what the world needs now

Advances in Consumer Research, Volume 49

Tonya Williams Bradford, Anat Keinan, and Matthew Thomson

Preface

The 52nd Annual Conference of the Association for Consumer Research (ACR) was held October 8 - 30, 2021 virtually with the ACR Community, and not in Seattle as originally hoped. This conference marked ACR's 2nd virtual conference. We leveraged lessons learned from the 1st ACR virtual conference (Paris) and introduced innovations for the community. Our focus was to continue the community's hallmark experience of welcoming scholars from around the globe from interdisciplinary perspectives and employing an array of methodologies to share and discuss knowledge of consumer behavior.

Our conference theme was "What the World Needs Now." This theme was inspired by the fact that the world was finding its way through the COVID-19 pandemic and grappling with racial, social, and climate injustices. It was our hope that ACR 2021 would be an opportunity for scholars across research interests and paradigms to unite with a focus on how we can employ our talents to improve the world around us through rigorous and relevant scholarship. Though we were originally inspired to have our community gather in Seattle—the Emerald City, we quickly found ourselves facing a different reality brought into focus by the pandemic. We were heartened by possibilities as the first vaccinations rolled-out but quickly realized that travel limitations would hinder the global ACR community from gathering. Thus, we moved forward with planning a virtual conference—one we hoped would take the best of what our community is and reimagine those experiences in virtual gatherings.

Amidst disappointment within our community that ACR2021 would be virtual, we sought to create novel opportunities for engagement while providing the rich intellectual stimulation that is the hallmark of ACR. We are appreciative to those who jumped onboard with these innovations which facilitated the personal interactions we look forward to, and the growth we crave through opportunities to share research and learn from one another. Further, we endeavored to garner conference participation across the rich diversity in our community—from institution type, geography and gender, race, or ethnic identification, to time in the field, methodology, and research area.

Throughout the conference, the challenge to advance research agendas that unite and help the world was brought to us through the Fellows' Addresses (by John F. Sherry, Jr. and Melanie Wallendorf), the Presidential Address (by June Cotte), the Keynote Conversation (Juliet Schor and David Crockett), the Sheth doctoral consortium, mid-career workshops, the Film Festival, Knowledge Forums, Competitive Paper Roundtable discussions, Special Sessions, and Working Papers.

We crafted three venues to facilitate social engagement and recreate opportunities for spontaneous interaction. In lieu of receptions, there were Globe Trotting sessions where conference attendees were introduced to a slice of life from different parts of the world. To meet new people, we invited colleagues from around the globe to host small group conversations in the form of Colleague Confabs. Recognizing that each year brings new members to ACR, the co-chairs hosted Meet & Greet sessions the weeks prior to the conference where we shared a bit about ourselves as members of this grand community. We are grateful to:

- Our colleagues who made the vision for Globe Trotting a reality beyond our wildest imagination, we thank you—Stefania Borghini and Andrea Rurale (Italy); Harija Banovic, Klaus G. Grunert, Lina Jacobsen, Maartje Mulders, Anne O. Peschel, Violeta Stancu, Catalin Stancu, and Sascha Steinmann (Denmark); Franklin Velasco (Ecuador); Sumitra Auschaitrakul, Theeranuck Pusaksrikit, Yupin Patarapongsan, and Sydney Chinchanachokchai (Thailand); and, Sumire Stanislawski, Kosuke Mizukoshi, Shuji Ohira, and Yuichiro Hidaka (Japan).

- The faculty who graciously volunteered as part of our Colleague Confabs: Eduardo Andrade, Donnel Briley, Rajesh Chandy, Amitava Chattopadhyay, David Crockett, Giana Eckhardt, Christina Goulding, Zeynep Gurhan-Canli, Ashlee Humphreys, Jeff Inman, Yuwei Jiang, Rob Kozinets, Angela Lee, Don Lehmann, Tina Lowrey, Debbie MacInnis, Ann McGill, David Mick, Anirban Mukhopadhyay, Connie Pechmann, Hilke Plassmann, Stefano Puntoni, Priya Raghubir, Hope Schau, Stacy Wood, and Juliet Zhu.

The pace of innovation in the field can be staggering, however the conference is an opportunity to ground us in our shared focus on consumer research. To provide opportunities for deep engagement with new content, Knowledge Forums were held in the weeks leading up to the conference, with supplemental discussions held during the conference. Competitive papers, a great way to advance research toward publication, were presented through videos. In addition, Competitive Paper Roundtables were moderated by scholars across the various tracks which allowed for lively discussions amongst authors and others interested in the different research areas.

As we do each year, the members of the ACR Community help make the conference a success. And, it was no different with this novel conference format. We especially wish to thank:

- The diligent Working Paper Co-chairs: Liat Levontin, Rima Touré-Tillery, Echo Wen Wan;
- The thought-provoking Knowledge Forum co-chairs: Jonah Berger, Michael Luchs, and Frederick Wherry;
- The ingenious Film Festival co-chairs Finola Kerrigan and Eric Li;
- The phenomenal Associate Editors: Fleura Bardhi, Jonathan Berman, Amit Bhattacharjee, Katherine Burson, Hanna Chang, Samantha Cross, Marcus Cunha Jr., Kelly Goldsmith, Hal Hershfield, Ryan Hamilton, Szu-chi Huang, Mathew Isaac, Uma Karmarkar, Selin Malkoc, Theo Noseworthy, Nailya Ordabayeva, Mario Pandelaere, Gabriele Paolacci, Lisa Peñaloza, Adriana Samper, Daiane Scaraboto, Yael Steinhart Abigail Sussman, Keith Wilcox, Lawrence Williams, and Meng Zhu;
- The indefatigable Program Committee, Competitive Paper Reviewers, and Working Paper Reviewers;
- The insightful Competitive Paper Moderators: Pankaj Aggarwal, Melissa Akaka, Zeynep Arsel, Lisa Bolton, Cynthia Cryder, Susan Dobscha, Giana Eckhardt, David Gal, Andrew Gershoff, Lauren Grewal, Neeru Paharia, Chiara Longoni, Sarah Moore, Jeff Parker, Marie-Agnès Parmentier, Cristel Russell, and Gülden Ülkümen;

- The incredible Mid-Career Workshop co-chairs: Simona Botti, Sonia Monga, and Americus Reed;
- The inspiring Sheth Doctoral Consortium co-chairs: Lea Dunn and Grand Packard;
- Our tech-savvy doctoral student hosts who helped presenters and participants navigate Webex and Zoom seamlessly; and,
- Every conference attendee who learned how to navigate the Ex Ordo conference platform and demonstrated flexibility moving from one Webex session to the next!

The conference featured 260 hours of live content and 244 recorded presentations and films for the 1,461 participants from 41 different countries. We received 874 total submissions and accepted 526, which represents a 60% acceptance rate. This year's conference presented 239 competitive papers (54% acceptance rate), 68 Special Sessions (87% acceptance rate), 201 working papers (63% acceptance rate), 9 Knowledge Forums (41% acceptance rate) and 7 films (88% acceptance rate). We thank our generous sponsors: The Sheth Foundation, the Society for Consumer Psychology, the Journal of Consumer Research, the Marketing Science Institute, Stukent, and the Schulich School of Business at York University.

Special acknowledgement goes to ACR Executive Director Rajiv Vaidyanathan, the ACR Executive Assistant Brenda Monahan, and our graphic designer Yoni Alter.

We have nothing but gratitude for June Cotte, ACR President 2021, and her trust in us to organize ACR 2021, and for her never ending encouragement and support for the wildest of ideas. Planning the SECOND virtual conference for this tremendous community was a labor of love for the three of us!

With thankfulness.

Your ACR 2021 Conference Co-Chairs,

2021 ACR Presidential Address

Generalists: Bulwark Against Tribalism

June Cotte, Western University, Canada

I am going to talk to you today about generalists, to make a case against hyper-specialization, and the need for generalists to help consumer research from descending further into tribalism. But I can't jump right into the fray. First, a bit of history. I would like to place what I am doing today within the history of ACR Presidential Addresses.

ACR Presidential Addresses come in many forms and I'd like to review three types, in order to situate my own approach.

One approach is when scholars use this platform to dive deep into their own research area, to plumb it thoroughly and draw out broad insights for the entire field. Two examples stand out in my mind. Debbie's MacInnis' 2004 Presidential Address built on her own work about hope to offer a lively discussion of generative concepts in consumer research. Joe Alba's 1999 discussion of consumer expertise (and lack thereof) was both smart and hilarious. My sense is that this genre is the most popular for Presidential speeches.

A second approach asks us to question what we are really doing as consumer researchers, and why. Why do we do this job? Why do we love it? What does it mean to be a consumer researcher? What should it mean? In 2014 Linda Price talked about wonderment in research, rather than a direct and instrumental approach to "getting published." A few years later, Stacy Wood cautioned us about the narrowness of a "single story." This type of address is harder to define, but it is basically smart people trying to remind us that research can be inventive, exuberant, and important. Remembering these things will help us make our research better.

A final type are those Presidential Addresses that are in some sense accusatory. They are aimed at showing us how we are going wrong, or when we are ignoring critical topics, or where we should go next. There are three exemplars across history I'd like to highlight. One is Russ Belk's 1986 address that exhorted us to consider more macro level consumption issues. In highlighting what was then a field almost entirely devoted to studying individual consumption decisions, often of the grocery variety, he made the "…very simple and obvious point … the care and detail with which we have imagined that consumers make choices - as if they were the sole focus of daily life. However true this may be for some consumers some of the time, it is not true of most consumers most of the time." Another is David Mick, whose 2005 address named and defined the Transformative Consumer Research movement, and beseeched consumer researchers to work on important substantive problems focused on improving consumer welfare. He was hoping the establishment of TCR would "…usher in a renaissance of an original mission of ACR, namely, to conduct and impart outstanding research in the service of quality of life." And in 2020, Eileen Fischer turned from a more traditional focus on research in general to interrogate the ACR association itself. She examined recent societal upheavals, and gave the field some clear marching orders, especially around diversity, inclusion, and intersectionality. This third type of speech is closest to what I am doing here with you today.

In many ways, I am aligning myself with Rich Lutz's 1989 Presidential Address. At the time, he was playing a dual role as ACR President and JCR Editor, a dual role I now find myself in. By the way, although he may not realize it, Rich was an early positive influence on me and my career. Although he was already "famous" he was welcoming and lovely when I met him as a doctoral student. And his deep dive into philosophy of science issues as he grappled with the emergence of what was then called "naturalistic" research remains an intimidating intellectual achievement. I think it's essential to revisit it. Why? Because what Rich, and others, argued for has come to pass: as consumer researchers, we largely accept the legitimacy of various ontological and epistemological traditions. But I am motivated by a second aspect of Rich's address where I feel that **we as a field have failed spectacularly**.

I want to quote him at length here: "We need to ***read*** and benefit from one another's work. Consumer research is a vital and vibrant field, due in large part to its diversity. We need to respect the legitimacy of different paradigms and draw on the eclectic insights offered by this variety of approaches. By cultivating a more sophisticated pluralistic view of the research enterprise, we can actually learn more from each other." I don't think we are learning from each other. I don't think we are learning from each other. And we should. That's what I'm going to talk about now.

Let's start with a thought experiment. As a researcher, do you mainly carry out experiments in labs or online? If so, when was the last time you fully read an article using ethnographic methods? Do you mostly rely on depth interviews? If so, when was the last time you carefully read an article that used machine learning tools to analyze large datasets? How many of you read JCR or JACR from cover to cover, every issue? How many of you regularly make yourself uncomfortable like that? I suppose it's good that we don't really argue anymore about the legitimacy of different approaches to carrying out research, but I worry it's because we have just learned to ignore each other. That is bad. That is not progress.

I have seen "bridging the gap" discussions at virtually every AMA doctoral consortium I've attended, and they are usually talking about marketing as a field splintering into quant, CB, and strategy. But in my twenty-five years in the field, I've also seen the birth and/or growth of CCT, SJDM, TCR, SCP and others. And I wonder: there a field of consumer research anymore? Does it matter?

Of course, we aren't alone in this. A biologist likely wouldn't introduce herself as such; she would likely say she was a microbiologist, a marine biologist, or even a biostatistician. A linguist isn't just a linguist, she may be a historical linguist, a sociolinguist, a psycholinguist, ethnolinguist, a computational linguist, or even a neurolinguist. We are hyper-specialized. And hyper-specialization is both blessing and curse.

I realized recently I've been ranting about this issue for years, but simplistically. It's only for the purposes of this talk that I've attempted to some intellectual meat on the bones of an old argument. Robin Coulter and others have written about the need for marketing, as a field, to work together across specialities. And Arnould and Thompson, more than ten years ago, wrote in JCR that rather than developments in consumer research fostering different camps, the various sub-specialities could create multiple, insightful, theoretical conversations that "enable consumer researchers to poach and cross-fertilize ideas, methods, and contexts from a variety

of theoretical conversations that differentially address core topics." This was true then, and it's true now. But I don't think we are having these conversations. We should, and we can, but I don't think we are.

I've shared my dismay in many excellent discussions with Robin and other colleagues. We have watched our students learn and scan the world differently than we did. We have watched the rise of electronic databases coincide with the departure of intellectual breadth in our field. Most of us rarely visit physical libraries, where opportunities for serendipitous discovery abound. The likelihood of running across ideas outside our training and research domains is miniscule because we carefully craft our keyword searches and focus our intake of ideas. We deny ourselves the joys of stumbling about.

I'd like to walk you through a personal example: one of my first research interests was gambling. When I went to the library, I grabbed books off the shelves, skimmed them and chose which to read. Along the way, due to the Dewey decimal system, I also came across books on play, which led to books on leisure, where there were mentions of leisure time, and chapters about how we think about time as humans. I did not read them all in one sitting, for certain, but my experiences wandering about the stacks took me from my own work on gambling to my dissertation topic on timestyles. That sort of discovery isn't possible on Google Scholar.

Something like this also happened with journal articles in the library. As a new student, I still remember going to look for one of Kahnemann and Tversky's articles and discovering this journal called Econometrica. At that point, I hadn't even heard of it, but it intrigued me that there was this whole other aspect to our field, and I recall sitting down and going through several issues, just to get used to the arguments and areas in that journal. Again, how many of us now, if we find a promising article through a Google Scholar search, would go back to the journal it came from and read an issue or two? I am pretty sure I wouldn't. Younger scholars in the audience are likely rolling their eyes now and thinking the equivalent of "okay Boomer." There's one advantage of a virtual address; I can pretend that isn't happening.

Analogously, this same argument emerges as we debate doctoral training. It comes up with special clarity when one discusses, as many of you have, what sort of comprehensive exam your students should take, or if they should take one at all. I've argued for years that in this emerging world of specialists, a comprehensive exam is the last time that we can insist our students really master a very wide range of material. But increasingly, this argument loses to the notion that the sooner students specialize in a very narrow area, the sooner they can publish, the better the job they can get, and on it goes. And I am not downplaying the pressure here. But those conversations that Arnould and Thompson talked about don't happen. And I think that if we, as a discipline, continue to do this, we are going to discover that in this domain, as in so many others, what may be good for the individual student, in the moment, is bad for the collective group of researchers, and the future of our field.

I'd like to investigate two questions for the rest of my talk. The first question is: What happens when consumer research becomes more hyper-specialized? My main thesis is not novel, but it bears repeating. I predict two outcomes from hyper-specialization. First, we will become a narrower and narrower set of subfields that fails to create innovative solutions to consumer-relevant problems, and we will have less and less to say about the world writ large. Second, we will continue to close ranks, to make meaningful communication between groups impossible. We will actively increase aggressive ingroup/out-group dysfunction, which, by the way, counts as its casualties both replication failures and retractions.

True to my own style, I started reading interesting books about these ideas and followed them to their influential underlying studies. Books like Range by David Epstein, Hivemind by Sarah Cavanaugh and Tribalism by Stevan Hobfoll. Of course, my choice of books is its own sort of confirmation bias: I believe we have become so specialized as to be dysfunctional, so I sought out evidence to support me. But these books make powerful arguments.

For example, David Epstein argues that cognitive entrenchment in our own subfields stifles innovation and understanding. In diverse areas such as music, sports, chess, education, video games, and yes, science, he shows support for the idea that people who become great at something very, very specialized often got there through broad sampling behavior and multifaceted learning. These people try new and varied things, leading them to build better abstract conceptual models and to grasp ideas more deeply. And he makes a pretty persuasive case that "learning is most efficient in the long run with it is really inefficient in the short run." I think most of us already know this. When we teach our undergrads or MBAs, we make them struggle a bit early by letting them wander about and stumble into developing their own compasses, so that in the long run they learn and retain ideas and understand material better. He quotes statistician Doug Altman, who says "Everyone is so busy doing research that they don't have time to stop and think about the way they're doing it."

And in the book, Epstein profiles Arturo Casadevall, a scientist at Johns Hopkins, who created the R3 Initiative, which stands for rigor, responsibility, and reproducibility, and aims to de-specialize the training of scientists. Scientists learn philosophy, history, logic, ethics, communication, and leadership, as well as statistics. In line with the thesis of the entire book, Casadevall argues that "Young scientists are rushed to specialize before they learn how to think; they end up unable to produce good work themselves and unequipped to spot bad or fraudulent work by their colleagues." Ouch. But I can't tell you how validating that felt to me. All these years of thinking this… if only I had thought to write a book about it! So we should recognize that there is quite a lot of research showing that a diverse group of specialists cannot fully replace the contributions of broad individuals. Contrary to much of the advice you may have heard, even if you move from topic to topic, or even broad area to broad area, your experience and learning move with you. You will look at a new area with information learned from the old one. As Epstein says, mental meandering is a source of power and head starts are overrated. Look around, learn around, and embrace the power of the well-timed stumble.

The second question I'd like to investigate is: why is specialization **dangerous** for the field? Beyond less learning, less creativity, and less problem-solving ability, there is an even greater risk to hyper-specialization in consumer research: we resort to our tribes. Now, I realize that tribes, and tribalism, as language, has more than a whiff of colonialism to it. But it's the best term I can find to describe the stronger-than-ingroup/outgroup behavior I intend here. And we have a history of using the term in consumer research when talking about consumers themselves: Cova, Kozinets, and Shanker's book on Consumer Tribes, with its many contributing authors, being just one obvious example. But there is a dark side to consumer researchers following a more tribal path. A friend of mine, political scientist Howard Ernst, once gave a talk where he argued that what starts as an affinity group may become a club, then a clique, and then, when resources become scarce or other threats emerge, it becomes a tribe in which we learn to distrust, fight or defend against, or just plain avoid, the "other."

As Stevan Hobfoll argues in his book " We can live in relative harmony when resources related to survival are not threatened or substantively lost. But even the whiff of threat of loss, awakens our deeper protective genetic makeup." We know this about people, about consumers. So why don't we know it about ourselves, as consumer researchers? There are only so many pages in a journal issue. Only so many awards to be won, and jobs to be granted. You may think I am overstating this. So okay, another thought experiment. You are sitting in a marketing faculty meeting. Your school has to hire a researcher, who will teach introductory consumer behavior. All consumer researchers could do that. Yet, how quickly, in your school, does this discussion devolve into the "type" of researcher you need? How fast do the laboratory experimentalists make the case for "one of their own?" How about the CCT researchers? What language gets used by the AI machine learning folks about the best sort of research? Importantly, these debates usually are framed as factual arguments.

As Hobfell argues: "We do not see the tribalism in plain view because we see ourselves as individuals, and falsely interpret our behavior as thoughtful and rational… Who would want to get up at a meeting at work and begin with the phrase 'Based on my distorted view of the world and this situation, and the fact that I feel threatened, I think…?'" Now, I understand why sticking with our tribe feels good; I get that, I really do. No one wants to feel left behind. No one wants to think that the research methodology, or areas of research, they specialize in (or hyper-specialize in), that is to say: their tribe, is outdated, incorrect, or not worthy of investment. And when threatened, a tribe often responds aggressively and retreats further into itself in defense.

So, in our current era of threatened scientific integrity, rather than reach out and collaborate WITHIN consumer research, we are defending our turf, casting aspersions on other tribes. This is a toxic breeding ground indeed. It threatens the progress and relevance of our entire field. It makes existential failures possible. And this brings me to Cavanagh's excellent book Hivemind. Although the book is focused on social media, it has clear implications for the argument I am making here. Indeed, the subtitle of the book is "The New Science of Tribalism in our Divided World." As many others have, she discusses echo chambers on social media. But we do this as well, in our consumer research tribes: we self-sort into groups who already share similar ideas and then repeat those ideas, and the associated research paradigms back and forth to one another, which strengthens them. This can be positive, because it feels secure to be part of a community, to be supported by others who were trained as we were, and who think similarly. I get it, it can be a warm and validating feeling. This can be positive, but I see the harm too. As we stick to our tribes, we dig deeper and deeper trenches, so that we can no longer discuss ideas across the entire field. And we get more and more polarized in our thinking. So, we get sweeping statements and accusations between the tribes: all experimentalists p-hack, qualitative work isn't science, we should only rely on big datasets, etc. It makes it impossible to learn from those outside our tribe, never mind collaborating with them!

Cavanagh also interviews social neuroscientist and psychology professor Jim Coan, whose arguments about in- and out-groups sort of turn traditional thinking on its head. He argues that ingroups aren't mainly about **excluding** some people, but about actively **including** some people. That when groups are pitted against each other, people in one tribe don't actually devote many resources to going after the outgroup; they devote more resources to their tribe. And by resources here I am stretching this to include more than money and jobs. I also mean time, attention, journal space, you name it. Philosopher Martha

Nussbaum talks about this when she makes the point that fear leads us to cling to our tribe and "…narrow our behavior and the options we consider, which is the opposite of what we should be doing."

I'd like to walk through an example to illustrate my argument. Let's take for our example, the very reasonable consumer research question: how do people decide what to spend money on? Our field has devoted extensive resources to answering this question, from many perspectives. There is CCT research on how consumers decide on spending, both day to day and for retirement. Often this research takes a social and cultural perspective to look at structural and market forces acting on consumers. There is also a rich history of more psychological oriented consumer research looking at this same question, from a decision-making or information processing perspective, for example. However, with some notable examples, most of this work (both sociological and psychological) largely cites work similar to theirs. Typically, there is very little integration of a more sociological bent into the psychological inquiries, and vice versa. I am not "naming and shaming" here, as it would entirely make my point about aggression in tribes. I am just pointing this out. And, of course, macro-economic approaches to consumer spending more broadly do not cite either the psychological or sociological perspectives. We are ignoring each other. Respectfully right now, but still…

So, what's the way forward? How can we as individuals within the ACR community build better knowledge about consumers? Can we broaden our perspectives and our training away from hyper specialization? I think we can, but there is massive institutional inertia to overcome. BUT AS A START WE NEED MORE GENERALISTS! What can we do? I have a few suggestions to get us started moving in the right direction. I am going to focus on individuals here, rather than institutions, because I think the beginning steps need to be taken by people.

I have three recommendations: 1) realign your self-appraisal. Why identify as an experimentalist? Why think of yourself as a machine learning expert? Or a consumer culture theorist? Is it because, deep down, we don't really want to identify as consumer researchers? Do we want to be psychologists, economists, statisticians, or sociologists? I don't know, but I think there is deep-seated issue there. Why not recognize that within marketing you have already specialized: in consumer research and consumer problems. Make it your goal to study consumers, and align your identity with solving consumer relevant problems. And when you teach doctoral students, teach them broadly as well as narrowly. Work as a consumer researcher; train others to be consumer researchers.

2) Focus by problem, not by research tradition, theoretical background, or method. Review the literature on the problem you are trying to solve, across all sources and methodologies. Read everything on your problem. Everything, or as close to everything you can get. And that likely includes books, and journals outside consumer research.

3) If you make the problem big enough, you can more clearly see it. For example, maybe you are interested in the effect of word-of-mouth on consumer decisions. We have psychological consumer research on persuasion knowledge and reactance, we have big data approaches to tracking WOM online, we have socio-cultural studies of power and status that could affect WOM sender and receiver, etc. Should one person be experts in all those fields? Not necessarily. But a generalist approach to the consumer problem would read widely across all those areas, and then would design research, perhaps with a team, that is informed by all those areas and is laser focused on solving the problem.

Many of you, I suspect, vehemently disagree with my idea that we need more generalists because specialization has become a prob-

lem in consumer research. But our field is reputationally threatened from outside consumer research due to data integrity scandals, the perception that we tackle small and insignificant problems, and other concerns. Perhaps our response can be to band together, to broaden together, and by learning to integrate more perspectives elevate all of us. If we don't learn to communicate from our increasingly narrow (yet deep) tribal trenches, we risk being stuck down in the muck, irrelevant, unheard, and unheeded.

It has been my honor to serve as ACR President, and I thank you all very much for honoring me in this way.

2021 ACR Fellows' Addresses

Capturing Sensuous Momentarity
John F. Sherry, Jr., University of Notre Dame, USA

Time travels in diverse paces with diverse persons.
Rosalind
As You Like It
Act III, Scene 2

Thanks

I thank all the creators and jesters, outlaws and caregivers, explorers and sages, poets and characters, and the ordinary invisible folk enabling my journey to be so interesting and fulfilling. They are so many that I fear overlooking some inadvertently in any list I might attempt. You know who you are. I thank my colleagues at the University of Florida for warmly initiating me into a fascinating new tribe and encouraging me to discern my own path. I thank my colleagues at Northwestern University for the entrepreneurial climate and intellectual challenge that allowed me to unfold, experiment and flourish as a scholar. I thank my colleagues at the University of Notre Dame for celebrating a homecoming that became an open invitation for generativity and communal engagement. I thank the convivial ACR community that has furnished me with a vibrant multi-disciplinary home. I thank the mettlesome CCT community in which I have grown up and grown old (and sometimes just groaned). I thank the co-authors, invisible college mates and reviewers who have improved my efforts immeasurably. I thank David Mick for his generous introduction. Finally, I thank all the Fellows of ACR who have literally laid down the figurative money in our joint learned enterprise, to advance the common good of our field. I am especially pleased to receive this honor in the company of my friend and co-conspirator, Melanie Wallendorf.

The time is out of joint
Hamlet
Hamlet
Act 1, Scene 5

Prologue

I began noodling this essay during the long sequestration of the pandemic, in the third trimester of an unplanned retirement. The time on my hands moved naturally enough to time on my mind. I paid closer attention to my home, my residential block, and the home office in my attic now overstuffed with the material culture of my former school office (Sherry 2013). Almost suspended in amber, but also caroming in time through these increasingly present objects of contemplation. All as I looked forward with joyous anticipation to the arrival of time's most ironic/heroic/tragic metaphor (Brown 2012), the bugs of (seventeenth) summer, the cicadas of Brood X.

I was also in the midst of wrapping up several projects with several co-authors that grapple with the experience of time. I have one research stream that examines the spatiotemporal dynamics that impart vitality to an event. Imagine a coordinate plane that represents dialectical engagements as poles of continua that generally characterize a phenomenon. One continuum extends from ordinary time (*chronos*) to extraordinary time (*kairos*). The other continuum extends from ordinary place (*topos*) to extraordinary place (*chora*) (Lane 2001). Burning Man would exist primarily in Quadrant I, where its participants use ferity, fantasy and festivity to create sacred time and sacred place, and contrast most strikingly with Quadrant III, the secular, profane or "default" world of ordinary marketplaces, such as periodic markets. Quadrant IV, which exalts the temporal dimension, would be home to vestavals such as tailgates, which encourage reflection, reminiscence, and reverie. Quadrant II, which exalts the spatial dimension, would be inhabited by such spectacular venues as cruise ships, those self-contained floating cities comprising hosts of themed micro-environments that invite consumers to escape from the mundane world. Almost all of this work (and the consumer research literature at large) has emphasized the spatial at the expense of the temporal, although these dimensions are thoroughly interpenetrating. It's time for us to take a closer look at time.

Theme

Let's take the instant by the forward top;
King of France
All's Well That Ends Well
Act V, Scene 3

There is little agreement on the ontology of time. Of the two leading interpretive contenders, the eternalist (as opposed to presentist) perspective is grounded in relativity theory and is favored by physicists and philosophers. This perspective posits a four-dimensional block universe in which past, present and future are equally real. It regards our subjective sense of time as an illusion of our conscious mind, abetted by the numerous cognitive, embodied clocks that inform much of our behavior, including the experiential time travelling (Buonomano 2017) that I engage today. Theorizing the ontology of time is currently beyond the purview of consumer research, but a better understanding of the phenomenology of time is of increasing interest to our discipline. Jackson (2018, pp. xv; xvii; 207) notes that *being-in-the-now* is inherently unstable, threatened with disruption by the sensuous, and that its apprehension requires a bracketing of conventional modes of representation in favor of exploring the interrelation of different temporal modes, preferably through art. Toward this end, I lay out some initial thoughts on prospective themes and methods I hope might interest you.

Momentarity is a point in time experienced in its full multisensory presence and associated layers of meaning (contra Gumbrecht 2003), or re-experienced in recollection elicited by the researcher. It is a specific case of the temporality characteristic of consumption sites such as periodic markets, vestavals and Temporary Autonomous Zones, the analysis of whose spatial dimensions we privilege in our literatures above their temporal aspects (Lee and Wei 2020; Kymäläinen and Nordström 2010). We've looked at time cycles timestyles, timescapes and timeworking (Belk, Wallendorf and Sherry 1989; Woermann and Rokka 2015; Sherry 2007; Robinson et al 2021) but largely from the perspective of degrees of duration or emplacement. While we could elaborate a phenomenology of "ordinary" time to interesting effect, the dimension of "extraordinary" time might prove a more immediately productive playground for identifying and delimiting the minimal parameters of momentarity. Thus, I suggest a primary focus on *kairos* rather than *chronos*, recognizing nonetheless their inescapable intertwining.

The evocative disruption of *chronos*, including our experience of caroming across *chronos* eras or leaving them altogether (as in episodes of ataraxia or nostalgia) are common *kairos* moments. These are happenings of momentous liminality. I propose the term "kairophany" as a cognate to the existing term chronophany, to capture the flickering character of this temporal shining through of qualitative difference. Kairophany is the sensation of these flickering moments of subjectively compelling *kairos* strands as they erupt from the *chronos* timescape. Similarly, I understand kairophany to be less discontinuous or ontologically levelling than the "rupture in time" (Eliade 1952, p. 230) that Jung ascribed to the manifestation of synchronicity. Kairophany is an interruption, rather than a shredding, of *chronos*.

The moment I imagine is a mash-up of epiphany and a kind of temporal narrative transportation that can only be described as time travel (Gumbrecht 2003; 2021; Bradford and Sherry 2019). The moment is unpredictable and evanescent. It requires a drop-everything-else approach to interrogation, a kind of premeditated spontaneity or strategic impulsiveness that permits capture before evaporation. Its representation and interpretation might require a Wordsworthian recollection in tranquility.

Ripeness is all.
Edgar
King Lear
Act V, Scene 2

Methods

Recall Beth Hirschman's (1985) invocation of Mitroff and Kilman's (1978) Jungian typology of scientific typologies in her exhortation that the discipline expand its approaches beyond those of the analytic scientist to include, in particular, the equally valid and insightful perspectives of the humanist. With the maturing of CCT we have made some significant progress in this direction, but a nascent sub-disciplinary embrace of arts-based research (Seregina 2019) promises to enrich our inquiry enormously. The rise of humanistic practices in contiguous social sciences (Cahnmann-Taylor and Siegesmund 2018) seems a signal that the time is ripe.

Our discipline's reluctant embrace of the crisis of representation (Sherry and Schouten 2002) has discouraged researchers from rendering their temporal epiphanies in a format more suited to exploitation than conventional academic prose. Poets (e.g., TS Eliot and Gary Snyder) and novelists (e.g., James Joyce and Kurt Vonnegut) have long experimented with nonlinear narrative and problematized time, as have artists in other genres. The creative nonfiction style and privileging of informant voices characterizing some of the literature on retroscapes, as well as some of the verse emerging from the poetic turn in consumer research, offer glimpses of the potential that alternative genres have to sharpen our interpretation and enhance our understanding of consumers' experience of time. And the variety and quality of temporary in our liminoid travel (Turner 1974).

I imagine one method of engaging momentarity to be a mash-up of autoethnography and subjective personal introspection, an insight-based approach that is grounded in what Spitler (2014) has called "thick participation". Thick participation would move us beyond the interview-centric format that dominates consumer ethnography, opening our inquiry to more sensory modalities and genres of representation. Thick participation would seem to be a requisite for the thick description (Geertz 1973) to which we aspire, but achieving this more embracive immersion demands that we expand our methodological palette. Or dance card. Or sheet music . . .

Consider a temporal counterpart to critical incident analysis. Critical moment analysis (Wei 2011) might permit us to capture, represent and interpret momentarity in a way that would challenge our own tempocentric bias. So also might lyrical or oneiric moment analysis. Or ritual moment analysis. A full account would certainly tax our descriptive capabilities, and likely require a portfolio of techniques beyond that employed in traditional ethnography. I would ground the enterprise in a multisensory ethnography (Howes 2019) that borrowed approaches from arts-based research (Leavy 2019). I would also suggest that the researcher become the subject in the initial phase of calibration. Experiment on yourself before others. Try practicing a kind of procedural mindfulness by noticing each moment, examining it, and instead of letting it go to focus on your breathing, break the meditative cycle through an act of *occupandi temporis* by focusing relentlessly on the interruption, almost as if you were proactively day dreaming. I think of this practice as a seizure, in the sense of the suddenness of capture; the moment might have a Dionysian or Apollonian quality. Also as a caesura, a pause or a break in the action. You might also think of it as a freeze, as an insect trapped in amber, or a frieze, as form of storytelling. As you might suspect, one of my go-to disruptive *being-in-time* practices is poetry (Sherry and Schouten 2002; Brown and Wijland 2015). The goal of the practice is to dive deeply enough into temporal experience to produce a rich, resonant representation receptive to interpretation.

Provocations

For in a minute there are many days.
Juliet
Romeo and Juliet
Act III, Scene 5

In keeping with my Prologue, I capture three moments in the episodes that catalyzed this essay. The first poem-in-progress is a covid poem, the second a retirement poem, and the third a cicada poem. While they are original poetry, they might also be understood as poetic transcriptions or poetic translations (Rojas Gaviria 2021; Canniford 2012), insofar as they constitute a form of me-search (Brown and Patterson 2020). I will recommend additional techniques in a later section. Following these poems, I'll offer some insights into time that arise from their creation.

covid reverie

struck by the image,
dull afternoon reflection in low sun,
in a window pane rimed near
translucent with cobwebs, pollen, mold,
gone cloudy with seasons of neglect,
set in a rotting side door forced open in his search
for rake and shovel in a damp garage,
the freeze before flight or fight
helped him identify the shroud of turin
his face became - the countenance at least,
the matted beard, hair shaggy on the shoulders,
face etched with dispossession and fatigue,
the appearance less miraculous
than delivery from the plague that bred it
felt to him that moment,
that the visage he envisioned
might even better be the green man
better caught in better light
off to remake the world another time,
or simply just the wandering dude
abiding in the mist

indolence

first day retired
spent
glued to YouTube,
gleaning nuances of
head butt,
approaches and angles,
pivots and plants,
crush of crown on
cartilage,
marveling at options
to become a spear,
to launch a low grade
payload like a poor
old man,
the best defense
a good offense,
using your head
for the first time,
the rest of your
life

brood ex situ

muzzle buzzing with
her meagre meal,
determined to acquire the taste,
lips flickering over dry teeth,
she fails to hide her grimace
with every crispy crunch,
obliged to munch against the tickle,
my lab was a lawn sweeper
battening on bugs
so many years ago
years later,
a new lab pup

grew weary of my tales
of grueling passages these
new bugs would endure
to fill her belly,
of the feast they would provide,
so eager was I
to relive the joyous frenzy
of sudden long awaited plenty
through her jaws

the raspy doppler
death chant trill,
the maddening million
rain stick serenade,
the victory song as dirt
rains from the trees
and sparkling prizes slowly
shell themselves
has barely sounded
near my home this year

a shimmering translucent
solitaire
lies in state
on a sidewalk slab,
a glory and
a disappointment,
a quick sniff from my pup

prevents a pawing,
an unmissed snack time
passed on the cement

warrens pock the lawns
this year instead,
colonies of rabbits
plague the gardens
bunny fluffles
flourish in the yards.
their stunning silence
calls out to the dog,
indifferent poses
instigating chase

she scatters them
like billiard balls on felt,
taunting bucks and does
shake her embrace.
happy and exhausted
she trots home,
untroubled by nostalgia's
subtle tug
or dearth of manna
that defers our feast

In each of the poems, prosody and imagery work in tandem to evoke the presence of different kinds of time, and their relationships to one another. This evocation is about the power of immediacy, about inhabiting the moment, and is prior to any invocation or elicitation of meaning that the poems may entrain. Collectively they are a made object, wrought by a "maker-thinker" (Loveless 2019, p. 37) to produce as visceral an effect as a cognitive one. In *covid reverie*, the fluid intermingling of *chronos* dimensions is punctuated by *kairos* interruptions, as the time-outside-of-time epiphanies of self-discovery are triggered by intertwining mythological, spiritual, folkloric, cinematic and seasonal time markers. Placemaking becomes an invitation to time travel. Personal transformation unfolds in the temporal seam between natural and spiritual rhythms. In *indolence*, the protagonist is both immersed and suspended in time, in a timing-is-everything challenge to identity, a liminal temporality affording him a surprising and powerful new sense of agency. Implicit judgments and critiques of just-being, of cyber time or screen time, and of senescence are countered in an apotheosis that is itself a not so veiled jab at Richard II's declamation "I wasted time and now doth time waste me." In *brood ex situ*, a simultaneous unspooling of chronos dimensions, a *pas de deux* of interspecies temporality (culminating in a literal bunny hop alluding to physicists' metaphoric use of billiard balls to describe apparently paradoxical behavior of *chronos* time in wormholes), and a protagonist's ill-fated desire to repeat unique *kairos* experiences conspire to remind us that an epiphany is always at hand if we are alive to the fullness of time. The moments in these poems – the arrest of attention, the suddenness of insight, the sounds of silence, the beings-to-becomings, the sensuousness of time, time travel triggers, nostalgia and aiglatson – are presences to be appreciated in their manifold fullness.

I asked three poets to comment on the poems, and I offer these excerpts as an affirmation of my premise:

" . . . I found myself ascribing the weight of extraordinary time to the moments of sublimity in these three poems. . . . the characters are all frozen in anti-classical living pictures. In each piece there is a subject in contrapposto . . . and another that's inert, with evenly-distributed weight. I loved this before knowing why & am continuing to meditate on the choice . . . [T]he poet . . . emphasizes that wonderful stillness-in-action. The commas and line breaks figure the distance in "clicks" across the poem, which is an effect that resonates within the distance . . . set up between the physical shapes: face and glass; face and screen; crown of head and face; face and leash; leash, dog; dog, cicada. It also sets [the reader] up for the wonderful subversion & commentary that is thematic in each of these poems . . . ordinary time is sometimes defined negatively as time that isn't interrupted and antagonized by the extraordinary. . .

"*brood ex situ* . . . [shows how] the persona's expectations are not met, but a new, softer, less exotic experience emerges as its counterpoint. It works for me as a commentary on how youth's magic, wonder, and excitement can't be recaptured by the old, but that age allows us to appreciate, if not expect, such letdowns for the beauty they offer in their own right. . . . *Covid reverie* has some of the same ordinary-time and ageing theme as "*brood*," with a connection to a relic of a distant past that delivers its myth-magic through a Catholic tradition. The conceit is good. The questions, "Can this be real?" and "Can this be me?" linger with the inevitable but unfortunate yes answer to both. . . . [T]he overall image

is haunting . . ." I wish . . . [*indolence*] wasn't an ordinary-time experience for me. It pains me how much I relate to it in my now. [Across all my readings] . . . nostalgic memories of my own . . . didn't happen to me in the moment. Just now, however, [the] post-covid-man-ghost did transport me to an experience I had in my early thirties . . ."

"I recognize the extraordinary in ordinary times and the ability for the poetic voice to stir up . . . experiences kept at bay . . . ; but a flicker, a word, a sentiment fans these fires again with the same ferocity as before and in some cases I am back in that moment and feeling the pain over and over again. Buried, yet not deep enough. . . . The poems have afforded me the opportunity to walk through difficult moments and to relive emotions . . . It is in the ordinary that extraordinary takes flight and it is these insights that shape us and speak to our core.". . . *Covid reverie* . . . speaks to a very critical moment in my life . . . a life changer . . . This episode marks another key moment . . . the beginning and the end of a special life. The words . . . brought the day . . . back to me. . . . Both very vulnerable episodes and 'locked out' on many levels emotionally . . . In *indolence*, I am amused at the capturing of myself . . . [and] all the ordinary things I do in a day, which . . . shout life . . . The pandemic has given the 'luxury' of sloth and I for one fully bathe in it . . . In *brood ex situ,* I think of my [favorite] cat . . . and of his quirks and personality . . . I knew I would never have the like of him again. [Later], a feral cat . . . had 5 kittens . . . and [the] last was a double of [this favorite cat.] . . . I knew he was reincarnated and . . . this gift of having him back was all consuming. I was not going to lose him again. However, it was not to be. Now . . . a visitor coming over the garden wall . . . could be mark 3."

The sensuous nature of temporal experience, its flickering, protean character, and its ability to provoke sympathetic time travel in its relating come through in these commentaries. As objects of contemplation and vehicles for projection, the poems transcend the persona's account and invite readers to explore their own temporal fades and cuts, a kind of implicit and nondirective "future research" invitation offered by the poet.

Poetry is just one method of helping us be in the moment, opening up space for the imagination in representation and analysis (Ballestero and Winthereik 2021). Other time-unbinding genres abound. Photography and videography have become consumer research staples; the former has been dramatized in exhibitions by Barbara Olsen and Tom O'Guinn, and the latter institutionalized by Russ Belk and Rob Kozinets in the ACR Film Festival. Short stories (Schouten 2014; Brown and Kerrigan 2020) have made time travelling inroads into the discipline. Rob Kozinets and Usva Seregina have used painting to render momentarity visible, and researchers have deployed a wide range of other media in the art installations and curations at CCT conferences. Elizabeth Chin has employed dance at one of these conferences as well.

Other techniques are ready for importation from other disciplines. Flash ethnography is "compressed and intense, saturated with vivid imagery and affect; and crucially . . . self-enclosed: . . . a discrete whole, rather than an excerpt from a larger project; 800 words is the limit (Stone and McGranahan 2021, p. 2). McLean (2016, pp.152-156) recommends the creation of "fabulatory art" that challenges ethnography to move from "descriptive fidelity" to "poetic invention," that would assume the shape of montage. Both

Causey (2017) and Taussig (2011) have championed drawing as a way of knowing. Graphic novels have now appeared in consumer research (O'Sullivan and Kozinets 2020). Both juxtaposition (Vogel 2021) and ethnographic post cards (Danyi et al 2021) – thematic photo on the front, short commentary on the back, shared and work-shopped among collaborators – are approaches conforming to the literary technique of katachresis. Tonya Bradford and I have experimented with this approach in our study of vestaval. Songwriting creates resonance and nuance in our understanding (Jacobsen 2018). Just listen to Chris Hackley moan the "CCT Blues," (https://www.youtube.com/watch?v=n1pgyaiw610), or Wharton's *Brand Inequity* cover the auto-erotic momentarity of "Mustang Sally" (https://www.youtube.com/watch?v=wRGsLcdQaZI). Performance is yet another way of dealing with the crisis of representation (Butler-Kisber 2018). Alternative vessels for discovering and conveying insights into time are bountiful.

Conclusion

O time, thou must untangle this, not I.
It is too hard a knot for me t'untie!
Viola
Twelfth Night
Act II, Scene 2

Time is illusive and elusive. The "scholartistry" I propose is a "direct embodied engagement with the sensory qualities" of temporal experience (Cahnemann and Seizesmund 2018, p. 5). It requires a commitment to "polydisciplinamory" and "experimental multimodality" if it is to realize its potential as "research-creation" (Loveless 2019, pp. 2; 55; 57; 61). It is the apotheosis of transgressive interdisciplinarity, the love driving our pursuit of inquiry that impels such rhizomatic wandering among the many ways of knowing that comprise form as well as content. It is the creative engagement with these dimensions, the courageous tilting against canons, which our senior scholars need to model and sanction, so that our junior scholars are empowered and incented to research-create. Consumer researchers (Belk 1986; Holbrook et al. 1989; Sherry 1991) have long advocated more humanistic approaches than we have rushed to adopt. Journals beyond the flagships have begun responding to the call, and some conferences have made space for performances and curations. I'd love to see this trend go mainstream, with more researchers probing momentarity creatively. I hope some of you will start today. *Ars longa, vita brevis.*

2021 ACR Fellows' Addresses

Seeing the Forest: A Sociological Perspective on Community in Consumer Research

Melanie Wallendorf, University of Arizona, USA

Thank you, David, for that touching introduction. I only hope I have lived up to your complimentary remarks.

I'm recording this speech in Tucson, Arizona, on land that has been continuously occupied by humans for over 10,000 years. I respectfully acknowledge that the University of Arizona sits on the land and territories of Indigenous peoples. Today, the state of Arizona is home to 22 federally recognized tribes, with the city of Tucson being home to the Tohono O'odham and the Pascua Yaqui.

Particularly given the topic of this address, I'm saddened to not be on a stage with David and my long-time co-author, co-conspirator, and friend, John Sherry. For the two of us to be receiving this award, and at the same time, is as unbelievable to me today as it would have been if someone had predicted it over 35 years ago when we began working together. At that time, our work on a team project that developed into the Consumer Culture Theory research area was critiqued by some in this very association as "not consumer research" and "not rigorous," to quote a few of the kinder descriptors. I'm deeply honored and moved that the field's evaluation of that work has shifted so profoundly over time.

I have chosen Community as the topic for this address, drawing on my background as a sociologist, to put forward some ideas that hopefully you haven't already thought of, but nonetheless will consider intriguing. That is a high bar. It means that, as a sociologist in a field of primarily consumer psychologists, I will have to entice you to be open to new ideas. I experienced early in my career what much research across many academic fields has found: openness to new ideas is *not* a characteristic hallmark of academics, despite their self-perception to the contrary. As Gary Zukav (1979) pointed out over four decades ago in his book *The Dancing Wu Li Masters*, "we clutch our ideas."

I've heard some consumer psychologists describe the difference between a psychological orientation and a sociological orientation to consumer research by stating that psychology studies individuals, while sociology studies groups of individuals. But from my perspective as a sociologist, that's not quite it. Instead, I would say that sociology studies community and society, attempting to understand people's positions in the social structures that pattern their connections to others.

Today I will try to persuade you to unclutch the idea that we are individuals, or at least unclutch that idea during this talk. That's right. I'm going to assert that the idea that people are individuals is a fabrication of our imagination. Instead, sociology views people as more like the coastal redwoods at Henry Cowell Redwoods State Park near Santa Cruz, CA where I have spent sabbatical and other breaks from teaching. There, I walk or hike among the *sequoia sempervirens,* the tallest trees in the world (Henze 2015). As Powers (2018, p. 142) writes about these forest trees: "There are no individuals. There aren't even separate species. Everything in the forest is the forest."

While their canopy is a fascinating ecosystem (Preston 2007), today I'm going to refer to the forest trees' connections to each other via their roots and a mesh of fungal strands that connects their roots. This mesh of fungi, called mycelium, is so dense in old-growth forests that one teaspoon of soil contains many miles of it (Wohllenben 2015).

I've learned from my former dissertation advisor, long-time mentor and friend, Jerry Zaltman (Zaltman and Zaltman 2008;

Lakoff and Johnson 1980), that we fathom new ideas by relying on metaphors, so I will use an arboreal one to drive this talk. These forest metaphors are based on the memoir by ecologist and silviculturist, Suzanne Simard (2021) titled *Finding the Mother Tree: Discovering the Wisdom of the Forest*; the Pulitzer prize winning novel by Richard Powers (2018) titled *The Overstory*; and the natural science volume by Peter Wohlleben (2015) titled *The Hidden Life of Trees: What They Feel, How They Communicate;* as well as other sources (Baker 1956; Hageneder 2005; Sheldrake 2020; Thoreau 1972/1864). As my former professor, mentor, colleague and friend, the late Sidney Levy, once observed, the good news about getting a Fellow's Award is having a year to prepare a speech, but the bad news is having a year to obsess about a it.

What do I mean when I say sociology studies community? I don't mean that it studies the nodes in a social network, where the individuals who are connected are the focus. Instead, I mean that sociology takes the perspective that the whole of what we are is defined through our connections and the social structures that undergird and pattern our behavior. Sociologists, then, study the equivalent of the mycelium strands in the soil that connect the trees, rather than studying the trees themselves.

The arboreal world of the old-growth forest has much to teach us about community. Old-growth forests "are at least 150 years old with a diverse ecosystem that has largely been left undisturbed by human impact or intervention" (Sloss 2021, p. 8). The old growth forest is a community of trees intricately connected and differentiated through the half of their biomass that exists underground (Wohlleben 2015). Powers (2018, p. 3) expresses this idea by giving voice to the trees as they address humans: "Your kind never sees us whole. You miss half of it, and more. There's always as much belowground as above."

What exists below ground in the forest is similar to the social structure that sociologists study. It isn't visible, and isn't even something that most people are conscious of as a force shaping their lives. Particularly in individualistic, Western societies, people view themselves as consciously directing their lives, rather than as making choices that are deeply rooted in and reinforcing of their positions in social structure. Forest trees communicate through the soil fungi that connect their roots in what the journal *Nature* termed a "wood wide web" (Simard, 2021, p. 165). The word *fungi* may bring mushrooms to mind, but really mushrooms are the ripened fruit of the fungal strands below the surface (Sheldrake 2020).

Consumer research's historical grounding in psychology has produced much fascinating research. However, it has also blinded the field, such that it sees the individual trees, and not the underground forest of social structure and its community connections.

Forest ecologists' knowledge about old-growth forests prompts important research questions about community and consumer behavior that have been understudied. I will overview questions that arise from considering the old-growth forest in these four arenas of consumer research: (1) cooperation and care, (2) responses to inequality, (3) dependence on climate, and (4) time frame.

Cooperation and Care

The interconnected community of trees in an old-growth forest is characterized primarily by cooperation and care rather than competition (Simard 2021; Wohlleben 2015). The fungal strands provide

water and nutrients from the soil to the tree, and the tree provides sugars produced through photosynthesis to the fungal strands. They are mutually supportive, but without tracking how much they owe each other. Through the fungal strands, trees communicate and provide resources to other trees within their community. In stressful times, different species can alternate giving and receiving; for example, in summer at the height of their photosynthesis, the birch give carbon to Douglas firs, but in spring and fall, the firs give more carbon to the birch (Simard 2021). Trees can differentiate their own roots from the roots of other trees, sensing which roots belong to their kin, or to their same species, or to other species (Simard 2021). Together they construct a mutually protective ecosystem. As Powers (2018, p. 453) notes, "A forest knows things. They wire themselves up underground. There are brains down there, ones our own brains aren't shaped to see."

The fungal strands containing that knowledge are severed when trees are transplanted, turning planted trees into loners (Wohlleben 2015). This means a planted tree does not have a network to call upon for resources or information about nearby dangers, so it is more fragile, and dependent on humans for irrigation and fertilizer. Even with this care, loner trees do not reach the height of the same species of trees in a forest, because, as with humans, reaching one's full potential requires the support of a community (Wohlleben 2015).

Human communities are also built on reciprocal relationships. We have long known that when those relationships are strong, the community is more resilient (Durkheim 1933/1893). Yet only a small portion of consumer research considers existing reciprocal relationships (for examples, see: Epp and Velagaleti 2014; Thomas, Price, and Schau 2013). The term *sharing economy* has been used to describe peer-to-peer, short-term rentals of possessions through an online platform (Sundararajan 2016), but that term is a misnomer, so I won't use it. When my mother told me to share my childhood toys with my younger sister, she certainly did not mean I should rent them to her.

Instead, I'll use Arnould and Rose's (2015) terminology to refer to these as relationships of mutuality, through which much consumption occurs. Mutuality raises research questions about how households manage their joint use of property, such as cars, in ways that prevent conflict. It also poses questions about what kinds of families or groups are more successful in managing mutuality in use of their possessions. Further consideration of the care and cooperation of mutuality generates research questions about the neighborhood networks through which consumers occasionally give neighbors a ride or help each other move big pieces of furniture or lend each other the proverbial cup of sugar. An interest in mutuality presents research questions about the networks of kin and friends through which used baby equipment and children's outgrown clothing circulate, in what we might call the *kula* (Malinowski 1922) of the cradle.

When and how do social bonds provision consumers with what they need, beyond the reach of the market? Are those bonds in fact, as popular belief asserts, less strong today than in the past? To what extent are craigslist and eBay supplanting relations of mutuality, replacing the care and cooperation of social networks with monetary exchange between strangers? What are the effects on community of such platforms?

Or, were neighborhood bonds of mutuality reinvigorated through shared consumption at driveway happy hours during COVID lockdowns? How did these events come about? Did consumers temporarily "make do" with happy hour with the neighbors or did they forge new connections, forming mycelium strands to draw upon later? Which kinds of neighborhoods are more robust as a result and which kinds are more fragile, having separated rather than connected consumers?

A counter-trend to mutuality is the privatization of what used to be public life. Privatization represents a consumption shift in society's bedrock about which our literature is almost silent. Gated communities privatize the provision of security for those who can afford to live there. Backyard swimming pools privatize what used to be a community gathering place, although one with a complex social history regarding its role in both gender and racial segregation in the U.S. (Wiltse 2007). Reliance on private cars rather than public transport separates us from contact with those who may be different from ourselves. All of these forms of privatized consumption may erode community ties, at a long run profit to some firm. They turn consumers into loner trees, rather than members of a forest ecosystem. What are the collective consequences of privatized consumption?

Forest trees cooperate by growing outward until their branches reach another tree's branch tips (Wohlleben 2015). After that, they don't grow outward anymore, because that light is already taken. They aren't greedy. They seem to know that each tree should take only its share of the community's resources. Could consumer research discover when and how consumers might act similarly, only taking their proportional share of available resources because it is in the best interest of the community, and ultimately, in their own best interest as a member wanting that community to persist? More consumer research is needed on how to get consumers in a community facing long-term drought to use their scarce water resources with the community's best interest in mind (see Phillips and Ozanne 2017).

Responses to Inequality

Turning to the second arena: Let's consider responses to inequality in access to resources. Not all tree seedlings take root in equally fertile soil with equal access to water and sunlight. Some sprout in rocky soil or soil with less water than nearby trees. Some have little access to sunlight, being shaded by larger trees. As a result, not all seedlings live. But one of the functions of the mycelium strands is to help redress structural inequality, to send help to young trees attempting to grow where fewer resources are available. The kin seedlings near a Mother Tree grow faster than other seedlings because the Mother Tree sends them more carbon. Interestingly, the Mother Trees are bigger when they are near kin seedlings, so they are also benefiting, not just being depleted by the kin seedlings (Simard 2021).

But if the Mother Tree also faces scarce resources, it has less to send to its seedlings, and the community is further weakened by not growing strong young trees. Strength begets strength, and weakness begets weakness, escalating inequality. Providing care through cooperative mutuality mitigates, but does not eliminate, inequality in access to resources.

Contemporary consumer culture has not learned how to mitigate inequality. Instead, economic inequality is sharply increasing within the U.S. (Horowitz, Igielnik, and Kochar 2020) and within most countries globally (UNDESA 2020). Economic inequality goes hand-in-hand with consequential consumption inequalities: in access to affordable housing, nutritious food, and adequate medical care. At its core, economic inequality is a central component of racial and ethnic inequality.

The consumption problems that arise from inequality are not widely studied in consumer research, most of which assumes consumers can choose from a plethora of products and services (for an exception, see Martin and Hill 2012). But what could we learn if we studied economically challenged consumers making highly constrained choices? More broadly, when the housing property value

that a child's parents can afford to buy determines funding levels for that child's public school, as is done in the US, inequality is perpetuated because of unequal fertility of the educational soil in which children grow. How can we expect to have equal outcomes for children if we don't fund schools equally or better yet, equivalently?

Economic inequality and its associated consumption inequalities persist despite their negative effects on everyone in a society, not just those at the bottom. Epidemiologist Richard Wilkinson constructed an index of social indicators that affect everyone, such as life expectancy, literacy, high school graduation rates, homicides, child wellbeing, mental illness and addictions. His team then explored differences among 23 relatively rich, market democracies (Wilkinson and Pickett 2010; Wilkinson 2011). Paradoxically, they find that well-being in developed societies is not dependent on average income levels, but is strongly dependent on there being relatively low levels of economic inequality.

Only when economic inequality is substantially reduced will the consumption equality that is assumed in much of our research become a reality.

Dependence on Climate

The third arena of questions raised by knowledge about the old-growth forest concerns dependence on climate. Forest trees are completely dependent on local climate; a tree can't move to find a better climate. We aren't that different; at present, we can't move to another planet if this one becomes uninhabitable. But trees are not actively involved in destroying their environment. In fact, they are doing everything they can to preserve ours. Trees store up to 22 tons of carbon in their trunks, branches and roots (Wohlleben 2015). After a tree dies, it turns that carbon to humus, and then to coal. Every functioning ecosystem must have a mechanism for eliminating its detritus.

Consumer culture has moved in the opposite direction, relying on indestructible plastics and difficult-to-replace coal. The coal we consume today is from trees that died 300 million years ago. Contemporary worldwide deforestation means that new coal is not being formed at the rate it is being burned to fuel consumer society. As Powers (2018, p. 286) phrases this idea: "We are cashing in a billion years of planetary savings bonds and blowing it on assorted bling."

Consumer research could address how to get consumers to make consumption choices that help improve the environment, acting like poplars and willows that clean soils of chlorinated solvents and remove heavy metals. What are the social network effects that can accelerate change in consumers' behaviors? Cotton shopping bags and recycled cans won't save the planet. Dramatic consumer change on a mass scale is needed quickly.

It is past time for consumption's role in climate change to be peripheral in our literature. We can't stand by, studying the minutia of consumer behavior while the planet becomes ever-more inhospitable to human life.

Time Frame

For a fourth arena of consumer research questions, let's return to the fact that old-growth forests are at least 150 years old. Forest trees live on a different time frame than humans. Coastal redwoods can live longer than 2,000 years (Hageneder 2005). Pondering these trees shifts us to a slower, longer time frame. In old growth forests, few changes are noticeable in a person's lifetime (Wohlleben 2015). Each time I return to Henry Cowell Redwoods State Park, its largest tree seems unchanged, blessedly not harmed by recent nearby wildfires.

By comparison, most consumer research studies phenomena that occur in a very short period of time. Understandably, most consumer research is chosen to fit the time frame of researchers' careers. Tenure decisions are made after six or seven years, where each article may take at least a year to get through the review process, pushing researchers to try to complete projects quickly. Each study in a paper may be based on a lab experiment that took no more than 15 minutes for participants to complete, with student subjects drawing from little long-run life experience. mTurk tasks take so little time that participants are paid in cents. Even ethnographers often visit a fieldsite only sporadically for a year or two, or only interview informants for an hour or two. By the time frame of trees, those are all very short time frames.

Wide open for study are the consumer behaviors that take place over a longer time frame. Imagine the advance in our understanding if some consumer researchers set up a panel early in their careers, and then tracked those same people across time regarding their purchase decisions and consumption, and then published each new discovery. Yes, of course, finding funding and repeatedly tracking down people pose challenges, but the rewards would be immense.

It is possible to do. For example, the Harvard Study of Adult Development studied 724 male participants every two years, starting in 1939 when they were 18 or 19 and continuing for over 80 years. Over this time, the project expanded to also study their wives, and their children. This Second Generation Study is examining the impact of childhood experiences, documented contemporaneously rather than retrospectively, on their health in midlife. The project has spanned several generations of researchers and has had 4 directors (Waldinger 2015).

Similarly, the Nurses' Health Study (https://nurseshealthstudy.org) has been continuously funded by the National Institutes of Health since its first wave of data collection in 1976. Every two years, health data has been collected from the original sample of over 121,00 nurses, with a younger cohort added in 1989. In 2010, the study expanded to a wider variety of health care workers, both male and female. In most waves of data collection, the response rate is around 90%.

What if a consumer researcher studied the consumption experiences of a group of children, and then tracked their consumption through their lives? What could we learn about how people become particular kinds of decision makers and consumers? Might we learn how some patterns of consumption persist in families over time?

Even a dead tree continues nurturing its offspring. Its wealth of stored water and nutrients are released through the efforts of insects and fungi to other nearby plants and especially to the tree's offspring. The Mother Tree, the hub that has seeded other trees around it, thereby transfers its knowledge of what is helpful or harmful to the next generation (Simard 2021).

Consumer research knows little about the intergenerational transfer of possessions and wealth, or about large bequests to charitable and not-for-profit organizations (for exceptions, see Bradford 2009; Curasi, Price, and Arnould 2004; Türe and Ger 2016). Our literature is mostly silent about this key driver of social structure. Yet, these wealth and property transfers are a primary cause of the intergenerational stability of economic inequality mentioned earlier. Perhaps studying these transfers could uncover ways to redress some of the growing inequality that threatens society's political stability.

If a tree dies by no longer being adapted to the environment in its location, it sends its resources to the incoming species,

sharing knowledge to help them, a form of welcoming and helping a new generation of immigrants (Simard 2021).

What ways of welcoming and helping immigrants adapt to a new consumer culture are most effective? While some consumer research on this topic has been done (Wallendorf and Reilly 1983; Peñaloza 1994; Oswald 1999; Askegaard, Arnould and Kjeldgaard 2005; Leudicke 2015; Veresiu and Giesler 2018), there is still much to learn about the longer term processes by which refugees, asylum seekers, and other categories of immigrants become rooted in their new consumer context. What is the role of consumer products firms and other corporations in welcoming them? How can their resettlement processes occur such that immigration does not exacerbate inequality?

In summary, consumer research that regards each individual as a separate person, equivalent to all other humans, in what Simard (2021, p. 288) calls "reductionist science," vastly oversimplifies human life. It misses people's connections in an ongoing community that profoundly directs the resources they have access to, the opportunities presented to them, and the choices that make sense to them, whether or not they are aware of social structure's impact on them. In looking at the ACR logo, notice that it has always had the idea of a connected community embedded in it; the three figures are holding hands.

In closing, I'd like to again express my deep appreciation in receiving this award.

Thank you for your openness in listening to this talk. I hope I have met the bar of providing some ideas that you hadn't already thought of, yet nonetheless find intriguing.

And finally, I encourage you to connect with other ACR members as you would if you were leaving a big room where this speech was given. Ask them, "So what did you think about the fellows' speeches?" In doing so, you will be fostering the connections that constitute a community, the network of mycelium strands beneath the surface.

And please, don't disappear in the community of trees. I'd love to hear from you, and would welcome your questions or comments. Thank you.

Competitive Papers—Full

Types of Possessions Associated with Physical Attractiveness

Tabitha S Thomas, Unaffiliated, India

INTRODUCTION

A few years back I remember seeing this attractive woman waiting for her flight at the boarding area. This woman was a stranger to me. Based on her looks, this is what I thought, "given her supermodel-like figure, she must never touch stuff like burgers or fries", "her bag although I do not see any brand name or logo on it seems like Hermès", and "her earrings look like they are from Tiffany & Co". In hindsight, sometimes I question myself as to why my notions about her were not something like "she loves eating burgers and fries", "her bag is from a thrift store", and that "she made her own earrings". Thinking back, I also wondered if I made similar assumptions about physically attractive people as a child. And the answer was yes. For example, as a seven-year-old, I believed that pretty girls lived in a room that had pink walls, slept on bedsheets that had pictures of princesses, and owned things such as stickers, glitter pens, and colorful feathers.

Psychologists refer to my response as the beauty-is-good stereotype (Langlois et al. 2000) or the halo effect (Nisbett and Wilson 1977) i.e., having certain perceptions about a person solely based on their external appearance. Beauty stereotypes exist in adults and children. Studies reveal that both grownups (Dittmar 2007) and kids (Thomas 2020) consider external beauty and luxury goods as cues for high-status. Examples of things that adults see as being luxurious include "fashionable ski outfits, upscale wines" (Sundie et al. 2011, p 664), "outdoor grills, sub-zero freezers" (Wang and Griskevicius 2014, p 835), "fur, fine china, pearl necklaces, and oriental rugs" (Richins 1994, p 512). Currently, the extant literature shows us the types of material possessions that adults link with high-status. But it is not definite in the extant literature if the material goods that children perceive as status related are the same as adults. Past research shows that children connect expensive things with attractive people and cheap things with less attractive people (Thomas 2020). However, we do not clearly know yet what these expensive or cheap possessions are in the minds of children. Therefore, the primary objective of the present research is to address this gap present in the extant literature.

THEORETICAL BACKGROUND

People and Possessions

People form bonds with possessions (Richins 1994) and sometimes think of them as being an extended part of themselves (Belk 1988). A college diploma, a wedding ring, family photos, and heirlooms are a few examples of material things people consider much-loved, special, treasured, and priceless (Ferraro, Escalas, and Bettman 2011). Possessions provide a sense of stability and security to humans. For instance, when people move from one place to another, they take certain things such as, artifacts, souvenirs, or furniture with them to preserve old memories and create familiarity in the new environment (Mehta and Belk 1991). Possessions help people relive the past and embrace the future. Older individuals use possessions to reminisce their early days (Price, Arnould, and Curasi 2000), while others hold on tightly to possessions received from someone beloved who is no longer alive (e.g., a gift received from a parent or grandparent). When people have to let go of their cherished possessions, they tend to experience intense grief, a period of mourning, and a feeling of identity loss (Ferraro et al. 2011).

Possessions also have a superficial angle attached to them. People use material objects to mark their status or class in society (Han et al. 2010). This kind of behavior is referred to as conspicuous consumption (Veblen 1899). Conspicuous consumption occurs when individuals feel the need to flash luxury items in front of others to be seen as superior or a person of high-class. Sometimes conspicuous consumption goes to an extreme degree where people diverge or completely stop consuming certain material goods to preserve their status in society (Berger and Heath 2007; 2008). For instance, individuals with ancestral wealth might avoid purchasing or using specific material possessions that are popular among the newly rich (Berger and Heath 2007). Like adults, children also engage in conspicuous consumption. Previous studies show that children use branded goods to signal identity, gain popularity, and seek high status among peers (Chaplin and John 2005; 2007; 2010). And when children are seen consuming non-branded goods instead of branded goods they are often ridiculed, pestered, and bullied by their peers (Wooten 2006).

External Appearance and Possessions

This article focuses on the relationship between beauty and material possessions. Previous research reveals that people associate happiness, success, and self-worth with individuals who are attractive and own luxury goods (Dittmar et al. 2014). The lifestyles of the good-looking and the wealthy are commonly described as the "beautiful-material-good-life" (Dittmar 2007). Studies indicate that the ownership of luxury items creates a halo effect. For example, men who show off their expensive possessions are viewed as more attractive (Sundie et al. 2011). Similarly, women who flaunt their designer handbags and shoes are seen as being more fashionable and pretty (Wang and Griskevicius 2014). While many studies have examined the beauty-material possessions link in adults, research done using children as participants is relatively less. Even though prior work shows us that children, like adults, connect expensive items with attractive people and in-expensive/cheap items with unattractive people (Thomas 2020), there is less clarity as to what these items actually are. Hence, the present research addresses this gap in the extant literature by revealing the types of material possessions children relate with attractive and less attractive individuals.

METHOD

Drawing Method: Past studies have used drawings as a tool to understand children's inner most thoughts especially in contexts where children have struggled to express their feelings verbally (Cherney et al. 2006). Hence, in the present research, a drawing method was implemented to identify the types of possessions children associate with attractiveness.

Participants: Two hundred and twenty-two children (55% females, M_{age} = 8.99) were recruited from three public schools. These children belonged to middle-income families. Required permissions and ethical approvals were taken before the commencement of this study.

Procedure: The children took part in the study while seated in a classroom at their respective school. Each room had approximately twenty children. Two students shared a table. Each participant was given an A3 size sheet of paper and a box of twelve color pencils. The paper was divided into two halves using a black line. The participants were asked to draw children of the same gender as themselves. Girls were asked to draw a picture of a "pretty girl" on the left side of the paper and a picture of a "less pretty girl" on the right side of the paper. Similarly, boys were asked to draw a picture of a "good-looking boy" on the left side of the paper and a picture of a "less good-looking boy" on the right side of the paper. When the drawings were completed, the participants were asked to answer the following question, "what types of things do the characters in your pictures own"? The entire activity took approximately an hour. At the end of the activity, the children were thanked for their participation and were asked to keep the box of twelve color pencils as an incentive for taking part in the study.

Data Analysis and Validity: To analyze the drawing data, Braun and Clarke's (2006, p 87) thematic analysis process was employed, which involved, familiarization with the data, generating initial codes, searching for themes, reviewing themes, defining and naming themes, and preparing themes. The data analysis was a back-and-forth process. I also requested an independent person to code 25% of the data to ensure cross-coder reliability.

FINDINGS
Figure 1 The Main Themes

Figure 1 shows the main themes obtained from the data analysis.

Theme 1. Things in the Physical Environment: The theme physical environment is defined based on the background that children drew around the pictures of their main characters. The analysis revealed that children represented dissimilar physical environments for attractive and unattractive individuals. For instance, in eight-year-old Lucy's drawing (see Figure 2) the pretty girl's picture has a background that has two trees, two butterflies, a green-colored cloud-like structure, sunshine, two blue flowers, an orange flower, and a red balloon. Lucy on the other hand has not drawn any background in the less pretty girl's picture. Similarly, in 9-year-old Sam's drawing (see Figure 2), the good-looking boy's picture has a backdrop of green grass and blue skies. However, the backdrop in the less good-looking boy's picture has no color. Female participants, in particular, have linked the world of the pretty girl with glitter, sparkles, flowers, blue skies, sunshine, and lots of colors. In contrast, the less pretty girl's world has been connected with bugs, insects, spiders, lizards, dark clouds, trees with no leaves, garbage, and a colorless world.

Theme 2. Adornment Things: *Adornment goods are possessions people use to enhance, rectify, and camouflage their physical appearance (*Bloch and Richins 1992*).* The female participants described the pretty girl to own lots of dresses, shoes, jewelry, handbags, and makeup. On the contrary, the less pretty girl was perceived by female participants to own plain-boring clothes and accessories. For example, in 10-year-old Anne's picture (see Figure 3), the pretty girl is seen wearing a fancy purple dress with flower-like patterns on it. Anne has also drawn a golden crown, a blue necklace, pink stockings, and a pair of purple high heeled ankle boots for the pretty girl. In contrast, Anne has sketched a blue colored dress with messy patterns for the less pretty girl condition. The data analysis showed male participants having similar perceptions. For instance, 11-year-old Kevin visualized the good-looking boy wearing a multi-colored shirt, a pair of pink pants, and dark green pointed shoes. On the other
Figure 2 Lucy and Sam's Drawings Depict the Things in the Physical Environment Associatedwith Attractive and Less Attractive Individuals

hand, Kevin has imagined the less good-looking boy in some form of yellow clothing and no shoes on his feet (see Figure 3).

Theme 3. Things Related to Status: When asked about the types of possessions attractive individuals owned both boys and girls mentioned that the attractive person owned expensive electronics such as computers, laptops, tablets (iPad), and mobile phones. The male participants indicated that the good-looking boy had video-games such Xbox and PlayStation, cars, buses, a bike, an airplane, a football, a bat, remote-control toys, and JCB branded toys (a popular construction equipment brand). Male participants stated that the less good-looking boy owned pictures of the devil, non-branded toys, broken toys, a knife, and things that resemble lizards or spiders". Similarly, according to female participants the pretty girl had Barbie dolls and cute stuffed animals whereas the less pretty girl owned dolls that were cheap, ordinary, and ugly. Both male and female participants emphasized that the attractive child had lots of money, lived in a big house, and slept in a cosy well-decorated room. By contrast,

the descriptive words used for the less attractive child was that they were poor, had very little or no money, and lived inside a hut.

CONCLUSIONS

The present research is the first to identify the types of material possessions children link with attractive and less attractive individuals. The present research is also the first to use drawings as a method to understand the relationship between physical attractiveness and perceived ownership of material possessions.

The first theme "things in the physical environment" is a novel finding that emerged from this research. Children in their pictures have depicted a perfect world for beautiful people and the opposite for those that are not so good-looking. One can presume that there are low chances of adults connecting things like balloons, ribbons, hearts, rainbows, and butterflies with attractive individuals and dry-lands, rain, pictures of the devil, insects, spiders, and lizards with unattractive individuals. But the drawing data demonstrates that children equate the above things to attractive and unattractive persons.
Figure 3 Anne and Kevin's Drawings Depict the Adornment Things Associated with Attractive and Less Attractive Individuals

Figure 4 Sarah's Drawings and Descriptive Words Depict Status Related Differences

This theme highlights the point that the halo effect or the beauty-is-good stereotype goes far beyond binary judgments.

The second theme "adornment things" align with prior work. For example, Bloch and Richins (1992) showed that people use adornment goods such as jewelry, makeup, clothing, shoes, and other accessories to enhance their physical appearance. The findings obtained from the present research illustrates that the adornment things children relate to attractive individuals are very similar to adults.

The third theme "status-related goods" tells us that children like adults' believe in the concept of the beautiful-material good life (Dittmar 2007). However, the findings reveal that the material possessions children consider as being luxurious are not the same as adults. For example, children view branded toys as high-status goods and perceive attractive individuals to own such goods. A reason why children consider branded toys as being high-status related may be attributed to the fact that branded toys are one of the most heavily advertised products in children's media (Fetters 2020). Even though few adults may have a hobby of collecting branded toys (e.g., Legos or Marvel characters) most adults do not use branded toys to feel superior to others.

The findings also show that children associate electronic goods with attractive people and consider it as a cue for high-status. Material parenting (Richins and Chaplin 2015) may perhaps be an explanation for this linkage. In many households' children are given

electronic goods as a reward or punishment for displaying good or bad behavior. For example, some parents say things like, "I'll give you the iPad if you finish your homework" or "I won't let you play with my phone if you fight with your little brother". Since children think of attractiveness as being a positive feature and the consumption of electronic items as rewards, they are possibly connecting the two together. Future research can examine the above relationships more explicitly.

The results obtained from this research are important because there is discrimination against people based on how they look. Research shows that stereotypes/biases in any form are found to be detrimental to children's growth and development (Bigler and Liben 2006). Interventions are therefore needed to change such perceptions in children. Children need to be taught to be accepting of others irrespective of the things they own and the way they look. Although the scope of this research was to identify the types of possessions children perceive with attractive versus less attractive others, the findings could imply that these are the same possessions children see as being significant for themselves. Future research needs to be undertaken to confirm this fact.

The limitations of this research are as follows. In the present study, girls drew pictures of girls and boys drew pictures of boys. Future research can look at reversing the condition, wherein girls draw pictures of boys and boys draw pictures of girls. This will al-

low us to understand what girls (boys) perceive attractive and less attractive boys (girls) to own. Lastly, this research does not provide the reasons why children hold beauty-material possessions related to stereotypes. Additional studies need to be conducted to answer this question.

Understanding Beauty Stereotypes Using the Big Five Labels

Tabitha S Thomas, Unaffiliated, India
Dolphy M Abraham, Independent Researcher, India

INTRODUCTION

Tom (not his real name) is a 9-year-old boy. He has drawn two pictures. The first picture is that of a good-looking boy and the second of a less good-looking boy. This is how Tom describes the characters that he has drawn. "*The good-looking boy is very handsome. He is very happy. All the girls come to him. He is a great dancer. He has fourteen friends. He loves to play videogames. I want to be this boy. He is me. The less good-looking boy does not do his homework. He does not listen to his mother. He likes touching bad things. He is unhappy. He has zero friends. He has no power. I do not want to be this boy*". Tom is one of the participants of this study (see Figure 4).

Past research shows that children like adults link positive traits with attractive people and negative traits with unattractive people, this bias is commonly known as the beautiful-is-good stereotype (Dion 1973; Dion and Berscheid 1974). Currently, we know at the surface level the traits children normally connect with attractive and less attractive individuals. However, there is still a need for further research to understand these traits at a deeper level. For instance, personality theories have not been used as frameworks to understand the beautiful-is-good stereotype in children. In other words, prior work reveals to us the general traits children relate with physical appearance, but these traits have not been organized and grouped in a structured manner to fully recognize the perceived personalities of attractive and less attractive individuals. Hence, the present research addresses this gap by examining beauty stereotypes in children using the big five labels i.e., (1) openness to experience, (2) conscientiousness, (3) extroversion, (4) agreeableness, and (5) neuroticism (Goldberg et al. 1992).

The present research is important for the following reasons. First, having stereotypes of any form is detrimental to a child's mental growth and can have an adverse impact on the kind of person they become in the future (Bigler and Liben 2006). Second, stereotypes can lead to discrimination, prejudices, and unfair treatment of others which can result in emotional and physical pain for the victim (Dovidio and Jones 2019). Lastly, perceptions of others are sometimes based on self-perceptions, referred to as the assumed similarity bias (Cronbach 1955). And so, if a child is associating positive personality traits with an attractive individual and the opposite with an unattractive individual it can also imply how the child is perceiving themselves. In other words, if a child thinks that they are attractive they may consider themselves superior to others and if they think they are unattractive they may perceive themselves as being inferior to others. Either of these thoughts are unhealthy for a child to have during their development.

In the example stated at the beginning of this paper, one can see that Tom not only aspires to be the good-looking boy ("I want to be this boy"), but he has also called himself the good-looking boy ("He is me"). The concerning part is that Tom has made it clear to everyone that he does not want to be associated or called as the less good-looking boy. Given the negative impact of stereotypes, a deeper understanding of the physical attractiveness biases is crucial for prevention, intervention, and bringing about changes in children's thinking and behavior.

THEORETICAL BACKGROUND

Physical Attractiveness Stereotypes

The extant literature on the beautiful-is-good stereotype in children is centered around friendships, peer popularity, and behavioral characteristics (e.g., Dion 1973; Griffin and Langlois 2006; Langlois and Stephan 1977; Rennels and Langlois 2014). For instance, children rate their attractive peers to be friendlier, kinder, smarter, and more popular than unattractive peers (Griffin and Langlois 2006; Langlois and Stephan 1977). These findings hold true even when attractive peers display aggressive behaviors. Prior research has also shown that when children are told to imagine a good and bad individual in their mind and then asked to identify which of the two individuals in their imagination is beautiful or ugly, children tend to refer to the good person as being attractive and the bad person as being unattractive (Ramsey and Langlois 2002). Overall, the beautiful-is-good stereotype literature reveals the positive and negative traits children associate with individuals based on their physical appearance. The present research extends prior work by providing a deeper understanding of the perceived personality types of attractive and unattractive people by organizing the general traits into categories using the labels from the big five.

The Big Five Labels

The big five framework of personality traits has been widely used by researchers to understand individual differences in people's thoughts, feelings, and actions (Cobb-Clark and Schurer 2012; Goldberg 1992; Komarraju et al. 2011; Roccas et al. 2002). The big five traits of personality consist of (1) openness to experience: individuals who are high in the openness to experience factor tend to think out of the box and are generally inspired and motivated to try out new things. Whereas individuals who are low on the spectrum are seen as being less creative and are prone to choose routine over variety. (2) Conscientiousness: individuals high on the conscientiousness dimension are likely to be goal-oriented, methodical, and responsible. But those that are low on the conscientiousness dimension are said to be unorganized, irresponsible, and impulsive. (3) Extroversion: individuals high in extraversion are talkative, gregarious, and social. They usually seem comfortable around others and are often regarded as the life of a party. However, those who are low on extraversion (high on introversion) tend to be thoughtful, quiet, and reserved. (4) Agreeableness: individuals high on the agreeableness factor are usually sweet-natured, helpful, sensitive, and affectionate towards family, friends, and even strangers. Individuals who are low on this spectrum are aggressive, insensitive, and cruel. (5) Neuroticism: Individuals who are high in neuroticism tend to be anxious, worried, sad, insecure, and emotionally unstable. Those low on the dimension are calm, happy, secure, and stable. This research uses the big five labels to understand the beautiful-is-good stereotype in children as it helps to organize the perceptions in a more structured manner

METHOD

A drawing method was implemented to understand physical attractiveness stereotypes in children. This technique has been successful in the past to understand children's inner most feelings and experiences (**Cherney et al. 2006**).

Participants: 122 girls and 100 boys took part in the study (M_{age} = 8.99). These children were from middleclass households. The study was ethically approved, and permissions were taken from required authorities.

Procedure: The study was conducted at the children's school. Each child was given a sheet of paper divided by a black line and then asked to draw pictures of an attractive person on the left and a less attractive person on the right. The gender of the characters in the pictures were of the same gender as the child. After the drawing activity was completed, children had to answer the following question "*Can you please describe the characters present in your pictures?*" Children were given a box of color pencils as an incentive for taking part in the study. Refer to Figures 2, 3, and 4.

Analysis: The data analysis was a back-and-forth process. The drawings and the descriptive words were coded based on an adaptation of Braun and Clarke's (2006) guidelines. An independent person coded 25% of the data to ensure intercoder reliability. To understand and make sense of the perceived personality types of attractive and less attractive individuals the descriptive words used by the participants were categorized and structured using the big five labels.

FINDINGS

Figure 1 reveals the perceived personalities of individuals based on their physical attractiveness using the big five labels

1. *Openness to Experience*: The participants perceived the picture of the attractive individual to be open to new experiences and the picture of the less attractive individual to be not. For instance, Ken's descriptive words for his picture of the good-looking boy were, "*he is interesting, adventurous, and fun-loving*". Similarly, Sam (see Figure 2) looked at his picture of the good-looking boy and said, "*he likes dancing, saluting, laughing, and playing games*". On the contrary, Sam described his picture of the less good-looking boy as "*he is weak, not energetic, and does not like to play*". Likewise, Sarah's description of her picture of the pretty girl was, "*she likes gardening and exploring new things*". In contrast, narratives used by Sarah for her picture of the less pretty girl were, "*she is gloomy, and she does not have interesting hobbies*".

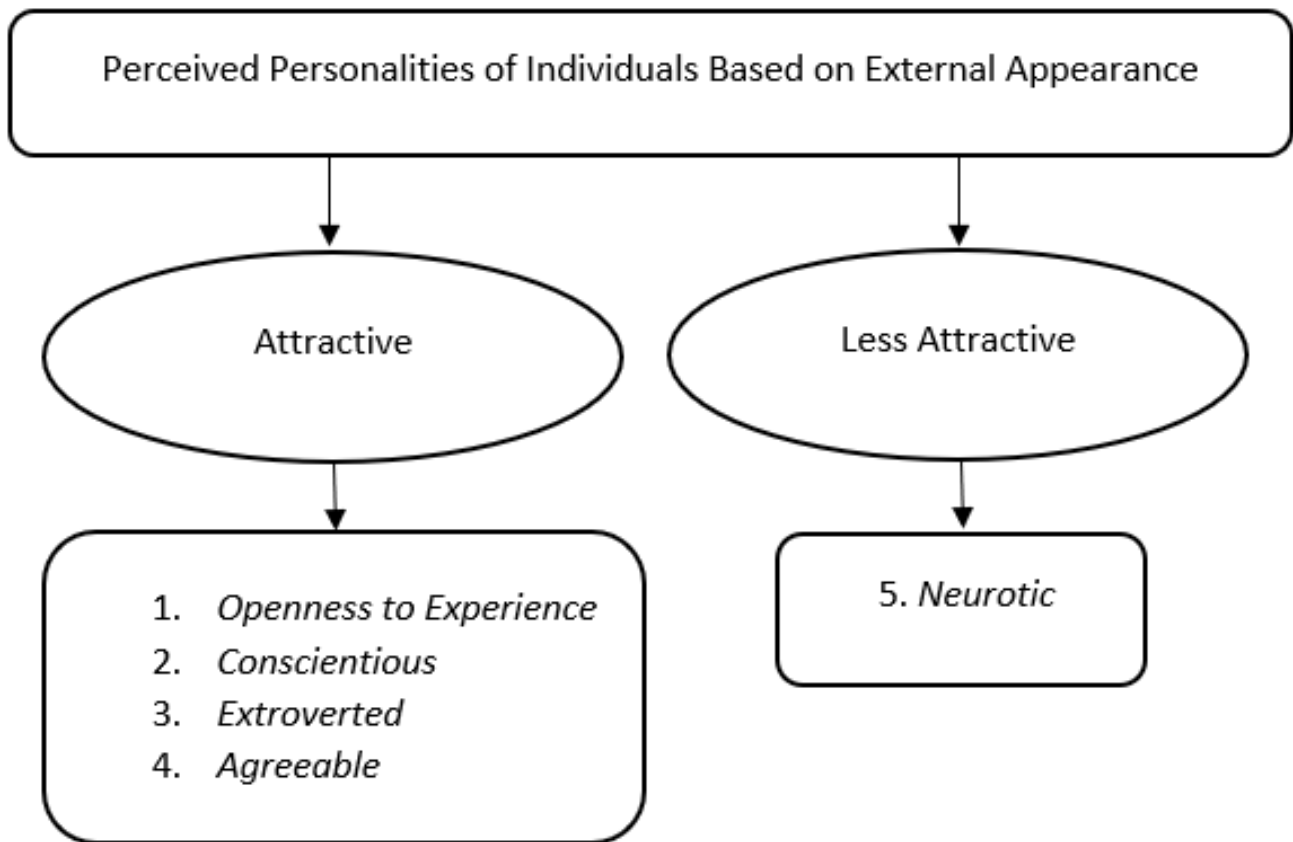
2. *Conscientiousness*. The participants considered the picture of the attractive individual to be conscientious and the picture of the less attractive individual to not be conscientious. For example, Troy used the following words to describe his picture of the good-looking boy, "*he is good at geometry, reads a lot of books, comes first in class, finishes his homework on time, and watches news and other educational programs on TV*". On the contrary, the words he used to describe his picture of the less good-looking boy were "*he doesn't study, doesn't do homework, comes late to class, doesn't do well in exams, and likes watching cartoons and horror movies all day*".


Figure 1 Children's Perception of Attractive and Less Attractive Individuals

Figure 2 Sam's Drawings and Descriptive Words

3. *Extraversion*. The participants linked extroverted behaviors with the picture of the attractive individual and introverted behaviors with the picture of the less attractive individual. For instance, Lily (see figure 3) described her picture of the pretty girl as "*popular, outgoing, and happy*". Lily also said that she wanted to be the picture of the pretty girl that she had drawn because the pretty girl is popular, has many friends, and is not sad. Likewise, Jim described his picture of the good-looking boy to be *cool, social and a ladies' man*". The participants used the following words to describe their pictures of the less attractive individual "*unpopular*", "*does not have any friends or has few friends*" and "*talks to self*", "*lonely*", and "*alone*".

4. *Agreeableness*. The participants considered the picture of the attractive individual to be agreeable and the picture of the less attractive person to be not agreeable. The words used by the participants to describe the pictures of the attractive individual were, "*she is kind*", "*she is helpful*", "*she is respectful*", "*he likes to share*", "*he listens to his parents and teachers*", and "*he has a good heart*". On the contrary, the pictures of the less attractive individual were referred as, "*she is mean*", "*she fights with everyone*" "*she is not nice*", "*he doesn't listen to his parents or his teachers*", "*he likes to jump and shout in class*", "*he is not helpful*", "*he is naughty and hits everyone*", and "*he likes troubling everyone*".
Figure 3 Lily's Drawings and Descriptive Words

Figure 4 Tom's Drawings and Descriptive Words

5. *Neuroticism*. The participants viewed their pictures of the less attractive individual to be neurotic and their pictures of the attractive individual to be not. The descriptive words used by the participants for the picture of the less attractive individual were, *"she's grumpy"*, *"she is sad"*, *"she is jealous"*, *"he is angry"*, and *"he throws tantrums when he is upset"*. The pictures of the attractive individual on the other hand were described as, *"he is happy, he smiles a lot, and he is full of joy"*, and *"she is cheerful and playful"*.

In summary, the findings reveal that children consider attractive individuals to be open to new experiences, conscientious, extraverted, agreeable, and not neurotic. The opposite was found regarding less attractive individuals.

CONCLUSIONS

The present research explored the personalities children associate with attractive and less attractive individuals using the big five labels. This paper contributes to existing theory in the following ways. Prior studies have identified the general traits children associate with physical appearance (Dion 1973; Rennels and Langlois 2014). However, these identified traits are (1) several, (2) at the surface level, and (3) not grouped into categories based on well-rooted personality theories to understand the perceived personality types of attractive and less attractive individuals at a deeper level. The present research addressed these limitations in the extant literature by (1) organizing the traits in a structured manner, (2) understanding the traits at a deeper level, and (3) recognizing the perceived personality types of attractive and less attractive individuals.

The results of the present research are significant for the following reasons. First, we live in a society that glorifies physical attractiveness and youthfulness. The "cosmetics and personal care" industry has been growing exponentially (Statista 2020). This industry is thriving because of the beautiful-is-good stereotype. Advertisements are filled with images of perfect-looking people who are desired by all and shown leading happy and successful lives (Ashikali and Dittmar 2012). Even though the present research did not directly measure the influences of traditional and digital media on beauty stereotype formation in children, based on the big five labels children assigned to attractive and less attractive individuals it could be inferred that the mass media may be held responsible for such associations. Future research needs to be conducted to confirm this fact.

Second, according to the assumed similarity bias (Cronbach 1955) perceptions of others are based upon self-perception. And so, when children are judging others based on external appearance it can also mean that they are judging themselves with the same labels. Research shows that negative self-relevant stereotypes can lower self-esteem and be detrimental to mental and physical health (Ambady et al. 2004). Lastly, passing unfair judgments over others can result in marginalization and stigmatization of targets. Therefore, understanding the beautiful-is-good stereotype becomes necessary to take actions that lead to changes in stereotypical thinking.

The current research also makes methodological contributions. Previous studies examining beauty stereotypes in children have mostly implemented quantitative techniques. Although dependent measures used in the past have rendered evidence for the existence of stereotypical judgments in children. The feelings and the experiential parts attached to these stereotypical judgments were missed out due to the quantitative nature of past studies. The qualitative technique employed in this research was able to counter these limitations. In the drawing study, children defined physical attractiveness by creating images and then assigned personality traits to their respective characters which were far beyond binary judgments. Hence, the findings obtained from the drawing data is richer and deeper compared to prior work.

Anchors on the Move: Digital Nomads' Solid Footholds in Liquidity

Christiane Aufschnaiter, MCI – The Entrepreneurial School, Austria
Sarah Schwarz, University of Innsbruck, Austria
Andrea Hemetsberger, University of Innsbruck, Austria

"I am rooted but I flow." Virginia Woolf, *The Waves*

INTRODUCTION

The permeation of technologies into consumers' lives has resulted in unprecedented opportunities for combining work and leisure while satisfying their *wanderlust* (Makimoto and Manners 1997). Digital nomads whose online work arrangements enable holistic freedom (Reichenberger 2017) embody the skill of adaptation to everchanging environments (Mancinelli 2020). Research has addressed that mobile consumers navigate the postmodern logics of today's marketplace in a fluid manner. Bardhi, Eckhardt, and Arnould (2012) and Bardhi and Eckhardt (2017) point to digital nomads' ephemeral, detached, and elastic relationship to materials. Others have used the context of voluntary lifestyle migration to illuminate the separation of consumers' utopias from the solid (Atanasova 2021) and the liquefaction of status and distinction (Eckhardt and Bardhi 2020).

Consumer research has portrayed digital nomads as role models living the stereotypical imperatives of liquid modernity. However, as Belk (1988) prominently demonstrates, materials may carry meaning for consumers and even become part of the extended self. Furthermore, studies depict digital nomadism as unfolding at the interplay between autonomy and structure/stability (Prester, Cecez-Kecmanovic, and Schlagwein 2019) or freedom and discipline (Cook 2019). Based on these hints that nomadic consumers' unsettled lives are not entirely liquid, we presume that their mobility projects are nourished by sources of solidity. Hence, this study shares the idea that by drawing upon the image of digital nomads as the vanguard of liquidity, researchers risk romanticizing the lifestyle of nomadic consumers (Korpela 2019). Embedded in the concept of anchoring and grounded in narrative interviews and netnography, this study uncovers digital nomads' social and material anchors across space and time.

THEORY

Consumer Mobility in Liquidity

In postmodern conditions of omnipresent change and precedence of "mobility and flow over stasis and attachment" (Cresswell 2006, 43), authors have introduced the nomad as the metaphor of a liquid world (Bauman 2000; Braidotti 2014). Sheller and Urry (2006) stress that recent decades have ushered in the emergence of a mobility paradigm where bodies and materials are on the move. As a consequence, scholars have shown rising interest in mobile consumers. Related studies have sparked discussion about individualistic pursuits (Tumbat and Belk 2011), detached relationships to objects (Bardhi et al. 2012), fluid notions of home (Bardhi and Askegaard 2008), and navigations across spatial and temporal dimensions (Figueiredo and Uncles 2015).

Bardhi et al. (2012) point to acculturation research having suggested that migrant consumers, who are driven by territorialized identities (Belk 1992), pursue anchors to former home places and attachments to the material that is imbued with symbolic value due to its reinforcement of connections to cultures and places (Joy and Dholakia 1991) and even social environments (Mehta and Belk 1991). Lifestyle migration research has emphasized that, unlike migrants, itinerant professionals such as digital nomads voluntarily follow inconsistent mobility trajectories (e.g., Bardhi et al. 2012). Detached from past and future narratives (Atanasova 2021), they assume a deterritorialized relationship to a locality's social and cultural practices (Bardhi et al. 2012). In their attempt to blur the line between acculturation and lifestyle migration research, Sharifonnasabi, Bardhi, and Luedicke (2020) underline the power of understanding traditional views on globalization more openly. For example, Askegaard and Kjeldgaard (2007, 145) state that while searching "for a centre that holds (Bauman 1990) in the middle of a turbulent period," globalized consumers satisfy their desire for stability through local products. This invites to "question the celebratory tone of the deterritorialization perspective" (Sharifonnasabi et al. 2020, 289) by investigating not only liquefaction but also solidification tendencies of lifestyle migrants. So, the question arises as to how digital nomads' mobility projects are anchored in sources of solidity.

Anchoring

Bauman (2000) portrays solidity as the counterpart of unstable and uncertain conditions produced by liquid modernity. However, research has recently highlighted the importance to study both liquidity and solidity as co-existing on a continuum (Bardhi and Eckhardt 2017). Proposing the conceptual framework of anchoring, Grzymala-Kazlowska (2016; 2018, 634) dissolves the dichotomy "between mobility and fixity." This theoretical approach introduces itinerants as establishing intangible (cognitive or emotional) and tangible footholds which provide stability and security during experiences of mobility (Grzymala-Kazlowska 2016). While the anchoring concept encompasses sources of solidity that relate to the social world, Grzymala-Kazlowska (2016; 2018) emphasizes that they can also be rooted in the material. Pradhan, Cocker, and Hogg (2019) draw upon this approach while studying migrant consumption. They stress that footholds offer these mobile consumers a sense of psychosocial balance and even contribute to identity projects, wellbeing, and imaginings. Thus, the concept of anchoring offers a powerful lens to investigate the role that sources of stability and security play in nomadic consumers' liquid lives.

METHODOLOGY

This study uses narrative interviews and netnography to gain a nuanced understanding of solid anchors unfolding in settings of postmodern liquidity. We studied digital nomads—technology-savvy consumers blending remote life and work practices (Mancinelli 2018). Participants were recruited virtually using maximum variation sampling (Patton 2014). The sample consists of 39 digital nomads with different genders, ages, nationalities, occupations, educational backgrounds, and mobility experiences—different pre-experiences of anchoring (e.g., ranging from slow to fast, single to family, and lightweight to van-life itinerants). We investigated their life-worlds (Kvale 1983) by conducting 31 in-depth online interviews from August 2018 until October 2020. Apart from engaging in observations and participating in discussions on diverse online platforms (Kozinets 2020), we focused on the textual captions of 1.932 Instagram posts published by eight nomadic consumers. We used social media as a naturalistic setting for an investigation to acknowledge the centrality of online platforms in itinerants' lives (Thompson 2019b). Following grounded theory, this study analyzed both verbatim tran-

scripts of interviews and Instagram data through the iterative process of categorization and abstraction (Spiggle 1994).

FINDINGS

Our findings show that digital nomads' lifestyle is characterized by an openness to "*go with the flow*" (Blayze-23-Canada) where "*the only constant is change*" (Tobias-32-Germany). Despite this appreciation of holistic freedom, our respondents reveal how they strive for integrating sources of solidity into their liquid lives. We found social and material anchors which do not constitute delineated categories but are rather overlapping.

Social and Material Anchors

Contrasting the view of postmodern itinerants as being individualized (Tumbat and Belk 2011) and embracing unstable networks (Kesselring 2008), our findings suggest that digital nomads are attached to social anchors (Bardhi 2006). Relationships among fellow itinerants are less transient than Thompson and Tambyah's (1999) study on expatriates implied. Reminiscent of migrants (Grzymala-Kazlowska 2018), nomadic consumers also use connections to non-nomads as footholds. While some of our respondents foster ties with locals, most digital nomads are not as eager to delve into unknown cultures as propagated by liquid modernity (Korpela 2019). Nomadic consumers further ascribe importance to traditional values such as marriage, which questions the detraditionalization of intimacy in globalization contexts (Giddens 1991).

Our findings add to studies on postmodern itinerants that emphasize the dematerialized nature of consumption (Bardhi and Eckhardt 2017; Bardhi et al. 2012). Unlike the elite digital nomads who are disconnected from their homelands (Kannisto 2016), our respondents curate connections to objects that potentially shape their (cosmopolitan) identity projects (Belk 1988). Despite favoring minimalism over material abundance, digital nomads choose the few possessions thoroughly, thus turning consumption itself into a fundamental everyday activity. Places and localities constitute another material anchor. Our findings go beyond the traditional consensus that cosmopolites do not belong anywhere (Friedman 1995; Hannerz 1992) showing that digital nomads establish (im-)mobile home bases, are passionate about countries conveying childhood memories, and return to travel destinations.

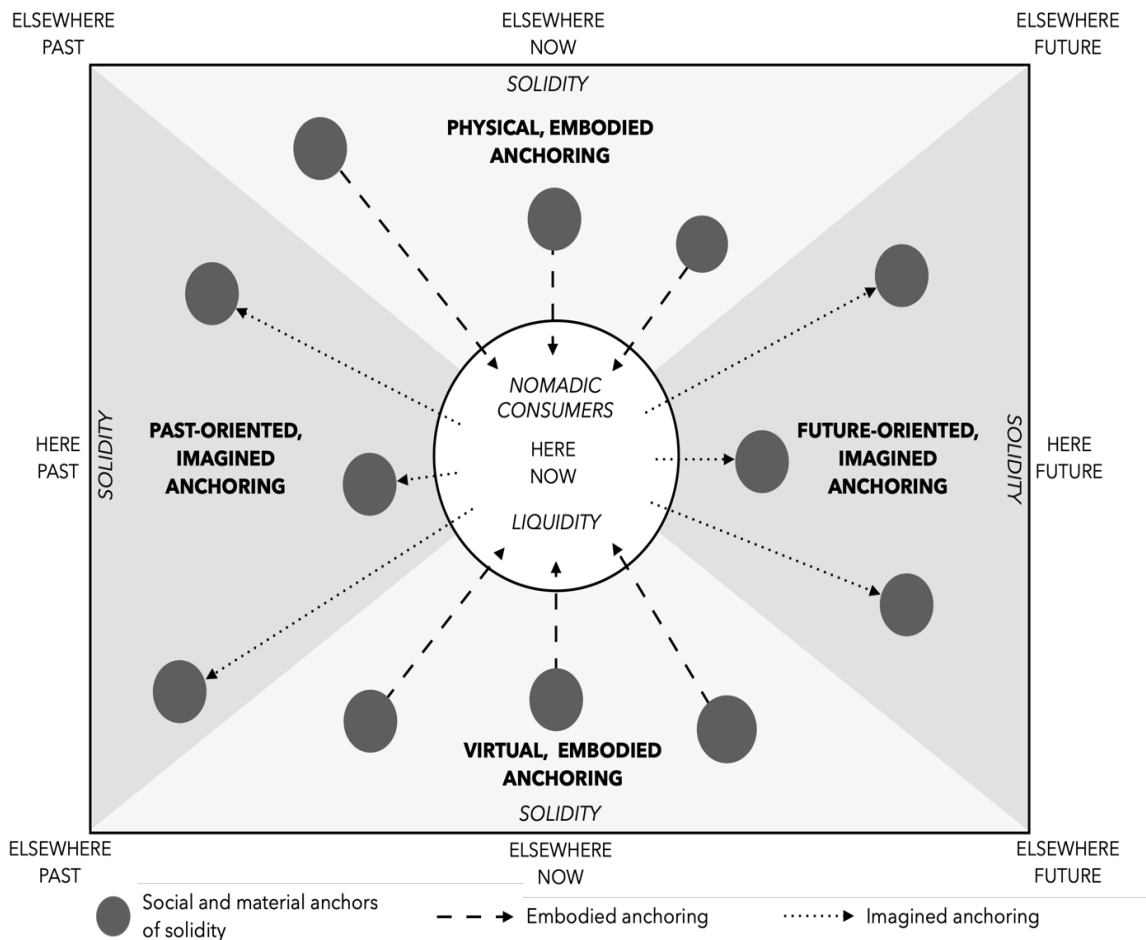
Social and material anchors can emerge in any spatial (here, elsewhere) and temporal (past, now, future) setting. While these footholds may carry functional values, our respondents appreciate them as they are imbued with symbolic meanings. To integrate the solid anchors into their liquid lives, nomadic consumers cross spatial and temporal boundaries in their bodies and minds. We identify and outline two forms of anchoring—embodied and imagined—each of which can involve both social and material sources of solidity (figure 1).


Figure 1: Nomadic Consumers' Anchors Of Solidity Across Space And Time

Embodied Anchoring

Based on Cruz and Buchanan-Oliver's (2020, 1331) definition of embodiment as "ways of performing and inhabiting the world in and through a body," we define embodied anchoring as nomadic consumers' incorporation of anchors into their present realities involving corporeal enactments and experiences.

Physical, Embodied Anchoring. Nomadic consumers are willing to cast aside their striving for individualism and minimalism as they invest time and money to establish long-term connections to people and materials. This continuity regarding certain social and material aspects in their lives is essential for sustaining a mobile lifestyle. Digital nomads fight social isolation and lack of community through embodied experiences with family members or partners permanently accompanying them as well as through physical homecomings and temporary reunions with family and friends.

> "*I'm lucky to travel as a couple. But not everyone does that, a lot of nomads are solo…But eventually, [they] may suffer about some kind of isolation and other kinds of psychological issues and I've seen that happening.*" (JR-41-Portugal)

Nomadic consumers carry along lightweight materials imbued with symbolic meaning. These objects remind the owners of people, places, or events and provide an anchor toward past familiarity. Most respondents do not dispose of their possessions but keep them, for example, in storage rooms where re-engagement processes (Epp and Price 2010) can take place. Furthermore, they rely upon homemaking practices (Bardhi and Askegaard 2009) which often involve materials to give formerly commercialized places, such as vans, a homey feeling.

Virtual, Embodied Anchoring. Embodied anchoring also occurs when nomadic consumers sustain social ties to people without geographical contiguity. They draw upon information and communication technologies to foster these relationships (Epp, Schau, and Price 2014), reducing the importance of being physically close to beloved ones (Kreuzer, Mühlbacher, and von Wallpach 2018). Alice (30-New Zealand) describes how she connects with non-nomadic family and friends via video calls in a way that allows them to do "*the same things that [they] would do if [they] were in the same room…[they] have a video call and then watch a movie together.*" It seems as if their mobile lifestyle potentially even facilitates fostering connections, as the following verbatim account shows:

> "*I have a MUCH better relationship with all my siblings and my mom…When I was in Chile, we were fighting all the time…And it's good because now that I am traveling, then every time we speak, [it] is positive. It is never negative.*" (Terry-30-Chile)

Social media applications such as Instagram also enable the establishment of new contacts, the maintenance of online communities, and the coordination of offline gatherings in new geographical locations among digital nomads (Thompson 2019b)

Imagined Anchoring

We define imagined anchoring as nomadic consumers' integration of anchors into their past or future realities which primarily takes place in their minds but nevertheless can influence actual behavior (Jenkins and Molesworth 2018).

Past-Oriented, Imagined Anchoring. When oriented toward the past, imagined anchoring can take the form of reminiscing about people and materials from pre-nomadic life. Particularly, digital nomads miss left-behind people and the related feeling of familiarity in situations when they would like to share special moments or are experiencing difficulties, such as health issues. Furthermore, remembering traditions involving beloved people, such as childhood Christmas celebrations with the family, links nomadic consumers to the past.

Our findings reveal that digital nomads also reminisce about materials from their homeland which they cannot consume in foreign countries, such as German bread. Also, positive experiences can cue memories, as Agata's quote about traveling to Slovenia, a country similar to her homeland, highlights:

> "*When we were crossing the border to Slovenia, I could see more traditions and more families and the villages and everything. You see that people have strong traditions and that gives me that cozy and warm feeling.*" (Agata-38-Poland)

Future-Oriented, Imagined Anchoring. Imagined anchoring also revolves around projections into the future (Figueiredo and Uncles 2015, 45) to pursue stable social networks. Challenging extant evidence that digital nomads are primarily aiming for "short-term pursuits of individualized desires" (Atanasova 2021), our findings support Mancinelli (2020) and Thompson (2019a) highlighting the difficulty of finding romantic love while being on the move. We identify this quest and the aim to establish a family as a social anchor toward the future. Many digital nomads can imagine sacrificing some of their liquidity to realize this dream even though they ultimately wish to continue living nomadically. The absence of materials in their present lives results in digital nomads' imagined anchoring toward a future that involves the consumption of materials like cars and even solid houses.

> "*My goal is to be a millionaire in the next few years. Because of course, a big part is, I'd love to have a big house, a fancy car, nice purses, nice shoes, like I am such a fashionista.*" (Blayze-24-Canada)

DISCUSSION

This study casts new light on the lifestyle migration of digital nomads. Our contribution to prior work on contemporary cosmopolitanism is threefold: First, we elucidate the bricolage of liquefaction and solidification tendencies in settings of voluntary mobility (Grzymala-Kazlowska 2016) and thus underline their co-existence along a spectrum (Bardhi and Eckhardt 2017). While corroborating earlier findings portraying digital nomads as the advocates of postmodern liquidity and holistic freedom (e.g., Atanasova 2021; Reichenberger 2017), this study explores consumer cosmopolitanism from an alternative angle. In illuminating the sources of solidity revolving around stability and security, we weaken the position that nomadic consumers are untied from footholds. Second, our study challenges earlier studies accentuating the functional value of materiality in liquidity (Bardhi and Eckhardt 2017; Bardhi et al. 2012).We unveil that even though possessions potentially threaten the mobility experience, materials serve as cherished companions imbued with symbolic meaning (Belk 1988). Additionally, this study makes the first step toward understanding the symbolic role others play in the constitution of cosmopolitanism. We show that stable social bonds stimulate the continuation of the nomadic lifestyle. Third, our findings question the prevailing image of nomadic consumers as the warriors of the here and now (Atanasova 2021; Bardhi et al. 2012). In uncovering nomadic consumers' fluid navigation between spatial dimensions, we foreshadow that globalization phenomena surpass the boundaries of deterritorialization (Sharifonnasabi et al. 2020). Furthermore, our findings substantiate the idea that digital nomads provoke the liquefaction of temporal constraints (Figueiredo and Uncles 2015) as they are pulled back and pushed forward to preceding and prospective times, respectively.

This study is limited as we acknowledge the intertwined character of social and material anchors without illustrating the overlaps between them. Future research could draw a more holistic picture of contemporary nomadism by delving deeper into the entanglements between the footholds in liquidity. Additionally, our findings indicate that nomadic consumers are caught between routes and roots. Subsequent studies should consider examining the negotiation practices nomadic consumers rely upon to navigate this tension. While we see considerable value in the avenues for research provided by studies on liquid consumption, this study initiates a debate about the revival of solidity within marketplaces in flux. Ultimately, the footholds anchoring digital nomads portend that these consumers are not so footloose after all.

Table 1: Findings

Social and Material Anchors of Solidity	
Embodied Anchoring [SEP] Digital nomads' incorporation of anchors into their present realities involving corporeal enactments and experiences.	
Physical, Embodied Anchoring	"*It was a long time that I hadn't seen her, so, the fact that we were able to reconnect at that spot…the emotional impact of seeing my mom again after five years and actually be able to share that moment with her, that's what made it even more important because it is something we will always have together.*" (Ava-31-US) "*I did have my friends write me letters, before I left, and I carry those with me. So, if I'm ever like feeling really sad and, you know, I'm in a different time zone or whatever, I can read their letters. And I've collected a couple of, sort of sentimental things like that along the way that I carry with me.*" (Elena-31-US)
Virtual, Embodied Anchoring	"*Like it's always been a very, very big deal, Christmas morning, my grandparents, my mom, my sister like, we spent every Christmas together. It's something I look forward to every year…this past Christmas was my first Christmas away from home…I called them on Christmas and so chatted with them when they were together.*" (Blayze-23-Canada) "*I noticed that I grew very attached to my, um, to social media. And that was just because a lot of the time you don't have anybody to talk to or share your stories or adventures with…I started using social media MUCH more than before. Just to be able to, um, communicate with the outside world.*" (Vic-39-US/The Netherlands)
Imagined Anchoring Digital nomads' anchoring into their past or future realities which primarily takes place in their minds.	
Past-Oriented, Imagined Anchoring	"*[Grandma] said that I should go and explore and see the world and should come back with a cool guy (laughs)…You'll find a good man on your trip. [After she died], I was like, okay, let's do this, grandma (laughs). And I still wanted to do my divemaster. And grandma would say, go for it. We were like, okay, let's do this.*" (Travel_Ainy-30-Germany) "*Um, there's only one thing that I miss in my house, but it's really stupid to say….um (laughs), it's really stupid, um, it's a… bag. And I really love it. It's yeah but I am not going to take it on the van because I did never know if someone can rob it or anything. And so, I leave it at home.*" (Pilar-34-Portugal)
Future-Oriented, Imagined Anchoring	"*This is something I really need to actively work on. Or want to actively work on. Like I do hope…to have more stability in my life. Like maintaining deeper relationships with friends. And obviously, I do hope to have a family, which is hard. But yeah, so these are [the] things I would hope for.*" (Tobias-32-Germany) "*So, um, probably [I] will keep on traveling my whole life, the rest of my life I will be traveling. And because that's one of the things I love to do, but I also will probably buy my piece of land and have my house. Even though I will be traveling or not, I will have my house in the countryside, not in the city.*" (Pilar-34-Portugal)

The Epistemic Cultures of Product Review Systems

Mikkel Nøjgaard, University of Southern Denmark, Denmark, and University of Lille, France

INTRODUCTION

The emergence of the product review has revolutionized the informational landscape consumers meet when they are searching for information about products and means that consumers do not have to rely on brands or prices as cues for product quality (Simonson & Rosen, 2014). However, the availability of product reviews has not ended consumers' struggles to determine the quality of goods. In the new information environment, consumers must navigate between different sources of product reviews, and these sources often employ different styles of reviewing. As a result, consumers are often presented with conflicting product quality assessments (Chen & Xie, 2008; de Langhe et al., 2016a). This observation begs the questions: why do product reviews often differ in their assessments? As product reviews are growing in influence on consumers' purchasing decisions, dissecting the information they provide is an essential task.

We pursue the question above by looking into how two different systems of product reviewing (i.e. socio-material arrangements designed to create and disseminate product reviews) generate product quality information. Specifically, we compare the creation of the expert reviews of the lead consumer organization in Denmark, *THINK*, with the creation of the online user reviews displayed on *Amazon. com*.

Our findings contribute to cultural consumer research on product evaluations (Arsel & Bean, 2013; Corciolani et al., 2020) and to recent discussions about the current state of the consumer information environment (de Langhe et al., 2016a; Kozinets, 2016; Simonson, 2016; Winer & Fader, 2016).

THEORY

From the Effects of Product Reviews to the Processes of Product Reviewing

Product reviews have in recent years attracted a lot of scholarly attention. A wealth of work has been dedicated towards uncovering the effects of product reviews. Myriad studies have tested whether product reviews have an effect on consumer demand and sales performance (Chakravarty et al., 2010; Chevalier & Mayzlin, 2006; Chintagunta et al., 2010; Dellarocas et al., 2007; Simonsohn, 2011), while others have studied the mechanisms through which such effects are achieved (Chen & Xie, 2008; Floyd et al., 2014; Hu et al., 2014; Jang et al., 2012; van Laer et al., 2019). The processes through which product reviews are created, however, have received relatively little attention.

Systems of Product Reviewing

For conceptualizing the evaluative processes of product review systems, I draw on the notions of 'epistemic cultures' and 'qualification'.

Cultures of Knowledge Construction

The concept of 'epistemic cultures' is based on the position that knowledge – even scientific facts (Latour, 2003) – is socially constructed and that knowledge takes its particular shape from the social processes of its construction. This position warrants looking at the "machineries of knowledge construction" (Knorr-Cetina, 1999, p. 3), that is, all the practices that scientists engage in when they are 'doing' science. Epistemic cultures refer to these clusters of practices (Knorr-Cetina, 1999) and is thus designed to help us move beyond understanding knowledge as 'given' – existing out there waiting to

be 'discovered' – towards understanding knowledge as contingent on the cultures in which it is created. For importing the concept to our context, it is useful to visit the notion of 'qualification'.

Product Reviewing as Qualifying Products

The concept of 'qualification' refers to processes of assigning qualities to goods (Çalışkan & Callon, 2010; Callon et al., 2002; Callon & Muniesa, 2005). Callon et al. (2002, p. 198) stress that the qualities of goods, much like facts, are not simply 'discovered' through mere observation. Rather, product qualities are constructed through "qualification trials" (Callon et al., 2002, p. 199). Qualification trials are often the subject of controversy, as actors may disagree on how to which qualities are relevant to products and how to rate these qualities (Callon et al., 2002, p. 199). How different systems of qualification qualify products depends in large part on the epistemic culture of the systems. If we are to uncover how different product review systems differ in attributing product quality, we must thus look into their epistemic cultures.

METHOD

For this purpose, we pursue a comparative case study strategy (Woermann & Rokka, 2015). We take our empirical point of departure in the cases of *Amazon.com*, a system of user reviews, and *THINK*, a system of expert reviews. We draw on a varied dataset, designed to capture both the symbolic and material structurings of these cultures.

The dataset used to shed light on the culture of Amazon.com consisted of 7 interviews with Amazon reviewers, 1 interview with a former Amazon employee, information on Amazon.com, news articles featuring statements from Amazon spokespeople, Amazon speeches and shareholder letters, and Amazon patents. The THINK dataset included 7 interviews with THINK employees, 1 interviews with a member of an international product testing organization, and product tests both THINK's website and magazine.

Our analysis led us to distill four constitutive elements of the epistemic cultures of product review systems: epistemic procedures, epistemology, epistemic aims, and epistemic devices (see Figure 1).

FINDINGS

EPISTEMIC PROCEDURES

'Epistemic procedures' refer to the explicit precepts, principles, and rules that govern how product review systems create product knowledge.

Expert Review Systems: Scientific Testing

THINK strive for the scientific principle of *rigor*. The data that underlie THINK's reviews are produced through highly formalized procedures where products are tested under controlled conditions in laboratories by trained test engineers. The engineers adhere to strict *test programs*, designed by THINK, when carrying out the tests. The use of test programs is emblematic for THINK's commitment to the principles of scientific testing such as rigor and reproducibility.

User Review Systems: Authentic Experiencing

The chief principle governing the review procedures of Amazon is *authenticity*. Amazon employ a set of guidelines and policies that are meant to ensure that Amazon reviews are based on authentic consumer experiences. Amazon have for example developed a set of 'Community Guidelines' that urge all reviewers to base their reviews

"on your own honest opinions and experience" (*Amazon.Com Help: Community Guidelines*, 2021). Further, Amazon only admit reviews from consumers who have spent at least $50 on Amazon.com using a valid debit or credit card, thereby seeking to ensure that reviews are made by a real users.

EPISTEMOLOGY

The 'epistemology' of the epistemic cultures of product review systems refers to how system members conceive of what counts as valid data for revealing a product's quality. The epistemological beliefs present in review systems are revealed by how their members warrant their knowledge claims and try to repudiate the claims of others.

Expert Reviews: Epistemic Technocracy

Today, every media covering consumer issues have an element they call 'test'. Unfortunately, far too many of them are based on a fragile foundation. […] At THINK, we call such tests 'reviews'. For us, a 'test' means much more. (THINK 2006)

The review system of THINK represents an epistemology of 'epistemic technocracy', where experts are elevated as the ultimate judges of product quality, enjoying privileged access to the 'true' nature of products.

User Reviews: Epistemic Democracy and Crowd Wisdom

In complete contrast to THINK, Amazon stress that their reviews are truthful exactly because they are *not* conducted by experts but rather by regular consumers, as for example argued by an Amazon spokesperson:

Amazon customer reviews reflect the feedback, tastes and concerns of real customers, not professional reviewers. That's what makes them powerful (Streitfeld, 2016)

Hence, Amazon employ an epistemology which grants epistemic weight to the experiences of ordinary consumers. Amazon review system represents an epistemology of 'epistemic democracy', as it encourages everyone to participate in the epistemic process and provides a platform for such collective participation.

EPISTEMIC VALUES

'Epistemic values' refer to the values that guide the knowledge-creating practices of product review systems. Whereas epistemology is concerned with what counts as valid knowledge, epistemic values is concerned with counts as valuable knowledge in product review systems.

Expert Reviews: Product Differentiation

In the review system of THINK, value is attributed to information that enables consumers to distinguish products. This epistemic value is clearly reflected in how THINK design their test programs. Test manager Grethe gives the test of child seats as an example of how the epistemic value of product differentiation shape the product reviewing practices of THINK:

Well, in a crash […] if the accident is violent enough, we break everything, no matter what chair it is. Then we can't see any differences because they have all been broken to splinters. […] And if you do it too gently, then they all make it without problems. So, we are trying to find, well, a level where we can actually see some differences, where we can separate the good from the bad. (Grethe)

User Reviews: Expectation Confirmation

In the review system of Amazon, information is not valued for how it makes products distinguishable but rather for its ability to let consumers predict if the reviewed product is likely to live up to their expectations. Users' expectations are often informed by product claims, and these claims therefore come to serve as tangible benchmarks for evaluating product performance:

the criteria that has to pass with me is, number one, it does what it says on the tin. […] What they claim is number one for me. If you're claiming something and it's true, I will say so, I will confirm it does this, it does that. If it doesn't, uhm well, that's no good for me. That's where you would lose the most amount of stars (Grant)

User reviews are thus not trying to facilitate comparisons of products and bring out their differences, and in fact the interviewed Amazon reviewers often explicitly refrained from basing their product reviews on comparisons. Take Tim, who "try to judge things as far as what they are", arguing that "*you can't compare everything to a Rolls-Royce*. It is what it is" (emphasis added).

EPISTEMIC DEVICES

'Epistemic devices' refer to the set of techniques and technologies that are employed to produce product reviews in product review systems. Two types of devices are involved: 'evaluation devices' and 'display devices'.

Evaluation Devices

Expert Reviews: Weighted Aggregation

THINK both rate products across individual parameters and assign products an aggregated score representing the overall quality of the product. In calculating the aggregated score, parameters are assigned different weights. The specific weights are determined by THINK's test managers drawing on their "experience" and "intuition" (Tobias).

User Reviews: Algorithmic Aggregation

Amazon also calculate an aggregated score, the star rating, but not all Amazon reviews are treated equally in calculating this rating. Amazon employ an algorithm that "give more weight to newer, more helpful reviews from Amazon customers" (Bishop, 2015).

Display Devices

Expert Reviews: Ideographic Ratings and the Comparative Table

THINK employ three main devices for displaying their test results: An aggregated rating from 0-100, an ideographic rating for each tested parameter, and a comparative table, which lists the aggregated and ideographic ratings for each tested product next to each other. The display devices are not merely devices for 'transmitting' information but rather construct the quality of products in a very particular way, of which the test managers are well aware. Consider for example Tobias who explains that the choice to assign an aggregated score risks blurring the differences between products:

"[…] sometimes we may be measuring too many parameters […] which can result in a somewhat murky overall result, right. Because the individual parameters can be contradictory, right. […] Then they [all the products] just become, like, 'good'. Then there aren't any that stick out completely in either end." (Tobias)

User Reviews: The Star Rating

The Amazon review system displays both individual user ratings as well as the aggregated star rating. The individual ratings are presented as a numerical score from 1-5 and are accompanied by a written review.

Next to the star rating, Amazon features the amount of user reviews products have. This is an important display device for warranting the aggregated star rating. Nigel, a former product category leader at Amazon, explains the reason Amazon actively work to accumulate reviews for their partners' products:

> If you go to a product and […] it has only had 3 reviews and they are all 5 stars, you just don't have certainty that that's a high quality product. Versus something that has 50 reviews and it's four and a half stars, you know, because that just kinda makes you go, "yeah, at least I know it's certain, whereas this one here, two of those are probably written by the manufacturer, so do I really believe..." (Nigel)

To convince people of the wisdom of crowds, you must first convince them that there is a crowd. Showing the amount of reviews helps perform this crowd.

DISCUSSION

In this paper, we shed light on how two product review systems, Amazon.com and THINK, qualify products. We argue that their qualifications are shaped by their epistemic cultures, which we show to be constituted by four elements: epistemic procedures, epistemology, epistemic values, and epistemic devices. We further show that these four elements differ across Amazon.com and THINK and suggest that the differences in their epistemic cultures provide a window into why they often reach divergent quality claims.

CCT and the Cultural Constitution of Utility

Our contribution to CCT is to turn attention to evaluations of goods in markets that are not centered around taste, which have been the focal evaluations in CCT research so far (Arsel & Bean, 2013; Corciolani et al., 2020; Maciel & Wallendorf, 2016). Where the exercise of taste has been demonstrated as the dominant mechanism of evaluation in systems of aesthetic evaluation, we find that taste captures poorly the evaluative processes in systems of functional evaluation. Instead, we show that epistemic practices, rather than taste-based practices, are central to the evaluation and construction of the functional quality of goods.

The Culture of Experts

We also contribute to the debate on the value of different types of products reviews. Our study underlines that product reviews are social and culturally contingent constructs, regardless of whether they are produced by users or experts, and the categories of 'objective' and 'subjective' are therefore poor for discussing how different review types differ (Chen & Xie, 2008; de Langhe et al., 2016a, 2016b).

The Expertise of User Review Systems

Our study also shows that user review systems, which are often criticized for their biases and misevaluations of product quality (de Langhe et al., 2016a; Godes & Silva, 2012; Jacobsen, 2015; Li & Hitt, 2008; Moe & Trusov, 2011; Schlosser, 2005), may be more expertise-based than conventionally thought. When seen as a system and not just a collection of reviewers, it is clear that the review system of Amazon.com, like THINK, represents an expert system (Giddens, 1990). Amazon for example deploy data science expertise for filtering user reviews. Considering Amazon.com as an expert system cautions us against drawing conclusions about the value of user reviews purely from studies focusing on users' reviewing behavior.

Tabel 1: Summary of Findings

Elements	Description	Expert reviews	User reviews
Epistemic procedures	Explicit precepts, principles, and rules	Scientific testing - Key principles: Rigor - Reflected in: Formalized test programs	Authentic experiencing - Key principles: authenticity - Reflected in: Community Guidelines
Epistemologies	Understandings of what constitutes valid data for generating product information	Epistemic technocracy - Only experts have access to the true quality of products	Epistemic democracy - The collective wisdom of consumers represents the true quality of products
Epistemic values	Understandings of what constitutes valuable product information	Product differentiation - Value of information grounded in its ability to help consumer differentiate products	Expectation confirmation -Value of information grounded in its ability to help consumers predict whether their product expectations are likely to be met
Epistemic devices	Technical tools for evaluating and displaying data	- Algorithmic processing of data - Ratings displayed via star-rating	- Weighted processing of data - Ratings displayed via ideographs and comparative table

Unappreciated Practices Creating Value

Debora Tayt-son, UFF, Fluminense Federal University, Brazil

Rafael Ramos, UFF, Fluminense Federal University, Brazil
Angela Da Rocha, Pontifical Catholic University of Rio de Janeiro, PUC-Rio, Brazil

INTRODUCTION

Value is a concept widely researched in the areas of marketing and consumer behavior (Bagozzi, 1975; Belk, 1987; Holbrook, 1999; Holbrook and Hirschman, 1982; Humphrey and Hugh-Jones, 1992; Levy, 1959; Zeithaml, 1988) and can be defined as the benefit perceived by the consumer in relation to a person, an object or an activity (Figueiredo and Scaraboto, 2016).

Some researchers in the area of consumer culture have investigated how value is created (Gummerus, 2013). They have proposed considering the sign value in the discussion of value creation (Peñaloza and Venkatesh, 2006; Venkatesh et al., 2006); the sociocultural perspective of value (Karababa and Kjeldgaard, 2013); the creation of a practice theory of value and value as a result of practices (Arnould, 2013); the market value system, composed of exchange, use, meaning, sociocultural and environmental value (Venkatesh and Peñaloza, 2014); the ontology of value and an object-centered approach to understanding processes of value creation (Arsel, 2016); and, lastly, the creation of value from the consumer-centered journey of consumption (Akaka and Schau, 2019). Additionally, research has contemplated practices as a mechanism for creating individual value in consumer groups (Holt, 1995); routine actions involved in creating collective value and maintaining brand communities (Schau et al., 2009); unintentional, random, unique and diverse actions carried out independently by individual consumers who contribute to the systemic nature of value creation (Figueiredo and Scaraboto, 2016); and the role of platform-based networks in creating value at the level of individual, and collective experiences by means of networks (Figueiredo and Scaraboto, 2018).

We noticed a common characteristic in these studies: the consumption practices that create value have a positive or neutral social connotation. In this work, we investigate the creation of value related to a practice which historically has received a negative social connotation, but which has acquired a new symbolic profile: the lunchbox. This term refers to both the object and the practice of taking food from home to other environments.

The lunchbox, which is extensively connected with Brazilian rural workers (Garcia and Gomes, 2016; Freitas, 2018), has long been seen as evidence of social fragility, and cause for embarrassment and shame (Garcia and Gomes, 2016). The lunchbox has also been associated with the working class, for having to eat away from home (Martins, 2012). City workers have used the lunchbox as a political symbol during a rebellion stemming from unfavorable work situations (Ferreira, 2005). Until recently, lunchbox consumption was never linked to meanings such as pride or status, given that neither the object nor the practice ever received social praise (Martins, 2012).

However, there has been a gradual construction of a new social image for the lunchbox in Brazil. If, for a long time, taking food from home to work was a sign of poverty and an option only when financial resources were scarce (Garcia, 1997), the benefits of homemade food are giving the lunch box new meanings nowadays (Garcia, 1997; Martins, 2012). Some of the advantages of using the lunchbox are: agility and practicality in its preparation; cost reduction; and healthiness with regard to food (Garcia and Gomes, 2016). It has been pointed out that the number of entrepreneurs in the household

food business (including lunchbox) grew 142% from 2014 to 2020, reaching almost 250,000 in Brazil (Martin, 2020).

Lunchboxes are the subject of a Brazilian TV program for a subscription channel aimed at affluent consumers. We adopted an interpretive approach to analyze this cultural discourse which, in addition to being a means of consumption per se, guides people in making purchases and choosing products (O'Guinn et al., 1985). Analyzing this TV show helps the understanding of how a practice, historically related to aspects considered negative, has been gaining value and conferring value to consumers.

METHOD

We analyzed thirteen episodes from the first season of the TV show *Marmitas e Merendas* (Lunchboxes and Snacks) (290 minutes, approximately) (GNT, 2021). Each episode has a theme (Fitness Food, Veganism, Oriental Food, Salads, etc.) and the host follows the eating routine of Brazilian celebrities (C) and anonymous individuals (A). Our analysis, inspired by Hirschman (1988), sought to capture the movement of the narrative and how it was unfolding. We adapted the concrete categories of actor, action and result to "characters," "action" and "motivations/needs," apropos for the program's structure, in order to give contour to the perceptions, practices, motivations and expectations of lunchbox users. The participants refer to "the lunchbox" when dealing with lunch and dinner meals and to "snacks" for intermediate meals.

RESULTS

The unappreciated lunchbox

The negative associations related to the use of lunchboxes are openly expressed in the program. In the first episode, the presenter asks the celebrity: "Isn't it sort of tacky to come to the record studio carrying a lunchbox?" Throughout the episodes, mention is made of this condition ("it was a poor people's thing"). The anonymous person in episode 3 (A3) tells how she used to avoid possible embarrassment because of her lunchbox: "I have even eaten lunch in the bathroom."

The characters recognize the negative image historically related to the practice, but a few of them challenged social judgers: "…at a time when no one was using lunchboxes." Negative associations still persist and are not limited to the practice itself, but also to the type of food in the lunchbox ("There is still some prejudice, but it has to do with the type of food you bring"). According to A5, 'diet' or 'smelly' foods contribute to deprecating the lunchbox.

Appreciating the lunchbox: benefits, affluent consumers and common interests

The program shows that the use of the lunchbox seems to be gaining a new profile and attracting new audiences. C3 offers an explanation: "Prejudice toward the lunchbox is changing in the name of a healthier diet." The benefits of the lunchbox range from being a "way of being careful about one's food" and "having the right time to eat a balanced meal," to "avoiding buying junk food on the street" and "helping with weight loss." A4 extends the list of beneficial effects by suggesting that the lunchbox "helps balance physical and

emotional stress from work." Low cost, quality and practicality were also mentioned in order to enhance the use of the lunchbox.

Part of what gives value to the program's lunchbox practice seems to be related to the one who uses it. The characters are affluent consumers. Brazil is a hierarchical society, where affluence is socially valued (Da Matta, 1984). The signs of affluence appear when the characters introduce their maids (who prepare their meal); suggest that they contain expensive foods; refer to certain topics ("this discussion [about healthy food] hasn't yet reached the low-income neighborhoods"); or when they celebrities or belong to a certain profession. Characters linked to the low-income socioeconomic strata do not appear in the program. The exception may be A8, who was originally from a low-income neighborhood, but became a successful entrepreneur.

Among the female celebrities who participated on the program, actresses, TV hosts, digital influencers and journalists predominate. Other characters have their careers linked to today's widespread consumption trend. C9, for example, is recognized for preparing recipes in search of "balanced nutrition." C2 is considered "a fitness muse." C12 is the author of the book "*Diário de uma Vegana*" ("Diary of a Vegan") and host of a TV program on the subject. Male celebrities (actors and dancers) appear less often.

The themes covered in the episodes provide for the approximation of famous and anonymous characters who, in theory, experience different worlds, but who have common interests. Whatever the theme may be, celebrities and anonymous individuals describe their lunchbox routines. Another point that should bring the characters closer has to do with the cultural capital at their disposal and which adds to their affluence (Bourdieu, 1984). The academic backgrounds and occupations of the anonymous individuals (lawyer, advertiser, chef, producer of organic products, etc.) decrease their social distance from the celebrities in the program to a certain extent. At any rate, even if the lunchbox does not erase the distinction between the characters, it distinguishes them from another group: the "uninitiated," who do not use lunchboxes.

The lunchbox creating value: distinction

The program shows that the lunchbox has gained a certain status ("I think it's chic and modern to use a lunchbox") and is different from those prepared by workers. Some characters insist on demarcating their veteran status, indicating that they adopted the lunchbox "when it wasn't even fashionable." By setting themselves up as veteran users, the characters claim authenticity in the adoption of the practice, differentiating themselves from newer lunchbox users, whose insertion into this type of consumption comes from the spread of the practice.

The distinction appears at other times in the program. C2 prepares her lunchbox for several meals during the day and she uses foods that are not common to the Brazilian diet (Canesqui, 1988; Bleil, 1998) (e.g. Azuki beans and fresh coconut). Other characters have "differentiated" contents in their lunchbox: protein dumplings, a sweet potato snack, dehydrated pineapple, grilled palm heart, ghee butter, "7-grain" rice and pumpkin-flavored toast crackers, for example. Another difference from "traditional" lunchboxes introduced by the program is the separation of food into different containers and the use of a special bag for transporting the lunchbox. Not everyone prepares their lunchboxes for the main meals of the day. C1, for example, refers to her lunchbox as an "S.O.S" (something for moments of hunger outside regular mealtimes), which, in itself, confers an intra-group distinction.

The lunchboxes prepared on the program are different from traditional ones not only in terms of content, but also in terms of design

("I have lunchboxes of all sizes and colors"). In the past, the object was not associated with any brand specifically (CNRTL, 2018). In some episodes, it was possible to observe the use of "Bentô" lunchboxes, whose prices range from US$18 to $45, depending on the model (Bentô, 2021).

The lunchbox creating value: connecting the consumer to other meanings

Specific needs guide the use of the lunchbox, depending on the theme of the episode. However, the similarity resides in the characters' health concerns. The lunchbox allows to access better food; after all, "it's the only way you can know for sure what it is that you're eating." For some, the lunchbox carries "a reconnection with the home," where "the best food" is made, as opposed to "industrialized" food. Healthy eating is a recurring theme in the characters' discourse and, although this concept is not explored, it is sometimes alluded to ("the color [of the food] is [indicative of] healthy").

Food safety is also a meaning attached to the practice ("The most important thing is taking [food] from home and consuming what we know is safe"). The feeling of autonomy appears as a means of reversing a potential restriction ("If I go to a barbecue and can't eat what's there, I have my lunchbox"). The security and autonomy provided by the lunchbox indicates a certain agency about what is consumed (Eckhardt and Mahi, 2004) ("You become your own master when you eat what you yourself have prepared at home or when someone you know has prepared it").

Lunchboxes also make it possible to be concerned about one's own well-being and that of others ("taking lunch is having respect for yourself"; "it's a way of taking care of the other person"). A1 explains the collective dimension of the practice: "the lunchbox is not just for me [...] it's for everyone; if I take chocolate cake, maybe three people will come up to me and ask what it is and if they can have a bite." A4 indicates that this sense of communion can go beyond the simple sharing of food to reach a deep symbolic dimension ("Now and then, you can save someone else with your lunchbox"; "I've fed a lot of co-workers with my lunchboxes").

FINAL CONSIDERATIONS

This work adopted an interpretive approach to consumption and analyzed the use of the lunchbox as represented on a TV show. Lunchbox consumption, traditionally associated with low-income individuals, has recently attracted affluent consumers. By exploring the adoption of the lunchbox by a new consumer profile, we were able to identify a historically unappreciated object and practice that are gaining value, being progressively reframed and that, due to that new condition, are conferring value to the consumer – something difficult to capture when we analyze practices that *a priori* have a positive social connotation. Table 1 summarizes the results:

On the TV program analyzed, the lunchbox is represented in the context of affluent, famous, or anonymous individuals, whose realities are brought together by the way they fit into the themes of the episodes and by the cultural capital they supposedly have. The characters start with their love of healthy eating, a theme that has received increased attention in recent years in Brazil (Garcia and Gomes, 2016), and they add benefits to consumption: low cost, perceived quality and practicality in the preparation and consumption of food. In this study, the change in the view of affluent consumers for food and the demarcation of food themes, which are predominantly distant from the reality of low-income consumers, are particularly important for generating some value for the lunchbox and for giving it a new meaning.

Table 1. Conferring value to the practice and creating value for the consumer

The unappreciated lunchbox	The appreciation of the lunchbox	The lunchbox creating value	
		Distinction	**Other meanings**
- it's tacky - it's a "poor people's thing" - it causes embarrassment - it carries negative connotations according to the type of food	*The benefits* - makes for better nutrition; - entails lower cost, more quality and practicality; *Affluent consumers* - celebrities and anonymous individuals; - elements that give affluence to the characters (ex: maids preparing the food; use of products with high added value; themes and professions); *Common interests* - celebrities and anonymous people use lunchboxes, according to their needs and the proposed themes; - the characters are distinguished from the "uninitiated," who do not use lunchboxes.	- it's chic and modern; - it's different from those used by low-income workers; - veteran users vs. new users; - the use of foods that are unusual in the Brazilian diet; - the use of separate containers to separate the food; - the use of a special bag for carrying the lunchbox; - the lunchbox as an S.O.S.; - the use of lunch boxes with different designs and values.	- the lunchbox enables one to: - eat "the best food"; - have a "healthier diet"; - reconnect with the home; - feel safe knowing what one is eating - have autonomy; - be concerned for one's own well-being and that of others; - share with others.

Although it was not within the scope of this research to specify to what extent the lunchbox has been or is being reframed, it was possible to understand how its new status has been giving value to consumers. For some, using lunchbox is "chic and modern," a form of consumption that makes it possible to show differences (in terms of the food one eats; the many containers one has; the brands one can buy). Distinction is, then, the symbolic value highlighted in the program. It can be inferred that the characters on the show and the consumers – the users of lunchboxes who see themselves represented there – form a group of "initiates" who are distinct from other consumer groups. Other symbolic values are depicted on the program. The lunchbox makes it possible for consumers to show concern for their health, to "return home," so to speak, and enjoy the security it can provide; and to regain some control over what they consume. Moreover, consumers who seek their own well-being have, in such consumption, a practice that enables them to access other symbolic layers of consumption, for example, by feeding and saving someone else with what they bring in their lunchbox.

We believe that the findings of this study can serve as a starting point for other studies that seek to explore: i) lunchbox use in different cultures and social strata; ii) the socialization process for lunchbox users; iii) gender differences associated with the use of the lunchbox, since the practice of preparing meals has always been associated with the female universe (Lelis et al., 2012); and iv) this same context from other data sources – a limitation of this research – and theoretical framework.

Depression in Consumer Research: An Integrative Review and Research Agenda

Daniela Gomes Alcoforado, Federal University of Pernambuco, Brazil
Francisco Vicente Sales Melo, Federal University of Ceará, Brazil

INTRODUCTION

Currently, consumption is considered a basic condition of living in society, a way of satisfying personal values, giving meaning to life, generating and maintaining relationships, expressing identity, status, and lifestyles, in addition to allowing participation in social and political practices (Ribeiro *et al.* 2019). However, consumption does not only have positive consequences. Consumption behavior has already been linked to impulsiveness in shopping, compulsiveness, indebtedness, as well as mood disorders, such as anxiety and depression (Brook *et al.* 2015; Hirschman and Stern 1998; Hojman, Miranda, and Ruiz-Tagle 2016; Mueller *et al.* 2010).

Nevertheless, the relation between depression and consumer behaviors is a neglected research area, still incipient in marketing literature. Recently, in the overview of a session hosted at the Association for Consumer Research (ACR) Conference 2019, Cristel Russell and Ronald Hill stated that few studies have tied mental health and consumption behaviors, but that taking into account the number of cases of people with mental disorders in the world, marketing researchers should strive better to understand the relationship between mental health and consumer behavior. Answering that demand and focusing on depression, a disorder that affects over 260 million people worldwide (WHO 2021), this article analyzed how constructs related to mood, mental health, and depression have been studied in marketing and consumer behavior.

Depressive disorder as a research object was selected from the awareness that by 2030 depression will be the most common disease on the planet, ahead of cancer and some infectious diseases. Also, the number of cases of people living with depression has increased by 18.4% between 2005 and 2015, and it can lead to suicide (Vos *et al.* 2016; WHO 2011, 2021); but current organizations and management models are not ready to deal with depressive consumers, workers, and citizens. Furthermore, the COVID-19 pandemic has caused an increase in the levels of anxiety, stress, and depression around the world (Ding *et al.* 2021).

Hirschman and Stern (1998) were pioneers in the study of the effects of depression on consumption. Through a study published in the ACR conference proceedings, volume 25, the authors identified general aspects of consumption that are affected by mood disorders. They stated that depression is related to risk-taking, sensation seeking, product involvement, innovativeness, and hedonic consumption. Most consumers who have recurrent depression can live in society and spend most of their time operating within the 'normal' limits of human experience. However, this portion of consumers has constant mood swings and extreme sensitivity to other people and the environment (Hirschman and Stern 1998).

The purpose of this study is not to present an exhaustive review of articles but to expose the topics that emerged from the literature, what we can infer about them and how we can act from now on in order to use consumption as an emancipation and transformation tool for individuals with mental disorders, such as depression. Thus, in the following section, the method used to conduct this integrative review is presented, followed by findings, in which the main aspects are discussed. Subsequently, main findings and a research agenda will be presented in table 1. Finally, the authors review the main contributions of this conceptual paper in the final considerations section.

METHOD

An integrative literature review (Torraco 2005) of scientific articles in English published in prominent peer-reviewed marketing journals was carried out. The analyzed articles were collected in the following academic databases: Emerald, JSTOR, Science Direct, and Taylor and Francis Online. The search period covered all manuscripts available by the end of March 2021. There was no time restriction, as the intention was to obtain a broader view of the state of the art of scientific production on the themes in question. The literature search was based on keywords: 'depressive' AND 'consumer behavior.' The use of the word 'depression' was not satisfactory because of the ambiguity with the word depression in the economic sense. Besides, depressive either served for the depressive itself or for the use of the expression depressive disorder, more commonly used in scientific articles. Second, the word consumption has been tested, but the results have been limited. With the use of the expression consumer behavior, the articles were more directed to the area of interest of the literature review. Also, they included the agent, the consumer, since consumer behavior was not in quotes in the search.

Due to the low number of studies that focus on depression in the marketing literature, the authors decided to expand the scope of the review to mood and mental health, two broader constructs but that encompass depression.

After conducting the search, the authors read all the titles of the articles and selected those that had an affinity with the theme of mood, depression, mental health, and some aspect of consumption. After reading the abstracts of the open articles, those that had a connection with the themes of the integrative review were selected. Most of the articles were not related to the search topic, being of different areas or emphasis. From the 2,645 articles analyzed, 95 were selected for detailed reading by the researchers. Among the 95, 41 were eliminated because they did not meet the criteria of the second filter (articles in which 'mood' is defined as mood in colloquial language; articles in which depression was only mentioned, but not the focus; article in a journal or by an author not from Administration or Marketing). Thus, 54 articles made up the research corpus of this literature review. The articles were analyzed with the aid of NVivo 1.0.

FINDINGS AND DISCUSSION

First, all articles were added to Nvivo 1.0, and a word cloud was generated to visualize the main constructs addressed in the research corpus. Based on the word cloud and the 41 articles previously read by the researchers, 30 categories were defined to be investigated in the data analysis. The categories were (in order of importance in the research corpus): marketing, advertising, emotion, health, depression, well-being, mood, stress, compulsive, materialism, happiness, addiction, anxiety, mental health, Facebook / Twitter, coping, drug, therapy, spending, impulsive, self-esteem, food, hedonism, social media-SNS, loneliness, mental disorders, compensatory, smoking, social comparison, and envy.

After viewing the more and less addressed constructs in the analyzed articles, it was decided to focus on those that most represent the central theme of this integrative review. In this way, a heat map of underlying categories versus mental health, depression, and mood was generated, represented in figure 1. Therefore, it was verified how much a category was related to the main themes that guide this literature review, by the authors of the selected articles. This figure

was useful to analyze the primary constructs associated with depression and aspects of mood in the field of marketing and consumer behavior.

In the 'mood' category, the greatest association was with 'emotions' (10.68%). Then, 'mood' was associated with 'depression' (5.13%); 'hedonism' (5.06%) and 'food' (3.93%). In this sense, it is clear how emotions affect the mood of individuals and that studies of mood can act as a support for studies of depression. In terms of consumption specifically, the biggest associations were with hedonism and food. Thus, it can be inferred that mood tends to affect the consumption of products due to hedonistic motivation and pleasure, with food consumption being the most mentioned aspect. Hedonism is a construct largely related to depression because it provides the possibility of escape and pleasure for a person with negative feelings. In the field of food, Maddock and Hill (2016) analyzed how advertisements for food products use associations between mood and food. They found that although healthy foods can improve mood, they are not usually used as an advertising message. On the other hand, advertisements for foods that can depress mood often adopt messages of happiness and well-being (as is the case with snacks and unhealthy foods). The authors also point out that an unhealthy diet is a risk factor for individuals with mental disorders, especially depression and anxiety. Furthermore, advertising has the power to affect the consumer's choice of food. Food affects mood and general well-being and contributes to the prevention and treatment of specific mental disorders.

Similarly, Garg, Wansink, and Inman (2007) concluded, through experiments with university students, that people eat more hedonic foods when they are sad and more healthy foods when they are in a positive (happy) mood. However, this effect is alleviated when the product's nutritional information is present. According to the authors, pharmaceutical companies that sell antidepressants may consider adopting a warning that depression can lead to overeating and choose products and portion sizes wisely when taking medications.

Second, 'health' was the category with the highest association with 'mental health' (23.89%); followed by 'depression' (6.78%);

'mental well-being' (5.15%) and 'spending' (4.14%). It is clear that mental health studies in marketing also act as relevant to studies on depressive disorder. However, concerning consumption, 'spending' was the leading category related to mental health. The depressive person becomes a more vulnerable consumer because he or she has a tendency towards impulse or compulsive shopping behaviors, which leads to indebtedness. In this sense, Dahal and Fertig (2013) stated that individuals with low to medium depression tend to spend more on all types of products, especially non-durable ones.

Thirdly, with regard to the main theme of this integrative review, 'depression', the most significant associations were with the categories of 'health' (6.73%); 'anxiety' (5.72%); 'emotions' (5.5%); 'stress' (4.72%); 'compulsive buying behavior' (4.07%); 'drugs' (3.09%) and 'addictions' (3.01%). As already widely established in the academy, depression is associated with anxiety and stress and negative emotions tend to trigger depressive episodes (Sneath, Lacey, and Kennett-Hensel 2014). However, the main finding in this category is the evidence that studies of depression in consumer behavior still focus on aspects of compulsive behavior and consumption of products that cause addictions, such as drugs.

Seven studies adopted compulsive behavior as main construct. According to Hirschman (1992), the compulsive depressive consumer uses consumption as a way to escape negative feelings or to obtain control of himself/herself. Additionally, Faber *et al.* (1995) found that shopping to overcome boredom or depression may be significant in the development of compulsive buying, and presented a correlation between binge eating and compulsive buying. More recently, Sneath *et al.* (2014) examined individuals who were victims of a hurricane, and found how the natural disaster induced stress that impacted on depression, what increased their vulnerability to impulsive and compulsive buying behaviors. This latter finding may provide insights into the current pandemic context.

Lastly, it can be seen that other aspects of consumption appeared in the analysis of the research corpus, but that were not very significant to depression. In other words, they were not much approached by the authors of the articles in the corpus. Themes such as hedonism, impulsive shopping behavior, therapeutic consumption,
Figure 1: heat map of underlying categories versus mental health, depression, and mood

coping, and materialism can still be further worked on in relation to consumers with mental disorders in marketing.

Finally, it can be seen that there are already studies relating depression and consumption in the field of marketing. However, such studies do not delve into knowing the daily habits and consumption preferences of a depressed individual or the consumption changes faced by consumers themselves when living with the disease. In other words, there is a gap in the literature in the sense that putting the depressive consumer in the focus of the research, seeking not only relationships with addictions and products of a hedonic character, but with the consumption of everyday items in general. Furthermore, it is concluded that marketing studies addressing the issues of mood and mental health still focus on theoretical constructs disseminated since the 1980s. Compulsive consumption is still the main theme addressed in the studies. In this sense, the importance of discussing deeper the coping or therapeutic nature of consumption for subjects with depression is emphasized. Table 1 summarizes the main findings of this integrative review.

FINAL CONSIDERATIONS

Consumer research can make significant contributions to the study of health and the resolution of health problems (Moorman 2002). As asserted by Hirschman and Stern (1998), a significant por-

tion of depressive consumers live in society and spend most of their time interacting with everyday situations that involve the consumption experience. However, despite having the potential to act positively and improve the quality of life and well-being of this portion of the population, the depressive has not yet been focused on as a target for changes in the marketing strategies of the State or private companies. Through this integrative review, it was seen that marketing studies that use the depressive as a research object still focus on themes that highlight the negative character of consumption, such as the behavior of compulsive shopping, in addition to the relationship between depression and the consumption of addictive or hedonic products. However, in a transformative orientation, if consumption can bring positive changes for the individual with depression and if there are categories of consumption that improve people's moods or mitigate symptoms of the disease, why are such categories no longer disseminated in empirical research in area of consumer behavior?

Based on the theme of this conference 'what the world needs now', we propose a research agenda—presented in table 1—that intends to address the depressive consumer needs and reflect how marketing researchers can contribute to the well-being of this relevant portion of the population. The main proposition is that marketing, especially in its transformative nature, adds the depressive consumer to its research agenda. Studies can investigate consumption habits

Table 1: Integrative model of mood, mental health, and depression in consumer research

	Mood	Mental health (MH)	Depression
Main constructs related to the category in consumer research:	Emotions Depression Hedonism Food	Health Depression Mental Well-being Spending	Health Anxiety Emotions Stress Compulsive Buying Drugs Addictions
Constructs less related to the category in consumer research:	Envy Social comparison Social media – SNS Facebook / Twitter Mental Disorders (MD)	Materialism Smoking Loneliness Hedonism Self-esteem	Compensatory consumption Advertising Coping Therapeutic consumption Happiness
Main studies:	Gardner (1985) Garg *et al.* (2007) Kang and Johnson (2010) Keller, Lipkus, and Rimer (2003) Ko *et al.* (2015) Labroo and Mukhopadhyay (2009) Luomala (1998) Luomala et al. (2004) Maddock and Hill 2016 Maxwell and Kover (2003)	Dahal and Fertig (2013) Han, Yu, and Hyun (2020) Machin *et al.* (2019) Nisar *et al.* (2019) Wyllie and Carlson (2018) Yeh, Jewell, and Thomas (2017)	Callaghan *et al.* (2013) Csikszentmihalyi (2000) Guzman, Barredo, and Caillan (2020) Donohue and Berndt, (2004) Hirschman (1992) Keller, Lipkus, and Rimer (2002) Sneath *et al.* (2014)
Research agenda:	1) The role of SNS (e.g., Facebook and Twitter) in consumer's mood; 2) How social media can be a positive tool for individuals with MD during lockdown; 3) How consumption can be a tool to generate positive mood for consumers with mental disorders.	1) How materialistic behavior affects an individual's mental health; 2) How hedonic consumption can harm consumers' mental health; 3) Consumption as tool to alleviate loneliness and increase MH during Covid-19 pandemic.	1) What is the meaning of compensatory and therapeutic consumption for individuals with depression; 2) How consumption can be a tool to cope with depressive disorder; 3) How advertising can better address the vulnerabilities of the depressive consumer.

of individuals with depression and other mental disorders; analyze the influence of depressive disorder on the consumption behavior of depressed individuals (i.e., therapeutic consumption, compensatory consumption, materialism, and coping strategies); in addition to investigating the role of emotions (e.g., envy, loneliness, and happiness) and social media in the consumption habits and mental health of individuals with depression.

Finally, the exploration of the idiosyncrasies of the depressive consumer and their relationship with consumption is not only relevant but urgent. It is predicted that in 2030 depression will be the most common disease on the planet (WHO 2021). More than 260 million people are affected by depressive disorder, and this number may be even higher after the incidence of the COVID-19 pandemic. For this reason, we highlight the role of investigating how marketing scholars can contribute to reducing the negative impact of consumption on depressed subjects and how employers and family members can be alerted in fighting the disease through something ubiquitous and inherent to life in society, consumption.

