate materials, but the real challenge for them is catching the limited promotional material. Some of the collectors are highly involved with dressing or painting (e.g., knitted or dazzling) the cans and bottles and uploading to the website in both yahoogroup and Facebook. These all leverage emotional attachments towards the brand and customer-firm interaction. Thus semiotic analysis can support the existence of the collection rituals that point to different forms of consumption:

> Friends, how many of you were able to collect the new bottle? And would you please tell me how many of them are in the market now? I was able to obtain only 4 varieties and I know that there is the 5th. (sinem, posted on Facebook Coke Collectors in 21.01.2008)

Given all the rituals and experiences, the cultural facet explored by this study reveals the meanings inherent in consumers' daily lives related to Coke, in particular the desire to co-create it better.

Ice-cold Cokes were drunk by the glasses with the Coke logo. Can you get how such stuff is like luxury for a student house dear uncle Muhtar Kent [the global CEO of Coca-Cola Company who is Turkish]?... Would they know the newly met girlfriend can be made happy by taking out a polar teddy bear with a scarf from under the table and saying "I got a gift for you Mualla. Close your eyes" after the meal and that makes you her lover boy? How would you know these Uncle Muhtar Kent? Have you ever had a girlfriend who cried after receiving a ridiculous polar teddy bear? (nouma21, posted on eksisozluk in 11.08.2009)

CONCLUSION AND DISCUSSION

The findings of this netnography group brand meanings into three broad themes within the context described as above. First are the negative connotations of brand meanings that create tensions. Second are the positive connotations of brand meanings that have the potential to resolve such tensions. Third are a host of co-created meanings that symbolize openness, transformation, and change. Negative connotations materialize into an anti-brand rhetoric ideologically positioned against globalization and related to radical Islam. These radical Islamic discourses contain the most radical form of opposition to Coke's meanings. In the anti-brand communities, unrelated topics are used by participants to instrumentalize Coke in order to support their views. We found two core meanings in the anti-Coke online communities: anti-branding and addiction. These core meanings play important roles in creating social tensions and also in resolving them.

The study offers a valuable non-Western context for theorizing about co-creation and the role of the social media. Local and non-Western cultural contexts may deserve separate scrutiny despite the fact that the subject of study is a leading global brand with uniform global positioning. Coke's brand community reveals practices with intrathematically consistent discursive elements. Some local rituals integrate the brand with the traditions of the local culture. Interestingly, environmentalism did not emerge among the anti-branding discourses we studied. We might suggest that this flexibility of ideological orientation could be a further finding to investigate in research on the ethical aspects, particularly in an anti-brand context.

Through local social media contexts, self-appointed advertisers emerge as a type of agent of cultural resolution. Thus, this study offers insights on how local and global social media and online discussions co-create the meanings surrounding a brand. Each culture has its own way of dealing with such tensions by daily consumption experiences and rituals. Adding to a growing body of knowledge in this area (e.g., Cova and Pace 2006; Izberk-Bilgin 2008; Sandıkçı and Ekici 2009), our research suggests that global-local social media-based brand co-creation can be understood as an ideological element of consumption processes in people's daily lives. Nevertheless, resolutions are not the province of those produce anti-Coke rhetoric, as Holt's (2002) study of resistant brand activists suggests, but rather of the average consumer.

Finally, our study shows how branding evolves as cultures and marketing evolve. At a time when the literature points to the developments of social media collaborative co-creation, new research that studies the interaction of local and global meanings in these contexts offers potentially novel insights into these processes of marketing reception and the dynamic nature of brand ideology and sustainability.

A Coke is never a Coke, but an evolving product of its time and its relationship with consumers.

Brand Authenticity:
Towards a Deeper Understanding of Its Conceptualization and Measurement

Manfred Bruhn, University of Basel, Switzerland

Daniela Schäfer, University of Basel, Switzerland
Daniel Heinrich, Technische Universität Braunschweig, Germany

ABSTRACT

In times of increasing uncertainty, authenticity is an essential human aspiration, making it a key issue in contemporary marketing and a major factor for brand success. By conducting a literature review and several studies with different consumers and brands, we develop a scale for measuring the strength of consumers' perceived brand authenticity, where authenticity is analyzed as consisting of four dimensions identified as continuity, originality, reliability, and naturalness. We also demonstrate the discriminant validity of brand authenticity with regard to related marketing constructs such as brand involvement, brand image, and brand satisfaction. Finally, we conclude our paper by discussing the implications for marketing practice and by offering stimuli for further research.

INTRODUCTION

Nowadays, our society is increasingly characterized by a growing feeling of uncertainty due to events such as the global financial crisis, increasing political instability, or climate change. People try to relieve this uncertainty by seeking authenticity in their daily lives, even in the products they consume and the brands they own. Thus, authenticity is as an essential human aspiration, making it "one of the cornerstones of contemporary marketing" (Brown, Kozinets, and Sherry 2003, 21). Moreover authenticity is also defined as one of the key values of brand image (Ballantyne, Warren, and Nobbs 2006) and a major success factor for brands in being a characteristic of brand identity (Beverland 2005; Kapferer 2004).

However, academic research on brand authenticity is still in its infancy. The few studies that do exist are predominantly of a general nature, either in establishing theoretical foundations or analyzing manifestations of authenticity in the marketplace: "Yet, consumer research has not given considerable focused attention to authenticity" (Grayson and Martinec 2004, 296). Past research (Ballantyne et al. 2006; Beverland 2006; Brown et al. 2003; Grayson and Martinec 2004; Groves 2001) presents a differentiated understanding of authenticity in general, and of brand authenticity in particular. This is often enhanced by the studies' focus on a specific product category such as wine (Beverland 2006), tourist attractions (Grayson and Martinec 2004), or food production (Groves 2001). Therefore, there is no consensus on a general definition for brand authenticity as well as no agreement regarding its dimensional structure in consumer research. Thus, it is necessary to conceptualize brand authenticity using a "bottom-up approach" and to acquire a deep understanding of how consumers perceive authentic brands.

To address this research gap, we aim to conceptualize the phenomenon of brand authenticity. As with other brand research, the underlying dimensions of brand authenticity need to be identified by means of a conceptual analysis. We generate a scale to assess the intensity with which a brand elicits diverse authenticity dimensions. As the phenomenon cannot be attributed with any one specific basic discipline, we have to conceptualize our construct based on a variety of academic fields and develop scale items based on this comprehensively derived theoretical conceptualization.

In order to define, conceptualize, and analyze the construct of brand authenticity, we structure our paper as follows. We begin by classifying brand authenticity within the general authenticity concept and derive its particularities. Based on this, we distinguish brand authenticity from other branding concepts. We then provide a review of the literature to understand and differentiate several brand authenticity dimensions. Additionally, we conduct qualitative consumer interviews (study 1) to assess the consumer's understanding of brand authenticity. Combining the results from the literature review as well as the interviews, we derive the different brand authenticity dimensions. In study 2, we ask test-persons to review the identified items and complement the item list with further brand authenticity associations. Using standard procedures, we reduce the number of items. In study 3, we request students to evaluate brands on the elaborated item list and run an exploratory factor analysis to identify the dimensions of the brand authenticity construct. In study 4, we empirically validate the scale and expand its generalizability. Moreover, in study 5, we examine the scale's discriminate validity. We conclude our paper by discussing the implications for marketing practice and by offering stimuli for further research.

THEORETICAL AND CONCEPTUAL FRAMEWORK

The Concept of Brand Authenticity

The concept of authenticity is derived from the Latin word *authenticus* and the Greek word *authentikos* conveying the sense trustworthiness (Cappannelli and Cappannelli 2004, 1). Due to its pertinence to the humanities and social sciences, it covers a wide field of conceptual associations. Within marketing research, a definition of the concept of authenticity can only be rarely found. Thus, a variety of associations and denotations of the term are implemented by different researchers (Grayson and Martinec 2004; Leigh, Peters, and Shelton 2006). It has been defined as a positively connoted concept with semantic associations of "genuineness" (Stern 1996; see also Aaker and Drolet 1996), agelessness and tradition (Aaker and Drolet 1996), "positive valuation", "cultural" and "personal" aspect (Stern 1996), originality (Ballantyne et al. 2006; Holt 2002; Stark 2002), substantiveness (Ballantyne et al. 2006; Stark 2002), "uniqueness [...]", "cultural or traditional associations", "characteristics of the production process", "presence of an authority" (Groves 2001, 251), "evidence and truth" (Grayson and Martinec 2004, 310), "heritage and pedigree, stylistic consistency, quality commitments, relationship to place, method of production" (Beverland 2006, 253), and dissociation from commercial motives (Beverland 2006; Holt 2002).

To sum up, the definitions of the general concept of authenticity differ. Nevertheless, the following conclusions can be drawn for the specific context of brand authenticity: (1) Authenticity in the context of brands deals with the authenticity of market offerings (objects and services) in contrast to the authenticity of human beings; (2) Brand authenticity is based on the evaluations of individuals rather than being solely related to the inherent attributes of the brand (for references on this topic cf. Beverland and Farrelly 2010); (3) Brand authenticity corresponds to a variety of attributes since there is no unique definition of the authenticity concept, particularly in the branding context.

Distinction Between Brand Authenticity and Further Brand-related Constructs

Although brand authenticity has conceptual commonalities with several other constructs within the branding context, it necessarily possesses its own distinctive features. It differs from brand involvement, brand image, and brand satisfaction. Brand authenticity differs from brand involvement in that the latter is defined as "A person's perceived relevance of the object [brand] based on inherent needs, values, and interests" (Zaichkowsky 1985, 342). In contrast to this definition, brand authenticity does not involve a motivational aspect. Consumers may perceive a brand to be authentic without being motivated to possess it or linking it to themselves in any way. Equally, brands that elicit a consumer desire for involvement need not possess any aspect of authenticity.

Brand authenticity is also not identical to brand image, but it could be seen as an aspect of brand image and thus as constituting characteristics that consumers associate with a brand. Brand image consists of the consumers' mental pictures of a brand which are linked to an offering (Dobni and Zinkhan 1990) and thus to a set of the consumers' perceptions about the brand, namely brand associations (Dobni and Zinkhan 1990; Keller 1993). This implies that brand authenticity can be regarded as one specific (positively connoted) brand association of consumers and thus a highly authentic brand could be assumed to have a positive effect on the overall image of a brand.

Brand authenticity can also be conceptually distinguished from brand satisfaction. Brand satisfaction can be defined as a positive emotional state of mind resulting from the fulfillment of a desire to consume a brand (cf. Hunt 1977 cited after Mano and Oliver 1993). It results from the perceived discrepancy between an initial reference point, the expectation, and the actual brand perception (Oliver 1980). Alternatively, brand authenticity need not be seen as depending on consumption of the brand. A consumer's judgement of a brand's authenticity then derives rather from an a priori notion of it. Moreover, brand authenticity is not the result of a perceived discrepancy, but instead is based on a single variable rooted in the consumer's brand mindset. Nevertheless, it could be expected that consumers who attribute a high degree of authenticity to a brand are more likely to be satisfied with that brand.

The Role of Authenticity in Other Scientific Disciplines

Considerable consensus exists on the meaning of authenticity among philosophers, sociologists, anthropologists, and psychologists. Within the field of philosophy, authenticity is related to the emancipation from conventional bonds as well as with originality (Taylor 1991). Moreover, the authentic individual is often defined as not being self-deceptive and thus being self-reliant as well as true-to-self (Steiner and Reisinger 2006). According to Heidegger (1996), authenticity is related to being oneself and thus implies that individuals who strive for conformity in their lives are inauthentic and risk losing their own identity (Steiner and Reisinger 1996). Sociologists investigate authenticity with regard to individuals, objects, their representation and/or performance. They denote authentic experiences or performances as being original, credible, sincere, genuine, natural, and unaffected (Carrol and Wheaton 2009; Fine 2003; Grazian 2003). In anthropology authenticity is often associated with the preservation of cultural values. Authentic experiences are comprehensively characterized as natural (e.g., unspoiled, untouched) (Handler 1986) and the opposite of being a fake, plastic, and kitschy imitation (Gable and Handler 1996). Anthropologists also understand authentic as being credible and convincing and at the same time closely related to distinctiveness (Bruner 1994; Cameron and

Gatewood 1994). Psychologists state that authentic individuals possess a strong and unique inner reality (Smelser and Baltes 2001). They regard the increasing orientation of the individual's behavior towards social expectations as the opposite of authenticity (Guignon 2004). Within psychology several researchers have proven an individual's authenticity to be a multidimensional construct (Goldman and Kernis 2002; Kernis 2003; Kernis and Goldman 2006; Lopez and Rice 2006; Wood et al. 2008).

Consistent with our conceptualization, the literature review of the different scientific disciplines reveals that authenticity is a rationally-created characteristic informing an individual's subjective perceptions and is thus not a characteristic interpreted as being immanent in objective reality. Combining these thoughts and results, authenticity seems to be related to and connected with terms such as stability, endurance, consistency, particularity, individuality, trustfulness, credibility, keeping promises, genuineness, and realness. In order to establish a holistic conceptualization of brand authenticity, we integrate the consumers' understanding of brand authenticity within the brand authenticity construct. Thus, we complement the results gained from the relevant research disciplines with an exploratory, qualitative study.

STUDY 1: ASSESSING THE CONSUMER'S NOTION OF BRAND AUTHENTICITY

As we aim to ensure that the consumer's notion of brand authenticity corresponds to the one we have developed so far, we ask 17 people to describe their perceptions of authentic brands by thinking of one brand of their choice. In a first step, using open-ended questions, we ask participants to select a brand which they perceive as highly authentic, to write down the brand name as well as the reasons why they perceive the brand as authentic. In a second step, we ask them to select a brand from an identical or closely related product category which they perceive as being hardly authentic or totally inauthentic. Contrary to the first case, participants in the second case are stimulated by words that we identified through the literature review as representing brand authenticity. This allowed us to establish whether consumers share our understanding of brand authenticity and investigate whether their perceptions of very authentic brands and hardly authentic brands differ (for the procedure of this study, cf. Brakus, Schmitt, and Zarantonello 2009). For a detailed analysis see table 1.

Later, we ask three raters to assign descriptions derived from the concept of authenticity to each brand identified as being authentic. For a better visualization of the descriptions, table 2 presents two characterizations selected by the raters for each of the strongly authentic brands. For Nivea and Porsche, we provide six descriptions and four descriptions, respectively, as these brands are named more than once. As displayed in table 2, respondents gave descriptions referring to stability, endurance, and consistency (e.g., "constant in its style," "offers consistent high quality," "was always like this"), a plethora of clues regarding particularity, individuality, and innovativeness (e.g., "novel ideas," "very innovative marketing campaigns," "satisfies exceptional needs," "witty creations"), descriptions about trustfulness, credibility, and keeping promises (e.g., "answers my product expectations," "trustworthy," "reliable," "confidence-building," "keep this promise"), and different indications regarding genuineness and realness (e.g., "it is what it is," "naturalness," "genuine," "uncontrived"). Participants situate their reminiscences of the brand in a commonly shared context (e.g., "I've been knowing it from my grandma's bathroom since I was little," "the company is still locally anchored in the area where it has its roots"). We also contrast the participants' descriptions of weakly and strongly authentic brands.

Table 1
Authentic and Inauthentic Brands

Strong Authentic Brands	Weak Authentic Brands
Number of Naming (in parentheses)	
Adidas (1)	Ariel (1)
Alnatura (1)	Balea (1)
American Apparel (1)	Bally (1)
Axe (1)	Crane Sports (1)
Calida (1)	Dove-Men (1)
Coca-Cola (1)	Fila (1)
Landliebe (1)	H&M (1)
Miele (1)	Jägermeister (1)
Nivea (3)	Müllermilch (2)
Nutella (1)	Nestlé (2)
Persil (1)	Opel (1)
Porsche (2)	P2-Cosmetics (1)
Tamaris (1)	Samsung (1)
66° North (1)	Snickers (1)
	Tata Motors (1)

Note: Some of the brands named in the studies were only known in the area where the study was conducted, and are therefore outlined in Appendix A.

This reveals that weakly authentic brands are perceived primarily in terms of their lack of an unambiguous brand image, which is not the case for strongly authentic brands.

Finally, additional findings that appear to be interesting were that all characterizations of strong authentic brands are positive, except for two. Moreover, many descriptions referring to authenticity are formulated in the same general terms that our conceptualization offered. The results of the first study indicate that all consumers have an idea of brand authenticity and that the descriptions assigned to brand authenticity by the respondents are mostly in line with the findings we derived from the literature review. Building on these results, it seems that the terms related to authenticity can be grouped into four overall categories representing a brand (1) to be stable and/or continuous over time; (2) to be creative, original and/or innovative; (3) to keep promises and/or be reliable; (4) to be genuine and/or natural. Thus, we anticipate brand authenticity to be a four-dimensional construct. We term the four dimensions comprehensively as (1) continuity, (2) originality, (3) reliability, and (4) naturalness.

STUDY 2: GENERATING AND SELECTING ITEMS FOR THE BRAND AUTHENTICITY SCALE

To capture the four elaborated dimensions of perceived brand authenticity, we develop a brand authenticity scale. The development of an appropriate scale presents specific methodological challenges. On the one hand, brand authenticity is a concept that has a very wide spectrum of reference. Therefore, we have to investigate several research disciplines in order to select items that are suitable in establishing its definition for our present investigation. On the other hand, the scale items should refer to the extent to which a consumer evaluates the brand as continuous, original, reliable, or natural; they should not measure the continuity, originality, reliability, or naturalness of the brand's specific components (e.g., whether the brand's advertisement is credible and likely to be true).

We conduct an extensive literature review to identify concepts associated with the four dimensions of authenticity that also prove to be transferable to the branding context. The literature demonstrates that continuity is an important concept, being often discussed in the

Table 2
Description of Authentic Brands

Adidas	Offers reliability regarding the quality and continuity of its products.
	Answers my product expectations.
Alnatura	Principles, promoted in marketing campaigns, are observed; i.e., employee satisfaction and organically produced.
	Always offers exceptional high-quality food.
American Apparel	American Apparel offers successfully reliable, beautiful, and consistent products.
	They've taken care of ecologically and socially sustainable production for a long time.
Axe	Very innovative marketing campaigns; they differ from one another but fundamentally have the same content.
	It's not a copy – it is what it is.
Calida	A confidence-building brand.
	A reliable brand that delivers what it promises; i.e., high quality and pleasant wearing comfort.
Coca-Cola	The advertisement is always modern and new but constant in its style.
	A classic beverage that hasn't changed over time.
Landliebe	Offers uncontrived and environment-friendly groceries.
	A natural-taste adventure.
Miele	Reliable, rich in tradition, and thereby constantly premium of quality.
	Longstanding success without aggressive advertising.
Nivea	Nivea offers consistent high quality in diverse product categories.
	Nivea is trustworthy and even abroad I can rely on its products being harmless.
	Nivea was always like this.
	It also satisfies exceptional needs.
	Stands for naturalness.
	I've known it from my grandma's bathroom since I was little.
Nutella	I buy it because it's delicious and I know what I get.
	Nutella promotes its brand with honest product claims.
Persil	Advertising messages are honest and appropriate.
	Persil has a long-standing market success and is always up-to-date.
Porsche	Genuine brand image of sportiness, exclusivity, and high quality.
	Company is still locally anchored in the area where it has its roots.
	Products are not very innovative, but the design still reminds me of nostalgic cars.
	Porsche is a brand with a long tradition.
Tamaris	I can trust in finding witty creations at Tamaris.
	The shoes are affordable and keep this promise, but are not made for eternity.
66° North	I can rely on the brand's quality even in extreme weather conditions.
	Products are created by experts who always have novel ideas.

context of relationships between individuals, consumers, and companies. However, research so far only defines and measures the continuity of relationships in terms of relationship duration (Anderson and Weitz 1989; Hess, Ganesan, and Klein 2003; Lusch and Brown 1996). For originality, we examine research on brand image, consumer, and advertising research (Lynn and Harris 1997; Netemeyer et al. 2004; Olney, Holbrook, and Batra 1991) and identify scales such as the originality scale, which assesses how a person views him- or herself as being creative, individual, and spontaneous (Im, Bayus, and Mason 2003). For reliability, we review the literature on branding, consumer, and advertising research (Goldsmith, Lafferty, and Newell 2000; Ohanian 1990; Rodgers 2004; Sengupta and Johar 2002) and find scales such as the brand trustworthiness scale (Erdem and Swait 2004), the brand trust scale (Delgado-Ballester, Munuera-Alemán, and Yagüe-Guillén 2003) and the ad believability scale (Beltramini 1988). Finally, for naturalness, only a limited number of literature streams that deal explicitly with the naturalness of products or brands are identified. The naturalness of products has recently become an important feature in the food sector, reflected in the huge demand for organic groceries. Thus, we review articles dealing with the naturalness of these and related products (Tenbült et al. 2005; Verhoog et al. 2003).

This literature review led to the identification of 31 terms. Although, we invested substantial effort in reviewing adequate scales and scale items, we cannot adopt these specific items and apply them to our four authenticity dimensions without reservation. One of the main reasons for their sometimes limited transferability often relates to their implementation within a non-branding context. Additionally, these identified items only refer to a partial aspect of brand authenticity and thus cannot comprehensively reflect whether and to what degree a consumer has a continuous, original, reliable, or natural perception of a brand.

Thus, to check the identified terms and to determine further items designed to capture the brand authenticity construct, we ask a sample of 10 students as well as marketing experts to name a brand which they perceive as highly authentic. Participants are then requested to specify on a seven-point Likert scale (ranging from 1 indicating 'not at all' to 7 indicating 'very much') the extent to which the 31 items describe the brand's authenticity. Additionally, respondents are asked to name further associations characterizing authentic brands that are missing in the initial list. Another 36 additional items are generated by this procedure, augmenting the total number to 67 items, which are then assigned to: (1) the continuity dimension covering items referring to stability, endurance, and consistency; (2) the originality dimension covering items referring to particularity, individuality, and innovativeness; (3) the reliability dimension covering items referring to trustfulness, credibility, and keeping promises, and (4) the naturalness dimension covering items referring to genuineness, realness, and non-artificiality.

For item purification, we ask a new sample of 20 students to name a brand they would classify as authentic and then ask them to point out the degree to which the 67 items describe the brand's authenticity using a seven-point Likert scale (ranging from 1 indicating 'describes poorly' to 7 indicating 'describes very well'). Building on the results of the participants' ratings, we remove items with a mean rating below four. We also reject the items that were not rated by more than 10% of respondents, supposing poor comprehensibility of these items (see Brakus, Schmitt, and Zarantonello 2009; Thomson, MacInnis, and Park 2005 for this approach). We also rephrased some items based on respondent's comments and conducted a face-validity check regarding the plausibility of the items as well as in order to

examine whether the items' content overlap. After these validations, we finally retain 24 applicable items.

Next, another sample consisting of 10 test-persons complete a comparative rating task for our assessment of substantive-validity. In this item-sort task, the respondents are requested to ascribe each identified item to one of the four authenticity dimensions. Respondents are then asked to verify their assignment of items to the respective construct and to review their responses as well as to make – in their opinion – any necessary changes. Following Anderson and Gerbing (1991), we calculate the "substantive-validity coefficient". This value indicates "the extent to which respondents assign an item to its posited construct more than to any other construct" (Anderson and Gerbing 1991, 734). This conducted procedure confirms the validity of all included items, confirming the developed item structure for the four brand authenticity dimensions.

STUDY 3: REDUCING ITEMS AND ASSESSING THE DIMENSIONALITY OF THE SCALE

The aim of study 3 is to further reduce items and establish the number of constituent brand authenticity dimensions. We choose to conduct the study with brands from the sports apparel and the soft drinks industry for two reasons: (1) First the brands that were most often mentioned in study 1 belong to these two product categories; (2) Second these categories differ as sports apparel represents durables and soft drinks represent commodities supporting the generalizability of the results. Based on this, we conduct a survey asking 60 students to name one authentic brand within these two product categories. The stated authentic brands are Adidas, Boss, Burton, Capri Sonne, Carpe Diem, Coca-Cola, Diesel, Esprit, Fanta, Gatorade, Gazosa, Gucci, H&M, Lacoste, Levi's, Nike, Orangina, Red Bull, Rip Curl, Rivella, Schweppes, Sprite, Strellson, Tommy Hilfiger, Vittel, Volvic, and Zara.

In the main study, we ask a new student sample (n = 288) to judge how well the 24 items describe the authenticity of one of the brands listed above. We use a seven-point Likert scale (ranging from 1 indicating 'strongly disagree' to 7 indicating 'strongly agree') to capture the test-persons' evaluations of brand authenticity. As the literature review as well as the results of our empirical studies 1 and 2 lead to the assumption of four distinct brand authenticity factors, we conduct a factor analysis using varimax rotation limiting the number of factors to four. The factor analysis with a strict loading condition ($> .7$) reveals a solution with eigenvalues greater than 1 (the variance explained shows a value of 70.33%). Fifteen items out of 24 are found to fulfill this condition (cf. Table 3). The identified four factors confirm the theoretical assumption of a four-factor structure. This means in more detail that solely reliability items load on the first factor (4 items), merely continuity items load on the second factor (4 items), only originality items load on the third factor (4 items), and finally, just naturalness items load on the fourth factor (3 items). Additionally, we test the derived items regarding their reliability using Cronbach's alpha (Nunally 1978). The Cronbach's alphas are in line with the required minimum value regarding all items of the four factors: continuity (.90), originality (.90), reliability (.96), and naturalness (.95).

STUDY 4: VALIDATING THE DIMENSIONS OF BRAND AUTHENTICITY

In study 4, we aim at validating the four dimensions by conducting exploratory as well as confirmatory analyses. We employ again new group of participants and brands to verify the stability of our scale. By doing this, we ensure that the scale items do not depend on the participants and brands. This enables us to reveal a general brand authenticity. For pre-testing we conduct 27 interviews

Table 3
Exploratory Factor Analysis

Item	Factor			
	Reliability	Continuity	Originality	Naturalness
I think *brand* is consistent over time.	.29	**.81**	.20	.08
I think the brand *brand* stays true to itself.	.27	**.79**	.20	.30
Brand offers continuity.	.28	**.84**	.16	.24
The brand *brand* has a clear concept that it pursues.	.17	**.77**	.32	.17

Brand stands out from other brands.	.12	.35	**.83**	.15
I think the brand *brand* is unique.	.33	.07	**.79**	.13
The brand *brand* clearly distinguishes itself from other brands.	.21	.19	**.83**	.23
My experience of the brand *brand* has shown me that it keeps its promises.	**.81**	.31	.25	.27
The brand *brand* delivers what it promises.	**.84**	.30	.23	.29
Brand's promises are credible.	**.82**	.28	.19	.33
The brand *brand* makes reliable promises.	**.83**	.28	.21	.32
The brand *brand* does not seem artificial.	.33	.24	.17	**.79**
The brand *brand* makes a genuine impression.	.32	.20	.23	**.86**
The brand *brand* gives the impression of being natural.	.31	.22	.22	**.85**

Table 4
Model Fit Comparison

Model	χ^2	d.f.	NFI	CFI	GFI	RMSEA
Independence model	17531.13	105	–	–	–	–
One-factor model	5898.74	90	.66	.67	.46	.28
Four-factor model	457.63	84	.97	.98	.93	.07
Second-order with four subdimensions	457.97	86	.97	.98	.93	.07

by asking participants to name two brands they regard as authentic and one brand they would classify as inauthentic. We focus on the brands with the highest frequencies of mention, for example Nivea and VW (each 5 mentions as being authentic), BMW and Coca-Cola (each 4 mentions as being authentic) and Müller-Milch (2 mentions as not being authentic). Most of the mentioned brands belong to the following product category: automobile, sports apparel, beverages, and body care. Following explicit calls for research regarding the attribution of human characteristics to retail brands (Ailawadi and Keller 2004), we integrate retail brands as an additional product category into the subsequent study, leading to a total number of 15 brands (three per category). Based on this broad pool of authentic and inauthentic brands, we conduct a main study to validate the generalizability of our proposed scale.

The study has the purpose to verify the scale's stability and to compare the four-factor model with other possible models for further validation. Thus, we analyze three different models which are oulined in the following: (1) a four-factor model (continuity, originality, reliability, and naturalness) with correlated factors, (2) a one factor model assuming that the entirety of items load on one brand authenticity factor, (3) a second-order model with four subdimensions. We conduct structural equation modeling and employ confirmatory factor analyses in order to define the model that produces a fit which is better than the fit of the other two models. We generate

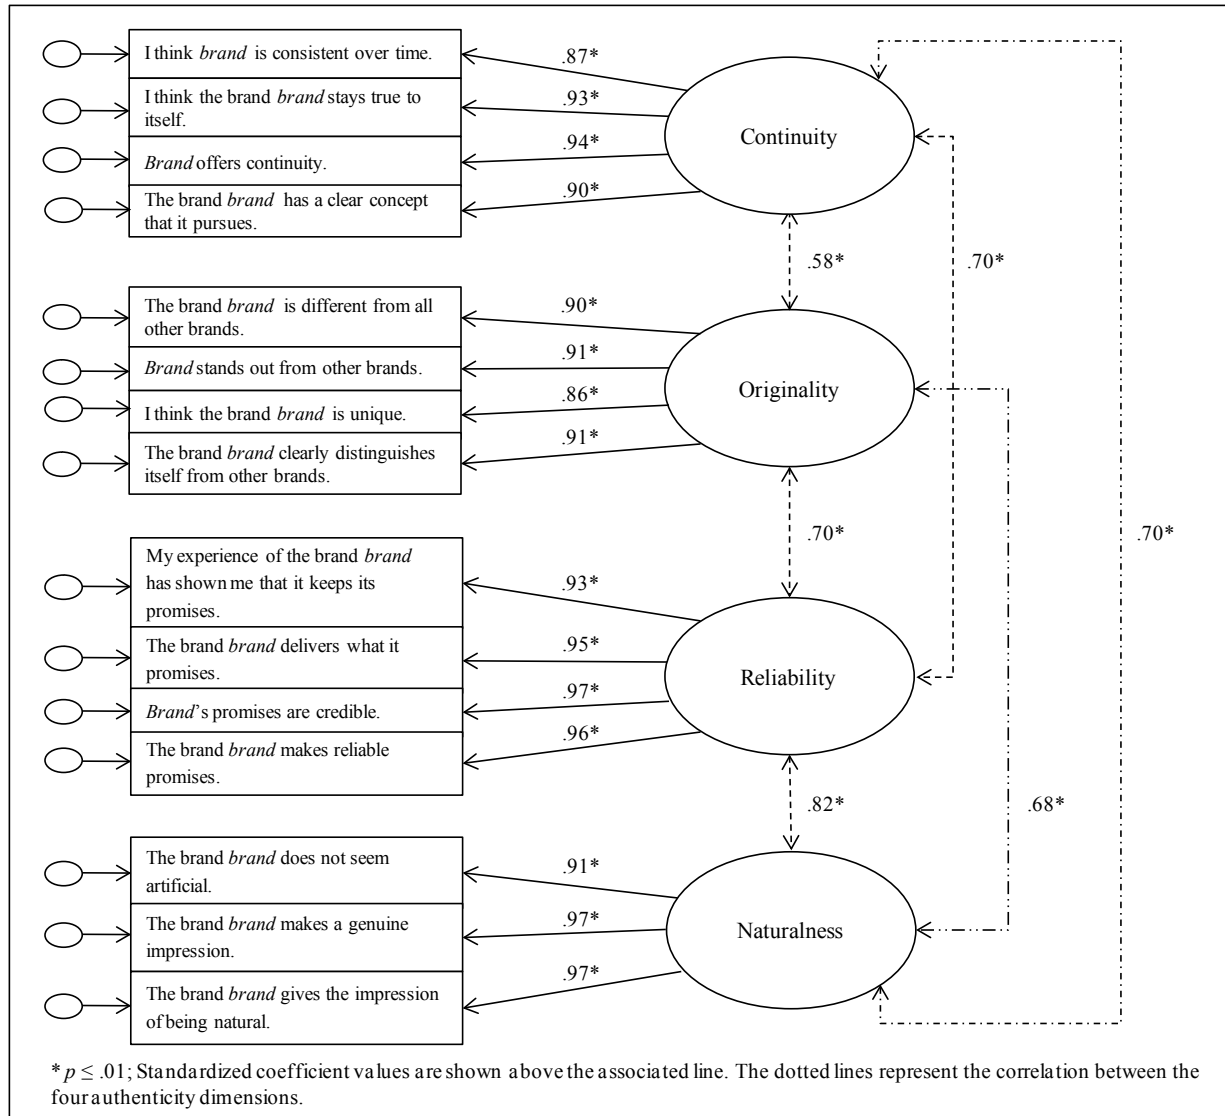
a sample of 857 participants with an age range of 34 to 69 and an average age of 49.6 years.

