Advances in Consumer Research, Volume 31

(Valdosta, GA: Association for Consumer Research, 2004)

Preface

The thirty-fourth Annual Conference of the Association for Consumer Research (ACR) was held at the Fairmont Royal York hotel in Toronto Canada, October 8–12 2003. This volume is comprised of the presentations made at the conference.

The conference was quite well-attended, with approximately 725 attendees from a wide variety of disciplines and geographic areas. Consistent with ACR tradition, the conference and therefore this volume represents an eclectic approach to understanding consumption, covering research spanning various methodological, theoretical and philosophical approaches. As always, the wide variety of attendees, papers, comments, and discussions illustrated the vibrant nature of the wider ACR community.

We have many people to thank for their contributions to ACR 2004. Of course, the paper authors and presenters deserve credit for the high-quality intellectual content of the conference. We felt fortunate to have an overwhelming number of submissions for ACR 2004, but unfortunate to have to choose among them! Specifically, there were 86 special session submissions and 248 competitive paper submissions to ACR 2004. From these submissions, we were able to accept 50 special sessions and 130 competitive papers. This volume contains summaries of special sessions and either full papers or abstracts for competitive paper submissions. Culling this extremely high-quality pool of submissions to ACR conference size was a huge task, and we relied on a talented and dedicated pool of scholars to help us. We thank the 57 members of our program committee for their insightful feedback regarding the special sessions. We also thank our 187 competitive paper reviewers, most of whom reviewed multiple papers in a detailed and timely manner.

We thank Jennifer Escalas (University of Arizona) and Rebecca Ratner (University of North Carolina) for organizing 10 roundtable discussions. We thank Eric Yorkston (University of Southern California) for organizing the working paper session where 45 works in progress were presented on Friday night of the conference. We also want to thank Jennifer, Rebecca and Eric for functioning as our ACR collaborators, providing valuable insight as the conference unfolded.

We thank Russ Belk and Robert Kozinets for conceiving and running ACR's Second Film Festival, which included 13 original films on consumer research topics.

We thank Chris Janiszewski (University of Florida) and Donnie Lichtenstein (University of Colorado at Boulder) for running the ACR doctoral symposium immediately before the conference in Toronto.

We were very fortunate to chair ACR in the beautiful and entertaining city of Toronto. We thank Andy Mitchell of the University of Toronto for his insider information and many efforts that allowed the ACR membership to enjoy this wonderful location. We also extend special thanks also to Steve Arenberg of the University of Toronto for his event-planning skill and advice. Finally, we thank several student volunteers from the University of Toronto: Melanie Dempsey, Darlene Walsh, Meng Zhang, Xiuping (Lily) Li, Liyuan (Vivian) Wei, and Hemant Sangwan. Beyond providing this invaluable human capital, the Rotman School of the University of Toronto also provided sponsorship of our Saturday night reception at Bambu by the lake restaurant.

As seems to be typical for ACR Co-Chairs, we would have been lost without the advice and help of Kathy Brown (University of Florida) and Jim Muncy (Valdosta State University). They provided both institutional knowledge and perhaps more importantly moral support.

When we agreed to co-chair ACR, we were confident of the high intellectual quality of the submissions and of the generosity of the community of ACR Program Committee members and Competitive Paper Reviewers. We knew that we would have great material and excellent guidance for the conference. However, we were worried about one thing—the huge administrative load involved in processing all of the papers! Our fears were more than allayed by the amazingly capable, and always good-natured, support we received from Meredith Wickman (University of Pennsylvania). In addition, we give sincere thanks to Alyssabeth Klein and Charles Darkoh for their administrative help.

We are grateful to Steve Barnett for producing this volume. Thanks to Bob Meyer for the cover artwork and for much support and guidance regarding the conference. Thanks to Rajiv Vaidyanathan (University of Minnesota) for running the website that kept ACR members involved and informed.

Finally, of course, we are particularly grateful to Wes Hutchinson, 2004 president of ACR, for giving us this wonderful opportunity. We also thank Wes for his grounded, rational perspective and executive decision-making ability in determining how we should react in the face of the global uncertainty that surrounded the SARS epidemic and the potential effects it could have on our conference planning.

We hope we have not forgotten anyone, but given the generosity of the ACR community, we fear we have. Of course, the conference, and this volume, is at its core a reflection of the community of ACR scholars, so our thanks go to all of you.

Gülnur Tumbat, University of Utah	

<p>FRIDAY OCTOBER 10, 2003</p> <p>SESSION 1 8:30–10:00 A.M.</p>
--

1.1 Competitive Paper Session: Individual and Environmental Influences on Decision Behavior

Chair: Ziv Carmon, INSEAD

<i>Belief Bracketing: Can Partitioning Information Change Consumer Judgments?</i>	18
Suzanne Shu, University of Chicago	
George Wu, University of Chicago	
<i>Special Random Numbers: Beyond the Illusion of Control</i>	20
Joseph K. Goodman, University of Texas at Austin	
Julie R. Irwin, University of Texas at Austin	
<i>Do Unto Others as You Would Do Unto Yourself: Variety-Seeking Motives In Gift Giving</i>	22
Tilottama G. Chowdhury, University of Connecticut	
S. Ratneshwar, University of Missouri, Columbia	
Kalpesh K. Desai, State University of New York, Buffalo	
<i>How Consumers Respond to Competing Market Signals: The Effects of Conflicting Quality Information and Consumer Thoughtfulness</i>	24
Subimal Chatterjee, Binghamton University	
Yong Soon Kang, Binghamton University	
Debi Prasad Mishra, Binghamton University	

1.2 **Special Session: Feeling Badly Helps: Negative Affect and Giving Behavior**

Chair: Sooyeon Nikki Lee, New York University
Michal Ann Strahilevitz, University of Arizona
Discussion Leader: Drazen Prelec, Massachusetts Institute of Technology

SPECIAL SESSION SUMMARY

<i>Feeling Badly Helps: Negative Affect and Giving Behavior</i>	27
Sooyeon Nikki Lee, New York University	
Michal Ann Strahilevitz, University of Arizona	
 <i>Helping a Victim or Helping the Victim: Altruism and Identifiability</i>	
Deborah A. Small, Carnegie Mellon University	
George Loewenstein, Carnegie Mellon University	
 <i>Take Aversion vs. the Joy of Giving: Another Case of Asymmetry</i>	
Michal Ann Strahilevitz, University of Arizona	
 <i>A Little Something for Me and Maybe for You Too: Promotions that Relieve Guilt</i>	28
Sooyeon Nikki Lee, New York University	
Kim P. Corfman, New York University	

1.3 **Competitive Paper Session: Individual Difference Factors**

Chair: Nancy M. Upton, Suffolk University

<i>Affect Intensity, Gender and the Expression of Emotion in Response to Advertising Appeals</i>	29
David J. Moore, University of Michigan	
 <i>Undermining Self-regulation Ability as a Means of Reducing Resistance to Persuasion</i>	31
S. Christian Wheeler, Stanford University	
Pablo Briñol, Universidad Autónoma de Madrid	
Anthony D. Hermann, Willamette University	
 <i>What Makes You Happier—a Nonloss or a Gain? The Moderating Role of Regulatory Focus and Need for Cognition</i>	33
Ashwani Monga, University of Minnesota	
Rui Zhu, Rice University	
 <i>The Impact of NFC and Knowledge on Consumer Response Toward Complex Print Advertisements</i>	35
Sanjay Putrevu, Bryant College	
Joni Tan, University of Western Australia	
Kenneth R. Lord, Mercer University	

1.4 **Competitive Paper Session: Context Effects in Decision Behavior**

Chair: Richard Yalch, University of Washington

<i>When the Attraction Effect Disappears: The Differential Impact of Adding Common versus Unique Features on Consumer Choice</i>	37
Young-Won Ha, Sogang University	
Sehoon Park, Sungkyunkwan University	
Hee-Kyung Ahn, Sogang University	
 <i>Expectation-Driven Separation in Preferential Choice Processes</i>	39
Kurt A. Carlson, Duke University	

<i>The Effect of Interpersonal and Interproduct Comparison on Product Choice</i>	41
Katherine A. Burson, University of Michigan	
<i>Inside the Minds of Buyers and Sellers: Mental Construals and Prospect Theory</i>	43
Himanshu Mishra, University of Iowa	
Dhananjay Nayakankuppam, University of Iowa	

1.5 **Special Session: Deliberation versus Automaticity: When Considering Just One is Misleading**

Chair: C. Miguel Brendl, INSEAD
 Discussion Leader: Chris Janiszewski, University of Florida

<i>SPECIAL SESSION SUMMARY</i>	
<i>Deliberation versus Automaticity: When Considering Just One is Misleading</i>	44
C. Miguel Brendl, INSEAD	

Who Am I Playing With? Interpretative Thinking and Automatic Effects of Context for Impression Formation in a Prisoner's Dilemma Game
 Dirk Smeesters, Tilburg University
 Luk Warlop, Katholieke Universiteit Leuven
 Eddy Van Avermaet, Katholieke Universiteit Leuven

Dynamic Effects of the Interplay Between Spontaneous Affect and Goals
 Suresh Ramanathan, University of Chicago
 Geeta Menon, New York University

Re-introducing Associative Mechanisms Into Persuasion Research
 Maria Galli, INSEAD
 Amitava Chattopadhyay, INSEAD
 C. Miguel Brendl, INSEAD

1.6 **Roundtable: Markets and Cultures**

Discussion Leaders: A. Fuat Firat, Arizona State University West
 Alladi Venkatesh, Center for Research on Information Technology and Organizations

Participants:	Aaron Ahuvia	Annamamma Joy
	Soren Askegaard	Robert Kozinets
	Gary Barmossy	Laurie Meamber
	Russell W. Belk	Per Østergaard
	Dominique Bouchet	Lisa Penaloza
	Dan Cook	John Schouten
	Janeen A. Costis	Jonathan Schroeder
	Fuat Firat	Craig Thompson
	James Fitchett	Alladi Venkatesh
	Rika Houston	Detlev Zwick

1.7 Special Session: Drivers and Contextual Moderators of Consumer Value Formation in Participative Pricing Mechanisms

Chair: Uptal Dholakia, Rice University
Discussion Leader: J. Jeffrey Inman, University of Pittsburgh

SPECIAL SESSION SUMMARY

Drivers and Contextual Moderators of Consumer Value Formation in Participative Pricing Mechanisms 46

Amar Cheema, Washington University in St. Louis
Uptal Dholakia, Rice University

Effects of Participative Pricing on Consumers' Cognitions and Actions: Goal Theoretic Perspective

Sucharita Chardran, Boston University
Vicki G. Morwitz, New York University

Dynamic and Persistent Anchors: How Adjacent Listing Prices Influence Focal Listing Success in Online Auctions

Utpal M. Dholakia, Rice University
Itamar Simonson, Stanford University

Consumer Value Construction and Bidding Behavior in Auctions: Contrasting The Effect of Motivational and Cognitive Influences across Ascending and Descending Auctions

Amar Cheema, Washington University in St. Louis
Dipankar Chakravarti, University of Colorado at Boulder
Atanu Sinha, University of Colorado at Boulder

1.8 Special Session: The Limits of Self-Regulation in Behavior, Consumption and Choice

Chair: Susan Jung Grant, University of Colorado
Discussion Leader: Brian Sternthal, Northwestern University

SPECIAL SESSION SUMMARY

The Limits of Self-Regulation in Behavior, Consumption and Choice 48

Susan Jung Grant, University of Colorado

Self-Regulation, Conscious Choice, and Consumer Decisions

Roy F. Baumeister, Florida State University

Self-Regulatory Abilities and Impulsive Spending

Kathleen Vohs, University of Utah
Ronald Faber, University of Minneapolis

The Effect of Goal Orientation on Self-Regulatory Depletion

Susan Jung Grant, University of Colorado
Jongwon Park, Korea University

1.9 Special Session: Beyond the Sacred-Profane Dichotomy in Consumer Research

Chair: Eric J. Arnould, University of Nebraska
Discussion Leader: Douglas B. Holt, Harvard University

SPECIAL SESSION SUMMARY

Beyond the Sacred-Profane Dichotomy in Consumer Research 52

Eric J. Arnould, University of Nebraska

Rethinking the Sacred and the Profane in Postmodernity
Eric J. Arnould, University of Nebraska
Linda Price, University of Nebraska

The Gold that Binds: The Ritualistic Use of Jewelry in A Indian Wedding 55
Karen V. Fernandez, University of Auckland
Ekant Veer, University of Auckland

Jewelry—Passing Along the Continuum of Sacred and Profane Meanings
Cathy L. Hartman, Utah State University
Pamela Kiecker, Virginia Commonwealth University

FRIDAY
OCTOBER 10, 2003

SESSION 2
10:30 A.M. – NOON

2.1 Competitive Paper Session: Virtual Consumer Behavior

Chair: Jay M. Handelman, University of Lethbridge

Satisfaction and Participation in Virtual Communities 56
Fred Langerak, Rotterdam School of Management, Erasmus University Rotterdam
Peter C. Verhoef, Rotterdam School of Management, Erasmus University Rotterdam
Peeter W. J. Verlegh, Rotterdam School of Management, Erasmus University Rotterdam
Kristine de Valck, Rotterdam School of Management, Erasmus University Rotterdam

Online Investing: Derealization and the Experience of Risk 58
Detlev Zwick, York University
Nikhilesh Dholakia, University of Rhode Island

Exploring Impulse Purchasing on the Internet 59
Sreedhar Rao Madhavaram, Texas Tech University
Debra A. Laverie, Texas Tech University

Talking Together: Consumer Communities and Health Care 67
Gillian Hogg, University of Strathclyde
Angus Laing, Open University Business School
Terry Newholm, Open University Business School

2.2 Special Session: Getting Specific about the Consequences of Stress and Emotion for Health Protection Intentions: Differential Sources of Stress and Emotional Reactions

Chair: Kirsten Grasshoff, University of Pennsylvania
Discussion Leader: Jennifer L. Aaker, Stanford University

SPECIAL SESSION SUMMARY
Getting Specific about the Consequences of Stress and Emotion for Health Protection Intentions: Differential Sources of Stress and Emotional Reactions 74
Kirsten Grasshoff, University of Pennsylvania

Emotional Antecedents of Protection Motivation
Punam Anand Keller, Dartmouth College
Ardis L. Olson, Dartmouth College

Judging Health Risk through Emotions
Nidhi Agrawal, New York University
Geeta Menon, New York University

Too Much Stress: The Negative Consequences for Screening Adherence
Mary Frances Luce, University of Pennsylvania
Barbara Kahn, University of Pennsylvania
Kirsten Grasshoff, University of Pennsylvania

2.3 Competitive Paper Session: Failure of Persuasion Attempts

Chair: Flemming Hansen, Copenhagen Business School

<i>Hidden Effects of Persuasion</i>	75
Zakary L. Tormala, Indiana University	
Pablo Briñol, Universidad Autónoma de Madrid	
Richard E. Petty, Ohio State University	
<i>“Et Tu, Brutus?” : A Case for Consumer Skepticism and Backlash against Product Placements</i>	77
Namita Bhatnagar, University of Manitoba	
Lerzan M. Aksoy, Koc University	
<i>When Good Deeds Dilute Your Equity</i>	78
Karen L. Becker-Olsen, Lehigh University	
B. Andrew Cudmore, Florida Institute of Technology	
<i>When Counterarguing Fails: Effects on Attitude Strength</i>	80
Derek D. Rucker, Ohio State University	
Richard E. Petty, Ohio State University	

2.4 Competitive Paper Session: Attribute Characteristics and Measurement

Chair: Jim Hunt, Temple University

<i>The Interactive Effect of Timing and Attribute Alignability on Consumption</i>	82
Selin A. Malkoc, University of North Carolina at Chapel Hill	
Canan Ulu, Duke University	
<i>Improving Attribute-Importance Measurement; A Reference-Point Approach</i>	84
Koert van Ittersum, Georgia Institute of Technology	
Joost M.E. Pennings, University of Illinois at Urbana-Champaign	
Brian Wansink, University of Illinois at Urbana-Champaign	
Hans C.M. van Trijp, Wageningen University	
<i>A Multidimensional Approach to Measuring Attribute Importance</i>	86
Koert van Ittersum, Georgia Institute of Technology	
Joost M.E. Pennings, University of Illinois at Urbana-Champaign	
Brian Wansink, University of Illinois at Urbana-Champaign	
Hans C.M. van Trijp, Wageningen University	
<i>Needle in the Cyberstack: Consumer Search for Information in the Web-based Marketplace</i>	88
Kuan-Pin Chiang, Long Island University	
Ruby Roy Dholakia, University of Rhode Island	
Stu Westin, University of Rhode Island	

2.5 **Special Session: The Psychology of Auctions: Enriching Models of Bidder and Seller Behavior**

Chair: Peter T. L. Popkowski Leszczyc, University of Alberta
Discussion Leader: Dipankar Chakravarti, University of Colorado

SPECIAL SESSION SUMMARY

The Psychology of Auctions: Enriching Models of Bidder and Seller Behavior 90
Peter T. L. Popkowski Leszczyc, University of Alberta

Revenue Equivalence in Online Auctions: The Case of Yahoo and eBay
Ramanathan Subramanian, University of Pittsburgh
Vikas Mittal, University of Pittsburgh
J. Jeffrey Inman, University of Pittsburgh

Reserves, Regret and Rejoicing in Open English Auctions
Eric A. Greenleaf, New York University

Bidding Frenzy: Intensity of Competitive Interaction Among Bidders and Product Valuation in Auctions
Gerald Häubl, University of Alberta
Peter T. L. Popkowski Leszczyc, University of Alberta

2.6 **Roundtable: Repetition and Spacing of Marketing Stimuli: Implications for Memory** 94

Discussion Leaders: Sara L. Appleton-Knapp, San Diego State University
Kathryn Braun-LaTour, Marketing Memories
Hayden Noel, Baruch College

Participants: Sara L. Appleton Chris Janiszewski
Joe Belch Michael La Tour
Mickey Belch Sharmistha Law
Kathryn Braun-LaTour Hayden Noel
Amitav Chakravarti Surendra Singh

2.7 **Special Session: New Frontiers in the Construction of Preferences**

Chair: Nathan Novemsky, Yale University
Discussion Leader: Drazen Prelec, Massachusetts Institute of Technology

SPECIAL SESSION SUMMARY

New Frontiers in the Construction of Preferences 95
Nathan Novemsky, Yale University

Parallels in the Underpinnings of Constructed Preference and Constructed Attitudes
Nathan Novemsky, Yale University
Ravi Dhar, Yale University
Itamar Simonson, Stanford University
Norbert Schwarz, University of Michigan

The Psychology of Matching and the Prominence Effect
Shane Frederick, Massachusetts Institute of Technology
Eldar Shafir, Princeton University

A Behavioral Analysis of Real Estate Prices
Christopher Hsee, University of Chicago
Yan Zhang, China Europe International Business School

2.8 **Special Session: Beyond Brand Image: Analyzing the Culture of Brands**

Chair: Craig J. Thompson, University of Wisconsin, Madison
Discussion Leader: Susan Fournier, Harvard University

SPECIAL SESSION SUMMARY

Beyond Brand Image: Analyzing the Culture of Brands 98
Craig J. Thompson, University of Wisconsin, Madison

Dirtbag Politics and the Outdoor Adventure Myth: How Patagonia Built an Icon from the Climbing Subculture
Douglas B. Holt, Harvard University

The Starbucks' Brandscape and the Ideological Mapping of Local Coffee Shop Culture
Craig Thompson, University of Wisconsin, Madison
Zeynep Arsel, University of Wisconsin, Madison

The Polit-Brand and Blows Against the Empire: The Collectively Approved Brands of the New-New Left 100
Thomas C. O'Guinn, University of Illinois at Urbana-Champaign
Albert M. Muñoz, Jr., DePaul University, Chicago

2.9 **Special Session: Corporate Social Responsibility: A Consumer Perspective**

Chair: Jill G. Klein, INSEAD
Discussion Leader: N. Craig Smith, London School of Business

SPECIAL SESSION SUMMARY

Corporate Social Responsibility: A Consumer Perspective 101
Jill G. Klein, INSEAD

Measuring the Effectiveness of Corporate Social Initiatives: A Consumer-Centric Perspective
CB Bhattacharya, Boston University
Sankar Sen, Baruch College

The Effects of Corporate Social Responsibility (CSR) on Product Quality Evaluations
Yeosun Yoon, Rice University
Zeynep Gürhan-Canli, University of Michigan

The Role of Corporate Social Responsibility in Consumers' Attributions and Brand Evaluations After a Product-Harm Crisis
Niraj Dawar, Western Ontario
Jill G. Klein, INSEAD

**FRIDAY
OCTOBER 10, 2003**

**ACR LUNCHEON
&
PRESIDENTIAL ADDRESS**

**FRIDAY
OCTOBER 10, 2003**

**SESSION 3
2:00–3:30 P.M.**

3.1 Competitive Paper Session: Consumption Experiences within Groups

Chair: Douglas Hausknecht, University of Akron

<i>Consuming Modernities: The Global Youth Segment as a Site of Consumption</i>	104
Dannie Kjeldgaard, University of Southern Denmark Søren Askegaard, University of Southern Denmark	
<i>Tastes, Distastes and Disgusts: Young Consumers' Positive and Negative Experiences of Food</i>	106
Emma N. Banister, Lancaster University Gayle J. Booth, UMIST	
<i>An Exploration of Social Influence on Dyadic Giving</i>	112
Tina M. Lowrey, University of Texas at San Antonio Cele C. Otnes, University of Illinois Julie A. Ruth, Rutgers University	
<i>Reconciling Christianity and Modernity: Australian Youth and Religion</i>	113
Teresa Davis, University of Sydney Jeaney Yip, University of Sydney	

3.2 Special Session: Drivers of Hedonic Choice

Chair: J. Jeffrey Inman, University of Pittsburg
Discussion Leader: Barbara Kahn, University of Pennsylvania

<i>SPECIAL SESSION SUMMARY</i>	
<i>Drivers of Hedonic Choice</i>	118
J. Jeffrey Inman, University of Pittsburg	

Let Us Eat and Drink; For Tomorrow We Shall Die: Mortality Salience and Hedonic Choice
Baba Shiv, University of Iowa
Rosellina Ferraro, Duke University
James R. Bettman, Duke University

Diversification and Partition Dependence in Consumer Choice
Craig R. Fox, University of California, Los Angeles
Rebecca K. Ratner, University of North Carolina
Daniel S. Lieb, Duke University

Variety-Seeking Strategies in Hedonic Choice
Jaap Boter, Vrije Universiteit Amsterdam
J. Jeffrey Inman, University of Pittsburgh
Michel Wedel, University of Michigan

3.3 **Competitive Paper Session: Senses and Experiences**

Chair: William T. Ross, Penn State University

<i>The Four Dimensional Impact of Color on Shoppers' Emotions</i>	122
Malaika Brengman, Ghent University, Limburgs Universitair Centrum Maggie Geuens, Ghent University	
<i>When Consumers Take Their Sense of Smell for Granted</i>	129
Anick Bosmans, Tilburg University	
<i>Why Consumption Vision? Understating Consumer Value in Anticipatory Consumption Imaging</i>	130
Glenn L. Christensen, Brigham Young University Jerry C. Olson, Penn State University William T. Ross, Penn State University	
<i>The Impact of Humor in Face-to-Face and Electronic Service Encounters</i>	132
Willemijn van Dolen, Vrije Universiteit Ko de Ruyter, Maastricht University Sandra Streukens, Maastricht University	

3.4 **Competitive Paper Session: Uncertainty and Conflict**

Chair: Sanjay Putrevu, Bryant College

<i>Affective Expectations and Uncertainty Orientation: When do Affective Expectations Stop Influencing Affective Reactions?</i>	140
Elizabeth Cowley, University of Sydney Colin Farrell, University of New South Wales Michael Edwardson, University of New South Wales	
<i>The Impact of Promotion Uncertainty on the Decision-making Process in Product Choice</i>	
Cathy Yi Chen, University of California, Los Angeles	
<i>Resolving Goal Conflict: The Effect of Regulatory Focus on Product Choice</i>	142
Andrew A. Mitchell, University of Toronto Meng Zhang, University of Toronto	

3.5 **Special Session: Melding Behavioral Research and Choice Modeling: How to Build a Better Choice Model**

Chair: Eric J. Johnson, Columbia University
Discussion Leader: Drazen Prelec, Massachusetts Institute of Technology

<i>Observing Unobserved Heterogeneity: Using Process Data to Enhance Choice Models</i>	
Bruce Hardie, London Business School Eric J. Johnson, Columbia University Robert Meyer, University of Pennsylvania John Walsh, IMD	
<i>Investigating Heterogeneity and Dynamics of Choice Heuristics</i>	
Jin Gyo Kim, Massachusetts Institute of Technology	
<i>Assessing Endogeneity in Choice Processes: Formal Models and Evaluation Effects</i>	
Fred M. Feinberg, University of Michigan Christina L. Brown, University of Michigan	

3.9 Special Session: The Gendered Nature of the Evolving Technoscape: Evaluating Identity, Representation, and Locality

Chair: Susan Dobscha, Bentley College
 Discussion Leader: Alladi Venkatesh, University of California, Irvine

SPECIAL SESSION SUMMARY

The Gendered Nature of the Evolving Technoscape: Evaluating Identity, Representation, and Locality 152
 Susan Dobscha, Bentley College

Romance and the Internet: The E-Mergence of E-Dating 153
 Angeline Grace Close, University of Georgia/North Georgia College and State University¹
 George M. Zinkhan, The University of Georgia

Female Cyborgs in Film: Heeding the Siren’s Call 158
 Leighann Nelson, Queen’s University

The Gendering of Public Technology Spaces: A Feminist Analysis of a Public Internet Center 159
 Susan Dobscha, Bentley College

<p>FRIDAY OCTOBER 10, 2003</p> <p>SESSION 4 4:00–5:30 P.M.</p>

4.1 Competitive Paper Session: Ad Messages and Meanings

Chair: Kathleen Brewer Doran, Lasell College

The Co-Creation of Meaning Between Marketers and Consumers; Step 1: How Marketing Creatives Interpret Consumer Motivations 162
 Jeffrey F. Durgee, Rensselaer Polytechnic Institute

The Interplay between Archetypes and Autobiography in Mass Media Preferences 168
 Elizabeth C. Hirschman, Rutgers University

Advertising and the Public Sphere 174
 Ozlem Sandikci, Bilkent University

Early Soviet Advertising: “We Have to Extract All the Stinking Bourgeois Elements” 176
 Natasha Tolstikova, University of Maine, Orono

4.2 **Special Session: Consumers' Beliefs about Luck and Consequent Reactions to Lucky and Unlucky Situations**

Chair: Donnel A. Briley, Hong Kong University of Science and Technology
Peter R. Darke, University of British Columbia
Discussion Leader: Dale W. Griffin, Stanford University

SPECIAL SESSION SUMMARY

Consumers' Beliefs about Luck and Consequent Reactions to Lucky and Unlucky Situations 177
Donnel A. Briley, Hong Kong University of Science and Technology
Peter R. Darke, University of British Columbia

Determinants of Consumer Luck

Chezy Ofir, Hebrew University
Itamar Simonson, Stanford University

The Paradoxical Effects of Luck

Peter R. Darke, University of British Columbia
Jonathan L. Freedman, University of Toronto

Negative Effects of Luck-based Promotions on Purchase

Donnel A. Briley, Hong Kong University of Science and Technology
Lydia J. Price, Hong Kong University of Science and Technology

4.3 **Competitive Paper Session: Narrative Approaches to Understanding Consumer Behavior**

Chair: Mickey Belch, South Dakota University

The Invisible Narrator: Attributes and Consumer Attitudes 178
Michael S. Mulvey, University of Ottawa
Barbara B. Stern, Rutgers University

Narrative Word of Mouth Communications: Exploring Memory and Attitude Effects of Consumer Storytelling 186
Yvonne Delgadillo, University of Arizona
Jennifer Edson Escalas, Vanderbilt University

Living in Another World: The Role of Narrative Imagination in the Production of Fantasy Enclaves 193
Athinodoros Chronis, California State University, Stanislaus
Ronald D. Hampton, University of Nebraska-Lincoln

Self-Brand Connections: An Exploratory Study into Construct Validity and Gender Effects 196
David J. Moore, University of Michigan
Pamela Homer, California State University, Long Beach

4.4 **Competitive Paper Session: Sales and Service Issues**

Chair: Susan M. Lloyd, American University

Nonverbal Cues-based First Impressions: What Can Static Images of Salespeople Tell Us About their Success at Selling? 198
Rebecca E. Walker, University of Texas at Austin
Rajagopal Raghunathan, University of Texas at Austin

<i>A Social Perception View of Business Relationships in the Service Sector</i>	200
Joachim Vosgerau, INSEAD	
Erin Anderson, INSEAD	
William T. Ross, Jr., Pennsylvania State University	
<i>Effect of Cultural Distance on Customer Service Satisfaction: A Theoretical Framework and Research Agenda</i>	202
C. Fritz Reichert, The Reichert Company	
Tripat Gill, Case Western Reserve University	
<i>Antecedents and Consequences of Service Quality in Online Banking: An Application of the SERVQUAL Instrument</i>	208
Sang-Lin Han, Hanyang University	
Seung Baek, Hanyang University	

4.5 Special Session: Branding Across Cultures: The Role of Analytic and Holistic Thinking

Chair: Deborah Roedder John, University of Minnesota
Discussion Leader: Durairaj Maheswaran, New York University

SPECIAL SESSION SUMMARY

<i>Branding Across Cultures: The Role of Analytic and Holistic Thinking</i>	215
Deborah Roedder John, University of Minnesota	
<i>Consumer Response to Brand Extensions: Does Culture Matter?</i>	216
Alokparna Basu Monga, University of Minnesota	
Deborah Roedder John, University of Minnesota	
<i>Exemplars or Beliefs? Implications of Representational Differences on Brand Evaluations across Cultures</i>	223
Sharon Ng, University of Minnesota	
Michael Houston, University of Minnesota	
<i>Cross Cultural Differences in Brand Extension Evaluation: The Effect of Holistic and Analytic Processing</i>	224
Yeosun Yoon, University of Michigan	
Zeynap Gurhan-Canli, University of Michigan	

4.6 Roundtable: Is it Worth It? If So, Research It: Exploring the Place of Diversity Research in Marketing

225

Discussion Leaders: Geraldine R. Henderson, Howard University
Carol M. Motley, Howard University

Participants:	Anne Brumbaugh	Carol Motley
	Mark Foreland	Lisa Penaloza
	Ronald Goodstein	Laura Peracchio
	Sonya Grier	Americus Reed
	Curt Haugtvedt	Jerome D. Williams
	Geraldine R. Henderson	David Wooten
	David Luna	

4.7 **Special Session: Context Effects in Choice**

Chair: Alexander Chernec, Northwestern University
Discussion Leader: Joel Huber, Duke University

SPECIAL SESSION SUMMARY

Context Effects in Choice 226
Alexander Chernec, Northwestern University

Context Effects without Context: Scale-Equivalence and Attribute Balance in Choice
Alexander Chernec, Northwestern University

The Effect of Tradeoff Resolution Order on Consumer Choice
Stephen M. Nowlis, Arizona State University
Ravi Dhar, Yale University
Itamar Simonson, Stanford University

The Psychology of Versioning: Context Effects and Counterfactual Thinking as Determinants of Fairness Perceptions and Choice
Andrew D. Gershoff, Columbia University
Ran Kivetz, Columbia University

4.8 **Special Session: How Regulatory Focus Influences Consumer Evaluations, Judgments and Choices**

Chair: Utpal M. Dholakia, Rice University
Discussion Leader: Tory E. Higgins, Columbia University

SPECIAL SESSION SUMMARY

How Regulatory Focus Influences Consumer Evaluations, Judgments and Choices 229
Utpal M. Dholakia, Rice University

Factors Determining the Persuasiveness of Promotion- and Prevention-Focused Appeals
Ginger L. Pennington, University of Chicago
Jennifer L. Aaker, Stanford University
Neal J. Roese, University of Illinois

When Do Consumers Use Conceptual Versus Experiential Processing Heuristics?
Rui Zhu, Rice University
Joan Meyers-Levy, University of Minnesota

Sequent Impulsive Choices Within a Consumption Episode: The Role of Regulatory Focus
Utpal M. Dholakia, Rice University
Richard P. Bagozzi, Rice University

4.9 **Special Session: The Positive and Negative Consequences of Materialism: What Are They and When Do They Occur?**

Chair: Marsha Richins, University of Missouri
Discussion Leader: Thomas C. O'Guinn, University of Illinois

SPECIAL SESSION SUMMARY

The Positive and Negative Consequences of Materialism: What Are They and When Do They Occur? 232
Marsha Richins, University of Missouri

The Effect of Materialism on Emotional Well-Being and Life Satisfaction: An Application of Multiple Discrepancies Theory

James W. Shaw, University of Arizona
Ada Leung, University of Arizona
Melanie Wallendorf, University of Arizona

The Influence of Materialism on Product Satisfaction

Jianfeng Wang, University of Arizona
Melanie Wallendorf, University of Arizona

The Relationship of Materialism to Compulsive Hoarding and Indecisiveness in Indian and American College Students

Kaamna R. Bhojwani, University of Illinois at Urbana-Champaign
Randy O. Frost, Smith College

DISCUSSANT'S COMMENTS

Hail, Hail Materialism 236

Thomas C. O'Guinn, University of Illinois at Urbana-Champaign

Alain Decrop, University of Namur	
Claude Pecheux, LABACC, Catholic University of Mons	
Geraldine Bauvin, Unilever	

5.2 **Special Session: Bliss is Ignorance? Emotion, Evaluation, and the Feeling Brain**

Chair: Stacy L. Wood, University of South Carolina
Discussion Leader: Mary Frances Luce, University of Pennsylvania

SPECIAL SESSION SUMMARY

Bliss is Ignorance? Emotion, Evaluation, and the Feeling Brain 298
Stacy L. Wood, University of South Carolina

Predicting Happiness: Social Norms and the Durability of Durability Bias
Stacy L. Wood, University of South Carolina
James R. Bettman, Duke University

Are Happy People Mindless or Mindful Processors of Information?
Yiorgos A. Bakamitsos, Dartmouth College
Angela Y. Lee, Northwestern University

The Heat of the Moment: The Effect of Sexual Arousal on Sexual Decision Making
Dan Ariely, Massachusetts Institute of Technology
George Loewenstein, Carnegie Mellon University

5.3 **Competitive Paper Session: Cause Marketing and Consumer Skepticism**

Chair: David Boush, University of Oregon

See How 'Good' We Are: The Dangers of Using Corporate Social Activities in Communication Campaigns 302
Valérie Swaen, Catholic University of Louvain (FNRS) and IESEG School of Management
Joëlle Vanhamme, Erasmus University Rotterdam–ERIM, LABACC

Customers or Sellers?: The Role of Persuasion Knowledge in Customer Referral 304
Peeter W. J. Verlegh, Erasmus University Rotterdam
Céline Verkerk, Erasmus University Rotterdam
Mirjam A. Tuk, Erasmus University Rotterdam
Ale Smidts, Erasmus University Rotterdam

Who Are You and Why Are You Being Nice?: Investigating the Industry Effect on Consumer Reaction to Corporate Societal Marketing Efforts 306
Lisa R. Szykman, College of William and Mary

Community Oriented Corporate Social Responsibility: Consumer Evaluation of Community Attachment 314
Jay M. Handelman, Queen's University
Roberto Bello, University of Lethbridge

5.4 **Competitive Paper Session: Hedonic Consumption**

Chair: Stacey Menzel Baker, University of Wyoming

A Motivational Framework for Self-Directed Hedonic Consumption 316
Monica C. LaBarge, University of Oregon
Peter A. Dacin, Queen's University

An Elaborated Model of Satisfaction With Live Musical Entertainment 318
Michael S. Minor, University of Texas-Pan American
Angela Hausman, University of Texas-Pan American

<i>Falling in Love with a Product: The Structure of a Romantic Consumer-Product Relationship</i>	320
Yun-Oh Whang, University of Central Florida	
Jeff Allen, University of Central Florida	
Niquelle Sahoury, University of Central Florida	
Haitao Zhang, University of Central Florida	

<i>Just for Fun: A History of Mentality based Analysis of Hedonic and Experiential Consumption</i>	328
Christian Jantzen, Aalborg University	
Per Østergaard, University of Southern Denmark	
James A. Fitchett, Nottingham University	

5.5 Special Session: Consumer Reactions to Marketing Practices: Skepticism, Suspicion, and Payback

Chair: Peter R. Darke, University of British Columbia

Discussion Leader: Margaret C. Campbell, University of Colorado

SPECIAL SESSION SUMMARY

<i>Consumer Reactions to Marketing Practices: Skepticism, Suspicion, and Payback</i>	329
Peter R. Darke, University of British Columbia	

The Skeptical Shopper: How Default Options Affect Choice By What They Tell Consumers

Christina L. Brown, University of Michigan

Aradhna Krishna, University of Michigan

One Rotten Apple Spoils the Barrel: Advertising Deception, Defensive Processing, and Consumer Suspicion

Peter R. Darke, University of British Columbia

Robin J.B Ritchie, University of Western Ontario

The Effects of Pro-Boycott and Anti-Boycott Communications on the Individual Boycott Decision

Vicki Morwitz, New York University

Sankar Sen, Boston University

5.6 Roundtable: Planting the Seed of Consumer Behavior in Latin America: Is it Time for ACR-Latin America

333

Discussion Leaders: Silvia Gonzalez, ITESM
David Luna, SUNY

Participants:	Gustavo de Mello	Fernando Alvarez Kuri
	Jennifer Escalas	Daniel Laufer
	Silvia Gonzalez	David Luna
	Joseph Goodman	Ana Valenzuela
	Amanda Helm	Rebecca Walker
	Dawn Iacobucci	Martin Zemborain

5.7 Special Session: The Role of Unconscious Processes in Consumer Choice and Decision Making

Chair: Robert S. Wyer, Hong Kong University of Science & Technology

Discussion Leader: Dipankar Chakravarti, University of Colorado

SPECIAL SESSION SUMMARY

<i>The Role of Unconscious Processes in Consumer Choice and Decision Making</i>	334
Kyeongheui Kim, University of Minnesota	
Robert S. Wyer Jr., Hong Kong University of Science & Technology	

Effects of Nonconscious Goal Priming on Consumer Choice Behavior

Baba Shiv, University of Iowa
Joel Huber, Duke University
Tanya Chartrand, Ohio State University

About Prisoner's and Dictators: The Role of Subliminality Presented Stereotype Primes and Social Value Orientation in Shaping Cooperative Behavior

Dirk Smeesters, Tilburg University
Luk Warlop, Katholieke Universiteit Leuven
Vincent Yzerbyt, Université Catholique de Louvain
Olivier Corneille, Université Catholique de Louvain
Eddy van Avermaet, Katholieke Universiteit Leuven

Effects of Priming on Product Choices for the Self versus for Others

Jongwon Park, Korea University
Kyeongheiu Kim, University of Minnesota
Junsik Kwak, Korea University
Irene Blair, University of Colorado at Boulder

5.8 Special Session: When What I Think , Feel and Do Depends on Who I Am: Identity Effects on Judgment, Choice, and Self-Reinforcement

Chair: Americus Reed II, University of Pennsylvania
Discussion Leader: Sonya A. Grier, Stanford University

SPECIAL SESSION SUMMARY

When What I Think , Feel and Do Depends on Who I Am: Identity Effects on Judgment, Choice, and Self-Reinforcement 335
Americus Reed II, University of Pennsylvania

Sticky Priors: Identity Effects on Judgment

Lisa Bolton, The Wharton School
Americus Reed, II, The Wharton School

Preference Reversals from Identity-Salience Shifts

Robyn A. LeBoeuf, University of Florida
Eldar Shafir, Princeton University

Identity Reinforcement: The Dynamic Effects of Evaluation on The Implicit Self Concept

Mark Forehand, University of Washington
Andrew Perkins, University of Washington
Americus Reed II, The Wharton School

5.9 Special Session: You Done Me Wrong (And That Ain't Right): The Role of Betrayal in Consumer Behavior

Chair: Andrew D. Gershoff, Columbia University
Discussion Leader: Raj Raghunathan, University of Texas, Austin

SPECIAL SESSION SUMMARY

You Done Me Wrong (And That Ain't Right): The Role of Betrayal in Consumer Behavior 339
Andrew D. Gershoff, Columbia University

Betrayal in Consumer-Retailer Relationships
 Yoshinori Fujikawa, Penn State University
 Keith E. Niedermeier, Penn State University
 William T. Ross Jr., Penn State University

Service Providers' Road to "Hell": Service Betrayal, Consequences and Recovery Attempts
 Linda Price, University of Nebraska
 Eric Arould, University of Nebraska
 Fleura Bardhi, University of Nebraska

Avoiding Betrayal Over Choosing Safety? The Moderating Effects of Type of Betrayal, Type of Choice, and Choosing for Others on Betrayal Aversion
 Andrew D. Gershoff, Columbia University
 Jonathan J. Koehler, University of Texas at Austin

5.10 Ferber Award Session

Christie Nordhielm, Northwestern University
 Joan Meyers-Levy, University of Minnesota
 Rebecca Hamilton, University of Maryland
 Drazen Prelec, Massachusetts Institute of Technology

SATURDAY
OCTOBER 11, 2003

SESSION 6
 10:30 A.M. –NOON

6.1 Competitive Paper Session: Trust and Credibility

Chair: Shailendra Pratap Jain, Indiana University

The Collective-Relational Paradox in Consumer Trust Judgments: Framework and Propositions 343
 Jagdip Singh, Case Western Reserve University
 Rama K. Jayanti, Cleveland State University

Cynics and Skeptics: Consumer Dispositional Trust 345
 Amanda Helm, University of Missouri

Is it Still Worth to be Credible? A Meta-Analysis of Temporal Patterns of Source Credibility Effects in Marketing 352
 Martin Eisend, Freie Universität Berlin

6.2 Special Session: Navigating Between Virtues and Vices: Moderators of Decisions Involving Hedonic versus Utilitarian Choices

Chair: Uzma Khan, Yale University
Oleg Urminsky, Columbia University
Discussion Leader: Drazen Prelec, Massachusetts Institute of Technology

SPECIAL SESSION SUMMARY

Navigating Between Virtues and Vices: Moderators of Decisions Involving Hedonic versus Utilitarian Choices 358
Uzma Khan, Yale University
Oleg Urminsky, Columbia University

Licensing Effect of Past Credentials on Sequential Choices
Ravi Dhar, Yale University
Uzma Khan, Yale University

Reconciling Impulsiveness with Self-Control: Explaining Differential Impatience toward Hedonic and Utilitarian Consumption
Oleg Urminsky, Columbia University
Ran Kivetz, Columbia University

License to Sin: The Liberating Role of Reporting Expectations
Gavan J. Fitzsimons, Duke University
Joseph Nunes, University of Southern California
Patti Williams, University of Pennsylvania

6.3 Competitive Paper Session: Cultural Influences on Consumer Behavior

Chair: Cristel Antonia Russell, South Dakota State University

International Differences in Information Privacy Concern: Implications for the Globalization of Electronic Commerce 362
Steven Bellman, University of Western Australia
Eric J. Johnson, Columbia University
Stephen J. Kobrin, University of Pennsylvania
Gerald L. Lohse, Accenture

Impact of Culture on Cognition: An Evaluation of Judgment and Choice Processes Through a Collectivist Lens 364
Avinash Malshe, University of Nebraska–Lincoln
James W. Gentry, University of Nebraska–Lincoln

Culture's Influence on Consumer Behaviors: Differences Among Ethnic Groups in a Multiracial Asian Country 366
Kwon Jung, KDI School of Public Policy and Management
Ah Keng Kau, National University of Singapore

Examining Consumer Behavior in the Liberalized German Energy Market—The Influence of Customer Satisfaction on Customer Willingness to Switch Public Utility Companies 373
Gianfranco Walsh, University of Strathclyde
Klaus-Peter Wiedmann, University of Hanover
Markus Groth, The Australian Graduate School of Management, UNSW

6.4 *Competitive Paper Session: Brand Extension and Evolution*

Chair: Michael S. McCarthy, Miami University

<i>Brand Extension Evaluations: Effects of Affective Commitment, Involvement, Price Consciousness and Preference for Bundling in the Extension Category</i>	375
Håvard Hansen, Norwegian School of Management	
Leif E. Hem, Norwegian School of Economics and Business Administration	
<i>A Consumer Preference Formation Perspective on Pioneering Advantage in Electronic Marketplace</i>	382
Kuan-Pin Chiang, Long Island University	
<i>Normative versus Comparative Fit: Prototype-based and Exemplary-based Brand Extension Evaluation</i>	387
Huifang Mao, Indiana University	
H. Shanker Krishnan, Indiana University	
<i>Brand Name and Consumer Inference Making in Multigenerational Product Introduction Context</i>	390
Seigyoung Auh, University of Melbourne	
Chuan-Fong Shih, Wake Forest University	

6.5 *Special Session: A Deeper Look at Assortment*

Chair: Susan Broniarczyk, University of Virginia and University of Texas at Austin

Discussion Leader: Leigh McAlister, University of Texas

SPECIAL SESSION SUMMARY

<i>A Deeper Look at Assortment</i>	392
Susan Broniarczyk, University of Virginia and University of Texas at Austin	

Feature Complementarity and Assortment in Choice
Alexander Chernev, Northwestern University

Too Many Choices: The Effect of Assortment on Anticipated and Experienced Regret
Susan Broniarczyk, University of Virginia and University of Texas at Austin
Joseph Goodman, University of Texas at Austin
Jill Griffin, University of Texas at Austin
Leigh McAlister, University of Texas at Austin

The Influence of Assortment Structure on Perceived Variety and Consumption Quantities
Barbara E. Kahn, University of Pennsylvania
Brian Wansink, University of Illinois

6.6 *Roundtable: Mediation Analysis*

395

Discussion Leaders: Dawn Iacobucci, Northwestern University
Adam Duhachek, Northwestern University

Participants: Pankaj Aggarwal Adam Duhachek
Tim Ambler Dawn Iacobucci
Yiorgos Bakamitsos Jim Oakley
Simona Botti Joe Priester
Frédéric F. Brunel

6.7 Special Session: The World According To Garp: The Influence of Lay Theories About Others on Consumer Judgment and Behavior

Chair: Gita V. Johar, Columbia University
Anirban Mukhopadhyay, Columbia University
Discussion Leader: Robert S. Wyer, Hong Kong University

SPECIAL SESSION SUMMARY

The World According To Garp: The Influence of Lay Theories About Others on Consumer Judgment and Behavior 396
Gita V. Johar, Columbia University
Anirban Mukhopadhyay, Columbia University

Apologies and Coupons to Resolve Consumer Complaints: How Appealing is Each to You Versus to Others?
Rebecca K. Ratner, University of North Carolina at Chapel Hill
Claudia Kubowicz, University of North Carolina at Chapel Hill

Seeing Choices in the Rejections of Others: Inferring Approach Motivation in Avoidance Motivated Decisions
Leif D. Nelson, New York University
Dale T. Miller, Stanford University

Where There Is a Will, Is There a Way? The Effect of Lay Theories of Self-Control on Goal Setting and Achievement
Anirban Mukhopadhyay, Columbia University
Gita V. Johar, Columbia University

6.8 Special Session: Consuming Cyborgs: Researching Posthuman Consumer Culture

Chair: Markus Giesler, York University
Alladi Venkatesh, University of California, Irvine
Discussion Leader: Robert Kozinets, Northwestern University

SPECIAL SESSION SUMMARY

Consuming Cyborgs: Researching Posthuman Consumer Culture 400
Markus Giesler, York University
Alladi Venkatesh, University of California, Irvine

Posthumanism and the Sciences of the Artificial: Some New Directions for the Epistemologies of Consumption
Alladi Venkatesh, University of California, Irvine

Consuming Cyborgs: Posthuman Consumer Culture and its Impact on the Conduct of Marketing
Markus Giesler, Kellogg School of Management

The Emergence of Virtual Commodities
Erik Davis, TechGnosis

6.9 Special Session: Advances in the Study of Creative Cognition in Consumer Behavior

Chair: James E. Burroughs, University of Virginia
Page Moreau, University of Colorado
Discussion Leader: Alice Isen, Cornell University

SPECIAL SESSION SUMMARY

Advances in the Study of Creative Cognition in Consumer Behavior 403
James E. Burroughs, University of Virginia
Page Moreau, University of Colorado