Transformative Social Marketing: Sharing "Swedish Dads" with the World

Susanna Molander, Stockholm Business School, Stockholm University, Sweden
Ingeborg Astrid Kleppe, Norwegian School of Economics, Norway

INTRODUCTION

How can Transformative Social Marketing (TSM) campaigns addressing global complex sociocultural issues connect with local stakeholders? This study aligns with this year's ACR call by tackling how consumer researchers, governments, non-profit organizations and corporations together can enhance consumer welfare. The paper is positioned within TSM (Lefebvre 2012), studying the Swedish foreign policy brand *Swedish Dads'* (SD) global promotion of paternal parental leave policies – a sociocultural issue considered radical in many countries. Gender inequality is one of many problems the world faces that requires fundamental changes in frameworks of knowledge and behaviors for a more sustainable world (UN 2030, n.d.). Sweden sees gender equality as a prerequisite to achieve its broader foreign policy goals - peace, security and sustainable development – and is the first country in the world to declare a feminist foreign policy agenda that also aligns with the UN 2030 Sustainable Development Goals (SDG) (Swedish Government, n.d.). The paper contributes with an operationalization of Lefebvre's (2012) conceptual TSM model by introducing the concept *malleable toolkit.* The concept stems from computer science and captures interfaces that must serve a heterogeneity of users and contexts (Egan 2017). We define the TSM malleable toolkit as a marketing strategy designed to interact and align with heterogeneous stakeholders, thereby enabling local partnership, local co-creation, and leveraging local conversations. In doing so, we also answer Kopp and Kim's (2018) call for a more global outlook on public policy and marketing. The paper delineates the TSM malleable toolkit's key characteristics and suggests practical guidelines on how to approach global TSM campaigns.

THEORY

Social marketing includes a wide variety of perspectives (Gordon, Russell-Bennett and Lefebvre 2016). We position our study within Lefebvre's (2012) conceptual TSM framework, focusing on the assumption that multiple stakeholders, including local governments, corporations, civil society and target groups, co-create value to "do good" for society. In operationalizing Lefebvre's conceptual model for this study we delineate the following key TSM processes: 1) having empathy with multiple stakeholders' motivations and values; 2) creating exchanges with those multiple stakeholders; and 3) participating in their ongoing local conversations to co-create value to achieve social goals. We also identify a need to understand social marketing across culturally diverse environments (Kim and Kopp 2018) and therefore extend the TSM model by drawing on Hall's (1980) communication theory that explains how various stakeholders encode and decode communication events. According to Hall (1980), raw events are facts encoded by a sender via a particular ideological apparatus, including certain frameworks of knowledge, into a meaningful communicative story. The target group then decode the communicative story according to their local frameworks of knowledge which may not always align with those of the sender. In sum, our operationalization responds to calls for more research considering a global outlook of public policy and marketing (Kopp and Kim 2018) that includes aspects such as power, gender and a multiple stakeholder value co-creation perspective (Gordon et al. 2016; Lefebvre 2012).

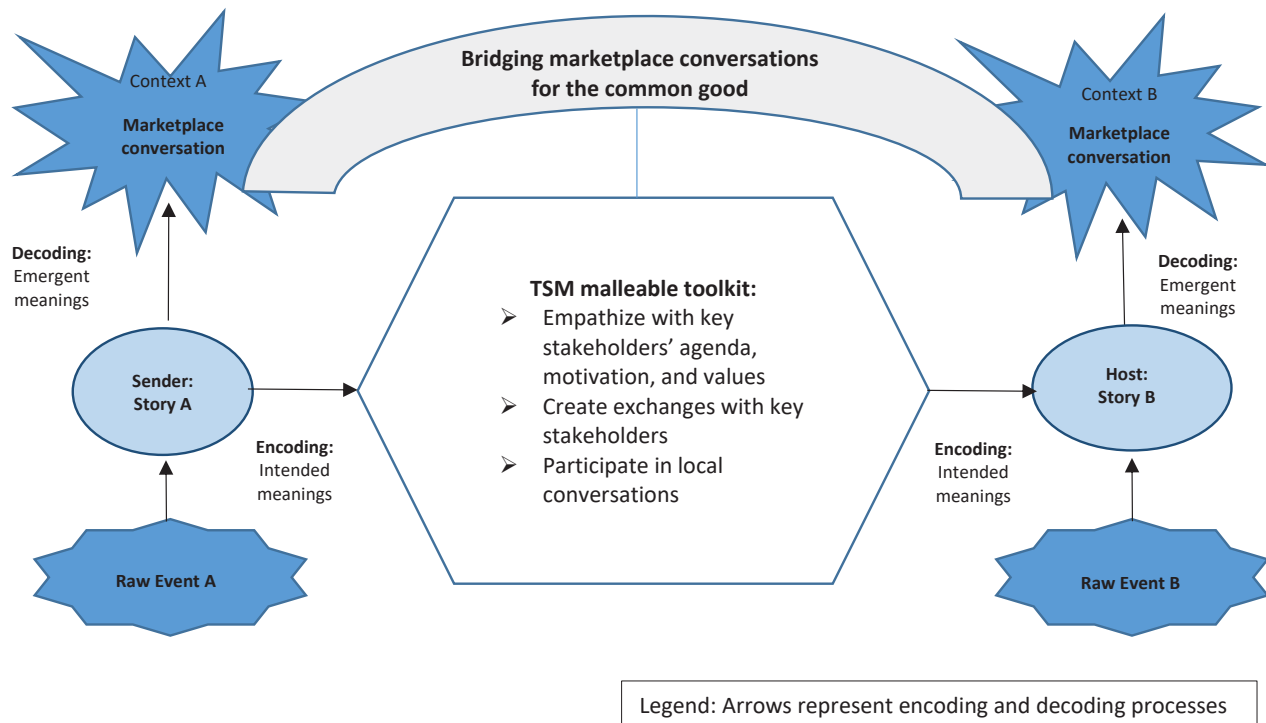
Figure 1 depicts our operationalization of the TSM model in the form of a TSM malleable toolkit in line with Lefebvre (2012) and Hall (1980). We applied it to analyze how stakeholders in three dif-


Figure 1. Elements involved in a TSM malleable toolkit applied in a global context

ferent countries engaged in the SD campaign, using what we identify as the SD malleable toolkit to encode and decode the campaign into different local marketplace conversations.

METHOD

We applied a single case study design (Yin 2009) of the case *"Swedish Dads"* in three embedded units of analysis: Shanghai, China; Bosnia and Herzegovina; and Australia. The three embedded units of analysis provided rich data that allowed us to identify common themes as well as variation across the units (Creswell 2007).

The "Swedish Dads" Case. Swedish Dads (SD) started as a grassroots marketplace event in 2015 with a photo exhibition and a book launch by the established Swedish photographer Johan Bävman (http://www.johanbavman.se/swedish-dads/). The raw event in Sweden was data indicating that some 14 percent of Swedish dads choose to share the parental leave that they have an equal right to with their partners (Bävman 2015). Bävman encoded this raw event into a communicative event (book and exhibition), tapping into Swedish marketplace conversations on shared parental leave and arguing that more fathers should consider it. The event went viral in the news and social media.

In 2016, The Swedish Institute (SI, a branch of the Swedish Ministry for Foreign Affairs) bought the rights to Bävman's photo exhibition and incorporated it into its Sharing Sweden international communication program. The program offers marketing toolkits for themed events **designed for an international audience. SD quickly became its flagship brand, to date shown in** 78 countries. The toolkit allowed stakeholders to adapt the event to local audiences in ways aligned with TSM's three key processes 1) empathize; 2) co-create; and 3) participate. We chose three embedded cases to explore how the projects played out in different contexts.

Embedded cases. Both authors have followed the evolution of SD closely from the fall of 2015 to 2019. Due to the exceptional speed with which SD disseminated across nations, we consulted the SI to make a short list of some 10 countries likely to provide rich data and variation across countries. Following three sampling criteria: i) geographical spread; ii) variation across sociopolitical and cultural contexts; and iii) variation across key stakeholder engagement (state, corporations and civil society) we sampled three case countries: China (more specifically Shanghai), Bosnia and Herzegovina (BH) and Australia. These three countries represent three continents, different sociopolitical and cultural contexts as well as different stakeholder engagements. Each project emphasized the importance of engaged fathers but for different reasons. The Chinese government focused on leveraging the new two-child family policy, in BH non-profit organizations engaged in leveraging gender equality by questioning gender stereotypes and promoting active fatherhood and in Australia leading corporations focused on leveraging corporate profit through parental leave policies.

Table A1 in Appendix 1 gives an overview of the data sources and describes the analysis.

FINDINGS

The raw event in China/Shanghai is the declining fertility rate, in Australia it is the ranking as the least generous paid parental leave policy scheme of all the OECD countries and in BH it is the lowest ranking among European countries on the Global Gender Gap Index. Each hosting country used SD's malleable toolkit as a means (communication technology) to encode their own gender data (raw event) into communicative events to stimulate local marketplace conversations. We have organized the analysis of the three cases according the three co-creation strategies depicted in Figure 1.

Chinese Babas (Chinese dads): Leveraging the two-child state policy

Empathizing with key stakeholders and their motivations and values. Since the introduction of the one-child policy in the 1980s China has experienced declining birthrates and an aging population. To curb this development China rolled out its two-child policy in 2016 aimed at encouraging increased childbirth. Chinese women still seem hesitant to have more than one child, causing extensive discussions about the problem of balancing work and family life after the second child. Fathers, however, have been more or less absent in these discussions (Bloomberg News 2020, Zhou 2019, Embassy interview 2019).

Creating exchanges with key stakeholders. When presented, a year after the roll out of China's new two-child policy, SDs fatherhood theme enabled local government stakeholders to highlight the two-child policy in a way that would ease the burden on women by encouraging fathers to be more involved. The Swedish Consulate in Shanghai cooperated with two local government arms: The Shanghai People's Association for Friendship with Foreign Countries (SPAFFC) promoting mutually beneficial exchanges and cooperation with foreign countries and the Shanghai Women's Federation (SWF) working for the advancement of women. Launched on the International Women's Day, the SD communicative event opened with a photo competition inviting Chinese men, women and children to contribute with photographs that represented Chinese Babas (Chinese Dads). Of the 15,000 Chinese submissions, 25 photographs were displayed side by side with 25 SD photographs in public spaces. IKEA in Shanghai also contributed by showing the Chinese Babas in their store (Embassy emails 2017; Embassy interview 2019).

Participating in ongoing local conversations. Given the goal to promote gender equality and bring fathers into the two-child policy conversations, the SWF were supportive of the SD project's efforts to initiate a debate around the role of fathers to increase gender equality. The idea was a broad outreach with the help of local arms of the government. The numerous submissions of Chinese Baba photos from local families along with the media coverage suggest that the campaign tapped into important local policy and consumer conversations.

BHtate (BHdads): Leveraging gender equality with the help of non-profit organizations

Empathizing with key stakeholders and their motivations and values. The rise of patriarchal nationalism in the beginning of the 1990s and the devastating civil war 1992-1995 was followed by more traditional gender norms and a backslide for women's rights (Hadziristic, 2016). Improvements in gender equality is considered key among those involved in the reconstruction of BH (Care International Balkans 2013; UN Women BH n.d; USAID 2016), in particular the Swedish government which is one of the contributors assisting BH to fulfill the requirements for EU integration (Swedish Government, BH 2018a; 2018b).

Creating exchanges with key stakeholders. In the aftermath of the war and its ethnic tensions some argue that BH has set up a complicated system of government (Nardelli, Dzidic and Jukic 2014). According to representatives for the Embassy of Sweden in BH (interview 2019), non-profit organizations are important operational partners, not least thanks to their PR skills and networks all over the country. In the case of SD, the Swedish Embassy collaborated with Care International Balkans and Infohouse in 2017. The project took on the local name BHtate (BHdads) to emphasize that local fathers were key to the event, functioning as norm-breaking pioneers that could open up for new types of conversations around masculinity. In

social media, local fathers were encouraged to send in photos of their experiences as engaged fathers to promote these BHtate photos side by side with the Swedish dads.

Participating in ongoing local conversations. Rather than promoting Swedish dads' long-term caregiving the Swedish way, the SD event aimed at co-creating marketplace conversations enhancing public awareness of the ability for men to stay home at all and their role in promoting gender equality. Via active fatherhood, traditional gender stereotypes were to be challenged. Indeed, the Embassy (interview 2019) described BHtate as a tool to develop and keep conversations on active fatherhood going, in both social and traditional media. The Facebook page BHtate was still active four years after the event (BHtate).

Aussie Dads: Leveraging corporate profits via paid parental leave

Empathizing with key stakeholders and their motivations and values. The Australian government's paid parental leave policy scheme is the least generous of all the OECD countries and only 1 in 50 Australian fathers take paid parental leave (Australian Human Rights Commission 2014). Parents at Work (PAW) is an Australian-based social enterprise focused on working parents. In 2017, after ten years of advocacy and education of corporations and families, PAW found no increase of men on paid parental leave. Looking for collaboration and possible help from abroad, PAW found that Sweden stood out on the global scene in both government policy schemes and in connecting parental leave policy with business profitability (interview with CEO of PAW).

Creating exchanges with key stakeholders. Together with the Swedish Consulate in Canberra PAW set up a SD project. From 2017 to 2018 PAW and the Swedish Consulate joined forces on a 12-month education and preparation plan to engage corporate stake-holders and build momentum for the launch of Aussie Dads showing caring Australian fathers side by side with the Swedish dads (archival documents and interview). PAW received backing from leading corporations including KPMG, Deloitte, Westpack, McQuaire Bank, HSBC, Australian Men's Health and the Swedish Australian Chamber of Commerce. It was the first time the exhibition took place in a workplace environment.

Participating in ongoing local conversations. The aim was to continue the marketplace conversations and education on profitability beyond the events. PAW hired Bävman to make an exhibition of Aussie dads alongside the SD exhibition next to the Sydney Opera House. The exhibition, workshop events and podcasts involving CEOs and HR managers from the sponsoring corporations generated a lot of news and social media coverage. The exhibition travelled to Melbourne and one year later to London *(interview CEO Parents at Work)*. The marketplace conversation starting with the Aussie Dads project continued locally with PAW in the driver seat. Together with business partners, PAW developed the Advancing Parental Leave Equality Network (APLEN) as part of the commitment to "lead UN global gender equality efforts to advocate and advance parental leave equality in Australia" (APLEN n.d.). They were also a public voice in initiating and participating in media conversation on how CO-VID-19 impacted parental roles and new work-family arrangements (PAW 2021).

DISCUSSION

How did the global SD TSM campaign apply the malleable toolkit to connect with local stakeholders? We found three co-creation strategies: 1) Equal and localized partnerships; 2) Co-created events empowering consumer voices; 3) Leveraging locally relevant issues. Our findings show how these three strategic elements that align with Lefebvre's (2012) TSM framework can contribute to con-

Table 1. Transformative Social Marketing strategies of the Swedish Dads foreign policy campaign using a TSM malleable toolkit.

TSM Strategies:	Chinese Babas	Cases: BHTate	Aussie Dads ➡	Bridging conversations
Empathizing with key stakeholders' motivations and values	**Government roll out** of its two-child policy campaign	**NGOs advocating** gender equality in the post-war reconstruction of BH	**Local business awareness** campaign of family friendly work-life.	**Equal and localized partnership**
Creating exchanges with those multiple stakeholders	The Swedish Embassy, consulates and global brands (IKEA) co-creating events with local Chinese governments and consumers Chinese Babas amateur photo competition.	Swedish Embassy collaborate with Care International Balkans and Infohouse and consumers. BHtate(s) amateur photo competition. The SD and Aussie Dads exhibitions integrated and displayed in business and public venues.	**Co-creating events and empowering consumer voices**
Participating in ongoing local conversations	Leveraging the two-child policy and initiating a debate around the role of fathers to create a more equal society.	Leveraging gender equality by fighting gender stereotypes and creating active fathers.	Leveraging corporate profits via paid parental leave.	**Leveraging locally relevant issues.**

nect people across nations to engage in a common social good. By design the SD malleable toolkit emerged as a platform, making resources available for local stakeholders to communicate their own gender and family policy agendas. This was in line with the principle of Swedish Feminist Foreign Policy to tap into and uncover local voices of gender equality (Aggestam et al., 2019). A large part of the capacity of the SD project was in its imagery. Like "hero shots" (Molander et al. 2018) challenging existing marketplace conversations, the local photo competitions empowered local voices by bringing them to the center of the events in the foreign policy project (Aggestam et al. 2018). Due to the transformative capacity of the imagery (Molander et al. 2018), these marketplace conversations lingered in the marketplace for a long time.

Our research responds to Lefebvre's (2012) call to operationalize social marketing approaches that address multiple stakeholders as co-owners who co-produce a better world. It also fills a gap in the social marketing literature on global social communications projects by offering a theoretical and practical framework that guides the communication process. By constructing the SD project as a malleable toolkit SI created a gender equality brand platform (Bertilson and Rennstam 2018) that functions as an interactive framework within which the various stakeholders could meet to co-create value. Aligning with the UN 2030 SDG and offering this interactive framework, our contribution is a step towards dealing with ethnocentricity and power issues largely ignored in the social marketing literature (Brace-Govan 2015; Gordon et al. 2016; Tadajewski et al. 2014). Moreover, our study offers a highly warranted empirical case of, and practical framework for, how foreign policy can align with and support the UN 2030 SDG agenda. Though not exhaustive, Appendix 2 exemplifies the formulation of practical guidelines in SD's malleable toolkits.

Doing VanLife: A Social Practices Perspective on Traveling with a Camper Van

Philipp K. Wegerer, MCI Management Center Innsbruck, Austria

INTRODUCTION

Traveling with recreational vehicles (RV's) is a vacation practice that has a long tradition among North American and European consumers. In recent years this trend has gained momentum under the blurring of work-life boundaries (Land and Taylor 2010), the emergence of digital nomadism (Bardi et. al. 2012), the increasing demand for flexibility (Bardhi and Eckhardt 2017), and the search for authentic travel experiences (Reckwitz 2016). A common practice among consumers is to buy a regular, second-hand transporter and transform it into a customized camper van. Once upgraded, it can be used for spontaneous weekend trips, holiday trips, or as a temporal, mobile home base for nomadic VanLife episodes. Within the European market, the Volkswagen camper van (VW Bus) has gained enormous popularity among young urban consumers. Since the so-called VW Bus has dimensions of a regular car, it provides the flexibility to be used as a vehicle in daily life, and enjoying the freedom of using it as a tiny, yet a fully equipped RV for traveling. To study how VW Bus owners, use their bus provides a fruitful empirical background for a better understanding of the contemporary consumer trend VanLife.

This study draws on practice theory (Reckwitz 2002; Warde 2005; Shove, Pantzar and Watson 2012) in order to explore the consumption practices that evolve around the use and ownership of VW camper vans. The study addresses the research questions of: (1) What cognitive, discursive and motivational behaviors do owners develop in the use of their camper van? And, (2) how is the social praxis of VanLife constituted through a combined and coordinated bundles of practices? The findings reveal how VanLife is constituted by three distinct, yet interrelated bundles of practices, that together resemble a recurring, authentic and singularizing travel experience.

THEORETICAL BACKGROUND

Practice Theory

Practice theory suggests that consumption is a 'doing' that is linked to multiple social levels. A recurrent question of a practice perspective is: What do consumers do? This sets the focus on what practices VanLife comprises. This question focuses upon those specific, situated practices that VW Bus owners engage in when they are living in their camper van. This empirical study draws on the differentiation into three elements of practice theory: *practices, practitioners* and *praxis* (Jarzabkowski, Balongu and Seidl 2007).

The first analytical element are *practitioners*. In this particular study, practitioners are defined as VW Bus owners, that are consumers who own and use a VW Bus, and thus develop distinct ways of behaving, thinking, coordinating and adopting their use of the VW Bus. The second and primary analytical element of this study are *practices*. Practices are „routinized types of behavior which consist of several elements, interconnected to one another: forms of bodily activities, forms of mental activities, ‚things 'and their use (…) “ (Reckwitz 2002, 249). The term ‘practice’ refers to both, the situated actions individual consumers perform (micro practices), and to socially defined practices (macro practices) that shape consumers in their individual actions (Warde 2005). This sets the analytical focus on activities that are associated, accomplished and developed around using and owning a VW Bus. From a practice theory perspective VanLife is a situated, socially accomplished activity that comprises actions and interactions with other actors and objects (Reckwitz

2002). Hence VanLife comprises all activities that are associated with buying, owning, using a camper van, with the goal of spending longer episodes living in the bus. ‚Owning a VW Bus’, is a consumption practice that is constructed as a flow of actions and interactions of multiple actors, practices and objects they draw upon (Jarzabkowski et al. 2007). Within this framework a camper van becomes a materially represented practice, a thing in terms of Reckwitz (2002), as it is used in a relatively routinized way.

The third analytical element are social *praxis*. In this case praxis is refers to the whole of human action related to VanLife *(*Jarzabkowski et al. 2007). The social practices of VW bus owners are situated within a wider social praxis of leisure time, vacation and automobile ownership. VanLife comprises dispersed consumers, and the social institutions within which these consumers act, and to which the contribute. It is the social praxis owning and camping and occurs as the nexus between these three elements.

METHODOLOGY

This study is based on a qualitative case study research design (Stake 1995; Flyberg 2006) employing multiple data collection techniques. Over a period of one year, the researcher conducted participant observations during mutual weekend trips, as well as participant-driven photo-elicitation interviews (Rose 2012). The participant observations of Volkswagen bus owners’ behavior and practices were an important data resource. Here the first researcher wants to state, that he does not own a camper van, so this research project was approached from an outsider perspective. Insights gained through extensive field observations served as a basis for in-depth interviews with VW Bus owners. The researcher conducted twenty-five participant-driven photo-elicitation interviews. Participants were selected based on the criteria of owning a VW Bus which they modified for camping, and that trips with their bus played an important role in their life. The VW Bus was chosen because it has an enormous popularity on the European market, and this was considered as an interesting phenomenon.

The interviews aimed at uncovering stories, memories and experiences that participants had with their busses. The photo-elicitation technique is especially well-suited, as “images evoke deeper elements of human consciousness that do words” (Harper 2002, 13) and helped to paint a clearer picture of the different behaviors and practices enfolding around the use of a VW Bus. Secondary data was an important resource for the analysis, including community forums (i.e. http://www.thesamba.com/vw/), VW Bus subreddits (i.e. https://www.reddit.com/r/VWBus/), Instagram posts (i.e. #vwbus), do-it-yourself YouTube videos, as well as national and international media coverage. The data analysis followed an inductive coding approach in order to identify emergent themes and patterns (Flyvbjerg, 2006). Following Eisenhardt’s (1989) methodological principle of ‘enfolding literature’, emerging themes were refined in the light of the practice theory perspective.

FINDINGS

Within the data three interrelated bundles of practices emerged: a) owning, b) traveling, and c) decelerating.

Owning

Personalizing. VW Bus owners are notoriously fond of their cars. This fondness becomes apparent in practices that aim to per-

sonalize their van. A common practice is to modify the interior and exterior of the van. Many consumers go as far as buying a bus without interior and building the entire camping equipment in a do-it-yourself fashion. This includes the construction of a kitchen, a bed and wardrobes as well as the exterior. This personalization of the van has a key role in establishing strong emotional bounds to the VW Bus. The customization of the VW Bus is often shared, presented and discussed with friends. Social media and online forums are used as a platform for inspiration and discussion with other owners.

Personifying. Practices of personification involve naming the van with a nick name, emotionally and verbally adopting the bus into the family, displaying pictures of the bus and taking intensive care of their van. The emotional attachment with the van was also apparent in the interviews, where participants described their VW Bus using names, gender specific pronouns and human traits such as strong, fragile, bitchy and iffy, persevering, down to earth or moody and fickle. The VW Bus is humanized by describing it with human features such as friendly eyes (headlights) and big smiles (radiator grill). Narratives often involve success stories about teamwork with the bus, the bus as a friend and faithful companion, or as a savior.

Community. VW Bus owners represent a subculture (Schouten and McAlexander 1995) with communitarian bounds (Muniz and O'Guinn 2002). For instance, when a VW Bus driver sees another VW Bus driver, he or she salutes and honk. This is especially the case, if the van is an older model. Stories about helping out, when another VW Bus on the side stripe needs help were regularly reported in the interviews. Online activities, such as posting pictures in social media, participating in online forums and following social media accounts of other VW Bus owners, resemble aspects of an online mediated brand public (Arvidsson and Caliandro 2016).

Travelling

Freedom. Traveling with the camper van was associated with the feeling and desire for freedom and adventure. These feelings of freedom and adventure are enacted through the routinized practice of weekend trips. These overnight trips resemble bundles of practices which are a complex combination of entangled elements that are encountered together (Woermann and Rokka 2015). Practices that involve structural elements of the bus involve cooking in the bus, reading in the back of the bus, sleeping in the bus and enjoying the landscape. These short trips involve a specific material-setup of the camper van and a range of bodily routines and skill elements (Woermann and Rokka 2015), such as searching for a perfect spot and how all daily activities are adopted to the spatial requirements of the van. Weekend trips are often combined with sport and leisure activities, that require skilled elements, such as climbing, surfing or mountain biking. The VW Bus serves as a mobile home that allows the freedom to enjoy spatial mobility and being closely related to the nature.

Spontaneity. Participants stated that a fundamental aspect of being on the road with a VW Bus is, that trips are planed only rudimentary, and that travel decisions are taken spontaneously along the way. Bus owners find themselves far from home and reliant on their Volkswagen camper van, a major, often very time-consuming and potentially frustrating aspect of a VW Bus trip is to search for the perfect camping spot. Spontaneity also means that the VW Bus allows surfers to go where the waves are best, or climbers to switch locations when the conditions change. Overall, VW Bus owners displayed a strong motivation for self-sufficient, independent traveling. Traveling with the van allows to escape time pressures and social obligations, and therefore to enjoy traveling without boundaries and constraints.

Risk taking. The bus can serve as a motivational factor for owners to be more adventurous and risk taking during their trips than in their ordinary life. Stories about getting lost in nature, breakdowns in remote areas, and dangerous encounters with local animals, or unplanned and uncomfortable overnight stays were reported proudly in the interviews. These experiences were recount with a sense of pride and praises for their adventurous spirit.

Bundle of Practices	Example quotes
Owning - Personalizing - Personifying - Community	"He (the bus) was seriously rusty and was a real grandpa. He was really cool, don't get me wrong and I loved him [...] Me and my dad, we did a lot of work on him, it was time consuming […] we did the entire interior by our self, the bed, the kitchen, everything." (Participant 10, f) "When you are so far away from home, you develop a real relationship with your bus and a unique dependence. I was not worried about my girlfriend back at home or my parents. There was only my bus. Is he parked safe? Is he locked? Is the battery charged? Worries that seem mundane [...] but if you are literally at the end of the world, it becomes clear how much you depend on the bus." (Participant 2)
Travelling - Freedom - Spontaneity - Risk Taking	"There are days when I leave in the morning, return in the evening and simply park somewhere with my bus. Just let the day pass and prance around (…) I just cook something and then open the hatchback, read and enjoy the view of the lake and the mountains" (Participant 2 m) "The fact that we could park wherever we wanted was the best thing in Norway. It was also this feeling that we enjoyed so much while travelling with the bus. We were not dependent on highways or public transport. We could camp wherever and whenever we wanted to. And we saw the most beautiful sunset next to a tiny road in some Fjord." (Participant 8 m)
Decelerating - Ritualization - Decelerating - Daydreaming	"When I get into the bus it needs to rattle and clatter. You need a big window because it is similar to a cinema. The world goes by your windows, time passes and you don't care. You drive slowly on the road and are deeply relaxed while enjoying the whole experience" (Participant 19 m) "Whenever I sit at the university, I always think about future traveling possibilities and where I want to go with my bus. These thoughts are my anchor for stressful days, because I know that I will have some free time soon and I can drive away with my VW bus" (Participant 16 f)

Decelerating

Ritualization. Participants describe how preparing and starting a trip becomes a ritualistic activity for them. Packing their stuff and preparing the bus for the planned trip becomes an integral part of the traveling experience, often starting days before the trip starts. The interviews contained extensive accounts of describing the feeling of stepping into the bus, sitting behind the wheel and starting the engine. As soon as the owners hear the roaring of the engine, feel the vibration of the bus, and smell the fuel burning, the trip begins and stress fades away. When the participants arrive at their destination, the have developed specific routines of occupying the spot and transforming it into their temporal home-base. First, they search for the perfect spot, then park their bus (preferred is a remote and secluded spot with a scenic view, not at a camping ground), open the hatchback, take out their cooking and leisure appliances, pose with the bus and take picture, and then start enjoying the surrounding landscape and their vacation.

Driving. Participants describe driving the bus as a calming ritual, that alters the way how they experience the flow of time (Husemann and Eckhardt 2019; Woerman and Rokka 2015). The bus is driven slowly and enables to decelerate from their accelerated daily life. Driving a VW bus is associated with the sound of the engine, listening to music or tune into a radio station. Also, in everyday life, driving the VW bus becomes a short retreat, a spiritual and relaxing experience, associated with the materiality of the bus. The deceleration through driving the VW bus is associated with elements of listening to music, voluntary slowing down the speed, driving on scenic country roads and avoiding highways. Driving the bus was described as an experience of deceleration, an activity in which all stress and worries fades away. In the bus, there are no obligations and no time pressure. The journey becomes driving the bus. The description of the role of material components, such as the distinct feeling of the driver seat, the big steering wheel, the big windows and nice views, the loud, yet relaxing sound of the engine, and the natural speed limit of older VW camper van models, played a key role in establishing the feeling of deceleration. This spiritual experience of driving transfers to everyday commuting. For instance, one participant was late because he was driving his bus and enjoying the road too much.

Daydreaming. When VW Bus owners are not able to travel, all reported to engage in the cognitive practice of daydreaming about the bus and future trips. VW Bus owners mentally plan the next weekend or summer trip, or recall past experiences to satisfy their need for travel and adventure. Photos of the bus are treasured and often help in recollecting memories. Pictures featuring the bus are shared on social media, and owners follow social media influencers.

CONCLUSIONS

This study provides an empirical inquiry into consumption practices that develop around the use of the VW Bus camper van in order to understand the trend of VanLife. Drawing on practice theory (Warde 2005; Reckwitz 2002; Jarzabkowski et al. 2007), the analytical focus was set on understanding what owners do with their VW Bus. This study addresses the first and the second research question: (1) What practices do owners develop in their use of the VW Bus? And, (2) how are different practices combined and coordinated into bundle of practices that constitute the social praxis of VanLife? The overall finding of this study reveals how VanLife is constituted by three distinct, yet interrelated bundles of practices: (1) owing, (2) traveling, and (3) decelerating with a camper van. Each of these three social practices consists of a bundle of combined and coordinated, yet distinct actual routinized behavior. Together they resemble a recurring, authentic and singularizing travel experience.

The findings contribute to our understanding of consumer- object relationships (Holt, 2002), the consumption patterns of liquid consumers (Eckhardt and Bardhi 2017), that seek authentic and singularizing consumption experiences (Reckwitz 2016), as well as the role of objects in structuring the temporal experience of consumers (Husemann and Eckhardt 2017; Woermann and Rokka 2015). Whereas current research on consumer-object relationships has pointed towards the declining role of solid possessions for liquid consumers (Bardhi and Eckhardt, 2012; Bardhi and Eckhardt, 2017), the current study clearly shows how persistent and recurring consumption practices can constitute a strong and enduring consumer-object relationship.

Controlling the Uncontrollable: Consumer Voluntary Risk-Taking amidst the Covid-19 Pandemic

Ramona Riehle, University of Innsbruck, Austria

INTRODUCTION

The global spread of the highly infectious lung disease Covid-19 transformed consumption activities involving contact with other consumers into high-risk endeavors. Formerly mundane consumption activities, such as going to the gym, meeting friends for dinner, or going on vacation, now involve risk of infection with a potentially deadly virus. As a response, governments worldwide implemented Covid-19 policies and disseminated expert health advice enforcing social distancing and hence anti-consumption. While social distancing measures reduced risk of infection with the SARS-CoV-2 virus (WHO 2021), an increasing number of consumers disregard expert health advice and Covid-19 policies to pursue consumption and social activities (The New York Times 2020).

Recent consumer research investigating socially undesirable behaviors amidst the Covid-19 pandemic reveals the individual level factors (Zhang, Mathur, and Block 2020) and the type of media reporting (Huang, Lu, and Rajagopal 2020) leading to non-compliance behaviors. Yet, prior research suggests that consumers' pursuits of consumption activities despite the risk of contracting a disease can also be a form of voluntary risk-taking (Belk, Østergaard, and Groves 1998; Bishop and Limmer 2018). While voluntary risk-takers know about the potentially deadly consequences of their risk-taking behavior, they do not perceive themselves at risk and emphasize their refined skills and knowledge allowing them to control risk (Celsi, Rose, and Leigh 1993; Lyng 1990).

During the Covid-19 pandemic even experts struggle to control risk of infection, hence, the question arises: How do ordinary consumers come to the belief of being able to control risk of infection? To explore this question, this study conceptualizes consumers' pursuits of consumption and social activities despite elevated risk of infection with Covid-19 as a form of edgework (Lyng 1990). Specifically, it intends to explore Lyng's (1990) notion of an "illusion of control" (Lyng 1990, 873), which allows voluntary risk-takers to act as if they could control largely chance-based events in their high-risk activities (Laurendeau 2006; Lyng 1990).

THEORY

Consumer Non-Compliance with Expert Health Advice

Prior research emphasizes consumers' tendency to avoid infection with contagious diseases (Griskevicius and Kenrick 2013; Huang and Sengupta 2020). Paradoxically, one can witness an increasing number of consumers defying preventative health measures during the Covid-19 pandemic (Huang et al. 2020; Zhang et al. 2020). Recent consumer research suggests that such non-compliance with expert health advice can have its roots in the consumer's personality (Zhang et al. 2020), in consumers' exposure to increasingly dehumanized death reports (Huang et al. 2020), but also in ineffective responzibilization efforts of firms and policy makers (Aboelenien, Arsel, and Cho 2020).

In addition, earlier studies on consumer risk perceptions show that consumers are less likely to follow health advice when they do not perceive themselves at risk of the disease (Menon, Block, and Ramanathan 2002). These studies emphasize the role of cognitive biases and simplifying heuristics in consumers' health risk (mis)-judgements (Menon et al. 2002; Raghubir and Menon 1998). Thompson (2005) and Wong and King (2008) criticize such a cognitive perspective and highlight that risk perceptions and risk understand-

ings are not universal, but culturally constructed. From this point of view, seemingly risky health behaviors or consumption choices can also represent alternative ways of risk reduction. Further, Belk et al. (1998) illuminate how a combination of cultural values, gender roles and emotions can motivate consumers to take heightened health risk. The authors also indicate that especially western consumers may understand their risk-taking as a form of high-risk sport. Yet, Belk et al. (1998) do not provide an in-depth understanding of how these consumers go about their voluntary risk-taking.

The Illusion of Control in Voluntary Risk-Taking

A prominent concept that explains why and how consumers voluntarily take risk is Lyng's (1990) edgework. Typical edgework activities are high-risk activities requiring voluntary risk-takers to negotiate the edge between life and death. Successful edge negotiations elicit heightened feelings of control and transcendence, allowing voluntary risk-takers to escape the unbearable institutional constraints of contemporary society (Lyng 1990, 2005). Edgework activities studied in consumer research are high-risk leisure activities, such as skydiving (Celsi et al. 1993), motorcycling (Murphy and Patterson 2011), or the consumption of illicit drugs (O'Sullivan 2015). Further, the concept has been used to explore risky health behaviors across disciplines (Cronin, McCarthy, and Collins 2014; Gailey 2009). These studies include investigations into the risk-taking behavior of male sex tourists, who purchase sex despite risk of infection with potentially deadly diseases (Bishop and Limmer 2018).

While all previously mentioned edgework activities "involve a clearly observable threat to one's physical or mental well-being or one's sense of an ordered existence" (Lyng 1990, 857), voluntary risk-takers do not perceive themselves at risk when negotiating an edge. Instead, they emphasize their expert skills and knowledge enabling them to control risk (Celsi et al. 1993; Lois 2001; Lyng 1990). However, Lyng (1990) highlights that there is never total control in high-risk activities and suggests that voluntary risk-takers construct an "illusion of control" (Lyng 1990, 873) allowing them to act as if they could control the chance determined aspects of their risk-taking (Laurendeau 2006; Lyng 1990). This notion of an illusion of control appears particularly relevant amidst the Covid-19 pandemic. In times when even experts struggle to control risk of infection, ordinary consumers may construct an illusion of control providing them with a sense of being able to "control the seemingly uncontrollable" (Lyng 1990, 872) when breaking health recommendations and Covid-19 policies.

SAMPLE, METHOD & ANALYSIS

This study draws on data from a qualitative diary study (Arnould 1998; Patterson 2005) with German and Austrian consumers. Starting with the first stay-at-home orders in March 2020, the respondents kept a diary of their pandemic experiences for at least 7 days, most up to 2-4 weeks. The diaries had an exploratory character with an inspirational set of questions, which asked for consumers' everyday experiences, feelings, emotional peaks, and consumption behavior. In November 2020, shortly before the second lockdown in Austria and Germany, I approached the same sample again and asked for a written follow up essay. In total, I included 14 consumers between the age of 25 and 69, who repeatedly reflected on their own and other consumers' non-compliance behavior.

Data analysis followed a grounded theory approach and took place throughout and subsequent to data collection. I applied open, axial, and selective coding, using MAXQDA to identify relevant themes (Charmaz 2006). In several rounds of data analysis, codes and themes evolved while I moved iteratively between data and literature (Corbin and Strauss 1990).

FINDINGS

Escaping the Emotionally Challenging Pandemic Reality

From the onset of the pandemic onwards, Austrian and German consumers were aware of the threat the Covid-19 disease poses to their individual and societies' collective health. However, over time prolonged social distancing measures increasingly challenge consumers' emotional well-being and ignite their desire to escape from their highly restricted everyday lives. Charlotte entrusts her diary with the emotional challenges of social distancing, and details how she feels torn between adhering to and breaking with Covid-19 policies and health recommendations. On the one hand, she is scared to infect herself and people that are more vulnerable; on the other hand, she is worried to grow lonely and allows herself *"some degree of freedom"*. As the pandemic progresses, consumers increasingly reflect on their intentions to and experiences with defying official health advice. Helen reminisces about her vacation in fall 2020. Despite governmental recommendations to abstain from international travels, she spent a one-week vacation in France and highlights the emotional relief she experienced. Similar to Husemann and Eckhardt's (2019) elaborations on contemporary consumers' attempts to escape their increasingly accelerated lives, it seems that pursuing consumption and social activities provides pandemic-plagued consumers with a much desired escape from their highly restricted, radically decelerated and hence emotionally challenging pandemic reality.

Controlling the Uncontrollable Risk of Infection

The diaries suggest that consumers only defy preventative health advice and current Covid-19 policies when they feel to possess the knowledge, skills, and means that allow them to control risk of infection. However, in times when even experts struggle to understand and control virus transmission, total control is impossible. Alternatively, I find risk-taking consumers to construct an illusion of control through the strategies of *contrasting, rationalizing, obscuring,* and *burying* (see table 1). The illusion of control allows voluntary risk-takers to sustain their belief of acting responsibly and to feel in control over the seemingly uncontrollable risk of infection.

Contrasting distinguishes the consumer's own voluntary risk-taking behavior from the behavior of the irresponsible and unreflected "other" consumer (Campbell, Sinclair, and Browne 2019; Giesler and Veresiu 2014). Voluntary risk-takers focus on the apparent wrongdoings of others to create feelings of superior competence, which they use to legitimize their own behavior. During the initial phases of the pandemic, Jakob wonders about elderly consumers doing extensive grocery shopping and criticizes their irresponsible risk-taking. Yet, he is less critical about his own behavior and emphasizes his knowledge about virus transmission, the course of disease, and misleading Covid-19 reporting. As an engineer, Jakob does not possess medical expertise, but derives his feelings of competence from his subjective experience with the disease, conversations with friends and family, online research as well as critical reflection on media reporting and governmental health advice. His belief of being more knowledgeable than other consumers does not match actual expertise and rather seems to be a byproduct of his constant exposure

to Covid-19 media reporting and policy makers and firms intensive responsibilization efforts (Aboelenien et al. 2020; Giesler and Veresiu 2014).

Rationalizing puts consumers' voluntary risk-taking into perspective and retrospectively frames it as responsible behavior (Campbell et al. 2019; Laurendeau 2006). Rationalizing involves deep reflection and produces seemingly understandable reasons, which allow consumers to (self-) justify their voluntary risk-taking. This provides voluntary risk-takers with feelings of control and eases fears of social disapproval. In her diary, Sarah rationalizes why she broke with Covid-19 policies to attend a BBQ party:" *[...] [our neighbors] invited us to a BBQ in the evening, because we live in the same house anyways [...]. I did not want to be so narrow-minded and we decided: okay let's go outside and have a look who is there. [...] they told us, that one guest visits them every day, so it does not make a difference [...] and the other one is a colleague from work, who they see every day, so it was okay [...]."* Sarah details the personal connections between the guests to conclude that risk of infection was under control. Other consumers report similar rationalizing and emphasize the reasons that lead to their risk-taking. This includes highlighting the inconsistency of policies, claiming that risk of infection was low, risk-taking unavoidable, or necessary to offset more immediate risks.

When *obscuring* consumers adopt and combine alternative preventative behaviors to mask their voluntary risk-taking. Independently from the actual risk reduction qualities of the selected behaviors, obscuring facilitates feelings of control and combats fears of social disapproval. In March 2020, Leo notes how he obscures with washing hands before visiting a café. Similarly, Charlotte writes: *"[...] although, it is prohibited at the moment [...] my friend visited us today [...]. But we kept distance and it was outside, she [also] gifted me a self-sewn mask."* Hence, while obscuring seems to be similar to skydivers' safety procedures before jumping from a plane (Celsi et al. 1993), it appears that voluntary risk-takers amidst the pandemic do not necessarily value obscuring for its risk reduction qualities, but more for its symbolic qualities allowing them to appear responsible and legitimize their risk-taking.

Burying permits voluntary risk-takers to access feelings of control and safety from pre-pandemic times (Holbrook and Schindler 2003). Voluntary risk-takers bury by participating in pleasurable pre-pandemic activities, but also by deconsuming news and social media to avoid confrontation with the pandemic reality. Jakob notes how he buried when breaking Covid-19 policies in April 2020: *"[...] there were six of us today, and we played Frisbee [...] after 2 hours I noticed that it's illegal what we are doing. [...] when you are doing [...] sport [...] then all that stuff is far away and really forgotten and that's actually a nice thing."* Similarly, Helen writes about the emotional relief she experienced when ignoring stay-at-home orders in March 2020: *"[I] left my cell phone at home, met a friend at 8 o'clock to go hiking [...]. This day gave me so much strength and made me forget the whole chaos for a few hours."* Despite its obvious restorative qualities, the illusion of control resulting from burying is a very fragile construct. As soon as voluntary risk-takers (are forced to) re-enter the pandemic reality the illusion of control dissolves.

DISCUSSION

This study conceptualizes consumers' non-compliance behaviors amidst the Covid-19 pandemic as a form of edgework. Findings reveal that consumers pursue consumption and social activities involving elevated risk of infection to escape the highly restricted, decelerated and thus emotionally challenging pandemic reality.

Table 1 – Controlling the Uncontrollable Risk of Infection to Escape the Pandemic

Escaping the Pandemic Reality	
	*"You do not want to infect anyone, and you certainly do not want to infect yourself! [...] The only solution would be to withdraw and isolate oneself from [any social contact]! I do not want that. Thus I have to live with the remaining risk, and hope, that it [the disease] will not hit me too hard." **(Walter, 69, Retiree, November 2020)***
	"Sometimes I am afraid that I could infect my parents and that they would show a serious clinical course of the disease. In addition, I do not see any changes coming within the next few months; even though there has been some progress concerning a possible vaccine. However, I am convinced that it will take months until we can return to some degree of normality. [At the moment] I feel torn between adhering to the measures and creating myself some degree of freedom, so I do not become lonely." **(Charlotte, 26, Pharmacist, November 2020)**
	"In contrast to March, I personally do not strictly comply with the measures anymore. I don't want to minimize the few social contacts I still have. Virus or not, my mental health is also important. I think that I behave responsible and rational. Even though, this may go beyond governmental policies in some respects." **(Helen, 25, University Student, November 2020)**

Construction of an Illusion of Control		
	Contrasting	*"[...] there are a lot of older people doing their groceries. Especially people that belong to the high-risk group, who do [...] extensive grocery shopping. It surprised me that their risk awareness appears to be extremely low [...] it looked like they were chatting quite extensively [...] I think that was weird. However, I still met with my friend to play drums in our rehearsal room. Well, I did not really meet people or a number of people, but I still met with someone." **(Jakob, 31, Self-Employed Engineer, March 2020)***
		"What shocked me, a friend told me, that her handball club wants to do something good, which is nice. They want to organize a neighborhood help to support older people with doing their groceries [...]. Now they want to meet up tomorrow, with fifty people. They ignore all the warnings that one should not meet in big groups. Apparently, the rationale was that they want to organize it together. Well, we live in the 21st century, digitization is everywhere, and you can organize everything via e-mail, WhatsApp, or social media and then meet in small groups. No, you do not have to meet in groups of fifty. They don't take it seriously, as far as I understand it." **(Paula, 27, Financial Accountant, March 2020)**
	Rationalizing	*„My consumption behavior has not changed too much because of Corona. The only slip, if you want to call it that, was my vacation in Greece, with the excuse that the risk of infection was lower, than it was here."* **(Walter, 69, November 2020)**
		"Yesterday evening I drove to Innsbruck. At the border, I only had to show my commuter confirmation, although the conformation is only valid for Salzburg. In the evening, I still met a friend, even though it is still prohibited. Today I went hiking with my roommate and another friend. Actually, we wanted to drive with separate cars, but it did not work out and we drove together in one car. You feel a bit guilty, but on the other hand, I think it does not make sense to meet nobody, especially in the long term I think it is better to meet fewer people for a longer period of time, than not meeting anyone and not being able to do this for a longer period of time. Nevertheless, I always feel guilty." **(Charlotte, 26, Pharmacist, April 2020)**
	Obscuring	*"After a "virtual" day at work I call the café to ask if they are open. Is a visit okay and acceptable in these times? [...] After thoroughly washing our hands, we take our bikes [...] to get there."* **(Leo, 31, Engineer, March 2020)**
		"Today a girlfriend of mine visited us in our garden, although, it is prohibited at the moment, I think. It is hard to distinguish what we are allowed to do in Austria and what we are allowed to do in Bavaria [Germany]. But we kept distance and it was outside, she [also] gifted me a self-sewn mask." **(Charlotte, 26, Pharmacist, March 2020)**
	Burying	*"I just came back from the park and there were six of us today, and we played Frisbee, laughed a bit in the sun, and at some point we had the idea to play a round of Ultimate [Frisbee]. Three against three and we completely escalated, so we played two hours of really, competitive Frisbee. [...]. You are really just running and guarding each other, so that is really exhausting and after 2 hours I noticed that it's illegal what we are doing. [...] so I was actually breaking Corona rules, I can take credit for that now. I very rarely do anything illegal, I am a very, very loyal, law-abiding citizen, but today I just completely escalated, I feel a little crazy, but I think I can still sleep tonight. [...] Actually, it is a good sign that it [the measures] do not influence our normal ways of thinking. Therefore, when you are doing some kind of sport, you are outside, then all that stuff is far away and really forgotten and that's actually a nice thing.* **(Jakob, 31, Self-Employed Engineer, April 2020)**
		"Today was a beautiful day - like on holiday. [I got up] at 7 am, left my cell phone at home, met a friend at 8 o'clock to go hiking [...], then we brunched, sunbathed on the balcony, did yoga, a workout and we relaxed. In the evening [when] I went home [I was] happy and satisfied. This day gave me so much strength and made me forget the whole chaos for a few hours. Almost everything was like it used to be." **(Helen, 25, University Student, March 2020)**

However, consumers only accept risk of infection when feeling in control. This study illuminates how voluntary risk-takers construct an illusion of control to sustain their belief of being able to control risk of infection via the three strategies of contrasting, rationalizing, obscuring, and burying.

The contributions of this study to consumer research are two-fold: First, it complements prior research on risky health behaviors by emphasizing the emotionally enriching nature of voluntary risk-taking. Especially during radically decelerated and restricted pandemic times, pursuing consumption and social activities involving heightened risk of infection may free emotional energies similar to the emotional energies of decelerating consumption activities in highly accelerated pre-pandemic times (Husemann and Eckhardt 2019). Secondly, it enriches literature on voluntary risk-taking with an in-depth investigation of how consumers come to the belief of being able to control risk. Prior research on high-risk consumption activities highlights that consumers (Celsi et al. 1993; Murphy and Patterson 2011; O'Sullivan 2015) and service providers (Arnould and Price 1993; Tumbat 2011) feel in control over risk due to their superior physical skills, knowledge, and emotion management capabilities. This empirical analysis shows that in the context of the Covid-19 pandemic consumers' beliefs of being able to control risk are not necessarily rooted in actual expertise. Instead, consumers derive their feelings of control from constructing an illusion of control.

This is a challenging situation; voluntary risk-takers know about the potential consequences of their non-compliance behavior, but perceive themselves as responsible and highly knowledgeable consumers (Aboelenien et al. 2020; Giesler and Veresiu 2014) possessing the ability to control risk. Policy makers and firms, who aim to maintain or increase compliance, should thus pay increased attention to consumers' emotional well-being and the conditions that create emotionally challenging situations. Consequently, the role of seemingly mundane consumption activities such as restaurant visits or travelling as means of escape should not be underestimated (Cova, Carù, and Cayla 2018).

While this study focused on milder forms of voluntary risk-taking, further research should explore more extreme non-compliance behaviors, such as travelling despite travel bans or joining illegal parties. More extreme cases may be less motivated by consumers' emotional challenges and more rooted in their reflexive doubts towards expert risk management (Beck 1999; Thompson 2005).

'Going' Green? Nomadic Consumers' Paradoxical Journey Toward Sustainability

Sarah Schwarz, University of Innsbruck, Austria

INTRODUCTION

"The world is waking up. And change is coming, whether you like it or not." In her speech at the 2019 U.N. Climate Action Summit, teen advocate Greta Thunberg challenged political leaders to further the global movement toward sustainability. However, introducing new understandings of consumption experiences (Tezer and Onur Bodur 2020), the growing discourse on *going green* also invites consumers to pay closer attention to the environmental repercussions of materializing tendencies. In times where mobility is celebrated as an indispensable feature of postmodern societies (Bauman 2000), studies have alluded to the potential of exploring the demand for sustainability in the context of travelers (e.g., Orel 2021)—liquid consumers.

The explosion of online technologies allows digital nomads to combine work and travel (Hart 2015). Mirroring the vanguard of a mobile lifestyle revolution, they escape from traditions propagated by the settled (Reichenberger 2017). Recent consumer research has initiated a dialogue about liquid marketplace interactions (Bardhi and Eckhardt 2017; Eckhardt and Bardhi 2020). While consumption in conditions of linear mobility such as migration or expatriation assumes linking value (Belk 1992; Thompson and Tambyah 1999), nomadic consumers celebrate flexibility, immateriality, and functionality since ownership poses a potential threat to lightweight movements. Thus, their detachment from the marketplace is a manifestation of neither market alienation nor consumer resistance (Bardhi and Eckhardt 2017).

Nevertheless, research has hitherto overlooked to refine the role environmental sensibility plays in nomadic consumers' encounters with the material world. Put differently, studies placing the concept of liquid consumption under the umbrella of sustainability—"meeting the needs of the present without compromising the ability of the future generations to meet their own needs" (UN/WCED 1987)—remain scarce. Regarding the topicality of sustainable mobility, this study examines how nomadic consumers negotiate the paradoxes of liquid consumption in crafting their narrative of environmentally sensitive travelers. Drawing from a paradox lens, in-depth interviews and Instagram posts reveal that digital nomads use rationalizing and fragmenting strategies to realize self-imposed sustainability agendas.

THEORY

Consumer Sustainability

The current movement for climate action has sparked more and more protests that call for concerted efforts to address environmental justice. With the accumulation of movements promoting messages to save the planet (Schlosberg and Coles 2016), the imperative of adopting sustainable lifestyles has increasingly been thrust into the public spotlight. As this interest in the consolidation of nature and the human has permeated research across disciplines (Rockström, Bai, and deVries 2018), recent years have witnessed a more widespread academic discourse on the socio-economic facets of environmentalism. Translated into the realm of marketing research, the idea of sustainability has undergone a revival in the study of consumerism (e.g., Lim 2017). Scholars have made attempts to develop more nuanced insights into a plethora of concepts including environmental consciousness (Mataracı and Kurtuluş 2020), moral competences (Valor, Antonetti, and Merino 2020), or green altruism and thinking (Ali et al. 2020). Others have situated the consumption model of the sharing economy in the trajectory of sustainability research (e.g., Plewnia and Guenther 2018). Lim (2017) summarizes debates from both within and outside academia and points to the threefold theoretical concepts of mindfulness, responsibility, and anti-consumption that crystallize in sustainable consumerism.

Similarly, a growing body of research has drawn attention to environmentally sensitive consumer behavior in contexts of postmodern mobility. Rokka and Moisander (2009), for example, highlight the critical role of global travelers' online communities in fostering an environmental dialogue. Alternatively, in their studies on contemporary nomads' de-materialization and pilgrims' deceleration, Bardhi et al. (2012) and Husemann and Eckhardt (2019) emphasize the importance of investigating the phenomenon of de-(or anti-) consumption in more detail. This quest for sustainable consumerism constitutes the flip side of multiplex and accelerated conditions (Bauman 2000; Rosa 2013). Thus, prior research has foreshadowed the ambivalent nature of consumption in liquidity where "everything is mobile, uncertain, temporary" (Bauman and Bordoni 2014, 88) and hinted at the power of illuminating the inherent paradoxical tensions.

The Paradox

Recent work outside of consumer research has gleaned further insights into the paradoxes of (de-)materialization, acceleration/deceleration, and (de-)consumption accompanying digital nomads. Studies from the field of information technology and tourism have implied that unsettled lifestyles are not only marked by minimalist and slowing-down tendencies but also nourished by material consumption facilitating immersion in ever-changing cultural contexts (Hannonen 2020; Mancinelli 2020). This suggests that digital nomads, who uniquely blur career and mobility trajectories (Hart 2015), find themselves *betwixt and between* these opposing quests of liquid consumption while feeding their narrative of environmentally sensitive travelers.

We aim to produce an all-encompassing picture of nomadic sustainable consumerism by reconciling the tensions unfolding in liquid conditions. This study therefore embraces the co-existence of polarities within consumer research (Firat and Venkatesh 1995; Mick and Fournier 1998) and carves out how nomadic consumers negotiate the "two sides of the same coin" (Lewis 2000, 761) on their journey toward sustainable working and traveling. We recognize the fruitfulness of the paradox lens as a perspective for describing postmodern phenomena (Brown 1995), and, more specifically, illuminating sustainability concepts from an angle that dissolves either/or divisions (e.g., Van der Byl, Slawinski, and Hahn 2020).

METHOD

Framed along an interpretive paradigm, this study draws upon narratives from interviews and social media posts to explore how digital nomads negotiate the paradoxes of liquid consumption to realize self-imposed sustainability agendas. We defined nomadic consumers—the poster child for liquid marketplace actors (Bardhi et al. 2012; Bardhi and Eckhardt 2017)—as lifestyle designers whose fluid working-while-traveling existence is nourished by digital technologies (Hart 2015; Reichenberger 2017). We applied heterogeneous purposive sampling to virtually select 17 interview participants with varying ages, genders, nationalities, professions, and mobility backgrounds. In-depth online conversations followed a semi-structured

guideline (McCracken 1988) and revolved around the role sustainability plays for nomadic consumers. We also studied online communication contexts netnographically (Kozinets 2020) to gain a more multifaceted picture of how digital nomads respond to the global call for *going green*. Considering the high priority that digital nomads attach to social media (Bonneau and Aroles 2021), we purposively selected four nomadic consumers, whose lifestyle blogs repeatedly picked up the debate on sustainable mobility, and paid closer attention to the written material (textual captions including hashtags) of overall 304 corresponding Instagram posts. We analyzed interview transcripts and online content through the iterative process of categorization and abstraction, using an inductive and constant comparison approach (Spiggle 1994).

FINDINGS

This study unpacks the paradoxes around liquid consumption, shedding light on the imperative of acting sustainably. Revealing mobile consumers' growing appetite for both de-materialization (Bardhi et al. 2012) and deceleration (Husemann and Eckhardt 2019), the findings show that they pursue de-consumption not only to travel lightly but also to realize self-imposed sustainability agendas. Our respondents' cosmopolitanism is accompanied by the appreciation of minimalism—"*you do not need a lot of things in this world to be happy*" (Mel-31-Australia)—and the rejection of fastness—"*you realize that sooner or later, that you need to slow down*" (Franz-

Table 1: Overview of Findings

RATIONALIZING AND FRAGMENTING STRATEGIES
used to reconcile the paradoxes of liquid consumption—(de-)materialization, acceleration/deceleration, and (de-)consumption—in nomadic pursuits of realizing self-imposed sustainability agendas
RATIONALIZATION = declining responsibility for unsustainable actions that align with the nomadic lifestyle
Stressing Values "*[Sustainability] plays a huge role for me. [But] I know that I cannot take on a long-distance journey without flying. Also, I am aware that planes are not really good for the environment… My concept of living was just not built upon [this idea of] staying in Germany for an eternity.*" (Caro-47-Germany)
Blaming External Factors "*In Panama and Costa Rica, it was just awful, the amount of plastic that was wasted. That made me feel sick and depressed. We felt like in these countries, we were forced to use more plastic in three or four months than we would in one whole year at home.*" (Michael-39-Germany)
Neutralizing Implications "*I know that flying is just one drop in the bucket…And that consuming animal-based products tremendously destroys [sustainable living]. I am not even talking about the underlying moral aspects. So, in this regard, I try to live environmentally friendly.*" (Max-35-Austria)
FRAGMENTATION = assuming responsibility for sustainable actions that align with the nomadic lifestyle
Balancing Trade-Offs "*I am vegetarian, would love to be vegan but that kind of doesn't seem to work out…I do not produce a lot of trash. I really am conscious. I do not consume unnecessary stuff. I do not buy leather products. But we travel a lot, which is for sure not sustainable.*" (Nora-30-Austria)
Choosing Alternatives "*I've started like [to carry] a water bottle with me…I kind of have converted a lot of like my stuff in our house, like into being a little eco-friendlier…We have tons of like terrycloth reusable towels and cloth napkins and, you know, just little things like that.*" (Brandy-31-US)
Minimizing Routines "*We have given a lot of thought to the fact that we fly more than most people and we do not like that, so we are trying to travel more regionally, [sustainably] …You know, we do fly three, four times a year and we would like to minimize that.*" (Claude-55-US)
Advocating Initiatives "*I worked in a natural reserve for one month…I was volunteering there, so we would pull out trees that shouldn't be there, because they were killing other vegetation and the animals shouldn't be eating them. And we would plant new trees.*" (Mel-31-Australia)
Promoting Initiatives "*If we can educate a few people to use their reusable shopping bags, I think that's helpful… And we, um, try to show, talk about some of these sustainability issues on our blog. And we've started a new business as well to help raise awareness.*" (Patricia-30-New Zealand)

35-Germany). Nevertheless, the findings also unveil that mobile conditions do not produce complete detachments from the material and the fast (Hannonen 2020; Mancinelli 2020). Nomadic movement depends on certain objects serving as strategic resources (Bardhi et al. 2012)—*"my laptop is my most important tool…basically, everything comes down to the laptop*" (Kerstin-34-Canada)—and coined by re-immersion in experiences of acceleration (Husemann and Eckhardt 2019)—"*I can't imagine staying at one place forever…I am just enjoying my [unsettled] self too much*" (Rickey-51-US). These accounts underline that digital nomads find themselves torn between (de-)materializing and accelerating/decelerating tendencies, rather than entirely escaping from consumerism. We further unveil that in their pursuit of crafting the narrative of environmentally sensitive travelers, nomadic consumers resolve the tension between these opposing quests by engaging in rationalizing and fragmenting strategies (table 1).

Data analysis reveals that the premise of sustainability—in this case, considering the environmental repercussions of consumer actions—runs like a continuous thread throughout digital nomads' lives. We therefore accentuate that "the display of social, environmental, and cultural knowledge" becomes the new token of liquidity (Eckhardt and Bardhi 2020, 93). Digital nomads feel responsible for "*keeping an eye on sustainable practices*" (Taba-26-Austria) and sometimes even try "*to encourage an open discussion and a big debate about all this*" (Claude-55-US). However, nomadic consumers also confess that aligning their lifestyle with self-imposed sustainability agendas poses a challenge since "*traveling is not as environmentally friendly as [they] would like to think*" (Andi-31-US).

Rationalization

The mobile existence of digital nomads is inextricably tied to materialized and accelerated consumption not serving sustainability goals, such as serial aerial transportation and innovative technological applications. We find that our respondents harmonize environmentally sensitive beliefs and discrepant behavior by drawing upon rationales "used to produce a notion of reason, and thus legitimation for one's own interpretation" (Kallio, Nordberg, and Ahonen 2007, 49). When falling into the seductive trap of accepting unethical offerings (Eckhardt, Belk, and Devinney 2010), nomadic consumers decline responsibility for acting unsustainably.

That is, our respondents engage in strategies of economic rationalization where actions are justified by prioritizing personal utilities (Eckhardt et al. 2010)—**stressing values** drawn from them. As exemplified in the case of consuming plane tickets, digital nomads "*flying around the whole bloody world*" (Kim-49-Denmark) reiterate that their mobile existence is contingent on long-haul traffic—"*I try to avoid aerial transportation. But how else should I travel from Europe to Asia*" (Taba-26-Austria). Moreover, our respondents consider **blaming external factors** to rationalize environmentally insensitive behavior. The findings point to consumers who attribute accountability to aggravating circumstances when assuming that actions are beyond their self-control (Kaptein and van Helvoort 2019). Michael's (39-Germany) account underlines this strategy: "*I am forced to live with plastic [bottles]…unlike when being at home in Europe, during my trips, I cannot just drink fresh water directly from the tap.*" Additionally, consumer narratives reveal that our respondents refer to rationalizing strategies by **neutralizing the implications** of their actions. The findings cast light on the claim of relative acceptability where justification is based on the argument that others act worse (Henry and Eaton 1999). Max (35-Austria), for example, stresses that nomadic transportation emissions are comparably in-

significant as "*70 percent of the greenhouse gases stem from animal husbandry [anyway].*"

Fragmentation

Digital nomads depend on materialized and accelerated consumption to carry out their mobility projects. This forces them to violate, to some extent, the environment (Orel 2021), which sparks feelings of guilt about "*traveling in a decadent way*" (Claude-55-US). The findings reveal that to balance environmentally sensitive beliefs and discrepant behavior, nomadic consumers seize opportunities for actively adapting the latter. Our respondents celebrate a fragmented "series of small wins" to tackle the problem (Weick 1984, 43) of unethical traveling, gradually taking responsibility for sustainable actions (O'Connor and Keil 2017) which align with their liquid existence.

One manifestation of these fragmenting strategies concerns the attempt of **balancing the trade-offs** between environmentally (in-)sensitive behavior. Digital nomads report making amends for their ecological footprint by renouncing from certain unsustainable experiences, such as using heating during European winters, purchasing counterfeit products, or possessing cars. Consumer narratives also emphasize the quest for **choosing alternatives** (Edbring, Lehner, and Mont 2016) to curate a nomadic yet environmentally sensitive lifestyle. Our respondents deliberately opt for the versions that seem to be most in accordance with the tenets of sustainability, exhibiting a preference for local over online shops, electronic over printed books, or natural over non-recyclable wrappings. Fragmenting strategies are further rooted in pursuits of **minimizing routines** that are considered environmentally insensitive. Digital nomads set limitations to corresponding behavior, such as in the form of temporal and spatial boundaries. For example, our respondents report taking advantage of slow traveling options by extending their stay in particular localities (Sales Oliveira 2020). Consumer narratives further unveil the attempt of **advocating initiatives** that address environmental issues (Schlosberg and Coles 2016) by contributing to the maintenance of natural resources. Examples are voluntary participations in beach clean-ups or programs for the protection of wildlife sanctuaries which outweigh the damage sometimes even caused from within the own tribe. Similarly, our respondents feel accountable for **promoting initiatives** (Marquardt 2020) of sustainable development to fellow travelers and local communities alike. Corresponding consumer narratives revolve around fragmenting strategies where online platforms (Rokka and Moisander 2009) (e.g., #zerowastelifestyle, #savetheplanet) and offline gatherings are used to communicate the urgency of environmentally sensitive living.

DISCUSSION

This study offers a novel account of digital nomadism in liquid times of unprecedented change and ambivalence (Bauman 2000; Bauman and Bordoni 2014). We contribute to recent literature as follows: Recognizing the potential of unpacking phenomena of sustainability in the context of contemporary mobility (e.g., Orel 2021), this study picks up the debate on environmentalism within consumer research. We add to Rokka and Moisander's (2009) study on global travelers by revealing that they encounter the opposing quests for (de-)materialization (Bardhi et al. 2012), acceleration/deceleration (Husemann and Eckhardt 2019), and (de-)consumption to realize self-imposed sustainability agendas. The findings describe digital nomads as consumers who adopt an environmentally sensitive mindset and identify themselves "as a 'good' group of travelers" (Agyeiwaah et al. 2020). Nevertheless, since nomadic living entails consumption that does not always comply with the tenets of sustain-

ability, this study challenges the assumption that attitudes, expectations, and values—the intangible—are tied to sustainable behavior—the tangible (Lim 2017; Sheth, Sethia, and Srinivas 2011). The findings echo Eckhardt et al.'s (2010) picture of consumers taking advantage of rationales to reconcile beliefs and discrepant unethical—in this case, environmentally insensitive—behavior. However, reminding of Festinger's (1957) cognitive dissonance theory, this study emphasizes that nomadic consumers also perform adaptations to actively work toward compensating this gap in fragments. This study suggests that digital nomads either decline or assume responsibility for *going green*, depending on whether either environmentally insensitive or sensitive actions align with their unsettled lifestyle. Ultimately, we introduce the idea that digital nomads negotiate the tension of being *betwixt and between* sustainable orientations and unsustainable actions by engaging in a cycle of taking from and giving back to the environment. Thus, the findings point to a rather paradoxical nature of nomadic consumers' journey toward crafting their narrative of sustainable travelers.

This study comes with limitations since we neglected to touch upon the role of the SARS-CoV-2 pandemic in digital nomads' pursuit of environmentally sensitive mobility experiences. Follow-up studies could adopt a longitudinal study to refine the long-term implications of the current upheavals for mobile consumers and their sustainability agendas. Additionally, future research should pay closer attention to the interwovenness between rationalizing and fragmenting strategies. In doing so, studies could elaborate in more detail on how they mirror the quests for (de-)materialization, acceleration/deceleration, and (de-)consumption. Overall, we aim to initiate a discussion about sustainable consumerism in settings of nomadic liquidity. This is a phenomenon worth studying—after all, something that the world needs now is *going green*, which can never be as literally embodied as by travelers themselves.

Value-ing Biodiversity in the Garden

Christina E. Dahl, University of Southern Denmark, Denmark
Julie Emontspool, University of Southern Denmark, Denmark

INTRODUCTION

Sustainable consumption practices have a long research tradition in consumer research, providing valuable insights about the role of the consumer in effecting sustainable social change, the barriers individual consumers face, as well as connections between sustainability and consumer identity (Beverland 2014; Connolly and Prothero 2010; de Burgh-Woodman and King 2013; Gollnhofer 2017; Holt 2012; Prothero et al. 2011). One of the latest sustainability concerns under debate in broader society relates to biodiversity. Public actors, companies as well as media dedicate growing attention to biodiversity concerns, addressing issues such as soil depletion or significant losses of insect populations across the world but especially in Western countries (Goddard, Dougill, and Benton 2010; van Heezik, Dickinson, and Freeman 2012).

Our focus in this paper lies on investigating how sustainable consumption trends centred on biodiversity reconfigure consumers' relationship to nature and how such a reconfiguration shapes consumers' value regimes, the arrangements reproducing value(s). Existing research suggests that increased attention to humans' harmful impact on the world's climate and nature may lead individuals to question human dominance over nature and result in changed values about interactions with nature (Buijs 2009; Cielemęcka and Daigle 2019). Yet the consumption consequences of such changed values as promoted by social actors, and in particular their influence on value regimes for sustainable consumption, are incompletely addressed, especially when it comes to the dilemmas this may pose for consumers. We contribute to filling this gap through an analysis of media discourses about sustainable gardening practices in private gardening magazines.

LITERATURE REVIEW

Sustainable, and particularly, green consumption has been discussed on both macro- and microsocietal level. Macro level studies address the question of responsibility for consumers, market place or policy makers (Boström and Klintman 2017; Connolly and Prothero 2008; Dolan 2002; Giesler and Veresiu 2014), including sustainable ethics (Cielemęcka and Daigle 2019; de Burgh-Woodman and King 2013; Holt 2012) and environmental, social, and political solutions (Boström and Klintman 2017; Connolly and Prothero 2008; Gollnhofer 2017). On the micro level, a focus on individual consumers identifies barriers to sustainable consumption (Connolly and Prothero 2003; de Burgh-Woodman and King 2013).

A recurring discussion at the macro level is how individual responsibilization on the one hand empowers consumers to make a difference through personal choices and actions, while on the other hand creating an unrealistic assumption that consumers alone can and must solve environmental problems (Boström 2012; Boström and Klintman 2017; Connolly and Prothero 2003, 2008; Dolan 2002). As seen in de Burgh-Woodman and King (2013), companies adopt this - for them convenient - assumption of consumer responsibility when using green marketing to provide motivation for sustainable consumption, while obfuscating an actionable sustainable agenda. Current research questions this consumer-centric view, critiquing the emphasis on the consumer and aiming to capture the complexity of sustainable consumption as well as its ethical notions of responsibility (Boström and Klintman 2019; Cielemęcka and Daigle 2019).

Sustainable (environmental) consumption strongly relates to value regimes about reshaping human-nature relations. Early consumer research showed how such consumer values draw on a critique of humanity's isolation from nature (Thompson and Troester 2002), echoing ecofeminist theories (Dobscha and Ozanne 2001; Radford Ruether 1995). A cultural turn in recent years regarding value(s) in marketing has opened new avenues for approaching these value and values from a consumer cultural angle. Based on Graeber's (2001) theory of value, recent research sheds light on the cultural, meaning- and practice-based articulations of value (Arnould 2014; Karababa and Kjeldgaard 2013). It connects them to value regimes, arrangements that reproduce value(s) through the interaction of higher-order values, exchanged objects and broader governance steering these values (Appadurai 1988; Gollnhofer, Weijo, and Schouten 2019). While existing research explains the interconnection between value(s), ideologies and norms, and consumption, the existence of contradictory value regimes underlying consumption practices such as gardening is less explored when it comes to the coexistence of human-centric and nature-centric value regimes as exist in sustainable consumption.

Private gardens' importance for sustainable consumption remains largely unexplored in consumer research. Yet with an increased focus on sustainability and climate change, the study of green spaces is at the center of the exploration of human-nature relationships (Bhatti and Church 2001; Buijs 2009; Canniford and Shankar 2013; Descola 2005; Dobscha and Ozanne 2001; Doody et al. 2014; Mansfield 2003). Gardens as social spaces are studied in light of urban community gardening, where the impact on social relationships, healthy food practices and environmental education is examined (Almers, Askerlund, and Kjellström 2017; Garcia et al. 2018). Human and non-human agencies (Bhatti and Church 2001) and the performance and management of other's impressions of the garden (Cloke, May, and Johnsen 2008) are linked to the front yard and neighborhood relationships (Blomley 2005; Doody et al. 2014).

Garden and sustainability research intertwine in the search for consumer influence on the biodiverse agenda (van Heezik et al. 2012; Winkler, Maier, and Lewandowski 2019). Private gardens can improve biodiversity by increasing wildlife-friendly habitats, contributing to environmental conservation, and battling the climate crisis through raised awareness and potential behavioral change (Galani-Moutafi 2013; van Heezik et al. 2012; Winkler et al. 2019). These changes in attitudes and practices are vital for environmental protection (van Heezik et al. 2012; Winkler et al. 2019). However, while the garden is an interesting space for researching societal transformation, garden research still lacks a fundamental discussion of consumer influence and responsibility, widely debated in sustainable consumer research as seen above. Conversely, consumer research has mostly addressed the enchanting effect of community-based gardening and agriculture (Thompson and Coskuner-Balli 2007), which differ from private gardening initiatives in the value regimes which are drawn upon. This article integrates the insights of these two fields, exploring biodiverse consumption within the garden itself, but also in relation to the co- and reconstruction of biodiverse garden trends by broader society, and how this societal transformation translates in garden consumption and value regimes.

METHOD AND CONTEXT

To answer the research question, we analysed consumption discourses in gardening magazines, which offer a valuable resource for investigating changing discourses about consumption over time (Galluzzo and Gorge 2020; Gollnhofer and Bhatnagar 2021).

The dataset for the preliminary discourse analysis consisted of articles from two major garden magazines in Denmark: *Isabellas* and *Alt om Haven* (respectively 138.000 and 146.000 readers). Gathering articles from the largest national players within the field of gardening allowed us to investigate the emergence of gardening trends and the staging of human-non-human relationships within each of these trends. We selected the sample for this paper in three rounds.

First, we used literature-based keywords relative to garden types to find articles showing the development in trends over time. Articles featuring garden trends and maintenance offered interesting statements about what is valued and not in the private garden. In order to be included in our sample, an article had to either feature a garden owner, trend or practice. Articles that had a clear sales purpose, were superficial or too short were not included. An initial read-through of the articles brought the largest points of conflict in relation to plant and animal life in the gardens forward. The second round used the keywords characteristic of these conflicts, for example "weeds", "insects", and "lawn", to find and select additional articles. By using keywords related to relations between human and non-human entities, we were able to find articles depicting garden practices during that period in time. This resulted in 1.624 articles published between 2011 and 2021. Third, we sorted articles after type of content, and selected 246 articles for in-depth analysis. A first reading of each article reduced the final sample to 195, sorting out articles with content lacking depth or commercial texts.

To analyse the data, we developed a codebook based on a hermeneutic screening to identify discursive patterns that might prove useful when selecting key elements for the categorization of content and emerging trend patterns. Rereading and coding a subsample of 26 articles, selected based on publication year and garden trend to maximize variety, enabled us to explore the boundaries of the first codebook, making adaptions and additions when the outlined framework could not capture interesting conflicts or evaluations of human-non-human relationships. New codes were included such as type of garden trend, relationship with plants and animals, evaluation of value, and conflicts. We then used the updated codebook on the entire sample, diving deeper into the discursive construction of trends and human-non-human relationships within the garden.

FINDINGS

Our findings indicate that over the course of the last 10 years, gardening trends increasingly exchange a human-centric value regime with a biosocial value regime. What we define as human-centric value regime has dominated garden owners' view of the garden, evaluating its value based on human needs and likings. This regime centres on higher-order aesthetic, recreational, and productive values. A new value regime emerges in two waves; the first wave in 2015-2018 includes organic garden trends and the second in 2020 - continuing into 2021 - based on biodiverse garden trends, progressively shifting the focus from human-centric to nature-oriented. The resulting biosocial regime builds on higher-order biodiversity and animal friendliness values.

Magazines present and promote both value regimes in turn, featuring garden owners who aim at living up to both regimes but experience challenges due to the conflicting practices required by these regimes. The magazines present two ways for garden owners to cope with this ambiguity: (1) facilitating value coexistence within

the garden and (2) redefining biosocial values to fit the human-centric value system.

A human-nature shift in value regimes

Our findings indicate that gardening magazines increasingly (re)present contrasting value regimes for gardening practices over time, shifting from a focus on the gardens' human inhabitants to a broader welcoming of nature and biodiversity.

A human-centric value regime based on symbolic and use value. Traditional, dominant garden trends are characterised by green lawns, lush flowerbeds, patios with garden furniture and sometimes a vegetable garden. The garden caters to the garden owner's needs based on a human-centric value system, articulated through aesthetic, recreational, and productive value. The garden owners construct their garden to be useful when satisfying a personal human need, whether that is being pleasing to senses, creating a ground for relaxation, or producing vegetables and herbs. All value is evaluated based on how useful entities are to the garden owner's needs (please see excerpt 1 in table 1).

Organic gardening trends with human-centric values. From 2015, articles on organic gardens emerge in the magazines. These still adhere to the human-centric value system, bringing forward health, taste, and price to give legitimacy to a trend that breaks with common garden practices regarding pesticides and fertiliser use (see excerpt 2 in table 1).

With increasing acceptance of organic gardens' legitimacy, novel gardening techniques grow in popularity within the next few years. Self-providing gardens, forest gardens, permaculture gardens, animal friendly gardens, and wild gardens multiply. Most of these new, nature-oriented trends borrow the human-centric value discourse to claim legitimacy and a place among accepted, useful garden trends (see excerpt 3 in table 1).

Shifting to a biosocial value regime. From 2020, new values based on a biosocial value system strenghten within the nature-oriented trends. The biosocial value system replaces human needs with non-human needs to benefit nature instead of satisfying the garden owner's needs. The articles express value based on biodiversity and/or animal friendliness (see excerpt 4 in table 1). As these biosocial values spread, they challenge the dominating, human-centric value system. It creates a conflicts of garden ownership as a new user is recognized, who also lays claim to the garden space and adds non-human needs to the garden's purpose. The conflict that arises in the garden mostly appears in the gardening methods, where opposing gardening practices creates a dilemma of how to approach different challenges. We find that the garden magazines promote these trends without explicitly addressing the dilemmas that opposing value regimes might create.

Resolving the dilemma

The nature-oriented trends described in our data create a dilemma for consumers when it comes to value regimes. In the magazines, garden owners, who adopt the new garden trends and the associated biosocial value regime, do not dismiss the human-centric value regime. They do not want to relinquish the gardens' human-centric values, yet at the same time, want to promote biodiversity, which can be difficult to achieve simultaneously as one might rule out the other. The former values indeed advocate for thorough garden maintenance, while the latter requires partial neglect of the garden to allow other lifeforms to thrive. Two ways for gardeners to navigate the ambiguity inherent in these opposing value systems appear.

Firstly, magazines display examples of consumers who allow opposing values to coexist within the garden, illustrating how for in-

Table 1: Findings

Data excerpt	Interpretation
Traditional gardening trends building on a human-centric value regime 140 Articles published between 2001 and 2021	
Excerpt 1	
"We have designed the garden spaces to make them harmonize in colour, radiating tranquillity. When you are stressed, it is important that there is something for all senses, and that you are allowed to simply be without having to do anything else but relax and find inner peace. From one of the many seatings in the garden it is possible to stimulate all senses, because the flower bed in beautiful and smells nice, and you can hear the sound of water." ("Sensing the Therapeutic Garden", Isabellas, 03/2015, p. 70)	As excerpt 1 shows, the values associated to the garden reflect aesthetic values expressed in terms of pleasing colours and sensual experiences, both focused on the human experience of the garden.
Organic and other nature-centred gardening trends building on a human-centric value regime 40 Articles published between 2011 and 2021, of which 36 articles published 2015-2019	
Excerpt 2	
"When organics emerged, it revoled around nature considerations. But today it is not only about nature and animal welfare – it is about health, taste, and especially the price, that we as consumers must pay for organic produce. Here we will give you four experts view of whether it is beneficial for you to shop organic." ("Organic in the Kitchen – Does it payoff?" Isabellas, Country life, 01/2015, p. 42)	Excerpt 2 demonstrates how gardening magazines reframe the organic gardening in terms of human health, taste and price, all three connected to human-centric values such as healthism, hedonism and thrift.
Excerpt 3	
"This is why you must attract bees and insects. Bees and butterflies pollinate plants, who are then able to grow flowers and thus fruits and berries. Insects are fighting vermin in the garden. For example the lady bug eats aphides, the dragonfly eats flying bugs, and ground beetles eat snail eggs and small snails. Insects will also attract birds and hedgehogs, who in turn will eat vermin and snails." ("Create life in your garden", Alt om Haven, 03/2020, p. 24).	Excerpt 3 illustrates the reframing of sustainable consumption trends in light of human-centric value regimes, bringing forward the "use value" of lady bugs, bees and butterflies.
Nature-oriented gardening trends building on a biosocial value regime 15 Articles published between 2020 and 2021	
Excerpt 4	
"It is not illogical to believe that a garden in itself is beneficial for nature, as long as something green is growing in it. And it is correct, that a green corner is more luxuriant than an asphalt parking lot, but seen from nature's point of view, there is a big quality difference from one garden to the next. For example, there is much more biodiversity in a flowering field than in a lawn, and organic fertilizer gives room for more life in the soil than chemical fertilizing pellets." ("A greener form of green", Alt om Haven, 03/2020, p. 3)	In contrast with previous excerpts, excerpt 4 illustrates the growth of discourses about nature for nature's sake in the magazines, advocating "nature's point of view" and offering corresponding consumption solutions.
Excerpt 5	
"In garden book author Annemette Olesen's' garden, wild plants are not seen as weeds but as important, useful plants. Many of them are beautiful, full of vitamins and rich in flavour, so they fit right into an ordinary, healthy diet." ("When weeds are given due credit", Isabellas, 04/2020)	Excerpt 5 depicts a way for consumers to navigate the dilemma between human-centric values with their definition of plants versus weeds, and biosocial values of tolerance towards weeds, by articulating the usefulness of these garden components in terms of human health.

stance fertilizer can be less harmful to the environment (see excerpt 4 in table 1). Here the solution is to adapt garden consumption by choosing products more compatible with the new, nature-oriented value regime while maintaining the traditional garden practice. Secondly, magazines help consumers reconstruct the new trends to fit the human-centric value system. This is happens by selecting a part of the garden for biodiversity, thus creating physical boundaries for each value regime represented in the garden, or by redefining biodiverse values in terms of human use value, for example assigning usefulness to wild plants seen as weeds or seing annoying insects as useful against destructive vermin (see excerpt 5 in table 1).

CONCLUDING DISCUSSION

When a new value regime challenges the dominant one, consumers can experience dilemmas in their consumption practices. Beyond focusing on individual consumers, our research demonstrates how media actors enable consumers to maintain human-centric value regimes while respecting biosocial values, resolving the dilemmas they themselves created through the introduction of new gardening trends in the magazines. These insights provide an important contribution to research about sustainable consumption in illustrating how social actors promote sustainability by offering ways for consumers to respect both human-centric and biosocial values. While these insights cannot avoid but confirm the consumer responsibilization as demonstrated in other studies on sustainable consumption, it contributes to existing knowledge by highlighting the co- and reconstruction of biodiverse garden trends in broader society, and how this societal transformation is negotiated in discourses shaping consumers' value regimes.

In addition to contributing to research about sustainable consumption, the findings of this paper also offer insights for a better understanding of value in consumer research, in particular the shift from human-centric values to biosocial values, which pose new challenges to consumer research by drawing attention to non-human subjects in the study of value regimes.

Arousal Reduces the Availability of Internal Reference Prices in Fairness Judgments

Alexander DePaoli, Northeastern University, USA

INTRODUCTION

Buying a product involves evaluating the price, and in doing so, making an emotional judgment of the fairness of that price (Xia et al. 2004). Consumers care that the prices they pay be "fair," and may have visceral emotional reactions to "unfair" prices which impact their purchase decisions and evaluations (Kahneman et al. 1986; Peters et al. 2003; Heussler et al. 2009). Evaluating a price's fairness involves weighing it against a "reference price," some subjectively appropriate or otherwise salient point of comparison (Thaler 1999). Generally, prices which are higher than the reference are seen as unfair while prices which are the same as or lower than the reference are seen as fair (Kahneman et al. 1986; Campbell 2007). Consumers' use of reference prices is automatic in purchase contexts, yet the processes by which references are selected, generated, or anchored on are not fully understood (e.g. Vaidyanathan and Muehling 1999; Xia et al. 2004).

A fruitful distinction exists between external references, such as prices posted in the environment, and internal references, namely prices stored in memory (Thaler, 1999; Xia et al., 2004). Even so, consumers may be simultaneously exposed to many external price cues and/or have access to many internal references, including recalled market prices or the most recent price they paid (Vaidyanathan and Aggarwal 2001). Manipulating which reference a consumer "selects" from among many possibilities is a fundamental principle of retailing (Kan et al. 2014). For example, retailers may host a sale event in which deceptively high "original" prices are made salient, which entices consumers to use these as their reference.

Reference price selection is susceptible not only to contextual cues, but to preexisting mindsets or affective states (Vaidyanathan and Aggarwal 2001; Campbell 2007), which follows from the affective nature of price fairness judgments. The current project examines one such affective state, namely incidental arousal, and its capacity to moderate consumers' selection of external versus internal reference prices. Arousal describes the level of engagement, energy, or physiological stress that an emotional state entails (Russell et al. 1989; Loewenstein 1996). For example, feelings of anger and excitement are high arousal, while feelings of sadness and peacefulness are low arousal. High arousal has several implications for consumer price judgments: it can magnify the effects of positive or negative emotional reactions (e.g., Menon and Kahn 2002), it can reduce cognitive processing by impairing or loading working memory (e.g., Eysenck 1982; Leith and Baumeister 1996), and it can lead to a myopic focus on decision criteria which are perceived as most relevant (e.g., Pham 1996). Leveraging these myopic tendencies of high arousal states, as well as the observation that information in the environment tends to be more accessible than information in memory unless that memory has been cued (Lynch and Srull 1982), it is predicted that high arousal consumers should be more (less) likely to base price fairness judgments on external (internal) reference prices as a result of arousal-induced myopia and load.

Four studies explore the impact of arousal on price fairness judgments. Studies 1 and 2 test a managerially relevant paradigm, and support the prediction that high arousal leads to greater reliance on external references. Studies 3 and 4 show that this effect arises due to arousal reducing the availability of internal reference prices.

STUDY 1: PRICE FAIRNESS

This study examined price fairness judgments in a context mimicking the managerial situation of interest. Participants were exposed to external reference prices which were much higher than market prices to set up a conflict between external and internal references. This conflict allowed for a simple test of the prediction that high arousal leads consumers to increase (decrease) reliance on externa (internal) references. If this is the case, fair price judgments should be higher under high arousal. This can also address an alternative hypothesis suggested by the preceding theoretical background that because arousal magnifies emotional reactions (Menon and Kahn 2002), fair price judgments could be generally lower under high arousal. Knowing whether either of these effects occur would be managerially useful as they have opposite implications for the efficacy of reference price promotions.

Methods

Participants on Amazon Mechanical Turk (N=150, M_{age}=30.0, 49% female) completed a four-minute autobiographical essay task based on Arousal condition (High vs. Control): High Arousal participants wrote about a time when they had an intense emotional experience, and Control participants wrote about their surroundings.

Participants then completed a "hypothetical shopping" task in which they viewed a series of 6-pack paper towel products ostensibly from Amazon.com which varied by brand with prices averaging to $15 (approximately double or triple the market price for similar products). Participants then identified a fair price for a single roll of unbranded paper towels.

Results and Discussion

High arousal was associated with higher fair price judgments (M_{high}=$2.35, SE=$0.08, $M_{control}$=$1.90, SE=$0.07; $t(148)$=2.51, p<.01), thus offering initial support for the claim that arousal leads to greater reliance on external references rather than increasing price fairness sensitivity.

STUDY 2: EXTERNAL VS. INTERNAL REFERENCES

This study provided a more nuanced view than the first by having participants explain their price judgments and then self-code their explanations to indicate whether they relied on external and/or internal references. A similar method has been used in thought-listing tasks (e.g. Cacioppo and Petty 1981).

This study used physical exercise to manipulate arousal (e.g. Pham 1996).

Methods

Participants (N=126, M_{age}=21.1, 59% female) were recruited via a campus behavioral lab for a workout study and were assigned to one of the two Arousal conditions (High vs. Low): Low Arousal participants completed four minutes of a "Deep Breathing" yoga routine on the Wii Fit, while High Arousal participants completed five minutes of a "Free Step" program on the Wii Fit at the maximum pace with the Wii Fit board elevated on an aerobic step. Prior to starting their activity, participants were shown how to measure their heart rate using a finger pulse oximeter. Participants recorded their heart rates after their Wii Fit activity in order to begin the rest of the study.

Participants completed a similar shopping task as in study 1 which randomly used either 6-packs of paper towels or 50oz bottles of laundry detergent to eliminate category-specific biases. They then indicated a fair price for an unbranded 6-pack or 50oz bottle, following which were asked to write an explanation for that fair price. Next, they completed a self-coding task of their responses. Participants were instructed to "select all that apply" to their written explanation from a list of possible reference sources, including "the prices shown" and "my emotional reactions" (external references) and "the last price I paid" and "the price I usually pay" (internal references). These code items were partly informed by Vaidyanathan et al. (1999, 2001).

Participants next completed a series of 100-point scales measure emotional arousal and valence adapted from the Affect Grid (Russell et al. 1989), and a questionnaire about their familiarity with the products, including how much they paid the last time they purchased a product from the same category (to serve as a measure of their internal reference price).

Results and Discussion

The arousal manipulation was validated against participants' heart rates (M_{high}= 84.29bpm, SE=1.31; M_{low}=71.20bpm, SE=1.46; $t(124)$=5.59, p<.001) and their arousal as measured with the Affect Grid (M_{high}=45.38, SE=1.74; M_{low}=-12.16, SE=5.02; $t(124)$=3.89, p<.001).

Recalled internal reference prices were significantly lower than the \$15 external reference prices (M=\$9.95, SE=0.29, $t(135)$=-17.15, p<.001), thus successfully putting these references in conflict. Participants' fair price judgments were predicted on the basis of both arousal and their internal reference prices using a linear regression, which revealed a strong effect of the internal reference (B=0.83, $t(122)$=4.57, p<.001), a marginal effect of arousal potentially suggesting that high arousal may be associated with greater reliance on external references (B=0.07, $t(122)$=1.69, p=.093), and a marginal interaction between arousal and internal reference (B=-0.01, $t(122)$=-1.83, p=.069). Decomposing this interaction, the internal reference predicted fair prices under low arousal (B=0.87, $t(57)$=5.25, p<.001) but not high arousal (B=0.73, $t(61)$=1.68, p=.098), suggesting that high arousal reduced participants' usage of recalled prices.

To investigate this further, the external and internal self-coding responses were tallied and individually predicted on the basis of participants' internal reference prices and arousal using Gaussian regression. There were no differences in the reported reliance on external references (B=-0.00, $t(122)$=-0.19, p=.852), but high arousal was marginally associated with reduced reported reliance on internal references (B=-0.01, $t(122)$=-1.95, p<.054). This is instructive but not conclusive evidence that arousal is shifting reliance away from internal reference prices.

STUDY 3: HIGH VS. LOW EXTERNAL REFERENCES

This study replicated and broadened the findings from study 2 by manipulating external reference prices to be either higher or lower than market prices. This created a paradigm in which participants were expected to rely more (less) on external references when the stimulus prices were low (high), thus moderating of the effects in previous studies to show that high arousal leads participants' price fairness judgments to track external references.

Methods

Participants on Amazon Mechanical Turk (N=748, M_{age}=32.5, 45% female) completed an expanded autobiography task from study 1 based on Arousal condition (High vs. Low vs. Control): High Arousal participants wrote about an experience of feeling "excited" or "angry," Low Arousal participants wrote about an experience of feeling "peaceful" or "sad," and Control participants wrote about geography. Affective valence was varied only to control for it as an alternative explanation in the analyses.

Participants then completed a shopping task for paper towels as in prior studies except that prices that were either 50% higher or 50% lower than market prices as determined by Price condition (High vs. Low). They then completed the same price fairness and self-coding tasks as in study 2, and similar final questionnaires.

Results and Discussion

Linear regression predicted fair price judgments on the basis of the arousal and price manipulations as well as participants' reported internal reference price. The price condition was the most significant predictor (M_{high}=\$8.71, SE= \$0.12; M_{low}=\$2.93, SE=\$0.04; B=5.79, $t(741)$=45.04 p < .0001) followed by participants' internal reference (B=0.03, $t(741)$=2.31 p < .022), while arousal was non-significant (B=0.02, $t(741)$=0.19, p=.851) and did not interact with price (B=0.10, $t(741)$=0.67, p=.503). These results do not suggest a direct effect of arousal, thus analysis of the self-coding data is used to explore indirect effects of arousal on this process.

Confirming the directional result in study 1, Gaussian regressions predicting the self-coded use of external and internal references on the basis of the manipulations found that high arousal participants were significantly less likely to report using internal references (B=-0.07, $t(745)$=-2.14 p < .034) with no corresponding increase in usage of external references (B=0.01, $t(745)$=0.35, p=.728). While there was no direct effect of arousal on fair price judgments as reported above, linear regressions predicting fair prices with the self-coding data found that reliance on external references predicted higher price judgments in the high price condition (B=1.41, $t(739)$=5.93, p<.001) while reliance on internal references predicted higher fair prices in the low price condition (B=-1.15, $t(739)$=7.34, p<.001), consistent with our predictions. Thus, a bootstrapped mediation analysis (5000 iterations, bias corrected) found that high arousal's suppression of the use of memory-based references led to lower price fairness judgments in the low price condition (95% CI[-0.034,-0.003]) and higher judgments in the High Price condition (95% CI[0.007,0.059]). There were no equivalent indirect effects through the use of stimulus-based references (95% CI[-0.007,0.017] and 95% CI[-0.038,0.023]).

This result suggests that arousal impacts price fairness by reducing reliance on internal reference prices without necessarily increasing reliance on external reference prices. Extant models of the ways in which consumers switch between environmental and recalled information suggest two possible explanations: either the availability of internal references (i.e., the ease with which they come to mind) is being suppressed and/or the diagnosticity of external references (i.e., their perceived importance or relevance) is being enhanced (Lynch and Srull 1982). Because this study's measure of reliance on external versus internal references is the sum of self-coded use of such references, which captures their availability but not their diagnosticity, we cannot disentangle these explanations. Thus, two independent judges read participants' fair price explanations and used a 5-point scale to rate the degree to which each participant emphasized the diagnosticity of the reference(s) on which they relied (Cronbach's alpha=.69). A linear regression found no differences in diagnosticity on the basis of arousal (B=0.01, $t(742)$=-0.60, p=.549), thus the mechanism driving the findings appears to be reduced availability of internal references rather than some increase in the availability or diagnosticity of external references.

STUDY 4: REPLICATION

This study replicated study 3 using a different population. It is briefly summarized here.

Methods

Participants in a campus behavioral lab (N=541, M_{age}=22.3, 55% female) completed the same paradigm as study 3. Once again, two independent judges rated participants' written price fairness explanations for discussions of reference diagnosticity (Cronbach's alpha=.77).

Results and Discussion

Study 3 was successfully replicated. There was no main effect of arousal on fair price judgments (B=-0.25, t(536)=-0.65, p=.258) but a significant interaction between arousal and external price (B=0.47, t(536)=1.69, p<.046).

Self-coded usage of internal references was reduced under high arousal (B=-0.13, t(536)=-3.36, p<.001) but there was no effect on use of external references (B=-0.01, t(536)=-0.49, p=.311). The indirect effect on price judgments through these self-codes replicated in the high price condition (95% CI[0.101,0.785]) and marginally in the low price condition (95% CI[-0.263,-0.000]). Arousal did not predict any differences in the diagnosticity indicated in written explanations (B=0.02, t(536)=0.99, p=.160). Taken together, these results support the conclusions derived from study 3, namely that high arousal leads consumers to be less attentive to internal references.

GENERAL DISCUSSION

This research has investigated the role that affective arousal plays in consumers' price fairness judgments, and found that it appears to make consumers less likely to rely on internal reference prices. While the net effect of this is an apparent increase in sensitivity to external reference prices, the results do not support the claim that arousal increases the availability or the diagnosticity of external references themselves. As such, a remaining question posed by this research is whether there is an unobserved factor or resource that "goes up" as availability of internal references "goes down." Regardless, the results provide a sufficiently granular view of the role of arousal as to provide managerial recommendations, namely that promotions providing high external reference prices should induce high arousal (e.g., with sensory input, such as music) or target consumers on the basis of high arousal (e.g., with online sentiment analysis), especially when consumers are likely to have internal references.

This research furthers the literature on affective and emotional impacts on consumer decision-making, much of which has traditionally focused on valence rather than arousal (e.g. Menon and Kahn 2002; Heussler et al. 2009), as well as work in the domains of price fairness and the use of reference prices.

Table 1: Summary of Results

High Arousal		High Stimulus Price			Low Stimulus Price		
		Control	Low Arousal	High Arousal	Control	Low Arousal	
Study 1 (N=150)	Fair price	$2.35 ($0.08)	$1.90 ($0.07)	n/a	n/a	n/a	n/a
Study 2 (N=126)	Fair price	$11.05 ($0.43)	$10.83 ($0.34)	n/a	n/a	n/a	n/a
	Self-codes (external)	0.89 (0.04)	0.85 (0.05)	n/a	n/a	n/a	n/a
	Self-codes (internal)	0.25 (0.06)	0.37 (0.06)	n/a	n/a	n/a	n/a
Study 3 (N=748)	Fair price	$8.89 ($0.19)	$8.67 ($0.18)	$8.45 ($0.30)	$2.95 ($0.05)	$2.90 ($0.08)	$2.92 ($0.08)
	Self-codes (external)	0.86 (0.05)	0.82 (0.07)	0.87 (0.05)	0.99 (0.03)	0.97 (0.06)	0.98 (0.04)
	Self-codes (internal)	0.78 (0.07)	0.83 (0.10)	0.83 (0.07)	0.33 (0.06)	0.49 (0.09)	0.54 (0.05)
	Diagnosticity	3.03 (0.02)	2.92 (0.03)	3.02 (0.02)	3.00 (0.02)	2.89 (0.02)	2.99 (0.02)
Study 4 (N=541)	Fair price	$6.62 ($0.41)	$5.70 ($0.45)	$6.35 ($0.33)	$2.22 ($0.41)	$2.23 ($0.20)	$2.59 ($0.53)
	Self-codes (external)	0.79 (0.03)	0.83 (0.04)	0.79 (0.03)	0.92 (0.06)	0.80 (0.04)	0.87 (0.07)
	Self-codes (internal)	0.13 (0.03)	0.21 (0.04)	0.17 (0.02)	0.04 (0.04)	0.29 (0.05)	0.43 (0.11)
	Diagnosticity	2.96 (0.02)	2.92 (0.04)	2.97 (0.03)	2.97 (0.02)	2.93 (0.05)	2.94 (0.03)

How to Lose Friends and Influence No One: The Documentation Penalty in Social Experiences

Freeman Wu, Vanderbilt University, USA

INTRODUCTION

Performers, organizers, and concertgoers have continually lambasted documentation behaviors as diminishing the live event experience. In this sense, the use of smartphones for documenting events seems, by most people, to convey a state of distraction (Kushlev & Dunn, 2019). Here, distraction suggests attentional conflict (Kupor & Tormala, 2015), where diminished attention to the live event reduces cognitive and emotional processing of the event itself (Petty & Wegener, 1999). In essence, then, the documentation of experiences may signal lower engagement and presence to the same extent as would playing Candy Crush or texting during the event. Consistent with this notion, "phubbing" has emerged as pejorative slang to describe individuals who cannot stay present in social interactions due to smartphone usage, resulting in negative impressions and ostracism (David & Roberts, 2017). Documentation, like many other technology-centric behaviors, has thus been described as another instance of the "present-absent paradox" (Mick & Fournier, 1998), whereby people are physically present with others but mentally absent as they become preoccupied with their devices.

However, as noted earlier, people can experience increased presence and enjoyment as a direct result of their documenting behavior. Of note is the role of *presence*—the extent to which someone is (mentally) present, immersed, or engaged in an ongoing experience (Diehl et al., 2016; Tonietto & Barasch, 2020). Consistent with this notion, prior work has shown that increased presence induces positive affect (Escalas, 2007; Green & Brock, 2000) and the experience of psychological flow (Csikszentmihalyi, 1990), which in turn enhances enjoyment.

A noteworthy distinction between documenting and other technology-related behaviors, then, is the focal stimulus demanding attentional resources. Namely, whereas other technology-based activities like gaming and texting are focused on stimuli that are obviously tangential to the live event, documenting centers the social experience—the show, the event, or the gathering—as its focus, thereby increasing immersion (Tonietto & Barasch, 2020). Despite these personal benefits, however, we contend that documenters who experience the event *primarily* through a recording device—which characterizes the behavior of most documenters—will be perceived as having an impoverished experience that others recognize and judge accordingly. As such, observers might infer that the documenter has a decreased sensory experience when documenting is the predominant behavior, thus leading to lower perceptions of presence. As a result, variation in perceived presence exhibited by documenters is likely to determine how others judge them, whether others would want to affiliate and attend future events with them, and so on.

To provide preliminary evidence for our predictions, we conducted a retroactive recall pilot study that gauged respondents' memories of concerts that they attended with an actual friend. 250 participants were asked to recall the extent to which their friend was taking photos and videos during this concert before indicating how much they would want to attend another concert with the same friend in the future. Finally, they were asked to indicate how close they were with this friend. Regressing interest in attending future concerts with this friend on documentation degree and relational closeness revealed a significant and expected simple effect of relational closeness ($p<.0001$), and importantly, a significant simple effect of documentation ($p=.0096$), where participants expressed lower interest in attending future concerts with their friend when this person engaged in more documentation during

the previous concert. While only correlational in nature, these findings shed initial insights into the potential negative interpersonal consequences of documenting social experiences.

We contend that documentation can evoke varying perceptions of presence, in turn shaping impressions of the documenter with downstream social consequences. Documentation is predicted to generate negative impressions and diminished social connectedness when others perceive lower presence—a "documentation penalty". However, based on our conceptualization, documentation need not be universally negative, as these negative judgments should be attenuated if documentation does not ostensibly detract from the individual's ability to remain engaged with the social experience. The inherent irony of documentation is therefore clear—people may feel more personally present and engaged as a result of documentation, and yet others around them are likely making directly opposing inferences about their behavior, potentially to the detriment of friendships and future affiliation intentions.

Study 1 (N=282) identifies the documentation penalty and provides initial underlying evidence in a 2(documentation method: self vs. outsourced) × 2 (behavior: enact vs. abstain) design. Participants read a passage about attending the concert of their favorite musical artist with a friend. In the self-documentation condition, their friend was constantly using their phone to take photos and videos of the concert (vs. put away their phone and did not check it during the event), whereas those in the outsourced-documentation condition encountered a vendor selling official live recordings after the concert (Abendroth and Diehl 2006), and their friend decided to buy (vs. not buy) the recording. Subsequently, we assessed impressions of their friend and their perceived presence.

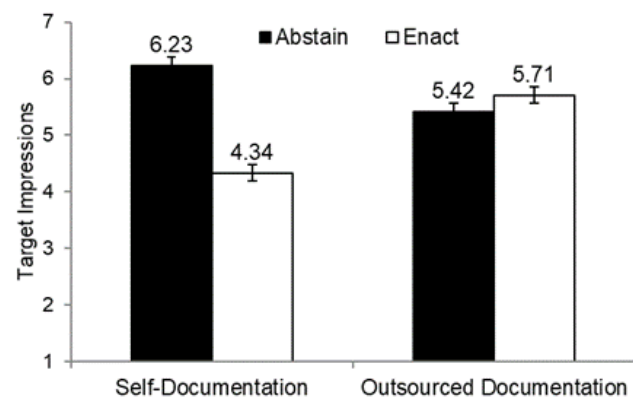
Results revealed a significant main effect of behavior ($M_{enact}=5.02$ vs. $M_{abstain}=5.82$; $p<.0001$), qualified by a significant 2-way interaction ($p<.0001$; Fig. 1). Whereas participants formed more negative impressions of their friend when this person engaged in self-documentation ($M_{self, enact}=4.34$) versus not ($M_{self, abstain}=6.23$; $p<.0001$), impressions did not differ whether their friend outsourced documentation (vs. not) by purchasing the concert recording ($M_{outsourced, enact}=5.71$ vs. $M_{outsourced, abstain}=5.42$; $p=.1589$). Finally, moderated mediation analysis (Model 8; Hayes 2017) revealed that perceived presence mediated impressions in the self-documentation condition (CI=-1.97, -1.03), but not the outsourced documentation condition (CI=-.17, .17).


Fig. 1: Documentation Method × Behavior on Target Impresions

In study 2 (N=213), we examine how observers respond to varying amounts of documentation. Specifically, we introduce more nuance to

documentation, because short of banning access to recording devices altogether, some level of documentation is to be expected. A such, we examine reactions to a minimal level of documentation in a 3-cell (behavior: documentation vs minimal capturing vs. no documentation) design, and predict that the documentation penalty will be attenuated to the extent that this behavior hinders perceived presence to a lesser extent. Participants read a similar passage as study 1, where they were attending a concert with their friend. The documentation and no documentation conditions were identical to those of study 1 in the self-documentation groups. In the minimal capturing condition, their friend used their phone to take a few photographs and record part of a particularly good song, but then put it away and did not check it for the rest of the event. Subsequently, participants competed the same measures capturing impressions of their friend and perceived presence.

A one-way ANOVA on target impressions revealed a significant main effect of behavior ($p<.0001$). Participants formed more negative impressions of their friend when this person engaged in documentation compared to no documentation ($M_{documentation}=3.93$ vs. $M_{no\ documentation}=6.25$; $p<.0001$) or minimal capturing ($M_{minimal}=5.82$; $p<.0001$), suggesting the documentation penalty was attenuated when this behavior disrupts perceived presence to a lower extent. Although impressions were more negative when this person engaged in minimal capturing as opposed to no documentation ($p=.0487$), this difference was substantively smaller in magnitude. Finally, multi-categorical mediation analysis (Model 4, Hayes 2017) revealed that perceived presence mediated impression for both the documentation versus no documentation (CI=1.57, 2.61) and documentation versus minimal capturing comparisons (CI=1.27,2.24).

In study 3 (N=218), we provide additional insight into the underlying process by directly manipulating the mediator, perceived presence, in a 3-cell (behavior: documentation vs minimal capturing vs. tripod) design, thereby demonstrating process via moderation. Specifically, we show that even if documentation behavior were held constant, the documentation penalty can be attenuated if the behavior does not ostensibly detract from the documenter's ability to stay present. In so doing, we address an alternative explanation based on the creation of a distracting environment for other attendees, because documentation should be equally distracting for others regardless of the documenter's own perceived presence. Participants were presented a scenario where they were attending a firework show with their friend. In the documentation condition, their friend was constantly using their phone to record the event, whereas in the minimal capturing condition, their friend used their phone to record a particularly good segment but then put it away and did not check it for the rest of the event. In the tripod condition, their friend brought a tripod to help record the event on their phone, but was the tripod was set up, they did not touch their phone again for the rest of the event. Subsequently, participants competed the same measures capturing impressions of their friend and perceived presence. Additionally, they indicated their interest in future interactions with this friend.

A one-way ANOVA on target impressions revealed a significant main effect of behavior ($p<.0001$). Participants formed more negative impressions of their friend when this person engaged in documentation compared to minimal capturing ($M_{documentation}=3.58$ vs. $M_{minimal}=5.29$; $p<.0001$) or documentation facilitated by a tripod ($M_{tripod}=4.71$, $p<.0001$), suggesting that the documentation penalty is attenuated when documentation does not ostensibly reduce the person's presence during the experience. The same analysis on interest in future interactions the same significance and pattern of results ($p<.0001$), such that participants expressed lower interest in future interactions with their friend when this person engaged in documentation compared to minimal capturing ($M_{documentation}=3.24$ vs. $M_{minimal}=5.71$; $p<.0001$) or docu-

mentation facilitated by tripod ($M_{tripod}=4.88$, $p<.0001$). Finally, multi-categorical mediation analysis (Model 4, Hayes 2017) revealed that perceived presence mediated impression for both the documentation versus minimal capturing (CI=.73, 1.39) and documentation versus tripod comparisons (CI=.57, 1.19). The pattern of mediation results for interest in future interactions was also significant in the same direction.

In study 4 (N=220), a 2-cell (behavior: documentation vs. minimal capturing) design, we focus on individuals' responses to their actual friends' documenting behavior, thereby enhancing external validity while exploring downstream social consequences with this friend. As such, study 4 assesses the judgments of targets with whom respondents already had established relationships. Participants were first asked to provide the names of three non-familial and non-romantic friends before indicating how close they were to each one. Next, participants completed a similar scenario task as in study 3, where they were attending a firework show with a friend who engaged in documentation or minimal capturing. Importantly, the scenario featured the actual name of the third friend that participants had provided earlier. Next, participants were told to suppose they were planning to attend an upcoming outdoor concert and were asked to indicate how likely they would be to invite each of their three friends to join. Subsequently, they indicated how interested they would be in future interactions with the focal friend from the scenario. Finally, participants completed the same index capturing perceived presence.

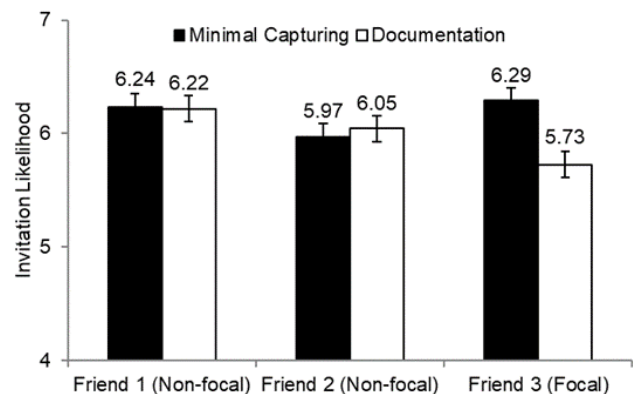
A 2 (behavior) × 3 (friend) mixed ANOVA on invitation likelihood revealed a significant main effect of friend ($p=.0006$), which was qualified by a significant interaction ($p<.0001$; Fig. 2). While participants were less likely to invite the focal friend to the upcoming concert when this person engaged in documentation (vs. minimal capturing) ($M_{documentation}=5.73$ vs. $M_{minimal}= 6.29$; $p=.0005$), the likelihood of inviting the two non-focal friends was unaffected by the focal friend's behavior ($F<1$). Importantly, consistent with the pilot study, the same pattern and significance of effects continue to hold when controlling for interpersonal closeness ($p<.0001$). A one-way ANOVA on interest in future interactions revealed that participants expressed lower interest in future interactions with the focal friend when this individual engaged in documentation ($M_{documentation}=5.37$ vs. $M_{minimal}=5.82$; $p=.0165$), which held controlling for closeness ($p=.0401$). Finally, mediation analysis (Model 4, Hayes 2017) revealed that the indirect effect of behavior on downstream consequence consequences through perceived presence was significant for both invitation likelihood (CI=-.86, -.17) and interest in future interactions (CI=-.83, -.10]), results that held controlling for interpersonal closeness. In sum, study 4 conceptually replicates the documentation penalty with one's own actual friends and shows that these negative impressions can carry important social consequences, including desire for future interactions.


Fig 2. Behavior × Friend on Invitation Likelihood

Summary of Results

Study	Measure	Main Results
1	Target Impressions	• Main Effect of Behavior: $F(1, 278) = 29.55$, $p < .0001$ • Documentation Method × Behavior Interaction: $F(1, 278) = 55.37$, $p < .0001$ $M_{\text{self, enact}} = 4.34$ vs. $M_{\text{self, abstain}} = 6.23$; $F(1, 278) = 83.50$, $p < .0001$ $M_{\text{outsourced, enact}} = 5.71$ vs. $M_{\text{outsourced, abstain}} = 5.42$; $F(1, 278) = 2.00$, $p = .1589$
1	Perceived Presence	• Main effect of Documentation method: $F(1, 278) = 7.82$, $p = .0055$ • Main Effect of Behavior: $F(1, 278) = 114.33$, $p < .0001$ • Documentation Method × Behavior Interaction: $F(1, 278) = 113.17$, $p < .0001$ $M_{\text{self, enact}} = 3.31$ vs. $M_{\text{self, abstain}} = 6.18$; $F(1, 278) = 229.12$, $p < .0001$ • $M_{\text{outsourced, enact}} = 5.12$ vs. $M_{\text{outsourced, abstain}} = 5.13$; $F < 1$
1	Mediation	• Index of Moderated Mediation: $b = -1.48$; 95% CI: [-2.0118, -1.0051] • Self-documentation condition: $b = -1.48$; 95% CI: [-1.9734, -1.0315] • Outsourced documentation condition: $b = -.00$; 95% CI: [-.1709, .1689]
2	Target Impressions	• Main Effect of Behavior: $F(2, 210) = 65.18$, $p < .0001$ $M_{\text{documentation}} = 3.93$ vs. $M_{\text{no documentation}} = 6.25$; $F(1, 210) = 114.59$, $p < .0001$ $M_{\text{documentation}} = 3.93$ vs. $M_{\text{minimal}} = 5.82$; $F(1, 210) = 76.50$, $p < .0001$ $M_{\text{minimal}} = 5.82$ vs. $M_{\text{no documentation}} = 6.25$; $F(1, 210) = 3.93$, $p = .0487$
2	Perceived Presence	• Main Effect of Behavior: $F(2, 210) = 117.69$, $p < .0001$ $M_{\text{documentation}} = 3.38$ vs. $M_{\text{no documentation}} = 6.56$; $F(1, 210) = 203.16$, $p < .0001$ $M_{\text{documentation}} = 3.38$ vs. $M_{\text{minimal}} = 6.04$; $F(1, 210) = 143.64$, $p < .0001$ • $M_{\text{minimal}} = 6.04$ vs. $M_{\text{no documentation}} = 6.56$; $F(1, 210) = 5.31$, $p = .0222$
2	Mediation	• Documentation vs. No Documentation: $b = 2.05$; 95% CI: [1.5690, 2.6088] Documentation vs. Minimal Capturing: $b = 1.72$; 95% CI: [1.2702, 2.2385]
3	Target impressions	• Main Effect of Behavior: $F(1, 215) = 47.01$, $p < .0001$ $M_{\text{documentation}} = 3.58$ vs. $M_{\text{minimal}} = 5.29$; $F(1, 215) = 90.79$, $p < .0001$ $M_{\text{documentation}} = 3.58$ vs. $M_{\text{tripod}} = 4.71$; $F(1, 215) = 39.20$, $p < .0001$ $M_{\text{tripod}} = 4.71$ vs. $M_{\text{minimal}} = 5.29$; $F(1, 215) = 10.17$, $p = .0016$
3	Interest in Future Interactions	• Main Effect of Behavior: $F(1, 215) = 73.20$, $p < .0001$ $M_{\text{documentation}} = 3.24$ vs. $M_{\text{minimal}} = 5.71$; $F(1, 215) = 141.13$, $p < .0001$ $M_{\text{documentation}} = 3.24$ vs. $M_{\text{tripod}} = 4.88$; $F(1, 215) = 61.68$, $p < .0001$ $M_{\text{tripod}} = 4.88$ vs. $M_{\text{minimal}} = 5.71$; $F(1, 215) = 15.44$, $p = .0001$
3	Perceived Presence	• Main Effect of Behavior: $F(1, 215) = 80.31$, $p < .0001$ $M_{\text{documenting}} = 3.10$ vs. $M_{\text{minimal}} = 5.43$; $F(1, 215) = 140.95$, $p < .0001$ $M_{\text{documentation}} = 3.10$ vs. $M_{\text{tripod}} = 5.02$; $F(1, 215) = 94.33$, $p < .0001$ $M_{\text{tripod}} = 5.02$ vs. $M_{\text{minimal}} = 5.43$; $F(1, 215) = 4.28$, $p = .0397$

3	Mediation	• Target Impressions
		  o Documentation vs. Minimal Capturing: $b = 1.05$; 95% CI: [.7331, 1.3874]
		  o Documentation vs. Tripod: $b = .86$; 95% CI: [.5680, 1.1914]
		• Interest in Future Interactions
		  o Documentation vs. Minimal Capturing: $b = 1.64$; 95% CI: [1.2925, 2.0222]
		  o Documentation vs. Tripod: $b = 1.35$; 95% CI: [1.0097, 1.7280]

4	Invitation Likelihood	• Main Effect of Friend: ($F(2, 436) = 7.49$, $p = .0006$) • Behavior × Friend Interaction: $F(2, 436) = 13.97$, $p < .0001$ $M_{\text{friend 3, documentation}} = 5.73$ vs. $M_{\text{friend 3, minimal}} = 6.29$; $t(436) = -3.49$, $p = .0005$ $M_{\text{friend 2, documentation}} = 6.05$ vs. $M_{\text{friend 2, minimal}} = 5.97$; NS $M_{\text{friend 1, documentation}} = 6.22$ vs. $M_{\text{friend 1, minimal}} = 6.24$; NS
4	Interest in Future Interactions	• Main Effect of Behavior: $F(1, 218) = 5.84$, $p = .0165$ $M_{\text{documentation}} = 5.37$ vs. $M_{\text{minimal}} = 5.82$
4	Perceived Presence	• Main Effect of Behavior: $F(1, 218) = 155.69$, $p < .0001$ $M_{\text{documentation}} = 3.67$ vs. $M_{\text{minimal}} = 5.86$
4	Mediation	• Invitation Likelihood: $b = -.51$; 95% CI: [-.8612, -.1686] • Interest in Future Interactions: $b = -.44$; 95% CI: [-.8260, -.0968]

Across a correlational study and four experiments, we investigated the interpersonal consequences of documenting social experiences and uncovered a documentation penalty, whereby people are judged more negatively for documenting experiences due to the perception that they are less present during the experience. These findings highlight an interesting self-other asymmetry, because while documentation has been shown to increase engagement, memory, and even personal enjoyment (Barasch et al., 2017; Diehl et al., 2016; Tonietto & Barasch, 2020; Zhang et al. 2014), observers infer that documenters are *less* mentally present, which in turn generates more negative social impressions. Accordingly, we highlight how this ubiquitous behavior can carry unintended consequences, influencing desire for and thus the likelihood of future interactions with the target.

Violence as a Consumption Object: Contributions from Other Fields to the Understanding of the Phenomenon

Renata Frota, Federal University of Rio de Janeiro (COPPEAD), Brazil
Letícia Casotti, Federal University of Rio de Janeiro (COPPEAD), Brazil

INTRODUCTION

There are few conceptual articles in the Marketing area, but they are necessary for the development of the discipline (MacInnis 2011; Yadav 2010). This conceptual article proposes violence as an object of consumption and articulates three distinct constructs: violence, power and authority. Every individual, consciously or not, consumes violence to some degree. It can be consumed explicitly in sports, movies, news, video games and entertainment, or it can be invisible when it is part of an industrial process or service, such as meat and vaccines that need testing on animals (Jain et al. 2020).

We contribute to future consumption studies that aim to explore the consumer desire for violence, to explore how marketing incentives violence and the adoption of public policies. Violence is present in experiences such as hunting, arms trade, MMA fights, horror films, electronic games. More recently, on digital platforms, we can spot violence on hate speeches, cancellation policy, social justice warriors, threats to democracy, necropolitics (Mbembe 2018).

Positive effects of violence can be connected to Belk, Ger and Askegaard's (2003) discussion on consumer desire. The *fire of desire* helps to explain violence as an object of consumer desire when positive feelings were associated with hunting or watching a fight. Violence and desire are primarily positive powerful motivating forces to consumption, but both have been scarcely studied.

In consumption studies, we identified researches that relate violence to gender (Joy, Belk and Bhardwaj 2015; Varman, Goswani and Vijay 2018; McVey, Gurrieri and Tyler 2021), to advertisements (Leonard and Ashley 2012) and to the media (Martin and Collins 2002; Söderlund and Dahlen 2010; Zlatevska and Spence 2012). We did not find systematic cultural studies that connect violence and consumption. There are themes and phenomena indirectly related to violence such as pain (Scott, Cayla and Cova 2017; Cova 2021), illegalities (Barros et al. 2010), negative feelings (Andrade and Cohen 2007), risks (Arnould and Price 1993; Celsi, Rose and Leigh 1993), hunting and weapons (Littlefield and Ozanne 2011), heavy metal music (Sinclair and Dolan 2015), hardcore players (Tiercelin and Remy 2019) and dominance (Ashworth, Pancer and Pyle 2010).

We chose to deepen violence discussion of subjective and positive violence bringing contributions from different perspectives such as philosophy (Hanna Arendt 1994; Slavoj Žižek 2014), psychology and neurology (Elbert, Weierstall and Schauer 2010; Weierstall and Elbert 2011) and health (The World Health Organization 2002). Violence is often treated as a synonym for authority and power but Hannah Arendt's philosophical thinking (Arendt, 1994) differentiates these concepts. We propose subjective violence (Žižek, 2014) as an object of consumer desire and articulate it with power and authority.

VIOLENCE AS AN OBJECT OF CONSUMER DESIRE: CONTRIBUTIONS FROM OTHER FIELDS

The World Health Organization (2002, 5) defines violence as "the intentional use of physical force or power, threatened or real, against oneself, another person, or against a group or community, which results or is highly likely to result in injury, death, psychological damage, poor development or deprivation". Jayme Paviani (2016) presents violence as "acts contrary to someone's freedom and will, and this is where their moral and ethical dimensions lie". These definitions cover the physical, psychological, social, cultural and other negative aspects of violence.

Why some people feel fascination and pleasure in the consumption of violence? We encountered a German group from psychology and neurology areas studying positive biological effects of violence (Elbert, Weierstall and Schauer 2010; Weierstall and Elbert 2011). They discuss aggression as the perpetration of violence (Weirstall and Elbert 2011). There is a Reactive Aggression, that happens as a resistance to a threat, and there is an Instrumental Aggression, which is proactive and predatory, related to some type of social or material reward (Weierstall and Elbert 2011; Anderson and Bushman 2002; Fontaine 2007; McEllistrem 2004).

Elbert (2010, 2017) described an "appetite for aggression" based on studies conducted in conflict regions. Members of urban gangs, child soldiers and street children reported that, at first, reactive and instrumental aggression in the fighting and killing experience are perceived as heinous, promoting fear and negative effects. However, after a period of adaptation, repeated acts of violence are felt with increasingly positive effects. Endorphins are released into the body with the emotion of a threat, and these hormones can be addictive (Elbert et al. 2010; Weierstall and Elbert 2011).

The evolution of aggressive behavior presupposes an empathic disconnection with the other living being. There is an association between increased hostility, dehumanization and levels of conflict with the escalation of violence (Weierstall and Elbert 2011). This happens because depreciation and dehumanization of the other reduce empathy and moral judgment (Elbert et al. 2017). Socially, the ability and predisposition to aggression stimulate bonding within a group. Working with others in a joint attack was perceived as pleasurable and fascinating (Elbert et al. 2010). However, this biological behavior is also regulated by moral restrictions, expressed in customs and laws. This duality appears as an internal conflict between the human instinct and the need to live in society.

Starting from this group of researches on the effects of violence on people, we can understand violence as an object of consumption, which provides the consumer with some objective gain (for example, prey or vaccines) or positive effect (such as emotion and feeling of power), either as a spectator or actually acting on it.

Elbert, Weierstall and Schauer (2010) analyze violence from the biological and psychological perspectives. The phenomenon of violence has been also studied by philosophers. The Slovenian philosopher Slavoj Žižek (2014) identified three types of violence: objective systemic, symbolic and subjective. Objective systemic violence is a result of the capitalist system, whose operation presupposes the formation of social groups of marginalized and excluded individuals. Symbolic violence deals with the creation of symbology, mainly through language. Words, rituals and objects can become symbols of naturalized violence. Subjective violence is perceived according to the context. A scene can be considered brutal, while in another context, the same scene can be acceptable. Žižek considers subjective violence to be the result of objective violence.

Hannah Arendt brings a phenomenological and philosophical perspective to analyze violence and compare it to other constructs. Arendt distinguishes violence "by its instrumental character. Phenomenologically, it is close to strength, since the implements of violence, like all other tools, are designed and used for the purpose of

multiplying natural strength until, at the last stage of their development, they can substitute for it" (Arendt 1994, 28-29). Arendt (1994) points out the importance of differentiating the concepts of strength, force, authority, violence and power. She observes that especially authority and power are often used as synonyms for violence. To complement her view, we brought contributions from consumer researchers who support the distinguishment of these other concepts.

DISTINGUISHING VIOLENCE FROM OTHER CONSTRUCTS

Concerning the concept of power, Arendt (1994) sees it as "the human ability not just to act but to act in concert. Power is never the property of an individual; it belongs to a group and remains in existence only so long as the group keeps together" (Arendt 1994, 27). Derek Rucker and David Dubois, researchers on consumer behavior, and Adam Galinsky, researcher on management and social psychology, complement the understandings on power by relating it to consumption. They looked at how having and not having power impacts perception, cognition, behavior and values. For them, power is an asymmetric control over valuable resources in social relationships (Rucker et al. 2011, 2012).

Before we continue to analyze the concept of power, it is imperative to differentiate power as an entity that affects consumption from consumer power. According to Denegri-Knott et al. (2006), marketers understand consumer power as the "ability of consumers to ignore, resist and adapt to even the most elegant and expensive multimedia attack" (2006, 1). Although it is a type of power, we think it is too specific for a relationship of resistance between consumers and the market. Our interest is more in tune with the study by Rucker et al. (2011, 2012), about how power alters consumer behavior due to the attributes of the product and the recipients.

Distinguishing violence from power is crucial, because the concepts can be confusing. Arendt (1994) says that, in the face of losing power, one is tempted to replace it with violence to maintain dominance. Violence appears when power is in danger. We differentiate the concepts, first, by understanding that violence works as an instrument, while power is an ability, working as a mediator. From the consumer's perspective, we find that the instrument of violence also works as an object of desire. Second, violence implies harm or death as a possible outcome, while power is about control. Third, violence can provide an objective gain or a positive effect on the consumer, while power is more related to a gain in status.

As for Authority, Arendt (1994) says there are two kinds: personal authority (for example, in the relationship between father and son, between teacher and student), and authority applied to positions (such as senators and politicians or hierarchical positions of the Church) (1994, 28). From the sociological perspective, Weber (2009) defined a different typology for authority, dividing it into three types: traditional (established by cultural customs), rational-legal (applied by law) and charismatic (granted because of the individual's personal qualities, history and/or personality). Charismatic authority is the type of authority most present in consumer relations today. In consumer studies, Hayley Crocker and James Cronin (2017) relied on the concepts of Weber (2009) to describe charismatic authority as "a certain quality of the individual's personality due to the virtue by which he is considered extraordinary and treated as having supernatural powers or qualities, super- or at least exceptional" (2017, 458).

Authority can be mistaken by power and violence because the three of them are means of government of one individual over the other, but the concept of authority excludes coercion and persuasion. When coercion/violence is needed, it means that authority has failed, while persuasion implies equality, which is opposite to the hierarchy

related to authority. The main characteristics of authority are recognition of asymmetric power, obedience and unquestionability (Arendt 1994). Unlike violence and power, we see authority more as a condition than an instrument, object or ability, although it works as a mediator like power. Individuals are invested with authority, what involves respect and legitimacy by others. Nowadays, we can see the impact of authority on consumers in the case of YouTubers, for example. Cocker and Cronin (2017) analyzed the cult of the streaming platform's personalities through Weber's understanding of charismatic authority, and discovered the change in their conditions from the analogue to the digital era.

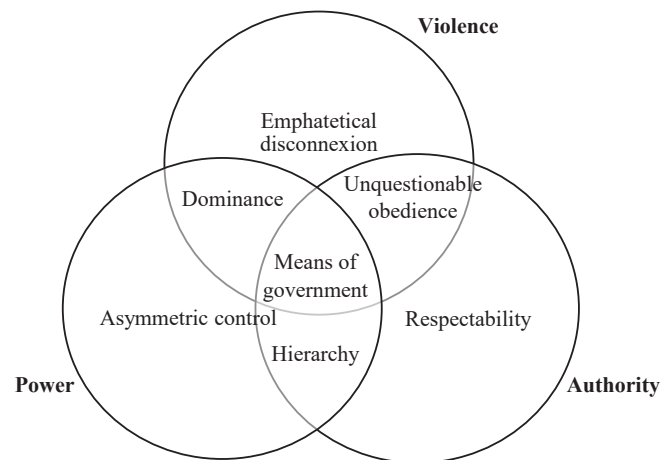
Authority and power are related, but are not the same thing. In common with power, authority presupposes a stablished order or hierarchy. It legitimates the exercise of power. When respect is lost, authority can be challenged. Both authority and violence require unquestionable obedience (Arendt 1994, 2006). But while authority requires respect from others, violence implies an empathetical disconnection. Figure 1 is a representation of the connections and singularities identified of power, authority and violence.


Figure 1 – Connections and singularities between power, authority and violence

Elaborated from Arendt (1994); Elbert et al. (2010, 2017); Weierstall and Elbert (2011); Rucker et al. 2011, 2012; Cocker and Cronin 2017.

DISCUSSION

The concept of violence is rich in providing insights into consumer behavior, marketing practices and public and social policies. The purpose of this conceptual article is to discuss the concept of violence and clarify its importance as an object of consumption desire, contributing by extending the already existing theory (Ladik 2008). Hegemonic understandings treat violence as a practice with negative effects, but it can also be understood as an object of consumption and desire with positive effects of pleasure on the consumer. We provide a different view on violence through the use of psychological, neuroscientific and philosophical contributions and question the positive effects that violence can have on consumers. We realized that violence is a sum of social, cultural, psychological and emotional aspects, that might be present across different contexts.

We have briefly identified further research questions that deserve attention. Is violence subordinated to a hierarchical process or established order? In the sociological and psychological domains, hierarchical structures were identified as antecedents of power and authority. These structures come from the perception of an asymmetry of power between individuals or groups. Ashworth et al. (2010) have found that scenes of dominance are more appealing to people,

especially men, when consuming violent media. Hierarchy must also be studied in the phenomenon of consumption of violence.

How is consumer resistance (disobedience) related to hierarchy? Many consumers are against animal exploitation and resist it by advocating cruelty-free products. In a hierarchical relationship between living beings, animal protectors defend equality between animal and human rights, instead of subordination. This discussion is present in the practices of the cosmetics, fashion, gastronomy and health industries, among others.

How empathy impacts on the consumption of violence-related products? Consumer researchers usually hold the assumption that empathy favors consumption. We located psychological and neurological studies showing that empathetical disconnection is required to appetitive aggression. Contrary to major understandings on empathy, in the case of violence, it can decrease positive consumption. Violence and empathetical disconnection should be more explored in cultural texts such as horror movies and books, brutal sports, bloody e-games.

How does a radical moment of social stress, such as the Covid-19 pandemic, affect the perception of violence? People can be more tolerable to violence in the name of survival or defending a greater good. The world has experienced different violent forces during this crisis: lockdown, social distancing, animal experiments for vaccines, negationist behavior, scarcity, increased inequality, unemployment, fears and trivialization of a large number of sick and dead people. In the case of a huge and unexpected pandemic, violence can change meanings, practices and justifications. This will certainly be a broad field for future researches on violence and correlated issues.

Violence as an object of consumption can have different implications to marketing research. How can violence create negative and positive effects on people? Violent sports, arts and practices, such as hunting (Littlefield and Ozanne 2011); aggressive music, such as heavy metal (Sinclair and Dolan 2015); high-risk activities, such as skydiving (Celsi et al. 1993); and painful adventure experiences (Scott et al. 2017) can cause fear, discomfort and, simultaneously, provoke excitement, pleasure, increasing adrenaline and endorphin. This paradoxical and secular human behavior constitutes an interesting and curious phenomenon to receive more attention in future studies.

Ethical Consumption As Subjectivation: Constituting The Ethical Consumer Subject

Cristiano Smaniotto, Aarhus University, Denmark
Søren Askegaard, University of Southern Denmark, Denmark

INTRODUCTION

Despite a 40 years long quest for it (Newholm and Shaw 2007), ethical consumption still remains a niche phenomenon (Carrigan and Attalla 2001; Eckhardt, Belk, and Devinney 2010; Holt 2012). According to interpretive scholars, part of the problem lies in that research has failed to understand ethical consumption by reducing it to an issue of ethical consumerism (Clarke 2008; Holt 2012) – an ideology which construes the consumptive act as a matter of free choice (Chatzidakis, Maclaran, and Bradshaw 2012) and consumers as rational actors who are capable and willing to integrate ethical concerns in their choices (Clarke 2008).

To balance this overemphasis on the ethical rationality of individuals, interpretive studies shifted focus onto how ethical consumption is constructed as a social and cultural phenomenon. These studies mainly investigated the individual and/or collective projects of resistance through which consumers (and other market actors) attempt to reconfigure the discursive and ideological structures underpinning mainstream market institutions and consumption practices (Chatzidakis et al. 2012; Cherrier 2009; Kozinets and Handelman 2004; Thompson and Arsel 2004; Thompson and Coskuner-Balli 2007a, b). However, scholars within and outside consumer research have argued that resistance perspectives tend to perpetuate dichotomic divisions – such as inside versus outside the market, consumer versus citizen, moral versus immoral – which at best are fictitious (see Arnould 2007; Miller 2001; Soper 2007) and at worst limit our ability to fathom new consumer culture imaginaries (Moraes, Szmigin, and Carrigan 2010; Soper 2007).

In an effort to refine existing knowledge about it and foster its development, the present article offers a new perspective on ethical consumption – one that does not reduce it to a set of consumer choices, nor to a form of ideological resistance to the market. Drawing on Foucault's (1984a, b, 2018) theory of ethics, we suggest that ethical consumption corresponds to the work of the self upon the self (Foucault 1984a) carried out by consumers to master the drives behind their consuming conduct. Through this work – performed as a set of techniques (or practices) of the self (Foucault 1988) – consumers transform themselves into ethical, self-governing subjects. Based on this framework, we investigate the processes and practices comprising ethical consumption work by asking: how do consumers constitute themselves as ethical subjects?

We answer this question by drawing on a multi-sited ethnography (Marcus 1995) of the ethical work performed by Danish self-proclaimed waste reducers through their waste reduction efforts, as changing waste habits involves *"implicating the self in a process of reflexivity"* (Hawkins 2006, 5). Denmark represents a peculiar context for our study because, despite scoring high in various sustainability indexes, it has the highest amount of waste per capita in Europe (Statista 2021). The findings identify three main stages (problematization, moralization and intensification) and six techniques (meditation, learning, confession, penance, exhibition, dialogue) through which waste reducers constitute themselves as ethical subjects.

The contributions of the study are three-fold. First, it extends prior insights on consumer subject formation (Coskuner-Balli 2020; Giesler and Veresiu 2014; Karababa and Ger 2011; Veresiu and Giesler 2018) by identifying the process of *subjectivation* (contra subjectification) through which consumers constitute themselves as ethical subjects. Second, it informs extant theorizations on the moral-

ity of consumption (Karababa and Ger 2011; Kozinets and Handelman 2004; Luedicke, Thompson, and Giesler 2010; Thompson and Coskuner-Balli 2007a) by illustrating the practices through which consumers constitute their consuming conduct as (im)moral. Third, it contributes to existing understandings of how religion shapes consumption (McAlexander et al. 2014; Saatcioglu and Ozanne 2013; Sandikci and Ger 2010) by revealing the religious techniques performed by consumers in an effort to transform themselves into ethical subjects.

THEORETICAL FRAMEWORK: FOUCAULT'S ETHICS

In an interview conducted in the year of his death, Foucault defines ethics as *"the conscious practice of freedom"* (Foucault 2019, 667). In the following, we clarify the basic tenets of this definition.

For Foucault (1984a), ethics is the work performed by individuals to subject themselves to a moral code, the set of values and rules of conduct normally prescribed by social institutions, such as family, school, religion, etc. This work comprises a set of *"conscious and intentional practices"* (Foucault 1984a, 16), which through the Hellenistic period and until early Christianity were exemplified by: (letter) writing, examination of conscience (exagoreusis), confession (exomologesis), meditation, (physical and spiritual) retreat (anachoresis), sex and food abstention, dream interpretation (Foucault 1984a, b, 2018).

Ethical practices are intentional (*volontaires*) because they presuppose an active involvement of the individual; and conscious (*réflechiés*) because they are founded upon the obligation of knowing oneself (Foucault 1984a, 2019). It is only by gaining knowledge about himself that the individual can determine the problem which must be worked upon and, therewith, transform himself into a subject of moral conduct. Thus, ethics is conscious because it entails a reflection of the subject upon itself.

Self-knowledge is also foundational to the development of the self-governing subject, which is an individual who is in control of the drives guiding his actions (Foucault 1984b, 2005). This control is *"a proof of power and a guarantee of freedom"* (Foucault 1984b, 99): free from the enslavement to their drives, self-governing individuals are able to moderate their power over others and, thus, ensure them their freedom. So, ethics as freedom defines a form of government based on the self-regulation of one's power.

Drawing upon this framework, we suggest that ethical consumption corresponds to the work carried out by consumers to control the drives behind their consuming conduct. In light of this definition, the current paper explores the practices comprising ethical consumption work by asking how consumers constitute themselves as ethical subjects.

RESEARCH PROCEDURES

The research design is premised on the idea of a multi-sited ethnography (Marcus 1995) since the object of study (i.e. ethical work) is not a phenomenon defined by clear spatio-temporal boundaries, but unfolds as a seemingly disconnected set of practices stretching through different times and spaces. In mobile ethnographies the object of study is constructed *"by tracing a cultural formation across and within multiple sites of activity"* (Marcus 1995, 96). Accordingly, we followed the ethical work performed by waste-reducing

consumers in Denmark across three different sites: the domestic, the digital and the cultural site.

The digital site corresponds to the Facebook group Zero Waste Danmark, which is a forum for discussion for *"anyone who is interested in zero-waste, waste reduction and sustainable lifestyles more in general"* (as the group description reads). The first author conducted digital ethnography (Murthy 2008) within the group for about two years, visiting the page on a regular basis and taking notes about the conversations and behaviors held by its members. In total, 91 posts and related comments were selected for closer analysis because emblematic of the interactions taking place within the group. Together with the researcher's fieldnotes, this dataset comprises 250 pages of text.

We used Facebook also to gain access to the domestic site and recruit participants for ethnographic interviews. Recruitment proceeded until we reached the point of information redundancy (Sandelowski 1995). Interviews focused on informants' efforts at waste reduction and were collected in informants' homes. In total, we collected 22 interviews lasting between 1 and 3 hours. These are accompanied by 40 pages of fieldnotes capturing the researcher's reflections about the conversation and details about the domestic site, and 120 pictures portraying objects, artefacts and situations representing informants' waste reduction efforts. Observational and visual data enriched our interpretation of the interview material (Türe and Ger 2016).

Finally, we investigated the cultural site by examining relevant cultural texts (Mikkonen, Vicdan, and Markkula 2013). Inspired by Foucault (1984a), we chose *"prescriptive texts… whose main aim is to propose some rules of conduct"* (Foucault 1984a, 22) in regard to sustainable and ethical consumption. Specifically, we selected three zero-waste guides for their relevance to the Danish context. Two of these guides are authored by Danish zero-waste advocates (*Bæredygtig livsstil: zero waste, veganisme, minimalisme* by Calina Leonhardt; *Bæredygtig badass: En zero waste livsstilsguide* by Gittemarie Johansen), whereas the third one is written by a US-based French author (*Zero Waste Home: The ultimate guide to simplify your life by reducing your waste* by Bea Johnson), whose work is popular among our informants.

Data analysis

We analyzed the different sources through a hermeneutical approach (Thompson, Pollio, and Locander 1994), going back and forth within and between the different data points, and relating and revising provisional codes and categories in light of emerging theoretical interpretations. The lead author began inductively with open coding (Charmaz 2006). As the analysis proceeded, the initial codes were discussed by the authors and revised based on Foucault's theory of ethics. At this stage, axial coding (Charmaz 2006) was performed to identify the categories corresponding to the different techniques of the self. Once we reached the point of theoretical saturation (Corbin and Strauss 2014), we proceed with selective coding by relating the identified categories in the process of subjectivation identified by Figure 1.

FINDINGS

Our findings illustrate the recursive process of subjectivation through which consumers constitute themselves as ethical, self-governing subjects. This process comprises three main phases: problematization, moralization and intensification (see Figure 1). Each phase comprises different techniques of the self. The current section provides a brief explanation of the findings summarized by Table 1.

Problematization

The first phase concerns the problematization of individual needs. At this stage, consumers perform a self-examination of their consumption habits by subjecting themselves to meditation and learning techniques. They do so in order to identify and separate true from false needs, as the latter are considered the cause of unsustainable consumption. Through meditation, consumers assess their reactions to imagined consumption situations; through learning, they acquire scientific and/or creative knowledge that helps them further determine the authenticity of their needs.

This finding indicates that (conscious) consumers do not merely adopt or embody institutionally created subjectivities (Giesler and Veresiu 2014; Veresiu and Giesler 2018), but by voluntarily subjecting themselves meditation and learning, they participate actively in the creation of their ethical subjectivity.

Moralization

Once ethical consumers have established the truth about their needs, they institute a mechanism which ensures their commitment to it. Two techniques are used for such purpose: confession and penance (see (Foucault 1988, 2018). Through these techniques, consumers commit themselves to the obligation of telling the truth about their needs both to themselves (through penance) and others (through confession). In this way, consumers constitute themselves as moral authorities responsible for judging their consumption acts.

This finding suggests that ethical consumers not only draw on alternative ideological frameworks to legitimize their consumption practices (Karababa and Ger 2011; Kozinets and Handelman 2004; Luedicke et al. 2010; Thompson and Coskuner-Balli 2007a), but also institute mechanisms of moral self-control to transform their consumption habits.

Intensification

The last stage is intensification, which involves the public manifestation of one's ethos (i.e. mode of being; Foucault 2019). This manifestation helps the subject enact the truth about itself (and its needs) discovered during the problematization stage. Consumers intensify their ethical subjectivity in the public space through the adoption of two main techniques: the *exhibition* of their waste reduction efforts; and the formation of (i.e. the giving form to) their thoughts through *debate*.

This finding provides new insights on the process of identification through which ethical consumers construct their identity while interacting with submerged networks (Cherrier 2007).

Table 1 - Summary of the findings

Stage	Description	Techniques of the self	Illustrative references
Problematization (development of hermeneutical relation to oneself)	Consumers subject themselves to self-examination to inspect their consumption habits and determine the authenticity of their needs	*Meditation*: assessing one's reactions to imagined consumption situations	Bea Johnson (*Zero Waste Home*): *"Areas to consider include: reducing packaging (Can I buy in bulk instead?); car usage (Can I bike more?); home size (Can I downsize?); personal effects (Do I need it?); technology (Can I do without?); and paper load (Do I need to print it?). Can I buy a lesser amount (maybe in a concentrated form)? Is the amount or size fitted to my needs?"* (book excerpt)
		Learning: acquiring scientific information *(savoir)* and/or enhancing creative abilities *(savoir-faire)* that help consumers problematize the authenticity of their needs	Randi: *"There [an. on Pinterest] I searched a lot for inspiration on Christmas gifts and zero-waste gifts. So, there I get a lot of ideas for Christmas. But I've also searched a lot for face-, or well, home-made care products in general. I have tried to make my own shampoo."* (in-depth interview 1)
Moralization (instituting moral self-authority)	Consumers institute a mechanism which ensures their commitment to the truth about their needs	*Confession* (exomologesis)*: publicly acknowledging one's status as a sinner while asking for help with unsustainable consumption habits on dedicated social media pages	*"In relation to zero waste and the environment in general. What is the best solution? (no, I can't do it myself – it tastes like water – yes, I've tried your recipe to) Plastic bottle with deposit refund or Tetra Pak??"* (include pictures of the two milk bottles) (Facebook post 1)
		Penance: making amends for immoral (unsustainable) consumption habits by adopting more sustainable habits in other areas	Rita: *"It doesn't make sense to, well, make my own toothpaste, or any of these [products] [...] So, if I have a toothpaste which I like, and I feel it gets my teeth cleaned, I just keep it. I'll have to buy indulgences on something else, and try to do something, that makes sense for me"* (in-depth interview 2)
Intensification (manifesting the subject's ethos)	Consumers reaffirm their ethos (i.e. mode of being) by manifesting their thoughts and behaviors about sustainable consumption	*Exhibition:* sharing personal efforts at reducing the burden of one's consumption	*"For me, zero waste is also about creative thinking. This old glass table had a broken leg when I got it. I had it welded. I've covered it with bathroom tiles. The typewriter and the old safety boxes under the table are also second-hand. I painted the old grey filing cabinet with a color that better suited our home, and now it stands in our living room all confident and proud. I sew pot holders out of old jeans and leather from old furniture/jackets. One of the thing I love about second-hand is that it triggers my imagination"* (include pictures of the work) (Facebook post 2)
		Dialogue: engaging in conversation opinions, ideas and facts about (un)sustainable consumption	*"Don't know whether anyone is ready for this, but now you know* *People are ditching toilet paper for reusable cloth rolls and I have so many questions* [link to webpage]*"* (Facebook post 3)

DISCUSSION AND CONCLUSION

This study brought Foucault's theory of ethics to bear to theorize the process of *subjectivation* through which consumers constitute themselves as ethical subjects. This process corresponds to the ethical work which consumers voluntarily perform on themselves in order to develop mastery over the needs guiding their consumption practices.

Our findings cast new light on the phenomenon of ethical consumption. Previous interpretive studies mainly explored ethical consumption as a moral project of ideological resistance to the capitalist market (Chatzidakis et al. 2012; Thompson and Arsel 2004; Thompson and Coskuner-Balli 2007a). Yet scholars within and outside consumer research have shown mounting skepticism towards resistance perspectives which may limit our ability to fathom new consumer culture imaginaries (Moraes et al. 2010; Shaw and Riach 2011; Soper 2007). In response to this scepticism, we suggest that ethical consumption is not characterized by ideological resistance but by self-imposed work to control and moderate one's consumption acts.

The theoretical contributions of our study are three-fold. First, it contributes to research on the formation of consumer subjectivity (Coskuner-Balli 2020; Giesler and Veresiu 2014; Veresiu and Giesler 2018). While existing studies provide compelling insights on processes of *subjectification* through which institutional forces produce and govern different types of consumer subjects, they tend to portray consumers as passive entities which almost unproblematically adopt (Giesler and Veresiu 2014) or embody (Veresiu and Giesler 2018) institutionally prescribed subjectivities. Our article complements these studies by exposing the process of *subjectivation* through which consumers constitute themselves as (ethical) subjects, thereby supporting and expanding on Karababa and Ger's (2011) insight that consumers participate actively in the formation of their own subjectivity.

Second, our article provides new insights on the interplay between morality and consumption. Previous research mainly considered the moral codes which consumers draw upon in order to negotiate, justify and legitimate their consumption practices (Karababa and Ger 2011; Kozinets and Handelman 2004; Luedicke et al. 2010; Thompson and Coskuner-Balli 2007a). Our study extends these insights by showing how consumers participate in the moralization of their consumption conduct. More specifically, the findings reveal how conscious consumers enforce self-regulation by constituting themselves as moral authorities who, through the techniques of confession and penance, monitor their own consuming behaviour and eventually punish themselves for it.

Third, our article bears implications for research on religion and consumption. Existing studies have shown that religious narratives influence consumption choices (Izberk-Bilgin 2012; Sandikci and Ger 2010), provide consumers with a source for identity construction (McAlexander et al. 2014; Saatcioglu and Ozanne 2013; Sandikci and Ger 2010) and even permeate the interactions of (brand) community members (Muñiz and Schau 2005). Our work shifts the focus onto the religious practices informing ethical consumption. Specifically, it demonstrates that ethical consumers subject themselves to religious techniques (examination of conscience, confession, penance) in order to control the drives behind their consumption.

Finally, we conclude with some implications for future research. While the present work offsets previous research emphasis on the techniques of domination through which more or less responsible consumer subjectivities are formed, more research is needed to explore the intersection between subjectivation and subjectification processes. A better understanding of this intersection – where according to Foucault (1988) governmentality lies – will help us imagine new solutions to the problem of fostering ethical forms of consumption. Furthermore, our findings also suggest that more research is needed on how consumers challenge well-established ideological frameworks, such as moral systems. If as Castoriadis (1981) claims the ecological society is a society based on the critical self-examination of its well-established institutions, more work is needed on the practices through which critical approaches to consumption (and other spheres of social life) develop.

Social Media Influencers Educating Consumers on Sustainable Fashion

Nina Mesiranta, Tampere University, Finland

Ines Kaivonen, Tampere University, Finland

INTRODUCTION

Researchers and practitioners in various fields are increasingly looking for ways to encourage sustainable consumption, which is characterized by a focus on environmental, social and ethical aspects as well as an "improvement in the quality of life" and "avoiding modern hyperconsumption" (Lim 2017, 71). Changes are needed both in the mindsets and everyday consumption practices of consumer-citizens (Sahakian and Wilhite 2014; Price et al. 2018). However, interventions usually target individual behaviors rather than social practices (Kemper and Ballantine 2019; Gonzales-Arcos et al. 2021). Social influence is a significant factor in facilitating behavior change toward sustainability (Sahakian and Wilhite 2014; White, Habib, and Hardisty 2019). The role of bottom-up initiatives, such as using social media, may hence be very relevant in facilitating sustainable consumption.

This paper examines how social media influencers (SMIs) educate consumers on sustainability in the context of fashion. Building on De Veirman, Cauberghe, and Hudders (2017) and Coco and Eckert (2020), we define an SMI as an opinion leader or tastemaker in one or more areas of consumption with a large social media following based on sharing text, audio, image, and video posts on a range of topics. Fashion industry and the current patterns of (fast) fashion consumption are major contributors to the global environmental crisis (Lehmann et al. 2019). Fast fashion refers to the business model of retailers who produce inexpensive clothing in a rapidly changing cycle, creating pressure for constant purchasing, and textile waste in the form of unsold clothes. Fashion is also one of the major areas of content produced by SMIs online. Hence, it provides a fruitful empirical context.

Recently, sustainability issues have gained more foothold in social media (Pearson et al. 2016). For example, consumers have started to take a stand on sustainability issues in their personal blogs (Joosse and Brydges 2018), but also SMIs have adopted sustainability as their central focus (Närvänen et al. 2018; Leban et al. 2021; Orminski, Tandoc, and Detenber 2021). However, more research is required on what is the role of these influencers in encouraging and facilitating the collective adoption of sustainable consumption.

In this paper, we draw from sustainability education literature (Frisk and Larson 2011; Redman and Redman 2014) and focus specifically on the domains of knowledge that the SMIs contribute to. By sharing knowledge, they also transfer meanings to their followers (McCracken 1989). The paper contributes to consumer research by extending literatures on SMIs and sustainable consumption by shedding light on the different domains of knowledge which are relevant by SMIs to accomplish change in consumption.

THEORETICAL BACKGROUND

SMIs as agents of change for sustainability

Previous research on consumers' social media activities has indicated the potential that social media have on creating change in issues related to sustainable consumption (Kozinets, Belz, and McDonagh 2012). Producing social media content on sustainability issues can take many forms, such as using sustainability related campaign hashtags or commenting on existing content, posting images,

or participating in discussions (Pearson et al. 2016; Närvänen et al. 2018; Paschen, Wilson, and Robson 2020). In their study of environmental blogs, Joosse and Brydges (2018) identified several levels of how sustainability becomes represented, ranging from making small adjustments or giving practical hands-on advice to more substantial lifestyle changes that redefine consumption. Social media have several advantages for building awareness and motivation for social issues. They create a space for existing social norms to become visible (Pearson et al. 2016). Furthermore, they enable to distill and curate complex information into easy-to-use heuristics, promote the establishing of social relationships and communities, provide customized information, and democratize participation (Kozinets et al. 2012). Social media "offer a powerful way for consumers to educate each other about sustainable options, assert their power to choose those options as democratic citizens in a capitalist global economy, and organize as concerned citizens and consumers" (ibid., 217).