The results of the analysis demonstrate that the four-factor model fits the data very well: $\chi^2(84) = 457.63$, $p < .001$, normed fit index (NFI) = .97, the comparative fit index (CFI) = .98, the goodness-of-fit index (GFI) = .93, the root mean square error of approximation (RMSEA) = .07. The four-factor model shows a clear superior fit to the one-factor model. The comparison to the second-order model with four subdimensions demonstrates a very good fit of both models and can not reveal one model to demonstrate a superior fit (table 4). As our theoretical derivations support the four-factor model with correlated factors and as there is no theoretical foundation that would privilege the more complex second-order model, we approve the four factor-model with correlated factors as the most suitable model (figure 1).

STUDY 5: ASSESSING DISCRIMINANT VALIDITY OF BRAND AUTHENTICITY AND RELATED

The objective of study 5 is to test for discriminant validity of the brand authenticity scale, demonstrating its discriminability from other relevant latent variables. A new sample of 115 participants respond to the 15-item brand authenticity scale and scales relating to brand involvement, brand image, and brand satisfaction. These constructs are measured implementing measurements that have been

Figure 1
Confirmatory Factor Analysis: The Brand Authenticity Construct

*p ≤ .01; Standardized coefficient values are shown above the associated line. The dotted lines represent the correlation between the four authenticity dimensions.


already developed and approved in previous works (Appendix B). To create variation in brand authenticity values, we followed the procedure of Thomson, MacInnis, and Park (2005). We requested about one third of the participants to imagine a brand which they evaluate as "strongly," "moderately," or "not authentic" in order to fill out the questionnaire. For manipulation checks, we examined the consumers' reported brand authenticity. Results demonstrate that the scores average 3.03, 5.63 and 6.67 in the three manipulation conditions (weak, moderate, and strong). Moreover, the resulting means significantly differ from one another ($p < .01$).

Prior to the analysis of discriminant validity, we transform all semantic differential scales to Likert scales ranging from 1 to 7 and compute composite scores for the four brand authenticity dimensions. The discriminant validity of the brand authenticity scale is assessed using an exploratory factor analysis with varimax rotation that included the composite scores of the brand authenticity dimensions as well as the items indicating brand involvement, brand image, and brand satisfaction. The factor analysis reveals four factors. Table 5 reports the results of this analysis.

Factor one and two represent brand satisfaction and brand involvement, respectively, whereas the third factor that emerges reflects brand authenticity. The fourth factor is comprised of items from the brand image construct. These results demonstrate the discriminant validity of the brand authenticity scale compared to other related marketing constructs, and it also shows that continuity, originality, reliability, and naturalness load on a single brand authenticity factor.

DISCUSSION

This paper primarily aimed at the development of a measure reflecting the consumer's perception of a brand's authenticity. We identified brand authenticity as a construct consisting of four dimensions, namely continuity, originality, reliability, and naturalness – with the dimensions being differentially evaluated for various brands. The final brand authenticity scale (15-items) is reasonable regarding its length and therefore easy to implement. The existence of the four-factor model is consistent across different samples and studies and thus passes reliability and validity tests successfully. Moreover, evi-

Table 5
Exploratory Factor Analysis with Brand Authenticity, Brand Satisfaction, Involvement and Image

Item	Factor			
	Satisfaction	Involvement	Authenticity	Image
Naturalness	.40	.31	.71	.28

Image 3	.26	.11	-.01	.82

examine the values of a specific country and its culture, respectively. Secondly, they have to investigate the symbols (e.g., a logo, an image) that represent these values, which can be expected to vary widely between different countries and cultures. Numerous channels exist for conveying these identified values and integrating them within the company culture: They can be incorporated in symbols printed on the brand's packaging and, if possible, integrated in the product design; they can be transmitted graphically, verbally or actively using the media of the brand's communications (e.g., storytelling through advertising, events); they can be incorporated in rituals and artifacts designed to promote them and be reflected in a pricing strategy and distribution channels that serve to reinforce them.

To enhance a brand's authenticity, companies should also aim at creating a unified brand perception, using all internal and external communication sources in order to ensure its reliability. This implies a persistent presentation of the brand name, logo, and slogan through all communication media and communication tools. Additionally, marketers need to focus on a contextual, formal, and temporal integration of all these communication activities. Contextual integration can be achieved through a consistent implementation of messages, arguments, and statements which should particularly emphasize the different dimensions of a brand's authenticity. Formal integration can be attained by a consistent brand appearance. This entails establishing fixed brand references such as the brand name, logo and slogan as well as to the font, typography, layout, colors, and images. Finally, temporal integration demands an action plan regarding the implementation of the different communication activities. In addition, communication also needs to be consistent with regard to the different target groups (consumers, retailers, the public) and external communication activities need to be coordinated with internal brand management. This also enhances a brand's reliability. One specific example of how to create authenticity using an integrated brand presence would be to create a communication platform to address the topic of sustainability and thereby highlight the company's engagement in supporting this issue (e.g., advertising campaigns, sponsoring activities). This communication platform could then be implemented for external as well as internal communication purposes. In summary, in order to achieve an integrated brand presence, companies need to ensure consistency (consistent statements), congruence (between communication and behavior), and continuity (regarding the implementation of the different communication instruments) of brand communications.

Thus, the brand authenticity scale developed in this paper is not only theoretically relevant, but will find application in marketing practice. As marketers strive to satisfy the consumer's search for authenticity more than ever before and as companies try to understand and improve the authenticity of their brands by clearly communicating their brand's salient sale's features, both groups will be able to use the brand authenticity scale for assessment, planning, and tracking purposes. With regard to using brand authenticity for appraisal and planning purposes, the brand's positioning should be assessed, and brand authenticity should be integrated within the company-specific brand model as a major component of brand positioning. The application of brand authenticity to brand positioning is also a relevant factor in the context of brand repositioning in a competitive market. Moreover, the scale can be used to track changes in brand perception when implementing any kind of marketing action (e.g., communication campaign), and it can also be used to track and evaluate important competitors over time in terms of their brand authenticity.

Nevertheless, our study is not without limitations. Although, we have been successful in validating the generalizability of the

dence of discriminant validity is obtained in study 5, where brand authenticity is distinguishable from other branding concepts.

Several implications for brand managers can be drawn from the results of our studies. In order to positively influence a brand's continuity and thus its authenticity, it seems necessary to determine key facts (historically as well as over time) about the brand, such as its foundation and its circumstances, the features upholding its traditions, its anniversary, the values based on its traditions, and to implement these in the marketing mix. Implementations can take a variety of forms: a brand's permanent pledge to its roots, and the introduction of proxies (e.g., founders, innovations, stories) that symbolize a brand's heritage. Key facts about the brand can also be implemented within brand communications in order to promote positive brand features associated with its traditionalism. This can be achieved by presenting images of traditional elements on brand packaging and integrating these values visually in brand logos and verbally in slogans. Events can also be used to convey these key facts about the brand: traditional occasions and brand anniversary celebrations offer opportunities to animate such associations.

Brands which symbolically embody the image of the consumer's national identity benefit from epithets such as 'rich in culture and tradition', and are thereby attributed with authenticity. Moreover, brand's originality and naturalness can be positively influenced by stimulating local icon value, as this is unique for every single brand and part of its real self. Thus, brand managers firstly have to

brand authenticity scale across various product categories, we have not fully achieved the aim of capturing the respondents' reports on brands that reflect extreme levels of brand authenticity. One possible explanation for this might be the fact that respondents in German-speaking regions tend to tick less extreme response categories than respondents in southern European countries (Van Rosmalen, van Herk, and Groenen 2010). This implies that it is necessary to validate the scale in further countries by paying particular attention to the country-specific differences in response behavior. This leads to another interesting area for future research; namely, an intercultural comparison of brand authenticity. It can be assumed that certain characteristics of brand authenticity are differently evaluated depending on cultural background.

With regard to the authenticity levels, the findings also demonstrate that brands with low measures of authenticity are scarce. However, some brands show moderate levels of overall brand authenticity, while they show very low values for specific authenticity dimensions. This result indicates that managers who aim to enhance their brand's authenticity should pay attention to the specific authenticity dimensions and implement dimension-specific analysis. The sparseness of results on highly authentic brands may either indicate that such brands are rare in the general branding context or that managers still have a considerable distance to go in improving their brand's authenticity. This requires future research.

Additionally, further research should be undertaken using the brand authenticity scale. It is interesting that the brands chosen by the respondents tended to be consumer goods, as opposed to services or even industrial goods. It is possible that consumer goods' brands are more frequently mentioned, because they are more salient and memorable, irrespective of their authenticity level. However, future research must investigate whether the type of product is relevant to the level of brand authenticity perceived and required by the consumer.

Additionally, longitudinal research on the development of brand authenticity over time would also be useful in order to identify the changes in brand authenticity that are possibly connected with changes in society. In the context of these issues, it would also be interesting to investigate whether the often-stated assumption of an increased consumer quest for authenticity in times of uncertainty, for example in financial crises or periods of political instability, can be empirically proven. In this context, an investigation of the role that brand authenticity performs in critical corporate situations arising,

for instance, from environmental scandals or public outcries against poor working conditions would present an interesting field for future research. Finally, an application of the authenticity concept to other contexts such as the authenticity of politicians would offer very promising research questions, particularly in view of the public's increasing political apathy today. Given the increasing relevance of brand authenticity in a constantly changing marketing environment, our findings provide a threshold to a wide area of future research.

APPENDIX A

Alnatura: Alnatura is a retail brand in the biological grocery sector. Alnatura offers groceries and textiles which are fabricated according to ecological standards and certified by an independent accredited institution for organic product testing.

Balea: Balea is a private body- and hair-care brand of a drugstore chain.

Calida: Calida is an underwear brand that specializes in day and night wear for men and women as well as on luxurious lingerie.

Landliebe: Landliebe is a dairy brand that emphasizes the naturalness of their products by claiming to guarantee that their animals are not fed on genetically modified food.

Lidl: Lidl is a discount chain for groceries.

Müllermilch: Müllermilch is a milky drink brand that is offered in a variety of basic flavors such as strawberry, vanilla, and chocolate, as well as special flavors such as pistachio-coconut.

Persil: Persil is a brand of laundry detergent.

P2-Cosmetics: P2-Cosmetics is the private make-up brand of a drugstore chain.

Rewe: Rewe is a retail chain for groceries.

Ryan Air: Ryan Air is a low-cost airline.

Tamaris: Tamaris is a shoe brand offered in their own outlets or in multibrand stores selling women's shoes at reasonable prices.

Competitive Papers—Extended Abstracts

Judging by Appearances: The Effect of Goal Pursuit on Product Preferences

Tess Bogaerts, Ghent University, Belgium
Mario Pandelaere, Ghent University, Belgium

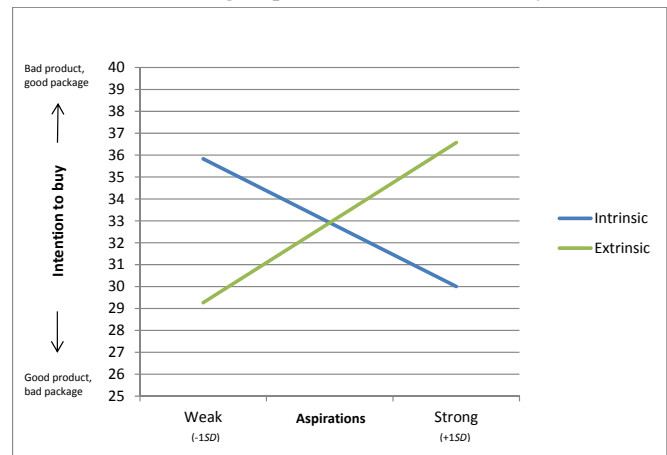
EXTENDED ABSTRACT

Self-determination theory (SDT) is a well-known theory of human motivation that explores both the process and the content of goal-directed behavior (Deci & Ryan, 1985; Sheldon, Ryan, Deci, & Kasser, 2004). Intrinsic goals are contrasted with extrinsic goals based on the extent to which they are directly satisfying one of three innate psychological needs - competence, relatedness and autonomy (Kasser & Ryan, 1993, 1996). The attainment of intrinsic aspirations such as personal growth, close relationships fostering or community involvement, is intrinsically rewarding because it directly fulfills the basic needs. In contrast, extrinsic goals, such as wealth, image or fame, are externally rewarding (e.g. result in praise) (Deci & Ryan, 2000; Sheldon et al., 2004). Accordingly, intrinsic motivations lead to behavior that is satisfying by itself, whereas extrinsic motivations result in instrumental behavior in order to reach outcomes extrinsic to the behavior itself.

Research has shown that placing relatively more importance on extrinsic rather than on intrinsic goals, is negatively associated with well-being (Kasser & Ryan, 1993, 1996; Ryan & Deci, 2000). An extensive body of research has demonstrated that intrinsic and extrinsic goals can affect how people feel, but, to our knowledge, no evidence has shown that intrinsic and extrinsic goals can influence consumer's product preferences. However, as consumers can incorporate product characteristics to their sense of self (Escalas & Bettman, 2005; McCracken, 1989), it seems plausible that they prefer product qualities that are appealing to them. Hence, we expect that people who pursue extrinsic goals will attach greater value to the aesthetic quality of a product, whereas people who pursue intrinsic goals will appreciate the inner quality of a product more.

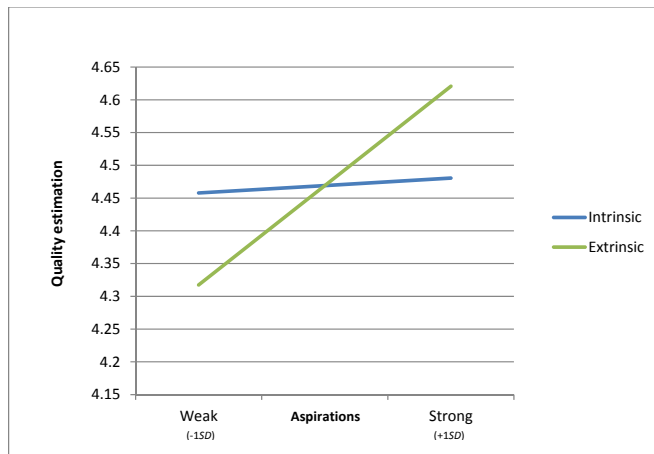
In Study 1, 122 people participated (Mage=29.22; SDage=13.13) in an online survey. We presented them two alternative products for five product categories, one superior version with a bad-looking package and one inferior version with a good-looking package. The products were basic, low-involvement products that people often buy: laundry detergent, orange juice, shower gel, kitchen roll and chocolate biscuits. We told the participants that the products were tested by a well-known national consumer organization which is specialized in testing and evaluating consumer products. Based on the expertise of this consumer organization, each product scored points out of ten. The superior products scored between one and two points higher than the inferior alternatives. To distinguish between good-looking and bad-looking packages, we designed the packages so that the good-looking packages had a more colorful and superior graphical layout. Participants had to indicate for each product category which version they would rather buy by moving the slider to their favorite product (0=superior product with bad-looking package; 100=inferior product with good-looking package). To assess participant's aspirations, we administered the Aspiration Index developed by Kasser and Ryan (1996). Multilevel analysis revealed that the more people are extrinsically motivated, the more they are inclined to buy inferior products with a good-looking package (F1,119=5.36; p=.022). In contrast, the more people are intrinsically motivated, the more they prefer superior products with a bad-looking package (F1,119=3.41; p=.067). Figure 1 demonstrates that people with a

strong intrinsic motivation (M=30.00) are less inclined to buy products of superior package design compared to people with a strong extrinsic motivation (M=36.57). Additionally, people with a weak intrinsic motivation (M=35.83) would rather buy inferior products with superior package design compared to people with a weak extrinsic motivation (M=29.27).

Figure 1: The effect of extrinsic and intrinsic goal pursuit on intention to buy


To find out why extrinsically motivated people would even consider buying an inferior product, we ran a second online study in which 125 people participated (Mage=41.15; SDage=14.24). We presented them two alternative products for six different product categories: chocolate chip cookies, body milk, olive oil, coffee, mascara for female participants and aftershave for male participants. We manipulated both the package design (good-looking versus bad-looking) and the product quality (superior versus inferior). Participants had to indicate to what degree each product appealed to them on a 7-point scale. Afterwards, all products were displayed separately and without quality information. The participants were asked to assess the quality of each product on a 7-point scale. To measure participant's aspirations, we used the Aspiration Index (Kasser & Ryan, 1996). In line with Study 1, we found that the more people are extrinsically motivated, the stronger their preference for products with an appealing package design (F1,121=8.69; p=.004). The more people pursue intrinsic goals, the more they opt for superior products with an unappealing package design (F1,126=5.67; p=.019). Moreover, as shown in Figure 2, we found that the more people want to attain extrinsic life goals, the more quality they assign to the products with an appealing package design (F1,122=7.29; p=.008). Current results suggest that extrinsically oriented people not only appreciate the aesthetic qualities of a product, but they actually infer from the nice exterior that the product itself should be of good quality too. Thus, even though they received objective information about the product quality, extrinsically oriented people derive information about the product quality from the package design. This might explain why extrinsi-

cally motivated people are more inclined than intrinsically motivated people to buy inferior products with an appealing package design.

Figure 2: The effect of extrinsic and intrinsic goal pursuit on quality estimation of products with an appealing package design


Taken together, we found that the extent to which people appreciate exterior over interior product qualities depends on the goals they pursue in their life. The contribution of this article is twofold. First, we contributed to self-determination theory. This research is the first to demonstrate that the aspirations people pursue in their life can affect which type of products they intend to buy. Second, current research adds new insights to the theory on product packaging. For people who strongly pursue image, fame and financial success in their life, product design can be of great importance, even for low-involvement products. Future research will be conducted to arrive at a better understanding of the effect of goal pursuit on the intention to buy inferior, but good-looking products. For now, we can conclude that people with a strong desire to attain extrinsic life goals, will be more inclined to judge products by their appearance.

Effects of Narrative Transportation on Persuasion: A Meta-Analysis

Tom van Laer, ESCP Europe, United Kingdom
Ko de Ruyter, Maastricht University, the Netherlands
Martin Wetzels, Maastricht University, the Netherlands

EXTENDED ABSTRACT

The impact of narrative transportation on persuasion continues to attract research attention (e.g., Escalas 2004; Escalas 2007; Green and Brock 2000, 2002; Slater and Rouner 2002). When consumers lose themselves in a story, their attitudes and intentions change to reflect that story (Green 2008). Since Green and Brock (2000) initiated quantitative transportation research, many studies have investigated narratives, how they transport consumers, and how they change consumers' views. Furthermore, recent developments have enhanced the significance of transportation effects, including interactive video games (Baranowski et al. 2008), narrative advertising (Chang 2009), and reality TV (Hall 2009). Thus, transportation demands theoretical and applied research attention (Singhal and Rogers 2002).

Despite notable strides, extant transportation literature remains fragmented, in terms of both its conceptual breadth and its empirical findings (e.g., Green, Brock, and Kaufman 2004; Moyer-Gusé 2008; Nabi and Krcmar 2004). A comprehensive synthesis that can unify and advance the field after a decade of transportation research is thus needed. Therefore, this research pursues three objectives: (1) develop a conceptual framework integrating the antecedents and consequences of the transportation effect; (2) empirically assess a model derived through a quantitative meta-analysis; and (3) uncover issues that deserve further attention.

We seek meaningful relationships of transportation with affective and cognitive responses, attitudes, and intentions. In line with the postulates of transportation theory (Green 2008; Green and Brock 2002), our meta-analytic model comprises the story, medium, and consumer attributes as the antecedents of the transportation effect. Finally, our model considers methodological factors in prior studies.

METHOD

To appear in our meta-analysis, a study must include transportation as a key variable. A vast array of experimental designs is acceptable. We limited our search to literature published after Green and Brock's (2000) empirical operationalization. Our search produced 12 unpublished and 187 published articles (including book sections) related to transportation.

We analyzed 287 effect sizes. To ensure the independence of the effect sizes, we applied Johnson and Eagly's (1989) technique. Two expert researchers classified the multitude of dependent variables reported in the identified studies, using four categories: affective response, cognitive response, attitude, and intention. These expert coders achieved acceptable agreement levels (Cohen's $\kappa = .74$, $p < .001$) but disagreed on 54 variables (18.8%).

For these 54 variables, 189 undergraduate students served as the coders. Each variable was summarized in several sentences and included on a questionnaire. The questionnaire instructed respondents to read each variable description carefully and decide which of the outcome categories it represented, as described at the top of the questionnaire. Respondents coded the variables and we entered the mode into the analysis.

The effect size statistic contrasts groups on their mean transportation and outcome scores. The Pearson correlation provides the effect size indicator. We calculated not only the sample-weighted, reliability-adjusted r but also the conservative random effect z (Hunter and Schmidt 2004). To determine the presence of heterogeneity, we used the QWithin statistic (Huedo-Medina et al. 2006). In addition, we determined the file drawer N, or the number of studies with a zero effect size required to reduce the mean effect size to a probability level of $\alpha = .05$ (Rosenthal 1991). The QBetween statistic tests whether the size of the effect differs across factor levels (Borenstein et al. 2009; Hedges and Olkin 1985).

RESULTS

Transportation had significant, positive on affective responses (file drawer $N = 2,955$), cognitive responses (file drawer $N = 330$), attitudes (file drawer $N = 8,001$), and intentions (file drawer $N = 3,304$). Because we determined positive main effects for all outcomes, we could merge the correlations of transportation with the four outcome variables into an overall persuasive transportation effect.

The transportation effect varied for chronology and intrusiveness. However, character similarity did not have an effect. The transportation effect was also greater with greater media readability. However, richness did not enhance the transportation effect. The transportation effect further differed depending on consumers' familiarity and transportability. However, no significant effect emerged for attention.

Finally, transportation occurs when a study uses participant distraction, simple observation, or in-story perspective manipulation; assigns participants randomly; focuses on a communication or marketing domain; provides incentives; and includes highly educated, young, male participants.

DISCUSSION

This research underscores the robustness of the effect of narrative transportation and builds on previous research to refine extant understanding. Transportation has a significant impact on each stage of narrative processing, from mental processing invested to empathize with story characters to changes in consumers' beliefs. Moreover, transportation's effect appears influenced by key variables, such as the consumer's familiarity with the story topic and chronic propensity to be transported. These findings have implications for not only persuasion research but communication practices overall—as demonstrated by the growing popularity of public narratives. As consumers increasingly experience transportation in their dealings with persuasive narratives, it becomes increasingly important to understand the processes underlying narrative communication. We have identified some research paths and thus hope to have enabled scholars and practitioners alike to see the way forward as well.

Good Deeds, Risky Bids: Accessible Pro-Social Behavior Increases Monetary Risk Taking

Maria Blekher, Ben-Gurion University of the Negev, Israel
Shai Danziger, Tel-Aviv University, Israel
Amir Grinstein, Ben-Gurion University of the Negev, Israel

EXTENDED ABSTRACT

Pro-social behavior is common. A rich literature explains why people act pro-socially (e.g., Boezeman & Ellemers, 2007; Erez, Mikulincer, Ijzendoorn, & Kroonenberg, 2008), and documents positive consequences of pro-social behavior on well-being and health (Borgonovi, 2008; Post, 2005; Strahilevitz, 2011; Thoits & Hewitt, 2001; Van Willigen, 2000). Recent evidence suggests accessible pro-social decisions transiently influence self-perceptions and consequently choice. Khan and Dhar (2006) find that in a hypothetical-choice task, choosing among volunteering options transiently boosts a positive self-concept, thereby "licensing" the choice of a self-indulgent option in a subsequent task. Mazar and Zhong (2010) find people act less altruistically after purchasing green products than after purchasing conventional products. The authors propose that by boosting a person's moral self-concept, virtuous decisions "license" indulgence in self-interested and unethical behavior.

We suggest accessible pro-social behaviors may also increase risk taking. Specifically, we propose that in addition to making people feel virtuous, accessible pro-social behaviors may signal a safe environment (Mikulincer et al., 2001, and Mikulnicer & Shaver, 2005, for evidence that people tend to volunteer when they feel secure), increase one's feelings of interdependence (Borgonovi, 2008), prompt an optimistic outlook (Mellor, et al., 2008), and increase sense of control (Mellor, et al., 2008). We propose these outcomes either independently or jointly contribute to feelings of security, which, as we outline next, increase financial risk taking, presumably via a mechanism whereby decision makers gauge risk by how they feel at the time of choice (Loewenstein, Weber, Hsee, & Welch, 2001).

Hsee and Weber (1999) report the size of a person's social network is positively correlated with one's willingness to take financial risks. The authors suggest the network serves as a safety net should the risky financial decision fail. Mandel (2003) found that people primed to think about their friends and family increased their financial risk taking, acting as if they had a safety net. Last, Levav and Argo (2010) show that being lightly touched by another person increases one's feelings of security, which mediates preference for risky financial decisions.

In light of these findings, we propose that accessible volunteering behavior increases feelings of security, which promotes risky decision making. We test our prediction in four studies. In each study, we assessed risk taking by asking participants to make 14 choices between sure payoffs and risky gambles. Studies 1a and 1b demonstrate that an accessible act of volunteering increases risky monetary decision making, the mediating role of sense of security, and that the volunteering effect is not contingent on just-world beliefs. Study 2 shows that expressing volunteering intent increases monetary risk taking in participants primed to feel insecure, but not in participants primed to feel secure. This finding demonstrates the moderating role of feelings of security. Finally, study 3 shows the effect of volunteering intent on risky decision making can be eliminated when the reason for volunteering is attributed to an external source.

Study 1a tested whether an accessible pro-social act increases monetary risk taking. Participants were asked either before or after they engaged in a purportedly unrelated monetary risk-taking task whether they had volunteered in the past six months. The monetary risk taking task consisted of making 14 hypothetical choices between a sure cash payoff and a risky gamble (Hsee and Weber 1999). Participants were told they would participate in a lottery and the four winners would receive payment according to their decision in a randomly selected choice out of the 14. We also measured sense of security. Supporting our prediction, accessible pro-social activity increased risk taking and sense of security mediated this effect.

Study 1b replicated the initial effect, ruled out an alternative account, and showed the effect is not contingent on just-world beliefs

Study 2 examined whether feelings of security moderate the effect of pro-social intent on risky monetary choices. Participants were randomly assigned to one of four conditions of a 2 (secure/insecure) x 2 (volunteering/control) between-subjects design. Participants completed three purportedly unrelated tasks; first, participants were primed to feel insecure or secure. Then, they either chose a community services or a chair. Finally, participants made the same 14 monetary choices as in Study 1. Consistent with our prediction expressing virtuous intent led to increased risk taking (relative to the control condition) in participants primed to feel insecure but not in participants primed to feel secure.

Study 3 examined whether attributing pro-social intent to an external source attenuates the effect of virtuous intent on risky decision making. As in Study 1, choices were consequential.

As we predicted, when people felt the decision to volunteer was not their own, they did not infer a benign environment and therefore were not more willing to take risks.

Four studies demonstrate a link between accessible volunteering behavior, feelings of security, and monetary risk taking. Importantly, in the introduction, we were careful to note that accessible volunteering may also increase monetary risk taking via a boost in optimism, sense of control, and positive mood (all of which may also contribute to feelings of security).

For example, although our manipulations did not produce significant mood changes, a stronger effect on mood may be experienced while volunteering, which could also increase monetary risk taking (Mano, 1994). Also, although individual differences in just-world beliefs did not moderate the effects of an accessible act of volunteering on risk taking in Study 1b, priming just-world beliefs may have such a moderating effect.

In summary, our findings extend existing research on volunteering behavior and on risk taking. First, we demonstrate a relatively distant, and therefore seemingly unrelated, consequence of accessible volunteering behavior and intent, and second, we document yet another factor that can transiently influence risk-taking preferences. Critically, we demonstrate that an accessible act of volunteering increases feelings of security, which increase the willingness to choose risky options.

When are Frugal Consumers NOT Frugal? It Depends on Who They Are With

Seung Hwan (Mark) Lee, Colorado State University, USA

EXTENDED ABSTRACT

When are frugal consumers not frugal? Increasing recognition by marketing researchers to understand non-consumption has sparked an interest in exploring the spending habits of frugal consumers (Bardhi and Arnould 2005; Lastovicka et al. 1999; Rick, Cryder, and Loewenstein 2008). By definition, frugality is a "unidimensional consumer lifestyle trait characterized by the degree to which consumers are both restrained in acquiring and in resourcefully using economic goods and services to achieve long-term goals" (Lastovicka et al. 1999, p. 88). It is the extent to which individuals exhibit self-restraint in their consumption behavior (Kasser 2005).

For the most part, literature on frugality has primarily focused on individual characteristics and behavior, ignoring the impact of individuals' network (and/or reference group) on their frugal behavior. Given that consumers are often influenced by how others will judge and perceive them (Calder and Burnkrant 1977), individuals' personal networks should play an influential force in one's frugal identity. Personal networks can also act as reference groups for consumers. Reference groups are important because it can be an influential force in establishing social norms (Fisher and Ackerman 1998). The normative pressures that the group exerts result in high levels of influence over a variety of individuals' decision (Feldman 1984). A major source of influence comes from consumers' belief about how others will perceive their decisions (Calder and Brunkrant 1977).