Manufacturing the Solution: The Role of Constraints in Consumer Creativity
 Darren Dahl, University of British Columbia
 Page Moreau, University of Colorado

Strategic Approach and the Degree of Novelty in New Idea Generation
 Thomas B. Ward, University of Alabama

Development of a Test of Metaphoric Thinking Ability and Initial Validation through a Creativity Experiment
 James E. Burroughs, University of Virginia
 David Glen Mick, University of Virginia

**SATURDAY
 OCTOBER 11, 2003**

**ACR
 LUNCHEON & BUSINESS MEETING
 NOON–1:45 P.M.**

**SATURDAY
 OCTOBER 11, 2003**

**SESSION 7
 2:00–3:30 P.M.**

7.1 Competitive Paper Session: Recreation, Sports, and Play

Chair: Brian Wansink, University of Illinois

Examining the Mediating Relationship of “Play” on Ritual Enduring Involvement 405
 Lee Phillip McGinnis, Washburn University
 James W. Gentry, University of Nebraska

Sex-Typing of Leisure Activities: A Test of Two Theories 412
 George M. Zinkhan, University of Georgia
 Penelope J. Prenshaw, Millsaps College
 Angeline Grace Close, University of Georgia/North Georgia College and State University

Assessing Motivations for Sports Volunteerism 420
 Paul Z. Wang, University of Technology, Sydney

7.2 Special Session: It Could Happen to Me: Risk Estimates and the Positivity/Negativity Bias

Chair: Nicholas Lurie, University of North Carolina at Chapel Hill
 Discussion Leader: Geeta Menon, New York University

SPECIAL SESSION SUMMARY

It Could Happen to Me: Risk Estimates and the Positivity/Negativity Bias 426
 Nicholas Lurie, University of North Carolina at Chapel Hill

Feeling Better or Staying Miserable: Why Self-Positivity
 Chien-Huang Lin, National Central University, Taiwan
 Ying-Ching Lin, National Chi Nan University
 Priya Raghurir, University of California at Berkeley

Risk Information: Truth and Consequences
 Punam Anand Keller, Dartmouth College
 Isaac M. Lipkus, Duke University Medical Center

The Effect of Making Risk Estimates on Consumer Preferences
 Nicholas Lurie, University of North Carolina at Chapel Hill
 Michael Ranney, University of California at Berkeley

7.3 **Competitive Paper Session: Group Influence**

Chair: Terry Bristol, Arkansas State University

Do The Ones We Love Sometimes Hurt Us The Most: The Role of Relationship Norms on Consumers' Perception of Fairness and Brand Evaluations 430
 Pankaj Aggarwal, University of Toronto

Group Dynamics of Impulse Buying: An Extended Social Facilitation Perspective 431
 Xueming Luo, State University of New York at Fredonia

When Research Participants Don't Tell it Like it Is: Pinpointing the Effects of Social Desirability Bias Using Self vs. Indirect Questioning 432
 Sabrina M. Neeley, Miami University
 Maria L. Cronley, Miami University

What is the Relation Between Culture and Desirable Responding? 434
 Ashok K. Lalwani, University of Illinois, Urbana-Champaign
 Sharon Shavitt, University of Illinois, Urbana-Champaign
 Timothy Johnson, University of Illinois, Chicago
 Jing Zhang University of Illinois, Urbana-Champaign

7.4 **Competitive Paper Session: Consumer Response across Types of Brands**

Chair: Nancy Upton, Suffolk University

Image Congruence and Attitudes toward Private Brands 435
 Dongdae Lee, Tongmyung University of Information Technology

Category Induction and Nonmonotonicity: Application to Branded Products and Their Competitors 442
 Christopher Joiner, George Mason University
 Barbara Loken, University of Minnesota

When Categorization is Ambiguous: Factors that Facilitate and Inhibit the Use of a Multiple (Versus Single) Category Inference Strategy 444
 Jennifer Gregan-Paxton, University of Delaware
 Steve Hoeffler, University of North Carolina
 Min Zhao, University of North Carolina

Is Being Good Better Than Being Cheap, or is Being Cheap Better Than Being Good? 446
 Håvard Hansen, Norwegian School of Management
 Bendik M. Samuelson, Norwegian School of Management
 Bengt G. Lorentzen, Norwegian School of Management

7.5 **Special Session: The Influence of Cultural Thinking Styles on Evaluative Processes**

Chair: Kyoungmi Lee, University of Illinois at Urbana-Champaign
Sharon Shavitt, University of Illinois at Urbana-Champaign
Discussion Leader: Nancy Wong, Georgia Tech University

SPECIAL SESSION SUMMARY

The Influence of Cultural Thinking Styles on Evaluative Processes 451

Kyoungmi Lee, University of Illinois at Urbana-Champaign
Sharon Shavitt, University of Illinois at Urbana-Champaign

Cultural Moderators to Feelings of Ambivalence: When Intra- versus Inter-Personal Conflict Leads to Feelings of Evaluative Tension

Joseph R. Priester, University of Michigan
Kiwan Park, University of Michigan
Richard E. Petty, Ohio State University
Yu-Peng Wang, Shih Chien University
Kyu-Hyun Lee, Hannam University

The Role of Cultural Cognition in the Use of Contextual Cues in Product Quality Judgments

Kyoungmi Lee, University of Illinois at Urbana-Champaign
Sharon Shavitt, University of Illinois at Urbana-Champaign

Service Encounters and Emotions across Individuals and across Cultures

Alexander Fedorikhin, University of Southern California
Catherine Cole, University of Iowa

7.6 **Roundtable: Qualitative Data Analysis–Part I: Issues in Data Analysis**

Discussion Leaders: Eric Arnould, University of Nebraska
Melanie Wallendorf, University of Arizona

Participants:

Eric Arnould	Sidney Levy
Soren Askegaard	Chuck Mc Mellon
Fleura Bardhi	Risto Moisio
Nivein Behairy	Kuitinee Neuvasiit
Dan Cook	Jerry Olson
David Crockett	Cele Otnes
Benet Deburry-Spence	Mark Peterson
Jeff Durgee	Torsten Ringberg
Karen Fernandez	Andrea Scott
Deborah Heisley	John Sherry
Pam Hendeson	Maura Troester
Jun Kimra	Melanie Wallendorf
Robert Kozinets	Pete Webb
John Lastovicka	Christine Wright-Isak
Ada Leung	

7.7 **Special Session: Effects of Framing on Magnitude Perceptions of Price**

Chair: Vicki Morwitz, New York University
Manoj Thomas, New York University
Discussion Leader: Russell Winter, New York University

SPECIAL SESSION SUMMARY

Effects of Framing on Magnitude Perceptions of Price 454

Manoj Thomas, New York University
Vicki Morwitz, New York University

The Pseudo-Sunk Cost Effect: How Varying Reward Levels Affects Prices in Alternative Currencies

Joseph Nunes, University of Southern California
Xavier Drèze, University of California

Price Partitioning: No One Likes Surprises

Joseph Redden, University of Pennsylvania
Gavan Fitzsimons, Duke University
Patti Williams, University of Pennsylvania

Penny Wise and Pound Foolish: The Left Digit Effect in Perceptual Responses to Multi-Digit Numbers

Manoj Thomas, New York University
Vicki Morwitz, New York University

7.8 **Special Session: Memory Accessibility and Product Judgment**

Chair: Stijn M. J. van Osselaer, Erasmus University
Discussion Leader: Robert S. Wyer, Hong Kong University of Science and Technology

SPECIAL SESSION SUMMARY

Memory Accessibility and Product Judgment 457

Stijn M. J. van Osselaer, Erasmus University

When Are Judgments Based on Product Benefits Versus Retrieval Ease?

Alice Tybout, Northwestern University
Brian Sternthal, Northwestern University
Prashant Malaviya, INSEAD
Georgios A. Bakamitsos, Dartmouth College
Se-Bum Park, Northwestern University

The Unbiasing Effect of Biasing Cues

Stijn M.J. van Osselaer, Erasmus University
Wouter Vanhouche, University of Florida

The Effect of Conceptual and Perceptual Fluency on Brand Evaluation

Angela Y. Lee, Northwestern University
Aparna Labroo, University of Chicago

7.9 Special Session: Diagnosing Identity: Exploring the Complex Relationship between Consumer Identities, Motivation, and Health-Related Behaviors

Chair: Sonya Grier, Stanford University
H. Rika Houston, California State University, Los Angeles
Discussion Leader: Americus Reed II, University of Pennsylvania

SPECIAL SESSION SUMMARY

Diagnosing Identity: Exploring the Complex Relationship between Consumer Identities, Motivation, and Health-Related Behaviors 458
Sonya Grier, Stanford University
H. Rika Houston, California State University, Los Angeles

The Motherhood Mandate: Gender, Identity, and Consumption in the Infertility Marketplace
H. Rika Houston, California State University, Los Angeles

Obesity: Government Definitions versus Self-Identity on Consumer Attitudes, Perceptions, and Behaviors
Michael Basil, University of Lethbridge
Edward W. Maibach, Porter Novelli

Identity as Motivation For A Non-Smoking Lifestyle: The Role of Cultural and Health Identity in Women's Smoking Behavior
Sonya Grier, Stanford University
Amy Marks, University of Cape Town

7.10 Competitive Paper Session: Consuming Places

Chair: Markus Giesler, Northwestern University

Clean and Dirty: Playing with Boundaries of Consumer's Safe Havens 462
Güliz Ger, Bilkent University
Baskin Yenicioğlu, Bilkent University

The Memetics of Transcendent Places 468
Charles S. Gulas, Wright State University
Kim McKeage, University of Maine

Provocation and Humor in Ad Effects: Constrained Multi-Group Analysis and Beyond 473
ChongMoo Woo, University of Florida
Jon D. Morris, University of Florida
Sanghoon Lee, LG Ad Inc.

**SATURDAY
OCTOBER 11, 2003**

**SESSION 8
4:00–5:30 P.M.**

8.1 Competitive Paper Session: Consumer Relationships with Each Other, Advertising, and Society

Chair: Laurie A. Meamber, George Mason University

<i>Relational Listening and Impression Management in Salesperson-Customer Relationships</i>	477
Avinash Malshe, University of Nebraska–Lincoln Susie Pryor, University of Nebraska–Lincoln	
<i>Materialism and Illegal Enterprise: A Life Stories Analysis</i>	479
Jon Littlefield, Virginia Tech Eloise Coupey, Virginia Tech	
<i>Direct-to-Consumer Advertising: Obligated to be Healthy</i>	485
Andrew Jardine, University of Otago	
<i>Consumer Complaint Behavior: Do “Other Customers” Make a Difference?</i>	491
Ruoh-Nan Yan, University of Arizona Sherry Lotz, University of Arizona	

8.2 Special Session: Regulatory Focus And Choice: Towards Unifying Emotional and Motivational Influences in Consumer Decision Making

Chair: Rik Pieters, Tilburg University
Discussion Leader: Hans Baumgartner, Pennsylvania State University

Ideals and Oughts and the Use of Feelings in Judgment
Michel Tuan Pham, Columbia University
Tamar Avnet, Columbia University

Self-Regulation Influences in Risky Choice
E. Tory Higgins, Columbia University
Scott Spiegel, Columbia University
Eric J. Johnson, Columbia University
Raghu Iyengar, Columbia University

Negative Returns of Positive Emotions: Effects of Pride and Self-Regulatory Goals on Repeat Purchase Decisions
Maria J. Louro, Tilburg University
Rik Pieters, Tilburg University
Marcel Zeelenberg, Tilburg University

8.3 **Competitive Paper Session: Effects of Culture and Gender**

Chair: Søren Askegaard, University of Southern Denmark

<i>Cultural Determinants of Behavior in Negotiations with Incomplete Information</i>	493
Ana Valenzuela, San Francisco State University	
Joydeep Srivastava, University of Maryland	
Seonsu Lee, Wonkwang University	
<i>Beyond Polarized Cultural Values: A New Approach to the Study of South Korean and US Newspaper Advertisements</i>	495
Hye-Jin Paek, University of Wisconsin–Madison	
Michelle R. Nelson, University of Wisconsin–Madison	
Douglas M. McLeod, University of Wisconsin–Madison	
<i>Cultural Differences in Fan Ritualization: A Cross-Cultural Perspective of the Ritualization of American and Japanese Baseball Fans</i>	503
Seungwoo Chun, University of Nebraska–Lincoln	
James W. Gentry, University of Nebraska–Lincoln	
Lee P. McGinnis, Washburn University	
<i>Men and Women Watching and Reading: Gender, Media, and Message Effects in Advertising</i>	509
Veronika Papyrina, University of Western Ontario	
June Cotte, University of Western Ontario	

8.4 **Competitive Paper Session: Methodological and Experimental Design Issues**

Chair: Alet C Erasmus, University of Pretoria

<i>Magnitude of Effects of Television Viewing on Social Perceptions Vary as a Function of Data Collection Method: Implications for Psychological Processes</i>	511
L. J. Shrum, University of Texas–San Antonio	
<i>A Study of Effect Sizes in Marketing Experiments</i>	514
Roger Marshall, Nanyang University	
Loi Soh Loi, Nanyang University	
Na WoonBong, Kyunghee University	
<i>Social Hubs: A Valuable Segmentation Construct in the Word-of-Mouth Consumer Network</i>	521
Andrea C. Wojnicki, Harvard University	
<i>The Interaction between Order of Elicitation and Event Controllability on the Self-Positivity Bias</i>	523
Chien-Huang Lin, National Central University	
Ying-Ching Lin, National Chi Nan University	
Priya Raghubir, University of California at Berkeley	

8.5 **Special Session: The Impact on Preferences of Consumer Access to Information in Online Shopping Environments**

Chair: Donna L. Hoffman, Vanderbilt University

Discussion Leader: Patricia M. West, Ohio State University

SPECIAL SESSION SUMMARY

<i>The Impact on Preferences of Consumer Access to Information in Online Shopping Environments</i>	530
Donna L. Hoffman, Vanderbilt University	

The Impact of Online Products Review Characteristics on Consumer Preferences

Donna L. Hoffman, Vanderbilt University
Thomas P. Novak, Vanderbilt University
Fang Wan, Vanderbilt University

Loves, Hates, and In-Betweens: the Role of Preference Structures in Agent Choice

Andrew D. Gershoff, Columbia University
Ashesh Mukherjee, McGill University
Anirban Mukhopadhyay, Columbia University

The Effects of Facilitating Access to Competitor Information on Consumer Preference

Valerie Trifts, Dalhousie University
Gerald Häubl, University of Alberta

8.6 Roundtable: Qualitative Data Analysis–Part II: Issues in Representation 535

Discussion Leaders: Eric Arnould, University of Nebraska
Melanie Wallendorf, University of Arizona

Participants:	Eric Arnould	Ada Leung
	Soren Askegaard	Sidney Levy
	Fleura Bardhi	Chuck Mc Mellon
	Nivein Behairy	Risto Moisio
	Dan Cook	Kuitinee Neuvasiit
	David Crockett	Jerry Olson
	Benet Deburry-Spence	Cele Otnes
	Jeff Durgee	Mark Peterson
	Karen Fernandez	Torsten Ringberg
	Deborah Heisley	Andrea Scott
	Pam Hendeson	John Sherry
	Jun Kimra	Maura Troester
	Robert Kozinets	Melanie Wallendorf
	John Lastovicka	Pete Webb
		Christine Wright-Isak

8.7 Special Session: Understanding the Evaluation of Future Events: The Impact of Psychological Characteristics Both of the Events and of the Evaluators

Chair: Jane E. J. Ebert, University of Minnesota
Discussion Leader: Daniel Read, London School of Economics

SPECIAL SESSION SUMMARY

Understanding the Evaluation of Future Events: The Impact of Psychological Characteristics Both of the Events and of the Evaluators 538

Jane E. J. Ebert, University of Minnesota

Value from Highlighting Time-Appropriate Outcomes

Nidhi Agrawal, New York University
Yaacov Trope, New York University

The Motivational Force of Future Rewards: Differences between Explicit and Implicit Valuations for Future and Uncertain Rewards

Jane E. J. Ebert, University of Minnesota
Drazen Prelec, Massachusetts Institute of Technology

Intelligence and Discounting

Shane Frederick, Massachusetts Institute of Technology

8.8 *Special Session: Implicit Measures of Consumer Judgments and Choice*

Chair: Andrew A. Mitchell, University of Toronto
Discussion Leader: Frank R. Kardes, University of Cincinnati

SPECIAL SESSION SUMMARY

Implicit Measures of Consumer Judgments and Choice 541
Andrew A. Mitchell, University of Toronto

Implicit Consumer Ethnocentrism—an Example of Dissociation between Explicit and Implicit Preference
Dominika Maison, University of Warsaw
Anthony G. Greenwald, University of Washington
Ralph H. Bruin, Medical Data Management Corp

The Relation between Implicit and Explicit Attitudes and Spontaneous Choice
Melanie A. Dempsey, University of Toronto
Andrew A. Mitchell, University of Toronto

Alternative Theoretical Positions on Implicit Attitudes
Paul M. Herr, University of Colorado
Andrew A. Mitchell, University of Toronto
Melanie A. Dempsey, University of Toronto

8.9 *Special Session: Consuming Television: Connectedness and Community in Broadcast Media*

Chair: Hope Jensen Schau, Temple University
Discussion Leader: Mary C. Gilly, University of California

SPECIAL SESSION SUMMARY

Consuming Television: Connectedness and Community in Broadcast Media 544
Hope Jensen Schau, Temple University
Cristel A. Russell, San Diego State University

Exploring the Relationship between Television Program Connectedness and Social Network Dynamics
Cristel A. Russell, San Diego State University
Andrew Norman, Iowa State University

Bonding through Cultural Subversion: Consumers' Connectedness with The Simpsons
Mary Finley Wolfenbarger, California State University—Long Beach
Hope Jensen Schau, Temple University

If You Can't Find It, Create It: An Analysis of Consumer Engagement with Xena: Warrior Princess and the Creation of a Consumer-generated Subtext
Hope Jensen Schau, Temple University
Albert M. Muniz, DePaul University

8.10 Meet the Editor's

CHAIR: Dawn Iacobucci, *Journal of Consumer Research*,
Ruth Bolton, *Journal of Marketing*,
Joel Cohen, *Journal of Public Policy and Marketing*,
Dhruv Grewal, *Journal of Retailing*,
Joel Huber, *Marketing Science*,
Dilip Soman, *Journal of Economic Psychology*,
Dick Wittink, *Journal of Marketing Research*,
Robert Wyer, *Journal of Consumer Psychology*,
Sharon Shavitt, *Journal of Consumer Psychology*

**SATURDAY
OCTOBER 11, 2003**

**RECEPTION
6:00–8:00 P.M.**

**Co-Sponsored with the
Rotman
School of Management
University of Toronto**

**SUNDAY
OCTOBER 12, 2003**

**JCR
POLICY BOARD MEETING
7:30 A.M. –12:30 P.M.**

**SUNDAY
OCTOBER 12, 2003**

SESSION 9
8:30 –10:00 A.M.

9.1 Competitive Paper Session: You are What You Eat

Chair: H. Rika Houston, California State University

<i>Exploring the Architecture of Contemporary American Foodways</i>	548
Elizabeth C. Hirschman, Rutgers University	
Nicole Carscadden, Rutgers University	
Lindsay Fleischauer, Rutgers University	
Martin Hasak, Rutgers University	
Melissa Mitchell, Rutgers University	
<i>Extreme Foods: Expanding the Boundaries of Taste</i>	554
Ann Veeck, Western Michigan University	
<i>Consumer Trust and Distrust in the Food System: Some Implications for the Debates on Food Biotechnologies</i>	555
Ahmet Ekici, Bilkent University	
<i>How Do Consumers Solve Value Conflicts in Food Choices? An Empirical Description and Points for Theory-building</i>	564
Harri T. Luomala, University of Vaasa	
Pirjo Laaksonen, University of Vaasa	
Hanna Leipämaa, University of Vaasa	

9.2 Special Session: Consumer Strategies to Avoid Decision Conflict

Chair: Kristine R. Ehrich, University of Texas, Austin
Julie R. Irwin, University of Texas, Austin

Discussion Leader: Baba Shiv, University of Iowa

SPECIAL SESSION SUMMARY

<i>Consumer Decision Strategies Under Conflict</i>	571
Kristine R. Ehrich, University of Texas at Austin	
<i>Conflict and Framing: Selecting versus Rejecting in Binary Choice</i>	
Margaret G. Meloy, Penn State University	
J. Edward Russo, Cornell University	
<i>Willful Ignorance in the Face of Conflict: The Avoidance of Ethical Attribute Information</i>	
Kristine R. Ehrich, University of Texas at Austin	
Julie R. Irwin, University of Texas at Austin	
<i>When Desire Conflicts with Willpower: The Role of Justification in a Theory of Unintended Purchase</i>	
Anirban Mukhopadhyay, Columbia University	
Gita V. Johar, Columbia University	

9.3 **Competitive Paper Session: Negative Emotions and Coping**

Chair: Loraine Lau-Gesk, University of Minnesota

<i>Outraged Consumers: What Lights Their Fire?</i>	573
Nada Nasr Bechwati, Bentley College Maureen Morrin, Rutgers University	
<i>Eating Guilt: Measurement and Relevance to Consumer Behavior</i>	575
Ajay Sukhdial, Oklahoma State University David M. Boush, University of Oregon	
<i>The Effect of Irrelevant Information on Consumer Irritation and Attitudes: The Moderating Role of Need to Evaluate</i>	577
Abhijit Biswas, Wayne State University Sweta Chaturvedi Thota, James Madison University	
<i>A Grounded Typology of Consumer Coping Strategies Within the Context of Infertility Treatment</i>	579
Eileen Fischer, York University Cele C. Otnes, University of Illinois Linda Tuncay, University of Illinois	

9.4 **Competitive Paper Session: Pricing Issues**

Chair: Frédéric F. Brunel, Boston University

<i>Consumer Evaluation of Multiple Internal Reference Prices</i>	580
Miyuri Shirai, Yokohama National University	
<i>Inferred Transaction Value: A Key to Understanding the Effects of Price Bundling</i>	584
Roger Heeler, York University Adam Nguyen, York University	
<i>Did You Hear What My Friend Paid! Examining the Consequences of Social Comparisons of Prices</i>	586
David Ackerman, California State University, Northridge Lars Perner, San Diego State University	
<i>The Influence of Price Difference and Equity Sensitivity on Consumer Satisfaction in a Dynamic Pricing Environment</i>	593
Susan K. Harmon, Middle Tennessee State University David A. Foote, Middle Tennessee State University	

9.5 **Special Session: Automatic Effects: The Consequence of Construct Accessibility for Behavior, Self-Regulation, and Information Processing**

Chair: S. Christian Wheeler, Stanford University

Discussion Leader: Chris Janiszewski, University of Florida

SPECIAL SESSION SUMMARY

<i>Automatic Effects: The Consequence of Construct Accessibility for Behavior, Self-Regulation, and Information Processing</i>	599
S. Christian Wheeler, Stanford University	

Automatic Effects of Exposure to Anthropomorphic Objects on Behavior

Gráinne M. Fitzsimmons, New York University
Tanya L. Chartrand, Ohio State University
Gavan J. Fitzsimmons, University of Pennsylvania

Decomposing Automatic and Conscious Components of Self-Control and Indulgence

Suresh Ramanathan, University of Chicago
Geeta Menon, New York University

The Role of the Self in Prime-to-Behavior Effects

S. Christian Wheeler, Stanford University
Kenneth G. DeMaree, Ohio State University
Richard E. Petty, Ohio State University

9.6 Roundtable: Olfactory Stimulation and Affect Intensity: Gender Differences in Yielding to the Enticing Aroma of Food 603

Discussion Leader: David J. Moore, University of Michigan

Participants: Paula Bone David J. Moore
Pam S. Ellen Eric R. Sprangenberg
Bianca Grhmann David E. Sprott
Pamela Homer Jerome D. Williams

9.7 Special Session: Advances in the Psychology of Consumer Investment

Chairs: Rongrong Zhou, Hong Kong University of Science and Technology
Michel Tuan Pham, Columbia University
Discussion Leader: Drazen Prelec, Massachusetts Institute of Technology

SPECIAL SESSION SUMMARY

Advances in the Psychology of Consumer Investment 604

Rongrong Zhou, Hong Kong University of Science and Technology
Michel Tuan Pham, Columbia University

Non-Random Walk Down the Main Street: Impact of Price Trends on Trading Decisions of Individual Investors

Ravi Dhar, Yale University
Alok Kumar, Cornell University

Financial Self-Regulation across Mental Accounts: Implications for Consumer Investment Decisions

Rongrong Zhou, Hong Kong University of Science and Technology
Michel Tuan Pham, Columbia University

9.8 Special Session: Alternative Decision Processes in Consumption: Personal Rules, Rationales, and Identity Maintenance

Chair: On Amir, Yale University
Discussion Leader: Dan Ariely, Massachusetts Institute of Technology

SPECIAL SESSION SUMMARY

Alternative Decision Processes in Consumption: Personal Rules, Rationales, and Identity Maintenance 607

On Amir, Yale University

Hot Predictions and Cold Choices: Rationalism in Decision Making

Christopher Hsee, University of Chicago
Fang Yu, University of Chicago
Jiao Zhang, University of Chicago

Decisions By Rules: Disassociation between Preferences and Willingness to Act

On Amir, Yale University
Dan Ariely, Massachusetts Institute of Technology

Personal Rules (Are Meant to Be Broken)

Drazen Prelec, Massachusetts Institute of Technology

9.9 Special Session: If I Could Be Like That...”: The Not so Harmful Effects of Social Comparisons of Consumers

Chair: Naomi Mandel, Arizona State University

Discussion Leader: Marsha Richins, University of Missouri

SPECIAL SESSION SUMMARY

If I Could Be Like That...”: The Not so Harmful Effects of Social Comparisons of Consumers 610
Naomi Mandel, Arizona State University

Idealized Images, Self-Perceptions and Behaviors of young Women: Explanation via the Third-Person Effect Model

Fang Wan, Vanderbilt University
William D. Wells, University of Minnesota
Ronald Faber, University of Minnesota

Effects of Exposure to Thin Media Images: Evidence of Self-Enhancement among Restrained Eaters

Jennifer S. Mills, York University
Janet Polivy, University of Toronto
C. Peter Herman, University of Toronto
Marika Tiggemann, Flinders University

Comparisons with the Good Life: Images of Success and the Preference for Luxury Products

Naomi Mandel, Arizona State University
Petia K. Petrova, Arizona State University
Robert B. Cialdini, Arizona State University

SUNDAY
OCTOBER 12, 2003

SESSION 10
10:30 A.M. – NOON

10.1 Competitive Paper Session: Grief, Loss, and Tragedy

Chair: Charles A. McMellon, Hofstra University

Consuming Activism: Peace, War, and Consumer Research 611
A. Fuat Firat, Arizona State University

<i>Identity, Consumption, and Loss: The Impact of Women's Experience of Grief and Mourning on Consumption in Empty Nest Households</i>	615
Carolyn Folkman Curasi, Georgia State University	
Margaret K. Hogg, Manchester School of Management	
Pauline Maclaran, Leicester Business School	
<i>From Patriotic to Tasteless: Exploring Consumer Reactions to 9/11/2001 Related Advertising</i>	623
Charles A. McMellon, Hofstra University	
Mary Long, Pace University	
<i>A Tale of Two Cities ("It was the worst of times"; "It was worse at times"): Shoppers in Montgomery County, MD and Washington, D.C. during the recent Sniper Attacks</i>	630
Denver D'Rozario, Howard University	

10.2 Special Session: The Adaptive and Less Adaptive Impact of Visceral and Cognitive Facets of Emotional Experience

Chairs:	Laurette Dubé, McGill University
	Catherine Cole, University of Iowa
Discussion Leaders:	Antoine Bechara, University of Iowa
	Ulf Böckenholt, McGill University

SPECIAL SESSION SUMMARY

<i>The Adaptive and Less Adaptive Impact of Visceral and Cognitive Facets of Emotional Experience</i>	632
Laurette Dubé, McGill University	
Catherine Cole, University of Iowa	

Reactions to Deceptive Advertising and the Aging Brain

Catherine Cole, University of Iowa
 Natalie Denburg, University of Iowa
 Antoine Bechara, University of Iowa

The Dark Side of Emotions in Decision Making: When a Dysfunctional Ventromedial Prefrontal Cortex Can Lead to More Optimal Decisions

Baba Shiv, University of Iowa
 George Loewenstein, Carnegie-Mellon University
 Antoine Bechara, University of Iowa
 Hanna Damasio, University of Iowa
 Antonio Damasio, University of Iowa

Positive-dominance and Complexity of Emotional Experience Positive-Dominance and Complexity of Emotional Experience and their Impact of Emotion Performance in the Elderly Consumer

Laurette Dubé, McGill University
 Catherine Paquet, McGill University

10.3 Competitive Paper Session: Media Issues

Chair:	Carol Kaufman-Scarborough, Rutgers University
--------	---

<i>Exporting Media Products: Understanding the Success and Failure of Hollywood Movies in Germany</i>	633
Thorsten Hennig-Thurau, Bauhaus University of Weimar	
Gianfranco Walsh, University of Strathclyde	
Matthias Bode, University of Hanover	

<i>Advertiser Portrayal of Consumer Time in the Late 20th Century US: An Update</i>	639
Barbara L. Gross, California State University Northridge	
<i>Does Crime Pay for Violent Program-Embedded Ads?</i>	646
Olivier Droulers, C.R.E.M. (UMR CNRS C 6211), University of Rennes	
Bernard Roulet, C.R.E.M. (UMR CNRS C 6211), University of Rennes	
<i>Using Market-Specific Symbols in Advertising to Attract Gays and Lesbians Without Alienating the Mainstream</i>	652
Gillian K. Oakenfull, Miami University	
Timothy B. Greenlee, Miami University	

10.4 Competitive Paper Session: Managing Brand Equity

Chair: Torsten Ringberg, University of Wisconsin

<i>If We Know the Difference What's the Harm? The Effects Brand Equity Misappropriation and Dilution</i>	654
Chris P. Pullig, Baylor University	
Carolyn J. Simmons, Washington and Lee University	
Richard G. Netemeyer, University of Virginia	
<i>Strategic Brand Concept and Brand Architecture Strategy—A Proposed Model</i>	656
Andreas Strebing, Vienna University of Economics and Business Administration	
<i>Consumer Responses to Discontinuance of Favorite Products: An Exploratory Study</i>	662
Melissa A. Martin, George Mason University	
<i>Processing General versus Specific Brand Information: The Influence of Relationship Norms in Consumer's Choice of Processing Strategies</i>	664
Pankaj Aggarwal, University of Toronto	
Sharmistha Law, University of Toronto	

10.5 Special Session: Investigating Links Between Consumption Emotions and Behavior

Chair: Adam Duhachek, Northwestern University
Discussion Leader: Dawn Iacobucci, Northwestern University

SPECIAL SESSION SUMMARY

<i>Investigating Links Between Consumption Emotions and Behavior</i>	666
Adam Duhachek, Northwestern University	
<i>An Examination of the Relationship between Emotions, Appraisals and Coping</i>	
Adam Duhachek, Northwestern University	
Dawn Iacobucci, Northwestern University	
<i>Oops, Will I Do It Again? Mixed Emotions after Impulsive Behavior</i>	
Suresh Ramanathan, University of Chicago	
Patti Williams, University of Pennsylvania	
<i>Mystery Moods: The Consequences of Success and Failure at Nonconscious Goal Pursuit</i>	
Tanya Chartrand, Ohio State University	

10.6 *Competitive Paper Session: Consumer Behavior Across Cultures*

Chair: Lisa J. Abendroth, Boston University

PRESIDENTIAL ADDRESS

Are We the Good Guys?¹

Wes Hutchinson, University of Pennsylvania

Most of the time, most of us in this room believe that most of what we do is well-intended and has positive effects. Nevertheless, many of the problems in the world today are blamed on consumers and/or the companies that supply them with goods and services. Implicitly, these criticisms apply to us, the people who observe, theorize, and collect knowledge about consumers. So, last year when I began thinking about my presidential address, I posed the question to myself, “Are we the good guys?” As you might imagine, I still do not have a definitive answer, but I would like to share with you the results of my inquiry.

Introduction

First, let me refer you to the Bibliography of this essay, which contains some of the resources I found most interesting and informative. I do not refer to all of these here, but they provided much of the “food of thought” that led to the ideas that follow.

Second, let me provide a little personal background on the origins of the ideas that follow. In 1981, I joined the marketing faculty of the University of Florida with a degree in cognitive psychology, never having even taken a course on any business-related topic. So I was pretty naive and uninformed. However, by the end of my first year two observations had impressed themselves upon me: Consumers belonged to things called “segments,” and companies worked very hard to market products that consumers want. More precisely,

1. consumers are heterogeneous in their preferences, knowledge, and decision processes, and
2. consumers are powerful (relative to governments and large corporations).

These observations led to the conclusion:

3. If our markets and mass media are filled with junk, or environmentally damaging products, or culturally vacuous entertainment, it’s because we (collectively) want that stuff.

Finally, let me be clear about who the “we” in “Are we the good guys?” is meant to include. There are two possible reference groups:

1. consumers in industrialized nations (particularly the U.S.), and
2. consumer researchers (i.e., ACR members, JCR authors, etc.).

Each of these definitions offers a distinct and informative perspective on the question, and each group could be a “good guy” or a “bad guy.” Reflecting this, my “method of analysis” will be to examine all four possible answers to the question at hand: good/good, good/bad, bad/bad, and bad/good. For each possible answer,

which is better called an opinion, I will review the basic arguments supporting that opinion. The empirical evidence that I have collected, which demonstrates that at least some people find these arguments persuasive, is that they can be found spoken by at least one central character in a popular movie. These are perhaps not the most rigorous data available nor are they the most persuasive arguments, but they provide “stylized opinions” on the matter that I think are useful in the same way that economists frequently use “stylized facts” to develop analytic theories of market behavior. The four opinions are summarized in Exhibit 1.

Good/good

The first opinion is that consumers are indeed the good guys, and consumer researchers are good as well. This position might be called “The ACR Member’s View” because most of us adopt this viewpoint in our day to day lives, if nothing else, to reduce cognitive dissonance. We view ourselves as advocates of consumer welfare, and believe that our efforts contribute to the protection of consumers. Implicit in this view is the belief that consumers, in fact, need protection. Recently, this issue has come to the fore among economists and legal scholars in the debate on merits “paternalism” (see Camerer et al. 2003, and Thaler 2003). The reasoning is essentially that if the weight of behavioral research demonstrates that consumer decision making is easily biased, then it is ethically permissible, and possibly required, to take paternalistic actions that debias consumers, so long as they do not infringe on the rights of others.

This we-can-all-be-good-guys opinion was nicely summarized in the movie, *Heaven Can Wait*. Warren Beatty plays the role of Los Angeles Rams quarterback, Joe Pendleton, who an angel mistakenly takes “too soon” in an automobile accident. The angel’s supervisor steps in to fix the problem and find Joe a new body. Temporarily he is given the body of an amoral captain of industry, Leo Farnsworth. At one point in the movie, alerted to Farnsworth’s evils by love interest Julie Christie, Beatty invites the press into a board meeting and gives a rambling, jock-pep-talk speech. The board, believing he is Farnsworth, is incredulous. In the middle of his pep talk he discovers that Exo-Gray’s tuna cannery kills an occasional dolphin in their processing. He says:

“Why not do the right thing? Let the other guys kill dolphins fishing for tuna. We could even make that part of our advertising. ‘Pay an extra nickel and save a dolphin.’”

Good/bad

The second opinion is that consumers are the good guys, but consumer researchers are the bad guys. Essentially, this opinion holds that consumer researchers, in both academia and industry, serve the interests of corporate welfare rather than consumer welfare. This opinion tends to spawn conspiracy theories of various sorts that place human greed at the heart of the matter.

This opinion was nicely summarized, with a twist, in the movie, *Wall Street*. In *Wall Street*, Michael Douglas plays the role of Gordon Gekko, a ruthless corporate raider in the process of a hostile takeover. During a stockholders meeting, the paternalistic owner of Teldar Paper, Mr. Cromwell, brands Gekko as the epitome of Wall Street greediness. Gekko responds:

¹A slightly revised version of the presidential address delivered at the 2003 Conference of the Association for Consumer Research held in Toronto, Canada.

EXHIBIT 1

		CONSUMERS	
CONSUMER RESEARCHERS		Good	Bad
Good		<p><u>The ACR Member's View</u></p> <ul style="list-style-type: none"> • Advocates of consumer welfare • Favorite Concepts: consumer protection, libertarian paternalism • Favorite Movie: <i>Heaven Can Wait</i> 	<p><u>Wes' Naive 1981 View</u></p> <ul style="list-style-type: none"> • Advocates of raising a family, getting tenure, and not being wracked by guilt in the process • Favorite Concepts: consumer power, (willful?) ignorance • Favorite Movie: <i>The Great Gatsby</i>
	Bad	<p><u>The "Average" Citizen's View</u></p> <ul style="list-style-type: none"> • Advocates of corporate welfare • Favorite Concepts: greed, conspiracy theories • Favorite Movie: <i>Wall Street</i> 	<p><u>The Third World View</u></p> <ul style="list-style-type: none"> • Advocates of wealthy, western-style, free-market democracies • Favorite Concepts: imperialism, colonialism, nationalism, self-determination • Favorite Movie: <i>Ghandi</i>

“The point is, ladies and gentlemen, greed is good. Greed works, greed is right. Greed clarifies, cuts through, and captures the essence of the evolutionary spirit. Greed in all its forms, greed for life, money, love, knowledge, has marked the upward surge of mankind—and greed, mark my words—will save not only Teldar Paper but that other malfunctioning corporation called the USA...Thank you.”

This echoes a much older view, that of Adam Smith (1776):

“The rich only select from the heap what is most precious and agreeable. They consume little more than the poor, and in spite of their natural selfishness and rapacity, though they mean only their conveniency, though the sole end which they propose from the labours of all the thousands whom they employ, be gratification of their own vain and insatiable desires, they divide with the poor the produce of all their improvements.”

The astute reader will note that these are both variations of the “bad is good” argument and essentially attempts to create a back door into the good/good cell of Exhibit 1. Clearly, there is much room for debate about whether the “invisible hand” that guides free markets and the hand of God indeed pull in the same direction, as Gekko and Smith suggest.

Bad/bad

The third opinion is that consumers are the bad guys, and consumer researchers are bad as well. Third world leaders and first world dissenters most often voice this opinion. Basically, the argument is that the whole system is merely the mechanism through which wealthy, western-style, free-market democracies maintain their self-centered world dominance. This viewpoint also tends to champion nationalism and self-determination, as the highest immediate goal for have-not countries.

This opinion was nicely summarized in the movie, *Ghandi*. Ben Kingsley plays the role of Mohandis Ghandi. At an early meeting of the Indian National Congress, he says:

“Here we make speeches for each other—and those English liberal magazines that may grant us a few lines. But the people of India are untouched. Their politics are confined to bread and salt. Illiterate they may be, but they are not blind. They see no reason to give their loyalty to rich and powerful men who simply want to take over the role of the British in the name of freedom.”

Later, he says: “Mr. Kinnoch, I beg you to accept that there is no people on earth who would not prefer their own bad government to the ‘good’ government of an alien power.”

Bad/good

The final opinion is that consumers are the bad guys, but consumer researchers are the good guys. This would appear to be an unlikely combination, but upon reflection I realized that this was exactly my naive opinion in 1981. It relies on my two initial observations: consumers (in triad countries, at least) are sufficiently powerful to get whatever goods and services they want, but they want a wide variety different things. Moreover, these different things are desired with little awareness of the consequences of having companies compete to provide them, and the consequences are often bad for others and sometimes for the consumers themselves.

This opinion was nicely summarized in the movie, *The Great Gatsby*. (Of course, F. Scott Fitzgerald's novel is the real source.) *The Great Gatsby* is a story told by an apparently impartial observer, Nick Carraway. He more or less plays our role as consumer researchers. The story is about Jay Gatsby in his quest to realize the American Dream of creating personal wealth and re-capturing the love of his youth, Daisy Buchanan, who is old money and married to old money, Tom Buchanan. Daisy kills Tom's lover in a hit-and-run accident. Tom tells his dead lover's husband that Gatsby was driving. The husband kills Gatsby and then himself. Daisy's crime is forever hidden. Nick meets Tom on the street and, to the reader, Nick passes judgment on Tom and Daisy.

"It was all very careless and confused. They were careless people, Tom and Daisy—they smashed up things and creatures and then they retreated back into their money or their vast carelessness, or whatever it was that kept them together, and let other people clean up the mess they made... I shook hands with him; it seemed silly not to, for I felt suddenly as though I were talking to a child. Then he went into the jewelry store to buy a pearl necklace—or perhaps only a pair of cuff buttons—rid of my provincial squeamishness forever."

Are consumers powerful?

A key premise of the good/bad viewpoint is that consumers are sufficiently powerful to both take care of themselves and to make the world a better place, if they so desire. So what is the evidence that consumers are powerful?

Litigation—There are many government regulations designed specifically to empower and protect consumers. Moreover, individual and class action lawsuits provide ready mechanisms for consumers to exercise their power (e.g., hot coffee at McDonald's=\$2.9 million, but empty calories at McDonald's=\$0).

Bubbles—Coordinated surges in demand occasionally reveal the even greater power exerted when the typical heterogeneity in consumer preferences suddenly congeals into homogeneity. Spontaneous surges (e.g., tulips in Holland, white wine in the U.S. in the 70s, tech stocks in the 90s, etc.) appear to be more efficacious than those that are organized (e.g., buy American campaigns, green marketing, etc.).

Boycotts—Coordinated withdrawals of demand (e.g., buses in Birmingham, Nestle's infant formula, Procter and Gamble's stars-and-moon logo, South African companies in the 80s), or even the credible threat of such withdrawals, exert considerable force on large corporations.

More evidence is provided by the following "gedanken" experiment. What would happen if, starting tomorrow, everyone

increased their personal savings rate by cutting their "discretionary" spending? Most observers would agree that if the rate went from recent levels of 0%–4% (of disposable income) to 8%–12%, the economic health of the U.S. and the rest of the world would be greatly improved now and in the future. If, however, it became 25% to 50%, there would be a worldwide recession or depression. The reason for this dire prediction is because virtually all countries depend on high levels of U.S. consumer spending.

Now, is it possible for the savings rate to go to 50%? I maintain that the answer is "yes." My reasoning is simply an existence proof. At least one person has shown the ability to cut consumption and increase saving by a large amount—my father-in-law, for example. My father-in-law was a university professor who decided to move to the mountains of North Carolina—a beautiful and meditative locale (see Exhibit 2). He built a small, energy efficient dwelling (see Exhibit 3) and has been pretty happy with his dramatically lower rate of consumption. Therefore, such a change in consumer behavior is "possible." However, is it "likely?" Absolutely not. Why? Because not everyone is not like my father-in-law (i.e., consumer heterogeneity). Which is not to say that everyone should be like him, just that they could be if they chose to do so, and if they did the savings rate would skyrocket, among other outcomes.

The implication of my gedanken experiment is that consumers have a tremendous amount of potential power, but coordinated action is required to exert that power. In the absence of coordinated action, individuals have relatively little power. As a result, I offer the following conjecture, proposition, and corollary.

CONJECTURE: Consumers are powerful, but are relatively ignorant of their power—like a child playing with a loaded gun; therefore, it is only the heterogeneity of preferences, values, and beliefs that keeps this power in check.

PROPOSITION: Because people act like children, doesn't mean they deserve to be protected like children. Only the powerless deserve to be protected.

COROLLARY: The worst system is one that protects the powerful and leaves the powerless unprotected.

But that's so depressing...

True. However, there is an alternative spin. Consumers have the market power to achieve the broad social goals for which there is a surprising amount of consensus (at the abstract level, at least). Consumers only lack the willpower to achieve those goals.

Thus, I could change my representative movie for the bad/good cell of Exhibit 1 from *The Great Gatsby* to *Pay It Forward*. In *Pay It Forward*, Kevin Spacey plays Eugene Simonet, a social studies teacher who gives his class an assignment to come up with an idea that could change the world. Trevor, played by Haley Joel Osment, offers the following idea.

"If someone did you a favor, something big, something you couldn't do on your own, and instead of paying it back, you paid it forward to three people. And the next day they paid it forward to three more...and the day after that those people paid it forward to three more. And each day everyone in turn paid it forward to three more people. In two weeks, that comes to 4,782,969 people."

Even though "Pay It Forward" leaves us feeling a bit warmer and fuzzier about the bad/good opinion, it has an important implication. If consumers are powerful, then we—the people who observe, theorize, and collect knowledge about consumers—are

EXHIBIT 2

EXHIBIT 3

also powerful. And if consumer researchers are powerful, then Eugene Simonet's challenge to change the world should be as thought-and-action provoking for us as it was for his 6th grade social studies class.

THE SECOND ANNUAL ACR FILM FESTIVAL

Russell Belk, University of Utah

Robert Kozinets, Northwestern University

The 2003 ACR Film Festival accepted 13 films by a variety of producers ranging from first time academic filmmakers to film school trained professionals. The films presented considerable diversity in their approaches to subject matter, ranging from abstract impressionistic films to talking head documentaries to travelogues. We were also pleased that three of these films were from Europe, two were from Asia, and eight were from North America. Besides the diversity of affiliations and geography, the films addressed an interesting variety of topics as the abstracts below attest.

This year we forsook the popcorn and moved the Film Festival to a daytime format running all-day Friday and Saturday. The daytime format was successful and we were also pleased to hear a number of references to the films during the paper sessions of the Conference. Each initial showing was followed by 15 minutes of question and answer with the filmmakers. We were delighted to see many lively and stimulating discussions during these periods. A second showing of each film took place on Saturday without the filmmaker interaction. We were assisted in running these sessions by a number of the filmmakers from this year's and last year's Festival and we greatly appreciate their help and involvement.

Prizes this year were to have gone to Gold, Silver, and Bronze award-winners based on People's Choice ballots submitted by film audiences. However, we had a pair of two-way ties and therefore awarded two Gold and two Silver awards as follows.

Gold Award: Christina Monnier and Charles Gulas, "American Odyssey"

Gold Award: David Toumajian and Gülnur Tumbat, "Toward a Meaningful Identity: The (F)Utility of Lifestyle Research"

Silver Award: Anders Bengtsson, Jacob Östberg, and Dannie Kjeldgaard, "The Embodied Brand"

Silver Award: Alain DeCrop, Olivier Cabossart, and Christian Derbaix, "Colors and Scarves: Symbolic Consumption By Soccer Fans"

Congratulations to the winners.

The first two years of the ACR Film Festival have been a very rewarding experience for us as organizers and we are gratified to see a variety of approaches being used. As a relatively new medium, film has tremendous possibilities to enlighten, expose, analyze, entertain, stimulate, and critique more effectively than other types of conference presentations. We encourage experimentation with a variety of approaches and techniques for the next Film Festival and are also in the process of issuing a call for entries in a special DVD issue of the journal *Consumption, Markets & Culture*. Leading consumer behavior texts have also picked up some of the films from the Festivals as supplements. And the *Journal of Consumer Research* has begun to include some streaming video as well as color photos with some of the articles on its web site. Such signs all suggest the growing interest in the potential of visual media and the lessening cost and growing accessibility of visual production technology.

EXTENDED ABSTRACTS OF FILMS

American Odyssey

Christina G. Monnier, Mansfield, Ohio

Charles S. Gulas, Wright State University

American Odyssey is an examination of the unique brand community that revolves around the bullet-shaped, recreational trailers manufactured by Airstream, Inc. The film is the culmination of approximately eighteen months of research. The background research took place in five states. Visits were made to trailer parks, RV rallies, the Airstream factory, and the archives of the Wally Byam Caravan Club International (WBCCI).

The primary data collection took place in two segments. In the first segment, interviews were conducted at two Airstream parks in Florida. Over the course of eight days, fifteen hours of interviews and verite footage were videotaped. In the second segment, an additional twenty-five hours of videotape were shot over a period of seventeen days while accompanying twenty-six Airstream owners on a caravan from Ohio to a week-long rally in Massachusetts. The forty hours of raw footage were ultimately edited to the thirty-four minutes presented in the finished film.

Brand Community

American Odyssey is the story of consumers who have chosen Airstream as a lifestyle. This lifestyle extends beyond the individual relationship with the brand and includes a brand community, the importance of which may supercede the relationship with the brand.

As the film shows, the WBCCI is Middle America on wheels. It is a mobile community, with shared consciousness and rituals, based on a particular brand and to some extent, models within the brand. Although all models of Airstream are welcome in WBCCI, this fact is not without controversy.