SMIs have been studied in marketing and consumer research from various other perspectives than sustainability. CCT research has highlighted that social media has become a megaphone for individuals who are able to exhibit their taste and expertise in different fields of consumption, including fashion (McQuarrie, Miller, and Phillips 2013; Dolbec and Fischer 2015), food (Kozinets, Patterson, Ashman 2017) and interior design (Arsel and Bean 2013). The power of SMIs as authentic, unique, and credible opinion leaders, and the various associated benefits to brands collaborating with them has also been studied (De Veirman et al. 2017; Djafarova and Rushworth 2017; Casaló, Flavián, and Ibáñez-Sánchez 2020). However, SMIs role in sustainability change still requires more research.

Domains of knowledge in sustainability

Within sustainability education literature, a framework outlining four domains of knowledge has been proposed for sustainable behavior change (Frisk and Larson 2011; Kaiser and Fuhrer 2003). The first domain in the framework is *declarative knowledge* which is the factual knowledge about environmental problems and systems. The second domain of knowledge, *procedural knowledge*, is action-oriented, entailing know-how information and concrete advice on how to do something. The third domain, *effectiveness knowledge* refers to knowledge about the (sustainability) impacts of specific behaviors and the responsibility for their outcomes. This can be also subjective in nature and concern people's own beliefs about the effectiveness of their actions. Finally, *social knowledge* refers to information regarding other people's motives and intentions, such as information on social norms or the legitimacy of certain values or goals in society. Previous research has demonstrated that for sustainable behavior change, integration of these various forms of knowledge is critical, especially beyond declarative knowledge (Kaiser and Fuhrer 2003; Redman and Redman 2014).

METHOD

The research was conducted through netnographic methodology, and the data were generated in two ways between October 2020 and April 2021. First, by exploring Instagram profiles related to sustainable fashion in Finland, we familiarized ourselves with the sustainable fashion social media arena. In previous research, Insta-

gram has been identified as one of the main social media channels for fashion influencers (Casaló et al. 2020) and for sustainable fashion (McKeown and Shearer 2019). Next, we conducted nine in-depth thematic interviews with sustainable fashion SMIs. Most of them can be considered as micro-influencers with less than 5.000 followers (Yalcin, Nistor, and Pehlivan 2021). We observed the SMIs for several months before contacting them to make sure that a substantial part of their social media content was related to sustainable fashion. The interviewees were in different stages of their SMI career, including the amount of followers, the length of their history as an SMI, and the degree of their professionalism (i.e. whether they considered influencing as a hobby vs. as a livelihood).

The interviews were conducted in Teams or Zoom, each lasting about 90 minutes. In addition, the social media postings of the interviewees were observed and analyzed from the preceding year. This data includes photos, videos and texts published on their social media channels, and these postings were also jointly discussed in the interviews by viewing them on a shared screen. All interviewees were active on Instagram, some of them also on YouTube or on their personal blogs.

Topics that were discussed during the interviews included, for example, the SMIs' own experiences and knowledge on secondhand fashion; their thoughts and future goals on their SMI careers, as well as their aims to educate and change the consumption behavior of their followers.

Data analysis and interpretation for both types of data followed the process outlined in Spiggle (1994). Two of the authors firstly categorized the data according to the framework of four knowledge domains (Kaiser and Fuhrer 2003). Consequently, through a joint discussion between all authors, we compared and integrated differences and similarities between different types of data and the four categories. We also utilized iteration to go back and forth between the framework and various types of data to assess the fit between the theoretical framework, the data and our interpretation.

FINDINGS

Declarative knowledge contains both technical or mechanical information and systems knowledge. The first kind includes facts on sustainable fashion consumption: materials, care, acquisition, and disposal practices. For instance, SMIs share technical information through material guides, where the features of different textile materials are compared. On Instagram, these guides are usually short lists of pros and cons, from where the followers can easily receive information without devoting a lot of time and effort into it. In blogs, the material guides are longer texts. Often the information is gathered from external sources: books, articles or from other SMIs. This emphasizes the role that SMIs have as declarative knowledge providers: they summarize and curate information from various sources to offer their followers information in a suitable form. The systems knowledge concerns the way the fashion system works, including the fashion companies' power in society. For instance, on Black Friday, one SMI wrote on Instagram: "Did you know that today is Buy Nothing Day? [...] also a cheap garment has an expensive price. Today is a good day to buy nothing!". Thus, declarative knowledge helps SMIs to subvert the dominant marketing and consumption practices in the fashion industry.

Procedural knowledge covers all stages of consumption from acquisition to use and disposition. Regarding acquisition, procedural knowledge is shared on how to recognize a piece of clothing that is of good quality, where are the best secondhand shops and the best tips for shopping there (e.g. "always try on clothes before purchasing" and "feel the materials of the clothes" in order to recognize poor

quality). Also tips for avoiding shopping are shared, such as how to make one's own clothing or how to refrain from shopping impulses. Related to the use phase, the SMIs share knowledge on how to style thrifted garments and how to maintain clothes in good condition, for instance, by using DIY laundry vinegar, avoiding washing clothes too often, or by using a special wool comb. In the disposition stage, the knowledge shared by the SMIs includes, for instance, advice on where to take the disposed clothes to recycle them in the most sustainable way or how to set prices when selling clothes in secondhand shops. Here, the SMIs highlight not only clothing-related knowledge but also knowledge about digital marketing and algorithms, such as how to either bypass or take advantage of the algorithms which target consumers based on their browsing history. Hence, the SMIs want to offer concrete advice for resisting particularly big fast fashion brands.

Effectiveness knowledge includes providing facts and reflections on the outcomes of specific actions and choices that consumers make in fashion consumption. The SMIs share knowledge on aspects of fashion consumption that the fashion industry controls (such as the environmental impact of different types of fabrics or CSR issues). They also share knowledge on the impacts of daily fashion consumption choices made by consumers. Some influencers highlight the need for a holistic perspective in terms of impacts and to have a prioritization system when evaluating the sustainability impacts of one's own actions. For instance, one SMI suggests "making a list of the sustainability values that are personally most important and then prioritizing your actions accordingly". The most sustainable choice is to use the garments you have - to "shop your closet" as one of the SMIs said. The SMIs also highlight social sustainability, such as the working conditions of fashion production. The SMIs thus help consumers who feel disempowered or overwhelmed by the amount of information. Furthermore, effectiveness knowledge includes the dimension of social media. The influencers highlight the consequences of, for instance, liking or commenting (even in critical tone) the posts of fast fashion companies as this will help the "bad guys of fashion" as named by one of the interviewees, gain more impressions and influence.

Social knowledge can be considered to include anything SMIs share about their personal experiences related to fashion consumption. This provides their followers social understanding of what other consumers (or SMIs) do and think. SMIs also share their own failures regarding fashion consumption, such as accidentally ruining a garment in the wash. In addition, they often share their growth stories as sustainable consumers: "This is how and why I broke free from fast fashion". These stories portray the SMIs as ordinary consumers and as vulnerable to mistakes and temptations, such as impulse purchases. Another form of social knowledge are the social norms: SMIs determine what is legitimate and acceptable and what is not. For instance, one SMI argues that "I hope that they [people with low income] will not feel insufficient or ashamed about their income. Sustainable choices should be made if and when one's income level rises". In addition to enforcing social norms, SMIs are tastemakers. Good taste is important to many SMIs, who are often enthusiastic about fashion and clothing. One SMI argues that buying secondhand does not mean giving up on being on top of fashion trends: "We all know that fashion rotates". SMIs often frame secondhand shopping as a style choice - in addition to being a sustainability choice.

DISCUSSION

Firstly, our findings extend the literature on the roles of SMIs in consumer research. Dolbec and Fischer (2015) suggested that consumer influencers are doing work earlier done by other actors, such

as photographers or fashion editors. From a sustainability perspective, however, it can be argued that the work done by SMIs can be also considered to be complementary or substitutive to sustainability campaigners, such as consumer activists, or public or private educational actors such as schools and non-profit organizations. Compared to these more traditional educators, fashion SMIs are considered as taste leaders. Especially because top-down interventions for sustainability, such as governmental bodies' information campaigns have been found inefficient (Gonzales-Arcos et al. 2021), SMIs provide more potential for social influence and credibility.

Secondly, our findings contribute to research on encouraging sustainable consumption through social media (Kozinets et al. 2012; Pearson et al. 2016; Närvänen et al. 2018) by revealing how the SMIs share different types of knowledge: declarative, procedural, effectiveness and social. Social media appears as a very suitable forum for going beyond declarative knowledge, which is important in influencing sustainability behaviors (Redman and Redman 2014). Furthermore, within fashion, knowledge on sustainability issues can create confusion and complexity, for example due to many trade-offs that must be made (Bly, Gwozdz, and Reisch 2015). Hence the role of SMIs becomes crucial in curating knowledge to their followers.

Thirdly, in addition to sharing knowledge on sustainable fashion consumption, the SMIs also engage in criticizing unsustainable aspects of the mainstream fashion system, such as fast fashion. The role of algorithms is significant and the SMIs share tips for resisting their power. Thus, the SMIs build awareness not only on sustainability of fashion but also on coping with the persuasive power of digital marketing.

Finally, the limitations of the study include that by focusing on SMIs only, the findings do not cover the impact of knowledge sharing on sustainable behavior of their followers. Furthermore, it would be interesting to compare the micro-influencers to big celebrity influencers using social media to discuss sustainability issues. Our study opens up avenues for investigating the relations between SMIs and followers further in the context of sustainability change.

Meanings of DIY in a non-Western Mediterranean Market: The Case of Pastry-Making in Algeria

Amina Djedidi, Université Paris-Est Créteil, France
Nacima Ourahmoune, Kedge Business School, France

INTRODUCTION

DIY has been widely studied in Western and industrialized contexts. In consumer research, masculinity in the home has until now been the general focus (Moisio et al., 2013; Watson and Shove, 2008; Campbell, 2005). Wolf et al. (2015) first demonstrated how it can contribute a perspective of female empowerment. Very few studies have investigated non-Western (Gurtoo et al., 2010) and Mediterranean markets (Jafari, Firat, Süerdem, Askegaard and Dalli, 2012). These are currently subject to heavy transformations in terms of DIY consumption practices. Non-Western consumers are observing a wider availability of ready-to-eat/wear/use experiences due to increased imports and new local industrial processes combined with a growing middle class. This is reshaping the essence of DIY as a practice in terms of both meanings and use. This context enriches our views of DIY in contrast with mature markets. Moreover, Southern Mediterranean contexts offer complex environments in which to examine DIY given their proximity to the Northern Mediterranean coast and the continuation of local practices in relation to handmade products including food. This research follows Türe and Ger's (2016) call to research craft-like activities in relation to social capital. It also focuses on handmade food pastry-making as a marker of social distinction (Bourdieu, 1979). Findings support the argument that the widespread practice of DIY pastry-making in Algeria reveals the complex dynamics of (social) expression.

This paper specifically sheds light on the contrasting meanings of DIY practices of pastry-making in Algeria in comparison to Western conceptualizations. Algeria is a rich context for this for 2 reasons. First of all, Algeria is a Southern Mediterranean country (under-represented in consumer research) and has a long history of hosting empires and reigns of Numidians, Phoenicians, Carthaginians, Romans, Vandals, Byzantines, Middle Eastern populations, Ottomans and finally French colonies (Djedidi, Ourahmoune and Dalli, 2017). These have inevitably permeated national food culture and offer a rich set of references within which to unpack the meanings of DIY. Algeria is also a transitioning market. After decades of socialism, Algeria opened its market up in 2000 and is currently experiencing strong economic and social transformations affecting consumer behaviors (Ourahmoune and Özçağlar -Toulouse, 2012). The intersection of a complex cultural heritage of food and the status of a transitioning market in a non-Western context offers a unique space in which to capture various layers of DIY meanings.

Counterintuitively, DIY did not disappear to leave more space for outsourcing and the consumption of ready-to-eat industrial foods. Instead, we are witnessing an intensification of DIY practices, channeled by a variety of modern resources beyond traditional family circles. Consumers use books, TV channels and blogs to discover popular recipes and actively partake in social media, sharing media content (pages, photos, videos, applications, etc.).

Using an ethnographic approach, this research derives inductive insights into how the DIY trend is lived and practiced through pastry-making. It anchors the micro in the macro, uncovering spatial and temporal dimensions at the heart of traditional and modern tensions, to identify subtle taste regime negotiations.

METHOD

The ethnographic case study method (Visconti, 2010) adopted in this research to capture the different overlapping meanings surrounding DIY pastry-making practices. Multiple data sources were used in order to enrich our understanding of the complex dimensions of the topic, including: (a) ethnographic interviews with 16 consumers, recruited using the snowball process until theoretical saturation was reached (Creswell, 2006), with a varied sample in terms of gender, class, age (ranging between 22 and 69), occupation, education and location to capture a variety of expressions of taste regimes; (b) 2 sets of netnography data (Kozinets, 2010) *via* blogs and social media pages of pastry-makers; (c) participant observations at social events (tea parties, weddings, sip and see parties, religious celebrations, etc.). Visual material was produced, in the form of photos of various stages of the pastry-making process, from preparation to consumption; and (d) the textual data was further enriched with the transcripts of 4 interviews with pastry-makers. The aim was to capture the motivations of DIY consumers who choose not to buy and those who choose to outsource ready-to-consume pastry. In accordance with Grounded Theory (Strauss and Corbin, 1990), interviews were transcribed and analyzed, categories evolved over time and their interpretations were revised.

FINDINGS

To expose the different meanings of DIY practices in the Mediterranean context of Algeria, the overlapping results of the research are presented around two important themes, which inductively emerged from the data analysis: (1) connecting time and space and (2) expressing taste and distaste.

Connecting time and space

Time perpetuation: celebration and convivial experiences of sharing. Pastry-making used to be an exclusively home-based activity, often gathering a large number of family members, and uniquely centered around joyful occasions such as religious celebrations, weddings, graduations and births. Now that most of these celebrations are held in party halls, and that family members have less time to spend on such collective activities as preparing for ceremonies, pastry-making is still perceived as a way in which to reproduce these convivial moments of sharing. Indeed, for many, it is not the end product that matters so much as the process. Here the act of creating food from scratch, of rising to challenges such as having the right temperature and baking conditions, choosing the right ingredients are part of the experience of suspense followed by gratification. This experience continues when serving the pastries and seeing family members and guests enjoy them.

Transcending space: simulating one's home country atmosphere. When one's environment is not conducive to experiencing the ambiance of preparing pastry from scratch, some interviewees say they participate in events where they try to recreate this atmosphere. Around six female immigrants among the interviewees came to France to study[1] and attended a professional Fair dedicated to the Algerian community in France. Because they knew the organizer, they wanted to participate by preparing pastries for this event (with 300 attendees) as a way of doing it "*the Algerian way*" and as such to recreate the atmosphere they missed from home. "*Preparing pas-*

---

[1]   In different domains: biology, computing, management, medicine, physics…

try for the Fair[2] was a festive occasion of excitement, discussions, laughter and music, just like a typical preparation for an Algerian wedding." (Ouerdia, F, 29 y). For more than 5 years, these interviewees wanted to replicate and convey the authenticity and care which had transcended country borders and which had enabled them to revive a genuine atmosphere of joy and sharing in a professional context (the Fair) where the dichotomy of personal/professional space is challenged.

Expressing taste and distaste

Social hierarchy: ranking tradition and innovation. Algerian culinary heritage is a reflection of its long history of finding itself at the crossroads of different civilizations and cultural footprints. The discourses of consumers and pastry-makers paint a picture of traditional pastries as symbolic of memories of special occasions, childhood, grandmothers' and family recipes. Preparing these pastries is seen as "*sticking to tradition: these are our origins, where we come from, and from where we develop*" (Imane, F, 32 y). For instance, some of the traditional types cited are Baklawa, Tcharak, Sablé, Mouskoutchou, Ghribia, Makrout Ellouz, and Croquet. This subset of pastries is widely associated with other cultural contexts: Baklawa and Tcharak are Turkish, Sablé owes its name to the French city Sablé-sur-Sarthe; Mouskoutchou is Spanish, Ghribia is analogous to the Spanish Mantecado de Sevilla; Makrout Ellouz and Croquet are comparable to, respectively, the Italian Ricciarelli di Sienna and Cantuccini di Prato, etc. So far, none of the individuals interviewed have mentioned the non-Algerian resonance of some pastry names. Throughout time, the process of endogenization, -prompted in both directions (South to North, North to South) and linking both sides of the Mediterranean-, has enabled a re-appropriation and integration of some pastries into culinary heritage within a repertoire/classification. The results question the Western versus Oriental categorization that overlooks such endogenization processes.

Moreover, all the traditional pastries, - whether they are comparable (or not) to other exogenous types -, are considered markers of distinction by contrast with newly introduced pastries. For example, interviewees underline how these original DIY traditional pastries have been refined over time, setting them in opposition to the recently introduced pieces inspired from other cultures, such as Syrian or Turkish Baklawa. Interviewees also describe how the modest and sober traditional DIY Sablé is more refined than the new Sablés with their extravagant decorations. Named Sablé Prestige, this new sophisticated Sablé is inspired by television programs like Top Chef and social media content about DIY pastry. Interviewees talk of "*bad taste*", "*bling*" and a "*nouveau riche attitude*" when pastry becomes extravagant in this way.

Furthermore, there is no link made between the price of the ingredients used in refined DIY pastry and the image of good taste. Invariably, traditional, original recipes will win over more contemporary ones in terms of perceptions of good taste. Makrout Lassel[3] pastry (made using very affordable ingredients) is the cornerstone of any well-to-do wedding and is judged a success only if it is traditional in both taste and appearance (size, form, etc.). Makrout Lassel is also prepared for mundane daily consumption, but once made in a ceremonial context, it acquires an extra layer of meaning. Moreover, tradition is also a structure that determines the extent to which innovation is tolerated. For instance, interviewees highlighted how it could be seen as "blasphemy" to present a pastry as an innovation when it is the same as a traditional recipe but merely shaped

or displayed differently. Consequently, interviewees only tolerate a minimal amount of extra decorations in traditional pastry-making in a bid to protect the legacy. Innovation is accepted where the pastry is the product of a completely new recipe, shape and name.

Outsourcing, delegating DIY and projecting taste expression by assembling skills. On special occasions such as weddings (with hundreds of guests), families are often overwhelmed. Therefore, they tend to outsource pastry-making in order to control the quantity/quality/price ratio. The DIY skills involved are converted into expertise assembling different pastries and presenting them according to what is considered a refined set of ceremonial pastries. The DIY process is transformed into a process of selecting the right experts among pastry-makers for each type of pastry (through word of mouth, sampling, skills, expertise in specific areas, etc.). The second requirement sought is the creative ability to fashion the right combination in order to express their vision of good taste and to impress guests. In this way, consumers who outsource pastry-making still derive pride and prestige through their choices of pastry types, colors, flavors and scenographic display. Given the expectation of traditional pastry to reflect good taste, opportunities for innovation and differentiation are necessarily limited and require subtle taste regime assemblages. Interviewees consequently highlighted the importance of impressing and surprising guests at the way in which the pastries are chosen and presented. The research shows how DIY can apply beyond the individual sphere to a more social one. Social DIY follows a specific trajectory from the kitchen to the point of serving, revealing the importance of scenography as a social ritual to derive social distinction and a wow effect.

CONCLUDING CONSTRIBUTIONS

This research contributes to the stream of consumer research focusing on the meanings of DIY. The practice of DIY in a non-Western Mediterranean context reveals new findings which reflect its collective and social dimension, rather than its generally individualistic nature in the West; and the ephemeral and shared production (of pastry) versus Western individualized practices (home improvement, etc.), the latter having been the focus of previous research. DIY as a practice is less uniform than it may seem and is anchored in its socio-cultural context. This extends our knowledge about the subtle forms of DIY entrenched in rapid socioeconomic transformations in emerging markets.

Furthermore, the results show how DIY pastry is a powerful expression of a nonlinear configuration of time as it brings together a condensed heritage of the different dynasties and civilizations, which shape Algeria today. We present a somewhat homogenous and nostalgic account of individual memories embedded in DIY pastry-making. Time is revealed as being "atemporal" (Djedidi and Ourahmoune, 2020) since time heterogeneity allows the past and present to coexist (Türe and Ger, 2016).

DIY pastry-making is a symbol of the nostalgic recreation of a home atmosphere. Kusenbach and Paulsen (2013) define home as "*a canvas for the expressions of styles and tastes*". DIY pastry-making embodies this notion by reshaping a subtle combination of practices to serve this view, adding the importance of negotiating taste regimes as is reflected throughout this paper. More specifically, the present findings suggest that DIY can transcend the definition of using one's own hands, resources and skills to produce. DIY is a wider process involving complex and subtle boundaries between classes, which shape taste regimes, and class dispositions. These are further magnified through "symbolic obstacles" and beliefs according to strict scripts for production, aesthetics and presentation, conforming to taste expectations, respecting legacy and the desire to impress oth-

3   Completely different from Makrout Ellouz

ers. Indeed, it shows how DIY extends to the options and decisions made when one chooses to outsource under constraints. Family contexts (Epp, Sunaina and Velagaleti, 2014) show how outsourcing of individual activities is motivated by both practicality and the desire to optimize quality time (Thompson, 1996). This paper emphasizes how DIY pastry-making is inseparable from social distinction dynamics even in its outsourced form. Indeed, food is ripe ground for social distinction (Bourdieu, 1979), and taste regimes reinforce cultural hierarchies (Arsel and Bean, 2013). Here, individuals seek to maintain social distinction and mobilize social and cultural capital to extend DIY skills and carefully assemble different pastry-makers (providers).

Assemblage theories unveil the complexity of component dynamics (Epp and Price, 2010; DeLanda, 2006). Assemblage, regarding outsourcing options in pastry-making, is considered an extended DIY practice as it entails expertise and cultural capital to assemble different pastry-makers based on a well-studied constellation of components. This paper enriches the array of sources that help to navigate the landscape of resources. Whereas Epp et al. (2014) investigated the role of the market in developing and revising assemblage, the present research highlights the important role of the social distinction motivation in shaping this assemblage. As choices of components are impacted by their complementarity and competition (Epp and Price, 2010; Epp et al., 2014), this paper shows how cultural capital (Bourdieu, 1979) can act as a navigational cue to minimize discrepancy or emphasize homogeneity among components.

Counter-intuitively, our paper shows how the pastry-making domain is strictly normative, with limited margin for accepted innovation. Thus, when DIY pastry is made with the purpose of shared consumption, the scenography chosen is a way in which to express singularity and distinction, enabling individuals to use their know-how and social skills. The results enrich Abrams' (2013) claims that scenographic imagination interacts with gustatory experience, recognizing the porosity of the human body and its connection with the environment. Indeed, Abrams' (2013) research scrutinizes the scenography, which engages an audience in the active production of the meal experience as their sense of self is involved. This paper goes further by presenting scenography as an extended form of DIY expertise and social distinction within a normative field.

APPENDICE
Table1: Results Summary

Themes: DIY meanings	Sub-themes	Quotations
Connecting time and space	Perpetuation of celebration and convivial experience of sharing	"When *you visit your family members in Eid, you give your dish full of different pastries to show the models you would have prepared, and when leaving, they would give you back your dish and fill it with their own pastries: it is the occasion to discover new models. Unfortunately, now people do not visit, they just call or send SMS*" (Souhila, F, 34 y).
		"*Now, even if you do not have time, you prepare small quantities of pastry, so that tradition is not lost… (Nowadays) some will order the pastry. As time goes by, this tradition will disappear, and for me, there would be no charm nor ambiance around Eid, because the messy kitchen, stress and effort generated by traditional pastry preparations are the sources of this charm, rather than simply putting a dish full of pastry out for consumption*" (Imane, F, 32 y).
		"*I really love it when I have made pastries with my own hands, from scratch, and when I offer it to others to eat. I feel happy, happier than if I had purchased it. I know that my pastries are better than those purchased from the market, but I feel it is a great accomplishment when I make pastry with my own hands and see my guests and family really enjoying them*" (Sabrina, F, 36 y).
	Simulation of home country atmosphere	"*Preparing pastry for the Fair[4] was a festive occasion of excitement, discussions, laughter and music, just like a typical preparation for an Algerian wedding.*" (Ouerdia, F, 29 y).
		"*We get out from office at 8 p.m., we go to Mimi's house, and start preparing pastry, each one does a sort, we put Chaabi music[5], we sing, we dance, we laugh, we are exhausted, but we don't care, just like in marriage or Eid, we sleep at 5 a.m … we just feel home while doing this as we really miss this kind of moments*" (Yasmine, F, 35 y)
Expressing taste and distaste	Ranking tradition and innovation in DIY pastry as embodiment of high taste	"(When choosing traditional models) w*e want something 'Betbaa We Shan'[6]. Even if people are trying to innovate, but traditional pastry charm is unique, it is never old-fashioned. All these new models with glitters and extra decoration are quickly outmoded*" (Imane, F, 32y)
		"*Traditional pastry is the one we prepare for Eid and for marriages ceremony, like Baklawa, Makrout Lassel, Ghribya, Tcharak, but I also think of Sablé, Croquet: it is not the same scale (laughter), but they can garnish the platter and they fit well with everyday coffee breaks*" (Fella, F, 33y)
	Delegated DIY revealing high taste through assembling competencies	"*In my brother wedding, we opted for our neighbor Z, they have a shop in Place des Martyrs, they are known for decades for making pastry, and we also heard that they are best known by their very delicious baklawa as it is stuffed with a mixture of almond and nuts… and the two other models of pastry, we ordered them from my brothers' friend mother B, she is known for making very good and neat pastry, she does it at her place and she is helped by her daughter, she is trustworthy, she respects deadlines, she delivers pastry in their paper liner, she uses good ingredients, not like bakeries that cheat on the ingredients. Her pastry was so good that our guests asked for her contact for their daughter wedding*" (Imane, F, 32).

Dimensions of Frugality

Rabia Bayer, Ko, Turkey
Zeynep Gurhan Canli, Koc University, Turkey
Ceren Hayran, Ozyegin University, Turkey

INTRODUCTION

We live in an era where rampant consumption is highly encouraged. We are bombarded with advertising messages, offers, and other means of marketing campaigns with slogans such as "buy now pay later", "buy two pay one", "eat as much as you can" and "upgrade your choice". On the one hand, rampant consumption has been associated with enhanced psychological well-being, life satisfaction and impression management in public. On the other hand, there is increasing concern about its damages on consumers' budget and environmental resources. The UNDP 2030 Agenda for Sustainable Development, for example, acknowledges that fundamental reductions in spending and consuming are needed to achieve global sustainable development. Accordingly, particular consumption practices are getting more and more popular among consumers such as, keeping hands off expensive consumption, selling and purchasing used products, mending a broken house appliance instead of buying a new one, renting instead of purchasing, or spending time and effort to recycle. Such practices have been compiled under the umbrella term of 'frugality' in previous consumer literature (Bove, Nagpal, and Dorsett, 2009). While recent developments have drawn attention to importance of frugality, previous research has provided contradictory evidence until now. In this research, we develop a two-dimensional scale of frugality mindset and elaborate on the roles of its distinct dimensions in explaining contradictory findings on frugal consumer behavior such as bargain hunting, stockpiling and recycling.

CONCEPTUALIZATION OF FRUGALITY

Frugality is first defined by DeYoung (1986: 285) as the "*careful use of resources and avoidance of waste*", and it is usually conceptualized as the opposite of consumption (Gronow and Warde, 2001). While this initial conceptualization of frugality approached the phenomenon from a waste avoidance perspective, subsequent research added the *acquiring* dimension to the conceptualization and defined frugality as "*a unidimensional lifestyle trait characterized by the degree to which consumers are both restrained in acquiring and in resourcefully using economic goods and services to achieve longer-term goals*" (Lastovicka, Bettencourt, Hughner, and Kuntze, 1999). Although the authors conceptually defined frugality as cited above, they explain their findings based only on the acquiring (or spending) dimension. Majority of subsequent research in consumer behavior has followed Lastovicka et al.'s (1999) conceptualization and used their scale to measure frugality (e.g., Goldsmith, Flynn, and Clark, 2014; Bove et al., 2009; Todd and Lawson, 2003). As opposed to this stream of research that operationalized frugality as thriftiness, i.e., spending as less as possible, subsequent research of DeYoung (1996) operationalized frugality as waste avoidance and making full use of purchased products (e.g., Rao, 2013; Evans, 2011; Witkowski, 2003). We acknowledge that both perspectives are true in nature, because frugality has inherently two dimensions: careful spending and careful consuming. As a result, research following the works of DeYoung (1996) and Lastovicka et al. (1999) has yielded contradictory findings. For example, Ballantine and Creery (2010) argue that frugal consumers are motivated to keep their spending at minimum, while Evans (2011) shows that frugal consumers tend to be environmentally conscious, involve in green consumption and thus are willing to pay higher prices in their purchases. Similarly,

bargain hunting for a lower price is regarded as a practice of frugality (Podkalicka and Potts, 2014), while spending time and money to reach the donation boxes is also another practice of it (Evans, 2011). Next, we briefly elaborate on the constructs that are theoretically related to frugality. Please note that due to space restrictions, we are not able to present a discussion on all related constructs, and hence focus on the most important ones.

3. CONCEPTUALLY RELATED CONSTRUCTS

3.1. Thriftiness

Thriftiness is "*the art of doing more consumption with less money*" (Evans, 2011), which stems from the notion of high pain of payment combined with a motivation to consume more (Rick, Cryder, and Loewenstein, 2007). Compared to frugal consumers, thrifty consumers are twice as more likely to feel pain of payment. Financially prudent consumers enjoy spending money to the extent that they deem necessary (Bardhi and Arnould, 2005). Another aspect that differentiates thrifty consumers from frugal consumers is that they do not focus on the quality related attributes of what they purchase, as long as they are reasonably cheap. These consumers tend to purchase cheap food with beyond-use date or visit charities to get free clothes which they do not need (Miller, 2001; Wilk, 2001). Moreover, unlike thriftiness, frugality does not have to result from perceived deprivation of resources or from efforts to save each penny (Evans, 2011).

3.2. Propensity to Plan Spending

Lynch, Netemeyer, Spiller, and Zammit (2010) demonstrate that frugal consumers tend to plan how they spend money. Investigating frugality as a spending related trait, Todd and Lawson (2003) have shown that frugal consumers are better than their non-frugal counterparts in setting goals and sticking to them with ambition, capability and with a sense of responsibility. Bardhi and Arnould (2005) have further shown that such consumers tend to plan their shopping days only on days of sales. Frugality motivates consumers to plan and monitor their spending, yet, planning is not sufficient to engage in frugal consumer behavior.

3.3. Voluntary Simplicity

Voluntary simplicity is defined as "*a system of beliefs and a practice centered on the idea that personal satisfaction, fulfillment and happiness result from a commitment to the non-material aspect of life*" (Zavestoski, 2002). Elaborating on simple lifestyle choices, some articles use frugality and voluntary simplicity as synonyms without pointing out their distinct aspects (e.g., Shama, 1981). In voluntary simplicity, reaching personal growth is the main consumer motivation (Leonard-Barton, 1981). However, frugality relates to a simpler lifestyle only in the sense of spending and consuming as needed; not more than necessary.

3.4. Value Consciousness

Value consciousness is defined as *"a concern for paying low prices, subject to some quality constraints"* (Lichtenstein, Netemeyer, and Burton, 1990). It generates a concern about acquisition utility, which is relevant to, yet distinct from frugality. Lastovicka et al. (1999) empirically showed that frugality and value consciousness

are distinct traits: frugal behavior is positively related to value consciousness, and this relationship has only medium strength (0.54). Later, Todd and Lawson (2003) demonstrated that the items on their frugality scale are not systematically related to value consciousness.

3.5. Environmental Consciousness

Environmental consciousness is defined as "*the degree to which a person is oriented toward concern for the environment*" (Lin and Chang, 2012). Environmentally conscious consumers do not necessarily have frugality goals, and not all frugal consumers may avoid waste due to environmental concerns. For example, buying fairly-traded products is regarded as an environmentally conscious choice (Evans, 2011). However, in fact, it has nothing to do with restraining acquisition and consumption of goods, and thus frugality. Moreover, compared to frugal consumers, environmentally conscious consumers are more likely to leave their purchased products unused, and they may even engage in overconsumption (Lin and Chang, 2012). Frugal consumers, on the other hand, try to make best use of their products without a focus on the environment.

3.6. Price Consciousness

Lichtenstein, Netemeyer, and Burton (1995: 235) define price consciousness as "*the degree to which the consumer focuses exclusively on paying a low price*". It usually generates outcomes at the expense of other consumer judgments such as quality (Alford and Biswas, 2002). Regarding price consciousness as a consequence of frugality, Lastovicka et al. (1999) showed that the relationship between frugality and price consciousness has a medium strength (0.68).

4. DIMENSIONS OF FRUGALITY

As depicted in its conceptual definition provided above, frugality has two dimensions: one is about the acquisition of goods and the other is about the usage of goods. In other words, one dimension is related to spending carefully; the other is related to consuming carefully.

4.1 Spending Related Frugality

Spending related frugality can be observed when consumers are motivated to make the necessary consumption with the least possible payment. According to Miller's theory of shopping (1998), spending related frugality can be understood in terms of an attempt to carefully use economic resources for further and better acts of consumption - not saving due to pain of payment. We suggest that it is dominantly salient in the pre-purchase stage of consumption, where consumers search for product information, compare prices and make purchase decisions. Previous research that conceptualized frugality as consumption related have found a positive relationship between frugality and market mavenism, bargain-hunting and price consciousness Podkalicka & Potts, 2014, Bardhi and Arnould, 2005).

4.2. Consumption Related Frugality

Consumption related frugality is observed when consumers are motivated to make the best use of their belongings leading to least possible waste or not trashing the items without being fully used. Using a bottle of shampoo till the last drop and crafting a pencil out of the bottle once it is fully consumed is one such example. Previous research that conceptualized frugality as consumption related have found a positive relationship between frugality and second-hand consumption, green consumption and recycling (Evans, 2011; Pepper, Jackson, and Uzzell, 2009). We suggest that it is salient both in the pre-purchase stage of consumption and during/after consumption. Specifically, it is evident during consumers' search for product

information while comparing product durability and when purchase is completed, during the consumption phase where they try to use the products carefully, and if possible repair and recycle them in later stages. Next, we present three studies for scale development, and an exploratory study that tests the consequential effects of two-dimensions of frugality (SRF and CRF).

5. DEVELOPMENT AND VALIDATION OF THE SCALES

5.1 Study 1: Item generation

To create an initial pool of items, we recruited a U.S. national sample using Prolific online panel. Our sample consisted of 12 respondents (*M*age = 32, 33% female). Using a set of open-ended questions, we asked participants to elaborate on and write their thoughts in detail about: a) spending money carefully, b) consuming possessions carefully, and c) the most important things while purchasing/using/disposing of their possessions. Item generation relied on theoretical insights derived from previous research as well as investigating data gathered in this exploratory investigation. We identified and converted frequently mentioned answers into scale items. An initial pool of 81 items was generated to reflect the two dimensions of consumers' frugality. Two research assistants were provided with the definition and explanation of each dimension as well as the set of items. They were then asked to allocate the items to one of the two dimensions or remove them from the set. After allocating or eliminating the items, a total of 18 items remained.

5.2. Study 2: Scale Development

We recruited a U.S. national sample using Prolific online panel. Our sample consisted of 216 respondents (*M*age = 32, 46% female). The 18 items generated in Study 1 were put into a seven-point Likert-type scale format (1: strongly disagree, 7: strongly agree). Respondents were asked to indicate the extent to which they agreed with these statements. We deleted items based on two criteria: if corrected item-to-total subscale correlations were below .50 and if they had statistically higher correlations with a dimension to which they were not hypothesized to be related to (Bearden, Netemeyer, and Teel, 1989). We used Varimax with Kaiser Normalization as the rotation method. The analyses generated a reduced scale of 9 items (see Table 1). Items that loaded on factor 1 constitute the scale of spending related frugality (SRF); items that loaded on factor 2 constitute the

Table 1: Factor Loadings

Rotated Component Matrix		
	Component	
Factor	1	2
I like to keep my budget under control	.759	
When I purchase something, I want to get the best deal	.725	
I plan my purchases beforehand	.621	
When buying something, it is good to think carefully about how much I spend	.617	
I wait until I can get a product at the best price	.584	
I do not dispose of a product if it can still be useful in alternative ways		.718
I do not throw things away unless they get too damaged to be repaired		.684
I keep empty items such as containers or bags to use them again in the future		.662
I try to make products last (like toothbrushes, shampoos, pens...)		.527

scale of consumption related frugality (CRF). We further calculated the Cronbach's alpha for each dimension (Cronbach's alpha for SRF =.784 and for CRF = .712).

5.3. Study 3: Convergent and Divergent Validities

We recruited a U.S. national sample using Prolific online panel. Our sample consisted of 302 participants (Mage = 35, 55% female). After the respondents responded to a set of conceptually related trait scales, we analyzed the correlations between them. In accord with Campbell and Fiske's (1959) suggestion, the traits were distinct and not perfectly correlated (see Table 2). The correlation between SRF and CRF was r = .448. Although SRF tends toward propensity to plan spending money and value consciousness, both dimensions are

DISCUSSION

This research explores the two distinct dimensions of the consumer frugality scale, which was defined as a unidimensional consumer trait by previous research. We suggest that frugality incorporates two distinct elements: *consumer related frugality* refers to careful consuming; *spending related frugality* refers to careful spending. Our findings support that CRF and SRF are theoretically and empirically distinct from each other, as well as from other frugality related constructs that are identified in consumer literature,

Table 2: Correlations Between Consumer Traits

		Correlations						
		Price Conciousness	Propensity to Plan Spending	Value Consciousness	Deal Proneness (active)	Deal Proneness (passive)	Voluntary Simplicity	Environmental Consciousness
SRF	**Pearson Correlation**	.242	.700	.691	.406	.392	.033	.252
	Sig (2-tailed)	.000	.000	.000	.000	.000	.564	.000
CRF	**Pearson Correlation**	.217	.374	.422	.301	.314	.171	.331
	Sig (2-tailed)	.000	.000	.000	.000	.000	.003	.000

not perfectly correlated with other traits. Therefore, we can conclude that the dimensions are distinct from each other as well as from other traits[1] listed below.

5.4. Study 4: Exploratory Test of Consequential Effects

We conducted an exploratory study to test the consequential effects of the identified sub-dimensions of frugality (SRF and CRF). Specifically, we hypothesized that 1) consumers with a higher trait consumer related frugality would be more likely to repair their items rather than buy a new one, and 2) consumers with a higher trait consumer related frugality would have a more positive attitude towards using second-hand items. However, we did not expect to find these effects for consumers with a higher trait spending related frugality. Our sample consisted of 218 student participants from a European university (Mage = 21,57, 51% female). After responding to a set of trait scale items including SRF and CRF, participants indicated their preference between buying a new outfit versus repairing the torn one, provided that both options cost the same. Then, they indicated their attitudes towards using second-hand goods (1= very negative, 7= very positive) and how willing they would be to buy a second-hand accessory at half the price of a new one (1= not at all, 7= very much). As expected, having an outfit repaired (vs. buying a new one) was strongly positively correlated with CRF (r = 0.23, p = 0.001), but not with SRF (r = 0.09, p > 0.05). Also, CRF was strongly positively correlated with positive attitudes towards using second-hand goods (r = 0.21, p < 0.05), and higher willingness to purchase a second-hand accessory over a new one (r = 0.15, p < 0.05). However, there was no correlation between participants' SRF and the measured DV's (p's > 0.05). These results provide initial evidence and shows that the two sub-dimensions of frugality identified in this research (SRF and CRF) has different behavioral correlates.

and have different consequential effects. As the next step, we are at the stage of manipulating CRF and SRF to identify cause-and-effect relationships between the distinct dimensions of frugality and the 3R (reduce, reuse, recycle) model of consumption. Specifically, we hypothesize that consumption-related frugality will lead to consumer behavior with 3R strategies such as secondhand consumption, repairing, reusing, donation and recycling, whereas spending-related frugality will not motivate these tendencies.

Food Well-Being at the Time of Covid-19: The Use of Coping Strategies Rooted in Caring for Low Socio-Economic Status Families

Ophelie Mugel, FERRANDI Paris, IRG EA 2354, France

Margot Dyen, Institut Paul Bocuse, France

Valérie Hémar-Nicolas, Université Paris-Saclay, RITM, France

INTRODUCTION

Covid-19 lockdown in spring 2020 upset families' lives, reorganizing their daily activities and restricting living space: dining out decreased, families learned to cohabit and parents took over school via distance education. This pandemic disrupted the way consumers ate, shopped and interacted with food (Janssen et al. 2021; Scott and Martin 2021). Yet, the effects of Covid-19 on food consumption and food well-being (FWB) differed depending on consumers' socio-economic situations (Hamilton 2021; Scott and Martin 2021). It became apparent that, during lockdown, families' FWB required material comfort and financial ease due in part to food price increases causing adverse effects on low socio-economic status (SES) families' FWB. Rooted in the TCR stream (Mick 2006; Mick et al. 2012), **this research aims to deepen our understanding of families' FWB in a state of vulnerability by analyzing the strategies they deployed in spring 2020 to face this unprecedented situation**.

THEORETICAL FRAMEWORK

Taking a dynamic perspective of vulnerability, we consider it as not unique to certain individuals, but as an experience that any person may live depending on their individual characteristics, economic, social, and environmental conditions, and a context (Baker, Gentry, and Rittenburg 2005). Similarly, although a crisis may touch the whole population, some individuals, due to specific vulnerabilities, may be more affected (Baker 2009). Vulnerability can be economic, cultural or social (Schultz II and Holbrook 2009; Spotswood and Nairn 2015) and is characterized by a loss of personal control (Baker et al. 2005). Although the Covid-19 crisis as a vulnerability context differs partly from the natural disasters studied so far, it also altered *consumption adequacy* (Hill, 2020; Hill and Sharma 2020) disrupting access to basic necessities (Martin and Hill 2012), specifically to food (Baker, Hunt, and Rittenburg 2007).

Block et al. (2011, 6) defined FWB as "as a positive psychological, physical, emotional, and social relationship with food at both the individual and societal levels". While most studies on FWB so far have been conducted among consumers who have access to abundant food (Hémar-Nicolas and Ezan 2019; Mugel, Gurviez and Decrop 2019), recent research has focused on consumers who lack access to affordable and nutritious food (Bublitz et al. 2019a; Parsons et al. 2021; Voola et al. 2018). Bublitz et al. (2019b) proposed an integrative framework of marketing practices that improve affordable access to healthy food for people experiencing hunger, highlighting the fundamental role of social and local entrepreneurship. Drawing from the five domains of FWB (Block et al. 2011) - availability, socialization, literacy, food policy, and marketing, these authors extend the FWB paradigm to include people who do not have adequate access to food. Similarly, Mugel (2020) highlighted how a social restaurant designed for homeless people meets their physical, emotional, and social needs. All these studies have focused on analysing FWB from a chronic vulnerability perspective, without taking into account the impact of a crisis context, which may accentuate difficulties. This research aims to bridge this gap.

Lazarus and Folkman (1984) defined coping mechanisms as a set of efforts made by individuals to reduce or tolerate sources of stress. To do so, individuals use resources to deploy problem-focused or emotion-focused coping strategies. Problem-focused coping aims to modify the environment causing the distress, whereas emotion-focused coping aims to reduce the negative emotions generated by the stressful situation (Stanton et al. 2000). Yet, this dichotomy is criticized for not taking into account the social and then collective context of individuals and sometimes for inducing a normative view of "good" (problem-centred) and "bad" (emotion-centred) coping (Hutton 2015). Focusing on families' responses to vulnerability due to the Covid-19 lockdown, this study contributes to the literature on coping strategies characterizing the collective dimension of coping, and better understanding the porosity between problem-centred and emotion-centred strategies.

METHODOLOGY

In a comprehensive approach, this qualitative study is based on 14 semi-structured interviews conducted with one parent of low SES families (Appendix 1), in France, from July to November 2020. In line with the ethical assessment of the study, explicit consent was obtained for each informant. Our sample was built on the basis of two conditions: 1) participants had to live in one of the three major cities' suburbs where a large number of households live below the poverty threshold (Observatory of French inequalities 2018); 2) households had to have at least one baby or a school-aged child. Neighbourhood-oriented social organizations helped us to recruit them striving to diversify vulnerability situations (Baker 2009). Due to the lockdown situation, seven interviews were conducted by phone, seven others face-to-face, allowing us to partially immerse ourselves in the local environment. During the data collection, researchers tried to understand and articulate the point of view of the families living the experiences (Baker and Gentry 2006). The interview guide aimed to explore the families' experiences of lockdown: food supply, meal preparation, meals, after-meals, FWB or food distress, and family well-being. Integrally transcribed interviews were analyzed through thematic analysis and interpreted independently by the coders who proceeded to break down the material collected into units of meaning, attempting to understand the meanings families attach to their experience and how those meanings cohere and confirm patterns (Miles and Huberman 1994; Spiggle 1994). We used credibility, dependability, confirmability, and transferability as four criteria of the trustworthiness of our findings (Lincoln and Guba 1985). Through this process, the place of care in intra- and extra-household coping strategies emerged from our findings.

RESULTS

(A summary of the results can be found in the Appendix 2, Table 2)

The lockdown multiplied the **stressful situations in low SES families**. First, it reinforced **economic tensions**. Job insecurity increased: "*you try to find small jobs like that, which bring in some food for your kids and so on, but with the corona, there was nobody! [...] I do gardening, there are people who know me but they tell you: 'Sir, we are not doing it right now.'*" (I2). Some interviewees observed an increase in their food expenses due to the presence of struggling relatives in their homes and/or the closure of school canteens: "*Before, I rarely had my children for lunch, so from an economic point of view, it was difficult to manage so many meals. I*

also had my sister-in-law and her daughter at home, economically speaking, it wasn't the same." (I14). Additionally, the families faced a rise in supermarket prices, which disrupted the purchase of basic necessities: "*I normally pay 50 cents for a kilo of flour at the supermarket, and here we could only find organic flour, which costs €1 per kilo (...) so in terms of price, we had to make a selection of the most important products.*" (I14). Second, the lockdown exacerbated **administrative tensions** among undocumented immigrants, who dared to go out less during this period, aggravating stress linked to food supply: "*Even if we went out to pick a food parcel up, if we meet the police somewhere, they can frisk people like that, and then I get sent back home. You lose... If you go out, you have to be careful. I'm ready to eat less and stay at home so as not to risk my family*" (I2). Third, Covid-19 led to **health tensions** within the households where members were at high risk from Coronavirus: "*my husband is a vulnerable person. So, there you go, he was sending me to the dogs (laughs)*" (I13). The meal could generate tensions for large families who were afraid of intra-household contamination: "*we have the big table for the boys and the small one for girls (...) Normally, we all sit at the same table. But as there is confinement, and we were not all supposed to be in the same room, we tried not to be together too much.*" (I5). Additionally, the lack of physical activity due to home confinement added weight concerns, specifically for children: "*Actually, I was very careful about what the children ate. Since I realized the risk and the danger, I've always tried, let's say, to regulate, to take care of their diet but to make it something important. But it's true that during the confinement, I realized that my son had put on weight*" (I14). Finally, **psychosocial tensions** emerged. As many families lived in cramped accommodations, staying at home generated a proximity detrimental to intimacy: "*there are four of us in an 193 sq.ft (18 m2) house with a kitchen, shower and everything*" (I9). In addition, some of them expressed a feeling of isolation because of the lack of real contacts outside the home: "*socially, I need [...] to see people, to talk about this and that. Being at home is complicated for me*" (I12). As a result, the lockdown aroused negative emotional states, which could affect FWB: "*it became complicated because we couldn't keep our spirits up, the laziness got worse and there wasn't much creativity left in the meals*" (I14).

Faced with the stressful situations described above, these families sought to **implement coping strategies within the household**. Some of them focused on food, which played a dual role. On the one hand, food, as a source of stress, required coping strategies. Coping strategies were then problem-focused, such as reducing the shortage risks and expenditure with tighter stock management: "*usually the children help themselves as they want, during the lockdown they had to ask first*" (I6), or cooking healthier to limit weight gain linked to sedentary life: "*by cooking properly, I make real dishes, by taking my time, it has even become a pleasure to cook. And subconsciously, there was no more room for nibbling.*" (I12). On the other hand, as a central activity in these confined families' lives, food was used as a resource to develop coping strategies. Cooking and commensality were widely mentioned as ways of mitigating negative emotions: "*we all ate at the table. Because my child used to eat on a little table in front of his TV (...) During the lockdown, we changed our habits. In a way, it was a time to get together, to be convivial*" (I13).

Beyond the intra-household sphere, **extra-household problem-centred and emotion-centred coping strategies** that involved actors in the neighbourhood were deployed. Once again, these strategies helped to reduce tensions related to food: "*the neighbourhood schools all did this. There were donation, food parcels, there were vouchers and nappies [...]. It helped us a lot. Without that, I don't think we would have managed to survive*" (I1); "*in food banks,*

sometimes you find things, for example very important things like vegetables, things like that, fish, to prepare a balanced meal*" (I2). Moreover, food, as a coping resource, generated social links with the outside world and thus helped to attenuate the lack of social life: "*with the mums from school, it was: I tried that, you should try it, it's good. (...) In fact, we shared recipes*" (I12); "*I had my family, some of them helped me a lot. They went to other places [to find food]. [...] My son takes Guigoz [baby milk]. Well, they took milk, they brought it to me! Meaning I had milk! We helped each other like that! For example, I took potatoes. If I still had some at home, I would give them to the family, that's it. I discovered something else*" (I1). These findings highlight that these coping strategies to reduce lockdown-related tensions, due to food distress but through positive food practices as well, were not only based on individual actions. They were also part of collective and ecosystemic initiatives, thus revealing the key-role played by coping strategies anchored in care.

DISCUSSION

Our findings highlight the role played by food in coping with the stress experienced by low SES families during the Covid-19 lockdown in spring 2020. Food is at the heart of both problem-centred and emotion-centred coping strategies (Appendix 3. Figure 1). In this respect, our work does not call into question the dichotomy between emotion- versus problem-centred strategies, but allows to show how food is a resource for achieving greater autonomy in stress coping. This research underlines the collective dimension of coping and echoes the notion of relational coping highlighted by Hutton (2015), who showed that women's active coping styles may have a relational or community orientation. In this way, this study advocates for the need to shift from a predominantly psychological and unidirectional view of coping to an ecosystemic view showing the interdependence between actors (Afifi, Hutchinson, and Krouse 2006; Baker et al. 2007). Actually, coping strategies related to food, centred on the individual, the family, and more broadly the local community, contribute to FWB by improving the psychological, emotional and social relationships with food at the individual and collective level (Block et al. 2011). While these strategies mainly affect food availability, one of the five pillars of FWB particularly impacted by the lockdown, they also have an effect on food literacy (culinary capabilities) and socialization (food solidarity, interactions with food...). Additionally, this study enriches the understanding of emotion- versus problem-centred strategies, which, in our case, depend more on the source of the stress (in this case, whether it is food-related or not) than on the actors' ability to act. In this way, this work contributes to avoiding the normative view that problem-centred strategies are more desirable than emotion-centred ones. This is particularly relevant when people in a state of vulnerability do not have the material resources to act on the problem. Nonetheless, this work does not allow us to deepen further the interplay between emotion- and problem-centred strategies. As a result, further research is required to scrutinize the interplay between factual delineation of a problem and the related emotions (Hutton, 2015).

Adopting coping strategies embedded in intra- and extra-household relationships, low SES families show that the way they faced lockdown to preserve their well-being, in terms of and through food, partly relied on care practices. These practices were designed for the family members themselves, and more widely for their neighbours, friends and extended family, who also experienced vulnerability. Indeed, we identify the three key phases of Tronto's caring model (Tronto 1993). Aware of the various tensions generated by the crisis within their family and the community ("care about"), the interviewees felt responsible for their well-being ("care for") and

sought to provide solutions ("care giving"). Care, in this case pertaining to food consumption, is therefore part of an ecosystem based on solidarity and benevolent values, at three levels. At the first level, intra-household care can be seen through cooking and commensality, as the mainstay of a family balance disrupted by the health crisis. A second level, extra-household, includes the families in the neighbourhood, who also face vulnerability. Care given to others relies on the spontaneous establishment of a localized network of support based on food exchanges and supportive social links, in particular through social media, where recipes and tips for food supply are shared. Finally, a third level integrates actors from the local community-based network who are less affected by the crisis, including nonprofits, schools, teachers, and, in some cases, local food retailers. This third level, characterized by personal and altruistic relations with the families, is considered by families as essential to their well-being, particularly with regard to food, owing to food donation, the sharing of recipes or the organization of online cooking workshops. This recognition by families of the care provided by local social and economic actors demonstrates the existence of the fourth phase of care ("care receiving") (Tronto 1993) and recalls the importance of reciprocal relationships between actors in a care ecosystem (Parsons et al. 2021; Shaw et al. 2017). A perspective of this work is therefore to interview the various stakeholders identified here (nonprofits, schools, teachers, and local food retailers), to describe this ecosystem of care and thus strengthen our understanding of the collective dimension of coping.

Appendix 2. Table 2: Summary of the findings

Types of tensions during the Covid-19 lockdown (*food-related* and <u>non-food-related</u> ones)			
Economic - <u>Job insecurity</u> - *Increase in food expenses* - *Rise in prices*	**Administrative** - <u>Anxiety among undocumented immigrants</u>	**Sanitary** - <u>Anxiety in case of co-morbidity</u> - <u>Fear of intra-household contamination</u> - *Weight concerns*	**Psychosocial** - <u>Lack of intimacy</u> - <u>Isolation due to a lack of real contacts</u>

FWB-related coping strategies		
Actors involved in the coping strategy	**Problem-centred versus emotion-centred coping strategies**	**Examples**
Intra-household: Family members within the household	Problem	Reducing tensions related to food shortage: "usually the children help themselves as they want, during the lockdown confinement we they had to ask first" (I6)
	Emotion	Reducing the feeling of loneliness: "we all ate at the table. Because my little baby, he's used to eating on a little table in front of his TV (...) During the lockdown, we changed our habits. In a way, it was a time to get together, to be convivial" (I13).
Extra-household: Family members living nearby, Neighbours, School, Food bank	Problem	Reducing tensions related to food access: "the neighbourhood schools all did this. There were donation, food parcels, there were vouchers and nappies (...). It helped us a lot. Without that, I don't think we would have managed to survive" (I1)
	Emotion	Reducing isolation: "with the mums from school, it was: "I tried that, you should try it, it's good. " (...) In fact, we shared recipes" (I12)

Symbolic Dimensions of Jewelry as a Gift: An Interpretive Study

Lara Grant, Pontifical Catholic University of Rio de Janeiro, PUC-Rio, Brazil
Angela Da Rocha, Pontifical Catholic University of Rio de Janeiro, PUC-Rio, Brazil
Ana Raquel Rocha, UFF, Fluminense Federal University, Brazil

INTRODUCTION

Marketing research on gift-giving was demarcated in the 1980s by the works of Levy (1982) and Sherry (1983), who built on Marcel Mauss's seminal work involving tribal societies (Sherry et al., 1995). Mauss (1988) addresses three obligations related to the gift: giving, receiving and reciprocating. The meanings of the gift are associated with status and power, in which the giver assumes a superior position, whereas non-reciprocation implies inferiority and subordination. Not accepting the gift is an offense, a refusal of fellowship, friendship and alliance. Furthermore, it is a matter of building a mutual network of obligations: the giver generates an obligation on the part of the receiver. Thus, the gift per se may be seen as a symbolic, ceremonial or ritual exchange (Mauss, 1988; Caillé, 2002). However, obligations and the form of reciprocity may vary in different societies, on different occasions, and depending on the roles played by the giver and the receiver.

For Sherry (1983, p.158), gifts are "tangible expressions of social relationships." The practice of gifting occurs mainly among family members and between generations (Belk, 1979) and the female gender is generally responsible for its management (Garner & Wagner, 1991). Nevertheless, the breadth of the relationship network and the obligation to give gifts vary from one society to another. In the United States, spending on gifts is associated with romantic relationships (Nguyen & Munch, 2011), the emotional characteristics of the gift giver (Pillai & Krishnakumar, 2019) and egocentric reasons (Givi & Galak, 2020), or even with materialism and status, as is also seen in India (Sharda & Bhat, 2018) and Brazil (Miranda et al., 2017).

But which objects cannot be given, but must be kept? This question led Godelier (2001, p.53) to investigate so-called "inalienable" objects, i.e., those that follow "the paths of transmission and rooting in time," those that can only be given to a small group such as children, relatives or initiates. Mauss himself (1988) speaks of objects that remain in the family. They are objects that must be kept because of their value or their meaning, which makes them almost sacred. For Baudrillard (2009, p.83), "the old object is always, in the exact sense of the term, a 'portrait of the family'."

Levy (1982) was possibly the first marketing scholar to point out the purchase for oneself as a self-gift. The self-gift is a symbolic act that can have rewarding, therapeutic properties, or have the purpose of celebrating passages or transitions (Mick & Demoss, 1990a, 1990b), usually in categories of high ego involvement and entailing a strong symbolic component, as in the case of jewelry (Mick et al., 1992). Several motivations may be behind the self-gift: rewarding oneself, celebrating, remembering (or forgetting), feeling loved and enjoying life, in addition to the therapeutic dimension, or compensating for something negative (Heath et al., 2015). Individuals with certain characteristics such as anxiety and insecurity (Rippé et al., 2019) may be more likely to self-gifting. In addition, in individualist cultures there may be a greater propensity to self-gift than in collectivist cultures (Suzuki & Kano, 2018).

This study investigated jewelry as a gift, identifying symbolic dimensions that differentiate the categories of giving gifts, receiving gifts and self-gifting. The peculiarity of jewelry is that it is a luxury item, which, in the literature, is related to the issue of distinction (Bourdieu, 1984) and status consumption (Beverland, 2004; Eastman & Eastman, 2015; Kapferer & Bastien, 2009).

METHOD

We conducted in-depth interviews with 25 young women (between 23 and 38 years old) from the upper middle class, living in the city of Rio de Janeiro, Brazil. All the interviewees had a university degree, were employed and were financially independent. The interviews were mediated by a semi-structured script, recorded and transcribed afterward. The names used in this paper are fictitious. We identified preliminary categories that emerged from the field, which were then grouped and compared with each other. The categories were subsequently refined, reaching a final concise relationship. Lastly, we compared the categories obtained with those mentioned in the literature.

FINDINGS

Jewelry received as a gift

Jewelry received as a gift appears in the context of family relationships and romantic love. It appeared as a link between generations, as a chain of continuity for the family, giving it connotations such as "tradition" and something "special" that can dignify the relationship with loved ones who have already passed. Letícia considered the jewelry that she inherited from her grandmother to be "emotionally valuable," something that enables her to "take her father's family" with her. Jewelry comes to symbolize a sacred relationship, one that transcends each life: "When you receive jewelry as a gift, it eternalizes the person who gave it".

Jewelry is also a symbol of familial love ("special, because my mother gave it to me"; "it was proof that my brother loved me"). The first piece of jewelry may also mark the passage to adulthood. Alice received from her grandfather "an adult's gift, a woman's gift." Sometimes, it refers to the giver's sacrifice to express love and to the receiver's worthiness. Lorena said that her father "was in no shape to buy that bracelet, [which he had bought with] little money that he had saved up," thus an expression of fatherly love. Secondarily, jewelry was also associated with terms such as "sweetness," "beauty" and "glamor." The gift of jewelry also symbolizes the romantic love between a man and a woman. It was described by Sarah as a kind of amulet against the possibility of the relationship falling apart. When it comes to definitive commitment, jewelry takes on a wider range of meanings, in that it reaffirms love, commitment and responsibility; it makes a rite of passage tangible, and it spells out romantic values in the relationship.

Jewelry as a self-gift

Jewelry as a self-gift was associated with simplicity of the object, something meant solely for daily use. When it is a "pricey piece of jewelry," explained Erica, it does not serve for such purpose. For those who self-gift, it may not have "the same charm," as Verônica observed: "Buying it for yourself isn't the same thing as getting it from someone else." The self-gift of an item of jewelry can mark passages and experiences. For Lorena, it suggests "showing yourself" how mature you are. Buying jewelry whenever "you can," takes on the character of being a "reward" and is a way to manifest one's

fulfillment in life. Isadora emphasized meanings of achievement and merit, bordering on a feminist viewpoint: "My mother always said that you should buy your jewelry with your own money." For Isadora, if, on the one hand, there is "a great feeling of independence; you worked for it." Sara agreed; she saw the self-gift of jewelry as a reflection of women's achievements in independence. Veronica, on the other hand, saw the self-gift as a symbol of femininity and gender demarcation: "Jewelry helps to comprise the female status." It can also take on the meaning of compensation. Erica was "feeling a little down" so she bought a necklace to cheer herself up. The self-gift of jewelry also appeared as a hedonistic manifestation.

Jewelry given as a gift

For those who give it as a gift, jewelry marks out passages and materializes the discussion about "giving the gift and staying with the object at the same time" (Weiner, 1992; Godelier, 2001). Lorena explained: "To this day, I still have the first gifts [of jewelry] that I gave to my children; they mean a lot more to me than to them." When the gift is meant for younger people, the ideas of a link between generations and tradition reappear. As Claudia stated: "I gave a Our Lady of Fatima necklace to my niece because the whole family has one." Claudia said that the gift meant "I care about you." Paula emphasized the value of perpetuity: "When you give, it means that it's forever." For Paula, the financial sacrifice implicit in the purchase adds value to the gift. Luana, on the other hand, felt that remembering the recipient and spending time on the choice make giving jewelry as a gift something special.

Gifting individuals who are not familiar with jewelry may represent a display of status, good taste, or wealth. Lorena stated that she will gift someone who "means a lot" to her, and when she "can't think of anything more valuable to give," or when she wants to "show-off," or "feel important." Gabriela explained: "I care more about what the person expects than what I'm giving,' indicating concern about giving the "right" gift.

DISCUSSION

The meanings raised in a first analysis movement were grouped together, taking underlying symbolic dimensions into account.

Gifting as a symbol of passages

People use jewelry to make life passages tangible throughout their lives (such as the engagement ring and wedding ring). The symbolic character of jewelry as the demarcation of passages runs through civilizations. Turner (1974, p.157) believes that "all societies ritualize and publicly mark with suitable observances to impress the significance of the individual" in his or her new status. There are secular and religious rituals in noteworthy passages. In general, dating and engagements are secular public or private rituals. Marriages are public rituals and can be performed in secular or religious ceremonies. In consumption studies, ceremonial celebrations and rites of passage are probably the most commonly studied occasions of gifting (e.g., Schmidt, 1995). In the case of the self-gift, however, the commemoration of passages tends to be private and secular.

Gifting as a symbol of the eternal

A piece of jewelry is something that lasts, representing the eternal, and transcending individual lives; a link between the past and the future on a timeline that must not be broken. It is possible to theorize that the impact of gifts with the meaning of intergenerational transmission is greater for those who receive them than for those who give them. Givers are freed from an obligation to transmit the "the portrait of the family" (Baudrillard, 2009, p.83) to following

generations. Whoever receives the object that embodies the family's perpetuity assumes the responsibility of maintaining and transmitting it. By this same logic, jewelry as an eternal link with loved ones appears much more in jewelry received than in jewelry that is gifted, since the symbolic and emotional content is more intense when jewelry is received as a gift. Sometimes the meaning of the piece of jewelry became clear only after the death of the one who gave the gift. As Baudrillard (2009, p.88) observed, the object is "fetishized" and transformed into a "relic," which enables it "to hold [...] the soul of the dead." It thus becomes a sacred object, involving "transcendent experiences of extraordinary significance to the individual" (Mick & Demoss, 1990b, p. 327).

In both cases – link between generations or link with loved ones – what lies behind it is the idea of perpetuity, of eternality. The same idea arises when the object is a symbol of love. Garner and Wagner (1991, p.370) called attention to the importance of gifts for maintaining "networks of love." Jewelry received in adulthood symbolizes the love relationship between partners, making tangible the romantic ideal of eternal love. The engagement ring carries coded "fidelity expectations" (Sherry, 1983, p.159) and commitment (Nguyen & Munch, 2011). As for jewelry given at other times in a couple's life, it is a reaffirmation of the commitment or a "realignment of the giver/recipient relationship" (Ruth et al., 1999, p.385).

Gifting as "emotional nutrition"

The two categories of meanings – deserving and compensating – appear strongly in the self-gift, with similar characteristics. Individuals allow themselves to buy a self-gift, either as a prize or a reward for a meritorious deed, or as compensation for something negative. Both situations require "emotional nutrition" (Mick & Demoss, 1990b, p.325). Jewelry as something that is merited is associated with passages (Mick et al., 1992), both as a gift received and as a self-gift. However, jewelry as compensation appears only in the self-gift.

Gifting as a symbol of reaffirmation of female roles

Two distinct meanings deserve attention. One, which we did not find in the literature, is that of jewelry as a symbol of female emancipation, and which is linked to the self-gift, symbolizing that the woman is not dependent on anyone to buy jewelry for her. At a time when the role of women is changing, it is possible that this is an indicator of new perspectives in the purchase of luxury items. However, jewelry also appears as a symbol of femininity, associated to elegance, beauty and glamor, highlighting the traditional role of women in society. The two views are not antagonistic since they coexist in the social environment.

Gift as a status symbol

A specific meaning appears in the case of jewelry given as a gift: jewelry as a status symbol, or as a mechanism of ostentation. The gift is given to acknowledge both the status of the giver and of the recipient. This is rather curious, because, in general, the search for status is referred to in the literature as the main reason for luxury consumption. If jewelry is a natural object of ostentation, why has the search for status been so little reported? It is possible that it is related to the understanding of jewelry as something sacred, a symbol of the continuity of the family or of love, and therefore, far above the purpose of ostentation. Or perhaps this quality – a status symbol – is not considered relevant when receiving the gift or self-gifting, but only when the object is worn.

Other meanings

One meaning that only appeared in the category of self-gift is that of jewelry as a hedonistic symbol, that is, something that has to do with the intrinsic pleasure that one experiences with the acquired object (Mick and DeMoss, 1990b). Jewelry also entails a financial sacrifice, both in the case of jewelry received, as well as jewelry given as a gift to someone else. Sacrifice adds value to jewelry; it is a display of affection.

FINAL CONSIDERATIONS

This research contributes to the literature on the consumption of luxury items by showing a range of meanings in addition to the display of status. Moreover, we found striking differences between jewelry received as a gift, given as a gift and as a self-gift. The most significant differences, however, were found between the gift and the self-gift, perhaps because the ritualistic behaviors are quite different in the two situations. We arrived at a set of six symbolic dimensions, which differ in part (and agree in part) with the existing literature, both in bringing some new dimensions, and in relation to the form and intensity with which dimensions that had already been identified in the literature appear. We found no study that mentioned the eternality dimension in the gift giving literature, although this dimension appears to be related to ancient objects in the anthropology of consumption. Nor did we identify any references in the literature connecting the self-gift with the issue of female emancipation.

Assembling Tribes on Instagram: Analysis of a Mega-influencer Follower-generated Hashtag Network

Dilan Rathnayake, Strathclyde Business School, University of Strathclyde, UK

Andrea Tonner, Strathclyde Business School, University of Strathclyde, UK

Petya Eckler, School of Humanities, University of Strathclyde, UK

INTRODUCTION

This study investigates the tribal assemblages formed around Instagram mega-influencers (Campbell and Farrell 2020). Researchers have been interested in 'consumer tribes', as contemporary consumption is increasingly characterized by consumption-focused social groups (Cova, Kozinets, and Shankar 2007). Aspects of consumer tribes such as members' organization (Mamali, Nuttall, and Shankar 2018), value co-creation (Dominici, Yolles, and Caputo 2017), and liquid entrepreneurship (Biraghi, Gambetti, and Pace 2018) have all been considered in this field. However, Ruiz, Penaloza, and Holmqvist (2020) recently signified that the extant literature does not provide a full understanding of the dynamics of tribal constitution and reconstitution, and suggest assemblage thinking as a useful lens in exploring how consumer tribes are assembled. We extend this notion to the networked environment, where virtual tribes (Gloor et al. 2020) in social media platforms may be yet more dynamic. Further, drawing to the vital role of user-generated 'text' (Gloor et al. 2020) (i.e., hashtags) in social media, we bring a methodological novelty through a hashtag network analysis approach to explore virtual consumer tribes, which is uncommon in marketing literature. Considering the immense popularity of Instagram (Djafarova and Rushworth 2017) and the vast consumer rallying around Instagram influencers (Casaló, Flavián, and Ibáñez-Sánchez 2018), this study addresses the question: *how tribal assemblages formed around Instagram mega-influencers are reflected in follower-generated hashtag networks?*

THEORETICAL BACKGROUND

Instagram is currently the fastest-growing social media platform (Djafarova and Rushworth 2017) based on visual aesthetics (Jin, Muqaddam, and Ryu 2019). It is popular among mobile-savvy individuals (Abidin 2016) with a higher engagement than other social networking sites (Casaló et al. 2018). Marwick (2015) sees Instagram as a "convergence of cultural forces: a mania for digital documentation, the proliferation of celebrity and microcelebrity culture, and conspicuous consumption." (p. 139). Hence, unsurprisingly the Instagram has become a promising platform for microcelebrities/social media influencers. Among distinct influencer categories, *mega-influencers* with over 1 million followers emerge as highly influential (Campbell and Farrell 2020). Followers tend to engage in a conversation around these influencers (Etter et al. 2018) and embrace trends set by them (Jin et al. 2019) even without direct influencer participation. We see this networked social grouping of followers as an indication of tribal formation. This also leads to what Usher (2020) emphasized: social construction of the microcelebrity brands. Though the significance of consumer tribes in traditional brand building has been previously examined (Canniford 2011), how virtual consumer tribes contribute to the social construction of mega-influencer (personal brands) remains under-theorised.

Cova and Cova's (2002) seminal work considers consumers' convergence into tribes to be more influential on consumers' behavior than mainstream marketing institutions and traditional cultural forces. This convergence leads to alternative social structures and new forms of communities (Goulding, Shankar, and Elliott 2001) where individuals increasingly gathering into multiple and ephemeral groups. Typically, consumer tribes are non-commercial entities (Goulding, Shankar, and Canniford 2013) having no structured hierarchy and established leadership (Cova et al. 2007). Further, consumer tribes are multiple, playful, and transient (Cova et al. 2007; Canniford 2011). Members of consumer tribes form social links through a 'linking value' (shared use of product/service) (Cova and Cova 2002) and seek emotional connection through nostalgic narratives (Mamali et al. 2018). Mega-influencers' followers collectively exhibit many of these characteristics, thus, are increasingly being theorized as tribes (Arvidsson et al. 2016) and some influencers call their fan base 'my tribe' (Marwick and boyd 2011).

Recently, Ruiz et al. (2020), emphasizing the dynamics of consumer tribes, inspired the infusion of *assemblage thinking* in understanding tribes. Following Deleuze and Guattarai's conceptualization, DeLanda (2016) defined an assemblage as "a multiplicity which is made up of many heterogeneous terms and which establishes liaisons, relations between them, across ages, sexes, and reigns – different natures" (p.1). How entities are bound together (territorialization and deterritorialization) (Bacevic 2019) and how emerging properties (enabling and constraining) are exercised (DeLanda 2016) are key tenets of assemblages. It considers the interdependencies among human and non-human actors while enabling the understanding of the agency redistribution from individuals to things, narratives, and socio-material networks (Canniford and Bajde 2015; Hoffman and Novak 2018). This provides a useful theoretical lens to uncover virtual tribal assemblages where social media users redistribute their agency to socio-material meshes (including other followers, captions, and hashtags), collectively forming tribal assemblages around mega-influencers. Ruiz et al. (2020) noted two other characteristics of assemblages: *hybrids* (individuals, materials, and discourse belong to the same analytical frame) and *fluidity* (enabling the freedom to investigate stability, deterioration, or reconstruction). This enables researchers to take Instagram users and their (hashtagged) discourse into the same analytical frame, making it a robust approach to understanding the formation of tribal assemblages around mega-influencers.

METHODOLOGY

We selected the hashtag network analysis approach (Meraz and Papacharissi 2013) to identify how tribal assemblages are reflected in follower-generated hashtag networks. Co-hashtag network analysis is a useful method in identifying topics, semantic representations, and network frames (Meraz 2017) and has been used to identify themes reflected in networked assemblages (Schöps, Kogler, and Hemetsberger 2020). Despite being novel and useful, this method is yet to be popularized in understanding consumer tribes and tribalism.

Influencer Marketing Hub's website (list of top non-celebrity Instagram influencers) was used to select an influencer as the access point to a co-hashtag network. We selected #nashgrier as the access point to a tribal network associated with the influencer Nash Grier based on three criteria: high number of posts related to his eponymous hashtag, high follower count, and frequent content creation on Instagram. The Instagram API was used to access a sample of Instagram posts using #nashgrier (N=5000) and capture the captions ensuring the anonymity of data. Hashtags were extracted from captions

and the co-hashtag network was constructed using a bigram script written using R software (Nasir et al. 2017).

The network consisted of 4321 unique hashtags (nodes) and 11439 co-occurrences (edges) and was visualized using Gephi, open-source software for network analysis (Cherven 2015; Ichau, Frissen, and d'Haenens 2019). We followed the procedure applied by Schöps et al. (2020) and analyzed the hashtag network using the modularity clustering algorithm embedded in Gephi. This algorithm detects groups of nodes based on shared characteristics (Cherven 2015). In our case, these hashtag clusters can be considered as themes of tribal thinking commonly shared by Instagram users in assembling the tribe around Nash Grier (figure 1).
Figure 1: Follower-generated hashtag network of #nashgrier

ANALYSIS AND DISCUSSION

This section explains four major themes that emerged from follower generated hashtag network visualized in figure 1.

MAGCON: nostalgia and heritage

The first theme that emerged from the hashtag network (coloured purple in figure 1) reflects Grier's influencer heritage through MAGCON, a teen group of which Grier was a part. MAGCON (Meet And Greet Convention) was a group of 12 American teen internet personalities who were famous on the Vine platform in 2013-2014 (Horan 2014). In addition to Grier, the team consisted of others who gained internet fame and their own influencer status: Cameron Dallas; Hayes Grier; Matthew Espinosa; Jack Gilinsky; Jack Johnson; Aaron Carpenter; Taylor Caniff; Shawn Mendes; Jacob Whitesides; Carter Reynolds; and Mahogany Lox.

Our data indicate that followers on Instagram still consider these influencers as strongly interconnected in their hashtagged conversations, even after years of MAGCON's dissolution. Dominant hashtags in this cluster were related to MAGCON and its members (see figure 1). These hashtags were mostly accompanied by nostalgic captions such as *"the golden years"*.

> "Yesterday was Thanksgiving and I am just so thankful for this boys. I can't imagine my life without them. Magcult forever and always."

This caption is evidence of some followers who demonstrated that history and nostalgia are a strong dimension of their bond and continued tribal relationships with Grier and MAGCON. Particularly, using terms such as 'Magcult' strongly reflects the tribal thinking of Grier/MAGCON followers.

This finding advances Spittle (2009) and Mamali et al.'s (2018) argument: neo-tribal consumers are fond of nostalgic narratives that can provide momentary identification on emotions. We find that, for virtual tribe members, nostalgic stories go beyond mere momentary identification and are used as means of sticking members together. This also provides the tribe a solid foundation with heritage, to which followers are attached. We also consider history and nostalgia as means of territorializing the tribal assemblage (Bacevic 2019) by homogenizing MAGCON followers as an enabler of the assemblage formed around Grier (by including the other MAGCON members' identity into the tribal assemblage). This furthers the understanding of how elements of an assemblage become parts of totality that is culturally and historically constituted.

Influencer as the 'linking value'

The hashtag network predominantly reflects Grier's personal aura but also shows a strong dynastic component (coloured green in figure 1). The second hashtag cluster is around a family theme including Grier, his brother, partner, and son. Top hashtags in this cluster included #nashgrier, #malakaigiavasisgrier, #taylorgiavasis, #baby, #hayes. Malakai particularly is a strong component of this part of the tribal narrative and is Grier's 2-year-old son. Followers seem to passionately embrace the boy's online presence as a mean of shared emotional connection within the tribe which is reflected in the following captions:

> "The definition of cute is @malakaigiavasisgrier"

> "We think that this 2-month-old boy is going to be the youngest successful #blogger@malakaigiavasisgrier"

> "i just had to share this one on its own because they make my heart burst #malakaigiavasisgrier #nashgrier #taylorgiavasis"

This is not only the case for Malakai. Eponymous hashtags of both Taylor (Grier's partner) and Hayes (Grier's brother) are dominantly represented in this cluster. #nashgrieredit, #meme, #youtuber were also dominant, reflecting the personal capabilities of these influencers. We see this as advancing Cova and Cova's (2002) concept of 'linking value' of social links within a tribe that emerge through shared product/service usage. As our data reflect, members of the tribal assemblage consider the influencer and his dynastic relations as instrumental in forming such social links via hashtagged conversations. This finding reflects how the tribal assemblage is stabilized (Schöps et al. 2020) by followers, collectively extending their co-functioning around Grier to his dynastic relations.

Playfulness of the tribe

The third theme that emerged from the hashtag network (blue in figure 1) predominantly reflects the playfulness of the tribe's members. #love, #cute, #happy, and #fun were dominant hashtags that represent emotions shared by members within the network. Some other hashtags (#photography, #music) symbolized activities whereas togetherness (#family, #friends), media (#tumblr, #film) and general hashtags related to playfulness (e.g., #aesthetic) were among top hashtags. These hashtags were annotated in captions such as:

"LETS MAKE IT VIRAL #MAGCON2020 #nashgrier #family #aesthetic #tumblr #vine #music #cute #edit #love #aesthetic"

"It's been raining to much here in New York, I'm starting to feel like a duck. Quack,quack.."

This finding furthers Canniford's (2011) reading: consumer tribes are playful. According to Cova et al. (2007), consumer tribes provoke an 'active play' with marketplace resources including aesthetics, emotions, music, and media which is also reflected in our data. Though Canniford (2011) argues that tribal consumers 'plunder' these resources during the active play, our findings show that virtual tribes' members rather 'amass' such resources as means of establishing the emotional connection between members and the tribe. We also extend this into assemblage thinking and see this playfulness as an agentic role (Hoffman and Novak 2018) of tribal members in shaping the identity of the whole tribal assemblage through the inclusion of emotions, activities, media, and aesthetics.

Fluidity of the tribe's boundary

It is a somewhat surprising finding that the fourth hashtag cluster symbolizes some mainstream celebrities and other internet personalities. Particularly, eponymous hashtags of mainstream celebrities such as Justin Bieber, Selena Gomez, and Ariana Grande were among the dominant hashtags along with #onedirection (an English-Irish pop boy band) and #bts (a South Korean boy band).

Notably, all these celebrities (and bands) also have a strong social media presence and possess enormous online fame. It was evident that Instagram users are likely to co-mention these celebrities with mega-influencers, rather than discriminating between them. This is exemplified in the following caption:

"Just imagine.........You are doing your make up and he is watching and waiting for you to finish. That's too cute. #austin-mahone #selenagomez #Arianagrande #shawnmendes #justin-bieber #camerondallas #nashgrier #bts

We consider this to be representing the 'fluidity' of the tribal boundary, especially within the digital realm, and extending Canniford's (2011) concept: 'multiplicity' of tribes (members can belong to distinct tribes simultaneously). Our data shows that the virtual tribe members tend to make the tribe's boundary fluid through the inclusion of celebrities and other internet personalities into the mega-influencer tribe, rather than perceiving them as having their own (distinctive) celebrity tribes. On this ground, we argue that virtual tribes can not only be 'multiple', but also 'inclusive'. Considering the similarities of these influencers and celebrities (i.e., young, into music, online presence) we theorize this followers' behavior as an effort of internalizing the celebrities (with similar characteristics) into the mega-influencer tribal assemblage and as an attempt of enabling the whole tribal assemblage to extend the territorialization.

Table 1: Summary of results

Network cluster	Theme	Key hashtags	Key findings
1	MAGCON: nostalgia and heritage	#magcon, #shawnmendes, #hayesgrier, #oldmagcon, #aaroncarpenter, #jackandjack, #taylorcaniff, #jackgilinsky, #matthewespinosa, #carterreynolds	Followers demonstrate that history and nostalgia are a strong dimension of their bond and continued tribal relationships with the mega-influencer.
2	Influencer as the 'linking value'	#nashgrier, #malakaigiavasisgrier, #taylorgiavasis, #nash, #baby, #grier, #austinmahonewallpapers, #nashgrieredit, #nashgrieredits, #meme	Members of the tribal assemblage consider the influencer and his dynastic relations as the 'linking value' in forming social links within the tribe via hashtagged conversations.
3	Playfulness as a tribe	#love, #cute, #like, #tumblr, #tbt, #music, #family, #photography, #friends, #aesthetic	Members of the tribal assemblage engage in an 'active play' with marketplace resources (such as aesthetics, emotions, media) and 'amass' such resources as means of establishing the emotional connection between members and the tribe.
4	The fluidity of the tribe's boundary	#austinmahone, #justinbieber, #camilacabello, #arianagrande, #selenagomez, #onedirection, #demilovato, #taylorswift, #bts, #harrystyles	Members make the tribal assemblage's boundary more fluid through the inclusion of celebrities and other internet personalities into the mega-influencer tribe, rather than perceiving them as having their own (distinctive) celebrity tribes.

GENERAL DISCUSSION AND IMPLICATIONS

Understanding virtual consumer tribes is challenging, yet, important (Hamilton and Hewer 2010). Despite previous theorizations, assemblage thinking is suggested as a useful lens to explore consumer tribes (Ruiz et al. 2020). This study shows how tribal assemblages formed around Instagram mega-influencers can be understood through follower-generated hashtag networks. We found 4 ways in which this type of analysis can advance tribal thinking.

Advancing the Spittle's (2009) argument, this study revealed that the members bring nostalgic narratives about the influencer, providing a heritage to the tribe while facilitating the cultural/historical constitution of the tribal assemblage. Also, our findings extend Cova and Cova's (2002) concept of 'linking value' by revealing that the influencer and his dynastic relations are instrumental in establishing social links, stabilizing the tribal assemblage (Hoffman and Novak 2018). As opposed to Canniford's (2011) argument of 'plundering', we found that virtual tribe members 'amass' marketplace resources (i.e., aesthetics, media) to shape the identity of the whole tribal assemblage. Finally, we add to the 'multiplicity' (Canniford 2011) of tribes by arguing that virtual tribes can be 'inclusive' as members make the tribe's boundary more fluid through the inclusion of celebrities and other internet personalities.

This study extends the theorization of virtual consumer tribes with the infusion of assemblage thinking. Hashtag network analysis opens a novel methodological stream for consumer researchers to investigate virtual tribes. This study also provides useful implications for practitioners. Particularly, themes emerging from a hashtag network of a consumer tribe would inform marketers of the directions of online consumer conversations within the tribe. This would enable marketers to align their brand's message to such directions appropriately. Understanding how members territorialize the tribal assemblage would be pivotal for marketers in determining the key actors through which a brand message can be significantly imparted into the tribe's conversation.

LIMITATIONS AND FUTURE RESEARCH

This study investigated a tribal assemblage formed around one mega-influencer. Future studies can compare among different influencers. The tribal assemblage formation in various social media platforms may be different due to their inherent characteristics. Cross-platform investigations may reveal how the platform functions mediate the tribal assemblage formation. Further, deeper investigations about 'fluid' boundaries between mega-influencer and mainstream celebrity tribes may be an interesting research avenue.

Authenticity, Cultural and Paracrisis: A Typology of Digital Influencers' Transgressions

Thaysa Nascimento, COPPEAD UFRJ, Brazil
Maribel Suarez, COPPEAD UFRJ, Brazil
Roberta Campos, COPPEAD UFRJ, Brazil

INTRODUCTION

Digital influencer is someone who posts on social media in exchange for compensation, not necessarily financial, and can be differentiated by factors such as focus, follower base, engagement rates, monetary requirements for collaboration and skill sets (Campbell and Farrell, 2020). An influencer's trajectory traces the beginning of an evolution towards the reaching of celebrity status (Erz and Christensen, 2018), considering aspects of authenticity, accessibility, expertise, and cultural capital (Campbell and Farrell, 2020). Types of influencers (Campbell and Farrell, 2020), relationship with brands (Nascimento, Campos, and Suarez, 2020) and with an audience (Kozinets et al., 2010) can shape these trajectories. Some controversial events such as transgressions can also shape these trajectories (Cocker, Mardon and Daunt, 2021).

Transgression, an act of breaking rules and exceeding limits, can be committed by different figures such as the individual consumer (Belk, Ger, and Askegaard, 2003), brands (Aaker et al., 2004) and celebrities (Finsterwalder, Yee, and Tombs, 2017). In general, transgressions are approached from the point of view of the motivations and consequences for the transgressor. Recent studies have begun to identify the digital influencer as a new transgressive figure (Cocker et al., 2021; Kozinets et al., 2010; Mardon, Molesworth, and Grigore, 2018). In the digital sphere, transgression appears as a tension between community rules and commercial partnership norms (Kozinets et al., 2010). Influencers are embedded in various relational systems that have specific norms. Understanding the types of transgressions that influencers can commit, beyond the commercial sphere, helps to understand how these figures relate to their consumers beyond simply to partner brands.

This research aims to identify what transgressions are and how they differ according to their underlying nature. Based on a netnographic longitudinal study, with 6 years of data collection, this study analyzes the transgressive trajectory of the Brazilian influencer Bianca Andrade, considered by the mass media as the Brazilian Kardashian. The researcher's findings suggest some criteria to identify and differentiate transgressions in social media. These criteria make it possible to delineate three transgression categories: *authenticity*, *paracrisis* and *cultural*. The relevant theoretical contribution lies in a conceptualization of other types of transgression beyond those previously discussed in the consumer behavior literature.

TRANSGRESSIONS: APPROACHES FROM THE TRANSGRESSOR'S POINT OF VIEW

Individual social transgression is configured as a breach of collective social behavioral norms (Bataille, 1957; Bakhtin, 1984) arising from the individual desire to change. For the transgressor, feelings of guilt and shame and the possibility of legal and social punishment are generated (McCullough, Fincham, and Tsang, 2003). Some studies analyze the role of transgression in the consumer's identity construction (Batat, 2014; Karababa and Ger, 2011; Kozinets, 2001), while others have presented transgression as a process for consumer's internal personal conflicts resolution (Belk, et al., 2003; Canniford and Shankar, 2013).

Brands transgressions are violations of implicit or explicit rules regulating the relationship with consumers, that are committed by a market agent (Aaker et al., 2004; Chung and Beverland, 2006; Gregoire and Fischer, 2008). Studies of brand transgressions generally address the consequences of such acts, which apparently always have negative effects for the transgressor, involving reevaluation or complete termination of the relationship (Chung and Beverland, 2006; Hemetsberger et al., 2009) and possibility of retaliation (Grégoire and Fischer, 2008). Recently, Parmentier and Fischer (2015) highlighted a dissipation dynamic, whereby consumers do not consider restoration of the relationship and simply abandon the brand. Studies on this approach claim that consumers feel betrayed and consider the brands' perceived sincerity to judge the transgressive act (Aaker et al., 2004).

Celebrities (McCracken, 1989) transgressions are perceived acts of immorality that can directly affect their success and can turn into public dramas (Finsterwalder et al., 2017). The fan-consumer premise in which a celebrity is a behavioral role-model to be followed, can also elevate transgression to scandal status (Um, 2013). Studies that address celebrity transgressions focus primarily on consumer reaction. Consumers with a strong emotional attachment to transgressive celebrities tend to defend them (Bhattacharjee, Berman and Reed II, 2013) while others judge based on the idea that transgression could have been avoided (Um, 2013). Consumers may also decide to forgive the celebrity, but forgiveness does not prevent a change in consumer's perceptions which were previously maintained (Finsterwalder et al., 2017).

Digital influencers have appeared in the literature as new transgressive figures. Influencer's transgressions are acts of violation of communal rules through excessive commercial relationships (Kozinets et al., 2010; Mardon et al., 2018). When violating privacy rules and digital exposure, evidencing their commercial partnerships, the influencer starts to face the judgment of their community (Kozinets et al., 2010; Mardon et al., 2018; Scaraboto and Fischer, 2016). Endorsement practices can also be considered transgressive acts by the audience (Cocker et al., 2021). Studies that address these transgressions seek to demonstrate how they generate conflicts between the influencer and his own community (Kozinets et al., 2010; Mardon et al., 2018). Influencers perform the act of rule breaking (Batat, 2014), but it is the followers who classify it as a transgression. Based on the tone of the comments made following the act, it is possible to define the transgressions' nature. Transgressions have often given rise to an online firestorm (Pfeffer, Zorbach, and Carley, 2014), featuring an apparently negative dynamic on social media (Scholz and Smith, 2019). Analyzing the influencer as a transgressive figure enables an understanding of a negative relational dynamic within social media.

Transgression literature frequently uses the transgressor figure as the level of analysis, considering mainly motivations and consequences. In addition to the transgressor's perspective, it is important to understand the transgression itself, as well as the factors and criteria that characterize this behavior to better understand the role of consumption in acts of this nature. When assessing digital influencers, there is a void in the literature about any other types of transgressions beyond community-commercial tensions. Considering transgression as a level of analysis, this research aims to understand what transgressions by digital influencers are and how they can be differentiated considering their nature.

METHODOLOGY

In order to identify transgressions committed by the digital influencer, this research opted for the longitudinal netnographic approach (Kozinets, 2019), which enabled observation of interaction in native conditions and an immersive understanding of the influencer's community. The chosen research context was the Brazilian digital influencer Bianca Andrade, who currently has more than 15 million followers only on Instagram. Considered by her fans and mass media as the Brazilian Kardashian, Bianca was involved in several controversial episodes throughout her trajectory, having lost 400,000 followers in one day following one of these events. As such, Bianca has become a platform for observing controversies.

This research followed Kozinets' (2019) procedural guide with two phases of data collection. An immersive exploratory phase began with observation of Bianca's social media, her content and interaction with fans. All profiles related to Bianca, such as pages of fan clubs, friends, family, and partner brands were followed by the researchers. This movement made it possible to characterize Bianca's ecosystem. From that, all posts made by Bianca that showed her work as an influencer on Instagram and YouTube were collected and saved in a Google Drive folder. After that, in the investigative phase, all posts and videos on Bianca's social media that showed a polemic episode were separated. Comments from followers, pronouncements from partner brands in their official profiles and reports on controversial events were collected as along with posts on gossip webpages, such as @webtvbrasileira, and hashtags related to the controversy. This phase allowed a fuller understanding of the dynamics of the transgression.

Data collection continued from September 2015 to January 2021 resulting in more than four thousand prints of posts and comments, in addition to 95 prints of numerical comparison rankings, which demonstrated the number of followers and views on social media over time, provided by the Social Blade platform. The researchers also collected one hundred news items about the controversies published in more traditional media forms such as newspapers and magazines. The analysis process began with separation of Bianca's transgressions. Within this set of transgressions, we identified the 15 that generated the most impact. In a second step, in a back-and-forth movement with the theory (Kozinets, 2019), we grouped the criteria that identify a transgression and also identify discrete categories according to the nature of the transgressions.

DISCUSSION

Digital influencers are inserted into innumerous relationships, created, and shaped in their social media. As consequence, they have contributed partially to the construction of the norms governing these relationships. Despite that, all parts of these relationships, especially the audience, are acutely aware of the applicable rules thus becoming behavioral inspectors. At the first sign that a rule has been violated, they comment on social media to explicitly identify a transgression. Through the data it was possible to separate transgressions committed by digital influencers according to their nature. Table 1 summarizes the characteristics of three categories: *authenticity transgression*, *cultural transgression* and *paracrisis transgression*.

Throughout their trajectories, digital influencers display character narratives that determine the expectations of followers regarding a given message and its meanings (Kozinets et al., 2010). *Authenticity transgression* occurs precisely when the followers perceive a violation in the character narrative constructed by the influencer. Authenticity (Arnould and Price, 2000) is socially constructed through individuals, groups, performances and is linked to the perceived sincerity around representational practices (Gannon and Prothero, 2016). The lack of authenticity can also be found in endorsement practices (McCracken, 1989; Nascimento et al., 2020), when the publicity is not perceived by followers as authentic (Cocker et al., 2021).

One example of an *authenticity transgression* is Bianca's liposuction episode. In 2017, during an interview, Bianca said that she had had liposuction and that she chose not to disclose it to her followers. Bianca had previously made a series of posts about how she had lost weight thanks to a healthier diet, a physical exercise routine and the use of a modeling belt, which was provided for her use as a paid partnership. When exposed, Bianca was criticized and seen as a liar by followers who were disappointed: "It was just about being sincere. You are an influencer. Think of the weight of your profession. Think of so many people who look up to you. I like you and I was extremely disappointed" (Follower's Comment X on Instagram Post – Andrade, 2017).

Influencers are also embedded within the set of moral rules that govern the society's behavior. *Cultural transgression* occurs when an audience identifies that the influencer has not acted correctly in relation to a social, moral, or ethical standard otherwise important to the group and its cultural practices and/or orientation and social mores. Followers use their own ethical principles to judge influencer's

Table 1. Typology of Digital Influencers' Transgressions

	Authenticity Transgression	**Cultural Transgression**	**Paracrisis Transgression**
Nature	Lack of authenticity perception	Positioning regarding Moral or Social Dilemmas	Non-compliance with commercial agreement
Identification Criteria	Followers' comments in a tone of disappointment	Followers' comments in a disapproval tone	Followers' comments in a problematizing tone
Relation Dyad	Influencer-Follower	Influencer-Society	Influencer-Consumer; Influencer-Partners
Relational Rule Violated	Expected Performance Rule	Social Moral Behavioral Rule	Business relationship rule
Enabling Factors	Character Narrative + ParaSocial Relationship	Narrative discourse + Socio-Cultural Context	Positioning + Marketing strategy
Case Example	Liposuction lie	Reality Show and Feminist Movement	Allergy products of her own makeup brand

actions considering the follower's sense of morality and the level of harm to society as a whole (Zhou and Whitla, 2013) generated by the perceived transgressive behavior or comments. This type of transgression, which violates socially accepted codes of conduct, can lead to an emotional state of embarrassment that triggers feelings of shame and disgust (Krishna et al., 2019), displayed in the disapproving tone of the follower's comments.

In 2020, Bianca decided to participate in the biggest reality show aired in Brazil, *Big Brother Brasil*. Bianca had always produced content seeking to value and encourage female empowerment. However, in actuality, she was in the position of defending anti-feminist attitudes and making fun of the movement that has become an increasingly more important topic of discussion over the past few years in Brazilian culture. Such behavior led followers to accuse Bianca of just using the feminist cause to promote herself: "When a woman is aware that a woman friend was the victim of a dirty plan made by a male and this first woman says to the male 'be careful with her' that he be careful with her friend. Bianca, you are CANCELED! You make a living with women consuming your products and work, you should at least be in favor of them!" (Follower's Comment Y on Twitter) (Otto, 2020).

From their evolutionary trajectory, influencers are seen as human brands (Thomson, 2006) and may even launch their own products. With that step, they begin to establish a consumer-brand relationship with their audience (Fournier, 1998) in addition to the parasocial one (Brown, 2015). *Paracrisis transgression* is configured as publicly visible crises that arise from a seemingly intentional, irresponsible, or unethical behavior on the part of a brand (Coombs and Holladay, 2012). These transgressions are related to competence or possible accidents with the influencer's brand.

In 2019, Bianca launched skin products using her own makeup brand, Boca Rosa Beauty. However, some consumers showed videos of their major allergic reaction caused by two of the products. This caused followers / consumers to start questioning Bianca's credibility (Hauser et al., 2017): "All products in the Boca Rosa line have a dubious composition! There are more reliable professionals if you want to invest money. Bianca sells the name and makes money" (Follower 's Comment Z on YouTube Video) (Simões, 2019) Although it also has a commercial nature, this transgression differs from the transgression previously reported in the literature (Kozinets et al., 2010) since it is not related to the excess of commercial contracts accepted by the influencer. *Paracrisis transgression* is related to the failure of the influencer's brand, which is differentiated from what the literature calls brand transgression (Aaker et al., 2004) because it is a transgression committed by the joining of two brands: the influencer's human brand (Thomson, 2006) and the brand created by him or her.

CONCLUSIONS

This research intended to expand the scope of transgressions committed by influencers beyond the commercial-community tensions (Kozinets et al., 2010) previously identified. By changing the level of analysis from the transgressor to the transgression itself, it was possible to identify the nature of each transgression and, consequently, identified transgression types. Our research contributes to a better understanding of the transgression committed by the digital influencer, a figure who presents and relates in a different way from already traditional figures such as brands and celebrities (Nascimento et al., 2020). Every transgression is relational, but each one has a system of convergence and opposition created by the regulatory rules of such a relationship, which shape and direct the dynamics of the transgression. So, the question is raised as to the possibility of establishing different criteria for the identification and judgment of a transgression. Future research may focus on the dynamics of transgression, seeking to understand how the transgression committed by influencers differs from those committed by brands and celebrities, as found in traditional marketing literature. Even considering the crossover among multiple relationships dyads in which the influencer participates.

Theorizing Brand Community Conflict

Robert Arias, Loyola University Chicago, USA

INTRODUCTION

…I'm going to start a GoFundMe that will fund the billboard [with] our message to help fire Garpax. I just want to… post here first to make sure that the community has someone that will start this out...; if there are others planning to do this too, I hope we can collaborate. (Fan post on r/chicagobulls (reddit.com), June 23, 2017)

In 2017, a fan of the Chicago Bulls, a team in the National Basketball Association (NBA), posted the above message on social media. One month later, fans raised over $8,000 globally to fund a billboard urging the firing of General Manager Gar Forman, and John Paxson, President of Basketball Operations (Kenney 2017). Like many beloved brands, the Chicago Bulls is the heart of a brand community, defined as a specialized social collective "based on a structured set of social relations among admirers of a brand" (Muñiz and O'Guinn 2001, 412), and present it as a point of connection for consumers. Extant research primarily examines how brand communities enhance the experiences of their members, which include consumers and other important stakeholders such as marketers (Schouten and McAlexander 1995; Muniz and O'Guinn 2001; Schau, Muñiz, and Arnould 2009; Kumar and Kumar 2020). Yet as this billboard example demonstrates, differences in community members' aspirations, goals, and values vis à vis their focal brands can trigger problematic, negative experiences, leading to conflict within a brand community.

In this paper, we explore two questions, one conceptual and one empirical. Our conceptual question, based on a review of the literature on community, conflict, and consumption is, "What is brand community conflict, and how can it enhance our understanding of the brand community?" Our empirical question is "What are the sources of brand community conflict?" In exploring these questions, we enrich the understanding of brand community by: 1) exploring how consumers perceive conflict within brand communities; 2) demonstrating the salience of Rahim's conflict management theory (hereafter, CMT) to consumer research, by leveraging it as our theoretical lens and 3) delineating specific sources of conflict in brand communities.

BRAND COMMUNITIES AND CONFLICT

Evolution of the Brand Community Construct

Muñiz and O'Guinn (2001) introduce brand community, demarcating it from other social collectives. McAlexander et al. (2002) develop our understanding of the construct by incorporating the brand, product, and marketing agents as brand community members. Moreover, McAlexander et al.'s (2002) theoretical model emphasizes the customer's experience (versus a community that revolves around a brand), providing a foundation to study consumers' relationships with various brand community elements.

Conflict in Consumption Communities

Muñiz and O'Guinn (2001) recognize in their seminal paper that conflict can be inherent in brand community, stating, "…the marketer is often regarded as having too much say in the brand's future. The brand's very ownership is contested" (424). Yet few studies emphasize the tensions that emerge within a brand community, and how these tensions impact members' experiences. Beyond brand communities, researchers examine tensions in the consumption communities, though we contend this research stream requires more investigation (Chalmers, Price, and Schau 2013; Husemann, Ladstaetter, Luedicke 2015).

Organizational Conflict.

Organizational scholars frequently study conflict, conceptualized as an "interactive process manifested in incompatibility, disagreement, or dissonance within or between social entities (i.e., individual, group, organization, etc., Rahim 2002, 207). This definition assumes at least two parties engage in some form of interaction, and that at least one party perceives both parties' concerns to be incompatible. Conflict can yield a variety of group outcomes, influencing a range of group dynamics, such as group performance, task efficiency, intragroup trust, cohesion, and group member satisfaction (Marks et al. 2001).

Definition of Brand Community Conflict

Our review of the literature leads us to offer the following definition: *brand community conflict* refers to the *brand-relevant, interactive processes consumers believe are rooted in incompatibility, disagreement, or dissonance within or between the five components of a brand community:1) focal consumer, 2) other consumers, 3) brand, 4) product, and 5) the firm*. Furthermore, we aver that a focal consumer may experience brand community conflict by merely *observing* (what they perceive to be) incompatibility, disagreement, or dissonance between/among other brand community members (such as the firm and its product).

CONTEXT: THE CHICAGO BULLS FRANCHISE

Given the Bulls' success with Michael Jordan, a renowned former professional basketball player who helped the franchise win six NBA championships, the Bulls possess a global presence, a rich history, and a loyal fan base. However, recent tension stemming from unpopular management decisions, poor team performance, and fan disagreements make the stakeholders coalescing around this NBA franchise a highly appropriate context for exploring brand community conflict. The community encompasses Muñiz and O'Guinn's (2001) three defining features of a brand community. Notably distinct from a material object, the human-based aspect of the focal product (e.g., the team and its aggregation of various "human brands") allows it to develop more nuanced relationships with other brand community elements (Thomson 2006), increasing the likelihood for conflict to arise. What magnifies this team-franchise relationship is the publicized conflict discussed among fans and media outlets. As we demonstrate, relationships within the brand community that do not directly include the focal consumer are still important to study, because of how these relationships impact consumers' perceptions of the team product.

METHODS

Depth Interviews

We used purposive sampling to interview two types of consumers: those self-identifying as either "die-hard" fans (14 informants) or casual fans (11 informants, n= 25). The first author conducted interviews between May 2018-May 2019. We ensured the ages of the participants varied for both loyal and casual fans and only interviewed male participants of diverse ethnicities to eliminate gender

effects. We offered each a $10 NBA store gift card for each hour of participation.

We first made broad inquiries about fans' original connections to the Bulls, then asked about their current thoughts, emotions, and behaviors pertaining to the team. We probed perceptions of tensions within the community (including the relationships between and among the franchise, team, and other fans) and asked about opportunities and challenges regarding their ability to participate in and connect with the Bulls' brand community.

Social Media Archival Data

Netnographic methods greatly enhanced our dataset (Kozinets 2002). We analyzed consumer-generated Facebook comments posted on the official Bulls franchise's Facebook page. Specifically, we captured every post from November 2015 to May 2018. We study fans' textual responses to these posts; thus, the posts reflect consumer-firm interactions and consumers' observations of the product-firm relationship. Because the Bulls organization uploaded original posts, disagreements with these often indicate fan-franchise tension. Fans' responses, formatted in Microsoft Excel files, totaling 439,379 comments. Using interview transcripts, informal conversations, background knowledge from preliminary analysis, and the first author's familiarity with the context, we initially narrowed this dataset to 1,254 comments, using neutral keywords solely related to consumer-firm interactions (such as "front office" and "management"). We periodically expanded the dataset to include notions of conflict, after additional topics arose through depth interviews, and through our own iterative data analysis.

Data Analysis

We imported transcripts into MAXQDA, a data-analysis software that organizes data, facilitates coding, and helps researchers approach text from diverse perspectives before they generate inferences. The first author coded as much text as he could in-vivo, ensuring informants' voices were well represented. Both authors revisited the codes to conduct thematic analysis, periodically reevaluating the codes and text excerpts.

Theoretical Lens: Rahim's (2002) Conflict Management Theory

Arguing that certain types of conflict are healthy and productive, Rahim (2002) shifts the focus of organizational theory from conflict resolution to conflict management. He contends his theory is applicable at various social levels: interpersonal, intragroup, and intergroup. Building upon theorization in Rahim and Bonoma (1979), Rahim (2002) asserts that conflict management styles vary along two dimensions: 1) the degree the focal party is concerned about his or her own interests, and 2) the degree to which the focal party values the other group's interest.

Rahim outlines five strategies for conflict management in the organization, demarcating the conditions under which each is particularly useful. He adopts a situational approach—not positing a single solution for conflict, but offering multiple options he avers are appropriate, depending upon the situation. Rahim (2002) notes that although organizations should work to reduce relational conflict at all levels, merely resolving conflict is not always the ideal outcome. Rather, firms should seek to *manage* conflict so it can exist purposefully – e.g., to spur dialogue on important issues within the firm. Thus, conflict may yield functional and dysfunctional outcomes.

In marketing, Rahim's CMT (2002) is limited to characterizing conflict in different contexts (e.g., marketing channels; Samaha, Palmatier, and Dant 2011, Watson IV et al. 2015; and relationship

marketing; Zhang et al. 2016. Thus, we believe Rahim's contributions remain underutilized in the marketing field, and can be useful in explicating brand community conflict.

EMPIRICAL FINDINGS: SOURCES OF BRAND COMMUNITY CONFLICT

From the perspective of Bulls consumers, we delineate four sources of conflict that emerge from consumers' perceptions regarding how the firm's actions (or inactions) compromise the brand. Also notable is that while our informants may incorporate a variety of brand community members when describing the brand community conflict they experience, they perceive all of these sources of conflict to originate from the firm, often absolving the product, other consumers, and the brand of blame for conflict.

Apathetic Brand Management

The first emergent construct we discuss relates to how consumers perceive a firm values its brand. Specifically, Bulls fans believe the franchise actually is indifferent to it. Utilizing psychological literature on apathy (Levy et al. 1998), we define perceived apathetic brand management as the *belief that a corporate institution is unmotivated to enhance its brand quality, brand status in the industry, and/ or its commercial success*. Research on consumers' attitudes toward brands, including their indifference, is abundant (Thurstone 1931; Tyebjee 1979). Firms' apathy toward their own brands, however, are less. Our informants clearly articulate the belief that the firm is apathetic in its crafting of the brand. Santino states: "Our front office [management] really doesn't care about the Bulls at all....They genuinely don't care about the product they put out onto the court and that's why you have the mess that the Bulls are in right now."

Incompetent Product Management

Organizational competence is characterized by three dimensions: knowledge, know-how, and attitude (Durand 1998). Here, this source of conflict pertains to consumers' lack of confidence in the firm's "know-how" regarding how to execute a strategically successful product performance strategy. As fans witness substandard team performances, accusations of incompetent management are frequent. A Facebook user comments on a particular poor performance and quickly assigns blame to the Bulls' general manager ("GM") for the loss, "Up by 20 not once but twice and still lose the game... maybe just maybe if the bulls had a GM that KNOWS HOW TO BUILD A TEAM[,] WE AS FAN[S] WOULDN'T BE DISAPPOINTED…"

Toxic Organizational Culture

Consumers identifying this source of conflict describe the Bulls' corporate culture as disrespectful, unaccountable, and inflexible. In our context, some consumers observe the Bulls' franchise disrespecting its employees. One such example includes the dramatic claim of Bulls' corporate employees spying on the players. Salvador explains, "I remember seeing a headline that management had put a snitch in the locker room…. Supposedly they were giving management information on the players…." Fans also accuse the franchise of being unaccountable and for using scapegoats to explain poor performance. In CMT, Rahim discusses the construct of organizational defensive routines, practices and procedures that employees enact to help them avoid negative attention, preventing them from "examining the nature and causes of that embarrassment or threat" (Rahim 2002, 213). In this context, the product itself is the scapegoat, with managers blaming coaches and unruly players for poor basketball performance. In CMT, Rahim alludes to accountability, who avers that to support organizational long-term effectiveness, conflict management requires employees to "take responsibility for their errors and not blame others for their mistakes or incompetence"

(Rahim 2002, 227). Finally, fans also describe the Bulls organization as closeminded. Related to this perception of inflexibility, CMT suggests organizational defensive routines inhibit employees' ability to accurately formulate a problem, and as a result, "…old policies, procedures, and practices continue to be followed although they may have been rendered ineffective due to changes in the external environment" (Rahim 2002, 214).

Inconsistent Firm Messaging

A final source of brand community conflict reflects the fact that consumers perceive inconsistencies in the Bulls' communication efforts from both the franchise and the team. Our data indicate such messaging manifests in a variety of forms, such as: selling false hopes, lack of team promotion by players, irrelevant marketing communications, statements to the public from the firm that contradict the firm's behavior, and management's attribution of poor product underperformance to coaches and players. When asked how he perceives the Bulls' promotional efforts on social media, Kenneth responds,

> Pretty negatively. Because if you just looked at how the Bulls market themselves, you would have no idea they sucked. But as someone who sees both that and they're on-court products, I can see the contradiction…. And that makes me feel like, '….Can we just stop hyping up these players when you can't win 15 games in a season?'

Fans often believe Bulls' promotional efforts are simply untrue, and sometimes they can prove it by referencing the firm's decisions. A fan posts online, "The same front office that claimed they wanted to 'get younger' last year but went and overpaid for two [older] past-their-prime players just to sell tickets." These "overselling" firm communications not only highlight the negative reality of current product quality, but also appear to consumers to insult their intelligence. Moreover, players uninterested in interacting with fans via media leads to fans believing the players (and the firm) do not value the product or the fan experience.

CONCLUSION

Delineating and developing the construct of brand community conflict should serve as a catalyst for marketing scholarship and practice. Primarily, the construct enables and encourages scholars to move beyond a myopic view of merely understanding the positive consumer experiences within brand communities (e.g., studying brand community practices that enhance brand value and consumers' brand community experiences; Schau, Muñiz, and Arnould 2009).

Thus, the theoretical insights that emerge from this study pose important implications for consumer research. In this research, we first discuss how deepening our understanding of what we term brand community conflict may contribute to extant scholarship in the brand community domain. In doing so, we explain the importance of utilizing conflict management theory in consumer research. We offer a definition of the brand community construct, illuminating possible negative communal experiences. We also urge scholars to acknowledge how consumers' observations of other brand community relationships may impact their experiences. Moreover, we introduce four sources of brand community conflict, including the new and distinct construct of perceived apathetic brand management. All of these contributions converge to offer a foundational understanding of conflict within brand communities. We encourage consumer researchers to continue this stream of research to develop a more holistic conceptualization of the brand community experience.

TABLE 1: Sources of Brand Community Conflict

Source of Brand Community Conflict	Apathetic Brand Management	Incompetent Product Management	Toxic Organizational Culture	Inconsistent Firm Messaging
Definition & Characterization	• Perceptions that the firm is not concerned with brand performance	• Belief the team is not managed properly due to the upper management's lack of skill, such that the team performs consistently poorly	• Consumers' perceptions of the firm's detrimental cognitive, emotional, and behavioral activities that members engage in (e.g., owner, managers, players, coaches) • Includes consumers' perceptions of the firm being too risk averse and inflexible	• Consumers' detection of the firm's contradictory, sometimes incoherent, messages regarding the Bulls' current and future status

How Conflict Sources Manifest among Consumers	• Consumers perceive the firm prioritizes other firm interests over the brand/product
	   o Profit margins
	   o The Chicago White Sox (another business the Bulls' owner operates)
		• Repeated poor performances by the team
		• Repeated poor decisions made by management (how the player roster is designed)
			• Unreasonable firm loyalty to incompetent managers
			• Inappropriate behavior among managers/ players (e.g., physical altercations, rumors of management spying on the team, and so on)
			• Management blaming underperformance on coaches and players
				• Irrelevant marketing communications
				• Public firm statements that contradict firm behavior

TABLE 1: (Cont.)

Empirical Evidence *Unnamed excerpts are consumers' comments posted on the Official Chicago Bulls Facebook page			
• Cameron: "[Managers] just care about getting money…to milk it out….to see how long they can keep their jobs." • Rick: "…how dare you [the Bulls firm] fucking charge 80 dollars a ticket to go see your team lose. No…to keep me in your seats…sell… cheaper." • "50% off [tickets]? Are [yo]u kidding? With this garbage dump of a team[,] I wouldn't go see them if you gave the tickets away. Put a team on the court instead of a trash heap then I'll go..." • "Pax [I] lost all respect for you bro. Yeah you helped us win rings in the past but you can care [less] about taking this team to the promised land again. You need to go…" • "I love the [B]ulls, that's my team. But do [P]axson and Forman do? …pissed off"	• Santino: "[managers are] not putting out a good product on the court and…it's not the players and coaches fault." • Joey: "I don't really want to watch the Bulls until those jokers [managers are] out of there." • "…world['s] most garbage sport organization….. decide to tank and DONT EVEN KNOW HOW TO TANK RIGHT!!!!!!!..." • "This dysfunctional organization hasn't a clue…. Terribly run rebuild by the 2 front office bozos." • "Chicago Bulls are Ran by garbage management, they suck period. I see no future with this roster, one horrible trade after another..."	• Kenneth: "…the only reason they've [two upper managers] had their jobs…is because there's some sort of 'old boys club' at the Bulls where they're…friends with the owner, and…they fulfill the owner's wants, …to make the team profitable…. if teams underperform consistently, especially for as long as the Bulls have, (so basically six years now), those guys would be fired." • Santino: "…that show[s] how much the disconnect between the fan base and front office is….the majority of the fan base doesn't have a problem with the players. A lot of us do have a problem with the front office…because Reinsdorf is too loyal to fire Forman and Paxson…." • Joey: "Instead of taking blame and saying, 'Hey, it's my fault. I made the wrong hire.' He's like, 'Oh, we did a lot of researching… he's this great communicator….' now you fired him… and…saying his main weakness is he doesn't communicate. Well whose fault is it? …. is it because maybe you didn't evaluate properly?"	• "Alright I give up[.] all this hype [and] when I saw 5 [points] per game..I didn't bothered watching it.. Too much hype for nothing.." • "Why are we showing highlights of players who are gonna be out of the league…. they're garbage" • "I love all the Bulls highlights. I noticed one thing though. They never show the final score…. Hot garbage."

How Do Consumers Manage Technologically Induced Scarcity of Time Through Digital Decluttering Practices?

Birte Manke, University of St Gallen, Switzerland

INTRODUCTION

For a few years, scholarly interest in the impact of resource scarcity on consumer behavior has been increasing (Goldsmith et al., 2020). Resource scarcity can be defined as "a subjective sense of having more needs than resources" (Mullainathan & Shafir, 2014, p. 86). When the resources are limited, the ever-increasing need-creation and abundance regarding market offerings can boost the perceptions of scarcity. This is what consumers experience for example, around time, which is finite and can neither be acquired nor stored (Cotte et al., 2004; Feldman & Hornik, 1981; Woermann & Rokka, 2015). Consumers need to make choices to allocate time between consumption opportunities and tasks (Holbrook & Lehmann, 1981; Kaufman et al., 1991). When consumers try to "save time" they reallocate time between different activities to increase efficiency (Feldman & Hornik, 1981; Fernbach et al., 2015). Consumers start to prioritize what to spend time on (Fernbach et al., 2015). So far, little is known about these reallocation decisions of consumers. With our research, we follow the call for research to start to work on a resource based model for consumers and better understand how consumers perceive and invest resources (Arnould & Thompson, 2005). With this paper, we want to address the research question: *How do consumers manage resource scarcity of time through digital decluttering practices?*

LITERATURE REVIEW

Time is a relevant concept for consumption decisions and experiences as it can mediate the quality and attractiveness of offerings in the market (Woermann & Rokka, 2015). Previous research focused on how retailers can adapt the experiences of time to accommodate their consumers' preferences (Arnould, 2005; Kozinets et al., 2004). Retailing research focused strongly on how to minimize the duration of time as a way to save consumer's time (Berry et al., 2002; Hui et al., 1998; Messinger & Narasimhan, 1997). However, additional research showed that the temporal duration of an activity does not equate to the perceived temporality of a consumption experience or practice (Woermann & Rokka, 2015). For example, Husemann et al. (2019) showed that unwanted interruptions by technology were associated with feelings of acceleration. Consumers slowed down temporal experience through limiting and controlling device usage. Woermann et al. (2015) found that temporal rush and stress can be caused by misalignment of practices. Practice misalignment is overall a negative state for consumers, which then engage in efforts to restore the practices (Phipps & Ozanne, 2017; Thomas & Epp, 2019).

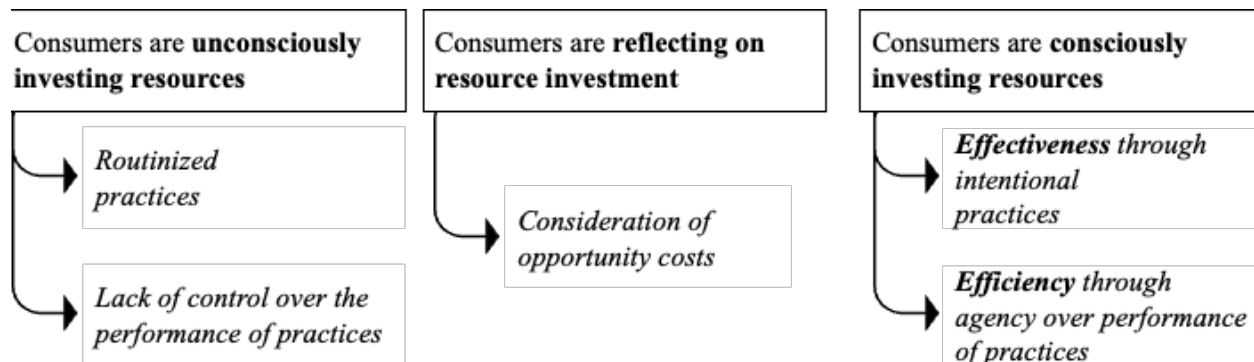
Paradoxically, modern technology is often acquired with the intention to save time and increase productivity; however, often enough, it ends up wasting time (Mick & Fournier, 1998). Consumers are facing an array of diverse opportunities to engage in specific consumption practices not only in the physical but growingly in the digital realm: Digital spaces enable "(…). new opportunities for transformational spaces and, therefore, new forms of pleasure and experience. What we are only just able to see and document are the range of new practices that these spaces are allowing" (Denegri-Knott & Molesworth, 2010, p. 116). Research shows that digital spheres can have such an alluring character and even increase consumers' desire to consume (Hoffman & Novak, 2018; Kozinets et al., 2017). The alluring nature of technological devices then seduces consumers to spend a considerable amount of time online and this can lead to feelings of wasting time and decreased productivity (Gonzalez Rodriguez, 2020). Time feels for many consumers like a scarce resource anyway (Bellezza et al., 2016), and techno-consumption can increase the experience of resource scarcity. Consumers are confronted with conflicts and trade-offs, e.g., between the on- and offline world or leisure and work activities (Kozinets, 2008). Little is known on how consumers efficiently and effectively allocate time in their techno-consumption.

METHODOLOGICAL APPROACH

To gain insights into consumers techno-consumption we studied the phenomenon of digital decluttering (Newport, 2019). Decluttering overall has become a major societal trend in the analog but also the digital sphere (Cherrier & Belk, 2015). For this study, we considered 19 in-depth interviews with consumers who shared with us how they organized and decluttered their digital life. The interviews ranged from 40 – 153 minutes, but on average 67 minutes. The interviews resulted in 300 pages of transcripts (single-spaced). Further, we examined 29 videos (308 minutes) on digital decluttering from YouTube, which were turned into 111 pages of transcribed content (single-spaced). We extracted discussions on digital decluttering from Redditt, which resulted in a total of 99 pages (single-spaced). The written content was then systematically coded.

FINDINGS

*Consumers are **unconsciously investing resources***

Resource investment in the online sphere is for many consumers unconscious before they started their decluttering process. This


Model 1 Stages of consumers combating technologically induced scarcity of time through digital decluttering practices

is, for example, something that Linda, a very nearly organized respondent, shared with us: *"I think it was more of a rational decision (....). I thought it would* **be healthy to give it up for a while** *and then* **do it again more consciously**. *And that was the intention with Instagram, too. (...) It was more rational for me in the sense of an* **alarmingly high screen time** *or this* **awareness of constantly looking at it** *and then actually at the end of the day* **you're totally knackered** *because you always have your brain running on three channels."*

Linda describes that she made the rational choice to distance herself from technology to be able to approach it more consciously afterwards. She confronted herself with the time she had invested in using theses apps and realized that she was constantly directing her attention to her phone. She became aware that all of this had a negative impact on her well-being and left her feeling 'totally knackered' at the end of the day.

While in traditional market places consumers exchanged consciously money for material goods (Kozinets, 2002), the exchanges in digital marketplaces can involve the exchange of alternative resources (e.g., time or attention), which is often less conscious. Many offerings in the digital sphere are free of direct monetary charge; however, consumers pay with their attention or time (Davenport & Beck, 2001). Consumption in the digital sphere is less material and focuses on access instead of traditional ownership (Bardhi et al., 2012; Bardhi & Eckhardt, 2017). Consumers first must realize that they are trading resources, like time and attention, and that they are paying a price for the investment of their resources. In Linda's case she realized that her well-being suffered. But why are consumers still engaging in practices which bring them undesirable outcomes?

Consumer behavior online consists of many highly routinized practices. This permits the unconscious investment of resources (i.e., time and attention). A deliberate choice is not made in advance. This is what David, a 24-year-old student with a strong focus on optimizing many parts of his life, described: *"It [using a specific app] kind of* **became a routine**. *A routine that* **I did not question**. *But at some point, it* **became too much, and it felt out of my control**. *It was not that I was addicted or anything. It just was a very* **routinized procedure**. *It was tough when I wanted to* **break with that routine**."*

David describes that he did not question the behavior. Giving his time and attention to the application had become a default setting for him. At a point he felt the need to break the routine and reset the behavior. However, material set ups often support specific routines and practices (Phipps & Ozanne, 2017). David described that he himself felt like having 'lost control'. This is not an uncommon feeling in digital spaces.

Consumers can have the feeling that they lack control over their behavior online because the spaces are designed to grab their attention. Claire, a 32-year-old researcher, described her struggle with spending less time on Facebook like this: „*It's just a little annoying. Facebook is pretty smart about that. They always want to* **incentivize you to have the app** *too, and then* **limit your app use** *when you're not here anymore. It used to be easy to look at everything on Instagram online, without an account, if you wanted to for maybe personal research and stuff. And that's not so easy now."*

Claire describes that the technological set up of social media applications force her to download and engage with the app. She experiences limited functionality when using Facebook only through a browser for example. Downloading it seduces her to spend more time online. Digital spaces have become alluring, which drives investment in the application (Kozinets et al., 2017). Some research

starts to critically reflect on the agency consumers have while interacting with technology (Hoffman & Novak, 2018)**.**

Consumers are *reflecting on resource investment*

Consumers are motivated to start a digital decluttering processes when they realize that their attention and time are not well used. During their reflection on how they spend their time online consumers start to consider opportunity costs and become aware of potential trade-offs they are (unconsciously) making. Our respondent Linda, when asked about her digital decluttering motivation, shared that she wanted to re-allocate the time to other activities: "*Yes, that I spend less time with it on the one hand. So, I have* **more time for other things**. *For example, I love to read and have read little in recent years, I would say. Of course, it also has to do with the fact that we have a job where we already read enough during the day. But it also has to do with the fact that before I pick up a book or a newspaper, I* **often look at the Spiegel [News] app or something** *(...).*"

With the awareness that she misses out on doing other things, Linda starts to become more intentional. She reflects on things that would be more rewarding to her. Consumers may also realize how their technology use affects the pursuit of long-term goals.

Consumers are *consciously investing resources*

Consumers want to increase the effectiveness of their resource investment. Consumers start to make sure that when they are spending time, they are spending it with things which they want to do, and which help them to attain their goals. Curating the experience has the goal to increase the quality. This leads to more effective resource investment. Dylan, a 21-year-old passionate photographer, described how he designed his use of the Instagram app like this: "*Instagram is a* **platform of inspiration for me**. *(...) On Instagram I've decided, I only follow* **other photographers whose content I find inspiring**. *I don't follow friends; I don't follow any celebrities or anything. Really just when I look in my* **feed it's just photos that I like**. *(...). I'm not in contact with, let's say, people who are revealing themselves on social media or any personal opinions about people, about political issues, because basically I'm not interested in that*. *"*

Dylan clearly defined a goal for the use of the application and designed the feed to suit his needs. He clearly defined criteria for content he wants to see and does not want to see. This is what others also engage in by (un-)following creators, unsubscribing newsletters, or limiting the access of unwanted information to their life. Consumers often struggle that the use can be prescribed by a technology itself (Shove, 2003). They must adapt the material infrastructure to support more desired practices (Phipps & Ozanne, 2017).

Consumers are increasing efficiency of resource investment by regaining agency and breaking with habits and routines that make them waste their time. Besides adapting the material set up of their digital spaces they also create intangible, temporal boundaries to help structure their consumption.

Consumers are setting temporal boundaries and compartmentalizing their time to make sure that certain activities do not spread all over their day. This can mean for example to set specific start or end times to engage in specific behavior. It is relevant to make sure that the technological features do not cross these temporal boundaries consumers set for themselves. David elaborates on his annoyance with being confronted with digital banners like this: "*Just this being torn out of peace again. Out of my inner peace of mind. I just google for a gift and then* **I get some banner. When I do something, I want to do that.** *And above all, I can influence that; if I'm walking on the street and someone honks, I can't do anything, but* **here I can influence it myself**."

David wants to be able to decide for himself what he wants to do and when and then be able to pursue that activity without any interruption. Features like pop-up ads, banners, or notifications disrupt the activity and consumers attention. Therefore, consumers engage in activities to limit access to them through installing ad-blockers or disabling notifications. Consumers prefer to proactively go and search for information instead of being contacted by third parties.

While outside distractions can lead to the overstepping of the set temporal boundaries the alluringness of technologies may lead to unwanted temptations and distractions. Managing these temptations was the main reason our respondent Abby deleted the app TikTok: *"One of those that I downloaded, but where I really said to myself, no, don't start, is TikTok. Somehow, I found it exciting, and I wanted to at least understand how it is and how it works exactly. But I also* **notice the potential for seduction that then you're there forever** *a little bit like YouTube (...). TikTok is* **really pure entertainment for me.** *Leisure activity and a lot of nonsense as well. Yeah, which is a* **pastime that I don't really want to add to it because other things are more important to me."**

Abby explicitly noticed the 'potential for seduction' to spend a lot of time with the application. She made then a trade-off between the value or entertainment she may get from the app and other things in her life and decided to delete the app again. She did not expose herself to the risk of having to perform a lot of self-discipline. Besides deleting applications, other practices to reduce the alluringness of digital devices may be putting a phone far away, turning the phone screen to black and white, hiding specific applications (e.g., in folders) to make them less accessible.

DISCUSSION

Previous research on techno-consumption started to explore consumers conflicting experiences with technology use (Kozinets, 2008; Mick & Fournier, 1998). We respond to the call for further research on techno-cultures (Kozinets et al., 2019) by expanding the research on how consumer solve these inner tensions (i.e. productiveness versus pleasure). We show that consumers are wasting time by highlighting taken-for-grantedness of practices in techno-consumption. Like within the household the digital sphere has unquestioned routines which are based on "conventions of comfort" and "convenience" (Phipps & Ozanne, 2017, p. 363). In digital decluttering processes the technological structures and the practices they support are critically reflected on and singularized by consumers. Much research has been done on the conscious and more public engagement in the web sphere (Kozinets et al., 2017; Schau & Gilly, 2003), so future research could explore more the tacit and private aspects of techno-consumption.

Prior research on household organization emphasized consumers conscious efforts to assign physical places for their consumption objects (see Arsel & Bean, 2013; Dion et al., 2014). Our research alludes to the role of temporality in digital decluttering processes and consumers efforts to assigning and protect a 'temporal place' for a specific consumption practice. This his means consciously deciding when and how long one is going to engage in that practice. Prior research focused on how practices produce experiences of temporality (Woermann & Rokka, 2015), our research highlights the role of temporality for the performance of practices, which further research could explore in more depths.

Not Just Impulsiveness: The Psychometric Characteristics of Intertemporal Preferences in Consumer Behavior

Antonia Krefeld-Schwalb, Columbia Business School, USA
Daniel Bartels, University of Chicago Booth School of Business, USA
Eric Johnson, Columbia Business School, USA

INTRODUCTION

Many of consumer choices involve a trade-off between sooner and later outcomes. For instance, food products rich in sugar and fat promise immediate reward but are damaging to health in the long run. Whereas, keeping a healthy lifestyle can require one to forego immediate satisfaction for the long-term health goal. Credits, loans and credit cards in particular allow immediate consumption, above and beyond one's current cash flow, while the expansion of the individual's purchase power comes with a cost. Saving for retirement or a bigger long-term investment, however, requires one to restrain from using the money immediately for a larger reward in the future (Chabris, Laibson, Morris, Schuldt, & Taubinsky, 2008).

Despite these decisions occurring in very different domains, it has been debated whether the individuals' general intertemporal preferences, summarized in a single or a small set of parameters, underlie the behavior observed in different domains (Chabris et al., 2008; Frederick et al., 2002). In particular, economic models of intertemporal preferences mostly assume that individuals discount future outcomes following a parameterized nonlinear function that flattens with longer delays (Laibson, 1997; Samuelson, 1937).

The discounting function is typically measured based on preferences elicited in a behavioral task. In the most common versions of preferences elicitation task, respondents are asked to choose between various smaller sooner and larger later options (Rachlin, Raineri, & Cross, 1991), or they are asked to match a larger later amount to a smaller sooner amount until the respondent perceives both options as equally attractive (Thaler, 1981). In several studies it has been illustrated, that similarly measured intertemporal preferences, are correlated with various consumer choices (Bradford, Courtemanche, Heutel, Mcalvanah, & Ruhm, 2017; Tasoff & Zhang, 2021; Bartels, Li & Bharti, 2021).

However, recent research revealed several problems in this approach, that threaten the validity and reliability of the measures. First, the measures are sensitive to small changes in the setting of the paradigms (Hardisty, Thompson, Krantz, & Weber, 2013). Second, behavior is often closely related to numeracy and other cognitive scales (Millroth, Juslin, Winman, Nilsson, & Lindskog, 2020). Third, most elicitation tasks measure only trade-offs for money over time (but see Augenblick, Niederle, & Sprenger, 2015; Chapman, 1996 for exceptions), although people make intertemporal tradeoffs involving other kinds of resources. Some studies suggest using measures of self-regulation instead, that are more reliable and provide more accurate predictions of real-life behavior (Eisenberg et al., 2019; Enkavi et al., 2019). However, while these surveys involve aspects that are relevant or closely associated to intertemporal preferences, they do not capture the fundamental aspect of how people tradeoff value and time.

To close this gap in the literature, we developed a survey for measuring intertemporal preferences in consumer behavior (IPICB) over five studies. Unlike scales of self-regulation, the IPICB items are specifically designed to emphasize the trade-off between two outcomes with different delays, in three domains: Consumer Finance, Health, and Readiness. Following the DOSPERT scale for measuring domain-specific variability in risk preferences (Weber, Blais, & Betz, 2002), the scale allows for the examination of domain-specific vari-ability in intertemporal preferences. The items are presented in two different versions, one with immediate outcomes and one with delayed outcomes, to further investigate discontinuities in preferences for immediate outcomes as suggested in some economic models of intertemporal preferences.

STUDY 1

As a starting point for our scale, we conducted a literature review to identify domains and items that are frequently associated with intertemporal preferences in the literature. Aiming to cover a broad range of behavior, we identified five relevant domains and 32 items: Health (e.g. "*At the end of the day, how likely are you to use dental floss after brushing your teeth?*"), Consumer Finance (e.g. "*When your credit card bill arrives by the end of next month, how likely would you pay it in full?*"), Readiness (e.g. "*Imagine you are having a birthday party with friends at your house, but it's getting late now. How likely are you to wash the dishes as soon as your guests leave?*"), Preference for Energy Efficient Products ("*Consider two apartments: Apartment A was recently insulated, and apartment B was not insulated. Due to the insulation, apartment A will have lower heating costs than the otherwise identical apartment B. Would you be willing to pay a higher rent (heating excluded) for apartment A?*") and Media Subscriptions (e.g. "*Your favorite online news page switched to charge most of its content for $120 per year. You can choose either to prepay the entire bill immediately or to split into monthly payments. How likely are you to pay the entire bill immediately?*"). We further designed two versions of each item where the sooner delay was either immediate or delayed.

We tested the survey on an online sample (N = 90, Prolific) to gather initial validity of the items. The items with immediate and delayed outcomes were tested in two separate blocks, in randomized order.

While the scale consistency of the subscales Health (Cronbach's α=.74), Consumer Finance (Cronbach's α=.75), Readiness (Cronbach's α=.73) was good, the scale consistency of the remaining two scales was insufficient Energy Efficient Products (Cronbach's α=.50) and Media Subscriptions (Cronbach's α=.24). A principal component analysis uncovered a clustering of the health items on one component, while the other items were scattered across different components. We extracted five components that explained 27% of variance in the correlations. The components did not capture differences in the items with immediate or delayed rewards. Instead, responses in the two versions of the same items were highly correlated ($r_s > .8$).

STUDY 2

The mixed results on (sub-)scale consistency, and component analysis let us reconsider whether the scale contained all relevant, and only relevant behavior that consumers perceive as involving a time-value trade-off. For that reason, we ran a crowdsourcing task asking an online sample to list behavior that involve time-value trade-offs.

The (N=49) respondents were incentivized to provide five unique, well suited examples. Many of the examples mentioned matched IPICB's existing items, such as healthy habits, buying on credit, long term investments, and studying hard for a long-term

goal, to name but a few. Other frequently mentioned examples were buying products on sale, learning to do services instead of paying for them and buying more expensive, high quality products instead of cheaper products that are to be replaced more often. None of the mentioned examples were tackling media or any other kind of subscriptions and only two examples mentioned energy efficiency.

STUDY 3

Based on Study 2 we revised the composition of the IPICB and its items. We dropped the subscales measuring preferences for energy efficient products and media subscriptions from the scale. Both subscales were not supported by the crowdsourcing task, and substantially overlapped with the consumer finance subscale, while nonoverlapping items of these scales were unrelated to the total scale. The remaining and newly added items were further streamlined to fit the following phrasing for immediate outcomes: "If X now, I would do Y instead of Z" and delayed outcomes: "If X later, I would do Y instead of Z". Please consider this newly added item from the consumer finance subscale as an example: "*If items are on sale today[next week], I would buy them as gifts for my family, instead of buying the items at full price around the holidays or their birthdays*".

Equipped with the 62-items scale (31 items in two versions) we conducted another validation and scale reduction study. In order to test the predictive validity of our scale, we recorded several relevant, self-reported behaviors and indicators of behavior (Credit Score, BMI, highest level of education, monthly income (before the pandemic), number of loans). In addition to these behaviors, we further collected several important covariates that have been associated with intertemporal preferences, and the behaviors (numeracy (Lipkus et al. 2001), impulsiveness (The Barratt Impulsiveness Scale (BIS); Patton et al., 1995), social desirability (The Balanced Inventory of Desirable Responding (BIDR); Hard et al., 2015), parents' education and average income in parent's home zip code area).

The data was collected online, recruited via Roi Rocket, in two waves, two weeks apart. The IPICB items were split between the two waves, such that only one of the two versions of each item was presented in one wave, in randomized order. We replicated the two-wave experiment twice with two independent samples of $N_{Study3a}$ = 144 and $N_{Study3b}$= 192[1] complete datasets in each sample, with 74% and 80% retention rates across the two waves, respectively.

We reduced the scales by repeatedly filtering out items that reduced the internal consistency of each subscale up until no more item could be removed. This let to 38 and 42 items in each of the samples, and 36 items that remained in the scale in both samples. The final version of the scale had excellent internal consistency for the total (Cronbach's alpha = .92) as well as the 11-item Health (Cronbach's alpha = .81), the 9-item Consumer Finance (Cronbach's alpha =.85), and the 16-item Readiness subscales (Cronbach's alpha =.84). All remaining analyses of study 3 will use this scale and the collapsed data of both samples 3a and 3b.

We first conducted a principal component analysis that was aimed at extracting three components, one for each subscale. However, all items loaded on one of the components, with all but two item loadings b > .4 suggesting a general factor without domain variability. However, it might also be the case that the psychometric structure instead is hierarchical with a general factor and domain specific sub-factors (Frey, Pedroni, Mata, Rieskamp, & Hertwig, 2017). To test this hypothesis, we compared the performance of five factor models with confirmatory factor analysis. The models con-

---

1   The data collection and analysis plan of study 3b was preregistered: osf.io/v9k8c

sisted of 1) only a general factor (BIC = 35908); 2) separate factors for immediate and delayed rewards (BIC = 36436); 3) three subscale factors (BIC = 35801); 4) three subscale and one general factor (BIC = 35180); and 5) three subscale and two separate factors immediate and delayed rewards (BIC = 35174). Comparing the models BIC for fitting the data revealed that the fifth model provided the best fit to the data. However, despite the implementation as uncorrelated factors, the factor scores of the model's general factors were highly correlated (r = .98) due to the high correlation of the two different versions of each item.

In order to cut this strong association, and test the robustness of our finding we used a second approach to test IPICB's psychometric structure. Instead of comparing the models on the entire scale only, we randomly constructed 1000 sub-versions of the scale that contained each item in only one of the delay versions. For four items, only one of the versions was included in the final 36 consistent items determined above, and these items were added to each sub-version. For the remaining 16 items, either the version with immediate or delayed outcome was randomly picked. The sub-versions of the scale thus had 20 unique items, with either immediate or delayed sooner outcomes. Next, we repeated the model comparison of the different factor models, on each of the sub-versions and counted how often each factor model had the smallest BIC. In more than 87% of the sub-versions, the model with one general factor and factors for each subscale provided the best performance for fitting the data.

Second, we tested the predictive validity of the 36-item and the 20-item sub-versions for the behaviors collected in wave 1. We estimated hierarchical regression models with random effects for the sample to account for variability between the two samples 3a and 3b, and fixed effects for all covariates as well as either one of all possible combinations of the IPICB subscales, only the mean IPICB, or no subscales of the IPICB. We then compared the performance for predicting the behaviors (with BIC and R^2). Table 1 summarizes the results by reporting the best fitting model including any of the IPICB scales, and the difference in BIC and R^2 compared to the model with only covariates. For all behaviors, except for the number of loans taken in the last year adding one or multiple subscales of the IPICB increased the model's performance.

Figure 1 further shows the results of the same analyses for the 1000, 20-item subversions of IPICB. The left column shows how often which of the compared regression models yielded the smallest BIC, and the right column of the figure shows the distribution of the R^2 of the best models. Despite the smaller number of items, the results replicate the analysis with the 36-item version of the questionnaire.

STUDY 4

The results of study 3 provide strong evidence for the predictive validity of the 36-item as well as any of the shorter 20-item subversions. In study 4, we extended these results further by predicting additional, relevant behavior (Bartels, Bharti & Li, 2021) and relying on only the shorter, 20-items version of IPICB.

Three-hundred-five respondents participated in this online study, recruited via the panel provider ROI Rocket. On top of respondents' credit score and BMI, we further collected additional self-reported variables that have been proven to be predicted by intertemporal preferences in a related study (Bartels, Bharti & Li, 2021), listed in Table 1. In addition to the self-reported variables, we constructed incentive aligned titrator paradigms corresponding to each IPICB subscale domain (Bartels & Urminsky, 2011). The titrators were tailored to estimate respondents' temporal discounting for vice behavior in each domain (unhealthy restaurant, fashion shopping and

	Virtue/Vice	H	5%	3	1%
	K	R	6%	5	1%

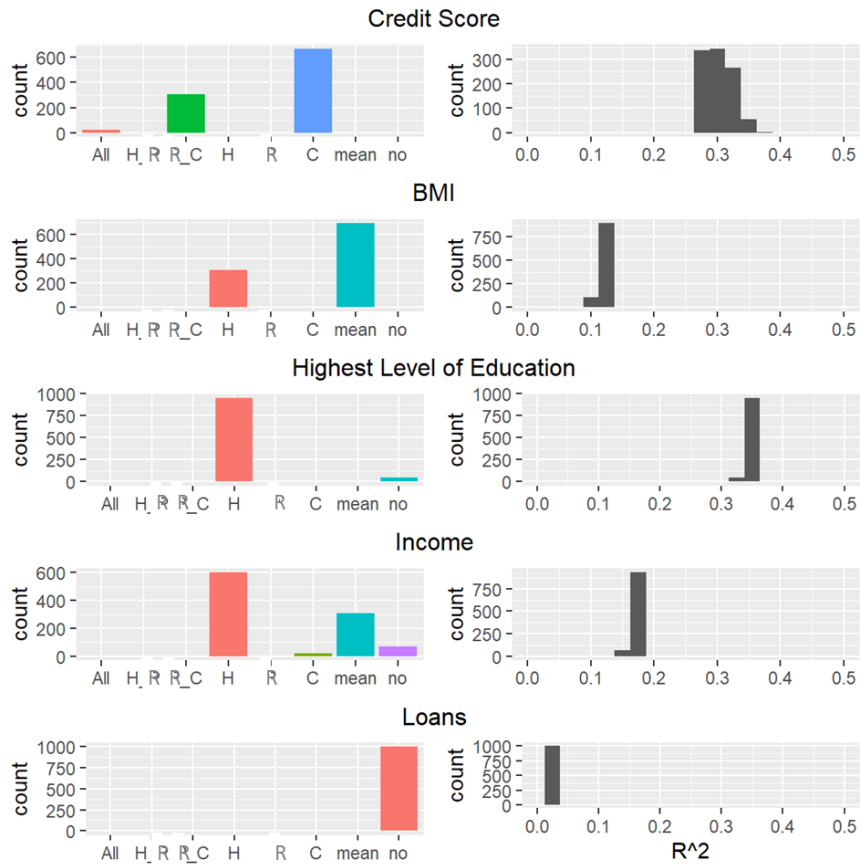
Note. [a] IPICB model refers to the best performing model among all models with at least one of IPICB's subscale, or the mean score. CF= Consumer Finance, H = Health, R = Readiness. [b] To account for the binary variable yes = I have been or will get vaccinated or no = I will not get vaccinated, the models were fitted with a log link function. [c] Options for the health domain titrator: virtue = vouchers for *Outback Steakhouse,* an restaurant chain perceived as unhealthy; vice = vouchers for the *Jamba Juice* a restaurant chain perceived as healthy. [d] Options for the consumer finance domain titrator: virtue = vouchers for *acorn,* an online investment and saving provider; vice = vouchers for Nordstrom, and luxury fashion retailer. [e] Options for the consumer finance domain titrator: virtue = vouchers for *acorn,* an online investment and saving provider; vice = vouchers for Nordstrom, and luxury fashion retailer.


Figure 1. Results of the model comparison between regression models that included all covariates and the models including different parts of the IPICB. The left column illustrates the number of best perfoming models (smalles BIC) for fitting each of the 1000 sub-versions of IPICB. The x axis indicates the name of best performing model: all = all IPICB subscales, H_R = IPICB health and readiness subscales, R_C = IPICB readiness and consumer finance subscales, H = IPICB health subscales, C = IPICB consumer finance subscales, R = IPICB readiness subscales, no = no IPICB subscales, only covariates. The righ column illustrates the distribution of R^2, of the best performing models for fitting the subversions of IPICB.

streaming) and their subjective value for virtue (healthy restaurant, online investment and online classes) over the corresponding vice behavior, for further details see Table 1.

Similar to study 3, we then estimated regression models predicting each of the behaviors with all covariates, and any combination of the IPICB subscales, the mean IPICB value or no subscale of IPICB. Next, we compared the models based on BIC and explained variance in the outcome variable. Replicating the results from study 3, all but two of the self-reported variables were better predicted using at least one of IPICB's subscales compared to regressing on the covariates alone, taking model complexity into account.

However, the titrators were not better predicted with the IPICB, except for the subjective value of healthy over unhealthy restaurants. Investigating which covariates instead explained most of the variance in the titrator measures revealed that all discount rates K were best predicted with numeracy. The best predicting variables for the subjective values instead varied between the domain specific virtue/vice ratios.

DISCUSSION

The IPICB has high predictive validity for various relevant consumer behavior on top of highly relevant covariates. The scale's psychometric structure and the specific predictive validity of the subscales suggest the existence of a general factor of intertemporal preferences, with some domain specific variability. The scale promises to be a valuable contribution to consumer researchers' instruments that may help to close the gap between economic models of intertemporal preferences, and psychological surveys of self-regulation.

User-Generated Content on Social Media: Values from Goals

Nirajana Mishra, Boston University, USA
Carey Morewedge, Boston University, USA

INTRODUCTION

Consumers invest considerable labor in creating, curating, and posting user-generated content (UGC) on social media. They spend as much time on social media platforms as they do in caring for and helping their children, spouses, and parents. However, do consumers value preserving their social media UGC for longer-term uses? In the present research, we examine the psychology of how consumers value the things they post online. Specifically, we investigate whether consumers perceive any 'enduring value' (i.e., value beyond its immediate consumption) in their UGC posted to social media. We also contrast this value with the value they attribute to similar UGC that they privately archive (e.g., in their phones, computers) but not share publicly on social media platforms.

Our results show that the content generated for sharing on social media is perceived as having inherently limited value. We explain this lower valuation with a goal-theoretic framework. Past research has shown that consumers evaluate stimuli relative to active goals, directing attention to attributes and functions compatible with the goal they are pursuing (Ferguson and Bargh 2004; Markman and Brendl 2000; Shah, Friedman, and Kruglanski 2002). We start with the assumption that UGC's creation and consumption are motivated by at least two important goals (Barasch, Zauberman, and Diehl 2018): (1) goal to share that content with others to facilitate social exchanges and (2) goal to use that content as a memory asset through which to remember experiences, accomplishments, and relationships. When the focal goal is to share the UGC with others (Harridge-March et al. 2010; Villaespesa and Wowkowych 2020), when posting on social media platforms, UGC has high immediate consumption utility, but consumers care little about its value as an enduring asset. When the focal goal of UGC is to preserve memories by archiving indexical connections with meaningful personal events (Tully and Meyvis 2017; Wallendorf and Arnould 1988; Zauberman, Ratner, and Kim 2009), its value is substantial to consumers. Across four studies, we find considerable evidentiary support that (a) consumers attribute little value to preserving their UGC on social media, and (b) a goal-theoretic framework helps explain why they value their UGC on social media less than comparable UGC they archive elsewhere.

Our first study (N=303) tested our directional prediction that consumers perceive the same kinds of UGC to have less value when they intend to post it to social media than when they intend to archive it. We compared the value of UGC to participants after they posted or archived it and restricted all comparisons to digital content in a 2(UGC intention: post, archive) X 3(UGC type: photograph, video, recipe) between-subjects design. Participants randomly assigned to a posting condition imagined posting either a digital travel photograph on Instagram, a digital video of an event with family and friends on Facebook, or a digital recipe board of weeknight dinners on Pinterest. In the archiving condition, participants imagined having saved a digital travel photograph on their computer, a digital video of an event with family and friends on their phone, or a digital recipe board of weeknight dinners on their computer. The UGC was similar in both conditions (i.e., digital travel photograph, digital video of an event with family and friends, and a digital recipe board of weeknight dinners). All participants then reported their WTP for application to restore that UGC if it was later corrupted on an analog scale with endpoints $0 and $10. As predicted, we found that the participants were willing to pay less to restore corrupted UGC posted to so-cial media (M_{WTP} = $2.74, SD = 2.99) than corrupted UGC archived on digital devices (M_{WTP} = $4.48, SD = 3.22; $F(1, 269)$ = 22.77, $p <$ .001, η_p^2 = .078). We suggest that these differences are due to the activation of different goals - posting UGC on any social media platform is less likely to activate a memory preservation goal than archiving similar UGC on a digital device, which leads consumers to value the same kinds of UGC lesser when posting than archiving it. Moreover, as all the archived content was also digital, the findings suggest that the difference between posted and archived UGC is not due to the different values ascribed to physical and digital goods (Atasoy and Morewedge 2018).

In our next set of studies, we directly tested our goal-theoretic process account. We showed that the lower value of UGC posted to social media than archived was driven by the activation of different goals. In Study 2A (N=658), participants were randomly assigned to one of three goal-priming conditions (control, sharing goal, memory preservation goal). All participants were told that they took a photograph to post on Instagram. Participants in a control condition were not given any additional information. Participants in the sharing goal-priming condition were told that they took the photograph to post on Instagram "to share with others in their network." Participants in the memory preservation goal-priming condition were told that they took the photograph to post on Instagram "to preserve it as a part of their history." All the participants then reported their WTP for the application to restore the photo, on an analog scale with endpoints $0 and $10. Analysis of variance showed a significant main effect of goal priming on WTP ($F(2,606)$ = 64.58, $p <$ .001, η_p^2 = .18). Post-hoc tests (Tukey' HSD), further, revealed that participants in the sharing goal-priming condition were not willing to pay more to restore their UGC than were participants in the control condition (M_{WTP} = $1.88, SD = 2.30 vs. M_{WTP} = $1.52, SD = 1.96; p = .331) indicating that posting UGC is more likely to activate a sharing goal. By contrast, participants in the memory preservation goal-priming condition were willing to pay 272% and 220% more to restore their UGC (M_{WTP} = $4.14, SD = 3.14) than were participants in the control and sharing goal-priming conditions, respectively ($p <$ .001).

In Study 2B (N=451), we measured endogenous activation of sharing and memory preservation goals for UGC posted to social media versus archived UGC. Participants randomly assigned to the posting condition imagined taking a photograph to post on Instagram or making a video of a bicycle ride on their vacation to post on Facebook. Participants in archiving condition imagined taking a photograph to save for their family album or making a video of a bicycle ride on their vacation to save in a '2019 folder' on their computer. To measure the activation of a sharing goal, participants reported how much they had thought about sharing their UGC on a 7-point Likert scale with endpoints, 1 = "Not at all" and 7 = "Very much." To measure the activation of a memory preservation goal, participants reported the extent to which they thought their UGC was 'proof of their past' and something that should be "preserved as part of their history" on 7-point Likert scales with endpoints, 1 = "Not at all" and 7 = "Very much." Participants reported the maximum amount of money in dollars that they would be WTP for an application that could restore their UGC items on an analog scale with endpoints, $0 and $10. As in our earlier studies, we found that participants were WTP significantly less to restore UGC they intended to post on social media (M_{WTP} = $2.10, SD_{WTP} = 2.62) than UGC they intended to ar-

chive (M_{WTP} = \$5.25, SD_{WTP} = 3.25; $F(1, 404)$ = 114.82, $p < .001$, η_p^2 = .221). In addition, participants who created UGC to post thought significantly less of their UGC as a memory asset (M = 4.03; SD = 1.70) than did those who created it with the intention of archiving it (M = 5.11; SD = 1.38; $F(1,404)$ = 50.12, $p < .001$, η_p^2 = .110). A sharing goal was more active for participants who intended to post their UGC on social media (M = 5.18; SD = 1.83) than for those who intended to archive it (M = 4.85; SD = 1.74); $F(1,404)$ = 4.19, p = .04, η_p^2 = .010). The mediation analysis produced a significant negative indirect effect of UGC intention (0 = archive, 1= post) on WTP through activation level of the memory preservation goal (b = -0.48, SE = 0.13, 95% CI = [-0.753, -0.255]). Activation level of the sharing goal did not mediate willingness to pay for the application to restore UGC (b = 0.06, SE = 0.05, 95% CI = [-0.005, 0.184]). Together, the results of these process studies (Studies 2A, 2B) suggested that posting UGC to social media was less likely to activate a memory preservation goal than archiving the same or similar content.