However, previous research suggests that frugality may be an exception; it is a trait that is considered not to be influenced by social factors. Lastovicka et al. (1999) suggest that frugal consumers are more independent than the average consumer, and thus they are less swayed by their interpersonal network. Since frugal consumers are disciplined in their spending, they are better able to withstand the social pressures to be engaged in money-spending activities (Lastovicka et al. 1999). However, this research will suggest that under certain conditions, the frugality trait is malleable to social influences, especially when they are consuming with individuals from high-spending networks. More importantly, frugality may be a relative trait, rather than a constant trait as people presumed it to be. Four studies were conducted to explore this inquiry.

Study 1 was a two-way between subjects design with two measured factors, average spending of their personal network (ASPN) and frugality (scale from Lastovicka et al. 1999) (n=110). High (low) ASPN indicates high (low) spending networks. Individuals were asked to list a close group of friends whom they see on a regular basis. Then participants rated each of their friends on three seven-point bi-polar items (Save Money / Spend Money, Thrifty / Spendthrift, Economical / Splurge). To calculate the degree of spending by their personal network, we averaged the scores of these three items (α = .89) for each person and then averaged the scores of friends listed (participant's social network) to get the ASPN index. Next, participants were asked to choose an ideal meal that they would have in their outing with their friends (the friends that they listed). The results show a significant interaction between individual's frugality and ASPN, β = .25, t = 2.76, p <.01, f^2 = .07. Simple slopes test confirmed that the effect of frugality on the amount ordered was significant for those in the low ASPN groups (one SD below the mean of ASPN), b = -4.17, t = -5.81, p < .001 and non-significant for those in the high ASPN groups (one SD above the mean), b = -1.20, t = .22, ns.

This study was replicated in a field setting using an actual social network (n=42). Instead of asking individuals to list their friends, network analysis was used to determine people's social network. The dependent variable for this study was average monthly spending (not including rent, groceries, and bills). Consistent with study 1's findings, there was a significant interaction between frugality and ASPN, β = .30, t = 2.03, p <.05, f^2 = .11. Simple slopes test confirmed that the effects of frugality on monthly spending was significant for those in low SN groups (one SD below the mean), b = -51.67, t = -2.50, p < .05, and non-significant for those in high SN groups (one SD above the mean), b = 7.80, t = .34, ns. More importantly, this study also revealed that frugal individuals in high spending networks have an inaccurate perception of their own level of frugality. Specifically, frugal individuals perceived that they were frugal, although they were not perceived to be frugal by their friends. This perhaps can explain why frugal individuals in high spending networks were willing to spend, because relatively, they may have perceived that they were spending less than their peers, thus believing that they were frugal.

The results from study 3 show that the effects of prior studies are limited to strong-tie networks, thus, introducing a boundary condition. When frugal individuals are consuming with high spending acquaintances (weak-tie ASPN), they behave according to their trait. However, when frugal individuals are consuming with high spending friends (strong-tie ASPN), they spent nearly as much as those who were non-frugal.

Finally, the results from study 4 show that the effects of prior studies are limited to publicly-consumed goods. Under the privately-consumed good (i.e., mattresses) condition, frugal consumers behaved according to their trait. However, under the publicly-consumed good condition (i.e., notebooks), frugal consumers spent more when they were primed to list a network of high spending friends.

In conclusion, findings from four studies (two experimental, two field-based studies) reveal that when frugal individuals consume with high spending networks, they spend more than those that consume with low spending networks (Study 1). These results are replicated in a field study, but also show that frugal consumers in high spending networks were not perceived to be frugal, even though they believed themselves to be frugal (Study 2). Next, the results demonstrate that these effects occur only in strong-tie networks (as opposed to weak-tie networks), introducing a boundary condition (Study 3). Finally, these effects apply only to publicly consumed products and not privately consumed products (Study 4).

From Bye-Bye to Buy Buy: Influence of Homophonic Primes on Judgment and Behavior

Derick F. Davis, Virginia Tech, USA
Paul M. Herr, Virginia Tech, USA

EXTENDED ABSTRACT

Can reading the word "bye" influence how much someone is willing to pay to "buy" a product? Or can telling consumers to "wait" influence their perceptions of a target object's "weight"? We investigate conditions where one homophone – a word that sounds the same as another but has different spelling and meaning –primes perceptions and behaviors related to the complementary homophone. We suggest that this priming effect is an outgrowth of the reading process and is more likely to occur when individuals experience cognitive load, as load suppresses a secondary corrective process (Gernsbacher and Faust 1991). This research represents the first demonstration of homophone behavioral and perceptual priming and contributes to our understanding of priming in general.

We argue the described effect is an outgrowth of an automatic process—wherein stimuli induce processing (Bargh 1994; Schneider and Shiffrin 1977). We also draw from research on homophones and their relationships from the cognitive psychology literature (Lesch and Pollatsek 1993; Lukatela and Turvey 1994; Van Orden 1987). This research finds that homophones are linked via their phonology and can influence subsequent tasks (e.g. lexical decision tasks, Pexman et al. 2001; stem completion tasks, Rueckl and Mathew 1999; and also induce memory errors, Azuma et al. 2004; Starns et al. 2006), however these investigations never extend to the behavioral realm—where homophones can prime behaviors and perceptions.

In four studies we investigate how one word in a homophone pair (i.e. wait, right, bye, or phew) can influence behaviors and/or alter perceptions related to the complementary homophone (weight, write, buy, and few, respectively). We find support for homophone priming, relative to control conditions, but only when participants experience cognitive load, suggesting participants suppress the influence of homophone primes with sufficient cognitive resources (Gernsbacher and Faust 1991).

In study 1, we test if reading, "wait" can influence perceptions of "weight". The experiment had eight conditions (Wait Type: No Wait, 30sec wait labeled "delay", 30sec wait labeled "wait", 30sec wait without labeling) x (cognitive load: load vs. no load). Participants were primed then completed the target task, wherein they viewed a grocery bag depiction and answered, "If you placed the bag on a scale, what is your guess for the readout in pounds?" and "To ask another way, how heavy is the bag above?" on a 7-point scale anchored by "not heavy at all" and "very heavy". Responses were combined into a composite measure of subjective weight (cronbach's alpha = .83). An ANOVA revealed a marginal main effect of wait type ($F(3, 223) = 2.5$, $p = .06$), and a significant wait type x load interaction ($F(3, 223) = 3.74$, $p < .05$). Planned contrasts revealed that subjective weights in the wait/wait load condition were significantly greater than in any other condition (all ps < .05). Indicating that participants who read "wait" perceived the grocery bag to weigh more, but only when under cognitive load.

In study 2, we test if reading, "right" elicits longer essays from participants (i.e. they "write" more). The experiment had five instruction conditions (two containing the word "right" and three controls) crossed with a load manipulation. The main task was to "tell us about" a recent grocery trip. Initial analyses confirmed that collapsing conditions into "right" vs. "control" was appropriate. An ANOVA revealed a main effect of condition ($F(1, 150) = 10.02$, $p < .01$) such that people who saw the word "right" wrote fourteen more words on average, a marginal effect of load ($p = .059$), which was qualified by a significant condition x load interaction ($F(1, 150) = 5.20$, $p < .03$). An inspection of the means revealed that participants wrote more (eighteen words more on average) when they read "right" under load. Control conditions did not significantly differ from each other.

In study 3, we test if reading "bye" influences "buying" behaviors. Participants read an ostensibly unrelated story about a vacationer's last day. The story either concluded with the writer saying "Bye Bye" or "So Long" to their vacation spot. These conditions were crossed with a load manipulation. Participants then read about a restaurant promotion and indicated their WTP for dinner for two, this was the dependent variable related to "buy". An ANOVA revealed a significant condition x load interaction ($F(1, 109) = 4.03$, $p < .05$) such that people under load who read "Bye Bye" were willing to pay the most for the restaurant deal. Planned contrasts revealed that WTP in this condition was significantly greater than in any other condition (all ps < .05).

In study 4, we test if reading "phew" can have a downward effect on behavioral intentions. Participants read a story that ended with the protagonist exclaiming "phew" or "close call". These conditions were crossed with a load manipulation. Participants then answered a behavioral intention question (9-point scale) about saving money in the next year (a socially desirable behavior). This served as the dependent variable. An analysis revealed a significant prime x load interaction ($F(1, 173) = 5.85$, $p < .02$) such that individuals who read "phew" while under load indicated that they intended to save less money than any other condition (planned contrasts, all ps <.05).

Taken together these studies provide initial evidence for how homophones can prime perceptions and behavior. It contributes to our understanding of how and when behavioral priming can occur, by identifying a new way to prime behavior and influence perceptions. Homophones can prime both "more" and "less" of a behavior, behavioral intention, and perceptions. Additionally, this research may contribute to a related stream of research on phonemes and the role of phonology in branding (Argo et al. 2010; Lowrey and Shrum 2007; Yorkston and Menon 2004) and marketing in general. Consider for instance, the case of the weight loss drug "Alli". It is a constructed or psuedohomophone designed to help consumers understand that the drug is their "ally" in weight loss.

Towards a Better Understanding of the Role of Social Media in the Processes of Independent and Interdependent Identity Construction

Gachoucha Kretz, ISC, Paris
Benjamin G.Voyer, ESCP Europe, UK

EXTENDED ABSTRACT

1. Introduction

With more than 520 million daily-active Facebook users (April 2012), social media have now become part of many customers' life. Individuals use social media to obtain information, entertain themselves, and fulfil mood-management needs (Shao, 2009). We argue and show here that social media also fulfil more profound identity construction needs, and can be used to communicate with brands about symbolic aspects of consumption. Using the example of consumers running weblogs about fashion and luxury products – which represent one of the most common types of weblogs on the Internet (Rickman & Cosenza, 2007) – we address one of the paradoxes of social media: namely, that despite the social nature of these media, many customers use them *primarily* for managing personal and symbolic aspects of their identity construction and relations with brands. The present paper contributes to the literature on social media and consumer identities, by offering a way of framing the existing literature and findings, combining both traditional literatures on symbolic consumptions (Levy, 1959) and more recent approaches to independent and interdependent identities and self-construals (Markus & Kitayama, 1991).

2. Methods

We carried out a netnography (Kozinets, 2010) from mid-2005 to end of 2011 on 30 popular fashion / luxury weblogs to research individual differences in self-construal and further corroborated our interpretations through in-depth interviews with 20 of these 30 bloggers.

3. Results & Discussion

Our findings – summarised in table 1 - suggest that fashion and luxury bloggers develop different types of independent and interdependent identities through personal branding, and carefully designed interaction strategies with others. The type of personal brand - or 'character'- construed differs on what we identified as the four dimensions of a blogger's identity: dominant mode of *self-construal*, type of '*others'* he/she interacts with, type of *relationship* he/she *aims a*t, and *dominant type of social media* used. Based on different combinations of these dimensions, consumers develop different characters, which they use to signal to others - and particularly to brands - the kind of communal activities bloggers would like to engage into and with what members.

Celebrity bloggers are bloggers who became very famous, regularly work for famous brands and designers, and post their work and stories on their weblog. Their primary motivation is to be recognized as a like of the people they admire (designers, photographers…), but not to belong to or interact with a community of bloggers. They thus hold a highly dominant independent *self-construal* - only making obvious bonds with the fashion and luxury people they have worked with - and low levels of interdependent self-construal. The '*others*' they interact with are mainly brands and brand representatives or fellow professionals. The '*type of relationship'* they aim at creating with brands is a worshipping one. Celebrity bloggers signal potential partner brands their willingness to work for them. Interestingly, we found that while these bloggers engage into active networking with

professionals they want to become like, they mostly do so offline. Celebrity bloggers gather most of their online social media content on their weblogs and make scarce use of other social networks like Facebook or Twitter.

Character bloggers are those who became famous among a very dedicated audience and web marketing agencies, being occasionally mentioned in women's magazines. They are rather independent, while entertaining very close relationships with a few peer- bloggers and web-marketing representatives with whom the have become friends. These types of bloggers have a high level of independent *self-construal*, and a moderate level of interdependent *self-construal*. The '*others*' made obvious in their weblogs are their blogger friends and brands promoted by their web marketing agencies' connections. The *relationship* they aim for is a 'clique' one: sharing scarce resources, with limited access for new entrants. The *dominant social media* used are weblogs, where most of the brand narrative happens. Facebook, Twitter, Lookbook or Flickr are used for a public account of activities, serve as a recruitment platform for other readers, and also as a location for extended self-construal and personal branding.

Spokesperson bloggers are bloggers that became famous and received media coverage, eventually turning their blogging activities into a job (journalism, acting…). Spokespersons usually use their influence to speak up about causes such as fighting for larger sizes in fashion. By embracing issues that federate other bloggers, they display a high level of interdependent self-construal. Their status also contributes to moderate levels of independent *self-construal*. The '*others*' they like to introduce on their weblogs are fellow bloggers, most of whom are simple readers, with whom they want to share opinions and co-produce debates and discussions. Brands are not always present in these discussions, except if relevant to the cause being defended. The *type of relationship* Spokesperson bloggers want to create is a highly interactive and communal one. Thus, discussions happen on every platform possible (e.g. commenting on their weblog, Facebook page, professional website, Twitter account…).

Finally, **Buddy** bloggers are those who are not famous but who are liked by a strong loyal community of readers / followers. Their motivation to weblog is most of all about sharing their passion and ideas about fashion and luxury consumption with other passionate people. Consequently, Buddy bloggers display high levels of interdependent *self-construal*, and low levels of independent self-construal. The '*others*' they interact with are firstly their readers, then fellow bloggers. Buddy bloggers are organized in 'bastions' or subgroups of similar bloggers, who adore each other within the subgroups and hate each other outside those subgroups. Brands are also very present in their narratives. Buddy bloggers mainly promote them directly in accordance with what they feel their audience will like. The *relationship* built with the audience is about recommending and trusting, and Buddy bloggers therefore always try and balance branded narratives with readers' expectations and comments. Because interactions and recommendations are at the heart of Buddy weblogs, discussions happens on all possible *loci*, whether in the weblogs comments or on various social networks.

Overall, our paper is the first to investigate the relation between the use of social media and the development of different types of independent and interdependent identities, via self-construal.

Time and Context Dependencies in Consumer Behavior

Euehun Lee, Korea Advanced Institute of Science and Technology, Korea
Anil Mathur, Hofstra University, USA
Choong Kwai Fatt, University of Malaya, Malaysia
George P. Moschis, Georgia State University, USA

EXTENDED ABSTRACT

Scholars have noted that many consumption phenomena are time and context-dependent, but have offered limited directions that would help researchers study consumers over the course of their lives. The life course paradigm, which is considered one of the most important achievements of social science in the second half of the 20th century and is widely used globally and across disciplines (Elder et al. 2003), can address time and context dependent consumer issues.

The life course approach focuses on examining gradual or abrupt changes in behavior of a unit (e.g., individual, family) that take place over time. These changes are assumed to be embedded with earlier life experiences, including earlier changes in behavior, and are studied as time- and context-dependent events, changes, or transitions. Behavior at any stage in life or given point in time is viewed as the product of responses to earlier life conditions and the way the individual or other units have adapted to various circumstances (Mayer and Tuma 1990). The purpose of this paper is to illustrate the life course approach. Theories and methods are presented, hypotheses based on theoretical life course perspectives are developed, and data from a national longitudinal study are used to test the proposed relationships. Implications of study findings for theory development and future research are also discussed.

According to the life course paradigm, biological and psychological changes during a person's life and social demands across the life course define typical life events and social roles that serve as turning points and affect a person's life; they create physical, emotional, and social demands and circumstances to which one must adapt by changing his or her thoughts and actions. Patterns of thought and action at a given stage in life are viewed as outcomes of one's adaptation to various demands and circumstances experienced earlier in life, with adaptation entailing the processes of (a) stress and coping responses, (b) socialization, and (c) development or growth and decline. These processes are the underlying change mechanisms of the three most widely-accepted life course perspectives: stress, normative, and human capital, respectively (Moschis 2007).

The rapid diffusion of the life course as a research framework across disciplines was largely because of the development of models collectively known as event history analysis (EHA) (Mayer and Tuma 1990). Most EHA models are defined by expressing the hazard rate of an event or change (or transition rate when a shift to one of several states is possible) as a specific function of relevant time dimension (e.g., duration, age), measured covariates, and unmeasured random disturbances (Mayer and Tuma 1990). When an event, transition, or change at any given point depends on how long an individual has been at a given state, it becomes duration-dependent; that is, it can be modeled as a probability in the rate of transition (change) with respect to time on the basis of how long (duration) a person has been in that state. In life course research, a change in behavior is equivalent to an event; it is viewed as a transition from one state to the next (e.g., from a nonuser to a user of a product). Movement from an original state to a destination state defines transitions. All people begin in the original state (e.g., nonusers) and are "at risk" of making the transition to the destination state. The risk of making a transition is defined as a function of time, and the dependent variable is expressed as a probability of change given the length of time a person has been at a given state.

We illustrate the application of life course paradigm by formulating our hypotheses based on the three theoretical perspectives to explain consumers' responses to two types of consumption choices (studied as events)—one first-time and another repeat choice. Acquiring membership in age-segmented associations that serve people over a certain age (ASAS) is a first time decision that requires age eligibility (age 50 that marks the beginning of the "risk" period and defines a person's membership in the "older-age" subculture (e.g., AARP). The second, changes in investments (CINV), which may involve both new investments and new allocation of existing assets, can be a repeated behavior (event) that requires no age eligibility; it is relevant to adult consumers regardless of their stage in life.

A stratified sample of 9500 household heads, heavily skewed toward older-age brackets received the first questionnaire, and exactly five years after the first survey was administered, the 709 identified respondents who agreed to participate in the second survey were mailed the second questionnaire. A total of 379 usable questionnaires were returned (53.4% of those who had agreed to participate), of which 318 could be matched to the first anonymous questionnaire by means of date of birth and other demographic information in rare cases. In our EHA models, the dependent variables were expressed as events that occurred after a consumer had entered the "risk" period of experiencing the specific consumer behavior change.

Among the study findings, results suggest that consumers change their behaviors in anticipation of specific life transition events, suggesting the importance of studying the timing of these changes in response to the expected transitions, and the types of consumers who change their behaviors earlier than others. The life course approach could make a useful contribution to research in consumer behavior because it because it makes time, context, and process more salient dimensions of theory and analysis.

What Effect Does the Relationship Portfolio Have on Well Being?
Comparing the Impact of Brand, Service, and Interpersonal Relationships

Seung Hwan (Mark) Lee, Colorado State University, USA
Allison Johnson, University of Western Ontario, Canada
Matthew Thomson, University of Western Ontario, Canada

EXTENDED ABSTRACT

Extensive psychological research suggests that the quality and quantity of interpersonal relationships are linked with increased life satisfaction (Argyle 1999). For example, a meta-analysis of almost 300 empirical studies shows that elderly people who enjoy extensive or high quality social contacts report elevated well-being (Pinquart and Sorensen 2000). What is absent, though, is a simultaneous consideration of well-being in light of a person's *consumption* relationships (i.e., service and brand relationships). To explore this opportunity, we contemplate consumers' more broadly-construed relationship portfolios.

Relationships are dyadic enterprises with different types of interaction that may confer a variety of benefits and costs. Interpersonal relationships have myriad possible forms and features, including emotional support (e.g., providing reassurance of self-worth and concern), appraisal support (e.g., feedback and confirmation), information support (e.g., advice and information) and instrumental support (e.g., money or resources) (Wills 1991). These interpersonal relationships "have a powerful effect on happiness and other aspects of well-being, and are perhaps its greatest single cause (Argyle 2001, p. 71).

Likewise, research suggests service relationships have many of these same features and play a non-trivial role in consumer's lives. Indeed, "many services are almost exclusively based upon person-to-person interactions" (Gremler and Brown, p. 174) and service relationships may provide many of the same benefits as interpersonal relationships (Wellman and Gulia 1999).

They typically include the servicing of important human needs such as autonomy, security and belonging (McKenna and Bargh 1999; Wellman and Gulia 1999) that leads to higher life satisfaction both directly and through enhanced self-esteem (Diener and Diener 1995; Kwan, Bond and Singelis 1997).

Here, we explore that possibility that not all relationships are beneficial: Specifically, we investigate whether the number and strength of brand relationships has a negative impact on a person's well-being (e.g. life satisfaction and self-esteem). Consumers form meaningful relationships with brands – this has been amply demonstrated by decades of research (Belk 1988; Fournier 1998). We propose several reasons to believe brand relationships can be detrimental to consumers' well-being. First, brands cannot act on their own behalf. Compared to relationships that involve humans (e.g. interpersonal and service), consumer-brand relationships are less interactive: "Brands do not experience emotions and therefore [do] not return a person's love…" (Batra et al. 2011, p. 3). Since brands are unable to reciprocate in a similar fashion to the consumers who hold them dear, there will be ever-increasing chasm between partners representing a lack of social exchange that over time will erode self-esteem. Moreover, brands' relational 'toolkits' are barren. They are less capable of reassuring communications such as pledges of commitment, encouragement or intimate self-disclosure that are common in and form the foundation of interpersonal and service relationships (Price and Arnould 1999). There is consistent evidence that physical proximity affects the likelihood of communication between actors (Krackhardt 1994), presumably by increasing the probability of positive, serendipitous interactions (Monge et al. 1995). These qualities are lacking in brand relationships. Finally, having many strong brand relationships may be associated with devaluing importance of interpersonal relationships (Thomson, Whelan, and Johnson, in press). Such consumers may prefer to gain comfort and psychological support from their possessions rather than with actual people (Kasser and Ryan 1993). Thus, this may cause individuals to become socially lethargic, as brand relationships become central to their lifestyle (Kasser and Ryan 2001). In consequence, people who value brand-relationships may become less socially productive and exhibit greater numbers of antisocial behaviors (Burroughs and Rindfleisch 2002; Cohen and Cohen 1996; Kasser and Ryan 1993), thus contributing to their lower self-esteem and well-being.

We examine the effect of people's relationship portfolio on their general well-being (i.e. "life satisfaction'; see Table 1) both directly and through self-esteem. We recruited 323 respondents using a private research panel composed of adults. We collected the following variables: Life Satisfaction (Diener et al. 1985), Rosenberg's Self-Esteem scale (1965), people's current state of health, financial strength, and a trait-measure of worry (Stober and Joormann 2001), as well as gender and age. We then asked in random order for individuals to list relationships that "mean a lot to you" in the context of other people (i.e. interpersonal), service providers (i.e. service) and brands (i.e. brand). For each relationship, respondents answered a two-item metric of 'relationship strength' (e.g. 'This brand [person] is important to me'). Once all this information was provided, we calculated respondents' number and average strength of each respective type of relationship. Upon centering each variable, we also calculated the interaction terms.

Using structural equation modeling, we conducted and replicated the basic result that interpersonal relationships improve a person's well-being. We also show that while person-service provider relationships have a similar effect, person-brand relationships are associated with significantly diminished self-esteem and well-being, even after accounting for a person's tendency to worry, age, gender and financial and physical health. In model 1, we find that stronger interpersonal relationship predict life satisfaction and self-esteem. With respect to service relationships, neither the number of the strength matters, but the interaction is a positive predictor. However, more and stronger brand relationships are related to significantly lower life satisfaction and self-esteem.

Understanding how this portfolio behaves is a worthwhile exercise not only because integrating across domains has theoretical value, but also because relationships are centrally implicated in predicting people's general well-being. Thus, there are considerable managerial and public-policy implications of understanding what patterns of portfolios are most beneficial for people. It also allows us to address the issue of whether the variety of target objects involved in the portfolio are complementary or competing with respect to an individual's well-being.

Figure 1: General Theoretical Model

Market Mavens and Networking: Benefits and Costs of Network Participation

Seung Hwan (Mark) Lee, Colorado State University, USA
Gail Leizerovici, University of Western Ontario, Canada
Shuoyang Zhang, Colorado State University, USA

EXTENDED ABSTRACT

Market mavens are "individuals who have information about many kinds of products, places to shop, and other facets of markets, and initiate discussions with consumers and respond to requests from consumers for market information" (Feick and Price 1987, p.85). Previous research has suggested market mavens act as important social beings for the marketplace. Specifically, they have a desire to help others and have a sense of obligation to share their market knowledge with others in their social networks (Walsh, Gwinner, and Swanson 2004). Even though prior research has documented the links between market mavens and a variety of social traits, what remains underexplored is how it influences consumers within the domain of emerging social networks. Our work fills this gap by tracking market mavens longitudinally and observing their network growth and their personal outcomes over time.

Our findings contribute to the extant literature in three distinct ways. First, despite their social nature and desire to interact, market mavens have a lower rate of network growth over time. They tend to build a selective network, rather than a larger network. Second, market mavens occupying central positions experience both positive (satisfaction) and negative (stress) personal outcomes over time. Finally, we identify the importance of differentiating perceptual networks (vs. objective networks) as the primary driver of consumers' personal outcomes.

Method

We conducted a longitudinal field study at a large North American university. Participants filled out questionnaires at two different time-periods. Time 1 data was collected approximately five to six weeks after the start of the academic freshman year (early October) and Time 2 data was collected about five months after the initial data collection (early February). The final sample (N=71) included 37 females and 34 males.

Network data were collected using the roster method, a technique that is widely used in network research (Wasserman and Faust 1994). This method is consistent with previous network studies in marketing and is useful in identifying individuals' network positions (Iacobucci et al. 1996). Then, participants rated their relationship strength (1 – do not know or barely know; 2 – acquaintance; 3 – friend; 4 – close friend) with every other student on the floor (Lee et al., 2010). To identify one's friendship network, a rating of 3 or above was chosen to reflect individual's strong-tie network. Therefore, for every direct link (a rating of 3 or above), the focal actor received a score 1 and all other responses were given a rating of 0. Given that this was a longitudinal study, we were able to track the change in development of outgoing ties and incoming ties over time.

To analyze the effects of market mavenism on individuals' social network development, a stochastic actor-oriented model of network dynamics was assessed using the SIENA 3.14 software (Snijders et al. 2007). The actor-oriented model, when elaborated upon for application use, contains parameters that are estimated from the observed data by a statistical procedure (Snijders et al. 2010). The effects of market mavenism on the development of network ties are assessed by examining the parameter estimates of three selection effects: *ego effect, alter effect,* and *similarity effect* (Burk et al. 2007). A positive (negative) ego effect implies that market mavenism is positively (negatively) associated with an individual's ability to develop social ties and thus is likely to increase (decrease) the number of friendship nominations made over time. A positive (negative) alter effect implies that market mavenism is positively (negatively) associated with being attractive as a friend and thus is likely to result in an individual receiving more (fewer) friendship nominations over time. Lastly, a positive (negative) similarity effect implies that individuals prefer friendships with others that have similar (dissimilar) levels of market mavenism (i.e., homophilous selection). To test the interaction of market mavenism x centrality on stress and satisfaction, we analyzed the data using regressions. Market mavenism, out-degree ties (for out-degree models), in-degree ties (for in-degree models) were centered and entered into a regression, along with their respective interaction terms, as predictors of satisfaction and stress.

Results

Contrary to our expectations, we find that market mavenism is negatively associated with network growth (negative ego effect). This result is unexpected given the social nature of market mavens. We speculate that despite market mavens' desire to interact and to connect with others, their motivation for building relationships stems not from assembling a larger network (connection quantity), but from nurturing a selective network that can bring social benefits (connection quality, positive similarity effect).

Further, we find that market mavens occupying central positions experience both positive (satisfaction) and negative (stress) personal outcomes over time. While previous research has generally viewed market mavenism as a positive characteristic (e.g., Feick and Price 1987), we find that market mavens are prone to experiencing stress as a result of their network position. We suggest that greater satisfaction was generated by centrally-located market mavens through more strategic and active use of their network. While this did not create satisfaction immediately, the results of their network building efforts garnered them greater satisfaction over time. On the same token, we also found that the market maven role came at a personal cost. Based on the demands-resources model of stress (Bakker and Demerouti 2007), the relationship between market mavenism and high network centrality was found to be positively associated with stress. We believe this was due to their increased investment in the time and energy to respond to the demands, which thereafter faltered due to their inability to keep up with the resource requirements necessary to meet those demands. This presents a paradox for market mavens as their market knowledge and sharing behavior, when linked with network centrality, may beneficial and detrimental to their personal well-being.

Finally, we find that individuals' perception of their network position were more strongly associated with their personal outcomes than others' perceptions. This is an important finding because it reveals that how one perceives him/herself within their network acts as the primary driver of his or her psychological well-being.

Is More Always Better? Examining the Effects of Highly Attentive Service

Maggie Wenjing Liu, Tsinghua University, China
Hean Tat Keh, University of Queensland, Australia
Lijun Zhang, Peking University, China

EXTENDED ABSTRACT

The services marketing literature generally indicates that attentive, friendly, and personalized services can help improve customer satisfaction (Bitner, 1990; Bitner, Booms, & Mohr, 1994; Hui, Au, & Fock, 2004; Price, Arnould & Tierney, 1995; Surprenant & Solomon, 1987). Some researchers even suggest that firms should attempt to transcend customer expectations by delighting them (Oliver, Rust, & Varki, 1997; Rust & Oliver, 2000). Consequently, it has become imperative for many service firms to invest in customer-focused procedures or programs in order to create more competitive service offerings (Lemmink & Mattsson, 2002), and some of them are even willing to go the extra mile in serving customers. For example, the wait staff of many restaurants is trained to get to know their customers, frequently drop by customer tables and enquire if things were going well (Scanlon, 1998).

The underlying assumption is that such outwardly concern for consumers and personalization would be well received. Yet, some customers may find such efforts to be overwhelming and disruptive of their service experience. As observed by Solomon, Surprenant, Czepiel, and Gutman (1985, p. 107), "greater personalization of service does not necessarily result in a more positive service expectation." Indeed, there is considerable anecdotal evidence suggesting that, rather than increasing customer satisfaction, highly attentive service may lead to customer complaints, dissatisfaction, and even switching behavior. This raises the paradox that more attentive service is not always better. From the perspective of the organization, Schneider, Paul, and White (1998) suggest that an overemphasis on service quality for end users may be detrimental to the organization in the long-term as overemphasis on a single constituent will be in conflict with the expectations and demands of other constituents such as employees and shareholders.

The literature in related areas indicates that too much of a good thing may not always turn out well. For instance, in the context of product choices, Iyengar and Lepper (2000) challenge the popular notion that "the more choice, the better." They find that consumers faced with extensive choices may find them to be initially more appealing but are subsequently less satisfied with their choices compared with those in the limited-choice condition. Similarly, when manufacturers put too many features into a product, it can be overwhelming for consumers and result in "feature fatigue" (Thompson, Hamilton, & Rust, 2005). We expect the effects of highly attentive service to be analogous to such choice overload effects.