"That new motor home that we pointed out, the Land Yacht, which is a fiberglass, square-sided motor home is probably one of the great sources of controversy within the Wally Byam Caravan Club. For many members that is a sacrilege. That's not a product that Wally developed and it therefore ought not to be in the Wally Byam Caravan Club." Doug Pederson

“It used to be that an Airstream was an Airstream trailer. But now we’ve got all kinds of square boxes and vans and motor homes and everything else they call Airstreams.” George James.

The begrudging acceptance of the “boxes” may be due in part to a survival mentality. Some WBCCI members voice concern that dying members are not being adequately replaced. Also, since the self contained motor home is relatively easy to operate, compared to a large trailer, some look at these vehicles a method of extending their years of caravanning, when they can no longer cope with a trailer.

Product as Life Saver

For some, the Airstream represents a tool for staying vital. The product, and the brand community formed around it, is perceived as not only enhancing the lives of owners but also extending them.

“If you couldn’t tow an Airstream you’d probably move into town and deteriorate quicker.” Ted Covington.

“There’s people that have gone, lived, ten-fifteen years longer because of these vehicles.” George James.

Conclusion

Airstream owners are committed to the brand, and more importantly, to the brand community it represents. *American Odyssey* adds to the growing understanding of these brand communities as an important aspect of consumer behavior.

Colors and Scarves: Symbolic Consumption by Soccer Fans

Alain Decrop, University of Namur (FUNDP), Belgium

Olivier Cabossart, Catholic University of Mons (FUCAM), Belgium

Christian Derbaix, University of Mons (FUCAM), Belgium

Football (soccer) is the most popular sport in the world. In European countries, professional football is a big business, with clubs generating large turnovers and substantial profits. Merchandising today represents a substantial part of those incomes. In this paper, we investigate the reasons why merchandising is becoming so successful: why supporters are increasingly buying and consuming shirts, scarves or hats of their preferred colors. The focus is on football fans, i.e. supporters who are highly involved in their team, who support it intensively by attending most of its matches.

The general interest in sport consumption is recent in consumer research. More than any other, Holt’s (1995) study on the consumption behavior of baseball supporters is the seminal work in this field. Based on an interpretive in-depth investigation of baseball supporters of Chicago, he developed a typology of four streams of consumption: consumption as experience, consumption as integration, consumption as classification and consumption as play. Other papers have been written on more specific aspects of sport behavior (Branscombe & Wann, 1992; Wann & Schrader, 2000). However, the thrust of this literature has focused on a sociological interpretation of sport consumption (e.g. Guttman, 1978; King, 1997).

This video results from an effort to consider all possible sources in understanding the consumption of material possessions by soccer fans in a naturalistic interpretive perspective. We immersed ourselves in the football fan subculture in order to gain a better insight into the reasons and motives why people buy and consume football-related tangibles within and outside stadiums on game days and on other occasions. How and why fans come to buy those items? Where, when and how do they consume them? What are the motives for such a consumption? What are the values conferred to those items? This broad and deep understanding of the consumption of the material possessions by football fans extends our 2001 ACR paper (Derbaix, Decrop & Cabossart, 2001).

In the last four years, we interviewed more than 30 fans of the most popular Belgian, French and Spanish teams. In addition, we observed them on some game days and during other football-related activities such as bus journeys to the stadium, meetings, dinners or visits to their fan club. To know more about the context of fan behavior within and outside football stadiums, we attended about 50 matches of the Belgian, French and Spanish national competitions. Finally, we interviewed experts and fan shop managers and we collected secondary documents such as brochures, press articles, and web sites. All these data were analyzed through inductive thematic analysis in order to bring order, structure and meaning to the mass of collected data. The use of different settings, methods, data sources, and researchers in a triangulation process contributes to the trustworthiness of the findings presented in this videography.

Clips show that action and possession are strongly connected as far as football consumption is concerned. Football fans conspicuously show a lot of support to their teams by such overt behavior as singing, shouting and cheering but also through a lot of material merchandise: scarves, hats, shirts... These two elements are present in informants’ definition of the “good” football fan, which is characterized both by his/her material possessions, in which colors play a major role, and his/her actions: s/he is faithful and supports his/her team even in bad circumstances.

The consumption of football entails a lot of symbolism, which is often connected with colors and to the football-related items that are paraded by the fans. The good supporter’s paraphernalia involves an identification, integration, socialization, expression and sacralization process. To summarize the major emerging findings of this study in one sentence, we could say that football fans express their identification with one team as an integrated community during sacred sport moments. This is not far from Belk et al.’s (1991) pioneering work on sacred consumption: “Sports fanaticism can be seen to promote community identification and spirit, but also to separate family members with differing tastes. Just as sports fans see themselves as a unified community during sacred sports moments, so do gift exchangers, heirloom-passing generations, and collectors” (p.92). Moreover, propositions of this videography are in line with Guttman’s (1978) ideas of players as heroes, stadiums as temples and artifacts as sacred relics.

Coyote Came: Spirituality and the American Desert

Xin Zhao, University of Utah

Janeen Arnold Costa, University of Utah

If the desert is holy, it is because it is a forgotten place that allows us to remember the sacred. Perhaps that is why every pilgrimage to the desert is a pilgrimage to the self. There is no place to hide, and so we are found.

Williams 1992

Throughout the American Southwest, consumers seek sacred experiences in the desert. A journey to the self, escape from the city, their jobs and everyday lives—these consumers cultivate a sense of place in the vast arid surroundings. Emotional bonding, rituals and invocations, the making and use of sacred objects, and the development of camaraderie or *communitas* all characterize their endeavors. This video explores the ways in which certain consumers approach and experience the desert of the American Southwest—a place they understand to be sacred.

The literature that informs our analysis is vast and multi-disciplinary, ranging from Durkheim's (1912/1965) sociological characterizations of the sacred and profane, to anthropology and cultural geography, where scholars have sought to understand the sense of place. Tuan's (1976) concept of *geo-piety*, and [van] Gennep's (1960) and Turner's (1969) explorations of rites of passage, *communitas*, and liminality or the liminoid, are all relevant. Finally, we are informed by Durkheim's (1897/1951) delineation of "anomie," by issues of identity as elaborated by such theorists as Giddens (1992), and especially by Foucault's (1976) concept of discourse. In our analysis, Western societal discourses of urban discontent, of the sacred and its various dimensions, and of the individual seeking escape, identity and empowerment, are all significant.

A century ago, Durkheim (1897/1951) first coined the term "anomie" to refer to feelings of marginalization and meaninglessness; today, *anomie* more broadly conveys a sense of alienation, conflict, disruption, and social absurdity. The feelings and motivations of the consumers we interviewed, read about and observed suggest they often feel a sense of *anomie* in the urban secular context. They seek and/or have found the meaningful opposite of these feelings in their sacred consumption experiences in the desert. Thus, displacement and powerlessness, along with a very real awareness of social constraints, hierarchy, and constricting obligations, precipitate this pursuit of the sacred.

The discourse of negative secularity is therefore opposed and complemented by the discourse of the sacred, within which our consumers encounter feelings of power, positive meaning, and spirituality. In this way, a third relevant societal discourse—that of Western individuality and freedom—comes to bear. It is through their own initiative, referred to in this context as "choosing a path," that the consumers in this study bring together and resolve the dialectically opposed discourses of the secular and the sacred. Through shared ceremonies and behaviors, our informants find others who are in search of the same spiritual feelings and experiences, and they develop a sense communion with other participants, with nature, and with the spirits of the Earth and of objects and living things around them.

Native American spirituality is a very significant part of the sacred Other that our consumers construct and experience. Information, ritual, and the use of sacred objects are drawn from Native American peoples of the Southwest, such as the Navajo, Hopi, Zuni, and Acoma. But the beliefs and sacred ways of the Lakota Sioux, Cherokee, Cheyenne, and other Native American Indian groups are also brought into play. The consumers purchase and use Hopi Kachinas, Zuni Fetishes, Navajo blankets and baskets, Acoma pottery, and Native American beads, crystals, dream-catchers and rattles. They buy books that describe and analyze Native American spiritual beliefs in great detail. In sweat lodges or *kivas*, they undergo rituals of purification using smoking sage and heat. Sometimes, it is Native Americans themselves who serve as role models, explaining how they and others have found spiritual fulfillment by bonding with their ancestral lands and contacting spirits through dreams and visions.

However, an individual is also free to choose from, and combine, other spiritual traditions, and guidance is provided by philosophies from Buddhism and Hinduism, to Christianity, from the vanished civilizations of the Toltec, Maya, and Aztecs, to Eastern practices of yoga and Ayurveda, and from European-based wizardry and witchcraft, to eclectic combinations involving astrology, shapeshifting, soul retrieval, and shamanism.

Clearly, the experiences of those who seek the sacred, and find it in the desert, are profound. Confronted with powerlessness, confusion, illness, or a sense of *anomie*, sacralization of the desert seems to provide many of these consumers with power, a sense of purpose and direction, and meaning in their lives. We believe that the emotional bonds they form with other participants, and with the desert itself, allow for escape from daily responsibilities and marginalization. In the course of their desert rituals and experiences, they enter a

liminal or liminoid phase, which serves to rejuvenate and empower them in preparation for return to their jobs and home life. Through on-going consumption of sacred objects, books about spiritual beliefs, seminars or lectures, and regular re-engagement with the desert itself and with co-participants, these consumers may even transform their daily lives into journeys of continual renewal and self-awareness.

Empowerment and Exploitation: Gendered Production and Consumption in Rural Greece

Janeen Arnold Costa, University of Utah

Globalization alters socio-cultural patterns in many developing societies; men and women work in new ways, sometimes to fulfill changing consumption desires. Women in developing societies who bring money or valued purchases into the home may also experience improved status. This may be particularly true in a globalizing economy, where increased income enables the family to purchase new consumer goods. However, as suggested in this video, women in developing societies often find themselves still fulfilling traditional roles in both production and consumption.

Tourism is the most important economic development engine in Greece, driving both production and consumption. For the town of Sami on the island of Cephalonia, whose people and way of life are the primary subject of this video, tourism was just beginning to develop in the late 1970s. Most economic and social life in Sami followed “traditional” patterns. Men who remained on the island mainly worked in the fields, and fished or hunted; some worked in or owned one of the few stores, restaurants, coffeeshops, or other businesses. People consumed their own olive oil and sold any excess to others. Many men left to earn money abroad or in Greek cities. Considered to be an island of seafarers, Cephalonia produced sailors and ship captains, many of whom were gone for months or years at a time. Those who remained behind sometimes took on multiple job, as day laborers in construction, on local ferry boats, as waiters in restaurants, or in the fields of those who owned larger tracts of land.

Women labored at home, cooking, cleaning and caring for children. In a few cases, families would make a room or two available for rent to summer tourists, and women cared for these visitors as well, cleaned their rooms, laundered towels and sheets, and provided directions and information. Rarely, poor Cephalonian women worked alongside their husbands or female in the fields, a family-owned store or office. The presence of others was a safeguard against suggestions of impropriety, since women were seen as a source of danger to the family’s reputation. At all times, a woman was expected to act with humility and piety, not looking at or returning the gaze of men, dressing modestly.

Thus, the villages of Cephalonia in the late 1970s largely conformed to a world of gendered divisions, including property, production and consumption. Agricultural land, pasture animals and associated tools and machines, the coffeeshop, the church sanctuary and courtyard, and the public square were male spaces and objects. The home and its surrounding courtyard, household goods and the tools and implements for maintaining it were female.

In the nearly 25 years since this research began, Sami and Cephalonia have undergone remarkable change. Flights originating in other European countries now fly non-stop to Cephalonia, and the island is popular with Athenians. Sami’s quiet waterfront is now crowded with restaurants and shops. Tourists, visitors and residents lounge by the waterside, dine at restaurants, and frequent bars or discotheques. New stores have opened. Beautiful homes line the streets where sheds and run-down homes once stood. The beach, originally rocks and a dirt road, now sports pavement, trees, benches and white sand brought in by local businesses. New seaside hotels are equipped with swimming pools, tennis courts, bars, restaurants and gift shops.

New businesses employ both men and women in increasing numbers. Tourists serve as culture change agents by demanding consumer goods/services, and their possessions and apparent wealth often spur Cephalonians to open shops, bars and restaurants, to rent out apartments and rooms, and to find other tourist-related employment. The false separation of production and consumption is abandoned here. Tourists’ consumption spurs production, producers consume goods as they engage in production, and some local production supports expanded consumption.

At a deeper level, however, traditional gendered production and consumption responsibilities remain unchanged, with the notable exception that women are often called upon to work outside the home, in addition to continuing tasks within the home. Moreover, the jobs women undertake are in many ways an extension of their domestic roles. Working mostly in hotels, women serve breakfast and clean tables, change beds, wash bathrooms and gather laundry, sweep sidewalks and the terrazzo floors of halls and rented rooms.

The man is usually the proprietor of a family business, while women are absent or sit nearby. Other times, family businesses are owned and/or operated by both men and women. All over the island, where men used to work the cash register in tourist shops or the hotel desks, women are increasingly found in these positions. Yet, unless she is an immediate family member, a woman will not be given full control over cash or accounting.

In bars and discotheques, some young women dress in a new way, in tight skirts or pants and revealing tops—modesty, even disguise of a woman’s sexuality under layers of clothing, no longer prevail. Yet it appears that the apparent changes that might be reflected in such attire are again superficial. Island women are still reserved in their interactions with men, especially when no male relatives are present to guarantee their safety and honor. Men still see women as inherently sexual, and see themselves as unable to resist sexual temptation.

In the public, males and females maintain discreet spaces, grouping together with others of the same sex. Young women walk together; mothers, aunts and grandmothers sit and watch children play. As boys mature, they move from play to undisguised gazing at women. Yet they, too, cluster together, not approaching or interacting with young women.

Thus, working more and more outside the home, Greek women may feel empowered, bringing in critical income for their family's ever-increasing desires. Yet, Greek women have only expanded their roles as wives, mothers and, in some cases, as highly sexual beings for men to desire and to guard against. The Greek man, in turn, performs and protects, occupying the public space with male prowess and guarding the family's honor.

Flea Markets: A Journalist's Perspective, Scratching an Intellectual Itch

Orpheus Allison, Asheville, North Carolina

Bob Mahosky, Asheville, North Carolina

Ken Corn, Asheville, North Carolina

Flea markets have been features of the landscape for many different societies. They function as clothing stores, furniture stores, pharmacies, and general stores for a variety of social groups. They function as clubs, meeting halls, and entertainment centers, making them rich sources for economic analysis, social analysis and integration, education, and journalistic endeavors. Flea markets function as barometers of the social fabric: Showing signs of prosperity, trends, and tribulations. The low initial investment, for the seller and the wide variety of participants make these locations appealing for the new immigrant or the resident citizen as they realize their dreams.

Originally discussed at a reporter's roundtable in 1990 when the author was a participant in a journalism workshop on economics reporting, a precursor project called "Flea Markets: The Art of The Deal", was filmed and aired on WLOS Television, Asheville, North Carolina, in April 2001. The project reflected the popular interest in flea markets: Low costs, unique items, and a fun activity for everyone. It proved to be popular with the viewers and staff. Further exploration of the idea was shelved as the author assumed other responsibilities. In 2002 the author decided to refocus his work on his Master's degree program by exploring the larger issues raised in the preliminary program.

The concept was very simple. Create a program of short vignettes capable of standing in whole or in part, which could be used in a variety of media formats and structures as a commercial vehicle. Examples of this realization would be as short feature clips for use in television news and magazine shows, as a complete program supported by sponsors, or as individual commercials for sponsors of varied programming. It was to be first an entertainment and then an exploration of some of the larger issues of society present in front of the lens. Integrating the fields of entertainment and education within a structural framework that could generate new interest from first-time and long-time viewers became the goal.

The author chose to examine two flea markets in close proximity to his home in an attempt to discover inherent natures, dreams and ideas unfolding within the confines of concrete, dirt, and humanity.

Research for the project led the producer to the discovery of the unique and groundbreaking research done by the Consumer Behavior Odyssey in 1986. This project sought to document actual flea markets, their participants and their relationship to consumer behavior using videotape as one part of the data gathering. The follow up papers, poems, essays, and reflections are powerful indicators as to the caliber and quality of information available to the researcher. Drawing from experience gained as a working journalist this author sought and received approval to develop this idea into a final project for his degree.

This project draws on the experience the author gained working as a photojournalist in a variety of broadcast markets. Battling a broken ankle, Diabetes, vagaries of employment and minimal funds, the author was able to complete the project with a budget of less than \$1,000 dollars. In the process he learned much about capabilities available for minimal costs: Colleagues donated time to photograph some aspects of the project; permission to use portions of the raw data from his previous project, "The Art of the Deal"; and, editing sessions in the University of North Carolina Asheville Media Laboratories. It was a first time effort using non-linear editing systems.

Flea markets do provide a social platform for the learning of new skills, new ideas, and new information. They are witnesses to socialization efforts as people learn the skills for doing business. They also are the defenders and protectors of cultural traditions, information and Languages. In the United States there exist approximately 5,000 of these occasional markets. One estimate is that 100 million visits to them will be made in one year and these visits generate five billion dollars in annual sales. Around the world the flea market functions as neutral ground for learning. Noisy, colorful, and fanciful collections of the mundane items of everyday life can be seen. As cultures interact with one another in this one to one relationship the chance to communicate with other people finds real appeal. It is a chance for one culture to observe, interact, and incorporate knowledge and information from another in a one to one moment.

This concept is sellable. Many flea markets are destination points for visitors to a region. Being able to see local and regional culture, history, and entertainment makes these locations mines for further study. The realization provided by this author indicates that it is possible to link commercial material into an intellectually challenging form of entertainment. The idea is intended as an igniter for further insight into the relationships, knowledge, and understanding to be gained from a visit to the local flea market.

I Just Wanna Dance

Angela Hausman, University of Texas-Pan American

Classical dancers are among the 30-50 million unpaid performers entertaining us each year. Every year increasing numbers of consumers rely on an endless stream of performers willing to donate their time and talents to enrich our lives (Weiss, Holbrook, and Habich 2001). Yet, we know little of what motivates and sustains these performers, most of whom will never achieve commercial success and notoriety. In fact, ballet was not considered appropriate in the United States until Jackie Kennedy decreed it acceptable and many retain negative stereotypes of male dancers. For instance, a teenage boy admitted to being a closet dancer, who changed schools to hide his dancing career.

Ballet, as one teacher noted, forms the language of dance, while other modalities are simple dialects of this language. As expressed by Meamber and Venkatesh (1998), this symbolic language creates individual and collective meanings as the body becomes a consumable object revealing control over culturally acceptable modes of conduct. Thus, the stylized and controlled body movements characteristic of classical ballet reflect the gendered reality of our culture. According to Hanna (1988), classical ballet echoes the puritanical ethos that the body must be harnessed in the pursuit of economic goals and denied freedom in efforts to achieve moral justice.

In contrast, modern ballet reflects postmodern themes, like intolerance and equality. It provides a rich voice to marginalized elements of our society. Even the movements, freed from constraining tutus and pointe shoes, celebrate the suppleness and sensuousness of the body. Jazz and Tap dances have gained wider acceptance in commercial performances with their modern themes and celebration of existence. Reflecting more freedom of movement, these art forms are less reliant on making audiences think, in favor of getting audiences to feel. Interestingly, especially in the case of jazz, this freedom is earned through years spent in subjugation to the more controlled movements of ballet.

The process of becoming a dancer reflects Staw's (1981) notion of escalation of commitment in a venture where the chances of success are slim. From the thousands of little 3 year olds who steal the hearts of audiences, intense competition produces only a few serious dancers and few of these will ever experience commercial success. And what professional success they might achieve is very fleeting, as ballet careers are measured in years not decades. Michael Flatley, whose performance introduced this film, is now unable to even walk without pain, for instance. Dancers must carefully weigh this reduced professional tenure against alternative life choices.

So, why do dancers devote countless hours training for careers with so little prospect of success. The answer appears to be in culturally-defined notions of success, which are less reliant on ephemeral and superficial values. Modern definitions of success, according to Firat and Venkatesh (1995), rely heavily on a rational economic system that affords no emotional, symbolic, or spiritual relief to the consumer. These intrinsic rewards are powerful motivators, especially obvious in observed gifting behavior. Not only is self-gifting evident, but rewards one obtains through giving gifts of dance to others is portrayed. Through dance, the body becomes not just a celebration of self-identity, it becomes an instrument for community consumption. Gifting dance is also seen as a sacrifice made in exchange for the talent a dancer was given—a cycle of gifting. Family members also participate in this gifting ritual of simultaneous giving and receiving, such that the mutuality of giving and receiving becomes so enmeshed in the dancer's definition of self that it escalates their commitment to dance.

Despite Bourdieu's (1984) contention that pleasure and pain avoidance have become hallmarks of postmodern consumer society, dancers embrace pain and deprivation to stimulate emotional experiences associated with mastery of the body. Others embrace the challenge of doing something others find difficult. But these rewards have costs. Dance thus articulates the inter-subjective relations between participants and audience (Tamisari 2000), emphasizing the sacrifice of self with the aim of advancing the larger society.

Dancers spend increasing amounts of time taking classes and preparing for performances, termed recreational specialization (Scammon 1987). This specialization isolates dancers from non-dancing peers and encourages emulation of codes established by more experienced dancers and teachers. Within this culture, symbolic meaning merges with mundane consumption artifacts, producing emotional involvement that transcends objective reality. Self-sacrifices endured in perfecting their craft further sanctify objects by transferring value to achievement tools and manufactured articles, especially pictures and videos that commemorate the transformation from novice to professional. Thus, while used pointe shoes are unattractive to outsiders, they attain special meaning for dancers, who develop rituals around old pointe shoes that enact the transformation to sacredness (Belk, Wallendorf, and Sherry 1991).

By observing cultural evolution informing the commitment of dancers to their art and interrelations between them and sacred artifacts representing that commitment, we develop an understanding of escalating commitment that transcends the economic, rational reality presented by modernist interpreters. Gifting, rather than ego-maintenance and sunk costs, create rationales for escalation in the absence of clear economic rewards. The study also highlights the importance of self-sacrifice, rather than impulsive hedonism in driving consumption. Concepts developed in this study enlighten understandings of similar pursuits, including such economically questionable activities as swimming and educational endeavors, like social work.

I'm an American Girl

Robert Kozinets, Northwestern University

John F. Sherry, Jr., Northwestern University

Nina Diamond and Albert Muniz, Jr., DePaul University

Stefnai Borghini, Bocconi University, Italy

Mary Ann McGrath, Loyola University

At 111 East Chicago, just off of Chicago's Magnificent Mile, in one of the priciest retail districts in the world stands American Girl Place, a doll store. The store is currently the centerpiece of a \$350 million brand empire owned by the American toy giant Mattel. The American Girl brand was launched by Pleasant Rowland, a teacher, reporter, and textbook author who had grown frustrated with girls' toy choices. Before selling it to Mattel, she built American Girl into a powerhouse brand. In the \$2.4 billion doll market, American Girl stands alone, commanding not only a fifteen percent market share but also incredible loyalty and respect.

The American Girl brand and the American Girl Place store present a range of fascinating topics for marketers interested in brands, in themed retail, and in community-market relations. This videography is based on an ongoing, multiperspectival, multiperson ethnographic team's invasion of the American Girl Place in downtown Chicago, and subsequent interviews with girls, mothers, grandmothers (and even some fathers) that the brand has deeply affected. Our film explores brand-related themes that emerge from this research, such as the deep involvement of the brand with both family history and personal needs and desires.

In the videography, we explore American Girl consumer experience with the brand to try to unpack how these successful brand connections have been made, and to help continue the important investigations of the role of brands in people's lives and experiences. The historical connection is a key attractor highlighted in the film. Each of the dolls—Kaya, Felicity, Josefina, Samantha, Addy, Kirsten, and Molly—is situated in a particular historical period, from 1764 to 1944. Each is backed by a rich narrative of books depicting their daily lives, their hopes, fears, and routines. The various dresses and accessories for each doll are meticulously tied into the stories and images presented in the books. The result is a detailed world unto itself, not unlike the detailed *Star Trek* and *Star Wars* universes.

We examine these brand connections through the eyes of several different consumers. One woman details the importance of dolls in her past, and ties this to a deep emotional connection to the American Girl brand and its narratives of "goodness." Two young girls discuss the historical connection of the dolls, and then demonstrate how they play with them. A young girl discusses her connection with the African-American Girl Addy, and talks about the stories her grandmother told her. Her mother then relates a family Christmas card she wrote based on the narrative world of Addy. A father shares his affection for a hippie American Girl doll he named "Flowergirl" and describes how its openness is the source of its appeal.

In the film, girls, mothers, grandmothers, and even fathers deploy the American Girl brand in a great and never-ending identity construction project. As people seek to understand themselves, others, what matters to them, and what they want in life, the rich narratives and many links to lived experiences and realities make the brand come alive with personal relevance. The film teaches us through the particulars of the American Girl brand that successful brands like this one offer intertextual hooks as well as a mirror into which people can look and see themselves. Meaningful brands offer consumers a rich and detailed set of meanings and images with which to play, and the conceptual space to play with them. Our film shows how different people look into the eyes of an American Girl doll, in different ways, in endless celebrations of individuality united, and see themselves.

Learning to Survive as a Consumer in Japan: Linguistic Illiteracy in a Cross-Cultural Setting

Thomas E. Muller, Haboromo University, Japan

Junko Kimura, Haboromo University, Japan

Today's world of knowledge is an explosion of printed information, electronic writing, and a seemingly infinite store of interconnected words on a computer-based web. So, illiteracy, a person's inability to read the written word, must surely be a very debilitating condition. It is hard to imagine how a consumer could function, today, without the ability to read.

Is it possible to get by, to survive, to maintain a reasonable standard of living, when one is illiterate? We know that many functionally illiterate people in our own society somehow manage to do this. They have rules of thumb, coping strategies, and ways of taking shortcuts to the knowledge essential for survival.

But what if you take a fully literate consumer—literate, that is, in his or her own society—and immerse this person in a completely alien culture? A culture where the spoken language is different, the writing is different, and even the ways of buying and selling are sometimes different.

How would such a consumer survive in this cross-cultural setting? What coping strategies would this consumer use? What barriers would there be to this consumer's standard of living, or even quality of life?

The subject in this 38-minute, case-study video is linguistically illiterate. For the past year, he has been living in Osaka, Japan's second largest city. He is illiterate because—as a consumer socialized in a Western culture and now living by himself in Japan—he is unable to speak, read, or write in Japanese. When he picks up a packaged food in the grocery store, he cannot read the label. When a waitress hands him a menu, he cannot decipher his choices. When he visits the cinema, he cannot make out the posters, to decide which film to see. Many of the marketplace cues that he has learned to use back home, in his English-language world, are useless to him in Japan.

So, how are his mental models, developed as a consumer in his own culture, transferred to his Japanese living environment? How does he fill in the blanks, for decision-making purposes, when he encounters marketplace data written in Japanese? And are his consumption decisions different because he is illiterate?

We find some answers to these questions when the camera follows him as he initiates shopping trips which conclude with consumption occasions for some of his day-to-day shopping and consumption needs. What methods does he use to get by (without a Japanese interpreter) when buying groceries, traveling by train, opening a bank account, renting an apartment, eating at restaurants, and so forth?

The case study is introspective and the subject in the video talks about his thoughts and decision making, giving an insight into the processes of acculturation, learning, episodic and iconic memory formation, and coping strategies adopted, in the absence of familiar marketplace cues learned back home in his English-speaking world.

The film shows that this linguistically illiterate consumer, living in Japan, appears to have learnt to survive in his foreign environment. Problems which arose during his day-to-day consumption activities—withdrawing money, buying food, taking trains, eating out—were handled with a variety of coping strategies. Many of these were decision-making strategies learnt from being a consumer in his native Western culture. A transfer of skills, from one culture to another. They could be applied in a foreign culture because Japan is a modern society with a highly developed economy and sophisticated infrastructure. It is similar, in many ways, to North America, Europe, or Australia.

And what about cultural illiteracy? It would be hard to make the case that our linguistically illiterate consumer was also culturally illiterate—in a general sense. After all, throughout his life he has traveled to widely differing countries and cultural regions and knows several languages (though not Japanese). Also, he has experienced foreign cultures through the artifacts of those cultures in the Western countries where he has lived—Chinese restaurants, for example, in Vancouver, Sydney, or Düsseldorf.

But, in a specific sense, he is culturally illiterate in Japan. Because he cannot speak or read Japanese, he cannot know how the Japanese think, or reason, or form opinions and attitudes. He must operate at the fringe of understanding, using only certain cross-cultural commonalities that seem to work in every alien culture—politeness, self-control, deference, gratitude, and so on. Some of these can be expressed through body language and gestures, and some by knowing a handful of words or phrases in the local language.

So, a specific kind of cultural illiteracy combines with linguistic illiteracy, and results in one type of consumption illiteracy. The kind we have seen in this video. And the results of this are: limited interactions with the native non-English speakers, a reliance on the available infrastructure in order to function as a consumer, and, occasionally, relinquished consumption opportunities and buying decisions.

“My Home, My Comfort”: An Ethnography of the Fantasy Home Comfort

Peisan Yu, Tung Hai University, Taiwan

Although the concept of comfort has long been empirically identified as a prevailing discourse involving a broad array of life values surrounding the home and the sense of homeyness, cultural research into these constructs is scant. The role of comfort in the building, maintaining, and sustaining of a symbolic home identity still remains unclear.

The present documentary is 54 minutes long. It is extracted from a pilot study exploring the ideas of comfort and its manifestation in the home sphere. Five in-depth interviews were conducted between the months of February and May, 2003, with long-term residents of Hong Kong in English and Cantonese. The use of group facilitation technique was also employed to better guide the informants from the objective imagery to the feeling state and to their elaboration of an ideal circumstance of home comfort. All the interviews were delivered at the informants' home. Other than the verbal narrative and conversation, drawings and projective tasks were also employed to complement the imagery of home comfort. The types of housing studied range from high-rise apartment buildings to suburban townhouses, with spaces ranging from 500 square feet public housing estate to privately owned housing of 400 square feet apartment, 1000 square feet apartment and 1800 square feet townhouse respectively. The informants come from a diverse socio-demographic background of age group, educational background, occupation and choice of residential districts.

I found that the idea of a home of comfort is often envisaged to lie somewhere between an abstract state of being and a concrete manifestation vested in a set of consumption objects. However, unlike the former diminutive depiction of single objects to decipher the symbolism in consumption objects, when home comfort is concerned, it is unexceptionally the ensemble of a constellation of consumption goods and their created atmosphere, style and harmony that the idea of home comfort is personified. The informants continuously juxtapose their ideal sought-after life values and the values embodied in their physical surroundings as a materialization of fantasies of self-fulfillment.

Interestingly, by probing the informants with the five senses, the researcher was able to facilitate the informants in visualizing their idea and relish of home comfort from an ineffable state of mind to the concrete and concentrated arrangement of various consumption goods to shape the overall design of interior space. Thus the idea of home comfort can be seen as a pendulum that swings between a constant adjustment between the different needs and desires, and the inevitable concession between the fastidiousness pursuit of one sense of comfort (e.g. visual imagery) and the crescendo of discomfort at the other level (e.g. the stress to maintain a visually harmonious display of interior space and objects)

By the same token, it is also through the extensive social comparison with other people's home and/or their experiences with the former residence that the informants are able to verbalize and articulate their desire and fantasy for a home of comfort. Emerging from the dialogues, home comfort is an ideal state that is always yet to be achieved and exist only when the ideal state of living conditions are realized. Moreover, to the informants, home comfort has largely to do with the anticipation of future events, either negative or positive, and the sense of security and satisfaction that is gained from the well-thought over management and preparation to tackle the incurred apprehension.

In the same vein of previous research, the perception home comfort does not merely encompass the pursuit of a physically perfect home interior, but rather follows the top-of-priority concerns of household harmony at the interpersonal level. Deeper levels of life values regarding intimacy, work-home separation and social-private boundary were also indicated by the informants in their conversation.

Themes of privacy, space and safety were often found to be the epitome of home-related values with significant impact in one's life. A majority of those interviewed also extended the conventional view of home “behind the closed doors” to include the exterior sphere of their residential environments, such as community and neighborhood into their overall scope of the territory. Evidently the consumption of home comfort does not stay with the interior sphere but also expands to the exterior frontier of surrounding neighborhood, scenic views and environmental conditions such as air quality, noise and closeness to the nature.

Contrary to treatments of home space as being split into a formal public sphere and a comfortable private sphere, ideas of home comfort were found to span this boundary. While it was often desired that there be a privatized retreat within the home, comfort was seen

to encompass both public and private spaces as well as to combine work and leisure aspects of life in an integral whole. Comfort was seen to occupy a large space within this three-dimensional characterization, such that seemingly paradoxical practices mirrored the similar oppositional underlying values such as freedom, independence and control.

Pretend It Like Beckham: Symbolic Consumption through Soccer Jerseys

Jill G. Klein, INSEAD

My previous film examined the loss of identity through the uniforms and numbers imposed on prisoners of Nazi concentration camps. This film examines an opposite phenomenon: the acquisition of identity through soccer uniforms and player numbers. I explore the meanings consumers project onto their soccer apparel.

It is often stated within the consumer behavior literature that the link between one's sense of self and one's possessions is powerful. Russell Belk (1988) has argued that possessions both build and reflect our identities. We derive a view of who we are (and who we were) from our possessions and we express ourselves through belongings (e.g., Wicklund and Gollwitzer 1982; Richins 1999; Solomon 1999). Wicklund and Gollwitzer (1982) assert that self-defining goals lead us to use symbols to define who we are, and that these symbols stand for the "capacity and readiness to behave and think in certain ways (p. 9)."

Through the interviews presented in the film, soccer players and fans discuss the meanings of their soccer shirts and the connections they feel to favorite teams and players through these possessions. Interviews were conducted in France and in Singapore (and one was conducted in Israel). Participants speak about the players they admire and the teams they support, and discuss how their shirts symbolize their feelings and project their allegiances to others.

Consumers strive for a strong congruence between self-image and the image of their clothing (Belk 1982; Solomon 1983), and they can also express their aspiration desires through their attire. The film strives to depict this aspiration through dialogue with interviewees and the interlacing of footage of recreational and professional players.

Respondents representing many ages, from as young as five to as old as 75, talk about the meanings held in their soccer shirts. Such topics as loyalty (e.g., continuing to support a team even when it performs poorly) and heroism are addressed in the film. Throughout, the beauty, passion and creativity that is the game of soccer is portrayed.

The Embodied Brand

Anders Bengtsson, Lund University, Sweden

Jacob Östberg, Royal Institute of Technology, Sweden

Dannie Kjeldgaard, University of Southern Denmark

This video focuses on the boundaries between the sacred, non-commercial sphere of the tattoo culture and the profane, profit-maximizing sphere of the commercial world, and the experienced inappropriateness of mixing these two spheres. Through interviews with tattoo artists, who are heavily immersed in this particular sub-culture, both as heavily tattooed consumers and as producers, we will capture some perspectives on the increasingly popular use of brand symbols as imagery for tattooing.

The meanings that are associated with tattooing have changed over the past century (DeMello 2000). From being heavily associated with people on the margins of society, such as sailors and bikers, tattoo consumption has developed into a more mainstream phenomenon. People who get tattoos today are not necessarily doing so to symbolize affiliation with a certain subculture, but can instead do so with the purpose of symbolizing a specific event in their personal life history (cf. Velliquette 2000). Given that tattoo consumption has spread into a larger spectrum of consumers and is no longer limited to members of specific sub-cultures, a more heterogeneous imagery from which proper inscriptions on the body can be chosen has emerged. In the eclectic use of tattoo imagery, symbols from popular culture such as football clubs, cartoon characters, and rock bands are frequently occurring. Some consumers go as far as choosing the logotype of commercial brands, such as Apple, Atari, Intel, Fender, MTV, Pepsi-Cola, and Wrangler, as imagery for their tattoos. This use of brand symbols in body expressions provides instances of permanent and deliberate brand consumption with the potential function of expression of self-identity. The practice illustrates how consumers take brands to new contexts, in a sense attaching a signifier to a new signified (cf. Ritson 1999).

In the late modern age it has been claimed that individual identities have become reflexive articulations of imagined biographies (Giddens 1991). As such, identities have become fluid in that there is a constant rearticulation taking place. Bauman (2001) goes as far as claiming that the identity strategy of today is less about committing oneself to one identity than it is about keeping possibilities for identity change open. Within consumer research, it is a widely received view that brands and consumer goods enter into this construction and display of self-identity (e.g. Arnould and Price 2000; Fournier 1998; Kates 2000). The brands used in body expressions are unique since they enter into a more or less permanent display and articulation of self-identity.

Compared to non-commercial tattoo imagery, brand symbols are part of a marketing system where systematic meaning management seeks to impose intended interpretations on the consumers (Holt 2002). Therefore, brands can be thought of as symbols with a more controlled association base than other symbolic expressions. The meaning of a brand can be subject to unexpected change; for instance, a brand can suddenly be repositioned and become loaded with new meanings and associations making the expression of a certain consumer self-identity more fluid. When using brands in body expression the consumer thereby leaves part of the power to construct the meaning to the whims of marketing strategies.

The tattoo artists interviewed for this video heavily opposed the use of commercial brand symbols as imagery for tattoos. In their view, the sphere of tattooing is infused with an ethos of outsidership that should be kept separate from commercial sphere. However, in trying to explain the relationship between the two spheres they could not escape the discursive logic of the commercial sphere. They hence willingly provided their services to consumers wanting to permanently mark their flesh with a brand symbol and regarded these consumers as "a dollar bill". In the tattoo artists' views, a brand symbol can not take on sacred meanings for the consumers. Therefore, it is not a pertinent symbol for body expressions in the way that, for instance, the portrait of a loved one can be.

Tourist Photos: Signs of Self

Russell Belk, University of Utah

One goal of tourist photography is to collect pieces of self-narrative. Even when the avowed purpose of a shot is to show beauty or document unusual people and places, the tourist is the director/cinematographer who expresses or reveals. In this video I explore the types of stories we tell about ourselves as tourists by drawing on participant observation, interviews with travelers, and comparisons with non-traveling locals.

Tourist activities in the video include flights over Antarctica, photo safaris in Africa, Ankor Wat visits, and hula performances in Hawaii. Across these diverse settings I find considerable similarity in the types of photos and videos taken or made. Of the ethnographic narrative types identified by John van Maanen, tourist tales come closest to dramatic- and self-ethnographies. However, tourists are not careful ethnographers. They instead play the lead in stories that draw on myth, adventure, comedy, tragedy, and pilgrim's tales. They also invoke many conventions, stereotypes, and clichés in making images to tell their tales. Besides idealizing, romanticizing, and exoticizing their experiences, they select local scenery, costumes, actions, and props in the service of an Orientalizing discourse that makes the Other their polar opposite. Unlike T. S. Elliot's traveler who returns home to "know the place for the first time," we seek to know or transform ourselves via tourist photography.

The photos made by tourists are partly a mnemonic aid and souvenir for recalling travel experiences, but they are also used in the service of ennobling the self and gaining bragging rights to the cultural capital of apparent familiarity with the exotic. That is, tourism, even by these potentially jaded global tourists, is an extraordinary event that is seen to open portals to an extraordinary ideal self. Human memory, together with selective photography and videography, gradually replace or omit dreary and embarrassing details. We choose not to photograph the mechanisms that ease and facilitate our encounters, such as tourist buses, souvenir sellers, guides, and amenities that make the less affluent world more like home. We polish the memories of our experiences through the telling of tales that are more consistent with the selves we would like to become. In the process we furnish ourselves with a meaningful past—at least as we anticipate enjoying our future reflections on our accumulated photographic artifacts.

Nevertheless, apart from their photography and sight-seeing, the international tourists studied are relatively passive posers in the scenes and activities they portray. In contrast, local spectacles are relatively devoid of photography and locals often play a more active role than the tourists. We don't tend to regard that which happens in our own back yard as being capable of revealing or creating a transformed ideal self.

Much has been written about the invasive, distancing, and acquisitive nature of tourist photography and its use to hide our guilt and unease as vacationers. The ways in which tourists apprehend the people and places they encounter via a camera is not the same as it would be without looking through a lens. The camera is a buffer that also keeps them from experiencing the scene that confronts them. While acknowledging these negatives, I also find benefits in touristic photo rituals involving emplaced meaning making, prospective memory making, mastery of the incomprehensible, and expression of the ineffable. Tourist photography enhances our life narratives even as it creates fictions that construct the Self vis-à-vis the Other.

Towards a Meaningful Identity: The (F)Utility of Lifestyle Research

David Toumajian, University of Utah

Gülnur Tumbat, University of Utah

Introduction

As Featherstone (1987) puts it "The term [lifestyle] ... connotes individuality, self-expression, and a stylistic self-consciousness" (p.55). Lifestyle research is one of the aspects of the movement towards a "postmodern consumer culture" in which there are no fixed status groups. In consumer research, postmodern approaches usually regard lifestyles as autonomous playful spaces beyond any determination.

According to Murray (2002), such theoretical accounts of conscious identity construction so prevalent in our field today are neglecting to give attention to broader social discourses and how our identity projects may have core structural components (i.e. *sign experimentation* vs. *sign domination*).

In the next section, we will provide a brief overview of lifestyle research followed by a presentation of the video. We will conclude with some implications.

Lifestyle Research: An Overview

Social consumption patterns are important in marketing since they form the basis of segmentation strategies (Solomon, Bamossy and Askegaard, 1999). The so-called lifestyle concept is one of the widely used concepts in marketing practices in which psychographic techniques attempt to classify consumers in terms of psychological subjective variables in addition to observable characteristics (see Veal 1993 for a review and Holt 1997 for a critical summary). One example of research using psychographics is the List of Values (LOV) developed by Kahle and Homer (1986). LOV uses a simple and quick survey in order to ascertain informants' most important value (from a list of 9) and seeks to formulate buying patterns based on this limited information:

The List of Values

- Sense of belonging (to be accepted and needed by your family, friends, and community);
- Excitement (to experience stimulation and thrills)
- Warm relationships with Others (to have close companionships and intimate friendships)
- Self-Fulfillment (to find peace of mind and to make the best use of your talents)
- Being well-respected (to be admired by others and to receive recognition)
- Fun and Enjoyment in Life (to lead a pleasurable happy life)
- Security (to be safe and protected from misfortune and attack)
- Self-Respect (to be proud of yourself and confident with who you are)
- A Sense of Accomplishment (to succeed at what you want to do)

In his poststructuralist approach to lifestyle research, Holt (1997) argues that meanings are always socially constructed in association with other cultural objects and activities. Meanings are unstable and consumption patterns depend upon contextual characteristics and they are expressed through regularities in consumption practices, rather than in consumer objects themselves. Here practices refer to "...how consumers understand, evaluate, appreciate, and use consumption objects in particular contexts" (p.334). He further argues that lifestyles are created by relational differences between consumption patterns and he refers to these differences as a type of symbolic boundary. Consumption patterns are meaningful to the extent that they exist in opposition to comparable alternatives. He argues that symbolic boundary approach enhances our understanding of lifestyles since it enables to see consumption patterns as expressions of collectivities rather than cluster of individuals. This approach provides a theoretical linkage between lifestyle categories and the social, economic, political, historical, and technological environments.

Lifestyles marketing research is but one of any number of lines of inquiry in marketing that, in the name of efficiency and predictability, seeks to develop universal theories of humanity entirely devoid of any cultural emphasis or understanding. Our video hence is a parody of sort seeking to emphasize the limited kind of the knowledge we can gain through psychographically defined populations or subpopulations. The subject, an anthropomorphized golf ball branded with the American flag, in discovering itself alone and abandoned, begins a quest to discover its own humanity (akin to Camus' *Sisyphus* or *The Stranger*). Initially seeking to use psychographic models it finds in a similarly (and conveniently) abandoned marketing textbook as a guide, this quickly proves futile. Rolling along to a café, the golf ball interviews people and asks them for clues in its identity quest only to be terribly disappointed with the supposed persona attributed to it. This resistance to the ascribed traits it "should" have then eventually lead to the development of a voice, a social identity driven by emancipatory concerns.

Moral and Managerial Mandates of Marketing Research

As researchers select and justify a concrete problem, they must reflect on the trade-offs between certain gains and certain losses in terms of the overall improvement of the human condition. (Murray et al. 1994, p. 564)

There are a number of problems with psychographics and lifestyle research, but perhaps one of the most profound is its refusal to problematize the relationship between "values" and consumer goods. There is no room in such an approach for the everyday struggles, frustrations, and desires that keep us bound to an endless cycle of consumption in order to achieve an idealized self, no mention of the interplay between the socio-cultural and life-worlds in theorizing where these values come from and how relative they are to different cultures and traditions, and there is a heavy bias towards developing a theory that can make concrete contributions to the applied-side of marketing rather than focusing on how a consumerist ethos impacts not only the individual psyche but also the world.

Belief Bracketing: Can Partitioning Information Change Consumer Judgments?

Suzanne Shu, University of Chicago

George Wu, University of Chicago

EXTENDED ABSTRACT

When evaluating a product or service, consumers seek out information to judge whether that specific product will meet certain needs. As consumers gather such information, marketers choose how much information to provide at any one time. Consider, for example, a consumer forming a judgment about a restaurant who sees reviews one or two at a time, as compared to seeing a dozen all at once. Is it possible that breaking information into smaller or larger partitions has an effect on beliefs about the product under consideration? In other words, can presenting information in broad versus narrow brackets influence product assessment? This question motivates the research presented here.

When consumers use information to form beliefs about the probability that a product will meet a specific need, the normative standard is Bayesian updating (e.g., Hagerty and Aaker 1984). There has been considerable testing of whether individuals obey Bayesian updating in forming both probability judgments and product judgments. Findings suggest that individuals use averaging models to integrate new information (Anderson 1981), that inappropriate attention is given to the credibility of the source (Birnbaum and Mellers 1983), and that non-diagnostic information weakens beliefs (Troutman and Shanteau 1976, Fischhoff and Beyth-Marom 1983). Failure to attend to source credibility has also been studied in the context of using consumer agents for recommendations (Gershoff, Broniarczyk, and West 2001), and influence of nondiagnostic information has been assessed in how consumers treat irrelevant product information (Simonson, Carmon, and O'Curry 1994). However, unlike these studies in which information varies in usefulness or credibility, we consider information that is diagnostic and relevant. Our main emphasis is not on the type of information being provided, but on how the bracketing of that information affects judgment.

The influence of bracketing is well-documented in choice (Read, Loewenstein, and Rabin 1999). Choice bracketing effects exploit gain/loss asymmetry (Kahneman and Tversky 1979) and decision makers' myopia (Kahneman and Lovallo 1992). Bracketing effects are less well-documented in judgment. One exception is the work of Ariely and Zauberman (2000, 2003), who find that breaking a hedonic experience into partitions dampens overall satisfaction, with broader brackets producing more extreme evaluations. Both choice bracketing and satisfaction partitioning effects result from a lack of information aggregation. Decision makers "miss the big picture", failing to see how individual pieces of information fit into a larger pattern. Although Ariely and Zauberman focus on satisfaction, we propose that bracketing affects other judgments.

Our prediction is that consumers observing information divided into multiple partitions will form different beliefs than when the information is viewed as a continuous whole. More specifically, we propose an *extremeness hypothesis*: final judgments will vary depending on the size of the partitions, with those formed under narrow brackets being judged less extreme than those formed under broad brackets. We formalize a model in which each information partition is observed and evaluated based on its level of representativeness. Small partitions (narrow brackets) will seem less representative, leading to less extreme judgments, while large partitions (broad brackets) will seem more representative, leading to more extreme judgments. This "bracketed" judgment is then

integrated into the overall judgment in a predictably biased way, due to unequal weight on the first and last partition-level judgments (primacy and recency effects). Thus, bracketing affects both information coding and integration. Although we expect that most sequences will be judged less extreme when observed in narrow brackets, we also expect an effect reversal for some sequences. More specifically, for sequences in which the initial and final partitions are particularly representative when observed under narrow bracketing, primacy and recency effects during integration may result in more extremeness in judgment.

To test these hypotheses, we conduct four studies that vary the number of partitions in which information is presented, and ask participants to make judgments regarding underlying characteristics of the product, service, or process being evaluated. Study 1 tests bracketing effects in the context of restaurant reviews. Subjects see restaurant reviews and judge which restaurants would appeal to a friend. We find that narrow brackets lead to less extreme judgments in the majority of cases. Analysis of partition-level judgments shows that primacy and recency operate during the integration process as proposed. Study 2 is identical to Study 1 except that there are no explicit judgments made by subjects after each partition. This tests whether on-line judgments are necessary for bracketing effects; based on evidence that individuals compulsively make judgments of information even when they are not required to (Russo, Meloy, and Medvec 1998), we predicted that the effect would persist. Our findings support this prediction; the results of Study 2 were not significantly changed from Study 1.