Finally, we found that the value of posted UGC can increase even when the context changes the active goal. In study 3 (N=404), we explored these contextual effects using a paradigm based on lawsuits by families suing platforms for access to the UGC of their relatives (Kunkle 2013; Olsen 2005). In a 2(user: self, other) × 2(life

status: living, dead) between-subjects design, participants reported their willingness to expend their money, on a sliding scale ranging from \$0 to \$50, to preserve the UGC on Instagram of one target: either their own UGC, or the UGC of their present or most recent romantic partner. To manipulate the value of their UGC as a memory asset, participants made decisions about whether to preserve that UGC either while the target was alive, or after his or her death. Suppose the value of UGC is high when the goal of memory preservation is focal. In that case, participants should ascribe higher value to their partner's UGC when that partner is not available than when the partner is available —i.e., higher when the partner is deceased than when they are living. By contrast, participants should attach similarly little value to their content, whether they are living or dead, as they should not associate the goal of preserving memories to their content in either case. Our results revealed a significant interaction effect of user and life status on WTP ($F(1,400)$ = 25.96, p <.001). We found that participants were willing to spend the most money to preserve the UGC of unavailable close others (M = \$20.64); more than available close others (M = \$7.56); and more than their own content in under either living (M = \$9.27); or dead circumstances (M = \$8.15). We also measured the extent of the activation of the memory preservation goals across all conditions and found a significant interaction

Table 1: Summary of Results

Study	Description	Tested Effects	Statistics	Interpretation
1A	UGC Shared on Social Media vs. Archived UGC	Main Effect on WTP (\$)	$(F(1, 269) = 22.77, p < .001)$.	$Mean_{post\_WTP}$ =\$\$2.74 $Mean_{archive\_WTP}$ =\$4.48
2A	Priming Sharing vs. Memory Preservation Goals	Main Effect of priming goals on WTP (\$)	$F(2,603) =0.48, p =0.622$	$Mean_{control\_WTP}$ =\$1.52 $Mean_{sharing\_WTP}$ =\$1.88 $Mean_{memory\_WTP}$ =\$4.14
2B	Mediation Via Memory Preservation Goals	Main Effect on WTP (\$)	$F(1, 404) = 114.82, p < .001$	$Mean_{post\_WTP}$ =\$\$2.10 $Mean_{archive\_WTP}$ =\$5.25
		Activation of the sharing goal		$Mean_{post}$ =5.18 $Mean_{acrchive}$ =4.85
		Activation of the memory preservation goal		$Mean_{post}$ =4.03 $Mean_{acrchive}$ =5.11
		Mediation of WTP via memory preservation goal	(95% CI: -0.753, -0.255)	
		Mediation of WTP via sharing goal	(95% CI = -0.005, 0.184]	
3	Value of Social Media as a Digital Legacy	Significant Interaction Effect of (user: self vs. others; between subjects) X 2(life status: living vs. after death on WTP (\$)	$F(1,400) =25.96, p <.001$	$Mean_{self-living}$ =9.27 $Mean_{self-dead}$ =8.16 $Mean_{others-living}$ =7.56 $Mean_{others-dead}$ =20.64
		Significant Interaction Effect of (user: self vs. others; between subjects) X 2(life status: living vs. after death on Memory Preservation Goal	$F(1,400) =7.95, p=.005$	$Mean_{self-living}$ =3.75 $Mean_{self-dead}$ =4.00 $Mean_{others-living}$ =3.93 $Mean_{others-dead}$ =5.20

effect of user and life status ($F(1,400) = 7.95$, $p =.005$). We find that that activation of a memory preservation goal for the UGC of unavailable close others (Mean = 5.20) was more than that of the available close others ($M = 3.93$) and more than their own UGC in under either living ($M = 3.75$) or dead circumstances ($M = 4.00$). These results suggest that when the UGC served as a meaningful reminder of a close other who had passed away, participants attributed more value to a user's posted UGC. These effects were independent of how often participants created or consumed UGC on these platforms and the extent to which they believed their content to reflect their identity accurately. It is important to note that mortality salience did not drive the results; participants were WTP almost nothing to preserve their UGC after their own death.

This paper adds to a nascent line of research exploring how motives within the consumer can determine the value ascribed to novel digital goods with no analog in the physical world (for a review, see Morewedge, Monga, Palmatier, Shu, and Small, 2021). Our results show that the goal platforms fulfill for consumers may dictate which revenue model is more appealing to consumers. Social media platforms that emphasize sharing UGC have mostly adopted a digital advertisement revenue model and provide consumers access to the platform for free. In contrast, platforms attempting to monetize by charging users a monthly subscription fee, such as google photos, emphasize archiving content for preserving memories (google photos says 'a home for your memories'). Lastly, our findings inform debates surrounding digital remains issues. The issue of posthumous ownership of user-generated content on social media platforms will only become more complex as the number of deceased users on these platforms rise (Ambrosino 2015; Brown 2016). As many as 4.9 billion Facebook users will die by 2100, assuming the social media platform continues to expand at its current rate (Öhman and Watson 2019). Consumers enter into hazy laws related to ownership of their digitized assets when participating on social media platforms. Our findings illustrate how active goals modulate new digital objects' value and provide insights for firms, policymakers, and the law seeking to understand when consumers will feel ownership for the enormous trove of content they generate.

What Makes Robots Appear to Have a Mind? Customer Reaction to Robot Anthropomorphism in Frontline Service

Salma André-Boukhriss, Emlyon Business School, France
Margherita Pagani, Emlyon Business School, France

INTRODUCTION

Advances in Artificial Intelligence are vastly extending the capabilities of machines. Their deployment in frontline service leads to new service archetypes where employees can be substituted or augmented by these technologies (De Keyser et al. 2019). Indeed, AI systems are able to complete numerous tasks ranging from basic ones requiring mechanical intelligence to more sophisticated jobs requiring empathetic intelligence (Huang and Rust 2018). Even if we expect in the near future a large deployment of robots capable of emotional intelligence in service settings (Huang and Rust 2021), they will hardly replace the human touch in tasks with significant ethical implications (Pagani and Champion 2020). For this reason, it is essential to examine the customer emotional and behavioral response to robots capable of or appearing to have feeling abilities. In this research, we contribute to filling this gap by examining a basic component of robots' perceived emotional intelligence: the robot's perceived ability to have feelings. Knowing that users make different inferences about the robot cognitive and emotional abilities from the robot's physical appearance, this research investigates the antecedent anthropomorphic features that lead customers to see robots with human-like mind. This latter is perceived through two dimensions: experience abilities (capacity to feel and sense) and agency (capacity to think and do). Considering the fundamental role of facial expressions in social interactions (Ekman and Keltner 1997; Frith 2009), we examine the robot face specifically as a predictor of agency and experience abilities. We also examine the consequent customer emotional response (irritation) and behavioral response (intention to use the robot in a service environment). We inspect these effects in the absence of body (study1), and in the presence of body (study2). We find that the face generates a perception of the robot agency only in the presence of body, while it generates a perception of the robot experience abilities in both absence and presence of body. We confirm this counterintuitive finding by manipulating the robot body in study3. To the best of our knowledge, the effects of these specific anthropomorphic dimensions on mind perception have not been examined separately.

LITERATURE REVIEW

Questions about whether non-human entities may have human-like minds have been of the interest of many philosophers such as Dennett (1996). Addressing this question implies the identification of an in-group, a class of mind-havers, which may include non-human entities such as an animal or a personal engine. More recent research suggests that mind perception can be decomposed into two dimensions: agency and experience (Gray, Gray, and Wegner 2007). Agency refers to the capacity to act and do, and to the related cognitive capacities such as communication, memory abilities, and exercising self-control (Gray and Wegner 2012). Experience refers to experience abilities and capacity to feel and sense such as feeling pain, fear, desire and joy. Assigning agency and experience are common attributions in anthropomorphism, defined as the tendency to ascribe humanlike characteristics to non-human entities such as objects (Epley et al. 2007, 2008; Waytz et al. 2010) or God (Guthrie 1995; Barrett et al. 1996). The intent is to facilitate rationalizing the object's actions in a particular social context (Duffy 2003). This phenomenon corresponds to the intentional stance strategy introduced by Dennett

(1996), used in interpreting, explaining, and predicting the behavior of non-human entities. This means to consider the object as a rational agent with beliefs and desire, capable of controlling its behavior according to its own mental states; by applying human-centered anthropomorphism to make sense of the object behavior from a human point of view, instead of an object-oriented anthropomorphism which attempts to explore reality from the object perspective (Hoffman and Novak 2018). It is acknowledged that the design plays a major role in attributing mental life to inert objects. This even applies to geometric shapes displayed on a device screen, whose position and movement can elicit a perception of animacy (Scholl and Tremoulet 2000). Robots are no exception to this phenomenon, people are more likely to perceive robots with human-like appearance with more humanness. The robot anthropomorphic design influences its likeability and trustworthiness (Castro-González et al. 2016; Mathur and Reichling 2016), its perceived sociability and the intention to rely on its guidance (Powers and Kiesler 2006), its perceived intelligence and hostility (Sims et al. 2005), and its influence on human partners in decision-making tasks (Burgoon et al. 2000).

If existing research brought to light how the users' attributions depend on the robot's anthropomorphic appearance, to the best of our knowledge, the specific anthropomorphic effects have not been explored. Previous research examined the robot's physical anthropomorphism as a one-dimension construct, while it can be decomposed in three distinct categories: surface look, body-manipulators, and facial features (Phillips et al. 2018). Surface features include eyelashes, head hair, skin, gender, eyebrows, and apparel; body-manipulators include hands, arms, torso, fingers, and legs; facial features comprise face, eyes, head, and mouth. We focus on two specific anthropomorphic feature: facial features and body. The Theory of Mind, which describes the process of attributing mental states such as cognitions, intentions, and desire to others (Baron-Cohen, Wheelwright, and Jolliffe 1997) states that facial features are crucial in attributing mind to others. This applies also to robots as displaying a face on a screen robot induces a perception of a human-like mind (Broadbent et al. 2013), and the display of eye gaze in robots triggers a perception of the robot as having mental states (Fong, Nourbakhsh, and Dautenhahn 2003). Robot humanlike appearance was also found to influence the robot's moral judgment: humanoid robots were blamed following the same moral judgments patterns applied to humans, while mechanical robots were blamed differently (Malle et al. 2016). Subsequently, we propose:

Hypothesis 1:   *A robot with human-like face (vs control) elicits a higher perception of experience abilities.*

Hypothesis 2:   *A robot with human-like face (vs control) generates a higher perception of agency.*

Experience abilities are considered in different studies as a discriminating factor between humans, as an in-group, and other species as out-group (Chalmers 2003; Dennett 1996; Descartes 1641; Haslam 2006). Robots with experience abilities (Haslam 2006), can be perceived as blurring the intergroup boundaries between the humans and machines, and thus trigger irritation. Research from social categorization and social identity specify that blurring intergroup

boundaries represent a threat to the distinctiveness motive and to the group member's identity (Crisp and Hewstone 2006; Dovidio et al. 1998; Hall et al. 2009; Hornsey and Hogg 2000). Appel et al. (2020) found that robots with feeling abilities create higher eeriness than the robots with agency, and this latter elicits higher eeriness than the absence of a perceived mind in the robot. Furthermore, the uncanny valley theory (Mori 1970) confirms that displaying robots with feelings can violate deep-rooted expectancies (Olson et al. 1996) about humans and machines and generate irritation. Thus, we propose:

Hypothesis 3: *The perception of a robot with high experience abilities generates feelings of irritation.*

Hypothesis 4: *The more customers experience irritation, the less is the intention to use the robot in service settings.*

Gray et al. (2007) show that robots are traditionally categorized among entities with a moderate level of agency but without experience abilities. People prefer robots capable of doing things rather than robots capable of feelings (Gray et al. 2012). Moreover, we know from the Technology Acceptance Model (TAM) literature (Davis, Bagozzi, and Warshaw 1989) and its theoretical extension (TAM2) (Venkatesh and Davis 2000) that the perceived usefulness is a predictor of technology adoption. Therefore we propose:

Hypothesis 5: *The more a robot is perceived with agency, the greater is the intention to use the robot in the service setting.*

STUDY 1

Method

Participants were asked to imagine that they were visiting the business school campus, looking for information about the school programs and activities. They were asked to imagine that they would find a service robot when they arrive to the reception desk. We used different robot's designs to ensure that respondents reacted to the specific anthropomorphic dimension we were manipulating and not to other design features. We selected robots from the ABOT database (Phillips et al., 2018) for each experimental condition as follows: in the absence of face or body, robots selected have a face score

or a body score less than 30 out of 100, in the presence of face or body-manipulators, robots selected have a body score or a face score more than 60 out of 100. In study1 we examine the effects of face in the absence of body-manipulators. 77 participants (46% female, 54% male, 85% 21-34) were randomly assigned to robot with face (vs control); all the seven robots did not display body-manipulators. Manipulation checks confirmed the manipulation was successful. All constructs were measured with 7-point Likert scales. Experience abilities were measured with eleven items ($\alpha=0.94$) (i.e. capacity to feel pain; pleasure) (Gray et al. 2011), and agency was measured with seven items ($\alpha=0.81$) (i.e. capacity to exercise self-control; plan actions) (Gray et al. 2011). Irritation was measured with three items ($\alpha=0.89$) (i.e. uneasy; unnerved) (Gray and Wegner 2012). The intention to use the robot was adapted from patronage intention scale (Wang et al. 2007) with three items ($\alpha=0.887$), (i.e. the likelihood that I would use this robot in a service environment as reception desks is very high).

Results

We have used customized model of Hayes's (2017) PROCESS macro for SPSS (version 3) with 5000 bootstap sample to test the conceptual model. The unstandardized regression weights for all estimated paths in the model are presented in Table1. Face elicits perceived experience (b=0.812, SE=0.276, p=0.004<0.05, 95% CI = [0.262; 1.362]), but it does not generate perceived agency (b=0.408, SE=0.280, p=0.150>0.05; 95% CI = [-0.150; 0.966]). Perceived experience creates irritation (b=0.412, SE=0.167, p=0.016<0.05, 95% CI = [0.079; 0.745]), and irritation negatively impacts intention to use the robot (b=-0.528, SE=0.098, p<0.001, 95% CI = [-0.722; --0.333]). The indirect effect of face on intention through perceived experience abilities and irritation is negative (b=-0.177, 95% CI = [-0.401; -0.023]). Perceived experience on intention to use the robot is not significant (b=0.167, SE=0.159, p=0.302>0.05; 95% CI = [-0.151; 0.481]), while the indirect effect via irritation is negative and significant (b=-0.177, 95% CI = [-0.401; -0.023]). Perceived agency increases the intention to use the robot (b=0.468, SE=0.158, p=0.004<0.05; 95% CI = [0.154; 0.783]), while the indirect effect of face on intention through perceived agency is not significant (b=0.134, 95% CI = [-0.121; 0.452]).

Table 1: Summary of Empirical Results Across Studies

			Direct effects on:		Indirect effects on Intention via:	
			Experience	Agency	Experience & Irritation	Agency
Study	Independent variables	Control	H1	H2	H3 & H4	H5
1	Face	Absence of Body	**.812***	.408	**-0.177***	0.134
2	Face	Presence of Body	**.621***	**1.283*****	-0.061	**0.467***
3	Body	Presence of Face	.163	**.633***	-0.020	**0.405***

Unstandardized regression weights

*** p<.000, ** p<.001, * p<.05

STUDY 2

Method

In study2 we examine the effects of face in the presence of body-manipulators. 72 participants (43% female, 57% male; 88% 21-34) recruited following similar snowball approach were assigned to a robot with face (vs control). Participants imagined interacting with it in business school reception desk. Seven robots were selected following the same procedure in study1. All seven robots in this study have body-manipulators. The dependent variables include: experience abilities (α=0.925), agency (α=0.749), irritation (α=0.823), intention to use the robot (α=0.811).

Results

Face creates a perception of experience (b=0.621, SE=0.307, p=0.008<0.05, 95% CI = [0.007; 1.234]), and agency (b=1.283, SE=0.240, p<0.001; 95% CI = [0.805; 1.761]). The effect of perceived experience abilities on irritation is not significant (b=0.276, SE=0.142, p=0.055>0.05, 95% CI = [-0.007; 0.559], includes 0). The indirect effect of face on intention through perceived experience abilities and irritation is not significant (b=-0.061, SE=0.050, 95% CI = [-0.187; 0.006]). Perceived agency increases the intention to use the robot is significant (b=0.468, SE=0.158, p=0.004<0.05; 95% CI = [0.154; 0.783]). The indirect effect of face on intention through perceived agency is significant (b=0.467, SE=0.235, 95% CI = [0.016; 0.935]).

STUDY 3

Method

In study3 we examine the effect of the body in robots displaying a face in order to explain study1 and study2 counterintuitive results. 83 participants (46% female, 54% male; 88% 21-34) recruited following similar snowball approach were assigned to a robot with body features (vs control). Participants had to imagine an interaction with a robot in business school reception desk. Eight robots were selected following the same procedure in study1. All eight robots in this study display face. The dependent variables include: experience abilities (α=0.937), agency (α=0.717), Irritation (α=0.845), the intention to use the robot (α=0.869).

Results

The body does not elicit perceived experience abilities (b=0.163, SE=0.308, p=0.598>0.05, 95% CI = [-0.450; 0.776], includes 0), but it generates perceived agency (b=0.267, SE=0.240, p<0.05; 95% CI = [0.202; 1.064]). Perceived experience does not create irritation (b=0.258, SE=0.131, p=0.053>0.05, 95% CI = [-0.003; 0.519], includes 0). The indirect effect of body on intention through perceived experience abilities and irritation is not significant (b=-0.020, SE=0.043, 95% CI = [-0.114; 0.069], includes 0). Agency increases the intention to use the robot (b=0.640, SE=0.167, p<0.001, 95% CI = [0.307; 0.973]). The indirect effect of body on intention through perceived agency is significant (b=0.405, SE=0.158, 95% CI = [0.123; 0.741])

DISCUSSION

Unlike previous research on mind perception, where the general concept of the robot human-like appearance was manipulated broadly, we examined the distinct effects of the anthropomorphic factors: face and body. We find that face generates a perception of the robot's experience abilities regardless of the presence or absence of body features. Contrary to what was expected, facial features do not elicit a perception of agency in the absence of body. This finding can be explained by the fact that a robot without a body is perceived as a toy or as an incomplete human. Therefore, customers fail to perceive its utility or capacity to accomplish certain tasks. Displaying face and body on robots generates a perception of both agency and experience abilities. Surprisingly, perceived experience in the presence of body features does not create irritation. Similarly to research on algorithm adoption (Castelo et al. 2019), we find that when the robot is perceived as competent, the feeling of unease is attenuated. We confirm that effects of perceived usefulness from Technology Acceptance Model (Davis, Bagozzi, and Warshaw 1989) remain valid for service robots; the robot perceived agency increases the intention to use the robot in a service setting. From a design perspective, if designers decide to display a face or a body on a robot, they should know that customers will expect that the robot is capable of specific abilities. Thus, the human-robot interaction should be in line with the perceived capabilities conveyed by the design. Otherwise, the risk of expectation gap and dissatisfaction may be higher for the end-user. Implementing robots that have or appear to have feelings in service settings with no human supervision, could not only be rejected by customers, but may have worse consequences. Knowing that affective abilities are more central to the concept of humanness than cognitive abilities (Haslam et al. 2005), we expect that customers will not only refuse to use these robots but much more than this, they can harm these machines. Whitby (2008) brought to light the evidence of robots abuse by humans when they display physical or behavioral similarity with humans. Future research should investigate assigning feelings to robots as an antecedent to hostile attitude toward robots.

Show Me You or The Goods? Effect of Image Content on Review Helpfulness

Mengqi (Annie) Ding, Ivey Business School, Western University, Canada
Shirley (Shuo) Chen, Wilfrid Laurier University, Canada
Xin (Shane) Wang, Ivey Business School, Western University, Canada
Neil Bendle, Terry College of Business, University of Georgia, USA

INTRODUCTION

Imagine that you saw three reviews while researching a restaurant. Three friends all visited and reviewed the same restaurant. Anne only wrote about the experience but Benson and Claire both uploaded an image with their reviews. Benson's image showed his fellow diners enjoying drinks after their meal, Claire's image featured a close-up of her drink. Which review will you find more helpful, assuming that all other review elements are identical?

Prior work has examined what makes a review helpful (Mudambi and Schuff 2010; Nguyen et al. 2020; Pan and Zhang 2011; Yin, Bond, and Zhang 2014), yet few looked beyond rating and text. The images accompanying the review have received limited attention while access to digital and smartphone cameras means images in online reviews have proliferated. In this work, we use mixed-methods to investigate how images in online reviews impact consumers' evaluation of review quality. We measure review quality by the number of helpfulness votes. Such helpfulness is rated by readers, i.e., the users of reviews. Thus, review helpfulness is associated with review quality in the sense that it helps the reader with their product search.

Our research contributes to the literature in several important ways. First, we add to the burgeoning literature on online word of mouth (WOM). While prior work has mainly focused on text and ratings of a review (e.g., Berger, Sorensen, and Rasmussen 2010; Büschken and Allenby 2016), we examine how images, a form of non-verbal communication, influence consumers. Given the rapid increase in images accompanying reviews, it is timely that we expand the current knowledge on online WOM by examining the effect of images and image content on review helpfulness. Second, our study investigates the differential impact of image across purchase domains (experiential vs material). Importantly, our paper demonstrates that consumer preference for image content also differs across product domains. While prior work suggests that reviews for experiential purchases are less helpful than those for material purchases (Dai, Chan, and Mogilner 2020), we show that this effect is more nuanced. Specifically, including images of person (rather than the product) can make the review more helpful for experiential purchases than for material purchases.

BACKGROUND AND THEORY DEVELOPMENT

With the prevalence of online reviews, consumers are often overwhelmed by the seemingly endless streams of information on review platforms. As such, consumers use review helpfulness votes, a peer-rating mechanism, to help them identify the most important reviews (Jones et al. 2004). Platforms (e.g., Amazon) also adopt consumer helpfulness votes in their algorithms to rank reviews (Sipos et al. 2014). As a result, helpful reviews are weighted more heavily in purchase decisions (Chen et al. 2008). Our research proposes a novel factor that affects how consumer evaluate helpfulness – the review's images.

Visual information has always been important in marketing — image content can significantly impact user engagement (Li, Shi, and Wang 2019) and appropriate image use helps increase brand perception (Dzyabura and Peres 2019; Liu et al. 2020). Compared to text, images are more easily understood and evoke the use of mental imagery (Childers and Houston 1984). Therefore, we posit that including images in a review can increase its perceived helpfulness.

Two important factors must be considered when assessing the helpfulness of images in reviews, image content and the purchase type.

First, different image contents provide different information about the purchase. Intuitively, an image of a chair can convey information about the physical attributes of the product, whereas an image of a person cannot convey that same information. Second, a plethora of research suggests that consumers exhibit different purchase behaviors when making experiential and material purchases (e.g., Caprariello and Reis 2013; Carter and Gilovich 2012; Gilovich et al. 2015). While experiential purchases are "made with the primary intention of acquiring a life experience" (e.g., movies and concert), material purchases are "made with the primary intention of acquiring a material good" (e.g., camera, coffee mug) (Van Boven and Gilovich 2003). We argue that, depending on the purchase type, the type of images included may influence how helpful a review is. Notably, when a product is depicted, consumers can extract information about its physical features. For example, the product dimensions or whether the material looks sturdy. Such information is useful when quality depends on assessments of the product tangible attributes (Dai et al. 2020). However, for an experiential purchase, a consumer's judgment of quality depends upon more subjective, holistic judgments. Therefore, the same image that only depicts a product might be less helpful because comparisons about the whole experience are more difficult to make. Compared to making a material purchase, where consumers often compare feature-by-feature, assessment of experiential purchases is more holistic (Gilovich and Gallo 2020) and people choose more intuitively. Thus, when making an material purchase decision, reviews that include images of a person (compared to a product) could be perceived as less helpful because there is a mismatch in processing style (Schwarz 2004).

STUDY SUMMARY

Three studies test our predictions. We first employ an event study to examine the importance of images in reviews. Taking advantage of an exogenous event (the shutdown of the image uploading feature on Amazon), we compare outcomes with and without the event and take the difference as the treatment effect. We demonstrate that images do indeed make reviews more helpful and that images are especially helpful for reviews with longer text. Specifically, our results show that the image uploading feature increase review helpfulness ($\beta = -.015$, $p < 0.05$). Further, additional analysis reveals that images complement the text ($\beta = -.001$, $p < .001$), such that reviews with longer texts became more helpful. This event study allows us to suggest a direct relationship between the presence of images and review with real-world support.

In Study 2, we use field data from Yelp and Amazon to examine image content's impact on evaluations of review helpfulness. Specifically, we see the impact on experiential or material purchases. We also examine the interaction between image and text, and image and rating. We first employ a neural network classification method to analyze the content of digital images attached to consumer reviews.

We find that, first, the number of images shared has a significant positive effect on review helpfulness, for both experiential ($\beta_{\text{Image Count}} = .32$, $p < .001$) and material purchases ($\beta_{\text{Image Count}} = .82$, $p < .001$). More images make for a better review. The content of the images, however, also matters. For both experiential and material purchases, images of a product are positively associated with review helpfulness. ($\beta_{\text{Image of Product; Experiential}} = .093$, $p < .001$; $\beta_{\text{Image of Product; Material}} = 1.91$, $p < .001$). However, images of a person are only positively correlated with review helpfulness for experiential purchases ($\beta_{\text{Image of Person; Experiential}} = .252$, $p < .05$).

Showing an image of a person in reviews for material goods is not helpful ($\beta_{Image\ of\ Person;\ Material}$ = .66, $p > .1$).

The use of different platforms in study 2 raised the possibility that platform features unconnected to our theory drove the results. To alleviate this concern, we use experimental methods in study 3 to test the Hypothesis that we tested with secondary data in study 2. These studies focus on understanding whether image content, specifically whether the image contains a product or a person, exerts differential effects on review helpfulness depending on the purchase type, experiential or material. Furthermore, we also examine the underlying mechanism that could help explain these effects by looking at how participants processed information.

In study 3, a total of 398 participants (M_{age} = 26.08, 8% female) completed the study on Prolific in exchange for compensation of £1. We used a 2 (purchase type: experiential vs. material) x 2 (image content: product vs. person) between-subjects design in this experiment. Unlike in the empirical studies, we kept the purchase consistent across both the material and experiential conditions. We followed prior work to frame whether the purchase was material or experiential (Bastos and Brucks 2017). All participants were instructed to imagine themselves reading a review for a grill. After reading the framing manipulations, participants were shown a review. For those in the product image condition, participants viewed an image of a BBQ. For those in the person image condition, participants saw an image of a woman cooking at a BBQ grill. To control for the effect of text length, we ensured that the text portion of the review contained the same content across conditions. After participants were shown the review, they were then asked to indicate how helpful the review was on a seven-point Likert scale: "Do you think that overall this review is helpful/useful/informative?", 1 = "not at all," 7 = "very much"; α = .85 (adapted from Study 5, Moore 2015). To test the underlying mechanism, we ask participants to evaluate the extent to which they perceived the grill as an integrated entity: "To what extent did you view the grill as (1 = a bundle of attributes, 7 = an integrated entity)?"(Huang, Wong and Wan 2019). Finally, participants were shown definitions of experiential and material purchases and were asked to complete a manipulation check about whether they perceived the purchase as experiential or material ("Thinking back to the review you read about, to what extent does the decision seem like..." 1 = "definitely an experiential purchase," 11 = "definitely a material purchase").

We found no significant main effect of image content on perceived helpfulness ($F(1, 396)$ = .11, p =.74), but a significant main effect of purchase type on perceived helpfulness ($F(1, 396)$ = 10.96, p = .001), such that on average, those in the material condition (M = 2.64, SD = 1.25) found the review to be less helpful than those who were in the experiential condition (M = 3.06, SD = 1.25). More importantly, we found a significant interaction between image content and purchase type ($F(1, 396)$ = 7.28, p =.007). In the material purchase condition, those who saw a review containing a product image (M = 2.83, SD = 1.34) found the review to be more helpful than those who viewed a person image (M = 2.45, SD = 1.14, $F(1, 396)$ = 4.67, p = .031). In the experiential condition, this pattern was reversed, such that those who saw a review containing a person image (M = 3.20, SD = 1.23) found the review to be marginally more helpful than those who viewed a product image (M = 2.90, SD = 1.23, $F(1, 396)$ = 2.75, p =.098).

To understand the mechanism that drove this pattern of results, we conduct a moderated mediation analysis (Model 14; Hayes 2017, with 5000 bootstraps). We use photo content as the independent variable, whether participants saw the purchase as an integrated entity as the mediator, purchase type as the moderator, and review helpfulness as the dependent variable. Results reveal a marginally significant interaction between the purchase type and whether participants viewed the purchase as an integrated entity (B = -.15, SE = .09, p = .08). In particular, the indirect effect of photo type on review helpfulness, via

product perception, was significant for material purchases (B = -.085, SE = .05, 95% CI = [-.1927, -.0017]) but not for experiential purchases (B = -.043, SE = .03, 95% CI = [-.1052, .0027]).

GENERAL DISCUSSION

With rapid technological advancement, sharing images has become commonplace. Visual information is potentially more engaging than texts and star ratings because it is easily processed (Lurie and Mason 2007). Indeed, recent work examining the role of visual information and social media engagement shows that the presence of images can enhance consumers' engagement with the platform (Li, Shi, and Wang 2019). This is especially relevant given that work has suggested that consumers have decreasing attention spans. The average attention span was reported to have dropped from 12 seconds in 2000 to just 8.25 seconds in 2013 (Gausby 2015). Thus, visual information is an attractive option given the risk of information overload in the digital space (Bawden and Robinson 2009), making it even more critical to understand the role of image in online reviews.

We contribute to the literature in several ways. First, we add to the online word of mouth literature by identifying a critical, but understudied aspect of reviews, namely, the role of images and image content on the helpfulness of online reviews. Past work has focused on how textual content and ratings shape the helpfulness of reviews. However, advances in smart-phone technology and the availability of fast cellular networks have made taking and uploading images increasingly easy. Because images are more concrete and easily processed, they provide information to a review that goes well beyond the text.

Second, we also contribute to the experiential vs. material purchase literature by identifying how the content of the images shared can have a differential impact on the consumer depending on whether the purchase is material or experiential. While prior work has identified that consumers find reviews for experiential purchases less helpful than those for material purchases (Dai, Chan, and Mogilner 2020), we show that reviews for experiential purchases can be more helpful when an image of a person, rather than a product, is included. This helps to deepen our understanding about how consumers react to reviews.

Our results have several practical implications. First, our findings provide important implications for user generated content systems aiming to help consumers. We suggest what may help determine review helpfulness. This will allow platforms to optimize incentives to encourage high-quality reviews. For example, platforms can improve review quality by rewarding reviewers that post images, and the reward's size may depend upon the image content. Indeed, Google's Local Guides uses points to encourage the uploading of images to reviews —a text rating gives 1 point but uploading an image gives the reviewer 5 points, allowing the reviewer to move to the next rank more quickly (Google. com 2020). In addition to implementing a points system, it is also easy to imagine how a platform might encourage the most helpful reviews. For example, they might say "post a picture of the product in your kitchen" for material goods like a kitchen chair or "post a picture of yourself at the restaurant" for experiential purchases.

Second, our research offers insights into how review sites could improve algorithms that rank reviews. Reviews containing especially useful images might be featured earlier on the page to help consumers find relevant information.

Third, our results shed light on how businesses could better manage reputation. For example, managers may offer incentives to customers to encourage them to post helpful images. Finally, our research can help the reviewers themselves improve their review quality. Being helpful is a social currency, many reviewers, whether for altruistic or self-promotion reasons, will find our advice useful in improving the service they provide to other consumers with their reviews.

Study	Main Findings
1	Image uploading feature increase review helpfulness (β = -.015, $p < 0.05$)
2	Number of images shared has a significant positive effect on review helpfulness, for both experiential ($_{\text{Image Count}}$ = .32, $p < .001$) and material purchases ($_{\text{Image Count}}$ = .82, $p < .001$) Images of a product are positively associated with review helpfulness. ($_{\text{Image of Product ; Experiential}}$ = .093, $p < .001$; $_{\text{Image of Product; Material}}$ = 1.91, $p < .001$). Images of a person are only positively correlated with review helpfulness for experiential purchases ($_{\text{Image of Person; Experiential}}$ = .252, $p < .05$).
3	Significant interaction between image content and purchase type ($F(1, 396)$ = 7.28, p =.007). Material condition: review containing a product image (M = 2.83, SD = 1.34) was more helpful than review containing person image (M = 2.45, SD = 1.14, $F(1, 396)$ = 4.67, p = .031). Experiential condition: review containing a person image (M = 3.20, SD = 1.23) was marginally more helpful than a product image (M = 2.90, SD = 1.23, $F(1, 396)$ = 2.75, p =.098).

Gender Stereotypes Be Gone: Creating Marketspace Inclusivity

Stephanie Voyer, York University, Canada
Peter Voyer, University of Windsor, Canada

INTRODUCTION

When purchasing clothes, men go to the "Men's section" and women go to the "Women's section." It's simple; but not for Alex. Purchase encounters are anxiety-eliciting events for Alex that often end in tears of frustration shed in quiet solitude at home. "Why can't it feel simple for me like everyone else" thought Alex. Externally, Alex possesses a male body, but on the inside a feminine soul. Alex can't bear selecting men's clothing (and products) knowing and feeling that her focus should be on selecting feminine attire. Reinforcing instore signage, clerks continually compound the problem when they steer Alex to the Men's section, where she knows that she doesn't belong. Alex knows it is all wrong – not only for her, but for virtually all her transgender friends, who similarly experience the pain, frustration and hurt associated with gender stereotyping – a fixture in most marketspaces, especially for products oriented to particular sexes.

Alex is transgender (trans); people whose gender identity is different from the gender they were assigned at birth, which is determined by bodily appearance based primarily on genitalia (Tannehill 2019). It's estimated that the number of transgender adults has significantly increased over the past decade, with a current best estimate of 390 per 100,000 adults (one in every 250 adults), or almost 1 million Americans, with greater numbers expected in the future as more precise surveying occurs (Meerwijk and Sevelius 2017). This is a substantial consideration that must be recognized and addressed in the consumer behavior (CB) discipline.

Sadly, as illustrated in the opening scenario, much psychological trauma and pain can result from gender stereotyping and compromised marketspace inclusivity. Resultantly, important CB research questions emerge. How can organizations avoid gender stereotyping? What actions can organizations take to be more inclusive of the trans community?

The extant CB literature, though strong in many areas, gives insufficient attention to the important and burgeoning subject of gender-related scholarship. This is not surprising given that scholars have only recently begun investigating this subject. Conceptual boundaries vary, religious beliefs are impactful, and it has become politically charged. Notwithstanding, motivating our research, we address the calls for research into this domain by heeding the influential recommendations from CB gender researchers such as: Steinfield et al. (2019a, 2019b, 2019c, 2019d), Hutton (2015, 2019), Takar and Pemberton (2019), and others. Additionally, we recognize and address the important observation made by Coffin, Eichert and Nolke (2019) that suggests that transgenderism from the perspective of consumer wellbeing has largely remained ignored.

We address the aforementioned research questions, inductively, by employing ethnographic research with transgender informants. Using a participant-observer approach, followed by a series of depth interviews, major themes emerge – notably, the criticality of "safe-space" – that yield key insights into the role of gender and dangers of gender stereotyping. These insights are in turn submitted as implications that can be used by organizations (not-for-profit organizations, retailers, services, restaurants, etc.) to create an inclusive marketspace – a safe-place, free of gender stereotyping.

The present research is positioned within the limited, but burgeoning, CB literature on gender and consumer wellbeing. In so doing, several key contributions are advanced: we develop a practical set of guidelines for organizations; we provide recommendations for implementation (of the guidelines); and importantly, from a theoretical perspective, the CB literature is enriched as theory from other disciplines is employed. To inform the present work, empirical research from: transgender studies, queer studies, feminism, sociology, social psychology, marketing, and CB is employed.

THEORETICAL UNDERPINNINGS

We begin by considering the concept of gender – what it is and what it is not. Traditional approaches have conflated it with sex (female/male); we do not – gender follows sex. Gender has been assumed to be stable; we do not make this assumption – gender is fluid. Gender has been viewed as being binary entrenched; we do not make this assertion. Our research is informed by the perspective that gender is not a static, nor a binary condition. Gender is fluid, complex, and nonbinary (Herdt 1996). The scholarship of gender within the CB discipline is in its nascent stages, where researchers are only beginning to examine its relevance and complexities.

Transgender is a term that has been defined in a variety of ways throughout academic scholarship (Tannehill 2019). Although the plethora of existing definitions have nuanced variations, most agree that transgender is an umbrella term that is expansive and encompasses a variety of gender identities beyond the binary of male and female (Williams 2014). We adopt the perspective of Norman (2017) who defines it as, "a person whose self-identity does not correspond to the gender linked with their biological sex and/or their initial gender role, or who experiences dysphoria in conforming to conventional notions of a male or female binary gender role" (xiii).

The separation between biological sex and gender identity is a foundational concept. The French philosopher Simone de Beauvoir famously proclaimed distinction between sex and gender in 1949 by stating, "one is not born, but rather becomes" (de Beauvoir 2010, 238). Notably, within the feminist literature in response to de Beauvoir was Rubin's (1975, 159) creation of the "sex/gender system" to explain that sex is what one is born with while gender is what one becomes (Parker 2011). Further Parker (2011, 157) stated, "feminists … use the terms female and male to refer to sex, and the terms feminine and masculine to refer to gender." Reinforcing this notion, Butler (1986, 35) claimed that this sex/gender distinction is "crucial to the long-standing feminist effort to debunk the claim that anatomy is destiny; sex is understood to be the invariant, anatomically distinct, and factic aspects of the female body, whereas gender is the cultural meaning and form that that body acquires, the variable modes of that body's acculturation." Further, Butler (1986) emphasized that gender is not only a cultural construction imposed upon identity, but it is a process of constructing ourselves. This notion of "becoming" is a significant theme throughout transgender literature; cis and trans people go through individual processes of *becoming* their gender (Garner 2014).

For Butler (1986), gender is not a costume that one could choose to wear. It's a repetitive system of norms that is reproduced across time and culture, which is what gives meaning to "masculine" and "feminine" in society. It is Butler's use of the transgender subject to illustrate gender performativity that causes contention among trans scholars. Prosser (2006, 258) asserted that foundational texts of queer studies are "crucially dependent on the figure of transgender" and suggested that Butler's implication that transgender identity is

queer and therefore, problematic. Despite the criticism of Butler's work, scholarship generally agrees that her literature advanced academia in a way that created space for transgender studies and allowed it to become oriented in existing research.

Much of the literature in this domain builds on Butler's notion of gender performativity to explain how transgender research examines how trans bodies are oriented in space and time while analyzing what kind of meaning is imposed upon a trans body. Being misgendered by people or society's strong imposition of gender roles and expectations are major contributing factors resulting in pervasive dysphoria among many trans people. A way that trans people often describe their gender dysphoria experience is that of feeling "trapped in the wrong body" (Carter 2013, 131). Our findings will expound these notions.

RESEARCH DESIGN, METHOD, AND FINDINGS

Research Setting and Informants

Our research was conducted at a North American residential summer camp (the "camp") for 2 spirit, lesbian, gay, bisexual, and transgender (2SLGBT+) youth aged 12 to 17 years. Campers could express themselves in an environment of kindness and acceptance – very novel experiences for most. Over a summer, four two-week sessions are conducted, each with 50 campers, most of whom are transgender. Activities emphasize community-building: social dance participation; a talent show; drag workshops; and singing around a campfire.

Our research objective was to elucidate as many aspects of the community as possible, revealing the interplay between all actors. We derived our data from prolonged participant observation over a summer (Jorgensen 1989) and depth interviews (McCracken 1988). Informants felt secure and readily shared their innermost thoughts. This gave us deep insights that were valid and authentic.

Informants represented different transgender identities, however, all were from the 2SLGBT+ community. We anonymize the informants with names unrelated to their real names. Here, to enhance brevity, we report on three illustrative informants from our depth interviews. Aaron, a trans-male, openly discussed his challenges with mental illness, poverty, and homelessness. Aaron experienced homelessness and had to live in a shelter, despite growing up in a family with financial privilege. His family disagreed with his trans identity, which created a hostile home life. JJ identified as transmasculine non-binary and preferred they/them pronouns. They had an education background in kinesiology and exercise physiology. JJ has worked as a Drag King professionally and loved performance, especially dance. Mya was a trans woman who worked professionally as a Drag Queen. She had a passion for performing arts and trans activism.

METHOD

First, observations were made. The focus of this field work was to observe the degree to which transgender youth expressed themselves through camp activities, while considering the influence these had on dysphoria, self-esteem, and mental health issues.

Second, depth interviews were conducted that focused on three topics: (1) informants' lives and how they evolved over time; (2) how informants enact their gender identities; and (3) informants' views of the community and how space and place allow them to safely navigate the presentation of their gender identity. To facilitate a broad and wholistic reflection of the camp experience, conversational-based interviews occurred over Skype, two-weeks after informants had completed their camp sessions. Following Strauss and

Corbin's (1990) procedures, we analyzed each transcript, thread, and set of field notes individually. We uncovered important themes using an iterative, back-and-forth reading process, uncovering patterns within and between informants, and within and between data sets.

FINDINGS

Observations were focused on camp events/activities/situations, and depth interviews enabled discovery of fine-grained insights. Resultantly, a major theme , – the importance of "safe-space" – of relevance to organizations that operate within a marketspace, that seek to minimize gender stereotyping and enhance inclusivity. Within this community, the notion of "safe-space" was highly salient. Informants' life experiences were often plagued with internal/personal and interpersonal tensions, which threatened their sense of belonging. Thus, a key benefit of the "safe-space" is a strengthening of belonging. Our findings, overviewed in table 1, are described herein.

GENERAL DISCUSSION AND IMPLICATIONS

The recognition of "safe-space" was pervasive in observations and interviews. Additionally, other key notions emerged: waiting for body to match identity; physical/bodily movement and posture; and dysphoria.

All informants identified "waiting" for medical gender affirmation as one of the largest trans challenges. This is consistent with the common theme of "becoming" in transgender scholarship – both cis and trans people "become" their gender. Butler (1986, 36) stated, "gender is not only a cultural construction imposed upon identity, but in some sense, gender is a process of constructing ourselves." The cultural constructs, "masculine" and "feminine" cause anxiety for trans people. Our findings illustrate that performative aspects of the male and female binary is frequently cogitated by the trans community.

Pervasively high rates of mental illness among trans youth were reflected in our research – consequential effects from frequent rejection, lack of validation and support in transition, and general discrimination in society. It is this notion of external influence on mental health that Iacono (2018) explained as resulting from distinct stressors induced by hostile homo/bi/transphobic cultural, social and institutional structures. Iacono (2018) suggested trans youth internalize societal oppression, which adversely impacts their wellbeing. Thus, safe-space is important.

For many, camp was a safe-space; the first time that they experienced the relief from anxiety. They were accepted and their identities celebrated. The concept of a "safe-space" is common in queer and trans advocacy communities. Poynter and Tubbs (2008) explained that it is unclear where the "safe" idea originated since the term has been widely spread to define inclusion-based campaigns, programs, and locations. "The hallmark of these 'safe' programs is the public identification of allies by placing a 'Safe' symbol, usually incorporating a pink triangle or rainbow or the word 'Ally' or a combination of all three, on office doors or within living spaces" (Poynter and Tubbs 2008, 123). Therefore, the importance of designating a space as "safe" is key and is consistent with *minority stress theory* – "many LGBTQ people will assume a space is not safe until shown otherwise. Prejudice and discrimination based on sexual orientation or gender identity often goes unchallenged, and because a person may not be recognizable as LGBT, she/he may hear heterosexist or homophobic comments from people who are not aware of whom they offend. Furthermore, potential LGBT mentors may be hidden within a hostile climate" (Poynter and Tubbs 2008, 128). By promoting a safe-space, organizations can convey a clear recognition that con-

Table 1. Depth Interviews: Highlights and Commentary

Theme		Quotation from Interview	Context and Commentary
Exploration and experimentation with gender with drag performance.	Mya	"Doing drag was a long therapeutic experience. It helped me come to terms with my gender, helped my confidence, now I have a career going with it. It has really built me up in a lot of ways." "I started to do drag to explore my femininity. It felt really natural to dress like that which was what made me think more about being trans – it became unavoidable question."	Mya first came out as a gay man at age 17 years. She admitted that at that time, she was not yet ready to start thinking about her trans identity even though it was a thought at the back of her mind. At age 24, Mya came out as trans and described it as a positive experience, especially in the drag community.
	JJ	"Drag helped me try on expressions that I would later on adopt in everyday life. Helped gauge reactions, and if the look actually worked… It is where I met the first trans person. There are a lot of trans people in the drag community." "Drag is just a different way to express yourself. It allows you to try different clothes, and you could try something different everyday. It is normal in the drag community. You need time to find your drag persona, which is really just your alter ego. Like you could be a pretty quiet person and be confident in drag and people accept it as being that other-named person that you are… that is exactly what I did. I have been a drag king for quite a number of years. That character evolved, just as I did in my transition, although my transition ultimately brought me to look a lot like my drag character."	JJ explained that now that they have been on testosterone for a number of years and have a beard, they make a more masculine appearing drag king than the cis-female drag kings who have to use make-up to create a beard aesthetic.
	Aaron	"It is just another way to affirm my identity through drag; like being able to be hyper-feminine during drag is the opposite of my identity. It is fun. It helps you release tension from your body and get energy out through movement. Being able to do drag as a character, you get to do things you normally wouldn't do because it is not you, it is the character you put on. The separation of make-up and dressing up helps a lot to make a distinction between your character and yourself. It gives you an excuse to wear things you normally couldn't because of the amount of transphobia you would have to deal with. It would just make me really anxious in general to wear a dress in public."	Adopting the archetypal façade was a way of gaining acceptance and enhancing their perceptions of belonging.
Transgender experience in everyday settings (informal gender performance)	JJ	"We are told to love ourselves, but when everyone is telling you to hate yourself, it makes it hard." "Your first-time slow dancing is awkward because you have to figure out what to do with your hands, like it changes if you are a boy or a girl: taking the lead while dancing with somebody… like hand position and all that kind of stuff."	Low confidence was pervasive; relates to self-esteem development as a trans. Thought patterns of negative self-talk were normal to many trans youth due to harsh judgement from mainstream society.
	Aaron	"I remember googling in high school 'how men dance.' It was like club dancing. And what came up was very casual, slow, almost not moving at all. That kind of swaying type thing." "I always was trying to make myself look smaller/less noticeable … the posture is like slouching but your shoulders are in together more. So normally slouching would just bring your shoulders forward but I would bring them in and my arms together; almost making yourself into a ball. Holding your shoulders or arms." "Being trans eliminated my ability to have neutral relationships with people because every time I interact with someone, I am visibly trans. Every interaction I have with someone, it is now impacted by this. Even interactions with people at fast food places or stores can be impacted … You can't escape being visibly trans and it provokes people that don't like trans people just by existing. Knowing you can't control that; every time you leave the house you think about the possibility of someone yelling at you. This could totally be enough to cause someone social anxiety because it is completely out of your control. You are always evaluating people and trying to pick up on subtle things that might tell you if they are OK with you being trans… It is difficult to exist in public, so you can start to want to isolate your-self and not leave the house. It can make you feel hopeless and help-less and feel despair."	Discomfort going to school dances as a teenager because of the gendering of dance movement. This illustrated the pervasive nature of gender stereotyping. Though Aaron considered confident posture to be more masculine as a transitioning teenager, he described how he never could embody this posture because of his struggle with dysphoria.

sumers' physical, emotional, and psychological safety is important and valuable. For 2SLGBT+ persons, this could serve to lessen the habitual anxiety and stress that they experience and allow benefits of this inclusive approach to accrue to the organization.

Examining bodily/physical movement during our observations offered interesting insights. The construct of what movements/gestures society reads as masculine vs. feminine was a source stress/discomfort among our informants. JJ explained that they always moved in a way that is read as masculine. Likewise, Mya said that she always moved femininely and no longer worried about socialized movement because moving as a woman in society is generally criticized less than for men. She explained, "I think the struggle is the pressure to adhere to masculinity at all times as a man, because women can get away with being a little butch and it isn't really an issue." While both Mya and JJ always had gender-affirming movement patterns in alignment with their identity, Aaron continued to be anxious about movement in his trans male body. He explained, "having to worry about how you move all the time is very common for me. Masculine and feminine movement is really about 'passing' or being read as male because you want to blend in."

When a space is liberated from the traditional gender expectations of society-at-large, it can become a place for trans youth to participate and enjoy the benefits of free and natural body movement without having to think about external stress as they engage with movement in a way that they find affirming.

Our observations regarding body posture were noteworthy. Some of the trans-male counsellors jokingly called this posture the "dysphoric hunch," because it was how they also carried themselves as teenagers prior to gaining bodily confidence. Aaron exemplified this posture by rarely making eye-contact, hunching forward, and tipping his head down. He addressed his experience with posture (table 1) – the desire to make himself smaller and less noticeable because of struggles with mental illness, and the location of his hunching posture would align with where he felt the physical discomfort of dysphoria. He explained, "sometimes the pain was in the back of the neck, where you would get a lot of tension from slouching and curling up … sometimes pain was in the centre of the chest … it is hard to identify where I hold the stress. I also hold trauma in different places in my body, so I think I would have a hard time distinguishing between which one the discomfort is (trauma vs. dysphoria). I think it might be the places I'm in, or dangerous situations, when I tense up the most."

Giving space for gender experimentation and discovery can be extremely valuable for improved mental health among transgender youth. Mya suggested that, "realizing I was trans and coming out as a woman has been one of the most positive experiences for my mental health. I was really struggling before. It was a really good affirmation that coming out was the right choice because I just feel better about everything. I am finally myself and feel comfortable in my skin for the first time. I describe it as all the dominoes falling in place."

IMPLICATIONS AND RECOMMENDATIONS

Managers/practitioners, must recognize the fluidity of gender and understand the human harm of gender stereotyping. To fulfill the marketing concept of *meeting the needs and wants of consumers profitably*, managers must not alienate consumers. Managers must create a safe-space via the following suggestions: non-binary washrooms/changerooms; signage should use terms such as "masculine" vs "men's" and "feminine" vs "women's;" label organizations as "Transgender Safe-space" and as "LGBTQ-friendly" on their Google listing to create an inclusive/welcoming environment. Like-

ly, profitability would increase as positive word-of-mouth regarding these businesses spreads through local transgender communities. Employees must be trained to be gender inclusive (use of appropriate pronouns, use non-binary language, avoid gender assumptions, etc.). Employees should realize that all consumers are unique in their self-identities. Organizations should avoid gender-based assumptions regarding activities and use appropriate LGBTQ+ terminology in marketing efforts.

The CB literature has been incrementally enhanced by our research. We have imported theory from other disciplines into the CB domain and thus, enriched the CB discipline. We have positioned our work outside of the binary male/female context of gender by recognizing an important reality – that gender is fluid; femininities and masculinities are in motion. As greater numbers of CB scholars continue to recognize these realities, the CB literature (as a whole) will evolve and robustness increase.

Beauty is Pain: Understanding How Gift Card Design Influences Acquisition, Redemption, and Product Evaluations

Freeman Wu, Vanderbilt University, USA
Adriana Samper, Arizona State University, USA
Andrea Morales, Arizona State University, USA
Gavan Fitzsimons, Duke University, USA

INTRODUCTION

The gift card market has grown exponentially in recent years, revealing staggering growth in 2020. In the first six months of 2020, customers purchased an average of 4.7 gift cards per quarter, representing a 20% increase compared to the 3.9 purchased per quarter in 2019 (InComm 2020). Such growth is in addition to their holiday season domination – gift cards have long been the most requested holiday gift, with 94% of customers claiming they planned to buy at least one gift card during the holiday season (NRF 2019). Furthermore, purchases of gift cards for self-use have also recently climbed — from January to June of 2020, 49% of consumers bought gift cards for themselves, up from 31% during the same period in 2019 (Moeser 2020). Such increased self-use may be attributable in large part to consumers acquiring gift cards to support struggling businesses during the COVID-19 pandemic (Pendrill 2020). Even as the pandemic has wreaked havoc on retailers worldwide, the global gift card market is projected to reach $1.92 trillion by 2027 (Goswami et al. 2020).

Despite their ubiquity, there has been limited work exploring the levers of gift card selection and redemption. This gap is surprising considering that companies have invested significant resources in the design of their gift card offerings, efforts that have made gift cards feel more personalized and desirable (Knaus 2020). Indeed, 84% of gift cards are gifted in additional packaging (Incomm Payment 2021), and many retailers offer attractive complementary packaging that is either visually integrated with the gift card itself or sold separately alongside the cards (Knaus 2020). This strategy certainly pays off, as more attractive gift card displays generate a 14% increase in gift card sales (Incomm Payments 2018).

As a result, there are now myriad innovative ways to display and package gift cards including miniature tins, baskets, slide out sleeves, and other intricately designed carriers (Knaus 2020). Sometimes, the card is physically sealed in the packaging to prevent fraud and theft (Cogan 2020), and other times, the packaging is visually integrated with and complements the gift card design itself, such that the gift card and carrier together form an aesthetically cohesive unit. For example, Starbucks routinely releases carriers that complement specific card designs, such as a recent collection of Christmas sweater-shaped cards packaged with corresponding "coat hanger" card holders (BucksCards 2020), while Amazon offers a "Reveal" line of gift cards that are embedded in attractive pop-up paper packaging like flowerpots or Easter eggs (Amazon 2021). Likewise, retailers from Finish Line to Nike promote gift cards featuring iconic sneaker designs in complementary miniature shoebox carriers (Hunter 2021), while Target regularly markets their WOW! gift cards in packaging containing lights, sound, and motion that increase the card's overall charm (Target 2011). In sum, attractive gift card presentations play a pivotal role in capturing consumer attention and driving gift card sales (Hunter 2021).

Notably, the production of attractive gift cards that are visually complemented by their packaging also implies that consumers must eventually compromise the gift card's integrated aesthetic appeal to redeem it, which can happen in at least one of two ways. First, at the subtlest level, the packaging may visually complement the design on the gift card, so that removing the gift card from the packaging involves separating, and by extension, *conceptually* destroying the visual unity made possible by the gift card and packaging presented together. Second, at a more obvious level, consumers may have to tear open the packaging to access the enclosed gift card, thereby *physically* destroying the card packaging. Importantly, both actions ultimately reduce the gift card's overall aesthetic appeal, so for simplicity, we refer to such compromising of aesthetics as "destruction," a construct that includes both conceptual and physical destruction.

In the current research, we investigate how investments in gift card design, which includes the gift card, its packaging, and the complementarity between these two elements, can impact gift card acquisition, redemption, and product evaluations. We find that givers are drawn to aesthetically appealing gift cards, many of which are visually complemented by their packaging and presented together as an aesthetically congruous unit. Notably, such visual complementarity also implies that, in the process of redemption, consumers must inherently compromise the gift card's aesthetic appeal, such that redemption requires the card's aesthetic appeal to be destroyed. Because people can be averse to breaking up entities sharing an emergent relationship (Mourey et al. 2013) and are reluctant to damage aesthetics (Wu et al. 2017; Young 1989), gift card recipients are subsequently less likely to redeem them. Moreover, when they do redeem them, they form more negative purchase evaluations, a pattern of results driven by what we denote the "pain of redemption," a specific form of pain of payment unique to gift card redemption. Notably, we posit that the pain of redemption emerges whenever gift card aesthetics is marred, whether this occurs when someone removes a gift card from its complementary packaging before the point of sale, or at the time of purchase. In this manner, we contend there are two factors that play a fundamental role in shaping responses to gift card design: the aesthetic appeal of the card's presentation, and whether accessing the enclosed card necessitates destruction of such integrated appeal. We examine these two factors across our studies and isolate and test gift card aesthetics and destruction as orthogonal constructs in our final study.

Study 1 (N=45,755), a field experiment conducted on Facebook, shows that gift givers are indeed drawn to attractive gift cards that are visually complemented by their packaging. Using Facebook Ad Manager's Split Test function, we compared the effectiveness of two gift cards in a 2-cell (visual complementarity: yes vs. no) design. Both ads featured the same ad settings and only differed in the ad image itself. In the visual complementarity condition, users saw an ad for a gift card featuring Super Mario, whose image on the card was visually complemented by graphics on the packaging showing the video game's iconic green pipe. Specifically, the gift card's placement on the carrier depicted Mario ascending from the pipe, just like in the video game. Thus, to redeem the card, consumers must separate Mario from the green pipe and inherently compromise the gift card's integrated aesthetic appeal. In the non-visual complementarity condition, users saw an ad for a similar gift card, but the packaging itself did not feature graphics and all the design elements were instead placed on the card itself, so redemption would not compromise the card's aesthetic appeal. Users who clicked on the ad were brought

to an actual registered website describing highly rated gaming gift cards.

As predicted, the ad featuring the gift card that was visually complemented by its packaging generated a higher click-through rate (2.00%) compared to the one not complemented by its packaging (1.20%; *p*<.0001). Study 1 documents, in a real-world social media setting, that people are more attracted to gift cards that are visually complemented by their packaging, which implies that they are also drawn to cards that require destruction of their aesthetic appeal at the point of redemption.

Importantly, neither the imminent separation of the gift card from its packaging (and the ensuing destruction) was made salient. In study 2 (N=503), a 2-cell (destruction salience: high vs. low) design, we examine how the salience of such imminent destruction shapes preferences for gift card aesthetics at acquisition. Further, we examine how the gift card's aesthetic appeal influences choice when consumers encounter higher and lower aesthetic options simultaneously, like actual gift card displays in real life. Participants imagined they were getting a Starbucks gift card for a friend and were presented with both the higher and lower aesthetic gift card options at the same time. In the high destruction salience condition, participants read that to use these gift cards, the recipient would first have to tear the packaging and destroy the design, heightening the salience of the packaging's destruction. Participants in the low destruction salience condition were not given this information and proceeded directly to the choice task. Subsequently, participants selected the gift card they would acquire. Consistent with our theorizing, participants were less likely to choose the higher aesthetic gift card when the salience of packaging destruction was high (vs. low) (56.97% vs. 67.86%; *p*=.0116). Study 2 demonstrates that when it is evident that a gift card's overall aesthetic appeal must be compromised through redemption, people shift their preference toward the less attractive option. In other words, when destruction salience is high, consumers avoid compromising beauty by selecting a less attractive gift card in the first place.

The next two studies shift from the acquisition stage to actual redemption decisions by examining how gift card aesthetics impact redemption when paying compromises their appeal. In study 3 (N=198), a second field experiment, we hold packaging destruction high and constant (i.e., all packages had to be torn open to access the enclosed gift card) and manipulate the aesthetic appeal of the gift card packaging to examine its causal impact on redemption decisions. Collaborating with a bookstore, we created two versions of gift card packaging—one with plain packaging, and one with attractive graphics on the package. The gift cards were distributed in front of the bookstore, and redemption was tracked for two weeks before the start of summer break. Fewer of the higher aesthetic gift cards were redeemed (14.14% vs. 25.25%; *p*=.0481), demonstrating that higher gift card aesthetics can deter redemption when paying requires ruining the gift card packaging's aesthetic appeal.

In study 4, using secondary data from a large retailer, we focus on highly aesthetic gift cards and examine the extent to which gift card packages which require (vs. do not require) their aesthetic appeal to be compromised through redemption can affect redemption at the aggregate retail level. Our retail partner has a nationwide footprint of more than 1,000 stores and an active gift card program. The retailer's gift cards are available for purchase in-store or on its online platform, with a minimum required purchase amount of $5, which it offers in a wide range of attractive designs and motifs. Most gift cards feature attractive designs directly on the plastic card itself and are packaged with generic removable gift card sleeves, which represent the no-destruction control condition. Importantly, a subset of the retailer's gift cards are integrated with and complemented by their packaging, such that customers who wish to redeem must either tear open the attractive packaging to access the enclosed card, or separate the gift card from its visually complementary packaging, thereby reducing the gift card's integrated aesthetic appeal. Such gift cards represent the destruction condition. In this sense, we compare two sets of attractive gift cards, one that requires their packaging to be compromised for redemption, and one that does not. Redemption rates for both types of cards were tracked for 35 months.

Of the attractive gift cards in the no destruction control condition that were sold, 90.1% were redeemed by the end of the 35-month window. On the other hand, for attractive cards that required some degree of destruction for redemption, only 75.9% were redeemed. As such, consistent with our theory, redemption was lower when the gift card's overall aesthetic appeal must be compromised before redemption, as reflected by the 14% lower redemption rates (*p*<.0001). Across two studies in real-world settings with consequential dependent measures, we show that higher gift card aesthetics can reduce actual redemption and spending when the gift card's aesthetic appeal must be compromised for redemption. First, in a controlled field experiment, study 3 examined the causal role of higher (vs. lower) aesthetic gift card packaging on redemption when redemption compromised the gift card's packaging. Second, using secondary data from a nationwide retailer, study 4 provides additional support for our conceptual model, examining redemption rates for attractive gift cards that required (did not require) their integrated aesthetic appeal to be destroyed for redemption.

In study 5 (N=398), a 2(aesthetics: higher vs. lower) x 2(destruction: yes vs. no) design, we test the full conceptual model, providing evidence for the underlying process by examining how gift card aesthetics and destruction jointly shape product evaluations. Participants received a paper token that had either been folded into an attractive design or simply folded into a similarly-sized rectangle, and were given the opportunity to buy something in the lab's store with the token (i.e., lip balm or chewing gum). All participants were asked to make a purchase. Participants in the destruction condition were asked to unfold the token before paying, whereas participants in the no-destruction condition were simply asked to turn in the token as-is. Next, participants evaluated the product they purchased (α = .97) before indicating how painful it felt to redeem the token (α = .92).

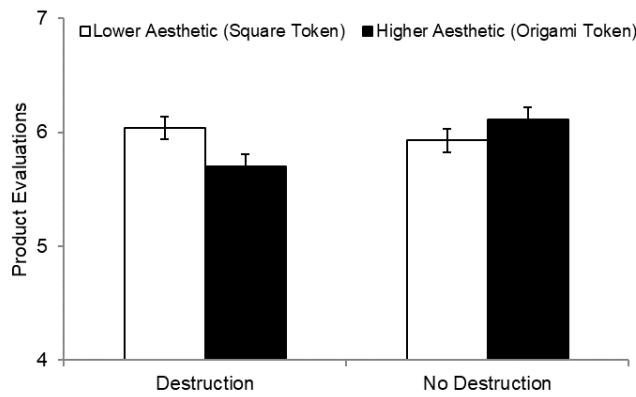
Results revealed significant interactions for product evaluations (*p*=.0106; Figure 1). In the destruction condition, product evaluations were more negative after redeeming the higher (vs. lower) aesthetic token ($M_{destruction, higher aesthetic}$=5.70 vs. $M_{destruction, lower aesthetic}$=6.05; *p*=.0134), but in the no destruction condition, product evaluations did not differ ($M_{no destruction, higher aesthetic}$=6.11 vs. $M_{no destruction, lower aesthetic}$=5.94, *p*=.246). Looked at another way, whereas product evaluations were more negative when participants had to destroy (vs. not destroy) the higher aesthetic token through redemption (*p*=.0051), product evaluations were unaffected by destruction when redeeming the lower aesthetic token ($F < 1$). Thus, consistent with our conceptualization, when redemption involves compromising the payment's appearance, higher (vs. lower) token aesthetics reduces product evaluations.


Figure 1: Study 5: Token Aesthetics X Destruction on Product Evaluation

Figure 2: Study 5: Token Aesthetics X Destruction on Pain of Redemption

The same analysis on the pain of redemption revealed a significant interaction ($p=.0185$; Figure 2). In the destruction condition, participants experienced greater pain from redeeming the higher (vs. lower) aesthetic token ($M_{destruction, higher}=1.88$ vs. $M_{destruction, lower}=1.52$; $p=.0200$), whereas in the no destruction condition, pain of redemption did not differ ($p=.3080$). Finally, we conducted a moderated mediation analysis (model 8, Hayes 2017) to test our proposed mediation path, whereby the pain of redemption mediates product evaluations, contingent on token destruction. The index of moderated mediation was significant (CI=-.1887, -.0214]), such that in the destruction condition, the indirect effect through the pain of redemption was significant (CI=-.1461, -.0075), but the indirect effect in the no destruction condition was not (CI=-.0251, .0846).

Across five studies combining lab, field, and secondary retail data, we examine how gift card design shapes acquisition, redemption, and product evaluations after purchase. While givers are drawn to attractive gift cards, many of which are visually integrated with and complemented by their packaging, because redemption requires the gift card's appeal to be compromised, consumers are subsequently less likely to redeem them. Moreover, when they do redeem them, they form more negative product evaluations, a pattern of results driven by the pain of redemption. As gift card designs continue to grow in complexity and ubiquity, understanding when and how this trend might shape gift card acquisition, spending, and product evaluations could have broad implications for consumers and practitioners alike.

Summary of Results

Study	Context	Design	Focal Dependent Variable(s)	Findings
1	Field Experiment	• 2 (Visual Complementarity: Yes vs. No)	• Click-through rate (as a proxy for acquisition) • Cost Per Click	• **Acquisition:** Gift cards that are visually complemented by their packaging (and thus more susceptible to destruction during redemption) increased click-through rates ($p < .0001$) and reduced cost per click
2	Online Experiment	• 2 (Destruction Salience: High vs. Low)	• Gift card choice	• **Acquisition:** Gift card aesthetics increased choice under low destruction salience, but decreased choice under high destruction salience ($p = .0116$)
3	Field Experiment	• 2 (Aesthetics: Higher vs. Lower)	• Gift card redemption	• **Redemption:** Gift card aesthetics reduced redemption ($p = .0481$), holding destruction high and constant
4	Secondary Data	• 2 (Destruction: Yes vs. No)	• Gift card redemption	• **Redemption:** Attractive gift cards that must be destroyed through redemption (vs. not) reduced redemption ($p < .0001$)
5	Lab Experiment	• 2 (Aesthetics: Higher vs. Lower) x 2 (Destruction: Yes vs. No)	• Product evaluations • Pain of redemption	• **Product Evaluations:** 2-way interaction ($p = .0106$) • Token aesthetics reduced product evaluations in the destruction condition ($p = .0134$), but not the no destruction condition ($p = .2469$) • **Pain of Redemption:** 2-way interaction ($p = .0185$) • Token aesthetics increased pain of redemption in the destruction condition ($p = .0200$), but not in the no destruction condition ($p = .3080$) • **Moderated Mediation:** 1. Destruction: Aesthetics → pain of redemption → product evaluations (95% CI=[-.15, -.01]) 2. No destruction: Aesthetics → pain of redemption → product evaluations (95% CI=[-.03, .08])

INTRODUCTION

Firms have discontinued 60% of chatbots used in the initial stages due to its poor performance; they were not meeting customer expectations because of poor chatbot design; inadequate appearance, lack of intelligence and autonomy in particular (Ben Mimoun et al., 2012). Later advancement in technology like Artificial Intelligence (AI) and Machine Learning (ML) have offered possibilities for developing much improved (intelligent) chatbots resulting in the increased usage of virtual assistants in different stages of the consumer journey on digital platforms. This led to the emergence of a second wave of more intelligent chatbots (Adam et al., 2020).

Conversational Agents (also known as chatbot, digital assistant, dialogue system, virtual assistant) are "natural language computer programs designed to approximate human speech (written or oral) and interact with people via a digital interface" (Thomaz et al., 2020). Early chatbots also known as rule based chatbots showed lower level of intelligence characterized as mechanical AI. Modern chatbots showed higher level of intelligence characterized as intuitive intelligence as they reply to customer queries based on contextual understanding and show an adaptive learning based on experience or past interaction which are key characteristics of intuitive AI (Huang & Rust, 2018). As chatbot's level of intelligence has increased, they showed successively higher level contextual awareness and has been able to simulate human conversations as oppose to responding to pre-defined set of questions/queries. These capabilities led to increased use of chatbots by organisations to interact with its customers in different stages of consumer decision journey. Brands are now increasingly using Conversational Agents (CAs) to interact with customers across all stages of consumer journey; at pre purchase stage; for advertising (Van den Broeck et al., 2019), for recommending services/ products to customers (Rhee & Choi, 2020), providing personalized services/ offers (Van den Broeck et al., 2019); at purchase stage for assisting customers in purchasing process as shopping assistant (Pantano & Pizzi, 2020) and at post purchase stage for helping customers in after purchase interactions such as customer query/compliant handling agent and customer feedback gaining tool (Trivedi, 2019; Araujo, 2018; Adam et al., 2020).

Most of the existing studies on CAs in information systems (Schuetzler et al., 2018; Pfeuffer et al., 2019; Ben Mimoun et al., 2017) and human computer interaction (Feine et al., 2019; Araujo, 2018; Burgoon et al., 2016; Go & Sundar, 2019; Hill et al., 2015), examined CA from a technology perspective. Despite recognition of CA application in consumer interactions, there are only a few studies that have examined chatbot from customer perspective (Ben Mimoun & Poncin, 2015; Adam et al., 2020). Literature examining effect of design of CA in human-computer interaction and information systems seems to be fragmented, with researchers focusing on specific aspects, separately in different studies. While theoretical foundations are in development, there is a need for synthesising extant research examining effect of CA design on customer based outcomes (Kumar et al., 2016). The objectives of this paper is to synthesise extant research examining the effect of socio-behavioural design of CA on customer responses.

The literature for review was selected from search in EBSCO host database using keywords bringing the research on *"conversational agents"* (conversational AI, chatbot, digital assistant, conversational agents, voice assistant, voicebot) and " *marketing*", "*consumer behaviour*", "*human –computer interactions*". The twenty-four empirical papers examining effect of socio behavioural design of CA on customer responses were synthesised based on their use in different stages in the consumer decision journey (use context) and in different industries (industry context) in the second section ; research findings from the synthesis and direction are provided in the third section.

CA DESIGN AND CUSTOMER RESPONSE: SYNTHESISING EXTANT RESEARCH ACROSS USE CONTEXTS AND INDUSTRY CONTEXTS

Empirical research modelling the effect of socio-behavioural design of CA on customer responses has picked up especially in the last decade. Research has examined effects across different stage of the consumer journey (use context) as well as across different industries (industry context).We have analysed the empirical research across the use context and industry contexts to synthesise the extant knowledge and identify areas for further research.

The implementation of online socialization agents (advanced chatbots) in firm–customer interactions is still in an experimentation phase (Köhler et al., 2011). Studies examining design cues of chatbot (CA) has analysed single design cues in different stages of consumer decision journey namely pre purchase, purchase and post purchase and in different industries including ecommerce, banking & finance, learning & education. There has not been any attempt to synthesise these findings to evolve a holistic understanding of the effect of CA design on customer outcomes.

Most studies found that CA and its anthropomorphic design cues results in positive customer response/outcomes (Araujo, 2018; Go & Sundar, 2019; Rhee & Choi, 2020; Coronado et al., 2018; Qiu & Benbasat, 2009; Ben Mimoun & Poncin, 2015). However some studies have reported negative effect of anthropomorphic cues/ features of chatbot (Fryer et al., 2017; Longoni et al., 2019; S. Kim et al., 2016). The need to resolve these inconsistencies underlines the need for the synthesis of extant literature.

EFFECT OF SOCIO BEHAVIOURAL DESIGN OF CA ON CUSTOMER RESPONSES: INSIGHTS, DIRECTION

(a) Effects of CA design on customer responses across USE contexts

Conversation agents empirical research were conducted across different stages in the customer interactions in decision journey; pre purchase, purchase and post purchase, termed as use contexts. Of the twenty-four empirical articles modelling the effect of design cues, conversation agents were employed at pre purchase in fifteen, purchase in four and post purchase stage in five studies.

Pre Purchase Stage

In pre-purchase stage, anthropomorphic design cues of CA as product recommendation agent, advertising tool and customer assistant resulted in positive customer responses such as enhance shopping experience, positively affect attitude towards product and enhance user satisfaction of CA across all industries (Ho et al., 2018; Van den Broeck et al., 2019; Dawar & Bendle, 2018; Araujo, 2018).

However, there is evidence from multiple studies on the negative effect of anthropomorphic cues such as impairing self-disclosure and evoking socially desirable response while using CA as a data collection tool (Schuetzler et al., 2019; R. Schuetzler et al., 2018; Pickard & Roster, 2020). Perceived understanding of CA and disclosure intimacy mediated the effects on customer responses (self-disclosure).

One reason for the lower perceived understanding of CA may be the lower acceptance of CA as it is in the early stage of adoption. It needs to be seen if incentives to use the CA or the perceived value of the CA could positively influence the perceived understanding and hence acceptance of CA. Hence it would be interesting to explore if consumer's willingness to try new technologies or consumer's age itself would moderate these relationships. Another mediator, disclosure intimacy, points towards the privacy concerns affecting the adoption of CA's. It is possible that the customer trust in the firm could also moderate these relationships; with higher customer trust, the disclosure intimacy could also be higher. Future research modelling the moderating effect of chatbot adoption/acceptance levels could consider varying effect of consumer related variable such as age, consumption motive, privacy concern as well as firm related variables such as corporate brand trust, type of service on customer responses.

Underlying mechanisms influencing customer's responses in different industry contexts: Five studies in e-tailing context used chatbots as a product recommendation tool. In the banking, it was used as customer assistant tool, in media industry as an advertising tool and in multiple industries as data collection tool. In ecommerce, visual, auditory and communication cues were used to anthropomorphise chat bots and affects customer behavior and responses primarily through perceived social presence. While using as a data collection tool the visual, communication cues used were human like face, human like voice and name identity etc.; however, these cues were mediated by perceived understanding, disclosure intimacy and did not positively influence self-disclosure.

Purchase Stage

In purchase stage, four studies (16%) examined the effects of socio-behaviour design, of which three were in e-tailing and one in banking & finance context; they used chatbot as a sales agent. In banking & finance, it was found to have negative outcomes such as decrease in purchase rate whereas in ecommerce it results in positive customer responses such as favourable attitude towards product, intention to use website (Luo et al., 2019; Pantano & Pizzi, 2020; Rhee & Choi, 2020;Trivedi, 2019). While social presence, perceived homophily, shopping value were modelled as mediators in ecommerce context, in banking and finance industry context the mediators were the perceived knowledge of CA, and perceived empathy of CA. Most of the studies employed text based chatbots, testing visual cues of chatbots on customer responses. There are evidence of increasing popularity of voice based chatbots among users pointing towards a need to explore the effect of auditory cues on customer responses. Voice based CA (e.g Alexa) gaining place in customers' everyday life, making it a relevant medium for marketers to connect and interact with customers which in turn demands a further understanding of customer adoption and usage of such CA.

Underlying mechanisms influencing customer's responses in different industry contexts: The effects of socio behavioural design cues, in particular visual cues on customer outcomes was modelled as mediated through "social presence, perceived homophily and shopping value" in the ecommerce context while "perceived knowledge and perceived empathy" of CA were the mediating mechanisms in the banking and finance contexts. The different mechanisms in

different industry context points to specific efforts required for enhancing customer acceptance and successful deployment of CA.

Post Purchase Stage

In post purchase stage, CA has been used for service delivery/consumption and found to evoke negative customer responses (Kim et al., 2016; Longoni et al., 2019). Replacing human agent with CA and its anthropomorphic design found to evoke varying customer responses while delivering educational services. For instance, when used as pedagogical agent, it resulted in positive customer response (increased motivation to study and engagement of students) (Pérez-Marín & Pascual-Nieto, 2013), whereas when used as language learning partner resulted it resulted in negative customer responses (reduce interest in course/task) (Fryer et al., 2017). One possible reason for contradicting results could be age of customers/students as in first case, it was tested on early adolescence and in the second case, it was tested with adults. There could be possible factors such as gender, age, technology readiness which might moderates the effect of CA on customers in various type of service delivery. Future research can identify and test such possible moderators and mediators as current studies in education service delivery roles does not identify any mechanism to explain CA design effect on customer/students' response.

Underlying mechanisms influencing customer's responses in different industry contexts: Studies examining the effect of CA's socio behavioural design on customer outcomes in education (Fryer et al., 2017), health care (Longoni et al., 2019) and in online gaming (S. Kim et al., 2016) resulted in negative effects (reluctance to use, decrease in motivation & interest in task, decrease in enjoyment) . The negative effect of these studies raised further questions on the mechanisms resulting in these negative outcomes. In the health care context, the effect of design cues on use intention of CA was mediated through the variable "uniqueness neglect". It is possible to improve the technical ability or intelligence to learn from interactions and customise service delivery to reduce the impact of design cues on uniqueness neglect. Hence there is a need to model the effect of the intelligence levels of the conversation agents along with the design cues to understand their moderating effects on uniqueness neglect.

In the computer gaming context where the CA was used a virtual helper, the effect of design cues was mediated by consumer's perceived "autonomy". The use of CA negatively impacted consumer's perceived autonomy which adversely affected customer responses. These studies point out the need to explore underlying mechanisms explaining the effect of socio- behaviour design cues on customer responses. Given that chatbots are continuously replacing human agents in different industries to enable 24*7 service and the paucity of studies in this area there is a need to undertake research using CA 's as service agents in different industries to offer enhanced understanding on factors affecting the adoption of CA.

(b) Effects of CA design on customer responses across INDUSTRY contexts

The design cues had positive influence on customer outcomes in different industry contexts except in the case of banking and finance sector. There were three studies in banking and finance industry context one in pre purchase stage and two in the facilitating the purchase transaction. In all the three studies the effect of socio- behavioural design cues has negative influence on customer outcomes, perceived knowledge and perceived empathy of the CA were the mediating variables used. Given the potential for CA's in this industry to further factors that would positively influence consumer perceived knowledge and perceived empathy; some of these factors could be consumer characteristics (like age or specific consumer segments/

cohorts) or firm characteristics (e.g. corporate brand trust), situational factors (e.g. nature of service, type of interaction). Consumer perceived risk in the transaction has been found as moderating variable in the finance and banking context (Trivedi, 2019) as well. Future research including these variables in modelling may offer better understanding of the different factors influencing customer responses other than the design cues themselves.

CONCLUSION

This emerging area, early stage review synthesises the empirical research examining the effects of socio behavioural design cues of CA on the customer responses based on the application of CA (use context) in different stages of the consumer decision journey namely pre purchase, purchase and post purchase across different industry contexts. The synthesis brings out reasons underlying the effects, differences across consumer decision stages and industry contexts, examining the mediators and moderators affecting consumer responses in different industry contexts. The understanding across multiple industries and multiple use contexts is expected to fuel further research to enhance the understanding of the factors affecting the adoption and enhance value to both the firms employing CA's as well as the customer's using them.

TABLE1: Research Issues, Direction

Effect of CA design on customer responses: Modelling Elements	Extant Research; Direction
Design Cues (Qiu & Benbasat, 2010; Qiu & Benbasat, 2009; Rhee & Choi, 2020), (Pantano & Pizzi, 2020; Go & Sundar, 2019) , (Ben Mimoun & Poncin, 2015)	*Visual Cues:* ○ At purchase and post purchase stage, most of the studies examined visual cues whereas there is lack of research examining design cues (auditory cues) of CA at these two phases. ○ Differential effect of visual cues on customer responses and outcomes across use contexts and industry contexts *Auditory Cues:* ○ Few studies examined auditory design cues such as voice gender, pitch, tone, volume and frequency. ○ As voice search is rising and increasing adoption of voice based conversational agents (e.g Alexa), auditory cues becomes imperative area for marketing and consumers researchers to explore in future. *Research Questions:* ○ How voice design elements (tone, pitch, celebrity voice) evoke various customer responses and its effect on customer loyalty and relationship? ○ How to design dialogue and linguistic features to increase customer engagement? ○ In which use and industry contexts do customers prefer voice based CA over text based CA?
Customer responses (Luo et al., 2019; Pantano & Pizzi, 2020; Rhee & Choi, 2020;Trivedi, 2019; Ho et al., 2018; Van den Broeck et al., 2019; Dawar & Bendle, 2018; Araujo, 2018)	*Customer Responses Examined:* ○ Most of the studies have examined customer relational (credibility of /trust in CA), behavioral (purchase intension, recommendation) and cognitive customer responses (perceived usefulness of CA, product evaluation) whereas there are very few studies which examines customer affective responses to brand/firm such as emotional connection/bond, engagement with brand/firm evoked by CA. *Research Question:* ○ What are the factors influencing the adoption of CA and how will it affect customer-brand relationship? ○ How CA can be used to build emotional connect between brand and customer and enhance loyalty?
Moderators (Trivedi, 2019; Qiu & Benbasat, 2010; Qiu & Benbasat, 2009; Rhee & Choi, 2020;Pantano & Pizzi, 2020)	*Moderators:* ○ Different moderators influencing the effect of design cues on customers offered were modelled across use contexts and industry contexts ○ In ecommerce, user gender moderated effect of CA design on customer responses while in finance & banking, customer perceived risk moderated CA effect on customer responses. ○ Future research modelling the effect CA design on chatbot acceptance levels could consider varying effect of consumer level variables (culture, age, education), firm level variable (firm trust, firm type/services) as well as other contextual variable (service/ product type) as moderators to examine the effect on customer responses.. *Research Question:* Future research could examine ○ To examine the effect of demographic (age, education), consumption goal (hedonic, utilitarian), personality, culture, privacy concern and technology readiness moderates effect of CA design on customer experience across various setting? ○ How firm level variables such as firm/brand trust, firm services (person oriented vs. object oriented) and nature of service (high touch vs. low touch) moderates effect of CA on customer responses? ○ How the nature of interaction (informational, transactional and relational) across various stages of consumer journey (pre purchase, purchase, post purchase) moderates customer responses to CA and its design cues?

| *Mediators* (Pérez-Marín & Pascual-Nieto, 2013; Fryer et al., 2017; Coronado et al., 2018; Qiu & Benbasat, 2010; Qiu & Benbasat, 2009; Luo et al., 2019 | *Mediators:* Mechanism which explains effect of CA and its design cue on customer responses differed across phases and industry context. In ecommerce, perceived social presence; in online gaming, perceived autonomy; In healthcare, perceived uniqueness neglect and in media & entertainment perceived interaction enjoyment and In finance and banking *"perceived empathy"* and *"understanding of CA"* were modelled to explain effect of CA's various anthropomorphic design on customer outcomes/responses. Future research can take a holistic approach to explain these differential effect and different mechanism across phases and industry/service context. *Research Question:* Future research can examine; What are the possible mediators explaining customer responses to CA across stages of customer decision journey? Does various design cues (visual, auditory, cognitive) affect customer responses through different mechanism? |

When a Gift Exchange Isn't an Exchange: Why Gift-Givers Underestimate How Uncomfortable Recipients Feel Receiving a Gift without Reciprocating

Julian Givi, West Virginia University, USA

EXTENDED ABSTRACT

The basic tenet of the norm of reciprocity in gift-giving is that, when someone receives a gift, they are generally expected to reciprocate. In many cases—for example, on Valentine's Day, Christmas, and anniversaries—reciprocation is expected to occur immediately (Wooten 2000). Unfortunately, however, when it comes to these "reciprocatory occasions," recipients do not always abide by the norm of immediate reciprocity. Indeed, in a Pilot Study, 93% of participants reported that they have received a gift without giving one in return and/or gave a gift without receiving one in return, for such an occasion.

This research studies whether givers accurately forecast the feelings of discomfort that recipients experience during such situations, the psychological process that underlies givers' forecasts and recipients' feelings, and a downstream consumption consequence. My predictions are as follows:

Hypothesis 1-Hypothesis 2: Givers underestimate how uncomfortable recipients feel when they fail to reciprocate a giver's gift (H1) because givers feel less strongly than recipients that the actions of the two parties imply an imbalance in appreciation (H2).

Hypothesis 3: When givers know before a reciprocatory occasion that a recipient will not have a gift for them, they give gifts more often than recipients prefer.

Study 1 tested **H1-H2**. It was a 2 (Role: *Giver* vs. *Recipient*) × 2 (History: *Prior Gifts Exchanged* vs. *Prior Gifts Not Exchanged*) between-subjects design. In the [*Prior Gifts Exchanged*/*Prior Gifts Not Exchanged*] condition, participants listed a friend with whom they [had/had not] exchanged winter holiday gifts in the last five years (this manipulation tested **H1**'s generalizability). Next, participants read a vignette which explained that it was just after the winter holidays and that they and their friend decided to meet for coffee. Some vignettes (*Giver*) explained that, when they met their friend, they gave their friend a $25 Amazon gift card, and their friend gave them nothing, whereas other vignettes (*Recipient*) explained the opposite. Next, [givers/recipients] indicated the extent to which [their friend/they] would feel uncomfortable, awkward, ashamed, and guilty (*1-7*; henceforth called the "Discomfort-Index") and the extent to which the actions of the two parties would imply an imbalance in appreciation, care, value, and gratitude (*1-7*; henceforth called the "Appreciation-Imbalance-Index").

Givers underestimated how uncomfortable recipients felt, regardless of whether the giver and recipient had ($M_{Giver} = 3.77$ vs. $M_{Recipient} = 4.63$, $p = .002$) or had not ($M_{Giver} = 3.55$ vs. $M_{Recipient} = 4.48$, $p = .001$) recently exchanged winter holiday gifts. Also, givers did not feel as strongly as recipients that the actions of the two parties implied an appreciation imbalance, regardless of whether the giver and recipient had ($M_{Giver} = 2.02$ vs. $M_{Recipient} = 3.43$, $p < .001$) or had not ($M_{Giver} = 1.98$ vs. $M_{Recipient} = 3.10$, $p < .001$) recently exchanged winter holiday gifts.

Study 2 tested **H1-H2**. It employed two conditions (Role: *Giver* vs. *Recipient*), and another between-subjects factor served as a control variable (Giver/Recipient Genders: *Female Giver, Male Recipient* vs. *Male Giver, Female Recipient*). Participants read a vignette which explained that it was Valentine's Day and that they had recently gone on a few dates with someone named Alex. The vignette then explained that the pair made plans to meet for tea at a teahouse that evening. Some vignettes (*Giver*) explained that, when they met Alex, they gave Alex a box of chocolates, and Alex gave them nothing, whereas other vignettes (*Recipient*) explained the opposite. Participants then responded to the Discomfort-Index and the Appreciation-Imbalance-Index. I planned to control for the genders of the giver and recipient (*Giver/Recipient Genders*) because the extent to which reciprocation is expected on Valentine's Day may differ based on this factor.

An ANCOVA on the Discomfort-Index with *Role* as an independent variable and *Giver/Recipient Genders* as a control variable, revealed a significant effect of *Role* ($p = .021$), such that givers underestimated how uncomfortable recipients felt. Also, an ANCOVA on the Appreciation-Imbalance-Index with the same predictors, revealed a significant effect of *Role* ($p < .001$), such that givers did not feel as strongly as recipients that the actions of the two parties implied an appreciation imbalance.

Studies 3A-B tested **H1-H3**. *Study 3A*: The study employed two conditions (Role: *Giver* vs. *Recipient*). Participants listed the name of a friend and read a vignette involving their friend. The *Giver* vignette explained that it was just after the winter holidays and that they and their friend made plans to meet for coffee since they had not seen each other during the holidays because their friend was on vacation. The vignette then explained that, before the participant left for the coffee shop, they remembered they had purchased a variety pack of artisan tea as a gift for their friend; however, they recalled that their friend had said that, because s/he did a vacation in place of the holidays, s/he did not purchase any gifts. Thus, they were not sure whether to give their friend the gift or to not give it. The *Recipient* vignette described the same scenario, only from the recipient's perspective. Next, [givers/recipients] indicated whether they would [give the gift/want to receive the gift] and responded to the Discomfort-Index and the Appreciation-Imbalance-Index as if the giver had given the gift.

Study 3B: The study was like Study 3A, except that the giver had not already purchased the gift and was deciding whether to stop at a store beforehand purchase it.

Givers gave the gift more often than recipients preferred (Study 3A: *Giver*: 88% vs. *Recipient*: 43%, $p < .001$; Study 3B: *Giver*: 72% vs. *Recipient*: 16%, $p < .001$), underestimated how uncomfortable recipients would have felt receiving the gift (Study 3A: $M_{Giver} = 3.03$ vs. $M_{Recipient} = 4.03$, $p < .001$; Study 3B: $M_{Giver} = 3.07$ vs. $M_{Recipient} = 4.47$, $p < .001$), and did not feel as strongly as recipients that the giver giving the gift and the recipient not reciprocating would have implied an appreciation imbalance (Study 3A: $M_{Giver} = 1.72$ vs. $M_{Recipient} = 2.82$, $p < .001$; Study 3B: $M_{Giver} = 1.73$ vs. $M_{Recipient} = 3.31$, $p < .001$).

EXTENDED ABSTRACT

Interviews were conducted with 27 TGD individuals about their gender affirmation journeys. Consumer culture theory and stigma management theory were implemented for interpretation of the data. Results illustrate affiliation cycles, information control, covering techniques, identity pegs, courtesy memberships, and market alliances in relation to consumer choices for the TGD individual.

Transgender and gender diverse (TGD) individuals who choose to begin a gender affirmation journey often find the experience challenging. TGD consumers must strategically interact with brands and products to successfully construct a new identity.

Theoretical Framework

Gender is performative, and the public performance of the TGD gender affirmation journey can be a highly stigmatized process. Stigmatized individuals are those who do not possess full membership in their given culture (Goffman 1963). As a result, these individuals often develop stigma management techniques. In the consumer behavior literature, stigmatized individuals often engage in compensatory consumption activities (Rucker and Galinsky 2008). They are said to have a shaken self (Gao et al. 2009) who engage in restorative consumption behaviors. Although ample research exists on consumer behaviors related to gender, little research exists on transgender and gender diverse consumers. The goal of this paper is to deconstruct the identity creation and communication processes that occur for TGD individuals through the lens of consumer culture (Arnould and Thompson 2005).

Methodology

In-depth interviews were conducted with 27 transgender and gender diverse individuals. Participants were recruited through a community-based participatory research process. Fifty-two percent of the participants identified as transgender women, 37% identified as transgender men, and 11% identified as gender diverse. Each interview lasted an hour and was then transcribed. The data was then inductively analyzed using Weiss's (1994) method of coding, sorting, local integration, and inclusive integration.

Results

The origination of one's TGD status can occur at any point in the individual's life. Several participants mentioned a recognition of this status in their earliest memories, while others acquire this identification at a much later stage in life. One frequently reported life stage by interview participants on when they began their gender affirmation journeys was during the adolescent phases of their lives.

Although being TGD can be an important aspect of one's overall identity framework (and can become highly salient during a gender affirmation journey), it is just one of a complex array of identifiers. For individuals whose authentic self is a binary gender category, once they near their desired self-expression, the TGD element may once again become a more secondary self-identifier. In other words, they may no longer wish to identify as TGD (e.g., transgender man, transgender woman). Instead, they just identify their authentic self as a man or a woman.

Once an individual has come to understand their TGD identity, there are many potential steps along the way in a gender affirmation journey. One of the first steps is often a change in one's dress and appearance. For many interview participants, this is an important step, because this modification of consumer behavior creates an immediate change in the way they are treated by others during social interactions. Information control and disidentifiers are often early practices in stigma management. Here, the individual is still wearing his or her social mask during routine business hours but dabbles in new presentations of self during off-hours. Later, the individual may venture out with this new presentation during more routine interactions with others. In our study, some participants noted rapid changes in dress, hair, etc., while others reported gradual shifts taking place over several years.

Whereas the activities related to information control are the intentional withholding of stigmatizing evidence from others, covering is the act of disclosing one's stigmatizing blemish in as graceful as a manner as is possible. The changing of one's name is a classic covering technique. Participants in our study noted that an informal name change, later followed by a legal name change, and subsequent changes to identification cards were stressful but liberating experiences. Also, once someone had changed their name, they also tended to request from others a change in the use of pronouns.

Stigmatizing traits are sometimes physical elements that are on continuous display. Therefore, if alterations could be made to these traits, then the social identity cue might be muffled or even rectified. Surgery and/or medical treatments are thus a common stigma management technique. The TGD individuals in our research study often laboriously considered these types of consumer purchases. Several participants asserted that hormone replacement therapy helped to bring about desired physical changes that aided in their shift to a more authentic presentation of self. Surgery is another potential healthcare purchase for TGD individuals. Not all interview participants engaged in this step, and the specific surgical procedures they pursued varied according to personal preferences and barriers to access. A few participants described purchasing additional medical services such as electrolysis for hair removal or voice training lessons from audiologists.

As stigmatized individuals flow through the stages of information control and covering, they must continually assess the levels of knowledge others possess about the individual's stigma. The world is divided into the wise, the questioning, and the oblivious. Research participants noted that the reactions from family, friends, co-workers, and significant others were especially salient. As the consumer behavior literature shows, reference group influence is one of the strongest external influences on the individual (Escalas and Bettman 2005). Several participants highlighted how the negative reactions by others to their new presentations of self were acutely stressful. Negative comments from others may even cause the TGD individual to pause and reconsider whether or not they want to continue on their gender affirmation journey.

Some participants reported neutral and positive reactions from others. In these social acceptance activities, the TGD individual is being given a courtesy membership to the social collective. The individual is now treated as if the stigmatizing trait does not exist. As social acceptance grows, the stress attached to the stigma fades.

When transgender and gender diverse individuals are actively engaging in a gender affirmation journey, they often must confront old-fashioned and even outdated perceptions of masculinity and femininity. Also, the reactions of others to the TGD individual's presentation of gender identity are particularly interesting instances of identity negotiations during social interaction. Here, societal gender roles are deconstructed, and social concepts of what is appropriate behavior for men and women are in flux.

Bias Neglect: When Human Bias, but not Algorithmic Bias, is Disregarded

Ipek Demirdag, University of California, Los Angeles, USA
Suzanne Shu, Cornell, USA

EXTENDED ABSTRACT

Previous research has shown that consumers view machines as cold and unemotional (Haslam et al. 2008). While consumers might regard humans as emotional and biased decision-makers, but see algorithms as unemotional and neutral entities, unemotionality does not indicate a lack of bias. Bias is a systemic and unfair discrimination against specific individuals or groups of individuals in favor of others (Friedman and Nissenbaum 1996). When we think about bias, we often think about systemic human biases. Recent work has found that those biases can extend to algorithms as these algorithms' data sets are often based on the actions of biased people. Therefore, although algorithms substitute human processes, it does not mean that they are unbiased.

Algorithms are often biased because the data that the algorithms use come from a biased society (Barocas and Selbst 2016). Human bias is transmitted to or even augmented through algorithms by various means such as training data and data preparation. Therefore, algorithmic decisions can often reflect the existing discrimination, especially if they are trained on past decisions. For instance, Amazon's hiring algorithm had to be terminated since its training data came from the hiring patterns in a male dominant technology sector (Dastin 2018); the algorithm preferred male applicants over female applicants. Although consumers may often consider humans as more biased than algorithms, this paper addresses whether or not this erroneous perception diminishes trust in and satisfaction with human (vs. algorithmic) decisions. We reveal a "bias neglect" phenomenon, i.e., consumers disregarding human bias and trusting human (vs. algorithmic) decisions.

Study 1 ($N = 640$, Amazon Mechanical Turk) used a 2 (Decision type: Human, Algorithm) x 2 (Decision context: Loan application, Employee bonus) between-subjects design. These different scenarios were employed since we aimed to test our Hypothesis in contexts with varying degrees of objectivity. Consumers trust and use algorithms more for objective (e.g., financial) than subjective (e.g., dating) tasks (Castelo, Bos, and Lehmann 2019). Other work has demonstrated that algorithmic decisions were viewed as less fair than identical decisions by humans, in the case of a subjective context (Newman, Fast, and Harmon 2020). As we are interested in perceived bias, we wanted to conduct our study in both an objective context and a subjective context (financial vs. HR decisions) to address these findings and examine our research question in tasks that differ in terms of objectivity. Loan application participants read that they applied for a bank loan and that their application was evaluated either by financial advisors or an algorithm. Employee bonus participants read that their bonus was determined by either human resources or an algorithm.

We predicted and found that loan application (vs. bonus allocation) context was viewed as more objective: $F(1, 640) = 5.43$, $p = .020$. Across both scenarios, algorithmic decisions were deemed less satisfactory ($F(1, 640) = 37.98$, $p < .001$), trustworthy ($F(1, 640) = 29.35$, $p < .001$) and biased ($F(1, 640) = 12.28$, $p < .001$). There was no (Decision type) x (Decision context) interaction. This does not support Castelo et al.'s findings which was that consumers trust and use algorithms more for objective than subjective tasks. A serial mediation analysis uncovered an indirect effect of the human (vs. algorithm) decision on satisfaction through bias and trust, indirect effect = -.073, 95% CI = [-.119, -.032]: human decisions were perceived

as more satisfactory through higher bias and trust. Despite high perceived bias, human decisions were more satisfactory because bias did not have a significant effect on satisfaction, while trust had a large positive effect on satisfaction. This was true in a more objective decision task (loan application) and a less objective decision task (bonus allocation). Hence, Study 2 was conducted to determine why humans were more trustworthy and satisfactory, despite being more biased, consequently demonstrating bias neglect. We also asked could we get a situation where bias is so strong that it diminishes trust? Since bias reduces trust, if we could get trust low enough by increasing bias, then algorithms could be similarly or more acceptable, eliminating bias neglect.

Study 2 ($N = 1280$, MTurk) had a 2 (Decision type: Human Decision, Algorithmic Decision) x 2 (Outcome Fairness: Fair Outcome, Unfair Outcome) x 2 (Outcome Valence: Loan Approval, Loan Rejection) between-subjects design. In this study, we had two goals. First, we wanted to learn why people disregard human bias and trust human decisions more than algorithmic decisions. Based on the affective human-likeness literature, we hypothesized that emotionality could explain this effect. Research has shown that machines such as robots are viewed as lacking human nature abilities, which are emotional (Haslam 2006; Loughnan and Haslam 2007). Affective human-likeness (which are the human capabilities that are affective/emotional) increases the use of algorithms in certain tasks (Castelo et al. 2019). Human-likeness can also indicate being biased. Our second goal was to determine whether unfairness influences perceptions of bias similarly for humans and algorithms. We aimed to create a scenario where bias is so strong that it diminishes trust in humans? Since bias reduces trust, if we could get trust low enough through an unfair outcome, then algorithms could be similarly or more trustworthy and bias neglect might disappear. Accordingly, we manipulated choice type, outcome fairness, and outcome valence in the context of a loan application decision.

We replicated the main effects and the bias neglect mediation in Study 1. Additionally, we confirmed that the bias neglect existed in unfair decisions, indirect effect = -.129, 95% CI = [-.099, -.024]. Importantly, bias neglect existed even in unfair decisions with negative outcomes: indirect effect = -.052, 95% CI = [-.099, -.024]. We wanted to investigate why bias neglect was such a robust enough effect that it even held for negative unfair decisions. A serial mediation revealed why human (vs. algorithmic) decisions were more trustworthy, despite being acknowledged as more biased. Human decisions were more trustworthy because they were viewed as more emotional and therefore biased, indirect effect = -.033, 95% CI = [-.055, -.013]. The positive influence of emotionality on trust was greater than the negative effect of bias; humans were trusted more because they were more emotional, leading participants to disregard the negative influence of bias. Therefore, people might find human decision makers more biased but this does not offset the positive effect of emotionality on trust.

Study 3 ($N = 641$, MTurk), in a 2 (Data handler: Human, Algorithm) x 2 (Decision-maker: Human, Algorithm) between-subjects design, broke down the two stages of receiving a decision in the digital world: data handling and decision-making. We aimed to investigate whether there is bias neglect in both stages. Participants read that their personal data for a loan application was handled either by a human or an algorithm and decided by a human or an algorithm. Hu-

man (vs. algorithmic) data handlers were viewed to be less biased, leading to higher trust and therefore satisfaction. In the same mediation, higher algorithmic bias negatively influenced satisfaction (B = -.086, 95% CI = [-.133, -.043]). Conversely and as in previous studies, human decision-makers were perceived as more biased, trustworthy, therefore satisfactory, while higher human bias had no effect on satisfaction (B = .036, 95% CI = [-.034, .103]). Hence, there was no bias neglect in the data handling stage, while bias neglect existed in the decision-making stage.

In study 4, we examined the differing effects of emotion as an input versus an experience on trust, bias, and satisfaction. We recruited 1044 MTurk participants who were randomly assigned to one of eight conditions in a 2 (Decision type: Human, Algorithm) x 2 (Emotion type: Input, Experience) x 2 (Decision context: Loan application, Health club application) between-subjects design. Emotion as input participants were informed that their application was evaluated, either by a human or an algorithm, who took the participants' feelings into account when making the decision. In contrast, emotion as experience participants learned that the decider determined their application based on the decider's personal feelings at the time of making the decision.

Regardless of which emotion type condition participants were in, we find that when emotionality was made a key part of our manipulations, unlike the previous studies, bias neglect disappeared. Specifically, our serial mediation analysis where we investigated the influence of decision-maker type on satisfaction through bias and trust showed that bias negatively impacted satisfaction: $b_1 = -.055$, SE = .021, 95% CI = [-.097, -.012]. Additionally, a moderated mediation analysis revealed that the influence of decision-maker type (human versus algorithm) on trust through bias was more important when emotion was used as an input (vs. experience): ACME (Emotion as input) – ACME (Emotion as experience) = .111, *p* = .004. This finding was replicated with satisfaction as the dependent variable. In other words, when participants' own emotions were utilized in the decision-making process, human decisions were viewed as more trustworthy and satisfactory due to higher bias than when the decision-maker was experiencing emotions.

In conclusion, across four studies we studied "bias neglect": although algorithms were viewed as less biased, human decisions were more trustworthy and satisfactory. This is true even in unfair decisions with negative outcomes. We also find that bias neglect applies to decision-makers, but not to data handlers. We find that bias neglect occurs since human emotionality is highly desired. Addition-

ally, we find that bias neglect disappears when emotionality is incorporated in the decision-making process by humans and algorithms. Ongoing studies investigate the perceived nature of bias. That is, we go beyond whether individuals think bias is present or not and look into the direction of bias. If people think that a subjective human decision maker implies that the human would favor them, human bias would be desirable. Moreover, we study whether we can reverse bias neglect, with bias decreasing satisfaction for humans and lack of bias becoming highly favorable for algorithms. In particular, we run studies with vulnerable populations (e.g., Asian Americans in the context of college admissions) to see how perceptions of bias can change when the bias is perceived as racially motivated and potentially more impactful if comes from humans (vs. algorithms).

Distinctive Ugliness as a Signal of Luxury

Ludovica Cesareo, Lehigh University, USA
Claudia Townsend, University of Miami, USA
Eugene Pavlov, University of Miami, USA

EXTENDED ABSTRACT

Consumers choose attractive products. Yet, luxury that is distinctively ugly (e.g., outrageous patterns, unflattering shapes, clashing color combinations) is selling well. This research identifies distinctive ugliness as a signal of luxuriousness and fashion-forward nature that consumers recognize. Thus, they choose distinctively ugly products as often as their attractive counterparts.

Drawing on costly signaling theory (e.g., Zahavi 1975; Bird, Smith, and Bird 2001), we identify the value of distinctively ugly luxury. We propose that, because beauty is universally appreciated (Bell 1914; Redies 2007), ugliness can be perceived as costly. Thus, it can signal something of equal or greater value (Zahavi 1975). However, for ugliness to signal, there must be an indication that it is a deliberate choice. Distinctiveness suggests intention; it is not a misjudgment or mistake (Kordes-de Vaal 1996). Thus, we predict that an aesthetic that is both highly unattractive and distinctive (i.e. eye-catching, non-normative, or extreme; Dinwoodie 1996; Fiore 2010) will suggest that the cost sustained was in order to gain something of equal or greater value, that is being from a luxury brand.

Hypothesis 1: *A distinctively unattractive aesthetic is a signal of luxury. Distinctively unattractive products are more likely to be perceived as from a luxury brand than non-distinctively unattractive, as well as both distinctively and non-distinctively attractive, products.*

Furthermore, we propose that distinctively unattractive aesthetics offer the additional signal of being fashion-forward, but only when identified as from a luxury brand. In the context of luxury, the intentional non-normativity of distinctive ugliness suggests innovation, as occurs with technological products (Truong et al. 2014).

Hypothesis 2: *While generally attractive products are perceived as more fashion-forward than unattractive products, when from a luxury brand, distinctively unattractive products are perceived as more fashion forward than non-distinctively unattractive, as well as both distinctively and non-distinctively attractive, products.*

Given that luxury is purchased for its signaling power (Han et al. 2010), we propose that while ugliness will negatively impact product choice in general (Bloch 1995; Bloch et al. 2003), this will not be the case when the product is distinctive and from luxury. The downside of ugliness (Page and Herr 2002; Townsend and Shu 2010) is counterbalanced by the upside of the ability to signal luxury and being fashion-forward. This will mediate the effect of aesthetics on choice.

Hypothesis 3: *While generally, choice is greater for attractive products than unattractive ones, when from a luxury brand, distinctively unattractive products are at least equally as likely to be chosen as distinctively attractive, as well as non-distinctive attractive and unattractive, products.*

Hypothese 4: *Choice of distinctively unattractive luxury products is driven by their ability to signal luxury and be fashion-forward.*

Study 1: Distinctive Ugliness Signals Luxury

Study 1 reveals that a distinctively ugly aesthetic signals the product is from a luxury brand (H1). Participants (1,170 Mturkers) evaluated a random four of 250 non-labeled fashion items.

A regression of luxury perceptions on attractiveness, distinctiveness, and logo prominence, controlling for brand fixed effects and clothing item gender (model adjusted R^2 = 67%) reveals main effects of attractiveness (= .14, t(236) = 4.85, p < .001), distinctiveness (= .17, t(236) = 5.07, p < .001), logo prominence (= .12, t(236) = 4.55, p < .001), and a three-way interaction (p < .01). A spotlight analysis (Spiller et al. 2013) at -1 S.D. of logo prominence (i.e., non-branded items) shows that items rated as unattractive and distinctive rated highest on luxury perceptions ($M_{DistinctiveUnattractive}$ = 6.92, SD = .07; all ps < .01; η^2 > .045; H1).

Study 2: Drivers of Choice of Distinctively Ugly Luxury

Study 2 examines Hypothesis 1-4. Participants (648 undergraduates) were randomly assigned to one of 8 conditions in a 2 (Brand: luxury (Christian Dior) vs. non-luxury (Old Navy)) by 2 (Attractiveness: attractive vs. unattractive) by 2 (Distinctiveness: distinctive vs. non-distinctive) design. Participants saw one of eight versions of a sweatshirt as per condition, rated it, and reported likelihood of selecting the sweatshirt over 20% of its cash value.

The distinctively unattractive sweatshirt was the most likely to be perceived as from a luxury brand (all ps < .038, H1). When the sweatshirt was Dior, the distinctively unattractive one was: 1) Perceived as at least marginally more fashion forward (all ps < .082, H2); and, 2) More likely to be chosen than the attractive non-distinctive one (t(171) = 2.073, p = .040), and equally as likely to be chosen as the unattractive non-distinctive and the attractive distinctive ones (all ps > .247, H3). Moderated mediation (Process macro, model 8, Hayes 2013) reveals that the negative effect of aesthetics on choice, via luxury signaling and fashion forward, was significant only when the sweatshirt was from a luxury brand (H4).

Study 3: The Price of Distinctively Ugly Luxury vs. Non-Luxury

Study 3 examines the real-world list prices for 1,596 luxury and non-luxury products as a function of their attractiveness, distinctiveness, and logo prominence. We find a three-way interaction (t(2773) = 2.19, p = .029, η^2 = .002); a spotlight analysis (Spiller et al. 2013) at -1 S.D. of logo prominence finds that for distinctively unattractive luxury products there is no price premium for attractiveness (F(1, 1669) =.21, NS). This study identifies the exception to the rule that beauty has value; luxury brands charge the same for distinctively unattractive and attractive products.

Study 4: Logo Prominence as a Boundary Condition

Study 4 identifies logo prominence within the luxury context as a boundary condition to the signaling benefit of distinctive ugliness. Supporting H1 and H3, we predict and show that, while loud branding increases choice of an attractive luxury product, with a dis-

tinctively unattractive product, the logo is redundant and does not increase choice (interaction of aesthetics and logo prominence on choice: $(F(1, 201) = 4.72, p = .031, \eta^2 = .023)$.

Discussion

We identify two benefits that a distinctively ugly aesthetic provides its users: it is a signal of luxury and is perceived as fashion forward. Therefore, in the context of luxury, the downside of not being attractive can be counterbalanced by these benefits of distinctively ugly fashion.

I Choose; Therefore, I Am? Impact of Identity Choice on Brand Evaluation

Sheikha Alia, Koc University, Turkey
Niranjan S. Janardhanan, London School of Economics, UK
Ali Faraji-Rad, University of Maryland, USA

EXTENDED ABSTRACT

Individuals define their sense of self to include multiple identities. While some of these identities are assigned to the individual by nature, their parents, coworkers, or the society, such as our national, gender, and ethnic identities. Others can be deliberately chosen or acquired by the individual through desires, choices, or achievements, such as our professional identity (Baumeister 1987; Oyserman, Gant, and Ager 1995). This indicates significant variation in the extent of *choice* inherent in any identity. We examine the effect of highlighting this choice associated with an identity on brand evaluations.

Identity choice refers to the extent of autonomy or intentionality associated with a particular social identity. When an identity is chosen, we argue that individuals are more likely to feel invested in entities associated with this identity. Individuals are known to categorize themselves into ascribed, chosen, or even arbitrary social groups (Garcia et al. 2005), driven by motives of control, belonging, and reduction of uncertainty (Ashforth 2001; Baumeister and Leary 1995). When these groups are chosen, rather than ascribed or random, individuals show higher levels of identification with and affective commitment to the group (Ellemers et al. 1999). Brands targeting a chosen identity may help provide individuals with an affirmation about their choice and likely to make individuals feel a higher sense of self-esteem. Therefore, targeting chosen identities is likely to lead to an increase in favorable brand attitudes. Conversely, targeting an assigned identity may not provide such attitudinal benefits for individuals as they may identify less with these identities in comparison. Thus, we hypothesize that brand evaluations are more positive when brands target chosen rather than assigned identities (*Hypothesis 1*).

The relationship between identity choice and brand evaluation can be explained through the role of psychological empowerment. Targeting a chosen identity is likely to evoke positive affect due to heightened feelings of self-determination and control. Thus, beyond merely the fit between brand and consumer identity, brands targeting a chosen identity reinforces individuals' agency and choice by activating a feeling of psychological empowerment, thereby resulting in favorable brand evaluations. Because assigned identities involve a sense of resignation, targeting assigned identities is likely to be invoke a lower sense of empowerment and a relinquishing of control, which in turn leads to negative feelings towards the brand. In response to the threat to their agency, consumers may evaluate the brand unfavorably to reassert their agency (*Hypothesis 2*).

We, further, hypothesize the boundary effect of self-construals (Markus and Kitayama 1991). Personal choice provides independents an opportunity to express themselves and establish a unique identity. While interdependents prefer choices made by a relevant in-group or an authoritative figure (e.g. mother) as it promotes social harmony and fulfills a sense of group belongingness (Iyengar and Lepper 1999). Thus, independents (and not interdependents) would be more likely to react more positively to a brand emphasizing a chosen identity through an enhanced sense of empowerment, than an assigned identity (Hypothesis 3). We test our predictions across three studies and five identities.

Study 1 (N = 110) showed that a chosen identity in a marketing message garnered more favorable brand evaluations, than an assigned identity. Participants were exposed to advertisements of Brand XYZ that either emphasized an assigned (nationality) or chosen (university affiliation) identity. They saw advertisements for ten miscellaneous products of the same brand, one at a time, and evaluated the brand and indicated the sense of empowerment the brand instilled. ANOVA revealed that participants in the chosen identity condition evaluated the brand more favorably ($M = 4.41$, $SD = 1.47$) than those in the assigned identity condition ($M = 3.46$, $SD = 1.65$), $F(1, 109) = 10.12$, $p = .002$. Bootstrap analyses using 10,000 bootstrap re-samples (Hayes 2013) revealed that the indirect effect of identity choice on brand evaluation through empowerment was significant (point estimate = .53; 95% bias-corrected confidence interval of .18, .94), supporting Hypothesis 2.

To demonstrate the consequences of choice independent of identity importance, we conducted Study 2, where we allowed individuals to choose an identity that is most important to them. 165 participants were presented with four identities, Gender and Nationality (assigned), Koç and Business Graduates (chosen). Participants were asked to rank the identities, the identity ranked as most important was inserted in the advertisement. ANOVA revealed that participants in the chosen identity condition evaluated the brand more favorably ($M = 4.56$, $SD = 1.11$) than those in the assigned identity condition ($M = 4.06$, $SD = 1.32$), $F(1, 164) = 6.93$, $p = .009$. Bootstrap analyses using 10,000 bootstrap re-samples (Hayes 2013) revealed that the indirect effect of identity choice on brand evaluation through empowerment was significant (point estimate = .25; 95% bias-corrected confidence interval of .06, .49), supporting Hypothesis 2.

Study 3 (N = 239) examined self-construal as a boundary condition for the relationship between identity choice and brand evaluations. Participants were randomly assigned to one of the four conditions, identity choice (nationality vs. professional) X self-construal (independent vs. interdependent). The experiment began by priming self-construal using Brewer and Gardner's (1996) word search method. After completing the task, similar to Study 1, participants saw an advertisement and brand evaluation and psychological empowerment were assessed. The conditional indirect effects with bootstrapping (10,000 samples) indicated that the mediation effect of identity choice on brand evaluation via empowerment is positive when primed with an independent self-construal (effect = 0.37, SE = 0.16, 95% CI: .07, .68) but not significant when primed with an interdependent self-construal (effect = -0.09, SE = 0.17, 95% CI: −.44, .23). The index of moderated mediation is significant (estimate = 0.46, SE = 0.23, 95% CI: .02, .93), suggesting that the indirect effect of identity choice on brand evaluation via psychological empowerment varies significantly depending on self-construal.

Scholars have suggested that agency, and the motivation to maintain and reinforce it (Kivetz 2005) is an important consideration in consumer decisions (Bhattacharjee et al. 2014). We extend this assertion and demonstrate empirically that identity choice, which pertains to agency in self-definition, has important consequences for consumer empowerment, and brand evaluations.

In the Face of Self-threat: Why Ambivalence Heightens Consumers' Willingness to Act

Taly Reich, Yale University, USA
Alexander G. Fulmer, Yale University, USA
Ravi Dhar, Yale University, USA

EXTENDED ABSTRACT

Be it the choice to ask for a promotion, negotiate a job offer, or even ask a potential romantic partner out on a date, consumers frequently find themselves faced with the decision of whether to approach or avoid desired outcomes that carry a risk of failure. Approach and avoidance have long been recognized as two fundamental motivations driving human behavior (Elliot 2006; Freud 1920; Higgins 1997; James 1890). Research on reason-based choice suggests that when choosing to approach or avoid, people are more likely to approach options based on their positive features (pros) and avoid options based on their negative features (cons; Shafir et al. 1993). In contrast, we propose that for choices where there is a risk of failure that is self-threatening, consumers who consider both pros and cons of an outcome, that is, generate ambivalence (Priester and Petty 1996), will be more willing to pursue the outcome than those who consider only the outcome's positive features. In seven studies (*N*=1,995), we show that bringing to mind the negatives of an outcome mitigates the threat of failure by reducing the outcome's desirability, while keeping in mind the positives of the outcome encourages consumers to pursue it. Further, we show that consumers do not intuit this effect and are likely not taking advantage of it.

Pretests of the designs of Studies 1-4B and the high self-threat manipulation in Study 5 confirmed that consumers perceived the contexts in these studies as self-threatening (*p*<.001 for all).

Participants in Study 1 considered negotiating their dream job's number of vacation days and wrote either three pros about getting more vacation days (low ambivalence) or one pro and two cons (high ambivalence). Control condition participants simply decided whether to negotiate. The omnibus was significant (χ^2(df=2, n=300)=11.71, *p*=.003). Those generating high ambivalence were more willing to negotiate (79.6%) than those generating low ambivalence (61.6%; *p*=.006) and those in the control condition (58.3%; *p*=.001), the latter two groups not differing (*p*=.626).

Participants in Study 2A considered asking someone who looks like their celebrity crush out on a date and wrote either three pros of dating their celebrity crush lookalike (low ambivalence) or one pro and two cons (high ambivalence). Those generating high ambivalence were more willing to ask their celebrity crush lookalike out (*M*=58.2) than those generating low ambivalence (*M*=49.34; *p*=.021). Those generating high ambivalence also felt more ambivalent (*M*=4.60) than those generating low ambivalence (*M*=3.89; *p*=.011), confirming that our manipulation induced ambivalence.

Participants in Study 2B were given the details of Study 2A, and the majority of them (81%) incorrectly predicted that participants in Study 2A's low ambivalence condition would be more likely to ask out their celebrity crush lookalike, χ^2(1) = 76.88, *p*<.001.

Currently employed participants in Study 3 generated either high or low ambivalence towards a promotion at their workplace. Participants who generated high ambivalence towards the promotion were more willing to ask for a promotion (61.0%) than those who generated low ambivalence (44.0%; χ^2(df=1, n=200)=5.79, *p*=.016). Participants who generated high ambivalence towards the promotion (*M*=2.97) reported lower self-threat than those who generated low ambivalence (*M*=3.56; *p*=.003). Bootstrap analysis (Hayes 2017) revealed that participants who generated high ambivalence felt less self-threat, resulting in greater willingness to ask for a promotion [95% CI: 0.02, 0.36].

As in Study 3, currently employed participants in Study 4A generated either high or low ambivalence towards a promotion at their workplace. Those generating high ambivalence reported that the promotion was less desirable (*M*=5.11) than did those generating low ambivalence (*M*=5.79; *p*<.001). Those generating high ambivalence also reported less self-threat (*M*=2.79) than did those generating low ambivalence (*M*=3.64; *p*<.001). Those generating high ambivalence indicated higher willingness to ask for a promotion (36.3%) than did those generating low ambivalence (11.2%; χ^2(df=1, n=200)=17.19, *p*<.001). Bootstrap analysis (Hayes 2017) revealed that participants generating high ambivalence desired the promotion less, and consequently felt less self-threat, serially mediating greater willingness to ask for a promotion [95% CI: 0.04, 0.58]. The reverse model with self-threat preceding outcome desirability found no mediating path from self-threat to outcome desirability leading to greater willingness to ask for a promotion (95% CI for the indirect effect: [-0.01, 0.15]).

Currently employed participants in Study 4B generated either positive, negative, or ambivalent attitudes towards a promotion at work. The omnibus was significant (*F*(2, 292)=3.20, *p*=.042). Participants indicated higher likeliness to ask for the promotion in the ambivalent condition (M=39.25) compared to both the positive condition (*M*=26.90; *p*=.019) and the negative condition (M=28.89; *p*=.049), which did not differ from each other (*p*=.703).

Participants in Study 5 generated either high or low ambivalence towards an IQ task, described as quicker than a Math task, before choosing between the two. Self-threat was manipulated by varying if one's ability to take the IQ task did (high threat) or did not (low threat) depend on performance on a pre-task. The interaction was significant (*b*=1.20; *p*=.001). In the high self-threat conditions, participants chose the IQ task at higher rates when they generated high ambivalence (76.2%) than when they generated low ambivalence (62.9%; *p*=.016). This reversed in low self-threat conditions; participants chose the IQ task at lower rates when they generated high ambivalence (68.4%) than when they generated low ambivalence (79.1%; *p*=.029).

The current research offers insight into how and when ambivalence leads to an approach motivation, adding to literature on the functional consequences of ambivalence (Cornil et al. 2014; Hershfield et al. 2013; Larsen et al. 2003; Lipkus et al. 2005). Second, it contributes to work on reason-based choice, qualifying the finding that people are more likely to approach an outcome only for its positive features (Barber et al. 2003; Hoch 1984; Shafir et al. 1993; Simonson 1989) by demonstrating that the generation of both positive and negative features can counterintuitively make action towards the outcome more likely within self-threatening contexts. Finally, it extends research examining the relationship between ambivalence and threat (Pagliaro et al. 2012; Reich and Wheeler 2016; Rothman and Vitriol 2021) by illuminating that ambivalence reduces self-threat.

Mobile Ethnography: A New Research Tool in Launching A New App

Amulya Thota, Valley Christian School, USA
Joanna Jones, InterQ Research, USA
Sweta Thota, Universit of San FranciscoUSA

EXTENDED ABSTRACT

Research Purpose:

Why is *Mobile Ethnography (ME)* important as a research method tool and what is its importance for future researchers and managers.

Method and Data:

- With millennials as highest users of mobile phones (90.3%) and the heaviest users and adopters of new apps, it is only natural to assume they are likely to be first ones to adopt the Vimi app.
- Recruiting students should not be mixed with students being a convenience sample as is perceived with most academic research in marketing.
- Since the goal of this study is to understand how college students use Vimi in practice, the researchers recruited 25 students from colleges throughout the U.S.
- All were pre-screened and fell into the category of medium/high mobile and social app usage.
- The participants used Vimi for a week and answered questions throughout the seven days on a mobile ethnography app called (OTS) that tracked their opinions as they completed assignments and explored Vimi's various organizational and chat tools.
- The students were told the specific dates that they would use the Vimi app and answer questions on the app during and after their app experience.

Summary of Findings

This timely research makes conceptual and methodological contributions in a few ways. First, this paper highlights ME as a timely, cost-effective research method tool that allows the researcher to probe the participants for greater insights and get immediate results. Second, through an ME study, this paper demonstrates the steps and procedures that are followed in using ME in testing a new app. Third, the specific in-the-moment insights through comments and videos through ME offer results and reflection on launching a new app such as Vimi and collecting real-time data in a very unique way. Thus, by using ME, researchers can successfully circumvent lapses in memory by capturing observations in real-time.

Key Contributions

ME is an important and timely marketing research tool that captures specific in-the-moment insights through comments and videos and offers reflections on launching a new app such as Vimi in a very unique way. This research could provide the managers with the benefits of using ME as a research method tool that can generate rich data and insights hitherto unknown. Insights such as the positive reactions and the ease with which files could be organized and shared, organizational and filing utility as the main positioning of the app, constructive qualitative feedback on minor UX changes to make the app feel immediately familiar to users are unlikely to be obtained through a traditional research method. These insights not only help with improvising a product but also with insights on positioning the product.

Strike While the Iron is Hot: Temperature Affects Consumers' Appetite for Risk

Josh Lundberg, University of Kentucky, USA
Adam Craig, University of Kentucky, USA
John Peloza, University of Kentucky, USA

EXTENDED ABSTRACT

Risk is inherent in many consumer decisions, from trying an unfamiliar product to choosing between brands at the grocery store. Accordingly, risk has been widely studied by researchers, who have focused on both the elements of the decision itself, such as its similarity to previous decisions (Webb and Shu 2018), as well as personal characteristics of the decision-maker, such as their level of cognitive depletion (Lisjak and Lee 2014). However, the impact of atmospheric cues on consumer decisions involving risk is largely unstudied (Jami 2019), with the exception of two studies regarding auditory pitch (Lowe, Loveland, and Krishna 2019) and elevation (Esteky, Wineman, and Wooten 2017).

We address this gap and extend the risk literature by introducing a situational variable that has been overlooked despite its ubiquity—temperature. Humans are extremely sensitive to temperature, able to detect variations as small as 0.02° C (Jones 2009). Further, consumers experience a wide range of temperatures throughout any given day (e.g., moving outdoors from indoors, walking through the freezer section of the grocery store, etc.). Thus, these mundane experiences may well be impactful on a wide array of consumer behaviors. Across three studies, we find support for a positive relationship between temperature and risk-taking. As temperature increases, consumers' appetite for risk also increases. Further, we find that this relationship is mediated by consumers' response to cues about the opportunity for reward, engagement of the Behavioral Activation System. Finally, and that the relationship between temperature and risk is moderated by the consumer's level of self-confidence.

We theorize that warm temperatures serve as reward cues. This is based on research demonstrating reward-seeking behaviors among monkeys and pre-humans in response to warmth. For example, monkeys are known to engage in rewarding activities such as play, grooming, and mating during warm conditions; meanwhile, they avoid conflict and pursuit of resources during cold (Bernstein 1975, 1976). These behaviors are consistent with theory suggesting that early humans pursued rewards such as sustenance during warm seasons (Watson et al. 1999) and that such search behaviors and reward dependence are linked to neural activity, such as that of the Behavioral Activation System (Cloninger 1986).

Self-confidence (SC) represents individuals' subjective evaluations of their ability to generate positive outcomes (Adelman 1987). The feelings of capability and self-assurance associated with high SC result in different reactions to environmental conditions. Those who feel more capable and self-assured are not as responsive to external influences on their perceptions and behaviors (Mossman and Ziller 1968). In discussing the resistance of those high in SC to environmental influence, Bearden, Hardesty, and Rose (2001) note that these individuals display more consistent decision-making over time. Thus we hypothesize that higher levels of SC will attenuate the effect of temperature.

Study 1 was conducted on Mturk using a conceptual manipulation of temperature. Participants (N = 152, 45% female) viewed a thirty second slideshow of images associated with either heat or coldness. This manipulation has been used in prior work (Halali, Meiran, and Shalev 2016; Zhang and Risen 2014) and produced significant differences in subjective temperature $(= 5.86, = 4.42; t(1, 137.7) = -6.71; p < .001)$. Risk engagement was measured with an incentive-compatible gamble, whereby participants could bet any amount of their $0.30 bonus, and using a scale measure of risk inclination, DO-SPERT (Blais and Weber 2006). Carver and White's (1994) measure of behavioral activation drive was included to gather process evidence. Those in the hot condition gambled significantly more of their income ($= 18$ cents, $= 13$ cents; $F(1, 150) = 6.75, p = .01$) and reported marginally greater inclination toward risky behavior ($= 3.38, = 3.04; F(1, 150) = 3.28, p = .072$). This relationship was found to be significantly mediated by an individual's drive to pursue reward.

Study 2 used therapeutic packs and a student sample (N = 120, 36% female) and utilized a mock retail environment to observe the effect of this manipulation on brand selection. Participants were tasked with finding and selecting five items in the retail store, requiring them to select a national or private brand for each. Private brands are viewed as inherently riskier compared to national brands (Dunn, Murphy and Skelly 1986; Gonzales-Mieres, Diaz-Martin and Trespalacios-Gutierrez 2006) and so their selections served as a measure of risk taking through the portion of private vs. national brands chosen. Those in the hot condition showed greater risk engagement than those in the cold ($= 0.604, = 0.494; F(1, 108) = 4.9, p < .029$). This effect was attenuated at levels of self-confidence higher than average ($\beta = -.153; t(109) = -2,74, p = .007$).

Study 3 analyzed Nielsen Retail Scanner data from the years 2015 to 2018 and from across the United States. We used the sales of twelve product categories, covering over 13,000 UPCs, that were pretested to differ in inherent risk. To assess the effect of temperature we used weather data compiled by the National Oceanic and Atmospheric Administration and utilized a fixed-effects linear regression model. This model controlled for local precipitation and windspeed, product price, systematic monthly differences, and idiosyncratic differences between stores. To observe the interactive effect of temperature and category risk, each product was coded with a risk level $1 - 4$, according to the results of a pretest. This model revealed a significant interaction between temperature and each level of inherent risk such that temperature had a negative effect on the sales of products in the lowest level of risk ($\beta = -.068$, robust SE $= .008, p < .001$), a null effect on the second lowest ($\beta = -.001$, robust SE $= .003, p > .05$), and positive effects on moderate ($\beta = .023$, robust SE $= .005, p < .001$) and high-risk products ($\beta = .018$, robust SE $= .005, p < .001$). These results demonstrate that the relationship between temperature and sales became increasingly positive as the risk associated with purchase increased, indicating that consumers' appetite for risk is attenuated under cold conditions and enhanced under warm conditions.

The Facilitating Effect of Physiological Self-tracking on Organ Donation

Chi Hoang, ESCP Business School, UK
Sharon Ng, Nanyang Technological University, Singapore

EXTENDED ABSTRACT

Encouraging people to support organ donation is not an easy endeavor. Although many people profess to support organ donation, the percentage of organ donors remains low around the world[1] (IRO-DaT, 2020). One of the main impediments to organ donation is the perception that when one donates an organ, one gives up part of the self (Belk, 1990; Belk, 1987). Addressing such belief is a key step in encouraging greater organ donation. In this research, we argue that people may be more willing to donate their organs if they perceive the body as a conglomeration of multiple parts (instead of a singular whole) as this bodily perception reduces the feeling that one is giving up the whole self when donating an organ. More importantly, we propose that physiological self-tracking, or the practice of recording, analyzing, and reflecting on one's biometric data (e.g., steps, heartbeat, and calories consumed; Sjöklint, 2014), may shift people's bodily perception in such a way that facilitates organ donation. We conducted four studies to test our predictions.

We first conducted a pilot study (N = 343) on Amazon Mechanical Turk (MTurk) to ascertain if there is any prima facie evidence to support our proposition. We asked participants to report whether they used a self-tracking device/app and to indicate their opinion on a list of issues, one of which measured the extent to which they supported organ donation. Results showed that compared to non-trackers, self-trackers were more supportive of organ donation ($M_{self-trackers}$=4.28; $M_{non-trackers}$=3.83; $F(1,341)$=16.40, p<.001), confirming our prediction about a positive effect of physiological self-tracking on organ donation.

Study 1 aims to provide causal evidence for the effect of physiological self-tracking on organ donation. We recruited 200 students from a Singaporean university. Participants were randomly assigned to either self-tracking or control condition. All participants were told that the purpose of the study was to obtain their opinion on a self-tracking device. Each participant was asked to wear the device, complete several physical tasks around the campus, and finish a survey about the device afterward. Participants across conditions received identical devices and completed similar physical tasks, but the instructions differed across conditions. Self-tracking participants were instructed to pay attention to the biometric information (i.e., steps, heart rate, and distance) provided by the device, while those in the control condition were instructed to pay attention to how comfortable the device felt on the wrist (i.e., biometric data were not shown to control participants). After the device-evaluation task and in a presumably separated survey, we ask all participants to indicate how comfortable they were to donate their organs and whether they would like to receive an organ donation pledge form. Results showed that participants in the self-tracking (vs. control) condition were more comfortable donating organs ($M_{self-tracking}$=5.49, $M_{control}$=5.08; $F(1,168)$=4.44, p=.04), and more likely to opt to receive the organ donation pledge form ($M_{self-tracking}$=29.8%, $M_{control}$=15.6%; $Wald$=4.17, p=.04).

Study 2 aimed to show that the observed effect is driven by whether people see their body as being unitary or fragmented. Study 2 was also designed to rule out an alternative explanation that self-tracking facilitates organ donation because it enables people to feel a greater sense of bodily self-control (Lupton, 2013; Sjöklint, 2014). We randomly assigned 249 MTurkers to either a self-tracking or no-tracking condition. In the first part of the study, we asked participants to evaluate a computer program (i.e., our self-tracking manipulation). Self-tracking participants were told that the program can track users' physiological information when they perform cognitive tasks. These participants then tested the program by completing an anagram task. After completing the task, self-tracking participants were provided with fictitious feedback on their biometric measures (i.e., calories, heartbeat, sweat rate, and respiration) during the task. Participants in the no-tracking condition completed the same anagram task without receiving any feedback on their physiological performance. In a subsequent and presumably unrelated study, all participants indicated the extent to which they supported organ donation. Participants also completed a scale measuring whether they viewed their body as a unitary whole and another scale measuring the extent to which they felt they had control over their body. Results showed that self-tracking participants were more supportive of organ donation than no-tracking participants ($M_{self-tracking}$=4.31, $M_{no-tracking}$=4.01; $F(1,214)$=4.78, p=.03). Furthermore, a mediation analysis revealed a full mediation through body view (95% CI=[.01; .32]; p<.05) but no mediation through perceived self-control (95% CI=[–.02; .03]; p=.75).

Study 3 provides additional evidence for the proposed mechanism by adopting process-through-moderation approach. We randomly assigned 451 Prolific participants to each condition in a 2 (self-tracking vs. no-tracking)×2 (holistic body-view vs. control) between-participants design. The first part of the study manipulated participants' self-tracking behavior in a manner similar to Study 2. The second part of the study was a reading task meant to manipulate participants' holistic body-view. Participants in the holistic body-view condition read an article that discussed a holistic therapeutic approach, which views all body parts as connected and treats the body as a singular whole. Those in the control condition read an excerpt about three new books. Afterward, participants indicated how comfortable they would be to donate their organs. Results showed a significant interaction between tracking condition and body-view condition ($F(1,432)$=4.28, p=.04). A follow-up contrast analysis showed that in the control condition, self-tracking participants were more supportive of organ donation than no-tracking participants($M_{self-tracking}$=5.83, $M_{no-tracking}$=5.30; $F(1,432)$=4.74, p=.03). Meanwhile, in the holistic body-view condition, participants across tracking conditions did not differ significantly in their support for organ donation ($M_{self-tracking}$=5.33; $M_{no-tracking}$=5.55; $F(1,432)$=.68, p=.41). These results demonstrated that when self-tracking participants were made to think of the body as a unitary whole, the effect of self-tracking was mitigated, further supporting our proposed mechanism.

Findings from four studies demonstrate that physiological self-tracking facilitates more organ donation tendencies. The effects of self-tracking on organ donation were robust across different samples (US, UK, and Singapore) and different manipulations of self-tracking. As such, we suggest promoting self-tracking practice as a means for addressing the current shortage of donor organs and saving more lives.

Are Preference Reversals due to Decision Contexts or Elicitation Procedures? A Theoretical Reconciliation

Chang-Yuan Lee, Boston University, USA
Nina Mazar, Boston University, USA
Carey Morewedge, Boston University, USA

EXTENDED ABSTRACT

Consumer research has documented a variety of decision contexts that produce preference reversals–where people prefer option X over Y in context A, but prefer Y over X in context B due to changes that should not matter from a normative perspective (e.g., intertemporal tradeoffs, adding decoy to choice sets, acquisition versus forfeiture; Ainslie, 1975; Huber, Payne, & Puto, 1982; Shafir, 1993).

While preference reversals have been studied across a variety of decision contexts and from many different theoretical perspectives, most of this research shares one common feature—it elicits preferences through a choice of options. In the present research, we revisit several decision context effects and test whether these preference reversals are solely due to changes in the decision context. We compare preferences for products elicited through choice and monetary valuation (WTP/WTA) in three classic paradigms of decision context effects: intertemporal tradeoffs, acquisition versus forfeiture, and the attraction effect. We propose that preference reversals attributed to decision contexts might be produced by the interplay between decision contexts and preference elicitation methods, and that using choice to elicit preferences is an important factor. In other words, preference reversals between decision contexts might be, paradoxically, more prevalent when preferences are elicited through choice than through WTP/WTA.

Our theory builds on the notion that market-relevant attributes (i.e., attributes that are commonly used to infer the price for an option) are more salient and weighted heavily in monetary valuation than in choice. When pricing a package of macarons, for example, people are likely to pay more attention to the number of macarons contained in the package than to how much time they must wait for delivery. When pricing an apartment, they pay more attention to its square footage or amenities than to its location convenience. We suggest that increasing the salience and weighting of market-relevant attributes should reduce sensitivity to decision contexts that produce a preference reversal by shifting the salience or weighting of attributes in choice. Consideration of market-relevant attributes to comparison standards outside the decision context should reduce the influence of decision context on attribute weighting in preferences elicited through WTP/WTA.

Across scenario-based Experiments 1-4, the results support our hypothesis that decision contexts are less likely to lead to a preference reversal when preferences are elicited with WTP/WTA than with choice. Experiment 2, for example, examined preferences elicited with choice and WTP/WTA in an acquisition versus forfeiture paradigm. In this paradigm, participants were presented with two lotteries, an impoverished lottery and an enriched lottery (Shafir 1993). We used the same choice paradigm as Shafir (1993) and added two additional versions, in which participants expressed their preferences through WTP and WTA. Replicating the original finding, we find that participants were more likely to choose the enriched lottery (over the impoverished lottery) in the acquisition mode than in the forfeiture

mode (76% vs. 47%, $p < .01$). However, in WTP/WTA, participants did not differ in their preferences for the enriched lottery between the acquisition mode and the forfeiture mode (87% vs. 90%, $p = .67$).

Next, we examined our process account by directly manipulating preference elicitation measures, response scales, attribute prioritization, and evaluation order (Experiments 5-8). We show that the difference cannot be explained by the different types of response scales (i.e., typically binary in choice versus continuous in WTP) but rather by a difference in the weight that the attributes receive. When expressing preferences through WTP, relative to choice, people allocate more weight to the attribute that is most related to its market price (e.g., the size of an apartment rather than idiosyncratic commuting times).

This research offers several theoretical contributions. First, decision contexts and preference elicitation methods are often considered separately in the constructed preferences literature (Payne et al. 1993). Our findings suggest that the construction of preferences reflects the deep interplay between decision contexts and the preference elicitation process. Second, preference reversals across decision contexts in choice have been interpreted as showing that consumers have an incomplete preference ordering. Our findings challenge the generalizability of this proposition and suggest that choice may be a less stable measure of preferences than alternative measures like WTP/WTA. Third, prior research demonstrates the violation of the procedural invariance axiom by showing preference reversals between different preference elicitation methods in a single context (e.g., Lichtenstein & Slovic, 1971; Tversky, Slovic, & Kahneman, 1990). Our findings illustrate how decision contexts can create and negate preference reversals between preference elicitation methods.

Donations in Japan: Hometown Tax Donation and Reciprocal Gifts

Yuichiro Hidaka, Okayama University, Japan
Sumire Stanislawski, Tokyo International University, Japan
Kosuke Mizukoshi, Tokyo Metropolitan University, Japan
Shuji Ohira, Chiba University of Commerce, Japan

EXTENDED ABSTRACT

Though Japan has historically had lower rates of charitable giving (Ouchi 2004), it has recently seen an expansion of donations through the introduction of the hometown tax donation system (HTD) by the Japanese government. The HTD allows taxpayers to write off donations to local municipalities as tax deductions based on adjusted income. Municipalities' competition to attract donations led to emphasis on reciprocal gifts, and led to concentration of tax revenue to the most "generous" municipalities with luxurious reciprocal gifts. This trend was criticized as counter to the pro-social origins of the system and mostly benefiting high-income individuals with high deduction limits (Sato 2017). While HTD is a relatively new system for charitable giving in Japan, it has seen wide adoption despite such criticism. This paper aims to further understanding of HTD and consider what drives charitable giving in Japan.

Bekkers and Wiepking's 2011 literature review found reputation to be an important mechanism that drives charitable giving where donations lead to social recognition and approval. Donations are perceived to impress others, and visibility tends to increase willingness to donate (Lee et al. 2020; Winterich et al. 2013). Yet, in Japan, there are critical views of publicly "doing good." Activities related to social good are expected to be done in secret under the beauty of a virtue called *intoku* (literally "hidden good") (Stanislawski et al. 2014). As society expects charitable behavior to be hidden, visible charitable acts can lead to minimal or even negative social reinforcement (Yamamoto and Tanaka 2018). How is HTD influenced by this cultural norm?

Costs and benefits were another major mechanism identified by Bekkers and Wiepking (2011). As costs go down (tax deductions) and benefits increase (reciprocal gifts), donations are predicted to increase. Yet, these factors can shift emphasis from giving to exchange, and "crowd out" intrinsic motivations and psychological benefits such as the "warm glow" effect (Andreoni 1989), dampening giving. Indeed, HTD's emphasis on reciprocal gifts has been widely criticized and led to government intervention limiting the value of reciprocal gifts (Hidaka and Mizukoshi 2018). Yet, this system has also been credited for making donations more accessible to the average Japanese as seen through considerable donations collected in response to disasters (The Mainichi 2018). This is significant because individual charitable giving is historically less common in Japan than in the West (Ouchi 2004). How do donors perceive HTD in relation to self-benefit vs. other-benefit?

To answer these questions, an exploratory research was conducted by interviewing twelve HTD donors using purposive sampling (Etican et al. 2015). As HTD aims to help areas with weak revenue bases, urban interviewees were primarily selected. Additionally, those with various motives (ranging from purely for reciprocal gifts to more altruistic) were recruited. Thematic analysis was conducted on interview transcriptions (Braun and Clarke 2006), and emerging themes were discussed among researchers until agreement was reached.

The appeal of realizing social benefits is said to be effective when donation behavior is visible, while the appeal of self-interest received by the individual donor is more effective when behavior is not visible (White and Peloza 2009). In HTD, the appeal of self-interest is enhanced given that donors do not want to publicly claim donations (since it does not lead to positive reputational effects due to *intoku*) and because donations are linked to income (which most consider private and do not wish to disclose). However, the focus on self-benefit was not seen to "crowd out" intrinsic motivations or prevent "warm glow" as might be expected.

Economic self-benefit was not perceived as problematic by respondents. Rather, reciprocal gifts were credited for stimulating local economies and fulfilling the original intent of HTD to help municipalities struggling with reduced tax bases. Moreover, the act of participating in this system was perceived as intrinsically rewarding, counter to expectations of extrinsic motivations crowding out intrinsic motivations and warm glow effects.

Past studies have shown that social recognition can facilitate donation behavior (Winterich et al. 2013). However, in Japan, donations are influenced by the norm of *intoku*, which is against "showing off" good deeds. Not only that, people are also generally expected to make modest self-presentations that refrain from appearance of self-enhancement (Kitayama et al. 1997). This is considered rational behavior aimed at displaying humility to maintain good relationships with others in mutually cooperative cultures (Heine et al. 2000; Yoshida et al. 2004). In this context, the existence of self-benefitting reciprocal gifts seemed to act as an "excuse" for the charitable act. In essence, reciprocal gifts "hide" the charitable act and make it socially acceptable to practice publicly.

It was found that HTD is driven by people seeking self-benefit from reciprocal gifts. However, people simultaneously found social significance and justified their enjoyment of these goods as contributing to social good by interpreting the reciprocal gift as a way to stimulate local economies. Under this understanding, it is "normal" to get returns for donations, and this act of what is in essence "responsible consumption" is interpreted (at least partially) as socially motivated rather than solely for oneself (Giesler and Veresiu 2014). In HTD, the benefits of reciprocal gifts are a target of vague positioning with dual meaning. This allows room for nurturing intrinsic motivations, and may even influence donor identities where past giving leads to more future giving (Kessler and Milkman 2018).

How and When does a Used (vs. Unused) Account Affect Consumption Behavior?

Siyuan Yin, Wharton School, University of Pennsylvania, USA
Marissa A. Sharif, Wharton School, University of Pennsylvania, USA

EXTENDED ABSTRACT

Consumers frequently have to make choices to spend their resources on an item that they may not need, but want, or hold on to it for later. These resources may be in a used account or an unused account. How does a used (vs. unused) account affect subsequent consumption in the same account? Building off of research on relative judgments (e.g., Morewedge, Holtzman, and Epley 2007; Sharif and Oppenheimer 2016; Stewart et al. 2002), we propose that people engage in within-account comparison, comparing the amount remaining to the original amount. Consumers then perceive the used account as closer to exhaustion, leading them to devalue and be more likely to spend their resources on non-essential items and activities from this account. We provide evidence of this effect in one archive dataset (N=210,586) and six preregistered studies (N=6055).

In the American Time Use survey, we find that consumers are more likely to spend their time on leisure activities, when they are closer to the end of an hour (a used account) than at the start of an hour (an unused account) (p<.001). In Study 2 (N=567), participants considered how to spend their time at 1:50 pm or 2:00 pm; we found that consumers were more likely to spend their time on leisure activities when it was part of a used (vs. unused) account (p=.002).

Study 3 (N=585) replicated the used account effect in a different domain – credit card reward points. In the used account condition, participants imagined that they had accumulated 100K points in a reward program, had spent 70K points, and now have 30K points. In the unused account condition, participants imagined that they had accumulated 30K points in a reward program and now have still 30K points. Participants valued the 30K points less (p<.001), were more likely to spend them (p=.03) in the used (vs. unused) condition; further valuation mediated the used (vs. unused) effect on purchase likelihood.

If our theory is true that a used account increases subsequent consumption due to a within-account comparison, then the likelihood of resource consumption increases only when consumers use resources from the account in consideration, rather than from a separate account. Study 4 (N=1144) introduced a new condition in which participants imagined that they had Card A (70K points) and Card B (30K points). They exhausted Card A but had not used Card B. Consistent with our theory, we found that participants valued the 30K points less in the used account condition than in this two-card condition (p<.001) and thus were more likely to spend the points in the used account condition than in the two-card condition (p=.02).

Study 5 (N=1129) examined how the proportion of account remaining moderates the used account effect in a 3 (available amount: $24, $16, vs $8) x 2 (gift card: used vs. unused) between-subject design. Participants in the used gift card conditions imagined they had $40 on their gift card originally and spent $16, $24, and $32 in the used $24 (60% left), $16 (40% left), and $8 (20% left) conditions. Those in the unused conditions imagined instead they had a $24, $16, or $8 gift card and had not yet spent money from these cards. As predicted, we found the used account effect on subsequent spending depended on how close the account was to exhaustion. In particular, we found a $24 (vs. $8) x used (vs. unused) interaction on the remaining valuation (p=.03) and the spending likelihood (p<.001): participants valued their gift cards less and were more likely to spend their resources in the used (vs. unused) gift card when the used conditions had 20% left in the account compared to 60% left. We found

a similar interaction between the $24 (vs. $16) x used (vs. unused) condition; and no interaction between the $16 (vs. 8) x used (vs. unused) conditions. Thus, our effect is moderated by whether more than 50% is remaining in the used account.

Study 6 (N=1091) examined the impact of the relative account remaining on the used account effect by holding constant the total resources and past spending in a 3 (proportion of account remaining: unused 100%, 75% vs. 25%) between-subject design. In the unused condition, participants imagined that they accumulated points in credit cards A (90K) and B (30K), exhausted Card A, and had 30K on Card B, which had not been used yet. In the used 75% condition, participants imagined they accumulated points in credit cards A (80K) and B (40K), spent 80K of Card A and 10K of Card B, and had 30K left on Card B. In the used 25% condition, participants imagined that they accumulated 120K points in a credit card, spent 90K, and had 30K left. The 30K points were valued less in the used 25% condition than the unused (p<.001) and the used 75% conditions (p=.001), leading to a greater likelihood of spending in the used 25% condition than the unused (p=.03) and used 75% (p=.09) conditions. Thus, we show that the relative proportion of account remaining moderates the used account effect, such that if there is a large proportion of the account remaining, the effect is attenuated.

Study 7 (N=1492) substantiated the used account effect in incentive-compatible online shopping. In the used account condition, participants were endowed with a 1000 reward points account. In the unused account condition, participants were endowed with reward points accounts A (900) and B (100). All participants were asked to spend 900 points on 2 of 20 items (450 points each; $15-$20) that they liked. After two purchases, participants were asked to spend 100 points on 1 of 6 items (100 points each; $2). We replicated the used account effect by showing that participants were more likely to hold onto the 100 points until the last choice with an unused account (56%) than with a used account (48%, p=.003).

This research substantiates our understanding of how the perception of consumers' accounts affects their consumption behavior and provides important implications for consumers and marketers.

When it is Best to be Last: How Constructed Distributions Influence Sequential Judgments

Siyuan Yin, Wharton School, University of Pennsylvania, USA
Maurice E. Schweitzer, Wharton School, University of Pennsylvania, USA

EXTENDED ABSTRACT

Some of our most important decisions involve selecting an option from an ordered sequence. From choosing a house, to buying a car, to hiring a candidate, we often select an alternative from a set of options presented sequentially.

In this work, we describe how the decisions consumers make are influenced by the order in which alternatives are presented. Across five pre-registered experiments (N=2773) and a field study (N=7835), we find that consumers evaluate attractive options more favorably when they are presented last than when they are presented first. We also find that consumers are more enthusiastic about both their selected option and the entire choice set when they evaluate alternatives in ascending quality order than descending quality order.

To account for our findings, we introduce a novel theoretical framework, Constructed Distribution Theory. Using a distribution builder, we show that consumers construct—and re-construct—reference distributions as they evaluate alternatives. Absent detailed information about the distribution, consumers judge early observations as more representative and closer to the global average than later observations. As a result, strong candidates rated early in a sequence are relatively under-valued (judged to be close to average), but weak candidates rated early in a sequence are relatively over-valued (judged to be close to average).

When consumers evaluate alternatives late in the sequence, however, they have a well-developed distribution with which to evaluate candidates. As a result, weak candidates rated late in a sequence are rated more harshly than when they are rated early in a sequence, and strong candidates rated late in a sequence are rated more favorably than when they are rated early in a sequence.

In Study 1 (N=198), participants evaluated six monologue performances. In a pilot study, we randomized the order of these performances and had participants rate the quality of these performances. We then constructed two different order conditions: Ascending order in which the performances increased in quality, and descending order in which the performances decreased in quality. After viewing each performance, participants rated the performer and generated a distribution of their perceptions of the entire pool of candidates. Supporting our theoretical framework, participants rated strong performers more favorably and weak performers more harshly when they were presented last. We also find that participants updated their reference distribution consistent with the order in which they viewed the candidates.

In Study 2 (N=745), we replicate our findings in Study 1 with very different stimuli (singing auditions). In addition, in this study, we show that order effects can influence the overall impression of the full set of candidates. Specifically, participants rated the entire set of candidates more favorably when they had evaluated the alternatives in ascending rather than descending order. This finding is akin to an assessment that the particular pool of candidates is particularly strong or weak.

Next, we consider the possibility that people with detailed information about the distribution will exhibit smaller order effects than those without experience. In Study 3 (N=679), we test this by having some participants view the entire set of candidates twice. In the first stage of the experiment, participants viewed all of the performances (Experience condition) or instead viewed unrelated material (six commercial ads; No-experience condition). In the second stage, participants evaluated the six monologue performances either in ascending or descending order. We find that experience diminishes, but did not eliminate the order effects we document in Studies 1 and 2.

In Study 4 (N=572), we replicate our findings in a different domain with a set of high-quality candidates. In this study, we had professional movers from TaskRabbit who had extensive experience and 5-star ratings create videos to describe their moving experience. In the main study, participants watched 1-minute videos of each mover in either ascending or descending order, rated each mover, and created a reference distribution of the quality of the set of movers. As in Studies 1-3, we find that the strongest candidate was rated best when they were presented last and that all five movers were rated more favorably in the ascending order condition than they were in the descending order condition (all p<.001).

In Study 5 (N=579), we manipulated the sequence to investigate how order effects might change who the decision maker selects as their favored candidate. Specifically, we created sequence orders to privilege either the best mover (presented first or last) or the second-best mover (presented first or last). Consistent with our theorizing, participants in Study 5 were more likely to select the best mover when the best mover was presented last (p=.01), but were more likely to select the second best mover when the second-best mover was presented last (p=.02).

In Study 6 (N=7835), we analyze a largescale field dataset of MBA interviews and admissions. We operationalized the quality of applicants as the score admission readers gave to their written application before the interview, and we operationalize the order as the order of interviews an interviewer had on a particular day. Consistent with the findings in our lab studies, high-quality MBA applicants who were interviewed last on a particular day were rated significantly higher than when they were interviewed earlier in the day (p<.001).