Our review of the literature yields surprisingly little insight into the paradox of highly attentive service (see Estelami & De Maeyer, 2002). Questions on how customers respond to highly warm or generous service attention, and to what extent should firms attend to their customers, have not been systematically addressed. Knowing the answers would be relevant and important for both managerial practice and marketing scholars. Accordingly, our objective in this research is to understand the nature of highly attentive service and how it affects customers' responses and evaluations of service providers. As little has been done in this area, we use a two-phase research design in conducting this study (Creswell, 1994). We first perform an exploratory qualitative research to define the concept of highly attentive service from the perspective of the customer. Based on the dimensions identified, we then proceed to conduct two experiments to better understand customers' response mechanisms. Specifically, we address the following research questions:

1. How do customers define or perceive highly attentive service?
2. How does highly attentive service influence customer affective response and evaluation of the provider?
3. Do customers' characteristics and situational factors influence their affective response and evaluation of highly attentive services?

Based on the related literature and content analysis of our qualitative study, we establish a conceptual model of highly attentive service and develop the relevant hypotheses. We conduct two experiments to test the model. Finally, we discuss the results, the theoretical and managerial implications, and conclude with the limitations of this study and directions for further research.

We contribute to the literature by expanding the scope of investigation beyond monetary generosity. As the literature is sparse on the "attentiveness fatigue" problem, our exploratory study on the nature and consequences of highly attentive service fills a major theoretical void. The main results of our empirical analysis are that highly attentive services have an inverted U-shaped relationship with customer satisfaction, and this relationship is partially mediated by customers' affect and moderated by customers' need for interaction. These findings are new to the literature, and impel us to reconsider the received wisdom of providing services that exceed the desired level (Zeithaml, Berry, & Parasuraman, 1993, 1996).

Specifically, our results confirm the affective satisfaction model (Oliver, 1993; Westbrook, 1987; Westbrook & Oliver, 1991); service attributes influence customer satisfaction both directly and indirectly via positive and negative affects. While past research highlights the effect of positive affect on satisfaction (Lemmink & Mattsson, 2002; Price, Arnould, & Tierney, 1995), our study reveals the crossover effects between service attributes and positive and negative affects simultaneously. Our factor analysis elicits one positive affect, "warmth," and two types of negative affects, "pressure" and "sadness/anger." This is in line with Russell's (1980) "circumplex model of affect," which posits two dimensions of affective structure, pleasure/displeasure and arousal/boredom.

In our three-factor affect model, "warmth" and "sadness/anger" are almost polar opposites on the same continuum, and are independent of (orthogonal to) "pressure." Additionally, we find that while both negative affects, "pressure" and "sadness/anger," are evoked by unfavorable service attentiveness conditions, the underlying mechanisms are different. Results show that "pressure" is more likely to be evoked by highly attentive services, but "sadness/anger" is not significantly different for either excessive or too little attention.

"Shall We Share Our Clothes?":
Understanding Clothing Exchanges With Friends During Adolescence

Elodie Gentina, University Lille Nord de France, France
Marie-Hélène Fosse-Gomez, University Lille Nord de France, France

EXTENDED ABSTRACT

The concept of exchange has long been of interest to marketing researchers (e.g., Alderson 1957; Houston and Gassenheimer 1987). According to Bagozzi (1975), any type of human intercourse is a form of exchange. Such reflections have prompted a stream of research on exchange theory in marketing, from which two oppositional perspectives emerge. The economic perspective stipulates that exchanges are valued for their economic worth, as determined by factors outside the dyad, including the monetary price (Belk 2009). Thus, the term "exchange" implies that each party to the exchange gives and receives something simultaneously (Bagozzi 1979; Sahlins 1972). A more social view of the phenomenon points to the (mostly non-economic) benefits available to consumers who engage in exchanges. Scholars subscribing to this social perspective understand exchange as an expressive act, not an instrumental response (Belk and Coon 1993). They investigate, for example, emotional bonds enjoyed by consumers who engage in exchanges within their family network, such as parents and their children (Belk 2009; Ozanne and Ozanne 2011), siblings (Tinson and Nuttall 2007), or couples (Belk and Llamas 2011).

What is lacking from both perspectives though is a consumer-centric understanding of what people seek when they engage in exchanges outside the family, such as with friends. Consumer researchers thus far also have not sufficiently explored exchanges during a crucial time in consumers' lives: their adolescence (Belk and Llamas 2011). Research in this area is particularly necessary because exchange transactions pervade the everyday lives of modern adolescents and are woven tightly into the matrix of their social lives (Gianinno and Crittenden 2005). During adolescence, children emerge from their family setting and begin to achieve independence from parents (Youniss and Smollar 1985). To support this process, adolescents increasingly rely on their friends to help construct their social identity (Mangleburg, Doney, and Bristol 2004).

With this research, we examine whether and how different forms of exchanges with friends contribute to define adolescent identity and explain the dynamic interplay of individual, relational, and group identities. Accordingly, we study the experience of exchanges in a field particularly relevant to adolescents: clothing. Clothing symbolizes adolescents' connections to their peer group and enables them to "fit in" with this group (Auty and Elliott 2001). Moreover, we focus particularly on adolescent girls, for whom, relative to adolescent boys, exchanging clothes with friends is a common practice (Lurie 1981).

An interpretive study of 20 adolescent girls (ages 13–18 years) provided a stronger understanding of the experience of clothing exchanges between friends. We combined photographs of the most often exchanged clothes by adolescent girls with in-depth interviews, conducted in the adolescent girls' bedrooms, to ensure an appreciation for their intimate and living space. The data set includes 382 pages of interview transcripts and 60 pictures. Each interview was analyzed for thematic categories, following an emic and bracketing approach (Thompson, Locander, and Pollio 1989).

Why do adolescent girls exchange clothes so often with their friends? Clothing exchanges are a practical way to minimize costs and enlarge their wardrobes with no additional expenditures. Beyond these economic benefits, adolescent girls exchange clothes to interact with their friends and manage their multiple identity projects. Instead of defining a sharp distinction between economic exchange and social exchange though, our results call for a more gradational continuum of clothing exchange that highlights a social scale of friendship, from most to least intimate ("just friends," "good friends," and "close friends"). The clothing exchange continuum guides different forms of exchanges, including balanced reciprocal exchanges with just friends, loans without any expectation of a reciprocal act with good friends, and unbalanced exchanges with close friends. It also determines rules for exchanging (e.g., time periods, place) (Figure 1).

Figure 1: The clothing exchange continuum

Three of the four metaphors identified by Holt (1995), namely, classification, integration, and play, provide a theoretical frame for understanding different processes that underlie the different forms of clothing exchanges. Our findings reveal that adolescent girls use clothing exchanges with just friends as classification, to build affiliations with some adolescent groups and enhance distinctions from others, in an instrumental way. With good friends, adolescent girls exchange clothes through an integration perspective: Clothes serve as resources to interact with significant others and mimic friends' behaviors or attitudes. The analysis further reveals that adolescent girls use clothes sharing with close friends as play, to socialize and preserve existing social bonds. These three consumption practices (following Holt's definitions) contribute to three dimensions of identity construction. That is, by exchanging clothes, adolescent girls define or enhance their individual identity, their group identity, and their relational identity.

Our discussion provides insightful accounts of the status of adolescents as materialistic consumers. Social scientists argue that modern adolescents are "the most brand-oriented, consumer-involved, and materialistic generation in history" (Schor 2004, p. 13). Consumer researchers also posit that materialistic values develop strongly in adolescence and that adolescents need to acquire material goods to develop positive social identities (Chaplin and John 2007, 2010). Concerns about the rising level of materialism in adolescents are thus increasing among consumer behavior researchers. Unlike previous accounts, our research revisits the very question of whether adolescents are materialistic beings in a marketplace that is increasingly oriented toward them as consumers. Because adolescents, who exist in a period of significant uncertainty, count on the symbolic property of clothes (Piacentini 2010), clothing exchanges offer a way to consume more. However, the social scale of friendship offers a different view that reveals how adolescent girls manage multiple identity projects, depending on the form of their clothing exchanges with friends.

Their purpose is not merely to "have" but rather to "be" or even to "become." Thus, adolescent girls seek, express, and ascertain a sense of being through the act of exchanging. With this finding, we provide a more nuanced conceptualization of materialism as a means to understand adolescents' world.

Alliteration Alters: Its Influence in Perceptions of Product Promotions and Pricing

Derick F. Davis, Virginia Tech, USA
Rajesh Bagchi, Virginia Tech, USA
Lauren G. Block, Baruch College, USA

EXTENDED ABSTRACT

Alliteration is the repetition of the initial sound in a word across two or more consecutive and/or adjacent words in a sentence or phrase. Alliteration is common in brand and organizational names (e.g. Best Buy, Coca-Cola, Better Business Bureau), is used extensively in advertising copy, political speeches, poetry and prose, and can facilitate memory and recall (Lea et al. 2008). Alliteration is one of many rhetorical devices, the main purpose of which is to persuade via effective communication (see McQuarrie and Mick 1996 for a framework). As noted by McQuarrie and Mick (1996), rhetoric is used widely, but little has been done (excluding the framework they present) to further theoretical understanding of how rhetorical devices influence consumers. Empirical research in this area is even more rare. Many questions remain in this field of research. Do rhetorical devices in the consumption domain truly exert influence on consumers? If so, in what way? Furthermore, what are some potential mental processes driving any observed effects? We present evidence that alliterative pricing presentations can positively influence price perceptions as well as process evidence for the observed effects.

In this paper we focus on the use of alliteration in communicating pricing for multiple items. We theorize that alliteration has a positive effect on evaluations such that alliterative prices (9 for $.90) are evaluated higher than objectively better nonalliterative prices, such as 9 for $.88, because the alliteration imparts a rhythm to the presentation that "sounds" better. Additionally, we theorize that if brand or product name is included in such pricing presentations, and whether than name is alliterative or not can also influence perceptions. For instance, we predict that "3 Threybles $30" will be rated higher than "3 Fables $30" because all components are alliterative in the former presentation and therefore "sounds" better. We present three studies that demonstrate this effect and provide evidence that supports our contention that the repetition of phonological units in alliterative prices "sounds" better, which in turn influences perceptions of the deal presented.

In study 1 ($n = 118$) we compared two types of price presentations for multiple items (a fictitious soap brand): one where the quantity, brand, and price were all alliterative, and one where quantity and brand where alliterative, the price was not (e.g. 10 Teven for $10 vs. 10 Teven for $9.70). Participants found the fully alliterative presentation (10 Teven for $10) to be a more attractive offer, more attention grabbing, had higher purchase intentions for the product, were happier with the deal, and thought the deal was a better value, than the alternate presentation (all ps < .03). In each case, the effects were fully mediated by participant's perceptions of whether the deal "had a ring to it" or "sounds right" (bootstrap mediation; Preacher and Hayes 2008).

In study 2 ($n = 244$) we used a different product (fictitious shirt brands) and compared the price presentations used in study 1 with two additional presentations, one where quantity and price were alliterative, but the brand was not (e.g. 3 Fables $30), and one where nothing was alliterative but the product was less expensive (e.g. 3 Fables $29). Planned contrasts revealed that participants who saw the fully alliterative presentation (e.g. 3 Threybles $30) were more likely to buy the product, thought the deal was more attention grabbing, were happier with the deal, and thought it was a better

deal than any other type of presentation (all ps < .05). As in study 1, all the effects were fully mediated by participant's perceptions of whether the deal "had a ring to it" or "sounds right" (bootstrap mediation; Preacher and Hayes 2008). Additionally, we rule out other potential process explanations including message recall, unit cost calculation difficulty, cost importance, attention, brand name typicality, and verbal/visual processing style (Childers, Houston, and Heckler 1985).

Study 3 was a 2 (Price/Quantity Presentation: Alliterative vs. Nonalliterative) x 2 (Cognitive Load: High vs. Low) full factorial between-subjects experimental design ($n = 108$). Nonalliterative price/quantity presentations (e.g. 2 for $19) always represented an objectively better deal than alliterative price/quantity presentations (e.g. 2 for $20). Cognitive load was achieved by asking participants to remember 7 words (high load) or 2 words (low load). We reasoned that rehearsal of the words in high load conditions would inhibit the positive effect of alliteration on price perceptions by disrupting the repetitive rhythm present in the price presentation. Therefore alliteration effects should persist under low load, but not high load conditions. Analysis of the data revealed significant two-way interactions for six dependent variables (all ps < .05). Planned contrasts revealed that the means were in the predicted direction, individuals who read alliterative price/quantity presentations while experiencing low cognitive load thought the offer was more attractive, were more likely to buy the product, thought the deal was more attention grabbing, had higher purchase intentions, and thought the deal was better and presented more value than in any other condition (all ps < .05).

In summary, this work presents the first (to the best of our knowledge) empirical demonstration that alliterative price presentations can influence perceptions of promotions. We contribute theoretically to the understanding of how rhetorical devices, such as alliteration, can influence consumers. More specifically, we provide process evidence supporting our contention that the rhythm-inducing effect of alliteration "sounds right" to consumers, which in turn influences perceptions. Furthermore, we can "turn off" this effect by interrupting the alliteration's repetitive rhythm via memorizing nonalliterative words. We situate this research at the intersection of phonological theories in marketing (e.g. Argo, Popa, and Smith 2010; Lowry and Shrum 2007; Yorkston and Menon 2004) and the use of rhetoric in marketing (McQuarrie and Mick 1996).

The Secondary Contamination Effect of Luck

Chun-Ming Yang, Ming Chuan University, Taiwan
Edward Ku, National Kaohsiung University of Hospitality and Tourism, Taiwan

EXTENDED ABSTRACT

The influences of superstition in consumer's daily life are prevalent. Superstition are peculiar beliefs which presumed to not be veridical (Berenbaum, Kerns, and Raghavan 2000) and do not have a rational, empirical, or scientifically established link to an outcome they are intended to influence (Kramer and Block 2011). Despite it may be denied on the conscious level, recent development in consumer psychology has demonstrated that consumers are affected by various superstition beliefs (Block and Kramer 2009; Jiang, Cho, and Adaval 2009; Kramer and Block 2008, 2011). Drawing on the research in social psychology, this research introduces the secondary contamination effect and demonstrates its influences on consumer's self-rated winning likelihood and risk-taking behavior.

In the current research, we define the secondary contamination effect as the consumer's responses affected by physically contacting with a contaminated vehicle. Originated from medical and social psychology literature (Hejmadi, Rozin, and Siegal 2004; Nemeroff and Rozin 2000; Rozin, Markwith, and McCauley 1994; Rozin and Nemeroff 1990; Rozin et al. 1989), the research stream on the law of contagion has indicated the possibility of the secondary contamination effect. Participants in these literatures consistently showed negative responses toward some contaminated objects (e.g., food or sweaters) because they believed that touching a contaminated object may make healthy people sick or catch some negative essences. In this research, the authors hypothesize that touching a contaminated vehicle may affect consumer's responses. More specifically, by either actually or virtually contacting with a source with different luck characteristic (lucky or unlucky), an originally neutral vehicle (e.g. a pen) is transformed into a contaminated vehicle, and a recipient's responses will be in turn affected by physically contacting with it. The authors conducted four experiments to test the hypothesis.

82 undergraduate students (42 male) participated in a hypothetical beverage taste evaluation study. They were randomly assigned to one of three different source characteristics (Lucky, Unlucky, or Control). When participants arrived at the research lab, they were asked to wait in a separate room for five more minutes because of the late arrival of another research assistant (i.e. our confederate). One minute later, the confederate appeared and explained why he was late.

We manipulated source characteristics by presenting different excuses for confederate's late arrival. In the (Un)Lucky condition, the confederate told the participant he was late because the local police station informed him that his lost wallet was found and his money were safe (were taken). In the control condition, the confederate was late because of traffic jam. After explaining the reason, our confederate poured drinks into a plain paper cup in front of the participants and told them to taste the drink as much as they want before reporting their evaluation. We measured participants' taste evaluation with three seven-point scales ($\alpha = .79$). Following the taste evaluation task the confederate informed our participants that they had a chance to win an additional $30 prize in order to appreciate their contribution. Participants were then asked to rate their likelihood of winning this lottery game with a seven-point scale. Results of an one-way ANOVA indicated that there were significant differences on self-rated winning likelihood between groups ($F(2, 79) = 10.47$, $p < .001$). A post-hoc analysis suggested that participants in the Lucky condition reported highest likelihood ($M = 4.85$), followed by the control condition ($M = 3.92$), and lowest winning likelihood for participants in the Unlucky condition ($M = 2.79$). However, results of another ANOVA showed no significant difference on taste evaluation ($F(2, 79) = .45$, $p > .60$, $M = 5.31$). Experiment 1 provided initial evidence for the secondary contamination effect.

Experiment 2 examines the influences of consumer's trait superstition (Carlson, Moen, and Fang 2009). The authors argue that consumer's trait superstition will moderate the relationship between source luck characteristics and downstream responses. Specifically, the secondary contamination effect will be stronger for those high in trait superstition. 145 undergraduate students participated in Experiment 2.

The procedure and manipulations were identical with experiment 1 except two modifications. First, in the current experiment, before our confederate's arrival, participants completed an unrelated lifestyle questionnaire. In this questionnaire, we captured participant's trait superstition with seven items adopted from Carlson et al. (2009). Secondly, participants participated in another ostensibly unrelated task after the taste valuation task. They were invited to a bigger or smaller game, and they could bet any amount on with their participation fee ($5). The betted amount was recorded as the dependent variable.

Multiple regression was conducted to test our hypothesis. Source characteristics were coded as two dummy variables using control condition as the baseline. As we expected, results indicated that Lucky condition had a positive effect on betting amount ($\beta = .16$, $p < .05$) and Unlucky condition had a negative coefficient ($\beta = -.28$, $p < .01$). Trait superstition had no direct influence ($p > .60$), but its interactions with both dummy variables reached significance. More specifically, for high-trait-superstition participants, the influence of (Un)Lucky condition on the betting amount was stronger (Lucky: $\beta = .18$, $p < .05$; Unlucky: $\beta = .27$, $p < .01$), comparing with those of low trait superstition.

In another two experiments, the authors found that the secondary contamination effect was attenuated when the participants believed that luck is an indivisible personal resource (experiment 3). Moreover, by modifying our experiment procedure, experiment 4 demonstrated that participant's direct observation was not a necessary condition for the secondary contamination effect.

This research contributes to the literature in consumer psychology in several ways. First, we introduced the secondary contamination effect into consumer research context. Second, our research answers a recent call for more research on the synergistic effects of various forms of peculiar beliefs (Kramer and Block, 2011). Third, the current research also suggests that people may take more risk just because they incidentally touch a contaminated vehicle.

Shifting Identities and Brand Preferences: How and When A Malleable Identity Helps Individuals Differentiate, and the Role of Brands

Sara Dommer, University of Pittsburgh, USA
Vanitha Swaminathan, University of Pittsburgh, USA
Rohini Ahluwalia, University of Minnesota, USA

EXTENDED ABSTRACT

Brand names enable consumers to express their self-identities in various ways (Fournier 1994; Swaminathan, Page, and Gürhan-Canli 2007). For instance, Vans shoes, whose slogan is "Off the wall," are likely to appeal to consumers who would like to exhibit their distinctiveness from the group. In contrast, Mercedes Benz's "Unlike any other" slogan will potentially attract consumers interested in demonstrating their superiority to others. Brands can also emphasize their power in helping consumers connect with others, such as AT&T's slogan, "Reach out and touch someone." While the symbolic use of brands has been an important topic in consumer behavior (Belk 1988), more recent research has been devoted to developing a greater understanding of *why* consumers use products and brands to express their identities.

According to symbolic self-completion theory, individuals use material possessions and other indicators to communicate aspects of the self, particularly when individuals feel insecure in such aspects (Braun and Wicklund 1989). Consumers have been known use brands to strengthen their belongingness to social groups (Escalas and Bettman 2005; Reed 2004; Swaminathan et al. 2007) or to cope with interpersonal rejection and social exclusion (Loveland, Smeesters, and Mandel 2010). While there is a lot of research suggesting that social exclusion and the need for belongingness can motivate consumers to use brands to blend in to their social surroundings, recent research has shifted the focus away from belongingness to understanding the role of distinctiveness (Chan, Berger and van Boven 2012).

The present research argues for two moderators that have not been examined previously: (1) need for belongingness; (2) self-esteem, which jointly create a preference for two types of differentiated brands (i.e., horizontally and vertically differentiated brands). In summary, this research suggests that there are two primary ways in which individuals (particularly those with low self-esteem) can differentiate themselves from others within their reference group: horizontal and vertical differentiation (Tafarodi, Marshall, and Katsura 2004). Horizontal differentiation implies achieving distinction by going against the norms of the reference group and distancing oneself from it. Second, individuals can achieve distinctiveness by being better (or superior) to others in a reference group, which is known as vertical differentiation. We argue that a preference for horizontal and vertical differentiated brands will be driven by an interaction of need for belongingness and self-esteem. Our hypotheses, which argue for an interaction of need for belongingness and self-esteem on preferences for horizontally and vertically differentiated brands as follows:

(1) When need for belongingness is high (i.e., social exclusion), preferences for horizontally differentiated brands will vary as a function of self-esteem such that: (a) Individuals high in self-esteem will seek to re-affirm their belongingness by increasing attachment to the in-group linked brand; (b) Individuals low in self-esteem will shift their identity and increase their preference for brands which are horizontally differentiated from the in-group brand, in order to reaffirm their belongingness elsewhere.

(2) When need for belongingness is low (i.e., social inclusion), preferences for vertically differentiated brands will vary as a function of self-esteem such that: (c) Individuals high in self-esteem will show no change in their preference for in-group linked brand; (d) Individuals low in self-esteem will increase their preference for brands which are vertically differentiated from the in-group.

METHOD

We used multiple approaches to test our hypotheses to establish the robustness of these results. In study 1, we identified a particular reference group (i.e., college students) and manipulated positioning strategies for a brand (i.e., Motorola cell phones) such that the same brand was positioned as in-group-consistent, exclusive, or counterconformity. In study 2, we allowed the reference group to vary by letting participants name both the reference group as well as the brands. Thus, both reference groups and brands were idiosyncratic to each individual. In study 3, we pre-selected both the reference group (i.e., business school student) as well as the brands using a pretest. Further, we utilized multiple dependent variables across studies ranging from purchase likelihood (study 1), to brand attachment (study 2), to brand choice (study 3). In Study 4, we changed the manipulation of social exclusion and used a Cyberball manipulation to demonstrate the effects. Results confirm our hypotheses.

FINDINGS

Taken together, the results from four studies provide strong support for the hypothesized conditions under which consumers use brands to either blend in or stand out. Our results make a few important contributions to the literature. First, much of the literature has shown how brands help fulfill belongingness needs (Loveland et al. 2010; Swaminathan, Stilley, and Ahluwalia 2009). We go beyond these findings to demonstrate that when belongingness is satiated or made temporarily unattainable, some individuals (i.e., those with low self-esteem) may seek differentiating counterconformity brands or exclusive brands.

Second, while the majority of the literature has focused on how brands can help consumers belong (Loveland et al. 2010), we extend this literature by showing that brands can also help consumers stand out, in line with recent research (Chan et al. 2012). We identify two moderators of the desire to seek brands that are differentiated from the reference group, i.e., need for belongingness and self-esteem. It is shown that when low self-esteem individuals' belongingness needs are thwarted, they shift their identity and increase their affiliation for brands that are distinct from the core brand. We show that when low self-esteem consumers' belongingness needs are attained via social inclusion their preference for exclusive brands increases. Because their belongingness needs have been attained, LSE consumers' focus most likely shifts to eliciting admiration from others in the in-group. An exclusive brand, which vertical differentiates one from the group, affords consumers the opportunity to be superior, or ideal, members of the group.

The present research demonstrates conditions under which consumers use brands for identity expression, be it group membership or differentiation. Reed (2004) supports the idea that identity expression can vary in importance based on contextual cues that may make identity more salient or important. An individuals' construal of self (Escalas and Bettman 2005; Swaminathan et al. 2007), and type of reference groups (White and Dahl 2007) also play roles in identity expression. We add to this stream by demonstrating that consumers

use brands express various identities (individual or social) depending upon whether they feel social excluded or included. By highlighting the moderating role of self-esteem in the desire for horizontal and vertical differentiation, we build upon White and Argo (2009)'s findings regarding the role of collective self-esteem in exhibiting identity avoidance effects.

Resistance to Persuasion: Minimizing Cognitive Effort by Implicit Forewarning

Marieke L. Fransen, University of Amsterdam, The Netherlands

EXTENDED ABSTRACT

Almost constantly people try to convince others to change their behavior. To reinforce their persuasive attempt, senders often use heuristic cues, such as 'expensive is good' and 'if an expert says so, it must be true' (Chaiken, Liberman, and Eagly 1989; Kruglanski and Thompson 1999; Petty, Cacioppo, and Schumann 1983). Recipients' reliance on these heuristic cues as a decision rule has been described as an automatic and unintentional process (e.g., Bargh and Ferguson 2000; Devine 1989; Dovidio, Evans, and Tyler 1986; Janiszewski 1988). Persuasion thus often happens because consumers automatically rely on heuristic cues concealed in persuasive messages (e.g., Bargh 2004; Cialdini 1993; Langer 1992). This automaticity may subsequently result in biased judgment (Tversky and Kahneman 1974) potentially hurting personal benefits.

 Research showed that even though the persuasiveness of heuristic cues is subtle and pervasive, people can correct for them by motivated effortful processing (e.g., Blair 2001, Forehand and Perkins 2005; Gorn, Jiang, and Johar 2008; but see Bargh 1999) which can be instigated by traditional resistance strategies like forewarning (Freedman and Sears 1965). Forewarning has been found to reduce the impact of persuasive messages by signaling risk, subsequently inducing effortful processing, counter-arguing, and attitude bolstering. Unfortunately, forewarning requires cognitive capacity (Freedman and Sears 1965; Hass and Grady 1975; Papageorgis 1968). In many situations, however, people lack the motivation and/or ability to devote their limited cognitive capacity (Baumeister et al. 1998; Baumeister, Vohs, and Tice 2007; Fennis, Janssen, and Vohs 2009; Vohs and Faber 2007) to the resistance of persuasive appeals.

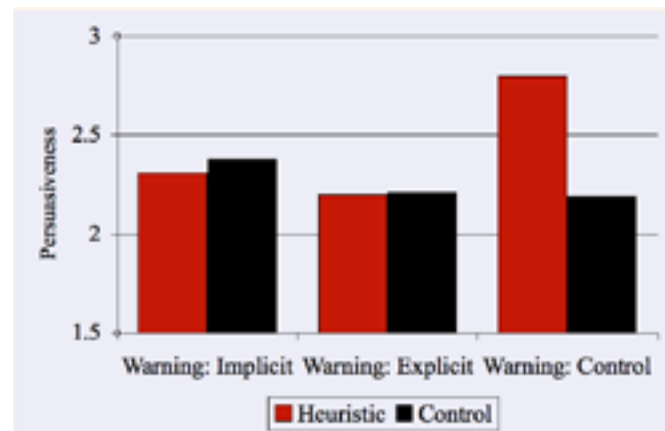
Does this leave the consumer defenseless against the influence of persuasive messages that rely on subtle cues? Recent research suggests not. Laran, Dalton, and Andrade (2011) recently showed that consumers sometimes correct for the effects of subtle marketing tactics by relying on automatic responses. The advantage of these automatic responses is that they do not require cognitive capacity (see the 'smart unconscious' Dijksterhuis 2004; Dijksterhuis et al. 2006). In the present research, it is suggested that implicitly warning people by reminding (i.e., priming) them of a situation in which someone tried to influence their behavior may automatically activate the responses that are associated with explicit (traditional) forewarning and therefore exert similar effects (i.e., reduce persuasion).

In sum, it is expected that explicit and implicit forewarning both enhance resistance towards an advertisement that includes a heuristic cue (compared to a control condition). However, explicit forewarning will consume more energy than implicit forewarning.

Experiment 1 tested the hypothesis that explicit and implicit forewarning both reduce persuasion. We conducted a 3 (forewarning: explicit vs. implicit vs. control) x 2 (heuristic cue: present vs. absent) between-subjects design. In the explicit forewarning condition, participants were informed that they would be exposed to an advertisement trying to convince them that the advertised brand is the best in it's kind. Participants in the implicit forewarning condition were instructed to recall a situation in which someone had tried to influence their behavior. In the control condition participants recalled a situation in which they had travelled with public transport. Next, participants were exposed to an advertisement in which a heuristic cue ('scientifically proven') was present or not. Subsequently, the persuasiveness of the advertisement was measured.

The results demonstrated no main effects of forewarning and heuristic cue. However, we did find the expected interaction effect between forewarning and heuristic cue ($F(1, 162) = 3.26$, $p < .05$). Simple main effect analyses demonstrated that participants who were not forewarned rated the advertisement with the heuristic cue as more persuasive ($M = 2.8$, SD = .74) than the control advertisement ($M = 2.14$, SD = .78; $F(1, 162) = 8.38$, $p < .00$). This effect, however, was not observed in both the explicit ($F(1, 162) < 1$) and the implicit forewarning conditions ($F(1, 162) < 1$, see figure 1). This indicates that forewarning consumers (explicit and implicit) eliminates the impact of heuristics in advertisements.

Figure 1.

Persuasiveness as a function of heuristic cue and warning


In a second experiment we included a depletion measure to assess whether implicit forewarning indeed consumes less energy than explicit forewarning. The design and method was exactly the same as in Experiment 1 although we used another heuristic cue (expert endorser). After participants evaluated the persuasiveness of the advertisement, the amount of energy consumption was measured. Participants responded to several cognitively demanding assignments. The idea behind this measure is that participants who provide more correct answers have more energy left and have thus spent less energy in resisting the message (Schmeichel et al. 2003; Fennis et al. 2009).

A main effect of heuristic cue was observed ($F(1, 135) = 6.12$, $p < .05$, such that the advertisement including the heuristic cue was observed as more persuasive ($M = 2.65$, SD = .70) than the control advertisement ($M = 2.36$, SD = .66). More importantly, the results yielded an interaction effect between forewarning and heuristic cue ($F(1, 135) = 3.64$, $p < .05$). Simple main effect analyses demonstrated that participants who were not forewarned rated the advertisement with the heuristic cue as more persuasive ($M = 2.90$, SD = .73) than the control advertisement ($M = 2.19$, SD = .64; $F(1, 135) = 13.32$, $p < .00$). This effect was not found in both the explicit ($F(1, 135) < 1$) and the implicit forewarning conditions ($F(1, 135) < 1$, see figure 2). This indicates that forewarning consumers (explicit and implicit) reduces the impact of heuristics in advertisements. However, participants in the explicit forewarning condition were more depleted, reflected in lower scores on the cognitive demanding assignments, ($M = 3.30$, SD = 1.56) than participants in both the implicit forewarning condition ($M = 4.04$, SD = 2.39; $p = 0.85$) and the control condition ($M = 4.33$, SD = 2.11; $p < .05$, see figure 3). These results demonstrate that although implicit and explicit forewarning both enhance resistance,

participants in the implicit forewarning condition consume less energy in doing so than participants in the explicit forewarning condition.

These findings provide a first empirical demonstration of the working of implicit resistance strategies. The major advantage of this kind of strategy is that it limits energy consumption making it more useful in many real life situations.