Study 3 more formally tests specific theoretical predictions. Participants judge the probability that a series of colored balls were drawn from one of two urns after seeing the series in brackets of one, two, or five balls at a time. Results again support the hypothesized effect of bracketing; probability judgments are typically more extreme when formed under broad brackets. However, as predicted, specific patterns produce the reverse effect, due to primacy and recency effects during integration. Study 4 is a complement to Study 3 to show representativeness' role in these effects. Participants judged the representativeness of the patterns of colored balls used in Study 3. Shorter patterns are judged to be less representative than longer patterns, as predicted. Analysis of these data in conjunction with the Study 3 data shows that these bracket-level representativeness judgments can explain the Study 3 results.

Although these studies vary in the use of memory (display of sequence history), when judgments are collected (on-line or retrospectively), and the type of judgment (product-specific or probability), the results of all four studies support the existence of belief bracketing effects. The overall finding is that judgments are more extreme for information delivered in broad brackets, as our model predicts. The findings also provide strong evidence for our proposed mechanisms of representativeness at encoding and primacy and recency during integration. In addition to the findings for judgment, we find bracketing effects for behavioral intentions (Studies 1 and 2) and for accuracy (Study 3), suggesting that the implications of bracketing go beyond judgment.

Special Random Numbers: Beyond the Illusion of Control

Joseph K. Goodman, The University of Texas at Austin

Julie R. Irwin, The University of Texas at Austin

EXTENDED ABSTRACT

Consumers wager approximately \$900 billion a year, two-thirds of which takes place in casinos (Seligman 2003). According to the National Gambling Impact Study Commission, 86% of Americans report having gambled in their lifetime and 68% have in the last year (Seligman 2003). Despite the random process of state lotteries, approximately 30% of lottery players choose their own numbers rather than have the computer pick the numbers for them (MUSL 2003). Similarly, the National Science Foundation reported that 60% of adults believe that some people possess psychic powers or extrasensory perception (Recer 2002). On average, 2.4 million consumers tune in to watch John Edward “cross over” into the land of the paranormal on his weekday television program. It is clear that (nonrandom) explanations for random events constitute big business. In addition, it is clear that some random systems, such as astrology and psychics, are more valued than others are.

Previous research (e.g., Langer 1975; Langer and Roth 1975; Wortman 1975) has shown that, when gambling (as in roulette), people prefer to bet on numbers that they picked themselves than to be assigned a random number by a system outside of their control. These numbers thus are special, researchers have argued, because people believe they have control over the outcome via their control over the numbers chosen. In this set of experiments we show that control is not as important a component of random number specialness as was previously suspected. We show this by manipulating task type; in some of our tasks, subjects are assigned the number by a complex personalized system (as is done with numerology, astrology, tarot cards, and other paranormal behavior). In other words, this personalized system gives them a “special random number” that they do not choose.

In the first set of experiments, all subjects gave their hypothetical bet for three roulette-type gambles (with order controlled). The number on which they could bet was generated by three different methods: (1) the number was randomly assigned, (2) the gamblers chose the number, and (3) the number was calculated via a personalized “numerology luck code.” All three gambles had the same objective probability of winning, and amount to win. Whereas the choice condition allowed subjects to have control over which number they chose to bet on, the numerology condition only allowed subjects to bet on a number calculated by their initials—a number (and letters) over which they presumably have no control. Subjects then rated their feelings of control, confidence, and enjoyment with their bet.

Both the choice and numerology conditions had significantly higher bets compared to the random condition. Furthermore, in a hierarchical model with all three ratings tasks (enjoyment, confidence, and control) predicting amount bet, feelings of enjoyment and confidence significantly predicted the increase in willingness to bet in the choice and numerology conditions but control did not.

A second set of experiments investigated which special random number systems (e.g., numerology) consumers prefer compared to a simple random number. A 2 (individual vs. not) X 2 (prevalent vs. not) + 1 (random) between-subject design tested whether preferences for the numerology condition were due to the individualness of the task and/or due to the similarity of the task to other prevalent personalized systems. We noticed that prevalent special random systems (e.g., numerology, astrology, Chinese horoscopes,

forecasting using one’s name, destiny numbers based on birthdates, etc.) are based either on one’s name or on particular days and months. The four conditions were: picking numbers individually out of a cup (individual, not prevalent), the subject’s own initials (individual, prevalent), the university initials (not individual, not prevalent) and the current month (not individual, prevalent).

Subjects were significantly more likely to indicate that they would bet in the prevalent conditions versus both the less prevalent and the random conditions. Specifically, subjects preferred to bet on numerology systems that were based on their own initials and the current month rather than systems based on their university or letters from a cup. The university and cup conditions were not statistically different from the random condition. The findings suggest that specialness of random numbers is confined to particular systems: namely, dates and initials. Consistent with the first set of studies, this study found that subjects enjoyed the prevalent gambles more and had more confidence in them, but the bet types did not differ in ratings of control. Furthermore, enjoyment seemed to fully drive the effect. A Sobel (1982) test found that enjoyment with the task significantly mediated the effect of the two conditions on subjects’ likelihood of betting. Neither confidence nor control showed this mediation effect.

This set of experiments has several implications. First, consistent with previous research, individuals prefer gambling systems in which they are able to choose their own numbers. But, this preference does not appear to be due to increased feelings of control. Even when people have no control, as in numerology, they find some numbers to be more special (and worthy of spending their money on) than others. For whatever reason, people like systems based on their name, and on dates. This finding is corroborated by all of the money spent on random psychic systems that follow one or both of these systems. Instead of control, the important factors appear to be confidence, and, especially enjoyment. People enjoy some random number systems more than they enjoy others, and this enjoyment translates to more spending. Future research can help disentangle whether names and dates are preferred because of cultural reasons (i.e., because more psychic systems in this culture revolve around them) or if there are deeper reasons for the preference. Intriguingly, in many cultures horoscopes, fortunes based on names, etc. are quite popular, suggesting the random numbers based on names and dates may for whatever reason be especially appealing to people in some primal way.

Do Unto Others As You Would Do Unto Yourself: Variety-Seeking Motives In Gift Giving

Tilottama G. Chowdhury, University of Connecticut

S. Ratneshwar, University of Missouri-Columbia

Kalpesh K. Desai, State University of New York, Buffalo

EXTENDED ABSTRACT

Is consumer variety-seeking behavior limited to one's own purchases, or might it also extend to purchases made for others? Prior research has provided considerable support for variety-seeking tendencies in purchase behavior (McAlister and Pessemier 1982; Ratner and Kahneman 1999). Researchers have also distinguished between variety seeking as an internal trait versus variety seeking triggered by external stimuli such as price promotions (Kahn and Louie 1990; Kahn and Raju 1991; van Trijp et al. 1996). More recently, researchers have also investigated the role of contextual variables (e.g., public vs. private decisions) in variety-seeking behavior (Ratner and Kahn 2002).

We focus here on variety seeking as a trait-like, individual-difference variable (Baumgartner and Steenkamp 1996; van Trijp et al. 1996). Several researchers have studied this variable in regard to individuals' own purchase behaviors. For example, van Trijp et al. (1996) find that the "intrinsic" variety-seeking trait interacts with product-level characteristics (e.g., hedonic vs. non-hedonic attributes) in determining whether consumers switch between brands or repeat purchase.

Notwithstanding, prior research has not explored whether a person's own variety-seeking trait might actually extend into buying products for others. We explore this issue in the context of gift decisions by investigating the composition and diversity of products (or lack thereof) in consumers' consideration sets. More specifically, the key issue in our research is the degree of product *heterogeneity* in a consideration set, i.e., the extent to which the choice alternatives in a consideration set span distinctly different product categories (Desai and Hoyer 2000; Johnson 1984; Ratneshwar et al. 1996).

The setting for our research is gifts bought online. We take into account in our theorizing the fact that online consumer decision-making processes are likely influenced by information presentation formats or "menus" that are unique to the Web (Haubl and Trifts 2000; Huffman and Kahn 1998; Lynch and Ariely 2000). A distinctive aspect of the Web environment is that it is possible for a retailer to make products available to the consumer in a *choice* of Web menu formats. The consumer can then go back and forth between these different menu formats while making an online purchase decision. Thus, for example, a consumer shopping for a gift online at *gifts.com* can browse through different product alternatives by clicking on menus that display only products in a specific category (e.g., only wristwatches), products in the same price range (e.g., diverse products from \$25 to \$50), products for a specific gift occasion (e.g., diverse products for a birthday), products for a specific gift recipient (e.g., diverse products for a brother), etc.

Further, the choice of a specific Web menu format (e.g., product-category based vs. non product-category based) should influence how consumers process information about different product alternatives. We expect that in general, product-category based Web menus should yield somewhat similar choice alternatives, thereby producing relatively homogenous consideration sets. In contrast, non product-category based Web menus (e.g., price-based, occasion-based, or recipient-based) should engender relatively dissimilar choice alternatives that cut across different product categories.

We propose that a high (vs. low) variety-seeking individual will be more motivated to improve his/her stimulation level by seeking novelty in the decision-making process (van Trijp et al. 1996). Further, this same individual will try to achieve an improved stimulation level even while buying gifts for others and thus might look for more variety in choice alternatives for stimulation. Consequently, such an individual will seek diverse choice alternatives by browsing different Web menus, especially non product-category based menus such as occasion- or recipient-based menus. Even if a high variety-seeking individual starts the search process with a product-category based menu, the need for variety and increased stimulation should eventually cause this person to switch to non product-category based menus. As a result, a high (vs. low) variety-seeking individual will be more likely to browse diverse product categories, which in turn is more likely to produce a heterogeneous consideration set.

Based on our theorizing, we examined in an online decision-making experiment the joint effects of variety seeking and gift buyer-recipient relationships on the composition of gift consideration sets. Subjects (N=83) shopped for products from actual e-tailer Web sites on the basis of hypothetical gift-giving scenarios. Individual differences in the variety-seeking trait were measured in a session two weeks prior to the main study. The results provide fairly consistent evidence that gift buyers project their intrinsic variety-seeking tendencies onto purchases made for others by considering a wider range of product categories as gifts. Variety seeking also interacts with the effects of distant (vs. close) relationships on the extent to which gift buyers consider heterogeneous product categories. For example, the variety-seeking trait seems to exert sufficient pressure so as to counteract the knowledge gift buyers likely have of gift recipients' specific product preferences (e.g., in the case of close relationships).

In sum, to the best of our knowledge, this is the first study to demonstrate that the variety-seeking trait might influence purchase behaviors beyond one's own self-consumption. Our study also extends literature in the area of two-stage choice models by demonstrating the role of variety seeking in producing consideration sets with heterogeneous product categories (i.e., across-category consideration). Implications, limitations, and future research directions are discussed.

How Consumers Respond to Competing Market Signals: The Effects of Conflicting Quality Information and Consumer Thoughtfulness

Subimal Chatterjee, Binghamton University
Yong Soon Kang, Binghamton University
Debi Prasad Mishra, Binghamton University

EXTENDED ABSTRACT

To credibly communicate the quality of their products to consumers in markets where quality is unobservable, marketers often send quality signals. Instead of directly addressing a product's quality, signals provide information external to the product which consumers can use to make quality inferences (Bloom and Reve, 1990). Quality signals that have received attention in the marketing and economics literature include brand name (e.g., Price and Dawar, 2002), price (e.g., Rao and Monroe, 1989), advertising (e.g., Kilhlstrom and Riordan, 1984), retailer reputation (e.g., Purohit and Srivastava 2001), and warranties (e.g., Boulding and Kirmani 1993).

Signals, however, seldom operate in isolation. For example, a seller can send multiple simultaneous signals (*Dodge's 7-year, 70,000 mile warranty mixes the warranty and the Dodge brand name*), or different sellers can send different signals (e.g., Shop A's services may be certified by the American Automobile Association, AAA, whereas Shop B may offer a warranty). When confronted with multiple signals, consumers need to make relative quality assessments (if Shop A's certification is more / less credible than Shop B's warranty), assessments that are likely to be moderated by at least two issues: (1) the consumers' willingness and/or ability to think about the signals, and (2) their own information about the sellers' quality, in particular negative information, which may conflict with the expectation of good quality associated with signals in general. In the present paper, we report two studies that test these issues

In Study 1, participants imagine that their car needs transmission repairs and they have a choice of two repair shops, Shop A promising a warranty and Shop B promising AAA-certified services. The participants are asked to judge the service quality at the two shops on a modified 5-item version of the SERVQUAL scale (Parasuraman et al., 1988), each item addressing a specific quality dimension: Tangibles (*The shop has up-to-date equipments*), Reliability (*The shop is dependable*), Responsiveness (*The shop's employees are always willing to help customers*), Assurance (*You can trust the employees at the shop*), and Empathy (*The shop gives you individual attention*). Following their assessment of service quality, participants are asked to judge the two signals on the following three criteria: (a) the dissipative nature (*to the extent the signal implies front-end investments in quality*; e.g., Rao, Qu and Ruekert, 1999), (b) vulnerability to losses in the case of false claims (*to the extent that the signal implies loss of money and reputation if the quality turns out to be bad*, e.g., Ippolito, 1990, Tirole, 1988; Wernerfelt, 1988) and (c) ease of renegeing by sellers (*to the extent the signal allows the seller to back out of the quality promise*, e.g., Price and Dawar, 2002).

The results show that, averaged across the five dimensions, the warranty and certification are judged comparable in signaling quality, but when compared on the individual dimensions, the certification scores significantly higher on tangibles. Consistent with its dissipative nature, certifications are associated with more investments in quality, although such investments do not translate into greater vulnerability, i.e., participants expect both shops to lose equally should their quality turn out to be bad. There is no difference between the two signals on the renegeing criterion as well (i.e.,

participants believe that it is equally easy for both shops to back out of their quality promise).

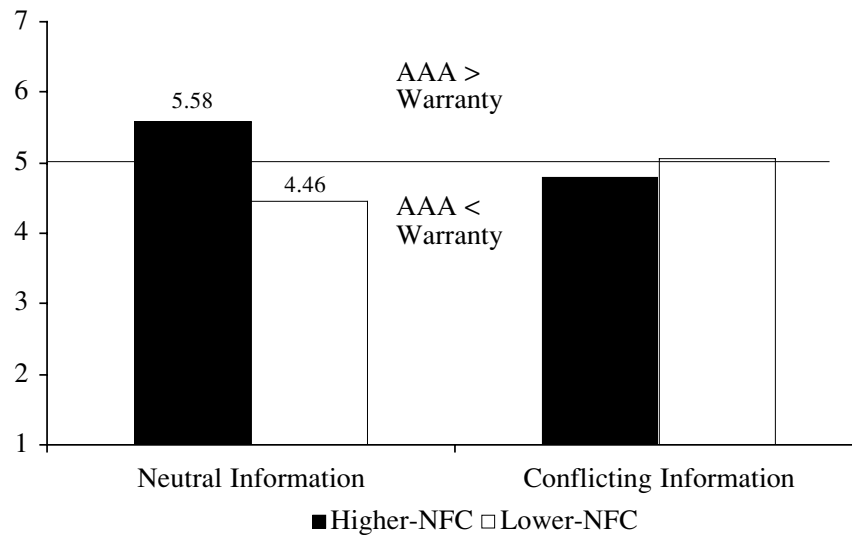

In Study 2, we use the same scenario as in Study 1 but (1) put our participants in a choice situation, (2) vary the nature of external quality information available to them, and (3) separately assess the responses of lower and higher-NFC participants. Thus, half of the participants are given neutral information about quality at the two shops (*the service quality at the two shops is not known, it may be good or bad*), while the other half of the participants are provided with conflicting quality information (*more than 80% of past customers have rated both shops as poor or very poor in quality*). We measure NFC by asking participants to self-rate themselves on the 18-item NFC scale (Cacioppo et al., 1984) and then create a composite NFC score for each participant by averaging the items. A median split of the average scores separates the lower and higher-NFC participants.

We assess likelihood of shop selection with two items: (1) What is the likelihood that one of the two shops will be your first choice, and (2) What is the likelihood that you will do more business with one of the two shops in future, on 9-point scales ranging from 1=Definitely Shop A to 9=Definitely Shop B. To account for alternative explanations, we control for (1) warranty coverage effects by manipulating the warranty coverage at two levels: low (6 months, parts and labor), and high (7 years, parts and labor; Price and Dawar, 2002), (2) familiarity with automobile services by explicitly assessing participants' familiarity with car repair shops on a 9-point Familiar / Unfamiliar scale, and (3) the underlying consumer motivation to seek gains or avoid losses (Higgins, 1997) by having participants self-select one of the following two options that best describes what is more important to them: *making sure that I get what is good for me*, versus *making sure that I avoid what is bad for me*.

The Figure shows the results. In neutral conditions when signals are the only information available in the market, higher-NFC participants are more likely to select the certified store compared to their lower-NFC counterparts. Testing the individual scores against indifference or 5.0 shows that higher-NFC participants significantly prefer the certification over the warranty, whereas lower-NFC participants significantly prefer the warranty over the certification. Introducing conflicting information equates the preferences of the two groups and makes both higher and lower-NFC participants indifferent between the two signals.

The results have several implications for sellers. At the simplest level, sellers need to realize that, in a competitive environment, signals will appeal differently to different segments stemming from the fact that a certain degree of cognitive sophistication is required for consumers to understand the quality implications. Furthermore, sellers should understand that signaling effects are moderated by any quality information that consumers may possess outside of the signals. It is critical therefore that sellers match their signals with the right quality communication. A certification signal, for example, should be accompanied by additional quality communications that stress front end investment in quality. Similarly, warranty signals could emphasize the sellers' contractual obligation (i.e., difficulty of renegeing) and, conditions permitting, promise unlimited or extended coverage.

SPECIAL SESSION SUMMARY

Feeling Badly Helps: Negative Affect and Giving Behavior

Sooyeon Nikki Lee, New York University
Michal Ann Strahilevitz, University of Arizona

The objective of this session is to explore the powerful influence of negative affect on prosocial or giving behavior in various marketing contexts. Each day, consumers contribute to charitable organizations, donate blood, and even risk their own life for the good of others. Such charitable behavior, we hypothesize, is often driven by negative affect. This session examines how empathic distress and guilt urge consumers to give. Empathic distress (Hoffman 2000) refers to negatively valenced empathy, which has shown a robust effect on motivating prosocial behavior (Batson 1991). Guilt, as a consequence of injustice perceptions, has been identified as an important factor in helping behavior (Blader and Tyler 2002).

The papers in this session demonstrate how these different types of negative affect influence consumer behavior, and suggest strategies that can be used to moderate that influence. Specifically, this session presents evidence of conditions under which giving behavior is strengthened by empathy or guilt, and examines alternative explanations for the phenomena described. All three papers illustrate that consumers often resort to giving behavior to reduce the aforementioned negative emotions. Collectively, the research in this session contributes to a better understanding of how negative affect involving others can be managed and provides practical implications to enhance marketing strategies.

Each paper in the session examines a unique facet of the relationship between negative affect and giving behavior. The first paper demonstrates how empathy can drive giving behavior. Small and Loewenstein, in a laboratory study and a field study, consistently show that mere identifiability of a victim can increase caring and donations to charity, via increased empathy. They further show that empathy exerts its influence on punitive behavior—people choose to punish those who do not give to others. The second and third papers focus on the influence of guilt. Strahilevitz shows that consumers feel guiltier about taking money back from a charity (even if they had not chosen to make the donation in the first place) than initially refusing to contribute to that same charity. Her research also examines the effect of whether or not the charity was initially chosen by the donor, and shows that the influence of guilt exists independently from the influence of status-quo bias. Lee and Corfman start from the assumption that hedonic purchases for purchasers themselves result in high guilt about spending money, and show how promotional strategies that restore equity can alleviate such guilt, such as including a free gift of a similar hedonic nature that will be given to someone other than the purchaser.

Whereas the first two presenters discuss how their results can be directly used to improve social marketing practices, the final paper focuses on how marketers can help alleviate consumer guilt in hedonic consumption by providing opportunities for them to give to others.

This session appeals to researchers interested in consumer decision making, charitable giving, promotional incentives, gift giving, and the causes and effects of experiencing and avoiding negative affect in consumer behavior.

A Little Something for Me, and Maybe for You Too: Promotions that Relieve Guilt

Sooyeon Nikki Lee, New York University

Kim P. Corfman, New York University

EXTENDED ABSTRACT

Depending on the nature and the intended user of an item being considered for purchase, a consumer may experience feelings of guilt that discourage that purchase. The intensity of the guilt is highest when consumers contemplate purchasing hedonic or pleasurable products and services for themselves (vs. someone else), which are more likely than utilitarian or practical purchases to be considered unnecessary. We propose and demonstrate that this guilt can be reduced through the use of promotions that restore balances between hedonic vs. utilitarian and self vs. other consumption. This research builds on work that explores the affective role of promotions.

The literature on guilt defines the construct as mainly interpersonal and often resulting from a sense of advantageous inequity—getting more than one deserves compared to someone else or compared to an absolute standard. An obvious way to alleviate feelings of guilt is to restore equity by redistributing outcomes (Baumeister, Stillwell, and Heatherton 1994). The guilt associated with the purchase of a hedonic product for oneself may result from a comparison with someone else—someone else's frugal behavior may induce feelings of guilt in someone contemplating the purchase of a luxury item—or it may be more budget-based or related to values of frugality or practicality. In the latter case, when a consumer contemplating a hedonic purchase feels guilt, it is due to a perceived imbalance between frugal or practical behavior and the self-indulgent behavior implied by the purchase. Consumers clearly vary in their feelings about the optimal balance between these kinds of behaviors and in their tolerance for engaging in more self-indulgent behavior than those around them. However, we propose that the feelings of guilt that do arise can be reduced. Past research suggests that this can be done by adding behaviors to the practical side of one's own scale. For example, Kivetz and Simonson (2002a; 2002b) found that consumers exerted effort to earn the right to indulge in luxury and by Strahilevitz and Myers (1998) found that subjects may have alleviated the feelings of guilt associated with a frivolous purchase by choosing to donate to charity. Another mechanism that reduces the guilt associated with such luxury or otherwise unnecessary purchases for oneself involves redistributing outcomes by giving to others, so that their hedonic consumption behavior is increased.

Marketers can help consumers make balance-restoring, guilt-reducing adjustments by offering free gifts with purchase. We predict that a free gift offered with the purchase of a hedonic product reduces feelings of guilt and that the degree to which guilt is reduced depends on both the intended user of the free gift and the nature of the gift: whether it is, itself, hedonic or utilitarian. First, we hypothesize that when the free gift is intended for use by the purchaser, guilt reduction is greater when the gift is utilitarian than when it is hedonic, because it helps restore the balance between self-indulgent and practical behaviors. Second, we hypothesize that guilt reduction is greater when the free gift is intended for use by someone else than by the purchasers themselves (e.g., the purchase of a bottle of women's perfume that comes with a tube of men's shaving cream). Giving something to someone else as well as to oneself helps correct the interpersonal balance. Finally, we hypothesize that when the free gift is intended for someone else, guilt reduction is greater when the gift is hedonic than when it is utilitarian (e.g., the bottle of women's perfume comes with men's cologne). Not only is the purchaser increasing someone else's

consumption level, the weight is all being placed on the hedonic side of the other party's scale.

Supporting the presence of guilt in consumer purchases, several pilot studies confirmed the association of stronger feelings of guilt with hedonic (vs. utilitarian) purchases for oneself and with free gifts intended for oneself (vs. for others). Generally, consumers feel guiltier about making hedonic than utilitarian purchases. Even within the realm of utilitarian purchases, consumers feel guilty about spending more money than necessary. Within hedonic purchases, consumers feel guiltier about buying a given hedonic item for themselves rather than for another.

In the main study, we focus on the situation in which there is the most guilt to alleviate—a hedonic purchase under consideration (the base product) for use by the purchaser. We employed a 2 (gift for purchaser vs. for someone else) \times 2 (hedonic vs. utilitarian gift) plus a control, between-subject design. Dependent measures were guilt and purchase intentions. Guilt was an index comprising six scales: reluctant, uneasy, hesitant, sorry, guilty, and regretful.

Results show that when a free gift is included, intentions to purchase the base product increase. This is not only because of perception of added value, but also because feelings of guilt are reduced, as demonstrated by a significant interaction within the free gift conditions. The pattern is such that when free gifts are explicitly intended for others, hedonic items reduce guilt more than utilitarian items, where as when the free gifts are explicitly intended for the purchaser, utilitarian items reduce guilt more than hedonic items. Purchase intentions followed a similar pattern, such that they increased when a free gift was included, but significantly more when hedonic gifts for others or utilitarian gifts for self were included. As predicted, guilt was a significant predictor of purchase intentions.

Guilt as a driving force in altruistic behavior has been examined in the literature, but not in the context of consumer purchases of hedonic products or promotions. This research provides insight into the ways in which consumers balance their consumption behaviors to reduce feelings of guilt and how promotions can be used to influence the feelings of guilt experienced by those who contemplate making hedonic purchases for themselves, by providing opportunities for giving to others.

Affect Intensity, Gender and the Expression of Emotion in Response to Advertising Appeals

David J. Moore, University of Michigan

ABSTRACT

The affect intensity measure (AIM) Larsen (1984) has been positioned primarily as a unidimensional construct measuring the characteristic strength with which people experience both positive and negative emotions (Larsen and Diener 1987). However, recent reexaminations of the factor structure of the AIM have demonstrated that people do not experience positive emotions with the same fundamental intensity as negative emotions (Weinfurt, Bryant and Yarnold 1994; Bryant, Yarnold and Grimm 1996). Since these findings seem to challenge Larsen's (1984) notion that the AIM is, in fact, a unidimensional construct, one of the objectives of this study is to reexamine the dimensions of the factors that comprise the AIM and to determine the manner in which these factors measure the intensity of positive and negative emotions.

Another relevant issue that has received insufficient attention in the consumer behavior literature is the role of gender with respect to affect intensity. A plethora of research has already shown that women characteristically score higher on measures of the intensity of both positive and negative emotions (Diener, Sandvik, and Larsen, 1985). Interestingly, Bryant, Yarnold and Grimm (1996), using a subset of 27 AIM items, found that women had higher scores on measures of negative reactivity, and were more emotionally reactive to negative stimuli than to positive stimuli. In contrast, men seemed to be more emotionally responsive to positive stimuli than to negative stimuli. The validity of these findings should be confirmed because of the critical implications for the relationship between affect and gender in the context of consumer behavior and advertising. Reviewing the empathy literature, Hoffman (1977) indicated that females do indeed appear to be more empathic than males, in that, they seem to be more adept at assessing another person's affective and cognitive perspective. However, Eisenberg and Lennon (1983) questioned these conclusions on the grounds that the presumed gender differences were actually a function of the method used to measure empathy. But even this conclusion by Eisenberg and Lennon (1983) seems to be implausible in light of the previous findings that indicate that females tend to express stronger emotionality than do men on the presumption that women are socialized to be more emotionally expressive (Brody and Hall 1993).

The questions facing researchers in consumer behavior and advertising are interesting. Previous research has shown that when consumers were exposed to emotionally charged advertising appeals, high affect intensity individuals, compared to their low intensity counterparts, manifested significantly stronger emotional responses to the message. In response to non-emotional ads, however, there were no significant differences in the strength of the emotions expressed by high versus low affect intensity respondents (Moore, Harris and Chen 1995). Moreover, what is still not clearly established is whether women will respond with stronger emotions and higher levels of affect intensity when exposed to emotionally charged advertising appeals. On the basis of prior research that has indicated that women do manifest significantly higher levels of affect intensity than do men (Diener, Sandvik and Larsen 1985; Bryant, Yarnold and Grimm 1996), there seems to be compelling theoretical justification to predict that gender may have an important influence in the determination of consumers' response to advertising appeals.

Objectives of the Study

One of the primary objectives of this paper is to investigate the relationship between gender and affect intensity, and the implications of this relationship for advertising and consumer behavior research. Study 1 examines the factor structure of the affect intensity measure and its relationship to gender. Study 2 investigates the extent to which affect intensity and gender influence the strength of the consumers' emotional response to emotional versus non-emotionally charged advertising appeals.

Subjects and Procedure

A total of 740 undergraduates (331 males and 409 females, aged 20-24) were administered the 40-item AIM (Larsen 1984). Each item was measured using a 6-point Likert-type scale (1=never, 2=almost never, 3=occasionally, 4=usually, 5=almost always, 6=always).

Data Analysis Procedure

The focus of the data analysis was a comparison of the model fitting capability and the factor structure of the 42 item AIM scale (Larsen 1984) versus the AIR three-factor model (Bryant et al. (1996). Using the method employed by Bryant et al. (1996), the same 27 items that comprised the AIR three-factor model were selected. Maximum-likelihood confirmatory factor analysis (CFA) was performed on both the 42 item AIM scale as well as the 27 item model using LISREL 8.53 (Joreskog & Sorbom, 1989).

Results

Three consistent factor groupings emerged: positive affectivity, negative intensity and negative reactivity. These factors were highly consistent with what Bryant et al. (1996) called the Affect Intensity Reactivity model and have therefore demonstrated a high degree of test-retest reliability for the AIR model. Therefore, the 27 item three-factor version of the AIM scale may conceivably serve as a more efficient instrument for measuring the intensity of positive and negative human emotions.

Gender Differences. In this study women consistently scored higher than men on each of the three AIR factors. However, we did not find support for the notion that men are more emotionally reactive to positive events than to negative events.

STUDY 2

It is already known that women experience more intense emotions than men and display a greater tendency to seek out emotional experiences (Allen & Haccoun, 1976; Larsen & Diener, 1987). In the context of advertising, there is no conclusive evidence that affect intensity interacts with gender to influence the message recipient's emotions and attitudes.

Subjects and Design

Ninety one subjects participated in a mixed-model repeated measures ANOVA design. There were two grouping factors: (a) Affect Intensity: high and low; and (b) Gender: male and female. Type-of-ad (emotional vs. non-emotional) served as a within-factor. Three different ads were nested in each of the two ad type conditions thus making it a nested factor.

Results

In response to the emotional ads, women displayed significantly stronger empathic emotions than men, and were more willing to help the victims featured in the message appeals. No significant effects occurred for the non-emotional ads. There were no significant Affect Intensity x Gender interactions for most of the measures for the emotional ads.

The main effects for affect intensity is consistent with prior research in advertising (Moore, Harris and Chen 1995). It also supports Larsen's (1984) original work that demonstrated that when people are exposed to an affect producing stimulus, those who are temperamentally predisposed to experience their emotions with great intensity will consistently manifest these higher levels of emotions. However, when confronted with a non-emotional stimulus, these individual differences tend to disappear (Larsen, Diener and Cropanzano 1987).

In general, the fact that higher scores for women over men were most significantly associated with the Negative Reactivity factor in Study 1 raises several theoretical questions: For example, it seems possible that specific dimensions of emotional intensity may have greater power to activate a stronger response from women than from men and this underscores the need for more systematic research on gender differences in the marketplace.

Undermining Self-regulation Ability as a Means of Reducing Resistance to Persuasion

S. Christian Wheeler, Stanford University
Pablo Briñol, Universidad Autónoma de Madrid
Anthony D. Hermann, Willamette University

EXTENDED ABSTRACT

Resistance to persuasion depends both on features of the attitude under attack (e.g., its accessibility or importance) as well as characteristics of the message recipient (e.g., his or her motivation and ability to resist the persuasive appeal). Although much is known about characteristics of the attitude that make it more resistant to change, less is known about factors that influence individuals' ability to resist counterattitudinal messages. In particular, the extent to which engaging in counterargument requires and is influenced by self-regulatory ability has not yet been explored.

The most studied and most well understood means for resisting persuasion involves generating counterarguments. Contemporary research has identified a variety of individual and situational variables that can influence resistance to persuasion by affecting the generation of counterarguments. For example, people form more favorable attitudes when they are in a positive than in a neutral mood (Petty et al. 1993) and when the message is presented by a source of high rather than low credibility (Chaiken and Maheswaran 1994). In this research, we sought to identify a new variable, ego-depletion, that could, instead of serving as a cue or biasing factor, interfere with individuals' ability to resist weak and specious counterattitudinal messages.

Research on self-regulation suggests that self-regulatory ability is a finite resource that can be diminished with exertion (Muraven, Tice, and Baumeister 1998). This state has been called ego depletion. Engaging in tasks requiring self-regulation in one situation (e.g., resisting a tempting plate of chocolate chip cookies) can make it more difficult to subsequently complete a seemingly unrelated self-regulatory task (e.g., holding a hand grip for as long as possible). These types of tasks are proposed to be depleting because they require one to effortfully override one's initial or default responses (i.e., reaching for the cookie and letting go of the hand grip once it becomes difficult). Interestingly, these types of results are not due simply to the amount of effort required to complete the task. For example, avoiding thinking about a forbidden topic has been found to reduce subsequent self-regulatory ability, whereas solving equally challenging multiplication problems has not (Muraven et al. 1998).

Resisting persuasion is another type of task that could draw on limited self-regulatory resources, and therefore, resistance processes could be impaired by previous self-regulation tasks. Much work on self-regulation suggests self-regulation failure can increase acquiescence (Baumeister and Heatherton 1996), and acquiescence is often a passive and low-effort response strategy (Krosnick 1991). Counterarguing persuasive messages involves actively processing information in the message, retrieving or generating contradictory information, and applying it in order to refute the message. All of these processes require active control processes in order to defend the pre-existing attitude from attack. These processes meet the criteria used to identify processes involving self-regulation—specifically, they involve engaging processes to reach a desired state (Carver and Scheier 1998) and overcoming a default or natural tendency (i.e., to agree with the supported position; Baumeister 1996). If counterargument requires self-regulatory ability, then engaging in self-regulatory tasks that deplete such a resource should impair the ability of individuals to subsequently resist

counterattitudinal appeals. This should occur primarily in those conditions under which counterargument would normally occur, namely when the arguments fail to provide compelling support for the advocated position. The present research tested these hypotheses.

Participants engaged in an initial task designed to deplete or not deplete their regulatory resources. This task involved detecting the letter "e" on a page using a rule that was learned and habitual (i.e., crossing out every "e"; non-depleting) or using a different rule that required overruling previously established habits (i.e., crossing out only selected "e"s after practicing crossing out every "e"; depleting). Following the depletion manipulation, participants read a message in favor of a counterattitudinal policy. Within the message, argument quality was manipulated such that some participants read strong and compelling arguments and other participants read weak and specious arguments.

Results indicated that resistance to the message was lower among individuals who had previously engaged in the depleting self-regulation task, but only for the weak arguments condition. Cognitive responses showed the same pattern and mediated participants' attitude formation. Additional analyses showed that participants reported putting equal effort into reading the message. Furthermore, their perceptions of the difficulty of, enjoyability of, interestingness of, effort toward, and fatigue after the depletion task did not account for the results.

These findings suggest that engaging in counterargument requires self-regulatory resources and indicate that controlling attitude formation and resistance processes may draw on the same limited self-regulatory resources as other tasks involving willpower. Additionally, they point to a new means of altering the cognitive response profiles and attitudes of message recipients and lowering resistance to advertisements and persuasive messages. These effects occur primarily when arguments are weak and specious and are consistent with the notion that depletion of self-regulatory resources inhibits the ability to generate unfavorable cognitive responses to counterattitudinal messages.

These findings expand understanding of how situational factors can affect the generation of cognitive responses. Previous research has shown that factors such as distraction in the immediate environment or time pressure can interfere with the processing of persuasive messages. This research shows that, even when individuals are free to take their time to read persuasive messages in a non-distracting environment, they may still lack the ability to accurately assess the merit of and reject weak and specious arguments. Hence, the effects of situational variations may sometimes move beyond the immediate environment and carry over to subsequent ones.

What Makes You Happier—A Nonloss or a Gain? The Moderating Role of Regulatory Focus and Need for Cognition

Ashwani Monga, University of Minnesota
Rui Zhu, Rice University

EXTENDED ABSTRACT

Framing refers to equivalent but different descriptions of the same information (Tversky and Kahneman 1981). For instance, consider the case of a surcharge for paying by credit card rather than cash. The same situation can be framed as a loss (i.e., penalty for paying by credit card) or as a gain (i.e., discount for paying in cash). These two frames can lead to four framed outcomes—a loss (i.e., paying the penalty), a nonloss (i.e., avoiding the penalty), a gain (i.e., getting the discount), and a nongain (i.e., not getting the discount). While both a loss and a nongain represent negative outcomes of equal magnitude, a nonloss and a gain represent positive outcomes of the same magnitude.

The impact of such frames on individuals' affective experiences can be viewed from two different perspectives—one based on prospect theory and another based on regulatory focus theory. Regarding negative outcomes of equal magnitude, both perspectives make the same prediction—that negative affect evoked by a loss will be greater than that evoked by a nongain. As for positive outcomes of equal magnitude however, these two perspectives differ. While prospect theory predicts that the positive affect evoked by a nonloss will be greater than that evoked by a gain, regulatory focus theory predicts exactly the opposite. It is this discrepancy that we aim to resolve in this paper. We try to figure out what makes people happier—a nonloss or a gain?

According to prospect theory (Kahneman and Tversky 1979), framing manipulations determine whether individuals will evaluate an outcome as a gain or a loss in relation to a reference point. Given that the loss portion of the prospect theory value function is steeper than the gain portion, the predictions that arise are that (1) for the same negative outcome, a loss feels worse than a nongain, and (2) for the same positive outcome, a nonloss feels better than a gain.

Regulatory focus theory (Higgins 1997, Idson et al. 2000) presents a different view of framing effects. According to this theory, a gain/nongain situation encourages a promotion focus, which in turn is likely to make a current goal seem like a *maximal* goal. In contrast, a loss/nonloss situation induces a prevention focus, which in turn is likely to make the same goal seem like a *minimal* goal. While minimal goals are those that one must achieve, maximal goals represent those that one aspires to achieve. Accordingly, failing to achieve a minimal goal (e.g., a loss) should be more aversive than failing to achieve a maximal goal (e.g., a nongain), whereas achieving a higher order maximal goal (e.g., a gain) should be more pleasurable than achieving a minimal goal (e.g., a nonloss). Notice that the latter prediction of gains being more pleasurable than nonlosses is the exact opposite of the prospect theory prediction.

In order to reconcile this discrepancy, we argue that one factor ignored by both theories is the regulatory focus that individuals have when they approach framed situations. We suggest that affect will be more positive when regulatory fit (Higgins 2000, Higgins et al. 2003) exists between individuals' regulatory focus, and the frame. Regulatory fit occurs when the strategic manner of one's goal pursuit is aligned with his or her regulatory orientation. Specifically, eagerness means fit a promotion focus and vigilance means fit a prevention focus. Accordingly, we propose that promotion focus individuals should experience fit when they encounter gain frames (i.e., eagerness means), whereas prevention focus individuals should experience fit when they encounter nonloss

frames (i.e., vigilance means). In terms of affect therefore, we should observe that gain frames lead to more favorable affect than nonloss frames (i.e., the regulatory focus theory prediction) when individuals adopt a promotion focus, but nonloss frames lead to more favorable affect than gain frames (i.e., the prospect theory prediction) when individuals adopt a prevention focus.

These effects should however hold only when individuals have the processing motivation required to perceive the fit/misfit. Research related to need for cognition (NFC) suggests that high NFC individuals, compared to low NFC individuals, are more sensitive to, and are more likely to elaborate on, the congruency/incongruency of information (Cacioppo and Petty 1982; Srull, Lichtenstein, and Rothbart 1985). Accordingly, high NFC people should be more sensitive to the level of fit between regulatory focus and frame, and exhibit such sensitivity in their affective judgments. Low NFC individuals, however, should be relatively immune to the differences in fit, and therefore exhibit comparable levels of affect. Specifically, we predict:

- H1: When individuals approach a frame with a *prevention* regulatory focus, those high in NFC should experience more positive affect for nonloss rather than gain frames. This difference in affect should however diminish for low NFC individuals.
- H2: When individuals approach a frame with a *promotion* regulatory focus, those high in NFC should experience more positive affect for gain rather than nonloss frames. This difference in affect should however diminish for low NFC individuals.

We use a series of scenario-based experiments to understand how regulatory focus might be induced in framed situations, and how this might have implications for affect. We first demonstrate (pretest 1) that buying situations induce a prevention focus whereas selling situations induce a promotion focus. Consequently (experiment 1), in support of our hypotheses, we observe an interesting reversal among high NFC participants, such that nonlosses produce more favorable affect than gains in buying situations, but gains produce more favorable affect than nonlosses in selling situations. This effect is absent among low NFC participants. We next replicate the buying situation results using a different scenario (pretest 2). Finally (experiment 2), we find further support for our theorizing by employing the same buying situation, but inducing a global, frame-unrelated regulatory focus before individuals actually see the frame.

Overall, our results demonstrate that, given adequate processing motivation, the prospect theory prediction (i.e., nonloss > gain) holds for prevention focus individuals and the regulatory focus theory prediction (i.e., gain > nonloss) holds for promotion focus individuals. This research presents insights into not only framing effects, but also the broader issue of how it is not only the ends, but also the means that matter.

The Impact of NFC and Knowledge on Consumer Response Toward Complex Print Advertisements

Sanjay Putrevu, Byrant College
Joni Tan, University of Western Australia
Kenneth R. Lord, Mercer University

EXTENDED ABSTRACT

In this era of high media clutter, advertisers frequently use a variety of ad-execution strategies to gain the attention of an increasingly fickle audience. One such strategy is to vary the level of complexity inherent in the message. To assess the efficacy of such a strategy, one needs to understand the impact of ad complexity on consumers. Research addressing this issue has generated mixed results; some find that simple ads are superior (Anderson and Jolson 1980; Paivio 1986; Rossiter and Percy 1983) while others find that complex messages are more effective (Chamblee et al. 1993; Lowrey 1998; Morrison and Dainoff 1972; Phillips 1997). This research attempts to reconcile such mixed findings by (a) isolating the various dimensions of message complexity and (b) studying the impact of two potential moderating variables, need for cognition (NFC) and knowledge, on consumer response toward complex messages.

The literature defines message complexity along four dimensions: visual complexity which refers to the number of distinct visual elements in the stimuli; technical complexity which refers to the amount of technical content and jargon used in the advertisement; lexical complexity which refers to the linguistic structure and semantic content of communications; and informational complexity which refers to the amount of product and/or usage information contained in the message.

Cacioppo and Petty (1982) define NFC as "the tendency for an individual to engage in and enjoy thinking." NFC could moderate the effectiveness of an advertisement through its influence on the preferred style and amount of processing. Consumers with high NFC derive intrinsic value from collecting information and obtain enjoyment from ads that are mentally stimulating. NFC may also be viewed as one determinant of a consumer's motivation to process information. i.e., high-NFC consumers are more likely to follow the ELM's central route to persuasion, forming attitudes on the basis of rational evaluation of message claims. Hence, such high-NFC consumers are likely to respond more favorably to messages that are complex along the dimensions noted above.

A knowledgeable consumer is one who has experience in a given context, possesses the ability to judge and evaluate product information and is more efficient in obtaining a given amount of information with less effort (Putrevu and Ratchford 1997). Researchers have found that knowledgeable consumers are equipped with the necessary skills or proficiencies to conduct in-depth processing of information (MacInnis et al. 1991). This superior ability might enable and motivate knowledgeable consumers to encode the rich cues embedded in complex messages. On the other hand, novice consumers might find the rich multitude of cues contained in complex messages to be confusing and overwhelming. Hence, knowledgeable consumers are likely to respond more favorably to complex ads containing a multitude of visual, technical, lexical, and informational cues.

The above predictions were tested on data obtained from a sample of 244 undergraduate students (53.7 percent male, 46.3 percent female) from a major Australian university. Subjects responded to fictitious ads for cars that varied along each of the four dimensions of ad complexity. Small (economy) cars were selected

as the target product because they were of relevance to the student population and also because of the product category's potential for variable positioning across the four types of complexity. Test ads were created for fictitious automobile brands to avoid potential confounds with prior preferences. Subjects were randomly assigned to treatment conditions. Each subject was exposed to a ten-page booklet containing a cover page, instruction page, four ads (two target and two filler ads) and four filler editorials. The target messages appeared third and sixth in each of the booklets; the order of the test ads (simple and complex versions of each dimension of ad complexity) and that of the six filler items was rotated to guard against systematic order or context effects.

The results are largely supportive of the hypotheses. High-NFC subjects exhibited higher affect and purchase intent toward visually, lexically, and informationally complex ads. However, there was no difference between high- and low-NFC subjects for technically complex ads. High-knowledge consumers showed a preference for complex messages along the dimensions of visual, technical, and lexical complexity. However, there was no difference between experts and novices for the informationally complex message.

These results suggest that NFC and knowledge (at least partially) moderate the impact of message complexity. However, the results are not consistent across all four dimensions of ad complexity, suggesting that these individual-difference variables have varying levels and directions of influence on each of the dimensions of ad complexity. The effects are strongest and most consistent for the visual and lexical dimensions with high-NFC and high-knowledge consumers responding more favorably to messages that are visually and lexically complex.

From a strategic perspective, these results suggest that consumers who are high in NFC and knowledge can be effectively targeted, and have their attitudes and purchase intentions enhanced, by the use of appropriate forms of message complexity. The study suffers from two limitations: the use of a student sample and a single product category. Future research should remedy these shortcomings by using more representative samples, studying other product categories, testing for the effects of earlier and later stages of the response hierarchy, and exploring whether the results would hold for other media types.

When the Attraction Effect Disappears: The Differential Impact of Adding Common versus Unique Features on Consumer Choice¹

Young-Won Ha, Sogang University
Sehoon Park, Sungkyunkwan University
Hee-Kyung Ahn, Sogang University

EXTENDED ABSTRACT

The attraction effect has received considerable attention from decision researchers (e.g., Ariely and Wallsten 1995; Heath and Chatterjee 1995; Huber, Payne, and Puto 1982; Huber and Puto 1983; Pettibone and Wedell 2000; Sen 1998; Simonson 1989, Simonson and Tversky 1992; Tversky and Kahneman 1991). It refers to the ability of an asymmetrically dominated or relatively inferior alternative, when added to the original choice set, to increase the attractiveness and choice probability of the dominating alternative (Simonson 1989). Despite its importance and robustness, the attraction effect has been typically demonstrated using simple choice sets, involving only a few alternatives described on two monotonic attributes (Ratneshwar, Shocker, and Stewart 1987). In this research, using choice tasks similar to those employed in typical attraction effect studies, we examine how adding a third categorical attribute to the choice set affects consumer choice

Consider the following scenario: A consumer is deciding between two identically priced vacation tour packages to a certain foreign country for next summer (Package A [competitor] vs. Package B [target]; 'core set'). Package A guarantees stays at four-star hotels, but the hotels have relatively poor location in terms of proximity to the tourist attractions. Package B guarantees stays at three-star hotels, but the hotels are closer to the tourist attractions and have relatively convenient locations. The trade-off here is between the quality of hotel service and the convenience of hotel location. Now imagine that a third package with the same price (i.e., Package C [decoy]) is introduced in the choice set (the 'extended set'). Package C guarantees stays only at two-star hotels, but the hotels are slightly more conveniently located compared with those of Package B. Our pilot study showed that such stimuli can induce the within-subjects attraction effect (Huber and Puto 1983).

The main experiment had a 2 (set size; core set vs. extended set) x 2 (feature; common vs. unique) mixed design. The first factor, set size, was administered within subjects and the second, feature, was administered between subjects. In the common feature condition, we added a common feature (i.e., 'France' for a vacation site) to each of the options in the original choice set developed in the pilot study. In this context, we argue that the common features (i.e., 'France' for a vacation site) will be ignored by decision makers because of their nondiagnosticity, i.e., they do not differentiate the alternatives (Tversky 1972). Consumers in this setting may well make trade-offs among the alternatives based on the provided information regarding the two monotonic attributes ignoring the shared feature. Thus, the attraction effect is hypothesized to persist under such circumstances. The result confirmed our prediction (McNemar Test, $p < .01$).