Across our studies, the best candidates were rated more highly when they were evaluated last than when they were evaluated earlier in the sequence. Experience moderates this effect (Study 3), but even experts are prone to order effects (Study 6). We find support for Constructed Distribution Theory: the distributions consumers construct were significantly influenced by the order of the sequence. Our findings substantially advance our theoretical and practical understanding of order effects (e.g., Biswas et al. 2010; Janiszewski et al. 2013; Suk et al. 2012), consumer learning, and dynamic belief updating (Erdem and Keane 1996; Erdem et al. 2008; Zhao et al. 2011).

Sex for Sale: People as Consumable Objects

Nilanjana Mitra, University of Calcutta, India
Ronald Paul Hill, The American University, USA
Himadri Roy Chaudhuri, Xavier School of Management, XLRI, India
Anindita Chaudhuri, University of Calcutta, Department of Psychology, India

EXTENDED ABSTRACT

Women have been stigmatized and commodified for millennia as institutional and structural norms seek to control their sexuality. We examine this condition in the context of sex workers in Calcutta, India who are bought-and-sold through prostitution, culminating in a set of identifiable selves that work to protest this status.

Contextual Framework

A mother neither you are, not a daughter either, or a darling wife Urvashi, as you are, O you remain the dweller of the heavens!!

The above couplet was written by Asia's Nobel laureate as well as poet-philosopher Rabindranath Tagore, who described the situatedness of *Vasabadatta* as a third Century heroine in a Sanskrit drama. She was a *ganika* or courtesan, and part of the profession of prostitution in India that dates back over 5000 years, with its first mention in the ancient text of *Rgveda.* These lines describe the predicament of a sex worker as service provider that is relevant in the context of the contemporary profession that exists on the periphery of society and fails to be fully understood. Hence, it has been subjected to scrutiny without a deeper appreciation of its meanings for consumer research. Specifically, infliction of social dishonor, sexual violence on women, and resulting shame and exclusion that normalizes patriarchal subservience and subjugation have not been considered in this exchange context.

Our emphasis on stigmatization and commodification helps to challenge current understandings of free market systems and people-as-products that is often viewed as an exception which unfolds in limited pockets of illicit sales (Bales 2000). We note that, following Crane (2013), the function of such market-based commodification is to create conditions that dehumanize participants on one side of the exchange equation, who exist in *fringe* zones of institutional legitimacy that are kept beyond the purview of most societal members. The predicament of a sex worker reflects such a bare life, and we examine stigmatization and commodification practices through study of how bodies of *liner-meyes,* or underprivileged sex workers, manifest in Kolkata, India. Through shame, stigma, and physical separation, they are stripped of citizenship rights and subjected to *exchanges*. Yet, women in our study draw on markets to create narratives of protest to stigmatization and commodification in their continuing quest for individuation and, ultimately, social approval.

Etymology of Prostitution

In a sense the terms commodification and prostitution are etymologically connected, as the latter evolved in the 16th Century BCE from the Latin word *prostitutus,* which means women who are *exposed publicly and offered for sale* (Online Etymology Dictionary, retrieved 2020-06-16). Originally, sex workers in India came from four categories of second-class citizenship: "They were born as prostitutes' daughters, or they were purchased, or captured in war, or they were women who had been punished for adultery" (Bhattacharji 1987, 35). Indian societies in the past accepted temporary unions without obligations or *muhurtika*—such affairs were voluntary or professional, depending on the attitude of partners. Over time, prostitution was classified and women were called *varangana, varastri,* signifying she is not the responsibility of a man but looks after herself by accepting payments from men she 'obliges'- hence, the phenomenon of a libidinal market emerged.

This historical and global perspective on women sets the stage for how prostitution and prostitutes have been treated—and for the emergence of two opposing approaches to the profession (Shrage 1994). The first approach is an outcome of patriarchy and capitalism that commodifies women and their sexual activity for the purpose of serving men (see Scott 2020). This paradigm argues that prostitution perpetuates social and economic inequality of women relative to male counterparts, and it implies either that female sexuality can be *owned* by someone other than the woman, or that it is capable of being bought-and-sold by male customers. The alternative paradigm is more libertarian and views prostitution as a natural outcome of varied sexual desires and economic liberties. Prostitutes are, in fact, capitalists who sell their bodies because their decision calculus reveals a net gain relative to what they give up; the profession is little different from other forms of wage labor. Of course, this approach fails to recognize that some women were sold into sexual slavery and may believe that they have little recourse other than to comply (Bertone 2004).

Research Orientation

Therefore, our research team entered into this project with the goal of understanding the process of *coping with stigma* that surrounds these exchange processes. As we learn, uncertainties of sex work in the face of vulnerability revealed efforts to protest stigma. Our research question on stigmatization of sex workers required further analysis and specificity of selves that manifest as women seek to (re)construct their identities (see Pryor and Reeder 2011). This study reveals how people associated with stigmatized individuals are perceived to devalue them, leading sex workers to be fearful and reluctant to disclose their profession (Sanders 2005; Quadara 2008). Ultimately, sex work remains troublesome for governments, even if exchange among prostitutes and clients is decriminalized (Lazarus et al. 2012; Begum et al. 2013; Foley 2017). We also found that sex workers develop an *eudaimonic* self that serves to juxtapose the prostitute with an accomplished social actor. Additionally, identities form around the *provider* self, who justifies her profession by recognizing the good for significant others that higher incomes of sex work provide. Other selves are presented that support more acceptable identities in the face of stigma, and they explicate this social process in a novel consumption-of-person in a libidinal market domain.

Psychologically Accessing Ownership: How Does Psychological Ownership Affect Peer-To-Peer Access-Based Consumption?

Otávio F. B. Teixeira, University of Brasilia, Brazil

EXTENDED ABSTRACT

The feeling of ownership one has over an object, in legal terms or not, generates a cognitive state known as individual psychological ownership (IPO) (Pierce, Kostova, and Dirks 2001, 2003). The current research directs its efforts to investigate the effects of IPO in peer-to-peer access-based consumption (P2P-ABC; e.g., Airbnb), that is, over a type of consumer-to-consumer consumption that may be mediated by the market, but where no transference of ownership takes place (Bardhi and Eckhardt 2012). Inspired by notable works applied to ownership-based consumption (OBC) (Felix and Almaguer 2019; Kirk 2019), the present research proposes that the more individuals can exercise IPO mechanisms (control, e.g., touching an object; self-investment, e.g., designing an object; and intimate knowledge, e.g., analyzing an object) over third-party's items, the more they tend to access (share) it. Precisely, this is expected to occur because of increased chances to exert these IPO mechanisms decrease individuals' psychological discrepancies regarding awaited and obtained benefits from the target, even though these benefits are consumed transiently (Gurven 2006). Therefore, this study seeks to answer the following research question: As is ascertained in traditional transactions where ownerships are transferred, does IPO affect transactions based on access (P2P-ABC)?

In an attempt to investigate the effect of IPO on P2P-ABC, answering the research question robustly, this study also incorporates the mediation role of consumers' utilitarian perception (UP) (Quiggin 1982) and the moderating role of basic individual values (BIV) (as proposed by the Values Theory Refined – Schwartz et al. 2012). In this regard, the current research employs four experiments to achieve its goals: test (i) the main effect of IPO on P2P-ABC (Experiments 1a and 1b), (ii) the presence of an indirect effect of IPO on P2P-ABC via individuals' UP (Experiment 2), and, finally, (iii) the conditional indirect effect in previous causal mediation regulated by the presence of value focus expressed by each person (BIV). The current work adopts the utmost diverse experimental drawings, represented by the use of all IPO mechanisms (control, self-investment, and intimate knowledge), widely used targets in real platforms (e.g., money, accommodation, everyday items – books and kitchenware), several alternative accounts (e.g., convenience, satisfaction), two participants' responses facets (attitude and behavior), and two mediation checks (measurement-of-mediation vs. manipulation-of-mediator).

The results confirmed all the current study's Hypothesis. Specifically, Study 1a supported the hypothesis (H_1) that the greater someone's IPO over a potentially accessed third-party target (book), the greater his chances of use (P2P-ABC) [MdnL.IPO = 5 vs. MdnH.IPO = 6; MrankL.IPO = 1.579 vs. MrankH.IPO = 2.162, U = 633, z = 2.531, p < .05, δ = .564].

Study 1b reinforced Study 1a findings (H_1) through a different design (e.g., P2P lending as the target) [attitudinal: MdnL.IPO = 5 vs. MdnH.IPO = 5.67; MrankL.IPO = 748 vs. MrankH.IPO = 1.143; U = 252, z = -3.092, p < .05, δ = .856; behavioral: χ2(1, N = 61) = 3.92, p < .05].

Study 2 confirmed the hypothesis (H_2) that individuals' UP mediates the effect of IPO on P2P-ABC [before: MdnUt = 6 vs. MdnPl = 5.83 ; MrankUt = 1.338 vs. MrankPl = 1.363, U = 622, z = .479, p > .05, δ = .111; after: MUt = 3.34, SDUt = 1.56 vs. MPl = 4.13, SDPl = 1.49; t (71) = -2.21, p < .05, δ = .518].

Study 3 confirmed the hypothesis (H_3) that the effect of IPO on P2P-ABC via UP is regulated by the focus of values (BIV) [Social Focus: (CI95%) = (.04, .87); Personal Focus: (CI95%) = (-.485, -.002)].

Noteworthy that all the alternate accounts were rejected (e.g., involvement).

Theoretically, the study extends IPO (Pierce, Kostova and Dirks 2001, 2003) and ABC research (Teixeira, Caldieraro, and Medeiros, 2020) by seldomly linking them, demonstrating that proportionating individuals with high levels of control, self-investment, and intimate-knowledge over a third-party's target, accessing this item enhances. This conclusion sounds counterintuitive considering that a factor theoretically grounded in pro-ownership practice is used to induce a non-ownership-based consumption. In addition, this work adds to the utilitarian literature (Sheth, Newman, and Gross 1991), extending the importance of targets' functional attributes toward ABC context and revealing, through an experimental technique, the causal mediation of individuals' UP, which is indicated as a displaced critical factor by past research (Eckhardt et al. 2019). Lastly, this works shows that depending on the focus of values individuals hold (personal vs. social), their proneness to access third-party's objects may change, considering that their UP may be threatened or strengthened. This final finding simultaneously adds and contrasts previous studies (Piscicelli, Ludden, and Cooper 2018) in BIV literature (Schwartz et al. 2012).

Managerially, this research proposes a set of actions for ABC practitioners and consumers. For example, considering the importance of the IPO mechanisms to induce P2P-ABC, Airbnb may reduce fees for those hosts that frequently stimulate their guests to fully use the amenities, reminding the visitors to use the accommodations as it were "YOUR" own home (high control). In this regard, DesignerShare, a P2P-ABC fashion company, may financially encourage its providers to permit consumers to adjust and customize the accessed outfits (high self-investment). Furthermore, based on the premise that people must perceive utilitarianism in the accessed targets so that IPO has an effective impact on P2P-ABC, companies like LendingClub (P2P-ABC money lending platform), for example, should highlight their products and services practical benefits such as loan diversity and stimulate their users' IPO over the platform by sending "exclusive" information about them (high intimate knowledge). P2P-ABC transport platforms such as Cabify may take advantage of the BIV prominence proven in this research to promote advertisements directed toward users with a higher personal focus, detaching the company image by its innovative services with regular transport consumption (e.g., private cars) and competitors (e.g., cabs and Uber).

Enhancing Trustworthiness to Gain Sustainable Development: The Signaling Effect of Voluntary "Hostage Posting" on Consumer Behavior

Soo Yeong Ewe, Monash University Malaysia
Motoki Watabe, Monash University Malaysia

EXTENDED ABSTRACT

The impact of Covid-19 has been accelerating consumers' purchasing to change from face to face to online in the world. At the online platforms, consumers have to depend more on the provided information on websites, which is controlled by sellers. Online purchase potentially increases such asymmetry of information, leading for customers to distrust and indecisive on purchasing. Therefore, how to reduce the uncertainty to develop trust from potential customers for sales increase should be worth to investigate.

One way to develop consumers' trust is to voluntarily provide self-sanctioning to signal that the company will compensate consumers if the products do not perform as desired (Nakayachi & Watabe, 2005). Hostage posting (HP) is a commonly used concept in Economics, which refers to a self-sanctioning system in an uncertain situation (Schelling, 2006; Yamagishi, 2011). It would be an effective signal to develop trust from consumers because the self-sanctioning imposes costs to provide and maintain, and it is costly for the company if they do not keep to their promise (Raub, 2004). Since Nakayachi & Watabe (2005) did not examine the HP effects under a buying behaviour context, it is not clear that their argument is the case in consumer service. This research aims to examine the direct effect of voluntary HP on consumer's buying intention, and perceived trust on two types of products with different warranty effect, i.e. sim card and air-conditioner.

The other purpose is to examine the moderating effect of group polarization on the voluntary hostage-posting effects. Group polarization refers to a phenomenon that the opinion of a group after a discussion will tend to be more extreme than the initial opinions of individuals before the discussion (Chen et al., 2001). In addition, this shift of group decision also shifts individual decision toward the same extreme way, known as "risky shift/ cautious shift." Thus, if individuals have chance to group discussion via online communication, the voluntary HP could have more effects on each individual after the discussion. As this possibility has not been tested in the current literature, this research also aims to examine the hypothesis that group polarization would amplify the effect of voluntary HP.

Through experimental approach, this research hypothesized that :

Hypothesis 1a: *Voluntary HP will increase intention to buy the product compared with non-voluntary HP.*

Hypothesis 1b: *The above effect will be stronger with group decision-making than with individual decision-making.*

Hypothesis 2a: *Voluntary HP will increase perceived trust by participant to product makers compared with non-voluntary HP.*

Hypothesis 2b: *The above effect will be stronger with group decision-making than with individual decision-making.*

Research Method

One hundred and thirty-one participants participated in this study. Sixty-six were assigned to the individual condition group, and another sixty-five to the group condition group. This study employed a 2 (voluntary HP vs. no HP) x 2 (individual vs. group) x 2 (sim card vs. air conditioner) experimental design. The manipulated conditions of individual and group used a between-subjects design whereas the voluntary HP and the consumer products used a within-subjects design. The selection of sim card and air-conditioner is to compare the effect of voluntary HP between the condition with lower warranty effect (i.e. sim card) and higher warranty effect (air-conditioner). The data collection was conducted during the covid-19 pandemic period (June-mid of Nov 2020), so online experiment was performed instead of physical experiment. The potential participants were invited via public platforms and online experiments were arranged after the agreement of the participants had been obtained.

Results

Intention to Buy

The results of repeated measures ANOVA reveal that in both sim card and air-conditioner scenarios, participants have higher intention to buy the product with warranty (Wilks' Lambda = 0.865, $F(1, 129) = 20.104$; $p < .001$; partial $\eta^2 = 0.135$). Hence, hypothesis 1a is supported. The repeated measures result also shows that there is a significant difference in terms of behavioral intention between individual and group condition ($F(1, 129) = 10.405$; $p < .01$; partial $\eta^2 = 0.075$). Therefore, hypothesis 1b is also supported.

Perceived Trust

The results show that there is a significant difference in perceived trust between the product with and without warranty ($p < 0.001$). It indicates that participants tend to trust more on product with warranty than those without warranty. Therefore, hypothesis 2a is supported.

In order to compare the perceived trust between individual and group condition, mean difference of Brand A and B, as well as mean difference of Co. A and B were computed for both individual and group condition for both sim card and air conditioner scenario. Thereafter, the mean difference (MD) for brand and company were combined and the total perceived trust scores were compared between individual and group condition. The results show that participants tend to trust more the product with warranty in group rather than in individual condition ($MD_I = 5.2424$ vs. $MD_G = 7.9385$; $F(1, 129) = 4.372$, $p < 0.05$, partial $\eta^2 = 0.033$). Therefore, hypothesis 2b is also supported.

Discussion and Implications

From the results, voluntary HP positively influenced consumer purchase behavior and perceived trust. Furthermore, this effect was enhanced by the group polarization effect. It is worth noting that the moderating effect of group polarization is larger in sim card than air conditioner condition. As the warranty effect in the sim card condition is smaller than the air conditioner condition, the results suggest that group polarization effect may be larger for the product with low warranty than one with high warranty. Including this possibility, future investigation may explore this difference across different types of products in more details. It would also be better if we could have measured actual decisions rather than the hypothetical scenario-based decisions.

This research also provides practical implications that the combination of voluntary hostage posting, and group discussion opportunity would reduce the uncertainty in consumers' purchase decisions. Especially when consumers are not familiar with the company's brand, warranty, and money back guarantee, with an opportunity for an online discussion would positively work.

Frequency, Probability, or Total Number? A Comparison of Different Mathematically Equivalent Presentations' Effect on Risk Perception During Covid-19

Yun Jie, Sun Yat-sen University School of Business, China

EXTENDED ABSTRACT

Since the beginning of the COVID-19 outbreak, the release of information about infections rates has been a matter of critical importance. Many governments and media outlets have updated information about infection rates daily. For example, the U.S. Center for Disease Control and Prevention (CDC) releases information on the total number of cases of infection and infection rate every day. In the CDC's information releases, total cases are expressed as a single number, while the infection rate is expressed as cases per 100,000. Similarly, websites such as ourworldindata.org/coronavirus, among others, also have presented total number of confirmed cases and infection rates, the latter expressed as confirmed cases per million. Our research question is: How do different presentation formats influence people's perceived risk of COVID-19 infection?

In the remainder of this paper, we refer to the total confirmed cases as the *total cases* format and the form of A/B (e.g., 1 in 1,000) as the *frequency* format. A third format of a decimal number between 0 and 1 is referred to as the *probability* format (e.g., 0.001). Clearly, probability and frequency can be converted to each other with no loss of information, and all three formats can be converted to one another if population information is available. Furthermore, although both the probability format and the total cases format can take *only* one form, there can be more than one frequency expression of the same probability when numerators and denominators are varied. For instance, 0.01 can be expressed as 1 in 100, 10 in 1,000, etc. Despite researcher have studied the probability-frequency difference across medical, legal, business, meteorological, and psychological domains, little is known about differences in perceptions of mathematically equivalent frequency formats.

Study 1 (preregistered at https://aspredicted.org/blind.php?x=6ap9v7) randomly assigned 359 MTurk participants into five conditions (frequency formats with numerators 1/10/100, total case with/without population information). Participants read the following scenario: "Suppose you are doing business in a foreign country of **1 billion** (bolded in the original material) population. You need to make an urgent business trip to this country, and travel to multiple cities. However, you are hesitating because of COVID-19 there. According to a credible information source, you know that **1/10/1,000 in every 10,000/100,000/1,000,000 people are currently infected.**" In the total case groups, the bolded part read "**100,000 people in total are currently infected in this country.**" The country's population information was not revealed in the total case without population group. After reading the scenario they needed indicated their perceived risk of travelling, perceived likelihood of infection and intention to make the trip. We found no perceived risk differences among the three frequency formats, although there are significant differences among all five groups. Post-hoc pairwise test revealed that the differences among the five groups were mainly driven by the two total cases groups vs. three frequency groups.

Study 2 (preregistered at https://aspredicted.org/blind.php?x=4dv2fn) adopted a similar scenario, and assigned six hundred and twenty –two CloudResearch approved MTurk participants into nine conditions (frequency formats with numerators 1/10/100/1,000/10,000/100,000, total cases, probability, mix of probability and total cases). Overall, there are significant differences among the nine conditions. The first seven frequency conditions can be divided into two groups, with the first four smaller numerators (numerators 1-1,000) constituting Group 1, and latter three (numerators 10,000, 100,000, and total cases) constituting Group 2. Specifically, 1. there were no significant differences among the first four experimental conditions in Group 1, replicating study 1's results; 2. There was a discernable increase in perceived risk from Group 1 to Group 2. That is, there was a significant increase in risk perception when the numerator increased from 1,000 to 10,000 and to 100,000. 3. There were no significant differences among the three groups in Group 2 (numerators 10,000, 100,000 and total cases). 4. The probability format indeed lowered risk perception by a large margin; mixing the probability and the total cases resulted in a medium level of perceived risks. A planned linear contrast with the last three groups showed a significant upward linear trend among the three groups $(t(210)) = 7.30$, $p < 0.001$. Finally, Study 3 replicated that mixing probability and total cases lead to a medium level of perceived risks.

Based on the results, we are offering four pieces of advice for decision makers choosing between the frequency and total number of cases formats when releasing information:

1. If the goal is to make sure people know the total number of cases, directly providing the total number of cases (vs. frequency) is advised.
2. If the goal is to reduce perceived risk, providing a frequency format with a small numerator is advised (e.g., X in 100). In addition, the 1-in-X effect suggests not to use 1 as the numerator.
3. If the goals are both for people not to overestimate risk and to provide them with the correct total number of cases, then using a mix of frequency and total number of cases formats is advised.
4. Although the probability format is less observed in practice, mixing it with the total number of cases can significantly reduce risk perception.

This paper asks a simple question: how do different presentation formats of the same COVID-19 information affect perceived risks? Particularly, we explored whether differences exist for the two most frequently used formats: total cases and frequency. We found people consistently perceived higher risks from total cases than frequency. Practitioners should be aware of this difference and make format choices conscientiously. Theoretically, we have identified boundary conditions for denominator neglect. We found no evidence for denominator neglect among frequency formats of relatively close numerators. Only when the numerators are several orders of magnitude apart discernable differences began to emerge. Last but not least, we found that mixing formats can moderate perceived risks.

Rating Inflations in Two-way Rating Systems – The Role of Perceived Closeness

Yongseok Kim, University of Texas at San Antonio, USA
Jihye Jung, University of Texas at San Antonio, USA
Emma Gibbons, University of Texas at San Antonio, USA

EXTENDED ABSTRACT

As peer-to-peer (P2P) and sharing economy business models have become prevalent, leading online platforms like Uber, eBay, and Airbnb have begun to adopt a two-way rating system. Unlike the conventional one-way rating system in which only consumers rate providers, the two-way rating system allows both consumers and providers to rate each other. In P2P models, individuals can participate as both providers and consumers through a platform that mediates transactions of goods and services between them (Einav, Farronato, and Levin 2016). Thus, the two-way rating system is believed to play a key role in building trust and facilitating transactions among strangers in this P2P setting (Resnick and Zeckhauser 2002). Despite its growing importance, little is known about the impact that the two-way rating system has on consumers' rating decisions. In this research, we investigate whether and how the two-way rating system would cause systematic biases in consumer ratings, relative to the one-way rating system. Specifically, we focus on the consumer's psychological state when reviewing others while also being reviewed by them as a potential cause of bias.

A handful of studies have empirically tested the effect of two-way rating systems on user-generated ratings (Bolton, Greiner, and Ockenfels 2013; Dellarocas and Wood 2008; Zervas, Proserpio, and Byers 2021). While these studies suggested an increase in user rating in the two-way relative to the one-way system, the reason for this increase is largely unexplored. Existing research discusses consumers' fear of retaliation as a potential explanation. Acknowledging this possibility, many platforms adopting two-way rating systems have recently modified their policies to allow consumers and providers to see how they were rated *only* after both parties have submitted their ratings of each other. However, empirical evidence shows that rating inflation still exists even after this modification (Fradkin, Grewal, and Holtz 2020; Zervas, Proserpio, and Byers 2021). This implies that fear of retaliation alone may not explain the whole story and that rating inflation may be a multiplicity effect driven by several factors.

In this research, we propose that a consumer's evoked perception of being closer to the provider may drive this inflation. Previous research on interpersonal closeness documented that subtle and even incidentally induced psychological closeness with another person can lead to behaviors favorable to the individual (Burger et al. 2004; Finch and Cialdini 1989; Dubois, Bonezzi, and De Angelis 2016; Jiang et al. 2010). Research on social identification (Duck 1977) has shown that relatively superficial levels of similarity (e.g., same occupation) influence in-group/out-group distinction and subsequent judgmental evaluations (Duck 1977; Tajfel 1982). From this insight, we predict that when both consumers and providers have an opportunity to rate each other, consumers are more likely to think of their transaction partner as a similar and connected entity that is close to them. An increased feeling of closeness in two-way rating systems makes it easier for consumers to take providers' perspectives and to care more about the providers' benefit and welfare, resulting in more generous consumer ratings.

We further explore a boundary condition of this predicted effect: when consumers experience relational failures with the counterpart providers, the rating inflation in the two-way rating system is attenuated because it hinders consumers' establishment of perceived closeness with the providers. In the context of our research, relational failures are associated with negative experiences that occur in the interpersonal interaction with providers.

Five studies test these predictions utilizing multiple methodologies, real and hypothetical behaviors, diverse samples, and different transaction contexts. In Study 1, we demonstrate that consumer ratings are higher in the two-way system than in the one-way system within a controlled experiment in the context of a used goods online marketplace. Consumers' perceived closeness was also greater in the two-way system. A mediation test revealed that perceived closeness indeed mediated the rating inflation found in the two-way system condition.

In Study 2, we further explored the underlying process of perceived closeness by testing it through moderation. We hypothesize that in two-way rating systems, consumers offer better ratings to the counterpart providers due to their increased perceived closeness with the providers. This implies that the inflation should attenuate if the consumer's perceived closeness to the service provider is already high. To test this idea, we operationalized existing closeness by categorizing participants by whether or not they have worked as a driver for a ride sharing service. The results show that rating inflation in the two-way system was observed only when participants had not worked as a driver and thus the existing perceived closeness to the driver was low, but not when participants had worked as a driver and the existing perceived closeness level was high. Additionally, a moderated mediation analysis found that perceived closeness mediated the rating inflation only for participants without driver experience. A series of parallel mediation analyses did not show a significant indirect effect of fear of retaliation.

In Study 3 we examine the boundary condition described previously within the context of vacation rentals. As expected, in the functional failure condition, participants in the two-way rating system gave better ratings. However, in the relational failure condition, there was no difference in ratings between the one-way system and the two-way system. Perceived closeness mediated the rating inflation when the service failure was caused by functional issues, but not when the service failure was caused by relational issues.

Studies 4A–4B examine our predictions with real user rating data from Tripadvisor and Airbnb, representing a one-way and two-way system, respectively. We specifically compare the ratings of hotels that have been cross listed across the two platforms, and again find that ratings are more positively skewed when using a two-way rating system. In Study 4B, we linguistically analyze the review text (using LIWC) to demonstrate that consumers on Airbnb use more positive words and less negative words in expressing their accommodation experience, compared to those on Tripadvisor. Drawing from previous literature suggesting that interpersonal closeness increases the use of informal language in conversations (Bickmore 2005; Wish and Deutsch 1976), we expect and find that review texts are written more informally on Airbnb compared to Tripadvisor.

"Does A 'Made In China' Label Make People Show Less Care For Products?"

Evelynn Devos, Ghent University, Belgium
Mario Pandelaere, Virginia Tech, USA
Anneleen Van Kerckhove, Ghent University, Belgium

EXTENDED ABSTRACT

Country-of-origin labels indicate where a product originates from and serve as cues that allow consumers to make inferences about products and their attributes (Bilkey and Nes 1982; Schooler 1965). Products that are made in less economically developed countries, such as China, are biased with pejorative quality and price expectations (Bilkey and Nes 1982; Interbrand 2005; Schniederjans, Cao, and Olson 2004; Verlegh and Steenkamp 1999). China is currently the world's largest exporter of goods (McKinsey Global Institute 2019), making the label globally widespread, and, the most relevant label to research. While country-of-origin-labels have been found to impact consumers' product perceptions and attitudes (Verlegh and Steenkamp 1999), little is known about how these biased expectations impact product care.

We believe that country-of-origin information may affect product care because it affects quality and price perceptions, which, together, form the perceived value of a product (Zeithaml 1988). Perceived product value is a consumer's assessment of the utility of a product based on a sum of what is received (quality) for what is given (price) (Cronin et al. 1997). Ackermann, Mugge and Schoormans (2018) proposed that products' functionality (quality) and expensiveness explain product care: if the product offers features that are valued by the consumer and when the product is expensive, a consumer is more likely to take care of that product. Moreover, as consumers expect high-quality products to last longer, they are willing to put effort in product care activities (Ackermann et al. 2018). These assumptions, however, have never been tested. We show that the 'Made in China' label makes consumers value a product less, and, therefore show less care for it.

Study 1A (N=79): tests the effect of a 'Made in China' label on product care. Participants imagined doing their laundry and were randomly shown a clothing care label of a white T-shirt; these differed only in country-of-origin label: 'Made in China' or 'Made in Italy' (positive clothing-country image). Afterwards product care, operationalized as the extent to which participants were inclined to abide by the label care instructions (α=.51, see summary table). Results showed that participants were less likely to wash their T-shirt in accordance to the care label instructions when it carried the 'Made in China' label (M=3.84, SD=1.45) than when it was 'made in Italy' (M=4.70,SD=1.40;t(77)=2.67,p=.009,Cohen's d=.61).

Study 1B (N=130): using a similar design like study 1A, explores the proposed underlying process through mediation. Furthermore, product care intentions were measured in a more direct manner than in study 1A. Again participants imagined doing their laundry and saw a care label with either 'Made in Italy' or 'Made in China'. Subsequently, we had participants report the perceived price and quality of the T-shirt (together: value of the t-shirt, r = .64), and their intention to show care for the T-shirt (r = .68; see summary table).

As predicted participants were less motivated to show care for the 'Made in China' T-shirt (M = 4.97, SD = 1.22) than for the 'Made in Italy' T-shirt (M = 5.38, SD = 1.15; t(128) = 1.97, p = .051, Cohen's d = .35). Mediation analysis confirmed that the 'Made in China' label leads to decreased value perceptions of the T-shirt, which in turn lead to decreased care intentions (ab = -.51, Boot SE = .13, 99% CI [-.93, -.23]; 10,000 samples).

Study 2 (N=256): manipulates the mediator value perceptions of the product rather than measuring it (Spencer, Zanna and Fong 2005). Thus, in addition to manipulating country-of-origin label ('Made in China' or 'Made in Italy'), we also created three value conditions. In the control condition, no value information was given (cf. study 1A/B). In the high (low) value condition, participants either saw that the hot beverages maker received a 4.5 out of 5 (1 out of 5) star rating and costed $529 ($59). Here, we expect no significant difference between careful use. Participants were told they were about to make their favorite hot beverage when the machine warned them to "REPLACE FILTER". Participants, then saw the machine with value manipulation/country-of-origin cue, and read the care recommendation to replace the machine's filter as soon as possible to avoid early breakdown. Subsequently, participants reported whether they would immediately replace the filter (careful use) on three items, perceived quality and price (details see summary table). Participants who had seen value information were asked whether they found the price and quality used in the scenario high (manipulation check).

Results showed that our value manipulation had worked, and, that when no additional value information was provided, consumers intended to significantly replace the filter sooner when the machine was 'Made in Italy' than when it was 'Made in China'. Here, participants delay care for the Chinese-made machine, because they value the machine less (ab=-.35,Boot SE=.13, 99% CI[-.75, -.08]). No significant difference in delaying care was found when value was manipulated (see figure 1 and summary table for test statistics). Admittedly, participants' intended care in general is high. In hindsight, this may be explained by the fact that delaying the water filter change may impose a direct risk to the health of participants as harmful contaminants are not removed. Health risk may function as another facilitator of product care which could be an interesting avenue for future research.

Study 3 (N=112) investigates actual behavioral effects of the label by testing whether consumers would exert more pressure on an identical pen when it displayed a 'Made in China' label versus no label. We operationalized product care as exerted pressure on the pen because objects break down or bend more easily the more force is applied to them. Participants were told they were testing the interface of tablet prototypes through an analogy game. In reality, they filled in analogy tests with their pen on a pressure measuring tool. Results show that participants exerted more pressure on the pen when it was labeled 'Made in China' (in grams; M=210.6, SD=66.29) compared to when it was unlabeled (M=171.6,SD=55.34;t(110)=-3.38, p=.001;Cohen's d=.65).

Why is it Wrong to Sell Your Body? Understanding Liberals' vs. Conservatives' Moral Objections to Bodily Markets

Shreyans Goenka, Virginia Tech, USA
Stijn van Osselaer, Cornell University, USA

EXTENDED ABSTRACT

Commercial bodily markets involve the buying and selling of the human body and its components (Hoeyer 2013). These markets include prostitution, commercial surrogacy, the trade of organs (e.g.., kidney, liver) and bodily products (e.g., blood plasma, sperm, breast milk), and even the trade of human cadavers. Needless to say, commercial bodily markets are morally contentious.

Numerous scholars have deliberated upon the morality of bodily markets (e.g., Chadwick 1989; Davis 1937; Erin and Harris 2003; Satz 2012; Weitzer 2010). Notably, existing scholarly research in this area has largely taken a prescriptive approach to discuss the morality of bodily markets. That is, the authors take a stance on whether the bodily market is morally acceptable or unacceptable and then present an argument for their position.

In the present research, we deviate from past research to take a descriptive approach. That is, we do not take a stance on whether these markets are morally right or wrong. Instead, we seek to understand lay consumers' moral attitudes towards these bodily markets. *Why* do people find bodily markets to be morally objectionable? What are the underlying beliefs that shape these objections? Importantly, how do these moral attitudes differ for liberals and conservatives?

Understanding the heterogeneity across the political spectrum is important because the bodily markets provoke heated political debates. Policymakers often struggle to understand the stance of their constituents, resulting in public outcry when misguided regulations are introduced (e.g., New York state's awry attempt to legalize commercial surrogacy (Wang 2019)). Moreover, policymakers also misunderstand the moral stance of the opposing political party, resulting in protracted political battles that stall progress (e.g., the five-year political impasse around India's surrogacy laws (Banerjee and Kotiswaran 2021)). Consequently, it is vital for policymakers to understand the moral objections of their specific liberal or conservative constituents to introduce representative legislation. Furthermore, it is also important for advocacy groups and think tanks engaged with the bodily markets to understand how laypeople's moral objections to the bodily markets might differ across the political spectrum to better engage their target segments.

Hence, this research examines lay consumers' moral objections to the bodily markets and how these objections might differ for liberals and conservatives. To examine this, we utilize a phenomenon-construct mapping approach with a descriptive goal (MacInnis et al. 2020). This approach allows us to capture the complexity of a real-world phenomenon using an appropriate theoretical lens and then generate implications for stakeholders engaged with the bodily markets. We draw from the Moral Foundations Theory (Haidt 2007) to posit that liberals *and* conservatives find bodily markets to be morally wrong. However, they will object to bodily markets for different reasons.

Specifically, we propose that liberals' moral objections towards bodily markets are driven by their adherence to the individualizing (harm and fairness) moral foundations. As per the Moral Foundations Theory, liberals (vs. conservatives) are especially cognizant of situations where individuals are harmed or denied their rights (Haidt and Graham 2007). In the context of the bodily markets, we would expect this to manifest as concern about exploitation in these markets. That is, liberals are attuned to the notion that the commercialization of these markets can cause harm to vulnerable people and magnify the entrenched inequality in society. In other words, liberals' adherence to the individualizing moral foundations makes them more likely to believe that bodily markets can become another means for rich buyers to exploit poor sellers, causing the latter systematic physical, psychological, and economic harm. Thus, liberals should be particularly sensitive to exploitation concerns in bodily markets.

Contrastingly, we propose that conservatives' moral objections towards the bodily markets are driven by their adherence to the purity moral foundations. This is because, conservatives (vs. liberals) are especially sensitive to preserving social, psychological, spiritual, physical, and physiological purity (Haidt and Graham 2007). In the context of the bodily markets, we would expect this to manifest as concern about the violation of the sanctity of the human body in these markets. That is, conservatives believe that the commercialization of these markets places a monetary value on the human body and reduces it to become like any other commodity. In other words, conservatives' adherence to the purity foundation makes them more likely to believe that the inherent sanctity of the divinely created human body is diminished or corrupted when it is bought or sold. Thus, conservatives should be particularly sensitive to violation of sanctity concerns in the bodily markets.

Five studies examined liberals' and conservatives' moral attitudes towards bodily markets. Study 1 assessed how socio-political leaders use different moral objections (exploitation vs. violation of sanctity) in real-world discourse to persuade their target audience. Study 2 demonstrated how the different moral concerns can be utilized to design more persuasive targeted advocacy campaigns. Study 3 demonstrated how the different moral concerns can be utilized to design more persuasive targeted donation appeals. Study 4 demonstrated causality by showing that inducing liberal versus conservative political identity changed sensitivity to the different moral concerns. Further, this study also demonstrated that liberals are more likely to punish the buyers over the sellers, but conservatives prefer to punish both the buyers and the sellers in the bodily markets. Finally, study 5 showed that the political differences in moral concerns manifest for bodily markets with live bodily products but attenuate for bodily markets with dead bodily products.

This research is the first, to the best of our knowledge, to demonstrate the heterogeneity in moral objections to bodily markets across the political spectrum. Importantly, this research generates novel implications for policymakers and advocacy groups. First, our findings show how socio-political leaders utilize the different moral objections to persuade their respective audiences. Second, we show how the different moral concerns can be utilized to design more persuasive targeted marketing campaigns. We demonstrate this in the context of deploying marketing campaigns to encouraging consumer advocacy and in the context of soliciting political donations. Third, the findings show how liberals and conservatives support different regulatory laws that punish buyers versus sellers.

Are Conservatives Less Likely Than Liberals to Accept Welfare? The Psychology of Welfare Politics

Shreyans Goenka, Virginia Tech, USA
Manoj Thomas, Cornell University, USA

EXTENDED ABSTRACT

It is well known that conservative political leaders tend to be against federal welfare programs. This is not only true of the leaders; conservative voters, even those of low-income, tend to disfavor welfare distribution policies (Gilens 2009; Skitka and Tetlock 1992, 1993). However, as far as we know, this stream of prior research has only examined attitudes when a third party is the recipient of welfare (i.e., "should the government provide economic assistance to other people?"). Considering the well-documented discrepancy between personal behaviors and social attitudes, conservatives' aversion towards welfare programs might not apply when conservatives need to accept welfare assistance for themselves. In other words, prior research cannot speak to whether and how low-income conservatives eschew welfare programs for themselves (i.e., "should I accept economic assistance from the government?").

In this research, we examine whether the willingness to accept welfare depends on political orientation. Are conservatives less likely than liberals to accept welfare for themselves? If so, when and why does this difference occur? Moreover, what strategies can policymakers deploy to mitigate the discrepancy between liberals' and conservatives' welfare acceptance?

We propose that the difference in welfare enrollment between liberals and conservatives depends upon whether the welfare program has a work requirement. Specifically, if a welfare program has a work requirement, conservatives are just as likely as liberals to enroll in it. However, if the welfare program does not have a work requirement, conservatives are less likely than liberals to enroll in it. Thus, we propose that for conservatives, participating in welfare programs might not be a purely economic decision. Their moral intuitions can interfere with cost-benefit reasoning, thus rendering the participation decision a moral decision rather than an economic decision. Paradoxically, this prevents some conservatives from accepting the much-needed economic assistance designed to help them.

We develop our conceptual framework by drawing from the Moral Foundations Theory (Graham et al. 2013). This theory proposes that moral values are comprised of two broad foundations. yet sometimes so variable? The *individualizing* foundations (care and fairness) emphasize protecting individuals and provide for individual rights in society. Contrastingly, the *binding* foundations (authority, loyalty, and purity) emphasize the group's welfare. These foundations suppress individual autonomy and self-expression to bind people into social entities such as families, clans, and nations (Graham and Haidt 2010). Notably, a large volume of research has demonstrated that conservatives tend to endorse the binding values more than liberals (Kivikangas et al. 2021).

One critical consequence of the binding values is that they motivate people to sacrifice their self-interest in the service of their group's welfare (Haidt 2012). That is, the binding values nudge people to place group welfare above their own welfare. Consequently, these people are less likely to engage in behaviors that might hurt their community or hinder the long-term success of their group.

We build on this theorization to propose that the binding values, in the quest to promote group success, create an aversion to free welfare, and reduce the propensity to enroll in welfare programs without work requirements. This is because the binding values make people sensitive to accepting welfare that draws from their group's limited resources. In other words, because the binding values prompt people to place group welfare over their individual welfare, they come to believe that accepting free welfare can make a person a "burden" on society and hurt the success of the community. Thus, the binding values reduces conservatives' likelihood of enrolling in welfare programs that do not require some form of repayment to society (i.e., attached work requirements).

Now, if conservatives' participation in free welfare programs is indeed dampened by their adherence to the binding foundations, then the effects should be mitigated by framing the free welfare program to be in concordance with the binding moral intuitions. Thus, we propose that employing a similar strategy should counter the aversion and increase welfare enrollments.

We examine our propositions in the context of a policy change for a federal welfare program. In 2009, the work requirement policy was waived for the U.S. federal supplemental nutritional assistance program (SNAP; formerly Food Stamps). This policy change served as a natural experiment for us to test our hypothesis. We analyze participation data prior to 2009 to show that when SNAP had a work requirement, liberal and conservative households were equally likely to enroll in the program. After 2009, however, when SNAP waived the work requirement, conservative households were less likely than liberal households to enroll in this program. To corroborate these results, we conducted preregistered controlled experiments using samples of low-income participants. These experiments show that conservatives are less likely than liberals to enroll in welfare programs only when the program does not have a work requirement. Further, the studies also demonstrate that conservatives' adherence to the binding values drives this discrepancy. Finally, we show how policymakers can utilize marketing messaging strategies to mitigate this effect and boost conservatives' welfare participation in programs without work requirements.

The findings present a novel conceptualization of how lower-income individuals' economic decisions are influenced by a complex interplay of utilitarian considerations and moral evaluations. In other words, we show that conservatives' moral intuitions can interfere with cost-benefit analysis and influence their economic behaviors.

Importantly, this research presents several practical implications for policymakers and federal agencies. First, these results inform the ongoing debate surrounding the work requirement policy. Our results show that waiving the work requirement policy does not uniformly increase welfare participation for all sections of lower-income individuals. Second, we show how government agencies can redesign welfare marketing materials based on these moral insights to boost conservatives' welfare participation. Hence, this research can help policymakers better understand the impact of their policy decisions and facilitate the implementation of outreach strategies to boost societal welfare.

The Bundle Halo Effect: Why Bundles Are More Attractive Than the Same Items Offered Separately

Franklin Shaddy, UCLA, USA
Stephanie Tjoa, UCLA, USA

EXTENDED ABSTRACT

Past work on bundling—offering multiple products for a single price—has largely focused on pricing, exploring implications for firms (Adams and Yellen 1976; Burstein 1960; Dansby and Conrad 1984; Schmalensee 1982; Telser 1979) or reactions from consumers (Chakravarti, Krish, Paul, and Srivastava 2002; Hamilton and Srivastava 2008; Janiszewski and Cunha 2004; Khan and Dhar 2010; Morwitz, Greenleaf, and Johnson 1998). Here, we ask whether the *very act* of bundling has a more basic effect on consumer perceptions. Specifically, we propose the *bundle halo effect*: Consumers not only view bundles as more attractive than the same items offered separately, but also view an item that is presented as part of a bundle as more attractive than the same item presented in isolation.

We draw from the "group attractiveness effect" in social cognition—the finding that people seem more attractive when evaluated as a group than when evaluated individually (Carragher et al. 2018, 2019; Walker and Vul 2013; van Osch et al. 2015)—to motivate our Hypothesis: Might it imply a parallel bundle halo effect in consumer behavior? Given that extant work examining the pricing of bundles has demonstrated they are viewed as greater than the sums of their parts (Shaddy and Fishbach 2017), we test the prediction that an item presented as part of a bundle is more attractive than the same item presented in isolation.

We provide evidence for this prediction across six studies (*N*=3,832; four preregistered).

In Studies 1-2, we employed a 3 (condition: bundle vs. bundle-member vs. separate; between-participants) × 5 (product type: cookware vs. knives vs. skincare vs. tools vs. electronics; within-participants), mixed design. We presented items as a bundle (bundle), a bundle with items labeled individually (bundle-member), or in isolation on different pages (separate). In Study 1 (MTurk; *N*=606), participants in the bundle condition rated the attractiveness of each bundle, and those in the bundle-member and separate conditions rated the attractiveness of each item: "How attractive do you find [this bundle/item]?" ("Not at all attractive"=1; "Very attractive"=7). In Study 2 (MTurk; *N*=600), we measured purchase intentions by averaging three items ($\alpha = .93$): "How likely is it that you would purchase [this bundle/item]?" ("Not at all"=1; "Very likely"=7); "Would you recommend purchasing [this bundle/item]?" ("Definitely would not recommend"=1; "Definitely would recommend"=7); and "How much would you like to have [this bundle/item]?" ("Not at all"=1; "Very much"=7). Across Studies 1–2, participants in the bundle condition rated items more attractive and expressed greater purchase intentions, relative to both the bundle-member and separate conditions (attractiveness: M_{bundle}=4.94, vs. $M_{bundle-member}$=4.41, p<.001, vs. $M_{separate}$=4.13, p<.001; purchase intentions: M_{bundle}=4.61, vs. $M_{bundle-member}$=4.37, p=.037, vs. $M_{separate}$=4.02, p<.001). They also indicated items were more attractive and expressed greater purchase intentions in the bundle-member condition (p=.005) than in the separate condition (p=.002).

We designed Study 3 (behavioral lab; *N*=198) to test whether consumers are more likely to *choose* bundles, relative to the same items offered separately. Study 3 employed a single-factor (condition: bundle vs. separate), between-participants design. Participants rated the attractiveness of and desire for various university-branded items (as a bundle or separately) and were offered a consequential choice between a $7.50 Amazon credit or all the items they evaluated. Participants indicated greater attractiveness and desire for items in the bundle condition than in the separate condition (attractiveness: M_{bundle}=4.59, vs. $M_{separate}$=4.29, p=.107; desire: M_{bundle}=4.32, vs. $M_{separate}$=3.78, p=.012) and were more likely to choose items in the bundle condition (62%) than in the separate condition (49%, $\chi^2(1)$=2.99, p=.084).

In Study 4 (MTurk; *N*=1,006), we manipulated the strength of the bundle's gestalt impression through brand (mis)matching (Rahinel and Redden 2013), predicting the bundle halo effect would attenuate for unmatched brands (due to the weaker resultant gestalt impression). Study 4 employed a 2 (condition: bundle vs. separate) × 2 (brand composition: matched vs. unmatched), between-participants design. Participants rated the attractiveness of three knives, presented as either a bundle or separately, which were either the same brand or different brands. Participants indicated brand-matched items were more attractive in the bundle condition (*M*=5.36) than in the separate condition (*M*=4.76; p<.001). But we did not observe a bundle halo effect for unmatched brands. Specifically, participants indicated brand-unmatched items were equally attractive in the bundle condition (*M*=4.85) and in the separate condition (*M*=4.69; p=.373).

In Study 5 (MTurk; *N*=401), we tested whether the extent to which the whole subjectively feels greater than the sum of its parts mediates the bundle halo effect by measuring the importance of replacing a missing item (Shaddy and Fishbach 2017). Study 5 employed a single-factor (condition: bundle vs. separate), between-participants design. After rating the attractiveness of cookware items, participants imagined that they actually owned the items, discovered one was missing, and indicated how important it would be to replace it. Participants rated items more attractive and believed it would be more important to replace a missing item in the bundle condition than in the separate condition (attractiveness: M_{bundle}=5.84, vs. $M_{separate}$=5.20, p<.001; desire to replace: M_{bundle}=5.69, vs. $M_{separate}$=5.21, p=.005). The desire to replace mediated the effect (95% CI=[.083,.326]).

Finally, we designed Study 6 (MTurk; *N*=1,021) to rule out a competing explanation—the possibility that selective attention to just the most attractive elements of a bundle positively biases overall evaluations. Study 6 employed a 2 (condition: bundle vs. separate; within-participants) × 2 (order: bundle-then-separate vs. separate-then-bundle; between-participants), mixed design. If selective attention explains the bundle halo effect, then asking participants to rate the items separately and *then* as a bundle would increase the salience of variation in attractiveness across items, attenuating the effect. Participants rated the attractiveness of knives as a bundle *and* separately, exhibiting the bundle halo effect in both separate-then-bundle condition (M_{bundle}=5.42 vs. $M_{separate}$=4.90; p<.001) and bundle-then-separate condition (M_{bundle}=5.39 vs. $M_{separate}$=5.21; p<.001). Regardless of evaluation order, the bundle was more attractive than the same items presented separately. In fact, the separate-then-bundle order produced the larger bundle halo effect, contravening a selective attention account.

The bundle halo effect makes an important contribution to the growing literature exploring the psychology of bundling (Hong and Bonezzi 2021; Karataş and Gürhan-Canli 2020; Shaddy and Fishbach 2017; Weaver et al. 2012). Linking two otherwise unrelated

literatures—social cognition and consumer behavior—this research possibly helps explain why bundles seem to have become so ubiquitous in recent years. Our findings suggest that firms would benefit from merely framing or presenting items as part of a bundle, due to the positive spillover from the resulting halo. In other words, products, like people, are simply better together.

Evolving Choice Sets: The Effect of Dynamic (vs. Static) Choice Sets on Preferences

Taly Reich, Yale University, USA
Jennifer Savary, University of Arizona, USA
Daniella Kupor, Boston University, USA

EXTENDED ABSTRACT

Most decision-making research examines static choice sets, in which the decision-maker evaluates all the options at the same time. However, many real-world decisions are characterized by dynamic choice sets, in which initial options are evaluated first and establish a salient standard of comparison (Simonson et al., 2013), and then a dynamic option emerges and is evaluated against that salient standard. Consider a student searching for an internship. Once she receives two offers, assuming neither is strictly-dominating, she begins deliberating (e.g., does she prefer to be in her desired location or to maximize her salary?). While evaluating this initial set of options, a new offer emerges. The central argument in the current research is that her decision is likely to be different in this situation, when her choice set is dynamic, than if she initially evaluated the three offers all at the same time, as a static choice set. This effect occurs even though she chooses from an identical set of options at the time of her final decision. Moreover, dynamic presentation can have opposite effects on preferences based on the relative position of the dynamic option compared to the initial choice set. To explain these findings, we propose and provide evidence for a unified theory based on perceived variance of the underlying attribute distribution.

We posit that dynamic choice sets are processed differently than static sets, because people are more sensitive to changes from a salient reference point (i.e., the position of the dynamic option relative to the comparative set) than they are to the final outcome (i.e., the final three option choice set; Kahneman and Tversky 1979). Moreover, because people are sensitive to the direction of change from a reference point, dynamic presentation shifts preferences in opposing directions based on the position of the dynamic option relative to the standard established by the initial options. Previous research has shown that in many decisions involving tradeoffs among attributes, consumers focus relatively more on one of the attributes (i.e., the salient or prominent attribute, Evangelidis, Levav, & Simonson, 2018; attributes with all unique values, Dhar and Sherman 1996). We leverage these extant operationalizations of focal attributes to propose that consumers will primarily attune to relative changes in the focal attribute value when a dynamic option emerges. Specifically, when the focal attribute value of the dynamic (new) option falls *outside* the initial comparative set, it *increases* the perceived variance the underlying distribution of that attribute. In contrast, when the focal attribute value of the dynamic (new) option falls *within* the initial comparative set, it *reduces* perceived variance of the focal attribute. Finally, we build on the established positive correlation between perceived variance, attribute weighting, and preferences (Meyer & Eagle, 1982; Myers & Alpert, 1968; Sujan & Bettman, 1989), to further predict that when consumers perceive more variance in the focal attribute, they will weigh that attribute more heavily and preferences will shift towards the option that is best on the focal attribute. In contrast, when the dynamic option is within the initial comparative set and consumers perceive relatively less variance in the focal attribute, preferences will shift towards the option that is best on the other, non-focal, attribute.

For example, imagine if the student in the opening example initially received two internship offers in which salary was the focal attribute and location was the non-focal attribute: one for $800/week in her preferred location, and one for $900/week in a less preferred location. These offers establish the comparative standard. When she later receives a third offer for $1000/week (also in the less preferred location), this dynamic option is outside the initial comparative set on the focal attribute, and she will come to perceive more variance in the distribution of internship salaries than if she had evaluated the three job offers at the same time. As a result, she will be more likely to choose the higher salary option, compared to if she had evaluated all three offers as a static choice set. In contrast, if her initial options were the $800/week-preferred location and $1000/week-less preferred location internships, the dynamic addition of the $900/week-less preferred location offer within the initial comparative standard would reduce the perceived variance of internship salaries, and she would be more likely to choose the offer that is best on the non-focal attribute – that is, the internship in the best location.

In sum, we propose that when the dynamic option is outside the comparative standard for the focal attribute, perceived variance of the focal attribute will increase, and preferences will shift toward the option that is best on that focal attribute. By contrast, when the dynamic option is within the comparative standard for the focal attribute, perceived variance of the focal attribute will decrease, and preferences will shift toward the option that is best on the non-focal attribute. We provide evidence in support of these Hypothesis using two classic choice paradigms: an asymmetric dominance choice set and a compromise choice set (Dhar & Simonson, 2003; Huber, Payne, & Puto, 1982; Simonson, 1989). Moreover, two pre-registered experiments test the full conceptual framework and demonstrate the mediating role of relative perceived variance.

Study 1. Study 1 ($N = 406$), uses an asymmetric dominance choice paradigm with three apartments: Apartment A, Apartment B, and Apartment C, which varied on location and rent (see Table 1A). Pretesting revealed that rent was the focal attribute. Participants were assigned to one of three conditions: (1) They viewed all three apartments simultaneously (i.e., the *Static* condition), (2) They initially viewed Apartments A and B, and then Apartment C was dynamically presented (i.e., the *Dynamic AB-C* condition), or (3) They initially viewed Apartments A and C, and then Apartment B was dynamically presented (i.e., the *Dynamic AC-B* condition). As predicted, dynamic (vs. static) presentation of the choice set affected choice share, $X^2(4) = 18.25$, $p = .001$). Compared to the *Static* ABC condition, the dynamic presentation of Apartment C (i.e., the apartment for which the focal attribute was outside of the initial options) shifted preferences towards the apartment that was best on the focal attribute ($X^2(2) = 10.37$, $p = .006$; Table 1A). Compared to the *Static ABC* condition, the dynamic presentation of Apartment B (i.e., the apartment for which the focal attribute was inside the initial options) shifted preferences towards the option that was best on the non-focal attribute ($X^2(2) = 7.53$, $p = .023$; Table 1A).

Study 2. Study 2 ($N = 500$; https://aspredicted.org/blind.php?x=es22rv) conceptually replicates Study 1 with a different asymmetric dominance choice set (job options which varied in their location and weekly salary, see Table 1B), and tests the proposed process. As in Study 1, participants were randomly assigned to either the *Static* condition, the *Dynamic AB-C* condition, or the *Dynamic AC-B* condition. Conceptually replicating Study 1, analysis revealed that dynamic (vs. static) presentation of the choice set affected choice share, $X^2(4) = 38.67$, $p < .001$). Compared to the *Static ABC* condi-

tion, the dynamic presentation of Job C (i.e., the option for which the focal attribute was outside of the initial options) shifted preferences the option that was best on the focal attribute ($X^2(2) = 16.26$, $p < .001$; Table 1B). Compared to the *Static ABC* condition, the dynamic presentation of Job B (i.e., the option for which the focal attribute was inside the initial options) shifted preferences towards the option that was best on the non-focal attribute ($X^2(2) = 18.94$, $p < .001$; Table 1B).

Before participants chose an option they indicated their relative perceptions of variance (measure adapted from prior research; e.g., Brauer & Er-Rafiy, 2011; Phillips et al., 2018): "Is the biggest difference between these job offers their location or is it their weekly salary?" (1 = The biggest difference between these job offers is their location, 7 = The biggest difference between these job offers is their weekly salary). A one-way ANOVA revealed a significant effect of condition on perceived variance, $F(2, 497) = 10.15$, $p < .001$. As predicted, planned contrasts revealed that compared to the *Static ABC* condition ($M = 4.61$, $SD = 1.86$), presenting Job C dynamically led people to perceive relatively more variance in the focal attribute (i.e., weekly salary; $M = 5.04$, $SD = 1.74$; Fisher's LSD: $p = .032$), whereas presenting Job B dynamically led people to perceive relatively less variance in the focal attribute ($M = 4.16$, $SD = 1.74$; Fisher's LSD: $p = .019$).

To test whether change in relative perceived variance mediates the effect of dynamic presentation on choice share, we conducted two mediation analyses (Hayes 2013). Consistent with our theory, compared to the *Static ABC* condition, the dynamic presentation of Job C (i.e., the option for which the salary attribute was outside of the initial options) increased the perceived relative variance of the salary attribute (i.e., the focal attribute), which in turn shifted preference towards Job C (i.e., the higher salaried job; 95%CI for the indirect effect: [.0049, .1279]). Also as predicted, compared to the *Static ABC* condition, the dynamic presentation of Job B (i.e., the option for which the salary attribute was inside the initial options) decreased the perceived relative variance of the salary attribute, which in turn shifted preference towards Job A (i.e., the lower salaried job in the better location; 95%CI for the indirect effect: [.0111, .1280]).

Studies 3A-3B. Studies 3-4 replicated this phenomenon in the context of three different compromise choice sets. First, in Study 3 ($N = 489$), participants made a choice between three cars that varied on ride quality and fuel efficiency (Table 1C). Pre-testing revealed that fuel efficiency was the focal attribute. As in Studies 1-2, participants were randomly assigned to either the *Static* condition, the *Dynamic AB-C* condition, or the *Dynamic AC-B* condition. Condition affected choice share, $X^2(4) = 107.59$, $p < .001$ (Table 1C). Compared to the *Static ABC* condition, the dynamic presentation of Car C (i.e., the car for which the focal attribute was outside of the initial options) shifted towards the option that was best on the focal attribute ($X^2(2)$ $X^2(2) = 13.22$, $p = .001$; Table 1C). Compared to the *Static ABC* condition, the dynamic presentation of Car B (i.e., the car for which the focal attribute was inside the initial options) shifted towards the option that was best on the non-focal attribute ($X^2(2) = 73.95$, $p < .001$; Table 1C). We replicated this same pattern among a different compromise choice set (in which participants chose between three different television options) in Study 3B ($N = 481$; Table 1D).

Study 4. Study 4 ($N = 800$; https://aspredicted.org/blind.php?x=6ey3tk) conceptually replicates this finding in a third compromise choice set (apartments that varied on distance from work and general condition, Table 1E), and tests the proposed process. Pre-testing revealed that distance from work was the focal attribute. As in the prior studies, condition affected choice share ($X^2 = 129.21$, $p < .001$; Table 1E). Compared to the *Static ABC* condition, the dy-

namic presentation of Apartment C (i.e., the apartment for which the focal attribute was outside of the initial options) shifted preferences towards the option that was best on the focal attribute ($X^2(2) = 8.69$, $p = .013$; Table 1E). Compared to the *Static ABC* condition, the dynamic presentation of Apartment B (i.e., the apartment for which the focal attribute was inside the initial options), preferences shifted towards the option that was best on the non-focal attribute ($X^2(2) = 20.37$, $p < .001$; Table 1E).

Participants indicated relative perceived variance using the same procedure and measure described in Study 2. A one-way ANOVA revealed a significant effect of condition on perceived variance, $F(3, 796) = 8.70$, $p < .001$. As predicted, planned contrasts revealed that compared to the *Static ABC* condition ($M = 5.30$, $SD = 1.44$), presenting Apartment C dynamically led people to perceive relatively more variance in the focal attribute ($M = 5.61$, $SD = 1.26$, Fisher's LSD: $p = .031$), whereas presenting Apartment B dynamically led people to perceive relatively less variance in the focal attribute ($M = 4.97$, $SD = 1.52$; Fisher's LSD: $p = .021$).

We conducted the same mediation analyses described in Study 2. Consistent with our theory (and conceptually replicating Study 2), compared to the *Static ABC* condition, the dynamic presentation of Apartment C (i.e., the apartment for which the focal attribute was outside of the initial options) led people to perceive relatively more variance in the focal attribute, which in turn shifted preference towards Apartment A (i.e., the apartment best on the focal attribute; 95%CI for the indirect effect: [.0045, .0631]). Also as predicted, compared to the *Static ABC* condition, the dynamic presentation of Apartment B (i.e., the apartment for which the focal attribute was inside the initial options) led people to perceive relatively less variance in the focal attribute, which in turn shifted preference towards Apartment C (i.e., the apartment best on the non-focal attribute; 95%CI for the indirect effect: [.0037, .0389]).

Discussion. Most choice research examines static choices, but many real-life choices are dynamic: People often initially evaluate a set of options, and additional alternatives are added during the decision process. The central contribution of this work is to present and provide evidence for a unified theory based on the perceived variance of the attribute distribution to explain the opposing effects of dynamic presentation on choice share. We find that a dynamic option that falls outside of the comparative choice set can increase perceived variance, regardless of whether the direction of the comparison is positive or negative. Said differently, a dynamic option increases perceived variance when it is outside the established standard, either by being better than the initial options (Studies 1-2) or by being worse than the initial options (Studies 3A-4). This indicates that the pattern cannot be explained by either an "improving" or "declining" sequence (Loewenstein & Prelec, 1993), or by alternative explanations related to primacy and recency (Miller & Campbell, 1959), as those mechanisms do no explain our findings.

Our findings also contribute to a nascent body of work on dynamic choice sets, which has focused on how dynamic presentation affects the decision strategies people use, and decision-makers' ability to identify a normatively optimal alternative (Mintz et al., 1997). By contrast, we examine a domain in which there is no normatively correct option. Instead we show how dynamic choice sets affect preference construction, when choosing among alternatives that require a preference-based tradeoff, suggesting that dynamic choice sets may affect choice among a wider array of decisions than previously understood. We also extend prior work on perceived variance (e.g., Sujan & Bettman, 1989) by suggesting that perceived variance of an attribute can be affected by the position of the dynamic option, relative to the initial choice set—which in turn drives choice.

Our findings also have potentially important substantive implications. For example, politicians contemplating when to announce their candidacy or managers debating the timing of a new product announcement could benefit from a more nuanced understanding of how the timing of their announcement could impact consumers' preferences for their product. The current research expands the discussion of choice architecture by uncovering how the dynamic evolution of a choice set can alter decision making.

Transforming Rituals and Rites of Passage During the COVID-19 Pandemic

Kristine De Valck, HEC Paris, France
Ana Babic Rosario, University of Denver, USA
Isabella Ciampa, HEC Paris, France

EXTENDED ABSTRACT

The COVID-19 crisis has forced consumers worldwide to stay at home and avoid social contact, either following nationally imposed lockdowns or because of self-imposed restrictions due to own health concerns. Physical distancing restrictions differ between periods, countries and regions, but the overall disruption of social life has been tremendous. In this paper we focus on the consequences on consumers who cannot engage in the rituals surrounding childbirth, entering adulthood, weddings, and funerals. These events represent rites of passage (Rook 1985) that have important identity and relational value. We explore how consumers deal with the disruption of these collective rituals and how they utilize technology to reinvent ritual elements. We find that consumers extend and reduce rituals to mitigate the negative effects of physical distancing measures on consumer well-being.

Literature Review

Rituals are a "*type of expressive, symbolic activity constructed of multiple behaviors that occur in a fixed, episodic sequence, and that tend to be repeated over time*" (Rook 1985). Rituals are considered a crucial mechanism for the (re)creation of society (Bell 1997; Durkheim 1912) in which individuals respect norms and traditions (Bell 1997; Weinberger 2015) and share experiences that maintain the emotional bonds within a community (Durkheim 1912; Etzioni 2000). There are four ritual elements: *artifacts*, the objects that hold specific meanings; *scripts*, the sequence of actions performed during the ritual; *performance role(s)* across actors involved in the ritual; and *audience* (Rook 1985). These ritual elements have been examined in consumer research (Sherry, McGrath, and Levy 1993; Wallendorf and Arnould 1991; Weinberger 2015).

We explore the impact of the COVID-19 pandemic and the associated physical distancing measures on a particular type of rituals, i.e. rites of passage (Schouten 1991; Turner 1969). One of the primary objectives of rites of passage is to delineate the transition of an individual to a different status in the community (Van Gennep 1908/1960), such as to adulthood (Fasick 1988), married life (Otnes and Pleck 2003), parenthood (Fischer and Gainer 1993; Ozanne 1992), or death (Bonsu and Belk 2003). While some research exists around the non-celebration of rituals and rites (Sherry et al. 1993; Weinberger 2015), there is limited knowledge on how consumers adapt a ritual when it cannot be performed with the usual elements. Specifically, to salvage their rites of passage during lockdowns, many consumers utilize technology.

Under COVID-19 lockdowns, the use of social media and videoconferencing applications has increased significantly as consumers use them to stay in touch with others (wearesocial.com 2020). While prior research has explored how consumers mobilize technology to reassemble practices that compose the daily family life, such as co-viewing television (Epp, Schau, and Price 2014; Kozinets 2019), it is not yet clear what happens with rituals surrounding the once-in-a-lifetime rites of passage.

Methodology

We conducted semi-structured phenomenological interviews (Thompson, Locander, and Pollio 1989) over phone, Skype, or Zoom with 13 purposefully selected informants who ranged in age, sex, country (France, Italy, the Netherlands, U.S.) and experience with the COVID-19 pandemic. We collected nine hours of audio recordings, yielding 112 single-spaced pages of transcripts. To supplement our interview data, we included 29 pages of introspections (Wallendorf and Brucks 1993) from two informants and the authors. To analyze our data, we drew on the relevant literature and identified patterns across and within the transcripts (Wallendorf and Belk 1989) that subsequently informed our framework and uncovered the key characteristics of transformed rituals.

Findings

The COVID-19 pandemic has forced consumers to reimagine rites of passage and their accompanying rituals. In particular, restricted physical gatherings complicate the rites of passage in which people are accompanied in the transition to another status in their community. Our findings show that consumers and service providers alike turn to technology to recreate the social setting. Some rituals can be fully transferred online (e.g., baby shower, graduation, birthday party, funeral mass), but others still require the physical presence of some performers (circumcision, official wedding ceremony, burial / cremation). We bring to light that consumers accept tech-mediated rituals if their end-goals and key elements are sufficiently preserved (e.g., baby shower aims at helping parents acquire the things needed to welcome the baby in their household and, under lockdown, gifts are sent by mail; graduation ceremony includes a hooding ritual—enacted in front of the computer—that symbolizes the student's transition). We posit that it is more difficult for consumers to respect lockdown restrictions when some ritual performers meet physically, as the feeling of missing out is concrete for distanced audience members. This is further exacerbated when the ritual can be performed only once (such as circumcision and cremation).

During lockdown, rituals are cancelled or transformed. The transformation of rituals takes two forms: (1) the ones that have a physical component are reduced (to limit the number of participants and time spent together), and (2) the ones that have a tech-mediated component are often extended—over time (multiple instances of the same ritual with different audiences) or in terms of audience size (as geographical and financial constraints are lifted). The ritual reduction and expansion can happen simultaneously, such as when a real-life ritual is streamed. Furthermore, the transformation of rituals consists of the blurring of roles of its elements, where each element can take up the role of another (e.g., the audience is replaced by an artifact or becomes a performer). Because of this, transformed rituals are not perceived as the 'real thing' and most informants express their wish to organize a follow-up ritual once they can again gather physically. Still, these follow-up rituals may not be perceived as authentic, as the transition has already happened (e.g., graduation).

The Effect of Quantity Cues on Product Perceptions and Preferences

Daniella Kupor, Boston University, USA
Tianqi Chen, Boston University, USA
Remi Trudel, Boston University, USA

EXTENDED ABSTRACT

Consumers' judgments of how well a product performs (i.e., the product's outcome quality; Bharadwaj 2004; Mishra and Datta 2011) are a primary determinant of their purchase decisions. Because outcome quality is often difficult to evaluate, people frequently evaluate it with the help of other cues (e.g., Yeung and Soman 1997). One particularly influential cue that shapes perceptions of outcome quality is the amount of resources that generate that outcome. Prior literature reveals that people perceive outcomes to be of higher quality when more human input contributes to those outcomes' creation (e.g., Kruger et al. 2004; Morales 2005).

We predict that there are systematic conditions in which consumers perceive that outcomes are higher quality when fewer resources are devoted to them. In particular, we examine consumers' perceptions of the material resources in physical products (e.g., laundry detergents, pesticides, and vitamins). When consumers perceive that a smaller (rather than a larger) quantity of these resources produce a particular outcome, we predict that consumers judge that resource to be more powerful, and that it produces a higher quality outcome as a result.

We propose that the current phenomenon is important not only because it alters judgments of products' outcome quality, but also because it shapes an additional consequential inference: Consumer perceptions of products' environmental friendliness. Prior research has found that consumers judge products that are more powerful as less environmentally friendly (Luchs et al. 2010; Gal and Wilkie 2010; Doorn et al. 2020). We propose that consumers infer a positive relationship between environmental friendliness and products' power: when a smaller (vs. larger) quantity of a particular product produces a particular outcome, it is seen as more powerful, and also more environmentally-friendly.

Experiment 1 manipulated the subjective quantity of detergent that was marketed as being required to clean one load of laundry—specifically, we manipulated whether the objectively identical quantity of detergent required to clean one load of laundry was displayed in a larger (vs. smaller) container, which in turn led participants to perceive that objectively identical of detergent as smaller (vs. larger). When a smaller (vs. larger) perceived quantity of detergent cleaned one load of laundry, participants judged the detergent as more powerful ($t(201) = 5.68$, $p < .001$), perceived that it producesd a higher quality outcome ($t(201) = 3.52$, $p = .001$), and were more likely to use it as a result ($t(203) = 2.81$, $p = .005$). Perceptions of the product's power, and in turn expectations of the product's outcome quality, accounted for the effect of condition on behavioral intentions (*95% CI*: .0893 to .4012; Hayes, 2013).

Experiment 2 replicated these effects ($ts(510) > 3.36$, $ps < .001$). In addition, and in contrast to prior literature finding that people judge more powerful products as *less* environmentally friendly, Experiment 2 found that participants judged the more powerful product as *more* environmentally friendly ($t(510) = 5.29$, $p < .001$).

Experiment 3 examined the consequences of this phenomenon in the field by launching online advertisements. Participants were more likely to click on an advertisement urging them to purchase a detergent when that advertisement highlighted that a smaller (vs. larger) quantity of that detergent was required to clean one load of laundry ($\chi^2 = 4.81$, $p = .028$).

Experiment 4 employed a moderation approach by leveraging a naturalistic intervention drawn from real product packaging: Whether or not the product's formulation was labeled as maximum strength. We predicted that stamping a product with a maximum strength label would attenuate the extent to which consumers rely on quantity information when judging that product's power. In a 2 (Perceived input: Smaller vs. Larger) × 2 (Explicit power information: Present vs. Absent) between-participant design, participants in the *Smaller* (vs. *Larger*) *Perceived Input* condition read that one ounce (vs. 28,349 milligrams) of soap was required to clean a load of dishes, which was followed by either explicit information that the product was maximum strength or was not followed by any other information. As predicted, whereas participants in the *Explicit Power Information Absent* condition perceived the product to be more powerful in the *Smaller Input* condition than in the *Larger Input* condition ($F(1, 798) = 46.56$, $p < .001$), this effect attenuated in the *Explicit Power Information Present* condition ($F(1, 798) = 1.67$, $p = .281$). The same patterns were found on expected outcome quality and behavioral intentions.

Experiment 5 compared the effect we found with previous research which found that people perceive outcomes to be of higher quality when their human creators invest more input into those outcomes (e.g., Kruger et al. 2004; Morales 2005). We posit that our findings diverge from this prior literature because people primarily perceive the outcomes that products deliver as fueled by (and thus incorporating) those products' power, but perceive the outcomes that people produce as fueled by (and thus incorporating) people's care, attention, and thought. As predicted, participants judged a laundry detergent's outcome quality to be greater when the product required a smaller quantity of time to clean one load of laundry ($F(1, 396) = 20.93$, $p < .001$); by contrast, participants judged a person's outcome quality to be greater when the person required a larger quantity of time to clean one load of laundry ($F(1, 396) = 13.51$, $p < .001$). We also found that participants judged the product to be more powerful when it required a smaller (vs. larger) quantity of time to clean one load of laundry ($F(1, 396) = 69.26$, $p < .001$), but that the quantity manipulation did not impact perceptions of the person's power ($F(1, 396) = .01$, $p = .991$). A moderated mediation analysis with bootstrapping (Hayes 2013) showed a significant index of moderated mediation through power perceptions (95% CI: .8259 to 1.6235).

Product websites, advertising, and packaging frequently highlight the quantity of product that produces the promoted outcome. We find that this usage information influences consumers' product judgments and preferences, and we uncover how marketers can optimally present this information to boost sales.

Branding Beyond Product: The Strange Case of Anti-Surveillance Camouflage

Rossella Gambetti, Labcom, Università Cattolica del Sacro Cuore, Italy
Silvia Biraghi, Labcom, Università Cattolica del Sacro Cuore, Italy
Robert Kozinets,University of Southern California, USA

EXTENDED ABSTRACT

Historically, governments and institutions have monitored tobacco marketing with a fragmented approach in which certain tobacco promotions on certain forms of media were prohibited, whereas other communication forms and touchpoints were allowed. This regulatory environment encouraged shifts in promotional spending, including substituting different forms of media and reinvesting in others (Saffer and Chaloupka 2000). Tobacco marketing did not cease. Instead, marketers adapted. In doing so, they found ways to elude institutional and societal surveillance.

In this study, we use an "anti-surveillance camouflage" (Monahan, 2015, 2018) lens to understand how tobacco companies successfully target consumers in a way that circumvents increasingly restrictive laws. Anti-surveillance camouflage ostensibly allows consumers to hide from cameras in plain sight. Similarly, Philip Morris uses parallel brand tactics to hide from regulators. Mission Winnow is partially detached from tobacco and tobacco brands, just enough to evade sanction. This detachment is discursively actualized through the careful crafting of a sophisticated parallel brand aesthetic. Despite being ostensibly decoupled from tobacco products and related symbols, Mission Winnow's brand aesthetic is resonant with both the parent tobacco brand, Marlboro, and the past's glorious epoch of tobacco sponsorship. Its purpose is to elicit favorable and subtle associations with the world of tobacco brands and smoking.

Social Media and the Shifting Logics of Tobacco Branding

Growing media restrictions compelled tobacco companies to innovate their branding strategies to fit within the spaces left open to them. In particular, tobacco companies shifted their promotional spending from television and event sponsorship towards other emerging media, such as social media. These proved to be extremely effective means to target young consumers with their evocative brand symbolism and imagery (Dunlop, Freeman and Jones, 2016; Cranwell et al., 2015; Elkin, Thomson and Wilson, 2010; Forsyth and Malone, 2010; Freeman and Chapman, 2009, 2010; Kim, Paek, and Lynn, 2010; Liang et al., 2015a, 2015b; Navarro et al., 2020; O'Brien et al., 2020; Hébert et al., 2017).

Beginning around 2015, Facebook, YouTube, and Instagram began announcing restrictive policies regarding direct and paid forms of advertising of tobacco products. However, these largely unenforced announcements have not eliminated tobacco related social media marketing. Rather, tobacco companies have leveraged the openness of social media to find ever more effective promotional alternatives that build upon seemingly organic social media influencers' content to achieve a deep level of cultural embeddedness in consumers' lives (Kozinets et al., 2019). This embeddedness reveals an operation of youth culture hacking whereby tobacco companies perform clear acts of surveillance resistance by cleverly deploying influencer and event marketing tactics (Kozinets et al. 2019, 2021).

Context and Method: a Netnography of Philip Morris's Mission Winnow

Mission Winnow is a digital communication platform launched in 2018 by Philip Morris International. In Mission Winnow, Philip Morris performs resistance to governmental and societal surveillance through various activities and resources. While recognizing the Mission Winnow project as anti-surveillance camouflage, our study aims to answer questions related to how a consumer form of aesthetic resistance applies to a brand project; which specific branding practices characterize Mission Winnow as aesthetic camouflage; and how such practices perform surveillance resistance. From a methodological standpoint, we engaged in a netnography, following the specific set of research practices identified by Kozinets (2020). We captured and analyzed the plethora of discursive and expressive practices and conversations flowing through the Mission Winnow's website hub, the Winnowers' community, the newsroom, the projects, and the profiles and groups variously related to Mission Winnow on the following social media platforms: Twitter, Instagram, YouTube, Facebook and Reddit.

Uncovering Anti-Surveillance Camouflage as Aesthetic Resistance in Mission Winnow

Like consumers who use anti-surveillance camouflage aesthetics to resist the discriminatory logics of surveillance societies, Philip Morris uses Mission Winnow's digital communication platform for anti-surveillance camouflage. It does this using a variety of different means, including: (1) using attractive visual brand design and symbolism, (2) deploying visionary themes of societal impact, (3) providing evocative vocabulary and imagery, (4) offering participatory communication devices, and (5) hosting exclusive events and networking with culturally-relevant brands and social media influencers. These techniques elude the evolving stringent governmental surveillance on tobacco companies and extend the game of regulatory cat and mouse. Our analysis also uncovers five forms of anti-surveillance camouflage – *visual, thematic, networking, avoidance, and participatory* – through which Philip Morris performs aesthetic regulatory resistance.

Although our study does not aim to generate nomothetic generalizations, the interface of marketing and consumer culture may provide some intriguing glimpses into the shadowlands where online meets offline, communication becomes culture, ethical boundaries blur, and brands merge with consumers' creative and participatory practices. These various crossovers have the potential to impact our understanding of contemporary branding. As brands continue their mergers and trespasses on interrelated cultural systems, new forms emerge in plain sight. Some brands may take forms that are similar to those we locate in Mission Winnow, becoming resistant to regulation and surveillance in a new neoliberal age of social media, civic engagement, and brand ambassadorship. Further research is needed to understand this interplay and the subtle, shifting branding logics depicted in this initial investigation.

Consumer Deceleration Through Market-Mediated Cultural Reflection

Sarah Grace, University of Arkansas, USA

EXTENDED ABSTRACT

"I was late for work. Even though my studio was in the same borough as our apartment, there wasn't a direct way from here-to-there. So my commute took me across three different subway lines. On the platform, through the people, in through the set of doors that were whooshing close behind me. Movement. Out the doors. Again. Again. I stopped at a bodega for coffee; a nondescript cup filled with nondescript liquid. I didn't drink it for the taste; I never really enjoyed the act, if that makes sense. It was about the effect. Caffeine. Energy. Go, go, go.

Now, in the mornings, I wake up a little earlier before work and before my boys wake up. I shuffle to the kitchen. And I warm water on the stove for a French press of coffee. Our kitchen looks out into the backyard which is heavily wooded. I take a moment and observe: the plant that has grown since the morning before, the animals scurrying about, any new snowfall that occurred overnight. I pour a cup of coffee, and it is a pure, sweet little moment. A ritual that anchors my day." - Allyson, age 34

Allyson, quoted above, made a significant lifestyle shift by moving from Brooklyn, New York to Portland, Maine. While several factors influenced this intentional change, one factor stands out for its interestingness: The Danish concept of hygge, which Allyson read about in 2016 New York Times article and then later researched extensively on Pinterest. Consequently, learning about hygge played an instrumental role in Allyson's quest to design a new way of life for herself and her family. Hygge informed her philosophy on child-rearing, working, vacationing, nutrition, family traditions, and leisure activities. But the main interest of this research is how hygge ultimately invited a slower pace of events in each of these spheres of everyday life.

Hygge eludes direct English translation, but may be understood as "a quality of coziness that comes from doing simple things such as lighting candles, baking, or spending time at home with your family" (Cambridge Dictionary 2021). Hygge is quintessentially Danish and permeates several aspects of Danish culture, from home-life, to social interactions, marketplace behaviors, and even foreign policy (Bean 2011; Bille 2015; Jensen 2017; Linnet 2011; Wiking 2017). The hygge concept exploded onto the US marketplace in the winter of 2016-2017, heavily promoted by book publishers, business-to-consumer media, and marketing research agencies (Mintel 2016; NPD 2017). Danish hygge has continued to permeate US market channels through social media, consumer products, and advertisements, typically peaking in winter months thanks to the commonly used signifiers of fireplaces, cups of tea, and wooly socks (Google Trends 2020; McCartney 2016).

This research seeks to understand the phenomenon of consumer deceleration in the context of the marketization and consumer adoption of Danish hygge in the United States. The question guiding this exploration is: how do consumers in the US personalize the meaning of hygge? And more specifically, how does hygge help consumers critically reflect on social temporality and their consequential pace of everyday life?

LITERATURE

Drawing upon the theories of social acceleration (Rosa 2013) and global mélange (Pieterse 2004), this research shows how consumers, when introduced to new ideas through a globalized marketplace, critically reflect on their current way of life and challenge cultural myths. The findings contribute to literature in consumer temporal-ity, specifically the notions of consumer deceleration (Husemann and Eckhardt 2019) and timeflow (Woermann and Rokka 2015), showing how the cultural myth of "time is money" is challenged through a dismantling of social norms and an agentic consumption of time. This research also contributes to our understanding of globalization and consumer culture by presenting a process of 'market-mediated cultural reflection', which may be used in future research endeavors to understand how cultural myths are reflected upon in an increasingly globalized consumer culture.

Woermann and Rokka (2015) study time in consumer culture from a "microperspective", that is, "in action as it unfolds in consumers' experience of concrete, lived through moments" (1488). In other words, the authors intend to study the phenomenological experience of time, focusing on a theoretical explanation for how different consumption practices evoke unique temporal experiences ("timeflow"). However, the authors do not comment on the broader temporal logics of society or culture in which certain consumption practices take place.

Husemann and Eckhardt (2019) understand temporality as a feature of social structure, studying how individuals respond to dominant temporal logics by altering consumption behaviors. The authors identify how consumers achieve deceleration in a sped-up world. However, this notion of consumer deceleration is limited as the findings hinge on an "oasis of deceleration" where time is experienced as passing more slowly and as being a more abundant resource in the context of an oasis that exists apart from the everyday lifeworld. In an oasis of deceleration, the objective social conditions surrounding consumer subjectivity certainly change, though the lasting impact on consumer subjectivity is unknown once the consumer exits the oasis. The purpose of this research is to extend Husemann and Eckhardt's findings by exploring how consumers can more permanently reshape subjective experiences of temporality in a sped-up society.

METHODOLOGY AND FINDINGS

This project employs a netnographic approach (Kozinets 2019) to understand how a particular group of US consumers critically reflect on the social meanings surrounding temporality (i.e., the cultural myth of "time is money") and their pace of everyday life through the adoption of Danish hygge. Multiple interpretive methods including participant-observation, visual analysis, existential-phenomenological interviews (Thompson, Locander, and Pollio 1989), and hermeneutic analysis (Thompson 1997) are used to develop meaningful responses to the research questions. Data was collected and analyzed iteratively over four years of immersion in a special interest facebook group called Cultivating Hygge.

Findings reveal that in the fast-paced environment of US culture, the temporal aspect of Danish hygge is attenuated. A thorough interrogation of the visual data reveals that in the context of the United States, hygge means "unhurried moment". This finding is elaborated upon in the analysis of the interview data, which reveals a process for how consumers alter temporality, or desired timeflow, through a process of market-mediated cultural reflection.

The visual data show that once introduced to the Danish tradition of hygge, US consumers resourcefully tinker with available materials to create their own expressions of hygge. Everyday objects, which might have once carried other meanings, became symbols and conduits of "hygge". For example: a manual French press coffee maker was deemed more hygge than an automated Keurig single-serve coffee maker ('I'm trying to slow down a little. And coffee

out of a French press rather than a Keurig helps that happen ... and makes it taste so much better!"); bread became hygge when it was homemade rather than store bought ("Sunday morning.....coffee and reading while bone broth is cooking for dinner tonight and bread dough is rising.....total peace"); and a home office felt hygge when it was adorned with string lights or a salt lamp ("If you've got to work on the weekend, make it hygge with dim lighting, soft music, and a scented candle").

The existential-phenomenological text reveals four main themes: cultural reflection; inspiration to downshift; existential curation; and desired timeflow. Importantly, these four themes reveal how the adoption of hygge helps to reshape consumer subjectivity through a process of dismantling layers of structural, cultural meanings surrounding temporality. US consumers use the borrowed philosophy of Danish hygge to experience a new, desired timeflow in everyday life.

Cultural reflection

Learning about another culture and its traditions gives individuals something to which individuals can compare their own culture. Learning about Scandinavian cultures through hygge prompts individuals to reflect, both critically and appreciatively, on their own culture of origin. In the words of Holly, "Hygge lends itself to being more self-aware, you know, you're supposed to sort of stop and think and be quiet and reflect a little bit." Such reflection prompts individuals to consider: "How should I live?" in the US cultural context, while simultaneously drawing upon influences from another culture. In this way, the structures of US culture are illuminated as individuals consider what these structures mean to them in their everyday lives.

Inspiration to downshift

Individuals become more familiar with hygge through various products, promotions, and stories diffused throughout the marketing system. Through community engagement in the Cultivating Hygge facebook group, individuals see how other individuals live differently from, or even in opposition to, generally accepted cultural norms. One of the cultural norms that is highlighted in the context of hygge is that of temporality. Through repeated engagement with this community, a certain social permission is granted to alter one's lifestyle. Individuals see evidence of others living differently and are inspired to also make decisions to live differently. In this, the individual becomes uncoupled from the dominant cultural structure and moves toward a greater ability to practice agency.

Existential curation

In the process of adopting hygge, individuals ask themselves, "How do I design the life that I want to live?". In the context of temporality this translates to, "How do I decide what remains and what changes in my life so that I can achieve a certain desired experience of time?" Individuals begin to experiment with hygge, playing with the tempo of everyday life. In this, individuals assign new meanings to temporality, replacing and redefining structural meanings of time with individual meanings of time.

Desired timeflow

Individuals incorporate elements of hygge into their everyday lives through consumption rhythms and rituals. These new practices help individuals achieve a certain desired timeflow. Woermann and Rokka (2015) define the timeflow of a practice as "its ability to evoke an experienced temporality". The phenomenological text reveals how hygge prompts individuals to emphasize a certain temporality in everyday life.

DISCUSSION

This research uncovers a case in which a market-mediated process helps challenge social norms surrounding temporality, which originate from a market-sanctioned understanding of social time in the first place. So, what does it mean that US consumers confront and question the "time is money" myth through their adoption of the cross-culturally marketed concept of hygge? This research raises important theoretical implications both for the phenomenon of temporality in consumer culture and for the notion of market-mediated cultural reflection.

First, the findings suggest that consumers may decelerate by consuming aspects of other cultures. For these consumers, deceleration is not merely a temporary change, but an enduring state resulting from a process of cultural reflection. Such reflection fundamentally alters the individual's mindset, or ideological orientation, toward temporality. While Husemann and Eckhardt's (2019) emphasis on "oases" of deceleration addresses Rosa's (2013) second type of inertia to social acceleration, the findings presented here harken to Rosa's fifth type of inertia: intentional deceleration as ideology. This essay also echoes Woermann and Rokka (2015) in that consumers achieve a certain feeling of timeflow by engaging in certain consumption activities. For many consumers in the US, a desired timeflow is a decelerated state from the normalized acceleration promoted throughout consumer culture.

Second, this research presents another way of conceptualizing how consumers might utilize borrowed (and marketed) cultural meanings to critically reflect upon the myths of their own culture. This conceptualization has important implications for an increasingly globalized consumer culture. Mixing between cultures results in an ongoing hybridization process (Neverdeen-Pieterse 2019). Cross-cultural diffusion often occurs as an act of bricolage, mixing, matching, and borrowing select signs from a culture of origin to a receiving culture. Such cultural mixing allows people to "acquire objects across social divisions to create new cultural identities" (Phillmore, Klass, and Knecht 2016, 8). These cultural identities may then become subcultures that stand in direct opposition to mainstream cultural ideologies. As a result, cultural mixing can ultimately create new accepted norms and structures in society while challenging existing dominant meanings.

Interestingly, the cultural myth of hygge enables individuals to question the myths of their own culture. Eckhardt and Mahi emphasize the importance of such consumer agency in an increasingly globalized environment, defining it as "the ability to transform and play with meaning" (2004, 137). So even though cultural myths typically act as binding structures in society, borrowed cultural myths (as is the case of Danish hygge in the United States) can be liberating, providing "the means by which we can seek new meanings" (Danesi 2018, 45).

Two limitations are worth noting. First, the marketization and adoption of Danish hygge in the United States reveals a specific consumer response in the context of a West-to-West cultural diffusion. A question to considers is: how might the findings change in the context of an East-to-West, West-to-West, or East-to-East cultural diffusion? And second, the data in this research were collected during the northern hemisphere winter months (primarily January-February) over the course of multiple years. This seasonality provides an extreme context, as interest in hygge certainly surges during the winter months (Google Trends 2020). While it is possible that seasonality might affect the nuance of the findings, the author suspects that the

main finding of cultural reflection would remain the same in other seasons of the year.

In sum, this research develops and empirically grounds a theoretical process that explains how cultural reflection can reshape consumer subjectivity in regard to temporality. This naturally invites the question: To what other contexts and what other phenomena may a similar process also apply? Can market-mediated mixing of cultural ideologies impact other domains pertinent to consumer and social wellbeing such as health, education, and sustainability? Further, how might an enhanced knowledge of market-mediated global mélange and cultural reflection help marketers constructively engage in such domains?

Alleviating Risk Aversion to Uncertain Impact Donations

Shoshana Segal, New York University, USA
Joshua Lewis, New York University, USA

EXTENDED ABSTRACT

Organizations raising funds for sustainable solutions to today's development issues often strive to meet ambitious goals, such as researching global disease eradication or lobbying for international policies that make strides toward ending climate change. However, when consumers want to use philanthropy to tackle major global issues such as climate change or animal welfare, the most effective solutions will be inherently risky (e.g., Samuel, 2019, 2020). While there is a non-zero probability that a donation to these organizations will change many lives, there is also a high chance that a donation will yield zero impact.

In this paper, we investigate how to reduce individuals' aversion to uncertainty about their prosocial impact. We explore a broad-bracketing intervention in which donors can invest in uncertain impact charities alongside other, certain impact charities, rather than in isolation. This intervention encourages consumers to consider the total impact of their donations rather than the impact of each donation separately (Benartzi & Thaler, 1999; Read et al., 1999). However, while the current literature suggests that broad bracketing works via mitigating loss aversion, this cannot predict an effect in the context we examine as all impacts are framed as gains. Instead, across four preregistered studies (N=1,870), we show that broad bracketing can also work via the peanuts effect (Prelec & Loewenstein, 1991) – that is, interventions which pair an uncertain impact with other, certain impacts cause donors to perceive the uncertain option as lower stakes and thus a tolerable risk.

In Study 1 (N=908), participants indicated whether they would prefer to donate to a charity fund with a certain & lower impact (e.g., mosquito nets), or a charity fund with an uncertain but potentially much higher impact (e.g., research for a malaria preventive). We manipulated broad bracketing by varying the number of prior donation decisions between certain impacts that each participant made (0 in the single-decision condition or 2 in the portfolio decision condition). Participants donated to uncertain impacts more often in the portfolio condition versus the single-decision condition, p=.003.

To rule out alternate explanations such as variety seeking or fatigue due to participants making a different number of choices in each condition, we ran a second study establishing our main effect (N=280), which asked each participant to make donation decisions concurrently, rather than over time. Decisions were presented as a set of four charities: three of which had a certain impact and one of which had an uncertain impact. In the "split" decision context, designed to broad-bracket participants' choices, each participant was asked to select two charities between which their donation would be split. In the "rank" condition, participants were told their donation would go to a single charity and asked to rank all four charities in order of preference. We evaluated participants' likelihood of placing the uncertain charity in their top two selections. Participants were more likely to include the uncertain charity when they split their donations between two charities versus when they only donated to one charity, p<.001.

Another alternative explanation would be that individuals want to have "just some impact;" that is, they care about risk more *when it presents the possibility of having zero impact*, which is impossible in the portfolio or split conditions. In Study 3 (N=141), we sought to test this possibility by seeing if the effect was moderated by whether the uncertain choice guaranteed at least a small impact. We used the same choice paradigm as study 2 while adding another factor to create a 2 (bracketing context: split versus rank) x 2 (uncertain impact: potentially zero versus potentially low) design. We again found a significant effect of bracketing, p=.003, including when the uncertain option guaranteed at least some impact (versus no impact), p=.005, and we found no interaction, p=.43.

In Study 4 (N=541), we examine why broad-bracketing is such an effective strategy for increasing donations to uncertain impact charities. We assigned participants to each of three bracketing conditions. The first two conditions were similar to those in Study 1, but we additionally included a third "aggregate" condition which was economically equivalent to the portfolio condition (that is, it represented the sum of all 3 choices in the portfolio condition, thus forcing participants to broad bracket). We also measured the perceived stakes of each uncertain-outcome option on scales from 1-7 (note that the actual risk remained the same across all conditions).

Results showed that the choice share of the uncertain impact option was significantly different in all three conditions; it was lowest in the single choice condition and highest in the aggregate condition, in which participants were essentially forced to broad bracket, p's<.001. We observed consistent results for the perceived stakes measure, indicating that as individuals evaluate an uncertain option in an increasingly bracketed choice context, they perceive the stakes as increasingly lower. A series of mediations provided further evidence of this process. These analyses demonstrate that increasingly bracketed choice contexts lower the perceived stakes of equally uncertain impact donations, which leads to an increase in preference for risky prosocial impacts.

The Structure of a Product, Retail Environment, and Brand Logo Can Affect Judgments of Value

Felipe M. Affonso, University of Florida, USA
Chris Janiszewski, University of Florida, USA

EXTENDED ABSTRACT

Structure is a concept related to the arrangement and organization of elements in an object, system, or construct. In nature, structure is manifested in predictable regularities, such as the Fibonacci sequence on the leaves of a plant. In people's everyday lives, structure is present in marketing stimuli (e.g., brand logos, products, product packages, retail environments), music (e.g., forms, scales, and chords), and architecture (e.g., building structure, interior design). We investigate the consequences of structure-based inferences about brand logos, product packages, product arrangements, and retail environments. For instance, Microsoft logo is structured (i.e., symmetric), whereas Pepsi logo is unstructured (i.e., asymmetric).

Visual attributes are often used to make inferences, including judgments about functional benefits (Labrecque and Milne 2012) and hedonic benefits (Warren et al. 2019). We propose that structure (a lack of structure) can encourage inferences about the value of a means used to pursue any utilitarian (hedonic) goal. Utilitarian goals include functional, performance, or operational goals. Likewise, hedonic goals include aesthetic, entertainment, and pleasure goals.

Structure is related to perceptions of increased order (Ngo and Byrne 2001), expectations of enhanced performance (Veryzer and Hutchinson 1998), certainty of choice (Rahinel et al. 2016), and causality (Kay et al. 2014), all of which are associated with the delivery of utilitarian value. Hence, we contend that consumers infer utilitarian value from structure. Increased utilitarian value, in turn, should boost an array of marketing-relevant outcomes.

A lack of structure, the counterpart to structure, is related to many of the characteristics that are desirable when hedonic considerations are heavily weighted. Most germane to our inquiry, a lack of structure is associated with unpredictability (Crutchfield 2012), excitement (Bajaj and Bond 2018), arousal (Luffarelli et al. 2019), uniqueness (Schmitt and Simonson 1994), and fun (Tonietto and Malkoc 2016). These characteristics are related to hedonic dimensions of consumer attitudes toward product categories and brands (Voss et al. 2003). Hence, we contend that consumers infer hedonic value from lack of structure. Increased hedonic value, in turn, should boost an array of marketing-relevant outcomes.

This research contributes to the marketing literature by broadening the conceptualization used to understand the influence of structure on an array of marketing-relevant outcomes. This research also contributes to practice in several industries. Professionals who work with product design and packaging, brand logo design, merchandising, and retail design can better understand when and why imposing structure, or lack thereof, can create superior value for the customer and, ultimately, for the firm.

Experiment 1 provides initial evidence for our Hypothesis. We conducted a large-scale field experiment using Facebook's advertising platform. We created Facebook ads for perfumes. Structure (or a lack thereof) was operationalized through symmetry and regularity (asymmetry and irregularity) in product imagery across two product replicates. Utilitarian and hedonic goals were operationalized via product framing.

The dependent variable was advertising click-through rates (CTRs), a function of impressions and clicks. CTRs are associated with real product interest. The ads generated a total of 82,413 impressions, 2,503 of which were clicked on (2.23%). A 2 (product design) x 2 (framing) Poisson log-linear model, which revealed the predicted interaction (β=.56,χ^2(1)=34.73, p<.001). As predicted, structure increased CTR when the product was framed as utilitarian ($CTR_{structured}$=2.53%vs.$CTR_{unstructured}$=1.82%;$Clicks_{structured}$ =529 vs.$Clicks_{unstructured}$=380; χ^2(1)=24.82,p<.001), but decreased CTR when the product was framed as hedonic ($CTR_{structured}$=2.03%vs.$CTR_{unstructured}$=2.54%;$Clicks_{structured}$=403vs.$Clicks_{unstructured}$=525; χ^2(1) = 14.29, p < .001). These results were observed in a large-scale field experiment, providing support for and showing the external validity of our framework.

In experiment 2 (preregistration: https://aspredicted.org/blind.php?x=2r58tp), we test the underlying mechanism or utilitarian (hedonic) value by using a controlled setting where we manipulate structure and the goals associated with the consumption experience. Participants (N=600) read the description of a store framed either as utilitarian or hedonic, and viewed a picture of that store that was either perfectly symmetric (vs. asymmetric). We measured evaluations, perceived utilitarian value, and perceived hedonic value (see preregistration).

A two-way ANOVA on the evaluation index revealed the predicted interaction (F(1,596)=20.97,p<.001). As expected, structure increased evaluations when the store was framed as utilitarian ($M_{structured}$=7.77 vs. $M_{unstructured}$=7.15;F(1, 596)=10.83,p =.001), but decreased evaluations when the store was framed as hedonic ($M_{structured}$=7.20 vs. $M_{unstructured}$=7.79; F(1, 596)=10.13,p=.002). Supporting our reasoning, bootstrapped moderated mediation analyses revealed that increased utilitarian value mediated the effect on evaluations for the utilitarian store framing (β=.46,SE=.15,95%CI: [.19to.77]). In addition, hedonic value mediated the effect on evaluations for the hedonic store framing (β=.39,SE =.12,95%CI:[.15to.65]), providing supporting for our mechanism.

In study 3, we demonstrate our effects in the marketplace for real brands. The data used in this study were collected from three sources. BrandZ, a leading marketing consultancy firm, publish annual rankings of the top 100 most valuable brands in billions of U.S. dollars. We used all the 100 brands from the BrandZ report. VMLY&R, a global full-service marketing agency, developed a customer-based brand equity measure, and they also provided control measures (e.g., usage behaviors) for all these brands. They granted access to this proprietary data. Finally, we recruited 1301 U.S. consumers and measured brand-related properties associated with structure (based on logos) and degree of how utilitarian or hedonic these brands were. Thus, our dataset had BrandZ top 100 brands financial valuations, customer-based brand equity measures for these brands, control measures, structure perceptions, and utilitarian-hedonic perceptions.

Using this data, we performed a Johnson-Neyman analysis that revealed a significant interaction (β=-23.70,t(85)=-3.11,p=.004). The results showed that brands associated with utilitarian (hedonic) products and services have greater brand value when brand logo structure (lack of structure) is higher, supporting our framework. These effects were observed for real brands in the marketplace. We replicated these effects using the customer-based brand equity measure. Our results support the notion that structure has an important role in the marketplace and it can affect judgments of value across a variety of marketing contexts.

Overcoming Self-Focus in the Presence of Contagious Diseases: Performance-Diagnostic Information Increases Donations to Causes with Benefits for Others

Felipe M. Affonso, University of Florida, USA
Juliano Laran, University of Basel, Switzerland

EXTENDED ABSTRACT

Donations to charitable health organizations have become increasingly important. Our key goal is to understand how organizations can create effective donation appeals for causes related to contagious disease prevention and treatment. A relevant question when creating a donation appeal is whether to focus on the donor's personal benefits of donating or the benefits for others (White and Peloza 2009). We propose that the effectiveness of highlighting personal benefits or benefits for others depends on people's perceived likelihood that they will get the disease or class of diseases mentioned in the appeal.

When the likelihood of getting the disease is low, people do not feel threatened by the possibility of getting it (Weinstein and Klein 1996). If a person believes it is unlikely that they will get a disease, they should infer that others will benefit more from the work of the health organization (Batson and Shaw 1991). In this case, appeals that focus on the benefits to other people are more effective because the donor will perceive that others are the right target for the benefits a donation could bring (H1). As the likelihood of getting the disease increases, people feel threatened by the prospect of getting sick (Sheeran, Harris, and Epton 2014). The perception of a threat should make them more focused on their personal interests, which will make donation appeals with self-benefits more effective. In this case, appeals that focus on personal benefits are more effective because the donor will perceive that him or herself is the right target for the benefits a donation could bring (H2).

These Hypothesis reveal a potential issue. As the spread of a disease in a community increases, people may derive real benefit from donating to a cause focused on benefitting others, as the fewer people in a donor's community get the disease, the less likely it is that a donor will get the disease themselves. The fewer people get infected in a community, the less the disease circulates, which ultimately benefits everyone (Fauci et al. 2020). We investigate a solution to this issue. We propose that the increase in donations resulting from self-benefit appeals is associated with the belief that a health organization's work is not enough to stop a disease from spreading around a community and ultimately benefit the donor. Therefore, providing information that is diagnostic of the successful performance of the organization should attenuate this belief. When such information is provided, appeals with benefits for others will be more effective than those with personal benefits (H3).

In addition to its contribution to the area of prosocial behavior, this research will help health organizations by demonstrating strategies these organizations can use to design donation appeals with the correct combination of information types (likelihood of getting a disease, benefit target) to maximize donations.

In study 1 (preregistration: https://aspredicted.org/blind.php?x=uu7fq8;N=800), we manipulate the benefit target of a donation appeal by presenting personal benefits versus benefits for others, and measure people's perception that they will get sick with the disease mentioned in the appeal. The main analyses were restricted to participants who donated at least one dollar. We apply this to all studies. A 2 (benefit target) × (perceived likelihood) regression on donation amount revealed an interaction (β=-1.02,t(610)=-5.09,p<.001). The effect of other-benefit (vs. self-benefit) appeals was positive below the 3.93 J-N point of perceived likelihood, suggesting that these appeals are more effective when the perceived likelihood of getting a disease is low. By contrast, the effect was negative above the 5.18 J-N point, suggesting that self-benefit (vs. other-benefit) appeals are more effective when the perceived likelihood of getting a disease is high.

In study 2 (preregistration: https://aspredicted.org/blind.php?x=uv7py8;N=400), we focus on COVID-19. We use information about the disease to manipulate perceptions of likelihood. In addition, we have hypothesized that donations are driven by the extent to which the benefits focus on the target the potential donor believes is right (self or other). To test this, we measured the extent to which participants perceived that the target was correct and predicted that this measure would positively predict donation amount. In the low likelihood condition, donation amount was lower in the self-benefit (M=6.00) than in the other-benefit appeal condition (M=8.63;F(1,279)=7.59,p=.006). The pathway to donation amount through on-target perception was positive (β=1.85,SE=.46,95% CI:[1.05;2.84]). When the likelihood was high, donation amount was greater in the self-benefit (M=9.61) than in the other-benefit appeal condition (M=6.10;F(1, 279)=15.94,p<.001). The pathway to donation amount through on-target perception was negative (β=-1.07, SE=.42,95%CI:[-1.95;-.33]).

In study 3 (preregistration: https://aspredicted.org/blind.php?x=kg736g;N=600), we investigate whether providing performance-diagnostic information increases donations for other-benefit appeals. Here and in study 4, we only examined donation behavior under a high likelihood perception. In the baseline performance information condition, donation amount was higher in the self-benefit (M=5.83) than in the other-benefit condition (M=4.64;F(1,519)=9.32, p=.002). In the performance-nondiagnostic information condition, donation amount was also higher in the self-benefit (M=5.85) than in the other-benefit condition (M=4.59; F(1,519)=11.18, p =.001). In the performance-diagnostic information condition, however, donation amount was lower in the self-benefit (M=5.08) than in the other-benefit condition (M=6.03; F(1,519)=6.32, p=.012). All effects were mediated by on-target benefits perception consistent with our Hypothesis.

In study 4 (https://aspredicted.org/blind.php?x=wf3339;N=800), we replicate study 3 by highlighting information about people the organization has helped in a community. In addition, we contrasted performance-diagnostic information with other types of information that are effective in increasing donations, such as providing specific information about a person the organization has helped or plans to help with the donated money (Jenni and Loewenstein 1997). We also use a "no target" condition to show the effect of other-benefit appeals relative to a more neutral group. In the performance-diagnostic condition, donation amount was higher in the other-benefit (M=8.89, SD=5.62) than in the no target condition (M=6.03; F(1,579) = 16.21, p<.001). In all other information conditions, donation amount was higher in the no target than in the other-benefit conditions. Taken together, our results contribute to the prosocial behavior literature and to health organizations focused on contagious diseases.

The Inescapable Quest for Happiness: Exploring How the Ideology of Happiness Shapes Contemporary Consumer Marketplace

Gabrielle Patry-Beaudoin, Queen's University, Canada
Jay Handelman, Queen's University, Canada

EXTENDED ABSTRACT

The quest for happiness has an extensive presence in contemporary Western culture, in which politicians, organizations and individuals all engage in different actions to increase happiness (Burnett 2012). Given the central place that happiness occupies in our society, researchers across disciplines have been interested in exploring the causes and consequences of happiness (Jugureanu 2016; Veenhoven 2015). Marketing researchers have contributed to this work, specifically exploring happiness correlates that pertain to consumption, such as materialism (Belk 1985), types of purchases (Bhattacharjee and Mogilner 2014; Nicolao, Irwin, and Goodman 2009), and consumption choices (Mogilner, Aaker, and Kamvar 2012). In addition, consumer culture theorists have emphasized the role of consumption settings in contributing to consumers' well-being (Higgins and Hamilton 2019). Several studies have pointed out that individuals experience different tensions in their everyday life, ranging from boredom to stress in a consumer culture. This research suggests that consumers compensate for these tensions by engaging in sensorial and spiritual experiences that allow them to feel good (see Higgins and Hamilton 2019 for a review). Overall, this recent work aligns with a psychological perspective, where happiness is understood as an individual feeling that is achieved when particular stimuli are in place (Layard 2005; Thin 2014; Veenhoven 2015).

However, in recent years, sociologists have put forward the idea that happiness can be understood as a complex social construction (Burnett 2012; Cabanas and Illouz 2019; Davies 2015; Hyman 2014). Researchers have highlighted that happiness has been interpreted differently over the years and across cultures, corresponding to multiple cultural discourses, including virtue, religion, public policies, productivity, and individual success and responsibility (Burnett 2012; Cabanas and Illouz 2019; Davies 2015). Rather than understanding happiness as an individual psychological state, this stream of research draws attention to the ideological nature of happiness. It suggests that happiness is associated with culture-bound values, norms and meanings that come to motivate different societal structures and ways of living in society. In this regard, all actors and institutions engage in cultural work to align with a certain belief system of happiness.

Still, there has been little discussion around how the cultural imperative of happiness influences a marketplace and marketplace actors. This research explores how the ideology of happiness structures the marketplace by addressing the following question: How does the ideology of happiness in contemporary consumer society inform the actions of consumers and producers? To answer this question, we draw on Foucault's concept of heterotopia, which refers to sites that juxtapose heterogeneous elements, such as spaces, social orderings, and discourses that are normally incompatible with each other (Chatzidakis, Maclaran, and Bradshaw 2012; Foucault and Miskowiec 1986). This theoretical framework enables us to better understand how different happiness discourses coexist in the marketplace.

We situate our study in the context of Disney's theme parks. Since the opening of the first park in 1955, the narrative of happiness has always been at the core of Disney theme parks (Chytry 2012; Dholakia and Schroeder 2001), which makes them an ideal context to explore the ideology of happiness within a mainstream capitalist marketplace. A qualitative methodology was adopted for this study.

First, we collected archival data from different media (newspapers' articles, television interviews, Disney Institute blog's posts) to develop an etic comprehension of the Disney brand. Second, we performed a content analysis of an online forum dedicated to Disney, analyzing the pre-trip and completed trip reports of three participants to deepen our understanding of consumers' trip. Third, we conducted depth interviews with 11 Disney theme park customers to directly access their own emic experiences with Disney.

Our analysis reveals four happiness discourses that are articulated in the Disney theme park marketplace. We introduce the idea of happiness heterotopia as a space where different, and contradictory, cultural discourses of happiness harmoniously coexist. This happiness heterotopia oscillates between a closed controlled space and an open space of possibilities, between present time and accumulation of time. The findings highlight that producers construct a closed space that is physically and symbolically distinct from the real world. Aligning with the ideology of utilitarianism, Disney employs theming and orderliness to develop a society of betterment and progressiveness that maximizes happiness of visitors and employees. Aligning with the happiness as a tool discourse, Disney also engages in backstage processes to ensure that the performance of the park at a fixed point in time is efficient and profitable. Overall, producers immerse customers in a happiness bubble that they fully orchestrate. Paradoxically, within the confines of this closed space, customers are able to access an open space where everything is possible. Following the individual responsibility discourse, customers take their trip to Disney in their own hands, proving to themselves and their families what they can do with their will and work. Following the eudaimonic discourse, customers connect their past, present and future at Disney, which enables them to reflect on their life as a whole and fulfill their true purpose. In the closed space of Disney, customers are free from their ordinary constraints and can openly develop their identity.

This study contributes to the marketplace literature by investigating the ideological nature of happiness. First, it shifts the focus away from the individual experience of happiness to a cultural level of understanding, highlighting that happiness is associated with various meanings in the marketplace. Second, the analysis reveals how these different happiness discourses interact in the marketplace by introducing the idea of happiness heterotopia. Third, the findings highlight how consumers and producers enact this ideology and analyze their roles in co-constructing this happiness heterotopia. Finally, these findings are of great interest for marketers and organizations, as they identify marketplace structures that producers can put in place to create spaces of happiness in a variety of contexts.

No Time to Enjoy the Extra! Aging and Consumer Reaction Toward Volume-Based Promotion

Jiexian (Chloe) Huang, Hong Kong Polytechnic University, Hong Kong
Linying (Sophie) Fan, Hong Kong University of Science and Technology, Hong Kong
Yuwei Jiang, Hong Kong Polytechnic University, Hong Kong

EXTENDED ABSTRACT

Population aging is a worldwide phenomenon, mainly because of a longer life expectancy and a lower fertility rate. In the United States, one in every five residents will be at age 65 and older by 2030 (U.S. Census Bureau 2018). The number of the older person (aged 60 or more) is expected to increase globally from 962 million in 2017 to 2.1 billion in 2050 and 3.1 billion in 2100 (United Nations 2017). Given its pervasiveness, aging has attracted research attention across different disciplines, such as sociology (e.g., Linn and Hunter 1979), medical science (e.g., Levy and Myers 2004), psychology (e.g., Drolet et al. 2019), and marketing (e.g., Williams and Drolet 2005). However, our understanding of how aging shapes consumer behaviors remains limited. The current research explores a novel marketing consequence of aging, namely, consumers' attitudes toward sales promotion.

Sales promotion is defined as temporary and tangible monetary or nonmonetary incentives whose purpose is to have a direct impact on consumer behavior (Blattberg and Neslin 1990). Price-based promotion (e.g., price reduction) and volume-based promotion (e.g., free extra product volume) are the two most commonly used promotion practices. Prior research has identified several antecedents that influence consumers' attitudes toward different types of promotions. For example, consumers opt for direct price discounts when they choose vice products whereas bonus packs are more preferred for virtue products (Mishra and Mishra 2011). From the marketers' perspectives, volume-based promotions should be preferred since they encourage greater stockpiling and consumption (Chandon and Wansink 2002), which can accelerate inventory sales more than price-based promotion does.

The current research proposes aging could serve as an important antecedent that influences consumers' reactions toward sales promotion. Specifically, we predict that consumers of chronological or psychological older age, they will exhibit less favorable attitudes toward volume-based promotion (e.g., free extra product volume) than their younger counterparts. We argue that this effect occurs because aging will trigger a limited-time horizon perspective among older consumers. In line with this proposed mechanism and given that time is an intrapersonal resource (Gino and Mogilner 2014), we should expect the effect to disappear when product judgments are detached from the consideration of consumption time. Thus, we further demonstrate that the proposed effect will be weakened or dismissed when the product is to be consumed by others (i.e., not by self).

Study 1 was a correlation study testing whether chronological aging influences consumers' reactions toward volume-based promotion, but not price-based promotion. After participants (N=195) completed demographic measures (including actual age), they evaluated a toothpaste after reading an ad featuring either a volume-based promotion (i.e., 25% more product) or a price-based promotion (i.e., 20% price discount), of equal economic value. As expected, participants' age negatively predicted their attitudes toward the product in the volume-based promotion condition, but not correlated with their reaction toward the price-based promotion.

Study 2 intended to replicate the observed effect with manipulation of psychological age. To minimize the influence of real age (e.g., Eibach, Mock, and Courtney 2010), we only invited adults in their thirties (i.e., aged 30 to 39). Participants (N = 203) were randomly assigned to conditions of a 2 (psychological age: older vs. younger) × 2 (promotion type: volume-based vs. price-based) between-subject design. First, participants were randomly assigned to recall a circumstance either making themselves feel older or younger than their actual ages (Guido, Amatulli, and Peluso 2014). Next, they evaluated a shampoo after reading an ad featuring its sales promotion. Similar to Study 1, the promotion is either a volume-based promotion or a price-based promotion, of similar economic value. Replicating findings in Study 1, participants in the older condition reported less favorable attitudes toward volume-based promotion than those in the younger condition. No difference was found for price-based promotion.

Study 3 investigated the mediating role of the limited time horizon perspective among older consumers. Participants (N = 162) in their twenties (i.e., aged 20 to 29) were randomly assigned to one of two (psychological age: older vs. younger) conditions. First, participants completed the same recall task of psychological age manipulation used in Study 2. Next, we measured the time horizon perspective (Lang and Carstensen 2002). Participants then evaluated the toothpaste after reading an ad featuring its volume-based promotion used in Study 1. We found that the observed effect of aging on consumer reaction toward volume-based promotion is indeed mediated by the limited time horizon perspective.

Study 4 tested whether the observed effect would be mitigated when the product is to be consumed by others (vs. by self). Participants (N = 359) in their twenties (i.e., aged 20 to 29) were randomly assigned to conditions of a 2 (psychological age: older vs. younger) × 2 (consumption context: self-purchasing vs. other-purchasing) between-subjects design. Participants first completed the psychological age manipulation used in previous studies. In the consumption task, participants imagined making a purchasing decision of almonds either for themselves (the self-purchasing condition) or for a friend (the other-purchasing condition). Then participants evaluated the bag of almonds after reading an ad featuring its volume-based promotion. Replicating our previous findings in the self-purchasing condition, participants in the older condition reported less favorable attitudes toward products with a volume-based promotion than those in the younger condition. However, in the other-purchasing condition, consumers' reactions to volume-based promotion did not differ across the older and younger conditions.

Putting together, the current research addresses this important theoretical gap by examining the downstream results of aging in the consumption domain. As the first to investigate the relationship between aging and consumers' attitudes toward volume-based promotion – and time horizon perceptions (expanded vs. limited) – a limited time horizon perspective mechanism driving it – this research extends the aging literature by revealing a novel consequence of aging, and contributes to the emerging literature in the consumption domain. It also gives insight into the antecedents and consequences of a limited time horizon perspective. Finally, the current research offers rich practical implications for marketers in terms of how to cope with today's aging consumer population that grow dramatically.

Strikes Against Emerging Competition: Respecting Consumers' Needs and Gaining Their Hearts

Hyunjung Crystal Lee, Universidad Carlos III de Madrid, Spain
Eline De Vries, Universidad Carlos III de Madrid, Spain

EXTENDED ABSTRACT

The current research examines how different types of labor strikes change consumers' perception of the company as well as their subsequent consumption decisions. Employees engage in strikes and protests for various legitimate reasons, including maltreatment of employees and breach of conduct of competing firms. While attracting the attention of the public regarding such issues can fuel necessary changes, the way such strikes are carried out can instead fuel stronger misperceptions and oppositions. We show that certain types of strikes, such as strikes protesting against a competing company, can drive consumers away from the company where employees initiated the strike and actually prefer the competing firm. Importantly, we demonstrate how such strikes can be framed to earn consumers' understanding, empathy, and business.

Reflecting the exponential rise in on-demand economy as well as strikes fiercely resisting such change, we aim to gain insight regarding consumers' reaction towards such anti-on-demand business strikes. Specifically, we focus on mobility-related on-demand businesses that use digital platforms to directly connect consumers with providers of product delivery or transportations. While on-demand businesses have been welcomed by many consumers for their transparency and convenience (The Economist Intelligence Unit 2016), they also have been subjected to widely active anti-on demand strikes from traditional businesses.

Drawing on theories of psychological reactance (Brehm & Brehm 1981), perceived fairness (Thompson & Loewenstein 1992), and empathy (Batson 1990), we posit that consumers will perceive anti-on demand business strikes by traditional businesses as going against their wishes, thus unfair, resulting in a lack of empathy towards the strikers, and ultimately shifting consumers' preference away from traditional businesses and toward on-demand businesses. Yet, when the method of strike reflects respect for consumers' needs and strike slogan communicates concrete ethical reasons for the strike, we expect consumers to show greater empathy and favor the strikers and the striking traditional business, as research has shown that concrete rather than abstract information enables greater perspective-taking and thus induces greater feelings of empathy (Batson et al. 2007; Batson, Early & Salvarani 1997; Galinsky et al. 2008).

Study 1 had three manipulated conditions of *strike type* (N=206). Participants read a news article that described a strike of food delivery employees traditionally hired directly by a restaurant. In the control condition, no information was given regarding the reason for the strike. In the 'up-salary strike' condition, the strike was described as an attempt to increase the restaurant delivery employees' salaries. In the 'anti-on-demand business strike' condition, the strike was described as a protest against on-demand food delivery apps. To be consistent across conditions, all news articles mentioned an increasing number of food delivery persons working for on-demand apps were reducing the amount of work for delivery employees hired by restaurants. Then, participants indicated their preference of on-demand versus traditional businesses, perceptions of the strike in terms of respecting consumers' needs and fairness, and feelings of empathy toward the strikers. The result showed that consumers perceived anti-on-demand business strikes as being ignorant of consumers' needs, less fair, and felt less empathy towards the strikers than with other types of strikes. Importantly, we found that these psychological

mechanisms ultimately led to a lower consumer preference for traditional over on-demand businesses, suggesting that anti-on-demand business strikes may backfire rather than help traditional businesses.

Study 2 investigated whether a certain form of anti-on-demand business strike could actually aid traditional businesses by increasing fairness perceptions and empathy toward the strikers. As such, we manipulated the framing of anti-on-demand business strikes in two ways (2x2 between-subjects design, N=326): First, the degree of respect for consumers' needs was manipulated by the strikers not delivering food (*low respect*) versus the strikers delivering food for free (*high respect*) for a certain period of time. Second, the *concrete slogan* read "We do not want to be exploited like the app delivery workers," while the *abstract slogan* read "The food delivery app industry is the enemy of society." Both slogans were selected from real-world anti-on-demand business strike slogans reported in the news. Participants responded to the same measures as in Study 1. Results demonstrated that a strike-slogan that emphasizes concrete unethical behavior of the opposing business won consumers' hearts while such a slogan in more abstract terms drove consumers away from the company which employees initiated the strike. Importantly, we found that strike-slogan framing matters only when the strike was carried out in a manner that respects consumers' needs. When the strike method was perceived as disrespecting consumers' needs by causing harm to consumers, consumers turned away from the striking firm regardless of the slogan framing.

Our research makes three key contributions. First, we demonstrate that consumers' perception of a strike is not simply a matter of supporting or not supporting the striking employees (Kelloway, Francis, Catano, & Dupre 2008), but can spur brand switching behaviors away from the striking company to the competing firm when turned off by the strike. Second, we show that gaining the essential understanding and empathy from consumers for strikes against competing businesses can be challenging, especially when going against on-demand businesses that often fulfill the needs of consumers that have not been met with traditional businesses. Third, we provide marketing implications regarding the specific framing of strikes that can gain consumers' empathy, even when striking against competing on-demand businesses.

By making these key contributions, the current research breaks new ground on the management of consumers' perceptions of labor strikes as a promising new research avenue in marketing. Moreover, we extend prior research on fairness-as-a-motivated-cognition (Barclay, Bashshur, & Fortin 2017) by showing that consumers' fairness perception of the strike hinges on whether the strike method communicates respect for consumers' needs. As demonstrated in the current research, strikers must first gain understanding and empathy from consumers to successfully communicate their objectives and drive positive corporate changes without turning them away from their business. For this reason, investigating consumers' perspectives of strikes is a noteworthy topic in marketing and crucial in developing strategies to voice employees' needs in ways that constructively build sustainable business environments.

Understanding Family Responses to Resource Scarcity

Asheeabee R Shaheen Hosany, University of Surrey, UK
Rebecca W Hamilton, Georgetown University, USA

EXTENDED ABSTRACT

Many consumers experience resource scarcity in the form of limited finances (Sharma and Alter 2012), time (Fernbach, Kan, and Lynch 2015), or space (Levav and Zhu 2009). Resource scarcity has predominantly been studied at the individual consumer level (Fan, Li, and Jiang 2019), ignoring how important consumption collectives, like the family (Epp and Price 2008), respond to constraints.

This paper's investigation of family responses to resource scarcity makes three key contributions. First, we provide one of the first empirical attempts to investigate resource scarcity at the interpersonal level. Second, we identify how collective goals, negotiations, domains of control and flexibilities within the family differentiate family responses from individual responses to resource scarcity. Third, we discern that scarcity-inducing life events tend to prompt short-term adjustments in consumption and longer-term shifts in resource investment by family members.

Theoretical Background

Although prior research examines lack of time for child care (Epp and Velagaleti 2014), or long-distance relationships (Epp, Schau, and Price 2014), such work has not developed more general theorizing on family responses to resource scarcity. In contrast to individuals, families have multiple members, giving them flexibility to adjust consumption and resource investment across members in response to scarcity. However, in responding to resource constraints, families must also negotiate multiple goals (Epp and Price 2011) and navigate domains of control (Spiro 1983; Qualls 1988).

Family decision making has been examined using both unitary and bargaining models. Becker's (1965) Household Production Theory contemplates the family as a unitary body, making decisions to maximise resource utility, with a focus on a single decision maker. Bargaining models (The Resource Theory of Family Power; Blood and Wolfe 1960 and Social Power Theory; French and Raven 1959) describe how household members seek to meet personal desires through negotiation and influence. Relative Investment Theory (Davis 1976) suggests that individuals with higher outcome motivations influence decision outcomes relatively more. We posit that the flexibility inherent in having multiple family members is tempered by family dynamics.

Method

Adopting McCracken (1988) funnel approach, and similar to Epp and Velagaleti (2014), we conducted semi-structured interviews with parents in two, and single-parent families. We focused on parents, who typically hold responsibility for resource generation and allocation. Using purposive sampling, we restricted our participants to families with children under 19 years old (Moore, Wilkie, and Desrochers 2017). We first approached families using personal contacts, followed by snowballing, with the goal of achieving variability (Huberman and Miles 1994), on key criteria such as income level and family type.

We conducted interviews with 22 families via Zoom, lasting an average of 66 minutes, between December 2020 and January 2021. We asked a few questions specific to Covid-19-induced scarcity, but guided participants to share more general narratives unless prompted to focus on the pandemic. Like Braun and Clarke (2006), we followed an iterative process, moving between data and theory to uncover, refine and triangulate themes across resource types, and families.

Findings

Our analysis reveals that life events have short- and long-term effects on resource scarcity. For example, Kate and Gabriel, both employed, explain the daily struggles they face due to limited time to handle their household, four children and work. Kate's return to full-time employment eased financial scarcity but generated time scarcity. Another family, Eloise and Matt, experienced financial scarcity and could not pay for all their family members to attend their wedding abroad. The significant monetary cost of their wedding necessitated changes in their consumption behaviour.

Family dynamics influenced consumption, reflecting bargaining models of family decision making. Mum Ritika explains how her children compromised by sharing a bedroom to create space for a home office for their dad. Reduced consumption by some family members, allowing for more consumption by others, demonstrates flexibility within the family.

Families also respond to resource scarcity by adjusting resource investment across members and resource substitution. When Nick is busy with work (time scarcity), Marla helps by collecting his online orders of materials for the family run business; Rose and Charlie, both employed full-time, negotiate task allocation in caring for their two sons. For these families, the investment of time as a constrained resource is shared between the parents. Mum Vicky, explains how her extended family stays in hotels when they visit, due to a lack of space, illustrating substitution between space and money.

We find that in the short term, families tend to adjust consumption of market bought goods and services in response to scarcity. If their own space does not allow children enough room to play, parents compensate by paying admission to play areas. Longer term, parents are more likely to cope through resource investment across family members, such as when a parent chooses to work outside the home and purchase child-care.

Discussions & Conclusion

Both one-off and recurring life events can create resource scarcity within families. Multiple family members negotiate responses to resource scarcity, which may involve changes in both consumption and resource investment. Consistent with previous research on family decision making, family goals and domains of control and expertise influence responses to the use of resources within families.

Notably family responses to scarcity follow a temporal pattern, extending Hamilton et al.'s (2018) discussion of consumer responses to financial constraints, in which consumers react by adjusting in the immediate or short term, but adapt the way they respond in the longer term. Our findings highlight the temporal nature of responses to scarcity of money, time and space and substitution among these three types of resources.

Practically, our research offers insight into marketing strategies. Affordable and trustworthy outsourcing for household tasks may help parents cope with competing resource claims. Suggesting viable resource substitutions and normalizing them may help families accomplish their goals while inducing less guilt. One limitation of our work is that we examine responses to resource scarcity in an environment where intensive parenting is the norm; another is that

we have studied only a limited number of families who have children at home. Future research assessing family responses to resource scarcity in alternative contexts may reveal additional mechanisms.

What Drives Consumer Adoption of Electric Vehicles? A Country-Level Analysis and an Implicit Association Test of Gender Perceptions with Electric Vehicles

Jana Plananska, University of St.Gallen, Switzerland
Rolf Wüstenhagen, University of St.Gallen, Switzerland
Emanuel de Bellis, University of Lausanne, Switzerland

EXTENDED ABSTRACT

Electric vehicles (EVs) represent the most promising option to decarbonize the transport sector (Bauer and Cox 2019; Miotti et al. 2016). While the sales of EVs have been recently growing, the global EV market share was only 2.6% in 2019 (IEA 2020). The literature analyzing the factors that influence consumer adoption of EVs has mainly focused on socio-demographic characteristics of potential adopters and techno-economic aspects of EVs (Li et al. 2017; Rezvani, Jansson, and Bodin 2015; Singh, Singh, and Vaibhav 2020). Cars are however culturally and symbolically loaded products; their purchases reflect a broad range of emotions and meanings such as status and identity (Bardhi and Eckhardt 2012; Steg 2005; Urry 2004). The analysis of cultural and symbolic meanings as determinants of EV adoption has only recently started emerging (Ashmore et al. 2018; Barbarossa et al. 2015). One of the distinct symbolic meanings of cars is their association with gender. Contributions illustrate how the internal combustion engine (ICE) centered car culture has been co-constructed together with male identities (Bardhi and Eckhardt 2012; Belk 2004; Ivory and Genus 2010; Morgan 2009). By contrast, EVs have been perceived as related to femininity (Brough et al. 2016; Scharff 1992; Wachs 1987).

Considering the need to accelerate EV adoption, it is important to understand what the relationship between EV-gender perceptions and consumers' purchase intentions is. Consequently, the present research aims to answer two research questions: (RQ1) how femininity of national culture affects EV market share at the country level, and (RQ2) how the strength of the EV-feminine association relates to consumers' EV purchase intentions.

To answer the first research question, we conduct a country-level analysis on a sample of 40 countries from five continents. It consists of a regression analysis that applies linear regression models to identify the effect of Hofstede's cultural dimensions on EV market share. We also control for other, non-cultural, factors commonly associated with EV ownership, namely GDP and car ownership per capita (Barbarossa et al. 2015; Dargay, Gately, and Sommer 2007; McKinsey 2014). The results show that the masculinity–femininity Hofstede's cultural dimension is the most important cultural predictor of EV market share, being significant in a simple ($R^2 = 0.17$, F $(1,38) = 7.854$, $b = -0.155$, SE = 0.055, $p = 0.008$) and in a multiple linear regression model ($R^2 = 0.249$, F $(6,33) = 1.828$, $b = -0.143$, SE = 0.062, $p = 0.028$) including all six Hofstede's cultural dimensions. The correlation between country's score on the masculinity–femininity dimension and its EV market share is negative; countries whose national culture is relatively more feminine have higher EV market shares. Hofstede's masculinity–femininity cultural dimension remains a significant predictor of EV market share even if we control for GDP per capita and car ownership per capita ($R^2 = 0.415$, F $(3,36) = 8.519$, $b = -0.127$, SE = 0.048, $p = 0.012$).

To answer the second research question, we conduct a consumer-level analysis. It includes an online survey with German consumers (N = 429) that combines an implicit association test (IAT) and explicit measures of stated preferences. The aim of the IAT is to identify if and to what extent participants associate EVs with femininity (Nosek, Banaji, and Greenwald 2002; Pogacar et al. 2019). The IAT is followed by a dependent variable question ("How likely would you buy an EV?", measured by a seven-point Likert scale type of question) and a number of questions related to the topic of the study. The IAT reveals that respondents associate EVs with femininity (N = 429, M = 0.29, SD = 0.44, t $(428) = 12.69$, $p < 0.001$, Cohen's d = 0.66, 95% CI [0.25, 0.34]). We find significant differences between men and women (ANOVA, F $(1,427) = 26.371$, $p < 0.001$). Male respondents (N = 204, M 0.41, SD = 0.45; t $(203) = 12.92$, $p < 0.001$, Cohen's d = 0.90, 95% CI [0.34, 0.47]) perceive EVs as significantly more feminine than female respondents (N = 225, M = 0.19, SD = 0.42; t $(224) = 6.90$, $p < 0.001$, Cohen's d = 0.46, 95% CI [0.14, 0.25]). Second, participants who consider purchasing an EV hold a slight EV-feminine association, that is very similar to each other and to the total sample (Men: N = 74, M = 0.33, SD = 0.45; t $(73) = 6.21$, $p < 0.001$, Cohen's d = 0.72, 95% CI [0.22, 0.43]; Women: N = 68, M = 0.29, SD = 0.41; t $(67) = 5.78$, $p < 0.001$, Cohen's d = 0.70, 95% CI [0.19, 0.38]). However, male respondents who do not consider purchasing an EV perceive EVs to be the most feminine of all measured groups (N = 100, M = 0.29, SD = 0.41; t $(99) = 12.06$, $p < 0.001$, Cohen's d = 1.20, 95% CI [0.42, 0.58]).

Our research brings relevant insights to consumer research. We are the first study to show a positive relationship between femininity of national culture and EV market share. Second, using implicit measures of inquiry (IAT), we identify that consumers associate EVs with femininity. We also show differences in the strength of this association between men and women and in view of EV adoption intentions. Our findings are also relevant to practice. We recommend policymakers to gear EV support measures to the characteristics of individual national cultures, especially their femininity. We also suggest targeting promotional messages towards individual consumer segments, such as considering the latter's differentiated strength of EV-feminine association and its implications for EV purchase intentions.

The research encountered some limitations that invite for further research. First, the reasons for the identified EV-feminine association and the differences in its magnitude between men and women would merit further analysis. Second, considering the cultural embeddedness of our work, it would be desirable to investigate consumers' EV-gender associations in differentiated cultural contexts. Finally, further research could survey consumers for their preferred EV model to investigate whether implicit gender associations differ from one brand and type of EVs to another.

Distance and Alternative Signals of Status: A Unifying Framework

Silvia Bellezza, Columbia Business School, USA

EXTENDED ABSTRACT

The specific goods, brands, and preferences that convey status at any given moment are not static but rather change and evolve depending on the social identity of the individuals associated with them (Simmel 1957). Typically, status signals tend to trickle down through society, from the upper classes to the lower ones (Robinson 1961; Sproles 1981). Elites adopt new signals, and subordinate groups soon catch on, imitating their high-status peers in the hope of enhancing their social standing and communicating desired identities (Frank 1985). However, as once exclusive status markers diffuse downward and become mainstream, the top strata abandon these consumption habits and move on to different signals, reestablishing distinction from others (Bourdieu 1984). Thus, the processes of status signaling and distinction in consumption are perpetually characterized by the adoption of new and alternative signals that reinstate, at least temporarily, symbolic boundaries between groups (Berger and Ward 2010).

When high-status individuals abandon their previous status symbols, what do they adopt next? While the abandonment of products and the dissociation from previously held tastes in the face of imitation are conceptually well-established (Lieberson 2000; Simmel 1957) and empirically documented (Berger and Heath 2008; Han, Nunes, and Dreze 2010; White and Dahl 2006), the understanding of new and alternative signals of status is rather fragmented and unorganized. Some research emphasizes that elites often move on to even higher-end signals, such as more expensive cars, watches, or jewelry pieces and exclusive vacations (Leibenstein 1950; Wang and John 2019). Although upgrading to higher-end status signals is the default strategy maintained by the well-known trickle-down theories and, indeed, many high-status consumers still opt for it to this day, several market dynamics and cultural shifts have progressively diluted the signaling power of these traditional status markers.

Aggressive growth targets, often imposed by the pressure of financial markets; evolving manufacturing methods with a transition toward mass-production instead of craftsmanship; a proliferation of distribution touchpoints, including discount outlets and online channels; and an increase in the quality and reach of counterfeits have all led to the widespread possibility to shop for luxury at all price points and the so-called democratization of luxury goods (Dion and Arnould 2011; Hudders, Pandelaere, and Vyncke 2013; Keller 2009; Thomas 2009; Tungate 2009). Accordingly, in the past decades, many scholars have argued that conventional conspicuous consumption has lost its luster and has become too mainstream to grant distinction to the top strata (Bellezza and Berger 2020; Blumberg 1974; Currid-Halkett 2017; Holt 1998; Trigg 2001). Moreover, traditional luxury goods are increasingly stigmatized and associated with some dark sides. An appreciation for conventional luxury and conspicuous consumption is progressively becoming a signal of inauthenticity (Goor et al. 2020), selfishness (Van Boven, Campbell, and Gilovich 2010), coldness (Cannon and Rucker 2019; Garcia, Weaver, and Chen 2019), undesirable ulterior motives (Ferraro, Kirmani, and Matherly 2013), and even immorality (Goenka and Thomas 2019)

In parallel with these dynamics, a growing body of work has brought to light many new, alternative status-signaling strategies. For example, rather than trickling down from the top, some new status signals seem to arise from marginalized groups or subcultures (e.g., hippies, bikers, punks) (Cova, Kozinets, and Shankar 2012; Field 1970). Rather than opting for the newest and forward-looking luxuries, vintage and retro-style accessories have gained momentum among luxury brands and celebrities (Amatulli et al. 2018; Cervellon, Carey, and Harms 2012). Instead of ostentatiously displaying their material possessions, some high-status consumers are opting for inconspicuous consumption and concealing their wealth (Currid-Halkett 2017; Eckhardt, Belk, and Wilson 2015). Furthermore, ugly luxury (Cesareo, Townsend, and Zijun 2019), voluntary simplicity (Currid-Halkett 2017), and busyness at work (Bellezza, Paharia, and Keinan 2017) are all gaining popularity among the top strata. These emerging status signals are *alternative* in the sense that they depart on at least one dimension from traditional forms of luxury consumption that emphasize upscale, vertically differentiated, and resource-intensive products (Dubois et al. 2021). So far, the literature has dealt with these nontraditional signals in isolation. By contrast, this article aims to establish a unifying framework based on the overarching theme of distance from the mainstream.

Given that the overarching motive driving status signaling is distinction (Bourdieu 1984; Leibenstein 1950; Simmel 1957), it follows that signals that are distant from products, brands, and preferences that have become mainstream will deliver on the objective of dissociating oneself from others. Thus, directly building on the distance literature and the multiple dimensions of the construct (e.g., spatial, social, temporal), the proposed framework suggests that alternative signals of status are distant from mainstream signals along the following six focal dimensions:

(1) Distance in terms of *time*, or how much time separates alternative signals from mainstream signals along the new/old continuum (e.g., vintage, retro-branding);

(2) Distance in terms of *conspicuousness*, or how different alternative signals are from mainstream signals in terms of visibility on the conspicuous/inconspicuous continuum (e.g., inconspicuous consumption, stealth wealth);

(3) Distance in terms of *aesthetics*, or how different alternative signals look from mainstream signals on the beautiful/ugly continuum (e.g., ugly luxury, ugly chic);

(4) Distance in terms of *quantity*, or how much alternative signals differ from mainstream signals along the many/few possessions continuum (e.g., consumer minimalism, decluttering, sustainable luxury);

(5) Distance in terms of *culture*, or how distinct alternative signals are from mainstream signals along the highbrow/lowbrow cultural continuum (e.g., mixing-and-matching high and low status, omnivorousness);

(6) Distance in terms of *pace of life*, or how different the rhythm of alternative signals is from mainstream signals on the slow/fast continuum (e.g., busyness at work, harried leisure class, active leisure).

In conclusion, this high-level and parsimonious framework based on the notion of distance from mainstream signals along six focal dimensions (i.e., time, conspicuousness, aesthetics, quantity, culture, and pace of life) reconciles existing theories, captures various consumption phenomena related to status signaling, and generates a fruitful agenda for future research.

Expressing Passion for Luxury Restores Warmth and Enhances Liking

SungJin Jung, INSEAD, Singapore
Charlene Chen, Nanyang Technological University, Singapore
Andy Yap, INSEAD, Singapore

EXTENDED ABSTRACT

Luxury consumption yields many social and interpersonal benefits. For example, luxury consumers receive higher status conferral and preferential treatment from others (Nelissen and Meijers 2011). However, these benefits come at a price. Research proposes that luxury consumers incur a warmth penalty—they are judged as having low warmth and likability—as observers associate luxury consumption with an attempt to enhance one's impressions (Cannon and Rucker 2019; Ferraro, Kirmani, and Matherly 2013; McFerran, Aquino, and Tracy 2014).

How can luxury consumers mitigate this warmth penalty? We propose that displaying passion for luxury restores perceived warmth among luxury consumers. Passion refers to intense positive feelings toward a valued preference (Jachimowicz et al. 2019). For instance, consumers may be passionate about brands (Albert, Merunka, and Valette-Florence 2013) and thus experience strong desires to use products from these brands and invest resources into them (Batra, Ahuvia, and Bagozzi 2012). Although luxury consumers tend to be passionate about luxury products and brands, many refrain from revealing such passion to others. Out of 200 luxury consumers surveyed in a **pilot study**, 61% indicated being passionate about a luxury product or brand they use. However, 47.5% indicated that they would not share their passion for luxury with others, even if they were passionate. This reluctance likely stems from their concern that displaying such passion makes them appear boastful and materialistic (Ferraro et al. 2013).

Contrary to these concerns, we show that expressing passion for luxury actually increases the perceived warmth of luxury consumers, making them more likable and appealing as interaction partners. Passion expression restores warmth by enhancing authenticity perceptions. We theorize that consumers who display passion for luxury would be viewed as consuming luxury products because they truly appreciate the intrinsic attributes of these products (e.g., craftsmanship; Kapferer and Valette-Florence 2019; Merk and Michel 2019), instead of consuming to manage others' impressions and gain social approval. Thus, observers would perceive them as being authentic (i.e., acting in accordance with their true selves; Gershon and Smith 2020) for consuming out of genuine interest. Greater authenticity would consequently increase warmth perceptions. Research has shown that authentic service providers are rated as friendlier (Grandey et al. 2005) and induce greater feelings of comfort (Hennig-Thurau et al. 2006).

Experiment 1a (*N*=199 luxury consumers) examined whether, despite potential interpersonal benefits of displaying passion, luxury consumers avoid revealing their passion for luxury to others. Participants imagined that they were passionate collectors of either luxury or non-luxury sneakers, and that a co-worker noticed and complimented their sneakers from either Gucci or Converse. Participants were less likely to reveal their passion to the co-worker when the passion was for luxury (vs. non-luxury) sneakers (*M*=5.29 vs. 5.70; *p*=.020).

Using a three-cell between-subjects design (non-luxury vs. luxury vs. luxury-plus-passion), **experiment 1b** (*N*=299) tested whether expressing passion for luxury actually makes luxury consumers appear warmer by elevating their perceived authenticity. Participants read a vignette where they complimented a co-worker's sneakers from either Gucci or Converse. They also read that the co-worker owned several sneakers from either luxury or non-luxury brands. The luxury-plus-passion condition used the same vignette as the luxury condition but contained additional information about the co-worker's passion for luxury sneakers (e.g., "He reveals that he is passionate about luxury sneakers). The co-worker was perceived as less warm (*M*=4.46 vs. 5.06; *p*<.001) and less authentic (*M*=4.02 vs. 4.75; *p*<.001) in the luxury condition than the non-luxury condition. Crucially, passion expression attenuated these differences: the co-worker was seen as warmer (*M*=4.97; *p*<.001) and more authentic (*M*=4.62; *p*<.001) in the luxury-plus-passion (vs. luxury) condition. The luxury-plus-passion and non-luxury conditions did not differ on warmth (*p*=.45) and authenticity (*p*=.36). Authenticity mediated the effect of the luxury-plus-passion versus luxury condition on warmth (95% CI=[.15, .48]). Although expressing passion eliminated the warmth penalty of consuming luxury sneakers, it did not alter perceived status and competence (*p*s>.15).

If expressing passion makes luxury consumers appear warmer, it should also enhance their appeal as potential interaction partners. **Experiment 2** (*N*=200) used a two-cell between-subjects design (luxury vs. luxury-plus-passion) where participants chose a partner with whom they would collaborate in a follow-up study. Participants first completed a questionnaire ostensibly as part of a partner-matching process. One of the questions asked them to choose which shoe brand they usually wear. The next question asked them to explain why they wear the shoe brand they chose. Next, participants saw profiles of Participants A and B who purportedly completed the same questionnaire. Participant A chose Converse and wrote a positive reason (e.g., "I think they're a good pair of shoes."). We manipulated passion by varying Participant B's profile: in the luxury (vs. luxury-plus-passion) condition, Participant B chose Gucci and wrote a positive reason (vs. wrote being passionate about luxury sneakers). Participants were more likely to choose Participant B (i.e., the luxury consumer) when they read (vs. did not) about his passion for luxury sneakers (13% vs. 3%; *p*=.017).

Using a three-cell between-subjects design (non-luxury vs. luxury vs. luxury-plus-passion), **experiment 3** (*N*=237) studied the downstream effect of luxury passion expression on interpersonal liking. Participants read a vignette where they noticed a co-worker's watch from either Rolex or Swatch. The luxury-plus-passion condition used the same vignette as the luxury condition but contained additional information about the co-worker's passion for luxury watches. The co-worker was less likable (*M*=4.00 vs. 4.61; *p*=.002), less warm (*M*=3.87 vs. 4.61; *p*<.001), and less authentic (*M*=3.79 vs. 4.40; *p*<.001) in the luxury condition than the non-luxury condition. Importantly, passion expression reduced these differences: the co-worker was marginally more likable (*M*=4.33; *p*=.090), warmer (*M*=4.34; *p*=.009), and more authentic (*M*=4.49; *p*<.001) in the luxury-plus-passion (vs. luxury) condition. The luxury-plus-passion and non-luxury conditions did not differ on likability (*p*=.14), warmth (*p*=.12), and authenticity (*p*=.59). Finally, authenticity and warmth serially mediated the effect of the luxury-plus-passion versus luxury condition on liking (95% CI=[.11, .39]), even when controlling for competence (95% CI=[.040, .25]).

Although many luxury consumers avoid sharing their passion for luxury with others, such passion expression restores their per-

ceived warmth (and thus enhances likability) by increasing perceptions of authenticity.

Some Numbers Are More Equal Than Others: How and Why Orderly Numbers Appeal to Consumers

Meyrav Shoham, Tel Aviv University, Israel
Elinor Amit, Tel Aviv University, Israel
Yael Steinhart, Tel-Aviv University, Israel
Uriel Cohen Priva, Brown University, USA

EXTENDED ABSTRACT

Imagine standing in your local wine shop and trying to choose a bottle for a special dinner. There are two bottles available of a special edition from your favorite winery, one with the serial number 6262 and the other with the number 6281 on the label. Which bottle would you prefer, and why? In this paper, we propose and demonstrate that numbers such as 6262 are more appealing to consumers, and that they will be more likely to choose such products and to be satisfied should they obtain them.

Consumers can encounter numerical information at various stages of their decision journeys. Numerical information such as prices, attribute values, rankings and ratings, version numbers, and loyalty points can all convey information about products to consumers (Santana, Thomas and Morwitz 2020). However, this research has focused on numbers as a signal about specific product attributes (e.g., Pena-Marin and Bhargave 2016; Shoham, Moldovan and Steinhart 2018) or quality (e.g., Gunasti and Ross 2010). Our paper diverges from the substantial literature on numbers that convey concrete information to explore how product numbers can be appealing in their own right.

Consumers favor certain numbers over others (Jiang, Cho and Adawal 2009; Smith, Newman and Dhar 2016), often because the number signifies something to the consumer: feelings of luck, a personal meaning, or a sense of connection to someone else. We offer a novel perspective on why consumers may prefer products with certain numbers, focusing on whether the number is orderly or noisy.

Taking an information theoretic approach, orderly numbers can be encoded using a smaller-than-expected representation (Shannon 1948; Swait and Adamowicz 2001). A number with repetition, such as 6262, is orderly because it can be represented as the number 62, repeated, rather than having to be conveyed using four separate digits. Research on other types of repetition indicates that it can have positive implications for consumer evaluations (Pogacar, Shrum and Lowrey 2018). We propose that the repetition of digits will also appeal to consumers, and that this happens because numbers with repetition satisfy the need for structure.

Consumers in general seek structure in consumption (Cutright 2012). A sense of structure can counterbalance beliefs that consumers prefer to avoid, such as the belief that outcomes in their lives are randomly determined, or that the world is governed by nothing more than chaos (Antonovsky 1979; Kruglanski 1989). We suggest that the orderly nature of numbers with repetition can provide a sense of structure, and that this is a key driver of their appeal.

Four studies demonstrate that consumers prefer numbers with repetition and that a sense of structure plays a role in this preference. In study 1, participants ($N = 201$) were asked to imagine that they were about to participate in a race and there were two available bib numbers for their shirt: 6262 or 6281. In the repetition condition, participants were told that they had received bib number 6262; in the no-repetition condition, they were told they had received bib number 6281. As expected, the bib number was seen as more appealing in the repetition condition ($M = 4.42$, $SD = 1.48$) compared to the no-repetition condition ($M = 3.38$, $SD = 1.54$; $t(199) = 4.88$, $p < .001$; Cohen's $D = 0.689$). Participants in the repetition condition were also

more satisfied with their shirt ($M = 4.42$, $SD = 1.44$) compared to those in the no-repetition condition ($M = 3.81$, $SD = 1.35$; $t(196) = 3.12$, $p = .002$; Cohen's $D = 0.440$).

In study 2, participants ($N = 98$) were presented with five scenarios, each involving a choice between two versions of the same product that had a number with or without repetition. We used a variety of number combinations and several different products and services. A logistic regression revealed that regardless of product type, participants preferred the option that had a number with repetition compared to those with no repetition ($b = 0.715$, $SE = 0.096$, $p < 0.001$).

Study 3 ($N = 198$) used the same paradigm as Study 1, and replicated the effect of repetition on product satisfaction. Importantly, it also showed that an enhanced personal sense of structure mediated the effect ($b = -0.36$, $SE = 0.11$; 95% CI: -0.59 to -0.18). A post-test ruled out a number of alternative accounts, including that orderly numbers make consumers feel more valued, enhance their good mood, or are desirable because they are an interesting conversation piece to share with others.

Study 4 tested whether numbers with repetition might compensate for less desirable product attributes. Participants ($N = 302$) were significantly more likely to choose a watch with a longer delivery time (and a serial number with repetition) compared to the baseline likelihood of choosing a watch with a longer delivery time without information about the number (21.0% vs. 6.0% respectively; Wald(1) = 8.566, $p = .003$). The likelihood of choosing the watch with the longer delivery time and a serial number without repetition did not differ from the baseline preference (5.9% vs. 6.0%; Wald(1) = .001, $p = .972$). We obtained a similar pattern of results for a second product (a shirt with a bib number).

In sum, consumers have a clear preference for products that have numbers with repetition. This occurs because such numbers enhance consumers' sense that their world is more structured. Our research thus contributes to the knowledge on numerical information in consumer behavior by highlighting the effects of orderly vs. noisy numbers, as conveyed by repetition or the lack thereof, on product preferences. It further demonstrates that a product's number can be appealing as a focal feature. From a practical perspective, our research suggests new ways for marketers to use numbers to appeal to consumers, which may be especially fruitful when consumers desire structure. Future research can explore how other types of orderly, low-complexity numbers might affect consumer preferences.

To Earmark or Not to Earmark: Givers' and Recipients' Diverging Preferences for Earmarked Cash Gifts

Julian Givi, West Virginia University, USA
Gopal Das, Indian Institute of Management Bangalore, India

EXTENDED ABSTRACT

Consumer researchers have recently shed light on multiple instances in which gift-givers' decisions do not align with gift-recipients' preferences (Galak, Givi, and Williams 2016), with much of this research focusing on givers' and recipients' preferences concerning types of products. In other words, the decision regarding *what to give* has received plenty of attention from gift-giving scholars. However, an important aspect of gift-giving that has not received much attention is the decision concerning *how to give*. In the present work, we shed light on this important facet of gift-giving by exploring givers' and recipients' preferences concerning the messaging aspect of *how to give*. Specifically, we study the two parties' preferences regarding the practice of *earmarking* cash gifts.

We define "earmarking" as *a giver accompanying a cash gift with a suggestion that the money be used to purchase a particular product*. The practice of earmarking cash gifts seems to be rather prevalent: When we asked 50 MTurk participants whether they had ever given or received an earmarked cash gift, we found that 70% of them had. Moreover, the vast literature on mental accounting (e.g., Heath and Soll 1996) suggests that earmarking money, more generally, is quite common among consumers. Despite the pervasiveness of earmarking, the gift-giving literature has not yet explored whether givers' and recipients' preferences for earmarking cash gifts align or diverge, nor has it explored the psychology underlying how the two parties construe earmarked cash gifts. In the present work, we explore both facets, thereby addressing these important voids.

We posit that givers are less likely to earmark cash gifts than recipients prefer because the two parties hold different views concerning the thoughtfulness of earmarking cash gifts: When a giver earmarks a cash gift, this could be seen by both parties as somewhat thoughtful. By including a suggested use for the money, the giver is attempting to personalize the gift. However, by suggesting that the cash be used to purchase a particular product, the giver is highlighting that they did not actually purchase it, or in other words, that their inputs (i.e., time, effort) towards the gift were lacking. This could lead givers to view earmarking as less thoughtful compared to recipients, as givers are more sensitive to their inputs towards a gift compared to recipients. For example, givers (vs. recipients) are more responsive to the amount of brainstorming (Gino and Flynn 2011) and effort (Zhang and Epley 2012) that the giver devotes toward the gift. If givers view earmarking as less thoughtful compared to recipients, this should lead them to be less likely to earmark than recipients prefer, as perceptions of thoughtfulness often inform givers' actions and recipients' preferences (Givi 2020).

Below, we report three studies that tested the aforementioned predictions.