New Variables for the Brand Prominence Construct

Heather M. Schulz, University of Nebraska at Kearney, USA
Steven A. Schulz, University of Nebraska at Kearney, USA

EXTENDED ABSTRACT

Brand prominence is a new construct in the literature associated with status signaling. Brand prominence describes, "the conspicuousness of a brand's mark or logo on a product" (Han, Nunes, and Dreze 2010, p. 15). The current study was designed to extend the literature on brand prominence by supplying three new variables of brand prominence: 1) brand presence, 2) brand frequency, and 3) brand abbreviation. These variables break down conspicuousness into more quantifiably measurable categories. A survey was conducted where respondents were shown images of shirts with manipulations of each of these variables and were asked about their behavioral intentions towards these items. Results reveal several statistically significant differences between men and women in their approach to the process of brand prominence behavioral intentions.

Han, Nunes and Dreze (2010) introduced the construct of brand prominence and through content analyses found that for luxury brands, brand prominence decreases as the price of the luxury item increased. The researchers also developed a taxonomy that classifies consumers according to their level of personal wealth and their need for status. From this, four consumer lifestyles associated with the use of products with difference levels of brand prominence: 1) patricians, 2) parvenus, 3) proletarians, and 4) poseurs. Individuals in these groups engage in strategic behaviors through conspicuous consumption in order to associate or dissociate themselves from individuals in other social groups.

The conspicuous consumption literature is the study of status signaling by individuals in a community. Conspicuous consumption describes the displayed use of a brand or a product in a social atmosphere. Veblen (1899/1994) is one of the seminal authors on this subject, and is heavily cited in the literature. Contemporary conspicuous consumption researchers have studied the social meaning (O'Cass and Frost 2002), social utility (Thompson and Norton 2011), social value (Wiedmann, Hennings, and Siebles 2009), and social power (Crosno, Freling, and Skinner 2009) associated with the signaling of one's status through the conspicuous consumption of luxury brands.

Research by Schulz (2009; 2011) has uncovered several themes for brands that are consumed by individuals in the public atmosphere. The major themes include: brand visibility, brand distribution, brand frequency, and brand abbreviation. Each theme also has several sub-themes. For example, brand frequency is made up of: 1) individual unique brand frequency, 2) individual gross brand frequency, 3) product unique brand frequency, and 4) product gross brand frequency. Several of these sub-themes were adapted into behavioral intention variables for brand presence in this study.

A survey was administered to 300 participants in a nationally-representative sample of the U.S. adult population. The survey captured participants' demographics and behavioral intentions towards brand presence variable manipulations across four conditions. The photographic stimuli for the brand prominence conditions can be seen in figure 1. A cross-sectional analysis was conducted in order to see what connections exist among brand presence behavioral intentions.

Figure 1: Stimuli for Brand Presence Variables

First, frequencies for the brand presence variable in the Armani and the Abercrombie & Fitch conditions show evenly distributed preferences among the aggregated consumer data. About half of the population prefers the shirt with the visible logo, while the other half prefers the shirt without the visible logo. However, when the data is split by sex, one can see that in both scenarios the majority of men preferred the shirt without the visible logo, while the majority of women preferred the shirt with the visible logo. In terms of the brand frequency (Armani) condition, the majority of both men and women prefer the shirt with only one logo versus the shirt with three logos. Finally, for the brand abbreviation (Abercrombie & Fitch) condition, the majority of both men and women prefer the shirt with the full logo rather than the abbreviated logo. Table 1 summarizes these results. Chi-square tests also reveal that gender differences produced significant effects in every condition. These results can be seen in table 2.

Overall, the results of this study show that on average, most consumers prefer the more subtle signal variations of brand prominence variables such as brand frequency. However, most consumers also prefer the fuller version of a brand signal rather than an abbreviated version. Plus, in relation to brand presence most men prefer clothes without branded signals, while most women prefer clothes with branded signals. Further testing of variables related to the brand prominence construct may aid in gaining a better understanding of consumer behavior related to status signaling and conspicuous consumption.

Table 1: Behavioral Intention Frequencies

Brand Prominence Variable	Condition	Women	Men	Total
Brand Presence	No logo (Armani)	31.5%	79.0%	53.3%
	Visible logo (Armani)	68.5%	21.0%	46.7%
Brand Presence	No logo (Abercrombie & Fitch)	23.5%	75.4%	47.3%
	Visible logo (Abercrombie & Fitch)	76.5%	24.6%	52.7%
Brand Frequency	One logo (Armani)	77.8%	93.5%	85.0%
	Three logos (Armani)	22.2%	6.5%	15.0%
Brand Abbreviation	Logo initials (Abercrombie & Fitch)	25.3%	15.2%	20.7%
	Full logo (Abercrombie & Fitch)	74.7%	84.8%	79.3%

Table 2: Behavioral Intention Chi-Square Tests for Gender

Brand Prominence Variable	df	Sample (N)	Pearson Value (X^2)	Significance (p)
Brand Presence (Armani)	1	300	67.57	< 0.001
Brand Presence (Abercrombie & Fitch)	1	300	80.54	< 0.001
Brand Frequency (Armani)	1	300	14.41	< 0.001
Brand Abbreviation (Abercrombie & Fitch)	1	300	4.63	< 0.05

Preferred Persuasion:
How Self Construal Changes Consumer Responses to Persuasion Attempts

Wenxia Guo, University of Manitoba, Canada
Kelley J. Main, University of Manitoba, Canada

EXTENDED ABSTRACT

While the literature on self-construal (independent versus interdependent) has examined such topics as advertisement appeals (Aaker 2000) and values (Triandis 1995), no research so far has investigated how self-construal influences consumers' responses to persuasion attempts. An independent self-construal is oriented towards the self (Miller 1984). Thus, a consumer with a salient independent self-view may evaluate a salesclerk based on his/her prior view of salesclerks (e.g., dishonest, a negative stereotype, Babin et al. 1995) with less influence of the type of persuasion attempt used. An interdependent self-construal is oriented towards social contexts (Miller 1984) and is more likely to be influenced by others and situational information (Iyengar and Lepper 1999), which may make the type of persuasion attempt matter when evaluating salesclerks. Further, when an interdependent self-construal is activated, people's sense of uniqueness may be threatened, which may make them more sensitive to individually focused persuasion (e.g., messages focused on distinctiveness) during the interaction with salesclerks.

The following studies examine whether individuals with a dominant interdependent self-construal should have higher perceived trustworthiness in a salesclerk and a higher need for uniqueness when processing individually focused persuasion attempts than interpersonally focused persuasion attempts. This difference will be attenuated for individuals with a dominant independent self-construal.

STUDY 1

75 participants from a Chinese university in Beijing were randomly assigned to a 2 (persuasion attempt: individually vs. interpersonally focused) × 2 (primed self-construal: independent vs. interdependent) between-subjects design. A pronoun (first-personal singular vs. plural) circling task in a paragraph involving a trip to a restaurant (Oyserman et al. 2009) primed independent versus interdependent. Next, a scenario was used to manipulate the interpersonally vs. individually focused persuasion attempt. The dependent variables were salesclerk trustworthiness (Main et al. 2007) and need for unique choice (Tian et al. 2001).

Results showed that when participants were primed with an interdependent self-construal, individually focused persuasion attempts led to higher trustworthiness ($F(1, 71) = 5.21$, $p < 0.01$, $M_{\text{interpersonally focused}} = 4.04$, $M_{\text{individually focused}} = 4.58$) and need for unique choice ($F(1,71) = 3.14$, $p < 0.1$, $M_{\text{interpersonally focused}} = 2.98$, $M_{\text{individually focused}} = 3.42$) than interpersonally focused persuasion attempts. However, when participants were primed with an independent self-construal, these effects were attenuated.

STUDY 2

This was a field study where interdependent self-construal was measured (Singelis, 1994). 79 participants were randomly assigned to two conditions (persuasion attempt: individually vs. interpersonally focused) and received $7 compensation.

Two new product lines were created solely for the purpose of this research so that students would be unfamiliar with the products. Participants were instructed to visit a retail store and evaluate the new product lines that were on display. A female confederate in her mid forties was selected to act as a company representative. She was responsible for the administration of the persuasion attempt: a uniqueness focused statement (individually focused) or a connection focused statement (interpersonally focused).

Regression analysis was conducted with persuasion attempts (dummy code), level of interdependence (mean-centered score; Aiken and West 1991), and the interaction term included in the model as predictors. There was a significant interaction between persuasion attempt type and the level of interdependence on trustworthiness ($\beta = 0.36$, $p < 0.05$) and need for unique choice ($\beta = 0.31$, $p < 0.05$) respectively. Simple slope analysis at one standard deviation above the mean of interdependence indicated a significant difference such that participants with a high level of interdependence trusted the clerk more ($\beta = 0.75$, $t = 2.58$, $p < 0.01$) and had higher need for unique choice ($\beta = 0.63$, $t = 2.20$, $p < 0.05$) for individually focused as compared to interpersonally focused persuasion attempts. Simple slope analysis at one standard deviation below the mean of interdependence showed no significant difference.

STUDY 3

Study 3 was to test the underlying process for the effect observed in proceeding studies. Briley and Aaker (2006) suggest that cognitive load is an alternative way to examine the underlying process from cross cultural studies. We propose that under low cognitive load, persuasion knowledge mediates the relationship between the interaction of persuasion attempts and self-construal on trustworthiness.

156 participants were randomly assigned to a 2 (persuasion attempt: individually vs. interpersonally focused) × 2 (primed self-construal: independent vs. interdependent) × 2 (cognitive load: high vs. low) between-subjects design. First, participants were primed with either an independent or interdependent self-construal adapted from Mandel (2003). The persuasion attempt manipulation was the same as study 1. The manipulation of high (vs. low) cognitive load required (vs. did not require) participants to remember eight numbers presented in the scenario.

Results illustrated a significant three-way interaction ($F(1,148) = 12.8$, $p < 0.001$) that showed self-construal had impacts on processing persuasion attempts under low cognitive load. We bootstrapped the indirect effect of the different persuasion attempts and priming on trustworthiness (Hayes and Matthes 2009). The 95% CIs demonstrated that the indirect interaction between persuasion attempt type and priming through persuasion knowledge on trustworthiness was significantly different from zero under low cognitive load, but was not significant under high cognitive load.

DISCUSSION

The present research contributes to the literature from several perspectives. First, this research integrates self-construal into the Persuasion Knowledge Model (Friestad and Wright 1994). Second, we identify a counterintuitive result given current research in the advertising literature. Advertising appeals that are compatible with a salient independent (versus interdependent) self result in more positive effects than appeals that are incompatible (e.g., Han and Shavitt 1994). However, the current study finds that when an interdependent self-construal is made salient, individually rather than interpersonally focused persuasion attempts result in more positive consumer perceptions. That is, an incompatible effect occurs in a retailing context.

Third, we contribute to the psychological literature by showing that priming participants with an interdependent self-construal can threaten their fundamental need for distinctiveness and thus results in a higher need for uniqueness. Subsequently, this threat affects people's interactions with others. In a retailing context, consumers may be more sensitive to individually focused persuasion attempts (i.e. focusing on uniqueness) which may help them rebuild their sense of uniqueness.

Consumer Propensity to Resist (CPR): Measurement and Validation

Annie Stéphanie Banikema, Groupe Sup de Co Amiens-Picardie, France
Dominique Roux, Université Paris Sud, France

EXTENDED ABSTRACT

This paper offers a valid measure of Consumer Propensity to Resist (CPR). A qualitative research helps define the construct. Then, a scale is developed through four samples from 1,476 individuals. A final model confirms the links between Self-Affirmation and Self-Protection, their antecedents and effects on various buying behavior.

THEORETICAL GAP AND RESEARCH QUESTIONS

Culturalist approaches have explored various forms of opposition in which people express their rejection of market structures (Peñaloza and Price 1993). However, from a micro-social perspective, research paradoxically presents a significant gap at the individual level. Thus, the aim of this paper is to provide a reliable and valid measurement tool of the consumer's propensity to resist (CPR), capable of predicting critical motivations and various buying behaviors in the marketplace. Its theoretical underpinnings rest on Mowen's (2000) hierarchical model of personality and motivation, where CPR is conceptualized as a situational trait i.e. resulting from the joint effects of elemental traits, compound traits and the situational context in which the behavior occurs.

LITERATURE REVIEW

Numerous qualitative approaches have focused on resistant behavior in various contexts (Close and Zinkhan 2009; Dobscha and Ozanne 2001; Giesler 2006; Holt 2002; Kozinets 2002; Kozinets and Handelman 2004; Romani, Grappi, and Dalli 2012; Sandikci and Ekici 2009; Thomson and Arsel 2004). Yet, although it is likely that people react differently to influences exerted on them, there has been very little research on capturing this individual trait. The anti-commercial consumer rebellion (ACR) measure proposed by Austin, Plouffe and Peters (2005) in fact focuses on resistant behavior rather than the propensity to adopt such behavior. The Iyer and Muncy (2009) anti-consumption measure is also mainly behavioral and noticeably different from resistance (Lee et al. 2011). Hence, a dispositional approach to consumer propensity to resist still has to be constructed.

METHOD

A two-step qualitative study provided an in-depth understanding of the dimensions of the construct and of its determinants and consequences. A measurement tool was then developed, covering four different market influence contexts—selling, advertising, retail and marketing—and replicated for the first two context. Finally, a structural equation model, including determinants and effects of CPR, was tested.

FINDINGS

The results of the qualitative study first show that CPR is an inherently volitional construct expressing the commitment and effort needed to enact a desired behavior (Bagozzi 1993; Perugini and Conner 2000). Two distinct orientations underpin informants' psychological orientation: for some, the wish to assert themselves, and for others, to protect themselves. Hence, CPR is conceptualized as a personality trait whose observable manifestations in an influence situation—self-affirmation and self-protection—echoes Higgins's (1997) regulatory focus. CPR is thus defined as *the consumer's conscious and voluntary psychological tendency to thwart market influence attempts, in order to self-regulate his consumer decisions and maintain self-control*.

The qualitative study provided 31 items—15 for the "Affirmation" and 16 for the "Protection" dimension—that were then examined by five experts to assess their clarity and relevance. 26 remaining items were purified through two data collections, finally producing a reliable 7-item scale. In the "salespeople" context as well as in the "advertising" context, the scale shows good reliability and convergent validity, based on the observation of confirmatory factor loadings higher than 0.607. It meets the intra-construct discriminant validity condition as the root average variance extracted (AVE) indices for each dimensions exceed the correlation between the two CPR dimensions. Though, an alternative one-dimensional model (in which the two latent variables are regarded as measuring a single construct) was tested. It finally attests to the superiority of the two-dimensional model.

Furthermore, discriminant validity is successfully met since CPR is more highly correlated with its two dimensions than with other potentially similar constructs such as skepticism, metacognition, psychological reactance and cynicism. Finally, the relationships between the antecedents of CPR and its behavioral consequences are tested through structural equation modeling. Based on the theoretical indices that emerged from the qualitative study and the literature review, four antecedents are retained:

- Skepticism (Obermiller and Spangenberg 1988), with which a positive relationship is postulated on both CPR dimensions.
- Metacognition (Friestad and Wright 1994) and Self-confidence (Bearden, Hardesty, and Rose 2001) as antecedents of the "Affirmation" dimension, since persuasion knowledge and self-assurance in everyday life inherently protect the consumer against sources of influence.
- Psychological reactance as an antecedent of the "Protection" dimension, since avoidance behavior is likely to be response to the perceived threat of loss of freedom (Clee and Wicklund 1980).

Five effects variables are also considered for testing the predictive validity:

- Smart shopping (Mano and Elliott 1997), second-hand shoppers' critical motivations (Guiot and Roux 2010) and the tendency to engage in socially responsible consumption (SRC) (François-Lecompte and Roberts 2006). The "Protection" dimension, predisposing consumers to exit, is expected to favor smart shopping or secondhand shopping rather than SRC. Conversely, the "Affirmation" dimension, prompting consumers to openly engage in resistance to the market, would be positively correlated with the SRC dimensions and negatively with smart shopping or alternative channel solutions. However, because of the volitional character of CPR, deal proneness and impulsive buying should be negatively correlated with the two CPR dimensions.

As hypothesized, CPR-Affirmation is well predicted by skepticism, metacognition and the two self-confidence dimensions, while psychological reactance appears, in addition to skepticism, as a specific antecedent of CPR-Protection. Regarding the effects, CPR-Affirmation well predicts expected orientations—both SRC dimen-

sions and critical motivations towards secondhand shopping. It is negatively linked to deal proneness and impulsive buying. Besides, CPR-Protection well predicts smart shopping and critical motivations toward secondhand shopping, but surprisingly, is positively linked to deal proneness and impulsive buying. Similarly, the postulated negative link between the CPR-Protection and SRC proves to be non-significant, showing that these consumers seem not to view responsible consumption as a relevant orientation to avoid market influence.

CONTRIBUTIONS

Ultimately, the CPR scale shows satisfactory psychometric properties. It has the advantage of being formulated so as to be adaptable to other contexts of market influence mechanisms. Overall, it captures consumers' tendency to resist, which reflects their dominant orientation in terms of regulatory focus (Higgins 1997). Finally, it shows that while CPR-Affirmation profiles are prone to oppose influence attempts, CPR-Protection consumers succumb to these more easily than first thought.

Negative Consumption Episodes, Counterfactuals and Persuasion

Kai-Yu Wang, Brock University, Canada
Xiaojing Yang, University of Wisconsin-Milwaukee, U.S.A.
Shailendra P. Jain, University of Washington, U.S.A.

EXTENDED ABSTRACT

Consumption outcomes often induce different consumer post-purchase responses, with one of them being counterfactual thinking (CFT). CFT refers to the process of reflecting on past events and simulating alternative possible outcomes. For example, in a consumption context, imagine that a consumer finds her HDTV needs repair just after the warranty expires. This consumer may think to herself: "If only I had purchased a TV with an extended warranty, I would not have to incur so much cost on this repair." CFT impacts consumers' emotions, judgments and decision making, and occurs in a variety of contexts, regardless of the valence of purchase outcomes. However, negative purchase outcomes are more likely to evoke CFT (Wang, Liang, and Peracchio, 2011). CFT plays an important role in an individual's experience of emotions such as regret and disappointment (Zeelenberg, van Dijk, van der Pligt, Manstead, van Empelen, and Reinderman, 1998) and these emotions influence customer dissatisfaction and behavioral response (e.g., brand switching and complaint) (Zeelenberg and Pieters, 2004).

Only a handful of studies have explored the impact of CFT on information processing and persuasion in consumer settings. In their research, Krishnamurthy and Sivaraman (2002) view CFT as a problem-solving function and investigate its influence on future problem-solving behaviors. They find that CFT makes consumers scrutinize ad claims encountered subsequent to the CFT generating episode. Upward CFT makes consumers feel worse vis-a-vis their chosen product, making them examine incoming information more carefully to prepare for the future. If we think of CFT as a preparative (problem-solving) function, CFT may influence consumers' preferences for different types of advertising. To examine this possibility and identify how CFT impacts such ad receipt, this research focuses on ad persuasion processes that involve CFT. In specific, we investigate how CFT initiated by a negative purchase experience impacts consumers' subsequent receipt of comparative versus noncomparative ads. Such motivational priming processes are only beginning to be understood in social psychology (Roese, Hur, & Pennington, 1999), and have not received much attention in the consumer behavior literature. Expanding on prior research in counterfactual priming effects (Kray, Galinsky, & Wong, 2006), our investigation examines whether a counterfactual mind-set evoked by a negative consumption episode may influence information processing and persuasion in subsequent related as well as unrelated consumption contexts.

We argue that comparative ads evoke both, approach and avoidance motivations, whereas noncomparative ads induce mostly approach motivations (Jain, Agrawal, and Maheswaran, 2006). Further, we expect that when individuals engage in counterfactual comparisons, the advertised brand in a comparative ad will be judged more favorably than the one in a noncomparative ad. This will be so because motivations (approach and avoidance) evoked by counterfactual comparisons are consistent with the motivations engendered by comparative ads. In contrast, when consumers engage in past-temporal comparisons (fact-based comparisons as opposed to simulation-based counterfactual comparisons), the brand in a noncomparative ad will be evaluated more positively because of the motivational (approach) consistency between processing focus and ad frames.

We conducted two experiments examining the impact of CFT in response to a previous negative consumption experience on the effectiveness of subsequently encountered advertising appeals. Experiment 1's stimulus featured the same category in the consumption experience and the ad. Experiment 2 featured a different category in the consumption episode vis-à-vis the one featured in the ad. Varying the category enabled us to test the robustness of our findings.

In both experiments, counterfactual thinking (CFT and control) and ad format (comparative and noncomparative) were manipulated. We hypothesized that when presented with a comparative ad, respondents encouraged to think counterfactually (vs control respondents) will generate higher ad evaluations, brand evaluations, and purchase intentions. In contrast, when presented with a noncomparative ad, control (vs CFT) respondents will generate higher ad evaluations, brand evaluations, and purchase intentions. The results for the two experiments were consistent with our predictions. Examination and analysis of thoughts provided additional support for the hypotheses.

Taken together, these two studies support much of our proposed theorizing regarding the effect of CFT on consumers' processing of subsequently encountered messages. In addition, we identify the process underlying this pattern of response (matching of motivational focus). The findings suggest that CFT evokes both approach and avoidance motivation whereas past-temporal comparison induces largely approach motivation. This difference in motivation leads to a difference in the preference for different ad formats. To our knowledge, this is the first attempt to apply CFT to comparative advertising contexts and advances our understanding of the impact of CFT on ad related persuasion. This research also extends CFT priming effects research to subsequent information processing in unrelated consumption contexts.

The Mediating Role of the Built Environment in Family Consumption Practices

Margaret K. Hogg, Lancaster University Management School, England
Pauline Maclaran, Royal Holloway University of London, England
Carolyn Folkman Curasi, Georgia State University, University Plaza, USA

EXTENDED ABSTRACT

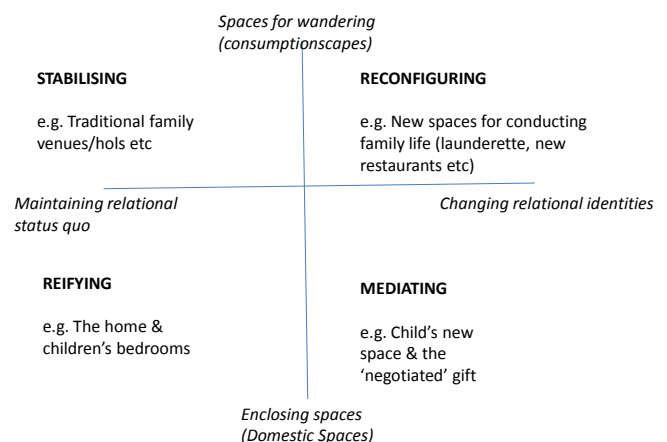
Our paper addresses two key questions: firstly how does the built environment, both public and private, mediate family relationships; and secondly, how are certain spaces used to re-create family life whereas others allow altered relationships between family members to emerge? We use empty nest families as our empirical site for investigating how consumption is employed in order to maintain a sense of family as family life moves increasingly outside its traditional setting of the domestic household to a variety of new places (e.g. children's new homes; wider urban spaces and consumptionscapes) as children move away from home.

This paper draws on two sets of literature: firstly about space and place; and secondly about the family. There are two main streams of research on place: firstly the servicescape literature about the built environment which includes studies on shopping malls (Sandikci and Holt 1998); flagship brand stores (Kozinets et al. 2002; Peñaloza 1999; Sherry 1998a); retail outlets (McGrath 1989; Otnes 1998; Maclaran and Brown 2005), and leisure venues (Kozinets et al. 2004). The second strand of literature on place relates to the built place of the home, for instance homes as part of the extended self (Belk, 1988); creating 'homeyness' (McCracken, 1989); and the material culture of the home (Miller 2001; Marcoux 2001a; 2001b; Gregson 2007). Alongside the literature on place and space we also draw on the family literature, most notably Epp and Price's (2008) work which identified that family identity comprises individual, relational and collective aspects.

In our study we concentrate particularly on the relational identities within families and, most notably, the mother/child dyad as an important site for generating relational identities within family via activities and consumption practices. We chose to track the changes in family life via mothers' perspectives because women have been identified as having the primary responsibility for the creation of family life in households via nurturance, socialization, relationality, and emotionality (De Vault 1991; Hochschild 1975; Hochschild and Machung 1989; Lorber 2000). It is women's relational identities as mothers that are particularly destabilized as they undergo dislocation and disruption in the context of empty nest households. The home traditionally represents the socio-spatial embeddedness of women's mothering identities; and this dislocation of their relational identities (as mothers) from its recognized spatial location (the home) is crucial to our examination of how space and place mediate the reconfiguration of social-spatial relationships.

For our data collection, accordingly, we focused on empty-nest mothers' experiences and feelings during the 18 months just after their adult child left the parental home, in order to study, first, how mothers work to recreate a sense of family life diffused from the fixed physical space of the original family household; and second, how both private and public spaces are appropriated (or re-appropriated) as family formation changes and relational mothering selves are reconfigured. We collected two data sets: firstly we undertook 27 in-depth interviews with women whose children have just left home (within the last 18 months); and secondly we used participant observation (netnography) on empty nester bulletin boards (this phase lasted for 6 months). As an interpretivist study that falls within the Consumer Culture Theory programme of research (e.g. identity projects, Arnould and Thompson 2005) we tacked back and forth between our qualitative datasets and the literature to analyze and interpret the data, identify themes and conceptualize our findings as an early stage in theory building.

Our conceptualization (Figure 1) flows from our findings which we map in relation to two main dimensions: spaces (firstly for wandering e.g. consumptionscapes; and secondly, for enclosing e.g. domestic places); and relational identities (firstly, maintaining the status quo and secondly, changing identities) into four quadrants. The first quadrant deals with reifying consumption practices where enclosing spaces are private, domestic & inward focused. Here there is a strong sense of rootedness and relational attachment; activities are directed at maintaining the status quo; children's bedrooms are used to freeze time and to tempt children to return home; and the materiality of the space physically anchors women's identities as mothers. The second quadrant mediates relational consumption practices, and here the child's new apartment/house acts also as a hestial space which means that it can exclude the parents and thus represent a threatening time for mothers. Mothers therefore seek to influence their children's strategic decisions about what to take from home and what to leave behind, and thereby try and emplace a sense of family life in the child's new space. The third quadrant is about reconfiguring relational consumption practices, and here there is a temporary appropriation of public spaces for family life. These are hermetic spaces that encourage temporary stays: dwelling by wandering versus dwelling by residing; they are outward rather than inward looking, de-centered rather than centered. These spaces tend to be unfamiliar, and invite exploration. In these spaces mothers seek ways of adjusting to different types of corporeal engagement and explore new ways of being with their children. The fourth and final quadrant relates to stabilising relational consumption practices by emplacing a continued sense of family life to reinforce the habitual, for instance by re-enacting familiar family routines away from home. Here we can see that consumptionscapes may have hestial qualities (cf. Sherry et al.'s work (2001) on American Girl; and Kozinets et al.'s (2002) paper on the ESPN zone). In this case, mothers look for more neutral environments in which to meet their children and stabilise existing relations.

Figure 1: Nature of Family Relational Consumption Practices Across Public & Private Spaces


In conclusion our study shows firstly, how relational identity changes over time and space, and the use of implacement practices (e.g. defending, maintaining or changing the relational self in dyads) by mothers to maintain a sense of family life; secondly the embedded nature of power relations and how they change over time and space, and how the balance tips between mother and child; and thirdly, how relational identities operate across public and private spheres and how space is used strategically with respect to relational identity.

Store Personality as a Source of Customer Value

Kim Willems, Vrije Universiteit Brussel & Hasselt University, Belgium
Sara Leroi-Werelds, Hasselt University, Belgium
Sandra Streukens, Hasselt University, Belgium

EXTENDED ABSTRACT

1. Literature Review

"What is the value of the different personality dimensions? Are certain personality dimensions more valuable at driving preference or loyalty than others?"

(Keller and Lehmann 2006, 741)

In the mature and highly competitive retailing environment, customers are more value conscious than ever before. Therefore, creating customer value is particularly vital for retailers to obtain satisfied and loyal customers (Sweeney and Soutar 2001). In line with Zeithaml's (1988, 4) definition that "perceived value is the consumer's overall assessment of the utility of a product based on perceptions of what is received and what is given", there has been a general consensus that customer value involves a trade-off between benefits and costs.

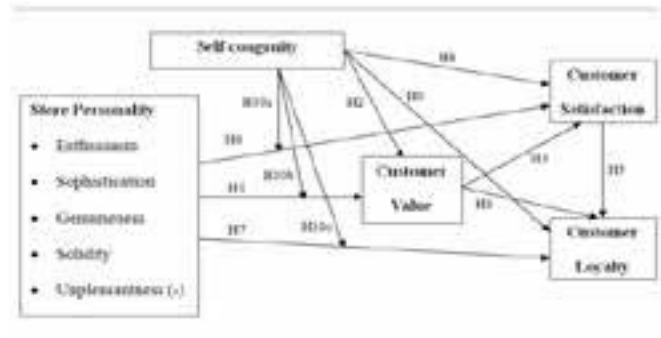
According to the utility theory which provides a theoretical underpinning for the value concept (He and Mukherjee 2007), customers do not buy products for their own sake, nor do they patronize retailers for merely functional benefits. We propose store personality as a potential source of value in retailing and define it as "the way in which the store is defined in the shopper's mind, partly by its functional qualities and partly by an aura of psychological attributes" (Martineau 1958, 47). Just as personality has been proven to serve as a viable metaphor to ascribe stable human characteristics to product brands, so can retail brands be expected to serve as symbolic devices (Caprara, Barbaranelli, and Gianluigi 1998). As such, the consumer's first, general impression of a store's personality may be positive and subsequently color further elaborative information processing on the store and its offerings (Freling, Crosno, and Henard 2011).

2. Research Objectives

This study examines the strategic role of store personality and the related construct self-congruity (i.e., the match between the customer's personality and store personality) by assessing their effect on customer value. Additionally, we investigate the potential interaction between store personality and self-congruity.

Figure 1 summarizes our hypotheses, with H1 and H2 as the focus of our research. Apart from unpleasantness, all store personality dimensions as well as self-congruity are hypothesized to positively impact customer value. Furthermore, the relationship between store personality and value is expected to be strengthened by perceived self-congruity (i.e., H10).

To obtain a full understanding of the impact of store personality and self-congruity on customer value, we take existing knowledge about the nomological web of these constructs into account (see Figure 1).