In the unique feature condition, we used the same stimuli that were used in the common feature condition except that the competitor's vacation site, France, is replaced with a relatively equally attractive feature, Italy. In this context, we argue that the replacement of the competitor's common feature with a unique feature would encourage categorization based on the added

qualitative attribute comprising unique features, especially if the unique features are important and relatively equally attractive. In such cases, subjects may process alternatives hierarchically; they may initially group alternatives into their categories to eliminate alternatives and simplify choice processing instead of making trade-offs using monotonic attributes (Tversky 1972; Tversky and Sattath 1979). Under such circumstances, the target's share is not likely to increase when the decoy is introduced to the choice set. Thus, we hypothesized that the attraction effect will disappear (or will be attenuated) when the competitor's common feature is replaced with an equally attractive unique feature. The result confirmed our hypothesis. (McNemar Test, $p = 1.00$). The result also indicates that the disappearance of the attraction effect is due to 'the lone option effect'; the competitor's share is larger when it is a lone option than when it shares a common feature with other options.

The current study suggests that when the added qualitative features can be used as a basis for categorization of the options in the choice set, consumers seem to engage in hierarchical processing of the options at the initial stage of the choice process. The categorization of the options may have reduced the extent to which subjects engage in cross-category comparisons in the extended set/unique feature condition. The decrease in the degree of cross-category comparisons in turn would have reduced the magnitude of the attraction effect. The attenuating effect of the added unique feature on the attraction effect raises the question about generalizability of the attraction effect to the environments where consumers can easily categorize choice options into two or more groups. The clarification of the boundary conditions for contextual influences such as the attraction effect in a choice task characterized by mixture of qualitative and quantitative attributes might enhance our understanding of consumer choice dynamics in general as well as the phenomenon of the attraction effect per se.

Expectation-Driven Separation in Preferential Choice Processes

Kurt A. Carlson, Duke University

EXTENDED ABSTRACT

In binary choice, *expected separation* is the non-directional expected difference in the holistic value of two alternatives. This article explores three consequences of expected separation. First and most basic, expected separation influences consumers' perceived separation between the two alternatives. Second, to adjust their perceived separation toward what was expected, consumers bias their attribute attractiveness evaluations. Third, consumers adjust their attribute weights to confirm their expectations. Two consumer choice studies support these claims. Relative to those expecting low separation, participants expecting higher separation perceive greater separation, exhibit more distortion of attribute attractiveness evaluations to favor one of the alternatives, and give relatively more weight to attributes that favor one of the two options (on average). Implications of this work and potential extensions are discussed.

It is well known that directional expectations, "I expect A will be better than B," yield expectation-consistent perceptions, "A is better than B." Such directional expectations can be strong, such as loyalty to a team (Hastorf and Cantril 1954) or a position on a social issue like capital punishment (Lord, Ross, and Lepper 1979) or as weak as an emerging preference for an option in a binary choice (Russo, Medvec, and Meloy 1996). Whereas most consumer research has focused on directional beliefs, especially strong ones like brand loyalty (Boulding et al. 1993; Hoch and Ha 1986; Spreng, MacKenzie, and Olshavsky 1996), this article focuses on the non-directional belief of *expected separation*.

Carlson (2000) hypothesized that consumers enter the choice process with a default magnitude of expected separation, representing the belief that the chosen option will be preferred by a margin proportional to the magnitude of the belief. This expected separation is updated throughout the choice process as new information is encountered. By the end of the choice process, expected and perceived separation converge with perceived separation emerging partly from biased predecisional processing to support one of the two alternatives.

The binary choice process has been characterized as one of creating differentiation or separation between options (Svenson 1992, 1996). As this process of distinction proceeds, there emerges at any given time both the directional knowledge that identifies which alternative appears to be superior and the magnitude of the non-directional perceived separation between the options. Following the large body of research on belief-consistent perceptions (Lord et al. 1979; Nickerson 1998; Sanbonmatsu et al. 1998), it is hypothesized that the magnitude of expected separation will influence perceived separation. It was also expected that consumers' reliance on the separation-construction tactics of information distortion and weight alteration would increase as expected separation increased. These hypotheses were examined in two studies.

Study 1 showed how perceived separation was influenced by the sorting mechanism used to establish the choice set. This demonstration paves the way for a more careful examination of biased predecisional processing and its impact on the choice process. Study 2 examined a structured choice between two backpacks to test the hypotheses. Expected separation was manipulated via the prior assessment of a participant's personal preferences and the cover story of a "product simulator" that designed two backpacks to be either slightly different in attractiveness (low expected separation) or considerably different in attractiveness (high expected separation). The results supported all hypotheses and revealed

distortion to be a partial mediator of the relationship between expected and perceived separation.

One natural extension of this work involves expected separation's impact on choice processes from sets of more than two options. Specific aspects worthy of inquiry might include choice deferral (Dhar 1997), attribute exclusion thresholds (Huber and Klein 1991), depth of information search (Bockenholt et al. 1991), and processing strategies (Biggs et al. 1985). Regarding the latter, it has been claimed that consumers select processing strategies based on expected costs and benefits of implementation (Beach and Mitchell 1987; Payne, Bettman, and Johnson 1992). Is it possible that expected disparity influences the expected costs and benefits of various strategies, thereby influencing strategy selection? Another issue of interest is whether there exists a nonzero level of expected disparity that is sufficiently low that consumers believe any option will do. We know from consumers' selection among commodities that some choices are made with almost no thought, presumably because (at least in some cases) expected disparity is zero. But does there exist a nonzero threshold of expected disparity for which the choice process defaults to commodity status? That threshold may differ by product category, but is it ever positive?

The Effect of Interpersonal and Interproduct Comparison on Product Choice

Katherine A. Burson, University of Michigan

EXTENDED ABSTRACT

Consumers rely on comparisons to determine the best product for themselves. Previous research has shown that consumers infer their personal valuation of alternatives from the portfolio of market offerings and some information about their own relative tastes (Prelec, Wernerfelt, and Zettelmeyer 1997). Participants who were asked to indicate in which segment of quality their preferred product lay (their “ideal point”) and then asked to give the percentile rank of each product in an array were likely to choose the product closest to their ideal point. Unfortunately, this reliance on interproduct rather than absolute information about products in a distribution contributes to errorful consumption decisions. For instance, Prelec et al. (1997) demonstrated that, given a distribution of ponchos, consumers who believed they are shorter than average purchased the shortest poncho despite the fact that the longest poncho was a better fit.

In the current experiments, I extend this theory in two ways. First, I demonstrate that consumers not only infer valuations of products from their relative preferences, but also from their relative *skills*. Secondly, I show that consumers’ beliefs about their skill level are often flawed in a predictable way, introducing yet another potential source of error into their product selection. Two studies show that consumers use both interpersonal and interproduct skill-based comparisons to choose products and that the perceived difficulty of tasks drives beliefs about relative skill.

The first experiment examines the role of interpersonal beliefs in product choice and demonstrates that skill-based consumption decisions are driven by both these and interproduct assessments. In this study, 54 participants were given a choice between six MBA programs (ranging from low-skill to high-skill), and chose the program that they thought was best for them. Skill was represented as the average GMAT of students in the program. Unlike previous research that required participants to indicate where their *preferred product lay*, this experiment measured participants’ estimates of their own relative standing on the GMAT as well as their estimates of the relative standing of each MBA program. I expected participants to choose the product that shared their own rank. In other words, participants who thought they were 80th percentile test-takers would choose an MBA program that they thought was 80th percentile. The results of study 1 show the predicted correlation between participants’ interpersonal and interproduct estimates. Furthermore, exactly 50% of participants matched their chosen MBA program to their own percentile rank (more than can be predicted by chance). Clearly, skill-based interpersonal comparisons play a role in product choice. The next experiment explores these beliefs about relative skill.

Study 1 shows that participants rely on both their comparisons to other participants and comparisons between products when they choose products. Previous research has shown that reliance on relative information about products could lead to consumption mistakes (Prelec et al. 1997). However, the extent to which people misestimate their relative skill is unclear. Some research suggests that only a minority of people make errors in interpersonal assessments (Kruger and Dunning 1999, 2002); unskilled people are allegedly more miscalibrated in interpersonal assessments than skilled participants are. I will refer to this as the “unskilled-unaware” hypothesis. This theory suggests that only people in the bottom quartile of performance are inaccurate judges of their standing. However, I argue that a majority of consumers makes

errorful interpersonal estimates. Poor performers are no more error-prone than good performers—they just appear that way in Kruger and Dunning’s data because of two effects: 1) subjective and objective measures of performance are imperfectly correlated, so estimates of relative performance regress toward the mean and 2) overall, people tend to give inflated estimates of relative ability.

If interpersonal assessments (like interproduct assessments in Prelec et al 1997) are errorful, then the results of study 1 suggest that, ultimately, the quality of product choice will suffer. If Kruger and Dunning (1999, 2002) are correct, then it is only the most incompetent consumers who will err in skill-based product choices. On the other hand, if my theory is right, then people who perform well will be as likely as those who do poorly to misestimate their relative standing and purchase inappropriate products. It is unclear which theory is correct and, thus, if a minority or a majority of people misestimate their relative standing. Therefore, study 2 examines whether or not skilled consumers are less errorful in relative estimates than unskilled consumers.

By looking at participants’ estimates by their actual skill level on hard tasks, I was able to see which of the two arguments fit: the “unskilled-unaware” or “everyone-equally-unaware”. I predicted that, because domains that are perceived as difficult lead to significantly lower perceived percentiles (Kruger 1999), low performers would appear to be more accurate and high performers less accurate on difficult tasks (supporting the equally unaware hypothesis). If unawareness is universal, then it will be the unskilled participants who will appear to be more aware of their relative standing even on difficult tasks, just as it was the skilled who appeared to be more aware on Kruger and Dunning’s easier tasks.

In this experiment, 40 participants were given six sets of trivia questions that varied in difficulty. For each of the sets of trivia, participants indicated their predicted percentile rank and the difficulty of the task.

A repeated measures MANOVA revealed that average percentile estimates decreased as the tasks became more difficult. In the sets of trivia that resulted in the lowest percentile estimates, *t* tests showed a reversal of the pattern reported by Kruger and Dunning (1999): Skilled participants were more inaccurate than unskilled participants were. Therefore, on hard tasks, it was the skilled performers who seemed unaware of their standing. This means that many more consumers than just the 25% of people that Kruger and Dunning hypothesized were unable to make accurate interpersonal assessments.

The results of these two studies demonstrate that skill-based consumption decisions are driven by comparative beliefs and that these beliefs and ultimately consumption itself can be predictably shifted. Furthermore, errors in interpersonal assessments are as common for skilled performers as for unskilled performers.

Inside the Minds of Buyers and Sellers: Mental Construals and Prospect Theory

Himanshu Mishra, University of Iowa
Dhananjay Nayakankuppam, University of Iowa

EXTENDED ABSTRACT

Research into decision-making has revealed an asymmetric response pattern towards losses as contrasted with gains (loss aversion) measured relative to any individual's initial status quo position (Kahneman and Tversky, 1979). One of the outcomes of such a response function is that sellers tend to overvalue objects relative to buyers. That is, the lowest price at which consumers agree to part from a good (selling price) is often considerably higher than the highest price at which they agree to acquire the same item. For instance, Heberlein and Bishop (1985) found that people were willing to pay \$31 for a hunting permit but were not willing to sell it for less than \$143. Thaler (1980) called this pattern—the fact that people demand more to give up an object that they would be willing to pay to acquire it—the *endowment effect*. The endowment effect has proved to be exceedingly robust (see, for e.g., Kahneman, Knetsch and Thaler, 1990). More recently, researchers have examined the underlying processes responsible for the endowment effect. Carmon and Ariely (2000) provide evidence that the endowment effect appears to reflect a differential attention to information, specifically a focus on the foregone.

We extend this line of research by inquiring into the processes and mental representations in the minds of buyers and sellers. Specifically, we hypothesize a fundamental difference in the mental construals of the object being traded. A seller's mental construal of the item being traded over-emphasizes the positive aspects of the foregone (i.e., the positive features of the item since that is what s/he stands to lose in a transaction) and under-represents the negative aspects of the foregone (i.e., the negative features of the item since that is not coded as a loss and does not loom as large). The valuation process is thus overly influenced by the positive features of the object and leads to an overvaluation of the object in question. We report herein the results of three experiments that tested predictions derived from such a process.

In Experiment One, we manipulated the foregoing of the positive features associated with the trade. We provided buyers and sellers with mugs that they could buy (or sell). Some sellers however, were provided with two mugs and asked to sell one. Other explanations for the endowment effect (affective overvaluation, a focus on the foregone item) would not predict an elimination of the endowment effect. We hypothesized that, in the two-mug condition, the fact that the positive features of the mug could still be enjoyed in the other mug (that was not sold) would alter the mental construal of sellers such that the positive features would no longer be coded as lost (and thus over-emphasized). That is, we predicted an elimination of the endowment effect. Results were consistent with such an analysis.

In Experiment Two, we collected process measures to assess the underlying mental construals of the object. Specifically, participants were randomly assigned to be buyers or sellers and provided with a pen. They were asked to quote reservation prices and to generate a list of thoughts about the pen, code the thoughts as positive, negative or neutral and state how difficult the thought had been to generate. Results were consistent with our conceptualization. It was, in general, easy to generate positive thoughts (the pen was an attractive pen) and buyers and sellers tended to initially generate positive thoughts. Later, however, sellers tended to generate neutral rather than negative, thoughts while buyers tended to generate negative, rather than neutral thoughts. Again, this is consistent with an under-representation of negative features in the minds of sellers.

Experiment Three utilized response latencies to assess differential memory traces in the minds of buyers and sellers for the object being traded. Participants were randomly assigned to be buyers and sellers and provided with a mug. They were also exposed to four statements about the mug, two positive and two negative. They were then asked to state their reservation prices and after a time delay, were tested for their memory for the positive and negative attributes of the mug. Consistent with our conceptualization, there emerged significant biases in the mental representations of buyers and sellers, as evidenced in the error patterns and response latencies. Specifically, buyers made a similar amount of errors on positive and negative features, but sellers made more errors on negative features than on positive features (i.e., they were more likely to misremember negative features as not having been there). An analysis of the response latencies for facilitations and hindrances was also consistent with our conceptualization. Buyers experienced greater hindrance on positive (rather than negative) features when statements were presented as false, rather than true. Sellers experienced facilitation in denying false negatives, as compared to affirming true negatives. In other words, it was easier to accept the absence of a positive feature (since it was presumably offset by the other, over-represented positive features but accepting the existence of a negative feature was much more difficult).

In conjunction, the three studies provide a compelling picture of the differing mental construals of the item being traded that exist in buyers and sellers' minds. It is these differing mental construals that seem to mediate the endowment effect.

SPECIAL SESSION SUMMARY

Deliberation versus Automaticity: When Considering Just One is Misleading

C. Miguel Brendl, INSEAD

“Who Am I Playing With? Interpretative Thinking and Automatic Effects of Context for Impression Formation in a Prisoner’s Dilemma Game”

Dirk Smeesters, Luk Warlop, & Eddy Van Avermaet

Many marketing interactions are like games with interdependent outcomes (e.g., sales negotiations). In such situations, it is important to construct a clear impression of the interaction partner; however, the impressions formed are easily influenced by the decision context. We argue that marketing interactions naturally activate a mindset. In three experiments we show that when the activated mindset is to interpret the interaction partner’s behaviors, the impressions of the interaction partner assimilate to accessible knowledge. This was the case even when the accessible knowledge consisted of extreme exemplars (e.g., after subliminally priming Hitler). When the mindset was to compare the behaviors to a reference point, however, the impression of the interaction partner was contrasted to the same knowledge base (again Hitler).

“Dynamic Effects of the Interplay Between Spontaneous Affect and Goals”

Suresh Ramanathan & Geeta Menon

We show that priming a temporary hedonic goal (choosing a breakfast cereal) in people who also have chronic hedonic goals results in more positive evaluations of goal-related items (sweet foods), the *longer* the time delay since priming. On the other hand for those without such chronic hedonic goals, the same priming effect is strong after a brief time delay since priming, but decays rapidly thereafter. We conclude that deliberative goal setting (choosing a breakfast cereal) triggers different automatic processes, either motivational ones when chronic goals are present, or cognitive ones when no chronic goals are present.

“Re-introducing Associative Mechanisms Into Persuasion Research”

Maria Galli, Amitava Chattopadhyay, & C. Miguel Brendl

This research investigates the importance of associative mechanisms, such as classical conditioning, in persuasion. Three experiments demonstrate that: (1) conditioning is more effective in shaping attitudes the more cognitive resources are devoted to the conditioning procedure, and that (2) despite forewarning of persuasive intent and a conscious attempt to avoid persuasion, once the cognitive resources are expended during the conditioning procedure, formation of the attitude is uncontrollable and thus can influence subsequent decisions. In fact, because forewarning focuses attention on the conditioning and learning is uncontrollable, forewarning boomerangs: it increases the effect of conditioning. These results have important theoretical and practical implications. First, they contribute to a better understanding of the process by which conditioned associations are formed. Second, they shed new light on the importance of associative mechanisms in persuasion, by demonstrating that they can be more powerful than commonly assumed, and that they are not germane only to low-involvement advertising situations or for low involvement products. Third, they suggest caution should be exercised when trying to warn consumers of harmful influences (e.g., tobacco advertising), as warning could increase rather than decrease advertising effectiveness.

ROUNDTABLE Markets and Cultures

Discussion Leaders:

A. Fuat Firat, Arizona State University West
Alladi Venkatesh, Center for Research on Information Technology and Organizations

Following economy's central role and influence in human lives that lasted many scores, culture is beginning to take the center stage alongside the economy. There is also a growing awareness that the economy is a part and a construct of human culture. Thus, the market that has been the medium through which modern society's economic relations were practiced, especially in capitalist western societies, is being subject to cultural scrutiny.

With this awareness, an increasing number of scholars across many social science and humanities disciplines, as well as in consumer research, have begun to study the interconnections between markets and cultures. Several insights have been developed based on these studies. One is that in the contemporary global order what has been known as consumer culture has become primarily a market culture. This market culture seems to be transcending national cultures within which it has historically flourished. In effect, this cultural collective seems to thrive on incorporating all marketable elements of all cultures, and, today, forms the basis of globalization. A second insight indicates that the market culture also contributes to either the marginalization of traditional cultural systems that cannot adapt to commercial, marketable elements or coopts them into the market culture. Thirdly, observations indicate that many countercultural theaters are arising that propose and promote non-market alternatives to human relations, or alternatives that try to utilize the market as one of a multiple means of human relations. Finally, there are many studies that have investigated the local-global interactions and implications of globalization discovering a multiplicity of consequences, including creolization, hybridization, and fragmentation. A selected bibliography of these works is provided below.

These are the debates that are currently directed toward an understanding of phenomena that are in the process of development. They all point to different perspectives and perceptions and would greatly benefit from a sincere, open discussion among consumer scholars. This is the major underlying motivation for this roundtable: to bring researchers who have invested in these different perspectives together and exchange ideas and set agendas pertaining to this very important topic.

SPECIAL SESSION SUMMARY

Drivers and Contextual Moderators of Consumer Value Formation in Participative Pricing Mechanisms

Amar Cheema, Washington University in St. Louis
Utpal Dholakia, Rice University

Auctioneers in both brick-and-mortar and Internet institutions recognize the importance of understanding consumer behavior for their trade. Growing consumer interest in on-line auctions such as eBay, and several recent calls for academic research (e.g., Bazerman 2001, Chakravarti et al. 2002, McAfee and McMillan 1996) have stimulated research on consumer behavior in auctions, and more generally, in settings where consumers participate in dynamic price formation processes.

There is a mature literature on the economic theory of auctions (Klemperer 2000) and significant empirical work testing this theory both with laboratory and field data (e.g., Kagel 1995, Laffont 1997). However, this paradigm makes restrictive assumptions regarding consumer values and bidding strategies. The laboratory tests often use stylized procedures and fictitious commodities designed to prioritize pristine theory tests. Although these tests often document failures of the celebrated revenue equivalence theorem (Vickrey 1961), large gaps remain in our understanding of what drives and moderates consumer behavior in auctions involving real products.

The assumptions of independent private values and even the pure common value model appear questionable in the light of the evidence from these studies as well as the work on contextually labile and constructed values (e.g., Ariely et al. 2002). Although Milgrom and Weber (1982) offer the “affiliated values” model to accommodate notions of consumer learning and updating of values as well as bidding strategy, more research is needed on the behavioral underpinnings of affiliation and its impact on consumer learning and strategic behavior in non-posted price contexts such as auctions (Chakravarti et al. 2002).

Consumer behavior in auctions is influenced by a variety of individual bidder differences and contextual information surrounding specific auction mechanisms (whether in traditional or on-line formats). The effects are important not only for their outcome impact, but also because they may be interpreted in the light of explanatory behavioral theory. Recent research has focused on generating a theoretical framework and an empirical understanding of these effects. This session brought together three such papers.

The Chandran and Morwitz paper examined the effect of bidders’ mindsets (whether deliberating a choice or implementing a chosen course) on their actions as they participate in the bidding process. The research demonstrated how participative pricing mechanisms focus the consumers on action and elicit greater commitment to the purchase. This action orientation leads to higher prices in auctions as compared to fixed-price offers. Further, individual differences in perceived control of the outcome moderate this effect.

The Dholakia and Simonson paper examined the impact of a specific contextual factor in online auctions, namely the prices of items listed adjacent to the focal item. This paper showed how these prices serve as dynamic and persistent anchors in the value formation process. Using data from eBay auctions, the authors find that adjacent prices positively influence the final bid price. Moreover, an individual difference variable (bidder experience) lowers susceptibility to such context effects in a manner consistent with prior work on context effects (Lynch et al. 1991).

The Cheema, Chakravarti, and Sinha paper explored the impact of individual-specific factors on how bidders construct values and implement bidding strategies based on the information that unfolds as auctions proceed. Their results show the influence of bidders’ goals and prior price knowledge on bidder behavior. The effects are specifically contrasted across different contexts: ascending and descending auctions with differing deliberation times. They also examine consumers’ post-auction, outcome-contingent regret levels and the motivated reasoning that drives changes in value.

Apart from directly meeting the contemporary calls for behavioral literature on auctions, the papers in this session focused more generally on value formation processes and context effects in consumer behavior. Together these papers provided new behavioral insights into participative pricing processes, and hold a potentially broader appeal to researchers interested in the sociology of competitive behaviors in consumer markets (Smith 1989, 1993).

SHORT ABSTRACTS

“Effects of Participative Pricing on Consumers’ Cognitions and Actions: Goal Theoretic Perspective”

Sucharita Chandran, Boston University
Vicki G. Morwitz, New York University

This paper explores consumer cognitions and actions that stem from participation in price determination. Participative Pricing is defined to include mechanisms where consumers participate in price setting in some way (for example via bidding in traditional and reverse auctions). Using a goal theoretic framework, this paper shows that relative to economically equivalent fixed price offers, a participative pricing offer focuses consumers on action (setting a price) rather than evaluation. By virtue of the intermediary price setting process, participative pricing offers evoke an execution orientation that drives higher behavioral commitment (purchase intents) and more positive attitudes. However, this process is moderated by consumers’ perceptions of their ability to control shopping decisions.

“Dynamic and Persistent Anchors: How Adjacent Listing Prices Influence Focal Listing Success in Online Auctions”

Utpal M. Dholakia, Rice University
Itamar Simonson, Stanford University

This research investigates the *contextual influence* of adjacent listing prices on a focal listing’s success in online auctions. Both the starting price and final price of adjacent listings are found to *positively* influence the focal listing’s success—as defined by bids accrued and its final price—*after controlling for* the listing-related determinants of auction success such as its starting price, duration, and seller’s reputation. Evidence suggests that adjacent listing prices may work as *dynamic and persistent anchors* throughout the auction duration. Further, these context effects are moderated by bidder experience — bidders appear to become *less susceptible* to such influences with increasing experience. The practical implications for sellers are considered and future research opportunities are discussed.

“Consumer Value Construction and Bidding Behavior in Auctions: Contrasting the Effect of Motivational and Cognitive Influences across Ascending and Descending Auctions”

Amar Cheema, Washington University in St. Louis

Dipankar Chakravarti, University of Colorado at Boulder.

Atanu Sinha, University of Colorado at Boulder

We experimentally study the value construction, bidding behavior, and regret management processes in both ascending and descending auctions. We focus on how bidders' motivations interact with knowledge (prior price information) and value salience to influence bidding behavior. We also examine how consumers mentally manipulate their own values and their assessment of competitors' values to manage post-auction regret, contingent on win/loss outcomes. The interactive effects of motivation, prior knowledge, and value salience are shown to differ across auction types. Further, post-auction regret is driven by goal-incongruent outcomes in descending auctions, but only by win/loss outcomes in ascending auctions. We contrast the effects of manipulated variables across auction types (ascending versus descending) and suggest implications for auction design.

The Limits of Self-Regulation in Behavior, Consumption and Choice

Susan Jung Grant, University of Colorado

Whether a consumer has determined to forgo chocolate, embark on an exercise regime or become master of his destiny, sustained self-control might be considered a key to success. Yet maintaining the strength of will to conquer such challenges is clearly a test that many fail. One explanation for faltering will power is provided by Baumeister and his colleagues (Baumeister, Bratslavsky, Muraven, & Tice, 1998; Muraven, Tice, & Baumeister, 1998; Muraven & Baumeister, 2000; Vohs & Heatherton, 2000; Baumeister & Vohs, 2003). In their model, the psychological resource that sustains the self's ability to regulate control or effort is conceived of as a resource that is temporarily depleted upon use, and thus, makes extended acts of self-control difficult to sustain. This session was designed to explore how the depletion of self-regulatory resources affects consumption behavior and what the potential consequences may be.

This session sought to extend this theoretical approach in an effort to understand how consumers behave under circumstances in which their self-regulatory resources are experimentally depleted. The three session participants are investigating this question from different angles; the first two papers relate the study of self-regulation to consumption contexts, such as choice and impulsive buying, while the third paper examines the effect that the nature of consumer goals may have on self-regulatory depletion.

The first paper, by Baumeister, discussed the evidence for a model of self-regulation as a resource that is situationally depleted upon use. Baumeister also related research pertaining to the depletion of regulatory resources to the act of choice. The results of two studies suggest that making choices in a consumption context renders the person vulnerable to self-regulation failure in a subsequent context. Moreover, Baumeister put forth the notion that situations calling for extensive choice making, such as in high-involvement purchasing circumstances or when choice is difficult, may incidentally promote self-regulation failure in subsequent, unrelated tasks.

In the second paper, Vohs and Faber investigate how depleted regulatory resources in consumers might account for impulsivity in purchasing contexts. In their research, these authors measure impulsivity by asking respondents about their willingness to pay, by observing their purchase behavior in a mock store with real money, and by measuring impulsivity on a scale. In addition to studying the effects of self-regulation depletion, Vohs and Faber also test interactions of impulsivity as a trait with experimental inductions that require the expenditure of regulatory resources.

The third paper, by Jung Grant and Park, investigates how the framing of goals may provide insight into how regulatory resources are managed. This work suggests that the self-regulatory resource may be a muscle that strengthens with use. Theorizing from Higgins' self-regulatory goal focus framework (1997) is integrated with Baumeister's model of self-regulation, suggesting that the limitations on the regulatory resource may be influenced by an individual's chronic regulatory orientation and the framing of the tasks that individuals attempt. By manipulating the motivational frame (an achievement orientation versus a safety orientation) of tasks respondents are asked to execute within Baumeister's two-task paradigm, this research suggests self resources develop as a muscle that strengthens with consistent exertion. These findings have implications for the way consumers pursue goals over the long term.

EXTENDED ABSTRACTS

"Self-Regulation, Conscious Choice, and Consumer Decisions"

Roy F. Baumeister

This presentation sought to extend theories of self-regulation to the arena of consumer decisions. First, an outline of the ways in which previous models of self-regulation can be applied to purchasing and consumer research was discussed. Second, the idea that making choices, a behavior that is central to many consumer-related phenomena, is a self-regulatory act was put forth. The act of making choices is shown to relate to self-regulation. The results of two studies suggest that choice making leads to self-regulation failure.

Failures of self-regulation lie at the heart of many of the greatest problems in contemporary society. Overeating, getting too little exercise, alcohol abuse, cigarette use, and marital infidelity, are but a few of the consequences of failing at self-control. (The terms self-regulation and self-control are used interchangeably.) Spending large amounts of money at once, living beyond one's means, not planning financially for the future, and making poor consumer choices are also problems that are likely linked to self-control.

Although the concept of self-regulation has begun to make its way into consumer thinking, there are currently few existing associations between these two areas. Most notably, Hoch and Loewenstein (1991) wrote about the push-and-pull between desire to have a product and the cognitive efforts to restrain the urge, a conflict at the heart of personal spending. A recent article (Baumeister, 2002) three ways in which consumer research could benefit from self-regulation models.

First, the presence of conflicting goals can easily sidetrack self-regulation efforts. One goal, for example, may be to promote one's business, which means paying for advertisements, refurbishing the office, or taking clients out to dinner. Conversely, the goal of saving more money for retirement may easily suffer if the goal

of promoting the business is attempted. A second route to self-regulation failure involves keeping track of one's progress toward the goal. Studies on eating, for instance, demonstrate that overconsumption occurs with ineffective monitoring. Third, a recent model of self-regulation mechanisms (e.g., Baumeister & Heatherton, 1996) posits that the ability to exert self-control is governed by a finite, but global, set of resources. Situational demands calling for self-regulation temporarily deplete this resource, resulting in poor self-regulation. Empirical studies validate this postulate, in showing that engaging in self-regulation on an initial task renders self-regulatory ability on a second task less effective (e.g., Baumeister, Muraven, & Tice, 1998).

Research on the resource model of self-control has expanded to include conscious choice making as a self-regulatory task that depletes the limited supply of regulatory resources. Daily human life is replete with decisions and yet the psychological consequences of decision making are unknown. Decision making itself is related to self-regulation, in that the act of making a choice means to have controlled a given outcome. Additionally, the act of choice making involves several responses that are intertwined with self-regulation: selecting options, drawing relevant comparisons, discarding irrelevant information, making priorities, and ultimately selecting an option to pursue. The act of deciding may have consequences for the rest of the psychological system, in that it may lead to self-control fatigue and later self-control failure. The choices that consumers make may therefore lead to subsequent self-regulation failures.

Two studies tested the idea that choice making leads to self-regulation failure, presumably because it depletes the same resource used in exerting self-control (Vohs, Twenge, Baumeister, Schmeichel, & Tice, 2003). In Study 1, participants in the choice condition were asked to make a series of binary choices between products, such as choosing between a yellow candle and a white candle, and then between a white candle and a purple candle. Participants in the no choice condition reported their opinions on each of eight advertisements. Next, all participants were seated in front of twenty small cups of liquid that had been made with orange drink mix, sugar, water, and vinegar. Participants were offered a nickel for each cup they could drink. Because the drink did not taste good, we surmised that it would take self-control to override the impulse to stop drinking. The results showed that there was a significant difference in the amount of vinegar drink consumed, with the choice condition participants drinking fewer ounces than the no choice participants.

A second study examined naturalistic choice making and self-regulatory ability. Participants at a shopping mall completed a questionnaire on the extent of their decision making during their excursion. Afterwards, they were asked to complete as many of 72 three-digit by three-digit addition problems (e.g., $349 + 891 = ?$) as they could. Time spent on the math problems was also measured. The results showed that the more choices people reported having made that day, the fewer math problems they solved and the less time they spent completing them.

The results of these studies indicate that choice making is costly to the self, in that it impairs further self-regulatory abilities. Moreover, it suggests that circumstances calling for extensive choice making, such as many purchasing situations, may incidentally promote self-regulation failure. In sum, hypotheses derived from self-regulation models are encouraging avenues for predicting consumer behaviors.

"Self-Regulatory Abilities and Impulsive Spending"

Kathleen Vohs and Ronald Faber

In the current research, we tested the hypothesis that weakened self-regulatory abilities promote impulsive spending. This prediction was derived from a model that describes self-control abilities in terms of a limited resource. The results of three studies suggested that self-regulation is a crucial determinant of impulsive spending, such that lower self-regulatory abilities due to a depletion of regulatory resources led to increased impulsive spending tendencies and behavior.

Research on impulsive spending began with the idea that the qualities of products (especially "impulsive" products) were what determined impulsive spending. Later, research shifted to an understanding that impulsiveness comes from within the consumer and not from within the product. Consumers' internal states, affective experiences, and trait impulsiveness, have been taken into account in recent decades (e.g., Rook & Fisher, 1995). However, these models have fallen short of providing a comprehensive account of impulsive spending, suggesting that crucial aspects are missing from current perspectives.

Controlled outcomes, such as eating, smoking, drug abuse, and consumer behaviors, have two components: the strength of the urge to engage in the behavior and restraints on that urge. Consumer research has done well in accounting for the urge component of impulsive spending, but little has been done to investigate the strength of restraints on the urge. Expanding the scope of research beyond only desire to buy to include self-control variables was the goal of the current research.

A recent model of self-regulation posits that the ability to control desired outcomes, restrain urges, override incipient responses, and manage emotions is governed by a global set of resources. This pool of resources is finite and thus can become momentarily depleted by situational demands (Vohs & Heatherton, 2000). Studies testing this model use a two-task paradigm in which participants complete one task that varies in self-control demands (high versus low/no self-control, typically) and then all participants are tested on a second task that requires self-control. Results of over 12 studies demonstrate that participants who had engaged in self-regulation initially perform worse on the second self-control task, suggesting that some impairment in self-control ability occurred as a result of the first task (see Baumeister & Vohs, 2003).

Three studies tested the hypothesis that self-regulation is a crucial determinant of impulsive spending. In Study 1, participants were shown a video of a woman being interviewed; there was no audio played during the tape and participants were told they would later complete personality ratings of the woman. The tape also

included a series of irrelevant words that appeared on the bottom of the screen. All participants saw the words on the screen; *attention-control* participants were told to ignore the words and immediately revert their attention back to the woman being interviewed, whereas *no attention-control* participants were not told any information about the words. Thus, the two groups differed only in their attention-control instructions. Afterwards, participants completed a version of a buying impulsiveness scale (Rook & Fisher, 1995), which was modified to pertain to how participants would respond if they were in a buying situation “right now.” The results showed that participants who engaged in attention control reported that they would be more likely to impulsively buy at that moment, as evidenced by higher scores on the scale. Presumably, participants in the attention control condition expended some of their regulatory resources in controlling their attention during the video and hence were less able to restrain urges to buy.

Study 2 used the same attention control manipulation as in Study 1 and subsequently asked participants to view pictures of 18 high-quality items (e.g., cars, tuxedos, boats) and name the price at which they would be willing to buy each item. Analyses of the proposed prices showed that participants in the attention-control condition would pay more money than the no attention-control participants for the same products.

Study 3 used a behavioral control manipulation and measured actual buying behavior. Regulatory resources were manipulated by having participants read aloud a set of boring historical biographies. Participants in the *behavioral-control* condition read them aloud under instructions to infuse into their reading as much emotion and body movements as they could; *no behavioral-control* participants were asked to read the biographies naturally. Afterwards, all participants were told that they would receive \$10 and were given the opportunity to buy products from a mock store as part of a marketing study. Participants were told that they could leave with all the money or spend any or all of it to buy products from the mock store. Analyses showed that behavioral-control participants spent more money and bought more products than no behavioral-control participants. Moreover, using scores on the trait version of the buying impulsiveness scale, we found that the increased buying after depletion was found primarily among participants who reported chronically high buying impulsiveness. This state-by-trait interaction suggests that the effects of depletion on restraints to buy are particularly predictive among people for whom the urge to buy is especially strong.

The results of all three studies indicate that when self-regulatory abilities are low, buying impulsiveness is significantly more likely. These studies also lend support to the notion that restraints on the urge to buy are an important component of impulsive buying.

“The Effect of Goal Orientation on Self-Regulatory Depletion”

Susan Jung Grant and Jongwon Park

Successful self-regulation involves the exertion of what is commonly called will power in the service of a goal. Though subject to failure, this resource has been conceived of as a muscle (Baumeister & Heatherton, 1996; Baumeister, Bratslavsky, Muraven, & Tice, 1998; Muraven, Tice, & Baumeister, 1998; Muraven & Baumeister, 2000). We explore the aptness of this metaphor by examining whether the conceptualization of the goal affects how this self-regulatory muscle is managed.

Higgins and his colleagues have conceptualized a framework of self regulation characterized by two motivational systems, known as promotion and prevention. These orientations describe whether individuals pursue goals to approach a positive outcome (seeking advancement) or goals to avoid a negative outcome (seeking safety). Although people are thought to have an innate chronically accessible goal focus, we manipulate how the goal is construed in order to make a particular goal focus situationally accessible. At this point, there has been little research addressing whether these orientations develop as a muscle would be strengthened with repeated use or whether they are merely different functions that draw on the same regulatory resource. Determining the dimensionality of these orientations is potentially important for understanding how adept individuals may be in switching orientations, and how these two orientations develop within an individual. We believe combining Higgins’ framework with Baumeister’s model of self-regulation may extend understanding of these motivational issues.

Therefore, our research question bridges these two related but separate streams of research to enhance understanding of the structure of self regulation, particularly with regard to the two motivational systems posited by Higgins. Specifically, we examine the effect of exerting self-regulation in one regulatory mode on the exertion of self-regulation in the other regulatory mode (e.g. promotion).

We find preliminary evidence that suggests that when Colorado students (whose chronically accessible orientation is promotion) are asked to perform two consecutive tasks, self-regulation failure occurs when either task conflicts with respondents’ chronic orientation. However, performing consecutive tasks that are framed in terms of promotion does not lead to depletion. In a second study, we find that when Korean students (whose chronically accessible orientation is prevention) are asked to perform two consecutive tasks, self-regulation failure occurs only when both tasks conflict with respondents’ chronic orientation. Respondents who execute a task that is framed in terms of prevention after executing a promotion task (or *vice versa*) or who execute consecutive prevention tasks show no signs of self-regulation failure. This suggests that self-regulation may be thought of as a muscle that is strengthened by exertion. It is plausible, then, that individuals’ cultural context may develop the self-control resource asymmetrically, depending on whether the culture is more oriented toward achievement (promotion) or safety (prevention).

In these studies, we operationalized self-control in terms of a promotion task (to type as fast as possible in a given amount of time) or a prevention task (to type with as few mistakes as possible in a given amount of time) and measuring performance on a subsequent task that is systematically varied as a promotion task (to solve as many anagrams as possible to win a prize) or a prevention task (to solve as many anagrams as possible to avoid losing a prize).

Finally we propose a third study that would test our findings using consumption-relevant stimuli and dependent measures. The study design calls for examining the effect of framing an initial

consumption task (engaging in product information search) framed in terms of a promotion goal (identifying the product with the most positive features) versus a prevention goal (identifying the product with the fewest negative features) on a second consumption task. (drinking a nutritional beverage) in terms of a promotion goal (to boost health and vitality) versus a prevention goal (to ward off illness and fatigue). We predict that if there are two independent dimensions of self-regulatory resources, the initial task should impair consumption of the second task only when the regulatory focus of the first task matches that of the second task.

Through this work, we hope to extend the self-regulatory model pioneered by Baumeister and his colleagues and to suggest strategies by which people might sustain a long-term focus on a goal. If distinct regulatory resources can be characterized by the goal focus one adopts, one conclusion of this research may be that people could be more effective in carrying out a long-term goal by alternating the framing of the tasks that help one to achieve the ultimate goal.

SPECIAL SESSION SUMMARY

Beyond the Sacred-Profane Dichotomy in Consumer Research

Eric J. Arnould, University of Nebraska

OVERVIEW AND CONTRIBUTIONS

This session contributes to a theory of the relationship between consumer goods and what is conventionally termed “the sacred.” Discussions of the sacred in consumer research are rare. Only 10 papers in ACR proceedings devote explicit attention to this aspect of consumption and consumer goods, and most discussions of possession meaning neglect the sacred dimension. And yet, as previous consumer research demonstrates, important life transition experiences (Belk, Wallendorf and Sherry 1989; Belk 1992; Curasi, Price and Arnould 2000; Otnes and Lowry 1993) implicate the sacred and sacred goods.

This session contributes to consumer behavior theory about sacred consumer goods in three important ways. First, we demonstrate the limitations of the Durkheimian sacred-profane dichotomy that constitutes the received wisdom in previous consumer research. In our sample, consumers believe objects combine both sacred and profane qualities either temporally (across the life of the object) or within a single historical moment. Objects are more reasonably described in terms of contextually and relationally ascribed sacred and profane qualities, mapped over a temporal lifecycle. Second, consumers enlist marketers to help transform objects from profane to sacred or to help recover or sustain the sacred from the profane qualities immanent in an object. In contrast with previous research that casts markets into the profane domain, marketers create sacredness in a myriad of ways in cooperation with and sometimes in opposition to consumers. Third, the sacred-profane continuum is enriched with the addition of a purity-pollution continuum based on research in South Asia. Specifically, the purity-pollution continuum enhances our understanding of how consumers are transformed through strategic use of consumer goods that vary in their sacred and profane qualities.

The session draws on empirical studies of consumer and marketer practices with jewelry in both Western and South Asian contexts. Several unique features characterized the papers presented in this session proposal. First, all three papers focus on jewelry. Laden with material and symbolic, intimate and social meanings, jewelry is an apt substantive domain to explore a brew of both sacred and profane properties. Second, all the papers identify family and household as key sites for enacting sacralization processes and all papers touch on the intergenerational transfer of meanings. Third, the three papers represent a diversity of cultures, informants and qualitative methods to advance our understanding of sacred consumer goods.

The Arnould and Price paper sets the theoretical frame for the session and draws on empirical illustrations to support an amended theory of sacredness that differentiates it from modern conceptions that inform previous theory and research. The Hartman and Kiecker paper uncovers how consumers and marketers cooperate and collide to manipulate goods that combine sacred and profane meanings. Their research identifies how marketers contribute to or facilitate consumers’ aims with regard to the creation and/or intensification of sacred possession meanings. They employ a life cycle perspective to articulate underlying sacralizing processes not previously identified in the literature. Fernandez and Veer’s research reasserts the importance of an alternative, neglected explanatory model to the sacred-profane dichotomy, that of purity and pollution. Further, their paper shows, via jewelry in Indian weddings, how sacred meanings move across family and generational boundaries, linking and dividing social categories as they do so.

“Rethinking the Sacred and the Profane in Postmodernity”

Eric Arnould and Linda Price

Following in the Durkheimian tradition, in their masterful *Journal of Consumer Research* article, Belk, Wallendorf and Sherry (1989) identify properties of sacredness, and processes through which consumers sacralize commodities and perpetuate their sacred status. Similarly, Curasi, Price and Arnould (forthcoming 2004) illustrate processes through which consumers seek to assert the inalienability of sacred heirloom objects. In both works, the authors emphasize the dichotomous nature of sacred and profane categories, and accept the Durkheimian premise that the sacred is always in danger of profanation. In a different vein, Arnould, Price and Otnes (1999, 1997) discuss how consumers may experience transformative experiences through a variety of practices involving consumption objects and services, ostensibly through contact with sacred powers. In this work, the distance between sacred and profane worlds is also taken for granted, even seen as a problem; magic is a laborious process designed to invest the profane with some sacred aura.

The proposal Arnould and Price make in this paper is that in postmodern consumer culture the sacred and profane no longer comprise (if they ever did) the dichotomy previous research supposes. Their approach borrows from Miller’s (1998) insistence on the infusion of the sacred into mundane shopping behaviors. They borrow from Kopytoff (1986) to suggest that the sacred and profane may be viewed as a situational or temporal continuum. Their view incorporates Campbell’s (1987) idea of imaginative longing as a key motivational force in modern consumerism. And they borrow ideas of the relational nature and mobility of object meanings from semiotic and post-modern theorists (Elliott and Wattanasuwan 1998; Floch 1995; Holt 1997). They extend these perspectives in a re-consideration of the classic sacred-profane dichotomy.

Arnould and Price demonstrate the myriad ways that both sacred and profane meanings attach to special possessions and are strategically and contextually ascribed both by consumers and marketers. Their theoretical framework builds from qualitative data sets generated to identify cherished possessions and their significance to consumers. They conducted open-ended depth interviews with a broad range of consumers about a variety of topics. In these discussions, jewelry emerged as one of the items informants most frequently mentioned. Subsequent data collection focused on rings. In this paper, analysis drew upon the uses and meanings of cherished jewelry.

They outline empirical findings that contrast with prior research on sacred and profane consumer goods. First, they found cases where attributions of profane meanings to consumer goods do not endanger attributions of sacred meanings. Consumers attribute both sacred and profane meanings; the meanings attached vary with use context. For example, one family member loans another money (profane) in exchange for a ring in order to avoid pawning the ring. The first person is motivated by the belief that the ring should become a bequest (sacred) to the second person’s daughter. In other cases, a profane meaning is covered over through narrative with a sacred meaning—an engagement ring is modified to propel a story that retains both the (profane) betrayal of a broken engagement and a subsequent (sacred) triumph and redemption.

Second, Arnould and Price identify several cases where consumers imaginatively distribute profane and sacred meanings. For example, a consumer may gift an object at a point when meanings

are profane for the owner in order to sustain the object's sacred meanings. Thus, a divorced mother passes a now profane wedding ring to her daughter giving her custody of sacred meanings that she can no longer sustain. The converse is also found. For example, the current owner considers liquidating a pocket watch contaminated with the essence of the current owner's late revered father since potential recipients "in the current generation" would not revere it.

Third, in contrast with research that associates the marketplace with the profane, the authors show that North American consumers may enlist the marketplace both in sacralization and in the perpetuation of sacredness. Thus, consumers may use jewelers as ritual agents (Rook 1985) to move objects imaginatively from one condition to another. Sometimes jewelers are enlisted to facilitate intergenerational transfers. For example, a grandparent's small diamond is integrated into a new setting for a granddaughter's wedding. A mother's pearl necklace is remade for a daughter's 50th birthday. Sometimes jewelers are enlisted to create items that amalgamate life transition meanings. For example, a person has a high school class ring melted down, shaped into a nugget and set with a diamond from her mother's necklace. Or, the diamond from a small engagement ring is added to a larger setting to celebrate a 25th wedding anniversary. The enlarged ring symbolizes the rite of intensification, the anniversary celebration.

Finally, examination of consumer-to-consumer and business-to-consumer practices allows the authors to identify some sacralization and perpetuation processes not previously identified (Belk, et al. 1989). The role of narrative framing has been mentioned, for example. Arnould and Price also found people purchasing jewelry in the past in anticipation that it would become sacred in the future. Further, they bundle jewels and precious jewelry from diverse kinsfolk to multiply and intensify the sacred quality of each element. But these sets do not form a collection in the conventional sense. In a different vein is the case of jewelers who refuse or discourage clients from breaking up an aesthetically unique piece of jewelry, but instead substitute new jewels and setting. In one case, a jeweler actually bought the item and substituted another. Thus, jewelers may sometimes act as guardians of sacred objects for the "right" owner. Guardianship has been noted previously, but only in domestic possession transfer contexts.

The authors suggest that well-known postmodern social processes favor changed emphases in the constitution of the sacred. These include the erosion of spatial horizons and boundaries, the flattening of time, the premium placed on identity work, and the reconstitution of personal morality as emotional self-expression and self-definition. Three sacred outcomes can be identified. Salvific moments are unscripted eruptions of the sacred in otherwise mundane contexts, such as perfect moments in sports contests during which people experience an aesthetic unity of being. Affective parishes describe spatially localized eruptions of the sacred such as the Toronto Blessing (see www.tacf.org), and gatherings of consumption tribes. Finally, spontaneous shrineing refers to the consecration of the self, often expressed through self-indexical possession meanings (Grayson and Shulman 2000), one of the differentiating elements of the sacred in post-modernity.

"The Gold that Binds: The Ritualistic Use of Jewelry in An Indian Wedding"

Karen V. Fernandez and Ekant Veer

Fernandez and Veer use depth interviews and participant observation of a Hindu wedding to examine the bi-directional transfer of meaning between jewelry and extended family in the wedding ritual. They show the wearing of gifted and borrowed

jewelry is part of a boundary crossing ritual whereby the bride is purified and crosses the threshold of the groom's extended family. The sources (functional, indexical and spiritual) and loci of meaning (private and public) of the jewelry are used to co-create a continuum of sacred meanings that become part of the legacy of the jewelry as each successive bride wears it. The authors have published an extended version of their paper in the current volume of *Advances in Consumer Research*.