Study 1 tested whether givers are less likely to earmark cash gifts than recipients prefer. Participants were randomly assigned to one of two conditions (*Giver* vs. *Recipient*). They first listed their name and a close friend's name. Next, [givers/recipients] listed an item ≤ $50 that [they/their friend] would consider buying [their friend/them]. Givers then read a vignette in which their friend's birthday was approaching. They decided to give their friend $50 as a gift but were contemplating which of two messages to write in their friend's card: i) A message that included a suggestion that their friend use the $50 to purchase the item listed earlier, or ii) A message that did not include a suggested use for the $50. They indicated their preference on a nine-point scale (1 = Strongly prefer non-earmarked message, 9 = Strongly prefer earmarked message). Recipients read the same vignette from the recipient's perspective and indicated their preference. Consistent with our theorizing, givers (vs. recipients) were less open to earmarking (M_{giver} = 3.24 vs. $M_{recipient}$ = 4.52, p = .005).

Study 2 again tested whether givers are less open to earmarked cash gifts compared to recipients and explored the psychological processes that could explain this asymmetry. It was like Study 1, except that participants also indicated the extent to which the earmarking message would be thoughtful, offensive, and make the recipient feel constrained, and the extent to which the recipient would like the item (*1 = Not at all, 7 = To a great extent*). Consistent with our theorizing, givers (vs. recipients) were less open to earmarking (M_{giver} = 2.71 vs. $M_{recipient}$ = 4.10, p < .001) and considered earmarking to be less thoughtful (M_{giver} = 3.31 vs. $M_{recipient}$ = 4.72, p < .001). Givers (vs. recipients) also differed in their responses concerning offensiveness (M_{giver} = 3.56 vs. $M_{recipient}$ = 2.01, p < .001) and constraint (M_{giver} = 4.38 vs. $M_{recipient}$ = 3.57, p = .002), but not item-liking (M_{giver} = 5.86 vs. $M_{recipient}$ = 5.99, p = .38). We tested for parallel mediation using Hayes (2013) model 4. Thoughtfulness mediated the preference asymmetry and had an indirect effect that was significantly stronger than the other indirect effects.

Study 3 again tested whether givers are less open to earmarked cash gifts compared to recipients and explored potential underlying mechanisms. It was like Study 2, except for two differences. First, participants did not initially list an item. Second, in the vignette, the giver decided to give $20 as their gift and was contemplating whether to suggest (in their card's message) that the money be used to buy a $20 YETI tumbler that the recipient had been considering purchasing. Consistent with our theorizing, givers (vs. recipients) were less open to earmarking (M_{giver} = 3.53 vs. $M_{recipient}$ = 4.58, p = .009) and considered earmarking to be less thoughtful (M_{giver} = 4.18 vs. $M_{recipient}$ = 5.17, p < .001). Givers (vs. recipients) also differed in their responses concerning offensiveness (M_{giver} = 2.75 vs. $M_{recipient}$ = 1.83, p < .001), but not constraint (M_{giver} = 4.35 vs. $M_{recipient}$ = 4.06, p = .34) nor item-liking (M_{giver} = 5.71 vs. $M_{recipient}$ = 5.44, p = .14). Thoughtfulness mediated the preference asymmetry and had an indirect effect that was significantly stronger than the other indirect effects.

Women's Attitudes Toward Sexual Objectification in Brands: A Political Ideology Perspective

Carlos Torelli, University of Illinois at Urbana-Champaign, USA
Yafei Guo, University of Illinois at Urbana-Champaign, USA
Hyewon Cho, Sogang University, Korea, Republic of

EXTENDED ABSTRACT

One of the key forces reshaping the consumer market in the United States is women's rising economic power (Brennan 2020). Beyond their rising economic power, women drive 70-80% of all consumer purchasing decisions (Davis 2019). Although women in the United States have made significant strides toward closing the gaps that have kept them from achieving equality with men, sexism and gender bias remains the major issue facing women today (Morris 2020). However, the country is sharply divided along party lines about the importance and ways to deal with these issues.

In this polarized context, marketers have found it challenging to devise branding strategies to successfully connect with female customers. Specifically, increasing concerns about the negative effects of sexism is causing disarray among established feminine icons that have built their brands based on the objectification of women as symbols of men's sexual desires (e.g., Victoria's Secret, Vembar 2019). Should brands unilaterally refrain from promoting the sexual objectification of women in their communications? Are there segments of female consumers more or less likely to respond favorably to depictions of women as symbols of male desire? Given the long tradition by marketers of using sex in advertising (Reichert and Lambiase 2014), are there sexual appeals better positioned to gain widespread acceptance by today's female consumers? This research provides nuanced answers to these questions by integrating research in political ideology and consumer behavior to better explain women's responses to sexual objectification in brands.

By integrating research in political ideology and branding, we develop a conceptual framework for identifying key branding strategies likely to resonate with female consumers who endorse a conservative ideology. We propose that conservative women, despite their relatively lower status in society (relative to men), would respond more favorably to brand communications that reflect sexual objectification (i.e., depiction of women as objects of male desire) compared to their liberal counterparts. That is, conservative women's support for sexism, characterized by viewing women stereotypically and in restricted roles (Glick and Fiske 1996), would make them more likely to favor feminine brands with an identity built around the sexual objectification of women than liberal women would. However, this effect is specific to sexual appeals that are objectifying in nature, and dissipates for appeals to sexual independence (i.e., an expression of the sexual self that is relatively free from the third person's perspective, and less attached to traditional standards of sexual attractiveness, Wilkins 2004).

Four studies, including three experimental studies and one secondary study, were conducted to test our framework and Hypothesis. With a 2 (brand condition: sexually objectified vs. neutral feminine) × 2 (political ideology: conservative vs. liberal, continuous measure) between-subjects design, study 1 showed that conservative (vs. liberal) women favored more a sexually objectified brand, while this effect was absent for a feminine brand that was not positioned on sexual objectification. This latter finding rules out the possibility that the effects of political ideology on women's brand favorability are simply driven by a general tendency by conservative (vs. liberal) women to favor feminine brands in general. Study 2 replicated the findings in study 1 and assessed the attenuating effect of promoting

sexuality as independence (vs. objectification). Furthermore, study 2 also found statistical support for the mediating role of the endorsement of benevolent sexism. To further investigate the underlying process by adopting a moderation-of-process experimental design, we conducted study 3 to manipulate people's anti-sexism belief (vs. control) and found that the salience of anti-sexism belief significantly mitigated the effect of political ideology on women's preference toward feminine brands with a sexually objectified image. Finally, study 4 utilized the secondary data about women's collective support for *Victoria's Secret*, the intimate apparel retailer considered an icon of women's sexual objectification (Smith 2002). We collected county-level data about percentage of votes for Democrat/Republican Presidential candidates competing in the 2016 election and used the greater support for the Republican (vs. Democrat) candidate as the measure of pervasiveness of a conservative ideology. Results showed that the greater the support for Republicans (vs. Democrats) in a county, the higher the number of *Victoria's Secret* stores in the county. This effect distinctively emerged for *Victoria's Secret*, but not for *Aerie* (a brand of intimate apparel well known for its body positivity and inclusivity image), suggesting that the support of conservative women is specific for a brand of intimate apparel associated with a sexually objectified image of women.

These findings make important theoretical contribution to the emerging consumer literature on political ideology, and research on sexism in the brand communication. Moreover, the current research has important managerial implications for segmentation and branding decisions. Our framework based on political ideology can help managers to segment the female market according to behavior in response to social trends toward greater gender equality. Marketers of feminine brands promoted with a sexually objectified image can selectively target conservative women with their products and expect a favorable response. These brands may not need to adapt their brands to the current social trends (e.g., by toning down sexual objectification themes in ads) and still win conservative women.

Upgrade when COVID-19 is in Town: Product Upgrading as a Response to Disease Concerns

Yunbo Zhang, Hong Kong University of Science and Technology, Hong Kong
Yunhui Huang, The Ohio State University, USA

EXTENDED ABSTRACT

Apple launched its second-generation iPhone SE in April, 2020, when COVID-19 was wreaking havoc around the world. Imagine that you have been using the first-generation iPhone SE for a few years, will your concerns about COVID-19 exert any impact on your likelihood of upgrading to a second-generation iPhone SE? Will how much you identify with the brand Apple also play a role in your decision?

Questions like these have become particularly relevant as CO-VID-19 rages across the world, making it ever-more important to understand how disease-related cues shape consumer decisions. Our thesis derives from recent research on Behavioral Immune System (BIS; Murray & Schaller, 2016), a psychological disease-avoidance system that has evolved in response to the threat of infectious pathogens. Merging the evolutionary perspective on disease-induced motives with research on product upgrading, this research postulates that concerns with infectious diseases evoke people-avoidance motives (Mortensen, Becker, Ackerman, Neuberg, & Kenrick, 2010; Sacco, Young, & Hugenberg, 2014), because other people are prime sources of contagion. This people-avoidance motive in turn heightens strong-(vs. weak-) SBC consumers' interest in upgrading to more exclusive products, which are by definition associated with fewer consumers (Wang & John, 2019). This occurs because for consumers with strong (vs. weak) SBCs, who presumably identify with the brand and see the brand as part of who they are (Escalas, 2004), gravitating toward more exclusive products offered by the same brand enables them to symbolically distance from the brand's majority of users (thus fulfilling their people-avoidance motive) while also preserving their relationship with the brand.

Study 1 was designed to provide preliminary evidence for our basic hypothesis that consumers with strong (vs. weak) SBCs will be more interested in upgrading within the brand's product line when they feel particularly concerned about disease threats. Participants were asked to report their strength of SBCs with Nike and interest in upgrading within the brand. They also reported their concern with the COVID-19 pandemic. Consistent with our prediction, concern with COVID-19 positively predicted likelihood of upgrading for participants with strong SBCs (mean + 1SD) with Nike ($b = .26$, $t(402) = 2.70$, $p = .007$), but not for those with weak SBCs (mean - 1SD; $b = -.002$, $t(402) = -.028$, $p = .978$).

Study 2 aimed to demonstrate the underlying process. Participants were asked to name a brand of apparel they frequently purchased. Next, they indicated likelihood of upgrading to a new or exclusive version of the brand they had named and the strength of SBCs with this brand. We then measured participants' intention to symbolically distance from other consumers of the same brand and their dispositional concerns with disease susceptibility using the Perceived Infectability (PI) subscale of the Perceived Vulnerability to Disease scale (PVD; Duncan, Schaller, & Park, 2009). The regression analysis revealed a significant main effect for both SBC strength ($b = 1.01$, $t(544) = 19.60$, $p < .001$) and perceived infectability ($b = .10$, $t(544) = 2.00$, $p = .046$). Importantly, the interaction between SBC strength and perceived infectability was also significant ($F(1, 544) = 4.79$, $p = .029$). Replicating results from study 1, higher perceived infectability was associated with greater intention to upgrade within the brand ($b = .21$, $t(544) = 2.95$, $p = .003$) for participants

who reported strong SBCs with the brand (mean + 1SD), but not for those with weak SBCs (mean - 1SD; $b = -.003$, $t(544) = -.05$, $p = .961$). A 5000-sample bootstrapped analysis showed that the interaction effect of perceived infectability and SBC strength on upgrading intention was mediated by symbolic distancing, indirect effect = .07, SE = .02; 95% CI = [.039, .115]. Specifically, symbolic distancing mediated the effect of perceived infectability on upgrading intention for strong-SBC brand users (mean + 1SD; indirect effect = .18, SE = .04; 95% CI = [.111, .259]), but not for weak-SBC users (mean - 1SD; indirect effect = .03, SE = .02; 95% CI = [−.005, .078]).

Study 3 examined a potential moderator—perceived popularity of the brand. If a consumer perceives a brand to be highly popular, he/she is likely to think that even the newest upgrades will attract a large number of consumers and consequently fail to serve as an instrument for symbolic distancing. Therefore, the hypothesized interaction should be attenuated for products that are perceived to be highly popular. Participants were asked to read a news article either about COVID-19 (disease condition) or about climate change (control condition). Next, all participants reported the brand of mobile phone they were currently using and indicated likelihood of updating from their current phone to the newest model from this brand. Finally, participants reported how popular they perceived their mobile phone brand to be. A significant three-way interaction was revealed by the analysis ($F(1, 335) = 9.90$, $p = .002$). Consistent with our hypothesis, there was a significant two-way interaction between disease manipulation and SBC strength only when participants perceived the mobile phone brand to be unpopular (mean - 1SD: $b = .58$; $t(335) = 3.11$, $p = .002$; mean + 1SD: $b = -.11$; $t(335) = -.62$, $p = .539$). Replicating our basic effect, exposure to information about COVID-19 pandemic led to greater interest in upgrading for strong-SBC participants (6.94 vs. 5.80; $t(335) = 3.05$, $p = .003$), but not for weak-SBC participants (4.86 vs. 4.88; $t(335) = -.11$, $p = .911$).

Taken together, these findings extend previous work on the effects of disease concerns on product decisions and contribute to our understanding of product upgrading by demonstrating that such decisions could be shaped by incidental environmental factors (i.e., disease cues). From a more managerial perspective, our findings emphasize the importance of creating strong SBCs, especially for less popular brands. Whereas a highly threatening disease cue might deter low-SBC consumers from making any purchases, for consumers who have strong SBCs with a brand, such cues could potentially increase the sales of exclusive, new, or limited products, which presumably have higher profit margin.

"It is Still Someone Else's!" The Effect of Implicit Theories on the Consumption of Pre-Owned Goods

Sohyun Bae, National Cheng Kung University, Taiwan
Natalie Truong, Nova School of Business and Economics, Portugal
Sharon Ng, Nanyang Technological University, Singapore

EXTENDED ABSTRACT

With the advent of new technology and increased awareness about environmental conservation, consumption of pre-owned goods has grown rapidly. Yet, despite this increased interest, research on the consumption of pre-owned goods is still limited. A key finding in this area shows that some consumers are reluctant to buy pre-owned products due to a fear of contamination (Xu et al. 2014). However, anecdotal evidence suggests that consumers' reluctance persists even if the pre-owned products are in clean condition (e.g., Roux 2006). This indicates that other factors may be concurrently driving consumers' acceptance of pre-owned products. In this research, we propose that consumers' implicit theories may influence their attitudes toward pre-owned goods as their beliefs affect the extent to which they feel a sense of psychological ownership over the products.

Research on implicit theories shows that entity theorists believe that people's traits are fixed, whereas incremental theorists believe that traits can be developed by way of personal effort (Dweck et al. 1995). Previous research found that entity theorists are more likely to use products and brands for a self-signalling purpose and regard their possessions as part of their extended selves (Park and John 2010). Drawing from this research, we propose that entity (versus incremental) theorists are more likely to believe that a pre-owned product cannot be incorporated into their self-identity as it carries remnants of the previous owner. This leads to a lower sense of ownership and lower purchasing intention toward such a product. In contrast, incremental theorists, who believe that things are malleable, are likely to believe that a used product can be detached from its previous owner and become their own.

Hypothesis 1: *Entity theorists will exhibit less favorable attitudes toward and willingness to purchase pre-owned products relative to incremental theorists.*

Hypothesis 2: *Psychological ownership mediates the effect of implicit theories on consumers' attitudes toward and willingness to purchase pre-owned products.*

We propose a reversal of the predicted effect in H1 in situations where remnants of the previous owner are seen as positive (e.g., coolness). Since people typically assume that users of a brand exude the same characteristics of the brand they use (Park and John 2010, 2012), entity (versus incremental) theorists who hope that such remnants may be "transferred" to them would view the lingering traits from the previous owner positively and exhibit greater willingness to purchase such products.

H3: Compared to incremental theorists, entity theorists are more likely to purchase pre-owned products that possess a desirable brand image.

We conducted five studies to test the Hypothesis. Study 1 (N=121) tests whether consumers' implicit theories influence their attitudes toward pre-owned goods. Participants were presented with pre-owned sunglasses and asked to indicate how much they would bid for them. Implicit theories were measured by using the 8 items adapted from Levy et al. (1998). We found that participants with stronger entity (vs. incremental) beliefs indicated a significantly lower bid price for the pre-owned sunglasses (B=-3.004, t=-2.17, p<.05).

Study 2 (N=607) replicated the results of Study 1 by using a different product-bicycle. We adopted a 2 (product type: pre-owned vs. new) between-subjects design with implicit theories measured as a continuous variable. Participants were randomly allocated to one of two product conditions. In both conditions, participants were presented with the same information about the bicycle, other than the fact that one was new whereas the other was pre-owned. After reading information about the bicycle, they were asked to indicate their attitudes toward the bicycle. Implicit theories were measured. Results showed a significant two-way interaction (B=-.18, SE=.07, p=.01). As expected, in the pre-owned product condition, entity theorists showed more negative attitudes toward the bicycle, compared to incremental theorists (M_{entity}=4.91 vs. $M_{incremental}$=5.37, B=-.13, SE=.05, p<.01), whereas entity and incremental theorists indicated similar attitude ratings in the new product condition (M_{entity}=5.77 vs. $M_{incremental}$=5.64, B=.04, SE=.05, p>.4).

Study 3 (N=355) aims to provide stronger evidence of causality by manipulating participants' implicit theories. Participants were randomly assigned to one of the three conditions (entity vs. incremental vs. control). Implicit theories were manipulated using news articles adapted from Chiu et al. (1997). After the manipulation, participants imagined that they found a pre-owned laptop online that suited their needs. Participants were asked to indicate how much they would bid for the pre-owned laptop. One-way ANOVA showed a significant main effect of implicit theories (F(2, 352)=3.12, p<.05). Specifically, participants in the entity condition (M_{entity}=$251.95) indicated a lower bid than those in the incremental condition ($M_{incremental}$=$284.47, p=.05) and control condition ($M_{control}$=$291.32, p<.05).

Study 4 (N=534) tests the mediating role of perceived ownership (H2). Design of Study 4 was similar to that of Study 2 except that perceived ownership was measured, and the focal product was a backpack. Analysis showed that the interaction between implicit theories and products type was significant (B=-.20, SE=.09, p<.05). Specifically, entity theories were less likely than incremental theorists to purchase the second-hand backpack ($M_{entity/secondhand}$=3.95 vs. $M_{incremental/secondhand}$=4.32, B=-.12, SE=.06, p<.05), whereas no difference was found in the new backpack condition ($M_{entity/new}$=5.22 vs. $M_{incremental/new}$=4.98, B=.08, SE=.06, p>.19). More importantly, perceived ownership mediated the effect of implicit theories on purchase intention (Indirect effect=-.04, SE=.02, 95% CI=[-.08, -.00]).

Study 5 (N=374) tests the moderating role of brand image (H3). This study employed a 2 (entity vs. incremental) by 2 (cool vs. normal brand) between-subjects design. Based on a pre-test, we selected Beats (vs. Sony) to represent a cool (vs. normal) brand. After reading a similar scenario used in previous studies, participants indicated their willingness to purchase. Analysis showed a significant two-way interaction (F(1, 369)=10.9, p <.01). More specifically, entity (vs. incremental) theorists were more likely to purchase the pre-owned Beats headphones ($M_{entity/cool\ brand}$=3.95 vs. $M_{incremental/cool\ brand}$=3.29, F(1, 369)=5.87, p<.05), whereas they were less likely than incremental theories to purchase the pre-owned Sony headphones ($M_{entity/normal\ brand}$=3.11 vs. $M_{incremental/normal\ brand}$=3.73, F(1, 369)=5.05, p<.05).

Collectively, findings from the 5 studies support our propositions that entity (versus incremental) theorists will evaluate pre-owned products less favorably as they feel a lower sense of psychological ownership over the pre-owned products.

Opportunity Neglect

Emily Prinsloo, Harvard Business School, USA
Kate Barasz, Univ. Ramon Llull, ESADE, Spain
Leslie John, Harvard Business School, USA
Michael Norton, Harvard Business School, USA

EXTENDED ABSTRACT

People often decide whether to accept or reject opportunities with high payoffs but a low probability of success. For example, a PhD student must decide whether to submit a paper for a prestigious award, or a job-seeker must choose whether to apply for a dream job. In some cases, people can be reluctant to take these opportunities due to objective costs. Many decisions, however, are relatively costless objectively, such as when a paper has already been written or the application process is fully anonymous.

We show that many people exhibit opportunity neglect, failing to pursue costless opportunities with only upside. We introduce a paradigm that controls for the objective costs of taking opportunities. Participants choose to accept or reject real incentive-compatible gambles that yield either a $0 payoff ("winning nothing"), or a positive dollar amount (e.g., $99) with a very low (1%) probability (e.g., "*There is a 1% chance that you will win $99, and a 99% chance that you will win nothing*"), and no cost to enter. Across 9 preregistered studies, we find that a non-trivial percentage of participants (between 23.0% and 56.4%) reject such gambles. We demonstrate that opportunity neglect is driven by a (erroneous) feeling of having "nothing to gain" from pursuing such opportunities; consistent with fuzzy trace theory (Reyna & Brainerd, 1995), it is as if people encode a 1% chance at winning as "I won't win anything."

Study 1a explored whether opportunity neglect occurs at high stakes. We employed a five-condition (payoff: $0.01, $0.1, $1, $10, $100) between-subjects design. Participants were offered a low-probability gamble with varying stakes: "You have a 1% chance of winning $[payoff] and a 99% chance of winning nothing." Participants were asked, "Would you like to take this gamble?"(*Yes/No*), and whether they could have lost any money by taking the gamble (83.6% correctly chose "*No*"). Opportunity neglect manifested even at the highest payoff: 40.7% of participants rejected the gamble at $100 (40.7% vs. 0%: z=3,774.36, p<.001). In fact (and surprisingly), the rejection rate in the highest payoff condition was statistically equivalent to that of the other payoff amounts, χ^2(4,N=500)=5.91, p=.21,Φ=0.11.

Study 1b explored whether opportunity neglect occurs when the low- and high-probability gambles have an equal expected value. We employed a two-condition (success probability: low, high) between-subjects design. The low [high] probability condition read: "You have a 1%[99%] chance of winning $99[$1], and a 99% chance of winning nothing." Thus, for both conditions, the expected value was $0.99. As in Study 1a, participants chose whether to take the gamble (*Yes/No*). Then, they completed the comprehension check from Study 1a (78.1% passed). In the low probability condition, 41.4% of participants rejected the gamble—a non-zero percentage (41.4% vs. 0%:z=4120.24, p<.001). This rejection rate was significantly higher than the 2.9% rejection rate in the high probability condition, χ^2(1,N=201)=43.49, p<.001,Φ=0.47.

To demonstrate the robustness of opportunity neglect, we conducted additional studies. In one study, we included three response options: *Yes, No* and *I'm indifferent*. We continued to observe opportunity neglect for a low-probability opportunity: 31.7% of participants actively rejected the gamble, and only 5.0% indicated that they were indifferent. In another study, participants neglected low-probability opportunities whether framed as a gamble (44.0%), opportunity (32.4%), lottery (38.8%) or draw (43.1%). In another study, we observed opportunity neglect in the field with goods. In the low (1%) probability condition, 27.2% (27.2% vs. 0%, z=2758.46, p<.001) rejected a chance at winning a University-branded pen. In another study, when defaulted into taking a low-probability gamble, participants even exerted effort to switch away from taking the gamble. Thus, transaction costs are unlikely to explain our effect.

In Study 2, we documented opportunity neglect in an everyday scenario. Participants supposed that they had the opportunity to be considered for a prestigious award "simply by uploading a statement" that they had "already written for a different application." Participants in the low [high] probability condition read, "You estimate that you have a 1%[99%] chance of receiving the award, and a 99%[1%] chance of not receiving it." Participants were asked, on a 7-point scale, "How likely would you be to apply to the award?" Participants were less likely to apply in the low probability condition (M=4.00, SD=2.28,mean rank=138.78) than the high probability condition (M=6.28,SD=1.32,mean rank=249.23;U=7894.50,p<.001). In the low probability condition, 22% selected the lowest possible value, displaying a strong aversion to taking the opportunity. Of course, everyday decisions can introduce other risks, such as reputational concerns; we do not suggest that these factors cannot play a role in people rejecting opportunities. Rather, we suggest that opportunity neglect plays a distinct role.

In Studies 3a&b, we tested our mechanism and designed interventions by re-orienting participants' attention toward the feeling of having "nothing to lose."

Study 3a intervened by explicitly labeling the "No" response as reflecting a "0% chance of winning." All participants were offered a low-probability gamble: "There is a 1% chance that you will win $10, and a 99% chance that you will win nothing." Between-subjects, response options were either unlabeled (*Yes/No*) or labeled with explicit probabilities: "Yes (You have a 1% chance of winning)" and "No (You have a 0% chance of winning)." On a new page, participants were asked: "How did this gamble feel to you?"(from "It felt like I had nothing to gain" to "It felt like I had nothing to lose"). Participants also rated their anticipated disappointment and regret. Merely reframing the "No" option as a "0% chance of winning" significantly reduced the rejection rate of the low-probability gamble (13.3% vs. 34.0%;χ^2(1, N=300)=17.73,p<.001,Φ=0.24. The feeling of having "nothing to lose" emerged as the primary significant mediator, b=-0.69,SE=0.26,95%CI=[-1.31,-0.28]. The indirect effect for anticipated disappointment was significantly smaller; anticipated regret did not emerge as a mediator.

Study 4B reframed the *Yes/No* decision to a (functionally equivalent but psychologically distinct) choice between gambles. Significantly fewer participants rejected the low-probability gamble under a choice frame (5.9%) than the single gamble frame (36.1%;χ^2(1,N=199)=27.72,p<.001,Φ=0.37). In contrast, rejection rates of the high-probability gamble did not differ significantly between the choice (2.0%) and single gamble condition (4.0%;χ^2(1,N=201)=0.67,p=.41,Φ=0.06).

The Effects of Loan Application Formats on Consumer Loan Decisions

Alicia Johnson, University of Arkansas, USA
Daniel Villanova, University of Arkansas, USA
Ronn Smith, University of Wyoming, USA

EXTENDED ABSTRACT

When consumers request to borrow funds from financial institutions, applications may elicit either a desired loan amount or monthly payment. Drawing from research on preference construction (Bettman, Luce, and Payne 1998), scale compatibility (Slovic, Griffin, and Tversky 1990), and selective accessibility (Mussweiler and Strack 1999), we hypothesize that the monthly payment versus loan amount format will bias principal requests because of the selective recruitment of different task-relevant numerical information. When loan amounts are elicited, consumers think of and request the cost of the expenditure they seek to finance. When monthly payments are elicited, consumers think of their monthly budget slack to construct and then request monthly payments they perceive to be affordable. Thus, we expect principal requests to be more strongly related to the purchase cost with a loan amount versus monthly payment format.

Study 1: Effect of Loan Application Formats

In Study 1, we show the effect on principal requests using a two cell between-subjects design. Participants (N=151) imagined that they wanted to go on a trip that cost $3,150, for which they would need to take out a personal loan. Participants were randomly assigned to provide either a desired monthly payment (MP) or loan amount (LA). Responses in the LA condition were the principal requests, and responses in the MP condition were converted to principal requests using the specified term (36 months) and interest rate (10.22%).

Participant responses were open-ended and resulted in some outliers. To address these outliers, in all studies, a standardized data cleaning process was followed. In all the studies, including these responses does not change the overall pattern of results but does inflate standard errors. We included income as a covariate in all regression analyses and used heteroskedasticity-consistent standard errors (HC3; Hayes and Cai 2007).

Principal Requests. As expected, participants requested significantly higher amounts in the MP versus LA condition (d=1.20, p<.001; all statistics are available in Table 1).

Study 2: Loan Application Formats Affect Elaborations

In Study 2, we sought to replicate the main effect with a different loan purpose, and to probe the hypothesized selective accessibility process. We used a 2 (Personal Loan Description: present vs. absent) x 2 (Loan application format: MP vs. LA) between-subjects design. Participants (N=301 CloudResearch-approved Mturkers) imagined financing a new washer and dryer ($5,150). Participants in the description present (absent) condition saw (did not see) the personal loan description, which we included to test whether the results were robust to having detailed information about personal loans or not. After providing their request, participants described what information they considered to determine their request amount. Then participants self-coded these elaborations by selecting from one of six possible responses.

Principal Requests. Participants requested significantly higher principal amounts in the MP versus LA condition (d=.44, p<.001). Of note, the effects of the personal loan description and interaction were non-significant (ps>.38).

Elaborations. The pattern of elaborations differed between the loan application formats (χ^2(5)=139.17, p<.001). Participants in the

MP condition were more likely to focus on affordability than those in the LA condition (60.3% vs. 9.3%, z=9.17, p<.001) while those in the LA condition were more likely to focus on the purchase price than those in the MP condition (75.3% vs. 9.9%, z=11.24, p<.001).

Study 3: Loan Application Format by Cost Level Moderation

In Study 3, we test the hypothesized reversal across cost levels. We manipulate the estimated cost of the purchase without changing the target expense. Participants who currently had a mortgage or owned their primary residence (N=268) were assigned to our 2 (cost: high vs. low) x 2 (loan application format: MP vs. LA) between-subjects design. Participants imagined that their roof needed replacing. In the high (low) cost condition, the estimated cost was $13,150 ($5,150). Participants proceeded as in previous studies.

Principal Requests. The focal interaction was significant (t(254)=-7.27, p<.001). In the low cost condition, requests were higher in the MP versus LA format (d=.87, p<.001). However, in the high cost condition, this effect was reversed, as expected (d=-.89, p=.001).

Study 3 provides moderation evidence of the hypothesized selective accessibility process. Specifically, the results indicate consumers request amounts that assimilate the cost of an expenditure when asked to provide a loan amount during the application process yet depart from cost when asked to provide a monthly payment (see Table 1), in line with differential accessibility of cost across the formats.

Study 4: Budget Slack as an Anchor

In this study, we use a higher cost purchase, which should result in MPs biased lower than what would be implied if individuals instead used the estimated cost. We manipulate individuals' budget slack upwards, which should reduce, and possibly reverse, this discrepancy. We also include a salient budget slack condition where we do not manipulate the amount, but the salience of slack, to address the possibility that our slack manipulation could artificially increase the salience of one's budget slack. Participants (N=454) were randomly assigned to our 3 cell (Budget Slack: control, high, salient) between-subjects design. Participants imagined that they needed to finance a wedding that cost $13,150 and proceeded as in previous studies.

MP Requests. Participants requested significantly larger MPs in the high versus control budget slack condition (t(393)=10.40, p<.001, d=1.26). Participants also requested significantly larger MPs in the high versus salient budget slack condition, and the effect was even larger (t(393)=11.54, p<.001, d=1.41).

Budget Slack Anchoring. Well above the majority of participants in each condition provided MP requests that were less than their budget slack amount (87%). Moreover, the correlation between budget slack and MPs was significant in the salient (r=.493, p<.001) and control (r=.195, p=.026) conditions.

Conclusion

Across four studies we find evidence that loan application formats affect consumer loan requests. While a loan amount (vs. monthly payment) format yields principal requests more in line with

expected costs, the consumer welfare conclusions of these findings are complex. A loan amount format might reduce over-borrowing for lower cost expenditures, but with given loan parameters, it leads to required monthly payments that are higher than those desired by consumers for higher cost expenditures.

Group Gift Giving: Why More Givers Tend to Buy a "Bigger" Gift?

Yaxuan Ran, Zhongnan University of Economics and Law, China
Yanfen You, University of Massachusetts Amherst, USA

EXTENDED ABSTRACT

From festivals and holidays to birthdays and graduations, friends and families often come and buy a gift together to a loved one. This kind of group gifting is also prevalent in practice. For example, eBay in 2015 has launched Group Gifts team, providing an online way for group gift giving. How would the collective form of gifting influence people's spending and gift preference? Intuitively, one may predict that group gifting would make people give less because everyone chips in the gift. Yet, in this research, we find a *bigger-gift effect*, such that people tend to spend more *per person* in a group gifting compared to that in an individual gifting because of a heightened desire to make an impact.

Extant research on gift giving has predominantly focused on gifting contexts with only one giver and one receipt (e.g., Ward & Broniarczyk, 2016; Paolacci, Straeter, & de Hooge, 2015). To fill this gap, we examine how and why group gifting versus individual gifting influences people's spending. We show that group gifting triggers a greater desire to make an impact than individual gifting. This desire may occur because people always hold a "strength in numbers" belief. In turn, consumers would be motivated to buy a bigger gift fit with the name of group, which further loosens their budget and engenders more spend per person.

Study 1 was a two-cell (gift giving mode: dyadic vs. individual) between-subjects design. 219 university students (31.25% males, M_{age} = 20.78) participated in this study were either randomly paired with another participant from the session whom they did not know (to create dyads; n = 62 dyads) or asked to work individually (n = 107 individuals). Participants in the individual (group) condition were told to imagine that their (co)friend A's 20-years-old birthday is approaching and they are planning to give a gift for A (together). Participants reported what kind of gift they want to give, how much the gift is (unit: ¥), and the range of cost they can afford (unit: ¥). Finally, they reported their demographics. Results indicated that compared to those in the individual gifting, participants in the group gifting would like to give an averagely more expensive gift (175.44¥ vs. 155.39¥; Z = 2.19, p = .028) and a greater range of gift price (93.75 vs. 65.78; $t(31)$ = 1.89, p = .069, d = 2.45).

Study 2 was a two-cell (gift giving mode: group vs. individual) between-subjects design. Participants were first told to imagine that they had a very close roommate A whose birthday was approaching and they had decided to give A a gift card named "One in Hundred." In the individual gift-giving condition, participants were instructed that they would buy the gift card alone. In the group gift-giving condition, participants were instructed to imagine that other two friends of A, B and C, would like to join with them and three of them will buy one gift card together for A. Then they wrote down the amount of money they want to chip in the gift card (unit: ¥). Participants then rated their desire to make an impact in the gift giving, face consciousness, and other controls. Results showed that participants in the group gifting condition indicated greater spending per person than those in the individual gifting condition (149.08 vs. 93.33; $F(1, 54)$ = 13.10, p = .001, η_p^2 = .20). And there is a significant indirect effect of desire to make an impact from group gifting on spending per person (β = .27, SE = .12, 95% CI: [.0717, .5249]).

Study 3 replicates the bigger-gift effect in a real-life setting. We collected the field data in a flower store located in a large public university in Southern China. In collaboration with the owner of the flower store, we launched a promotion activity for one week before the Teacher's Day in fall 2016, from 5th Sep (Monday) to 10th Sep (Saturday). Consumers shopping in the store would be invited to answer a short questionnaire and then receive a ¥5 cash voucher (approximately U.S. $.80 dollars). The voucher can be used to purchase all flowers in the store. The questionnaire included the purchase time, whether they buy flowers for the Teacher's Day, and if not, what is the purpose of buying flowers. After that, participants reported the number of givers, whether they have discussed about the gift, whether he/she is the decide-maker, whether there are other products, and how much the price of other products is. Results of the regression model showed that the square term was significantly negative (β = -.59, t = -1.90, p = .060), but the main effect of the number of givers was not significant (β = .02, t = .07, p = .943). These results confirmed an inverted U-shape relationship between the number of givers and spending per person. This suggests that as the number of givers increase, the spending per person tend to increase (when the number of givers is relatively smaller) and then decrease as the number of givers increases.

In the present research, we compared the group gifting to individual gifting. Two experiments and one field study demonstrate that compared to individual gifting, group gifting leads to higher spending per person and a more loosing budget, which we called the bigger-gift effect. This effect occurs because group gifting elicits a heightened desire to make an impact. At the conceptual level, this research extends previous work from the individual gifting to group gifting. This research also contributes to literature in group decision by proposing a new finding that is opposite to social loafing and free riding effect.

When Lifestyle Advertising Hurts Luxury Brands

Jingjing Ma, Peking University, China
Zichuan Mo, Sun Yat-sen University, China
Yuanjie Zhao, Peking University, China

EXTENDED ABSTRACT

In 2019, consumer spending on luxury products amounted to $1.58 trillion globally (D'Arpizio et al. 2020). Advertising plays an important role in inducing luxury purchases and is usually a sizable investment by luxury companies. For example, in 2018, the total advertising spending for luxury products exceeded $12 billion and was growing at an annual rate of 2.4% (Mika et al. 2018). Therefore, understanding the effectiveness of luxury advertising is critical to the success of luxury brands.

Most luxury advertisements, whether online or in stores, tend to express a certain lifestyle, personality, taste, or identity. Elements such as functionality, quality, material, and craftmanship are less common. For example, Emporio Armani uses the slogan "Doesn't like to be called an influencer. Likes to have influence" in one of its advertisements to suggest an independent and elegant lifestyle. In our research, we define advertisements emphasizing intangible or abstract features (e.g., lifestyle, personality, taste, identity) as *lifestyle* advertisements; those centering on tangible or concrete features (e.g., functionality, quality, material, craftsmanship), *functional* advertisements (e.g., Chernev, Hamilton, and Gal 2011; Cosmas 1982). Irrespective of the marketplace or in the existing literature, seemingly luxury brands predominantly opt for abstract and lifestyle advertisements instead of concrete, functional advertisements (Gurzki, Schlatter, and Woisetschlager 2019; Kim, Lloyd, and Cervellon 2016). Is this because lifestyle advertisements are more effective in inducing luxury purchases than functional advertisements?

Intuitively, the answer should be yes. In fact, existing literature on luxury advertising has documented the advantages of using abstract and lifestyle advertisements, such as conveying symbolic or identity value of the luxury brand and promoting engagement of advertisements (e.g., Freire 2014; Gurzki et al. 2019; Kim et al. 2016).

However, in the present research, we argue that, depending on the situation, functional advertisements can be more effective for luxury products than lifestyle advertisements. Specifically, we apply a two-stage model of decision making (Dhar, Huber, and Khan 2007; Wood 2001; Xu and Wyer 2007) to the luxury purchase context: Stage 1 is the *motivation formation stage*; consumers do not yet intend to buy a luxury product and are still forming purchase interest and motivation. Stage 2 is the *purchase decision-making stage*; consumers desire to buy a luxury product, and their focus is on deciding which product to buy. According to the construal level theory, when consumers are in stage 2, they are in closer proximal distance (both temporally and hypothetically) with purchasing a luxury product than when they are in stage 1. This leads to their focusing more in stage 2 on low-level, concrete, and pragmatic information than in stage 1. Because functional (vs. lifestyle) luxury advertisements are more likely to emphasize such low-level information, we hypothesize that in stage 2 (vs. stage 1), functional advertisements can be more effective for luxury products than lifestyle advertisements.

We tested our propositions in four studies. Study 1 (1a - 1b) tested our proposition that at stage 2, functional (vs. lifestyle) advertisements can lead to higher purchase likelihood for luxury products.

Study 1a assessed the proposition in a choice setting where a "new" watch brand (i.e., Imet; a fictitious luxury brand we created) was competing with the market leader (i.e., Rolex; Statista 2019). Luxury consumers were recruited and were asked to make a purchase decision between the Imet watch and the Rolex watch which having the same price. Respondents either saw a lifestyle slogan or saw a functional slogan of the Imet watch. Result showed that respondents were more likely to choose the new brand (Imet, rather than Rolex) when the watch was accompanied by a functional (vs. lifestyle) slogan (75.1% vs. 59.7%; (1, N = 399) = 10.86, $p < .001$, = .33).

Study 1b involved realistic choices of real luxury products. Student consumers who were about to purchase luxury lipstick (i.e., stage 2) were recruited. Respondents were told that, as an extra reward for their participation, they had a 1 in 25 chance of receiving a luxury lipstick voucher worth 330 RMB (about $50). They would be able to use this voucher for a Givenchy lipstick or a Dior lipstick. We randomly assigned one lifestyle and one functional slogan to the two lipsticks. Results showed that respondents were more likely to choose the lipstick accompanied by a functional advertisement rather than by a lifestyle advertisement ((1, N = 111) = 5.06, $p < .05$, = .44).

Study 2 tested our proposition with both stages. Through a Pre-study, we found that consumers tended to associate some luxury advertisement channels (e.g., social media) with stage 1 (vs. stage 2), and some channels (e.g., e-commerce stores) with stage 2 (vs. stage 1). According to this Pre-study, we applied social media and e-commerce stores to stage 1 and stage 2, respectively. Besides, we included four product categories (shoes vs. wristwatches vs. tops vs. sunglasses) in this study to improve the generalizability of our findings. Respondents were asked to rate on two seven-point scales in terms of the extent to which they were attracted by the displayed products vis-à-vis exposure to a lifestyle or functional advertisement. Results showed that, for all four product categories, the relative attractiveness of functional advertisements (vs. lifestyle advertisements) was greater in stage 2 (vs. stage 1) (= .48 vs.= .31; $F(1, 2007) = 7.82$, $p < .01$, = .13).

Study 3 explored the underlying mechanism for the proposed effect. We assessed consumers' construal level when they were processing functional or lifestyle advertisements, and when they were in stage 2 or stage 1 by asking them to report their thoughts in each condition. Results suggested that functional (vs. lifestyle) advertisements were more compatible with consumers' construal level in stage 2 (vs. stage 1).

In sum, the results supported our proposition that in stage 2 (vs. stage 1), functional advertisements can be more effective for luxury products than lifestyle advertisements. This research contributes to literature on luxury branding, lifestyle and functional advertising. In addition, this research offers practical implications to luxury brand managers in terms of advertising strategy.

Enhancing Sensitivity to Probability Through Experiential Sampling of Outcomes

Jon Bogard, University of California, Los Angeles, USA
Craig Fox, University of California, Los Angeles, USA

EXTENDED ABSTRACT

A keystone of Prospect Theory is that people over-weight low probabilities, under-weight high probabilities, and are under-sensitive to differences in intermediate probabilities. Research on decisions from experience, in which people sample from probability distributions over outcomes, reveals greater sensitivity to intermediate probabilities. This suggests a novel technique for debiasing probability distortions in practice: present probabilistic information in an experiential manner.

To illustrate, suppose a doctor tells you that you have a 1 in 10 chance that a recent scan indicates cancer, and you expect to get the final diagnosis at the end of the week. Most people would substantially overweight this emotional event, perhaps preparing for aggressive treatment and getting affairs in order. Now suppose instead that you simulate 9 people with scans like yours getting a happy phone call (no cancer, no, no...no) and getting one unhappy call from the doctor (yes cancer). In this experiential presentation, most people weight this probability in a more appropriate way and are somewhat less concerned.

In this project, we show that when the odds of an event occurring are represented experientially (rather than descriptively), people better discriminate probabilities in a manner more consistent with linear probability weighting. We surmise this is because experiential presentation, unlike descriptive presentation, forces attention to outcomes in proportion to their probability of occurrence.

In Study 1, we test the effect of presenting the proportion of experts believing that some negative event would occur (either p=.1 or p=.9) either by explicitly describing the proportions (description-based decision making; "DBDM") or by sequentially flashing 20 outcomes proportional to the underlying distribution of expert opinions (experience-based decision making; "EBDM"). For instance, one scenario involved expert opinions of whether an American city would become submerged due to climate change. Participants were then asked to express their degree of support for reallocating public funds earmarked for that category (e.g. municipal projects) to the particular problem at hand. We find that, across four domains, people show considerably greater sensitivity to differences in the proportion of experts expressing concern when these proportions are presented as EBDM rather than DBDM (p<.001). This increased sensitivity is especially noteworthy since learning is a noisy process and any counting errors in the EBDM condition would be expected to have a regressive effect on probability judgments and hence diminish sensitivity to probability differences. Further, we find that in a "hybrid" condition wherein participants were given the explicit odds and then shown the EBDM simulation, they were significantly less sensitive to probability differences compared to EBDM but more sensitive than DBDM.

In Study 2, we replicate the design of Study 1 using an incentive-compatible design and find that prices are more sensitive to the proportion of favorable reviews when presented in an EBDM versus DBDM manner.

In Study 3, we replicate the effect using an auditory presentation of expert opinions in a simulated news story regarding policy legislation.

In Study 4, we test the robustness of this phenomenon by manipulating the EBDM depiction of the low-probability event (e.g., changing its color or presenting it for longer) to see if an attention-grabbing manipulation of the less-frequent outcome diminishes sensitivity to probability. We find that these salience-distorted EBDM representations still perform significantly better than DBDM but directionally, though not significantly, worse than EBDM.

In Study 5, we compare DBDM and EBDM to a natural alternative: a pictographic (frequentistic) representation of the odds. We find that, in the domain of medical decision making, people are more sensitive to differences in medical consensus with EBDM versus DBDM, and that the pictographic representation is only marginally better than DBDM.

As demonstrated in Study 4, we find that presenting probabilities experientially is robust to various presentations and manipulations. In Study 6, we test the robustness of pictographic representations. A worry we had about pictographic representations is that they do not necessarily hold attention to outcomes proportional to their likelihood. Instead, people may spend time dwelling on low-probability events depending on how visually salient these outcomes were compared to the high-probability events. Thus in Study 6, in addition to our typical EBDM and DBDM manipulations, we also included three different forms of pictographs: a 2-dimensional (4x5) pictograph, a 1-dimensional pictograph (1x20), and a 1-dimensional pictograph in which the low-probability outcomes were non-contiguously scattered throughout the 20 positions. We wanted to see whether seemingly inconsequential design decisions altered the efficacy of pictographs. We find, once again, that DE outperforms DD (p=.04). We find no advantage of pictographs compared to DD either when pooled (p=.20) or evaluated separately (p=.94). From this we conclude that pictographs are not as robust a presentation format as sequential simulation at facilitating probability discrimination.

In this paper, we show that when the odds of an event occurring are represented experientially rather than descriptively, people discriminate between probabilities more linearly. We surmise this is because experiential presentation forces attention to outcomes proportional to their probability of occurrence. It is hard to get an intuitive sense of what 15% is, we think, but an experience simulation can foster a gist impression of the odds. This suggests a novel method for promoting more rational decision making, and the possibility of a simple app-based intervention inspires hope.

Culture and the Containment of the COVID-19 Pandemic: How Collectivism Fosters Preventive Behaviors

Hyewon Cho, Sogang University, Korea, Republic of
Yafei Guo, University of Illinois at Urbana Champaign, USA
Carlos Torelli, University of Illinois at Urbana-Champaign, USA

EXTENDED ABSTRACT

Apart from some personal-level and societal-level factors, we propose that culture should also play a role in the spread of COVID-19. Because controlling the spread of COVID-19 involves a collective effort in which each individual does his/her part (i.e., by engaging in preventive behaviors), ait stands to reason that cultural models that facilitate collective coordination built around others' beliefs and goals should positively contribute to control the spread of the disease. Accordingly, we propose that a collectivistic orientation should be particularly likely to provide the coordination needed to control the spread of COVID-19. Collectivists construe the self as primarily interdependent with others and are motivated to adjust to the demands of others (Markus and Kitayama 1991), and particularly so in public settings. In this context, they are likely to draw on their beliefs about the opinions of others to guide their behavior (i.e., others' beliefs, Torelli 2006). We propose that cultures high (vs. low) in collectivism would be more successful in controlling the spread of COVID-19, as people in these cultures would feel an obligation to engage in preventive behaviors they believe are shared by others.

In Study 1, we retrieved and calculated the COVID-19 cases per country and tested whether COVID-19 cases are associated with collectivism. As predicted, collectivism was associated with a lower spread of COVID-19 ($p<.05$). This effect was robust and emerged after controlling for a variety of other country-level factors associated with the spread of communicative diseases.

In Study 2, we recruited participants in a large University in Hong Kong (Study 2a), and students enrolled in a large University in the United States (Study 2b) for an online study in exchange for course credit. Participants indicated their endorsement of a collectivistic orientation by completing Triandis & Gelfand's (1998) cultural orientation scale. Participants were also presented with a survey about "Behavioral Guidelines for COVID-19", in which they rated the self-importance of engaging in six behaviors (Study 2a), or the likelihood to engage in the same six behaviors (Study 2b). As predicted, collectivism was positively associated with importance of engaging in six behaviors ($p< .01$)(Study 2a), and likelihood to engage in the same six behaviors ($p< .01$)(Study 2b).

In Study 3, students in a large University in the United States participated in an online study in exchange for course credit. Participants rated their intentions to get vaccinated against COVID-19. Af-ter the behavioral ratings, they completed the same cultural orientation scale as in Study 2a and 2b. We conducted a regression analysis with vaccine intention as the dependent variable, and participants' average endorsement of collectivistic and individualistic orientations as predictors. Supporting our hypothesis, results yielded a positive and significant coefficient for collectivism ($p=.05$).

In study 4, students enrolled in a large University in the United States participated in an online study in exchange for course credit. Participants followed the same procedure in Study 2a, except for the following change. After the behavioral ratings, they indicated their beliefs about the extent to which others considered the same behaviors as being important (i.e., others' beliefs, 2-items). A regression analysis with this index of behavioral expectation for preventing the spread of COVID-19 as the dependent variable, and participants' average endorsement of collectivistic and individualistic orientations as predictors, yielded a significant coefficient for collectivism ($p<.01$). Mediation analyses confirmed that beliefs that others consider important to engage in the preventive behaviors (i.e., others' beliefs) underlie the effect of collectivism on participants' expectation of engaging in these behaviors.

Results from five studies using both secondary datasets and laboratory experiments conducted in two different countries demonstrate that collectivism is: (a) negatively associated with the spread of COVID-19, (b) positively associated with the self-importance/expectation to engage in widely publicized behaviors to prevent the spread of the disease, and (c) positively associated with the likelihood to get vaccinated against COVID-19. Our research highlights the importance of incorporating cultural factors in social marketing research. In this COVID-19 pandemic, our findings suggest some public health strategies to control the spread of COVID-19, as well as to encourage people to get vaccinated against the disease. Public health campaigns to persuade individuals to engage in preventive behaviors or to vaccinate should then focus on both communicating the widespread belief about the importance of such behaviors, while activating a collectivistic orientation. Addressing some of the critical challenges of the 21st century (e.g., global warming) requires that societies exercise a collective effort to change individuals' behaviors. Our research shows that a collectivistic orientation can be helpful to the social coordination needed to mobilize such collective effort.

Voluntary Simplicity Consumption In Japan: Alternative Consumption And Backward Consumption Among Minimalists

Shuji Ohira, Chiba University of Commerce, Japan
Akiko Masuda, Senshu University, Japan

EXTENDED ABSTRACT

Minimalism can be understood through the concept of voluntary simplicity (VS) as defined by researchers (Lloyd and Pennington 2020). VS means that consumers gain happiness by choosing simple living as their lifestyle. While previous studies on VS have largely concentrated on lifestyle (Leonald-Barton 1981; Iwata 1997), consumption styles in VS have also been examined from the perspective of reduced consumption (Shaw and Newholm 2002) and anti-consumption (Iyer and Muncy 2009). However, Shaw and Moraes (2009) researched VS consumption in terms of market interaction, and as a result considered that voluntary simplifiers who live in a market economy find it difficult to avoid consumption. Thus, this study focuses on the consumption behavior of voluntary simplifiers.

Elgin (1981) pointed out that during the 1960s, VS roots were apparent in the United States and Western nations. However, the first VS in Japan was born in 721 (Ohira and Masuda 2020). The ancient Japanese believed that luxury living brought harm and natural disasters, which led the Japanese government to enforce VS through several policies. The most famous VS policy was the *Kenyaku-rei*, implemented by the Samurai government to reconstruct financial management systems during the Edo period (from 1603 to 1876). This study focuses on the original lifestyles created through this VS policy, as many modern Japanese lifestyles have been shaped by this era (Francks 2009).

This study finds that current minimalist lifestyles in Japan can be traced back to the Edo period. It seems that consumption styles are harking back to this ancient era and are producing a phenomenon called backward consumption—a kind of nostalgia consumption. Therefore, studies suggest that backward consumption is induced by the influence of residual institutional effects (Ohira and Masuda 2020) in minimalists' minds.

This study emphasizes that there are two types of consumption in VS. The first is alternative consumption. Beginner voluntary simplifiers first practice reduced consumption when they start leading VS lifestyles (McDonald et al. 2006). Ohira and Masuda (2020) stated that frugal simplifiers—those who start VS through not only saving money but also through reduced economic consumption—were the first to start VS lifestyles and form one type of beginner voluntary simplifier. Although frugal simplifiers initially reduced the total amount of consumption expenditure, they may have changed the use of money over time, while still maintaining VS lifestyles. For instance, while some voluntary simplifiers may save money by reducing consumption, others may choose to buy better quality products or services, hence incurring the same level of expenditure even as they reduce consumption. Thus, it is deliberated that the later simplifiers have created a new form of consumption known as "alternative consumption."

Second, backward consumption can be understood as nostalgia consumption. Modern society is a consumer society that provides easy access to various products and services. However, most people lived the lifestyle of voluntary simplifiers in the past (Brunk, Giesler, and Hartmann 2018). Stern (1992) stated that nostalgic thoughts may be generated by forming a history of time before one was born (historical/communal nostalgia). Holk, Havlena, and Matveev (2006) noted that there were four categories of nostalgia (personal nostalgia, interpersonal nostalgia, cultural nostalgia, and virtual nostalgia). The concept of backward consumption in this study is included as a part of virtual nostalgia, where modern consumers relate to an old type of lifestyle that they have never actually experienced.

This study selected 19 VS bloggers from a published minimalist lifestyle book by Shufunotomo (2019). We contacted all VS bloggers on their SNS through direct messages, and seven accepted our interview invitation. These semi-structured interviews, which lasted 1–1.5 hours, explored their simple living and minimalist lifestyles.

First, we considered how minimalists define themselves, and concluded that minimalists think of themselves as people who have free spaces in their minds and lives. However, the findings of this study indicate that it is necessary to distinguish between "minimum minimalists" and "maximum minimalists" in order to fully understand the various degrees of simple living.

Second, there are two types of consumption styles demonstrated by people leading a VS lifestyle. The first is alternative consumption, of which there are two types: focused and upgraded consumption, in which minimalists spend more money on high quality products that last longer instead of reducing their total amount of consumption; and the second is ethical consumption, where minimalists consider the environmental impact of the goods they purchase.

In terms of the common product preferences of the interviewees, this study found that they all favor MUJI (a famous Japanese retailer). A study published by Yamaguchi (2016) explored the relationship between minimalists and MUJI. These findings indicate that MUJI products fit with a VS lifestyle because they use natural materials and provide simple designs.

This study also illustrates backward consumption as a type of virtual nostalgia consumption. Minimalists' rooms are simple, like those of the Edo period, and they live in a manner similar to that of their predecessors (Please refer to the Edo-Tokyo Museum (https://www.edo-tokyo-museum.or.jp/en/)). This phenomenon is one of virtual nostalgia and backward consumption, in which consumers practice the lifestyle of their predecessors, even though they have never experienced it. This is considered to be a residual institutional effect, that is past institutions have influenced the behavior of present consumers (Ohira and Masuda 2020). Although it may be unintended, the lifestyles of minimalists reflect the past. Thus, in this context, backward consumption can be understood as virtual nostalgia consumption that is unintended by consumers.

This study makes three major contributions to the existing literature. First, it examines focused and upgraded consumption as alternative consumptions in VS. While voluntary simplifiers reduce their total amount of consumption, they focus on and upgrade some specific and favorable product categories and, as a result, incur higher expenditure. Second, it describes backward consumption as one form of nostalgia consumption. Finally, it examines the residual institutional effects that have influenced the minimalist lifestyle in Japan; that is, the choices of consumers are directly affected by past institutions, even though they have not lived during those periods in Japanese history.

Online Shopping Cart Abandonment: Placing Self-Expressive Products in the Shopping Cart Reduces Purchase Intentions

Liat Hadar, Tel Aviv University, Israel
Yael Steinhart, Tel-Aviv University, Israel
Gil Appel, George Washington University, USA
Yaniv Shani, Tel-Aviv University, Israel

EXTENDED ABSTRACT

We propose that online shopping cart abandonment is more likely for high (than for low) self-expressive products because the mere act of cart placement diminishes the experiential shopping value typically derived from shopping for such products. Findings from field data and online studies support our hypothesis and identify its moderators.

Online cart abandonment, consumers' tendency to place items in shopping carts without purchasing them, has become a pressing issue among e-commerce organizations. Industry reports reveal that, on average, e-commerce shopping cart abandonment rate is almost 70% (Baymard Institute 2019). This research examines the effect of product self-expressiveness on online shopping cart abandonment. We propose that placing items in the shopping cart is a task-related action that attenuates shopping enjoyment -- an experiential value derived from shopping (Babin, Darden, and Griffin 1994). Building on the notion that shopping for high self-expressive products is more strongly driven by seeking experiential value than shopping for low self-expressive products (Franke and Schreier 2010), we offer that placing high self-expressive items in the shopping cart (compared with choosing such items without placing them in the cart) negatively influences shopping enjoyment and, consequently, is more likely to reduce purchase intentions. This effect is not expected to occur when shopping for low self-expressive products.

Study 1 participants (N =407) were randomly assigned to one condition in a 2 (task type: choose-only vs. choose-and-add-to-cart) × 2 (product type: low vs. high self-expressive product) factorial design. Participants were instructed to search for shoes they would like to buy for themselves at *nike.com*. Half only chose shoes whereas the other half chose shoes and placed them in the shopping cart. Based on the results of a pretest, product self-expressiveness was manipulated by asking participants to search for shoes that would satisfy their exercising needs and would also reflect their personal taste (high self-expressive condition) or shoes that would satisfy their exercising needs and would not necessarily reflect their personal taste (low self-expressive condition). Next, we measured participants' purchase intentions and shopping enjoyment (1 = very low, 7 = very high). As predicted, there was a significant interaction on purchase intentions ($F(1, 403) = 11.645$, $p = .001$, $\eta_p^2 = .028$): in the high self-expressive condition purchase intentions were higher in the choose-only condition than in the choose-and-add-to-cart condition (5.69 vs. 5.25; $F(1,403) = 5.79$, $p = .017$). In contrast, in the low self-expressive product condition the effect was reverse (5.16 vs. 5.60; $F(1,403) =5.85$, $p =.016$). A similar pattern was observed for *shopping enjoyment* ($F(1,403) =8.27$, $p = .004$, $\eta_p^2 =.020$). Finally, there was a significant moderated mediation (PROCESS model 7, Hayes 2013) ($b =-.534$, $SE=.196$; 95% CI=[-.936,-.174]), whereby shopping enjoyment mediated the effect of task type on purchase intentions in the high-self-expressive-product condition ($b=-.300$, $SE=.136$; 95% CI =[-.562,-.034]), but not in the low-self-expressive-product condition ($b=.233$, $SE=.137$; 95% CI =[-.015,.523]).

Study 2 (N =407) manipulated the process variable, shopping enjoyment, by interrupting the shopping process for half of the participants. We predicted that the findings of Study 1 would replicate in the absence of the interruption, but would diminish in its presence because participants would not enjoy choosing high self-expressive products nor would they be influenced by task type. As predicted, we found a significant 3-way interaction between task type, product type, and shopping interruption ($F(1,750) =11.98$, $p=.001$, $\eta_p^2 =.016$), where the results of Study 1 were replicated without shopping interruption ($F(1,750)=12.87$, $p < .001$), but not with it ($F(1,750)=2.08$, $p =.157$).

Study 3 (N=400) examined the hypothesis that the effect of product self-expressiveness on purchase intentions will be attenuated among consumers low on need-for-uniqueness because they are less motivated to express their personal preferences and are thus expected to derive lower enjoyment from shopping for high self-expressive products. The procedure was identical to that of Study 1, except that participants were asked to search for a shirt for exercising on *amazon.com* and to complete a Consumer Need for Uniqueness scale (α = .926; Tian et al. 2001). Regressing purchase intentions on task type (0=choose-only, 1=choose-and-add-to-cart), on product type (0=low self-expressive product, 1=high self-expressive product) and on consumer NFU (PROCESS Model 3; Hayes 2013), revealed the predicted three-way interaction (b =-.471; 95% CI =[-.850,-.092], SE =.193, $t(392)$ =-2.444, p =.015): The effect of task type on purchase intentions for the high (but not for low) self-expressive product condition was significant only for participants with high NFU (above 5.54; b_{JN}=-1.014, SE =.516, p =.05). A similar pattern was revealed for shopping enjoyment (b=-.611; 95% CI=[-1.034,-.189], SE=.215, $t(392)$=-2.847, p=.005). Finally, shopping enjoyment mediated the effect of task type, product type, and NFU on purchase intentions (b=-.338, SE=.129; 95% CI=[-.601,-.098]). This mediation was significant only in the high self-expressive-product condition and only among participants with high NFU (b=-.401, SE=.167; 95% CI=[-.736,-.090]).

Study 4 (N=690) examined the hypothesis that if the act of placing items in the shopping cart becomes exciting, such that it increases shopping enjoyment, it should no longer have a negative influence on purchase intentions for high self-expressive products, even when these products are placed in the shopping cart. We manipulated cart excitement by notifying participants they would receive an exciting surprise upon placing their chosen item in the shopping cart. A 3 (task type: choose-only vs. choose-and-add-to-cart vs. choose-and-add-to-exciting-cart) × 2 (product type: low vs. high self-expressive product) ANOVA revealed a significant interaction ($F(2,684) = 3.20$, $p = .041$, $\eta_p^2 =.009$). In the high-self-expressive-product conditions, purchase intentions were higher in the choose-only condition than in the choose-and-add-to-cart condition (5.306 vs.4.948, $F(1,684) = 4.29$, $p =.039$). However, purchase intentions were similar in the choose-and-add-to-exciting-cart condition (M=5.164) and in the other two task type conditions (p_s >.219). In the low self-expressive-product condition, however, purchase intentions were similar across conditions (all p_s >.135).

Finally, we analyzed field data on 9,365 items provided by a small e-commerce website. We classified the items to high vs. low self-expression conditions based on the results of a pretest. Consistent with the previous findings, the (log) purchase frequency was

lower for high self-expressive items (b = -.027), controlling for product price (b =.173) and (log) abandonment frequency (b = -.75).

This research contributes to the decision making literature by proposing cart placement as a driver of willingness to act (purchase), and by addressing whether and how elements of the purchase process influence the propensity to purchase self-expressive products.

Leveraging User Data to Investigate the Effectiveness of Interstitial Ads in Mobile Game Applications: Evidence from a Field Experiment

Jamel Khenfer, Zayed University, UAE

EXTENDED ABSTRACT

Mobile gaming was expected to generate $77.2 billion in global revenues in 2020, accounting for half video-game revenues ($159 billion) (Reuters, 2020). One of the most distinguishable aspects of mobile gaming compared to traditional gaming systems (i.e., consoles and computers) is the business model adopted by most mobile game applications. Unlike traditional gaming systems, a mobile game application can generate revenues above and beyond the initial purchase—if any—by monetizing user engagement (Rutz et al., 2019; Appel et al., 2020). One well-established monetization strategy consists in displaying advertisements.

While various advertising formats are available, interstitial ads have become a preferred choice in mobile game applications. Interstitial ads are full-screen ads that cover the interface of an app until closed by the user, typically after a forced 5-second delay. This ad format is well-suited for mobile game applications since it was designed to display ads at natural transition points in the flow of an app's execution such as between levels (Google, 2020a). Because of their sole relevance to mobile media, interstitial ads have been an under-researched topic compared to other formats of mobile display advertising such as banner ads.

Because interstitial ads cover the entire device screen, they are well-suited to generate ad clicks, which is the primary source of advertising revenues for developers (Google, 2020b). In contrast, mobile banner ads are characterized by their small display size that reduces the area available for advertising (Grewal et al., 2016). Supporting studies show that prominent brand placements in video games draw consumers' attention and positively influence attitudinal response to stimuli (Lee & Faber, 2007; Schneider & Cornwell, 2005). Unrelated to video games, other research suggests that media richness in mobile advertising drive consumers' behavioral intents because combinations of text, images, audio, and video convey more information than simpler formats (Tseng & Wei, 2020).

Hypothesis 1: *Interstitial ads (vs. banner ads) generate more ad clicks.*

Hypothesis 2: *Interstitial ads (vs. banner ads) generate more advertising revenues.*

Nevertheless, interstitials' key advantage may have damaging implications for user experience. The adverse effect of the intrusiveness of in-app advertising has been a growing concern in recent years (e.g., Appel et al., 2019). But only a handful of studies provides evidence of the implications for mobile application usage. For instance, Ghose and Han (2014) found that in-app advertisements adversely affect app-demand; their research however considered mobile display advertising as a whole and did not discriminate between ad formats.

Hypothesis 3: *Interstitial ads (vs. banner ads) lower user engagement.*

To test our Hypothesis, we employed a randomized field experiment. The research presented herein used several Google-owned software and platforms to create a mobile game application (Android Studio), to allocate users randomly across conditions (Firebase), to set up the ad formats (AdMob), to publish the app (Google Play Console), and to manage and download the data (BigQuery).

We developed a 2D arcade game specifically for this research (available at https://play.google.com/store/apps/details?id=com.jkhenfer.datw). Our experiment ran from late October 2020 to late November 2020 and relied on a sample of 1,065 Android smartphone users. To recruit participants, we advertised our mobile game application through Facebook Business in the fast-growing Indian market.

Both advertising formats were placed in a way that would not interfere with the gameplay. Interstitial ads appeared once users lost a game, before returning to the home screen. Banner ads appeared at the bottom of the home screen below the start button. While ad impressions were contingent on the quality of users' Internet connection, we found no difference between experimental conditions.

We analyzed our results using Bayesian inference. As such, the approach implemented herein tells us which of the two ad formats (interstitial or banner) is likely to be the best performing in terms of ad clicks, advertising revenues, and user engagement. Ad clicks and advertising revenues were measured using automatically recorded events. User engagement was measured as the number of games users played.

First, we found that in the version of the app where users were exposed to interstitial ads, 135 of them clicked at least once on an advertisement, that is, a conversion rate of 26%, whereas they were only 37 in the banner variant, that is, a conversion rate of 6.7% (Δ = 290%). The probability that the interstitial variant would perform better than the banner variant in ad clicks was higher than 99.9%. The credible intervals of the conversion rate for the two variants did not overlap (banner: CI_{95} [4.8%; 9.0%]; interstitial: CI_{95} [22.5%; 30.1%]).

Second, we found that in the version of the app where users were exposed to interstitial ads, the total advertising revenue amounted to USD 2.89, or USD 0.00560 per user, whereas it amounted to USD 0.43, or USD 0.00079 per user, in the banner variant (Δ = 1,000%). The credible intervals of revenue per user for the two variants did not overlap (banner: CI_{95} [0.00043; 0.00097]; interstitial: CI_{95} [0.00500; 0.00990]).

Third, we found that in the version of the app where users were exposed to interstitial ads, the average number of games played was 7.60 (Median: 5.0) whereas it was 9.60 (Median: 7.0) in the banner variant (Δ = -2.00). The credible intervals of user engagement for the two variants did not overlap (banner: CI_{95} [9.31; 9.83]; interstitial: CI_{95} [7.35; 7.83]).

The present research provides evidence of the effectiveness of interstitial ads. Despite the massive importance of this ad format in mobile gaming, very few papers have investigated their impact on user behavior. Leveraging user data, we demonstrate the superiority of the interstitial format over the banner format both in terms of ad clicks and advertising revenues despite a negative effect on user engagement.

The mobile game application developed for the purpose of this research was downloaded by 1,065 users who played a total of 9,187 games over the course of four weeks. Yet, it generated revenues that did not exceed four dollars. This illustrates how difficult it is for developers to monetize apps profitably. We showed here that using interstitial ads rather than banner ads is worth the adverse effect on user engagement given the former's ability to trigger more ad clicks and

generate more advertising revenues. Moreover, this research implemented an innovative method designed to conduct randomized field experiments using mobile applications based on tools freely available to researchers.

Overcoming the Potential Conflict Between Eudaimonic Versus Hedonic Outcomes of Transformative Service

Adam Nguyen, Siena College, USA

EXTENDED ABSTRACT

Transformative service entails an eudaimonic approach to service design that aims to help consumers live well to realize valuable human potentials (Anderson et al. 2013; Blocker and Barrios 2015; Furrer et al. 2020; Ostrom et al. 2015). An issue that bears on the viability of transformative service is the potential conflict between its eudaimonic versus hedonic outcomes. Obtaining eudaimonic outcomes (e.g., becoming healthier or more knowledgeable) is often an effortful process, involving overcoming challenges and barriers; this process likely produces negative hedonic outcomes such as strain, stress, anxiety, perceived uncertainty, and lack of control (Ethan and David 2011; Ryan and Deci 2001; Ryan et al. 2008). This conflict may turn consumers away from a transformative service or hinder their willingness to fulfil their coproduction role that is required for the attainment of the intended eudaimonic outcomes of the service (Anderson et al. 2016).

Notwithstanding the implication of this conflict for the viability of transformative service, extant research has not explicitly examined whether and how a transformative service can be effectively designed to overcome the conflict.

This conceptual work addresses this question in the context of the higher educational service. As a critical service that plays a central role in the personal development of students who are the future of society (Hennig-Thurau et al. 2001; Ostrom et al. 2015), the higher educational service should be designed to maximize its eudaimonic benefits (e.g., learning) (Chonko et al. 2002; Ng and Forbes 2009). But consumers (students) tend to prefer an educational service that is high in hedonic benefits, that is, one that is entertaining and that requires the least effort (Chonko et al. 2002; Gruber et al. 2010 ; Ng and Forbes 2009). Accordingly, the college educational service provides a fertile ground for scholars to examine the issue of how to overcome the conflict between the eudaimonic versus hedonic outcomes of a transformative service because this conflict is profound.

The general proposition is that the potential conflict between the eudaimonic versus hedonic outcomes of a transformative service can be overcome by designing the service with a view to help consumers experience active pleasure in the process of exerting efforts to advance their eudaimonic well-being.

To develop this proposition, I first draw on the view of pleasure developed in the well-being literature (Ryan et al. 2008) to argue that it is possible to transform the relationship between hedonic and eudaimonic outcomes from conflicting to complementary goals by replacing *passive pleasure* that is irrelevant or in conflict with eudaimonic well-being with *active pleasure* that is complementary to eudaimonic well-being. While passive pleasure is associated with the feeling of being relaxed and free from problems, active pleasure is associated with active engagement in an activity (Borgmann 2000; Csikszentmihalyi 1990). Passive pleasure helps individuals restore the physical and intellectual resources needed to continue to function, but do not directly contribute to the development of these resources (Csikszentmihalyi 1990). Moreover, excessive pursuit of passive pleasure promotes disengagement and the weakening of our faculties (Borgmann 2000). In contrast, active pleasure directly contributes to eudaimonic well-being by broadening people's thought-action repertories, which in turn serves to build their enduring personal resources (Fredrickson 2001; Fredrickson et al. 2008).

Second, I draw on the theory of optimal experience (Csikszentmihalyi 1990) to identify the conditions that facilitate simultaneous attainment of active pleasure and eudaimonic well-being (the conditions of the optimal experience). According to this theory, a person's experience will be most positive when the person perceives that the environment contains challenges that are manageable (i.e., that match the person's ability). When that happens, the person is not only enjoying the moment, but is also stretching his or her capabilities with the likelihood of attaining new skills and personal complexity (Csikszentmihalyi and LeFevre 1989). The pleasure that this state of experience produces is active pleasure (Csikszentmihalyi 1990). A closely related condition is motivation. Given that the person has the needed ability; it takes psychic energy to utilize that ability to cope with the challenges. Thus the person has to be willing to put out the efforts in order to achieve the optimal experience (Csikszentmihalyi 1997).

Third, I draw on Lengnick-Hall's (1996) model of human service to specify how elements of an educational service (standards, tasks, collaboration, feedbacks, and care) can be structured to create the conditions for the optimal experience to occur. Specifically, it is proposed that the service provider employ the following principles: 1/set high but achievable academic standards; 2/provide participants with intrinsically rewarding and appropriately challenging tasks; 3/ organize peer collaborations to encourage participants to work together to overcome the challenges; 4/ support participants' progress through accurate yet encouraging feedbacks and caring but not pampering. To the extent that the service provider implements the above principles effectively, s/he creates the structural conditions for the optimal experience- manageable challenges coupled with sufficient motivation to cope with the challenges.

Although the proposed model is developed in the context of the college educational service, it is extendable to other human service contexts, for as Lengnick-Hall (1996) suggested, the relationship between the service provider and consumer of the educational service captures the essence of the relationship between the service provider and consumers of human service in general. Future research will verify, qualify, and adapt specific features of the model to other human service contexts.

Silence in Consumer Research: Interdisciplinary Overview and Research Agenda

Noémie Dehling, Kedge Business School, France

EXTENDED ABSTRACT

Consumption is filled with forms of silence. It is an object of desire and luxury when consumers seek periods of quietness in their busy lifestyle through meditation, outdoor times or noise-cancelling products (Canniford and Shankar 2013; Husemann and Eckhardt 2017). In the same line, silence conveys a sense of social distinction and uniqueness in the sober and quiet market environments (Dion and Borraz, 2017; Pracejus, Olsen and O'Guinn 2006). It is also a practice that allows consumers to control their relationships with and within the market through technology-mediated consumption and communication (Lee and Lee 2020). Conversely, silence can be a source of frustration and dissatisfaction for consumers when it symbolizes the absence or ignorance of their interlocutors (Hogreve, Bilstein and Mandl 2017). Polymorphous, silence in consumers' experience can be chosen or imposed, complete or relative, sought or avoided.

In contrast with its pervasiveness in consumers' experiences and practices, consumer research has dedicated limited attention to the concept of silence. This lack of conceptualization may find an explanation in the difficulty of defining silence in an exhaustive and comprehensible manner. Originating from the verb "*silere*", the word silence has indeed been used interchangeably to describe quiet soundscapes and the absence of communication in social interactions. This article thus aims to propose a conceptualization of silence grounded in theoretical and empirical articles from various disciplines including psychology, sociology and anthropology and to offer a propositional agenda for future research.

Based on a review of existing conceptualizations (Bruneau 1973; Goffman 1981; Kurzon 2007; Jensen 1973; Tannen and Saville-Troike 1985), we define three main forms of silence: 1) an *environmental silence* defined by the relative quietness of a setting, 2) a *relational silence* as a social and cultural practice, and 3) an *inner silence* relating to a reflective and quiet state of mind. Interestingly, among the numerous typologies, there is a shared acceptance that developing a unified theory or definition of silence would not only be impossible but also counter-productive (Acheson 2007). Rather, existing literature invites researchers to think metaphorically about silence in specific social settings (Jaworski 1997), as it relates to both a physical perception (absence of sound or voice) and to a social and cultural construct (tacit communication, discretion or avoidance, silencing) (Scott, 2018; Winter 2010; Zerubavel 2006). Going beyond the traditional dichotomies opposing silence to speech or sound (Kurzon 2007), and in line with research on crossmodal correspondences (Spence, 2011), silence can also be experienced through visual stimuli where pictures of empty beaches evoke quietness (Thurlow and Jaworski, 2010) and blank spaces facilitate information processing and convey a sense of distinction (Pracejus et al. 2006).

Across multidisciplinary literature, silence in its various forms has been found to perform a wide range of functions at the individual and collective levels. While consumer research has evaluated the positive impact of silence on consumers' attention and preference (Ang and Yeo 1999; Olsen 1994, 1997), further research in medicine and biology have shown that both environmental and inner silences increase positive physiological and cognitive responses to environmental stimuli (Venditti et al. 2020; Ben-Soussan et al. 2020). In interactions, silences are interpreted through the lens of cultural and social norms to reveal both positive and negative valences: silence between two individuals can be voluntary or oppressive (Cast-

agno 2008), a form of dominance or connivance (Basso 1970; Luke 1994), and consequently a source of either serenity or stress. Based on existing literature across disciplines, silence appears as a multidimensional concept characterized by its performativity (a present absence), its relativity (social and cultural construct), its ambiguity (verbal, non-verbal, voluntary/involuntary, noticed/not noticed), and its ambivalence (positive or negative consequences).

Although the concept of organizational silence (Morrison and Milliken 2000) has opened new avenues in management literature, its social and cultural nature seems evicted when it comes to consumers, limiting our understanding of its potential functions. In contrast to the multiplicity of definitions in other domains, so far silence has been only indirectly addressed in consumer research. In sensorial marketing, the sonic atmosphere of servicescapes (Bitner 1992) has been an object of study since the 1960s (Smith and Curnow 1966) to understand the effects of sound and music on consumers' cognitive, emotional and behavioral reactions. But despite the numerous characteristics under analysis (source (Sayin and al 2015); tempo (Milliman 1982); complexity (North and Hargreaves, 1996); congruence (Areni and Kim, 1993); volume (Mehta, Zhu and Cheema 2012)), literature keeps relatively silent about silence. Even when cited in titles, its analysis is limited as a control variable to determine sound effects (North and Hargreaves 1999). Secondly, and in line with our typology, silence also appears in relations between consumers and firms where it defines the absence of communication. Mostly based on justice theories and focusing on the recovery process (Khamitov, Grégoire and Suri 2019), this research observes organizational responses' linear effects on consumers' justice perceptions and following satisfaction (Gelbrich and Roschk 2010). With less focus on interaction and micro-practices, silence, when addressed, is often assimilated to customer's waiting time and measured by its duration. Consequently, and similarly to research in sensorial marketing, silence seems to operate in a mechanical way affecting consumers' perceptions negatively.

In conclusion, the multidimensional conceptualization suggested by this multidisciplinary review implies that current approaches in marketing have limited conceptually and methodologically the potential usage of silence as a way to communicate and to organize social spaces and interactions. By examining the broader functions of silence, we also offer a non-exhaustive research agenda to interrogate its potential meaning and value in consumers' experience.

The Principle of Discrete Sensitivity

Ioannis Evangelidis, ESADE Business School, Universitat Ramon Llull, Spain

EXTENDED ABSTRACT

Understanding how people perceive and respond to magnitude differences is one of the most fundamental areas of research across various disciplines of psychology, such as psychophysics, cognitive psychology, and judgment and decision-making. Perhaps the most influential finding from this stream of research is the principle of diminishing sensitivity, which postulates that the impact of a difference in two amounts diminishes as a function of the distance from the reference point (typically set at zero). Historically, the principle of diminishing sensitivity can be traced to the pioneering experimental research of Ernst Heinrich Weber (1834). In his experiments, Weber observed that participants were less likely to notice the same difference in weight between two objects (e.g., a difference of 10 grams) when the objects were relatively heavier (e.g., when the weight of the objects was close to 100 vs. 1,000 grams). Weber's findings sparked a great amount of research in social sciences that invoked diminishing sensitivity to describe and predict how humans make judgments and decisions.

Importantly, diminishing sensitivity is a central tenet of dominant theories of decision-making, such as Prospect Theory (Kahneman and Tversky, 1979) and its advancement, Cumulative Prospect Theory (Tversky and Kahneman 1992). Diminishing sensitivity is incorporated in Prospect Theory's value function for both gains and losses. For example, for gains, the pleasure of moving from $0 to $100 is larger than the pleasure of moving from $100 to $200, whereas the pleasure associated with the latter is larger than the pleasure of moving from $200 to $300. Similarly, for losses, the pain of moving from 0 to –$100 is larger than the pain of moving from –$100 to –$200, whereas the pain associated with the latter is larger than the pain of moving from –$200 to –$300. The impact of these theories on psychological research has been profound. To date, Kahneman and Tversky (1979) and Tversky and Kahneman (1992) have collectively amassed close to 80,000 citations (according to Google Scholar).

Interestingly, research on product choices has offered evidence that may suggest the need to reconsider the principle of diminishing sensitivity and, by extension, Prospect Theory's value function. Specifically, Shampanier, Mazar, and Ariely (2007) studied people's choices between a cheaper chocolate and a more expensive alternative as a function of price. The authors observed that choice of the cheaper chocolate did not change significantly when its price decreased from 2¢ to 1¢ and the alternative's price decreased from 27¢ to 26¢. However, they observed that choice of the cheaper chocolate increased dramatically when its price decreased from 1¢ to 0 and the alternative's price decreased from 26¢ to 25¢. While these findings are to some extent consistent with diminishing sensitivity, Shampanier et al. (2007) offered an alternative account that could better explain their results. Specifically, they proposed the existence of a discontinuity around zero in Prospect Theory's value function. Similar discontinuities have been reported in other domains besides product choices, such as perceptions of probabilities (Tversky and Wakker 1995; see also Fox, Rogers, and Tversky 1996; Wu and Gonzalez 1999), valuations of goods or other amounts (Desvousges et al. 1993; Frederick and Fischhoff 1998; Kahneman and Ritov 1994), intertemporal decisions (Frederick, Loewenstein, and O'Donoghue 2002; Jackson and Yariv 2014; Laibson 1997), as well as moral decisions (Berman and Kupor 2020).

Building on this evidence, in this paper, I propose the existence of a general discontinuity around zero that spans multiple domains of decision-making. To accommodate this discontinuity, I advance a novel principle, which I coin discrete sensitivity. I argue that discrete sensitivity may often better reflect people's valuations of outcomes compared to diminishing sensitivity. According to the principle of discrete sensitivity, people are sensitive to the presence versus absence of an outcome, but are rather insensitive to the scope of the outcome when that outcome is present. Thus, discrete sensitivity implies that the impact of a change in outcomes on people's evaluations is characterized by a discontinuity around zero. For example, according to discrete sensitivity, the impact of a $100 increase in losses is felt dramatically more when moving from 0 to –$100 than when moving from –$100 to –$200. Further, according to discrete sensitivity, the impact of a $100 increase in losses is not experienced differently when moving from –$100 to –$200 compared to when moving from –$200 to –$300 or when moving from –$300 to –$400. Thus, discrete sensitivity may be conceptualized as a special type of diminishing sensitivity whereby people are sensitive to changes in outcomes solely when those changes involve the presence versus absence of an outcome.

I provide evidence for discrete sensitivity 8 well-powered pre-registered experiments that employ modified versions of prominent problems across a wide range of domains. Specifically, my experiments provide evidence for discrete sensitivity in valuations of outcomes that involve the loss of human life (Experiment 1), valuations of financial losses (Experiment 2) and gains (Experiments 3-4), in purchase decisions (Experiment 5), in evaluations of goal-related performance (Experiment 6), in evaluations of intertemporal outcomes (Experiment 7), and in evaluations of outcomes associated with moral harm (Experiment 8). By doing so, my experiments trace multiple empirical regularities that were uncovered by research in social sciences to a common fundamental principle—discrete sensitivity.

The Impact of Pandemic Cues on Consumer Preference for Anthropomorphic Products

Sunxu Xu, Renmin University of China, China
Ying Ding, Renmin University of China, China

EXTENDED ABSTRACT

Anthropomorphism refers to the attribution of human characteristics to non-human entities (Epley, Waytz, and Cacioppo 2007), which has been widely used in marketing. Prior research mainly demonstrates that anthropomorphism strategy could result in more favorable attitudes towards products (Aggarwal and McGill 2007). However, few studies have concentrated on the detrimental effect of anthropomorphism. Recently, studies focusing on this question found that when consumers in socially crowded contexts or under high distinctiveness motives, anthropomorphism strategies might backfire (Puzakova and Kwak 2017; Puzakova and Aggarwal 2018). Although these studies provide meaningful insights, the effects of macro-environmental factors such as pandemics on consumer preference for anthropomorphic products remain unclear. In this research, we defined pandemic cues as information related to the spread of contagious diseases that could evoke concerns about being infected (Galoni et al. 2020), for example, the news of COVID-19. Through a set of four studies, we aim to investigate when and why will pandemic cues affect consumer preference for anthropomorphic products.

When feeling vulnerable to contagious diseases, consumers would generate instinctive reacting behaviors to avoid being infected (Schaller and Park 2011), for example, a heightened behavioral avoidant tendency in response to others (Mortensen et al. 2010). Therefore, we propose that pandemic cues can facilitate social withdrawal, which leads to the avoidance of interpersonal contact. Since consumers can obtain quasi-social experiences with anthropomorphic products and apply social attitudes to the objects in anthropomorphic terms (Chen, Wan, and Levy 2017; Kim and McGill 2018), the social withdrawal evoked by pandemic cues would lead consumers to avoid interaction with anthropomorphic products, thus in turn reduce their preference for anthropomorphic products (Puzakova and Kwak 2017). Moreover, we examine two boundary conditions from both consumer and product dimensions: power state and product format.

Study 1 ($N = 229$) provided initial evidence of the proposed pandemic effect through a 3 (pandemic cue vs. accident cue vs. control) between-subjects design. The accident cue condition was employed to demonstrate that if the threat is not related to interpersonal interaction, this effect will be mitigated. First, participants were randomly assigned to read one of three news: Covid-19, air crashes, and a dental technique. Next, participants were asked to indicate their preferences between one high-anthropomorphic versus one low-anthropomorphic storage box. As expected, participants in the pandemic cue condition reported lower preferences for anthropomorphic products compared with the other two conditions.

Study 2 ($N = 218$) replicated the detrimental effect of pandemic cues by using a real choice and validated the mediating role of social withdrawal. We used a 2 (pandemic cues: salient vs. without) × 2 (anthropomorphic design: high vs. low) between-subjects design. The pandemic cues manipulation was similar to study 1. Next, participants were presented with a volunteer recruitment advertisement from an environmental NGO. In both conditions, the contents were the same, but we manipulated the degree of anthropomorphism by changing the association logo and slogan. Participants then indicated whether they would join the association and those who chose to join provided their phone numbers and email addresses for future arrangements. Finally, we measured social withdrawal. The results showed that participants in the high-anthropomorphic condition were less likely to join after being exposed to pandemic cues. However, the results were reversed in the low-anthropomorphic condition, which can be explained by the mortality salience induced by the pandemic cues (Fritsche et al. 2010). We then conducted a moderated mediation analysis (Model 8). The 95% confidence interval of the index of moderated mediation excluded zero (95% CI = -.84 to -.43), indicating social withdrawal as a mediator.

The social distance theory of power suggests that high-power consumers feel more subjective distance than low-power consumers (Magee and Smith 2013), which indicates that the former may feel more secure in social interactions. Therefore, we conducted study 3 ($N = 230$) to examine the moderating role of power state, by using a 2 (pandemic cues: salient vs. without) × 2 (power state: low vs. high) between-subjects design. We first manipulated power state with a writing task adapted from Galinsky et al. (2003). Then, we used infectious disease insurance advertisements or property insurance to manipulate pandemic cues. Finally, participants were instructed to choose their preferred advertisements between high-anthropomorphic versus low-anthropomorphic battery advertisements. The results showed that in the low-power state condition, a smaller proportion of the participants chose the high-anthropomorphic advertisements after exposure to pandemic cues. In contrast, there was no such difference in the high-power state condition.

Study 4 ($N = 192$) provided further support for the proposed process by examining the moderating role of product format. We argued that this pandemic effect is only likely to manifest when the product carries the potential risk of infection. Since physical contact does not exist in digital products, the activated behavioral immune system would not affect anthropomorphic products in digital formats as they are non-threatening objects (Atasoy and Morewedge 2018). Hence, we employed a 2 (pandemic cues: salient vs. without) × 2 (product format: digital vs. physical) between-subjects design in Study 4. We first manipulated pandemic cues by a popular science article. Next, participants were instructed to imagine they were about to receive a digital or a physical membership card. Then, participants indicated their preferences for two card designs with different degrees of anthropomorphism. We also measured social withdrawal. Our findings supported that the detrimental effect of pandemic cues would be mitigated for products in digital formats and validated social withdrawal tendency as the underlying process.

This research first contributes to the anthropomorphism literature by identifying pandemic cues as a macro-environmental factor that could significantly shift consumer preference for anthropomorphic products. Second, we introduced a new scenario where anthropomorphism could backfire. Third, our research advances the extant literature on pandemics by extending its effect to the product preference domain. Managerially, we inform marketers should be cautious about using anthropomorphism strategies during a pandemic or when designing pandemic-related products. More importantly, we suggest that marketers consider the target consumers' power state and product formats when adopting an anthropomorphism strategy.

The Impact of Online Review Linguistic Features on Reviewers and Readers

Alisa Wu, Columbia University, USA
Vicki Morwitz, Columbia University, USA

EXTENDED ABSTRACT

This project explores how the linguistic features (emotionality versus cognition) expressed in online review text predict reviewers' attitude toward their consumption experience and readers' reactions toward the review. We also offer review system design guidance for companies and online platforms with the aim to help benefit both review writers and readers.

A typical online review includes both a numerical rating score, usually ranging from 1 (Poor) to 5 (Excellent), and reviewers' open-ended comments. In this research, we extract from these comments emotion and cognition-related linguistic features. We use text-processing procedures to categorize reviews as being primarily emotion- or cognition-based depending on whether they primarily contain emotion or cognition related words. These procedures measure the degree to which an individual's attitude and reaction are based on emotions or on beliefs, causality, inference, and reason (Robinson et al. 2017; Rocklage, Rucker, and Nordgren 2018).

We use a variety of different natural language processing techniques to extract two linguistic features – emotion and cognition – in online reviews. We first calculate a linguistic feature called *emotionality*, using the Evaluative lexicon 2.0 (Rocklage et al. 2018). This method treats cognition and emotion as two ends of a spectrum, where a higher (lower) score means the reviewer wrote the review with more emotion (cognition). We also use Language Inquiry and Word Count (LIWC; Pennebaker, Booth, Boyd, and Francis 2015) to extract separate measures of emotion and cognition.

We test our Hypothesis in seven studies, using a mix of field and laboratory data. Study 1 measures the correlation between linguistic features in TripAdvisor museum reviews and numerical ratings. Study 2 analyzes data from Yelp where review readers can evaluate the review on three dimensions (i.e., useful, funny, and cool) to examine whether linguistic features predict readers' review evaluations, while controlling for review rating. Study 3 replicates the results of previous studies in an experimental setting with more control. In Study 4 we directly manipulate whether reviews are more emotion or cognition-related to test for causality. Study 4 also examines the mediating role of emotion/cognition linguistic features on reviewers' attitudes and readers' reactions. Finally in studies 5a and 5b we introduce a review system intervention – review text and rating order – and show how order affects both linguistic features and writer and reader reactions.

Through the analysis of over 100,000 online reviews and experimental data, this paper finds that the degree to which reviewers' review text reflect primarily emotions or cognitions not only correlates with their numerical ratings of the experience, post review-writing feelings, and revisit intentions, but also predicts readers' reactions to the review. Specifically, reviewers who recount their consumption experience primarily based on their emotions (cognitions) tend to give higher (lower) numerical ratings to the experience, feel better (worse) after writing the review, and exhibit higher (lower) revisit intentions. Readers are more (less) likely to give emotion-based (cognition-based) reviews reaction responses. The role these two linguistic features play in driving these effects are examined using mediation. Finally, two review system design interventions aimed to improve customer satisfaction as well as the average numerical rating of companies' products or services are tested: a) encouraging reviewers to express more emotions rather than cognitive processes in review writing and b) prompting reviewers to write open-ended comments before giving a numerical rating of their experience.

Theoretically, the current research contributes to the literature on online word-of-mouth by showing that emotionality positively predicts reviewers' attitude and reactions (e.g., numerical rating, post-review feelings, revisit intentions, etc.) and readers' reactions. We also show that text is a stronger predictor of reader-related consequences than are numerical ratings. Practically, our results suggest that companies and platforms can provide their consumers instructions or templates for how to write reviews (e.g., provide suggestive words to use in the reviewers to influence writers' tendency to use emotion or cognitive linguistic features, write about the experience first before providing a numerical rating) that will have a positive impact on both review writers and readers.

Punish or Permit? Predictors of Consumers' Reactions to Purity Violations

Jodie Whelan, York University, Toronto, Canada
Sean T. Hingston, Ryerson University, Toronto, Canada

EXTENDED ABSTRACT

During the ongoing coronavirus pandemic, there has been a marked increase in preference for products and services that mitigate the threat of getting and spreading the highly contagious coronavirus (e.g., health and hygiene products; contactless payment systems), as well as products that are free of contaminants (e.g., organic produce). Similarly, recent research finds that pathogenic cues increase preferences for products that have not been handled or used by others (Huang, Ackerman and Sedlovskaya 2017; Huang and Sengupta 2020). Together, these findings suggest that when pathogen threat is salient, consumers become more concerned with keeping their environments and bodies free of contaminants, or, in a word, purity.

Importantly, purity is more than just a physical concern—it is a moral one. Rooted in the evolutionary need to avoid toxins, parasites, and other dangerous pathogens, moral purity is concerned with keeping the body and soul free from physical *and* moral contaminants (Haidt and Joseph 2007). To this end, purity-based norms govern behaviors with a high risk of pathogen transmission (e.g., food preparation, hygiene, and sexual contact), and violating these norms is met with moral condemnation.

Crucially, purity violations are not limited to the social domain. Brands, employees, and public figures are all guilty of some pretty gross behaviors. Thus, in this research, we examine whether the apparent relationship between pathogen threat and increased preference for products associated with physical purity transfers to moral purity and greater condemnation of purity violations. We propose that pathogen threat will amplify condemnation of purity violations, but this will only occur for those who grew up wealthy. Because wealthy childhood environments prioritize individual freedom over social coordination (Hoff, Laursen and Tardif 2002; Kraus et al. 2012; Weininger, Lareau and LaRossa 2009) and because fighting off infectious disease is an adaptive challenge that necessitates a coordinated, collective response (Gelfand et al. 2021), we reason that people with wealthier childhoods may feel ill-equipped to manage pathogen threats. Consequently, when pathogen threat is salient, they should become especially sensitive to violations of norms with pathogenic implications.

Seven studies, conducted pre- (studies 1-4) and mid-pandemic (studies 5a, 5b, and 5c), provide experimental and correlational evidence for this prediction. In **study 1**, 180 American MTurk workers (N = 180) were randomly assigned to one of two between-subjects conditions (threat: pathogen vs. control). Threat was manipulated by having participants view either a slideshow about disease in America (pathogen) or about architecture (control; Hill, Prokosch and DelPriore 2015). Next, participants reported their condemnation of a number of purity violations (Horberg et al. 2009) and completed an established measure of childhood SES (Griskevicius et al. 2011). As predicted, pathogen threat increased condemnation but only among participants with wealthier childhoods.

Study 2 investigated whether study 1's findings would replicate in a marketplace setting. American MTurk workers (N = 180) were randomly assigned to one of two between-subjects conditions (threat: pathogen vs. control). Threat was manipulated using the same manipulation as in study 1. Then, participants read a fictional article about a company that recalled several thousand jars of peanut butter because its new packaging featured "characters that were taken from a pornographic cartoon." Then participants reported their attitudes toward the company and their childhood SES. As predicted, pathogen threat decreased attitudes but only among participants with wealthier childhoods.

Study 3 and **study 4** were, respectively, designed to test whether the observed effect was unique to pathogen threat and purity violations vs. threat and moral violations more broadly. In **study 3**, 180 American MTurk workers were randomly assigned to one of two between-subjects conditions (threat: pathogen vs. *negative* control). To manipulate threat, participants were either asked to rate how interesting they found five different facts related to germs and/or illness (pathogen) or accidents and/or death (negative control) embedded in five unrelated facts. Then, participants read the same article used in study 2. As predicted, pathogen threat significantly decreased attitudes for participants with wealthier childhoods and unexpectedly, significantly increased attitudes for participants with poorer childhoods.

In **study 4**, 240 American MTurk workers were randomly assigned to one of four conditions in a 2 (threat: pathogen vs. control) 2 (violation: purity vs. loyalty) between-subjects design. After viewing the pathogen threat slides manipulation described in study 1, participants read an article about either a marketplace purity violation or a marketplace loyalty violation. Analyses revealed the predicted three-way interaction: the pathogen threat by childhood SES interaction was only significant in the purity condition; the interaction did not significantly predict attitudes in the loyalty condition.

Study 5a, 5b, and 5c tested whether perceived controllability mediates the effect of pathogen threat and childhood SES on condemnation of purity violations across social (5a), marketplace (5b), and political (5c) domains. In addition, as all of these studies were conducted in April 2020, instead of manipulating pathogen threat, we measured perceived threat of COVID-19. In all three studies, regression analyses revealed that perceived threat of COVID-19 and childhood SES interacted to predict condemnation. Further, in each study, perceived controllability mediated the effect of the interaction on condemnation. For participants with childhood SES at or above the mean, increasing COVID-19 threat predicted lower controllability, which then predicted greater condemnation.

The current research makes a number of contributions. First, this research extends the literature on consumer morality by identifying novel situational and individual factors that influence consumers' reactions to moral violations. Second, we contribute to growing interest in how pathogen threat affects consumer behavior and are the first to consider how pathogen threat influences consumers' condemnation of moral violations. Third, by identifying childhood SES as a novel moderator of the effects of pathogen threat, we provide further support for the notion that the effects of early childhood environments can have long-lasting effects on consumer behavior, especially in the face of threat (Mittal and Griskevicius 2016; Mittal, Griskevicius and Haws 2020; Whelan and Hingston 2018).

Offensive-Stereotyping Ads: Disidentification Tendency in Action

Enav Friedmann, Ben-Gurion University, Israel
Eliran Solodoha, Ben-Gurion University, Israel
Dorit Efrat-Treister, Ben-Gurion University, Israel

EXTENDED ABSTRACT

Offensive-stereotyping advertising includes insulting those low in social power (Dahl et al., 2003, Waller et al., 2004). We examine the short and long-term effects of such offensive ads on the consumer response of discriminated individuals. Offensive ads affront discriminated groups, such as women and Blacks (Magee and Galinsky, 2008; Waller et al., 2013). Women are demeaned compared to men, specifically in the use of sex-role stereotypes (Sengupta and Dahl, 2008). Blacks are often represented in ads in demeaning ways (Cohen-Eliya and Hammer, 2004). Such ads might threaten the 'self' of the offended individuals, causing an initial negative emotional reaction of anxiety, leading to fight-flight-freeze reactions (Bracha et al., 2004). Over time, we expect that this threat will decrease while the ad's content will be remembered (Kumkale and Albarracin, 2004), yielding stigma management actions. Avoidance response is activated when trying to reduce the self-threat when people accept the public representation of the group, but do not accept the stigma as applied to themselves, termed disidentification (Elsbach and Bhattacharya, 2001; Miller and Major, 2000). Formally, we expect:

Hypothesis 1: *Feelings of racial group discrimination when exposed to the offensive ad will moderate the relationship between group identification and purchase intentions in the long-term (not the short-term).*

Hypothesis 2: *Feelings of gender group discrimination when exposed to the offensive ad will moderate the relationship between group identification and actual brand choice in the long-term (not the short-term).*

METHOD

Study 1

Sample. 347 Prolific respondents (treatment=201: 103 White, 98 Black; control=146: White 80, Black 66). Participated in a longitudinal experiment on race-offensive ads promoted a hypothetical brand, "Bubble Soap".

Design. mixed 2 (race) x 2 condition (control, treatment) x 2 time-points (exposure: short (immediately), long-terms (10 days after exposure) design.

Measures. (1-7 scale). Perceived ads' offensiveness level of ad's offensiveness (Alwitt and Prabhaker, 1994). Group identification: asking "At what level do you identify with the race group you belong to? (Postmes et al., 2013). Feelings of *race* group discrimination: asking "How often have you felt that people of your race group are discriminated against in our society?" (Szymanski and Balsam, 2011). Consumer response was measured using purchase intentions - asking "If I want to buy this product, I'll probably buy this brand" (MacKenzie et al., 1986; Bergkvist and Rossiter, 2009). Last, we collected demographics.

In the long-term, we also measured brand awareness by asking "What is the brand that appeared in the ad from 10 days ago?" and memory of the ad's content by asking to describe the ad (Chessa and Murre, 2007).

Results and discussion. The treatment group showed greater perceived offensiveness of the ad than the control group ($M_{control}$=1.29, SD=.95; $M_{treatment}$=5.64, SD=2.18). In both the conditions, Black participants felt more discriminated against than White participants in both the short-term ($d_{control}$=-.35, SE=.27, *p<.001*; $d_{treatment}$=-3.10, SE=.26, *p<.001*) and long-term ($d_{control}$=-3.65, SE=.26, *p<.001*; $d_{treatment}$=-3.85, SE=.25, *p<.001*), suggesting they are indeed perceived as having lower social power. As predicted, feelings of group discrimination moderated the group identification-purchase intention relationship, but only in the treatment condition in the long-term ($B_{Group\_identificationXdiscrimination}$=-.10* (.05), *p<.05*(. The interaction effect was not evident in the control group in the long-term ($B_{Group\_identificationXdiscrimination}$=-.03 (.03), *p=.33*(. As expected, in the short-term, this interaction was not significant, neither in control ($B_{Group\_identificationXdiscrimination}$=-.033 (.032), *p=.29* (, nor in the treatment condition ($B_{Group\_identificationXdiscrimination}$=-.043 (.040), *p=.29*(. The disidentification tendency is evident only in the treatment group and in the long-term. The triple interaction between group identification x feelings of group discrimination x short vs. long-term was significant (B=-.36 (.10), *p<.001*(.

Study 2

Sample. 221 MBA students (treatment=141: 49 men, 92 women; control=80: 27 men, 53 women). *Design.* a mixed 2 (gender) x 2 conditions (control, treatment) x 3 exposure-times (baseline, short-term, long-term) design. Low and high-discriminated groups (men and women, respectively) were randomly exposed to control vs. treatment ads.

Measures. As in Study 1, except consumer response which was actual brand choice, and group discrimination referred to gender (not race). Long term measurement was extended to a month after exposure.

Results and discussion. The treatment differed from the control in terms of perceived ad's offensiveness ($M_{control}$=2.72, SD=1.60; $M_{treatment}$=5.50, SD=1.70, t(218)=-11.87, *p<.001*). Feelings of group discrimination were a significant moderator in the group identification-actual brand choice relationship and only in the treatment condition in the long-term, as expected in the predicted direction ($B_{Group\_identificationXdiscrimination}$=-.26* (.11), *p<.05*(. This relationship in the long-term was more negative for the discriminated groups than for the non-discriminated groups, similar to the pattern found in Study 1. This interaction effect was not evident in the control group in the long-term ($B_{Group\_identificationXdiscrimination}$=.068 (.20), *p=.74*(. As expected, when examining the model in the short-term, this interaction was not significant neither in control ($B_{Group\_identificationXdiscrimination}$=.21 (.24), *p=.37*) nor in the short-term treatment condition ($B_{Group\_identificationXdiscrimination}$=.01 (.10), *p=.92* (. Like Study 1, Study 2 shows the disidentification tendency is evident only in the treatment group in the long-term. The triple interaction between group identification x feelings of group discrimination x short vs. long-term was significant (B=-.28 (.14), *p<.05*(.

Conclusion

Offensive ads have a dynamic effect that changes over time and differs between discriminated-low-power and non-discriminated-high-power group members. In the short-term, discriminated group members exposed to offensive ads will respond with a fight-flight-freeze resections, resulting in lower consumer responses (purchase

intentions and actual brand choice). However, in the long-term, when the negative affective reaction will recede, they will process the content of the message, leading to low disidentification with their lower power group, which will result in higher consumer responses. Our contributions are addressing the *time* as a player in impacting consumer response; quantifying the response over time of *different consumer segment*s based on their sense of group discrimination; *integrating* literature about stigma management, approach and avoidance, and fight-flight-freeze, into literature in consumer behavior.

Brand Hive Mind: Building the Bitcoin Decentralized Brand

Mariam Humayun, University of Ottawa, Canada
Russell Belk, York University, Canada

EXTENDED ABSTRACT

"Bitcoin is resilient. Bitcoin is principled. Bitcoin is native to internet ideals. And it's a great brand."[1] – Jack Dorsey (Twitter)

Bitcoin is a brand without a manager or a C-suite. It is the quintessential product of – and *for* – the digital age. The value of this decentralized brand continues to grow despite a lack of central authority; and it has become a cultural icon with global brand recognition (Holt 2004). All of this is happening without a traditional marketing apparatus. While many brands are co-produced (Schouten and McAlexander 1995; Holt 2002; Muñiz and O'Guinn 2001, Schau, Muñiz, and Arnould 2009; Diamond et al. 2009; Brown, McDonagh, and Shultz 2013; Parmentier & Fischer 2015; Swaminathan et al. 2020), Bitcoin takes branding toward extreme decentralization where the brand *itself* is decentralized. This conceptual paper is based on a longitudinal study of Bitcoin since 2014 drawing on 65 in-depth interviews, archival data, netnography, and fieldnotes from participant observation. We focus on Bitcoin as a decentralized brand with a *hive mind*. After the financial meltdown of 2008, a Bitcoin white paper was posted by a pseudonymous founder using the name Satoshi Nakamoto (Humayun & Belk 2018). From a value of zero in 2009, when the blockchain was launched, the cryptocurrency reached an all-time-high of $ 64,000[2] USD before tempering down in early summer 2021. While there have been growing signs of legitimacy, from PayPal allowing its customers to trade Bitcoin, controversial moves like El Salvador accepting it as a legal tender in 2021, to Elon Musk accepting then rejecting Bitcoin payments for Teslas – the fact remains that Bitcoin has grown tremendously in the last few years and its key innovation – the blockchain – has spanned thousands of cryptocurrencies.

Bitcoin has evolved a global brand ecosystem through what we are calling the *hive mind*. Kelly (1994, 25) describes the hive as "irredeemably social, unabashedly of many minds, but it decides as a whole when to swarm and where to move. A hive possesses an intelligence that none of its parts does…where distributed, headless, emergent wholeness becomes the social ideal." Kozinets et. al (2008) categorize online consumer communities and their collective intelligence as either hives, crowds, mobs, or swarms. They define *hives* as "self-organizing, industrious, diligent" with an intention to reach high and "produce quality product" (346). We extend these analyses by exploring how the *brand hive mind* produces a collective social memory of the decentralized brand through its varied narratives. The hive mind allows Bitcoin to survive and thrive in crisis after crisis without anyone at the helm.

Given that decentralized brands do not have a central management team, they often evolve through multiple stabilizing and destabilizing forces which serve as *metamorphic moments* that help shape the brand hive mind. Destabilizing forces include the multiple crises which have supplied a steady stream of news stories that stimulate new brand narratives, populations, and myths. Stabilizing forces include the developers, miners, the connective tissue of social media, content creators, meetups/conferences, journalists, entrepreneurs, cryptocurrency news media, the legitimacy halos of endorsements or use by business leaders and celebrities, associations, companies trying to co-brand with Bitcoin, memetic artworlds, and Bitcoin branded artifacts such as hats and t-shirts circulating in the ecosystem: all contribute to shaping the brand.

There is cross-pollination among various cryptocurrency brand hive minds as new cryptocurrencies emerge. Not unlike worker bees working in a hive, those contributing to their favoured cryptocurrency form symbiotic relations with others in the hive mind. These brand hive minds also feed off of each other. For example, the crypto news media ecosystem that arose to defend Bitcoin's reputation in its early years, helped sustain various cryptocurrencies besides Bitcoin. Decentralized brand hive minds assembled around a cryptocurrency like Bitcoin are brand communities (Muñiz and O'Guinn 2001) at their core and connect with brand publics (Arvidsson and Caliandro 2016) which in turn help consolidate the overall brand ecosystem.

Today, there are movements underway to return the internet to its early roots of a pseudonymous economy where the boundaries between economic and personal lives are maintained and where there is freedom of speech. There is renewed discussion about having a "decentralized web" Web 3.0 that is a kinder implementation rectifying the mistakes that social media has unleashed. Brand hive minds are likely to grow in the coming years with the rapid growth in DAOs (Decentralized Autonomous Organizations) which are a product of the crypto-ecosystem (DuPont 2017, Hsieh et. al 2018). There are emerging means of monetizing value created by fan/brand communities through NFTs (Non-Fungible Tokens), rapid experiments in DeFi (Decentralized Finance) where oracles allow for greater transparency creating newer financial markets. While many of these endeavors are still experimental, they pose important questions about how brand hive minds will operate in the coming years. What do decentralized brand hive minds offer? Will consensus solve all governance problems that arise? How will brand hive minds negotiate conflicts and coordination issues? Are they only disruptive in terms of the economy and ways of doing business or do they represent a threat to capitalism, corporate control, or other taken-for-granted institutions? The answer no doubt remains in how institutions like governments engage with them. But as Belk (2020, 168) put it "welcome to the era of distributed brand ownership…".

Mythologizing the Dark Knight: A Process Enquiry

Saurabh Shinde, Indian Institute of Management Calcutta, India
Krishanu Rakshit, Indian Institute of Management Calcutta, India

EXTENDED ABSTRACT

The past two decades have seen a considerable increase in franchise movies (Garrahan, 2014). Preece et al. (2019) showed their contribution to the branding theory. In this article, we study one of the oldest movie franchises, Batman, to understand how it created value, why it failed sometimes, and how it adjusted to revive itself.

We adopt a historical study and discourse analysis approach, where triangulation is achieved by comparing narratives from multiple sources. Our sources include documentaries (15), newspaper articles (30+), Published interviews of movie producers and directors (12), memoirs (3), books on Batman (8), class assignments (4), and online forums (2000+ posts).

From the data, three significant value co-creation practices (Corsaro et al., 2014) emerge: Production Practice (PP), Creation Practice (CrP), and Consumption Practice (CP). CrP consists of the phases of movie-making from its conceptualization to creating prints; PP essentially involves financing, marketing, and other logistic support; while CP includes direct consumption, giving feedback, participating in fan movements, etc. In a movie franchise, these practices are replicated through a definitive process, making movies the ideal medium for mythmaking (McConnell, 1979).

In any franchise, mythos mediates the interaction between PP & CrP and affects CP - through *externalization*. In the process, certain elements are added/updated to the mythos – through *internalization*, i.e., internalization and externalization are interdependent subprocesses (Figueiredo & Scaraboto, 2016, p. 528), originating and terminating at the mythos. Essentially, a movie is an outcome of interactions not only between spatiotemporal practices (i.e., PP, CrP, and CP) but also between other nonhuman elements (past movies, blogs, comics, etc.) which create the mythos. The resultant "mesh of practices and material arrangements," i.e., the movie, then becomes what Schatzki (2002) calls the "Site of the Social."

Either of these adjectives unavoidably gets associated with Batman. Out of various meanings for the word 'camp' (Sontag, 2018), the most applicable here is "shockingly vivid color schemes, tongue-in-cheek dialogues and a dual address to both children and adults" (Brooker, 2012, p. 178). On the other hand, 'dark' refers to "that grim crime fighter driven by an obsession born of tragedy" (Brooker, 2012, p. 174), depicted through the *noir* tone of the movie, realistic portrayal of the characters, and fallibility of the hero.

Batman appeared in 1939 in the comic version; Batman emerged as a 'dark' character. However, to cater to the "kiddie" (Scivally, 2011) audience for a comic book superhero, the producers adopted a camp version. Still, the repeated failure of these endeavors prompted the creators to bring back the dark version of Batman. Once financial success was achieved, the darkness remained a persistent theme.

Producers archetypically look for financial profits, actively seek customer feedback, and oblige only when profit is at stake; Creators, on the contrary, could care less about finances but would not compromise their creative expression because they want to "leave their personal stamp on virtually [e]very movie they make" (Kuhn & Westwell, 2012; Simonton, 2004, p. 170); and the Audiences predominantly expect that their overall consumption experience should be worth their psychological and monetary investments (Holbrook, 1999; Sood & Drèze, 2006).

The comic version of Batman engaged the PP and CrP in establishing the foundational elements of the Batman ethos. While they formed the essential 'core' of the Batman franchise and were repeated every time, some other peripheral elements were introduced and dropped almost immediately. Other elements appear with irregular frequencies and occupy the space between the core and the periphery, e.g., the 1960s and 90s regularly experimented with alternate 'dark' and 'camp' themes. This establishes that mythos is not an abstract concept but has a particular structure. It consists of time-tested dimensions at the "core" that give identity to the site. Hence they also serve the "author function," which helps in identifying those "empty spaces that have been masked by [nonaccidental] omission" (Foucault, 1977, p. 135). On the other hand, non-crucial dimensions stay at the periphery, being weakly bonded to the site. Thus, the structure of mythos resonates with the loosely coupled system between hierarchical levels (Orton & Weick, 1990).

We propose that mythos is a "taste regime [which] … provid[es] the teleoaffective structure of a practice that orders objects, meanings, and doings" (Arsel & Bean, 2013, p. 902). It is a knowledge resource that is "continually regenerated through interaction and exchange" (Akaka et al., 2012, p. 32) to create value-in-context at each site (Chandler & Vargo, 2011). Finally, it is also a repository of "shared symbols, embedded within broader institutions, [that] guide[s] the enactment of value cocreation practices—normative, representative, and integrative — and enable effective coordination of interactions, communication of information, integration of resources, and ultimately, evaluation of value" (Corsaro et al., 2014, p. 7).

Our findings suggest that interaction logics through CP, CrP, and PP play a crucial role at all the steps of systematic value creation – enactment (e.g., recruitment of director), transvaluation (e.g., presentation on screen), assessment (e.g., critical reviews), and alignment (e.g., planning for next movie). The movie acts as a "context" where "resource integrators" (Vargo & Lusch, 2011) negotiate their practices to co-create the value. As shown above, the resource of "theme" has been utilized in alternate ways till 1998. However, its consistently same use (i.e., dark portrayal of Batman) in the past two decades has made it a core dimension of mythos and affected all the practices thenceforth. This paper brings in a unique type of circulation – circulation through disintegration. While the franchise model tries to maintain uniformity, the interplay of logics brings variety. The concept of mythos allows it by de-contextualizing the narrative element during transvaluation and re-contextualizing it during the alignment phase. Such conceptualization also overcomes the limitation of the practice theory of excluding non-routinized actions (Figueiredo & Scaraboto, 2016) because every activity impacting the story gets transvalued in the mythos.

Can't Wait to Lose: The Desire For Goal Closure Increases Impatience to Incur Costs

Annabelle Roberts, University of Chicago Booth School of Business, USA
Alex Imas, University of Chicago Booth School of Business, USA
Ayelet Fishbach, University of Chicago Booth School of Business, USA

EXTENDED ABSTRACT

Consumers' impatience is often portrayed as the preference to receive gains sooner or to postpone costs for later. But can consumers also be impatient to incur costs *sooner*? We explore several common situations in which consumers are impatient to incur costs. We find that consumers prefer to pay and work more sooner rather than less later. This preference would seem anomalous in the context of both standard and behavioral models of time discounting, as it would suggest that consumers have *negative* time discounting. We propose that this behavioral pattern can result from a desire for goal closure.

Consumers who desire closure may be impatient to conclude tasks regardless of whether they gain or lose. Accordingly, our main hypothesis is that consumers can be impatient to incur costs when it allows them to achieve earlier goal closure (H1). Further, we predict that this preference increases with the desire for goal closure. Consumers have a stronger desire for goal closure when the mental cost of the unresolved goal is higher (such as when they need to invest mental effort to remember it) and when they are able to finish a goal (Hull, 1934; Kivetz et al. 2006; Koo and Fishbach 2012; Nunes and Dreze 2006; Roberts and Fishbach 2020). Thus, we predict that consumers are more impatient to incur costs when the unresolved goal is more mentally costly (H2) and when it allows them to finish a goal (H3). We tested our predictions across five studies (*N*=1,099), four of which are preregistered.

In Study 1, we explored whether people would be impatient to resolve a debt (H1). Participants either read that they owed a co-worker money or a co-worker owed them money. Participants chose between resolving the debt sooner and losing $2 (i.e., paying $2 more or accepting $2 less than owed) or leaving the debt unresolved and not losing money. The majority of participants preferred to lose money to resolve the debt sooner both when they owed money (91%), X^2(1, N=95)=62.41, *p*<.001, and when they were owed money (81%), X^2(1, N=101)=39.30, *p*<.001. Whereas people are often impatient to receive money, in Study 1 participants were impatient to lose money in order to close a debt and achieve closure sooner.

In Study 2, participants made incentive-compatible choices between two options that varied in the number of work tasks but offered the same payment. The majority of participants (65%) chose to complete the longer task when it occurred sooner than the shorter task, X^2(1, N=100)=9.00, *p*=.003. Only a minority of participants chose to complete the longer task when they both occurred sooner (21%), X^2(1, N=96)=32.67, *p*<.001, and later (18%), X^2(1, N=105)=42.75, *p*<.001. Thus, participants were only impatient to complete more work when it allowed them to finish the task and achieve closure sooner (H1).

In the remainder of the studies, we manipulated the desire for goal closure to test the effect of our proposed mechanism on impa-tience. Study 3 tested whether people would be more impatient to incur costs when the unresolved task was harder to remember, and thus, more psychologically costly to delay (H2). Participants were more impatient to complete a greater amount of work sooner (vs. smaller amount later) when they would receive no reminders (70%) about the task versus three reminders (54%), X^2(1, N=199)=5.57, *p*=.018. Thus, participants were more impatient to complete work when the mental cost of the unresolved task was higher. Telling people that they will receive reminders about a task can reduce impatience.

Studies 4 and 5 explored the mechanism further by testing whether people would be more impatient to incur costs when it allows them to finish a goal (H3). In Study 4, we presented a task as either first or last in a sequence. Participants were more impatient to complete more work sooner (versus less work later) when finishing a task (60%) than when starting a task (45%), X^2(1, N=199)=4.10, *p*=.043. Participants also reported a greater desire for goal closure when deciding when to finish (vs. start) the task, *t*(197)=2.28, *p*=.024. This desire for goal closure mediated the effect, indirect effect=-1.15, SE=0.57, 95% CI=[-2.39, -0.17]. Participants were more impatient to complete an incentive-compatible task when it determined when they could finish a goal.

Beyond the position of a task, the framing of a task can also influence the desire for closure, which in turn decreases patience. In Study 5, we manipulated whether participants would prefer to complete a longer product review task sooner (vs. shorter version later) if it was framed as "finishing the task" as opposed to "completing a bonus task." Participants were more likely to choose to complete the longer task sooner when it was presented as the last task (61%) instead of a bonus task (39%), X^2(1,N=200)=9.68, *p*=.002. Additionally, participants felt a significantly greater desire for goal closure when the task was presented as last compared to as a bonus, *t*(198)=3.70, *p*<.001. This desire for goal closure mediated the effect of the task framing (last vs. bonus) on the decision to work more sooner, indirect effect=-0.64, SE=0.22, 95% CI=[-1.14, -0.28]. Participants were more impatient to complete an incentive-compatible product review task when it enabled them to achieve goal closure.

While impatience is often portrayed as a preference to acceler-ate gains or delay costs, we find that consumers are also impatient to incur costs sooner. We propose that the desire for goal closure explains this behavior. Accounting for the desire for goal closure can explain impatience to incur larger costs sooner (vs. smaller costs later), which otherwise appears as discounting the *present* rather than the future. Our findings have important implications for consumer decision-making. Reducing the desire for goal closure can allow consumers to make more patient choices with their money and time.

The Temporal Slippery Slope: Decline in Sequential Ratings within Batches of Online Reviews

Chen Pundak, Tel-Aviv University, Israel
Lev Muchnik, The Hebrew University, Israel
Yael Steinhart, Tel-Aviv University, Israel
Jacob Goldenberg, Interdisciplinary Center, Israel

EXTENDED ABSTRACT

Online reviews and product ratings are essential factors in consumers' decision processes (Chevalier and Mayzlin 2006). Previous research focused on how reviewers adjust their ratings for a specific product according to previous ratings of others given to this product (Moe and Schweidel 2012). The present research adds to this stream of knowledge by focusing on the dynamics of ratings given by a single reviewer for different products in a short time period. Specifically, we show that reviewers tend to generate ratings in batches, that is, to provide more than one rating during a session in an online review platform.

Moreover, we expect a sequential effect within a batch, considering how consumers' earlier decisions within a sequence influence their later ones (Sumer and Knight 1996). Specifically, we expect reviewers to start with the highest rating within a batch, with which they are extremely satisfied, given the tendency for positive skewness in online reviews (Schoenmueller, Netzer, and Stahl 2020). For later ratings within a batch, we expect reviewers to experience doubt, which is reflected by mixed feelings and indecisiveness about the product and a longer decision time (Bargh et al. 1992), and therefore reviewers may spend more time contemplating the score of each subsequent ratings, which is also predicted to be lower.

We formally hypothesize:

Hypothesis 1: A substantial fraction of online ratings is produced as part of a batch.

Hypothesis 2: Rating scores of the same reviewer will drop as a function of time within a batch.

Hypothesis 3: Doubt about rating scores will increase over time within a batch, such that later rating scores reflect higher doubt than earlier ones.

We examine our Hypothesis using a multi-method approach, incorporating analysis of large-scale field data and a set of controlled experiments. In study 1 we present evidence for the ubiquity of the batching behavior on five popular review websites—Yelp, IMDB, Rotten Tomatoes, TripAdvisor, and Goodreads. For each website, we determine the percentage of ratings given as a daily batch. In line with H1, we demonstrate the frequency under which two or more ratings are given by a single reviewer on the same date (varying between 12.41% and 80.94%) and the percentage of reviewers who produced a batch at least once (between 9.5% and 99%). Also, we show that on average reviewers' fraction of daily batch was higher than the assumed given a random distribution of activity with, using Kolmogorov-Smirnov test (all $p < .001$). Given the frequency of daily batch, we move forward to narrow the phenomenon into a shorter time.

In study 2 we crawled two different review platforms that specialize in (a) books (11.3M ratings produced by 49,816 reviewers) and (b) movies and TV series (110.49M ratings produced by 564,982 reviewers), both with a time resolution of seconds. In both platforms, we calculate the difference in seconds between each two sequential ratings created by the same reviewer and regress the reviewer's rat-

ing on the time (in seconds) passed since his or her last rating in the batch controlling for the reviewers' current average rating, number of previous ratings, current product average rating and number of ratings, and the batch size. In line with H2, we find that in a single session, a reviewer's rating score is negatively affected by the time passed since the reviewer's prior rating (both $p < .001$). Moreover, we show in both datasets that ratings' variance (which is associated with doubt, Snyder and Tormala 2017) increases as the time between two sequential ratings in a batch increases ($p < .001$).

In study 3 we rely on online experiments to better control and explain the role of doubt in driving the drop in sequential ratings within a batch (H3). In study 3A, participants (n = 200) were asked to rate either a movie or a book of their choice and report their doubt regarding each rating score. As expected, longer rating duration was associated positively with higher doubt, and negatively with rating score, regardless of product type ($p < .001$). In studies 3B (n = 300), participants were asked to specify a movie and rate it. Next, they were asked to specify a second movie and rate it. However, we operationalized the level of doubt about the second rating (high-doubt vs. low-doubt vs. baseline). In accordance with H3, a mixed ANOVA model revealed a significant interaction between the difference in ratings and experimental conditions ($p < .001$, $\eta^2_p = .099$): In the high-doubt condition, the second rating score was significantly lower than in the low-doubt and baseline conditions ($M_{high\_doubt} = 6.09$, $M_{baseline} = 7.71$, $M_{low\_doubt} = 8.1$, $p < .001$). In study 3C (n = 401), we used a similar design as in 3B. This time, we operationalized the level of doubt about both the first and second rating scores (first rating: high-doubt vs. low-doubt) X (second rating: high-doubt vs. low-doubt). A mixed ANOVA model revealed a significant interaction between the difference in ratings and experimental conditions ($p < .001$, $\eta^2_p = .250$): Having low doubt about the first rating and high doubt about the second rating replicates the drop in ratings (first rating: $M_{low\text{-}doubt\text{-}high\ doubt} = 8.83$, second rating: $M_{low\text{-}doubt\text{-}high\text{-}doubt} = 6.30$, $p < .001$). The drop was significantly higher than the low doubt–low doubt condition and the high doubt–high doubt condition ($p < .001$). Having high doubt about the first rating and low doubt about the second rating reversed the effect (first rating: $M_{high\text{-}doubt\text{-}low\text{-}doubt} = 6.87$, second rating: $M_{high\text{-}doubt\text{-}low\text{-}doubt} = 8.42$, $p < .001$).

The current investigation incorporates two novel aspects: 1) a focus on a single reviewer's ratings, as opposed to investigating how ratings of others influence reviewers; and 2) an analysis of reviewer's rating distribution at a high temporal resolution (seconds instead of days). It seems that the tendency to produce reviews in batches is quite common and is overlooked by previous research. The opportunity to identify the deliberation process for online ratings can enable companies, platforms, and consumers to take greater control over the review process.

The Curse of Similarity: When and How Similarity Induces Persuasion Reactance

Suntong QI, The Chinese university of Hong Kong, Hong Kong
Xianchi Dai, The Chinese university of Hong Kong, Hong Kong
Man Ching Canice Kwan, The Open University of Hong Kong, Hong Kong
Robert S. Wyer, University of Cincinnati, USA

EXTENDED ABSTRACT

It was suggested that a consumer has two possible roles in the face of a salesperson: a goal seeker and a persuasion sentry (Kirmani and Campbell 2004). As goal seekers, consumers utilize the salesperson and seek information to help them make a better purchase decision. As persuasion sentries, they resist and respond strategically to unwanted persuasion attempts. Thus, focusing on the consumer side, the effectiveness of a salesperson's persuasive effort is jointly determined by a salesperson's perceived helpfulness and sales intention. In this project, we study how consumers' product familiarity and salesperson-consumer similarity change the relative salience of the two forces. We propose that when consumers make a purchase in an unfamiliar product domain, the same persuasive effort from sellers of high (vs. low) similarity would be more effective; alternatively, when consumers make a purchase in a familiar product domain, the reverse is true.

To gather information or to detect persuasion could vary upon consumers' product familiarity. Consumers who are familiar with the product domain already have enough product knowledge or even possess an established preference, while consumers who are unfamiliar with the product domain are not yet able to identify their preferred attribute combination (Mogilner, Rudnick, and Iyengar 2008). These two groups of consumers are likely to have different goals when interacting with the salesperson. The former group is more directed and relies less on external information when making a decision. Therefore, they focus less on the salesperson's helpfulness, but more likely to recognize salespersons' sales intention when receiving a recommendation from a salesperson. In contrast, the latter group faces the task of forming a preference as they have limited knowledge about the products to distinguish different options. They rely more on external information to learn about the products and determine their preference (Hilton and Darley 1991). For this reason, though they may be aware that the salesperson is trying to sell, their primary goal is to evaluate the salesperson's helpfulness when receiving a recommendation.

No matter a consumer is evaluating the helpfulness or sales intention of a salesperson, they are making inferences about the salesperson. Interpersonal similarity thus plays a role. Similarity leads to an easier simulation of mental states, and people are more strongly engage in simulation for similar other (Faraji-Rad, Samuelsen and Warlop 2015; Woo and Mitchell 2000). Based on the assumption that consumers more easily simulate the mental states of similar rather than dissimilar persons, we propose that salesperson-consumer similarity increases consumers' confirmation of inferred helpfulness and sales intention of a salesperson. Thus, when making purchase decisions in unfamiliar product domains, where consumers' primary goal is to form their preference by seeking useful information, consumers are more confirm a similar (vs. dissimilar) salesperson is helpful, and thus similarity increases persuasiveness. Alternatively, when making purchase decisions in familiar product domains, as consumers have already formed their preferences, they focus more on the sellers' sales motives. Therefore, they are more confirm a similar (vs. dissimilar) salesperson's sales intention, and thus similarity decreases persuasiveness.

We first tested two assumptions. Pilot study 1 ($N = 371$) showed that consumers' familiarity with the product influenced their inference of the salesperson's helpfulness and sales intention. Pilot study 2 (the US, $N = 149$; Asia, $N = 57$) showed that people are more confirm about their inference on a salesperson who is similar than dissimilar to them.

Study 1a ($N = 284$) and study 1b ($N = 181$) tested the hypothesis that consumers who are unfamiliar (familiar) with the product domain are more (less) likely to accept a recommendation from a similar salesperson than from a dissimilar one. Results showed that participants with high product familiarity are more likely to take a recommendation from a salesperson with a different ethnicity (study 1a) and gender (study 1b) compared with a salesperson with the same ethnicity (study 1a) and gender (study 1b). For participants who are unfamiliar with the product domain, a similar salesperson has a higher persuasiveness.

In study 2 ($N = 326$), we tested the mechanism that consumers' inference certainty mediates the interaction effect of product familiarity and similarity (with the seller) on persuasiveness. We manipulated salesperson similarity and product familiarity (through familiar versus unfamiliar products) and measured inference certainty about information usefulness and sales intention. We found that inference certainty of information usefulness mediated the effect for unfamiliar products, and inference certainty of sales intention mediated the effect for familiar products.

In study 3 ($N = 473$), we examined a boundary condition to further test the underlying mechanism. To test the advantage of dissimilarity when consumers focus on sales intention, we added a third factor to manipulate the salience of sales intention. We found that the previously proposed effect replicated when participants were paying for the product but attenuated when they got the product for free (low sales intention).

In study 4 ($N = 421$), we tested the proposed effect in real purchase behavior. We gave participants a chance to buy products with four options, and a "salesperson" recommended one of the options. We replicated the interaction effect of product familiarity and ethnic similarity on participants' likelihood to purchase the recommended option.

Secondary data ($N = 10554$) from an insurance company lent further support to our proposition. An analysis of telesales data showed that renewals (customers who are familiar with the product category) were more likely to renew an insurance contract from a salesperson (through phone calls) of the opposite sex than same-sex, but the reverse pattern was found for new customers (i.e. customers who are unfamiliar with the product category).

The Effects of Reviews on Consumer Experiences

Dena Yadin, Bar-Ilan University, Israel
Nira Munichor, Bar-Ilan University, Israel
Elanor Williams, Washington University in St. Louis, USA
Inbal Stockheim, College of Law & Business in Ramat-Gan, Israel

EXTENDED ABSTRACT

Product reviews influence consumers' decisions and, consequently, product sales (Chevalier & Mayzlin, 2006; Trusov, Bucklin, & Pauwels, 2009), but there is reason to suspect that the effect of reviews on consumption may not end when a product goes in a consumer's shopping cart. Can exposure to reviews shape the consumption experience itself?

We suggest that reading product reviews before consumption can affect actual experiences with the product, leading consumers to have different product experiences than those who interact with the product without reading reviews. We further suggest that consistent with the idea that negative information has greater influence than positive information on decision making (Herr, Kardes, & Kim, 1991), negative reviews will have a greater effect on consumption experiences than will positive reviews. We believe this happens because consumers are more likely to focus on and retain negative information than positive information (Robinson-Riegler & Winton, 1996). Thus, consumers are likely to recall more negative attributes of the product at the time of consumption after exposure to negative reviews than after exposure to positive reviews or without exposure to reviews, and this recollection may impact the consumption experience.

Study 1 tested the effect of review exposure on consumption experiences in an incentive-compatible setting. Participants either could choose or were assigned a book excerpt to read and were given negative reviews of the book, positive reviews of the book, or no reviews of the book. Then, participants read the book excerpt and evaluated their experience on five 7-point scale items (e.g., "I enjoyed reading this book"). As expected, there was only a main effect of review exposure on evaluations ($F(5,591)=65.73$, $p<.001$) indicating a greater effect of negative reviews on experience ($M=2.6$, $SD=1.31$) compared to positive reviews ($M=4.05$, $SD=1.35$, $p<.001$) and no reviews ($M=3.87$, $SD=1.37$, $p<.001$). There was no significant difference in evaluations between participants who read positive reviews and participants with no exposure to reviews, no effect of choice on evaluations, and no significant interaction between choice and review exposure ($p =.19$). Thus, negative reviews influence experience whether consumers choose or merely receive the product they consume.

Study 2 ruled out an alternative explanation for our results: rather than experiencing products differently, consumers may merely be adjusting their evaluations to be consistent with those provided by previous consumers. This study focused only on negative reviews of a poorly written book and included a condition where participants first experienced the product and only then read reviews, in addition to conditions where participants read reviews first and where they read no reviews. An ANOVA revealed a significant effect of experience sequence on evaluations ($F(2,360)=13.12$, $p<.001$). Participants who read reviews *after* consumption provided lower evaluations ($M=1.81$, $SD=1.06$) than participants who did not read reviews ($M=2.13$, $SD=1.41$, $p=.026$). However, consistent with our experience change account, evaluations of participants who were exposed to reviews *prior* to consumption were significantly lower ($M=1.48$, $SD=.89$) than those of both participants who read reviews after

consumption ($p=.002$) and participants who did not read reviews ($p<0.001$).

Studies 3a and 3b provided direct support for negativity bias as a mechanism, by showing that exposure to negative reviews enhances recall of negative consumption attributes and that this recollection mediates the effect of reviews on experiences. In both studies, participants listened to a piece of music after reading negative reviews, positive reviews, or no reviews. Study 3a's participants evaluated their experience after listening, and then wrote five things they remembered about the music and indicated whether they liked or disliked them. Study 3b's participants performed the recollection task before they provided their evaluations. In both studies, analyses (PROCESS Model 4; Hayes 2013) found that the indirect path from the review conditions to evaluations through the number of recalled negative attributes was significant when comparing negative reviews to no reviews (Study 3a: $b=.543$, $SE=.14$, 95% CI [.2652, .8306]; Study 3b: $b=.881$, $SE=.13$, 95% CI [.6290, 1.1404]), and when comparing negative reviews to positive reviews (Study 3a: $b=.375$, $SE=.15$, 95% CI [.0930, .6612]; Study 3b: $b=.586$, $SE=.15$, 95% CI [.2972, .8784]). The results point to increased number of recalled negative attributes after reading negative reviews, which in turn is associated with worse evaluations.

Study 4 explored consumers general orientations towards positivity (Caprara et al., 2012) as a boundary condition. If the power of negative reviews to worsen consumer experience is due to consumers' heightened focus on negative product attributes, these effects should manifest more prominently in some consumers than in others. It seems plausible that consumers who generally fixate more on positive aspects may be less sensitive to negative reviews. Thus, in addition to measuring participants' responses to review exposure, we measured participants' positivity orientations. Participants watched a stand-up comedy show after reading negative reviews, positive reviews, or no reviews. Next, participants evaluated the stand-up and reported the extent to which they felt responsible for reporting positive aspects of the consumption experience. Simple slope analyses revealed effects of positivity orientation on consumption experiences. The more positivity oriented participants were, the higher the evaluations they gave, regardless of the reviews they read: positivity orientation was positively related to evaluations in the reviews-absent condition ($b = .14$, $SE = .04$, $F(1,121) = 24.15$, $p < .001$), in the positive-reviews-present condition ($b = .44$, $SE = .06$, $F(1,123) = 65.87$, $p < .001$), and in the negative-reviews-present condition ($b = .22$, $SE = .05$, $F(1,126) = 17.44$, $p < .001$). Thus, a strong positivity orientation can, to some extent, counteract the negative effects of negative reviews on the consumption experience. Correspondingly, in the negative-review condition, those with positivity orientations that were higher than the scale midpoint gave evaluations ($M = 2.93$, $SD = 1.43$) that were no different from the means of the review-absent condition ($t(51) = -1.47$, $p = .149$).

Across 5 studies, we show that exposure to negative reviews enhances recall of negative attributes, and thus negatively affect product experience (above and beyond adjustment to others' opinions). Our work suggests that product reviews influence not only what consumers purchase, but how they experience those purchases, as well.

Familiarity Attracts Consumer Attention: Two Methods to Objectively Measure Consumer Brand Familiarity

Ursa Bernardic, University of Geneva, Switzerland
Benjamin Scheibehenne, Karlsruhe Institute of Technology, Germany

EXTENDED ABSTRACT

Marketing practitioners and academics have long recognized the importance of brand familiarity—a consumer's prior direct or indirect experiences with a brand (Johnson and Russo 1984; Alba and Hutchinson 1987; Kent and Allen 1994). Past research has shown that brand familiarity impacts advertisement (Campbell and Keller 2003), evaluation (Laroche, Kim, and Zhou 1996), and consumer choice (Laroche et al. 1996). Consequently, brand familiarity has become a key element in models of brand strength and brand equity (e.g., Aaker 1997; Erdem 1998; Keller 2013; Heinberg et al. 2020).

While there is a clear support that familiarity is a major driver of consumer preferences, much less is known about whether and how familiarity influences more basic mechanisms, such as visual attention. Since past research on the impact of brand familiarity and research on visual design have mainly advanced in parallel, studies investigating brand-related features that impact visual attention have so far focused only on unfamiliar brands, and on bottom-up, logo-related features (Kim and Lim 2019).

Looking at theories from cognitive science and marketing, we found that studies investigating how familiarity or novelty influences visual attention have produced mixed results (reviewed in cognitive science: Wolfe and Horowitz 2017; and marketing: Sample et al. 2020). Therefore, we sought to bridge this gap by investigating the role of brand familiarity in consumer settings, beginning with asking whether familiar or novel brands attract human attention.

Based on a series of three preregistered visual search, we show that familiar logos are found faster than unfamiliar logos (Study 1), even when controlling for other logo-design features in a cross-cultural study using visual search task (Study 2), and that video recognition task provided an objective measure of brand familiarity which does not require multiple trials and yields in larger effect sizes (Study 3).

In Study 1, we aimed to test the hypothesis that brand familiarity, as opposed to brand novelty, impacts consumers' attention in a computerized visual search task. One hundred participants were recruited on Amazon's Mechanical Turk (MTurk) (M_{Age} = 35.9 years, SD = 10.5; 37% female). Participants were instructed to find different smartphone app logos ("targets") among either seven or 23 distractor logos. Half of the targets were familiar app logos from the Google Play store and the other half were unfamiliar logos from apps that were primarily used in China. The familiarity ratings at the end of the experiment were significantly higher for the familiar app icons (M = 3.7, SD = 0.7) than the unfamiliar app icons (M = 1.2, SD = 0.6), suggesting our manipulation of familiarity was successful. In line with our hypothesis, participants found familiar targets (Mdn = 568 ms) faster than unfamiliar targets (Mdn = 585 ms). To summarize, Study 1 demonstrated that brand familiarity as opposed to brand novelty enhances search speed and thus visual attention.

The Study 2 was a cross-cultural laboratory study. In this preregistered experiment, we again tested the influence of brand familiarity on visual search speed. In contrast to the first study, here we manipulated brand familiarity by using national brands from two countries, Switzerland and Slovenia. The same preselected set of brand logos from both countries was presented to participants from Switzerland and Slovenia, respectively. Thus, this design provides a rigorous control for bottom-up effects: If the results from the first experiment were driven by bottom-up effects, both Swiss and Slovene participants will be faster at finding bottom-up salient logos. However, if a shorter visual search is indeed the result of brand familiarity, Swiss participants will be faster at finding Swiss brands than Slovene brands and vice versa for Slovene participants. A total of 100 students from a large public university in Slovenia and 100 students from a large public university in Switzerland participated in the study (M_{Age} = 21.6 years, SD = 1.87, 49% female). The target stimuli were drawn from a set of 40 unfamiliar logos (Slovene for Swiss participants and Swiss for Slovene participants) and 40 familiar logos (Swiss for Swiss participants and Slovene for Slovene participants) in each session. To assess the effect of familiarity, participants were asked to repeatedly find a target logo among either seven or 23 distractor logos. In line with our hypothesis, Swiss participants were faster at finding Swiss logos than Slovene logos and vice versa for Slovene participants. The BIC difference between the baseline model (m0) and the extended model that included target familiarity rating as a predictor (m1) was 169. This translates into a BF of 4.4e + 36 (Wagenmakers, 2007).

To provide a more practical task for measuring brand familiarity objectively, for Study 3 we developed and tested a perceptual decision task in which participants watched a video that gradually changed from a noisy mask to the respective target brand image and where participants had to press a button as soon as they recognized the brand. Hence, the main dependent variables were reaction time and recognition accuracy. In line with our preregistered predictions, Swiss participants recognized Swiss logos (M = 11.64 s, 95% CI [11.40, 11.90]) about 2 s faster than Slovene logos (M = 13.87 s, 95% CI [13.57, 14.17]). To test if target familiarity had a credible influence on video response times, we compared the baseline model against an extended model that also included individuals' target familiarity rating as an additional fixed effect (m1). The BIC difference between the models was 128, which translates into a BF of 4.4e + 21 (Wagenmakers, 2007).

Our research sheds light on a prevalent, yet understudied research question of how brand familiarity affects visual attention. Across three studies, we found converging empirical evidence that familiarity improves visual search efficiency. As a methodological contribution, we introduced two objective measures of brand familiarity based on reaction times that can be used as a blueprint for researchers and practitioners alike. Both measures can be incentivized, rewarding participants for correct responses and thus avoiding the pitfalls of subjective self-reports based on Likert scales. Together with the use of real-world brand logos, this enhances the external applicability of our findings.

Pavlov's Buzz? Mobile Vibrations as Conditioned Rewards

William Hampton, University of St. Gallen, Switzerland
Christian Hildebrand, University of St Gallen, Switzerland

EXTENDED ABSTRACT

One increasingly prevalent, but understudied, stimulus in the realm of digital consumption is mobile vibrotactile feedback. Online retail and e-commerce firms such as Amazon and ASOS have recently begun to deliver mobile vibrations to consumers in shopping contexts, such as for shopping cart adds. The majority of prior work examining subjective responses to vibrational stimuli comes from the ergonomics and information systems literature (Cole, Mohammed, and Shanmugam 2015; Koskinen, Kaaresoja, and Laitinen 2008; Lee and Lim 2014; Saket et al. 2013), with only one academic study from the marketing domain (Hadi and Valenzuela 2019). These initial findings indicate that mobile vibration can influence self-reported behavior broadly, but they do not elucidate how consumers psychologically respond to mobile vibrations, nor the underlying mechanism that governs subjective response to mobile vibrations. Anecdotally, people tend to report that a vibration from their phone evokes an approach response. Given that approach responses are very often triggered by reward-seeking (Simon et al. 2010), the question arises as to whether mobile vibration might be construed as a reward that can systematically influence consumer behavior.

Pilot

In the Pilot we sought to confirm that the most common vibration duration (400ms) maximizes reward response and examine how vibration reward response varies by consumer impulsivity and mobile notification valence. Online participants (n=150) reported their subjective reward response to mobile vibrations (ranging from 25ms to 3200ms; random presentation). We found that reward response varied by vibration duration $F(3,147)=6.52$, $p<.001$, with reward perception peaking at 400ms, as expected. We also found that both impulsivity and notification valence were significant moderators such that people who were higher in impulsivity ($\beta_{Imp\times Duration}=.02$; $t(1,1141)=2.05$, $p<.05$) or with more positive mobile notification valence ($\beta_{Valence\times Duration}=.63$; $t(1,1141)=2.68$, $p<.01$) also exhibited a stronger reward response across vibration durations.

Study 1

In Study 1 we tested whether pairing a rewarding vibrational stimulus with a simple action (pressing a button on a touchscreen) promotes that action, while also examining the potential role of arousal and novelty. We recruited 400 participants from an online panel (MTurk) who were randomly assigned to one of three experimental conditions that determined the kind of vibrational feedback item adds triggered: no vibration (n=130), 400ms vibration (n=129), or 3200ms vibration (n=130). We selected durations of 400ms and 3200ms because out Pilot showed that the 400ms mobile vibration evoked a stronger reward response but less arousal than 3200ms. Aside from conditional variation in vibration feedback, all conditions also received two forms of identical visual confirmation feedback (pop-up text box and numeric counter). We found that a rewarding mobile vibration boosts item count in a tightly controlled item adding task. On the contrary, we find that participants added significantly *fewer* items in the longer vibration condition (higher in both arousal and novelty) than in the intermediate-length vibration condition (lower arousal and novelty, but higher reward).

Study 2

In Study 2 we test three further propositions: (1) whether exposure to vibrotactile stimuli can influence item adds and shopping basket totals in a typical online shopping environment; (2) whether a rewarding vibrotactile stimulus more strongly affects consumers with higher (vs. lower) levels of impulsivity; and (3) whether the observed effects are influenced by artefacts of online panel recruitment, including selection bias and device heterogeneity, by conducting the study in a behavioral lab environment and holding the type of device constant across participants and experimental conditions. We recruited 137 participants for a lab study in which participants (randomly assigned to a vibration or control condition) sat at partitioned cubicles, each with a Samsung Galaxy Tab 10 that was identical in terms of hardware and software, with all settings held constant. Participants first completed a grocery shopping task using our custom-built simulator. In the control condition, adding an item updated the cart count and basket total, but did not produce any other feedback. In the vibration condition, clicking the add-to-cart button had the same visual feedback as in the control, but also triggered a rewarding vibration of intermediate duration. Extending the findings of Study 1 to a more ecologically valid setting, consumers in the vibration condition added a significantly more items to their shopping cart ($M_{VibrationTotalItemCount}=18.94$ vs. $M_{ControlTotalItemCount}=16.29$; $F(1,135)=4.13$, $p<.05$, $\eta^2=.03$). After controlling for individual differences in general online shopping behavior, we found that consumers who were impulsive or reported more positive notification valence and had a stronger vibration reward response also purchased marginally more items in the shopping task ($\beta_{Imp\times Reward}=.35$, $t=2.01$, $p<.05$; $\beta_{Valence\times Reward}=-.09$, $t=-2.65$, $p<.01$).

Study 3

Working in cooperation with a major European grocery store, we conducted an anonymous, randomized field experiment (N=6,866) drawing on regular online grocery shoppers of the company. We worked with this firm to develop an updated version of their mobile grocery shopping app for their customer base that included custom-made code that triggered vibration upon clicking the add-to-cart button (as in Study 2). Customers were randomly assigned to either receive rewarding vibrotactile feedback for shopping cart adds in the vibration condition or no vibrotactile feedback in the control condition. The initial timeseries dataset included all purchases (using any Android or iOS mobile device) made during the data collection period of one week. Replicating our lab-controlled Study 2 findings in a setting with real economic consequences, participants in the vibration condition purchased significantly more items per order ($M_{ControlItems}=53.15$ vs. $M_{VibrationItems}=54.60$, $F(1,6864)=5.58$, $p<.05$), which resulted in higher net sales ($M_{VibrationSales}=210.15$) relative to the control condition ($M_{ControlSales}=206.88$; $F(1, 6864)=4.00$, $p<.01$). These findings were robust when controlling for age, gender, and device operating system.

Discussion

We examined the impact of mobile vibrations on consumer decision-making in a variety of experimental settings, drawing on a diverse participant pool, leveraging both controlled experiments and a large, country-wide field anonymous experiment to assess theoretically and practically important boundary conditions. We find that common mobile vibrations evoke a reward response, particularly among impulsive consumers, which in turn boosts purchasing in online shopping environments. Our findings have implications for the effective design of haptic interfaces in marketing and the role of mobile vibrations as a novel reward.

Prosocial Poison: Using Sadness to Prompt Help Giving May Alienate Potential Help Seekers

Andrew Smith, The Wharton School of the University of Pennsylvania, USA
Cait Lamberton, University of Pennsylvania, USA

EXTENDED ABSTRACT

Marketers have developed a rich literature on encouraging donations to charities. What we haven't yet considered is whether those tactics to increase giving also impact the likelihood that people in need seek help. We show how one popular and well-cited fundraising tactic—portraying charity recipients as sad (Clark et al. 1987; Eisenberg et al. 1989; Small and Verrochi 2009; Baberini et al. 2015)—decreases help seeking, because it makes people believe seeking help would be more threatening to their self-esteem.

Previous work in other fields has argued help seeking decreases the more people believe it would threaten their self-esteem (Fisher, Nadler, and Whitcher-Alagna 1982; Kim, Zhang, and Park 2018). Self-esteem can be threatened in multiple ways. Consider someone in need, contemplating seeking help from Charity X. X, having read that portraying recipients as sad increases giving, has run campaigns emphasizing this. The consumer sees this on a billboard and on X's home page. The consumer may predict their self-esteem would be threatened by applying to Charity X, first because aligning themselves with the "sad" recipient group negatively affects their self-concept (Turner 1982; Turner et al. 1987; Tiedens 2001). Second, people might not seek help to avoid negative stereotypes about sad people (White and Dahl 2006), like that they are weak ("real boys don't cry"; Levant 1992). Third, the portrayal might be interpreted as disrespect, which is a signal of lower status (Blincoe and Harris 2011). People would not seek help from a disrespectful charity because it offers continued reminders of their negative status and makes it more likely they would be disrespected directly. Finally, seeking help from X despite these motives not to may signal dependence, which threatens self-efficacy. Across four experiments, we examine how this negative portrayal of charity recipients as sad lowers the likelihood people will seek help from that charity.

Experiment 1 (N=418) followed a between-subjects behavioral paradigm. Participants ostensibly completed a motor task for a performance-dependent bonus. We told everyone they didn't perform well enough for a bonus, but that participants who received bonuses could donate to the others. They could sign up to receive some of the donations. We showed participants our message requesting donations, which contained a photo of a hypothetical recipient with a happy or sad face. Participants indicated whether they wanted to receive donations, then answered a threat-to-self-esteem measure developed for this research (=0.79). The aggregate effect was directional ($Seek_{Sad}$=66% vs. $Seek_{Happy}$=72%, =1.60, p=.2053). More importantly and as hypothesized, the sad-faced message elicited less help seeking because it created a greater anticipated threat to self-esteem ($Threat_{Happy}$=3.81 vs. $Threat_{Sad}$=4.27, F=22.10, p<.0001; Indirect Effect=-0.16, 95% C.I.=[-0.28,-0.08]). The residual effect was not significant (Direct Effect=0.02, SE=0.11, 95% C.I.=[-0.21,0.24]), consistent with indirect-only mediation (Zhao, Lynch Jr., and Chen 2010).

Experiment 2 (N=134) followed a 2 group (Expression: Sad vs. Happy) within-subject design. Participants were given ads for two cancer research hospitals and asked which they'd contact for help if their child were newly diagnosed. One ad included a picture of a sad child, while the other showed a happy child (taken from Small and Verrochi 2009). Charity choice constituted our dependent measure. We also asked participants about the threat posed to their child's self-esteem. (=0.84). Consistent with our theory, consumers were less likely to seek help from the charity in the first ad if they displayed the sad child ($Choice_{Happy}$=70% vs. $Choice_{Sad}$=26%, =18.65, p<.0001), mediated by threat to their child's self-esteem ($Threat_{Happy}$=2.31 vs. $Threat_{Sad}$=3.42, F=26.17, p<.0001; Indirect Effect=-0.38, 95% C.I.=[-0.71,-0.16]).

Experiments 3a (N=152) and 3b (N=154) used actual ads for two types of need-based charities: homeless care organizations (3a) and services for children experiencing hunger (3b). They used the same procedure as experiment 2. To eliminate any confounds, and orthogonally manipulate emotion, all ads originally featured sad people. We created a happy version of each ad using Photoshop, and randomized which ad would feature which emotion. Participants more often chose to seek help from charities which used happy people in their ads (Experiment 3a: $Choice_{Happy}$=69% vs. $Choice_{Sad}$=28%, =23.57, p<.0001; Experiment 3b: $Choice_{Happy}$=62% vs. $Choice_{Sad}$=25%, =11.65, p=.0006).

Experiment 4 (N=1604), following a 2 (Emotional Expression: Happy vs. Sad) x2 (Message: Supportive Message vs. Control) between-subjects design, showed one way to mitigate the effect. Based on the self-esteem framework, presenting a self-esteem threatening stimulus like sadness in a supportive way should reduce the threat, mitigating its negative effect on help seeking. This would not work on happy portrayals because happiness is already perceived positively. Participants saw an ad for a financial aid charity, featuring a photo of a sad or happy woman and a brief charity description, and indicated the likelihood they would seek help from it. Half of participants also saw a headline in the ad, framing the ad's emotion in a self-esteem supportive manner. Consistent with expectations, we found interaction effects between the Emotional Expression and Message conditions for threat to self-esteem (F=6.17, p=.0131) and likelihood to seek help (F=4.47, p=.0347). Without the supportive headline, the ad with the sad woman constituted a greater threat to self-esteem ($Threat_{Happy/Control}$=4.02 vs. $Threat_{Sad/Control}$=4.81, F=106.57, p<.0001), lowering help seeking ($Seeking_{Happy/Control}$=3.53 vs. $Seeking_{Sad/Control}$=3.07, F=12.48, p=.0004; Indirect Effect=-0.27; SE=0.03; 95% C.I.=[-0.34, -0.21]; Direct Effect=0.06; SE=0.06; p=.36). Adding the supportive headline reduced threat when the ad featured a sad woman ($Threat_{Sad/Control}$=4.81 vs. $Threat_{Sad/Supportive Message}$=4.43, F=24.87, p<.0001) but not a happy woman ($Threat_{Happy/Control}$=4.02 vs. $Threat_{Happy/Supportive Message}$=3.91, F=2.06, p=.1518). With the supportive headline, differences in help seeking between happy and sad became non-significant ($Seeking_{Happy/Supportive Message}$=3.31 vs. $Seeking_{Sad/Supportive Message}$=3.23, F=0.26, p=.6134).