Figure 1
CONCEPTUAL MODEL


With these research objectives in mind, four unique aspects of this study differentiate it from previous studies. First, whereas the dominant focus in most customer value studies is on the consequences of customer value (Cronin, Brady, and Hult 2000), our focus is rather on the antecedent side. Second, rather than focusing on the most easily observable (and also the most straightforward to copy by competitors) store cues, such as price, merchandise quality or store design (Baker, Parasuraman, Grewal, and Voss 2002), the antecedents under study situate at a higher level of abstraction. Third, although customer value, personality, and self-congruity are extensively studied in a product context, these concepts are relatively scarcely studied in retailing (Sirgy, Grewal, and Mangleburg 2000). Fourth, we contribute to the research stream on the conceptualization and operationalization of both customer value and store personality. With regard to customer value, Holbrook's (1999) Typology is adapted to a retail setting, resulting in seven retail value types (i.e., efficiency, product excellence, service excellence, aesthetics, play, social-, and altruistic value), as opposed to the traditional dichotomous view on shopping value (i.e., utilitarian and hedonic value; Babin, Darden, and Griffin 1994). With respect to store personality, the robustness of d'Astous and Lévesque's (2003) operationalization is formally tested.

3. Methodology

We collected data from 206 visitors (61% female) of an international fashion retailer. The questionnaire consists of existing scales adapted to the setting at hand. As our conceptual model contains both reflective and formative constructs, we opted for PLS path modeling to estimate the relationships. We evaluated the statistical significance of the parameter estimates by using bootstrapping procedures based on 5000 samples.

Since customer value is a second-order construct, we used the two-stage approach to model it in PLS (Reinartz, Krafft, and Hoyer 2003; Ringle, Sarstedt, and Detmar 2012).

In order to prevent multicollinearity problems commonly associated with the product indicator approach, we tested the interaction effect between store personality and self-congruity by using the orthogonalizing approach (cf. Lance 1988; Little, Bovaird, and Widaman 2006).

4. Results

First, we examined the measurement model and conclude that all constructs display favorable psychometric properties.

With regard to the structural model, the R-squared values indicate that our model is very well supported by the data.

Regarding our main hypotheses, we can conclude that both store personality and self-congruity have a significant influence on customer value, supporting respectively H1 and H2. In order of decreasing (absolute) magnitude of coefficients, value is significantly influenced by self-congruity, solidity, unpleasantness, enthusiasm, and genuineness.

Turning to H10, related to the moderating influence of self-congruity on the relationship between store personality and the outcome variables, we fail to find any significant effect. Hence, H10 is not supported by our data.

5. Discussion and Further Research

Our findings indicate that store personality indeed can be considered as a source of customer value. Value has been recognized as one of the most significant factors in the success of organizations (Slater 1997), leading to satisfaction and loyalty (Cronin et al. 2000). Since the latter two constructs are widely acknowledged as antecedents of a firm's financial performance (e.g., Anderson, Fornell, and Lehmann 1994), investing in store personality potentially offers a good return on marketing.

Additionally, self-congruity is found to have a positive effect on customer value but the moderating effect was not supported. Although future research is needed to assess whether this particular finding indeed holds, our results are consistent with the notion that store personality and self-congruity are separate and complementary constructs (Helgeson and Supphellen 2004) and that store personality is valued regardless of whether there is a match with the self-concept (Zentes, Morschett, and Schramm-Klein 2008).

Helping Others or Oneself: How Incidental Social Comparisons Affect Prosocial Behavior

Ann Schlosser, University of Washington, USA
Eric Levy, Cambridge University, UK

EXTENDED ABSTRACT

We propose that an important yet overlooked variable affecting individuals' willingness to be charitable is how the social context provides comparative information regarding being better (vs. worse) off than others. As a result, seemingly irrelevant social comparison situations--such as one's relative position in line at a store—can affect individuals' propensity to be charitable. Specifically, social comparisons can vary in terms of direction (Aspinwall and Taylor 1993; Taylor, Wayment and Carrillo 1996). For instance, comparisons can be with those in a relatively better position (i.e., upward comparisons) or worse position (i.e., downward comparisons). Direction of comparison is important because it can have different motivational effects. For instance, upward comparisons can motivate individuals to improve their relative position (i.e., a self-improvement motive), whereas downward comparisons can cause individuals to relax such motives (Taylor et al 1996). We build upon this literature by proposing that downward (vs. upward) comparisons cause individuals to feel a general sense of accomplishment, which in turn frees them to benefit from sharing their resources with others (e.g., to view themselves as kind and generous). Conversely, upward comparisons should cause individuals to feel less accomplished, thereby motivating them to devote their resources to improving themselves rather than helping others. In summary, downward (vs. upward) comparisons should cause individuals to be more receptive to subsequent charitable appeals (H1). We test this and the basis of H1 through moderation and mediation in four studies.

In study 1, we test H1 by giving participants a purchasing scenario in which they have spent less or more than a co-worker for the same product (a downward vs. upward comparison respectively), after which they are asked whether they would buy a candy bar with a charity incentive (i.e., part of the proceeds goes to charity). Because social comparison (SC) effects should be strongest among those less confident in their abilities in the domain being compared (Festinger 1954), we measured confidence in the compared domain (i.e., consumer self-confidence; Bearden, Hardesty and Rose 2001) and expected SC effects to be strongest when confidence is low (H2). Consistent with H1, downward (vs. upward) comparisons led to higher purchase intentions ($b = .95$, $p =.001$) and willingness-to-pay, or WTP ($b = .82$, $p = .01$). Furthermore, the SC x confidence interaction was significant for purchase intentions ($b = -1.52$, $p < .001$) and WTP ($b = -.92$, $p <.05$; see Figure 1). Consistent with H2, SC had a significant effect on intentions and WTP for those with less (vs. more) confidence in their purchasing decisions.

In study 2, we examine whether these SC effects are specific to the presence of a charitable incentive. If downward (vs. upward) comparisons free individuals to use their resources to view themselves positively by helping others, then downward (vs. upward) comparisons should cause individuals to be more receptive to products when they are bundled (vs. unbundled) with a charity incentive (H3). We tested H3 with a different manipulation of SC and product (a barbeque lunch) that either had a charitable incentive or not. Consistent with H3, a significant interaction emerged for purchase intentions ($F(1, 149) = 4.61$, $p < .05$) and WTP (F(1, 149) = 6.40, p =.01). When the product was bundled with a charity incentive, purchase intentions were higher among those in the downward than upward condition ($Ms = 1.17$ vs. $.59$, $F(1, 149) = 4.35 \, p < .05$), whereas when the product did not have a charity incentive, there was no significant

Figure 1

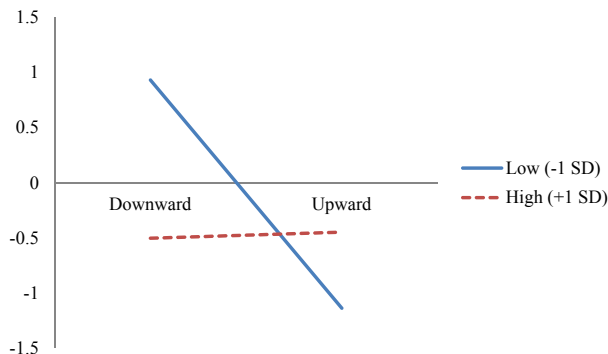
Figure 1A. Purchase Intentions (Mean Centered)


Figure 1B. Willingness to Pay (Mean Centered)
difference between conditions ($Ms = .18$ vs. $.53$, $F(1, 149) = 1.32$, NS). The results for WTP similarly supported our predictions.

If those making downward (vs. upward) comparisons are more receptive to charitable requests because such acts allow them to view themselves as kind and generous, then our predicted SC effects should be greatest among those who highly value such characteristics-- when individuals have a high (vs. low) moral identity (H4). Thus, in study 3, we measured moral identity (Aquino and Reed 2002) as well as used a SC manipulation using line queues (Zhou and Soman 2003), thereby making the compared resource time rather than money. Supporting H4, the interaction was significant for both purchase intentions ($b = .26$, $p < .05$) and WTP ($b = .95$, $p < .005$; see Figure 2). Downward comparisons led to higher purchase intentions and WTP than upward comparisons only when individuals had a high moral identity ($b = 1.07$, $p <.05$ and $b = 2.73$, $p < .05$ respectively). For those with a low moral identity, SC had no significant effect on purchase intentions ($b = -.67$, NS) or WTP ($b = -1.93$, NS).

The final study was designed to test personal accomplishment as a mediator (H5) in addition to measuring donation behaviors and donations of time. SC was manipulated by providing participants with false feedback on a performance test. As part of an ostensibly unrelated study on consumer decision making, participants had the opportunity to win $25. Similar to past measures of helping behavior (Cialdini and Kendrick 1976), participants were told that they had

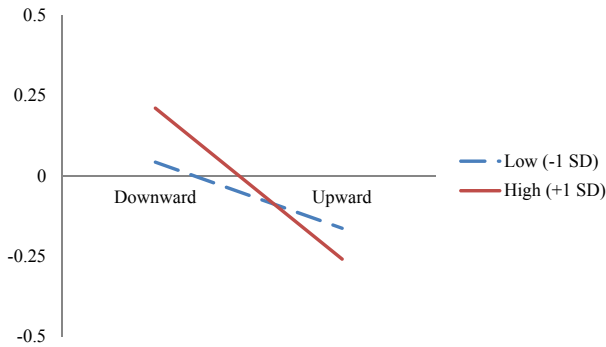
Figure 2
Interactive Effect of Moral Identity and Direction of
Comparison on Willingness to Be Charitable
Figure 2A. Purchase Intentions (Mean Centered)


Figure 2B. Willingness to Pay (Mean Centered)
five raffle tickets that they could use all, some, or none of to enter themselves (vs. a charity) in the raffle. As predicted, those in the downward condition donated more tickets to charity than those in the upward condition did (Ms = 4.38 vs. 3.37; $F(1, 52)$ = 6.60, p = .01). In addition, a higher proportion of those in the downward than upward condition opted-in to a volunteering email list (35% vs. 7%; χ^2 = 6.58, p = .01). Furthermore, those in the downward (vs. upward) condition had a higher willingness to volunteer their time (Ms = 4.78 vs. 3.73; $F(1, 52)$ = 5.05, p < .05). Moreover, the mediation results using bootstrapping methods showed that the indirect effect from SC to prosocial behaviors and intentions through perceived accomplishment was significantly different from zero at p < .05. In conclusion, the results of these four studies provide support for our theory of the incidental effects of social comparison on prosocial behavior.

Becoming a Mindful Eater: Improving Food Choices through Emotional Ability Training

Blair Kidwell, Ohio State University, USA
Jonathan Hasford, University of Kentucky, USA
David Hardesty, University of Kentucky, USA
Terry Childers, Iowa State University, USA

EXTENDED ABSTRACT:

Poor food choices have far reaching negative consequences for consumers including obesity and decreased quality of life (Chandon and Wansink 2007) and have contributed to the burgeoning health-care crisis (Cheema and Soman 2008). As a result, government programs and mandates to inform consumers of the caloric content of their food choices have been implemented across the United States (Rosenbloom 2010). However, we suggest an alternative to these programs by developing the mindfulness of consumers through emotional ability training. Emotional ability training has the potential to enable consumers to more systematically think about their choices and subvert underlying tendencies to engage in unhealthy, yet hedonically rewarding decisions.

In this research, we draw upon the emotional calibration framework to understand how emotions impact food choice. Emotional calibration involves the correspondence between one's emotional intelligence (EI, also known as emotional ability; Kidwell et al. 2008a) and consumers' confidence in their emotional ability (i.e., subjective emotional knowledge). Since emotions can have profound influences on daily decisions (Schwarz and Clore 1996), enhancing one's knowledge about emotions and how emotions can be used to make better quality decisions. Despite the potential importance of training people to more effectively use their emotions, research has yet to develop and implement an EI training program that not only can increase emotional abilities, but also show improvements in performance of trained individuals. In two studies, we utilize the default-interventionist framework (Evans 2008) to show that the development of emotional intelligence creates more emotionally calibrated consumers (Kidwell et al. 2008b), allows individuals to more analytically process their food decisions, and ultimately improves food choice. Conversely, individuals who lack emotional abilities are susceptible to heuristic processing of food choices (i.e. tasty = unhealthy heuristic; Raghunathan, Naylor, and Hoyer 2006) and subsequently make poorer food choices.

STUDY 1

Participants completed either EI training or training in nutrition knowledge (NK; mirroring current government mandates). One hundred and twenty-three students with high confidence and low emotional ability were selected from a prescreening survey that included the consumer EI scale (CEIS, Kidwell et al. 2008a) and related confidence items. Of the 123 individuals contacted, 49 signed up to participate in the study (Response Rate = 39.8%, 25 EI participants and 24 NK participants). Participants in both conditions completed a 45-minute training session described as equally informative (p > .05) and clear (p > .05) across training conditions.

After training, participants completed the CEIS and related confidence items. Participants also completed the unhealthy = tasty Implicit Association Test (IAT; Raghunathan et al. 2006). Upon leaving the lab session, participants completed the study by keeping a 24 hour food diary of all food and drinks consumed 48 hours after their training session. Calories were computed via independent raters. The diary also contained follow-up items measuring how analytically their food choices were made during the 24 hour period.

Results showed significantly higher emotional intelligence for EI trained participants (norm CEIS score = 109.83) relative to NK trained participants (87.98, p < .01). Furthermore, EI trained participants reported significantly lower caloric intake (M = 1823) relative to NK trained participants (M = 2388, p < .05). Lastly, PLS was used to demonstrate that emotional calibration was positively related to analytic processing (ß = .37, t44 = 2.37 p < .05), which was negatively related to caloric intake (ß = -.32, t44 = -2.45, p < .05). Conversely, emotional calibration was negatively related to heuristic processing (ß = -.39, t44 = -3.72 p < .05), which was positively related to caloric intake (ß = .28, t44 = 3.56, p < .05). Study 1 thus demonstrates the ability of emotional ability training to improve food choice. Study 2 investigated the impact of EI training on confidence, identified the underlying mechanism of positive arousal, and demonstrated the longitudinal effect of training on caloric intake.

STUDY 2

Participants completed either EI training or were in a no-training control condition. Two hundred and seventy students with low confidence and low emotional ability were selected from a prescreening survey. Of the 270 individuals contacted, 69 signed up to participate in the study (Response Rate = 39.8%, 34 EI trained participants and 35 control participants).

The design was similar to Study 1. However, after participants were (not) trained, they completed measures of positive arousal toward their food decisions in addition to the CEIS, confidence items, and the IAT. After the lab session concluded, participants again completed a food diary after training with similar explicit processing items.

Results provided additional support for the effects of training on emotional ability, confidence, analytic processing, and food choice. Individuals in the EI group following training scored higher on the CEIS than the control group (M = 108.5 vs. 91.1, t61 = 5.64, p < .01). Furthermore, individuals trained in EI had higher reported confidence in their emotional ability relative to individuals in the control group (M = 89% vs. 68.6%, t61 = 5.96, p < .01). PLS analysis demonstrated support for the proposed model. Emotional calibration was positively related to positive arousal (ß = .30, t59 = 2.90, p < .01), which was positively related to explicit processing (ß = .19, t59 = 2.13, p < .05). Explicit processing was negatively related to caloric intake (ß = -.17, t59 = -2.02, p < .05).

Approximately 3 months after completing the initial food diary, participants were again contacted to complete another 24 hour food diary. 17 EI trained and 20 control participants completed the follow up diary for 10 dollars. Results remained consistent as EI trained participants consumed significantly fewer calories relative to control participants (Ms = 1555 vs. 2173, t35 = 4.13, p < .01). These results provide support for the longitudinal effects of EI training on caloric intake.

The results of two studies demonstrate the ability of emotional ability training to increase the mindfulness of individual food choice and improve food decision making. These findings further develop the emotional calibration framework and provide implications for transformative research and government programs and mandates aimed at improving consumer health.

Political Ideology, Persuasive Appeals, and Sustainability

Blair Kidwell, Ohio State University, USA
Adam Farmer, University of Kentucky, USA
David Hardesty, University of Kentucky, USA

EXTENDED ABSTRACT:

At the forefront of the sustainability movement are efforts to increase environmental consciousness and promote sustainable consumption (McDonagh, Dobscha, and Prothero 2012). Yet, many consumers are either skeptical of or reluctant to embrace green marketing efforts (Luchs et al., 2010). Considerable research has been devoted to understanding and overcoming this reluctance through policy, regulatory, market, and technological innovations (Crittenden et al., 2011). However, very little progress has been made in actually changing behavior (Polonsky 2011; Prothero, et al. 2011). Given the sharp divide in attitudes toward many sustainability issues (e.g., climate change) between groups on different sides of the political aisle (Baumgartner and Jones 2009; Kim, Rao, and Lee 2009), surprisingly little attention has been paid to understanding how differences in political ideology might influence sustainable behaviors. For example, might conservatives and liberals be differentially likely to engage in specific sustainable behaviors like recycling or purchasing green products? Might different types of appeals targeted to these two groups of consumers, based on their underlying ideological differences, be more effective at persuading them to adopt environmentally conscious behaviors? If so, what process can inform us about how these consumers are influenced?

In this research, we investigate the impact political ideology has on sustainability practices and propose ways to appeal to liberals and conservatives based on their underlying moral foundations. In addition, we uncover the mechanism by which political appeals influence intentions and demonstrate how the behaviors of each ideology can ultimately be changed through tailored persuasive appeals.

In our efforts to address these issues, we make four main contributions. First, we examine the understudied area of how political ideology affects consumer behavior in order to understand its impact on sustainability. Second, we highlight the underlying moral foundations of each ideology and develop persuasive appeals based on these foundations to influence disposition behavior (recycling) as well as the spillover effects on acquisition (selection of sustainable products) and usage (conservation of resources) behaviors. Third, we examine the effectiveness of these persuasive appeals in a 113-household longitudinal field study on recycling behavior. Fourth, we offer practical implications for marketers, public policy officials, and environmental scientists interested in changing acquisition, consumption, and disposition-related behavior.

Matching Persuasion to Moral Foundations

We developed persuasive appeals that are congruent with conservative and liberal moral foundations to promote enhanced sustainable behaviors. Given that conservatives value duty, authority, self-discipline, and actions consistent with their in-group's social norms (Graham et al. 2009; McAdams et al. 2008), we created a persuasive appeal designed around the message to "joint the fight" to help the environment. This type of messaging incorporates adherence to social norms and in-group effects while promoting actions that will strengthen the social order (Janoff-Bulman et al. 2009). This is also consistent with a binding moral foundation in that this appeal uses terms like we, citizens, duty, and our as well as images of patriotism. Conversely, liberals value empathy, fairness, and individuality (McAdams et al. 2008; Morrison and Miller 2008). We developed a message designed to appeal to liberals underlying moral foundation revolving around "making a difference." This type of messaging sets the individual apart as one who helps others while promoting behaviors or actions that improve overall social justice (Janoff-Bulman et al. 2009). This is consistent with an individualizing appeal through a call to individual action, images of helping and fairness, and relies on a caring nature.

Study 1

Eighty-two undergraduate business students completed measures of political ideology and moral foundations. Specifically, 40 participants saw a "Join the Fight" binding appeal while 42 participants saw the "Make a Difference" individualizing appeal. Next, participants completed a thought listing task and a manipulation check measure assessing the moral foundations associated with the appeals. Lastly, participants completed recycling intention measures.

A chi-square test of independence revealed a significant difference in the number of foundational thoughts generated by the different appeals. In addition, the full model was also significant ($F(3, 78) = 2.98$, $p < .05$). The results revealed a significant interaction of political ideology by appeal ($\beta = .82$, $t(78) = 2.37$, $p < .05$). The results of study 1 provided support that congruent moral foundation appeals affect intentions to recycle depending upon one's political ideology.

Study 2

Study 2 was conducted to examine the mediating effect of fluency on the relationship between the interaction of political ideology and appeal to recycling intentions. We also rule out two alternative possibilities that might reasonably result from message congruence.

Specifically, 73 participants saw the "Join the Fight" appeal while 69 participants saw the "Make a Difference" appeal. Next, participants completed process measures pertaining to fluency, involvement, and recycling efficacy related to the appeals, and finally their intentions to recycle, purchase compact fluorescent light bulbs, and to conserve water.

The indirect effect of the interaction onto recycling intentions through fluency revealed a positive and significant indirect effect ($\beta = .10$) as the 95% confidence interval did not include zero (CI: .02 to .26). Study 2 demonstrated that appeals congruent with moral foundations are more effective due to fluency than incongruent appeals. Enhanced fluency positively influenced intentions to recycle as well as have spillover effects on acquisition and usage disposition intentions.

Study 3

Study 3 was conducted to assess the effectiveness of our persuasive appeals on actual recycling behavior in a longitudinal field setting. Specifically, a 14-week field study was conducted to assess the effects of the two persuasive appeals on recycling behaviors of households from a typical southeastern U.S. city.

Study 3 provided an examination of persuasive appeals designed to initiate recycling behavior across 113 households. The congruent appeals resulted in greater recycling than the control conditions ($t = 2.04$, $p < .05$ and $t = 2.47$, $p < .05$). Appeals congruent with underlying moral foundations were found to influence actual recycling behavior for both liberals and conservatives over a 14-week period.

Putting Your Eggs in One Basket: Sex Ratio Effects on Bet-Hedging

Joshua Ackerman, Massachusetts Institute of Technology, USA
Vladas Griskevicius, University of Minnesota, USA

EXTENDED ABSTRACT

Human populations, from towns to regions to countries, vary in their distributions of men and women. These differences in operational sex ratio, the relative number of sexually mature men to women, can produce marked changes in various cognitions and actions, such as modulating tendencies toward aggression, parenting style, and long-term vs. short-term romantic proclivities (e.g., Barber 2001). The same is also true in a wide variety of animal species (e.g., Kvarnemo and Anhesjo 1996). Differences in population sex ratios index the availability of potential mates and can produce competitive behaviors even in individuals not actively seeking romance. Recent research has shown that, in addition to real skews in sex ratios, perceptions of sex ratio skew can also lead people to change their behavior. For instance, male students who believed their school was populated by more men than women (an unfavorable ratio for heterosexual males) were less likely to save income and more likely to spend to the point of debt (Griskevicius et al. 2012). In the current paper, we expand on this research by investigating how changes in sex ratios affect the more general process of decision-making under uncertainty. We do so by asking whether perceptions of increased and decreased potential mate availability directly influence preferences for option variability in situations where choice entails risk. Specifically, we test whether sex ratio skew affects bet-hedging behavior.

Bet-hedging refers to the notion that individuals often gain long-term utility by lowering the variance of their decisions and spreading risk over possible outcomes (Slatkin 1974). A specific form of bet-hedging, diversified bet-hedging, involves an individual investing resources in several (possibly competing) strategies simultaneously (Olofsson, Ripa and Jonzén 2009). That is, not "putting all your eggs in one basket." Diversified bet-hedging is often considered to be a safer strategy than investing resources in single-options and thus is more often employed by individuals with a relatively short time-horizon (Olofsson et al. 2009). In contrast, we predict the perceptions of decreased mate availability that accompany an unfavorable sex ratio will produce a competitive mindset through which people (implicitly) presume that success necessitates risk-taking (cf., Kunreuther and Wright 1979). Further, we predict that this mindset can generalize to other decision-contexts. Thus, we expect that exposure to unfavorable sex ratios will produce decreases in diversified bet-hedging behavior.

Study 1 investigated this idea in the context of gambles. Participants took part in a study labeled "accuracy in interpersonal perception and memory." Participants were briefly shown multiple arrays of face photographs ostensibly taken from the local area (e.g., campus, websites) and were told they would complete a memory test on these faces later in the study. After each array, participants recalled the number of men and women in each set as a measure of "accuracy." These arrays varied in the ratio of female to male faces, and were either female-biased or male-biased between-participants (from 68-78% of the more numerous sex). As an interlude before a (non-existent) final memory test, participants completed several supposed distracter items, beginning with the primary dependent measure. This task required participants to imagine playing a lottery and choosing between one of two options, either 1 $10 ticket with a possible $10,000 prize or 10 $1 tickets for a possible $1,000 prize. Analyses revealed that, consistent with predictions, people who viewed unfavorable ratios (men + male-biased, women + female-biased) were more likely to choose the single ticket, high-payoff/high-risk option—to put their eggs in one basket—than people who viewed favorable ratios.

Study 2 expanded on this finding by testing outcomes that allowed for a greater degree of decision diversification. Participants received a similar cover story, and after completing the face array tasks, were told that they would complete several tasks prior to a face memory test. These two tasks included a retirement account investment procedure and a public funds investment procedure. The retirement procedure involved making allocation decisions regarding the percentage of one's investment that should be assigned to stocks (described as higher risk, higher return), bonds (lower risk, lower return) and cash (no risk, little if any return). The public funds procedure asked participants to imagine that four companies were working on a disease vaccine to prevent a possible future epidemic, and to decide how the government should allocate research funding support between the four (with funding described as increasing a company's research speed, but not necessarily success). For each procedure, decision variance (spread of allocations across the options) was used as the dependent measure. Both measures showed similar patterns: People who viewed unfavorable sex ratios invested more money into fewer options, again putting their eggs into fewer baskets.

In summary, two studies show that perceptions of environmental variation in the relative numbers of men and women can influence whether people choose to diversify their decision outcomes or not. "Unfavorable" sex ratios led to less diversification and more high-risk/high-reward decisions, consistent with the interpretation that success under such conditions necessitates risk-taking. This work contributes to our understanding of the incidental factors that elicit risky behavior and highlights how decision domains with quite important long-term relevance (e.g., retirement accounts, research funding) are susceptible to seemingly irrelevant situational cues. Future research will investigate particular mediating mechanisms and individual differences that may play a role in these decision strategies.

"How About Giving My Things Away Over The Internet?"
When Internet Makes It Easier To Give Things Away

Valérie Guillard, Paris Dauphine University, France
Céline Del Bucchia, Audencia Business School, Nantes, France

EXTENDED ABSTRACT

Many studies have explored the way people dispose of items they no longer want (Jacoby, Berning and Dietvorst 1977; Cherrier 2009; Arsel and Dobsha 2011) either through the market economy (Chu and Liao 2009; Sherry 1990), the kith and kin gift economy (Price, Arnould and Curasi 2000), charities (Bendapudi, Singh and Bendapudi 1996) or online (Nelson, Rademacher and Paek 2007; Arsel and Dobsha 2011). Studies investigating online recycling have generally looked at the trend from a community perspective, concluding that giveaway websites are underpinned by a mechanism of generalised reciprocity. However, these websites have a specific feature that makes it interesting to analyse the online giving process from an individual slant since, unlike giving possessions to charities, free recycling websites enable the giver to *meet* the unknown recipient and, unlike gifts to close friends or family, they allow the giver to meet a *stranger*. In short, free recycling websites offer a new channel whereby individuals can give things away to a stranger in person, a factor that is likely to change the way givers perceive gift-giving. Underpinned by research on the difficulties inherent to giving (Price, Arnould and Curasi 2000; Lastovika and Fernandez 2005; Marcoux 2009), our paper illustrates how recycling websites resolve the tensions that the giver may otherwise be confronted with when giving, by offering an encounter with an alien recipient.

REVIEW OF THE LITERATURE

Many studies have highlighted the romantic aspects of giving (Belk and Coon 1993; Joy 2001), but the process also has a darker side (Sherry, McGrath and Levy 1993; Ruth, Otnes and Brunel 1999; Marcoux 2009). Gifts to kith and kin can lead to unease in both the giver and the recipient. The giver is not entirely free when giving, but is trapped in a web of constraints and norms. Giving to friends and family not only means that the giver gives, but also that the recipient must receive (Gouldner 1960) or must reciprocate (Godbout and Caillé 1992). Giving to charities, on the other hand, presents fewer constraints, and is underpinned by a notion of solidarity (Frémeaux and Michelson 2011). However, it can also be a source of frustration for the givers who have no idea what happens to their donations. In effect, some people need to meet the future beneficiary in order to be able to detach themselves from their possessions (Roster 2001; Lastovicka and Fernandez 2005). While previously, only the market enabled two strangers to meet in the circulation of second-hand goods (Herrmann, 1997), today free recycling websites also offer this possibility. Our aim is to explore what this encounter means to the online giver.

METHODOLOGY

To understand how givers experience online recycling and what it means to them as individuals, we conducted 27 long interviews (McCracken 1986), adopting a phenomenological approach (Thompson, Locander and Pollio 1989). The respondents were recruited through the managers of the free recycling websites www.recupe.net, www.donnons.org and www.recupe.fr, who put us in touch with givers. The interviews began with the question "*Can you tell me about the different options you choose when you decide to get rid of something?*" and then focused on online recycling and how this is experienced by the giver.

FINDINGS

In addition to the practical and environmentally-friendly nature of the practice (Nelson, Rademacher and Paek 2007; Arsel and Dobscha 2011), our analysis led us to identify two central factors that give insights into the meaning of the online recycling experience: first, givers experience it as spontaneous gift-giving rather than just an opportunity to get rid of unwanted clutter. Second, the gesture is given its full sense through the encounter with the unknown recipient. This specific feature of online recycling removes the obstacles inherent to the three-way gift-giving process that arise in other forms of gift-giving (Mauss 1924): i.e. the giving, the receiving and the return.

With regard to *giving*, online recycling means that the giver does not run the risk of a refusal as may be the case when giving to friends or family, or to a charity. A refusal is often painful for the giver: by refusing an object, individuals signal a rejection of the relationship. Refusal is very rare in online recycling as recipients are aware of the state of the items they will find at the givers' beforehand. Consequently, givers are able to give 'everything away as they are not worried about being judged for the 'poor' quality of their objects. With regard to *receiving*, the giver chooses the future beneficiary he or she will meet in order to give them the object, along with its history, its wear and tear and its special way of working. In listening to the giver, the recipient implicitly makes a promise to take care of the object, thereby reassuring the former (Lastovicka and Fernandez 2005). Finally, with regard to the *return*, the interaction with the recipient makes the giver feel (s)he exists and is recognised. Online recycling fulfils the need of givers for recognition, without necessarily creating a bond of dependence: the meeting is a brief, one-off situation, and reciprocity is immediate. The desire not to get involved with the recipient, that is also reflected in other studies (Bajde 2009), can be seen in the way the items are passed on: some givers will place the items in a neutral space like the hallway or the corridor (Korosec Serfaty 1988) to ensure that the recipient does not trespass on the giver's privacy.

CONCLUSION

This article adds to current research on the circulation of second-hand goods (Lucas 2002; Cherrier 2009) in several ways. The study contributes to our understanding of the topic by analysing online recycling websites from the perspective of the individual. This is interesting in view of one specific feature of such websites, namely the *encounter* with an unknown recipient.

The article also illustrates how free recycling websites remove the difficulties inherent in giving to kith and kin or to charities. Such sites offer givers the potential for rewarding interaction with the recipient that is also liberating. It is rewarding since they are recognised for their gesture, unlike giving objects to charities. At the same time, it liberates the giver as, even if there is a meeting with the recipient, it is brief, reciprocity is immediate and it does not create a relationship or a bond of dependence in the same way as a gift to family or friends. At the same time, the study enriches the model proposed by Marcoux (2009): by removing the obstacles linked to giving, free recycling websites offer individuals the possibility to remain in the gift economy. The gift economy and the market economy are two options that free individuals from the obligations inherent to other forms of giving, although they are not mutually exclusive.