"Jewelry—Passing Along the Continuum of Sacred and Profane Meanings"

Cathy L. Hartman and Pamela Kiecker

This paper examines sacred and profane meaning as a cycle evidenced in the life stages or biography of jewelry. The diverse perspectives of jewelry manufacturers, retailers, purchasers, and owners are represented, offering rich insights into the meanings associated with jewelry, which are as individual as those who create, sell, buy, possess, and/or re-fashion the pieces. The creation of meaning is viewed through Kopytoff's (1986) process of commoditization. A jewelry piece begins its "life" with its fabrication by jewelers and other artists, passing through retail jewelry sellers, to its acquisition by consumers via purchase, gifting, inheritance, and potential re-creation and entry into a new cycle of meaning.

The study uses depth interviews with jewelry manufacturers/jewelry artists, jewelry retailers, and jewelry owners to explore the variety of meanings associated with individual pieces of jewelry that are intended for both sacred and profane purposes. Insights from the interviews suggest that the lifecycle of jewelry may contain a continuum of symbolisms, representing varying degrees of the sacred and the profane, at different times.

Interviews include (1) a "creator" of sacred pieces—an artist who sees her jewelry creations as "heritage" pieces and strives to personalize each piece to its owner to solidify its sacredness; (2) a "bridger" of sacred pieces—a retailer of vintage pieces who may or may not know the specific sacred history of jewelry but "sees" their sacredness and makes special, personal connections with her customers to ensure that the sacredness of each piece is retained; (3) owners (and the jewelers and retailers involved in their acquisition of goods) who variously create, maintain, and restore the sacred and/or profane nature of jewelry pieces, including a divorced woman who has a cocktail ring made from her wedding/engagement rings, a mother who creates identical rings from her own heritage piece to leave to her two daughters upon her death, and a young couple who "build" their future together with a ring that represents a special part of both of their pasts.

Each story traces the lifecycle of meanings running along the sacred/profane continuum and teaches us more about the power of possessions in communicating meaning throughout our lives. Analysis over the course of jewelry's post-purchase lifecycle leads the authors to recognize several ways in which consumers' productive behavior leads to modifications in the dichotomous portrayal of the sacred and profane. Consumers' productive behaviors move items between the spheres of sacred and profane that in classic formulations are supposed to be insulated from each other. Consumers' productive behaviors, or undertaken by jewelers on their behalf, may convert formally unconvertible profane items into sacred ones. Data also shows there is considerable reorganizing and reshuffling between the spheres. For example, profane items may be restored to sacred status through the intervention of jewelers. Sacred items at risk of profanation may be preserved through jewelers' enhancements.

The Gold that Binds: The Ritualistic Use of Jewelry in A Hindu Wedding

Karen V. Fernandez, University of Auckland

Ekant Veer, University of Auckland

EXTENDED ABSTRACT

Gold jewelry is deeply woven into the social, cultural and religious fabric of Indian Hindu ("Hindu") life. In most Hindu communities, gold forms an indispensable part of the jewelry that bedecks a bride (Shukla 2000) as she undergoes the rituals that will incorporate her into her groom's family. Since weddings are the major cultural performance of every Hindu family (Kolenda 1984), we examined the ritualistic use of gold jewelry in weddings to develop insights into the Hindu perspective of possession meaning. We synthesized the relevant literature with data from fifteen depth interviews before, during, and after participant-observation of the Hindu wedding of "Lisa" (WF22) to "Sanjay" (IM22). The longitudinal nature of the data collection engendered a temporal perspective of Lisa's journey into a Hindu extended family.

We found that gold jewelry carries functional meaning for Hindu consumers, as a store of wealth and as a way to conform to social norms of respectability (Gell 1986). It can also function as a private and public display of status within and without the extended family (Minturn 1993). A second source of meaning is indexical meaning, wherein it serves as a link to extended family (Mehta and Belk 1991). Both these categories of meaning resonate with the Western perspective of jewelry. However, Hindu culture differs from Western culture in the shared importance placed on the spiritual values that permeate Hindu life and imbue symbolic meaning into objects (Venkatesh 1995). Gold jewelry carries spiritual meaning that underlies its use as a ritual artifact as the bride crosses the threshold of the extended family. As jewelry is lent or given to each new bride that enters the extended family, the jewelry grows heavier with nuanced meaning that becomes part of the legacy of the jewelry.

We explored the nuances of meaning inherent in the purity of the gold used, in the value and nature of the gold given, and in the differences between "pure" (an emic term for 22 carat gold which has 91.7% gold content) and "heavy" gold jewelry (an emic term describing traditionally-styled, inherited jewelry). Since cultural perspectives of corporeal boundaries are affected by social structure (Douglas 1966), it seems plausible to suggest that relationships with meaningful possessions such as jewelry are also affected by the social order. While the popular perception of caste is that it embodies a set of hereditary hierarchical occupational groups, what truly underlies caste is a continuum of pure and polluted states (Douglas 1966). Just as a member of an intermediate caste is less pure than one from a higher order caste, but purer than one from a lower order caste, there can be intermediate states between sacred and profane (Belk, Wallendorf and Sherry 1989). For example, we found that jewelry of made of less than 22 carat gold was profane, "pure" gold was quite sacred, and "heavy" gold was extremely sacred.

Furthermore, we found evidence to support the contention that cultural categories of purity and auspiciousness (Das 1982) clarify how rituals protect extended family from the dangers of liminality (Turner 1967). Traditionally, an unmarried Hindu woman was viewed as liminal, and hence dangerous to patrilineal, patrilocal kinship system which characterizes most Hindu communities (Kolenda 1984). In this view, she remains liminal until she completely transcends the boundary into an extended family, usually upon the birth of a son (Minturn 1981). Gifted and borrowed jewelry plays an indispensable role in the ritual purification and

transformation of the bride from an 'other', commoditized, female into part of the bridegroom's extended self and subsequent incorporation into the sacred domain of the extended family. The gold jewelry worn by the bride has sacred meanings based in notions of auspiciousness that persist, even if a negative, indexical meaning profanes the possession. However, Hindu consumers seem comfortable with the temporal co-existence of sacred and profane meanings.

The polysemous meanings of the gold jewelry reflect cross-cultural differences in the sacred and the profane. The sources (functional, indexical and spiritual) and loci of meaning (private and public) of the jewelry used co-create subtle shades of sacred meanings. This indicates that, contrary to classical Durkheimian perspective, sacred and profane are not dichotomous categories for Hindu consumers. We also found that some meanings (e.g. functional meanings) could be profane, while other meanings (e.g. spiritual meanings) could be sacred. In contrast to the prevalent dialectical perspective of sacred and profane, sacred and profane meanings in Hindu culture are not antithetical: sacred and profane meanings can and do co-exist temporally in possessions.

EXTENDED ABSTRACT

Introduction

One of the most interesting phenomena since the introduction of computer-mediated communication is the virtual community. Virtual communities can bring together individuals from all over the world who are interested in the same subject. Bagozzi and Dholakia (2002, p.3) define virtual communities (VCs) as "...mediated social spaces in the digital environment that allow groups to form and be sustained primarily through ongoing communication processes." VCs are formed around a broad range of topics varying from religion to sex, from music to money, and from trivial to serious. Within these communities members may obtain or provide information, share their experiences, and even develop relationships.

Although VCs are amongst the most visited websites, in most instances, financial viability is low (Balasubramanian and Mahajan 2001). Because of the seemingly endless stream of new VC-initiatives, a key factor for success is generating member satisfaction, repeat visits and active participation in order to create a community that offers value to both its users and administrators. However, the issue of e-satisfaction and loyalty has only been addressed for Internet environments in general (e.g., Szymanski and Hise 2000; Reibstein 2002; Wolfenbarger and Gilly 2002; Zeithaml, Parasuraman and Malhotra 2002), and not for VCs specifically. Due to the differences in structure between VCs and other e-business models, results may not be generalized.

To date, no studies have focused on the measurement of satisfaction within VCs and its impact on member participation. We draw on: (1) sociological and marketing literature on communities; (2) e-commerce literature, and; (3) customer satisfaction literature, to develop a four-dimensional conceptualization of members' satisfaction with virtual community interaction and to investigate the effect of each satisfaction dimension on member participation.

Theoretical Framework and Hypotheses

We used qualitative research to identify four essential elements describing the interaction structure within VCs: (1) interactions between the members; (2) interactions between the organizer and individual members; (3) interactions of the organizer with the community as a whole, and; (4) the community site that facilitates interaction between all constituents. We propose that satisfaction with VC-interaction is based on satisfaction with each of these interaction elements. In doing so, we assume that satisfaction with VC-interaction is a multi-dimensional construct (cf., Bolton and Drew 1994).

In our study, we explain member participation in the VC. Member participation refers to the amount of time a member spends in the community. It is operationalized as visit frequency and duration. In line with prior research in which satisfaction is found to positively affect service usage (Bolton and Lemon 1999), we expect that all four components of VC-interaction satisfaction are positively related to the level of member participation in the VC (H_1).

When members first enter a VC, they are not familiar yet with the environment, the other members, and the "rules of the game".

As a result, they have fewer social ties and are to a lesser extent embedded in the community (Walther 1995; Kozinets 1999). Compared to experienced members, novices lack knowledge needed to participate in the social interaction within the community. Their visits will therefore be mainly aimed at retrieving information. Over time, this lack of knowledge is overcome. Members are increasingly able to use the VC not only for topical information, but also for social and symbolic exchanges. Participation becomes more valuable, thus members spend more and more time in the community. Hence, we expect that membership length has a positive effect on member participation (H_{2a}).

Social interactions among members develop and deepen over time. Besides, they are self-reinforcing, i.e., the value of each interaction increases with the number of interactions that precede it (Frenzen and Davis 1990). This may be represented by a positive quadratic effect of membership length on member participation. Thus, we expect that the positive effect of membership length on participation becomes stronger as membership length increases (H_{2b}).

Methodology

To test the hypotheses, we conducted a survey among 73,851 registered members of a VC aimed at youngsters (12-24 years). Topics of interest include dating, music, school, games, television, and jobs. Interaction takes place by means of boards, forums, email, personal web pages and chat. The community's content is mainly generated by its members. The administrator acts as a moderator (e.g., filtering out racial comments). Commercial exploitation is limited. The survey resulted in 3,605 usable responses.

Items for measuring our constructs were generated using literature search, free-form interviews and online discussions. After pre-testing, we measured the four dimensions of VC-interaction satisfaction using twenty-eight items. Responses were recorded on Likert scales. Membership length, visit frequency and visit duration were assessed by self-reports using fixed categories. We used standard procedures and structural equation modeling to assess our measures' psychometric properties.

Results

The results of OLS regression analysis show that members' satisfaction with member-member interactions, organizer-member interactions, and the community site have a positive and significant effect on member participation. Members' satisfaction with organizer-community interactions has no significant effect. Hence, H_1 is supported for three of the four dimensions of VC-interaction satisfaction. The results further reveal that both the linear and quadratic effect of membership length on participation were positive and significant, which supports H_{2a} and H_{2b} .

Discussion

Our study highlights the complexity of conceptualizing satisfaction within VCs. This is evident from the support we obtained for our proposition that VC-interaction satisfaction is a four-dimensional construct of which the origin lies in the complex nature of the interaction structures within VCs. Against this background the use of a single item to measure satisfaction with VC-interaction seems

inadequate. Additionally, our study sheds some light on the effect of satisfaction with VC-interaction and membership length on member participation. The findings underscore that satisfaction within VCs should be viewed as a multi-dimensional phenomenon. Moreover, results highlight the importance of long-time members for maintaining viable VCs. More research into other aspects of participation, such as online behavior, is needed for a more complete understanding of satisfaction effects. Besides, our study should be replicated with members of other VCs, that vary in size, uniqueness, target audience etc., before results can be generalized.

Online Investing: Derealization and the Experience of Risk

Detlev Zwick, York University
Nikhilesh Dholakia, University of Rhode Island

EXTENDED ABSTRACT

In this paper we set out to show that the Internet causes a disruption in traditional patterns of online investors' perception, resulting in, what Lyng (1990) calls, *edgework*: a desire to experience risk as an end in itself. The perceptual disruption caused by the Internet is a function of two distinct yet interrelated processes: virtualization and derealization (Virilio, 2000). Virtualization denotes the process of substituting reality with virtual representations, including money, the practice of trading, companies, and even the Self. Because of this progressive virtualization of its key components, the entire investing experience seems increasingly *unreal* (derealization). It is only after the phenomenon of online investing has been derealized in the mind of the investor that it emerges as site *par excellence* for voluntary high risk-taking behavior, transforming its purpose from maximizing risk-adjusted returns to maximizing the experience of risk for its own sake.

Our model is the result of an analysis of 35 long, phenomenological interviews (Kvale, 1983; McCracken, 1988; Thompson, Locander, & Pollio, 1989) with 25 informants between the summer of 2000 and the fall of 2002. This study is part of a larger project that pursues two interrelated goals. First, we want to go beyond quantitative analyses and instead concern ourselves with questions of perception, experience, and meaning related to individual online investing. Here, we follow an emerging stream of research in behavioral finance (McGoun, 1996, 1997), anthropology (Conley & O'Barr, 1992; O'Barr & Conley, 1992), and consumer behavior (Allen, McGoun, & Kester, 2000; Allen & McGoun, 2000) that seeks to overcome some of the limitations of financial and economic research by looking at investing as a meaningful social practice and a significant cultural expression.

Second, we wish to extend our understanding of the role and effect of the Internet on online consumer behavior. To date, such discussions have borrowed exclusively from the field of communication theory, pointing mainly to the Internet's interactive nature as well as its many-to-many broadcasting capability (e.g., Hoffman & Novak, 1996, 1997; Kozinets, 2002). While such approaches add much to our understanding of online consumer behavior, they fail to address both, the medium's facility to alter familiar patterns of human perception and the effects of altered perceptions on consumer behavior. We therefore borrow from media and literary theory to propose that the Internet intervenes in human nature in important ways (cf. Benjamin, 1968; Virilio, 1989, 2000). For the purposes of this paper we focus on the *perception of reality* and how its disruption through communication technologies might influence consumer dispositions and actions.

Our research also adds to an existing body of knowledge in the field of behavioral finance. Barber and Odean (1999) and Odean (1999) have shown that investors who move their stock trading activity online trade more and have a tendency to buy more risky stocks. Such results suggest, contrary to traditional economic and finance theory, that the medium used for trading has an effect on trading habits. Yet, precisely what this effect might be has remained unclear because such research would require an analysis of the medium itself. Our research closes this gap by demonstrating that perceptual disruptions caused by the Internet affect online investment behavior in ways observed by behavioral finance scholars. Therefore, by illuminating the effect of the medium on investors' perceptual horizon, our model adds to our understanding of online trading and online consumption more generally.

Exploring Impulse Purchasing on the Internet

Sreedhar Rao Madhavaram, Texas Tech University

Debra A. Laverie, Texas Tech University

ABSTRACT

This paper explores the concept of impulse purchasing behavior online. A comprehensive review and analysis of the literature suggests that there are some unresolved issues regarding the state of knowledge on impulse purchasing behavior. In addition, the current conceptualizations of impulse purchase behavior do not adequately capture impulse purchase behavior over the Internet. Therefore, we propose a broadened conceptualization to resolve those issues and to accurately capture impulse purchases that take place in retail stores as well as on the Internet. The results of our exploratory study are consistent with our conceptualization, and present a robust platform for future research.

INTRODUCTION

The importance of understanding impulse purchasing in retail stores was first identified in the marketing literature over fifty years ago (Clover 1950). Impulse purchasing accounts for a substantial percentage of the products sold across a broad range of product categories (Colb and Hoyer 1986; Hausman 2000; Rook and Fischer 1995). Research on impulse buying has been based on varying conceptual definitions of the construct and has focused primarily on in-store retailing. In this article we attempt to broaden the concept of impulse buying and explore impulse buying on the Internet. With the prominence of online retailing it would seem appropriate to expand the concept of impulse purchasing to accurately capture impulse purchasing behavior online as well as in stores.

A number of researchers have made important contributions to our understanding of impulse purchasing behavior (Stern 1962; Rook and Hoch 1985; Rook 1987; Rook and Gardner 1993; Rook and Fisher 1987; Puri 1996; Weun and Beatty 1998; Beatty and Ferrell 1998; Hausman 2000). Stern (1962) identified four distinct types of impulse purchasing: planned, pure, reminder, and suggestion. Our understanding of impulse purchasing was enhanced when Rook and Hoch (1985) offered a psychological model of consumer impulse buying episodes. Beatty and Ferrell (1998) extended research by exploring the precursors of impulse purchasing and examining how in-store browsing, for recreational and informational purposes, influences impulse purchasing behavior. Recently, Hausman (2000) established that impulse buying is a common method of product selection, in part, because it provides hedonic rewards. Though, this research has made significant contributions to our understanding of impulse purchasing, researchers have not come to a consensus on the conceptualization of impulse purchasing. Thus, unresolved issues exist in the literature preventing a clear understanding and resulting in inconsistent operationalization of the construct.

Understanding of impulse purchasing is further confounded by the prevalence of online retailing, an easily available mode for making impulse purchases. Online retailing eliminates the constraints of time and space that often face shoppers (Kalakota and Whinston 1997; Eroglu, Machleit, and Davis 2001). Recently, Donthu and Garcia (1999) profiled Internet shoppers and found that Internet shoppers are more impulsive than in-store shoppers. However, consumer behavior on the Internet is not well understood (Sultan 2002). Thus, in this article we explore how to improve and broaden the concept of impulse purchasing and examine impulsive purchasing behavior online.

The purpose of this paper is to: (1) review and analyze extant research, and to broaden the concept of impulse buying in order to comprehensively account for impulse purchases over the Internet as well as in traditional retail stores; (2) identify specific unresolved issues that have relevance to the broadened conceptualization of impulse buying; (3) present exploratory research findings on consumers' descriptions of their impulse buying behavior online; and, (4) discuss conceptual implications and direction for future research.

IMPULSE BUYING

A decade after Clover's (1950) preliminary research study on impulse purchases, Stern (1962) delineated four distinct types of impulse buying: pure, reminder, suggestion, and planned impulse buying:

- (i) *Pure impulse buying: is a novelty or escape purchase which breaks a normal buying pattern*
- (ii) *Reminder impulse buying: occurs when a shopper sees an item or recalls an advertisement or other information and remembers that the stock at home is low or exhausted*
- (iii) *Suggestion impulse buying: occurs when a shopper sees a product for the first time and visualizes a need for it, and*
- (iv) *Planned impulse buying: takes place when the shopper makes specific purchase decisions on the basis of price specials, coupon offers and the like.*

Stern's (1962) contribution is quite significant, because even today most research studies use his concept of impulse purchases as a starting point (Beatty and Ferrell 1998, Dittmar et al. 1996; Han et al. 1991; Rook 1987).

Applebaum (1951) introduced the notion of exposure to stimulus into the concept of impulse buying, and defined impulse buying as "buying that presumably was not planned by the customer before entering a store, but which resulted from a stimulus created by a sales promotional device in the store". Although this was an improvement over the earlier definition, it was still a limited definition because the stimulus that Applebaum (1951) discusses is restricted to sales promotional devices in the store which the consumer could be using as an external memory aid. Over time, researchers began to look at consumer characteristics rather than product characteristics or stimuli as it was agreed that impulse purchasing is not confined to any particular product or product category (Rook 1987). The hedonic or affective components of this type of purchasing became central in many studies (Cobb and Hoyer 1986; Piron 1991; Rook 1987; Weinburg and Gottwald 1982). Rook (1987) reported that consumers often felt a calling to purchase the product.

As researchers began to focus on the behavioral dimensions of impulse buying they moved away from viewing impulse buying as an unplanned purchase. Rook and Hoch (1985) state the growing consensus among researchers when they suggest that defining impulse purchasing as unplanned is neither a sufficient condition nor a necessary condition for construal as an impulse purchase, since consumers clearly use store layout as external memory aid. In fact, consumers may plan impulse buys. Rook (1987) discusses situations wherein consumers have occasionally described how they plan to go on impulse buying excursions.

Rook (1987) suggests impulse buying occurs:

when a consumer experiences a sudden, often persistent urge to buy something immediately. The impulse to buy is hedonically complex and may stimulate emotional conflict. Also, impulse buying is prone to occur with diminished regard for its consequences (p. 191).

This definition has acquired much wider acceptance than the other previously discussed definitions. However, many have viewed impulse buying negatively, perhaps due to the lack of perceived behavioral control that is associated with impulsivity (Hausman 2000). Recently, consumer research suggests that individual consumers do not view their specific purchases as wrong and indeed retrospectively report a favorable evaluation of their behavior (Hausman 2000). Interestingly, Rook (1987) reports a relatively low number of informants (only 20 percent) report feeling “bad” about their impulse buying, but an astonishingly large number of informants (41 percent) report that they actually feel good about their impulse purchases, which is ironic as the definition does not accommodate for such behavior.

Piron (1991) argues Rook’s definition is too narrow since it implies that emotional and cognitive reactions must accompany the purchase, because whether or not customer experiences emotional and cognitive reactions may depend on the economic, personality, and cultural factors on behalf of the customer and characteristics and price on behalf of the product. Beatty and Ferrell (1998) overcome the issues in Rook’s definition that Piron (1991) argues are problematic. Beatty and Ferrell (1998) state that:

Impulse buying is a sudden and immediate purchase with no pre-shopping intentions either to buy the specific product category or to fulfill a specific buying task. The behavior occurs after experiencing an urge to buy and it tends to be spontaneous and without a lot of reflection (i.e. it is “impulsive”). It does not include the purchase of a simple reminder item, which is an item that is simply out-of-stock at home (p. 171).

Similar to Rook’s (1987) definition this definition does not consider the role of stimuli in the impulse purchase decision. While early impulse purchase research focused on the product as stimuli, it is likely that advertisements, articles and word of mouth can act as stimuli. In the following section we will discuss issues that we argue are unresolved yet important in understanding impulse buying.

Considering that (1) there is a consensus among researchers that defining impulse purchasing as simply unplanned purchasing is faulty (Rook and Hoch 1985) (Unplanned purchases of milk, candy, and toilet paper may be triggered by a reminder and are not impulsive purchases); (2) definitions of impulse purchasing are too narrowly focused on either emotional and cognitive reactions (Piron 1991) or the unplanned element (Rook and Hoch 1985); (3) most conceptualizations do not account for impulse purchases online; we propose the following conceptualization of impulse purchasing:

Impulse buying is a result of a purchaser’s immediate reaction to external stimuli that is often hedonically charged. An impulse buying episode signifies a change in purchaser’s intention to purchase that particular product before and after the exposure to stimuli. The stimuli is not limited to just the product and change in purchaser’s intention does not include a reminder item that is simply out of stock at home.

The definition takes into account Wolman’s (1973) definition of impulse: not consciously planned, but arises immediately upon confrontation with a certain stimulus. The definition also broadens the exposure to “stimulus” element by mentioning that the stimulus need not be just the product, and thereby accommodates impulse purchases on the Internet. This definition improves upon the earlier definitions by bringing in an element of “change-in-intentions” into the concept of impulse purchases. Finally, the definition incorporates the hedonic elements that likely accompany an impulse decision. This definition takes into account that brand switching and purchasing substitute products could sometimes be impulse purchases.

UNRESOLVED ISSUES IN THE IMPULSE PURCHASING LITERATURE

Stimuli

In the original conceptualization of impulse purchasing, the notion of the product as stimuli was a very important part of the definitions of types of impulse purchases. Applebaum (1951) suggested that impulse purchasing might stem from the consumer’s exposure to sales promotion stimulus. Wolman (1973) defines an impulse as not consciously planned, but arises upon confrontation with a certain stimulus. Kroeber–Reil (1980) also argues that impulse buying is reactive behavior and often involves an immediate action response to a stimulus. Impulse purchasing may occur as a result of marketer’s environmental manipulations through atmospherics (Kotler 1974), merchandising stimuli such as retail shelf location (Rook, 1987), and amount of shelf space affected impulse buying (Cox 1964; Patterson 1963). Yet, Rook’s (1987) definition focuses on the consumer and does not mention explicitly what causes that sudden, often powerful and persistent urge to buy something immediately. However, it is implied at various places in his research that the product itself acts as stimulus. Rook (1987) suggests that consumers have the most difficult time resisting the urge in the moments following the encounter with the object and the consuming impulse originates from within the product (Rook and Hoch 1985). Others have considered the product itself to be the stimulus effecting impulse purchases research (Weun et al. 1998) and link browsing to urge and impulse buying (Beatty and Ferrell 1998).

While some research focused on the product as stimulus, certainly other factors can trigger impulse purchasing. One possible reason for researchers treating product as being the only stimulus is probably one of the greatest advantages that a traditional physical retailing store can offer: the ability to personally experience a product on a multisensory basis (Alba et al. 1997; Rosen and Howard 2000). As Hirschman and Holbrook (1982) mention, one aspect of hedonic consumption is the experience of products through their tastes, sounds, tactile impressions, and visual images. But, Childers et al. (2001) suggest, if shoppers believe that the sensory information available via the interactive media is sufficient, there is reason to believe that the shoppers will enjoy using the new media for web-shopping. Following Kotler’s (1974) observation that impulse purchasing may occur as a result of marketer’s environmental manipulations through atmospherics, there is a possibility that “webmospherics” which according to Childers et al. (2001) represents the virtual environment counterpart to the physical surroundings associated with the retail atmosphere (such as graphics, text, pop-up windows, search engine configuration, audio, color, streaming video, and organization and grouping of merchandise), may lead to impulse buying.

One plausible reason for some researchers’ conceptualizing the product as the only stimulus that can cause impulse purchases,

could be their perception that a purchase decision made immediately upon exposure to a stimulus other than the product, but away from the point-of-purchase, can translate either into a planned purchase or into a rescinded purchase decision. But, is product the only stimulus that invokes the impulse that will immediately lead to a purchase? Danthu and Garcia (1999) imply the contrary and say that Internet shoppers are more impulsive due to the stimuli to which they are exposed to. Within a store environment the stimuli that effect impulse purchases could be something other than the product. Stern (1962) implied that stimulus could be something other than the product itself when he concluded that the tone of in-store advertising may change in the light of increased impulse buying and explained that signs, pole cards, and the like may serve less as attention seekers and provide more information and explanation. The stimuli may be an image, a description in an email, a banner advertisement, an article in a magazine or on the Internet, and a sign. In sum, research based on just the product being the stimulus is inadequate to capture the phenomenon of impulse purchases.

Consumer Focus

Early research on impulse purchases classified products as impulse versus non-impulse items. Most studies investigated frequencies of impulse buying across various product categories (Applebaum 1951; Clover 1950; Katona and Mueller 1955; West 1951) and in different retail settings (Clover 1950). Even today, impulse buying is still discussed in terms of which products are and are not impulse items (Assael 1985; Bellenger et al. 1978; Dittmar et al. 1996; Dittmar and Drury 2000). However, Rook and Hoch (1985) argued that placing sole emphasis upon product type provides a limited perspective, since it is the individuals, not the products, who experience the impulse to consume. Cobb and Hoyer (1986) also state that in the process of focusing on the influence of type of product and type of outlet, investigators have not considered adequately the influence of consumer characteristics on impulse purchase behavior.

Although their definitions of impulse purchases are very different, both Kollat and Willett (1967) and Rook (1987) agree that impulse purchasing is not confined to any particular product or product type. In fact, Kollat and Willett (1967) state that the impulse-purchasing phenomenon has been used to describe purchases of such products as: durable goods (Katona and Mueller 1955); jewelry, apparel, hardware items, furniture (Clover 1950); drugs and toiletries (Drugstore Brand Switching and Impulse Buying 1963); and grocery products (West 1951; Stern 1962; Consumer buying habits studies 1945, 1949, 1954, 1959, 1965). Similarly, Rook (1987) argues that the product dimensions of impulse buying extend well beyond snack items and gossip magazines. He argues that impulse buying extends to the outer limits of one's cash and credit and can likely include an extra TV set, a VCR, or a vacation cruise (Rook 1987). Most researchers agreed that the taxonomical research that classified products into impulse and non-impulse categories is too limited in perspective and fails to focus on the consumer. But does that mean that classification should be based on people (i.e., impulsive and non-impulsive consumers)?

Psychological theory and research has long considered "impulsiveness" to be a personality trait (Freud 1949; Goldenson 1984; Kipnis 1971; Mead 1981; Phypers 1979; Reich 1925; Winshie 1977). This notion was adopted in consumer research (Rook 1987; Rook and Gardner 1993; Rook and Hoch 1985). In addition, studies drew from this idea and developed an instrument to measure consumer impulsivity as a lifestyle trait (Heslin and Johnson 1985; Weun et al. 1998). The scale is designed to measure impulsive buying tendency.

Hence, just as categorizing products into impulsive and non-impulsive products is a limited perspective; similarly categorizing people as impulsive and non-impulsive consumers presents a limited perspective. According to Welles (1986), there is evidence that nine out of ten shoppers occasionally buy on impulse. As the person and product both are involved in the purchase process, studying impulse purchase behavior with strictly product or strictly person orientation puts forward a limited perspective. However, if our understanding of the concept of impulse purchases can be improved either through product or person orientation, then the researchers should definitely investigate according to the appropriate orientations.

Mood and Affect

In an effort to improve our understanding of the impulse-purchasing construct researchers have explored how mood states (Gardner and Rook 1988; Rook 1987), in-store browsing (Beatty and Ferrell 1998), and positive and negative affect (Beatty and Ferrell 1998) influence impulse purchases. Beatty and Ferrell (1998) draw parallels between their utilization of orthogonal constructs of positive and negative affect and the positive and negative moods addressed by Rook and Gardner (1993).

Rook and Gardner (1993) undertook an exploratory study of the mood antecedents of impulse buying after observing that findings from other lines of research demonstrate that mood states, despite their diffuse and short-lived nature, impact both consumers' mental and overt behaviors (Belk 1984; Gardner 1985, 1987). Rook and Gardner (1993) propose that each of the three basic mood dimensions (pleasure, arousal, and dominance) is associated with a primary core theme that either supports or dissuades consumer's buying impulses. They suggest pleasure is associated with motivation; arousal is associated with mobilization; and, dominance is associated with capability. Rook and Gardner (1993) suggest that a mood state sufficiently motivates consumption, mobilizes a transaction, or induces a subjective sense of capability to do so, generates psychological associations that increase the likelihood of making a purchase.

Pleasurable moods range from positive to negative and can either motivate or demotivate a buying impulse (Rook and Gardner 1993). Similarly, Beatty and Ferrell (1998) argue positive affect is related to in-store browsing, examining a retailer's merchandise for recreational and/or informational purposes without an immediate intent to buy. Furthermore, impulse buying has been related to hedonic motivations, such as fun, novelty and surprise (Hausman 2000).

It seems likely that exploring consumers' responses to online retailing can shed light on the influence of mood states on impulse purchasing. In-store browsing on the Internet is easy and consumers can examine the on-line retailer's merchandise for recreational and/or informational purposes without an immediate intent to buy in the comfort of their home. Drawing from the findings of Beatty and Ferrell (1998), browsing is often related to positive affect. Browsing is related to activation and the mobilization of the mental and physical resources that a particular impulse purchase requires (Rook and Gardner 1993). They claim that a vast majority of their survey respondents indicated a positive mood would be more conducive to impulse buying than a negative mood. However the effects of negative moods on behavior are unclear. Sometimes they produce effects similar to those produced by positive moods, while at other times they produce opposite effects (Clark and Isen 1982). In sum, whether a person is in a positive mood or in a negative mood, the Internet makes it easy to browse the merchandise and also minimizes the expenditure of physical and mental resources, and hence goes long way toward motivating the buying impulse.

The traditional focus on impulse purchasing as unplanned purchasing is especially problematic when considering online purchasing. By focusing on the consumer and hedonic dimensions, we can better understand what motivates consumers to engage in shopping online and online impulse purchases. Online retailers create an immersive, hedonic environment that is seen as a positive shopping environment by many consumers (Childers et al. 2001) with many atmospheric cues that influence shopping behavior (Eroglu, Machleit and Davis 2002). From this perspective, the addition of hedonic components suggests that impulse buying can be viewed as a valued shopping behavior rather than just a means of acquiring unplanned goods (Hausman 2000).

EXPLORATORY STUDY

This study explored the concept of impulse purchasing in the context of Internet purchases. Due to the exploratory nature of our proposed conceptualization, this research used an open-ended paper and pencil approach. We set out to: (1) to discover what consumers associate with impulse purchases, (2) to explore elements that influence impulse purchases on the Internet, (3) to investigate what kinds of stimuli cause impulse purchases on the Internet.

This research is exploratory in nature since it was established in the earlier sections of this paper that extant research falls short of providing an accurate account of impulse purchases; an exploratory design that prioritizes discovery over confirmation is more appropriate (Kaplan 1964; Deshpande 1983). Similar to Rook and Gardner's (1993) observation on impulse buying, since online impulse buying research is relatively immature, conceptually driven exploratory studies are still appropriate (cf. Anderson 1983; Deshpande 1983; Peter and Olson 1983) and qualitative inquiry can also elicit new or different issues of concern to respondents overlooked in previous work. More specifically, this study proposes to explore impulse purchasing on the Internet, while clarifying the unresolved conceptual and exposure to stimulus issues concerning impulse purchases.

Method

This study is based on data collected using a self-administered screening questionnaire followed by an in-depth questionnaire. The initial questionnaire consisted of an open-ended question that asked the respondents define impulse purchases in their own words and questions that asked respondents to describe impulse purchases they had made on the Internet. The open-ended question on defining impulse purchase was included to gain insights into consumer's understanding of an impulse purchase. The respondents were asked to describe purchases that they had made on the Internet and to respond to some questions regarding those purchases.

The informants who had made purchases on-line formed a convenience sample of consumers who made an impulse purchase on the Internet according to their definitions; they then completed an in-depth questionnaire consisting of open-ended questions aimed at exploring the characteristics associated with impulse purchases online and clarifying the unresolved issues with impulse purchases.

Results

The 263 respondents each described how they defined an impulse purchase. The definitions were content analyzed to obtain insight into how consumers define impulse purchases. A summary of the categories that emerged from the content analysis appears in Table 1. Approximately, 22% of the respondents (57 out of 263) made impulse purchases on the Internet. The respondents' understanding of impulse purchases is consistent with our conceptualization. The major characteristics that emerged were:

unplanned, response to stimulus, change in intentions and spontaneous reaction. Almost, all of the respondents, who made impulse purchases on the Internet, browsed the Internet for both informational and recreational purposes. It can also be clearly seen that the new definition by introducing the concepts of "exposure to stimuli other than product", and "change of purchaser's intention" accommodates for impulse purchases in traditional retail stores and also on the Internet.

Consistent with extant research (Kollat and Willett 1967; Rook 1987), respondents showed that impulse purchasing is not confined to any particular product or product type. The impulse purchases of the respondents included products such as CDs, clothing, cosmetics, DVDs, shoes, books, toys, car air filter, computer, computer hardware, amplifiers, golf equipment, life jacket, wet suit, printer, and so on.

Respondents were asked to describe stimuli that influenced their impulse purchases on the Internet. See Table 2 for a summary of the responses. The responses demonstrate that images, banner advertisements, price, and special offers can all be stimuli for impulse purchases. Most of the respondents also indicated that there was a hedonic element related to a good mood would be more conducive to impulse purchasing and Internet browsing. Statements suggest good moods are conducive to shopping on-line. However, some respondents expressed that they are indifferent to moods while browsing or shopping and a few have also mentioned that they are more prone to impulse purchasing when in a bad mood. Hence, the concepts of in-store browsing, online browsing, and mood states potentially could become increasingly relevant to understanding impulse purchasing behavior.

In our data collection, we also attempted to explore consumers' perception of shopping online versus in stores. See Table 3 for a summary of responses. In addition, concerns with purchasing in online retail stores such as security, credit card information, delivery, and inability to use sensory organs with products could inhibit consumers from impulse purchases online. Efforts on part of online retailers to convince the potential customers in specific, and everyone in general that the above concerns can be taken care of with sufficient technology and better service could help increase the confidence of potential customers to shop over the Internet.

DISCUSSION AND IMPLICATIONS

The introduction of online retailing and diffusion of marketing innovations (Rook 1987; Rook and Gardner 1993) such as 24-hour retailing, telemarketing "cash machines", "instant credit", and home shopping networks make it increasingly easy for consumers to purchase products. As Stern (1962) pointed out, ease of buying is likely to increase impulse purchasing. Hence this paper has sought to analyze the extant research for unresolved issues and shortcomings, and broaden the concept of Impulse purchases to accurately capture all kinds of impulse purchase in the stores as well on the online.

The results of this exploratory study are consistent with the broadened conceptualization of impulse purchase behavior. The concept of "Exposure to Stimulus" is analyzed in detail and is broadened to include stimuli other than the product itself. This is important because if research is centered on product being the only stimulus and assumes that only physical proximity leads to impulse purchases then it fails to account for impulse purchases on the Internet. The findings suggest that impulse purchases exist on the Internet, and there are "stimuli other than the product", that cause the eventual impulse purchases.

Conforming with the analysis provided earlier in this paper, it is established that a strictly product or people orientation of impulse purchasing behavior is problematic as most people at one time or

TABLE 1
Impulse purchases online

1. Respondents' understanding of impulse purchases (n=263)	Relevant Components: Unplanned, un-researched 75% Response to stimuli 55% Change in intentions 43% Spontaneous / Immediate Reactions 66%
2. Of all the respondents,	Proportion who made impulse purchases over the Internet 22%
3. Of those who made impulse purchases over the Internet,	Proportion who made impulse purchases in a traditional retail store 100%
4. Of those who made impulse purchases over the Internet,	Proportion who browse for recreational purposes 97% Proportion who browse for informational purposes 100%

TABLE 2
External stimuli and mood influences of impulse purchases online

Relevant Issues with online impulse purchases	Sample answers by category
1. Stimuli responsible for impulse purchases over the Internet	Virtual customization of the product Reading the copy and viewing the graphics Appeal of the product, the extra discount that was given Ads on the Internet, or friend mention it, looks, benefits of having that product Advertisement on the web page Clicked on banner and ended up purchasing The product just jumped at me and said BUY ME, BUY ME NOW I liked what I saw Price Great price, couldn't have bought the item for less in town URLs in magazines Brother's suggestion Sales price, good deal
2. Influence of mood states impulse purchases over the Internet	Mood doesn't matter I am more apt to shop when in a good mood Good mood will make me want to buy something More carefree when in good mood Because I feel like doing something fun and exciting I feel better and willing to shop Feel like I need to buy something to better my mood...it gets your mind off things I really don't think my mood affects purchasing I don't think it matters Bad mood- don't feel like waiting for pages and pictures to browse or look through Mood is not a factor

another indulges in impulse purchases (Welles 1986). The findings are consistent with the problems that exist with strictly product or strictly people orientation of impulse purchasing behavior. However, the importance of avoiding speculation and accurately profiling impulsive and non-impulsive products if they so exist is noted for the purposes of better understanding the concept of Impulse purchases.

In addition, this paper incorporates variables such as in-store browsing (Beatty and Ferrell 1998), mood states (Rook and Gardner 1993) that influence impulse purchases. We then theoretically extended the application of these variables to impulse purchases on the Internet, as online retailing makes it easier for people to browse and respond to their respective mood states. The results support that both in-store browsing and mood states influence impulse pur-

TABLE 3
Impressions of online retailing

Relevant Issues with online retail stores	Sample answers
<p>1. Differences between traditional retail stores and online retail stores</p>	<p>Quality/Experience with the product Can tell quality when in a store In a retail store you can see and confirm quality and colors of product, on internet it can only be seen In the store you can actually see and feel the product On internet you are going on pictures. In the store you can try it on, feel the fabric Can't try things on Can't ask questions</p> <p>Selection/Delivery On the Internet you more likely to find exactly what you need On the Internet there isn't a guarantee of satisfaction and no instant gratification More selection Pay for shipping</p> <p>Ease/Convenience Not crowded, no lines, no salespeople Go at your own pace and no closing times No lines and shop in your underwear Took place of catalog shopping for me Quicker</p> <p>Impulse More likely to think through a purchase in a store Easier and faster, no salespeople and clutter</p> <p>Returns Not easy to return items</p>
<p>2. Concern with online retail stores</p>	<p>Security Auction sellers are crooks Credit card information Problem using credit card, afraid company will keep charging my card and send me more stuff Credit card fraud Worried about abuse and misuse of credit cards</p> <p>Returns Returning items, clothes don't fit</p> <p>Delivery Delivery time Time it takes to actually get the product</p>
<p>3. Mood influences on browsing</p>	<p>Good mood, I'm not on computer when in bad mood Generally good mood– browsing is recreational Mood doesn't really affect browsing If I'm in a bad mood, I don't have the patience to browse I like the internet so mood is not a factor A bad mood makes me feel like I need to buy something Affects browsing retail sites– browse less in bad mood</p>

chases on the Internet. Furthermore, consumers suggest online retailing makes it easier to make impulse purchases. Yet, perceptions of quality and experience with the product are not as realistic online. Online retailers, according to our respondents, offer ease and convenience but security and returns are a concern. Our conceptualization brings together all the elements that go into making an impulse purchase and is differentiated from all earlier definitions of Impulse purchases.

It is important to note that this is an exploratory study. The limitations include: (1) the use of a convenience sample (2) this study was exploratory and descriptive and thus not generalizable; and, (3) this discussion and findings are somewhat speculative and we would require methodological variations and replication to make more evidence available in support of broadening the concept of impulse purchases. However, this study brought forth some significant findings that provide a robust platform for future research. With reference to online impulse purchasing behavior, results suggested that: (1) impulse purchases are reflected in change in intentions due to response to stimuli; (2) In addition to the product, there are other stimuli that may influence consumers, which will then affect impulse purchasing; (3) Atmospheric cues are likely to influence impulse purchases; (4) Mood and affect may influence consumers' desire to use the Internet and their subsequent desire to make online purchases impulsively; (5) Positive hedonic experiences are related to impulse purchases online.

The advent of Internet makes it easier than ever before for consumers to buy impulsively. Researchers should pay particular attention to the tremendous role that Internet can play in facilitating easier and interesting browsing opportunities, opening newer possibilities for immediate gratification based on mood states, and providing hedonic shopping environment.

Hence, future research needs to spend more time and renewed efforts on broadening the concept of impulse purchases to accommodate impulse purchases in the retail stores and as well as on the Internet. Also, research would benefit from paying individual attention to the concepts of exposure to stimuli (other than product), browsing the Internet for recreational or informational purposes, and mood states. Consequently experimental studies (For example, experimenting with different retail web-sites with different stimuli to measure stimuli to explore implications for web-page layouts), structured quantitative studies would greatly enhance our overall understanding of impulse buying phenomena in traditional retail stores as well as online.

In addition, research paying specific attention to stimuli such as (1) graphics, text, pop-up windows, audio, color, e-mail, streaming video, and organization and grouping of merchandise for online retail stores; and (2) price specials, coupons, product usage demonstrations, store layout, and store atmospherics for traditional retail stores could contribute immensely towards our understanding of impulse purchasing behavior. Also, influence of website effectiveness elements on impulse purchasing behavior could be studied. However, researchers should note the possibility that in case of some products (food, clothing) customers still rely on experiencing the product on a multisensory basis (taste, sound, smell, scent).

Talking Together: Consumer Communities and Health Care

Gillian Hogg, University of Strathclyde
Angus Laing, Open University Business School
Terry Newholm, Open University Business School¹

ABSTRACT

Consumer involvement in computer mediated communities (CMCs) is increasing particularly in high involvement services such as healthcare. This paper examines the role of CMCs as providers of patient information and support and the subsequent effect on the relationship between 'informed' consumers and health care providers. The evolving dialogue between consumers in virtual communities provides one key axis along which professional service consumption will evolve. The challenge for service consumers is to develop frameworks that facilitate robust dialogue and exchange of information and emotional support to complement their rising authority. The parallel challenge is for the established medical profession to recognise the consequences of this evolving dialogue and develop approaches to service delivery that effectively engage with consumers on the basis of this increasing authority.

INTRODUCTION

Consumer communities are not a new concept, indeed as Muinz and O'Guinn (2001) point out, the concept of community is a core construct in social thought, possessing a long intellectual history. What is new is the potential for modern communications technology, specifically the internet, to facilitate communities that lie outside of traditional social or geographical boundaries, enabling consumers to communicate with like minded individuals with whom they would not normally have contact. Evidence suggests that this type of virtual community is increasingly common: Horrigan & Rainie, (2002) suggest that 84% of U.S. internet users have, for example, visited one or more online consumer groups and 79% of them could identify at least one virtual community with which they stay in regular contact. There is evidence that participation in online forums such as chat rooms, bulletin boards, listservs and newsgroups can significantly impact on consumer knowledge and behavior, such that virtual communities act as important reference groups for their participants (Jolink, 2000; Kozinets, 1997). Clearly, the value of the internet as an information resource is potentially immense, it is in the nature and veracity of information available that problems arise. Although this might not be of particular concern in most situations, the use of virtual communities as a source of information in respect of professional services such as health care, has important implications for consumers. Specifically, if the information which consumers gather from the internet is inaccurate or biased, significant health problems may ensue. While significant research is emerging which focuses on health care professionals' perception of internet based information (see for example Impicciatore 1997; Neuberger 2000; Eysenbach 2002; Kunst 2002; Purcell 2002) there is little research to date addressing consumers' use of internet communities in health care situations. In this paper we examine the dynamics and use of virtual consumer communities as sources of medical information. Based on interviews with consumers and site managers, the research specifically examines the role of virtual communities as providers of patient support, consumer's view of the information they receive in this way and the subsequent effect on the relation-

ship between consumers and health care systems at both service delivery and policy levels.

LITERATURE REVIEW

The role of the internet in the consumption of professional services has potentially important implications for both the conceptualisation of consumer behaviour and the delivery of professional services. The internet offers consumers access to a level of specialist technical information that was formerly the preserve of service professionals. Equally, it facilitates close interaction between diverse groups of consumers across national boundaries through the emergence of service specific computer mediated communities (CMCs). Such CMCs may be viewed as analogous to the emergent online brand communities (Muniz and O'Guinn, 2001) in which the customer rather than the company is the central source of communication (Hoffman and Novak, 1996). This empowerment of consumers through enhanced access to technical information has the potential to redress the informational asymmetries characteristic of professional services and challenge the established legitimacy and power of professionals within the service delivery process (Hogg et al, 2003). Professional services have traditionally been characterised by an in-built power imbalance where the consumer engages with the professional from a position of dependency, and the professional determines what is in the consumer's best interest on the basis of his or her professional judgement (Parsons, 1975). Mills and Moshavi (1999) describe such services as knowledge based services which "use intellectual capital—a body of ideas—to diagnose or determine client priorities and justify a recommended course of action" (p.49). Health care has been described as an arch-typical professional service (Wilson, 1994): core to the health care exchange is the fact that the consumer is inexpert, lacking both diagnostic skills and knowledge of treatment options, while the professional is presented as the specialist, possessing the relevant technical skills and knowledge. The analogy has been that of supplicant and priest:

"The consumer's only right is to have access to the health care system, to the secular church: once that has been achieved, it is for the professional providers to determine what treatment is appropriate" (Klein, 1995 p.307)

The consumer is viewed as passive, a patient by displaying patience, deferring to the expert judgement of the professional and limiting his or her involvement to consenting to the professional's preferred option (Ham and Alberti, 2002). Thus in the twentieth century modernist settlement, a clear boundary was apparent between healthcare professionals and the broader population of consumers.

This deferential patient-professional relationship is increasingly challenged by the ongoing socio-economic changes occurring across post-industrial societies. These have created the environmental conditions where a growing proportion of consumers are increasingly willing and able to utilise the emerging information resources to challenge this conventional professional supremacy. Driven by government policy initiatives, increased levels of education, particularly tertiary education, and high profile cases of professional negligence indicative of a 'failure' in health care services, the relationship between health service professionals and

¹The research on which this paper is based is funded by the Economic and Social Research Council under the "Cultures of Consumption" Programme.

consumers is changing. Consumers are no longer inclined to accept the uncorroborated advice of the professional and are increasingly turning to other sources of information to educate themselves about their health. The internet is an important source of such information, offering consumers a range of information sources and facilities for discussion. No longer is technical and comparative health care information the preserve of the professional, rather it is now accessible to consumers (Hogg et al 2003). A key source of such information is the virtual communities of consumers focusing on specific conditions.