Together, in a comprehensive set of prosocial situations, these experiments demonstrate the use of popular and well-cited tactics previously shown to increase help-giving might depress help-seeking. Research on help seeking in consumer contexts is sparse. It is completely non-existent in mainstream consumer/marketing journals, outside of a handful of papers on mental health services, whose stimuli and processes are not generalizable to other contexts. This research highlights the need for increased research into help seeking: all along, the strategies we have given non-profits may have hampered their mission to help people in need.

Context Even Matters in Virtuality: Perception of Object Proximity and Ownership in Augmented Reality

David Finken, University of Lucerne, Switzerland

Aradhna Krishna, University of Michigan, USA
Florian Wangenheim, ETH Zurich, Switzerland

EXTENDED ABSTRACT

Augmented Reality (AR) technologies are booming. Overall, the AR market is expected to grow at a compound annual growth rate of 46% from 2019 to 2024 (Wood 2020) and Forbes even encourages CMOs to consider experimenting with AR (Evans 2021). Worldwide, 334 million consumers have actively used at least one AR application (Boland 2020) and in some countries even more than half of consumers have experienced AR (Finken et al. 2021).

AR is defined as a technology that enables users to interact with virtual contents in their own context by reciprocal alignment of reality and virtuality (Azuma et al. 2001). Unlike Virtual Reality (VR), where users completely immerse into virtual environments, AR only superimposes virtual contents onto a user's screen device (Brooks 1999). In e-commerce, for instance, AR allows conveniently placing virtual furniture into consumers' homes or trying on virtual clothes from the comfort of consumers' homes. Initial evidence shows that this can increase sales or motivate consumers to select higher valued products (Heller et al. 2019; Tan et al. 2021).

Our research develops and tests a conceptual account for when and why AR can heighten product preference. Drawing on psychological distance and construal level theory we argue that products presented in AR (vs. in 3D or in 2D) are perceived to be more proximate (vs. more distant) to the self. Psychologically distant objects are evaluated in terms of abstract (high-level, de-contextualized) construal and psychologically proximal objects are evaluated in terms of concrete (low-level, contextual) construal (Maglio, 2020; Trope et al., 2010). We argue that, although physically and digitally equally distant to the self, presenting a product on a mobile screen (e.g., smartphones or tablets) in AR versus in 3D or in 2D reduces consumer's perceived distance (i.e., increases perceived proximity) between the self and the product. That, in turn, may increase feelings of perceived ownership, consumers' feeling that something "is mine" without legally owning an object **(Jussila et al. 2015; Pierce et al. 2003).**

Prior research has already started looking into perceived ownership from an AR perspective (Carrozzi et al. 2019), but with mixed results and often through a more practical lens (Brengman et al. 2019; Hilken et al. 2017). Research argues that AR positively influences perceived ownership due to exerting virtual control (e.g., manipulating or touching objects on digital interfaces or HoloLens) (Carrozzi et al. 2019). The link between control and ownership, however, does not only pertain to AR presentations—in 3D presentations without context embedding and white background consumers reported higher levels of behavioral control compared to AR (Petit et al. 2021). Importantly, we argue that our proposed mechanism is independent of perceiving control over products which has already been shown by prior research. **Thus, we propose:**

Hypothesis 1a: AR (vs. 3D or 2D) product presentation increases consumers' perceived ownership.

Hypothesis 1b: The positive influence of AR (vs. 3D or 2D) product presentation on perceived ownership is mediated by perceived proximity to the product.

As AR allows the product to be perceived in consumers' actual context, its effect on proximity and ownership perceptions will likely be influenced by the nature of that context. Context effects theory states that contextual data can affect evaluations of a target object (Meyers-Levy and Tybout 1997). Context effects occur when the interpretation of an object shifts when its context changes, even though the object itself does not change. Specifically, we also propose that contextual cues (i.e., congruent vs. incongruent usage contexts) moderate our conceptual account such that the boost from AR is less likely to occur (or occur at all) when the context is incongruent with the products' usage context. Therefore, we hypothesize:

Hypothesis 2: The positive influence of AR (vs. 3D) product presentation on perceived ownership is moderated by contextual congruity, such that it is attenuated in less congruent contexts.

In marketing research, perceived ownership can influence consumers' willingness-to-pay and also explains the endowment effect (Morewedge et al. 2020). As a result, we argue that AR product presentation increases perceived ownership, which has a positive impact on marketing downstream consequences (e.g., purchase intention). Thus, we propose:

Hypothesis 3: The influence of AR (vs. 3D) product presentation positively impacts downstream consequences.

We test our expectations in five controlled online experiments (N = 1,411) with different products (mugs, an orchid, or a blender) and varying forms of product presentation formats (AR, 3D product image (360-degree), or 2D product images) on mobile devices. In all studies, participants received instructions to observe a product and answered related measures (e.g., perceived ownership and perceived proximity). Specifically, in experiments 1 and 2 (pre-registered on OSF), we test for our causal expectations against various presentation formats. Experiment 3 tests for the robustness of our mechanism against other conceptual accounts (e.g., novelty or immersion) and experiment 4 tests for the impact of usage context by manipulating presentation format (AR vs. 3D) and contextual cues(congruent vs. incongruent). In experiment 4 participants were told that we study smartphone and tablet usage behavior in various parts of their homes. Next, we asked them to go to a specific place in their home, followed by observing a blender. The 3D-conditions displayed generic kitchen or bathroom images in the background of the virtual object. Our results show that incongruent usage context dampens the effect on perceived ownership in the AR condition, but not in the control condition. Finally, experiment 5 highlights the impact of AR product presentation on downstream consequences.

Overall, our conceptualization and later our empirical package provide evidence that consumers perceive to be more proximate (vs. more distant) to products presented in AR compared to 3D or 2D presentation formats. We argue that AR triggers a concrete (vs. abstract) thinking style with implications for e-commerce and our general understanding of virtuality. Importantly, we show that these

effects are triggered by embedding a virtual object in a usage context that is congruent with the product, independent of control and touch. Our findings imply that managers of e-commerce platforms are well-advised to find ways to encourage consumers to use AR, specifically in the right context.

Consequences of Humanizing Robo-Advisor by Adding Phatic Communication Ability: Perceived Empathy and Investor's Trust

Kuan-chou Ko, National Taiwan University, Taiwan
Shino Uchikata, National Taiwan University, Taiwan
Shian-ko Liu, National Taiwan University, Taiwan

EXTENDED ABSTRACT

Although robo-advisors have been deemed an excellent tool for financial inclusion, adoption rate is relatively low. One of the reasons why people resist to use algorithms is that people believe AI cannot feel (Gray 2017) so will not fully take the unique, personal condition of everyone into account. Thus, people could not trust AI because computers are perceived as less empathetic and only capable of operating structured tasks (Luo et al. 2019).

We posit that people will favor a robo-advisor with the phatic communication ability because they tend to view it as more empathetic. In linguistics and pragmatics, phatic communication (e.g., greetings) can be defined as a universal opening ritual for conversational interactions (Pillet-Shore 2012; Duranti 1997), aiming at creating a favorable impression and making the conversation at ease (Riggio, Friedman, and DiMatteo 1981). Thus, we posit that the robo-advisor's initiation of a conversation through phatic communication could mimic a relaxing human-to-human conversation, increasing the likelihood for consumers to believe that their AI counterpart attempts to understand and care for their needs, representing as empathy (H1).

We further posit that people tend to trust robo-advisors when they are perceived as empathetic (H2a). Previous studies have revealed two routes to build consumer trust. The first route is to demonstrate qualified competence (White 2005; Sniezek and Van Swol 2001). However, the competence path may not be effective for robo-advisors. Algorithm aversion research has indicated that although AI has been proved to outperform human in many areas, people still prefer services from human agent (Hildebrand and Bergner 2020; Luo et al. 2019; Longoni et al. 2019).

The second path is showing the benevolence, the extent to which one party believed that the other party had the intentions and motives beneficial to their joint interest (Ganesan 1994; Doney and Cannon 1997). Cognitive empathy is defined as the ability to accurately and completely understand other individuals (Ye et al. 2017). So, when we perceive our interaction partners as empathic, we tend to believe that they are more likely to response to our needs (Ye et al. 2017), act for our benefit or personal interest (Wirtz et al. 2018), and engage in prosocial behaviors (e.g., help; Batson 1987). These behaviors and reactions correspond with the definition of benevolence that involves taking care of joint interests and showing altruism, and therefore, represents a sign of benevolence (McCullough and Hoyt 2002). Thus, we predict that robo-advisors can build up consumer trust when they are perceived as empathetic.

Furthermore, the greater consumer trust should lead to the greater willingness to accept the advice from the trustees (H2b). Previous studies have revealed the positive effect of trust across different context (e.g., financial product, Johnson and Grayson 2005; online product recommendation agents, Benbasat and Wang 2005; Komiak and Benbasat 2006; mobile payment applications, Srivastava et al. 2010; internet banking, Roy et al. 2012).

Study 1:

To validate the Hypothesis and rule out an alternative explanation that the effect of phatic communication may come from the presence of human name rather than communication, one hundred twenty-three participants recruited from Amazon Mechanical Turk were randomly assigned to one of 2 (phatic communication (small talk): no vs yes) x 2 (human name: no vs yes) conditions. In phatic communication condition, participants were shown an image of a sample chatlog with relaxed topic starter (e.g., do you have any plans for the weekend?) whereas in no phatic communication condition, they were shown an image of an investment-related conversation (e.g., How may I help you today?). In robo-advisor with a human name condition, they were told that their advisor was Amy, an A.I. algorithm whereas in robo-advisor without a human name condition, they were only told that their advisor was an A.I. algorithm. Finally, participants answered their willingness to follow robo-advisors' recommendation, trust in the robo-advisor (adapted from Kumar, Scheer, and Steenkamp 1995), perceived humanness and control variables (i.e., age, gender, experience and familiarity with investment).

As H1 and H2 predicted, perceived humanness was significantly influenced by phatic communication (coefficient= 17.158, p=.001) but not human name (coefficient=.195, p=.062). More specifically, when perceived humanness and phatic communication were included in the analysis for trust, only perceived humanness remains significant (coefficient= .022, p=.000). Besides, both perceived humanness (coefficient= .011, p=.015) and trust (coefficient= .887, p=.000) were significant predictors of willingness to follow advisor's recommendation even when perceived humanness and trust were included in the analysis for willingness to follow advisor's recommendation.

Study 2:

Study 2 was a 3 (Robo-advisor with a human name vs Robo-advisor using phatic communication vs Robo-advisor without a human name and phatic communication) between-subject design and was designed as a replication of Study 1 with four key differences: inviting open discussion as implementation of phatic communication, recruiting different language speaking participants, using three-item empathy scale (Ye, Dong & Lee 2017) to measure perceived humanness and controlling for participants' expectation for robo-advisor performance by adding descriptions regarding robo-advisors' performance. Fifty-nine students recruited from Taiwan participated in the study.

The results were similar with those in study 1, supporting H1 and H2. Perceived empathy was significantly influenced by phatic communication (coefficient= 2.1, p=.000) but not name (coefficient=-.448, p= .179). Moreover, when perceived empathy and phatic communication were included in the analysis for trust, only perceived empathy remains significant (coefficient= .52, p=.000). Besides, when perceived empathy and phatic communication were included in the analysis for willingness to follow advisor's recommendation, only trust (coefficient= .669, p=.000) was significant.

Our findings highlight the role of phatic communication. Prior studies have indicated that humanizing AI by adding human-like communication features is effective to enhance trust (e.g., voice, Epley et al. 2007; emotions, Ketron and Naletelich 2019). Yet, little research investigates humanization from a pragmatics perspective (one exception please refer to Hildebrand and Bergner 2020). We are one of the scant studies of designing the AI-human conversation and

focused on how to initiate a conversation with phatic communication ability.

Is This for Me? Differential Responses to Inclusivity Initiatives by Represented and Underrepresented Consumers

Francesca Valsesia, University of Washington, USA
Lea Dunn, University of Washington, USA
Jennifer K. D'Angelo, Texas Christian University, USA

EXTENDED ABSTRACT

Brands are taking on an ever-growing number of initiatives that speak to issues on inclusivity (Nittle 2018). One such initiative provides product lines that represent a diverse range of consumers' skin tones. For example, many cosmetics companies have expanded foundation lines to offer a wide range of skin tones shades. Band-Aid, in the summer of 2020, announced a line of bandages representing, for the first time, black and brown skin tones. While these initiatives are typically lauded by public opinion, do all consumers respond equally positively to them?

The extent of consumers' receptiveness to such initiatives may depend on whether they feel their skin tone is currently represented in the marketplace. Consumers who have not felt represented in the past may be skeptical about these initiatives. For example, they may question the authenticity of the brand's motivations ("woke washing"; Vredenberg et al. 2020), which might negatively affect brand perceptions (Cinelli and LeBoeuf 2020). Alternatively, negative reactions may evolve due to skepticism about product fit. Consumers often have concerns about whether a product's attributes match their needs (Hong and Pavlou 2014), and underrepresented consumers may be skeptical that a brand would have the ability to produce products matching their needs given the brand's lack of prior experience with underrepresented consumers. For example, while a brand may offer an inclusive line of foundation shades, it may still fail at choosing the proper undertones and pigments to flatter dark skin tones (Levy 2020).

This research seeks to explore how both represented and underrepresented consumers respond to a brand's inclusivity initiatives. We find underrepresented consumers are less positively inclined than represented consumers toward an inclusivity initiative. This hesitancy is driven not by brand authenticity perceptions, but rather by product fit skepticism.

Study 1a (n=146) and 1b (n =196) explore the differential reactions from represented and underrepresented consumers to inclusivity initiatives. In Study 1a, we utilized a real-world press release announcing Band-Aid's inclusivity initiative described above. Feelings of representation significantly predicted brand attitude (b=.186, t=2.38, p=.019), such that consumers who felt less represented experienced more negative attitudes. In Study 1b, we replicated these findings with a fictional brand, Stick-It (b=.299, t=4.30, p < .001).

Study 2 (n=135,907) sought to support our findings in a field setting. Partnering with a skincare company, we created a cosmetics advertisement for an inclusive product line. In the control condition, the ad was targeted toward all women who met predetermined criteria[1]. In the underrepresented condition, the ad targeted women who met these same criteria but were also interested in "African American" or "Asian American" culture. These were selected as the closest approximation for targeting underrepresented consumers (based on pretesting). The general population condition led to significantly more click-throughs (.44%, n=70,637) than the underrepresented population condition (.36%, n=65,270; b=.19, SE=.09, Wald $\chi^2(1)$=4.70, p=.030).

Study 3a (n=197) and 3b (n=373) explored the reasons why underrepresented consumers may react more negatively to a brand's inclusivity initiatives. We focus on two potential reasons: perceptions of authenticity of the brand's motives and skepticism the product line will fit one's needs.

In Study 3a, participants read an advertisement about a new line of inclusive cosmetics. Feelings of representation predicted concerns about product fit, such that the more underrepresented consumers felt, the more skepticism they had (b=-.52, SE=.08, t=-6.76, p < .001). Feelings of representation did not predict perceptions of authenticity of the brand's motives (b=- .07, SE=.09, t=-.617, p=.538).

In Study 3b, we examined the mediating role of product fit skepticism on the relationship between feelings of representation and brand attitude. We used the same design as Study 3a, but measured both brand attitude (α=.96) and product fit skepticism (α=.82). Feelings of representation predicted brand attitude, such that the more underrepresented consumers felt, the more negative their brand attitude (b=.17, SE=.05, t=-3.78, p < .001). Further, feelings of representation predicted product fit skepticism (b=- .57, SE=.05, t=12.20, p < .001). A formal test of mediation confirms that negative expectations about product fit drive consumers' more negative brand attitudes (indirect effect: b=.15, SE=.04, CI$_{95\%}$ [.08, .23]).

Study 4 (n=847) tests our process through moderation and provides guidance on how brands can assuage underrepresented consumers' skepticism by offering individualized solutions. We test two different means to introduce individualized inclusive products: personalization and customization. Personalization, where the brand ultimately decides on the formulation of a product, may be less effective than customization, where the consumer decides for themselves.

Participants were randomly assigned to one of three solution conditions (control vs. personalization vs. customization). In the control condition, participants saw an advertisement for a line of inclusive cosmetics. In the personalization condition, they saw the same ad along with information about how skin tone match technology would be used to generate an individualized product. In the customization condition, participants also saw the ad along with information about how they could customize an individualized shade for themselves. Next, participants were asked about their brand attitude (α=.96) and product fit skepticism (α=.87).

Again, feelings of representation predicted product fit skepticism (b=-.74, SE=.06, t=-12.65, p < .001). Moreover, as predicted, the customization condition (relative to the control) moderates product fit skepticism (b=.25, SE=.08, t=3.01, p < .003) while the personalization condition does not (t=.47, p=.64). When comparing the customization (vs. control), the index of moderated mediation was significant (index=−.095, SE=.040, CI$_{95}$ [−.176, −.021]), providing a formal test that customization moderates the mediation. When comparing the personalization versus control, the index was not significant.

While inclusivity initiatives are intended to reach a diverse consumer base, we find underrepresented consumers respond more negatively to these initiatives than represented consumers. This adverse reaction is driven by skepticism the product will actually fit their needs. We provide an actionable tool companies can use wherein skepticism can be assuaged. By providing consumers the ability to

---

[1]   Ages 18-65+, women, location United States, interests: cosmetics, beauty, skin care, self-care.

customize (meaning that the consumer, not the company, has control over their product choice), product fit skepticism decreases.

Hiding in the Crowd: Preference For Diversity in Competition

Ying Zeng, University of Toronto, Canada
Jiajia Liu, Peking University, China
Jingyi Lu, East China Normal University, China

EXTENDED ABSTRACT

Competition is prevalent, and people frequently make competitor choices when involved in a competitive context. Yet little research has examined how individuals choose whom to compete with. This research focuses on one important factor that could be irrelevant to the competition outcome while still influence competitor choices: the diversity of competitors.

Normatively speaking, people should always choose competitors who are inferior to them in factors that determine whether one would win the competition or not (the *determinant* factor). Other factors irrelevant to the competition outcome per se, such as factors that influence whether the comparison between different candidates is straightforward or not (the *alignment* factor), should also be irrelevant to the competitor choices. In reality, however, consumers may also strategically leverage the alignment factor. Literature in the structural alignment model (Gentner and Markman 1997) has shown that comparisons are easier and faster if made on alignable attributes (e.g., comparing an apartment with two bedrooms with an apartment with one bedroom), while harder and slower if made on nonalignable attributes (e.g., the comparison between a camera and a voice-recorder, Markman and Loewenstein 2010; Mussweiler and Epstude 2009). In addition, as the attribute alignability decreases, ambiguity would increase and additional assumptions may be drawn to make comparisons (Zhang, Kardes, and Cronley 2002). Consequently, factors that are not directly relevant may also play a role in competition by bringing ambiguity to the comparison, and thus adds noise to the decision. With this reasoning, we propose that people with disadvantages may strategically choose to compete in a less alignable context, hoping that the noise brought by the low alignability would blur their disadvantages and thus increase their chances to obtain the desired outcome. One real-world strategy to reduce alignability is choosing to compete with diversified others, such as competitors with different majors, nationalities, or constellations.

Across four preregistered studies, we observed that people preferred to compete with diversified over homogeneous competitors when they had disadvantages (Study 1 and 2). This preference persisted even when people were less likely to win the competition should they compete with diversified competitors (Study 3). We attributed this effect to the motivation to "hide" one's disadvantages and showed that such preference was attenuated when one had objective advantages over other competitors (Study 4).

Participants in Study 1 ($N = 177$) imagined that they were competing for a job as an accounting student and completed an online evaluation. They then chose to take an interview with either a group of three accounting competitors (homogenous) or a group of three competitors, each majored in finance, economics, and management (diversified). The online evaluation score of the participant ranked second in both groups. We found a preference for diversity: 62.2% chose to compete with diversified others ($p = .001$, compared to 50%).

Study 2 replicated the preference for diversity and ruled out the alternative explanation that the preference was driven by ingroup favorability, using a different operationalization. Participants ($N = 168$) imagined applying for graduate school and chose to take an interview from a school whose applicants all submitted GRE scores (homogenous) or a school whose applicants submitted either GRE or GMAT scores (diversified). Participants were informed that GRE and GMAT scores could be converted to each other, and their rank remained the same in both groups. Results showed that 70.2% of participants chose the school accepting diversified scores ($p < .001$, compared to 50%), replicating our finding.

Study 3 included an evaluator condition to test whether the diversity preference could be biased. Participants ($N = 301$) imagined being a sales manager competing for nomination for a manager award, with either a group of sales managers (homogenous) or a group of managers from diversified departments (diversified). Two factors were relevant to their competition outcome: KPI and peer evaluation, and participants had a higher objective rank in peer evaluation in the homogeneous group. Again, 64.4% of participants chose the diversified option and 59.7% predicted that choosing the diversified option would entail a higher likelihood to be nominated (both ps < .001, compared to the benchmark calculated with evaluator's nomination). Notably, participants were actually more likely to be picked should they compete with homogenous others than diversified others (25.6% vs. 13.5%, $p = .06$), consistent with the relative rank in determinant factors (peer evaluation). Results suggested that the preference for diversified competitors could override the rational consideration for determinant factors and lead to suboptimal decisions.

Study 4 explored the reasoning behind the preference for diversity by manipulating objective advantage. Participants ($N = 300$) imagined looking for a dating partner. All participants were told that they were Capricornus, and had a rating of 3.5 / 2 / 0.5 stars in the no / weak / strong disadvantage conditions (between-subjects). Competitors were either all Capricornus (homogenous) or had different constellations (diversified). Results showed that 73.7% in the strong disadvantage condition chose to join the diversified group ($p < .001$, compared to 50%). This proportion became lower in both the weak (59.0%, $p = .07$, compared to 50%) and the no disadvantage conditions (52.4%, $p = .63$).

The studies together documented a novel preference for diversity in competitor choices, showing that such preference resulted from a motivation to "hide" disadvantages in a diversified group, that it could be costly and cause welfare loss. This research contributes to the literature on competitor choice, competition, strategic thinking, and heuristics and biases in general.

As Wages Increase, Do People Work More or Less? A Wage Frame Effect

Luxi Shen, CUHK Business School, Hong Kong
Samuel Hirshman, The Norwegian School of Economics, Norway

EXTENDED ABSTRACT

Marketing problems evolve as the market evolves. As new technologies and platforms like Uber become prominent, firms need to make pricing decisions for a variety of users, including both traditional consumers such as Uber riders and non-traditional consumers such as Uber drivers. Our research focuses on non-traditional consumers and studies a unique pricing problem—how to communicate a wage change to strategically affect work supply.

Charlie drives with Uber part-time. Driving with Uber is not exactly fun for Charlie. If it were not for the money, he would rather stay home and play video games or watch television. Assuming that there is a sudden increase in Uber's pay scheme, and everything else in Charlie's life remains unchanged, how will Charlie respond to this change? On the one hand, he can think of the wage increase as a great opportunity to earn more money. On the other hand, now that the wage has increased, he doesn't need to work as hard so he can have more free time to do things he really enjoys doing. So, will Charlie drive longer or shorter hours after the wage increase?

Economic theory does not make a clear prediction. The empirical literature also finds mixed evidence (e.g., Chen and Sheldon 2015; Camerer et al. 1997). This research proposes a reliable way to predict the effect of a wage change on labor supply. Suppose that Charlie used to make $20 per hour (he drove 30 hours and earned $600 a week). A new wage, $30 per hour, could be interpreted in one of two ways. Charlie could think, "from now on, if I drive the same 30 hours, I can earn $900," which is a pay-change frame. Alternatively, Charlie could think, "from now on, I need to drive only 20 hours to earn the same $600," which a load-change frame.

We propose that the direction of the work supply change depends on whether the wage change is framed as a pay change or a load change. In particular, the pay-change frame facilitates a change in work supply in the same direction as the wage change, while the load-change frame facilitates a change in the opposite direction. Normatively speaking, the frame of the wage change is irrelevant to the effect of the wage change on work supply and $WF=0$, but we expect WF to be positive if the wage change is positive (i.e., a wage increase) and negative if the wage change is negative (i.e., a wage decrease).

We tested our propositions in a series of experiments. Study 1 studied real workers in a real labor market: Amazon's MTurk workers (N=993). Personalized wage increase information in the pay-change frame generated, on average, 9.30 more hours of work per week on MTurk than that in the load-change frame (B=9.46, SE=0.66; t(991)=14.30, p<.001). Study 2 (N=132) replicated the wage frame effect with actual labor and actual payment—participants pumped up balloons for the lab—and for both wage increases and decreases, meaning that even a wage decrease can elicit the same amount of labor supply as a wage increase if the change is communicated strategically.

Study 3 (N=1,474) explored the cognitive mechanism underlying this wage-frame effect: In multi-attribute decision making, an attribute whose value varies across options receives greater attribute weight than an attribute whose value is shared among options (Dunn et al. 2003; Tversky 1972). In the wage-change context, the wage frame varies one of the attributes—either workload or payment—to enhance the corresponding motivation—leisure and money. We adopted the Charlie's Uber scenario and, as a theoretical extension, added a "default frame" condition. Because the default frame presented as an hourly rate (a conceptual pay-change frame), we predicted that it would yield a similar effect as our pay-change frame on the work supply decision. All participants were assumed a role as a part-time Uber driver who used to drive 30 hours and make $600 a week. Then, they were assigned to one of the wage-frame conditions: pay-change as "*From now on, you can drive 20 hours to earn the same $600*", load-change as "*From now on, you can drive the same 30 hours to earn $900*", and default as "*From now on, your rate increases to $30 per hour*". We replicated the wage frame effect on willingness-to-work (pay-change: +6.42hr; load-change: -3.94hr; WF=+10.36, SE=0.91; t(557)=11.43, p<.001, 95% C.I.=[8.58, 12.14]) and indeed found the effect of the default frame (+5.71hr) similar to that of the pay-change frame. More importantly, we asked all participants what motivated their work supply decision by choosing between: "*Now I can have free time to do things I really enjoy doing*" (weighting leisure) and "*It is a great opportunity for me to earn more money*" (weighting e money). Consistent with our theory, we found that the load-change frame caused a weight increase in leisure (+.24, p<.001) and the pay-change frame (-.08, p<.01), as well as the default frame (-.04), a weight decrease in leisure.

Like many economic variables, the influence of a wage change on work supply depends on the manner in which the wage change is communicated. Our wage frame effect not only provides psychological insights to the classical labor economic problem but also contributes to the marketing management literature on pricing (e.g., Liu and Soman 2008) and the consumer behavior literature on numerical cognition (e.g., Larrick and Soll 2008) and the relationship between time and money (e.g., Okoda and Hock 2004; Shaddy and Shah 2018).

Why Not Set Pen to Paper? How Typeface Design Influence Charitable Behaviors

Xing-Yu (Marcos) Chu, Nanjing University, China
Dickson Tok, Nanjing University, China
Junjie (Jensen) Gui, Nanjing University, China

EXTENDED ABSTRACT

Consumers often rely on visual representations (e.g., text or pictures) to make decisions regarding charitable activities (Cryder, Botti, and Simonyan 2017). However, visual elements such as the typeface remain unexplored in the context of charitable appeals. The aim of the current research is to explore whether people facing a charitable appeal that uses a handwritten (vs. typewritten) typeface design are more willing to engage in the advertised charitable activities and conduct charitable behavior.

Two types of typeface design are classified: handwritten or typewritten (Schroll, Schnurr, and Grewal 2018). A handwritten typeface appears to have been written by human beings (Schroll et al. 2018). The curved, irregular strokes and letters (Henderson, Giese, and Cote 2004) appear to be more personal, friendly, and full of emotion, but less professional and more childish (Izadi and Patrick 2020). In contrast, typewritten typefaces have been entered via a keyboard and generated by a machine (Schroll et al. 2018). It is usually straight, square and regular (Henderson et al. 2004), considered to be impersonal and mass-produced, but more formal (Izadi and Patrick 2020). We propose that a handwritten (vs. typewritten) typeface generates this sense of connectedness which, in turn, increases people's willingness to engage in charitable activities. It is because a handwritten typeface embodies human characteristics (Schroll et al. 2018), associates with human origins (Izadi and Patrick 2020). Such sense of a human presence creates psychological closeness with consumers (Ren, Xia, and Du 2018)—a feelings of connectedness (Yim, Tse, and Chan 2008)—which also increases individuals' empathetic responses (Cialdini et al. 1997).

Two types of charitable appeals are proposed as the first boundary condition: self-benefit and other-benefit (Fisher, Vandenbosch, and Antia 2008). We suggest that the other-benefit appeal emphasizes that the beneficiaries are completely unrelated to oneself, but related to other people or organizations. A handwritten typeface design provides a visual connection between the donor and the cause or the beneficiary, thus justifying the donor's helping behaviors. In contrast, a self-benefit appeal emphasizes the fact that the main beneficiary is the donor, which creates a strong connection between the consumer and the cause. Thus, the handwritten typeface effect to make no difference when the connection between the consumer and the charitable activity is already strong.

Brand attachment is the second boundary condition. It is defined as a strength of connection between the brand and the individual from weak to strong (Park et al. 2010). Since brands desire to create a strong bond between themselves and their target consumers, and given the likelihood that consumers will switch to a company associated with a cause (Cone Communications CSR Study, 2017). When employing CSR to reach consumers who have a weak attachment to the brand, A handwritten typeface design may offer the opportunity to strengthen the brand-consumer relationship—enhances the sense of connection that the consumer feels with the brand, further increasing consumers' engagement in the charitable behavior. In contrast, consumers who are highly attached to the brand are more motivated to perform behaviors that use considerable consumer resources (Thomson, MacInnis, and Whan Park 2005). Therefore, when a brand applies CSR to reach consumers who are already strongly attached to the brand, the choice of typeface design may not have much of an impact on the brand-consumer relationship.

The first study was a pilot study using a single-factor (typeface: handwritten vs. typewritten) between-subjects design. It was a field experiment collaborated with two local convenient stores for two weeks. The results showed that the handwritten (vs. typewritten) donation box raised more money on average.

Studies 1 and 2 were a lab experiment to test the effect of handwritten typeface in a more control setting. The results of both studies replicated the findings in the pilot study. That is, participants were more likely to engage in sponsorship when exposed to charity ads using the handwritten typeface than a typewritten typeface. Furthermore, in Study 2, we tested feelings of connectedness as the underlying mechanism, including "love," "warmth," "uniqueness," and "cuteness" as possible alternative mechanisms. A parallel mediation analysis (Model 4 in PROCESS; 5,000 resamples) showed only significant indirect effect through feelings of connectedness.

Study 3 had a 2 (typeface: handwritten vs. typewritten) x 2 (charitable appeal: other-benefit vs. self-benefit) between-subjects design. As expected, in the other-benefit charitable appeal condition, participants who viewed the handwritten message in the ad showing a greater donation likelihood to the charity. No such differences were observed on participants in the self-benefit charitable appeal condition.

Study 4 had a 2 (typeface: handwritten vs. typewritten) x 2 (brand attachment: strong vs. weak) between-subjects design with real customers drawn from the loyalty program of a skincare brand in China. VIP customers and ordinary customers of the brand were represented as strong and weak levels of brand attachment. The result showed that in the weak brand attachment condition, participants who viewed the handwritten message in the ad indicated a greater willingness to support the charity. No such differences were observed on participants in the strong brand attachment condition.

This research makes several theoretical contributions. First, we extended the research on typeface design in charitable appeals, showing that a subtle manipulation of typeface design can enhance the effectiveness of a charity ad. Second, we examined the impact of using a handwritten typeface design in a charitable appeal for the first time, suggesting that the choice of typeface design should be dependent upon the type of charitable appeal and the strength of the relationship between the target consumers and the brand. Third, we extended the humanization literature, suggesting that a handwritten typeface is also a viable humanization strategy.

The current research offers rich managerial implications. Handwriting as an important factor in a charitable appeal, we provide brand managers an actionable strategy, especially when consumers are not strongly attached to the brand or when using an other-benefit charitable appeal. Also, we provided guidelines that can help social marketers and charity fundraisers in deciding the typeface design, giving them a greater understanding of the benefits of using handwriting in marketing communications.

Assembling Fitness on Instagram – A Critical Visual Content Analysis of Consumer-Generated Content

Veronika Rojkowski, University of Innsbruck, Austria
Jonathan D. Schöps, University of Innsbruck, Austria

EXTENDED ABSTRACT

"The society of consumers brandishes before its members the ideal of fitness"
– Zygmunt Bauman, *Liquid Modernity*

Nowadays, social media provide access to digital interactive networks, which invite consumers to "become flâneurs, who 'survey and consume' others' bodies in the 'airport departure lounge' of postmodern society" (Gill, Henwood, and McLean 2005, 39). As such, visually-driven social media feeds constitute avenues paved with ostentatious displays of obsessively shaped bodies that appear like flawless statues carved out of white marble. Especially on Instagram, the body constitutes an object of consumption that needs to be continuously sculptured to meet the aesthetic requirements of the postmodern fitness regime, and, consequently, experience aesthetic inclusion (Bauman 2005; Schöps 2020; Tiggemann and Zaccardo 2018). Hashtags, such as #thinspo, #fitspo, #weightlosstransformation, or #nopainnogain, that consumers attach to their fitness visuals (Talbot et al. 2017), reinforce this fitness regime.

Recent consumer research frames fitness on social media as bio-pedagogical source for health and fitness information (Jong and Drummond 2016), which enables consumers to seek inspiration in fitness imagery on social media (Carrotte, Prichard, and Lim 2017; Santarossa et al. 2019; Slater, Varsani, and Diedrichs 2017). Yet, scholars demonstrate that fitness imagery on social media strongly reinforces idealizations of thin and muscular body shapes rather than transmitting health-oriented representations of fitness (Boepple and Thompson 2016; Talbot et al. 2017). Moreover, research finds that consuming visuals of these mostly unattainable bodily ideal types impacts beholders' self-perception negatively (Slater et al. 2017; Tiggemann and Zaccardo 2015). Although these studies recognize the dangerous and seductive potential of fitness imagery, and acknowledge Instagram's pivotal role in this regard, research on the very nature of visual fitness rhetoric on social media, that is, the compositionality of fitness imagery remains obscure.

Correspondingly, this study aims to contribute to research on fitness and body culture on social media by investigating the compositionality of fitness consumers' visual rhetoric on Instagram. Data analysis focuses on visual data material tagged with the hashtag #fitness. This study finds three communicative dynamics in fitness consumers' visual rhetoric, namely, *competing*, *acting*, and *balancing*. The article closes with discussing and delimiting findings, and offering possibilities for future research.

THEORY

A postmodern view on fitness

From a postmodern perspective, fitness can be understood as a fluid, transformative and unstable bundle of meanings—a cultural phenomenon that is processually constructed and subjectively experienced within different contexts and moments (Bauman 2000). Albeit the postmodern condition of fitness cannot be defined precisely (Bauman 2000), its contemporary usage generally refers to the "state of one's psycho-physical wellbeing" (Glassner 1989, 216), and an "esteemed mode of caring for the body" (Smith Maguire 2002, 449) within the tenets of heroic transformation and self-improvement (Featherstone 2010).

However, fitness entrenches individuals in a culture of permanent self-reproduction and self-aggrandizement (Bauman 2000) exploiting the aesthetic and functional potential of the body to limitless extent. Conforming to all standards of an exciting, satisfying and socially admitted lifestyle represents the postmodernist credo (Bauman 2000; Featherstone 2010). This credo demands a "chase after a[n ever-new] quarry" (Bauman 2000, 78) with no final triumph in sight. Simultaneously, this imperative constitutes a fitness consumer's dilemma—an obstacle course necessitating to balance the ethics of aesthetics and health obsessively and delicately (Bauman 2000).

Consequently, postmodern consumer society—a society of "universal comparison" (Bauman 2000, 76)—commodifies both fitness and bodies (Schöps 2020) by presenting "the good life as available for purchase" (Featherstone 2010, 200). This purchase, however, becomes a "costly affair" (Bauman 2000, 80). That is, fitness imposes a strict regime of normative regulations on the body. Nowadays, this regime foremost manifests on social media such as Instagram. On Instagram, consumers express themselves by assembling a visual rhetoric "of more-or-less discrete components" (Zappen 2005, 323). As such, fitness consumers' visual rhetoric encompasses material and expressive components (Rokka and Canniford 2016) which contextualize fitness as a whole.

Assemblage theory

DeLanda's (2006) assemblage theory offers a powerful lens to analyze fitness consumers' visual rhetoric composed of heterogeneous components, that is, material and expressive components. While material components refer to tangible physical entities, expressive components encompass signs, symbols, and language (DeLanda 2006). In the context of this study, we investigate fitness consumers' visual rhetoric as an assemblage of material objects, such as human bodies, fitness equipment, or distinct settings, as well as expressive, "communicative" (Rokka and Canniford 2016, 1798) capacities, such as triumph, vulnerability, or keenness.

A second helpful notion of assemblage theory is that dynamic, processual interactions between various components can have a stabilizing or destabilizing effect on an assemblage's corporate identity depending on its overall repertoire's homogeneity (DeLanda 2006). In the present study, this notion helps to address Instagram's "prone[ness] to fluidity" (Rokka and Canniford 2016, 1792) by shedding light on how fitness consumers' rhetoric of accumulated single visual bits provokes stabilizing or destabilizing effects within the fitness assemblage as a whole.

METHODOLOGY

This study draws on visual data that was scraped from Instagram by running the InstaCrawlR scripts in RStudio (Schröder 2018). Specifically, we performed a single #hashtag query for the hashtag #fitness, and scraped a meta data set of 10,000 posts in October 2020. The meta data set contains, for instance, post URL, and captions. We sampled every 10th visual in the data set by using the post URL to access and download the visuals until we achieved theoretical saturation. The final sample comprised 101 visuals.

Data analysis involved a critical visual content analysis (Rose 2012) in which we, in line with our assemblage theoretical perspective, analyzed and coded the visuals in terms of their material and expressive components, and their respective capacities (Schöps, Kogler, and Hemetsberger 2020). Analysis further encompassed a process of inductive categorization, constant comparison, and abstraction (Spiggle 1994) to grasp the essence of communicative dynamics within fitness consumers' visual rhetoric.

FINDINGS

The findings of this study provide insights into fitness consumers' visual rhetoric on Instagram. The following paragraphs give a detailed account of the communicative dynamics within fitness consumers' visual rhetoric—*competing*, *acting*, and *balancing*.

Competing

Our analysis reveals that fitness consumers compete with each other on who performs better (Bauman 2000) rather than sharing motivation and inspiration (Jong and Drummond 2016). This is foremost indicated by the low amount of instructions (16.18%), motivation (18.18%), solidarity (20.8%), and tolerance (11.9%), and, in contrast, by the repeated appearance of hostile (26.7%) and swanky (32%) expressions in the visuals. Visual statements, such as "*Best fitness classes*", or "*Beast Mode*", as well as visual representations of aggressive or wild animals (8.91%), e.g., lions, reinforce the competitive nature of fitness. This competitiveness is further expressed in consumers' keen (55.4%) attempts to carve out any muscular parts of their bodies (79.9%) through body-hugging poses (82.8%), or skin-tight clothes (31%). Interestingly, 76.19% of hostile, and 81.5% of swanky expressions, as well as 85.7% of raised eyebrows, and 78.6% of clenched fists are accompanied by at least one muscular body part.

By contrast, less well-defined bodies more often share contemplation (24.8%), disappointment (59.1%), and even fear (18.6%). Consequently, dependent on their bodily state, fitness consumers' visual rhetoric seems to convey either an unspoken invitation to competition, or an insecure request for mercy of others. These competitive dynamics point to a rigid hierarchical structure in which thin and muscular bodies experience aesthetic inclusion, while non-shaped bodies are stigmatized, or banned (Bauman 2000). Moreover, 68.75% of all bodies that are photographed in public settings show at least one muscular body part, while bodily flaws (3.17%), or expressions of exhaustion (3.96%) are strictly hidden. The only setting, in which problem zones are revealed, are before/after images illustrating individual transformational (12%) journeys (Bauman 2000; Edgley 2006).

We further find that 90.9% of seductive elements are expressed by well-shaped bodies highlighting such bodies' apparent superiority. As such, aesthetically pleasing bodies are "key to all enjoyments, the sensations, tastes and activities of consumer culture" (Featherstone 2010, 200). However, the competitive spirit of fitness does not only encompass the pursuit of fitness per se, but also a celebrity-oriented lifestyle (Marwick 2015). This manifests in celebrity-esque material components, for instance, sunglasses (4.95%), swimwear (6%), or holiday-indicating (12.5%) seaside (8.33%) settings combined with body modification elements, such as make-up (12.9%), and tattoos (20.3%). Moreover, accessories, such as watches (6.93%), jewelry (24.8%), as well as expensive brands, are repeatedly appearing in the visuals—typical status symbols of celebrity culture (Marwick 2015; Senft 2013). Selfie poses (28.6%), accompanied by duckfaces (9.26%) and attentional hashtags, e.g., #likeforlikes, as well as tags

to other profiles (18.8%), further illustrate fitness consumers' competitive quest for attentional capital (Marwick 2015).

Acting

In accordance with the platform´s etiquette of acting (Marwick 2015), fitness consumers on Instagram share ideal representations of their lives rather than documenting their true self (Featherstone 2010) illustrated by seemingly paradoxical pairings of material and expressive components. For example, visuals set in sports-related surroundings rarely show actual exercising (10.9%), or engagement in any other sport activity (15.6%). Similarly, material signs of exhaustion, such as sweat (5%), or red faces (3.33%), which would indicate previous exercise, are absent. Moreover, training equipment is strategically arranged for the photo instead of actually being used (42%)—just like decorative props in a stage play. Likewise, mouthwatering dishes appear unaffected in 85.7% rather than being eaten (1%).

Fitness consumers' dramaturgy (Edgley 2006) is further reflected in representations of human bodies in rigid, statuesque postures instead of being spontaneously caught (21%) in dynamic movements (23.4%). Accordingly, still poses (82.8%), marked by framed hips and bottom (32%), or squared shoulders (38.2%), are paired with training gear, which is, however, not worn during any physical training (92.1%) but rather fulfills the purpose of indicating athleticism, and optimizing the body shape. Interestingly, fitness consumers scarcely accept (19.8%), or triumphantly celebrate (23.8%) their bodies—59.1% of the visuals even convey a sense of disappointment. These expressive components illustrate fitness as an eternal lifelong process in which the goal is never fully reachable (Bauman 2000).

Although fitness consumers keenly try to imitate the visual iconography of mainstream celebrity culture (Marwick 2015) through typical model poses, holiday imagery, and similar material components, they eventually convey a different image. Contrary to the happy, brightly smiling models and celebrities in broadcast media, fitness consumers are restrainedly grinning (35.2%) rather than decently laughing (7.41%). Additionally, more than half of all displayed humans do not show any expression of contentment, and are depicted unaccompanied (80.95%) instead of being in the company of peers. Contrary to the idea of bodily excess and lust, the body's vulnerability (35.6%) is revealed through stiff and artificial poses (57.4%) underlined by expressions of insecurity (46.7%). Accordingly, fitness consumers' visual rhetoric creates a dreary atmosphere in which pleasure is lacking in 68.3%, while 92.08% of the situations seem to be neither exciting nor adventurous.

Balancing

Despite competitive and pretentious displays of fitness, fitness consumers also exhibit honest representations of a healthy, performance-oriented lifestyle. Correspondingly, consumers recurrently try to balance the contradicting ideals of a hedonistic celebrity and fitness culture. Paired rhetorical elements, such as lust and self-discipline, holiday and work, relaxation and exercise, body and mind, illustrate this balancing act.

Balancing lust and self-discipline manifests in food practices, for instance, replacing and up-valuing ingredients. That is, ingredients considered unhealthy are exchanged for healthy ones, e.g., swapping burger buns for lettuce leaves (table1). Moreover, visuals containing unhealthy groceries often simultaneously entail healthy food elements, e.g., an avocado-topping on the burger, or a Coca-Cola bottle, which is held up in front of a fruit basket (table 1). Additionally, a large number of different food types (41.1%) indicates

fitness consumers' concern for a balanced diet in which the majority of depicted groceries is appetizingly arranged for the visual, while still featuring indulgent expressions (44.4%).

Furthermore, balancing is reflected in visuals that simultaneously display components indicating holiday and work, for instance, beach-photography showing a tanning person while holding a notebook in his hands (table 1). Taking into account that "the 'good' life" is directly linked to "making career" (Senft 2013, 139), and the main purpose of notebooks is to enable location-independent work, this image perfectly illustrates fitness consumers' balancing rhetoric. Balancing exercise and relaxation is foremost evident in visuals of resting places, which simultaneously contain material components that indicate sportive activity, for instance, couches or beds (3.53%) repeatedly appear next to humans wearing training gear. Moreover, fitness consumers frame their balancing rhetoric around bringing mind and body in harmony. This manifests in contemplative expressions (24.8%), calm (43.6%), idyllic (18.8%) settings in nature (21.4%), yoga exercises (15.4%), as well as visual statements such as *"A beautiful day begins with a beautiful mindset"* underpinned with hashtags, such as #mindset or #mentalhealth.

DISCUSSION

This research contributes to an increased understanding of fitness and body culture on social media by illustrating how the compositionality of fitness consumers' visual rhetoric frames the fitness assemblage on Instagram as a whole. Besides of seemingly being spurred by a relentless hustle for attentional capital (Marwick 2015), fitness consumers' fierce chase after muscles and thinness reflects the postmodern fitness credo of "leav[ing] every already achieved standard behind" (Bauman 2000, 78), and succumbing to a strict regime of permanent self-improvement (Bauman 2000).

Accordingly, the findings of this study indicate that this normative concept of postmodern fitness does not seem to experience any destabilizing waves of resistance but is "justifie[d] with no need to argue" (Bauman 2000, 97)—"well mapped and closely watched and guarded" (Bauman 2005, 95). The findings particularly show that fitness consumers' visual rhetoric is framed as an assemblage of fragmented, seemingly immaculate body parts. This rhetoric further pushes the already illusive postmodern bodily ideal types to even higher "unattainable heights" (Bauman 2000, 80). Yet, higher heights come along with deeper depths. That is, postmodern fitness consumers are no longer only burdened with the requirement to balance health and bodily appearance delicately (Bauman 2000), but also to forcefully perceive these burdens as part of a pleasurable lifestyle of concupiscence itself (Featherstone 2010). Rather than a process of self-castigation, fitness is therefore framed as an envisaged status—ready to be instantaneously consumed in the "supermarket of identities" (Bauman 2000, 83). However, the rhetorical compositionality of acting reveals that this logic only promises momentary sparkles of winning in lieu of final triumph (Bauman 2000; Bauman 2005). Instead of being key to a "meaningful, satisfying and socially approved lifestyle" (Featherstone 2010, 200), the hunt for these fitness ideals seems to be a never-ending "chase after utopias" (Bauman 2005, 96), brought into life and brandished before its members by postmodern consumer society.

We delimit our study to one social media platform. We see potential in conducting a cross-platform analysis of visual fitness content. Future research could, for instance, investigate the relationship between content of professional content creators on YouTube and regular users on Instagram.

When Insect Consumption is Socially Risky: Social Norms as a Major Barrier to Widespread Acceptance of Non-Normative Food

Gesa Stremmel, University of Goettingen, Germany
Ossama Elshiewy, University of Goettingen, Germany
Yasemin Boztug, University of Goettingen, Germany

EXTENDED ABSTRACT

The reduction of meat consumption is often discussed as an important intervention to mitigate climate change. However, alternative food concepts are needed to fulfill the demand for essential proteins. Alongside other novel foods like in-vitro meat, insects are a promising alternative source of high-quality protein and micronutrients, while maintaining sustainable production and healthful consumption (Oonincx and Boer 2012; Rumpold and Schlüter 2013; van Huis 2013). One major problem is the low acceptance of insects as food within Western cultures (Hartmann et al. 2015; Vanhonacker et al. 2013). Previous research has focused on factors that influence the acceptance of insects as food. Some of the most important barriers are disgust, opposing cultural influences, food neophobia and unfamiliarity (Batat and Peter 2020; Looy, Dunkel, and Wood 2014; Tan et al. 2016; Verbeke 2015). Our research extends previous findings by examining the role of social norms and social context with respect to the refusal to eat insect-based dishes.

Social norms contain information about what behavior others usually approve (injunctive norms) or typically practice (descriptive norms) (Cialdini, Reno, and Kallgren 1990). Food can be considered normative if the majority consumes it and approves its consumption. This includes most staple foods like fruits, vegetables, dairy products, and meat. Food can be considered non-normative if only a minority consumes it, while the majority of consumers resist and reject its consumption. Non-normative foods are often associated with disgust, moral opposition, feelings of unnaturalness, or contamination. Recent examples are genetically modified foods, in-vitro meat, or insect-based dishes (Hartmann et al. 2015; Hingston and Noseworthy 2018; Siegrist, Sütterlin, and Hartmann 2018). As such, the consumption of some novel foods in Western countries is still not normative and is predominantly perceived as a violation of prevailing social eating norms. According to Higgs (2015, p. 39), "social eating norms are perceived standards for what constitutes appropriate consumption." Prior research suggests that violating social eating norms bears some inherent social risk. This risk manifests as a threat to group affiliation and can lead to negative evaluations by other group members (Deutsch and Gerard 1955; Higgs 2015). In general, people adhere to social norms to be accepted and liked by others, and to avoid negative social consequences such as disapproval (Baumeister and Leary 1995; Cialdini, Kallgren, and Reno 1991). Thus, if individuals have no further information about deviating group norms, they will strive to adhere to majority-accepted social eating norms. It can therefore be assumed that individuals show avoidance tendencies when it comes to consuming a non-normative food in the presence of others. Accordingly, we formulate our first hypothesis:

Hypothesis 1:   *Lower willingness to consume non-normative food (insect-based dish) versus normative food (meat-based dish) will be serially mediated via perceived norm-violation, perceived social-risk, and perceived threat of negative evaluation.*

The degree to which individuals strictly adhere to these social eating norms varies with the degree to which they already feel accepted by others present (Higgs 2015; Robinson et al. 2011). It is likely that social eating norms are more salient and perceived as more mandatory in social contexts where individuals are more concerned with being accepted and sympathized by others (like on a first date). Consistently, previous research teaches us that eating decisions are influenced by impression management concerns, which in turn increase norm adherence (Herman, Roth, and Polivy 2003; Mori, Chaiken, and Pliner 1987; Roth et al. 2001). This suggests that the mechanism described in H1 is more pronounced in situations where individuals are keen to make a good impression. Accordingly, we formulate our second hypothesis:

Hypothesis 2:   *The serial mediation effect formulated in (H1) is moderated by the social context (with low vs. high impression management concerns).*

For social context as moderator, we identified two levels using a qualitative and a quantitative pre-study, namely "a meal with close friends" (= low impression management concerns) versus "a meal with new colleagues" (= high impression management concerns). To test our Hypothesis, we used a moderated serial mediation model with three mediators (PROCESS Model 85, Hayes 2018, p. 609). We employed a 2 (food type [X]: meat-based dish vs. insect-based dish) x 2 (social context [W]: close friends vs. new colleagues) between-subjects experimental design. We used indirect questioning and asked participants to put themselves into a hypothetical situation. Participants then rated *perceived norm-violation* (M1), *perceived social-risk* (M2), *perceived threat of negative evaluation* (M3), and *willingness to consume* (Y) for the experimentally manipulated food type. We recruited online participants from Germany, Austria, and Switzerland via SurveySwap and arrived at N = 186 valid responses.

We initially tested for moderation using 2-way ANOVA and found significant main and interaction effects for each mediator and the dependent variable. Importantly, we observed no gender effects in these analyses. Our test for moderated serial mediation confirms hypothesis H1. Lower *willingness to consume* insect-based dishes (vs. meat-based dishes) (Y) is serially mediated via *perceived norm-violation* (M1), *perceived social-risk* (M2), and *perceived threat of negative evaluation* (M3) on both levels of the moderator. Our moderation hypothesis H2 is also confirmed. As predicted, the mediation effect is amplified by the social context which evokes higher concerns of impression management (i.e., new colleagues vs. close friends).

The results of our study show that there are social inhibitions among consumers regarding the consumption of insect-based dishes. This is reinforced by social contexts in which individuals strive to make a good impression, which shows how unpresentable the consumption of insect-based dishes remains. Future research should investigate how to make the consumption of such non-normative foods appear normal, widespread, and socially accepted in order to reduce the associated perceived norm violation. If the consumption of novel foods like insects is not perceived as socially acceptable, then the intake is not only a matter of personal preference, but also of social risk-taking. This barrier to the acceptance of healthful and sustainable novel foods must be recognized in order to develop appropriate interventions to ultimately reduce meat consumption.

Blending In or Popping Out? Which Photos of Consumption Experiences Positively Affect Consumer Engagement

Der-Wei Huang, Indiana University Bloomington, USA
Shanker Krishnan, Indiana University Bloomington, USA

EXTENDED ABSTRACT

Consumers engage in consumption experiences and capture these experiences in photos, and share them on social media such as Instagram and Facebook every day (Facebook 2021; Instagram 2021). Given that these millions of photos are viewed by others, it has become an organic way for companies to gain awareness from other viewers (i.e., potential consumers) to obtain awareness and engagement (e.g., Likes).

Some of these photos records the consumption event without the focal consumer, such as a photo of the Ferris wheel at a theme park. We label this an "Experience" photo. The other type of photo captures both the consumption experience and the focal consumer engaging in the experience. We label this type of photo a "Person" photo. Which type of consumption experience photos trigger consumer engagement vis-à-vis the most likes?

Research in marketing and psychology has well-documented the antecedents and consequences of consumer photos. However, most of this research focuses on the consumer who is taking the photo, their sharing intention and how taking and sharing photos affect their well-being. In contrast, scant work has examined how such posted photos affect other viewers' attitude and engagement. With the rise of social media where consumer photos of consumption experiences are pervasive, how such photos affect consumer engagement is highly relevant.

We propose that Person (vs. Experience) photos lead to more positive consumer engagement through theories of aesthetic judgement, and that people view Person (vs. Experience) photos as more attractive, which further lead to their feelings of empathy of the focal consumers' consumption experience, and thus generate greater consumer engagement. We test these propositions using a multi-method approach including lab experiments, secondary data, and simulated eye tracking data.

This paper contributes to the literature in consumer experience by demonstrating that different types of consumer photos differentially affect consumer engagement. This substantive finding has implications for marketing of consumption experiences.

Further, we provide a unique theoretical explanation that photo type affects perceptions of attractiveness and in turn empathy. Whereas past research in marketing, has shown how photos and emotional texts/photos (Bagozzi and Moore 1994; Mooradian, Matzler and Szykman 2008) are linked with empathy and consumer engagement, the link between types of consumer experience photos and aesthetic judgement, empathy, and consumer engagement has not been established.

Extant research has well-documented that consumer photos generate differential effects on both the focal consumer and other consumers that are viewing the photos. On balance, less attention has been devoted to the psychological consequences on viewers. Emergent work has attempted to close this gap (e.g., Berger and Barasch 2018; Hofstetter et al. 2020; Hartmann et al. 2019). Based on the literature there are likely many ways to examine effects of photos of consumption experiences. Our focus is on unexplored aspects of consumer engagement.

First, we examine how others perceive the shared photo of a consumption experience. This should provide insights as to what types of shared photos engender the most influence on others. Second, in addition to the informational effect provided about an experience in photos, photo types could generate positive psychological reactions from other consumers. Studying this effect can provide insights on consumer well-being, and provide insights to marketers.

Viewers judge the attractiveness of consumer photos through attractiveness and emotional expressions of focal consumers in photos (Bryan, Perona and Adolphs 2012). The differential aesthetic judgement then influences people's social behavior and consequential evaluations of the subject (Wald 2015). We argue that in addition to the appearance of the focal consumer, the structure of a photo also affects viewers' aesthetic judgment.

Aesthetic judgment has been shown to stimulate emotional sensations that triggers our ability to share others' emotional states (Gallese 2003). We hypothesize that viewers are more likely to feel the emotions and understand the consumption experience of a consumer when they find the photo posted by the consumer attractive.

Research in marketing, psychology, and computer science has shown that the presence of a human-being, leads to better advertisement effectiveness (Babin and Burns 1997; Bagozzi and Moore 1994; Sajjacholapunt and Ball 2014). Based on this, we predict that viewers engage more with Person (vs. Experience) photos because they are more aesthetic, and thus, the viewers empathize the focal consumers' experience more, and thus, lead to higher engagement.

In Study 1, we use data obtained from public accounts on Instagram, and showed that Person (vs. Experience) photos generate higher engagement (i.e., more Likes) from other users through Likes, after controlling for the number of followers and linguistic features of the captions.

Study 2 further tests for the role of aesthetic judgment and empathy through serial mediation. We show that Person (vs. Experience) generated more favorable "Like" intention (; ; $F(1, 209) = 4.58$,). Serial mediation analysis uncovered a positive, significant indirect effect of the suggested pathway).

Study 3 examines this process using simulated eye-tracking program. The heatmaps and visual sequence maps show that when a photo contains the focal consumer in it, viewers will collect visual information from both the focal consumer and the consumption experience, thereby leading the viewers to perceive this photo as more attractive, and developing feelings of empathy with the consumer.

Thus far the comparisons have been between Experience and Person photos. However, it is reasonable to expect consumers to want to focus exclusively on themselves (Person-focused) or choose to include much of the consumption in the backdrop (Person-in-context).

In Study 4, we show that Person-in-Context (vs. Person-focused) photos generate higher consumer engagement (; ; $F(1, 321) = 9.27$,) and anticipated enjoyment (; ; $F(1, 321) = 12.33$,).

In this article, we identify and define how different types of photos affect consumer engagement. With the findings of our work, marketers can benefit from this knowledge by encouraging consumers to take photos of a particular type, training their employees to take a particular type of photo when they are asked by the consumer, or rewarding the best photos by featuring them on their event website or provide a monetary award.

Algorithms Just Want Attention: Consumers' Resistance through Digital Detoxing

Mariam Humayun, University of Ottawa, Canada
Georg von Richthofen, Alexander von Humboldt Institute for Internet and Society, Germany
Maja Golf-Papez, University of Sussex, UK

EXTENDED ABSTRACT

We live in a surveillance economy where our attention is constantly being monetized (boyd 2012, Davenport and Beck 2001, Wu 2017, Zuboff 2019). If data is the 'new oil', algorithms are its miners; and they feed off of our attention (Lanier 2014). A rising trend in recent years has been the growing need to "digital detox," whether it is situated in digital/mindfulness well-being discourses, or the recognition that many of our digital tools may be addictive by design (Purohit et. al 2020, Humayun 2020). Even before the release of *The Social Dilemma* in September 2020 – a documentary about how tech companies monitor and compete for their users' attention – the movement towards a more mindful digital existence had been underfoot (Newport 2019). Scholars have pointed out the need to slow down and take stock in our accelerated world (Honoré 2004, Rosa 2013, Husemann and Eckhardt 2018). For example, there has been a resurgence of analogue consumption in recent years, and a recognition that the digital has infiltrated all aspects of life. As Humayun and Belk (2020, 633) describe: "Our digital world encourages a sedentary form of *flaneurship* where we scroll past various windows into the lives of others."

While we know that digital detoxing or social media breaks can be driven by a quest for authenticity (e.g. Syvertsen and Enli 2019), we know a lot less about consumers resisting algorithmic control over their attention. We do not know how complete this resistance is, or what narratives form these escapes from "the system." What underpins the politics of this technological (social media) refusal? What escapes are truly possible in a digitally saturated world? Drawing on the metaphor of extraction and attention, we examine how consumers manage to meaningfully disconnect. Based on data from 25 in-depth interviews, 23 email interviews, a netnographic study of r/digitalminimalism, people posting #digitaldetox/#offline/#socialmediabreak/#digitalwellness on Twitter/Instagram/YouTube videos, and in-person meetups (pre-Covid) alongside archival data drawn from mainstream news media, we focus on such refusal in the form of digital detoxing by consumers who are letting go of not just their digital devices – but their connections to the new public forums that social media represent.

Rosa (2013) posits that alienation is often caused by the fast pace of technological change, the acceleration of life, and hyper competitiveness in society. With monetization of social media, there is a growing infiltration of a neoliberal mentality where every status update amounts to constructing a brand (Marwick 2013; Ashman et. al 2018). Kozinets et. al (2017) argue that social networks stimulate desire and the passion to consume. The ad-based business models of social media platforms have turned them into virtual shopping malls filled with influencers. There are debates about whether social media consumption will be considered the new smoking – and if alongside the long list of terms and conditions if there should also be the warning about its potentially harmful impacts on mental health and addictiveness. Sutton (2017, 2020) for instance uses a food metaphor to explain how social media is akin to junk food; processed, thereby lacking in authenticity.

We focus on how consumers experience technological deceleration through the practice of giving up their social media. While previous work has focused on extreme instances of such digital detoxing (e.g. going to detox camps, or taking a digital detox vacation), the new evangelical consumers are the ones who are resisting *algorithmic creep* into their daily lives. Unlike pilgrimages, yoga retreats, Burning Man, or going off into the mountains to relive the past (Belk and Costa 1998, Kozinets 2002, Husemann and Eckhardt 2018), digital detoxing represents a new form of consumer emancipation and resistance in times when everything is digitally mediated. As other scholars have noted, it is not always an easy exit either (Karppi 2018, Van Dijck 2013).

According to Rosa (2019), the alternative to alienation is *'resonance'* – the ability to connect meaningfully. Many of these consumer narratives indicate a need to find such *resonance* in their interactions. Connecting meaningfully entails regaining control over one's social media consumption, which involves the interrelated processes of *reflecting, refraining, reconnecting, relapsing,* and eventually *regaining* control of their attention. Some consumers point to the need to curate and edit, be it the algorithmic newsfeeds they encounter or their "friends" list. Others point to how they need to be more extractive when it comes to where they spend their time and attention on social media. They do this by choosing seemingly lesser evils (e.g., giving up Facebook's feed for a more intentional experience on Reddit/podcasts). Even consumers who manage to regain control eventually experience periods of relapse. Our findings suggest that in the world where possibilities of escaping algorithmic control are limited and incomplete, being able to control our own attention has become a virtue; a technology of self. Boym (2001, 351) suggests that "the disease of the millennium will be called chronophobia or speedomania and its treatment will be embarrassingly old-fashioned." Our analysis shows how consumers are taking back control over their time, attention, and emotions through digital detoxing. This research contributes to the evolving discussion around consumers' quest for digital well-being and the desire for new forms of humane technologies that enable rather than entangle us as we keep turning into our digital selves (Belk 2013).

How and When Non-Costly Status Signals Increase Perceptions of Status

Susan Danissa Calderón Urbina, University College Dublin, Ireland
Antonios Stamatogiannakis, IE Business School, IE University, Spain

EXTENDED ABSTRACT

Literature suggests that effective status signals should be costly (Veblen, 1899). We investigate the conditions under which signals that are not costly, and thus are supposedly ineffective status signals, could increase perceptions of status and preferences.

Although status signals that do not entail any cost are theoretically ineffective, they may still be symbolically associated with constructs related to status, such as power and quality. Thus, they may still signal status under certain conditions. We propose two such conditions. First, consumers *should be seeking status.* These consumers look intensively for status signals (Han et al., 2010), and thus might perceive status even from non-costly signals. Second, supposedly ineffective status signals *should not become salient* during status evaluations. The symbolic association that these signals have with status is inconsistent with the fact that they are not costly. This inconsistency may become apparent when they are salient and, hence, their influence on status perceptions may be discounted (c.f., Schwarz and Clore, 1983). Finally, we suggest that the described increase in status perceptions carries over to preferences.

We study the case of color-value, a supposedly ineffective status signal, the cost of which is not important for managers (Gorn, et al. 1997). A pilot study (N=64) verified our assumption that color-value was not considered as effective as other established status signals.

However, low color-value (i.e., dark colors) can increase perceptions related to status such as power (Labrecque and Milne, 2012) and quality (Jacobs et al., 1991). Given this association, low color-value could increase perceptions of status, under the conditions outlined previously. First, when consumers are seeking status they may associate lower (vs. higher) color-value products with status, and prefer them over higher color-value products. Second, this effect is inconsistent with the fact that, color-value is not costly. Hence, making color-value salient during status evaluations might discount its influence on perceptions of status. Three initial studies tested these predictions.

In study 1, 84 participants were randomly assigned to either a "seeking status" or a "*not* seeking status" condition, by imagining that they were in a position of low versus high status, respectively. Participants were asked to choose among six pens (3 white, 3 black; same design, and price). A chi-square test revealed that participants seeking status were more likely to choose the low than the high color-value product (84% vs. 16%; $p<.0001$). This choice was reversed, but not significant, for participants not seeking status ($p=.09$).

In study 2, 222 participants were randomly assigned to a 2×2 between participants design with color-value salience (salient vs. not) and product replicate (scarfs vs. hats) as factors. Participants were randomly presented a pair of hats or scarfs: one product was darker and the other was lighter. Participants were either explicitly reminded of the difference in color-value or not, depending on their salience condition. They were asked to evaluate comparatively status perceptions and choose between the two products. We measured perceptions of status on a six-point comparative scales with lighter and darker products as anchors, and status-seeking (Eastman, et al., 1999).

Analysis revealed a significant mediated moderation (95% CI:.0127 to 1.0264). The status-seeking x color-value salience interaction significantly influenced status perceptions ($p=.02$). Participants high in status-seeking perceived higher status from lower (vs. higher) color-value products in the "non-salient" condition than in the "salient" condition ($\hat{y}_{Non-salient}$=4.59 vs. $\hat{y}_{Salient}$=3.84, $p=.001$). Color-or-value salience did not affect perceptions of status for participants low in status-seeking ($p=.97$). Subsequently, higher perceptions of status increased preference for lower over higher color-value products ($p<.001$).

Study 3 used field data. We recorded the color-value, hue, and chroma, of 198 "Gucci" or "Prada" handbags from two online stores: one luxury replica store and one original fashion store. Bestselling rank of a bag at each store was our dependent variable. A regression revealed a significant interaction effect between color-value and store ($p<.0001$). Moreover, for the replica store, where customers were assumed to seek status more (Han et al., 2010), lower color-value bags were the better-selling ones ($p=.01$). For the originals' store, color-value did not predict ranking ($p=.40$).

Two additional studies examined when color-value can influence status perception and preferences, even if it is salient. Thus, color-value was salient for everyone. We predicted this effect, first, *under cognitive load*, because symbolic associations are still impactful (Fitzsimons and Williams, 2000), but discounting effects such as that of salience are unlikely (Kahneman, 2003). Second, when consumers *believe that low color-value is costly*.

In study 4, 381 participants were randomly assigned to a 2 (not seeking vs. seeking status; Griskevicius et al., 2010) x 2 (control vs. cognitive load; Fitzsimons and Williams, 2000) between-participants design. Participants were presented with four bags that only differed in color-value. To make color-value salient, participants were reminded that the bags differed only in color-value. They indicated which version they preferred, and evaluated perceptions of status having each bag as a point in a 4-point scale.

Analysis revealed a significant mediated moderation (95% CI:.0273 to .5448). The status-seeking × cognitive load interaction significantly influenced perceptions of status ($p=.03$). Cognitive load increased status perceptions for the lower over the higher color-value products for participants seeking status ($M_{High-CogLoad}$=2.99 vs. $M_{Control}$=2.74; $p=.04$), but did not affect perceptions of status for participants not seeking status ($p=.36$). Higher perceptions of status increased preference for lower over higher color-value products ($p<.001$).

In study 5, 408 participants were randomly assigned to a 2-cell (beliefs:darker is not costly vs. dark is costly) between-participants design. We manipulated color beliefs using an excerpt suggesting that darker colors are equally (vs. more) costly than lighter colors. Participants chose one of four bags (as study 4). We measured chronic status-seeking (Eastman, et al., 1999).

Regression analysis revealed a significant status-seeking×color beliefs interaction effect on preference ($p=.04$). Participants high in status-seeking preferred relatively more the lower (vs. higher) color-value products in the "dark is costly" than in the "dark is not costly" condition (M_{Costly}=3.45, $M_{NotCostly}$=2.96; $p=.0005$). Color beliefs did not affect preference of participants low in status-seeking ($p=.44$).

Our findings contribute to theory by showing when non-costly signals can increase status and influence preference.

More Trust in Fewer Followers: Diverging Effects of Popularity Metrics and Green Orientation Social Media Influencers

Matthew Pittman, University of Tennessee, USA
Annika Abell, The University of Tennessee, Knoxville, USA

EXTENDED ABSTRACT

Influencers are primarily categorized by popularity metrics such as number of followers and like counts. Micro-influencers are generally considered to be more trustworthy and authentic than mega-influencers (Appel et al. 2020). However, research shows that high follower counts reach most consumers and are beneficial in terms of influencer likeability (De Veirman, Cauberghe and Hudders 2017). With macro-influencers, higher engagement metrics are understood as a signal of greater success (Arora et al. 2019). These conflicting results beg the question of when brands should partner with different levels of influencers.

We explore the idea that explicit, visible popularity metrics such as follower count and number of likes can influence invisible influencer characteristics such as trust (Seo et al. 2019) in different ways. We specifically investigate green living orientation of influencers as a moderating characteristic. Based on prior literature, we hypothesize that green influencers with lower popularity will have greater success in sponsoring sustainable products than green influencers with a large following. The opposite would be true for regular (non-green) influencers (De Vries 2019, Seo et al. 2019). We expect this effect to be mediated by trust.

We conducted three experiments with female MTurk panel workers to test our Hypothesis. In Study 1, we investigated the effects of follower count of non-green influencers compared to green influencers on purchase intentions and attitudes toward a product. Study 1 was a 2 (follower count: 1,190 vs. 119,109) x 2 (influencer type: influencer vs. green influencer) factorial design. We invited 275 female Instagram users (M_{age} = 40) to participate in our survey on MTurk. Several participants failed simple attention checks, leaving a final dataset of 263 participants.

Participants were asked to look at the profile of an influencer or green influencer. Next, we showed participants a sponsored post. Participants indicated their purchase likelihood for the focal product (laundry detergent) on two items (r=.82) and indicated their product attitudes on three items (α = .92).

An ANOVA with influencer type and follower count as independent variables and purchase intent as the dependent variable revealed a significant interaction effect ($F[1, 259]=12.11$, $p=.001$, $\eta^2=.05$). Specifically, post hoc tests comparing the groups showed that the micro-greenfluencer's post led to higher purchase intentions than the micro non-green influencer ($M_{micro—greenfluencer}=5.20$ vs. $M_{micro\_influencer}=4.32$, $F[1, 259]=12.04$, $p=.001$, $\eta^2=.04$). Purchase intent was higher for the macro non-green influencer ($M=4.99$) than for the micro non-green influencer ($M=4.32$; $F[1, 259] = 6.65$, $p=.01$, $\eta^2=.03$), while purchase intent was higher for the micro-greenfluencer ($M=5.20$) than for the macro-greenfluencer ($M=4.60$; $F[1, 259] = 5.48$, $p=.02$, $\eta^2=.02$). Differences between the two different macro influencers were not significant.

An ANOVA with the same independent variables and attitudes toward the product as the dependent variable revealed a significant interaction effect and comparable differences between the groups. We also found a moderated mediation (PROCESS model 8) for the interaction effect of influencer type (green versus non-green) and influencer status (low versus high following) with attitudes toward the product as a mediator and purchase intent as the dependent variable ($B=-.825$, SE=.254, CI_{95}: -1.346, -.337).

In Study 2, in line with prior literature (Seo et al. 2019), we decided to manipulate popularity by the number of likes on the post itself. The influencer status was implied by the number of likes on the post and participants saw only one image. The study was a 2 (like count: 98 vs. 20,298) x 2 (influencer type: non-green influencer vs. influencer) factorial design. In addition to answering questions about purchase intentions and product attitudes (a white shirt), participants indicated their trust perceptions on three items (α = .98) (McCroskey and Teven 1999).

In this study, we replicated the findings from Study 1 for purchase intentions and attitudes. We also conducted a moderation mediation (PROCESS model 85) to test the complete model. The index of moderated mediation was significant, indicating that like count moderated by influencer type was serially mediated by trust as the stage-one mediator and attitudes toward the product as stage-two mediator ($B=-1.152$, SE=.247, CI_{95}: -1.6520, -.6895) (Hayes 2017).

Next, the purpose of Study 3 was to replicate the moderated serial mediation found in Study 2 and to show that there are behavioral downstream effects of the interaction between popularity counts and influencer types.

Study 3 was conducted with a sample of three hundred and eighteen female MTurk participants. Six participants who entered the survey from another country were excluded from the analysis, leaving a final sample of three hundred and twelve (M_{age}=37.2). In addition to responding to the same questions as in Study 2, participants completed a donation task. Participants were told that the company collaborated with a charity and were offered a 50-cent bonus. Then, they were instructed to indicate if they were willing to donate all or a portion of their bonus (Goenka and Van Osselaer 2019).

In this study, we were able to replicate the moderated serial mediation (PROCESS model 85) found in Study 2. A zero-inflated Poisson regression with influencer type and follower count as the two independent factors revealed a significant interaction ($B=-.306$, SE=.05, $Z=-6.15$, $p<001$). We explored this interaction through planned comparisons. We found that donations were significantly higher in the low follower greenfluencer condition, than in the low follower non-green influencer condition ($B=-7.51$, SE=1.69, $Z=-4.45$, $p<.001$). Donation amounts between the two "high follower" conditions did not differ. Additionally, we found significantly higher donation amounts in the low follower count green influencer than the high follower count green influencer conditions ($M_{low}=27$ cents vs. $M_{high}=20$ cents; $B=5.42$, SE=0.80, $Z=6.75$, $p<.001$), while donation amounts directionally reversed for the non-green influencer ($M_{low}=$ 17 cents vs. $M_{high}=22$ cents).

Despite green marketing efforts becoming more commonplace, our results indicate that something about a green lifestyle may still be considered non-mainstream: participants were more apt to trust a greenfluencer when popularity metrics were low. Inflated popularity metrics may carry connotations of financial or materialistic success that seem antithetical to a more sustainable lifestyle.

Why Do Some Consumers React More Negatively to Losing than Others? The Effect of Support-Oppose Framing on Reactions to Undesired Outcomes

Jacob Teeny, Kellogg School of Management, Northwestern University, USA
Richard Petty, The Ohio State University, USA

EXTENDED ABSTRACT

This research was motivated by a common, consumer puzzle: When two consumers prefer the same outcome to the same degree, why does one of them react much more negatively when the non-preferred outcome transpires? In trying to answer this question, we turn to research on *framing effects*, where construing the objectively same choice or preference in different forms can impact people's evaluations and behaviors (Levin, Schneider, and Gaeth 1998). In using framing effects to address the present question, we consider an ecologically common, yet relatively understudied type known as *support-oppose framing* (Bizer and Petty 2005).

Support-oppose framing refers to construing one's preference between two options (e.g., sports team A > B) in terms of support for the liked option (e.g., being pro-A) or opposition to the disliked one (e.g., being anti-B). Although most framing research examines how frames influence which choices consumers make (e.g., Meyerowitz and Chaiken 1987), support-oppose framing uniquely applies to choices where a preference is already established, framing that preference in terms of opposition to the disliked option or support for the liked one. So, which framing would likely elicit more negative reactions to nonpreferred outcomes?

Previous research suggests that an opposition (vs. support) mindset could lead consumers to feel less *ambivalent* in their preference; and these reduced feelings of ambivalence could lead to more negative reactions. That is, an opposition (vs. support) mindset focuses people on the negative (vs. positive) information behind their preference, which is more likely to reduce feelings of ambivalence (Snyder and Tormala 2017). Consequently, because lower ambivalence is associated with being less able to see the "silver lining" in undesired outcomes, it should elicit more negative reactions (Reich and Wheeler 2016). Thus, in the following studies, we provide evidence for what we label the *opposer's loss effect*: preferences framed in opposition (vs. support) lead to more negative reactions to undesired outcomes, because opposers (vs. supporters) experience reduced feelings of ambivalence about their preference. Moreover, we show how these augmented, negative reactions can lead to increased retaliatory behavior (i.e., enacting one's negativity toward the perceived source or cause of it).

In Studies 1 and 2, we use longitudinal designs to test whether consumers' natural framing of their preferences at Time 1 (i.e., as being more opposition vs. support driven) could impact their reactions to negative outcomes at Time 2. In Study 1, we recruited fans of the NFL teams competing in Super Bowl 53. Before the game, we measured fans' preference between these teams and the extent to which that preference was motivated by their support for the liked team or opposition to the disliked team (i.e., on a single bipolar scale). A day after the Super Bowl, we contacted fans of the losing team and measured their reactions to their team's defeat. Holding constant the extremity of fans' Time 1 preference, the more consumers framed that preference in terms of opposition (vs. support), the more negative they were toward their team's loss. In Study 2, we ran a conceptual replication in the context of the 2018 U.S. Midterms elections, where we measured Ohio and Georgia voters' preference and preference framing (i.e., on two unipolar scales, one for opposition, one for support) between gubernatorial candidates. A day after the election, we contacted voters who had favored a losing candidate for their reactions to the defeat. Again controlling for the extremity of voters' Time 1 preference, only voters' degree of opposition (and not support) significantly predicted their post-election negativity.

In Studies 3-5, we provide experimental support for the opposer's loss effect. In Study 2, participants completed a "stock selection game," where they chose between pairs of companies in which to invest – either done by selecting companies they support or those they oppose. Although this manipulation did not impact how much participants preferred their kept stocks over their discarded ones, participants in an opposition (vs. support) mindset were more upset when their kept stocks ostensibly lost. In Studies 4 and 5, we provide further evidence for the opposer's loss effect as well as (1) evidence for the mechanism behind it, subjective ambivalence, and (2) consequences of it, retaliatory behaviors. In Study 4, we manipulated participants' support-oppose framing in choosing between two tasks to complete for their participation reward. Later, all participants learned they were to complete the nonpreferred task. Although opposers (vs. supporters) reported no differences in the extremity of their preference, opposers (vs. supporters) reported (1) less ambivalence in their preference, (2) more negative reactions to this undesired outcome, and (3) greater intentions to retaliate against the research team. A test of serial mediation as outlined above was significant. Finally, Study 5 conceptually replicated Study 4 with actual behavior. That is, we manipulated participants' support-oppose framing in their preference between one of two videos to watch, where their feedback on the content of the video was ostensibly important to the researchers. We then assigned them to watch the nonpreferred video and measured how long they watched it (i.e., less time watching = greater retaliation by providing worse feedback). Replicating Study 4, opposers' (vs. supporters') reduced ambivalence and heightened negativity toward the undesired outcome of watching the nonpreferred video serially mediated opposers' reduced time watching the video.

Across our studies, we provide robust evidence for the opposer's loss effect: consumers holding the same preference to the same degree, but who frame that preference in terms of opposition (vs. support), react more negatively to nonpreferred outcomes. We provide evidence that this effect is mediated by opposers' (vs. supporters') reduced feelings of ambivalence, and that these effects can lead to increased retaliation. For marketers, we believe the current work is valuable in light of how products are commonly positioned, either in opposition to the competition or support for one's own offering. Although this framing should not impact overall preferences, it may have important differences if the consumer is eventually dissatisfied – a particularly important consideration in light of the retaliatory behaviors in which consumers might engage.

The Ghost in the Gift: A Contagion Perspective on Heirloom Gift-Appreciation

Ali Tezer, HEC Montreal, Canada
Matthew Philp, Ryerson University, Canada
Ethan Pancer, Saint Mary's University, Canada

EXTENDED ABSTRACT

In general, heirlooms symbolize and preserve familial heritage and memories, which makes them highly appreciated gifts (Grayson and Shulman 2000; Kessous et al. 2017). Overall, this is in line with past consumer research showing that inanimate objects can serve as memory storage devices (e.g., Belk 1991; McCracken 1986; O'Guinn and Belk 1989; Peñaloza 2001) and that consumers appreciate items that allow them to recall past events (Marcoux 2017; Wallendorf and Arnould 1988; Zauberman et al. 2009).

In the current work, we build upon research on heirloom gifts by demonstrating that their value is not only driven by their ability to conjure memories (i.e., memory-value), but also their ability to channel the spiritual essence of past owners (i.e., essence-value). This is because an heirloom gift, beyond being a piece of familial heritage, is unique in the sense that family members may have also *used* it. Drawing from past research on the magical-law-of-contagion (Nemeroff and Rozin 2000; Rozin et al. 1989; Rozin and Nemeroff 1990), we suggest that prior physical contact allows for the transfer of a spiritual essence to an heirloom, further increasing recipient appreciation beyond its ability to cue memories. However, consistent with the magical-law-of-contagion, this effect could also backfire if prior family members had nefarious pasts. Yet, extending this research, we also suggest that imagining your own essence in an item be gifted to your own child in the future as an heirloom can increase appreciation when receiving that same gift in the present.

Method

In a single-factor three-level (Gift: brand-new, unopened-heirloom, used-heirloom) between-participants design, Study 1 tested the role of essence-value in driving the appreciation of heirloom gifts above and beyond memory-value. Participants imagined receiving a Montblanc pen gift from their father that was either recently purchased (brand-new), purchased by their grandfather but never opened (unopened-heirloom), or it was purchased and used by their grandfather (used-heirloom). Participants then indicated their gift-appreciation (Paolacci et al. 2015; $\alpha = .96$) and their agreement with two items to assess memory-value ("The pen would represent the happy memories I have with my father") and essence-value ("I would feel like my dad is around me with this pen").

Participants in the used-heirloom condition ($M = 8.08$) indicated higher gift-appreciation than both the unopened-heirloom ($M = 7.30$; $F(1,157) = 4.94$, $p = .028$) and brand-new ($M = 6.50$; $F(1,157) = 20.61$, $p < .001$) conditions. PROCESS analysis (model 4; Hayes 2017) revealed that compared to brand-new, the positive effect of a used-heirloom on appreciation was mediated by essence-value ($\beta_{indirect} = .28$, $CI_{95\%} = [.011, .637]$), whereas an unopened-heirloom was not ($\beta_{indirect} = .08$, $CI_{95\%} = [-.123, .339]$). Importantly, the positive effect of a used- (vs. unopened-) heirloom on appreciation was mediated by essence-value ($\beta_{indirect} = .20$, $CI_{95\%} = [.001, .508]$) but not memory-value ($\beta_{indirect} = .20$, $CI_{95\%} = [-.045, .581]$) (Figure 1).

Study 2 tested whether an heirloom once possessed by a family member with a negative (vs. positive) past influences gift-appreciation when it was previously used (vs. unopened). In a 2(Gift: unopened-heirloom, used-heirloom) × 2(Previous user: negative, positive) between-participants design, participants were asked to imagine a person receiving their grandfather's Montblanc pen from their fa-ther that was either used or not (Gift) and that their grandfather was either a criminal or not (Previous user).

A significant interaction ($F(1,343) = 8.41$, $p = .004$) showed that when the previous owner had a negative past, the participants indicated that the gift would be appreciated more if it was unopened ($M = 4.99$) compared to when it was used ($M = 4.29$; ($F(1,343) = 4.72$, $p = .03$). When this negative connotation information was absent, however, the effect flipped to replicate the findings of Study 1, such that arappreciation for the gift was marginally more when it was used compared to unopened ($M = 8.00$ vs. $M = 7.39$; $F(1,343) = 3.70$, $p = .055$).

Study 3 tested the effect of receiving a gift that was intended to be a heirloom. In a single-factor two-level (Gift: future-heirloom, control) participants imagined receiving a brand-new record player as a gift from their father and were either told that their father wanted them to use the product and to one-day gift it to their own child in the future (future-heirloom) or not (control). Participants then indicated their gift appreciation ($\alpha = .95$) and responded to two items measuring the legacy memory-value ("In the future, the record player could serve to represent the memories I have to someone else") and legacy essence-value ("In the future, the record player could make someone else feel like I am always around them") (1 = strongly disagree, 9 = strongly agree).

Results showed that participants in the future heirloom condition would appreciate the gift ($M = 7.55$) more than those in the control condition ($M = 6.94$; $F(1,201) = 5.57$, $p = .019$). PROCESS analysis (model 4, Hayes 2017) revealed that the effect of gift type on gift-appreciation is mediated by legacy memory-value ($\beta_{indirect} = .09$, $CI_{95\%} = [.002, .195]$) and legacy essence-value ($\beta_{indirect} = .17$, $CI_{95\%} = [.054, .311]$). The direct effect of gift type on gift-appreciation was no longer significant ($\beta_{direct} = .05$, $t = .61$, $p > .60$).

General Discussion

In terms of gift-appreciation, several paradigms have been used to understand the acts of gifting and receiving. Both economic (Belk 1976; Sahlins 1972) and social exchange (Chan and Mogilner 2017; Ruth et al. 1999) paradigms highlight that norms of reciprocity are crucial. The agapic framework emphasizes gifts as a device to communicate feelings (Belk and Coon 1993; Ward and Broniarczyk 2016). And finally, the identity-based paradigm (Klein et al. 2015; Paolacci et al. 2015; Ward and Broniarczyk 2011) focuses on the identity signalling power behind giving and receiving. Our experimental demonstration for the increased appreciation felt towards heirloom gifts cannot be adequately explained by these prior paradigms. Instead, our results point towards a contagion-based paradigm, where prior usage and physical touch of a gifted item can further influence appreciation.

Holding Your Tongue for the Sake of Mother Earth: When and Why Consumers React Less Negatively Following Green Product Failures

Ali Tezer, HEC Montreal, Canada
Matthew Philp, Ryerson University, Canada
Anshu Suri, University College Dublin, Ireland

EXTENDED ABSTRACT

One of the reasons consumers react negatively after a product failure is to help others and the society with their choices, by discouraging exploitive firms from existing in the marketplace altogether (Hennig-Thurau et al. 2004; Walsh et al., 2004; Wetzer et al. 2007). In general, acting in a prosocial manner like this is desirable (Sherman and Cohen 2006). Similarly, consumers simply feel good for buying (Trudel 2019) and even using (Tezer and Bodur 2020) green (i.e., environmentally-friendly) products because it is the prosocial thing to do. However, reacting negatively towards these products if they were to fail should be counter to this prosocial motive. This research tests how negative reactions following product failures differ depending on whether the product is considered environmentally-friendly or not.

Method

See Table 1 for result summary. Study 1 built a data set consisting of 50 brands from Amazon.com that sold both a green and conventional version of the same product. We then compared the percentage of one- and two-star reviews to the total number of reviews for each product. Results showed that the percentage of negative reviews on average is significantly lower for the green (M = 11.94%) compared to conventional (M = 16.58%; $F(1,49) = 15.33$, $p < .001$) versions of products.

Replicating this in an experiment, participants read about buying an umbrella (Study 2A), detergent (Study 2B), or a backpack (Study 2C) with an environmentally-friendly attribute or not that later failed. Results revealed that participants in the green (vs. conventional) condition were more likely to forgive the brand (M = 2.94 vs. M = 2.46; $F(1,198) = 7.82$, $p = .006$; Study 2A), less likely to share negative reviews (M = 4.56 vs. M = 5.14; $F(1,138) = 4.44$, $p = .037$; Study 2B), and more likely to give the brand a second chance (M = 3.62 vs. M = 2.74; $F(1,143) = 5.07$, $p = .026$; Study 2C).

Study 3 followed the same product and failure scenario as Study 2A, asked the same likelihood to post a negative review items as Study 2B and asked how much they would perceive reacting negatively to the failure as a prosocial behavior. PROCESS analysis (model 4, Hayes 2017), revealed a significant indirect effect of product type on likelihood to post a negative review through prosocial behavior ($\beta_{indirect} = -.21$, SE = .08, $CI_{95\%} = [-.372, -.059]$; See Figure 1).

In Study 4 participants read the same green (or conventional) product failure scenario as Study 2C, indicated their likelihood to post a negative review (Study 2B and 3), and completed a 6-item environmentally-consciousness scale ($\alpha = .94$, Haws et al. 2014). Regression analysis showed a significant main effect of product type ($\beta = -.31$, $t = -2.26$, $p = .026$), replicating prior studies, and a significant interaction with environmental-consciousness ($\beta = -.38$, $t = -3.74$, $p < .001$). Probing this interaction by re-centering at +/-1SD above and below the mean of environmental-consciousness, results showed that at higher levels the effect of product type on likelihood to post a negative review was significant ($\beta = -.85$, $t = -4.28$, $p < .001$) but not at lower levels of environmental-consciousness ($\beta = .14$, t = .78, $p > .40$).

Study 5 examined how a product made environmentally-friendly intentionally vs. unintentionally acts as a boundary condition to this effect in a single-factor three-level (product type: conventional, green-unintentional, green-intentional) between-participants design. The product descriptions in the green-intentional and green-unintentional conditions were identical to those used by Newman et al. (2014, study 1). Specifically, in the green-intentional condition, participants were told that the product was environmentally-friendly as the result of the brand working on developing this new formula to ensure it would be better for the environment. In the green-unintentional condition, participants were told that the brand has been working for months on developing this new formula, which unexpectedly happened to be better for the environment. The conventional product condition did not include any of this information. All participants then imagined that the product failed to perform as intended and indicated their likelihood to post a negative review. Planned contrasts showed that participants in the green-intentional condition (M = 3.83) were less likely to post a negative review compared to participants in the green-unintentional condition (M = 4.68; $F(1,192) = 6.13$, $p = .014$) and conventional condition (M = 4.56; $F(1,192) = 4.63$, $p = .033$). The likelihood to post a negative review was not significantly different between the green-unintentional and conventional conditions ($F < 1$, $p > .60$).

General Discussion

The availability and sale of green products has been growing (e.g., Kronthal-Sacco et al. 2020). Therefore, it is necessary to shift attention from getting people to purchase green products to understanding post-purchase behaviors for a more holistic view of green product marketing. To help fill this gap, this current research shows how reactions to product failures differ depending on whether the product is considered "green" or not.

We demonstrate that in the case of green products, the prosocial motive that drives negative reactions is not as strong. Instead, the prosocial motive to react negatively directly conflicts with the general prosocial motive to support and protect green products and brands (e.g., Du et al., 2007; Hur et al., 2014; Johnson et al., 2019; Sen et al., 2006). This results in consumers reacting less negatively towards a green (vs. conventional) product failure, especially if they are more environmentally-conscious or the product is intentionally positioned as "green." Overall, the finding extends prior research in negative reactions to product failure, demonstrating that the overall prosocial motive to reacting negatively to product failures can decrease, when the product itself is good for society in general.

If I Can Change, So Can They: The Sense of Self-discontinuity in Increasing Donation Intention

Xiaozhou (Zoe) Zhou, IE Business School, Spain
Dilney Gonçalves, IE Business School, Spain

EXTENDED ABSTRACT

Recipients of a charitable campaign can generally be bifurcated between innocent victims who are not personally responsible for their current unfortunate situations and those whose unfavorable situations can be attributed to their own actions. The first group includes recipients who were born into a less privileged background or suffered from natural disasters. The latter group often made mistakes in the past that have caused their own miseries. Receiving support and assistance from the public is the first step for them to reintegrate into society. However, nonprofits often find themselves facing pushback from donors when raising donations for this group, as donors cast doubt on whether they are capable of changing or learning from their past mistakes.

Research in self-continuity might provide insights into donors' resistance as it suggests that people believe their core self remains unchanged (Chandler 1994). In contrast, people experience self-discontinuity when they perceive that who they are now is not connected to who they were in the past. Empirical evidence shows that individual donors are concerned with whether their donation can make a difference to the cause they are supporting (Bekkers and Wiepking 2011; Diamond and Kashyap 1997; Zhou et al. 2021) and donors are not willing to make a donation if they hold the perception that their donation will probably not make an impact (Duncan, 2004; Gneezy et al., 2014). Thus, the common belief of self-continuity could pose a challenge for nonprofits when they are raising donations for certain groups. If donors believe that the true self could never change, they are less likely to help those who have made mistakes in the past because their donation could be perceived as not meaningful, or even wasteful. Since self-continuity might add to the belief that people do not change, we propose that nonprofits could potentially benefit from a sense of self-discontinuity. By making donors experience that their current self is different from their past self, nonprofits could prime them with a mindset that allows them to believe that the delinquent recipients could also change.

We further propose that people's willingness to donate to delinquent recipients when they are primed with a sense of self-discontinuity could differ between independent and interdependent self-construal. Since individuals with independent construal perceive the core self as not changeable, they are less likely to be affected by our manipulation and adopt a mindset that people could change. Furthermore, they may also experience psychological reactance and generate counterarguments to defend their beliefs, further decreasing their donation intentions. On the other hand, we expect individuals with interdependent self-construal to increase their donation intentions when primed with self-discontinuity.

In the first study, we aimed at providing initial evidence that the feeling of self-discontinuity could increase donations for delinquent recipients. Participants were first primed with self-discontinuity or self-continuity condition and we measured their donation intentions for someone who lost his house because of gambling addiction. An independent-samples t-test revealed that donation likelihood was significantly lower for the self-continuity condition (M_{sc} = 2.89, SD = 1.98) than for the self-discontinuity condition (M_{sdc} = 3.62, SD = 2.04; $t(127)$ = 2.05, p = .04).

Study 2 tested the moderating role of self-construal. We first manipulated self-discontinuity. Then, we asked participants to indicate whether they were willing to donate their payments earned from this study to a delinquent recipient. In the end, we measured self-construal by using the scale developed by Singelis (Singelis 1994). A logistic regression revealed a significant interaction of self-construal and self-discontinuity on donation (β = 11.01, $\chi^2(1)$ = 4.53, p = .03). When participants experienced self-continuity, the probability of agreeing to make a donation remained unchanged regardless of their self-construal. However, in the self-discontinuity condition, those who scored lower on the self-construal index (thus more independent) had a lower probability of making a donation and those who scored higher on the self-construal index (thus more interdependent) had the highest probability of agreeing to donate their payments.

Study 3 formally tested the mediating role of the belief that one can change. It also examined the influence of the valence of self-change. Participants were assigned at random to one experimental condition in a 2 (self-discontinuity vs. self-continuity) x 2 (change valence: positive vs. negative) between-subjects design and they also indicated their donation intentions to a delinquent recipient. We found a significant interaction effect of self-discontinuity and self-construal (β = 3.88, p < .01) on change belief. We found a significant three-way interaction effect (β = 8.75, p = .01) of self-discontinuity, change valence, and self-construal index with donation likelihood as the dependent variable. Specifically, when participants considered a positive change, the interaction of self-discontinuity and self-construal was significant (β = 6.33, p < .01). When the change type was negative, we did not find a significant interaction effect of self-discontinuity and self-construal (β = -2.26, p = .40). The moderated mediation was supported (indirect effect = 3.01, SE = 1.24; 95% CI [.8365, 5.7655]) by using Hayes' PROCESS macro model 7 in SPSS (Hayes 2013).

Our research provides important contributions to the literature that studies donation behaviors. Gaining support and help from the community is the first step for delinquent recipients to reintegrate into society. Common fundraising strategies often attempt to induce the empathy of donors to encourage donation, however, it might be less effective for delinquent recipients. Thus, it is essential, both theoretically and practically, to explore how to encourage donations for those recipients. Our research also extends the understanding of self-continuity in various ways. Existing studies mainly studied self-discontinuity when the past self is better than the current self. Our research extends the discussion and provides a glimpse into the consequences of self-discontinuity with self-change in both directions.

The Effect of Anatomical Product Representations on Consumer Outcomes

Seo Yoon Kang, University at Buffalo, USA
Junghan Kim, Singapore Management University, Singapore
Arun Lakshmanan, University at Buffalo, USA

EXTENDED ABSTRACT

Knowledge of how a product is put together from various components helps understanding product architecture. Prior literature from a firm-oriented perspective shows that understanding and improving product architecture reduce manufacturing cost and time (Baldwin & Clark, 1994; Mikkola & Gassmann, 2003; Schilling, 2000). Firms also utilize product architecture for marketing communications. For example, the VR headset ad of Quest 2 employs exploded views which visually deconstructs the product, revealing its internal components that are normally invisible to consumers. We term such product visualization as *anatomical representations*. Anatomical representation is commonly used to advertise technology gadgets and various consumer goods. While extant consumer research has studied different product visualization and its impacts on product evaluation and perception (e.g., Childers & Houston, 1984; Edell & Staelin, 1983; Lurie & Mason, 2007), little to no research has examined how depicting product architecture affects consumers. Thus, we fill this gap by outlining how anatomical representations affect understanding product architecture and its influences on consumers' judgments and behaviors.

When a product is composed of physically decomposable parts, the process of putting together such parts may aid to acquire a relational knowledge of how the parts come together (Baldwin & Clark 1994, 2000) which we call *architectural knowledge* (AK). Since architecture relies primarily on grasping component assemblage, AK could be gained via images (i.e., anatomical representation) without verbal information (Kosslyn, 2006). Furthermore, neuroscience research has showed that an object evokes goal-directed motor simulation associated with it (Chao & Martin, 2000; Grezes & Decety, 2002). Therefore, we suggest that anatomical representation that activates simulation of assembling components increases AK.

Drawing upon learning research (Hutchinson & Alba, 1991; Lutz, 1975), acquisition of product knowledge and experience increases consumers' certainty. For example, when consumers perceive a product to be riskier due to limited, inaccurate information (Bauer, 1960), consumers restore certainty and confidence by gaining new information (Cox, 1967; Keller & Staelin, 1987). Similarly, anatomical representations would function as a consumer empowering tool by augmenting AK that produces better outcomes (i.e., decrease in performance risk perceptions; increase in product purchase). We test our propositions in the following experiments.

Study 1 establishes the main effect on product preference. 168 undergraduates participated in a 2 (ad: exploded view vs. control; between-subjects) × 2 (product category; within-subjects) mixed design experiment. Participants in the exploded view (vs. control) conditions viewed dissembled components (vs. fully intact products). After viewing each ad, participants indicated liking and purchase intention which formed product preference ($r_{headphone}$ = .788; r_{shoe} = .844). We conducted a between-subjects ANOVA on product preference which treated ad as a fixed factor and adjusted for the random effect of product category. As expected, exploded view (M_{shoe} = 4.03, $M_{headphone}$ = 4.65) led to greater product preference than intact image (M_{shoe} = 3.68, $M_{headphone}$ = 3.33; $F(1,333)$ = 11.77, p = .001).

Study 2 examined visualization of product architecture in anatomical representations by maintaining assembly sequence. We adopted a 3 (ad: ordered sequence, random sequence, control; be-tween-subjects) × 4 (product category; within-subjects) Latin square design. We similarly manipulated ads for the control and ordered sequence conditions as in Study 1; but the random sequence conditions employed exploded views whose product parts were shown in a random order. 152 MTurk participants viewed four product ads in total. After viewing each ad, participants reported three-itemed AK (e.g., based on the ad, I can easily imagine how the product is assembled together; adapted from Sarantopoulos et al., 2019).

After removing disqualified participants which left 142 participants (M_{age} = 37.03, 81 males), an ANOVA on AK (α = .79) was conducted by building a random effects model which treated anatomical representation and product replicate as fixed factors and controlled the random effect of participants. The main effect of ad was only significant ($F(2,421)$ = 6.33, p = .002). A post hoc Tukey HSD test showed that the mean difference between the ordered sequence (M = 5.31) and control (M = 5.05) conditions showed a significant difference ($M_{ordered-control}$ = .26, SE = .07, p = .001), however, other comparisons revealed insignificant differences. The results illustrated that the core effect dissipated if ads failed visualizing product architecture.

Study 3 tested two different types of anatomical representations, specifically, we employed an exploded (vs. X-ray) view to manipulate the high (vs. low) relational knowledge. Compared to X-ray view, exploded view visually separates components so that product architecture is easily graspable. 225 undergraduates were randomly assigned to one of the three ad conditions (exploded view vs. X-ray view vs. control). After viewing the ad, they completed the AK scale (α = .92). An ANOVA on AK revealed a significant main effect ($F(2,222)$ = 23.33, p < .001). Three contrast tests revealed that participants who viewed exploded image (M = 5.29, SD = 1.29) scored higher on AK than X-ray (M = 4.21, SD = 1.51; $t(222)$ = 4.64, p < .001) and regular images (M = 3.66, SD = 1.29; $t(222)$ = 7.00, p < .001). Moreover, AK in the X-ray condition was higher than the control ($t(222)$ = 2.34, p = .019).

Study 4 tested the downstream effect and the moderating effect of visual processing style. 125 undergraduate students participated in a single-factor (exploded view vs. control) between-subjects experiment. Participants viewed an ad and responded to product preference (r = .72), performance risk (e.g., "how confident are you of the advertised product's ability to perform as expected?"; adapted from Agarwal & Teas, 2001; r = .80), AK (α = .97), and visual processing style (Childers et al., 1985). Three ANOVAs showed that participants in the exploded view condition, compared to the control, reported higher levels of product preference ($M_{exploded}$ = 5.03, SD = 1.46; $M_{control}$ = 4.52, SD = 1.35; $F(1,123)$ = 4.19, p = .043), performance risk ($M_{exploded}$ = 2.33, SD = 1.10; $M_{control}$ = 2.85, SD = 1.30; $F(1,123)$ = 5.68, p = .019), and AK ($M_{exploded}$ = 5.03, SD = 2.17; $M_{control}$ = 3.38, SD = 1.86; $F(1,123)$ = 20.95, p < .001). An analysis using PROCESS (Hayes, 2017; Model 83) further confirmed a significant moderated mediation effect (anatomical representation × visual processing style → AK → performance risk → product preference). The serial mediating effect was significant for participants who scored high (95% Cl = [.023, .204]) and moderate (95% Cl = [.017, .152]) on visual processing style (95% Cl = [−.003, .095]).

Future studies will test AK utilizing objective measures (e.g., recall) and explore other consequential outcomes on confidence, pertaining to product assembly.

A Tale of Two 'States': Partisan Differences in Consumer Response to Brand Activism

Nitika Garg, University of New South Wales, Australia
Geetanjali Saluja, University of Technology Sydney, Australia

EXTENDED ABSTRACT

Political ideology has become associated with one of the most salient identities in the current environment (Iyengar and Krupenkin, 2018; Van Bavel and Pereira, 2018). Research in the last decade has demonstrated its significant impact across a variety of factors such as openness to new experiences (Van Hiel et al. 2000), morality-based judgments (Silver and Silver 2017), collectivism and interdependence (Janoff-Bulman 2009), and consumer behavior (Crockett and Wallendorf 2004). For example, it has been found to influence response to persuasive appeals and sustainable behavior such as recycling intentions (Kidwell et al. 2013).

In recent times, a phenomenon called 'brand activism' where the brand takes a stand on controversial socio-political issues (Moorman 2020; Mukherjee and Althuizen 2020; Vredenburg et al. 2020) has emerged. This can hurt brands by alienating consumers opposed to the issue (Mukherjee and Althuizen 2020). Given the significance of political ideology-based differences in consumer response in the marketplace (Crockett and Wallendorf 2004; Jost 2017), it is critical to understand *whether* and *how* it might influence consumer response to brand activism. Past work has shown that conservatives (vs. liberals) favor self-responsibility and personal control in solving problems (Everett et al. 2020; Eidelman et al. 2012; Jost 2017). They also exhibit greater compliance with social order and prefer status-quo (Jung et al. 2017). The current research thus seeks to examine how brand activism might influence brand attitudes and willingness-to-pay (WTP), and whether political ideology moderates this effect. Both affective (positive and negative) and cognitive (brand-value identification) routes as drivers of these effects are tested.

Authentic Activism versus Slacktivism. Consumers can either see the brand as genuinely engaged with the issue or as just engaging in 'slacktivism' or inauthentic brand activism, seen largely as an opportunistic involvement via marketing messages (Kristofferson, White, and Peloza 2014; Vredenburg et al. 2020). Thus, it is important to empirically assess how consumers respond to it, and whether the effect is distinct for conservatives versus liberals.

Affective route as a driver. When dissatisfied with the brand, consumers can experience an array of negative emotions (Patterson, Brady, and McColl-Kennedy 2016; Wetzer, Zeelenburg, and Pieters 2007), leading to negative brand consequences (Kähr et al. 2016; Sen, Gurhan-Canli, and Morwitz 2001; Wetzer et al. 2007). On the other hand, a firm's participation in valued actions elicited positive emotion of gratitude (Xie, Bagozzi, and Gronhaug 2015). Thus, we expect that when brand activism is supported by the consumer, they will experience positive affect and vice-versa; which might in turn be implicated in downstream outcomes.

Cognitive route as a driver. Consumers tend to be drawn to brands where their values are aligned with the brand's (Johar and Sirgy 1991). This has been shown to positively influence consumers' brand-value identification and thereby, positive WOM, brand attitudes, and commitment (Tuskej, Golob, and Podnar 2013). Given that brand activism reflects the brand's values (Vredenburg et al. 2020), we argue that when consumers' values match brand's and they identify with them, they will be more likely to hold positive brand attitudes and higher WTP.

Studies and Results

Study 1 examined the interactive effect of brand activism (present, absent) and political ideology (continuous) on consumers' brand attitudes and willingness to pay. Results revealed a significant interaction between brand activism and political ideology for brand attitudes ($F(1, 248) = 50.76$, $p < .0001$) and WTP ($F(1, 248) = 41.95$, $p < .0001$). Specifically, for both brand attitudes and WTP, liberals (vs. conservatives) report more positive brand inclinations in the activism condition, but this effect is reversed for conservatives. Further, mediation analysis revealed a significant index of moderated mediation for happiness on brand attitudes (= 3.29, SE = .51, 95% CI = 2.35, 4.35) and WTP (= 3.31, SE = .52, 95% CI = 2.33, 4.37), confirming a significant pathway through positive affect.

Study 2 examined how political ideology moderates the effect of activism issue type (pro-conservative, pro-liberal). It also included measures of pride and gratitude. Results showed a significant interaction between brand activism and political ideology for brand attitudes ($F(1, 246) = 88.64$, $p < .0001$) and WTP ($F(1, 246) = 97.59$, $p < .0001$). Specifically, liberals (conservatives) had more positive attitudes and higher willingness to pay for the brand when it engaged in pro-liberal (pro-conservative) issue activism. Mediation analysis revealed a significant index of moderated mediation for attitudes via emotions (happiness: $I = -1.79$, SE = .49, 95% CI = -2.87, -.90; pride: $I = -1.19$, SE = .51, 95% CI = -2.29, -.27) and WTP (happiness: $I = -1.63$, SE = .55, 95% CI = -2.86, -.68; pride: $I = -2.41$, SE = .60, 95% CI = -3.67, -1.32); supporting and building on Study 1's findings by establishing happiness and pride as mediators.

Finally, *Study 3* studied how conservatives and liberals respond to "slacktivism" compared to activism-present and absent conditions. It also assessed brand-value identification as a mediator. Results showed that conservatives had lower attitudes and WTP when the brand engaged in activism ($M = 3.83$) versus slacktivism ($M = 4.40$) ($b = -.57$, $SE = .26$, $t = -2.21$, $p = .03$; 95% CI = -1.07, -.06), while liberals had more positive attitudes and WTP in the activism ($M = 6.16$) versus slacktivism ($M = 3.99$) ($b = 2.17$, $SE = .22$, $t = 9.78$, $p < .001$; 95% CI = 1.74, 2.61) condition. Finally, when both affective and cognitive routes were accounted for in the same model, pride (but not happiness) ($\beta = -.19$, $SE = .11$, 95% CI = -.44, -.02) and brand-value identification ($\beta = -.85$, $SE = .31$, 95% CI = -1.48, -.26) significantly mediated the interactive effect of political ideology and brand activism on consumer's response.

Discussion

Overall, our findings demonstrate that while liberal (vs. conservative) consumers had higher brand attitudes and WTP in the brand activism versus absent condition (Study 1), this effect depended on issue type (pro-liberal vs. pro-conservative) (Study 2). Further, our results show that engaging in inauthentic activism or slacktivism, is poorly received by *both* conservatives and liberals (Study 3). Affective and cognitive factors mediate these effects.

While past work has looked at how consumers react to brand activism (Mukherjee and Althuizen 2020), our research is one of the first to examine consumer response to it through the lens of political ideology as well as contributing to the emerging literature on brand activism by demonstrating the pitfalls of brands engaging in slacktivism.

Psychological Ownership as an Intervention: Addressing the Government Benefits Participation Gap

Wendy De La Rosa, University of Pennsylvania, USA
Eesha Sharma, Dartmouth College, USA
Stephanie Tully, Stanford University, USA
Eric Gianella, Code for America, USAs
Gwen Rino, Code for America, USA

EXTENDED ABSTRACT

Each year, eligible individuals forgo billions of dollars in financial assistance in the form of government benefits. For example, approximately 20% of eligible individuals do not claim the EITC, forgoing an estimated $7.3 billion annually (1). This difference between eligibility and uptake in government benefits is commonly referred to as the "benefits participation gap." Closing this participation gap is important, as receiving government benefits can reduce poverty, childhood hunger, educational gaps, as well as physical and mental illness (2-4).

While existing research focuses primarily on awareness and logistical considerations (5-7), we suggest that applying for government benefits feels like requesting assistance, which can feel aversive and decrease individuals' desire to apply for them. As such, we hypothesize that psychological ownership interventions can increase interest in applying for government benefits. Psychological ownership refers to the extent to which a target feels like "mine" and can be felt towards a range of targets including money (8-11). By encouraging individuals to conceptualize government benefits as their own money, psychological ownership interventions should make applying for government benefits seem less like an uncomfortable "ask for help" and more like a rightful "ask for what is mine."

We first report three large-scale field experiments ($N = 60,729$) examining the effectiveness of psychological ownership interventions in increasing the pursuit of the EITC and stimulus checks. For all field experiments, Code for America, a non-profit aimed at improving how the government serves the public, randomly generated experiment participants from an internal list of low-income individuals likely to be eligible for these benefits. A final controlled study (N = 810) provides a full test of the proposed conceptual model utilizing another type of benefit (i.e., COVID-19 funds). It demonstrates that increasing psychological ownership of available COVID-19 funds decreases individuals' discomfort around asking for help, increasing their probability of pursuing those funds. All studies were pre-registered on AsPredicted.

Experiment 1 aimed to message a random sample of 10,000 U.S. residents from Code for America's user base that were likely EITC-eligible via email or text message. Participants received either a control message or a higher psychological ownership message. One week after the messages were sent, we compared participants' likelihood of visiting the website and beginning the process of claiming their benefits (i.e., clicking "Get Started" on the homepage) by condition. As predicted, participants in the psychological ownership condition were more likely to visit the website (PO: 29.9% vs. Control: 15.5%; Wald χ^2 (1) = 282.54, $p < .001$) and click "Get Started" on the homepage to begin the process of claiming the EITC (PO: 11.5% vs. Control: 5.1%; Wald χ^2 (1) = 128.92, $p < .001$). All results remained significant regardless of message format. A post-test revealed that these results cannot be explained by the higher psychological ownership framing increasing participants' perceptions of their eligibility, increasing the certainty of receiving benefits, decreasing the perceived difficulty of applying, increasing loss aversion, or reducing perceptions of social stigma.

Experiment 2 expanded the ecological validity of our findings by testing the impact of higher psychological ownership framing for another benefits program: the stimulus checks. We randomly assigned 50,000 individuals to receive a higher psychological ownership message or a control message. All messages were delivered via text. As predicted, binary logistic regressions revealed that participants were more likely to visit the website (PO: 17.5% vs. Control: 14.0%; Wald χ^2 (1) = 91.52, $p < .001$) and click "Start Filing" on the homepage to begin the process of claiming their stimulus checks (PO: 8.9% vs. Control: 7.4%; Wald χ^2 (1) = 30.80, $p < .001$) in the psychological ownership versus control condition.

Experiment 3 compared the relative effectiveness of psychological ownership to other popular interventions. Code for America identified 10,000 individuals who were likely EITC-eligible. Participants received an email or text message with one of four messages based on condition. In addition to the control and psychological ownership conditions, we included a social norm condition ("Millions of people like you have filed…") and a deadline condition ("File before the deadline…"). Participants were more likely to visit the website in the psychological ownership (36.7%) versus the control (20.7%), social norm (17.4%), and deadline (27.5%) conditions, all Wald χ^2 (1) ≥ 47.12, all $p < .001$. As in Experiments 1 and 2, participants in the psychological ownership condition were also more likely to begin the benefits claiming process (all Wald χ^2 (1) ≥ 30.61, all $p < .001$).

Experiment 4 investigated whether psychological ownership increases interest in government benefits by reducing participants' discomfort towards requesting assistance. Eight hundred and ten participants on Cloud Research completed this incentive compatible experiment for a small payment. Participants read either a control or higher psychological ownership message about available COVID-19 funds and indicated whether they were interested in receiving more information. As predicted, a greater proportion of participants chose to receive information about the COVID-19 funds in the psychological ownership (68.1%) versus control condition (53.6%), Wald χ^2 (1) = 17.88, $p < .001$. In addition, participants reported lower discomfort towards asking for assistance in the psychological ownership (M = 4.15, SD = 2.62) versus control (M = 4.83, SD = 2.68) condition, $t(808) = -3.63$, $p < .001$. Moreover, discomfort around requesting assistance significantly mediated the effect of message framing on participants' choice (95% CI: .017, .116; 20,000 resamples). These results replicated when using participants' visits to the website as a second DV.

Substantively, our work offers psychological ownership as a new means for reducing the government benefits participation gap. More broadly, as the first large-scale field investigation of psychological ownership interventions, our work shows that psychological ownership can be a powerful nudge. Our results suggest that in some contexts psychological ownership interventions can be more efficacious than other common interventions informed by behavioral science. Given that psychological ownership interventions, such as those used in the current research, can be simpler and cheaper to implement relative to logistical interventions, our work highlights

the importance of psychological ownership as a new tool in the portfolio of potential behavioral science interventions.

How Do Self-Service Technologies Shape Consumer Value Co-Creation? Insights From the Cultural Sector

Fei Gao, HEC Montreal, Canada, Canada
Francois Colbert, HEC Montreal, Canada, Canada
Danilo C. Dantas, HEC Montreal, Canada, Canada

EXTENDED ABSTRACT

As technologies are rapidly developed and adopted, increasing number of companies replace their traditional human-based services with self-service technologies in order to lower cost and improve efficiency and service quality. Self-service technologies (SST) refer to "technological interfaces that enable customers to produce a service independent of direct service employee involvement" (Meuter et. al. 2000, p.50). However, technology adoption cannot guarantee service success (Bitner, Ostrom & Meuter 2002). Kmart, which is the first retailers adopting self-checkouts in 2001, removed those machines two years later (Tiffany 2018). This is the result of many factors. One of them is that technology infusion has changed the way consumers interact with other service elements over their consumption journey. Understanding how consumers use SST helps explain the reason they response to technological stimuli unexpectedly. Giebelhausen et. al. (2014) argues that technology usage significantly influences rapport-building between employees and customers. However, customer experience is multi-dimensional, including not only relational dimension, but also physical, sensorial, affective and cognitive dimensions (Schmitt 1999; Becker & Jaakkola 2020; Verhoef, Lemon, Parasuraman, Roggeveen, Tsiros & Schlesinger 2009; Gentile, Spiller & Noci 2007). This study takes a holistic point of view, exploring how SST usage influence overall customer experience. More specifically, this research aims to answer two questions: 1) how do consumers use self-service technology to co-create experiences and values over the entire consumer journey? 2) what are the roles of SST in value co-creation?

These questions are studied in the context of Cité Mémoire, which is one of the largest outdoor video-projection installations in the world. A mobile app is designed to assist with visits. Visitors need the app to explore and access projections over their consumption journey. This differentiates our study from previous SST research that mainly focus on SST usage in a specific consumption phase. A mixed research strategy is taken: researcher's personal experience, observation, and semi-structured interviews. 27 visitors in 18 visit groups participated this study. The unit of analysis is experience of individual visit group. Following grounded theory (Strauss and Corbin 1990), we coded transcripts and notes and compared visit experiences of the 18 visit groups.

We adopt appropriation theory to exhibit co-creation process. Appropriation is "a subjective process through which consumers gradually immerse themselves in an experiential setting" and transform the experience into expressions of themselves (Stavraki et al. 2018, p. 1890). It involves "exercise of authority, control and physical or psychological power over an object or place" (Carù and Cova 2005, p. 43). The appropriation process comprises three major practices: nesting, investigating, and stamping. Nesting implies consumers' active search for familiar elements in an experiential context as anchorage points. Consumers further explore unknown experiences and enhance their knowledge and control over the experience with investigating practice. Stamping, as the final practice, is an imaginative and intellectual activity that consumers involve to attribute personal meanings to the experience. The appropriation process is incisive in explaining customers' interactions with and perceptions of diverse service elements in consumption context and thus enables us to unfold the mechanism of consumer value co-creation.

Results reveal two entangled appropriation processes: SST appropriation and core service appropriation. The appropriation of the mobile app is considered as a process out of the appropriation of core service. Visitor #24 said "it felt like homework…it was something we had to pass through to get to the fun stuff". It seems not to be an enjoyable task, but it is the necessary "sacrifice" for the real fun. Otherwise, they may miss partial experiential and functional value. In general, adopting the mobile app increases their workload.

Before visit officially started, visitors explored the app and pictured upcoming visit experiences in their minds based on the project information found in the mobile app. Visitors' nesting and investigating operations on the core service were largely consistent with SST nesting and SST investigating because the mobile app is the only avenue where visitors acquired project information. The pre-visit stamping of core service was vague impressions of the overall project and personalized visit plan, different from but based on pre-visit SST stampings. When visitors started their visit, their knowledge of the mobile app and the project and their visit plan were transformed into anchorage points, serving for onsite physical and sensorial investigating of core service. After they found projection locations with the help of the app, investigating of projection content depended on the result of SST investigating. For example, visitor #9 failed in playing the soundtrack in the app and thus misunderstood stories in the projections. She missed the cognitive value because of failed SST investigating. After watching video projections, visitors had stamping on cognitive value, emotional value, personal value of the project and the mobile app. Visitors' appropriation, in post visit phase, only happened on the core service level and SST appropriation stopped.

Furthermore, we have found three roles of SST in co-creation process: experience implementor, experience transformer and economic value signal. The fundamental role of SST is service implementer. Previous SST research are mainly on this role. SST affects investigating of core service through its performance and functionality. SST can also be an experience transformer, transforming ordinary experiences to extraordinary experiences or terrible experiences. Some visitors feel excited because they perceive strong sense of control and ownership. The intensive emotional and psychological perceptions generated by using the mobile app color the emotional and personal stamping of the core service. This corresponds to the service psychological ownership dimension of service appropriation. SST usage can improve consumers' service psychological ownership when consumers experience strong positive emotions and have psychological perceptions. It is also possible that SST usage weakens consumers' psychological ownership if consumers' emotional and psychological perceptions are negative. SST also plays the role of economic value signal. In our study, participants see the app as an economical alternative of human service. If the price for SST-mediated service is the same as human employee service, visitors would quit the service or feel less satisfied with the service. This perspective directly associates with consumers' visit decisions and evaluations.

Received! The Effect of Take-Back Program Acknowledgment on Perceptions of Company Sustainability and Consumer Recycling Intentions

Yuly Hong, Georgia Institute of Technology, USA
Sara Dommer, Pennsylvania State Univeristy, USA
Karen Page Winterich, The Pennsylvania State University, USA

EXTENDED ABSTRACT

A growing number of companies offer take-back programs, whereby consumers send or drop off used products for recycling, as part of their sustainability initiatives and move toward a circular economy. Prior research offers insights for companies to encourage consumers' recycling behaviors in an effort to initiate participation (Burn and Oskamp 1986; Hornik et al. 1995; Iyer and Kashyap 2007; Trudel 2019; Winterich, Nenkov, and Gonzales 2019). But beyond simply offering such take-back programs, are there additional actions companies can take?

We propose a simple yet effective action that companies can take to positively impact their sustainability image and encourage continued recycling from consumers: acknowledgment. Specifically, we argue that when a company acknowledges consumers' recycling (e.g., an email confirming the receipt of the goods to be recycled), consumers perceive that the company is willing to responsibly communicate with them regarding the take-back program (Morales 2005; Parris et al. 2016; Weiner 2001). This increased transparency, in turn, makes consumers trust the company's recycling claims more (Dubbink, Graafland, and van Liedekerke 2008; Reynolds and Yuthas 2008). As a result, consumers perceive the company to be more sustainable and have greater future recycling intentions with the company.

We present the results from six studies, using both fictitious and real brands in various product categories (coffee capsules, athletic shoes, and clothing), in support of this argument. The basic design of all studies is as follows: participants first imagined that they frequently purchased products from a company and received an email from the company that encouraged the recycling of their unused products using the company's prepaid mailing label. They also imagined that they collected their unused products and dropped them off at the UPS store to recycle. Then participants were randomly assigned to one of the acknowledgment conditions.

Study 1 provided an initial demonstration of the acknowledgment effect using a one-way (acknowledgment: no acknowledgment vs. acknowledgment vs. compensation) between-subjects design. Given that compensation does not offer greater transparency than acknowledgment alone, we expected that it would have a similar effect as the acknowledgment. After reading the scenario, participants indicated their sustainability perceptions of the company and future recycling intentions with the company. As predicted, participants in both the acknowledgment and the compensation conditions perceived the company to be more sustainable and were more willing to continue recycling with the company compared to those in the no acknowledgment condition ($ps < .001$).

Study 2A demonstrated whether recognition alone, without gratitude in acknowledgment, results in similar effects and also examined the underlying process of acknowledgment effect. Participants were assigned to one of three conditions (acknowledgment: no acknowledgment vs. acknowledgment without gratitude vs. acknowledgment with gratitude) in a between-subjects design. As our theorizing regarding the effect of acknowledgment on transparency perceptions does not require the presence of gratitude, we did not expect a significant difference between acknowledgment with gratitude and acknowledgment without gratitude. After reading the sce-

nario, participants completed the same measures from study 1 and rated their transparency perceptions (Dapko 2012) and trust toward the take-back program (Erdem and Swait 2004). As predicted, participants perceived the company as more sustainable and had greater future recycling intentions when they were acknowledged for their recycling, regardless of whether gratitude was expressed ($ps < .01$). Furthermore, transparency perceptions and trust serially mediated the effect of acknowledgment on sustainability perceptions and future recycling intentions.

Study 2B replicated the acknowledgment effect found in prior studies for a real brand (Nike) using a one-way (acknowledgment: no acknowledgment vs. acknowledgment) between-subjects design. Also, this study further supported the proposed process of transparency perceptions to trust and ruled out alternative processes (warm glow and personal impact) for the acknowledgment effect.

Study 3 demonstrated that the effect of acknowledgment holds only when the company offers acknowledgment, not when any kind of marketing communication is offered. To do so, we added a factor to our experimental design: whether or not participants received an email advertisement from the company. Participants were assigned to a condition in a 2 (acknowledgment: yes vs. no) x 2 (advertisement: yes vs. no) between-subjects design. We only expected a main effect of acknowledgment, such that participants in the two conditions with acknowledgment would have greater sustainability perceptions of the company and future recycling intentions with the company, compared to those in both no acknowledgment conditions, which was indeed the case ($ps < .001$).

Study 4 provided evidence of the process for the acknowledgment effect by examining information provision as a moderator. Specifically, we further examined the role of transparency by manipulating the amount of information about the company's take-back program given to participants, since transparency centers around consumers' perceptions of how open the company is to share information (Kang and Hustvedt 2014; Vaccaro and Echeverri 2010). Participants were assigned to one of four conditions in a 2 (acknowledgment: yes vs. no) x 2 (information provision: yes vs. no) between-subjects design. Consistent with the proposed role of transparency perceptions, providing additional information about the take-back program increased sustainability perceptions and future recycling intentions in the no acknowledgment condition ($ps < .01$), demonstrating that the company's provision of information regarding their take-back program (transparency) influences the acknowledgment effect.

Study 5 demonstrated the downstream behavioral outcome of the acknowledgment on consumer word of mouth using a one-way (acknowledgment: no acknowledgment vs. acknowledgment) between-subjects design. Specifically, acknowledging consumers' recycling led more consumers to indicate that they would tell their friends and family about the company's take-back program ($p = .02$) and to list more people that they would tell about the take-back program ($p = .05$). Also, study 5 replicated the mediation results of Studies 2A and 2B.

This research contributes to sustainable behavior literature, which recognizes the need to make consumers' sustainable behavior sustainable beyond one-time action (White, Habib, and Hardisty 2019), as well as the literature on acknowledgment and transparency.

Additionally, as the demand for circular approaches is growing (McDonough and Braungart 2010), this research offers companies a viable and straightforward way to strengthen their sustainable image and encourage repeated consumer recycling through their take-back programs.

Hostile Consumption Communities: Unwelcoming New Consumers

Clarice Huston, Monash University, Australia
Angela Cruz, Monash University, Australia
Eloise Zoppos, Monash University, Australia

EXTENDED ABSTRACT

This study explores how new consumers experience and cope with the challenges of a hostile community. Consumption communities are rife with conflict, with studies such as Husemann, Ladstaetter, and Luedicke (2015), Muniz and O'Guinn (2001) and Beverland, Farrelly, and Quester (2010) and Chalmers Thomas, Price, and Schau (2013) illustrating how communities manage conflict and different understandings of authentic participation. Additionally, consumers face challenges when participating in a community including social stigma (Kozinets, 2001) and material barriers (Schouten & McAlexander, 1995). These studies illustrate how communities manage conflict and different understandings of authenticity. However, what is less known is how these conflicts and different understandings shape the new consumer experience. As the consumer's initial impressions can influence their overall consumption experience, particularly when experienced with other consumers (Bhargave & Montgomery, 2013), it is important to understand how hostile communities shape the beginnings of the consumer journey. We draw upon the consumer journeys literature to help understand the interactions a consumer has with a consumption experience across multiple interactions and touchpoints (Hamilton & Price, 2019), with focus on the beginnings of the consumer journey. Thus we ask the question: how does a hostile community shape the beginnings of the consumer journey?

This research is conducted in the context of esports – "an organised and competitive approach to playing computer games" (Witkowski, 2012, p. 305). Esports has an insider culture, where participation requires understanding the norms, behaviour, and language to authentically participate (Seo, 2013; Taylor, 2012). Semi-structured in-depth interviews and netnography were combined to capture consumers' first experiences within the esports fields and to understand the challenges they faced when entering the community. These data sources provided emic accounts of how consumers experience esports. Data was analysed using a practice theory lens to understand the contextual meanings surrounding the routinised behaviours of actors (Nicolini, 2013) and drew upon the first author's past experiences as an insider within the field to provide a nuanced understanding of the data set (Askegaard & Linnet, 2011; Blythe, Wilkes, Jackson, & Halcomb, 2013).

The new consumer experience within hostile communities is illustrated through three themes: field-level challenges, unwelcoming practices, and coping practices. Within inhospitable consumption communities, field-level challenges and unwelcoming practices create a hostile environment for new consumers. New consumers enter a complex field, where knowledge requirements and material barriers present challenges to engagement. Video games are highly complex and liquid (Bardhi et al., 2017), with constant updates radically changing how the game is played. Furthermore, experienced consumers engage in practices that unwelcome new consumers such as blaming new consumers for miserable experiences while playing the game or smurfing (purposefully playing in lower skilled games to beat less experienced players), creating tensions within the community and a difficult beginning for new consumer journeys. However, new consumers can cope with their first experiences through independently acquiring knowledge or finding a mentor throughout their journey. Coping practices such as parasocial mentoring allow new consumers to ease their transition from new player to community member.

This study contributes to the literature in two ways. Firstly, while consumption communities are known to have conflict (Chalmers Thomas, Price, & Schau, 2013; Husemann et al., 2015; Muniz & O'Guinn, 2001), less is known about how conflict shapes the new consumer experience. The present study illustrates how conflict shapes the beginnings of the consumer journey and the tensions that arise between new and existing community members. Due to their lack of knowledge stemming from the subpar tutorials and learning content provided by producers, new consumers are seen as a burden by existing community members. Thus, new consumers enter a community that is hostile to inexperience and are expected to navigate the field with minimal assistance from the producer. Secondly, in contrast to the social relationships that assist in welcoming new consumers to consumption communities (Goulding et al., 2013, Schau et al., 2009, Littlefield & Ozanne, 2011), new consumers to hostile communities rely on parasocial relationships with content creators within the esports field to learn the basics of the game and overcome unwelcoming practices. Knowledge acquisition is individually driven, with the creators of guides and tutorials often being well-respected members of the community. Rather than personal relationships, new esports consumers experience one to many or parasocial relationships with content creators such as streamers (Leith, 2021), where the individual develops what is perceived to be an intimate relationship with a media figure (Horton & Wohl, 1956). Overall, new consumers can cope with this hostile community through parasocial relationships with content creators or seek mentors through subcommunities created by experienced consumers.

Is My AIVA Reducing My Intelligence? The Effects of AIVA-enabled Search on Consumer Cognition

Laura Pricer, University of North Texas, USA
Priyali Rajagopal, University of North Texas, USA

EXTENDED ABSTRACT

AI-enabled virtual assistants (AIVAs) have become increasingly popular (e.g. Amazon Alexa, Google Home), and assist consumers with a variety of tasks, including home automation, access to media, entertainment and shopping. Indeed, they have a significant influence on what their users hear, watch, and buy through offering suggestions in response to verbal commands (Segan & Greenwald, 2020). Despite their popularity, little is known about how consumer interactions with these devices can impact subsequent outcomes including cognition, emotions and choice. Our research addresses this gap and focuses on one consumer outcome – cognitive performance. Specifically, drawing on previous research on cognition (Pekrun, 2006; Schukaljow et al. 2012) and perceived control (Ryan & Deci, 2000; Chen, Lee & Yap 2016), we predict that interacting with AIVAs (versus online search engines) will lead to decreased cognitive performance, thereby impacting important downstream outcomes such as WOM and search intentions.

We suggest that these effects arise because information search using AIVAs offers less perceived control as compared to traditional online search (e.g. inability to parse through a set of results, presentation of results controlled by AIVA), thereby adversely impacting cognitive performance. Since consumers can attempt to restore lost control through sharing word-of-mouth (Consiglio et al., 2018), we also predict that respondents Intentions to search and WOM will increase after search interactions with AIVAs.

We find support for our predictions across four studies, using different tasks to assess cognitive performance (verbal and quantitative), after interactions with both real (Amazon Alexa) and fake (Halo) AIVA brands, thereby enhancing confidence in our findings. Studies 1 and 2 document the performance disadvantage for AIVAs as compared to online search engines. Study 3 establishes the mediating role of perceived control, and study 4 documents the implications of these findings on WOM intentions.

Contribution

While the use of AIVAs has increased dramatically among consumers, little is known about the effects of interacting with these devices on consumer cognitions, emotions, and behaviors. Our research begins to address these gaps and documents that information search using AIVAs lowers consumers' perceptions of control and subsequently reduces their cognitive performance. Attempting to restore lost control increases consumers' interest in future search and word-of-mouth intentions, leading to more positive evaluations of subsequent information. These results hold significant implications for research on the effects of cognition and technology.

While previous research has focused on technology as a distraction (Ward, Duke, Gneezy, & Bos 2017; Strayer & Johnston 2001) and as a repository for information (Sparrow, Liu, & Wegner 2011), our results suggest that perceptions of control play an important role in subsequent cognitive ability, thus adding a new mediator to this literature. This is consistent with prior research, which has found deleterious effects on learning and performance when students lack control over their learning (Schukaljow et al., 2012; Bieg 2017). Two, the outcomes of lost control can be manifold and hold important implications for marketers, suggesting that future research on these outcomes, as well as ways to attenuate/amplify them, will be beneficial. Three, the finding that the similarity between the search and the subsequent cognitive task impacts cognitive performance is an important qualifier to my effects. Thus, when consumers use AIVAs to search for information, there may not be a subsequent detrimental effect on their ability to complete routine consumption-related numeric tasks such as computing discounts or comparing relative value.

Our research also offers significant implications for marketing practitioners. More than a fifth of consumers in developed countries use AIVAs for a variety of tasks (Hippold 2018), and due to the circumstances brought about by Covid-19 (e.g., contactless shopping – expanding e-shopping and e-services; and remote working/learning), this usage is likely to grow faster than originally predicted (Khan, 2020). In fact, recent research indicates that almost 60% of AIVA owners have used the device to make a purchase and they predict that voice commerce has the potential to reach $40 billion by 2022 (Osman, 2021). This widespread adoption of AIVAs renders understanding the effects of such use on consumers highly critical. It is evident that both firms and consumers are fascinated by this new AI-enabled technology, but neither fully understand their capabilities or the effects they have on consumer behavior. Limiting consumers' cognitive functioning influences countless aspects of their everyday lives, from decision-making (Bettman. Johnson & Payne, 1991) to the enjoyment of experiences (Weber et al., 2009). Thus, the use of AIVAs for information search may consequently lead to sub-optimal consumer outcomes, including greater impulse purchases and choices favoring vices (e.g., unhealthy foods) over virtues (e.g., healthy foods), increased consumer spending (reduces searching effort – reducing fatigue), and increased susceptibility to persuasive advertising (especially if presented through the device).

A Field Study Investigating the Effect of Four Established Message Framing Theories on Mask-Wearing Behavior

Anastasiya Pocheptsova Ghosh, University of Arizona, USA

EXTENDED ABSTRACT

The COVID-19 pandemic dramatically affected daily life. Workplace and school closures played an important role in containing community spread (e.g., Leidner et al. 2021), but these closures came with significant economic and social costs (e.g., Chatterjee 2021). Amidst the pressure to reopen (Honein, Barrios, and Brooks 2021), organizations are looking for ways to safely resume in-person operations. In lieu of vaccination – for which uptake is startlingly low in the U.S. (New York Times 2021) – one of the most effective behaviors for reducing transmission is public mask wearing (CDC 2021). Willingness to comply with mask-wearing recommendations, however, varies widely among individuals, with only 65% of the US population reporting full compliance (Institute for Health Metrics and Evaluation 2020).

In a large, longitudinal field experiment, we compared the effectiveness of four theoretically motivated public service announcements (PSAs) designed to increase public mask wearing in a large organization: social proof (e.g., Cialdini et al. 1991), implementation plans (e.g., Gollwitzer and Sheeran 2006), peer accountability in goal pursuit (e.g., Lee and Ybarra 2017), and loss aversion (e.g., Rothman et al. 2006). Based on the extensive body of previous work, our expectations were that all four would perform better than control (informational) conditions.

A longitudinal field study was designed and conducted in cooperation with a large public university in the Southwestern United States and approved by the University's Institutional Review Board (preregistration: https://aspredicted.org/blind.php?x=dp8ku2). Our sample consisted of $n = 4{,}083$ students living in 16 dorms divided into six comparably sized participant pools and randomly assigned to six conditions (2-3 dorms per condition). We measured mask-wearing behavior over a 5-week period in response to either a pure informational (control) PSA, or one of four different theoretically motivated treatment PSA messages. Dorm residents were exposed to one version of the PSA (depending on the randomly assigned experimental condition) delivered via print advertisements, digital advertisements, emails, and professionally filmed videos.

Seven research assistants (blind to condition) observed mask-wearing in two distinct common areas of each dorm each day for five weeks. The primary observation location was in direct view of dorm staff (by the main entrance) and a secondary location was in an equally high traffic area that was not observed by dorm staff. This distinction was important because mask-wearing was mandatory and enforced by the dorm staff during the data collection period. In total, 388 observation sessions occurred over the five weeks, with a total of 7,328 unique observations.

We first ran a model including all relevant two- and three-way interactions:

$$y_{it} = \beta_0 + \beta_1\,Condition_i + \beta_2\,Exposure_t + +\beta_3 Location_t + \beta_4\,Condition_i \times Exposure_t + \beta_5\,Condition_i \times Location_t + \beta_6\,Condition_i \times Location_t + \beta_7\,Condition_i \times Exposure \times Location_t + \varepsilon_{it}$$

where y is the proportion of observed students wearing a mask in dorm i at time t, *Condition* represents one of the conditions to which a dorm is assigned, and *Exposure* equals 1 for weeks 2-5 (exposure to PSA) and 0 for week 1 (no PSA exposure), and *Location* equals 0 for primary location monitored by dorm staff coded as 0, and 1 for secondary location not monitored by staff. Standard errors are clustered at the dorm level.

We found a marginally negative effect of observation location on proportion of observed students wearing a mask ($\beta = -0.047\ (0.024)$, $p = 0.074$). This indicates that, as expected and consistent with extant theory (McCambridge et al. 2014), students were significantly more likely to wear a mask when monitored by an authority figure such as the front desk staff. Next, we found a significant negative interaction between Location and Loss Aversion Condition ($\beta = -0.204\ (0.061)$, $p = 0.004$), qualified by a marginally significant three-way interaction between Location, Loss Aversion Condition and Exposure ($\beta = -0.115\ (0.058)$, $p = 0.066$). No other effects were significant.

To decompose the three-way interaction, directly test our theory, and better describe the nature of these patterns, we next estimated a difference-in-difference model for each location separately. Further, because there was no difference between two control conditions on the main dependent variable of interest nor interactions (all ps > .27), to simplify the exposition we use the combined data from both control conditions as the control (reference) group when testing the efficacy of the four treatment conditions. There was no significant effect of any of the PSA messaging conditions in the monitored location 0. More importantly, in the unmonitored location 1, the Loss Aversion condition has a positive and significant effect, increasing mask-wearing after exposure to PSA as compared to control condition ($\beta = 0.178\ (0.081)$, $p = .04$). No comparable effects were observed for other PSA messaging conditions. Further analysis looking at the week-by-week effect reveals that the effect of Loss Aversion condition on mask wearing behavior in the unmonitored location 1 accumulates over PSA exposure weeks (week 3: $\beta = 0.234\ (0.131)$, $p = .09$; week 4: $\beta = .226\ (0.121)$, $p = 0.081$; week 5: $\beta = 0.282\ (0.088)$, $p = 0.006$). Finally, the results remain qualitatively unchanged when including dorm-level demographics (e.g., composition of gender, age, race, etc.) are includes as control variables.

These results offer promising insights for organizations that want to reopen and stay open. Namely, interventions encouraging individuals to think about the loss they may experience if they do not wear a mask in public have a significant and positive effect on public mask-wearing behavior. The present research also highlights the potential for using passive measures (e.g., advertisements in populated areas) to encourage individual mask-wearing behavior. This finding is crucial in the fight to save lives and resume in-person interactions amid the ongoing COVID-19 pandemic.

Unfair Value Allocation: The Role of Data Ownership in Privacy Concerns

Jia Chen, University of Illinois at Chicago, USA
David Gal, University of Illinois at Chicago, USA

EXTENDED ABSTRACT

Privacy is an issue of increasing public concern. In response to such concerns, governments and technology companies have taken steps to reassure consumers that their data is being protected from exposure. For example, the tech giant company, Google, recently began assigning consumers to cohorts rather than tracking individual-level information to protect individuals' information from exposure while displaying relevant advertising. Will this initiative to be sufficient in assuaging consumers' privacy concerns?

Prior research has broadly documented privacy concerns in terms of data exposure, its associated costs and risks (e.g., identity theft, embarrassment), and the general perception of being intruded upon (Acquisti, Brandimarte, and Loewenstein 2015; Acquisti, John, and Loewenstein 2012; John, Acquisti, and Loewenstein 2011). It is often assumed that consumers tradeoff the risks/costs of data exposure for the benefits they receive from divulging their private information. However, this research proposes another important consideration consumers have when disclosing their data: are they receiving fair value for their data? In this sense, the exchange of private data for services is similar to other exchange transactions consumers engage in, such as exchanging money for goods and services. As when exchanging money for goods (or vice versa), consumers desire to receive fair value in return for their private information.

Across five preregistered experiments, this research shows that among other cues, consumers frequently rely on the profits that firms earn through the use of consumer data, ascribing more value to their private information when firms are able to exploit it to earn higher profits. As such, they are less happy to disclose their data when firms earn relatively higher profits from their data.

Experiment 1A was designed to test our main hypothesis. Participants (N = 169) imagined their experiences of using multiple applications from a company called WI and were informed that WI would integrate their information across products. Subsequently, participants in the low (vs. high) profit increase condition were told that WI would get a small (vs. huge) increase in profit. After that, participants reported how concerned they are that WI would invade their privacy. Results revealed that privacy concerns were significantly higher in the high profit condition (M_{high} = 5.18, SD = 1.55) than in the low profit condition (M_{low} = 4.07, SD = 1.89, $F(1, 167)$ = 17.50, $p < .001$, $partial\ \eta^2$ = .09).

To clearly assess whether consumers would spontaneously express privacy concerns, in experiment 1B, we asked participants to elaborate any concerns if they have and reported the intensity of their concerns. A chi-square test revealed that a higher proportion of consumers expressed privacy concerns in the high profit condition (50.34%) than in the low profit condition (35.61%, $\chi^2 (1)$ = 5.56, p = .018). Furthermore, privacy concerns were significantly stronger in the high profit condition (M_{high} = 2.75, SD = 2.96) than in the low profit condition (M_{low} = 1.95, SD = 2.74, $F(1, 277)$ = 5.46, p = .020, $partial\ \eta^2$ = .02).

Experiment 2 was designed to provide support that privacy concerns arise from the perception of not receiving the fair value created from the personal information. All participants (N = 187) were assigned to either elaborate on the firm's or the customer's benefit from the integration of information and reported how they feel about disclosing their information to WI. Subsequently, we measured the mediator about the extent to which they feel the benefits they re-ceive reflect the fair value of the private information they give up. A planned contrast revealed that participants felt happier about disclosing their information when they were in the customers' benefit condition ($M_{customers}$ = 4.12 SD = 1.55) than in the firm's benefit condition (M_{firm} = 3.04, SD = 1.63, $p < .001$, $partial\ \eta^2$ = .11). Mediation analysis confirmed the perception of unfair value allocation explained the effect, (β = .677; 95% CI = [.342, 1.030]).

In experiment 3, we measured two types of privacy concerns (how they feel the firm is profiting off their data without giving them fair value in return and how they are worried that their data would be exposed). Subsequently, participants indicated the likelihood that they would be to vote that WI be examined for its practices in profiting from user information. Results revealed that the perception of unfair value allocation was significantly higher in the high profit condition (M_{high} = 5.24, SD = 1.73) than in the low profit condition (M_{low} = 4.77, SD = 1.75, $F(1, 238)$ = 4.31, p = .039, $partial\ \eta^2$ = .02). Conversely, data exposure did not reveal a significant main effect of the profit level (M_{high} = 4.67, SD = 1.89, M_{low} = 4.47, SD = 1.83, $F(1, 238)$ = .67, p = .412). Besides, participants were more likely to elect the more profitable firm (M_{high} = 5.44, SD = 1.60) than less profitable firm (M_{low} = 4.98, SD = 1.54, $F(1, 238)$ = 5.15, p = .024, $partial\ \eta^2$ = .02) to be examined by the government. Mediation analysis supported our theorizing about the perception of unfair value allocation.

In experiment 4 we examined how directing participants to focus on either fair or unfair value allocation affected privacy concerns. Consistent with our prediction, the effect of profit level on privacy concern depends on whether it is a fair value allocation ($F(1, 179)$ = 6.18, p = .014, $partial\ \eta^2$ = .03). When value allocation was unfair, participants' concerns over privacy were greater for the high profit than for the low profit firm (M_{low} = 4.13, SD = 1.75 vs. M_{high} = 5.10, SD = 1.65, $t(86)$ = 5.12, $p < .001$). However, this effect was attenuated when the value allocation was fair (M_{low} = 3.91, SD = 1.60 vs. M_{high} = 4.28, SD = 1.71, $t(93)$ = 2.26, p = .026).

Consistent with our account, five experiments offer convergent evidence that the degree to which consumers perceive they do not receive a fair value created from their personal information raise consumers' concerns over their privacy. The findings are meaningful in broadening future privacy research by identifying a new dimension to consumers' considerations regarding whether to disclose their data. Insights from this research might suggest that adequate protection of consumer data involves not only preventing consumers from data exposure but also ensuring a competitive and transparent market in which consumers can obtain the fair value in exchange for their data.

At The Pursuit of Harmony Between Men, Land and Brands : A Chronotopic Exploration of Slow Cosmetic Brands' Narratives

Camille Anin, Université Grenoble Alpes, France
Pierre Valette-Florence, Université Grenoble Alpes, France

EXTENDED ABSTRACT

"*Conservation is a state of harmony between men and land*" wrote Aldo Leopold in his *Sand County Almanach* (1949). Conservation is increasingly staged by firms through brand discourses in order to value their sustainable agenda, making even more saillant the role of marketing institutions as "*prime movers of both matter and meaning, shaping culture both material and immaterial*" (Scott et al, 2014) and the calls to further explore their transformative potential, not only to make coexist men's and land's needs along one another but also to reframe our relationship(s) to nature and abundance. In the branding literature, sustainability has mostly through the lens of green marketing or corporate social responsbility (Melo & Galan, 2011 ; Kumar & Christodoulopoulou, 2014 ; Paswan, Guzman & Lewin, 2017 ; Harjoto & Salas, 2017, Chen, 2010, Naidoo & Abratt, 2017 ; Ishaq, 2020), brand discourses on sustainability and its impact on meaning-making processes has been relatively understudied (few notable exceptions are to be noted, e.g de Burgh-Woodman & King, 2013 ; Ourahmoune & Binninger, Robert, 2014). Yet, the entanglement between brands and culture (McCracken, 1986 ; Holt, 2004 ; Allen, Fournier & Miller, 2008 ; Fournier & Alvarez, 2019) calls for exploring the emergent paradigm to uncover the transformative potential for change that lies behind brands and highlights its possible contribution as a social actor to the transition toward more sustainable lifestyles.

Sustainability is often depicted as a triptych of social, environmental and economic sustainability. Yet, what lies behind each type of sustainability and how these relates to one another is controversial (Purvis et al, 2019). As a modern concept, sustainability is the product of diverging subjectivities and political agenda (De Pisani, 2006), what Purvis et al (2019) calls "conflicting realities", echoing very different approaches, values and agenda actors push for through the notion of sustainability. As an idea, sustainability is much older. Sustainability is also "*our primal world heritage*"(Grober, 2012). A critical reflection on time is central to the concept of sustainability as sustainable development refers to "*the development that meets the needs of present without compromising the ability of future generations to meet their needs*"(Brundtland Report, 1987). Sustainability also posits a reconstruction of space as it emphasizes belonging to mankind living on Earth and individual and collective duties to ensure human and non-human lives to sustain (Grober, 2012). Consequently, the notion of citizenship is not only a nation-state construction but growingly a combination of supra-national, national and local identities and awareness (Mansouri, Johns & Marotta, 2017). Sustainability profoundly reframes our relationship to time and space, nature and culture, questionning us the future but also how the past contribute to our own present and vision of sustainability.

Through concepts such as sustainability marketing (Belz & Peattie, 2009 ; Thomas, 2018 ; Kemper & Ballantine, 2019) but also green commodity discourse (Prothero & Fitchett, 2000 ; Prothero, McDonagh, & Dobscha, 2010 ; McDonagh & Prothero, 2014) or new materialism (Scott, Martin & Schouten, 2014), authors explore the ability of marketing to forge new subjectivities that may help promote an alternative to an unsustainable system based on materialism and overconsumption. The embeddedness of branding into the fabric of society makes them social and moral agents (Roper, Min & Iglesias, 2017 ; Thomas, 2018) that contribute to meaning-making processes and invites them to explore the transformative potential of branding when it comes to rethink production, consumption and disposal for sustainable aims. Concepts such as brand citizenship (Willmott, 2001, 2003 ; Crane, Matten, Glosen & Spence, 2019) and brand activism (Bhagwat et al., 2020 ; Moorman, 2020 ; Vredenburg et al, 2020) well illustrate the political and social responsibilities that goes along with the involvement with society and its future in the transition toward more sustainable lifestyles. Few research has paid attention to sustainable brand narratives and its structure (de Burgh-Woodman & King, 2013, Ourahmoune & Binninger, Robert, 2014) but such investigations could help us to better understand how brands related to consumers so as to nature and communities in their narratives and how it transforms consumer-brand dynamics.

In order to investigate sustainable brand discourses, we have selected a set of 177 sustainable brands narratives that have received the « Slow Cosmétique » mention. Drawing on the centrality of time and space regarding sustainability, we chose to explore the temporal and spatial dimensions in brand sustainability discourses, building on both emerging data and existing literature on chronotope (Bakhtine, 1978 ; Bemong, & Borghart, 2010). Qualitative analysis aimed at creating emerging temporal and spatial categories and chronotopes (time-space relationships) in brand narratives, adopting a constructivist grounded theory approach (Charmaz, 2006, Minas, Anglin & Ribeiro, 2018 ; Charmaz & Thornberg, 2020).

This chronotopic exploration identifies three types of time dimensions (spiritual, grounded, legacy-oriented) so as of spatial dimensions (caring, creative, citizen-oriented) which enable us to build time-space categories (untouched nature, nature as a ressource, nature as a moral construct) and reframe the identity of brands so as of nature. These chronotopes recreate new forms of myths which contribute to brand meaning-making processes by situating the consumers into webs of mutuality. Each of the chronotope puts the emphasis on different types of value creation by tying consumers to nature, to people and their own self in various ways.

This qualitative investigation offers a new perspective on sustainable brand narratives, reminding us that brands as cultural and social actors are definitely under investigated agents of change in the transition toward more sustainable lifestyles. This research is not without limitation. Brand discourses could have been enriched by other sources of information (brand visual content, interviews with brand managers) in order to have a more complex picture of the given brands. And the focus on the slow cosmetic movement makes it a requirement to replicate research and increase generalizability of findings. Nevertheless, results yield some interesting contributions by highlighting the distinctive role of time-space relationships in brand sustainable narratives and open stimulating areas for future research in branding and consumer ethics. We hope this research will encourage more students and academics to pay close attention to the potential of brands to contribute and accompany positive change for society, environment but also for individuals.

Indulgent Consumption Signals Interpersonal Warmth

Qing Tang, Nanyang Technological University, Singapore
Kuangjie Zhang, Nanyang Technological University, Singapore
Irene Huang, Nanyang Technological University, Singapore

EXTENDED ABSTRACT

Indulgent consumption is pleasurable and provides instant gratification (e.g., Kivetz and Keinan 2006; Shiv and Fedorikhin 1999), but it often has aversive consequences in the long run (e.g., Siddiqui, May, and Monga 2017; Wertenbroch 1998). Thus, indulgent consumption usually signals that the consumer is impulsive and has poor self-control (Dhar and Wertenbroch 2012). Due to this negative effect, consumers tend to choose healthy foods and avoid consuming indulgent foods in public (Sinha 2016).

Our research, by contrast, uncovers a positive signaling effect: indulgent consumption can signal interpersonal warmth. This is because consumers believe indulgent consumption reflects one's genuine preference, and thus choosing indulgent consumption enhances the perceived authenticity of enjoyment. As authenticity of enjoyment is an important driver of warmth perception (Grandey et al. 2005), people should consider a consumer engaging in indulgent consumption as warmer. Thus, we hypothesize that engaging in indulgent (vs. healthy) consumption will increase warmth perception of the actor, and this effect is mediated by the perceived authenticity of enjoyment.