The article has implications with regard to three pillars of sustainable development: i.e. economic, as the free flow of objects facilitates the decision to replace them (Roster and Richins 2009); social, as free recycling websites help people to find what they need at less cost, while developing social links, and finally, environmental, as free recycling websites contribute to reducing the volume of waste.

Finally, our research opens up several potential avenues for further research to enhance our understanding of online recycling. While our study focuses on givers, an investigation of the recipients could raise some interesting questions: what signals does the recipient put out that the giver picks up as recognition for his or her gesture, for instance? How does the recipient receive a gift via the Internet? Why does the recipient use free recycling websites apart from the obvious reason of getting something for free?

From Luxury Counterfeits to Genuine Goods: Why Would Consumers Switch?

Anne-Flore Maman Larraufie, INSEEC & SemioConsult, France

EXTENDED ABSTRACT

Counterfeiting of luxury goods is a key issue for all major luxury industries. Some conglomerates such as LVMH have even set up some kind of fighting force to identify, to arrest and to sue counterfeiters. However, little attention has been paid to those consumers who occasionally or on a regular basis do mix legal and illegal purchases of luxury goods (Ha and Lennon 2006; Wilcox, Kim, and Sen 2009). Various reasons have been advanced as triggers, from demographics characteristics (Safa and Jessica 2005) to postmodern ethics (Maman 2009), including rational price-saving strategies. This article aims at providing a different view to the issue: instead of focusing on the reasons why people buy fake luxuries, it has a look at what would make these consumers turn to the purchase of their genuine versions.

To our knowledge, no past research has been conducted to investigate how consumers of non-deceptive luxury counterfeits (knowingly buying a counterfeit good) perceive the worlds of luxury and hence which kind of arguments could be used by luxury companies to convince those people to switch from the fake to the genuine item. Therefore, the present research will be exploratory by nature, in a discovery-oriented perspective. This is to pave the way for future more confirmatory research, by reducing the chance of beginning with an inadequate, incorrect or misleading set of research objectives.

Hence, we defined on purpose quite broadly our research questions: How do consumers of non-deceptive luxury counterfeits perceive the worlds of luxury and of counterfeiting? What makes them stay away from luxury houses? How could marketers use such knowledge to capture these consumers?

To answer these questions, we relied upon a qualitative methodology, as it looked like the most appropriate way to really get insights and understandings from the consumers. The selected research method was in-depth interviews, for they "are much the same as psychological, clinical interview" (Zikmund and Babin 2007). This method suits our needs in understanding the various values associated with the luxury/counterfeiting world or the consumption of luxury goods. Attitudes are mentally-driven, and since we are interested in getting the 'why' of their existence, and not only identifying them, in-depth interviews would really enable us to uncover underlying motivations, beliefs, attitudes and feelings.

More specifically, 21 in-depth interviews were conducted with MBA students from two French Business Schools (13), high-school pupils (3) and grown-ups with job activity (5). Students from Western business schools are usually said as having as having more purchasing power and as being more sensitive to the consumption of conspicuous goods, such as luxury or luxury-looking goods, than other types of students. Besides, they have been found as regular consumers of non-deceptive luxury counterfeits. High-school pupils are usually considered as having no or low purchasing power, as they only get a limited amount of pocket money but might in the future be able to buy luxury goods. Working adults dispose of a regular income they can spend the way they want.

The interviews lasted between 40 minutes to one hour and a half and were unstructured. The first part of the interview dealt with the topic of luxury. Respondents were asked to describe past experience and express feelings about luxury consumption. Their ultimate luxury was also touched upon. The second part of the interview dealt with counterfeiting. Past experience about its consumption and vari-

ous thoughts were under investigation in this part. It also included a projective drawing to elicit deeper feelings of the respondents. For the analysis, the interviews were transcribed and coded, with a goal to identify the key dimensions emerging from the discourse (see Spiggle 1994 and Strauss and Corbin 2008 for a discussion of the procedures used in this stage). Coding schemes were modified as analysis progressed and new concepts were uncovered.

As previously mentioned, the objective of the analysis was to be able to identify potential connections in-between how people view the world of luxury, and their view of the world of counterfeiting. This was achieved in three steps.

Step 1: What's in the World of Luxury

A content analysis of what the interviewees mentioned about luxury goods ended up in the identification of six specificities related to Luxury, potentially leading to purchase intents.

Table 1 sums up the characteristics and identification 'labels' of these faces.

Step 2: What's in the World of Counterfeiting?

A content analysis of the discourses regarding counterfeiting isolated four actors in the consumption process of counterfeits: the brand, the context, the consumer and the product per se. These four actors are no surprise but what is more interesting is the various characteristics associated with them and how they interact. Figure 1 sums up the overall findings.

Step 3: What Incentives to Switch Consumption from Fakes to Real Goods?

A comparison of the two previous steps helped us identify three necessary conditions that must be met to allow consumers of non-deceptive counterfeits to switch to the purchase of real goods. These are: an exigency of quality, both in terms of product and of sales forces' competencies; a retail environment "smelling luxury" (quoted from one respondent); and a service experience without any flaw. Table 2 exhibits this comparison.

ANALYSIS AND CONCLUSION

The two content analyses give a better understanding of how people develop an initial attitude toward luxury, toward counterfeiting and potentially how one attitude may impact another one. For instance, seeing the luxury world as a superficial/artificial world is very much connected with the idea that some people engage in the consumption of counterfeits to display artificial symbolic codes of belonging to a potential social class.

A discourse analysis leading to a semiotic analysis of the discourses hold by the respondents was thus conducted (see Figure 2). Out of four types of consumers, three would be eligible for switching from fake consumption to genuine one. The reasons why (consumption values) are represented on a semiotic square.

With such better knowledge of deep consumption motives, capturing some counterfeit consumers appears feasible if proper marketing strategies are undertaken.

Friends Show the Forest Beyond the Trees:
Friendship Enhances Consumer Self-Control by Facilitating Global Processing

Eline L.E. De Vries, University of Groningen, The Netherlands
Debra Trampe, University of Groningen, The Netherlands
Bob M. Fennis, University of Groningen, The Netherlands, and Norway Business School BI, Norway

EXTENDED ABSTRACT

While years ago consumers' potential shopping activities were limited to eight hours a day, the 24/7 economies of today's society present a never-ending stream of consumption opportunities. Notwithstanding the positive effects, the ever-present consumption temptations pose a serious challenge to consumer self-control (Faber and Vohs 2011; Hoch and Loewenstein 1991; Vohs and Faber 2007).

Whether or not consumers succumb to consumption temptations depends on their processing style (Fujita, Trope, and Liberman 2010; Fujita et al. 2006). Self-control failure has been associated with *low-level construals:* a focus on the local, subordinate and secondary features of an entity or event, whereas *high-level construals* (i.e., a focus on the global, superordinate or primary features) have been associated with effective self-control (Fujita and Han 2009; Fujita and Roberts 2010; Fujita and Sasota 2011; Fujita et al. 2010). For instance, Fujita et al. (2006) showed that activation of high-level construals results in less positive evaluations of consumption temptations and in decreased preference for immediate over delayed consumption. Hence, increasing consumers' construal level (i.e., promoting ones global, as opposed to local, processing; Förster and Dannenberg 2010; Förster, Liberman, and Shapira 2009) entails an interesting opportunity to promote consumer self-control.

In the present research we hypothesize that reminding consumers of friendship promotes consumer self-control by increasing global (conceptual or perceptual) processing. We expected that reminding individuals of an abstract, superordinate and long-term goal such as friendship (Baumeister and Leary 1995) would broaden consumers' processing style. This, in turn, would allow consumers to transcend and see beyond the alluring but subordinate features of consumption temptations, resulting in enhanced self-control.

Findings reported by Förster, Özelsel and Epstude (2010) provided initial support for our hypothesis. In their studies, individuals were primed with either love or lust. The authors reasoned that whereas love is generally associated with a long-term perspective, lust is associated with the short-term. Indeed, their studies showed that love priming enhanced global perceptual processing, while lust priming induced a more local processing style. Consistent with our hypothesis that friendship increases self-control by enhancing global processing, the authors suggested that friendship, like love, is related to long-term goals. Moreover, a number of defining characteristics of love (i.e., caring for and identifying with a person, and emotional bonding) also apply to friendship. Hence, reminding consumers of friendship may engender global processing.

Three experiments tested our hypothesis that friendship increases global processing and subsequently, self-control. In the first experiment, participants were either reminded of friendship by writing a short essay about a situation in which they experienced friendship or they were not reminded of friendship and wrote about the manufacturing process of a table. They then completed the Behavior Identification Form (BIF) as a measure of (conceptual) processing style (Förster et al. 2009; Vallacher and Wegner 1989). Results showed that participants who were reminded of friendship construed situations at higher construal levels than participants in the control condition. In all three studies reported here, the friendship manipulation did not influence positive or negative affect. Experiment 1 shows that reminding participants of friendship broadens their (conceptual) processing style.

In the second experiment, we used a 3 (friendship: friend vs. peer vs. control) × 2 (self-regulatory resource depletion: depletion vs. no-depletion) between-subjects factorial design and aimed to disentangle the friendship effect from a mere social presence effect. In addition to a friend condition, in which participants wrote about their relationship with a good friend, and a non-social control condition, we added a condition where participants wrote about their relationship with a fellow student they knew but were not friends with (peer condition). The next task consisted of the manipulation of self-regulatory resource depletion (Baumeister et al. 1998). We then measured participants' global (perceptual) processing with the Kimchi-Palmer task (Gasper and Clore 2002; Kimchi and Palmer 1982), asking participants to indicate which of two sample figures looked most like a target figure (e.g., a triangle made up of small squares). Choice of local sample figures indicates a local processing style, whereas choice of global sample figures reflects global processing. Finally, we added a measure of self-control by asking participants to indicate their willingness-to-pay for a cupcake. Results showed that under conditions of susceptibility to consumption temptations (i.e., self-regulatory resource depletion), being reminded of a friend, but not of a peer in general, enhanced global processing and reduced willingness-to-pay relative to the control condition. Moreover, in line with our hypothesis, a significant bootstrap analysis (Zhao, Lynch, and Chen 2010) showed that the effect of friendship and depletion on willingness-to-pay was mediated by enhanced global processing.

In the third experiment, we used a 2 (processing style: local vs. global) × 3 (friendship: friend vs. peer vs. control) between-subjects factorial design, to provide converging evidence that friendship enhances self-control in consumers prone to self-control failure (i.e., participants with a local processing style). We directly manipulated processing style with the Navon task (Navon 1977), showing participants a series of composite letters (a global letter made up of local letters), and asked them to report either the global or local letters, dependent on condition. We used the same friendship manipulation as in experiment 2. We subsequently showed participants photos of six hedonic products and, following Fujita et al. (2006), measured participants' self-control by measuring their preference for immediate versus delayed consumption of these products. In line with our expectations, reminding participants with a local processing style of friendship significantly enhanced their self-control (i.e., reduced their preference for immediate over delayed consumption) relative to both the control and peer conditions. Unsurprisingly, friendship did not influence the self-control of participants in the global processing condition.

In sum, employing multiple validated tasks to assess or manipulate local versus global processing, we demonstrate the facilitative effect of friendship on self-control and the mediating role of global processing. By broadening consumers' (conceptual or perceptual) processing style, friends show consumers the proverbial forest beyond the trees and as such substantially enhance consumer self-control.

The Perception of Two Types of
Corporate Social Responsibility on the Consumer-brand Relationship

Lei Huang, Dalhousie University, Canada

EXTENDED ABSTRACT

The research identifies two categories corporate social responsibility information – corporate operational performance (COP) and social performance (CSP) – to test their respective impact on consumer brand advocacy and brand trust. Results from two empirical studies suggest that product involvement has a moderating effect on COP/CSP and brand advocacy and brand trust.

LITERATURE REVIEW

Corporate Social Responsibility (CSR) has been an important area of research in brand equity. Consumers may associate CSR with a positive product and its evaluations, brand recommendations, and brand choice (Drumwright, 1994; Brown and Dacin, 1997; Osterhus, 1997; Handelman and Arnold, 1999; Sen and Bhattacharya, 2001). On the other hand, negative CSR, or Corporate Social Irresponsibility (CSI), can impair brand equity by weakening consumers' brand evaluations and purchase intentions (Dawar and Pillutla, 2000; Armstrong, 1977). However, the debate about the nature of CSR has been debating for decades. The purpose of this article is to examine a fundamental, yet unexplored, question: Do consumers respond differently to CSR information?

RESEARCH TOPIC

In answering to the above proposed question, I define two major dimensions of CSR – corporate operational performance (COP) and corporate social performance (CSP) – to test and predict their respective impact on consumer brand advocacy and brand trust. The former captures a company's publicly released information regarding product quality and innovativeness capability (Gatignon and Xuereb, 1997; Rust, Moorman, and Dickson, 2002); the latter includes a company's activities and status related to its perceived societal or stakeholder obligations (Varadarajan and Menon, 1988). The assumption is that successful relationship marketing requires trust as the cornerstone (Morgan and Hunt, 1994) and relies on advocacy to flourish (Berens, van Riel, and van Bruggen, 2005).

Furthermore, as an unobservable state of motivation, arousal, or interest toward consumption (activity) of a product or object (Olsen, 2007), the role of product involvement on the relationship between CSR and brand trust has not, to this author's knowledge, been tested empirically. The objective of this study is to add to the body of theoretical and empirical research in CSR by demonstrating that COP and CSP information can be applied to a consumer–brand relationship context.

HYPOTHESES

In the consumer-brand continuum, we expect that the exposure of CSR-COP may strengthen consumer brand advocacy (i.e., purchase intention, and evaluation of the corporation, and WOM communications, etc.), especially when the brand is in the high involvement product categories. Consumers will rely more on this diagnostic information for judgment. That is, when consumers look at low involvement products, CSR-CSP/ CSR-COP has a stronger effect on brand advocacy than CSR-COP/ CSR-CSP, whereas CSI-COP/ CSI-CSP has a stronger effect on brand advocacy than CSI-CSP/ CSI-COP (H1a/b). Similar postulations are held for brand trust (H2a/b).

METHODOLOGY

Study 1 is a 2 (COP-CSR vs. COP-CSI) × 2 (CSP-CSR vs. CSP-CSI) × 2 (high- vs. low- involvement) between-subject design. Fictitious companies producing juices and manufacturing TV sets were used as the low and high involvement product categories, respectively. All the experimental stimuli and the valence of messages were pretested. A total of 326 commerce major undergraduate students were randomly assigned to eight experimental conditions and asked to finish a questionnaire including COP and CSP ratings after reading the scenarios. Then, subjects were told that this company had recently introduced a new juice drink/a new model of TV set, with the product descriptions, and asked to provide a purchase intention rating with the assumption that they were interested in buying a juice for their breakfast/buying a TV set for their apartment. Finally, subjects were quizzed on whether they had guessed the purpose of the experiment before debriefing.

Study 2 is similar to Study 1 but using actual brand names instead of fictitious ones.

FINDINGS

Study 1 presents a significant three-way interaction ($F = 35.24$, $p < .05$). Results from further two-way ANOVAs suggested significant interaction effects between COP and CSP under low ($F = 15.12$, $p < .01$) and high ($F = 17.36$, $p < .01$) product involvement situations, respectively. Simple effects tests showed that in the low involvement circumstance (H1a), CSR-CSP had a stronger effect on brand advocacy than CSR-COP ($F = 11.78$, $p < .01$), whereas CSI-COP had a stronger effect on brand advocacy than CSI-CSP ($F = 7.13$, $p < .05$). As H1b predicted, COP and CIP presented opposite patterns in the high product involvement circumstance. Results from Study 2 indicate the similar patterns.

For brand trust, although the three-way interaction among COP, CSP and product involvement is significant ($F = 28.87$, $p < .05$), only the conditional two-way interactions between COP and CSP in the high ($F = 14.57$, $p < .05$), but not low ($F = 2.03$, $p > .3$) involvement (Study 1 and 2). However, CSR-CSP has a stronger effect on brand trust than CSR-COP, whereas CSI-COP has a stronger effect on brand trust than CSI-CSP for low involvement products in Study 2. Thus, both H2a and H2b are supported.

CONTRIBUTIONS

This study suggests that individuals have different WOM preferences in positive/negative CSP and negative/positive COP information for low/high involvement products. These findings can further contribute to the everlasting WOM information valence research as well as the relatively infertile cause-related marketing areas.

By extending the expectancy value theory that posits overall brand attitude through the formation of brand associations held in consumer's memories (Ajzen and Fishbein, 1980), results from the current study add that for low involvement products (e.g., juice), consumers associate a company's CSP information as more diagnostic information compared with COP in brand evaluation and consequent advocacy behavior intentions while for high involvement products COP is viewed more diagnostic and valuable. These findings can also contribute to clarifying how consumers perceive and react to distinctive CSR information and how firms can design communication strategies to utilize these effects. Finally, the lack of empirical

research on brand trust in CSR could be explained by the fact that applying interpersonal relationship theories such as trust is not well-understood because the brand is an inanimate object. In a marketing context it is impossible to completely detach trust from the nature of its object. These empirical results shed some light on the moderating effect of product involvement in this CSR-trust consumer and brand relationship.

All Numbers are Not Created Equal: Price Points, Price Processing and Price Rigidity

EXTENDED ABSTRACT

One common type of price points is *9-ending prices*, also known as *psychological prices* (Kashyap 1995; Levy et al. 2011; Knotek 2010). In the current research, we use data from a lab experiment, a field study, and a large Midwestern US supermarket chain to study the rigidity of 9-ending prices. Our results demonstrate a hitherto undocumented asymmetry in rigidity associated with 9-ending prices, and provide a link between consumers' cognitive costs and pricing policies that have significant effects on demand and inflation.

TESTABLE HYPOTHESES

Empirical evidence suggests that individuals usually process multi-digit numeric information, including numbers and prices, from left to right (Poltrock and Schwartz, 1984, Stiving and Winer 1997). The marketing literature also suggests that consumers often use 9-endings as a signal for low prices (Schindler 2001, 2006; Thomas and Morwitz 2005). We therefore expect that while consumers will process *numbers* digit by digit, they will use 9-endings as a signal when comparing *prices*. Since relying on 9-endings as a signal interferes with left-to-right processing, we predict that consumers will be less accurate in comparing prices and in judging price changes. We also predict that retailers are likely to respond strategically to these consumer perceptions in setting prices. Specifically, retailers will tend to set 9 ending prices after price increases because the consumers are less likely to recognize a price increase when the new price is 9-ending. Retailers are less likely, however, to set 9-ending prices after price decreases, because price decreases are often promoted by alternative signals of low prices, such as shelf signs and leaflets. Thus, we predict an asymmetry in the price rigidity of 9-ending prices, with 9-ending prices being less likely to increase than, but as likely to decrease as, non 9-ending prices.

3. DATA AND ANALYSIS

3.1. Evidence from a Laboratory Experiment

Participants compared 300 pairs of numbers or prices on lab computers. They were instructed to respond as quickly and as accurately as possible. In addition, they were told that 10 percent of them would be selected at random and paid according to their performance. The results suggest that 9-endings reduce participants' accuracy only for price comparisons but not for number comparisons. In addition, we find that 9-endings reduced accuracy only when the greater of the two prices ended with 9 but not when the smaller of the two prices ended with 9, consistent with our premise that consumers oftentimes mistaken a 9-ending price as being smaller.

3.2. Evidence from a Field Study

We recruited 365 shoppers at three supermarkets located in different cities in Israel. Consumers exiting the three supermarkets were approached, and only those who shopped in the same supermarket also in the previous week were given a questionnaire. The questionnaire was composed of a list of 52 goods in 12 categories. For each good, respondents were asked whether the good's price had increased, decreased or remained the same from the previous week to the current week.

Recall data suggest that 9-ending is associated with a higher probability that a consumer thought that a price had decreased, but does not affect the probability that a consumer thought that the price had increased. We also find that consumers are more likely to associate changes from 9-endings to non-9-ending prices with price increases, and associate changes from non 9-ending prices to 9-ending prices with price decreases.

Analysis of recall accuracy revealed that consumers are less likely to recognize price increases when the new price is 9-ending. At the same time, 9-ending prices do not increase the probability that the consumers correctly recognized a price decrease. This might be because many price decreases are sale prices that are promoted by shelf signs, leaflets, etc., regardless of whether the new prices are 9-ending or not.

3.3. Evidence from a Large U.S. Supermarket Chain

Finally, we use data on price changes in Dominick's Finer Food, a large Midwestern US supermarket chain, to test our predictions concerning retailer's pricing behaviors. We find that retailers are more likely to set 9-endings after price increases than after price decreases. Moreover, the likelihood that the prices will be 9-endings is even lower for sale prices than for regular price decreases, confirming our speculation that price decreases are oftentimes promoted by shelf signs, flyers, etc. rather than by the 9-ending. In addition, when the old price is 9-ending, the retailers are more likely to change it to another 9-ending price than when the old price is non 9-ending.

Addition analyses showed that the right-most digits were less likely to adjust if the previous prices ended with 9, more so following a price increase than following a price decrease; 9-ending prices are significantly less likely to increase than, but as likely to decrease as, non 9-ending prices; non 9-endings transitioned to 9-ending with higher probabilities for price increases than for price decreases; and 9-ending prices, when they did change, had a larger average magnitude of change than non 9-ending prices for increases but not for decreases. These results combined depict a clear pattern for an asymmetry in rigidity, with 9-ending prices being more rigid than non 9-ending prices upward but not downward.

CONCLUSION

We use data from a lab experiment, a field study, and a large Midwestern US supermarket chain to study the rigidity of 9-ending prices. We find that consumers often interpret 9-endings as a signal for low prices and therefore, they are more likely to make mistakes in price comparisons if the greater prices end with 9, and are less accurate in recalling price increases from non 9-ending prices to 9-ending prices. Retailers respond to these consumer perceptions by setting prices at 9-endings more often after price increases than after price decreases.

Thus, it seems that 9-endings as an outcome of retailers' response to consumers' cognitive bias might have significant effects on pricing policies and consequently on market structure, demand and inflation (Basu, 1996, Kehoe and Midrigan, 2008, Knotek, 2010, Eichenbaum et al., 2011).

In the Aftermath of an Earthquake: Interactive Effects of Self-construal and Victim Group-Status on Charitable Behavior

Rod Duclos, Hong Kong University of Science and Technology, Hong Kong
Alixandra Barasch, University of Pennsylvania, USA

EXTENDED ABSTRACT

When a natural disaster strikes, consumers often face numerous requests to help devastated communities. Only a small percentage of people who view these ads, however, wind up contributing resources to aid rescue and rebuilding efforts. What factors influence consumers' decision to help victims of natural disasters and other disadvantaged populations? The present research tackles this question by investigating the interactive effects of self-construal and victim origin on prosocial behavior.

Fundamental to people's emotional and cognitive responses, *self-construal* characterizes the extent to which one considers oneself separate from versus connected with others (Markus and Kitayama 1991). Not surprisingly, one's mental representation of personhood activates quite distinct mindsets. Whereas individualism (i.e., independence) highlights the personal and centralizes individuals as the unit of analysis, collectivism (i.e., interdependence) highlights the social and contextualizes individuals as parts of socially-connected units (Oyserman et al. 1998). Because the *interdependent* self focuses on social roles and relations, one might expect interdependents to be more generous than independents with needy others. Consistent with this view, several studies found positive correlations between interdependence and charitable behavior (Moorman and Blakely 2006; Eckstein 2001; Skarmeas and Shabbir 2011).

Drawing from work in psychology, however, we nuance the above view and argue that interdependents may not necessarily be more connected to and generous toward others. Indeed, recent self-construal research underscores the importance of group status (*in* vs. *out*) for the interdependent self (Iyengar and Lepper 1999; Kitayama et al. 1997). That is, whereas interdependents are generally motivated to integrate themselves with and meet the expectations of others, they do so mostly when these "others" are considered *relevant* (e.g., family members, peers; Heine and Lehman 1997).

Accordingly, the present research investigates the interaction of self-construal and victim group-status on donation behavior. In three experiments run in both America and China, we manipulated participants' self-construal before observing their prosocial dispositions toward victims of natural disasters. Our central proposition is that victim group-status (in vs. out) influences more heavily interdependents' willingness to help than independents' (since the latter see themselves as more separate from others, regardless of group-status).

To test this hypothesis, our three studies adopted a similar 2 (Self-construal: Independent/Interdependent) by 2 (Victim group-status: In/Out) between-subjects design. To manipulate self-construal, we asked participants to complete an alleged "emotional empathy questionnaire" (Gardner et al.1999) which required reading a story written either in the first person (e.g., I, my, me) or in the inclusive plural form (e.g., we, our, us) before completing manipulation checks. Next, participants viewed an appeal from "Global Relief", a fictitious charity collecting money to help victims of natural disasters. Vivid in nature, the advertisement featured death toll statistics (e.g., "hundreds dead and millions homeless"), a description of victims' needs (e.g., "food and medicine for vulnerable children and devastated families"), and the pictures of suffering victims underneath the text. The ad concluded by asking participants to visit the charity's website to make a donation. Of note, the photographs featured within each study were identical in every aspect (e.g., content;

victims' age, gender, apparent suffering) except race. Extensive pretests further ensured the pictures differed in neither mood nor arousal (e.g., nervous, excited, bad, good, depressed, relaxed).

Study 1 recruited online 292 Americans (all-White sample; average age = 35) before randomly assigning them to one of four conditions (cf. design and procedure above). Upon completing the self-construal manipulation and its manipulation checks, participants reviewed an ad from "Global Relief" depicting recent tornado victims in the southern U.S. To manipulate group-status, the ad portrayed either White (i.e., in-group) or Black (i.e., out-group) victims. Our analyses revealed no main effects but a significant crossover interaction (cf. table). On average, independents were neither more nor less likely to donate than interdependents. Similarly, White victims elicited neither more nor less donations than their Black counterparts. As expected, however, contrast analyses confirmed our central hypothesis. Whereas independents were just as likely to make a donation regardless of victims' origin, interdependents donated significantly more to in-group (i.e., White) than out-group (i.e., Black) victims.

Study 2 replicated these findings with 148 Chinese undergraduates. After being induced to think individually vs. collectivistically, participants reviewed an ad by "Global Relief" asking them to support rebuilding efforts following the Sichuan (i.e., in-group) vs. Haiti (i.e., out-group) earthquake. Once again, independents were neither more nor less likely to donate than interdependents. Similarly, Chinese victims elicited neither more nor less donations than their Haitian counterparts. As predicted, however, independents were just as likely to donate regardless of victims' origin whereas interdependents donated significantly more to in-group (i.e., Sichuan) than out-group (i.e., Haitian) victims. A look at our mood (i.e., PANAS) and self-esteem measures further revealed that neither affect- nor esteem-based explanations could account for our findings.

To articulate these results, **study 3** re-enacted the above procedure with 171 Chinese undergraduates but added attitude measures intended to capture consumers' lay beliefs about happiness and prosocial behavior (Duclos et al. 2012; Oyserman et al. 1998). The same pattern of results emerged (i.e., no main effects but a significant interaction). Whereas independents were just as likely to donate regardless of victims' origin, interdependents donated significantly more to in-group (i.e., Sichuan) than out-group (i.e., Haitian) victims. Once again, mood (i.e., PANAS) and self-esteem measures remained incapable of explaining our results. The extent to which participants believed that "helping others promotes happiness", however, did mediate the self-construal by victim group-status interaction on donation intentions (mediated moderation; Sobel test: z = 2.349, p = .019).

By uncovering the interactive effects of self-construal orientation and victim group-status on prosocial behavior in both Western and Eastern cultures, the present paper offers novel insights for both psychology and consumer research. Moreover, by articulating the mediating role of cognitions (vis-à-vis affect and self-esteem) in charitable decisions, our findings provide charities actionable insights into the psychology of donors (e.g., matching recipients of help to donors' profile in *interdependent* contexts, stressing the happiness derived from helping others). Hence, for its contributions to both theory and practice, we believe this research would be of interest to a wide audience at ACR.

Do Open Hands (Always) Open Wallets: The Influence of Gestures on Generosity

Ellen Garbarino, University of Sydney, Australia
En Li, Central Queensland University, Australia

EXTENDED ABSTRACT

Emerging research on embodied cognition (Glenberg 2010), explores the influence of the body on the mind. We contribute to this literature by examining the influence of hand gestures on generosity. Two recent studies provide evidence that generosity can be embodied in certain hand processes. Williams and Bargh (2008) found that participants whose hands experienced physical warmth (vs. coldness) displayed higher generosity. Hung and Labroo (2011) demonstrated that participants who firmed their hand muscles were more likely to make monetary donations to an earthquake relief appeal. However, hand firming did not affect the amount participants donated. To extend this hand processes research, we focus on two gestures that are metaphorically related to generosity: "open-hand" (which relates to the idiom open-handed, or generous) and "tight-fist" (which relates to tightfisted, or stingy). We hypothesize and demonstrate that holding an "open-hand" (vs. "tight-fist") gesture increases consumers' generosity and that this embodied generosity effect is moderated by consumers' idiom knowledge (study 1), gesture timing (study 2), and self-monitoring (study 2).

STUDY 1

The embodied cognition literature suggests that perceptual-motor patterns are an integral part of the representation of concepts (Barsalou 2008). Hence, making a gesture related to a concept should increase the accessibility of the concept, which should shape thoughts and behaviors to which the concept is applicable. From this logic, we propose that consumers who hold "open-hand" (vs. "tight-fist") gestures should be more (vs. less) generous. Furthermore, as knowledge availability is a necessary condition for its accessibility (Higgins 1996), consumers' idiom knowledge should increase their susceptibility to this embodied generosity effect.

Online panel participants were asked to hold certain body position, including the key gesture manipulation (randomly assigned to hold palm or fist gestures with both hands). To maintain such gestures for a sufficient amount of time, they were asked to complete some online tasks (e.g., watching and evaluating a tv commercial) before releasing the required body position. Afterwards, they completed a spendthrift-tightwad scale (Rick, Cryder, and Loewenstein 2008) and a survey of their knowledge of English idioms (including open-handed and tight-fisted idioms). It was expected that those cued for generosity (open-hand) would report higher spendthrift scores. We find participants who had held palm gestures reported marginally higher spendthrift scores ($p = .10$). This generosity effect was more pronounced among participants who knew the correct meanings of both idioms ($p < .01$) than those who didn't ($p = .40$); thus, supporting the moderating role of awareness of the concepts on generosity.

STUDY 2

"Effector dependency" theory suggests that embodiment effects should only be driven by activation of relevant muscles (Glenberg 2010). As people use their dominant hand to perform skilled actions, the dominant hand, rather than the non-dominant hand, could be the more critical effector involved in hand related embodiment effects (Borghi and Scorolli 2009). Hence, the proposed generosity effect could be driven by the gesture on one's dominant hand. To probe this possibility, we manipulated gesture timing, some participants

holding the requested gesture then released both hands to complete a donation task (i.e., prior gesture condition), and others kept holding the gesture with the non-dominant hand while using the dominant hand to respond (i.e., simultaneous gesture condition). We predict the prior gesture condition would be more likely to activate generosity concepts among participants holding an open-hand (vs. tight-fist) gesture, leading to higher generosity in a donation task (as it did in study 1). While the simultaneous gesture condition should lead to the opposite effect; holding an open-hand (vs. tight-fist) in the non-dominant hand would make the dominant hand seem more (less) constricted by comparison and could consequently lead to activation of "less generous" (vs. "less stingy") responses.