It is possible to discriminate between four types of consumer communities active on the internet. These communities encompass firstly, the type of brand communities discussed by, for example Muinz and O'Guinn (2001), which are focussed on particular brands or products; secondly, communities of interest which are based around hobbies such as gardening or cookery and members share information about these interests; thirdly, fantasy communities which are focused on particular computer games and share information such as 'cheats'; and finally communities of relationship which are based around personal problems and illness and provide support and information to members based on shared experience. It is this latter group that is the focus of this research. Under the classification developed by Kozinets (2000) this type of community is constructed around chat rooms and email lists. Following Muinz and O'Guinn (2001), we define the internet based communities examined in this study as specialised, non-geographically bounded groups, marked by a shared consciousness, rituals and traditions and a common sense of moral responsibility. In this context the rituals and traditions are based on an understanding of medical care and its social practices and rituals that "serve to contain the drift of meanings" (Douglas and Isherwood 1979, p65), i.e. to create a common understanding of the social and cultural experience of healthcare. To this extent we concur with Muinz and O'Guinn (2001)'s contention that contemporary communities are imagined, based on the sense of unmet fellow members, liberated from geography by relatively inexpensive and accessible communication (see also Anderson 1983; Wellman 1979). The essential difference between virtual and traditional communities is the voluntarily nature of membership, whereas in traditional communities membership may be imposed by chance of birth, proximity of residence, etc (Bagozzi & Dholakia, 2002). Membership of these groups is highly fluid and levels of interaction with the community vary and behavioural change as a result of membership is likely to be a result of the perceived value of the information obtained (Okleshen and Grossbart 1998). The internet provides the vehicle for motivated individuals to communicate, to exchange information and to provide what Gusfield (1978) referred to as 'consciousness of kind' provided by communities; thus by their very nature contributing participants in these virtual communities of relationship are high involvement consumers, having deliberately determined to engage with other consumers confronting similar situations (Mathwick, 2002).

One of the challenges faced by consumers in interacting within such a virtual community is the legitimacy, and indeed identity of the participants. Very little background information needs to be supplied by participants and there is no obvious way to verify the accuracy and quality of information available (Impicciatore et al, 1997; Wyatt, 1997). Recent developments linked to the problems of children being contacted by paedophiles over the internet has highlighted that on the internet you can be whoever you want, may make untrue claims and give inaccurate information with impunity. This anonymity strips individuals of their 'status trappings' such as race, age, gender, looks, timidity, handicaps and encourages frankness (Garrison 1994) allowing the development of what Tambyah

(1996) calls the 'net self', an alternative to IRL (in real life). Whilst this implies the democratic and relational nature of the internet, it also exposes the anarchic nature of the medium: freedom from control can also mean freedom from accuracy. Meyrowitz (1985 p.39) suggests that in any given situation we unconsciously ask "who can see me, who can hear me? and who can I see, who can I hear?" The answers to these questions allow the choice of appropriate behaviour and the role that will be acted out. The internet alters the possibilities by providing an alternative social situation where the roles are negotiated beyond the normal boundaries and social markers that determine interpersonal behaviour. Given that in most social situations 90% of communication takes place non verbally and that non verbal cues are the most powerful indication of detecting deceptive communication between individuals (Argyll 1994), the absence of these cues leaves consumers exposed and vulnerable. A fundamental requirement of such communities is therefore trust: members trust that the participants are acting in the best interests of the community and that they are providing the benefit of their experiences in an open and altruistic way. This has important consequences in health care situations where inaccurate or misleading advice regarding, for example, drug treatments may cause physical harm.

It is, however, important to recognise that with regard to the actual health care information available via the internet at one level this may in fact not be substantially dissimilar to the word of mouth information and misinformation passed between individuals, albeit within a broader network encompassing greater shared experience and potentially expertise. There are frequently divergent views on the validity of treatments, even amongst professionals (Flanigan and Metzger, 2000) and patient support groups have been a feature of healthcare for many years. However, it is in the range and reach of these groups in terms of participation that the internet has had an effect. These groups have lower barriers to participation than traditional patient support groups in terms of factors such as time and commitment. Importantly, because the participants can remain anonymous and therefore protect their privacy, they are more inclined to be open and to express views or feelings that they would be reluctant to share in a face to face encounter. A central theme in this regard is the scope for participants to adopt alternative identities as part of the process of 'anonymisation' facilitated by the internet. Reflecting such characteristics on line communities offer consumers the opportunity to compare healthcare systems across national boundaries, diagnosis and treatment as well as offer mutual support and 'counselling'. In addition, because of the evolving expertise of the 'members' of such communities, they have the potential to provide a mechanism for consumer education, thereby addressing the cognitive shortcomings of consumers in utilising specialist technical information. Equally the social inter-connectedness, or *communitas* that develops within net communities has been shown to lead to the development of bonds that are as powerful as traditional communities (Tambyah 1996). It is against this complex expertise and relational context that the dynamics of virtual communities require to be considered in respect of their impact on patterns of professional service consumption.

RESEARCH FOCUS

This paper is based on exploratory research undertaken in the United Kingdom and the United States into a small number of consumers' and professionals' perceptions of health based consumer communities and the impact of participation in this type of forum on their health care experiences. In understanding and researching such communities two types of community membership have been identified, namely 'posters' and 'lurkers'. Posters actively contribute to the discussions and provide continuity to the

group while lurkers observe without participating (Rheingold 1993). Each may feel a sense of belonging to the community but until lurkers make a contribution to the discussion their presence is unknown to the rest of the group. As a result, in this research we only address the community of posters, i.e. individuals who are willing to participate in the discussion. The data collection involved in-depth interviews with 20 consumers who participated in such interactions (10 in the UK and 10 in the US) selected by posting a message on a range of health based web sites chosen at random from a search engine. The interviews were conducted either face-to-face or online. It is important to recognise that the consumers represented in the interview sample are 'high involvement' consumers, that is consumers who have experience with both the internet as an information source and participation in relationship communities. As such they are not necessarily typical of current patterns of consumption. However, they give an indication of how 'early adopters' are using the internet and may provide indicative evidence of evolving patterns of consumption behaviour. The interviews were supported by observation of health related discussion forums. Such participation enabled both the content and dynamic of these forums as sources of consumer information to be analysed. Whilst there are clear limitations of this research in both the size of the study and the generalisability of the findings, it provides a valuable insight in an emerging issue and as such we believe is of value to both professionals and patients.

RESULTS

Three core themes emerge from the interviews with consumers participating in internet based virtual communities. The first theme concerns the dynamics of such virtual communities, and particularly the nature of interaction within such communities. Associated with this is the issue of the quality and credibility of information and advice available through such communities as well as the implications for consumers. The second core theme relates specifically to the nature of the information available to consumers through such communities. Two key sub-themes emerge in respect of the nature of information, namely the comparative nature of the information available due to such communities bridging multiple health care systems, and the generation of participant awareness of the service options available in respect of a particular condition. Implicit within both these sub-themes is the challenging of existing service provision, both at the health care system, that is policy, level and at the operational, that is consultation or service encounter level. The third core theme relates to the support function of these virtual communities both in terms of providing immediate personal support to individual consumers and in terms of campaigning for changes in service provision at the collective level.

Dynamics of Virtual Communities

The most common mechanism through which virtual community interaction occurs through the internet takes the form of so called 'chat rooms' (Pew Research Centre, 2001). Structurally within such a forum a host generally monitors the postings, i.e. the contributions made by participants and helps to stimulate the conversations. By effectively controlling what is posted and who is allowed into the chat rooms, hosts regulate and 'manage' the community. While the range and power of the host varies, they play a critical role in shaping the nature of the information exchange undertaken, in the same way as a traditional editor. This raises questions over the perceived democratic nature of the internet and the associated implication for patterns of behaviour. What is striking about the information exchanged through such forums is the level of sophistication. For example a consumer in a chat room calling herself "young women with heart disease" had a question

about the risk of heart disease due to menopause. The response given by the host was:

Here is what I have learned! At menopause a woman's risk of cardiovascular disease increases. This includes diseases of the heart and blood vessels such as heart attack, angina, stroke, and hardening of the arteries. The pro's of hormone replacement therapy? Estrogen replacement reduces the rate of bone loss after menopause, which would affect osteoporosis. Research indicates the estrogen replacement in post-menopausal women reduces the incidence of heart disease. It may be due to the change in cholesterol and triglycerides produced by estrogen...

Although the host did not present herself as medically qualified the information provided is detailed, and explained medical treatment options in considerable depth and from a position of someone who is in the same situation. This sharing of personal experiences is a particularly powerful source of information, creating an emotional tie which generates strong source credibility and empathy. This tie may even take precedence over the traditional consumer-professional relationships, which tend to be less personal and frequently criticised for their non-empathic nature (John 1996).

Not all reported experiences of such chat rooms were positive. For example, this US consumer felt sufficiently knowledgeable to challenge the information and advice provided by the host. This highlights the ongoing importance of 'intellectual capital' in determining the relative power of participants in professional service 'encounters':

I have mainly used two Websites and one is very good, the host is objective, but the other one is very bad. The host bullies people that do not agree with his opinions and he tries to sell them treatments that he agrees with. He is selling 16 grams of hydrocortisone, which is very dangerous. I told him, so he struck me off the page. (Female- US)

Such experiences not only highlight the power dynamics inherent in virtual communities but also that in effectively utilising internet based information there is, for some consumers, evidence of a steep 'learning curve'. Managing to get information from the internet that the consumer views as adequate can prove a challenge. Novice chat room users are inherently vulnerable to the influence of both hosts and apparently knowledgeable community members. For example a female community participant from the UK indicated;

When I first started using the internet I would like go off on all these tangents, and waste all this time, lots of junk which just confused me, some really technical stuff to which was more for scientist instead of patients. It took me a long time to learn how to use the internet chat rooms to answer my questions.

A number of key issues regarding the role of the internet as a source of health care information are evident from such representative experiences. First, the objectivity of the information provider must be questioned given the prevalence of site ownership by providers of health care products and services. This is particularly insidious in the context of a chat room, which is perceived by consumers to be an open and neutral information forum and rarely is site ownership or the affiliation of members declared. Second, the power of the host to control the conversations and to monitor participation thereby shaping the information provision has the potential for abuse, as evidenced in the experience quoted above. This is an issue of particular significance given the characteristic vulnerability of

health care consumers arising from the circumstances under which the consumption of such ‘distress’ services occurs (Strasser et al, 1995).

Informational Function: Comparative Information

A central theme arising from this research is the comparative nature of the information accessible to consumers. This can range from advice on second opinions within a particular healthcare system to comparing treatments between countries. For example, certain treatments are not permitted under the UK NHS, where the scarcity of public resources have resulted in, and in turn been further highlighted by, decisions not to allow the prescribing of certain drugs. This leads some patients to believe that they would be better treated in other countries, for example:

The government won't let you have that 'flu drug, they say it hasn't been proved to work yet, but I was on the web and they can get it in Australia—if its safe there, why not here? Its just political because they think too many people will want it, but why not? (Female UK)

These communities offer patients a network of information gathered around the world. For example a UK consumer stated:

I receive about 20 e-mails a day, using the list box system. This is how I found the current medication that I am taking, which is working. First I contacted a person in the US who put me in touch with someone in Canada, who knew a doctor in Australia, who had a colleague in London who provided me with information and treatment (Male, UK).

An important aspect of this patient-to-patient communication is the comparison of healthcare systems. One particular list box group consists of about 200 people from twenty countries and highlight deficiencies in each country's medical system. For example an UK patient using the ‘list box’ e-mail system stated:

The list box system makes you aware of healthcare in other countries. Everybody in the US has lists of tests for the same condition that I have. They included neurological, tilt table and live blood test (TV screen). The UK government is not big in testing, they look down a government chart for a pill that fits the condition. It is silly because testing helps prevent illness. (Male, UK)

This level of dissatisfaction with their own health care system was apparent on both sides of the Atlantic with US patients perceiving that the European system was better based on evidence from chat rooms:

Well I think one of problems here [USA] is that we pay too much for healthcare. In Europe they all get it free or at really low costs. I also think the pharmaceutical companies are making out like bandits, because they get a higher price in the USA for their drugs (Female, USA)

These communities emphasise and reinforce the differences in health care systems between countries and break down the traditional geographical restriction on comparison. Whilst a limited number of international travellers had previously had the experience to make these comparisons they are now regularly discussed in chat rooms with potentially significant political consequences. As these quotes indicate, this erosion of boundaries between health care systems raises fundamental questions regarding consumer choice within

publicly funded health care systems and costs in privately funded systems. In the face of increasing consumer ‘knowledge’ the system of healthcare is politicised and its sustainability is brought into question.

Informational Function: Service Options

Information exchanged is not confined to health care systems or drug and other product related information. Equally several consumers indicated that they had received suggestions about tests to establish the nature of their illness, usually undiagnosed by current health care providers, for example:

For ten years I had a condition that would destroy my throat and tongue. I kept going to the hospital but they could never find the problem. I was in a chat room and someone suggested it could be an allergy so finally I told them [hospital staff] that I would not move from the chair unless they gave me an allergy test. It turned out to be an allergy to the mercury in my fillings. As soon as my fillings were changed the condition went away. It was a simple test. Why didn't they try it first! Why did they make me suffer for ten years! (Male UK)

A central theme in this regard is the perception that professionals do not offer patients the full range of service options they expect as informed consumers. Many patients who are utilising chat rooms are often looking for alternatives to the therapies recommended by their conventional health care professional, particularly in respect of drug treatments. There was a commonly held view that the medical profession turn to drugs without considering alternative therapies and that by speaking to other patients, advice on alternative therapies could be shared, for example:

I took control over my own destiny by setting down a recovery protocol based on homeopathic medicine. I got information about alternatives to prescription medication from the chat room and brought it into my physician, he did not seem interested and I had the feeling that I was wasting his time. (Female, USA)

This indicates another common theme, namely the reluctance of health care professionals to accept the information which patients gather from such sites and their scepticism of the validity of the information. In this respect a UK respondent commented;

I did not agree with the traditional science based attitude towards illness. They seem to try to fit illnesses into a codebook and just look up the prescription. That's why I started to look at the internet and found other people who agreed with me. (Male UK)

This is reinforced by anecdotal accounts in the letters pages of journals such as the *British Medical Journal* and *New England Journal of Medicine* from health care professionals describing consumers arriving for a consultation armed with reams of internet printouts (see Coiera, 1996; Eysenbach and Diepgen, 1998). More fundamentally such attitudes and behaviours can be seen as part of a broader questioning not just of professional power and authority but also of established scientific paradigms and the nature of knowledge in post-modern societies (Laing and Hogg 2003).

Support Function: Individual and Collective

It is clear that members find support and comfort from communicating with other people with similar conditions over the internet,

regardless of the information exchange. For example, a female participant from the USA stated that she used the internet as:

A source of hope and something to keep me busy, it also lets me interact with other patients' which makes me feel that I am not alone.

In a similar vein a male participant from the UK described the support he gained from these chat rooms

When I was first diagnosed I knew no one else with my particular illness. I was scared and finding people on the internet to talk to helped me cope, just to know it is possible to live a normal life (male UK).

These support groups have common emotional ties through illness and strong personal bonds are formed. Many of these patients have been through the same emotional process of dealing with illness which allows them to offer support on a more personal level than professionals. The patients discuss medication and compare treatment but also support each other using terms like "hugs", "positive things come out of negative", "hang in there".

Traditionally a patient's medical history has been regarded as confidential due the personal nature of illness. This research found evidence of a cultural change associated with a more open environment of healthcare information through the net. Patients were willing to post entire medical histories, either describing positive success stories or negative stories of medical mistakes or drug side effects. This arguably reflects the anonymity afforded to consumers by the internet and the reduction of the parochialism associated with geographically defined communities.

An example of a success story would be "Alexandra's heart page", which is dedicated to a parent's (Trent & Diane) successful struggle with their newborn baby's congenital heart defect (<http://www.geocities.com/Heartland/Prairie/1187/>). This Web site included the complete patient history from diagnosis to the surgical operation that provided the cure, the child's heart diagram, complete with initial diagnoses and a diagram of heart after the operation. When interviewed these parents commented:

Sharing our child's treatment helped to ease the pain and also helped us to connect with other parents who had similar experiences. It was just such a traumatic experience and using the net helped to cope.

The emotional trauma associated with the treatment of their illness helped to elevate some of the negative aspects of being a primary caregiver for their child. Clearly, contributing to the web site was in itself a help to the family, in addition to support from the net public who visited the site, sent letters of support and also shared their experiences with the family. These Web-sites are frequently linked through 'webring' technology which links Web based communities that are organised by related interest into "easy-to-travel" networks. For example, the 'webring' for one particular illness, namely childhood heart disease, had at the time of the research, 128 linked web-sites which received 10,682 hits in an eight-week period ([http://stat/webring.com](http://stat.webring.com)) providing a robust indication of the reach and popularity of such interconnected communities of interest.

Similarly, in addressing negative consumer experience patients who have had damaging side effects from prescription medicine are able to meet and organise against the manufacturers of pharmaceutical drugs and the established healthcare system. One example is a patient group called the National Lupron Victims

Network (NLVN) (<http://www.voicenet.com/~nlvn>). This is an independent grass roots organization comprised of men and women who had taken the prescription drug Lupron and were experiencing medical problems after stopping the medication. The information provided by the NLVN is supplied in a factual, scientific manner indicating a high level of education of the authors and the NLVN homepage includes detailed articles attacking the clinical and medical data associated with the marketing of this drug.

Patient groups who challenge the effects of medication are not new to the healthcare environment, what is new is the speed and ease of organization with which they can develop as a result of computer based communication technologies. Such developments have important implications for pharmaceutical companies in terms of managing both the product development process and organisational reputations. It also has implications for drug regulatory bodies. If they are perceived to make a mistake and approve a drug with weak clinical data, patients through their ability to assimilate and analyse data have the ability to rapidly create an anti-drug movement. Obvious examples of such behaviour can be identified in the public rejection of the MMR vaccine and campaigns in the UK against mercury based DWTP vaccines for children. Once again a key theme in this regard is the ability of such communities to mobilise data across national health care system boundaries. Inevitably this power may also be used as a 'political' tool to influence the drug regulatory approval process.

Of particular interest in understanding the dynamic and role of such virtual communities, is the emerging evidence that these communities are starting to develop as entities outside the net environment through the formation of geographically based chapters. For example on the "little-hearts" home page (<http://nav.webring.com/cgi-in/navcgi?ring=littlehearts;list>) there is a picture of the Connecticut group meeting for a picnic, followed by the California group expressing an interest in forming a similar social meeting. This is significant because it suggests that whilst the internet provides the impetus for these people to connect with each other it does not necessarily replace social interaction on an interpersonal level. Such developments in turn have significant implications for the role of established support and information communities centred on particular medical conditions as well as the relationship between such traditional communities and the emerging virtual communities of interest.

CONCLUSION

The emergence of virtual communities of interest in health care has profound implications for future patterns of health care consumption and delivery. By creating forums where consumers can address complex health care problems relatively free from the script and role constraints imposed by health care professionals, the resultant inter-consumer dialogue empowers health care consumers to challenge conventional patterns of behaviour and interaction. Specifically by offering consumers access to technical and comparative information, as well as by facilitating consumer understanding of such information, the dialogue in such communities creates the scope for consumers to re-balance the health care encounter from one of elitist professional domination to a more egalitarian format. In its most acute condition, the conventional boundary between the informed consumer and the established medical profession dissolves. At the same time consumers seem emboldened by 'communities of relationship' to advocate alternative healthcare discourses to the established medical discourse, for example homeopathic and holistic healthcare (Thompson 2003). Alternatives vie with the conventional medical 'knowledge' for the legitimacy to interpret the flux of events. To the extent that these challenges are successful, consumers relativise the merits of alter-

native healthcare discourse to establish a plurality of 'products' and service options.

Alongside this informational role such virtual communities also serve a relational function in terms of the provision of emotional support. Drawing together consumers with shared experiences of a condition, yet varied experiences of treatments and outcomes, virtual communities offer an empathic environment that provides consumers with the emotional support frequently perceived to be lacking in traditional consumer-professional relationships. By facilitating consumers' cross boundary comparisons it also significantly adds to the politicisation of healthcare provision.

The potential anonymity offered by such virtual communities allows a degree of intimacy in sharing experiences and emotions that is unlikely to occur in IRL communities where participants may be identifiable and familiar through membership of other overlapping communities. Additional to the relational dimensions occurring at the level of the individual service encounter, such virtual communities also provide a collective support function through enabling the emergence of campaigning communities operating across geographical and political borders capable of mobilising the expertise to challenge the professional and political health care establishments. It is as a consequence of such factors that virtual communities can be viewed as enabling a fundamental change in the format of professional service consumption. One aspect of such communities that has yet to be examined is the motivation for participation and the extent to which consumers are motivated by learning goals, i.e., the gathering of information, or performance goals or the desire to parade knowledge without the desire to improve it. Further research in this area is required to address the motivation for participation and to compare this with traditional geographic communities.

Yet it would be erroneous to suggest that these virtual communities of interest are uniformly advantageous for consumers and do not pose significant challenges for participants. At the core of such problems are themes of identity, credibility, power, control and democracy. As with real life communities, central to the workings of virtual communities are the characteristics of the participants, their background and experience together with the environment within which such communal dialogue occurs. However, within virtual communities these issues are exacerbated by scope for participants, as a result of the inherent anonymity associated with the internet, to adopt net identities unconstrained by their 'real' identity measured in terms of status, education and expertise. Even for highly socialised consumers such virtual environments may disable their ability to form adequate judgements regarding the credibility of community participants, the role and affiliation of participants, and the veracity of the information being exchanged. Consequent to this is the heightened dependence on trust in the ethical behaviour and community ethos motivating participants to share information and provide advice. Given that health care is a high involvement service and highly personal in its impact, it is striking that consumers evident trust in dialogue with other consumers as a source of health care information is matched by declining levels of consumer trust in health care professionals. Arising in part from high profile cases of professional negligence, this reappraisal of the relative trustworthiness and credibility of different sources of information also requires to be seen as part of a broader challenging of professional status and questioning of scientific information and knowledge associated with post-modernist consumption. Indeed in the most extreme view the exposure of 'failure' is seen as a ploy to bolster the simulacra of a 'real' medical profession (Baudrillard 1988). Simultaneously the post-modern healthcare consumer is created through the new plurality of

products while the certainty that might have reduced the perceived risks is undermined.

Within this context of a risk society (Beck 1999) the evolving dialogue between consumers in virtual communities provides one key axis along which professional service consumption will evolve. The challenge for service consumers is to develop attitudinal, behavioural and social frameworks that facilitate robust dialogue and exchange of information and emotional support to complement their rising authority. The parallel challenge is for the established medical profession to recognise the consequences of this evolving dialogue and develop approaches to service delivery which effectively engage with consumers on the basis of this increasing authority.

Getting Specific about the Consequences of Stress & Emotion for Health Protection Intentions: Differential Sources of Stress and Emotional Reactions

Kirsten Grasshoff, University of Pennsylvania

In many health contexts, decision making is increasingly becoming the patient's responsibility. Many of these decisions have potentially stressful consequences that can generate negative emotion and stress. Health psychology research has explored the general notion of such negative affect as a barrier to health promotion (e.g., Rippletoe & Rogers 1987). However, relatively little attention has been devoted to how specific sources and aspects of affect (beyond positive versus negative valence or generalized notions of stress) might influence adherence behavior.

This session explores the impact of distinct sources of negative affect on health protection intentions and in the process delineates how specific emotions influence health promotion. All three papers focus on health behaviors and take a nuanced view of how emotion and stress influences behaviors.

The papers find that various types of affect cause systematic and predictable deviations from normative behavior. Thus, incorporating an understanding of the effects of emotions and stressors in these decision making domains, rather than merely focusing on cognitive or rational intentions, can help consumer researchers make better predictions about likely behavior. Taking a nuanced (e.g., task versus ambient, specific emotion) view of these effects further deepens our understanding of these important decision domains.

The first paper, (Anand Keller and Olson) examines the role of fear and stress in adolescents' health decisions. They find that severity and vulnerability perceptions increase fear and fear in turn increases self-efficacy and protection intentions, in contrast ambient stress increases vulnerability and reduces self-efficacy and protection intentions. They propose that these non-cognitive dimensions of fear and stress as well as the impact of other emotions need to be considered in the Protection Motivation Theory Model.

The second paper, (Agrawal and Menon), examines how specific emotions, such as anxiety elicited by the message, could shape perceptions of risk and intentions to get tested. In a first study, they find that contextual cues embedded in the message systematically elicits specific emotions that in turn increase or decrease the effectiveness of the message and subjects intentions to get screened for hepatitis C. In a second study, they replicate their findings using incidental emotions. They conclude that emotions that are both incidental (ambient) and message evoked (task-related) are critical components to a comprehensive theoretical framework of health communications.

The third paper, (Luce, Kahn, and Grasshoff) explores the role of stress in decisions to get medical screening tests. Specifically, they find that if task related stress is primed by having individuals with a prior false positive test result briefly report that incident, adherence for future test intentions is decreased. Future test adherence does not decline in the absence of false positive results or if these previous results are not primed. Further, if patients are experiencing ambient stress from independent sources these declines in future adherence in the primed, false positive condition are heightened. This suggests that the effects of differential sources of stress (i.e., task versus ambient) can interact, with important implications for health behavior.

Hidden Effects of Persuasion

Zakary L. Tormala, Indiana University
Pablo Briñol, Universidad Autonoma de Madrid
Richard E. Petty, Ohio State University

EXTENDED ABSTRACT

In persuasion research, an ad is assumed to be effective to the extent that it changes the valence or extremity of a person's attitude, as reported on a rating scale. The present research argues that when people appear to have resisted persuasion (or an ad appears to have failed) according to traditional measures, there might actually be some important yet previously hidden effects on the target attitude. We apply two different paradigms in an attempt to understand whether resisted persuasive messages might under some conditions have hidden success.

First, based on recent advances in research on automatic evaluations, we test whether attitude change that is not apparent on direct self-report measures might be captured by indirect automatic measures, such as the Implicit Association Test (IAT, Greenwald, McGhee, & Schwartz, 1998). Recent research suggests that automatic evaluations are sometimes sensitive to experimental treatments even when explicit measures have not shown the same influence (e.g., Dasgupta & Greenwald, 2001; Maison, Greenwald, & Bruin, 2001; Olson & Fazio, 2001). In Experiment 1 of the present research, we examine the possibility that automatic evaluations can be affected by advertising even when self-report measures fail to evince any persuasive impact.

A second intriguing possibility is that when an ad fails to change the valence or extremity of a target attitude, it might have an impact on the underlying certainty with which that attitude is held. Tormala and Petty (2002) recently demonstrated that when people perceive that they have resisted persuasion, and feel that they have done a good job in this capacity (e.g., they resisted a strong attack), the certainty with which they hold the target attitude can *increase*. However, there may be some situations in which people resist persuasion yet perceive that they have not done such a great job (e.g., they resisted, but could only generate specious counterarguments). Experiment 2 tests the possibility that under such conditions, "failed" persuasive communications might actually reduce attitude certainty, which would make the target attitude less predictive of behavior and potentially more vulnerable to later change (see Gross, Holtz, & Miller, 1995).

Experiment 1

Seventy-nine undergraduates were placed in a high elaboration context and asked to read a neutral (control) message or a strong persuasive advertisement in favor of vegetable consumption. Following the message, participants reported their attitudes toward vegetables on a series of scales. Implicit attitudes were also assessed using the IAT (Greenwald, et al., 1998). Explicit and implicit attitude data were standardized and then submitted to a 2 x 2 mixed ANOVA, with type of measure (explicit or implicit) and type of message (ad or control) as the within- and between-participant factors, respectively. As expected, there was a significant interaction between these variables. Although explicit attitudes were unaffected by message condition, participants did show more favorable *implicit* attitudes toward vegetables when they had read the ad rather than control message. Thus, the traditional self-report measure did not reveal any persuasive impact of the advertising, but the implicit assessment clearly suggested that it had a hidden impact. Although we did not explore the moderating conditions of

this effect, we suspect that it is particularly likely when elaboration is high and the ad contains relatively strong arguments.

Experiment 2

Thirty-five participants were exposed to a counterattitudinal persuasive message. Before reading the message, participants reported their initial attitudes and attitude certainty. Following the message, participants were instructed to generate as many counterarguments as possible, after which they reported their post-message attitudes. Participants then received false feedback that their counterarguments were either strong or weak, after which they again reported attitude certainty. We conducted 2 x 2 mixed ANOVAs with time of measurement (pre or post) and counterargument feedback (strong or weak) as the within- and between-participants variables, respectively. Analysis of the attitude data suggested that attitudes were not affected by the message.

The certainty data revealed a different picture. There was no main effect for counterargument feedback, but there was an effect for time of measurement. Participants became significantly less certain of their attitudes following the message. This effect was qualified, however, by a significant interaction. Specifically, the decrease in certainty was confined to the weak counterargument feedback condition. When participants were led to believe their counterarguments were strong, certainty did not decrease. Also relevant, attitudes became less predictive of behavioral intentions when they were held with lower rather than higher certainty. In short, although conventional measures suggested the message did not affect attitudes, it actually weakened those attitudes under some conditions, thus revealing a hidden effect of the message.

Discussion

In 2 experiments, we found that when the impact of a persuasive communication appears to be nil, there might actually be some important yet previously hidden persuasive effects. Experiment 1 demonstrated that although an ad did not affect explicit self-report measures of attitudes, it did produce attitude change as assessed with an implicit measure. Experiment 2 revealed that although a persuasive communication failed to impact the valence or extremity of an attitude, it significantly reduced the certainty with which that attitude was held under specifiable conditions. On the surface, these effects seem very different. Indeed, one is based on automatic associations and stored cognitive representations, whereas the other is based on a higher order metacognitive kind of reasoning. However, these effects could ultimately prove related. What is clear is that when persuasion appears to have failed by conventional standards, there can be important effects worth exploring. Specifically, it appears that under some conditions at least, seemingly resisted persuasive messages can have a greater degree of success than was previously known.

“Et Tu, Brutus?”: A Case for Consumer Skepticism and Backlash against Product Placements

Namita Bhatnagar, University of Manitoba
Lerzan Aksoy, Koc University, Turkey

EXTENDED ABSTRACT

Marketers find themselves faced with the challenging task of creatively capturing and maintaining consumer attention. Two trends contribute to the search for unconventional methods for message delivery: (1) the gradual adaptation of consumers to existing modes of marketing communications; and (2) the increasing abundance of marketing messages that compete for limited consumer attention. Placing brands within media content (e.g., movies, T.V. programs, music) is one such method. This practice is termed as ‘product placement’—while brand sponsors pay for embedded commercial messages, this sponsorship frequently remains hidden (Balasubramanian 1994; Solomon and Englis 1996).

Placements are considered as cost-effective alternatives to advertising based on widely held assumptions (i.e., consumers are naïve and unwittingly consume marketing messages in the guise of entertainment due to the naturalistic and covert manner of brand inclusion) that may not necessarily bear out given the sophistication of audiences today. This assumed lack of persuasion knowledge is questioned based on contradicting anecdotal and pretest evidence: consumer speculations about the commercial intent of embedded messages and consequent skepticism are found to be high. Scant academic attention has been paid to the impact of variations in consumer awareness, except in the case of ethically controversial products (e.g., alcohol, tobacco) where public policy legislation is called for. The role of persuasion knowledge in generating a consumer backlash against placements (e.g., lowered trust in media and placed claims) remains unexplored. Important insights into the need for regulating placement activities may be gained from this research. If consumers are indeed more sophisticated than they are given credit for and possess adequate awareness and consequent mechanisms to cope with persuasive attempts, the call for government intervention may be unwarranted.

Further, investigations into placement efficacy have been limited to brand memory and evaluation (Babin and Carder 1996), and evidence available is ambiguous at best. Drawing upon tenets of the persuasion knowledge model (Friestad and Wright 1994) adds complexity to the placement efficacy construct (by also including trust in brand sponsors, the claims they make and trust placed in participating media). This suggests that the effectiveness of placements can be gauged from the point of view of all participants involved: for consumers (from a welfare perspective), for brand sponsors (from a brand and claim memory, attitudinal and trust perspective), and for participating media (from a trust and reputational perspective). Several issues thus warrant investigation: (a) Whether product placements are indeed as attractive as have been portrayed in past literature?; (b) Whether there are extenuating circumstances that might make advertisements more attractive?; (c) Whether product placement effects can prove to be a double edged sword for brand sponsors (by increasing memory on one hand, and hurting trust on the other) and for media (by generating additional revenue, yet potentially hurting its credibility); and (d) Whether government legislation of placement practices is needed in order to protect consumers that lack the ability to do so themselves?

The investigation focuses on consumer awareness of the covert commercial aspect of product placements and the consequent impact on placement efficacy. The 2 key hypotheses tested

are: (1) memory for placed brands and claims is higher than the memory for advertised brands (in line with past research); and (2) awareness of commercial intent moderates the effect of the trust in brands, claims made and media used, such that high awareness leads to lowered trust for claims and lowered perceptions of motive purity for media used, when brands are placed versus when they are advertised. In other words, placed claims are expected to enhance memory. At the same time, a potential backlash can occur if consumers become aware of the hidden commercial intent of sponsors. This backlash would not occur when awareness is low and no commercial intent is perceived. Consumers are already aware of the commercial nature of advertisements, and the question of feeling manipulated and consequent backlash does not arise here. Results support the proposition that though people appear to remember placed claims better, it may sometimes be better to advertise brands. Media managers in addition need to understand that repercussions to covertly embedding brands within the programming or editorial content are possible.

Three laboratory experiments (two conducted, one planned) test these hypotheses. Study 1 uses a paper-based scenario about brand placements for a fictional vitamin brand within a hypothetical magazine article. Awareness of commercial intent is manipulated, and the trust in brands, perceived motive purity of the medium involved, and feelings of betrayal in the medium are measured. Study 2 uses more realistic stimuli (presented as excerpts from a hypothetical magazine), measures awareness of commercial intent, and compares persuasion outcomes when claims about an unfamiliar brand of instant soup are placed versus advertised. Memory as well as trust measures for the brand and the medium are measured. Results bear out the proposition that placements can lead to better memory outcomes, yet they also have the potential to create a backlash if consumers feel they are being manipulated via covert marketing attempts. This dual nature of placements is under-investigated in existing placement literature and the implications for media tend to be ignored. In Study 3 we propose to investigate whether this backlash gets exacerbated when placements are discerned in highly credible media. Since consumers tend to hold credible media up to a higher standard of conduct, they may feel even more betrayed since such conduct would not be within the realm of their expectations.

When Good Deeds Dilute Your Equity

Karen L. Becker-Olsen, Lehigh University
B. Andrew Cudmore, Florida Institute of Technology

Based on the assumption that firms are rewarded for their social initiatives, many firms have become socially responsible (Levy 1999). However, consumers may not blindly accept these social initiatives as completely selfless. Therefore, it is proposed that consumer's evaluation of a social initiative is dependent upon the relationship between the firm and the cause, rather than the corporate act alone. Thus, the benefit accrued to the firm depends on whether the consumer (1) believes the social initiative makes sense or fits the firm; (2) believes the act is motivated by pro-social ideals; and (3) perceives the act as proactive rather than reactive. Through two studies, this research investigates the role that fit, perceived corporate motive, and timing play in determining consumer response to corporate social initiatives.

STUDY 1: EFFECTS OF FIT AND MOTIVATION

The Role of Fit

Fit is important because it affects: (1) how much thought people give to a relationship, (2) what types of thoughts are generated, and (3) the clarity of the company's position and ultimately their response to the company. Generally, we expect high fit programs to enhance company attitude and low fit programs to dilute company attitude (Aaker 1990; Keller and Aaker 1992; Mandler 1982; Simonin and Ruth 1998; Speed and Thompson 2000; Till and Busler 2000). If a company's social initiative fits or "matches" with prior expectations, knowledge, and associations about the firm (e.g., Home Depot and Habitat for Humanity), then the act and all of its positive associations should flow to the company (Till and Busler 2000). More specifically, if there is a fit between the company and the initiative based on a competency domain (e.g., building materials and homes for poor people), we expect the new information to be easily integrated into the consumer's cognitive structure of company associations strengthening the connection between the two (Fiske and Taylor 1991). The following hypotheses related to fit are examined:

H1: low fit between the company and the social initiative, versus high fit, results in:

- a. a greater number of thoughts
- b. thoughts that are less favorable and are more focused on motive
- c. less favorable overall attitude toward the company
- d. beliefs about the company being less credible
- e. lower likelihood of customer support

The Role of Perceived Corporate Motivation

Similar to fit, perceived corporate motivation is likely influence the number of thoughts, the content of thoughts, overall attitude toward the company, and specific belief measures related to corporate citizenship and corporate credibility. Specifically, when the initiative is motivated by profit rather than social welfare, consumers are likely to increase their elaboration which, in turn, is likely to increase the probability that persuasion knowledge (Friestad and Wright 1994, 1995) will be used and consumers will question the company's motivation (cf. Campbell and Kirmani 2000; Friestad and Wright 1994, 1995). Further in the low fit case,

this effect is likely to be more pronounced. The following hypotheses related to motivation are examined:

H2: profit motivated versus socially driven social initiatives, result in:

- a. a greater number of thoughts
- b. thoughts that are less favorable and more focused on corporate motive
- c. less favorable attitude toward the company
- d. beliefs about the company being less credible
- e. lower likelihood of customer support

We test the previous hypotheses in an experiment in which subjects were given news clippings to read about two well-liked companies (Home Depot and Revlon Cosmetics) and two social issues (Homelessness and Domestic violence).

Results

We find that social initiatives that are perceived as high fit and socially motivated have the strongest positive influence on consumer attitudes, corporate credibility and corporate positioning. Interestingly, when fit is low, motivation does not seem to matter in that consumer attitudes and beliefs about the company are consistently diluted. Additionally, we find that when fit is low, more thoughts are generated and that these thoughts tend to focus on efficacy of the program and corporate motivation.

These results suggest that firms need to fit their social initiatives with their corporate image and competencies in order to enhance consumer corporate perceptions. Such perceptions will be further enhanced if the corporate initiative is not perceived as profit motivated

STUDY 2: THE EFFECTS OF TIMING OF INFORMATION

In this experiment we identify an additional variable, timing, which we believe influence responses to social initiatives.

Timing

We predict that consumer perceptions of a socially responsible firm are influenced by whether the initiative is approached proactively or is a response to some environmental catalyst or corporate crisis (e.g., Benetton and capital punishment, versus McDonalds and their use of recyclable packaging material and Exxon and their environmental programs).

We know from the customer service and business ethics literature, that when service or ethics perceptions are exceeded by company actions, the company is rewarded in terms of more positive attitudes and behavioral intentions (Creyer and Ross 1997; Pyu 1998; Zeithmal 1998). If consumers expect a company to act or react in a given way, in this case socially responsible, that becomes the baseline reference point for which they gauge the company's actual behavior. In the case of reactive social initiatives (e.g., because of the Valdez oil spill Exxon becomes more openly involved in environmental issues), consumers may view the company as either just meeting or even falling short of the baseline reference point. However, in a high fit proactive program, consum-

ers may perceive the company as going beyond the reference point, and thus, are more likely to reward the company (Creyer and Ross 1997). The following hypotheses related to timing are examined:

H3: reactive versus proactive CSR initiatives, results in:

- a. thoughts that are less favorable and more focused on corporate motive
- b. attenuation of overall attitude
- c. beliefs about the company being less credible
- d. lower likelihood of customer support

Results

We find that attitude toward the company is enhanced when the program is perceived is proactive and diluted when the program is perceived is reactive. Further, we find that corporate credibility, corporate positioning, and purchase intention are all significantly enhanced when the initiative is proactive. Interestingly we also find that corporate ability is also enhanced when the initiative is proactive and high fit.

In summation, managers need to proactively and carefully choose their corporate social programs and make sure that communications are framed so that consumers perceive the initiative as socially motivated.

When Counterarguing Fails: Effects on Attitude Strength

Derek D. Rucker, Ohio State University

Richard. E Petty, Ohio State University

EXTENDED ABSTRACT

Popular models of persuasion suggest individuals can process information in either an objective or a biased manner (see Petty & Wegener, 1999). Objective processing is data-driven (i.e., individuals generate whatever thoughts naturally come to mind). Biased processing, however, refers to focusing specifically on either rejecting or accepting a message (e.g., focusing on generating negative or positive thoughts). In the present research, we examine the consequences of biased processing involving a goal to counterargue a message versus a goal to simply think about the message carefully.

Prior research suggests a biased processing goal to counterargue a message is never good from the perspective of a persuader. For example, several lines of research have shown invoking a resistance goal in individuals leads to reductions in attitude change relative to objective processing goals (Petty & Cacioppo, 1977; Killeya & Johnson, 1998).

Recent research has suggested that a resistance goal can even increase certainty in one's initial attitude. Tormala and Petty (2002) found that when participants successfully counterargued a message perceived to be strong, their initial attitudes were held with more certainty compared to individuals whose attitudes also did not change because they did not receive any message. Tormala & Petty (2002) suggested people become more confident in their attitudes after successfully counterarguing a strong message because they can attribute success to the validity of their attitudes (e.g., "I counterargued strong arguments, so my attitude must be right!").

Thus, a survey of prior research leads to the conclusion that attempting to counterargue a message often leads to less persuasion, or even enhanced confidence in one's initial attitudes. This leads to a fairly simple conclusion that counterarguing is never advantageous. However, this conclusion is based on an incomplete empirical picture because past research has focused on situations in which counterarguing has been successful. Past research has neglected consequences associated with failed counterarguing.

The present research uses very strong arguments to ensure counterarguing fails to prevent the attitude from changing. We examine whether attitudes following a failed attempt to counterargue a message are different from attitudes that result from just thinking. Our hypothesis is that changing one's attitudes as a consequence of failed counterarguing will open the gates to inferences that do not accompany comparable attitude change associated with relatively objective message processing. For example, just as inferences people make regarding success might strengthen one's initial attitude (Tormala & Petty, 2002), inferences associated with a failure to counterargue may lead to a strengthening of a person's new (changed) attitude compared to a comparable change brought about without attempting to counterargue. Specifically, failure may increase individuals' certainty in their new attitude because they can conclude that they really have no negative thoughts about the advocated message. A person may think, "I tried to think of counterarguments against the message, but I really couldn't think of any. Now that I know I have no negative thoughts, I'm sure my new attitude is correct!" Individuals who processed the same message objectively, however, may not make this inference, having not aggressively considered the drawbacks to the message. They would simply be aware of their positive reactions to the strong arguments

without realizing that there are no drawbacks. Implications for behavior are also examined.

Procedure

In two experiments, participants were exposed to an advertisement for a novel aspirin. In both experiments, there were three conditions. Participants were randomly assigned to either (1) provide attitudes in the absence of a message (control), (2) to focus on their thoughts about the aspirin, or (3) to focus on their negative thoughts about the aspirin. Participants in treatment conditions received a message containing very strong arguments that had been pre-tested to elicit few negative thoughts. In experiment 1, participants' attitudes, attitude certainty, and behavioral intentions were assessed. In experiment 2, the mediator of the hypothesized strength effects was examined.

Results

Experiment 1: Compared to the control group, participants exposed to the message had more positive attitudes about the product. However, the attitudes of the message groups were identical regardless of whether they were instructed to focus on their thoughts or negative thoughts. Of primary interest, a significant main effect emerged such that individuals instructed to generate negative thoughts exhibited more certainty in their attitudes than individuals instructed to generate thoughts. Finally, even though participants instructed to generate negative thoughts showed the same amount of attitude change as those instructed to generate thoughts, the new attitudes of participants directed to generate negative thoughts were more predictive of intent to behave than were the new attitudes of participants who simply generated thoughts.

Experiment 2: Experiment 2 replicated the findings of Experiment 1. Specifically, participants showed identical attitude change relative to the control condition, regardless of whether they attempted to generate general thoughts or negative thoughts. However, participants who had attempted to generate negative thoughts reported being more certain of their attitudes. Furthermore, we found that participants' perceived negative reactions (i.e., the number of negative thoughts they believed they had) mediated the observed certainty differences in the following manner. Individuals instructed to generate negative thoughts inferred they possessed fewer negative thoughts about the product compared to individuals instructed to generate thoughts.

Discussion

This research makes a new contribution to understanding attitude change and strength. We demonstrate that attitudes following exposure to a compelling message, although equivalent in valence, can differ in strength depending on people's motives in processing the message. When people attempted to counterargue the message, their attitudes were held with more certainty compared to attitudes formed through relatively objective processing. An important consequence of this certainty is that the new attitudes are more predictive of behavior. Finally, our results suggest that this increased certainty is due to participants' metacognitions about the number of negative thoughts they think they have. Aggressively considering drawbacks to a product, but finding none, allows individuals to conclude they truly have few negative thoughts,

which increases attitude certainty. Individuals who objectively process a message have not aggressively considered the faults, and therefore are not as certain.

The Interactive Effect of Timing and Attribute Alignability on Consumption

Selin A. Malkoc, University of North Carolina at Chapel Hill
Canan Ulu, Duke University

EXTENDED ABSTRACT

In understanding how consumers evaluate or choose among product options, it is important to consider the situations where the decision and the experience are temporally separated. One of such situations takes place when the consumption of the product is delayed. Consumers often face situations where the purchase decision is immediate but the consumption of the product is in the future. For instance, one can purchase a book in order to start reading it in the very near future (e.g., in the coming week). Similarly, one can buy a book to read in an undetermined time in the future (e.g., when she is finishes reading the books she already bought before). Does the consumer decision making process differ depending on the consumption immediacy? Will the changes in time horizon for consumption systematically affect the way consumers represent and evaluate the options?

There has been ample amount of research on how consumers make choices and form preferences, most of which concerning immediate consumption scenarios. A well-accepted answer to this question suggests that consumers represent options by their attributes and then compare these attributes in order to determine their preference (Bettman, Johnson and Payne 1991). It has been found that when evaluating alternatives, consumers mostly rely on attributes that are shared by alternatives (alignable differences) and mostly ignore attributes that are identical (commonalities) or that do not have a correspondence in other alternatives (non-alignable differences) (Gentner and Markman 1994).

However, characteristics that are unique to representation of future events can lead these results to be inapplicable. Temporal construal theory (Liberman and Trope 1998, Trope and Liberman 2000) suggests that distant future events have more abstract, general and de-contextualized representations (high-level construal) that relate to desirability considerations, whereas near future events have more concrete, specific and contextual representations (low-level construal) that are feasibility oriented. Therefore, product options that are considered for future consumption will have more abstract representations. This abstraction in the representation would enable the use of holistic (alternative-based) strategies and creation of abstract level attributes in the evaluation process (Johnson 1984). Consequently, in constructing abstract features or creating a holistic evaluation for each option, consumers are as likely to use non-alignable differences as they use alignable differences.

We hypothesize that the relative importance of non-alignable differences will be higher for choices in the distant future relative to choices in the near future. We tested this hypothesis with an experiment, by manipulating time horizon (tomorrow vs. six months from now) between subjects with the following scenario.

“Imagine that you have been chosen to be the part of the group who is going to prepare the end of classes party this year, which going to take place *tomorrow night (six months from now)*. You have been given the responsibility of choosing and buying the microwave popcorns for the party.”

Following this, descriptions of two popcorn brands were presented (in a counterbalanced order), which had equal overall attractiveness ratings (Zhang and Markman 2001). Brand P is designed to be better in alignable attributes, while Brand Q is designed to be better in non-alignable attributes. Hence, a shift in preference between these brands in different time horizons will

reflect the different attention given to alignable and non-alignable differences. Participants were asked to indicate their preference (11-point scale anchored Prefer P and Prefer Q, with a neutral point of indifference), allocate 100 points between the brands and provide thought listings.

We expected to find a preference toward the alignable-better brand in near future, and a shift toward the non-alignable better brand in distant future, since consideration of the non-alignable attributes would make non-alignable better brand as much or more attractive than the alignable-better brand. Thus, finding participants to be either indifferent or have a preference toward the non-alignable better brand in distant future, would be an evidence for increased attention to non-alignable attributes.

As expected, alignable-better brand was preferred by 77% (68 out of 88) of the participants in near future, but only by 65% (58 out of 89) in distant future ($Z=-1.78, p<.05$). In contrast, 23% (20 out of 88) of the participants were either indifferent or preferred non-alignable better brand in near future, as opposed to 35% (31 out of 89) in distant future ($Z=1.78, p<.05$). Similarly, mean number of points allocated to the non alignable-better brand was greater in distant future ($M=43.38$) than in near future ($M=37.80$); ($F(1, 177)=4.816, p<0.05$).

Lastly in thought listings, which were coded by an independent rater who was blind to the hypotheses, we expected to find a greater mention of the alignable attributes in near future, but not in distant future. As expected participants mentioned alignable attributes ($M=1.40$) more than the non-alignable attributes ($M=0.77$) in near future ($F(1, 176)=3.799; p=.053$), but not in distant future ($M_A=1.08, M_{NA}=0.90; F(1, 176)<1, p>.1$), suggesting more emphasis on alignable difference in near future, but a more balanced consideration to both types of differences in distant future.