Five studies provided converging support for our Hypothesis. In Study 1, we created two versions of tweets from a fictitious Twitter account called Jeannie. The tweet posted a drink picture with the description: "Look at what I drank today", depicting a cup of chocolate milkshake (spinach juice) in the indulgent-consumption (healthy-consumption) condition. Participants reported their warmth and competence perceptions towards Jeannie on two warmth-related traits (warm/friendly) and two competence-related traits (competent/capable) on seven-point scales (1 = not at all, 7 = very much). Results show that participants perceived the blogger to be warmer when she posted about an indulgent consumption ($M_{indulgent}$ = 4.80) versus a healthy consumption ($M_{healthy}$ = 4.45; $F(1, 199)$ = 9.23, p = .003). There was no significant difference on competence perception ($M_{indulgent}$ = 4.53 vs. $M_{healthy}$ = 4.76; $F(1, 199)$ = 1.90, p = .17).

Study 2 tested whether consumers intentionally use indulgent consumption to signal warmth to others. Participants themselves meeting a new neighbor (warmth-signaling condition) versus a business supervisor (competence-signaling condition) at a café, and then indicated whether they would like to order a chocolate cake or a fruit salad. Results revealed that participants in the warmth-signaling condition were more likely to order a chocolate cake (68.00%) than those in the competence-signaling condition (50.00%; χ^2 = 6.70, p = .01).

Study 3 sought to investigate the underlying process. Participants viewed an ice-cream picture posted by Jeannie on Instagram. In the indulgent-consumption condition, the tagline read, "Double-Cream, Vanilla Ice-Cream. Indulge Myself: Life Is Sweet." In the healthy-consumption condition, the tagline read, "Sugar-Free, Non-Fat Ice-Cream. Go Healthy: Health is Wealth." The text read, "I had this ice-cream today. So yummy (healthy)! #indulgent (healthy)" in the indulgent-consumption (healthy-consumption) condition. Participants rated their warmth and competence perception of the blogger as in Study 1, and rated the authenticity of enjoyment ("I think Jeannie is truly enjoying this consumption," "I think Jeannie's behavior expresses her genuine preference," and "I think Jeannie pretends to enjoy something when in actuality she really doesn't" [reverse-coded]; 1 = strongly disagree, 7 = strongly agree; α = .87; adapted from Kernis and Goldman 2005). Results revealed that the blogger's warmth was rated higher in the indulgent-consumption condition ($M_{indulgent}$ = 5.25) than in the healthy-consumption condition ($M_{healthy}$ = 4.81; $F(1, 198)$ = 6.75, p = .01). There was no significant difference in perceived competence ($M_{indulgent}$ = 4.74 vs. $M_{healthy}$ = 4.59; $F(1, 198)$ = .63, p = .43). The blogger's enjoyment was perceived as more authentic in the indulgent-consumption condition ($M_{indulgent}$ = 5.18) than in the healthy-consumption condition ($M_{healthy}$ = 4.57; $F(1, 198)$ = 10.03, p = .002). A mediation analysis with 5,000 bootstrap samples revealed a significant mediation effect of perceived authenticity of enjoyment (indirect effect = .31, 95% CI = [.12, .54]).

Study 4 provided further support for our proposed underlying mechanism. We predicted that posting indulgent consumption no longer boosts warmth if the content was sponsored by the company, as it would not be considered authentic. Study 4 followed a 2 (consumption type: indulgent vs. healthy) × 2 (sponsorship: control vs. sponsored) design. In the indulgent (healthy) consumption condition, the tweet mentioned "I spent whole day watching movies and having fun (doing exercises and working out) in The Halifax Movie (Fitness) Week," and the picture depicted a group of people watching movies (doing exercises). An additional sentence of "Thanks @Halifax for inviting me. #ad #sponsored" was added for the sponsored conditions. In the control conditions, such information was not provided. In the control conditions, we replicated the results observed in previous studies. However, there was no difference in perceived warmth when participants knew the content was sponsored.

Study 5 sought to provide field evidence for our proposed effect. Engagement rate measures the average number of interactions (e.g., likes, comments, and sharing) per follower has with a social media account. As people tend to approach and interact with interpersonally warm others (Cuddy et al. 2007), an account's engagement rate should be positively correlated with the indulgence level of its contents. Our target influencers are the 155 most-followed Instagram food influencers listed on Feedspot.com. We extracted the engagement rate data of these influencers from Starngage.com. Engagement rate information from 60 influencers was not available, leaving 95 influencers in our analysis. We collected the screenshots of the 12 pictures on each account's first page and recruited 302 US participants to rate their perceived indulgence of the contents (1 = very healthy, 7 = very indulgent) of 10 randomly-selected screenshots. Our result revealed a significant positive correlation between the indulgence level of the content and engagement rate (r = .22, p = .03).

Our research offers important theoretical contributions and relevant practical implications. Theoretically, despite the prevailing negative view on indulgent consumption, our research shows a positive signaling effect of indulgent consumption. In terms of practical implications, our findings suggest that marketers can share contents about indulgent consumption on social media platforms if they want to establish a warm brand image.

The Impact of Societal Conditions on Migrants' Consumer Acculturation Prospects

Sonja N. Kralj, University of Augsburg, Germany
Michael Paul, University of Augsburg, Germany

EXTENDED ABSTRACT

In contrast to the variety of consumer identity positions and acculturation outcomes in extant research (e.g., Askegaard, Arnould, and Kjeldgaard 2005; Peñaloza 1994), scholars have recently started to focus on macro-conditions of consumer acculturation (Veresiu and Giesler 2018), but have in total painted a rather one-sided theoretical picture of the societal conditions in which consumer acculturation takes place. First, these conditions appear predominantly oppressive, as positively oriented or welcoming settings are less frequent. Researchers report outright oppression due to ethnicity or race (Oswald 1999; Peñaloza 1994), religion (Jafari and Goulding 2008) or social status (Üstüner and Holt 2007), open conflict due to a crumbling majority domination (Luedicke 2015), symbolic domination (Veresiu and Giesler 2018), or discrimination (Askegaard, Arnould, and Kjeldgaard 2005). Second, in many articles, this majority domination implies a lack of migrants' agency to counter this domination and to reach recognition (Chytkova 2011; Üstüner and Holt 2007; Veresiu and Giesler 2018). Third, the societal conditions in extant research seem temporally stable, as most theorizations resemble a temporal snapshot and do not address changes in the macro environment (Oswald 1999; Veresiu and Giesler 2018).

Taken together, prior consumer acculturation research paints a rather dire picture of immigrant consumer acculturation conditions, i.e., a picture where broader society dominates most migrant groups, where individuals almost inevitably fail to fulfil their dreams of market integration. Therefore, we seek to answer the following research questions: which broad conditions shape migrants' consumer acculturation prospects? Are there conditions in which migrants have better chances at successful consumer acculturation? Which societal spheres consitute these conditions?

In order to look for different societal conditions for consumer acculturation, we conduct a historical ethnographic analysis of ethnic German repatriate consumers from the former Soviet Union over 70 years. The ancestors of these migrants emigrated from Germany to Russia from the 18th century on, and their descendants have repatriated to Germany after World War II until today. This context suits our theoretical goals well, since on the one hand, these repatriates are similar enough to indigenes to resemble them in their appearance, names, legal status, and religion, but different enough in their consumer culture and language proficiency to be identified as a distinct migrant group which may encourage stigmatization in the form of labeling or discrimination. This context ist thus different from most researched contexts, in which globalization accounts for mostly labor-related migratory flows. Instead, it is based on an imagined community (Anderson 1983) and historic-ethnic path dependencies.

In line with process theorization (Giesler and Thompson 2016), we collected a macro-, meso- and micro-level data set which is rich and comprehensive enough to support our theorization of changing societal conditions for consumer acculturation. Our data set comprises 57 interviews (with repatriates, indigenes, and institutional representatives), 651 pieces of archival data (e.g., parliamentary proceedings, newspaper articles,), field data (e.g., 553 photographs and videos, 190 pieces of print field material such as advertising flyers, field notes from repatriate-related events), and netnographic data (e.g., 125 pictures and videos from Facebook, Instagram, Twitter, and YouTube). We conduct a social representations analysis with our data (Moscovici 1984). Social representations are "ways of world making" (Moscovici 1988, 231) which make something unfamiliar familiar by recreating reality (Moscovici 1984).

Our study reveals how societal representations of a migrant group change over time, producing four theoretically distinct consumer acculturation conditions for migrant consumers. Over our 70-year analytical period, our focal migrant group was welcomed by the receiving society (a condition we call *interest*), discriminated against and stigmatized (*inharmony*), fell into oblivion (*indifference*), and was recognized as making a societal contribution (*influence*). Three societal spheres are involved in constituting these conditions: the political sphere, the market sphere, and the public opinion sphere (comprised of mass media and indgenous consumers). We argue that most migrant groups face either of these four conditions at a time of study and may experience a switch from one condition to another in the wake of, for instance, political shifts, disruptive events such as terrorist attacks, changing hierarchies among migrant groups, or the public visibility of migrant celebrities.

As just argued, these conditions might be transferable to other migration contexts, but we are cautious about whether the dynamics of this case apply to others without caveat. Future research should examine this. Also, it might be that there are more societal conditions beyond the four that we find. Besides, future research may look at individual-level acculturation in the case of repatriate migrants, as literature has not looked this migration pattern yet. Several non-academic stakeholders find value in our research, too. First of all, it provides local policy-makers a complete picture of the dynamics at work in terms of repatriates' acculturation, which helps them to consider migrants adequately in terms of legislation, assistance programs, and so on. Second, as findings show indigenes' knowledge on repatriates' background is low, we suggest to include it in history lessons in school. On a bigger scale, our study is relevant also for policy-makers in other countries who are currently in the process of inviting their emigrants back or will do so in the future. Our insights shall serve as a reminder not to have too high expectations and to frame their communications accordingly. Furthermore, the research informs marketers active within the repatriate marketplace how this marketplace is viewed by indigenous consumers and thus allows them to reflect upon their offerings.

A Natural Fit: Exposure to Nature Influences Regulatory Focus

Hajar Fatemi, University of Windsor, Canada
Jing Wan, University of Guelph, Canada

EXTENDED ABSTRACT

Rapidly growing modern cities, provide limited contact with natural environments (Shanahan et al., 2015). Decades of research suggest that exposure to nature—whether in the form of hiking in a forest, strolling through a neighborhood park, or merely looking at pictures of nature—can influence people's physical and psychological health (Berto, 2005; Hartig et al., 2003; Berman et al. 2008). While much is known about how exposure to nature can benefit individuals' psychological and physical health, relatively little is known about how exposure to nature can influence psychological states such as motivational state, i.e., regulatory focus (Higgins, 1997).

Nature creates an opportunity for individuals to think outside the box of their day-to-day responsibilities, routines and social obligations, which are typically associated with prevention-focused motivational states (Kaplan, 1995; Lee et al., 2000; Kaplan & Kaplan, 1989). Simultaneously, sensing the presence of something greater than self, exposure to nature encourages individuals to think beyond themselves, their possessions, and their familiar local environment and experience more cognitive creativity, flexibility and abstract thinking (Basu et al., 2019; Joye et al., 2020; Shiota et al., 2007; Friedman & Forster, 2002; Forster & Higgins, 2005). Accordingly, we posit that being in nature reduces prevention-oriented focus and improves promotion-oriented focus. We argue that the feeling of being away and distancing oneself from daily life is the mechanism for to the decrease in prevention focus, whereby people can shed the need to vigilantly monitor their surroundings and concern themselves with their obligations. Concurrently, exposure to nature would lead to an increase in promotion focus, whereby people are able to focus on something beyond their own lives and their self-centric view.

The results of four studies provided support for our predictions. In studies 1a and 1b, we examined the main effect of exposure to nature on the regulatory focus of individuals. In study 1a, the participants either searched for nature-related words (e.g., river, sun, flower) or non-nature related words (e.g., machine, tools, factory) in a word-puzzle. As a measure of regulatory focus, participants were requested to indicate how concerned they would be about avoiding negative outcomes and achieving positive outcomes if they were invited to talk in a meeting (task adapted from Pennington & Roese, 2003). We found a significantly lower relative level of concerns for avoiding negative outcomes versus achieving positive outcomes in the nature condition (M_{Nature}=.44, SD= 1.45, $M_{Control}$=.04, SD= 1.43, $F_{(1,210)}$ =3.96, p=.04). In Study 1b, participants saw either nature pictures (e.g., mountains, lakes, trees; adapted from Berman et al., 2008) or screen-filled images of solid colors. As a measure of regulatory focus, participants were asked to write about one of their goals in life and indicate if they were focusing more on achieving positive outcomes or avoiding negative outcomes regarding that goal (task adapted from Bullard & Manchanda, 2017). Our results showed that the participants in the nature condition were significantly less concerned about avoiding negative outcomes and more concerned about achieving positive outcomes in pursuing their life goals (M_{Nature}= 2.36, SD=1.66, $M_{Control}$= 2.82, SD=1.91, $F_{(1,270)}$ =4.57, p=.033), suggesting a shift toward relatively stronger promotion-focus and weaker prevention-focus.

Study 2 examined the mechanism behind the effect of exposure to nature on regulatory focus. Additionally, we used more mundane images of nature (e.g., foliage, front lawn, blades of grass) versus solid colors. As a measure of how removed participants felt from their daily life, we adapted scale items from the measure of "being away", a subcomponent of attention restoration (Payne & Guastavino, 2018). We found (using the same measure as in Study1b) that the participants who watched the nature video were significantly less focused on avoiding negative outcomes and more focused on achieving positive outcomes (M_{Nature}=1.38, SD= 1.82, $M_{Control}$=2.56, SD= 1.87; $F_{(1,98)}$ =3.17, p=.049). As expected, participants felt more removed from their daily life after watching the nature video compared to the color videos (M_{Nature}= 4.95, SD= 1.46, $M_{Control}$= 4.05, SD= 1.67, $F_{(1,98)}$ = 8.06, p=.005) and this feeling mediated the impact of the conditions on regulatory focus (indirect effect=-.098, SE=.05, $LLCI$=-.23, $ULCI$=-.007, with 95% confidence interval).

Study 3 tested the boundary condition of reminders of daily routines. Participants viewed a series of nature pictures (similar to study 2) or pictures of everyday household products (e.g., table, coffee maker). They were instructed to either look at the images or to imagine maintaining what was depicted in the picture (e.g., maintaining the lawn vs. maintaining a kitchen appliance). As a measure of regulatory fit, we adapted a task from Mogilner et al., 2008 and asked participants to evaluate an either promotion or prevention-focused message. In the no-maintenance condition, the participants in the nature condition showed less favorable attitudes towards the prevention-focused message compared to the participants in the everyday products condition ($M_{Prevention-Nature}$=6.06, $M_{Promotion-Nature}$=6.82, $F_{(1,203)}$ =5.32, p=.022). However, the difference between the attitudes of participants in the nature and the everyday products conditions towards the promotion-focused message was only marginally significant ($M_{Prevention-Everyday}$=6.86, $M_{Promotion-Everyday}$=6.24, $F_{(1,203)}$ =2.75, p=.098). In the responsibility condition, we found no difference between the attitudes of participants towards the prevention and promotion-focused messages across two conditions ($M_{Prevention-Nature}$=6.46, $M_{Prevention-Everyday}$=6.15, $M_{Promotion-Nature}$=6.26, $M_{Promotion-Everyday}$=6.51, $F_{(1,205)}$ =1.26, p=.26). These results suggest the decrease in fit with the prevention-focused message and the increase in fit with the promotion-focused message was due to nature drawing people away from their daily responsibilities and obligations. When the reminder of daily routines was salient, the effect of nature on regulatory focus was attenuated.

Our research is the first, to our knowledge, to identify the impact that exposure to nature has on consumers' motivational orientation, and we provide evidence for the mechanism behind this effect. The findings of this research contribute to the current literature on situational regulatory focus (e.g., Higgins, 2002; Mourali & Pons, 2009; Bullard & Manchanda, 2017) by identifying a novel context in which situational regulatory focus may be cued—namely, natural settings.

Mask Colors and Trustworthiness

Shubin Yu, Peking University HSBC Business School, China
Changxu Li, Peking University HSBC Business School, China

EXTENDED ABSTRACT

Due to the rapid spread of COVID-19 throughout the world, many of the Centers for Disease Control asked citizens to wear face coverings (masks) to prevent the spread of the virus and protect themselves. Therefore, wearing a mask (in particular, a medical mask) has become the new normal since the outbreak of COVID-19 will probably last for a longer period than previously expected (Kissler et al., 2020).

People wear a mask when going out. Service providers like salespeople and flight attendants also wear masks when providing services. Imagine that you go to a supermarket for a bottle of wine. A supermarket employee wearing a yellow mask approaches you and offers you some suggestions. Will the color of the mask influence your perception of that employee?

Although masks have been used for a long time, the influence of the color of masks remains unknown. One possible assumption of mask color effects is that color itself can affect people's feelings. Previous studies have already found that colors affect individuals' emotions and behavior (Valdez and Mehrabian 1994). For example, longer wavelength colors (e.g., red) are perceived as arousing, while shorter wavelength colors (e.g., blue) are perceived as relaxing (Nakshian 1964).

An alternative explanation is that particular colors may trigger a process of feeling transfers. People often observe healthcare professionals wearing a mask in blue, white, and green. Therefore, they tend to associate trustworthiness with masks in these colors. Therefore, when people see somebody wearing a mask in regular colors, they may transfer the positive feeling from healthcare professionals to that person. As a consequence, they may perceive people whose masks are in regular colors as being more trustworthy. Hence, we examined how mask colors influence a person's trustworthiness and the rationale behind such effects.

Generally, researchers found that cool colors can increase positive feelings, credibility, and trust. In a shopping context, consumers exhibit a more positive feeling and higher purchase intention in blue (vs. red) retail environments (Bellizzi and Hite 1992). Cool colors have also been confirmed to have positive effects on trust in e-commerce (Lee and Rao 2010).

Based on the aforementioned literature, we may conclude that masks in cool colors may increase one's perceived trustworthiness. However, when the color is associated with masks, predictions simply built on the "cool-color effect" theory may seem to be too naïve. We expect particular mask colors to increase trust because of evaluative conditioning and trust transfer.

Based on the associative learning theory (Martin and Levey 1978), and trust transfer theory (Stewart 2003). We posited that the mask color will affect an individual's perceived trustworthiness toward a person. In this context, the third party are the masks in regular colors. People may trust others wearing a mask in regular colors, compared with those who wear a mask in irregular colors. The figure illustrates the trust flow from the trustworthy group to the trustee. Points A, B, and C indicate 3 important paths. The trust flow can proceed from the trustworthy group (i.e., doctors) to the trustee only when 3 prerequisites are met:

A) A person wears a mask in regular colors.
B) People trust healthcare professionals.
C) People associate masks in regular colors with healthcare professionals.

As such, we assume that a person wears a mask in regular colors (i.e., blue, white, and green) are perceived to be more trustworthy than in irregular colors (prerequisite A). However, this effect vanishes when the trustor shows a lower trust in healthcare professionals (prerequisite B) and when people associate masks in irregular colors with healthcare professionals (prerequisite C).

Through four studies, this research reveals that the color of masks has an effect on people's perception of trustworthiness based on the evaluative conditioning theory and trust transfer theory. Wearing masks in regular colors can increase one's perceived trustworthiness. However, this main effect is moderated by the degree of trust in healthcare professionals an consumers' association of particular mask colors and healthcare professionals. The mask color effect disappears when one shows a lower trust in healthcare professionals and when participants were primed that healthcare professionals are associated with irregular colors. Furthermore, the effect of mask colors is not influenced by the similarity between the trustee's profession and the trust group's profession. In other words, similarity does not assist the process of trust transfer.

This study makes several contributions to the literature. First, this research uncovers the underlying mechanism of how the mask colors affect one's perceived trustworthiness. We proposed and confirmed a detailed model of the trust flow based on the evaluative conditioning theory and trust transfer theory (Martin and Levey 1978; Förderer and Unkelbach 2011). If people trust a certain group of people, they tend to associate trust with particular symbols possessed by the group. Individuals who display those symbols are also perceived as more trustworthy. We further confirmed the three prerequisites of the trust flow. Only when these three prerequisites are met can the trust flow proceed from the original group to the trustee.

Second, the current research explores whether the trust transfer process is easier when the trustee (service providers) possesses similar features with a trustworthy group (healthcare professionals). However, the similarity does not enhance the trust transfer process. This implies the proposed trust flow model is valid across two service types, which increases the generalizability of the trust transfer theory. Previously, the trust transfer theory was mainly applied to the e-commerce context (Stewart 2003; Stewart 2006; Lu et al. 2011).

These research findings also provide insightful managerial implications. For the service sector where service providers are required to wear masks, instead of using consumers' service evaluation. For government or other organizations, officers should be advised to wear a mask in regular colors in public. This can increase their trustworthiness. For example, a spokesperson from the local municipal who advocates a certain social distancing policy may put on a mask in white or blue to increase the persuasive power of his/her initiative.

Delivery of Material Aid: Effects of Aid Restrictiveness on Perception of Justice and Satisfaction Among Consumers of Varying Power Levels

Nea North, University California-Irvine, USA
Connie Pechmann, University of California, Irvine, USA

EXTENDED ABSTRACT

Sudden, traumatic events can cause individuals to temporarily face resource scarcity — a discrepancy between current resource levels and more favorable levels (Cannon et al., 2018). In fact, within months of the COVID-19 pandemic, 40 million+ unemployment-benefit claims were filed in the U.S. (Morath, 2020) turning a health crisis into an economic crisis. Furthermore, about 23% of U.S. households lacked the resources necessary to get enough food compared to 16% during the Great Recession (DeParle, 2020).

To help individuals facing scarcity, government (e.g., Food Stamps) and charity programs (e.g., Feeding America) have been built to provide security. However, it remains unclear how the type of aid provided can be optimized to improve the program's impacts on beneficiaries. Researchers have investigated the advantages and disadvantages of delivering different forms of aid on outcomes like program costs and goals (Sabates-Wheeler and Devereux, 2010; Margolies and Hoddinott, 2014), but little research has examined perceptions or satisfaction of the beneficiaries. Yet, regulatory strategies often impose restrictions on the beneficiaries of the aid, and these may have an impact on beneficiaries.

Thus, this research proposes that offering restrictive aid that reduces recipients' ability to select a preferred course of action (Inesi et al., 2011), such as giving them less freedom of choice in the items received, will negatively impact their perception of justice — perceived impartiality in the procedures and processes used to arrive at distribution outcomes (Namasivayam and Mount, 2006), and aid satisfaction — when a product meets the individual's desires and expectations (Spreng et al., 1996). Moreover, when there is a state of powerlessness due to an imbalance in the marketplace, consumers become vulnerable (Baker et al., 2005). Thus, we propose these effects will only occur for the most vulnerable consumers in low power positions, either financially (e.g., unable to pay bills) or interpersonally (e.g., subservient in an exchange).

We examined three forms of aid: in-kind meaning goods or services, cash transfers meaning cash or pre-paid cards, and near-cash transfers meaning vouchers to purchase specific products, and we find support for these propositions in controlled lab experiments, including one involving COVID-19, and a field experiment at a food pantry, which are discussed below. In total, six studies were conducted to test our Hypothesis. In all our studies, individuals were in a resource scarce context where they faced material hardship.

The first two studies focused on examining the effects of aid restrictiveness on satisfaction. Study 1a manipulated the restrictiveness of the aid offered with two levels: more restricted versus less restricted in-kind aid. Study 1b manipulated aid restrictiveness using cash versus voucher aid. Study 2 was our field experiment in a food pantry, and it manipulated aid restrictiveness. The final three studies examined consumers' level of power as a moderator while continuing to examine the impact of aid restrictiveness on satisfaction. Study 3 introduced measured financial power as a moderator. Study 4 examined those financially impacted by COVID-19 and introduced the perception of justice as a mediator. Lastly, Study 5 manipulated interpersonal power as a moderator with the perception of justice as a mediator

Together, this research finds that increasing aid restrictions decreases an individual's perception of justice and satisfaction, and the perception of justice mediates satisfaction, with beneficiary power as a key moderator. We studied both financial and interpersonal power and find consistent moderating effects. For vulnerable individuals, offering aid that is more restrictive decreases satisfaction, and this is mediated through the perception of justice.

Our research has important implications for the consumer power, justice, and satisfaction literatures, and it adds to the research on the advantages and disadvantages of different forms of aid delivery. This research also provides meaningful managerial insights for organizations by illustrating the benefits of providing vulnerable individuals with less restrictive aid that allows them to make their own consumption choices and empowers them. Overall, our work sheds light on how organizations can be more effective in holistically helping individuals in need.

Based on our findings, a number of programs need to examine their current process for delivering aid. For example, charity programs should examine their aid restrictions and also closely look at the exchange relationships between employees with aid beneficiaries. Ultimately, organizations need to consider this: If aid restrictiveness makes people perceive less justice and reduces satisfaction, is the aid truly holistically helping those in need?

Is Older Brand More Moral? The Impact of Brand Age on Consumers' Perception of Brand Moral Identity

Yiran Jiang, Zhongnan University of Economics and Law, Wuhan, China
Lan Xu, Wuhan University, China
Nan Cui, Wuhan University, China

EXTENDED ABSTRACT

Although many brands attempt to enhance their brand image by engaging in corporate socially responsible (CSR) behaviors, not all brands can receive positive response from consumers. Since CSR context is a business context involving morality, in which consumers' perception of brand morality will have important impact on their brand attitude. Studies have shown that some inherent attributes of a brand, such as brand image, reputation, or brand personality affect consumers' perception of brand morality. In this research we theorize and demonstrate a new brand attribute that influence consumers' perception of brand morality: brand age. Specifically, we argue that brand age would affect consumers' perception of brand moral identity (BMI), and we show that this effect is mediated by consumers' perception of brand long-term orientation (LTO). We also examined the impact of brand age and BMI on consumer brand attitudes in CSR context

Brand age is the duration of the brand's existence from its establishment. As an inherent attribute, brand age represents the position in its life cycle, which plays an important role in the formation of consumers' brand recognition and attitude (Zhang, Kashmiri, & Cinelli, 2019). Although brand age may often be associated with aging, obsolescence or outdating (Lehu, 2004), many old brands take their age as an advantage, emphasizing their age in brand introductions and stories to make consumers feel that the brand is strong, enduring and trustworthy (Guillory, 2013; Zhang et al., 2019). For example, Tissot includes "Since 1853" in its brand logo.

To explore the influence of brand age on consumers' perception of brand, we introduced the moral identity theory to explore the relationship between brand age and brand moral identity (BMI). According to the research on personal moral identity (Aquino & Reed, 2002; Reed, Aquino, & Levy, 2007) and organizational moral identity (Matherne, Ring, & Farmer, 2018), we define BMI as consumers' perception of brand's moral characteristics. Consumers tend to infer that brands with stronger BMI will engage in more moral behaviors.

We argue that consumers' perception of BMI will be affected by brand age. First, older brands have formed steadier market foundation for a long time, indicating that their behaviors, concepts and moral standards are accepted by consumers to a greater extent (Erdem & Swait, 1998). Second, the long-term development of a brand relies on its good moral reputation and image (Bendixen & Abratt, 2007; Brunk, 2012; Sierra, Iglesias, Markovic, & Singh, 2017). From this perspective, older brands are more likely to maintain a consistently good brand image in terms of morality.

In addition, we argue that the above effect of brand age on BMI is mediated by consumers' perception of the brand's long-term orientation. Long-term orientation (LTO) is defined as a cultural value that views time holistically (Bearden, Money, & Nevins, 2006). Individuals with LTO will value both the past and the future, respect tradition, value the long-term development, care less about the immediate interests, work hard for future interests and perseverance (Bearden et al., 2006). LTO can be used as one of the brand's strategic orientations (Wang & Bansal, 2012), which can be perceived by consumers through brand behaviors and concepts.

We propose that brand age would affect consumers' perception of brand's LTO. First, consumers may tend to perceive that older brands with longer brand history are more tradition-conscious (Urde, Greyser, & Balmer, 2007). Second, the values of older brands would be perceived by consumers as more continuity and inheritance (Hudson & Balmer, 2013; Urde et al., 2007). Consumers tend to believe that older brands would pay more attention to their long-term development and long-term goals in the future. Third, older brands could survive in the fierce market competition, which means that they have stronger survivability and long-term perseverance (Guillory, 2013; Zhang et al., 2019). Hence, consumers may perceive that older brands have stronger LTO.

Previous studies have shown that individuals with stronger LTO will pay more attention to the long-term impact of current behaviors (Bearden et al., 2006), value future interests and social responsibility (Singhapakdi, Karande, Rao, & Vitell, 2001), and less engage in behaviors that violate morals and ethics (Nevins, Bearden, & Money, 2007). Therefore, consumers tend to think that a brand with stronger LTO will engage in more moral behaviors, and have stronger BMI.

In addition, we argue that brand age, as an important factor affecting BMI, would also affect consumers' brand attitude in the CSR context. According to our theory, consumers perceive that older brands have stronger BMI and engage in more moral behaviors, older brands' CSR activities are consistent with consumers' expectations. Consumers will enhance the altruistic attribution of the brands' behaviors (Rifon, Choi, Trimble, & Li, 2004), and therefore enhance brand attitudes. On the contrary, younger brands with weaker BMI engaging in CSR behavior may cause consumers to question their motives (Barone, Miyazaki, & Taylor, 2000; Chang & Cheng, 2015; Elving, 2013), which is not conducive to improving consumers' attitudes towards the brand.

In order to verify the hypothesis proposed, we conducted a total of three experimental studies and one second-hand data study. Specifically, studies 1 test the influence of brand age on consumers' perception of brand moral identity. Study 2 examined the mediating role of brand long-term orientation. Study 3a and 3b tested the downstream effects of brand age and BMI on consumers' brand attitudes in the context of CSR through experiment and second-hand data, respectively.

The theoretical model and empirical results of the current research enrich the existing research and literature in the related fields. Moreover, this research also provides guidance for the work of brand managers and marketers.

Our research has some limitations. We did not explore boundary conditions of the brand age effect in moral context, leaving gaps for future research. In addition, future research can expand research context (i.e. field experiment) further.

The Effect of Powerlessness on Preferences for Free-From-Products

Lijun Zhang, Nanyang Technological University, Singapore
Elaine Chan, Nanyang Technological University, Singapore

EXTENDED ABSTRACT

Going gluten-free and dairy-free are popular nowadays. Such products are often categorized into free-from-products (FFP), which refer to products that are purposely made to remove ingredients or materials that include allergens (Priven et al. 2015). Interestingly, the increasing demand for FFP is largely driven by tolerant consumers who do not have known allergic reactions (Volta et al. 2013). This research intends to identify one psychological factor—power that drives tolerant consumers' demand for FFP. Power is defined as "asymmetric control over valued resources in social relationships" (Magee and Galinsky 2008). According to approach/inhibition theory, the powerful pay attention to rewards in the environment and adopt approach strategies (Keltner, Gruenfeld, and Anderson 2003). In contrast, the powerless are sensitive to possible threats in the environment and adopt inhibition strategies (Anderson and Berdahl 2002). This sensitivity to threats in the environment is particularly relevant to FFP, because FFP are to reduce the potential risk of allergic reaction. We propose that as the powerless (vs. powerful) are generally more sensitive to threat, they might also perceive greater health threats posed by allergens, which drives their preference to FFP. Formally:

Hypothesis 1: *Feeling of powerlessness increases consumers' preferences towards FFP.*

Hypothesis 2: *The effect of powerlessness on the preference for FFP is mediated by the heightened perceived health threats.*

To provide support to our Hypothesis, we conducted six studies. Study 1 aimed to test H1. Participants (N=170, MTurk) were asked to imagine being either a team leader (*high power*) or a team member (*low power*). Participants then indicated their preference between a classic (1) and a gluten-free (7) muffin. As predicted, results showed that the powerless (*M*=2.49) preferred the gluten-free muffin more than the powerful (*M*=1.92; $F(1,168)$=4.49, *p*=.04). Study 2 aimed to rule out the status signaling account as the powerless might use the more expensive FFP to compensate for their lack of power (Rucker et al. 2012). This study (N=178, Mturk) used the same design as in study 1 except that the consumption setting was in private (i.e., alone at home). Results again showed the powerless' preference for FFP ($M_{low-power}$=2.98 vs. $M_{high-power}$=2.28; $F(1,176)$=5.10, *p*=.03), suggesting that signaling is less likely to drive our effect.

Study 3 tested the alternative account that the powerless prefer FFP because they perceive FFP to be healthier. In this study (N=221, MTurk), participants imagined being a boss (*high power*) vs. an employee (*low power*). Next, they were asked to choose between a *whole-wheat* blueberry muffin and a *gluten-free* blueberry muffin. The whole-wheat muffin was pretested to be healthier than the gluten-free muffin. Despite being a less healthy option, results found that the powerless (24.8%) were more likely to choose the gluten-free muffin (vs. whole-wheat muffin) than the powerful (14%; β=.71, Wald-χ^2 (1)=3.91, *p*=.04). Hence, our results are less likely to be driven by the powerless' preference for healthy food.

Study 4 included a control condition (without any power manipulation) to demonstrate whether the powerful or the powerless is driving the effect (N=369, MTurk). We manipulated power by a scrambled words task (Smith and Bargh 2008). Participants were then asked to choose between a classic and a gluten-free pretzel and answer questions about perceived health threats. Results revealed that participants in the low power condition (29.6%) were more likely to choose the gluten-free pretzel than those in the control (16.2%) and high power condition (18.1%; $\chi^2(2)$=7.66, *p*=.02), suggesting that our effect was driven by the powerless' preference for FFP. Further, in support to H2, our effect was mediated by perceived health threats.

Studies 5 and 6 aimed to test our mechanism. We argue that the powerless perceive more health threats and hence adopt an inhibition strategy by consuming FFP. However, prior research has shown that powerless individuals shift their attention to potential rewards and no longer pursue inhibition strategy when the power is perceived to be unstable (i.e., when the power position can be changed, Kim, Shin, and Lee 2017) or illegitimate (i.e., when the power is acquired unfairly, Lammers et al. 2008). As such, their preference for FFP should also be attenuated. We examined these boundary conditions in studies 5 (unstable power) and 6 (illegitimate power).

Study 5 used a 2 (high vs. low power) × 2 (stable vs. unstable) design (N=281, students). Participant were assigned to be a superviosr (*high power*) or a subordiante (*low power*) in a business simulation task. We manipulated stability in a practice trial. Participants were told that their role would remain unchanged regardless of their performance in the practice trial in the *stable condition* (vs. might change depending on their performance in *unstable condition*). Next, they indicated their preference between a cucumber fragrance (1) and a fragrance-free (7) facial wash. We found a significant interaction between power and stability ($F(1, 263)$=5.60, *p*=.01). When power was stable, the powerless preferred the fragrance-free facial wash more than the powerful ($M_{low-power}$=5.24 vs. $M_{high-power}$=4.61; *p*=.04). In contrast, power did not influence their preference in unstable condition (*p*=.17).

Study 6 used a 2 (high vs. low power) × 2 (legitimate vs. illegitimate) design (N=271, students). Participants imagined being a group leader (*high power*) or member (*low power*) in a class project. They were told that the leader was assigned because the person was the most capable in the *legitimate condition* (vs. because the person's surname ranked first in an alphabetical order in the *illegitimate condition*). The dependent measure was the same as in study 5. Results revealed a significant interaction between power and legitimacy ($F(1, 266)$=6.68, *p*=.01). When power was legitimate, we replicated our earlier findings ($M_{low-power}$=5.19 vs. $M_{high-power}$=4.59; *p*=.04). However, the effect was attenuated when power was illegitimate (*p*=.10).

Taken together, we obtained consistent evidence that the feeling of powerlessness increases consumers' preference towards FFP. This research sheds light to food consumption literature by demonstrating experimentally what drives people to purchase FFP besides medical requirements. We also extend our understanding of powerlessness, which is often understudied in the literature. Finally, we provide practical implications to both policy makers and marketers on what drives the increasing demand of FFP.

Fresh Start Cues Increase Consumer Preferences for Formal Stimuli

Zhenyu Jin, University of South Carolina, USA
Xiaojing Yang, University of South Carolina, USA
Yanfen You, University of Massachusetts Amherst, USA

EXTENDED ABSTRACT

Consumers often experience fresh start occasions (e.g., the outset of a new week/month/ year, changing jobs, moving to a new city), making them want to "make a new start, get a new beginning, and chart a new course in life, regardless of their past or present circumstances" (Price et al. 2018, 21). Moreover, fresh start cues (e.g., ads, pictures, quotes) are omnipresent in consumers' day-to-day lives. For example, universities (e.g., Harvard University 2018) remind their students about "a new semester, a fresh start" at the beginning of semesters; brands and firms encourage consumers to make a fresh start by purchasing their updated arrivals (e.g., the email campaign "Start Fresh with Winter Neutrals" by *Le Creuset*, Milled 2021). Due to the frequency of fresh start cues that people may encounter, we examine and find that fresh start cues can influence consumers' subsequent preference for objects that elicit different styles. Specifically, drawing from the literature on fresh start (Price et al. 2018), meaning in life (Rudd, Catapano, and Aaker 2019), and perceptions of formality (Hannover and Kühnen 2002), we propose that fresh start cues activate consumers' meaning-seeking motives, which in turn lead them to seek out products or activities that elicit formal (vs. casual) styles.

In Study 1, we first asked participants to evaluate either ten fresh start quotes (e.g., "Whatever their past, people can look forward to a fresh start;" the fresh start condition) or ten quotes selected at random (e.g., "Color is a power which directly influences the soul;" the control condition). Secondly, in a seemingly unrelated part, we asked participants to help us pretest some reading materials by choosing their interested article from two alternative topics: one was about "formal lifestyle," and the other was about "casual lifestyle." Afterward, participants read their selected article to complete the survey. The results showed that participants in the fresh start condition chose greater proportion of the article about formal (vs. casual) lifestyles to read than those in the control condition.

Study 2 provides additional evidence that fresh start cues increase consumer preferences for formal stimuli. In the fresh start manipulation, we provided participants with a paragraph which framed Monday as either a fresh start of the week (the fresh start condition) or an ordinary day of the week (the control condition). Afterward, we asked participants to make decisions in three scenarios, each of which included a pair of product alternatives—one was more formal, and the other was more casual (e.g., "Imagine that you are shopping in an outfit store and deciding on which shirt to buy: a dress shirt vs. a button-down shirt."). The results showed that participants in the fresh start condition chose greater proportion of formal (vs. casual) clothing than those in the control condition, replicating our previous findings.

Employing a more conservative fresh start manipulation (fresh start vs. start) and a different choice scenario, Study 3 provides evidence that the observed effect is mediated by consumers' meaning-seeking motives. Specifically, in the fresh start (vs. start) condition, we provided participants with a set of visual ads containing reminders of fresh start (vs. start). For example, one of the visual ads showed in the fresh start condition advertised a financial program: "*Fresh Start* Program. Apply Now and Begin Your *Fresh Start*;" such an ad presented in the start condition became "*Let's Start* Program. Apply Now and Begin Your Program." Next, in a seemingly unrelated part, we asked participants to imagine that they were making up their minds to choose a virtual book club to join—one was a more casual book club, and the other was a more formal book club. Afterward, we measured participants' meaning-seeking motive by asking them to rate on a four-item, seven-point Likert scale (e.g., "I want to do something that gives me a sense of meaningfulness/ importance/significance/ seriousness;" adapted from Crumbaugh and Maholick 1964; Park and Folkman 1997). The results replicated our previous findings by showing that participants in the fresh start condition chose greater proportion of the formal book club than those in the start condition. More important, the mediation analyses (Hayes 2017) yielded a significant indirect effect, indicating that meaning-seeking mediated our proposed effects.

Study 4 examines consumers' behavioral intentions after being exposed to fresh start cues. We demonstrated that there was a matching effect between fresh start cues exposure and formal stimuli. That is, when consumers encounter fresh start cues and evaluate formal stimuli (the matching situation), their subsequent reaction was affected in a positive way (e.g., showing more favorable attitude toward the stimuli); however, when consumers are exposed to fresh start cues and evaluate casual stimuli (the mismatching situation), their downstream responses are affected in a negative direction.

Our research contributes to the fresh start literature by demonstrating that reminding consumers about fresh start can systematically increase their preferences for formal (vs. casual) stimuli. Moreover, this research adds to the research on consumer lifestyles (Holt 1997) and aesthetics (Patrick and Peracchio 2010) by examining the frequently-encountered yet hitherto-untested dominion—formalness versus casualness—that consumer often weight up in decision-makings. Additionally, providing an empirical examination showing that consumers' meaning-seeking motive can be activated via simple situational cues and can further impact consumers' subsequent consumption preference, our work contributes to the literature on meaning in life (Baumeister and Vohs 2002), which is considered facilitative in consumer self-transcendence, thereby enriching the transformative consumer research (Mick 2006).

Attribute Conditioning in Brand Image Creation: Single versus Multiple Attributes

Lisa Eckmann, Goethe University Frankfurt, Germany
Fabia Högden, University of Cologne, Germany
Jan R. Landwehr, Goethe University Frankfurt, Germany
Christian Unkelbach, University of Cologne, Germany

EXTENDED ABSTRACT

Brand associations and brand attitude are critical components of a brand image which in turn is a crucial determinant of brand equity (Aaker 1996). While a body of research has examined how brand attitude can be positively influenced to create a favorable brand image (e.g., Sweldens, Van Osselaer, and Janiszewski 2010), the examination of the formation of concrete brand associations has received less scholarly attention in the brand management literature. In particular, the current brand management literature does not offer a comprehensive empirical framework that allows to systematically investigate the formation of brand associations, which inhibits research on how to create a distinct and unique brand image effectively.

Recent work in psychology has offered attribute conditioning as a potential mechanism to explain how semantic associations are transferred from one stimulus to another, and thus an approach for the formation of brand associations (Förderer and Unkelbach 2014). Attribute conditioning refers to the change in a stimuli's (conditioned stimulus; CS) assessment regarding a specific attribute after having been repeatedly paired with another stimulus (unconditioned stimulus; US) that possesses this attribute (Förderer and Unkelbach 2015). Attribute conditioning has been shown to be robust across a variety of stimuli (Förderer and Unkelbach 2011, 2014, 2015). Similar to the related evaluative conditioning paradigm (Sweldens et al. 2010), the underlying learning mechanism of attribute conditioning is associative in that an enduring referential link between the CS and the US is formed in memory (stimulus-stimulus learning; Förderer and Unkelbach 2016; Unkelbach and Förderer 2018).

Empirical research on attribute conditioning in a multi-attribute context where the US simultaneously possessed several attributes showed that only the attribute that was primed to be more accessible was conditioned (Förderer and Unkelbach 2014). Extending this finding, we examine attribute conditioning when CSs are paired with multiple USs that possess only one salient attribute each without imposing any attribute dominance. In particular, we hypothesize that pairing a CS with multiple USs that differ in their salient attributes versus one US with a single salient attribute should weaken the associative link between the CS and each US such that the assessment of the CS regarding each attribute will be weaker compared to the single-attribute case (H1). Additionally, we expect this effect to be more pronounced for uncorrelated (athletic and smart; pretested correlation $r = .05$) than for correlated attributes (athletic and healthy; pretested correlation $r = .58$; H2).

In study 1, 185 participants from MTurk completed an online study with a 2 (CS paired with athletic USs: yes vs. no) by 2 (CS paired with smart USs: yes vs. no) within-subjects design with two stimulus replicates per condition. As CSs, eight of 14 neutral brand logos from Henderson and Cote (1998) were randomly chosen for each participant. As USs served four images showing individuals engaging in sport and four images showing individuals in a laboratory or educational context. Participants watched a slideshow in which two CSs each were individually paired four times with an athletic US, with a smart US, alternately with an athletic and smart US (four times per attribute), or shown without a US. Participants then evaluated the eight CSs regarding athleticism (1 = not at all athletic, 101 = very athletic; participants only saw the verbal anchors of the scale) and smartness (1 = not at all smart, 101 = very smart) in counterbalanced order, and then regarding liking (1 = not at all likable, 101 = very likable). Linear mixed models (West, Welch, and Galecki 2015) indicated significant main effects for both attribute ratings and a significant interaction effect for the athleticism rating. Post hoc tests indicated that logos paired only with athletic (smart) USs had significantly higher athleticism (smartness) ratings compared to logos paired with both attributes, which supports H1.

In study 2, the experimental setup was identical to study 1 except that the logos paired with multiple attributes were now shown only four times instead of eight times (i.e., twice with an athletic US and twice with a smart US) to hold the number of CS presentations constant across conditions. The same pattern of results as in study 1 emerged.

In study 3, we again used the experimental setup from study 1 but substituted the attribute smart with the attribute healthy (the USs were images of vegetables) and the smartness rating with a healthiness rating (1 = not at all healthy, 101 = very healthy). For the athleticism rating, the pattern of results from studies 1–2 replicated. For the healthiness rating, we found significant main effects and a significant interaction. Post hoc tests indicated no significant difference in the means of logos paired with the attribute healthy only and logos paired with both attributes, which supports H2.

In sum, our findings provide evidence that attribute conditioning is a robust and powerful mechanism for establishing brand associations. Importantly, we demonstrate that its effectiveness in a multi-attribute context depends on the relationship between attributes. For marketers, this implies that investing in a marketing campaign that features one attribute in all advertisements is likely to generate stronger brand associations than alternating between two uncorrelated attributes. Likewise, doubling the advertising budget to include two uncorrelated attributes does not proportionally increase brand assessments and it seems to be a more efficient budget allocation to focus on a single attribute instead. If attributes are correlated, however, a campaign featuring a mix of two attributes may increase in efficiency.

The Potential Downside of Being Dubbed "Insta-worthy"

Jianna Jin, The Ohio State University, USA
Xiaoyan Deng, The Ohio State University, USA
Rebecca Reczek, The Ohio State University, USA

EXTENDED ABSTRACT

As the customer journey becomes more social (Hamilton et al. 2021), influencers occupy an increasingly important part of many consumers' decision processes. However, no research to our knowledge has investigated how influencers' descriptions of a brand can affect customer response. While the social-media savvy influencers often focus on the Insta-worthiness of the places, brands, and events they post about (e.g., using hashtags like #instagramhub), our work examines when and why such explicit description of a brand as Insta-worthy may backfire.

Three studies demonstrate that consumers respond negatively to descriptions of a brand as Insta-worthy (vs. good or beautiful), resulting in reduced purchase intentions because of the inference that the typical customer of the brands is driven by misrepresentation motives, which are generally judged negatively (Samper, Yang, and Daniels 2018; Sengupta, Dahl, and Gorn 2002; Smith, Vandellen, and Ton 2021). As a result, average consumers distance themselves from the brand in order to avoid sending the signal that they too have misrepresentation motives, consistent with research on dissociative reference groups (White and Dahl 2006).

Study 1 (n = 307) demonstrates the proposed effect and its underlying process by comparing purchase intentions for a brand described as Instagrammable versus good. Participants saw a mock-up Instagram post from an Influencer promoting a restaurant called The Morning, which was either described as an "Instagram-worthy" or "good" place to have brunch in the city. Participants then indicated their visit intentions, inference about the misrepresentation motives of the brands' customers (e.g., "The customers who go to The Morning are trying to put forth an image of someone they are not"), and desire for dissociation (e.g., "I do not want to be associated with the kinds of the customers The Morning attracts"). As expected, visit intentions were significantly lower when the influencer described it as Insta-worthy (M = 5.21, SD = 1.54) versus good (M = 5.72, SD = 1.23; $F(1, 305)$ = 10.22, p = .002). Further, participants in the Instagram-worthy (vs. good) condition inferred stronger misrepresentation motives ($M_{\text{Instagram-worthy}}$ = 3.03, SD = 1.62 vs. M_{good} = 2.33, SD = 1.40; $F(1, 305)$ = 16.12, p < .001) and indicated greater desire for dissociation ($M_{\text{Instagram-worthy}}$ = 2.75, SD = 1.59 vs. M_{good} = 2.18, SD = 1.43; $F(1, 305)$ = 10.86, p = .001). A serial mediation analysis (PROCESS MODEL 6; Hayes 2017) revealed that the indirect effect of brand description on visit intentions through the two mediators was significant and negative (index = -.24, 95% CI [-.39; -.11]).

In study 2 (n = 305) we conceptually replicate study 1 using a different control condition, type of influencer, and retail establishment. Notably, study 2 rules out two alternative explanations: impression management motives (i.e., presenting oneself in a positive way) and quality perception. All participants were shown a page from a blog called Coffeespots.com which introduced a coffee shop called The Roastery. In the Instagrammable (vs. beautiful) condition, The Roastery was described as "one of the 10 most Instagrammable (vs. beautiful) coffee spots in the city." To hold quality constant, in both conditions, it was mentioned that The Roastery had won the best local coffee-of-the-year award for two consecutive years. Participants first indicated their visit intentions, and then their inferences about misrepresentation and impression management motives (e.g., "The customers go to The Roastery because they want to present

themselves in a positive way") of The Roastery's customers (order counter-balanced). Finally, they rated the quality of the coffee shop ("Compared to other coffee shops, how would you rate the quality of the drinks at The Roastery?" 1 = much better; 7 = much worse). Consistent with the findings of study 1, visit intentions were significantly lower when The Roastery was described as Instagrammable (M = 5.76, SD = 1.27) versus beautiful (M = 6.05, SD = 1.19; $F(1, 303)$ = 4.32, p = .04). Further, participants in the Instagrammable (vs. beautiful) condition inferred stronger misrepresentation motives ($M_{\text{Instagrammable}}$ = 3.22, SD = 1.65 vs. $M_{\text{Beautiful}}$ = 2.82, SD = 1.75; $F(1, 303)$ = 4.88, p = .04). However, there was no significant difference across conditions for impression management (p = .32) or quality (p = .16). A mediation analysis (PROCESS MODEL 4; Hayes 2017) revealed that the indirect effect of brand description on visit intentions through misrepresentation motives was significant and negative (index = -.03, 95% CI [-.08; -.00]). Neither impression management nor quality were significant mediators.

If consumers avoid brands described as Instagrammable because patronizing these brands sends a signal that they have misrepresentation motives, when the signal becomes less indicative of misrepresentation motives, the negative response to the brand should be attenuated. We test this prediction in study 3 (n = 300) using a 2 (Brand description: Instagramable vs. Beautiful) X 2 (Cause marketing: Absent vs. Present) between-subjects design. The cause marketing absent conditions were identical to study 2. In the cause marketing present condition, the blogger mentioned that "The Roastery donates 10% of every sale to local charities in need." Thus, it was possible for participants in this condition to infer that customers who visit The Roastery are not necessarily driven by misrepresentation motives but instead a desire to donate to a cause with their purchase. Analysis yielded the predicted interaction ($F(1, 296)$ = 4.20, p = .04), such that in the cause marketing absent conditions, we replicated the earlier findings ($M_{\text{Instagrammable}}$ = 5.54, SD = .16 vs. $M_{\text{beautiful}}$ = 6.24, SD = .17; $F(1, 296)$ = 9.32, p = .01). However, when cause marketing was present, there was no difference in visit intentions across the two conditions (p = .81). A moderated mediation analysis using PROCESS MODEL 7 (Hayes 2017) demonstrated that the indirect effect of instagramability on visit intentions through misrepresentation motives was only significant in the cause-marketing-absent condition (index = .13, 95% CI [.01, .29]).

Together, our findings contribute to the emerging literature investigating factors that drive the effectiveness of influencer marketing and provide implications for brands interested in understanding how to guide influencers in creating content relevant to the brand.

The Role of Social Virtual World in Increasing Psychological Resilience During the On-Going COVID-19 Pandemic

Iman Paul, Clarkson University, USA
Rumela Sengupta, University of Illinois at Chicago, USA
Smaraki Mohanty, Binghamton University, USA

EXTENDED ABSTRACT

In March 2020, the novel coronavirus disease known as CO-VID-19, was labeled a pandemic by the World Health Organization. The fear and threat of contagion with COVID-19 is leading to enduring psychological problems among people which can be more detrimental in the long run than the virus itself (Depoux et al. 2020). Given this background, it is imperative that intervention tools are identified quickly to help assuage the mental stress associated with the fear of contracting the disease. To this end, this research offers a potential intervention tool and proposes a novel yet simple coping strategy to mitigate anxiety and fear of contracting COVID-19: becoming members of social virtual worlds (SVWs) via avatars. We propose that the disembodied experience stimulated by being a member of an SVW via an avatar increases the psychological resilience towards the fear of contracting COVID-19. Drawing on and extending the "Proteus Effect" (a phenomenon in which the behavior and attitude of an individual is influenced by the characteristics of their avatar, both in online and offline environment; Yee and Bailenson 2007), we argue that the disembodied experience stimulated by transitioning to an avatar in an SVW enables the user to envision living in an immune body in a parallel life away from the constraints and limitations of the human body which in turn increases the psychological resilience towards the fear of contracting COVID-19.

Study 1 examined our main proposition. Participants (N = 210; Mage = 34.32, 43.8% female) were randomly assigned to one of two conditions (new identity: SVW vs. work) in which they either adopted a new identity of an SVW member or a new work identity. Before introducing the condition specific stimuli, participants were presented with an article excerpt about COVID-19 to prime them with COVID-19-related thoughts. Next, in the SVW condition, participants were asked to imagine that they became members of an SVW and create a customized avatar to represent themselves in the platform. They then completed a series of interactive questions to increase their sense of involvement with their new SVW. In the work condition, the participants were asked to imagine that they started a new job and were asked to pick one of two generic user-profile icons to represent themselves in their new company. They then completed a series of interactive questions similar to SVW condition. Following the interaction process, participants were asked to indicate their agreement to the four-item dependent-variable measure capturing their level of psychological resilience towards the fear of contracting COVID-19 and hence their confidence in coping with COVID-19-related anxiety. All measures used 9-point, Likert-type scales (1 = strongly disagree, 9 = strongly agree). An ANCOVA on the COVID-19 psychological resilience dependent variable (α = .87) with new identity as a categorical predictor, gender as a categorical covariate, and age as a continuous covariate revealed a significant main effect of new identity ($F(1, 206)$ = 4.10, p = .044). Consistent with our prediction, participants felt greater psychological resilience regarding coping with COVID-19 when they adopted a new SVW member identity (MSVW = 5.27, SD = 2.26) compared to when they adopted a new work identity (Mwork = 4.60, SD = 2.36).

Study 2 used mediation-by-measurement design to directly investigate the role of disembodied transition as the mechanism underlying the above effect. After the COVID-19 priming tasks, participants (N = 93; Mage = 36.37, 44.1% female) were randomly assigned to one of two conditions (digital platform: SVW vs. social media). The SVW condition was identical to that in Study 1. In the social media condition, participants were asked to imagine they had decided to become a member of a social-media platform and create a customized avatar as a profile picture. Similar to SVW condition, participants then encountered a multistep process to create their customized avatar, followed by series of condition-specific involvement questions.

Following the interaction process, participants in both the conditions were exposed to the four COVID-19 psychological resilience items from Study 1. Afterward, they completed a two-item process measure for disembodied transition adapted from Holsapple and Wu (2007). All measures used 9-point Likert-type scales (1 = strongly disagree, 9 = strongly agree). An ANCOVA similar to Study 1 resulted in a significant main effect of digital platform ($F(1, 89)$ = 3.97, p = .049); participants who became members of the SVW indicated higher COVID-19 psychological resilience (MSVW = 5.47, SD = 2.35) than those who became members of the social-media platform (Msocialmedia = 4.44, SD = 2.38). Next, we tested the mediation using Hayes's (2017) PROCESS macro (Model 4; 95% confidence interval; 5,000 bootstrap samples). Consistent with the prediction, the results revealed a significant overall mediation effect (b = 1.48, SE = .37, 95% CI [.82, 2.26]) of the composite disembodied transition (α = .91).

The present research makes theoretical contributions to the literature on Proteus Effect (Yee and Bailenson 2007). Extant literature considers the implications of the physical attributes of digital self-representation (i.e., avatars) on an individual's real self. Extending this, the present research reveals the influence of a more innate feature of graphical avatars, that is their imperviousness from the limitations of a corporeal body. The results show that individuals experience disembodiment when they represent themselves through avatars. This enables them to envision themselves as similar entities immune to limitations of the human body, in this case, the CO-VID-19 virus.

In addition to making theoretical contributions, this research also has important implications for marketing efforts in responding to the COVID-19 mental health crisis. The results show that by small intervention tools like encouraging people to become users of SVWs can provide a remedial solution for the mental health crisis arising as an aftermath of the COVID-19 pandemic. Therefore, we expect the current findings to be of interest to health policy experts and consumers as an intervention tool that is simple, has a short turnaround and can be used in conjunction with another tools. Additionally, the findings of this research will also be of interest to designers and developers of SVWs. We believe the benefit examined in our investigation will accelerate the adoption of SVWs and help this technology reach its full potential. Many real-world businesses (e.g., IBM, Levi's jeans, Reebok, and Toyota) are increasingly developing a presence in SVWs to build their brands or grow their revenues (Arakji and Lang 2008). We believe that the rise of SVWs now offers a unique opportunity for marketers to take their quest for brand superiority to the next frontier.

The Effect of Anticipated Embarrassment on Preference for Using Chatbots

Rumela Sengupta, University of Illinois at Chicago, USA
Lagnajita Chatterjee, Worcester State University, USA
Jeffrey Parker, University of Illinois at Chicago, USA

EXTENDED ABSTRACT

In recent times, chatbots have become the fastest growing digital communication trend and one of the strongest tools that marketers have at their disposal. Chatbots interact with users, respond to their questions, and address their concerns. In addition to these interactive abilities, design features like visual appearance, speech synthesis, discourse structure, and reasoning increasingly make these chatbots seem humanlike which enable the human users to anthropomorphize them (Epley, Waytz, and Cacioppo 2007). Although chatbots afford many opportunities (e.g., convenience, automation, and interactivity), they also have potential negative impacts on their users, such as a perceived loss of decision autonomy and free will, a perceived lack of transparency and privacy concerns (André et al 2018; Carmon et al. 2019; Ng et al. 2020). Contributing to the research on the negative consequences of anthropomorphizing chatbots, the current research examines the effect of anticipated embarrassment on the willingness to use them. Drawing on the literature on chatbots, social presence and embarrassment, we argue that, when conducting an online search, consumers will be less likely to use a chatbot when they anticipate feeling embarrassed about the search than when they do not. This results from a sense of perceived social presence while interacting with a chatbot. Since embarrassed individuals are motivated to avoid social contact (Chen and Pham 2019), they tend to avoid using chatbots that beget the sense of social presence.

Four studies tested the basic proposition and the underlying process for the effect. In study 1, participants (N=245) were presented with a list of products and asked to select a product which they would be (i) not embarrassed, (ii) mildly embarrassed or (iii) extremely embarrassed to buy for themselves. Next, participants were asked to imagine that they were shopping online for their chosen product and that they could look for the options either by manually browsing the website or by using a chatbot. Participants rated how likely they would be to ask the chatbot for help (1 = not likely at all; 9 = very likely). The likelihood of using the chatbot differed significantly across the three conditions ($F(2, 242) = 4.23, p = .016$). Participants in the highly-embarrassing condition ($M_{high} = 4.44$, SD = 2.72) were significantly less likely to use the chatbot than those in the mildly-embarrassing condition ($M_{mild} = 5.65$, SD = 2.74, $F(2, 242) = 8.32$, $p = .004$), and marginally significantly less likely than those in the not-embarrassing condition ($M_{no} = 5.26$, SD = 2.59, $F(2, 242) = 3.49$, $p = .06$). No significant difference was found between the not- and mildly-embarrassing conditions ($F(2, 242) = 0.93, p = .342$).

Study 2 tested the basic effect by measuring participants' relative degrees of anticipated embarrassment within an information search context and examined the moderating role of self-esteem. Participants (N=89) were asked to imagine that they had been experiencing involuntary incidents of flatulence. They were then asked to indicate their likelihood of using the chatbot to conduct an online the search for more information on involuntary flatulence. Next, partici-

pants responded to a nine-item self-esteem scale adapted from Song et al. (2017). A linear regression revealed that likelihood of using a chatbot was negatively related to anticipated embarrassment (b = -.33, $t(85) = -1.89, p = .06, f^2 = .04$). Additionally, a marginally significant interaction between anticipated embarrassment and self-esteem (b = .23, $t(85) = 1.86, p = .06, f^2 = .039$) was found. A subsequent spotlight analysis showed a significant negative effect of anticipated embarrassment on the likelihood of using the chatbot to conduct the search (b = -.75, $t(85) = -2.53, p = .01$) among participants with low self-esteem (-1 SD = 4.73) but no effect among participants with high self-esteem (+1 SD = 8.28: b = .08, $t(85) = .29, p = .77$).

Study 3 utilized a 2 (search aid: chatbot vs. search bar) × 2 (scenario: sexually transmitted disease [STD] vs. furniture assembly [FA]) mixed design with search aid manipulated between subjects and scenario randomized within subject. Participants (N = 398), in STD (FA) scenario were asked to imagine that they are looking for *a new product to prevent STD (DIY instructions to assemble furniture)*. They were then asked how likely they were to complete the search using a chatbot (vs. search bar). Participants were also asked to rate the extent to which they felt (1) embarrassed while searching for the information (1=not at all, 9=very). Participants expected to experience more *embarrassment* in the *STD* scenario than in the *FA* scenario ($M_{STD}=4.90$, $M_{FA}=2.36$, $p<.001$). A mixed-design ANOVA revealed a significant interaction ($F(1, 395)=9.40, p=.002$) between search aid and scenario. Participants were significantly more likely to use the search bar than the chatbot in the *STD* scenario ($M_{searchbar}=6.32$, $M_{chatbot}=5.22$, $p<.001$), while no significant difference arose in the furniture scenario ($M_{searchbar}=6.99$, $M_{chatbot}=6.63, p=.093$).

In study 4, participants (N = 453) were randomly assigned to one of four conditions in a 2 (scenario: incontinence [embarrassment] vs. donation [pride]) × 2 (search aid: chatbot vs. search bar) between-subjects design. Participants in the embarrassment (pride) condition were asked to imagine that they had been *experiencing public incontinence* (*thinking of donating to a cause*) and were looking for related information online. They were asked how likely they were to complete the search using either a chatbot or a search bar (1=not likely at all to 9=very likely). Participants also completed a 10-item perceived humanness measure adopted from (Watyz et al. 2010) for their respective search aid ($α=.98$). The chatbot was perceived as significantly more humanlike than the search bar ($M_{chatbot}=4.50$ vs. $M_{searchbar}=2.76$, $p<.001$). A two-way ANOVA, revealed a significant interaction between scenario and search aid ($F(1, 390)=7.05, p=.008$). Participants were less likely to use a chatbot (vs. search bar) to search for embarrassing questions ($M_{chatbot}=5.53$ vs $M_{searchbar}=7.49, p<.001$). Conversely, no significant difference was observed for *pride* condition ($M_{chatbot}=5.68$ vs $M_{searchbar}=6.33, p=.28$).

Together, the results provide support for the negative influence of anthropomorphizing chatbots on users' preference for interacting with them.

How Do Influencers Monetize their Audiences?

Pierre-Yann Dolbec, Concordia University, Canada
Andrew Smith, Suffolk University, USA
Trang Hoang, Concordia University, Canada

EXTENDED ABSTRACT

Current work on social media influencers overwhelmingly focuses on how they acquire their influence (e.g., McQuarrie et al. 2013) or understanding their persuasive effect and role in brand communications (e.g., Hughes et al. 2019). Yet, how people and professionals use social media to develop and exploit an audience has transformed in recent years. Influencers now compete against brands with brands of their own (e.g., Chiara Ferragni), and many professionals have turned to social media to advance their careers or practice (e.g., therapists, fitness coaches, and dieticians).

Although we know much about the opinion leadership dimension of influencers, we know much less about their entrepreneurial dimension. Importantly, and of central interest for this research, we know little about how influencers monetize their audience and influence. This gap is important because of the increased variance in monetization strategies deployed by influencers and its relevance to an important stakeholder of digital marketing. In this conference paper, we ask the question: What roles can influencers take to create value for themselves and monetize their audience and influence? In our analysis, we concentrate on explaining how these roles inform monetization activities. Answering this research question should support not only influencers' work but also brands that want to hire or collaborate with them.

Method

We explore this question through an extensive qualitative dataset of more than 150 influencers. Our dataset is composed of archival and interview data. For archival data, we collected data for different purposes. To inform the phenomenon generally, we collected more than 150 articles around the general phenomenon of monetization by influencers from various outlets (455 pages). To better understand how influencers monetize, we collected data on 33 influencers through secondary interviews and media articles covering specific influencers (656 pages). We also reviewed their social media presence. To understand monetization activities better, we collected one year of Instagram posts from 110 influencers. We also collected 90 podcasts where an influencer was interviewed about their monetization activities. Last, for interview data, we collected 20 interviews with influencers, most with more than 100,000 followers.

Findings

We find that influencers inhabit three types of roles as they create value for themselves and monetize their audience and influence. In the rest of the findings, we expand on these three roles: the persuader, the founder, and the professional.

Persuader Role

When acting as a persuader, an influencer monetizes their audience and influence by participating in persuasion campaigns with third parties (e.g., sponsored post on Instagram) or by directly monetizing their attention (e.g., by deriving revenue from YouTube views). Their ability to monetize is rooted in their capacity to build and engage audiences on social media platforms.

Influencers enacting the persuader role use these strategies through a variety of tactics. Among other things, they produce sponsored posts, host affiliate links that earn commissions, and collect advertising revenue from platforms that display advertising along with the influencer's original content. Although prior research identifies that influencers engage in such behaviors as a part of their work for brands (e.g., Hughes, Swaminathan, and Brooks 2019), it does not recognize it as existing in a wider nexus of activities and roles that explain how influencers monetize their labor.

Founder Role

When acting as a founder, an influencer monetizes their position by identifying and exploiting business opportunities associated with their brand, audience, and influence (e.g., creating and marketing their own brand of products). In contrast to the persuader role, the basis of monetization for the founder role lies in an influencer's ability to identify and exploit opportunities in the market rather than monetize attention more directly.

The strategy of founders is to commercialize brands, products, or services rather than add credibility to another brand's messaging as an influencer would do in a persuader role. Social media may serve as one sales channel for influencers inhabiting the founder role. Still, many successfully diversify and support their commercialization through multiple means, such as massive online paid courses. The range of items marketed and sold by entrepreneurial influencers in the founder role is truly extensive (e.g., Jeffree Starr and cosmetics; Jordan Ferney and party supplies; Grumpy Cat and virtually anything).

Professional Role

When acting as a professional, an influencer monetizes their position by selling professional services (e.g., a therapist that uses Instagram to promote and sell their services as a professional therapist). The basis of their monetization is rooted in their ability to develop a public appreciation for their professional skills and knowledge. In contrast to persuaders, they are less dependent on building and engaging large audiences that advertisers seek to access. Nor are they as bound to exploiting business opportunities, distinguishing them from founders. For professionals, social media signals popularity and credibility, which can become marketable resources.

The monetization strategy for influencers in a professional role entails expanding their paid employment opportunities or client base, which they generally serve outside social media. Social media may enable professionals to acquire new clients, as therapists, designers, financial advisors, or trainers might do (see also Gandini 2016). Alternatively, it may allow them to showcase their value as employees.

Discussion

Our study contributes to our understanding of influencers by identifying three distinct roles they can take when monetizing. By doing so, we first shed light on the monetization activities of influencers, which is empirically central to their endeavors but has been undertheorized in existing work. Second, our typology provides an organizing framework to map existing literature on people with influence. Namely, we suggest that persuaders mostly align with work on opinion leadership, professionals tie closely with work on person-branding, and founders align with work from entrepreneurship. We see three distinct but related streams of literature as providing potential theoretical insights for future studies on influencers.

COVID-19 Stress and the Performance of Gender Counter-Stereotypical Behavior (GCSB): Market Opportunities From an Overlooked Segment During the Pandemic

Enav Friedmann, Ben-Gurion University, Israel
Gal Gutman, Ben-Gurion University, Israel
Gil Peleg, Yeshiva University, USA
Niv Reggev, Ben-Gurion University, Israel

EXTENDED ABSTRACT

"Feminine" and "Masculine" behaviors are stemming from gender stereotypes that manifest in different life domains (Ellemers, 2018), including consumption behaviors (Carroll et al., 2017). Individuals perceive these behaviors as appropriate or inappropriate to perform according to gendered expectations (Avery, 2012). Consumption choices constitute a performative act that expresses beliefs about gender and identity and are aligned with gender-stereotypical behavior (Palan, 2001). However, this stereotypical behavioral tendency might be altered in atypical situations, such as the COVID-19 pandemic, where cognitive resources are less available. This paper explores a different behavioral tendency in which gender counter-stereotypical behavior (GCSB) increases due to stress-induced resource depletion.

We suggest that gender norms (GSB – gender-stereotypical behavior, prescriptive behaviors) and prohibitions (GCSB, proscriptive behaviors) pose two qualitatively different cognitive demands on an individual, as claims for negation require more cognitive resources than claims without negation (Mayo et al., 2004). We expect:

Hypothesis 1:   Individuals will require more cognitive resources to judge GCSB than GSB or gender-neutral behaviors (GNB).

Utilizing fMRI (N=28) in our first study, we found that multiple brain regions related to effort-based decision-making (Botvinick & Braver, 2015) were associated with increased activity for GCSB judgments. These include: the bilateral insula, dorsal anterior cingulate cortex and right temporal-parietal junction, suggesting that GCSB judgments trigger increased information processing.

GCSB judgments that negate the gender stereotypical behavioral scheme require many cognitive resources. However, what happens when these resources are depleted? Low cognitive resource availability can be caused by stressful situations (Hobfoll et al., 2016) and accompanied by negative emotional experiences (Plessow et al., 2012). To confirm the effect of stress on cognitive resources, we will ensure that the two are negatively associated and that we expect that:

Hypothesis 2   High stress is associated with lower cognitive resources availability.

Low cognitive resources availability is known to affect stereotype associations and effectively increase GSB (Gilbert & Hixon, 1991; Keinan et al., 2000). We suggest a parallel process for GCSB when there are insufficient resources available to enact the costly prohibitions for behaving in a counter-stereotypical fashion, and behaviors identified with the opposite gender will also increase:

Hypothesis 3   Individuals will increase GCSB tendencies in stressful (compared to non-stressful) situations.

In the second study (n=20), we implemented a between-subjects (stress vs. non-stress) lab experiment using bio-psychological sensors to examine if stress decreases cognitive resources and increases GCSB. The findings confirm that participants who were exposed to COVID-19 stress experienced higher cognitive load followed by GCSB increase.

Since resistance to performing GCSB requires more cognitive resources, any depletion of these resources in stressful situations increases such behavior. However, the underlying mechanism is not clear. Self-regulatory cognitive demanding processes alter responses (e.g., physiological and emotional) to fit the demands of the situation (Calkins & Fox, 2002) are known to be hampered under stress (Baumeister, 2014). Emotional regulation allows individuals to interpret experiences of the world, and classify them based on their viewpoint (Baumeister, 2014), and enables them to deal with CGSB (Kaldewaij et al., 2019; Pechtel & Pizzagalli, 2011; Raio et al. 2013) Therefore:

Hypothesis 4   Emotional regulation mediates the effect of stress on GCSB.

We suggest that stress, in addition to increasing gender-stereotypical behavior (Margittai et al., 2016), might lead to reduced inhibitions to performing GCSB due to lower emotional regulation, and therefore it will result in a conditional indirect effect (IE) of stress on GCSB via emotional regulation.

To examine the underline mechanism we implemented a between-subjects (stress vs. non-stress) online experiment (n=196), and a within-subjects online survey (n=115). The online experiment showed low ER was associated with an increase in feminine behavior only for men ($\beta_{ER \times male}$=-0.94, SE=0.32, $p<0.01$), the interaction term of ER by gender was significant: $\beta_{ER \times gender}$=0.86, SE=0.37, $p<0.05$). The model's moderated-mediation index was significant only for the treatment condition (index=-0.16 (0.09); $CI_{0.95}$=[-0.38, -0.01]). Similarly, low ER was associated with an increase in masculine behavior only for women ($\beta_{ER \times female}$=-0.95, SE=0.22, $p<0.01$), the interaction term of ER by gender was indeed significant: $\beta_{ER \times gender}$=-0.72, SE=0.26, $p<0.01$), The model's moderated-mediation index was significant only in the treatment condition (index=0.13 (0.06); $CI_{0.95}$=[0.01, 0.28]. The online survey revealed the same mechanism within participants measuring GCSB (sweets-feminine category and alcohol consumption-masculine category) before and during the pandemic outburst: low ER was associated with an increase in sweets consumption only for men ($\beta_{ER \times male}$=-0.43, SE=0.18, $p<0.03$. The indirect effect of stress on sweets consumption was significant only for men (IE=0.39 (0.17), $CI_{0.95}$ [0.04, 0.73]). The index of moderated-mediation was significant=-0.47(0.18); $CI_{0.95}$ [-0.83, -0.13]. Furthermore, low ER was associated with an alcohol consumption increase only for women ($\beta_{ER \times female}$=-1.41, SE=0.58, $p<0.02$). The IE of stress on alcohol consumption was significant only for women (IE=1.28 (0.56), $CI_{0.95}$ [0.24, 2.47]). The index of moderated mediation was significant=1.32 (0.70); $CI_{0.95}$ [0.04, 2.77].

GENERAL DISCUSSION

This paper builds on previous research demonstrating the effect of stress on gender-stereotypical behavior. Past literature has focused on the effect of stress on GSB, while the effect on GCSB has been somewhat neglected. We found that in times of stress, alongside an increase in gender-congruent GSB, individuals also tend to increase

their GCSB. The effect of stress on GCSB is important to explore, especially since gender is a complex scheme composed of two distinct and interdependent sub-schemes that influence behavior: "do" (prescriptive behaviors) and "do not" (GCSB; proscriptive behaviors). Understanding gender-related behaviors require additional exploration of the complementary sub-scheme: GCSB. Our study provided an explanation for the GCSB increase under stress: emotional regulation serves as an underlying mechanism that activates GCSB. Normally, when cognitive resources are available, adjustments to emotions and behaviors are feasible. Under stress, emotional regulation can be damaged and trigger an increase in CGSB. These findings add to the marketing literature by showing the effect of stress from COVID-19 on GCSB. These results are also theoretically informative, as they emphasize the role of cognitive resources in maintaining gender-proscriptive behaviors. Practically, marketers can also target men for traditional feminine categories and women for masculine categories or use CGSB behaviors in their advertising appeal.

An Ecofeminist Understanding of "Emotion Work" in Market Delegitimization.

Lucie WIART, Sciences Po Lille, France
Nil Özçaglar-Toulouse, Université de Lille, France

EXTENDED ABSTRACT

In consumer research, emotions are gradually examined, but research is rather fragmented, and sociocultural treatments undertheorized (Gopaldas, 2014). The work of Gopaldas (2014), however, has been central in illuminating the role of "marketplace sentiments," collectively shared emotions that are produced strategically as tools for activism (see Valor et al. 2020). In neo-institutional theory-oriented research, emotions are considered as tools to gain agency in creating, transforming, and disrupting institutions (Lawrence, 2008) such as markets. However, when examining Animal Rights Organizations, Jarvis et al. (2019) suggest that *suppression* of emotions might also play a role in institutional work. Due to a 'reactive-affective conflict,' Animal Rights Organizations advocates are encouraged to suppress their emotions while still attempting to elicit them via visuals. However, it does not question why emotions are considered legitimate or not, depending on the context, to contribute to strategies of institutional works.

This paper argues that this strategic understanding of emotions omits power issues related to their expression. This tension between "emotions" and "rationality" in institutional work has not been examined as a result of meta-discourses and power relations reproduction. Therefore, we ask in this paper: what are the power relations involved in this strategic (non)use of emotions, and what are their impacts on activists' strategy? Drawing on ecofeminist theory, we wish to question the epistemic foundations of this "emotions/reason" dualism and its impact on the process of market (de)legitimization.

An ecofeminist perspective on emotions

Ecofeminist framework is crucial to illuminate long-held dualisms such as "reason vs. emotion" and their impacts on power relations. Emerging in the 1970s (D'Eaubonne, 1974), ecofeminism encompasses both academics and activists' works. Differences among ecofeminists are vast (Merchant, 1992), and we align with the critical analysis of modern dualisms offered by Plumwood (1993). In her work, she points out how masculine values are privileged in western societies, leading to a set of unquestioned dualisms. Among these dualisms, the "reason-emotion" dualism is central. According to her, 'reason is not a gender-neutral aspect of human cognition, but instead, it is a tool men have used to silence the voices of women, the value of non-human animals, and the larger ecosystem.' (Littlefield, 2010, p.). Following continental and post-modern work, modern rationality would be the hidden core of western ideological systems.

Identities are thus constructed according to this process of dualism. The masculine, the reasonable, the cultural would be dominant. The feminine is constructed as lacking rationality, superiority, in the same way as nature and non-humans. In this process, emotions are constructed as 'essentially unreliable, untrustworthy and morally irrelevant, an inferior domain to be dominated by a superior, disinterested (and of course masculine) reason' (Plumwood, 1994, p. 167).

We can find connections with Derrida's thinking and his notion of the 'phallogocentric' structuring of Western subjectivities (Derrida, 1989, 2006). *Phallogocentrism* means the privilege of logos, inherited from classical Greek metaphysics, in Western culture: reason over emotion, the signified over the signifier, and the masculine basis of subjectivity. Since masculinity is linked to reason, women and non-humans have inferior status. Thus, in this paper, we will consider the meta-discourse leading to such dualism as a *phallogocentric* one.

Animal Rights Activism against Meat Market

To study phallogocentric meta-discourse impact on the use of emotions in delegitimization strategies, we focus on the context of French Animal Rights Activism against meat market. French food culture and livestock economics being significant, there has been intensive discursive struggles around meat consumption for few years. This resulted in the development of rivalries between Animal Rights Organizations, particularly on differing modes of consumer awareness.

The strategic use of emotions by Animal Rights Organizations has been well documented in management and political literature. Generating emotional responses through "moral shocks" (pictures of animal suffering) or suppress them (Jarvis et al. 2019) plays a central role in motivating and recruiting activists (Jasper and Poulsen, 1995). This focus on strategic and instrumental use of emotions might, we argue, overlook power issues related to emotions and gender.

Methodology

We collected two data sources to examine phallogocentric discursive construction of emotions and the resulting impact on activists' institutional work: semi-structured interviews with vegan, vegetarians, and meat-eaters (30) and newspapers archival data on Animal Rights Activists' actions (530 articles). We analyzed data by engaging with a discursive and deconstructive analysis strategy.

Findings and discussion

We make two contributions to the emergent consumer research literature on emotions and institutional work.

First, rather than considering emotions merely as instruments for conveying counter-hegemonic discourse, findings suggest that emotions have a "dislocative" power: they are fundamental in constructing individual senses of ethics. Therefore, following care ethics, we can consider emotions as "upheavals of thought" with their intelligence (Nussbaum, 2007). In this, we extend the work of Valor et al. (2020) by considering a performative approach to Marketplace Sentiments in suspending the distinction between emotions and discourse.

Second, we found out that a phallogocentric framing of emotions conditioned the power to change institutions. While emotions are central in the interpellation of vegan subjects, we show how they are rejected, a rejection supported by a philosophical discourse, and the use of a pragmatic and depoliticized approach. Valor et al. (2020) suggested the creation of a "pathic stigma" as the result of emotional prototyping to delegitimize consumer practices. Here, we suggest, in return, the construction of a "phallogic stigma" that delegitimizes activists' institutional work based on emotions. Vegan activists are, thus, constructed as being irrational. To counter such stigma, we observed a necessary alignment with a dualist framing of emotions. We point out the risk of such a strategy: by denigrating emotions as feminine and hysterical, activists contribute to the stigma they are fighting against.

Conclusion

We conclude by advancing how a "rational conception of emotions" (Mumby & Putnam, 1992), that is, a recognition of "the

knowledge-producing dimension of emotions" (p. 480), can help us to question both hierarchies of knowledge in marketing and consumer research and current theorizations of emotions. Such perspective allows an understanding of power relations behind dynamics of emotions and discursive work in (de)legitimization.

The Rise of a Nudge: Field Experiment and Machine Learning on Minimum and Full Credit Card Payments

Daniel Schwartz, University of Chile, Chile

EXTENDED ABSTRACT

There are 2.8 billion credit cards in the world (Shift, 2021). While this payment method has offered convenience, it had also brought financial distress to people who cannot manage their debt payment (Hodson, Dwyer, & Neilson, 2014). As a partial solution, policy regulations in several countries have included a mandatory minimum payment warning in credit card statements. However, several studies using administrative data or laboratory-based experiments have shown that highlighting the minimum payment may cause lower full balance payments (e.g., Navarro-Martinez et al., 2011; Salisbury, 2014). For this reason, the minimum payment policy has been described as a perverse nudge due to the anchoring bias (The Economist, 2008; Wang & Keys, 2014; Stewart, 2009). This paper introduces a novel statement balance warning to answer whether and why a minimum and/or a statement balance warning can change credit card payment behavior. In addition, research from psychology distinguishes that when there is a hierarchy of goals, one is prioritized, and non-prioritized goals are ignored (Unsworth, Yeo, & Beck, 2014). For that, this paper uses a randomized preregistered field experiment with credit card debtors who received email payment reminders before their credit card payment was due.

Debtors (N=179,706) were randomly assigned to four experimental conditions. The Minimum Payment Warning condition included the sentence: "If you at least pay the minimum ([$]) before the due date, you will pay additional interest charges but avoid late fees." The Statement Balance Warning condition included the sentence: "If you pay the statement balance ([$]) before the due date, you will avoid additional interest charges." The Both Warnings condition included the statement balance and minimum payment warnings. Finally, the Control condition was a simple reminder that included neither the statement balance nor minimum payment warnings.

Results. All warning messages decreased the likelihood of paying less than the minimum compared to a simple payment reminder without warning messages. On average, debtors decreased their less-than-the-minimum payments by 7.9% more than debtors who received a simple payment reminder (an absolute difference of 0.77 percentage points; ps < 0.01). However, this masks a significant change in payment distribution depending upon the specific warning message. Debtors who received the statement balance warning were 1% more likely to pay in full than debtors who received the simple payment reminder (a difference of 0.64 percentage points; ps < 0.01). In contrast, debtors who received the minimum payment warning increased their minimum payment by 5.9% compared to the simple reminder (a difference of 0.52 percentage points; p < 0.01), and there was no sizable change in the likelihood of paying in full despite the precise estimate. This means that debtors who received the minimum-payment warning shifted their payment mostly toward the minimum amount (63% of the shift), and debtors who received a message including the statement-balance warning shifted their low payments almost entirely toward paying in full (87%).

Even though debtors who received both warning messages behave very similarly to those who received only the statement balance warning, their effect on the interests charged on the following billing cycle after the experiment is not the same. Debtors who received a message including both warning or the only minimum warning saw their delinquent interest (i.e., the interest generated by not paying at least the minimum) being reduced by 3.9% and 3.4% (ps < 0.05),

respectively, more than those who received the message with only the statement balance warning, and 8.0 and 7.5% (ps < 0.01), respectively, compared to debtors who received the simple reminder. Also, consequent to the changes in payment distribution, there is a difference in the revolving interest charged (i.e., the interest generated by paying less than the statement balance). Debtors who received both warnings or only the statement balance warning saw a reduction of 6.0 and 3.8% (ps < 0.06), respectively, more than debtors who received only the minimum warning message, and 9.0 and 6.9% than those who received the simple reminder (ps < 0.01).

In order to explore heterogeneous effects, the field experiment was combined with a recently developed machine learning technique, causal random forests (Wager & Athey, 2018). Although a large fraction of debtors increases the portion they paid of their statement balance because of receiving a message with both warnings, a small fraction reduces this outcome. Different factors explain a positive and large treatment effect in this regard: debtors with previous payments closer to the statement balance, a small distance between the minimum and statement balance amounts, and a considerable variation on previous percent payments. These factors are consistent with debtors prioritizing one warning depending on which becomes more relevant and reachable to them.

In conclusion, results show that a statement balance warning not only increases payments in full, but also decreases delinquency and revolving interest. This paper contributes to the literature on nudges and financial decision-making by testing in the field the role of the minimum payment warning and, more importantly, its interaction with a new statement balance warning.

When Brands Get Disemvoweled: Challenging the Conventional Wisdom behind Unconventional Brand Names

John Costello, University of Notre Dame, USA
Jesse Walker, Ohio State University Fisher College of Business, USA
Rebecca Reczek, Ohio State University Fisher College of Business, USA

EXTENDED ABSTRACT

An increasingly common "outside the box" strategy amongst brands is to select a brand name that relies on an unconventional spelling of an existing word (e.g. "UrthBox" rather than the conventional "EarthBox"). Research in linguistics and consumer behavior has documented several common forms of unconventional brand spelling (Wong 2013), but little is known about how the use of this strategy impacts consumers' inferences about the brand and, ultimately, their likelihood to support it. We propose that consumers believe that brands primarily use an unconventional naming strategy in an effort to persuade, which activates consumers' persuasion knowledge (Friestad and Wright 1994) and undermines the extent to which consumers view the brand as sincere (Aaker 1997). This decrease in perceived sincerity is likely to reduce support for the firm (Eisend and Stockburger- Sauer 2013). Hence we predict:

Hypothesis 1:   *Use of an unconventionally spelled brand name leads to significantly lower support of the brand as compared to the equivalent conventionally spelled brand name.*

Hypothesis 2:   *The effect predicted in H1 will be mediated by a decrease in the perceived sincerity of the brand.*

Importantly, we theorize that this decrease in sincerity is based on consumers' inferred motive about why the brand decided to employ an unconventional spelling. However, if consumers attribute a brand's naming intentions to a sincere motive that does not involve an overt persuasion attempt, we predict that the backfire effect predicted in hypothesis 1 will be attenuated.

Hypothesis 3:   *If consumers are aware that the brand had sincere naming intentions (i.e., using unconventional spelling for reasons other than the motive to persuade) the effect predicted in H1 will be attenuated.*

We test our predictions across seven studies, using both incentive-compatible and hypothetical measures of brand support. We use a variety of brand names across studies, both real and fictional, and employ all three unconventional naming strategies previously established in the linguistics literature (Wong 2013).

In study 1 (301 Prolific participants), we tested hypothesis 1 by asking people to choose which of two real brands they preferred based solely on the name of the brand. Using lists of "brands to watch" we identified five brands with unconventional names, and 40 brands with conventional names. A pre-registered, a multi-level linear model with choice of the target brand as the dependent variable, conventionality as an independent variable, and participant as a random factor revealed that conventionality was a significant predictor of preference ($p < .001$).

In study 2, we again tested hypothesis 1 using an incentive-compatible pre-registered design. Participants were assigned to one of two conditions in which they read about a clothing brand that had a name which was spelled conventionally or unconventionally and reported their incentive compatible WTP for a prize pack from that brand. As predicted, participants were willing to pay significantly less for the prize pack from the unconventionally-spelled brand than the conventionally-spelled brand ($p = .002$).

In study 3a, we tested hypothesis 2. In a preregistered study, participants (304 MTurk workers) were assigned to one of two conditions (Conventional vs. Unconventional) in which they read a short description of a drink brand. Participants indicated their purchase intentions and rated the extent to which they perceived this brand as sincere using the eleven sincere trait measures taken from Aaker's (1997) brand personality scale. A one-way ANOVA revealed that participants were significantly less likely to buy from the unconventionally-spelled brand than the equivalent conventionally-spelled brand ($p < .0001$) and mediation analysis revealed that the indirect effect of appeal type on purchase intentions through sincerity was significant.

In study 3b, we once again tested Hypothesis 1 and 2 and measured several other potential mediators (e.g., fluency, excitement, novelty) to rule out alternative explanations. Participants (183 undergraduates) were assigned to one of two conditions (Conventional vs. Unconventional) in which they read a short description of a clothing brand. As in study 3a, participants indicated their purchase intentions answered Aaker's sincerity measures, as well as measures for other alternative accounts. A one-way ANOVA revealed that participants were significantly less likely to buy from the unconventionally-spelled brand than the equivalent conventionally-spelled brand ($p < .0001$). Parallel mediation analysis also provides evidence of mediation via sincerity but not the alternative accounts.

In study 4a we tested hypothesis 3. Participants (302 Mturkers) were assigned to one of three conditions (Conventional vs. Unconventional vs. Unconventional Sincere Intentions). In the *Unconventional sincere intentions* condition, participants read that the restaurant had to change its name to the unconventional version for intellectual property reasons and to minimize customer confusion. Orthogonal contrasts revealed that purchase intentions were significantly lower in the *unconventional* condition than in the *conventional* and *unconventional sincere intentions* conditions ($p = .004$), which did not significantly differ from each other.

In study 4b (194 undergraduates) again tested hypothesis 3 using a similar design to study 4a but a different operationalization of sincere intentions. Specifically, participants in the *unconventional sincere intentions* read that the brand's name was not an unconventional spelling but actually the last name of the family that started the brand, which, we predicted, would lead participants to attribute the brand's name choice to sincere intentions. Contrasts revealed that purchase intentions were significantly lower in the *unconventional* condition than in the *conventional* and *unconventional sincere intentions* conditions ($p = .022$), which did not differ from each other.

Study 5 (403 MTurkers) employed a 2 (Brand name: Conventional vs. Unconventional) by 2 (Naming intentions: Sincere vs. Control) study design that used the same brand as study 3a. Participants in the *sincere* condition were told that the brand's name was selected by the public, which we expected would be viewed as sincerer. We observed our predicted significant a two-way interaction between brand name and naming intentions on purchase intentions ($p = .0003$). Planned contrasts revealed that participants in the *control* condition

were significantly more likely to purchase from the brand when its name had a conventional rather than an unconventional spelling (*p* <.0001) but that purchase intentions did not differ when the brand had sincere naming intentions. Moderated mediation analysis further provided evidence for our proposed conceptual model.

The Language That Drives Engagement: A Systematic Large-Scale Analysis of Headline Experiments

Akshina Banerjee, University of Chicago, Booth School of Business, USA
Oleg Urminsky, University of Chicago, USA

EXTENDED ABSTRACT

What motivates people to consume information? A broad range of theories in social and cognitive psychology have identified relevant characteristics, including, linguistic structure, fluency, affect, construal, personalization and many other factors. We take an ecologically valid and general approach to identifying causal effects of language on engagement decisions, using a large-scale database of field experiments.

Online journalism increasingly relies on catchy "click-bait" language in headlines to optimize engagement (Frampton 2015). In particular, Upworthy has used emotional appeals to promote popular and uplifting content to become one of the most successful purveyors of engagement-optimizing content online (Karabell 2017; O'Donovan 2013). We investigate what makes messages effective at driving engagement, using Natural Language Processing tools to bridge the gap between the numerous specific but atheoretical results from a database of thousands of experiments conducted by Upworthy, and academic behavioral theories of how people generally interact with messages and textual cues.

The Upworthy experiments each varied the language used in headlines for a given piece of content to identify the most effective version. The dependent variable in our analysis was the click-through rate on a given headline, relative to the click-through rate for the other headlines tested for the same article, in the same experiment. The experiments run by Upworthy were not designed to isolate specific factors, but instead to test between different approaches that often differed from each other in multiple ways. We extracted theoretically relevant measures from the content of the headlines themselves, using both existing tools (LIWC2015; Pennebaker et al. 2015; Berger et al. 2020) and custom-defined scoring. Factor analyses were then used to extract underlying constructs from the measures. After testing for sufficient identifying variation across treatments, we identified 35 testable psychological constructs that mapped to informational, cognitive, linguistic and affective research literatures, for 20 (57%) of which the literature provided directional predictions.

Informational: Consistent with prior research on informational factors, using forward reference language (such as using unresolved pronouns) in headlines, increased engagement with the headlines (ß=.0007084, t(3345)=8.97, p<.001). Using language that focuses on the present rather than the past reduced click-through (ß=-.0005007, t(3345)=-6.85, p<.001), potentially consistent with some prior research but inconsistent with the general idea of present bias in decision-making. Contrary to prior research, headlines that incorporated information-seeking cues (e.g., content that would answer a question or teach something) performed more poorly (ß=-.0005351, t(3345)=-6.41, p<.001).

Cognitive: Among the cognitive factors tested, three were significant. Consistent with prior research, particularly the Elaboration Likelihood Model, including deliberation-related language increased engagement, on average (ß=.0004757, t(3345)=6.24, p<.001). The impact of sensory cues was more mixed. Consistent with the literature in sensory marketing, highlighting the senses of perception and sight in headlines increased reader engagement with the content (ß=.0005764, t(3345)=8.94, p<.001). However, contrary to the same literature, references to senses other than sight or hearing, such as touch, reduced click-through rates (ß=-.0001633, t(3345)=-3.14, p=.002).

Linguistic: Five constructs with significant effects were identified, two of which were predicted by the prior literature. Surprisingly, given the generally positive effects of syntactic and semantic fluency in the prior literature, greater disfluency in language increased click-through rates (ß=.0004811, t(3345)=6.01, p<.001). Headlines with longer sentences, more difficult readability, and higher word count were clicked on more. The presence of numbers in headlines increased click-through rates (ß=.000336, t(3345)=5.75, p<.001), while other aspects of fluency did not have significant effects. Consistent with prior literature, however, making headlines more concrete improved engagement (ß=.0003257, t(3345)=3.87, p<.001). While most linguistic elements of narrative style did not have a significant effect, headlines implying social stories about individuals were more effective (ß=.0009515, t(3345)=9.58, p<.001), but writing headlines directed to the reader backfired (ß=-.0004716, t(3345)=-5.62, p<.001).

Affective: The effects of affective cues were somewhat limited and mixed. Using more emotionally intense language increased engagement (ß=.0004502, t(3345)=5.45, p<.001). However, including more positive emotion words in headlines reduced engagement (ß=-.0004867, t(3345)=-5.66, p<.001), a somewhat ironic finding given Upworthy's mission of providing positively oriented content.

Overall, after correcting for multiple comparisons, out of the constructs for which the literature provided predictions, the results were as predicted for about 20%, non-significant for 60% and the opposite of what had been predicted for 20% of constructs. Our findings provide a unique test of a wide range of persuasion-relevant theories, in an important real-world context, and illustrate how to use large-scale atheoretical experimentation to test theories of behavior.

Impact of Foreign Language labeling on Food Valuation and Choice

Akshina Banerjee, University of Chicago Booth, USA
Oleg Urminsky, University of Chicago, USA

EXTENDED ABSTRACT

Marketers often use textual prompts to grab consumer attention and create value from intangible experiences, which in turn can affect the consumers' choices (*Wakefield & Blodgett, 1999; Ellis & Rossman, 2008*). When consumers read textual cues, they not only consumer literal information but engage in a psycholinguistic "guessing game" about interpretation (*Goodman, 2014*). To study consumer choice, we investigate mixed language cues, in which one part is in an unknown (and hence, unreadable and non-informative) foreign language, and the other is in the consumers' native language. Prior research (*Piron, 2000; Chattalas et al., 2008*) has documented that "country of origin" labels can provide both informational and intangible benefits, affecting consumer preference. We use the domain of food, holding country of origin constant, and test for intangible benefits from the use of foreign language on restaurant menus and product labels, where such language cues are commonly used.

In Study 1 (N=501, pre-registered) we elicited participants' willingness-to-pay (WTP) for items on a hypothetical menu, in a 2 (language: English only vs. bilingual) x3 (cuisine: French, Korean or Turkish) between subjects design. Participants were shown a single menu and asked to provide their (WTP) for each item. WTP was higher for the items on the bilingual menus (with text in both English and the language of the cuisine) than the items on the English-only menus (Mean = $9.97 vs. $7.37, p < 0.001) overall (Fig. 1), as well as for two out of the three cuisine types. Furthermore, the bilingual menus were perceived as more authentic and hence of higher quality, which in turn predicted the higher WTP, yielding a marginally significant indirect mediation effect (p =0.068). In Study 2 (N=364, pre-registered), we replicated Study 1 across location types (urban vs. rural).

In Study 3 (N=685, pre-registered) we looked at choices between two menus. In a 2 (language, within) X 3 (cuisine, between) mixed design. Participants in this study were shown two menus (one bilingual and one English only, order counterbalanced) for a given cuisine type. Then they were asked to choose between the two, or to indicate indifference (to avoid tie-breaker effects). Only 13% of the participants were indifferent. Among the remaining 87%, the majority of consumers (66%) chose the bilingual menu (Fig 2). This preference occurred because the bilingual menu was seen as more authentic and of higher quality, significantly mediating the effect of menu language (indirect mediation effect, p<0.001).

In Study 4 (N=720, pre-registered), we used a 2 (language) X 3 (cuisine) between-subjects design to test the effect of bilingual cues on packaged goods choices (types of soup) involving price differences. We showed participants images of two canned soups. The target soup's label was either bilingual or English only for the assigned cuisine. The control soup was a standard chicken noodle soup with an English-only label. After participants viewed both options, they completed a series of choices between the control soup for $2.50 and the target soup (with prices varied between $0.50 and $5). Nearly half (48%) of the participants chose the target soup when both were the same price. However, among those people who preferred the target soup, the indifference price for the bilingual label ($3.61) was higher than the indifference price for the English only label ($3.43, p=0.043) (Fig 3). As in the prior studies, the bilingual-label soup was seen as more authentic and unique, and hence of higher quality.

In Study 5 (N=689, pre-registered, 2X3 between subjects), we tested the robustness of the bilingual menu effect to the presence of another available authenticity cue in a 2 (language) x 3 (chef bio: control vs. American vs. Turkish) between-subjects design. Participants saw an English-only or bilingual Turkish restaurant menu, with the biography of a chef who either was born in and studied in Turkey (authentic), born and studied in the US (inauthentic), or an uninformative control (no country mentioned), and measured WTP and visit intention. We replicated our previous finding of higher WTP for the bilingual men in the control condition (M=$8.99 vs. $10.57, p=0.019) and US chef (M=$8.62 vs. $10.79, p<0.001). However, when the chef was born and raised in Turkey, the WTP did not differ significantly by language of menu (p=0.176), although the interaction was not significant (Fig 4). The higher WTPs were mediated by perceptions of authenticity, uniqueness, and quality (indirect effect p<0.006 for both control and US biographies).

Participants were significantly more willing to go to the restaurant with the bilingual than English-only menu for both the inauthentic (92% vs 63%, p<0.001) and control (90% vs 68%, p=0.007) biographies. For the authentic biography, the menu language had no effect on visit intentions, but intentions were significantly lower for the bilingual authentic biography menu than the other two bilingual biography menus (76% vs. 88%, p=0.0077).Thus, not all indicators of authenticity have the same effect on choice, and bilingual menus may be a more effective signal of authenticity than other signals (e.g., chef bio) when other signals have negative associations.

Finally, in study 6 (N=612; pre-registered, 2X3 mixed design), we confirmed that the effect of language holds across tiers of restaurant in a 2 (language, within) X 3 (tier, between = high: fine dining, middle: casual dining, or low: local takeout; pre-tested) mixed design. Only 15% of participants were indifferent between the two menus. In each tier, participants preferred the bilingual menu over the English only (70% vs 39% for fine dining, 59% vs 25% for casual dining, 68% vs 48% for local takeout; all p's<0.008) (Fig. 5). Overall, choice was significantly mediated by perceptions of authenticity, uniqueness, and quality (indirect effect p<0.001).

These six studies show, through multiples scenarios, that non-evaluable cues of foreign origin can signal authenticity and quality, increasing valuation and choice.

The Experience Impinging Effect: How Contagion Affects Consumer Choice in Sharing-Based Consumption

Tu Tu, Iowa State University, USA
Huifang Mao, Iowa State University, USA
Xiaojing Yang, University of South Carolina, USA

EXTENDED ABSTRACT

Prior research has documented a consumer contagion effect, which holds that consumers devalue products that others have touched due to the fear of physical contamination, and prefer untouched alternatives (e.g., Argo, Dahl, and Morales 2006). Specifically, consumers perceive products that have been touched by others as disgusting (Rozin and Fallon 1987), thanks to the belief that offensive substances (e.g., germs) are transferred through physical contact (Rozin, Markwith, and McCauley 1994).

Despite being well-established in various contexts where consumers evaluate products for purchase decisions (Huang, Ackerman, and Newman 2017), this effect appears understudied in sharing-based consumption, in which consumers pay for temporal access to a product to gain consumption experiences (e.g., access to a restaurant table or gym equipment; Bardhi and Eckhardt 2012; Chen 2009). Given that rights to access the product transfer frequently among consumers, all consumption options in such contexts have been touched previously. This raises an interesting question of whether the documented contagion effect still holds when there is no untouched alternative. As sharing-based consumption becomes increasingly popular and important (Bardhi and Eckhardt 2012), our research aims to answer this question by examining whether, how, and when prior contacts with others affect consumer choices in sharing-based consumption.

We argue that contagion persists in sharing-based consumption, although driven by a different mechanism. In sharing-based consumption, oftentimes, all options are physically contaminated, often, to undistinguishable degrees (e.g., all tables in a restaurant). Thus, the physical contamination account would predict all choices as equally unfavorable and no difference in consumer preferences. However, considering that consumers engage in sharing-based consumption to acquire consumption experiences rather than product ownership, they tend to be particularly sensitive to factors that may impinge their experiences (Bardhi and Eckhardt 2012; Chen 2009). Specifically, since consumers are well aware that all options have been contacted with, a vivid mental imagery of a prior contact between a consumption option and another consumer, such as resulted from witnessing the contact, may serve as a distraction and dampen consumers' own experience. Consequently, fear of such psychological contagion may shift consumers to other options. Thus, we propose the psychological contagion effect, which is activated by imagery of a prior contact and reduces consumer choice of the option in sharing-based consumption.

Following our logic, disgust, the underlying mechanism of physical contamination, also cannot fully explain the psychological contagion effect, because all consumption options have been touched, and therefore, are "disgusting." Instead, we propose that the psychological contagion effect is driven by experience impinging, defined as the extent to which one's consumption experience is infringed by unwanted distractions. After witnessing a consumption option being used, the mental images and subsequently aroused feelings of disgust would interfere with and tarnish the consumer's own experience (Kirk, Peck, and Swain 2018). To avoid the potential impinging to their own consumption experiences, consumers would be motivated to shift their choices toward other alternatives.

Finally, we propose a boundary condition of the psychological contagion effect, perceived risk, which refers to the probability of negative consequences associated with a consumption option choice (Campbell and Goodstein 2001). When perceived risk in using a consumption option (e.g., product failure) is high, witnessing a consumption option being used signals adequate functionality and performance and would positively influence consumer choices, resulting in the positive risk-reducing effect offsetting the negative psychological contagion effect. Hence, we anticipate witnessing a prior contact only reduces choice when perceived risk is low.

Studies 1 and 2 examine the psychological contagion effect and its underlying mechanism by adopting a one-way (imagery: a prior contact vs. control) between-subjects design. In different contexts (a public swimming pool and a restaurant), participants were presented with sketches showing either a consumption option being used by another customer (imagery) or none of the consumption options being used (control). To rule out the recency of the witnessed contact as an alternative explanation, study 2 specifies that the witness occurred one week prior to the choice. In both studies, participants were significantly less likely to choose the consumption option after witnessing it being used. More importantly, this effect is serially mediated by disgust and experience impinging, but not solely by disgust. Study 3 directly manipulates the degree of physical contamination to seek further evidence that the proposed effect is driven by psychological impinging rather than physical contamination. With a 2 (physical contamination) × 2 (imagery) between-subjects design, we found that only imagery significantly impacted consumer choices, suggesting that psychological impinging overpowers physical contamination. Finally, study 4 explores the moderating role of perceived risk using a 2 (imagery: a prior contact vs. control) × 2 (perceived risk: low vs. high) between-subjects design. As expected, the psychological contagion effect occurs only when the perceived risk is low.

Across four studies, we found convergent evidence for the psychological contagion effect and showed that contagion indeed matters in sharing-based consumption. Although consumers are aware that all consumption options have been contacted by others, witnessing an image of a prior contact makes feelings of disgust salient and subsequently, shifts consumer choice to other options. Importantly, this effect occurs because consumers do not want their own consumption experiences to be impinged by the imagery of another consumer using the product.

Our research contributes to the relevant literature by introducing the psychological contagion effect, which is distinct from previously established physical contagion effects (Fedotova and Rozin 2018; Huang et al. 2017). The psychological contagion effect targets consumers' experiences and drives their choice regardless of the degrees of physical contamination. Moreover, our findings offer pertinent practical implications to marketers in the sharing-based consumption industry. With the proliferation of sharing-based consumption in the current marketplace, consumers frequently choose product options for temporal access (Eckhardt and Bardhi 2016; Eckhardt et al. 2019). While it is a common marketing strategy to showcase other consumers using the product, we caution such a strategy may negatively impact consumer choices in sharing-based consumption contexts.

Self-Other Differences in Perceptions of Debt

Rafael Batista, University of Chicago Booth School of Business, USA
Abigail Sussman, University of Chicago Booth School of Business, USA
Jennifer Trueblood, Vanderbilt University, USA

EXTENDED ABSTRACT

This project examines how people think about debt when it is their own versus another's. We provide evidence that, holding net worth constant and providing complete information about debt and assets, people tend to focus on different sides of the balance sheet when thinking of themselves versus others. Across five experiments, we find that people tend to focus more on debt when thinking of themselves versus others. We discuss implications for conspicuous consumption.

In Experiment 1, we examine expectations for the future while holding wealth constant for self and others. 495 participants were randomly assigned to one of four conditions in a 2 (Self; Other) by 2 (Positive; Negative Net Worth), between-subjects design. Participants were told that they would be shown 20 financial profiles - either another individual's or, hypothetically, their own - and that their task would be to predict what the financial situation would look like in one year. For example, a participant might have been asked to "Imagine that [you have / Mr. G has] $2,500 in assets and $1,300 in debt." For each profile, participants were then asked to predict how much they (or this other person) would have in assets and in debt in one year; specifically, "In 1 year, what do you estimate [your / Mr. G's] assets will be?" and "In 1 year, what do you estimate [your / Mr. G's] debt will be?" Participants tended to be more optimistic about their own future wealth relative to their expectations of others'. Specifically, this increased optimism appeared to be driven by participants' beliefs that their own debt would shrink more than other people's over the course of one year ($t = 3.7$, $p < .001$); there were no self-other differences in predictions about assets.

In Experiment 2, we borrow from the Experiment 1 design to investigate the origins of these expectations, by eliciting written explanations for each response. We code each response as either reducing debt or growing assets. We find that participants focused more on repaying debts when thinking about themselves, but focused more on growing assets when thinking about others ($\chi^2 = 15.67$, $p < .001$).

Experiments 3a and 3b then explored how focus on debt might shape perceptions of overall wealth for self and others when provided with full information about a large purchase; in this case, a car or a house. We varied the price of the house and car as well as the amount of debt used to finance the purchase. Others were seen as more financially well-off (Exp 3a: $b = .22$, $p < .001$, 95% CI [.15, .29]; Exp 3b: $b = .24$, $p < .001$, 95% CI [.18, .30]). Importantly, this effect was larger for others with higher priced homes (Exp 3a: $b = .20$, $p < .001$, 95% CI [.10, .30]) and higher priced cars (Exp 3b: $b = .34$, $p < .001$, 95% CI [.25, .44]). That is, at higher levels of debt, the price of the asset affected perceptions of wealth more for others than for the self. This suggests perceptions of wealth for the self are shaped by the relative amount of debt with little weight placed on the asset's price. In contrast, for others, wealth is seen as a function of debt and the price of the asset.

Experiment 4 replicated the findings of Experiment 3a and 3b while adding a third condition which asks participants to consider how others might see them. We find that perceptions of wealth differ when considering how you would evaluate others versus how they would evaluate you. To the extent that people care about how others come to judge them, these differences introduce a conflict between one's self-image and their social image. Beliefs about one's social image appear to be an exaggerated version of their self-image - people believe others will see them as *less* wealthy (than they see themselves) when buying cheaper products (Car: $b = -.45$, $p < .001$, 95% CI [-.55, -.36]; House: $b = -.27$, $p < .001$, 95% CI [-.37, -.17], and as *more* wealthy when buying more expensive products (Car: $b = .78$, $p < .001$, 95% CI [.65, .91]; House: $b = .81$, $p < .001$, 95% CI [.67, .95]). Interestingly, people see others' differently from how they imagine others' seeing them.

Together, this evidence suggests that when looking to the future, people are more optimistic about their own financial outlook than they are about others'. This effect is driven, at least in part, by a differential focus on shrinking debt for oneself. Consistent with this differential focus, participants' perceptions of their own wealth are shaped more by the relative amount borrowed than the total value of the product. When thinking about others, however, assets and debt play a more equivalent role. These findings suggest that people may engage in conspicuous consumption to preserve a positive social image despite the negative consequences for their own financial state and their self-image.

Distribution Builder vs. Slider Scales: What Is the Best Way To Elicit Belief Distributions?

Beidi Hu, University of Pennsylvania, USA
Joseph Simmons, University of Pennsylvania, USA

EXTENDED ABSTRACT

How should researchers assess consumers' beliefs? By far, the most common approach is to simply ask consumers to make a simple judgment or choice (e.g., "What do you think Company X's stock price is going to be one year from today?"; "Which product is most likely to provide the best value?"). But such elicitations omit a great deal of information. Most notably, they fail to capture consumers' beliefs about all possible options or outcomes (e.g., "How likely is Company X's stock to go up 0-2%, 2-4%, 4-6%, etc.?"). To remedy this, researchers have recently embraced the practice of eliciting consumers' entire subjective belief distributions. Our research compares two common ways of eliciting such belief distributions and indicates that one of those ways is probably better.

To elicit consumers' subjective belief distributions, researchers typically provide a graphical interface that (1) divides the entire range of options into several mutually exclusive and collectively exhaustive categories, and (2) asks participants to estimate the frequency of each category (if the task asks them to do their best to reproduce an existing distribution) or the probability that the true outcome will fall into each category (if the task asks them how likely each outcome is to materialize).

Two variants of this approach have been most frequently used: the *Subjective Probability Interval Estimates (SPIES)* method proposed by Haran, Moore, and Morewedge (2010) and the *Distribution Builder* proposed by Goldstein and Rothschild (2014; see also Sharpe, Goldstein & Blythe, 2000; Goldstein, Johnson & Sharpe, 2008). Both methods allow participants to create a visual histogram that best represents their subjective distribution. The key difference between the two methods is the interface. The SPIES interface (Haran et al., 2010) contains an ordered array of horizontal slider scales, each representing one category. Participants assign probabilities to each category by sliding the bars from left to right. The Distribution Builder (Goldstein & Rothschild, 2014; Andre, 2016) contains a graphical interface that allows participants to allocate a fixed number of balls into vertically displayed bins, each representing one category.

Both methods have been adopted to study a wide range of consumer research topics, such as financial decision making (Sharpe et al., 2000; Goldstein et al., 2008; Long, Fernbach, & De Langhe, 2018; Camilleri, Cam, & Hoffmann, 2019; Reinholtz, Fernbach, & De Langhe, 2021), consumers' perceptions of income distributions (Page & Goldstein, 2016), statistical intuitions (Hofman, Goldstein, & Hullman, 2020; Andre, Reinholtz & De Langhe, 2021), and overconfidence (Ren & Croson, 2013; Moore, Carter, & Yang, 2015; Moore et al., 2017; Prims & Moore, 2017; Soll et al., 2019). There is currently no research investigating how these two methods might induce different response patterns or whether one of them might be superior.

In this paper, we report the results of seven pre-registered experiments (N = 10,815) that investigate whether SPIES vs. Distribution Builders yield different response patterns and, specifically, whether one method leads to more accurate distributions. We examined accuracy using three different paradigms. In the first paradigm, participants were instructed first to observe a set of numbers as frequencies and then to do their best to reproduce the distribution of the numbers they saw. We recorded the absolute deviation of individual responses from the normative answer across all categories to derive a measure of individual-level accuracy. In the second paradigm, we moved away from memory tasks and instead assessed the accuracy of participants' subjective probability distributions for general knowledge questions. We operationalized accuracy as the probability allocated to the category containing the correct answer. Finally, we used an incentive-compatible design to examine which elicitation method more accurately reflects people's true beliefs. Participants made predictions by providing their entire belief distribution. They also indicated confidence in their predictions using a self-report measure and decided how much to wager on their predictions. We derived participants' confidence in their prediction implied by the belief distribution and computed the absolute difference between that and self-reported confidence.

In every study, we manipulated whether participants used SPIES or Distribution Builder to indicate their belief distributions, and in most studies, we also manipulated the shape of the correct distribution (i.e., right-skewed, symmetric, left-skewed).

Our findings reveal that Distribution Builder elicits more accurate belief distributions than SPIES whenever the true distribution is not right-skewed. This was directionally true in 10 of 10 head-to-head comparisons, and significantly so in 5 of them. The average effect size for those 10 comparisons was $d = 0.16$. When the true distribution was right-skewed, the findings are more mixed. SPIES directionally, but non-significantly, outperformed Distribution Builder in 4 of 8 comparisons (average effect size: $d = 0.07$). In the other 4 right-skewed comparisons, Distribution Builder yielded directionally superior results, of which 2 were significant (average effect size: $d = 0.10$).

These somewhat complex results can be at least partially explained by a simple mechanism. Compared to participants who use Distribution Builder, participants who use horizontal slider scales (i.e., SPIES) tend to (1) start with the first and lowest categories of outcomes, and (2) subsequently assign higher frequencies and probabilities to those low categories. When the true distributions are right-skewed, containing more mass in the lowest categories, this form of biased responding can sometimes yield more accurate distributions. But when the true distributions are not right-skewed, this form of biased responding proves harmful, and accuracy suffers relative to Distribution Builder. On balance, these results suggest that, all else equal, it is probably best to assess subjective belief distributions using Distribution Builders rather than horizontal slider scales.

Given the rising popularity of both the Distribution Builder and the SPIES, our research affords a practical recommendation for future consumer research. All else equal, the Distribution Builder is the preferred method to elicit belief distributions. Furthermore, whereas a large prior literature shows that discrete subjective estimates can be influenced by elicitation methods (Juslin, Wennerholm, & Olsson, 1999; Klayman et al., 1999; Teigen & Jorgensen, 2005; Funke, 2016; Thomas & Kyung, 2019), our research shows that the same is true of subjective belief distributions.

Authentically Creative? Identifying and Reconciling the Tension between Authenticity and Creativity

Shiyu Yang, University of Illinois at Urbana-Champaign, USA
Jack Goncalo, University of Illinois at Urbana-Champaign, USA
Olga Khessina, University of Illinois at Urbana-Champaign, USA
Kyle Emich, University of Delaware, USA

EXTENDED ABSTRACT

Perceptions of authenticity are associated with a number of positive market outcomes, such as product appeal and customers' willingness to pay (Frake 2017; Kovács, Carroll, and Lehman 2014). Consequently, many marketers are in pursuit of products and services that are experienced as authentic.

Yet, given the complexity of the marketplace, it is unlikely that authenticity is the only objective that an organization might pursue (Smith and Besharov 2019). Indeed, even as the call for authenticity has grown in strength, there has been an increasing demand for creativity – the production of solutions that are both novel and useful (Amabile 1996). It remains to be seen whether it is possible to successfully achieve both objectives at the same time. In this paper, we investigate the possible tension between authenticity and creativity.

Although various literatures differ in their specific definitions of authenticity, generally they refer to authenticity as that which is "real" or "genuine" or "true" (Dutton 2003). To make an authenticity judgement, observers conduct a verification process in which they test an entity against a relevant referent (Dutton 2003; Lehman et al. 2019). When the referent is a market category, an entity is perceived as authentic to the extent that it is a typical representative of the given category (Lehman et al. 2019). When the referent is a point of origin, an entity is perceived as authentic to the extent it adheres to traditions and maintains a connection with its past (Frazier et al. 2009; Smith, Newman, and Dhar 2017).

Because creative insights likely emerge when individuals combine knowledge in atypical ways, generate new categories of ideas, and depart from the point of origin to a novel frontier, it seems that a salient concern with maintaining the authenticity of an entity might be at odds with suggesting creative ways to modify that entity. Authenticity requires fidelity to a referent while creativity often requires the willingness to break from a referent. Hence, authenticity concerns, defined as concerns with preserving, maintaining, or increasing a given entity's authenticity, might place constraints on the categories, features, functions, components, or resources that might be allowed to be modified to reach creative solutions.

Hypothesis 1:   Individuals concerned with preserving the authenticity of an entity will be less likely to suggest creative ways to modify that entity.

We predict that the suppressing effect will generally hold, but for one important exception—when the referent itself is based on creativity. For example, a referent for the "true" craft microbrewery is a market category that constantly comes up with new beer flavors and experiments with wide variety of styles (Verhaal, Khessina, and Dobrev 2015). As a result, a brewery that exercises creativity in its products is *more* likely to be seen as authentic compared to a brewery that does not undertake such creative changes. If a referent is based on creativity, the desire to preserve the entity's authenticity will motivate individuals to share rather than suppress their most creative ideas directed to this entity.

Hypothesis 2. Individuals concerned with preserving the authenticity of an entity will be more likely to suggest creative ways to modify that entity when creativity is itself the referent upon which authenticity is based.

We conducted four studies to test the predictions. Using a cross-sectional dataset with 3,323,861 reviews from 46,453 restaurants, Study 1 found a significant negative relationship between restaurant authenticity and creativity in customer reviews. Next, Study 2 recruited 199 participants to generate either "an authentic burger recipe" or "a high-quality burger recipe". Results showed that the authenticity condition generated recipes that were less creative than the high-quality condition. Mediation analysis confirmed that participants' increased concerns with preserving a burger's authenticity mediated the negative effect. Study 3 built upon Study 2 by examining self-brand identification (Escalas 2004) as a boundary condition. 122 participants performed on a logo design task for Starbucks. Participants assigned to the authenticity condition read that authenticity is the top priority at Starbucks. Participants in the control condition proceeded with the drawing task without seeing the cues of authenticity. Results revealed a significant moderated mediation effect, such that among participants who identify strongly with Starbucks, authenticity condition led to increased concerns with preserving the brand's authenticity, which in turn decreased their creativity in the logo design task. However, this effect was absent among participants with low self-brand identification.

The results of previous studies support H1. To test H2, we chose the context of the beer brewing market. Research has shown that audiences use a brewery's creativity in products as a key criterion in making authenticity judgments about the brewery (Verhaal et al. 2015). The craft breweries' genuine passion to make the best beers possible in a great variety of styles and flavors is what makes audiences see microbreweries as highly authentic. Therefore, craft breweries are expected to be more inventive and experimental in their beer offerings compared to mass producers (Verhaal et al. 2015). In this context, being creative and being authentic are congruent demands, making the context appropriate for testing H2. In Study 4, 203 beer consumers were randomly assigned to generate product ideas for a well-known microbrewery called *Flying Dog Brewery* (authenticity condition) or for the mass beer producer *Budweiser* (control condition). Participants in the authentic brewery condition generated beer flavors that were more creative than participants in the control condition. Results also revealed that authenticity concerns positively predicted creativity for the authentic brewery, but not for the mass brewery.

To conclude, we develop a theoretical perspective pointing to a potential cost of pursuing authenticity. Because authenticity demands adherence to tradition, conformity to a category, and/or connection to a point of origin, the desire to maintain authenticity may stifle the pursuit of creative ideas. Using experimental and archival methods, we find converging evidence that authenticity dampens creativity. Importantly, we also identify the context in which this effect could be reversed. When being creative is within the scope of what

authenticity connotes, authenticity becomes a facilitator rather than an inhibitor of creativity.

Happy Workers are "Rich" Consumers: Enjoyable Earnings Inflates Subjective Income

David Dolifka, UCLA Anderson School of Management, USA

EXTENDED ABSTRACT

Earning and spending are closely related: the former enables the latter, and the latter motivates the former. Yet, these two sides of the consumer's financial equation are often regarded as separate, rather than connected processes. Drawing upon prior work in both labor economics and consumer psychology, I consider how the experience of earning impacts how consumers perceive and use their income. This research suggests consumers with enjoyable work perceive their income to be larger and their costs to be relatively cheaper and less painful.

Prior research on compensating wage differentials in labor economics demonstrates nonpecuniary job attributes impact market-clearing wages (Rosen 1986). For example, hazardous, risky, or effortful work may require a wage premium (Cousineu, Lacroix, and Girard 1992), while meaningful and purposeful work may attract labor at lower wages (Ariely, Kamenica, and Prelec 2008; Leete 2001). Applying this theory of wage differentials, consumers with more enjoyable work should have lower reservation wages (H1a). If consumers compare their actual salary against their required salary, this difference will grow as reservation wages drop. Prior work on the perceived value of money (Wertenbroch, Soman, and Chattopadhyay 2007) suggests this type of difference assessment may cause enjoyable income to feel larger (H1b). Because consumers assess costs by comparing against salient financial quantities (Morewedge, Holtzman, and Epley 2007), enjoyable work should decrease subjective cost judgments (H2a) because expenses are compared against a larger subjective income (H2b). As a result, enjoyable work may increase spending (H3).

S1 ($N = 200$) tests the links from work enjoyment to reservation wages and subjective income. Participants read a job description for enjoyable or unenjoyable work. After indicating their reservation salary, participants learned the job paid $65,000 and indicated how large this amount felt (0-100 slider). Consistent with H1a, participants required a lower salary for the enjoyable job ($M = \$45,899$, $SD = \$16,589$) than the unenjoyable job ($M = \$53,168$, $SD = \$17,985$; $t(198) = 2.97$, $p = .003$). As predicted by H1b, $65,000 felt larger in the enjoyable condition ($M = 70.8$, $SD = 26.0$) than in the unenjoyable condition ($M = 60.2$, $SD = 28.0$; $t(198) = 2.78$, $p = .006$).

S2 ($N = 400$) surveys participants about their work and financial experiences. Subjective income was measured as perceptions of financial slack (Zauberman and Lynch 2005) and subjective costs were measured using the pain of paying for various items with specified prices (see Morewedge et al., 2007). Participants subsequently indicated their work enjoyment and actual income (binned). Controlling for income, work enjoyment was positively associated with slack ($b = 0.31$, $se = 0.05$, $t(388) = 6.00$, $p < .001$) and negatively associated with the pain of paying ($b = -0.18$, $se = 0.04$, $t(388) = -4.72$, $p < .001$).

S3a-S3b experimentally manipulate imagined work enjoyment. Participants first provided various baseline pain of paying ratings. Next, they recalled a past or present full-time job and imagined the most (least) enjoyable aspects of the job. Finally, they estimated their pain of paying for a focal item using wages from the imagined job; this was used to create a within-subject reduction of pain difference score. In S3a ($N = 250$), the enjoyment condition did not affect actual income expectations ($p = .258$); however, it did affect (i) how large the income felt and (ii) the reduction in pain of paying with wages from the imagined job (ps < .05). Consistent with H2a and H2b, sub-jective income mediated the effect of condition on the reduction of pain ($ab = 0.30$, $CI_{95\%} = [0.07, 0.55]$) in a model with a significant total effect ($c = 0.52$, $p = .013$) and no direct effect ($c' = 0.22$, $p = .323$).

S3b ($N = 601$) rules out an alternative explanation for these results: mood. Using a 2 (enjoyment: enjoyable, unenjoyable) x 3 (situation: work, volunteer, watch TV) between-subjects version of S3a, I predict the effect of enjoyment should operate through imagining work (as in S3a) and not through imagining a volunteer or TV-watching situation. This pattern would suggest the process operates through financial comparisons, as opposed to incidental changes in mood. As expected, the enjoyment manipulation affects perceptions of slack in the work condition ($b = 0.46$, $se = 0.09$, $t(595) = 5.22$, $p < .001$). This effect was attenuated in both the volunteer and TV conditions, as indicated by the two negative interactions ($b_{VxE} = -0.28$, $se = 0.12$, $t(595) = -2.27$, $p = .023$; $b_{TVxE} = -0.37$, $se = 0.12$, $t(595) = -3.02$, $p = .002$). The same pattern emerges for the reduction in pain of paying (interactions below $p < .01$).

S4 ($N = 399$) replicates S3a in a real-effort setting. Participants sorted through pairs of images. The images were either food photos (enjoyable) or shades of the color gray (unenjoyable). Using the 0-100 slider, the fixed earnings felt larger in the enjoyable condition ($M = 69.7$, $SD = 23.2$) than in the unenjoyable condition ($M = 64.1$, $SD = 26.3$; $t(397) = 2.26$, $p = .024$). Again, subjective income mediated the relationship between condition and pain of paying ($ab = -0.13$, $CI_{95\%} = [-0.26, -0.02]$).

S5 tests the effect of enjoyable earnings on spending (H3). Workers on Prolific read a memo about some possible changes to the platform and were reminded of their projected future earnings, calculated from prior hours on the site. Following enjoyable changes, participants anticipated a greater likelihood of using projected earnings to purchase a $35 meal delivery ($M = 2.88$, $SD = 1.88$) compared to unenjoyable changes ($M = 2.16$, $SD = 1.38$; $t(198) = 3.09$, $p = .002$).

This research makes four contributions. First, it establishes a link between work enjoyment and reservation wages. Second, it presents a novel theory connecting the experience of earning to the consumer's judgments of income size. Third, this extends prior work on perceived costs (Morewedge et al. 2007) by demonstrating that subjective—as well as objective—quantities may be used as financial referents. Fourth, this paper suggests nonpecuniary work attributes may affect consumer spending.

Give a Little Help for My Business: How a 'Vulnerability Appeal' Fosters Consumers' Prosocial Behavior Towards For-Profit Companies

Lucia Barros, FGV EAESP, Brazil
Farah Diba Abrantes-Braga, Insper, Brazil
Cristiane Chammas, Centro Universitário FEI, Brazil
Murilo Costa Filho, Centro Universitário FEI, Brazil

EXTENDED ABSTRACT

Past research has extensively studied *who*, *why*, and *when* people help others. However, for *whom* assistance is given has been limited to non-profit organizations or for-profit firms engaged in social marketing and people. Helping a distressed for-profit generate revenue has never been the target of academic research, perhaps due to common-sense assumptions that for-profit firms are unlikely targets of helping behavior. Indeed, research has demonstrated that people express anti-profit beliefs, perceiving for-profit businesses as immoral and harmful (Bhattacharjee et al. 2017), cold (Aaker et al. 2010), and elicit anger when they are perpetrators of transgressions, but no empathy when they are victims (Rai & Diermeier 2015). Notwithstanding, we argue that, in specific circumstances, for-profit companies might elicit empathy when they become victims, and the company's vulnerability may sensibilize consumers to help them.

In this paper, we propose a novel type of message, the 'vulnerability appeal,' which makes salient an organization's vulnerability under difficult circumstances and asks consumers to help them survive by purchasing from them. We argue that by overtly exposing the firm's susceptibility to hardships and, at the same time, maintaining its expected market function by requesting consumers to purchase, instead of donating, such an appeal is likely to be successful. In this research, we investigate the effectiveness of the 'vulnerability appeal' in the risky situation of the COVID-19 pandemic. As a result of social isolation and lockdowns, a significant number of businesses found themselves closed and became vulnerable, representing an appropriate context to test the effectiveness of the proposed appeal. In five studies, we show that consumers are more willing to purchase products to help companies, responding to a vulnerability appeal, than a conventional appeal. Our findings show that this effect is mediated by empathy and personal norms.

In study 1, participants (n =355) were randomly allocated to one of three conditions (type of message: vulnerability appeal to a for-profit business vs. vulnerability appeal to an entrepreneur vs. control). The vulnerability appeal message emphasized that companies were at risk of going bankrupt due to lock-down measures that forced them to close during the COVID-19 pandemic. Participants were requested to think of a restaurant they liked. Following, they read a message urging them to join a campaign to help the restaurant survive the crisis by purchasing a voucher from a restaurant to use later. The control message did not mention that the restaurant was in trouble and was framed as a conventional campaign ('buy today, enjoy later'). As predicted, participants' intentions to purchase and willingness to spend on the voucher were higher when exposed to the vulnerability appeal (both business and entrepreneur conditions, which did not differ) than in the control condition.

In study 2, we conducted a field experiment in partnership with a coffee shop located at a university campus, used the same message appeals as in Study 1. Students and staff from the university (*n* =252) received one of two messages (vulnerability appeal vs. control) to purchase a voucher from the coffee shop up front and consume later by clicking on a link provided. Replicating Study 1, more participants clicked on the link in the vulnerability appeal condition than in the control condition. Study 3 tested whether the effect was due

to perceptions of the company's vulnerability. Participants (n =397) were randomly assigned to one of four conditions: 2 (message type: vulnerability appeal x control) x 2 (firm's vulnerability: high x low). We used the same manipulation of the type of message as in Study 1. The vulnerability was manipulated by making participants think of either a small (high vulnerability) or a big restaurant (low vulnerability). Indeed, results showed that participants were more likely to purchase the voucher in the vulnerability appeal condition than in the control condition when the vulnerability was high, but not when the vulnerability was low.

In study 4, we tested the mediating effects of empathy and personal norms. Participants (n = 231) were asked to read either of the two scenarios in Study 2. Results replicate previous studies. Purchase intentions were higher in the vulnerability appeal than in the control condition. Also, the vulnerability appeal elicited more feelings of empathy and moral obligations to participate in the campaign than the control condition. A mediation analysis using PROCESS model 6 (Hayes, 2018) supported our model: vulnerability appeal elicited more empathy, which elicited personal norms, which in turn increased willingness to purchase.

Finally, in study 5, we ran a survey to investigate whether consumers' motivation to purchase vouchers during the pandemic was to help a for-profit business. Respondents (n =314) answered which (if any) products they had purchased during the quarantine. Participants were then requested to rank their primary motivation for this purchase. 16.6% of respondents reported having bought a voucher, 40.4% of which did it to help a firm. Interestingly, consumers who purchased the voucher (n = 52) were mainly motivated to help (59.6%), either the firm (40.4%) or its owner (19.2%). Conversely, consumers who had not purchased vouchers (n =217) were mainly interested in the product itself (70.5%). Thus, many consumers reported purchasing with the primary purpose of helping a for-profit business.

Overall, the findings from our studies provide evidence that consumers can be moved by for-profit firms in risk if their vulnerability is explicitly made salient by a direct appeal, a vulnerability appeal. Specially if companies are in danger that are caused by traumatic events beyond their control (e.g., COVID-19 pandemic), consumers may be motivated to support the firm by committing to purchase its products. Understanding that consumers care about vulnerable firms to the point of purchasing products to avoid them going out of business is not only novel and interesting per se, but it also has relevant theoretical and practical implications. We have shown that, despite negative general anti-profit beliefs, for-profit companies can elicit empathy and sensitize consumers to help them in specific circumstances.

Should a Luxury Brand's Chatbot Use Emoticons?

Yuan Li, Georgia Southern University, USA
Hyunju Shin, Georgia Southern University, USA

EXTENDED ABSTRACT

The luxury industry constantly faces new challenges due to changing market dynamics. The recent global pandemic has been a major setback for luxury brands and makes online sales important. AI powered chatbots, as virtual agents, have allowed luxury brands to interact online with customers (Luo et al. 2019). Though chatbots are adopted by many luxury practitioners, empirical evidence on how luxury brands need to leverage their AI chatbot application remains limited.

As research interest in AI has grown, scholars have explored various ways to make chatbot communication resemble human interactions. One such way is through the use of emoticons, the textual or pictorial icons that are used in digital communications to express emotion (Derks et al. 2008). Most existing research focuses on human-to-human interactions. Little is known about customer reactions toward the chatbot's emoticon usage in the luxury brand context. Therefore, this research aims to examine the efficacy of a chatbot's use of emoticons by luxury brands on the status perception of the brand. We propose chatbot emoticon usage in luxury brand communications leads to a lower luxury status perception because it reduces the appropriateness perception. Such negative effect only exists for aspiration luxury brands but not for masstige brands.

There are three theoretical accounts we've drawn from the literature to support our propositions. First, the effects of emoticons in brand communication are mixed. Some studies demonstrate that emoticons elicit positive affect, strengthen consumer engagement, and increase purchase intention (Das et al., 2019; Lee and Hsieh, 2019), while others point out that the use of emoticons can backfire. For example, service employees who use emoticons are seen as low in competence but high in warmth (Li *et al*., 2019).

Secondly, practices deemed appropriate for the mainstream may not apply to luxury brands (Moreau et al. 2020; Park, Im, and Kim 2018). Luxury brand communication focuses on catering to privileged customers by highlighting the high status of the luxury brand (Kapferer and Valette-Florence 2018). When luxury brands use emoticons in their chatbot communication, it may violate customers' expectations about the brand's communication. Thus, a luxury brand chatbot's use of emoticons may be perceived as inappropriate and lower the brand status perception.

Third, luxury evolves into a multidimensional construct including both high-end aspirant brands and masstige brands (Banister, Roper, and Potavanich 2020; Kauppinen-Räisänen et al. 2019). Masstige creates a fusion of mass and class (Silverstein & Fiske, 2003). Since masstige brands are primarily targeted toward the masses, the use of emoticons in chatbot communication for masstige brands should not affect the status perception of the brand via perceived appropriateness as much as it does for aspirational brands.

Three studies were designed to test our proposition. Study 1 was a between subject design with 131 undergraduate students. They imagined having a conversation with a luxury hotel's chatbot and viewed one of the two screenshots of the conversation, one with emoticons, the other without emotions. They then rated the status perception for the hotel and whether they perceived the chatbot communication as appropriate following previous literature (Youn, Park, and Eom 2019; Li, Chan, and Kim 2019). Consistent with our hypothesis, results show that the luxury chatbot interaction using emoticon lowers the status perception compared to the ones without emoticons. It also showed the underlying role of perceived appropriateness.

Study 2 extends study 1 by testing perceived unexpectedness as an additional mediator. With a between subject design, study 2 recruited 99 customers from Prolific. All participants imagined that they were shopping online at Rolex and were interacting with Rolex's virtual assistant chatbot. Participants were shown one of the two screenshots of a live chat between a shopper and a chatbot: one with emoticons, the other without emoticons. Participants answered the same questions as study 1 with additional evaluation on unexpectedness (Li, Chan, and Kim 2019). Results replicated a similar finding as study 1. It also supported the mediating roles of perceived unexpectedness and perceived appropriateness.

Study 3 sought to test the important moderating role of the luxury brand type in a fashion brand context. One hundred and seventy-six undergraduate students were randomly assigned to a 2 (emoticon: yes vs. no) × 2 (luxury brand type: aspirational vs. masstige) between-subjects design. Prada and Coach were chosen to represent an aspirational luxury brand and a masstige brand respectively. Study 3 also measured chatbot reuse intention (Venkatesh *et al*. 2003). Study 3's results replicated previous findings and showed that chatbot interaction using emoticons led to a lower reuse intention compared to chatbot interaction without emoticons for luxury brands. However, these effects didn't hold for masstige brands.

Our work makes three theoretical contributions. First of all, this study contributes to the understanding of the role of chatbots in the context of luxury brands. Second, this research explores the effect of emoticons in the context of human-chatbot interaction. Lastly, our findings contribute to knowledge about luxury brand communication. For marketing managers, aspiration brands need to be cautious of the potential risk of lowered status perception when emoticons are used in their chatbot communications.

Nature Human and Machine: Awe for Nature Elevates Preference for Artificial Intelligence through Humanness

Eujin Park, The Open University of Hong Kong, Hong Kong
Shinhye Kim, University of Missouri, USA
Kalynn Coy, University of Missouri, USA

EXTENDED ABSTRACT

While interaction with artificial intelligence (AI), e.g., Alexa, is widespread, a recent poll of more than 6,000 adults (Pegasystems, 2018) found that 38% of participants indicated humans deliver superior customer services than AIs do. Hence, we investigate a solution to embrace interactions with AIs that are, by nature, short in human qualities.

We argue that *awe for nature* can diminish human-centered perspectives since the feeling alleviates hubristic, self-centered perspectives by experiencing "vastness" and "self-diminishment" through nature (Keltner & Haidt, 2003). Machines are often considered as having deficient humanness: emotionality, warmth, flexibility, animation, higher cognition, morality, and sophistication (Bastian et al., 2013). Hence, feeling awe for nature, by reducing the sense that humans are superior and distinct from other beings (Shiota et al., 2007), may alter AI preference.

Hypothesis 1:   *Nature-induced awe reduces humanness.*

Hypothesis 2:   *Nature-induced awe increases AI preference via diminished humanness.*

Study 1 predicts that nature-induced awe (vs. pride) diminishes humanness (H1). Since awe and pride view the self in an opposing manner (Rudd, Vohs, & Aaker, 2012), nature-induced awe (vs. pride) may diminish (vs. enhance) the self (Piff et al., 2015).

Participants (190, 92 women, M_{age} = 40.82) in nature-induced awe and pride wrote about when they felt nature-induced awe and pride through personal accomplishments (Piff et al., 2015) respectively and reported (7 = very likely, 1 = very unlikely) humanness (*alpha* = .90; Bastian et al., 2013), sense (7 = very likely, 1 = very unlikely) of awe, pride, negative, and positive affects.

Participants feeling nature-induced awe (*M* = 5.43, *SD* = 1.14) experienced greater awe than those feeling pride (*M* = 4.23, *SD* = 1.53, $F(1, 159)$ = 32.43, *p* < .001). Yet, participants feeling pride (M = 6.36, SD = 1.01) reported greater pride than those feeling awe for nature (*M* = 4.57, *SD* = 1.9, $F(1, 159)$ = 47.74, *p* < .001). Positive (*p* > .1) and negative affect (*p* > .1) did not vary. Participants feeling awe for nature (*M* = 5.1, *SD* = 1.32) had significantly lower humanness than those feeling pride (*M* = 5.57, *SD* = 1.24; $t(159)$ = -2.26, *p* = .03; H1).

Study 2 anticipates that people with conflicting appraisal processes through in-situ awe for nature (vs. a neutral state) will exhibit less humanness and, in turn, favor AIs as supporters of humans (H2). Participants (104, 48 women; M_{age} = 37.72) in awe for nature watched an extensive outer space scene while those in neutral state watched a clear sky (Zhao et al., 2018). They then reported preference for Artificial Intelligence (AI) as assistants (7 = AI, 1 = human) of financial customer services: banking, finance, and insurance (*alpha* = .85). Then, reported humanness (*alpha* = .91) and affects (see study 1).

Participants in awe for nature (*M* = 5.45, *SD* = 1.21) experienced greater awe than those in neutral state (*M* = 4.1, *SD* = 1.75; $F(1, 94)$ = 19.32, *p* < .001). Positive (*p* > .1) and negative (*p* > .1) affects did not vary. Humanness fully mediated the effect of the awe

for nature on AI assistant preference (PROCESS Model 4; .02, .28; 95% CI; H2).

Study 3 examined whether self-reported awe for nature (vs. pride) affects humanness and alleviates people's disinclination for AIs as self-governing agents in an access-based consumption context that consumers have low concern for outright purchase (H2; Morewedge et al., 2021).

Participants (330, 174 women, M_{age} = 39.95) were randomly assigned to one of 2 (emotion: awe for nature vs. pride) x 2 (favorability: AI vs. human) mixed-subject design conditions. They read about a mock ride-hailing company and reported favorability towards the AI (7 = excellent/favorable/good, 1 = poor/unfavorable/bad; *alpha* = .98) versus human driver (*alpha* = .93). Then, reported humanness (*alpha* = .92) and affects (see study 1).

Participants feeling awe for nature (*M* = 5.58, *SD* = .97) experienced greater awe than those feeling pride (*M* = 3.43, *SD* = 1.6, $F(1, 245)$ = 171.83, *p* < .001). Yet, participants feeling pride (M = 6.19, SD = 1.19) reported greater pride than those feeling awe for nature (*M* = 4.54, *SD* = 1.72, $F(1, 245)$ = 73.15, *p* < .001). Feelings of positive (*p* > .1) and negative affect (*p* > .1) did not vary.

We subtracted favorability of AI driver from that of human driver (i.e., 6 = favor human driver more than AI driver, 0 = no difference in favorability) to test the influence of awe for nature on the preference for humans over AIs. Humanness mediated the effect of awe for nature on preference for humans over AIs (PROCESS Model 4; -.25, -.01; 95% CI; H2).

Extending study 3, study 4 tests people's preference for a real brand with AI service when in threat-based awe for nature; awe for nature may diminish humanness and elevates preference for AI regardless of valence.

Students (329; 163 women, M_{age} = 20.4) were randomly assigned to one of 2 (emotion: threat-based awe for nature vs. neutral) between-subject conditions. They wrote essays for either threat-based awe for nature or about something recently done (Gordon et al., 2017), watched Tesla Self Driving, and reported purchase likelihood (1 = very unlikely, 7 = very likely), humanness (*alpha* = .89), and affects (study 1).

Participants in threat-based awe (*M* = 5.23, *SD* = 1.23) experienced stronger awe than did participants in neutral state (*M* = 3.49, *SD* = 1.58, $F(1, 302)$ = 113.63, *p* < .001). Since threat-based awe was considered as a negative affect (Gordon et al., 2017), participants in awe (*M* = 3.66, *SD* = 1.62) experienced stronger negative affect than did participants in neutral state (*M* = 2.4, *SD* = 1.12, $F(1, 302)$ = 63.3, *p* < .001) and reported weaker positive affect (*M* = 3.59, *SD* = 2.11) than did participants in neutral state (*M* = 4.65, *SD* = 1.73, $F(1, 302)$ = 22.87, *p* < .001). Controlling for willingness to drive/ride in the future, humanness mediated the effect of threat-based awe for nature on purchase likelihood (PROCESS Model 4; .12, 4.3; 95% CI; H2).

Consumption Context on the Big Screen: Context Differences Predict Food Healthiness and Branding in Top-Grossing American Films

Bradley Turnwald, University of Chicago Booth School of Business, USA
Rina Horii, University of Minnesota, USA
Hazel Markus, Stanford University, USA
Alia Crum, Stanford University, USA

EXTENDED ABSTRACT

Consumption behaviors are subject to a host of social, situational, and informational influences in the consumption context. Context effects on consumption are studied broadly across marketing, psychology, behavioral science, economics, and public health (Higgs and Thomas 2016; Rozin and Tuorila 1993; Thomadsen et al. 2018; White, Habib, and Hardisty 2019). The domain of food consumption has garnered particular interest for understanding context effects that promote healthier consumption. From the types of foods available, to which goals are activated, the presence of social others, portion sizes and rituals–context shapes many aspects of healthy food consumption.

While we know that context effects impact consumption in real life, we know little about whether context effects are modeled in popular media. Movies are a central channel of normative influence and can particularly influence viewers' memory, attitudes, preferences, and behavior when integrating products with audiovisual character interaction and plot connection (Russell 2002; Balasubramanian, Karrh, and Patwardhan 2006; Kamleitner and Khair Jyote; Naderer, Matthes, and Zeller 2017). Given the demonstrated impact of food depictions in movies on consumer behavior and the importance of context in shaping food consumption, this research aimed to quantify all aspects of the consumption contexts in which healthier versus unhealthy foods are depicted in movies.

This preregistered study content-coded the consumption context across 9,093 foods from 29,707 minutes of film in the 244 top-grossing American movies released between 1994–2018. The central goal was to test whether the contexts in which foods are depicted, character behaviors, and character demographics differ as a function of a food's healthiness and branding. We define the consumption context broadly to include macro- and micro- levels of the setting (country or culture, urban versus rural, grocery store versus in the home), presence of social others or social rituals (e.g., celebrations, social bonding), identity-relevant factors of the people present in the situation (e.g., age, race, gender, body type) and the verbal and non-verbal behaviors that they display towards the foods. Because American movies reflect cultural norms, our core Hypothesis were that healthy foods would be depicted in ways that mirrored stereotypical American eating patterns, attitudes about healthy foods, and social consumption rituals.

Using the Nutrient Profile Index, a robust nutrition classification system used in advertising law in the United Kingdom and prior research on food advertising (Bragg et al. 2020; Harris et al. 2013), our results show that top-grossing American movies more commonly depict unhealthy foods in contexts that prior research shows are more impactful to viewers. Compared to unhealthy foods, healthier foods were less likely to be actually consumed by characters (p < .001), evaluated positively in characters' speech (p < .001), appear centrally on screen (p < .001), appear in American contexts (versus other countries; p < .001), and be part of social connection events like celebrations (p < .001) and social bonding (p < .001). The most striking differences among character demographic groups were that child characters consumed less healthy foods than adult characters (p = .001) and that, when talking about foods, child characters had a stronger negative relationship between evaluation valence and food healthiness (i.e., evaluated healthy foods more negatively and unhealthy foods more positively) than adult characters (p$_{interaction}$ = .041).

Furthermore, our detailed nutritional analyses show that compared to the average American diet per 2000 kcal (Rehm et al. 2016; Turnwald et al. 2021; U.S. Department of Agriculture 2016), the foods that movie characters consumed were 39.8% higher in sugar, 5.6% higher in saturated fat, 24.8% lower in sodium, and 3.8% lower in fiber. The foods that movie characters evaluated positively also contained much more sugar (38.5% more) and less sodium (26.8% less), but contained even more saturated fat (25.1% more) and even less fiber (30.0% less) compared to the average American diet.

We also demonstrate surprising findings regarding food brands in context. Compared with non-branded foods, branded foods are less likely to be in the foreground, consumed, and depicted as part of social connection events like celebrations and characters eating together. These findings call for a shift in thinking about the prevalence and efficacy of brand appearances in media from reliance on memorable anecdotes (e.g., Reese's Pieces in *E.T. The Extra-Terrestrial*, which were followed by spikes in Reese's sales; Newell, Salmon, and Chang 2006) to systematic analyses of how effective brand placements truly are (Karniouchina, Uslay, and Erenburg 2011) and how brand integrations compare with the high frequency of non-branded foods. It also suggests that depicting unhealthy foods in more influential contexts may better reflect cultural rather than market (i.e., paid product placements) influences.

Our large data set and innovative methodologies add to the robustness of these findings and can be applied broadly to answer questions about the vast food images in the online marketplace (e.g., food delivery, food review, and recipe-sharing platforms). We used precise nutrition information from government databases, nested mixed-effects models for analysis that account for the non-independence of foods that co-occur within scenes and within movies, linguistic analyses of character speech when talking about foods, pre-registration of Hypothesis and analytic strategy, and comparison to nationally-representative data regarding Americans' actual consumption and federal nutritional guidelines. Taken together, this research demonstrates that the power of the situation in dictating consumption behaviors is not limited to real life. The patterns that consumers observe in everyday life are reinforced by depictions in popular cultural media that reach hundreds of millions of viewers worldwide.

The Days-Of-The-Week Effect in Temporal Judgments

Tatiana Sokolova, Tilburg University, Netherlands

EXTENDED ABSTRACT

Many marketing activities entail information on the time they will take, e.g., the number of days it will take a packet to ship or the number of days a vacation will last. Depending on how temporal information is framed, consumers come to perceive objectively equivalent temporal intervals differently (Burson, Larrick, and Lynch 2009; Lembregts and Pandelaere 2013; Monga and Bagchi 2012; Pandelaere, Briers, and Lembregts 2011; Ülkümen and Thomas 2013). We show that merely including days of the week information in descriptions of temporal intervals (e.g. "ordered today, delivered on Thursday, February 4th" vs. "ordered today, delivered on February 4th") affects consumers' temporal judgments. This happens because the days-of-the-week framing prompts people to rely on more narrow-span temporal evaluation scales. As a result, the days-of-the-week framing elongates perceived temporal duration, making it undesirable in contexts where the company aims to reduce perceptions of temporal duration (e.g. delivery times and delays) and desirable in contexts where the company aims to increase them (e.g. vacation descriptions).

We base our predictions on the assumption that people will hold an implicit association between days-of-the-week framing and shorter temporal durations. This will happen because people use and see days-of-the-week framing more in descriptions of shorter temporal intervals (Golding, et al. 1995). The implicit association between days of the week and short temporal intervals, in turn, should prompt people to rely on more narrow-span implicit scales when assessing temporal intervals under the days-of-the-week framing (e.g. 0 to 14 days vs. 0 to 30 days).

Building on the range-frequency theory (Parducci 1965), we further propose that consumers' temporal judgments will depend on whether they rely on a narrow-span versus a wide-span implicit scale. Specifically, any two dates should be placed farther apart on the implicit scale when the scale span is narrow (e.g. 0 to 14) than when the scale span is wide (e.g. 0 to 30). Similarly, a given date should be placed farther from the lower end of the scale (i.e. 0) and closer to the upper end of the scale when the upper bound of the implicit scale is low rather than high (e.g. 14 vs. 30). As such, people should perceive the time between two dates (e.g. from Monday February 1st to Thursday February 4th) and the time from today until a given date (e.g. from today to Thursday February 4th) as longer under the days-of-the-week framing. Results from a pilot study and six experiments support this theorizing (N = 2,194, p-curve power at 76%).

Study 1 tested the days-of-the-week effect in the context of a hurricane description. Participants read about a tropical storm Karen. Half of the participants read that the storm "started on Monday September 23rd" and that it "moved to the open sea and weakened there on Thursday September 26th" (days-of-the-week condition). Another half of the participants read that the storm "started on September 23rd" and that it "moved to the open sea and weakened there on September 26th" (dates condition). Participants then rated the storm duration. As predicted, the hurricane was perceived to last longer under the days-of-the-week framing, than under the dates framing ($M_{days-of-the-week}$ = 4.09 vs. M_{dates} = 3.48; F(1, 197) = 8.40, p=.004, d=0.41).

Study 2 tested the effect in a product delivery context. Participants received information about delivery options for three products. They then rated the time difference between standard and express delivery options for those products. For half of the participants the dates were expressed in terms of days of the week and dates (e.g.,

Monday, July 8); and for another half of the participants the dates were expressed in terms of dates only (e.g., July 8). As predicted, the days-of-the-week framing increased the perceived difference between express and standard delivery options ($M_{days-of-the-week}$ = 3.99 vs. M_{dates} = 3.57, F(1, 198) = 8.12, p=.005, d=0.40).

Study 2 also compared the perceived discreteness, vividness, concreteness, familiarity, ease of visualizing and of evaluating the time periods across the two temporal frames to probe alternative explanations of the days-of-the-week effect (Lembregts and Van Den Bergh 2019). The analyses did not reveal significant differences for any of these measures (all F < 1).

Study 3 tested whether consumer satisfaction with a carrier delaying a product delivery would be lower when the delay information was presented under the days-of-the-week instead of the dates framing. To ensure that our results are driven by the days-of-the-week framing, rather than by the amount of information, in study 3 participants in the days-of-the-week condition only saw days-of-the-week information (e.g. expected on Wednesday, delivered on Friday) and participants in the dates condition only saw date information (e.g. expected on May 1st, delivered on May 3rd). The study showed that people were less satisfied with the carrier following a delivery delay under the days-of-the-week framing ($M_{days-of-the-week}$ = 2.77 vs. M_{dates} = 3.16, F(1, 296) = 6.71, p=.010, d=-0.30).

Study 4 tested whether the days-of-the-week effect is generalizable to periods spanning more than one week. Participants rated 16 product delivery periods lasting for 9, 10, 11 or 12 days under the days-of-the-week framing (e.g., from Monday, November 4th to Thursday November 14th); or under the dates framing (e.g., from November 4th to November 14th). As in studies 1-2, the-days-of-the-week framing elongated temporal duration perceptions ($M_{days-of-the-week}$ = 6.49 vs. M_{dates} = 5.87, F(1, 198) = 5.83, p=.017, d=0.34).

Studies 5A-B showed that the days-of-the-week framing also elongates perceptions of temporal duration when people consider the time from today until a given date (e.g. from today to Sunday, January 10th vs. from today until January 10th). Further, the studies provided process evidence for the days-of-the-week effect: consistent with the scale-span account, when people were prompted to rely on a wide-span temporal scale, by, for example, first rating (study 5A) or by first considering (study 5B) a relatively distant time point, temporal judgments became similar across the days-of-the-week and dates frames.

This work adds to research on the role of measurement scales in consumer judgments and sheds light on the link between consumers' implicit associations and magnitude evaluations.