Another potential moderator lies in individual differences in self-monitoring. Existing research shows that individuals who are high (vs. low) in self-monitoring are more sensitive to external cues (vs. internal states) (DeMarree, Wheeler and Petty 2005). As the prior gesture condition does not provide present external cues for the donation task, low (vs. high) self-monitoring consumers would be more likely to make their donation decisions based on their internal states, including bodily sensations carried over from prior gesture. Therefore, the proposed embodied generosity effect should be more prevalent among low (vs. high) self-monitoring consumers under the prior gesture condition. The simultaneous gesture condition, provides the still gesturing hand as a salient external cue, rendering high (vs. low) self-monitoring consumers more susceptible to the proposed effect.

Participants were assigned to one of four conditions: 2 (gesture: tight-fist vs. open-hand) × 2 (gesture timing: prior gesture vs. simultaneous gesture). They completed a questionnaire including the Revised Self-Monitoring scale (Lennox and Wolfe 1984). They then reset their body position including the manipulated hand gesture. After holding the gesture for 60 seconds, those in the prior gesture condition released both hands and proceed with the donation task, those in the simultaneous gesture condition were only allowed to release their dominant hand. Participants were told that one out of every 100 participants would receive $100. They indicated, by writing with their dominant hand, how much of their $100 they wanted to donate to a charity, if selected.

The results indicated a significant gesture × gesture timing interaction ($p < .05$). In the simultaneous gesture condition, contrasts revealed more generous donations from participants who held a tight-fist than from those who held an open-hand ($p < .05$). In contrast, a reversed pattern was found among participants in the prior gesture condition, though the level fell short of significance ($p < .18$). Spotlight analyses (Fitzsimons 2008) shows the predicted effects of gestures among high self-monitoring participants in the simultaneous gesture condition ($p < .05$) but not among low self-monitors ($p > .50$) and the predicted effects among low self-monitoring participants in the prior gesture condition ($p < .05$) but not among high self-monitors ($p > .70$).

The current study illustrates that generosity can be embodied in subtle hand gestures. Further, this embodiment effect is moderated by consumer idiom knowledge, gesture timing, and self-monitoring. Future research could seek support for this effect in other consumption domains (e.g., product purchase decisions).

Leisure Consumption as Conspicuous Work

Andre F. Maciel, University of Arizona, USA
Melanie Wallendorf, University of Arizona, USA

EXTENDED ABSTRACT

One characteristic of postmodernity that is of central interest for marketing scholars is the reversal and interpenetration of production and consumption (Firat and Venkatesh 1995). This altered relation between the two is encountered in distinctive practices such as those addressed in the growing literature on co-creation (Prahalad and Ramaswamy 2000; Schau et al. 2009; Vargo and Lusch 2004). Beyond practices, this altered relation between production and consumption also generates the co-existence of sometimes conflicting ideologies (Ritzer and Jurgenson 2010; Zwick et al. 2008) that are regarded as incompatible when viewed through a modernist lens (Campbell 1987; Gelber 1999; Weber 1958). Our research addresses this cultural condition in a consumer-centric study that asks: what are the personal and cultural meanings of consumer practices that emerge from contemporary interpenetration of production and consumption in leisure?

This ethnographic project was implemented in two empirical contexts of productive leisure (Gelber 1999) where individuals intertwine production and consumption both voluntarily and consistently across time. That is, they do not engage in productive activities because of financial need, as with low income people for whom producing may sometimes be cheaper than buying. Further, they are not occasional customizers of products or assemblers of do-it-yourself kits. In productive leisure, individuals (called *productive consumers*) acquire domain-specific skills to enact a continuous cycle of production-consumption in which they buy supplies, infuse labor and creativity to make a final product, and eventually choose the intended user. The formative stage of the research pointed to the importance of including both a female-dominated and a male-dominated context to understand the gendered nature of production-consumption. Ethnographic fieldwork has been conducted among knitters and beer homebrewers to enhance the depth and the conceptual nuance of the project (Pyett 2003; Whittemore et al. 2001).

Fieldwork indicates a key outcome of the interpenetration of work and consumption in leisure is the cultural re-signification and repositioning of manual, slow-paced labor. With contemporary late capitalism's emphasis on efficiency and intellectual work, manual labor has been devalued in the realm of production (Sennett 2008). With regards to consumption, however, we argue that late capitalism has created the cultural and economic conditions for the assertion of social status through leisure activities that are particularly compatible with American production-oriented values of work and self-reliance (Gelber 1999; McClelland 1961; Weber 1930). Unlike the privileged classes' historical practice of marking status through conspicuous consumption of luxury items produced by others as well as through non-productive leisure (Veblen 1899), productive consumers build distinction in their social circles (Bourdieu 1987) by dedicating leisure time to productive manual activities that are inefficient as compared with capitalist mass-manufactures.

We find three practices that productive consumers of both genders employ to conspicuously display their work-like leisure and its handmade output to demonstrate distinctiveness. First, they find ways to take this activity beyond the realm of domestic production to also engage in the slow production of their crafts in public settings. When they do so with other hobbyists in places where the practice of productive leisure is expected (e.g., homebrewing clubs), they find recognition for creativity that is often scarce in their middle-class jobs. Productive consumers value this aesthetic feedback based on the emergent standards of the group, inasmuch as they operate in craft fields that tend not to have well-defined aesthetic standards (Becker 1978). When productive consumers take their activities to places where it is somewhat unexpected (e.g., knitting in the airplane), they commonly command admiration from others who show appreciation for the time and labor productive consumers apply to manually produce things in a society oriented towards convenience and efficiency.

Second, productive consumers engage in practices that ensure high visibility for the handmade origin of their output. In gift-giving, a common outlet for their handmade production, they draw the recipient's attention to the handmade character of the gift through cards or commentaries to ensure that the time and effort invested in it will be converted into higher esteem (symbolic capital) from the recipient (Bourdieu 1987). Moreover, productive consumers from both genders often create products to insert in special social events (e.g., a homebrewer making beer for Christmas or a knitter making a *huppah* for her wedding) to signal their commitment to the occasion and enhance others' esteem for them.

Third, in a subtle demonstration of their labor, productive consumers enact a self-presentation strategy (Goffman 1959) that downplays mass-manufactured items to emphasize both the quality and the handmade-ness of the item. Productive consumers use mass-produced items as a background for the display of the handmade, as with knitters who often favor relatively plain outfits that make a colorful handmade shawl stand out. Productive consumers thus relegate mass-produced items to an inferior position to draw attention to what is much more central to their identities and much more socially distinctive: their capability to produce things manually and inefficiently.

Strikingly, productive consumers invest a substantial amount of time and labor that is not remunerated in order to craft products that do not necessarily comply with current taste standards. The process through which the handmade items acquire value relies less on aesthetic and financial criteria than on the distinctiveness they convey when delivered in the context of the larger culture's transition from modernity to postmodernity. This research unpacks a particular dynamic between time, leisure, and labor that emerges from a contemporary reencounter of work and consumption during leisure. In this dynamic, which is interestingly consistent across genders, relatively privileged classes emulate the work practices of lower classes to build distinctiveness and prestige. Unlike non-productive leisure, this strategy is validated by the centrality of work, time, and self-reliance in contemporary American culture. Productive consumers use unpaid, time-consuming, and labor-intensive activities to reassert and display their control over scarce, valuable resources, thereby acquiring and communicating symbolic capital.

Influence of Future Time Perspective on Involvement:
An Approach with two Studies

EXTENDED ABSTRACT

Both marketers and scholars have recognized the growing economic relevance of older consumers (Yoon, 1997; Yoon et al., 2005). While demographic change alone cannot justify research on older individuals' consumer behaviour, this field is nevertheless important as there is a great deal of evidence regarding age differences in consumer behaviour (see e.g. Yoon & Cole, 2008). The aim of this research is to extend current knowledge of older consumers' behaviour, focusing on involvement and future time perspective (FTP). Furthermore, older consumers face new challenges in daily life, for instance in the realm of medical decision-making (Wood, Shinogle, & McInnes, 2010). We propose recommendations for the development of customer approaches in the context of colon cancer prevention.

INVOLVEMENT

Involvement is defined as "a person's perceived relevance of the object based on inherent needs, values and interests" (Zaichkowsky, 1985, p. 342), and has an affective and a cognitive dimension (Zaichkowsky, 1985, 1987, 1994). It affects the cognitive effort people put into decision-making processes (Bienstock & Stafford, 2006; Mittal, 1995). Research mostly focuses on product involvement (Laurent & Kapferer, 1985; Michaelidou & Dibb, 2006, 2008; Mittal, 1995). This paper extends research in the area of services (Bienstock & Stafford, 2006; Varki & Wong, 2003) and health services in particular (Shaffer & Sherrell, 1997).

FTP

FTP, a construct embedded in the socioemotional selectivity theory (SST), describes a person's subjective perception of time left to live. FTP can vary depending on life situation (Bouffard, Lens, & Nuttin, 1983; Carstensen & Fredrickson, 1998) and lifestyle (Lang & Carstensen, 2002), and can be influenced through framing in advertisements (Fung & Carstensen, 2003; Fung, Carstensen, & Lutz, 1999; Williams & Drolet, 2005).

SST provides a comprehensive approach to explaining age related differences in consumer behaviour (Drolet, Lau-Gesk, Williams, & Jeong, 2010). For example, consumers with a more limited FTP prefer more positive information in a health context, and avoid negative information (Löckenhoff & Carstensen, 2007). Yet, ignoring information is an important issue in the health care context (Löckenhoff & Carstensen, 2004). Furthermore, older adults' focus on emotions has been identified in many different studies (for a commentary see Drolet, Lau-Gesk, Williams, & Jeong, 2010). SST holds that this focus on emotions is due to older individuals' limited FTP (Carstensen, 2006).

HYPOTHESES

Health is of emotional relevance, especially for older adults. According to SST, emotionally relevant goals are prioritized by adults with a limited FTP. We therefore derive the following hypothesis:

Hypothesis 1: *Adults with a limited (vs. expansive) FTP have a high (vs. low) affective/ cognitive involvement in colon cancer prevention.*

In order to prove that the FTP-involvement link is not mainly based on a cohort effect, we hypothesize that FTP manipulation influences involvement as follows:

Hypothesis 2: *Affective/ cognitive involvement can be increased (vs. reduced) through limited (vs. expansive) FTP framing.*

METHOD

To test H1, study 1 was carried out among 538 younger (mean age: 25.03) and 482 older adults (mean age: 57.89). After reading a text containing information about colon cancer prevention, participants answered a questionnaire including an involvement (Hagendorfer, 1992; Zaichkowsky, 1994) and an FTP scale (Carstensen & Lang, 1996; Lang & Carstensen, 2002). Cronbach's alphas were good for involvement (.913) and FTP (.905).

In Zaichkowsky's involvement concept and in SST, the emotional component is a substantial part (Zaichkowsky, 1987). Therefore we checked for the influence of emotions. Furthermore we included questions regarding lifestyle (cf. Reitzler, 2001; Hess, 2001).

In order to test H2, for study 2 we added an FTP frame (based on Williams & Drolet, 2005) in the text about colon cancer prevention. A 2 (older vs. younger adults) x 3 (limited vs. expansive vs. control condition) between-subjects design resulted. 160 younger (mean age: 23.58) and 127 older adults (mean age: 64.38) participated in this experimental study.

STUDY 1

Our results confirm that FTP influences involvement. Analyses relied on structural equation modeling using AMOS 19. The fit indices show the acceptable model fit (χ^2/d.f.=7.439, RMSEA=.079, IFI=.852, CFI=.851). The paths from FTP to affective involvement (–.17, p<.001) and cognitive involvement (–.26, p<.001) were significant. Thus, H1 is supported. The results (see figure 1) show that the path from FTP to lifestyle is significant (.55, p<.001). Furthermore, lifestyle is related to cognitive involvement (.10, p<.001). As expected, emotions have an impact both on affective (.87, p<.001) and cognitive (.84, p<.001) involvement. Findings are consistent with the assumptions of SST and earlier research on involvement.

STUDY 2

A 2 x 3 ANOVA on the FTP index found a significant effect for framing group (F(5, 280)=28.582; p<.000). Although this effect is attributed to differences between age groups rather than framing (see table 1), data encourages the view that FTP framing can influence involvement. Two 2 x 3 ANOVAs on the affective involvement (F(5, 268)=6.539; p<.000) and cognitive involvement (F(5, 278)=8.491; p<.000) indices found significant effects. Differences exist between age groups: younger participants have a more expansive FTP and are less involved than older participants. Thus, we again find support for H1. Furthermore, older individuals are less involved in the limited frame than in the expansive frame and in the control condition. For the young, the results do not show clear framing effects (see table 1).

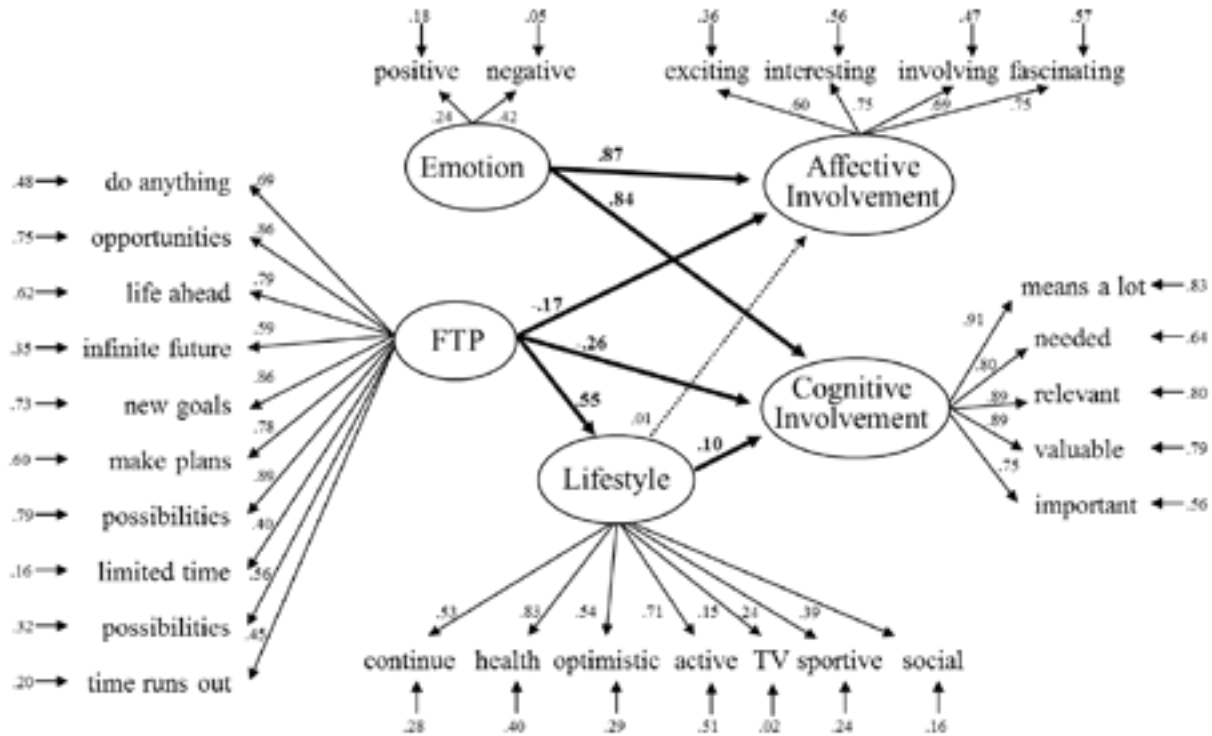
Figure 1
The relationship between FTP and Involvement: Structural Equation Model Results


Table 1
Study 2 Results

	Younger adults		
Frame	Expansive	Limited	Control
FTP	2.35 (.69)	2.19 (.63)	2.31 (.66)
Affective involvement	4.02 (1.35)	4.04 (1.09)	4.22 (1.17)
Cognitive involvement	2.98 (1.28)	3.13 (1.07)	3.24 (1.30)
	Older adults		
Frame	Expansive	Limited	Control
FTP	3.63 (1.17)	3.63 (1.38)	3.73 (1.16)
Affective involvement	3.06 (1.59)	3.62 (1.22)	3.05 (1.37)
Cognitive involvement	2.10 (1.52)	2.51 (1.55)	1.77 (1.21)

Results imply that older and younger adults react differently to FTP framing. While a limited FTP frame seems to alienate the elderly from screenings, merely mentioning life time seems to provoke positive reactions towards prevention among the young. Although H2 is not supported, results indicate that the FTP-involvement link is independent from cohort effects.

CONTRIBUTIONS

FTP affects involvement in the context of health care services. Furthermore, involvement can be influenced through FTP manipulation. These findings provide players in the health care sector with the possibility of adopting FTP-based approaches for successfully addressing older customers. Concerning the participation in medical screenings, consumers could be activated more efficiently. Future research should verify if the relationship between FTP and involvement exists for other services.

Differential Discounting of Hedonic and Utilitarian Rewards:
The Effect of Outcome Related Affect on Time-Sensitivity

Selcuk Onay, University of Waterloo, Canada
Valeria Noguti, University of Technology Sydney, Australia

EXTENDED ABSTRACT

Hyperbolic discounting has been proposed as an explanation for impulsive, time-inconsistent behavior (Ainslie 1975; Ainslie and Haslam 1992; Strotz 1955). Although previous research on intertemporal choice has consistently demonstrated that hyperbolic discounting can explain time preferences better than exponential discounting (for a literature review see Frederick, Loewenstein, and O'Donoghue 2002), the underlying psychological mechanisms involved in this process are not well understood. More importantly, the explanations for hyperbolic discounting proposed so far in the literature either focused solely on affective motives and visceral factors (Loewenstein 1996; Metcalfe and Mischel 1999) or only on perceptual and cognitive factors such as time-sensitivity (Ebert and Prelec 2007; Zauberman et al. 2009). We argue that while each of these two approaches can successfully explain a wide array of consumer behaviors, affective and perceptual factors are not independent of each other and the interaction between them gives rise to the discount function's shape. More specifically, we propose that affect toward delayed rewards reduces sensitivity to time in intertemporal decisions leading to differential discounting of hedonic and utilitarian rewards.

We operationalize time sensitivity using Ebert and Prelec's (2007) *constant-sensitivity discount function* which separates impatience (parameter *a*) from time-sensitivity (parameter *b*). Ebert and Prelec (2007) have argued that hyperbolic discounting can be explained by insufficient sensitivity to prospective delays and that time-sensitivity can be heightened or reduced experimentally. We propose that positive affect toward hedonic outcomes reduces time-sensitivity giving rise to more hyperbolic discounting of affect-rich, hedonic rewards compared to affect-poor, utilitarian ones (Dhar and Wertenbroch 2000; Hirschman and Holbrook 1982; Khan, Dhar, and Wertenbroch 2004). A similar effect has been demonstrated in the domain of risky choice. Rottenstreich and Hsee (2001) found that sensitivity to probabilities is reduced for affect-rich rewards.

We report three studies in which we demonstrate: (a) lower time-sensitivity for hedonic than for utilitarian rewards, and (b) a decrease in time sensitivity as a function of an increase in positive affect. In all studies we used two categories of rewards (between subjects): hedonic and utilitarian. In study 1 participants were asked to suppose that they had won a contest and could choose to receive a reward valued today at $100 or to receive a higher value reward in the future. Indifference points were elicited by using sets of six matching questions, each relative to a different future time (one day, one week, one month, six months, one year, and two years) and to a given category. Questions were worded as follows: "what is the minimum value of the [reward] in [future time] that would make you choose to receive the [reward] in [future time] instead of receiving the $100 [reward] today?" Participants also indicated the intensity of their feelings when receiving each reward type. Following Ebert and Prelec's constant-sensitivity function (2007), the parameter *b* was estimated for each individual. Higher *b* indicates more sensitivity to the time dimension. We obtained a significant category effect (β = .32, $t(57)$ = 2.54, $p < .05$). In the utilitarian category *b* was significantly higher (M = .39, SD = .14) than in the hedonic category (M = .31, SD = .11). Positive affect mediated this relationship.

In study 2 we demonstrate that an increase in positive affect towards rewards leads to decreased time sensitivity. A choice task was used instead of matching. Positive affect conditions were created by introducing the word 'excitement' in the options. For example, each question read: "Option 1: I prefer *the excitement of* getting a $100 [reward] gift certificate now" or "Option 2: I prefer *the excitement of* getting a $x [reward] gift certificate in [future time]". In the neutral condition *b* was higher for utilitarian (M = .59, SD = .24) than for hedonic rewards (M = .51, SD = .21; β = .24, $t(122)$ = 1.97, $p = .05$), but in the positive affect condition *b* was at the same level for utilitarian (M = .52, SD = .17) and hedonic rewards (M = .54, SD = .24; β = .12, $t(122)$ = .91, $p > .10$).

In study 3 we develop an imagery-based manipulation of positive affect and demonstrate that cognitive reflection moderates the impact of positive affect on *b*. An iterative choice task was used. In both conditions a picture was introduced in the choice screens. In the neutral conditions the pictures were factual, e.g., an electricity meter to represent bills (example in the utilitarian category). The pictures in the positive affect conditions depicted happy people, for example, a smiling lady holding coins and a bill to represent bills. The positive affect conditions involved an additional task before the choice questions in which participants were asked to imagine that they won a contest and the prize was a $100 [reward] gift certificate. They were then asked to visualize themselves when receiving the certificate and the excitement and joy they would feel on the occasion. Next, participants responded to the CRT (Cognitive Reflection Test) questions (Frederick 2005). We found a main effect of category (M_{util} = .60 vs. M_{hed} = .51; β = .23, $t(126)$ = 2.65, $p < .01$) and the two-way interaction between positive affect and CRT (β = .22, $t(126)$ = 2.54, $p < .05$). The predicted effect of positive affect decreased *b* for low CRT participants ($M_{positive}$ = .48 vs. $M_{neutral}$ = .61; β = -.46, $t(125)$ = -2.78, $p < .01$) but did not change *b* for high CRT participants ($M_{positive}$ = .58 vs. $M_{neutral}$ = .54; β = -.06, $t(125)$ = -.36, $p > .10$).

In conclusion, we propose that positive affect reduces sensitivity to time, and hence enhances hyperbolic discounting, and demonstrate that time sensitivity is indeed reduced when positive affect increases. This argument provides a significant contribution to the literature as so far little has been published on how the interaction between hedonic motives and "time perception gives rise to the discounting function's shape. We also provide an explanation for why discounting is more hyperbolic for affect-rich, hedonic goods than affect-poor, utilitarian goods.

Cooling Down or Heating Up with Emotions:
How Temperature Affects Customer Response to Emotional Advertising Appeals

Pascal Bruno, University of Cologne, Germany
Valentyna Melnyk, University of Waikato, New Zealand
Franziska Völckner, University of Cologne, Germany

EXTENDED ABSTRACT

Target's heartwarming mascot-puppy Bullseye, the adorable Pillsbury-Doughboy, the cute Gerber-Baby – emotional advertising appeals are prevalent and are even considered as more influential on purchase decisions than reason (Binet and Field 2009; Wood 2012). Advertising particularly frequently arouses emotional warmth (Fam 2008; Smit, van Meurs, and Neijens 2006), that is, a positive, mild, volatile emotional construct triggered by experiencing a love, family or friendship relationship (Aaker, Stayman, and Hagerty 1986). Despite the prevalence of warmth in advertising, empirical research on the effectiveness of such a strategy has been scarce (Vanden Abeele and MacLachlan 1994). So far, it is unclear whether and under which conditions emotionally warm (e.g., joy) or cold advertising appeals (e.g., disgust) are effective.

Recent embodied cognition research proposes that cognition is grounded in the physical context (Barsalou 2010), and emotional and physical warmth are interrelated (e.g., Williams and Bargh 2008). Drawing on this interrelation, we introduce and test in an advertising context the moderating influence of physical temperature on consumers' responses to emotional warmth versus coldness. We demonstrate in a lab experiment that physical coldness enhances consumers' attitudes towards emotionally warm ads; physical warmth decreases consumers' responses to emotionally warm ads and instead enhances attitudes towards emotionally cold ads. Our findings have implications for seasonal and international advertising campaigns.

THEORETICAL BACKGROUND

Embodied cognition research proposes that cognitive activity is grounded in the environment (Barsalou 2010). Put simply, it suggests that mind and body are closely related. Studies found, that respondents experiencing physical warmth considered a person's personality as warmer (Williams and Bargh 2008) and socially closer (IJzerman and Semin 2009). In contrast, people feeling physically cold were willing to pay more to watch romantic movies (Hong and Sun 2012), or felt lonelier (Bargh and Shalev 2012) and vice versa (Zhong and Leonardelli 2008).

From a biological perspective, humans urge to keep themselves warm to survive (Austin and Vancouver 1996). Hence, feeling physically cold should lead to an increased desire for warmth. Given the apparent link between physical and emotional warmth, an anxiety for emotional warmth could channel this desire to warm up under physical coldness.

As emotional warmth is predominant in advertising (Fam 2008), this study focuses on the ad context, analyzing the relation of physical temperature with *ad-induced warmth* in contrast to *ad-induced coldness*. We predict that *physical* coldness (warmth) activates a need for *psychological* warmth (coldness) and thus should increase consumers' response to advertising triggering emotional warmth (coldness).

METHODOLOGY

In total, 299 students (46.8 % females) were randomly assigned to one of the four conditions of the 2 (cold vs. warm physical temperature) x 2 (cold vs. warm advertising) between-subjects design experiment. In the warm (cold) temperature condition, we held room temperature constant at around 30 °C/86 °F (14 °C/57.2 °F). The emotional temperature was manipulated by pretested emotionally warm (cold) advertisements.

Participants evaluated the ads on six 7-point scales: ad liking, ad interest, convincingness of the ad, ad appeal, the ad's potential to be remembered, and ad effectiveness. Next, participants indicated the ad's perceived emotional warmth and the perceived physical room temperature (on 7-point scales, respectively).

We conducted a 2 (physically cold vs. warm) x 2 (emotionally cold vs. warm) between-subjects ANOVA. As our dependent variable, we calculated an index for attitude towards the ad (A_{ad}) as the mean of our six consumer response items (Cronbach's α = .836).

We find a significant main effect of emotional warmth of the advertisements on A_{ad} ($F(1, 290) = 13.52$, $p = .000$, $\eta^2 = .045$). The main effect of physical temperature on A_{ad} ($F(1, 290) = .06$, $p = .800$, $\eta^2 = .000$) was not significant. However, as predicted, the interaction effect of emotional warmth and physical temperature on A_{ad} was significant ($F(1, 290) = 8.37$, $p = .004$, $\eta^2 = .028$). This result implies that respondents' physical temperature moderated the effect of emotional warmth (see figure 1).

To better understand the interaction effect, we conducted planned comparisons. Respondents in the cold temperature condition indicated for emotionally warm advertisements a significantly higher A_{ad} ($M = 3.68$) than for emotionally cold advertisements ($M = 2.70$; $F(3, 290) = 7.42$, $p = .000$). Thus, under the influence of cold temperatures our results indicate a positive effect of emotional warmth (vs. emotional coldness) on consumers' responses to advertising. Moreover, the attitude towards an emotionally warm ad is higher in the physically cold condition ($M = 3.68$) than in the physically warm condition ($M = 3.29$; $F(3, 290) = 7.42$, $p = .072$). Hence, the results indicate that cold temperature enhances attitude towards emotionally warm ads.

Figure 1
Moderating Effect of Temperature on the
Effect of Warm/Cold Appeals
Furthermore, as expected, attitude towards the ad arousing emotional coldness is significantly higher in the physically warm condition ($M = 3.17$) than in the physically cold condition ($M = 2.70$; $F(3, 290) = 7.42$, $p = .022$). However, once people feel physically warm, they show no significant difference in attitude towards emotionally cold ($M = 3.17$) and warm advertising ($M = 3.29$; $F(3, 290) = 7.42$, $p = .581$). Hence, while consumers use, as suggested by embodied cognition theory, warm appeals to warm themselves up in a physically cold environment, they do not seem to make a difference between either cold or warm emotional stimulation when they are physically warm.

DISCUSSION AND IMPLICATIONS

Drawing on embodied cognition research, we introduce and empirically test the environmental context moderator of physical temperature on the effectiveness of emotionally warm versus cold advertising campaigns. We find that while cold physical temperature enhances consumers' responses to emotionally warm ads, warm physical temperature decreases consumers' responses to emotionally warm ads and instead enhances consumers' attitudes towards emotionally cold ads.

Our findings have important implications for the execution of seasonal and international marketing campaigns. Managers might, for instance, employ either warm or cold appeals in advertising during the summer months or in countries with warm climates, while they should prefer warm appeals over cold ones in winter or in colder regions.

The Specificity Heuristic: Consumer Evaluation of Expert Recommendation

Mauricio Palmeira, Monash Unviersity, Australia
Gerri Spassova, Monash Unviersity, Australia

EXTENDED ABSTRACT

This research investigates how consumers evaluate expert advice in the presence of little diagnostic information. Consumers often seek recommendations from a range of sources, referred to as consumer agents (Solomon 1986; West 1996). Such advice represents an important component of the decision-making process and the offering (Beatty and Smith 1987; Solomon 1986; Urbany, Dickson, and Wilkie 1989).

THEORETICAL BACKGROUND

Prior research has identified several factors that influence perceptions of the diagnosticity of agent advice, such as expertise and past performance (Feick and Higie 1992; Gershoff, Broniarczyk, and West 2001), or perceived similarity of the source to the self (Brown and Reingen 1987; MacKie, Gastardo-Conaco, and Skelly 1992; Reingen and Kernan 1986). In many cases, however, consumers have little access to such information (Gershoff et al. 2001) and resort to heuristics in judging the soundness of the advice (Yaniv 2004). For example, they may judge the expertise of the agent based on his confidence (Karmarkar and Tormala 2010; Keren and Teigen 2001; Price and Stone 2004; Sniezek and Van Swol 2001) or the extremity of the claims (Gershoff et al. 2003; Goldberg and Hartwick 1990). In this research we propose another heuristic that consumers use when evaluating advice – the specificity heuristic.

Individuals who use the specificity heuristic infer that the expertise of an agent is positively correlated with the level of specificity of his recommendation. Specificity can take various forms, from excluding particular options from a recommended set, to specifying the manner in which a recommended option should be taken. It is not driven by the amount of detail provided, but rather by how restricted the recommended course of action is. The specificity heuristic cannot be explained through a negativity bias either – it is equally effective when it takes the form of including a specific behavior, as it is when taking the form of excluding a specific behavior.