The results of the experiment provide support for the hypothesis that the representation and evaluation of alternatives are systematically different for situations with varying consumption immediacy. Specifically, we find that consumers put more emphasis on the non-alignable differences when the expected consumption is in distant future as compared to being immediate. This result is consistent with our prediction that people's representations of the options in future time framing does lead to a more abstract and holistic processing.

Current findings add to the understanding of how consumers evaluate and chose among alternatives when the consumption is in the future, by demonstrating a systematic shift in attention paid to different types of attributes for immediate versus future consumption scenarios.

The findings in this paper also extends the structural alignment theory (Medin, Goldstone, & Markman 1995), by addressing the issue of when and how the contextual factors promote the processing of the non-alignable attributes, which have been found to be effortful and difficult. Specifically, we have showed that the differences in time horizon can moderate the effect of alignability on preference formation.

Improving Attribute-Importance Measurement; A Reference-Point Approach

Koert van Ittersum, Georgia Institute of Technology
Joost M.E. Pennings, University of Illinois at Urbana-Champaign
Brian Wansink, University of Illinois at Urbana-Champaign
Hans C.M. van Trijp, Wageningen University

EXTENDED ABSTRACT

Abstract

Despite the importance of identifying the hierarchy of product attributes that drive judgment and choice, the many available methods remain limited regarding their convergent validity and test-retest reliability. To increase the validity and reliability of attribute-importance measurement, we focus on the central antecedent of the importance of product attributes in judgment and choice: consumers' valuation curve of an attribute—the idiosyncratic valuation of an attribute at different attribute levels relative to consumers' reference points. We propose two new attribute-importance measures that reflect the determinance and the relevance of an attribute respectively, and show that accounting for the effects of reference points increases the predictive validity of attribute-determinance measures.

Introduction

Identifying product attributes that are important in judgment and choice is a key objective of consumer research. A wide variety of methods to identify important attributes have been proposed and examined (Van der Pligt et al. 2000). However, the convergent validity among these methods is low, and sometimes replications even yield inconsistent results (Jaccard, Brinberg, and Ackerman 1986).

The objective of this research is to improve the efficiency, validity and reliability of attribute importance measurement. We propose that valid and reliable attribute-importance measures can be obtained by focusing on the central antecedent of attribute importance: the consumers' valuation curve of an attribute. This valuation curve reflects the idiosyncratic valuation of an attribute at different attribute levels, relative to consumers' reference points (Tversky and Kahneman 1991). Building on reference-dependent theory (Kahneman and Miller 1986, Tversky and Kahneman 1991), we show that the importance of product attributes in consumer judgment and choice depends on *reference points*. We introduce two new attribute importance measures that explicitly include the reference point concept and compare them against existing importance measures. The proposed approach helps explain the lack of validity among and reliability of existing methods, and yields valid and reliable attribute-importance measures that account for the effects of reference points and loss aversion. The approach allows for the determination of *two* dimensions of attribute importance: the *determinance* of an attribute in a judgment task (the importance of an attribute in judgment and choice), and the *relevance* of an attribute, independent of a product space (the importance of an attribute for a consumer) (Myers and Alpert 1968). Furthermore, the approach can be used for a variety of attributes and in different contexts, an important property, as both factors affect the importance of attributes in judgment and choice (Tversky, Sattath, and Slovic 1988).

Theoretical Background

The determinance of attributes reflects the importance of attributes in judgment and choice. It is generally calculated based on the difference in valuation of different attribute levels (e.g.,

conjoint method). Research on the determinance of attributes generally ignores the use of reference points. However, we hypothesize that the determinance of an attribute is larger when its attribute levels are perceived as losses, relative to reference point, than when these levels are perceived as gains (cf., Bell and Bucklin 1999).

To understand the effect of reference points and loss aversion on attribute importance, following Fishbein and Ajzen (1975), we assume that attribute-valuation curves drive judgment and choice additively. The attribute-valuation curve of an attribute reflects the valuation of attribute at different levels, related to products, relative to the related reference point. We assume that consumers' reference point of an attribute is determined by the level of the attribute of the product they currently use and that all alternatives in a specific product space are compared to this point (Briesch et al. 1997). The basic shape and properties of attribute-valuation curves are determined by three assumptions (Tversky and Kahneman 1991). First, it is assumed that the valuations of attribute levels are gains or losses relative to a reference point (*reference dependence*). Second, it is assumed that, as losses loom larger than corresponding gains, consumers weigh losses more heavily than gains (*loss aversion*). Third, it is assumed that the marginal valuation of both gains and losses decreases with their size (*diminishing sensitivity*). The assumptions produce an asymmetric S-shaped valuation curve, concave above the reference point and convex below it.

If consumers' reference points influence the determinance of attributes, we should account for this effect in calculating the determinance of attributes and develop more valid and reliable determinance measures. By testing the predictive validity of a new determinance measure that accounts for the effects of reference points and loss aversion, we can gain some initial insights into the validity of this proposition.

Attribute-valuation curves reflect both the *determinance* as well as the *relevance of the attribute*. By correcting the attribute-valuation curve for the difference in weights of losses and gains, as well as for the effect of diminishing sensitivity, the relevance of the attributes, the importance of the attribute for consumers, can be calculated as well.

Method

We examine and test the proposed approach in a controlled field experiment, involving 396 weekend visitors to an academic open-house at a Midwestern University. Assuming that attribute-valuation curves drive judgment and choice additively, we measure consumers' valuations of specific attribute levels as well as their valuations of the reference point related to the attribute under consideration using full factorial conjoint (1-9 Likert scale). Next, using the assumptions of reference dependence, loss aversion, and diminishing sensitivity, we examine the effect of reference points on attribute importance, and calculate two new attribute importance measures: *the determinance* and *relevance* of attributes.

Results and Conclusions

First, the results show that the determinance of attributes depends on the consumers' reference point, and on whether the attribute levels in the product space represent gains or losses relative to that reference point. The determinance of an attribute is

larger when the attribute levels represent losses compared to the consumers' reference point than when they represent gains. This effect is found both for the price and the taste attribute.

Second, building on this finding of the effects of reference points and loss aversion on the attribute determinance, we propose a new attribute-determinance measure, which explicitly accounts for the effects of reference points and loss aversion. The results suggest that the predictive validity of this new measure is higher than that of attribute-determinance measures that ignore the effects of reference points and loss aversion.

Third, we show that focusing on the attribute-valuation curve not only allows for the calculation of the determinance, but also for the relevance of attributes. By correcting the attribute-valuation curve for the difference in weights of losses and gains, as well as for the effect of diminishing sensitivity, the relevance of the attributes, the importance of the attribute for consumers, can be calculated as well. Reference points do not seem to influence the relevance of the attributes studied. Because the proposed approach generates two attribute-importance measures (with minimal burden on respondents), we conclude that the proposed approach is relatively efficient compared to methods that require respondents to execute two tasks to ascertain both the determinance and the relevance of an attribute.

A Multidimensional Approach to Measuring Attribute Importance

EXTENDED ABSTRACT

Abstract

Identifying product attributes that are important in consumer judgments is a key objective of consumer research. Unfortunately, the many available methods to identify important attributes often lack convergent and nomological validity. The objective of this research is to gain a better understanding of the determinants of this lack of validity and to outline a framework that will provide convergence for future studies. As such, this research is an important first step in identifying and developing methods that enable both practitioners and scholars to improve the validity of attribute importance measurement.

Introduction

Identifying product attributes that are important in consumer judgment and choice is a key objective of consumer research, both for practitioners and for scholars. Although there are a wide variety of methods to identify important attributes, the convergent validity among and nomological validity of different methods is often low (e.g., Jaccard, Brinberg, and Ackerman 1986; Heeler, Okechuku, and Reid 1979).¹ Low levels of validity can cause serious empirical and practical problems. Investigating consumer decision-making and behavior (as well as developing new products) strongly depends on understanding the importance of attributes.

Theoretical Background

Research on attribute importance measurement generally takes a *unidimensional approach* to attribute importance (e.g., Van der Pligt et al. 2000). Building on the work of Meyers and Alpert (1968), we provide a *multidimensional* research framework of attribute importance for understanding the lack of convergent validity among and nomological validity of methods for identifying important attributes. The research framework differentiates between three dimensions of attribute importance: the salience, the relevance and the determinance of attributes (Myers and Alpert 1968, 1977).² *Salience* reflects the degree of ease with which attributes come to mind when thinking about or seeing a certain product. The *relevance of attributes* reflects the general importance of attributes for consumers, and is largely determined by consumer desires. The *determinance* of attributes reflects the importance of attributes in judgment and choice.

The rationale for taking a multidimensional approach is that we expect that there is lack of convergent validity among and nomological validity of available methods for identifying important attributes because they identify different dimensions of attribute importance.

¹Convergent validity identifies whether different measurements reflect the same construct (i.e., are positively correlated). Nomological validity examines whether measures are related to other constructs in a theoretically meaningful way (i.e., predictive accuracy).

²We use the term "relevance" instead of "importance," as proposed by Myers and Alpert (1968), and use this latter term to reflect the general concept of attribute importance.

We use the framework to formulate hypotheses regarding which method identifies which specific dimension(s) of attribute importance. We focus on twelve common methods for identifying important attributes: 1) direct-rating method,* 2) direct-ranking method,* 3) point-allocation method,* 4) analytical hierarchy process,* 5) means-end chain method,* 6) multiattribute-attitude model, 7) trade-off method, 8) swing-weight method, 9) free-elicitation method,* 10) conjoint method, 11) information display board,* and 12) the use of verbal protocols* (due to space limitations, we cannot discuss each method in detail in this abstract). We hypothesize that the methods marked with an "*", identify attributes that are salient and valuable to consumers. The other methods are hypothesized to identify determinant attributes.

Method, Results and Conclusions

Our hypotheses are subsequently tested through a critical and integrative review of seemingly divergent findings in the literature. In line with hypotheses, the results suggest that there is *convergent validity* among and *nomological validity* of methods that identify the *same* dimension(s) of attribute importance. For instance, Srivastava, Connolly, and Beach (1995) report convergent validity among the direct-rating (1) and the analytical-hierarchy process methods (4), both of which we hypothesized that they identify salient and valuable attributes.

Additional evidence for our proposition was obtained by investigating the *discriminant validity* between methods that are hypothesized to identify *different* dimensions of attribute importance. In line with expectations, we find evidence for *discriminant validity* between methods that identify *different* dimensions of attribute importance. For instance, the lack of convergent validity among the direct-rating method (1) and the trade-off method (7) in Fischer's (1995) study may be attributed to the fact that the direct-rating method identifies salient and valuable attributes, while the trade-off method identifies determinant attributes.

Overall, we conclude that there is convergent validity among and nomological validity of methods that identify the same dimensions of attribute importance, while there is discriminant validity between methods that identify different attribute-importance dimensions. These results suggest that taking a multidimensional approach to attribute importance, and relating these dimensions to different methods, may actually be a first step toward more valid attribute importance measurement.

Needle in the Cyberstack: Consumer Search for Information in the Web-based Marketplace

Kuan-Pin Chiang, Long Island University
Ruby Roy Dholakia, University of Rhode Island
Stu Westin, University of Rhode Island

EXTENDED ABSTRACT

With a few simple clicks, consumers can navigate the World Wide Web, move from site to site, access and examine vast amounts of information unconstrained by time and place which have traditionally restricted consumer behavior in the physical marketplace. At least, that is according to theory. Information search on the Internet should, therefore, increase since search costs are reduced. But empirical evidence seems to suggest otherwise. Why aren't consumers searching for more information? Although the Internet reduces the cost of physical effort in moving from store to store, it may not reduce the cognitive cost of moving from site to site. Further, if consumers' motivation to shop online is to reduce effort and save time, why should one expect consumers to search for more information even if the search costs are relatively lower?

Several reasons suggest that conventional economic theories do not adequately explain consumer behavior in this new marketplace. First, the fundamental premise of economic theory is that information search will increase when search costs are reduced (Stigler 1961). Empirical evidence, however, has shown otherwise. Johnson et al. (2000) found that the levels of search across three product categories are fairly low, ranging from 1.1 stores for books to 1.8 stores for travel-related products. Another study by Jansen et al. (2000) revealed a similar pattern from the analysis of transaction from 18,113 users of Excite.com. Results show that Web queries are short. Most users had only few queries per search and 76% of users did not go beyond their first and only query.

Second, it is cognitive, not only physical effort, that affects online search behaviors. According to the Roper Starch Survey, it takes about 12 minutes on average before a user gets frustrated when searching the Internet. Although physical efforts (e.g., going to stores) have been reduced to finger clicks, the cognitive challenges of interacting with computers and online information remain that limit consumer information search within and between sites. This study is one of the first attempts to provide a systematic investigation of consumers' search behavior in the Web-based marketplace that provides some explanation for the discrepancy of theoretical proposition and empirical findings.

The study draws relevant theoretical perspectives from economics, psychology, and the wayfinding paradigm to investigate information search in the Web-based marketplace. The economics of information identifies two types of search costs that influence information search—external and cognitive. The costs of resources consumers invest in search, such as monetary costs to acquire information, or opportunity costs of time during acquisitions, are external search costs. Such costs are influenced by factors beyond consumers' direct control. They are exogenous and depend on situational influences. On the other hand, cognitive search costs are internal to the consumer and reflect the cognitive effort consumers must engage in to direct search inquiries, sort incoming information and integrate with stored information to form decision evaluations (Hauser, Urban and Weinberg 1993; Stigler 1991). They are influenced by consumers' ability to cognitively process incoming information.

In the psychology literature, consumers are viewed as information processors, interacting with a choice environment, acquiring and processing information and making a decision from alternatives (Bettman 1979). Bettman and Park (1980) theorized that

information search depends on both one's ability and one's motivation. Either determinant without the other inhibits information search. The notion that both ability and motivation are required to process information is consistent with Bettman's (1979) model and with Petty and Cacioppo's (1986) Elaboration Likelihood Model (ELM) that suggests that both the ability and motivation to process information are necessary before someone engages in effortful cognitive processing. Similarly, it is logical to posit that both motivation and ability are required to acquire information via effortful search.

Since the online environment possesses several spatial characteristics, researchers have applied the wayfinding paradigm to analyze online navigation (Spence 1999; Hodkison et al. 2000). When users engage in goal-directed navigation, they usually use three methods: landmark, route and survey knowledge (Hodkison et al. 2000). Each method is used under different conditions and depends on the navigator's familiarity with the environment. Hodkison et al. (2000) elaborate these concepts in the online environment. Landmarks are stable and conspicuous in an environment (Dillion et al. 1993) and could include search engines and a user's frequently visited sites from bookmarks or manual entry of a URL. Route knowledge consists of instructions that must be followed to arrive at the desired destination. These instructions enable navigation although the user does not really know much about the environment.

The focus of this study is on external information search directed by a specific purchase under consideration. In the information-rich Web-based environment, consumers need to be transformed as computer users as well (Koufaris et al., 2001). They must be able to identify the location of information and employ efficient search techniques, hence, personal variables such as domain and system expertise are likely to affect consumers' search for information. Further, coupled with personal variables, system factors such as interruption and information load unique to the online environment are likely to impose search costs on consumers and influence the amount of information search.

Results from the pre-experimental survey show two different perceptions of search costs between the physical and online environments. Perceived external search cost is lower in the physical environment whereas perceived cognitive search cost is higher in an online environment. In the four 2 x 2 online experiments, using a custom-designed Web browser, domain expertise was found to be negatively related to perceived cognitive search cost, thus affecting information search between and within sites. In addition, subjects with a lower level of domain expertise search for more information among brick-and-click retailers. System expertise was found to significantly affect information search between sites only in the interruption experimental condition. No significant main effect of system variables—information load and interruptions—on information search was found. Overall, these findings suggest that although physical efforts have been reduced to finger clicks, the cognitive challenge of interacting with computers and online information limits consumer information search in the Web-based marketplace.

SPECIAL SESSION SUMMARY

The Psychology of Auctions: Enriching Models of Bidder and Seller Behavior

Peter T.L. Popkowski Leszczyc, University of Alberta

Despite increased consumer interest in auctions and several calls for more research on this topic (e.g., Chakravarti et al. 2002, Bazerman 2001, McAfee and McMillan 1987), the marketing and consumer research literature on this topic is sparse. Therefore, developing an enhanced understanding of participants' behavior in auctions is critically important. Both traditional and Internet auctioneers have acknowledged the importance of understanding consumer behavior, though little research has focused on this.

There is a large body of literature on the economic theory of auctions (for an overview, see Klemperer 1999). However, these are mostly normative models with restrictive assumptions regarding consumer values and bidding strategies. In fact, Rothkopf and Harstad (1994) have voiced the need to develop more realistic models of how bidders actually behave in auctions. However, little is known about how auction participants actually do behave, as opposed to how they ought to behave (Bazerman 2001). The focus of this session is therefore on several important behavioral aspects of auctions, bringing together three papers related to the psychology of auctions. These papers show how actual behavior of participants in auctions tends to differ from the predictions of normative models.

The first paper, by Subramaniam, Mittal and Inman, examines the difference in auction revenue for two different auction formats. Vickery's landmark paper (Vickrey 1961) has shown revenue equivalence for several different auction formats. However, economists have not yet studied a new popular hybrid auction format used by eBay. Results of this study indicate that Vickery's revenue equivalence theorem does not hold for a comparison of the English auction format (as used by Yahoo) and the hybrid strategy (as used by eBay).

The second paper, by Greenleaf, focuses on how sellers set reserve prices in auctions over time. A sequential auction experiment is used to study the anticipated effects of rejoicing (when the property sells for the reserve rather than due to competitive bidding) and regret (when the highest bid exceeds their value for the property but not the reserve) on reserve price. The results of this paper show that the impact of anticipated regret and rejoicing can be detected by observing how sellers set reserves when they learn over sequential auctions. This impact can also cause sellers' learning to be the opposite of predictions from normative models that omit regret and rejoicing.

Finally, Häubl and Popkowski Leszczyc investigate how two aspects of the intensity of competitive interaction in open ascending-bid auctions, the frequency of arrival of others' bids and the perceived number of bidders, influence consumers' valuations of auctioned items. Their results show that the dynamic competitive interaction among consumers in such auctions may result in *bidding frenzy*, a mental state characterized by a high level of arousal, a sense of competitiveness, and a strong desire to win. In contrast to normative models, the authors find that bidders' valuations are influenced by the intensity of bidding.

The papers complement each other by studying different aspects and biases of consumer behavior in Internet auctions. Together, they enhance our understanding of consumer decision making in Internet auctions, which is becoming an increasingly important area of consumer research.

“Revenue Equivalence in Online Auctions: The Case of Yahoo and eBay”

Ramanathan Subramaniam, Vikas Mittal, and J. Jeffrey Inman,
University of Pittsburgh

We compare the revenue generated in an English outcry auction to a hybrid auction. The hybrid auction combines the features of an English outcry auction and a second price sealed bid auction. In the hybrid format, the highest bidder and the second highest bid are known to all, and at the end of the auction duration the highest bidder gets the object at the second highest bid. Therefore, this hybrid is like a second price sealed bid auction with multiple rounds of bidding. This hybrid format is interesting as this is the format used in www.ebay.com. Theoretically, such a comparison is interesting as it establishes that the hybrid auction (ebay format) should yield a higher price realization than the English outcry auction *even in the presence of risk aversion*. In the past, it has been believed that the English Auction should generate the highest revenue when the bidders are risk averse (Milgrom and Weber 1982).

We argue that this hybrid auction has higher revenues because in such an auction the bidder has the opportunity to revise his valuation after observing rival *valuations* whereas in the English outcry, this revision is done after looking at the rival *bids* which yield less information than the valuation. Theoretically, this occurs because the hybrid being a second price auction, it is optimal for the bidder to bid his/her valuation at any point in time (if s/he chooses to bid).

We empirically examine the above hypothesis using data from two auctions: www.yahoo.com and www.ebay.com. Whereas ebay has exactly the same auction format as the hybrid described above, yahoo has the same format as the English outcry auction with reentry. Specifically, we examine the revenue realized from auctions for 206 matched pairs of objects in yahoo.com and ebay.com. The pairs are matched with respect to the object being auctioned and the duration of the auction. We also statistically control for the presence of common values, last minute bidding, auction duration, reserve price, number of participating bidders and jump bidding (in the English outcry format).

Results show that the revenue realized from the hybrid auction is higher compared to the English outcry format in the presence of common values. We also find that jump bidding depresses revenues in the English outcry auction. Consistent with Wilcox (2000), and Roth and Ockenfels (2002), last minute bidding also negatively impacts the revenue realized. In our study, we compare the revenues from two different auction formats while accounting for last minute bidding behavior while Roth and Ockenfels(2002) specifically study the last minute bidding behavior and relate it to the rules for ending an auction. They look at www.ebay.com and www.amazon.com which have the same auction formats but differ only in their ending rules. They find last minute bidding behavior to be more pronounced in ebay than in amazon. This result is primarily due to the ending rules in amazon where the auction ends only if there are no bids submitted for some fixed period of time (rather than having a “hard” ending time as in ebay). Our study thus relates to this issue as we recognize and control for last minute bidding while comparing the revenues from ebay and yahoo.

We also examine the impact of pre-emptive jump bidding in the English Outcry auction. Avery (1998) shows theoretically, that

such jump bidding behavior discourages other bidders resulting in higher payoffs for the bidder and thus reducing revenue for the seller. Our study verifies this empirically as we find that revenues from yahoo are less compared to ebay when there is last minute bidding.

In summary, by comparing the revenue from ebay and yahoo, this paper examines the revenue generated by a new auction format not studied in economic theory. This new format, that is ebay, yields higher revenue than the English outcry auction with reentry in the presence of risk aversion. Further, we are able to empirically show the effect of auction features such as jump bidding in Internet auctions. Finally, these results provide a possible reason for the popularity of the ebay format even when most bidders are risk averse. More importantly, support for this conjecture holds even when we control for last minute bidding. This suggests that the new hybrid format needs closer scrutiny on other dimensions as well.

“Reserves, Regret and Rejoicing in Open English Auctions”

Eric A. Greenleaf, New York University

One of the most important decisions that auction sellers must make is setting the reserve price, which is the lowest price at which they are willing to sell auctioned property to a bidder. If no bidder is willing to bid a price that at least equals the reserve price, the property does not sell (it is “bought in” in auction parlance) and it returns to the seller. The reserve affects the seller’s expected auction revenue. Optimal reserves have been modeled in an extensive theoretical auction literature (for reviews see Chakravarti et al. 2002; Klemperer 1999; McAfee and McMillan 1987; Rothkopf and Harstad 1994). However, there is still a need for work examines whether these auction models accurately reflect how sellers set reserves, and whether these models need to be enriched to accommodate additional aspects of seller decision making and utility.

This work proposes that anticipated regret and rejoicing (Bell 1982, 1983; Landman 1987, 1993; Larrick 1993; Loomes and Sugden 1982) affect how sellers set reserves in open English auctions, which are the most popular type of auction. We then test this proposition in a laboratory auction experiment. Anticipated regret occurs when decision makers believe, before making a decision, that after observing the decision outcome they will find out that they would have been better off had they made the decision differently. Anticipated rejoicing occurs when decision makers believe that after observing the outcome they will find out that the decision they chose made them better off than other decisions that they rejected. Anticipated regret and rejoicing have been found to influence consumer decision-making (Inman, Dyer, and Jia 1997; Inman and McAlister 1994; Simonson 1992).

One of the basic results of almost all normative models of reserves is that the optimal reserve price should exceed the value the seller places on the item being auctioned. We propose that sellers who set reserves this way will experience anticipated regret from the possibility that the highest bid in the auction will exceed their own valuation, but not be high enough to exceed the reserve. As a result, the property does not sell, and the seller finds out after the auction that he or she would have been better off setting a lower reserve, which would have allowed the property to sell. Sellers have negative utility for this anticipated regret.

We propose that sellers will experience anticipated rejoicing from the possibility that the property will sell for the reserve rather than due to competition among bidders. This result indicates to sellers that they successfully used the reserve to obtain some of the winning bidder’s auction surplus, by driving up the price that bidder must pay. Sellers have positive utility for this anticipated rejoicing. Although anticipated regret has been included in theoretical models

of bidder behavior at first price, sealed bid auctions (Engelbrecht-Wiggans 1989), it has not been included in models of open English auctions, or into models of seller behavior, nor have its effects been tested empirically. Rejoicing’s impact on auctions has not been studied.

We propose that the impact of regret and rejoicing can be observed by examining how sellers set reserves in a series of sequential auctions where important auction parameters are kept constant. This sequence allows sellers to learn as the auctions progress, so they can use the results they observe in the prior auction to help set their reserve in the next auction. We propose a learning model for how sellers will set reserves as they learn over sequential auctions. We show that certain aspects of learning for sellers who experience anticipated regret and rejoicing will be the opposite of learning if sellers do not experience these factors. This allows us to test for the presence of regret and rejoicing. We propose that this impact on learning will be particularly evident if sellers use a frequency heuristic (Alba and Marmorstein 1987; Alba et al. 1994; Hasher and Zacks 1984) to process information observed in prior auctions. More specifically, sellers using this heuristic will give relatively too much weight to which of four possible categorical auction outcomes occurred in the most recent auction (involving two ways that property can fail to sell, and two ways in which it can sell) and too little weight to the magnitude information which they can also observe, as embodied in the highest bid offered in the auction.

We use a laboratory auction experiment to test whether anticipated regret and rejoicing affect reserves. The 72 participants in this experiment act as auction sellers. To keep bidder behavior constant, the experiment uses simulated bidders. These bidders’ valuations and bidding strategy follow the independent private value model of bidder valuation (Vickrey 1961; Riley and Samuelson 1981). Sellers set reserves in a total of 36 consecutive auctions. These auctions contain four blocks of sequences that vary important elements of the auction - the number of bidders (3 vs. 6) and the seller’s own valuation (\$2500 vs. \$5500 experimental dollars) – to allow studying regret and rejoicing across a variety of auction contexts.

The results of the experiment support the impact of regret and rejoicing. We estimate the learning model using a repeated measures regression. We find that the impact of the auction outcomes proposed to cause anticipated regret, and anticipated rejoicing, have the signs consistent with those predicted for regret and rejoicing, rather than the opposite signs consistent with a learning process that does not incorporate regret and rejoicing. The results of this study suggest that anticipated regret and rejoicing should be incorporated into auction sellers’ utility functions.

“Bidding Frenzy: Intensity of Competitive Interaction Among Bidders and Product Valuation in Auctions”

Gerald Häubl and Peter T. L. Popkowski Leszczyc, University of Alberta

This paper examines how the intensity of the competitive interaction among bidders affects their valuations of an auctioned item. The dynamic process of determining a product’s selling price in open ascending-bid auctions is characterized by a sequence of increasing bids by multiple consumers, with direct competition among bidders for “winning” the auction (Ariely and Simonson 2003; Ku, Malhotra and Murnighan 2003). We propose that, as a result of the interactive nature of such auctions, bidders may experience a mental state, which we refer to as *bidding frenzy*, that is characterized by a high level of arousal or excitement, a sense of competition, and a strong desire to win. Furthermore, we hypoth-

esize that, all else being equal, greater levels of bidding frenzy will cause consumers to value an auctioned product more highly.

Our focus is on two key aspects of the intensity of competition in an auction on consumers' product valuations: (1) the frequency of arrival of others' bids and (2) the perceived total number of bidders participating in the auction. We propose that an auction participant's experienced level of bidding frenzy increases as the pace at which others submit bids increases and as the perceived number of bidders decreases.

The effects of bidding frenzy on consumers' product valuations were examined in five laboratory experiments. The studies used an innovative method, originally proposed by Häubl and Popkowski Leszczyc (2003), for measuring individuals' product valuations in computer-based ascending-bid auctions. This method involves simulated auctions in which subjects are under the illusion that they are participating in an online auction with a group of other bidders.

In Experiment 1, we investigated the effect of dynamic interaction among bidders on consumers' product valuations. To examine the net effect of being able to observe and react to others' bids on an auction participant's willingness to pay for a given product, we compared consumers' bidding behavior under two auction types: open ascending-bid (English) auctions and second-price sealed-bid auctions. These auction formats are strategically equivalent, i.e., they can be shown analytically to produce the same expected selling price (Vickrey 1961). However, they differ in one important respect central to our research. While English auctions allow dynamic interaction among bidders with publicly available high bids, sealed-bid auctions do not. We find that bidders' valuations of the auctioned product were significantly higher under the English versus the second-price sealed-bid format. Moreover, the positive effect of the interactive English-auction format on consumers' willingness to pay is mediated by increased levels of indicators of bidding frenzy. The remaining experiments focused on English-style auctions.

Experiment 2 examines the effects of two key aspects of competitive intensity on consumers' product valuations. Both the frequency of competitors' arrival (the bidding machine's bids) and the perceived number of active bidders in the online auction were manipulated independently. The results suggest that, all else being equal, higher frequency of competitors' bids leads to higher product valuations, and that the effect is again mediated by the level of bidding frenzy.

In Experiment 3, we investigate whether the results obtained in Experiment 2 are affected by the level of the bid increment and time pressure (by varying the time till the completion of the auctions). The results show again that higher frequency of competitors' bids leads to higher product valuations. However, the bid increment or the time pressure did not affect valuations.

In Experiment 4, we examine whether our results of bidding frenzy can be attributed to affiliation of bidders' valuations. Milgrom and Weber (1982) proposed the affiliated-values model to accommodate notions of consumer learning, value updating and learning of bidding strategy. However, little research is available on the behavioral underpinnings of affiliation and its impact on consumer learning and strategic behavior (Chakravarti et al. 2002). The results of Experiment 4 indicate that learning about the value of an auctioned item based on the observed bidding behavior of other auction participants can be ruled out as an alternative explanation of the effects.

Finally, in Experiment 5 we test for the importance of human interaction in the competitive bidding process. Our results indicate that a necessary condition for the experience of bidding frenzy is

that an auction participant competes directly with other human bidders rather than with a pre-programmed electronic bidding agent.

The results of our five experiments provide strong support for the hypothesis that, all else being equal, both greater frequency of arrival of others' bids and a smaller perceived number of bidders lead to higher product valuations. We also show that these effects on valuations are driven by the experienced level of bidding frenzy. These results are in sharp contrast to the normative theory of bidder behavior in auctions and represent an important building block of a behavioral theory of auctions.

ROUNDTABLE
Repetition and Spacing of Marketing Stimuli: Implications for Memory

Discussion Leaders:

Sara L. Appleton-Knapp, San Diego State University

Kathryn Braun-LaTour, Marketing Memories

Hayden Noel, Baruch College

Much research has shown evidence for strong and robust effects on memory resulting from the spacing of repeated stimuli. Namely, to-be-remembered items presented without a lag between presentations (massed items) are not recalled as well as items that are presented with time or other items intervening between presentations (spaced items). However, researchers are divided on why spacing to-be-remembered items improves recall. Some work suggests that encoding variability drives the effect (Singh, Mishra, Bendapudi and Linville 1994; Unnava & Burnkrant 1991). Other results provide evidence for the role of study-phase retrieval practice (Appleton-Knapp et al. 1999; Janiszewski, Noel & Sawyer 2003). Reconstruction is also proposed as contributing to the effects of spacing (Braun 1999; Braun, Ellis & Loftus 2002; Jacoby 1978). Clearly more work is needed to disentangle these processes and to determine how they interact in producing improved memory for spaced material. An understanding of the spacing effect is particularly important for advertisers who can use findings in this area to optimize advertisements and to understand how varying lag lengths between presentations of ads can affect consumer memory.

The purpose of this roundtable is to bring together researchers with differing views to discuss their research and to gain a better understanding of how the spacing effect works and what predictions can be made about spacing in marketing. Braun-LaTour brings expertise in false memory research. Specifically, she can speak to how reconstruction processes can lead to false memories and how false memories are more likely to occur with long lags between product experience and advertising. Appleton-Knapp and Noel have both done work on study-phase retrieval and can discuss its contribution to the spacing effect. Noel, along with C. Janiszewski, is currently examining whether reconstruction can also account for this phenomenon and what are possible moderating variables. In addition, Appleton-Knapp has experimental evidence to show that under some conditions, variation in advertisements can attenuate the spacing effect. Much work on the spacing effect has been conducted in basic psychology. Another benefit of a roundtable on spacing led by this group of researchers is that they all are well-versed in the psychology literature on spacing. Braun-LaTour has worked with Loftus, one of the foremost psychologists working in the false memory domain and Appleton-Knapp has worked with R. Bjork, a renowned psychologist who studies memory processes. A discussion led by Appleton-Knapp, Braun-LaTour and Noel would explore new areas for research in spacing as well as expand the opportunity for collaborative work among researchers in related areas.

SPECIAL SESSION SUMMARY

New Frontiers in the Construction of Preferences

Nathan Novemsky, Yale University

The idea that preferences are constructed rather than retrieved from memory has been very influential in the thinking of many consumer choice researchers (e.g. Bettman, Luce and Payne, 1998). Studies derived from this idea have uncovered many interesting effects. The composition of the choice set has influenced this construction process and resulting preferences (e.g. attraction effect). The type of preference elicitation has also been shown to have important influences on preference construction (e.g. matching versus choice). While many strides have been made in understanding the preference construction process, there is still much to learn about the mechanisms of preference construction. This session can help develop some specific mechanisms involved in the construction process.

The first two papers are more theoretical and the third paper is more applied. In the first paper, techniques are borrowed from the attitude construction literature to help understand the mechanisms behind some common effects in preference construction. Using a feelings-as-information approach allows us to identify which context effects can be influenced by subjective feeling states at the time of the decision. This allows us to better understand how the context effects affect the preference construction process. The second paper looks at how the preference elicitation task (choice versus matching) affect preference construction. That research identifies simply arithmetic construction strategies (e.g. ratio or difference matching) that underlie responses to matching questions. These strategies allow us to refine previous choice theory (i.e. the prominence effect) by appealing to the low level methods of preference construction. The last paper looks at a real-world example of how matching and choice differ. It shows that very consequential decisions (housing prices) can be greatly affected by biases in the preference construction process.

LONG ABSTRACTS

“Parallels in the Underpinnings of Constructed Preference and Constructed Attitudes”

Nathan Novemsky, Yale University

Ravi Dhar, Yale University

Itamar Simonson, Stanford University

Norbert Schwarz, University of Michigan

The notion that preferences are constructed rather than retrieved from memory has been an important influence on consumer choice research (e.g. Bettman, Luce and Payne, 1998). Many effects, including choice context effects rely on this orientation. While constructionist ideas were flourishing in choice research, researchers studying attitudes were suggesting that attitudes are constructed rather than retrieved from memory. In fact, there are many parallels between the two bodies of research. Context effects based on temporary and often normatively irrelevant cues were having effects both on the construction of preferences and on the construction of attitudes. However, many ideas that might be applied to both attitudes and preferences have not crossed the boundary between these two fields. In the research described below, we attempt to introduce a key idea from attitude research (feelings-as-information) into preference contexts.

In attitude research, there is a line of research known as feelings-as-information (Schwarz, 1990; 2001) that shows that

individuals use their current subjective feeling state to inform their attitudes toward various objects. In our research we attempt to induce feelings (e.g. difficulty) in individuals making decisions and see how that affects their preference construction. We look at three preference construction effects: the compromise effect, the attraction effect, and the no-choice effect.

In several studies, we investigate the compromise effect. Demonstrations of this effect involve adding a third option to a two-option choice set in such a way as to increase the share of one the original options. For example, consider a choice between a high quality/high price option (B) and a low quality/low price option (C). When a very high price/very high quality option is added to the choice set, consumers seem to often choose the middle or compromise option (B) even more than they chose it in the two-option set. In our studies, we expand this design to include an inducement of a subjective feeling of difficulty. We manipulate the subjective difficulty of the choice by asking respondents if they can think of 2 or 10 reasons for their choice. Most people cannot think of 10 reasons in the choices we offer, so the 10-reason condition induces a strong subjective feeling of difficulty. When subjective difficulty is increased, we observe a greater compromise effect. This suggests that the compromise effect is the result of a deliberate strategy that the decision maker adopts to help them make a choice.

We also conducted several studies looking at the effect of adding a no-choice option to a decision. Similar to the compromise effect, we find that the no-choice option has a bigger effect when the subjective difficulty is high. This suggests that no-choice effects are also mediated by a deliberate strategy.

Interestingly, subjective difficulty does not always increase context effects in choice. We investigated another preference effect, the attraction effect. In the attraction effect, adding a third option to a two-option choice set that is dominated by one of the original options but not the other increases the share of the dominating option relative to the two-option set. Using the same 2 versus 10 reasons manipulation we varied the perceived difficulty of choices related to the attraction effect. We find that the attraction effect, as opposed to the compromise effect or no-choice effect, is attenuated when the subjective difficulty of the choice is increased. We believe that the attraction effect is reduced because it is a perceptual effect. That is, the attraction effect occurs because the dominated option makes one option more attractive. Choosers are generally not aware that the dominated option is having an effect on the choice. Rather, the chooser just perceives the dominating option as more attractive. Increasing the subjective difficulty interrupts this effect by encouraging the chooser to think more about the choice.

In the studies above, the difficulty in generating reasons for the choice is attributed to the difficulty of the decision-maker in making the decision. In follow-up studies, we manipulated whether the difficulty of generating reasons was attributed to the decision-maker having difficulty with the decision or to something else. For example, by telling respondents that other people on average can generate only a few reasons, the difficulty in generating reasons is attributed to the fact that too many reasons were requested not to the fact that the respondent is having difficulty with the decision. When the attribution for the feeling of subjective difficulty is directed away from the decision the influence of the number of reasons on the context effects is eliminated.

“The Psychology of Matching and the Prominence Effect”*Shane Frederick, MIT**Eldar Shafir, Princeton University*

Most objects of preference can be evaluated along multiple dimensions or attributes. Apartments vary on rent, square footage, and distance from work. Automobiles vary on gas mileage and safety. Gambles have different payoffs and probabilities. Thus, evaluating such options typically requires tradeoffs between attributes.

Determining the relative importance or weight people assign to various attributes is a central theoretical and practical topic in economics, psychology, decision analysis, and consumer research. Various elicitation methods have been used to infer attribute weights, including choice, matching, rating and pricing, and even asking people to directly graph their indifference curves (e.g., MacCrimmon & Toda, 1971).

These alternate elicitation procedures often imply different attribute weights. One of the most striking and widely cited examples of this was first reported by Slovic (1975), who found that respondents tended to select the alternative that was superior on the dimension they had previously rated as more “important” even though they were choosing between pairs of alternatives they had previously “equated” in a matching task. This effect, which Slovic first termed the “more important dimension hypothesis” was renamed the “prominence effect” by Tversky, Sattath, and Slovic (1988, p. 372), who replicated and extended Slovic’s original findings. The prominence effect has subsequently been replicated for many decision contexts and types of attributes (see, e.g., Fisher and Hawkins, 1993; Hawkins, 1994; Sekides, Ariely, & Constantine, 1999; Fischer et al., 1999). However, no consensus has emerged regarding its underlying cause(s).

In this paper, we explore the prominence effect in the context of the various strategies respondents use to solve matching tasks. We propose that respondents may match alternatives using one of three different strategies (*difference matching, ratio matching, and adjustment*), and that each may be used depending on the comparability of attributes, the units in which the scale values are denominated, the relative magnitude of the scale values, and even the ease of subtracting vs dividing. Depending on the particular task and attribute values, the application of such strategies can lead to patterns consistent with the prominence effect. However, it can also generate the opposite pattern (in which the more important attribute is weighted more heavily in matching than in choice). We show several such examples.

In our first study, we show that in cases where a ratio matching strategy is likely to be used, the prominence effect can be eliminated or even reversed merely by changing scale values. Indeed, we show that the most widely cited illustration of the prominence effect (Tversky, Sattath, and Slovic’s “lives vs. money” problem) disappears when the numbers used to describe lives and money respectively are swapped (Carmon and Simonson, 1998, show a similar effect in consumer choice problems).

In a second study, we show that the size and direction of the choice-matching discrepancy can be manipulated by changing the scale value at which one of the choice options is instantiated. In each case, we demonstrate both the prominence effect *and its converse*, merely by manipulating the attribute value at which one of options varies. This effect has been completely ignored in prior research on this phenomenon, because the choice task is ordinarily taken as the ground against which various versions of matching tasks are compared.

In a third study, we show that the imputed tradeoff rates can be dramatically affected by manipulating the ease with which people

can apply the various strategies (e.g. making the attribute levels multiples of each other may focus attention on ratios, rather than differences). We also show a new type of dominance violation that can arise when increasing the scale value switches people from focusing on ratios (which favors that item) to focusing on differences (which favors the competing item).

In summary, this paper offers a discussion of the meaning and imputation of attribute weights and attribute “importances,” and a typology of alternative strategies that respondents may use to generate responses in matching tasks, including *difference matching, ratio matching, and adjustment*. Against this background, we show that the size and even direction of the prominence effect can be influenced by factors that have nothing to do with attribute importance, per se, and that prior accounts of the prominence effect are, in this sense, misleading. However, we also show several phenomena that are qualitatively consistent with the prominence effect, including matching responses that are radically insensitive to *qualitative* task features (e.g. whether a graduate applicant is applying for admissions to an English Department or a Mathematics department) and choice proportions that seem inadequately sensitive to *quantitative* task features (e.g. the exact number of crimes prevented or false arrests created by a more aggressive crime prevention policy).

“A Behavioral Analysis of Real Estate Prices”*Christopher Hsee, University of Chicago**Yan Zhang, China Europe International Business School*

The present article examines the same pattern of units on different floors in a given building. There are three main sale patterns. The first is a flat pattern, in which all units are sold at about the same rate, whether the units are on good (high) floors or bad (low) floors. The second pattern is bad-before-good, in which low-floor units are sold faster than high-floor units. The last pattern is good-before-bad, in which high-floor units are sold faster than low-floor units.

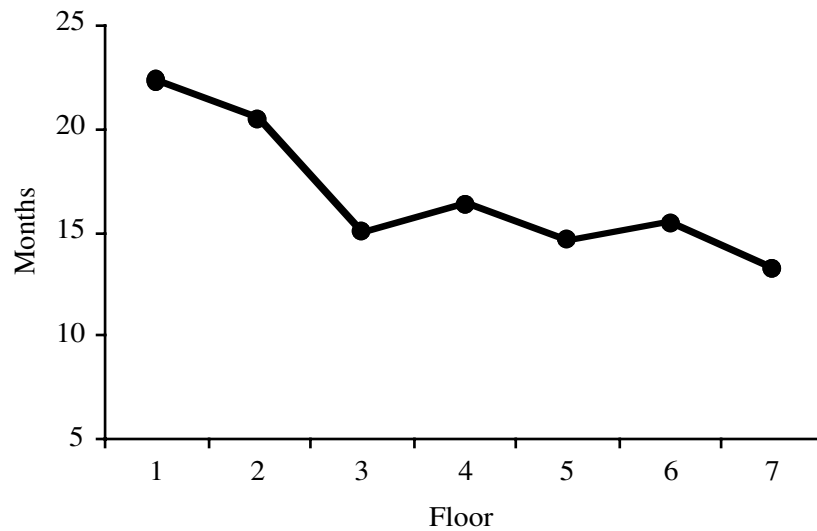

Theoretically, developers can precisely control the sales pattern of units in a given building through pricing. For example, if developers want a bad-before-good pattern, then they should price the low-floor units sufficiently low and price the high-floor units sufficiently high. If developers want a good-before-bad pattern, then they should keep the price difference between high and low-floor units small.

Our research examines whether developers price floors in such a way that the actual sale pattern matches their intended sale pattern. Our prediction is that it does not. Our theory is that when developers price the units, they are in a matching or anchoring-and-adjustment mode, but when buyers decide which unit to purchase, they are in a choice mode. We also know from extensive interviews that consumers consider floors as a more important (prominent) dimension than price. Based on prior research (Tversky, Sattath & Slovic, 1988), we predict that developers (the matchers) will give the more prominent attribute (floors) less weight than the consumers (the choosers). As a result, the final sales pattern will differ from the developers intended sales pattern, with high-floor units selling faster than intended by the developers.

In this talk, we will present both data from controlled questionnaires and actual real estate sales data from Shanghai, the most active real estate market in the world today. The results of our research can be summarized as follows:

1. Most professional developers and realtors prefer the flat sales pattern or the bad-before-good sales pattern over the good-before-bad sales pattern.

FIGURE 1

2. When developers price units, they use one of two strategies: (a) an anchoring-and-adjustment strategy (they anchor on the price of the average unit, and adjust the price for better or worse units); and (b) a matching strategy (they set the price of a given unit and ask potential buyers to match the price of a better or a worse unit so that these units would be equally attractive).
3. Given the prices set by those realtors or developers, the actual sales pattern differs from what they intend. The high-floor units usually go faster than low-floor units. The graph above (Figure 1) is the data of a typical new construction (7-story midrise), where the x-axis is floors, and the y-axis is the average number of months the units on a given floor are on the market before they are sold.
4. So far our focus has been on the discrepancy between the intended sales pattern and the actual sales pattern. We have not discussed what is the optimal (most profit-maximizing) sales pattern. We will also present some preliminary data showing that a flat pattern or a bad-before-good pattern may be better than a good-before-bad pattern. It suggests (a) that the realtors/developers' intuitions are right, and (b) that the actual sales pattern (i.e., good-before-bad) is suboptimal.

This research has important implications for pricing strategies. It is also an important application of a seemingly subtle BDT effect in the real world.

SPECIAL SESSION SUMMARY

Beyond Brand Image: Analyzing the Culture of Brands

Craig J. Thompson, University of Wisconsin- Madison

In the conventional brand management literature, culture primarily enters into the theoretical equation through the construct of brand image. From this perspective, a brand is a central node of an associative network constituted by consumers' learned connections between the brand and a variety of cues, benefits, user types, and symbolic meanings (van Osselaer and Alba 2000). A related normative assumption is that managers can exert a fairly high degree of control over brand image through careful strategic choices and by avoiding a laundry list of commonplace pitfalls (Aaker and Joachimsthaler 2000; Keller 1998). This managerial-psychological view reduces culture to an array of information that individuals more or less incorporate into a cognitive schema, which then influences future information acquisition, attitudes toward the brand, and choice strategies (van Osselaer and Janiszewski 2001).

An emerging stream of consumer research suggests a far more encompassing and significant interrelationship between cultural processes/structures and brand meanings. Drawing from personal relationship theory, Fournier (1998) argues that consumers form emotionally-laden relationships with brands that anchor their self-concepts. Adopting an anthropological view, Muniz and O'Guinn (2001) and McAlexander, Schouten, and Koenig (2002) analyze brands as the loci of complex communities that cut across conventional geographic and societal boundaries. Rather than just being a symbolic resource for the construction of personal identity, communal brands are a foundation of group identification and experiences of social solidarity. Holt (2002) analyzes brands in relation to the co-evolution of marketing practice and consumer culture. He argues that, in the postmodern marketplace, marketers strive to ingratiate and integrate their brands into various spheres of popular culture. Brands that successfully accomplish this cultural emplacement acquire an aura of authenticity which consumers then covet as they seek to create distinctive personal identities and, paradoxically, to resist conventional corporate influences.

A major implication of this research stream is that marketing managers exert far less direct control over brand meanings than is commonly supposed in the brand management literature (see Holt 2002, 2003; Muniz and O'Guinn 2001). Furthermore, a nexus of politics of consumption issues are raised by a dialectical view of brand cultures that have not been broached by the existing consumer research literature. For example, consumers may attribute considerable moral-political significance to their brand preferences, on the assumption that these valued brands are in some sense anti-corporate, and these perceptions can be easily leveraged for marketing advantage. A dialectical conception also calls into question a prominent assumption that subcultures exist as autonomous groups, whose authentic meanings are inevitably appropriated by parasitic corporations (e.g., Hebidge 1979). An alternative view developed in this session is that marketing, brands, and subcultures exist in a far more symbiotic relationship where marketing discourses actually help to crystallize a subcultural identity and its ideological outlooks.

The goals of this session were three-fold: 1) to further advance understanding of the different processes through which brand meanings are culturally constructed and in a dialectical fashion, exert an influence upon consumer culture and consumer identities; 2) to profile key theoretical benefits that accrue from viewing brands as cultural forms; and 3) to stimulate future research into brand cultures and in particular, their politicized consumption

meanings. Each paper in this special session offers theoretical insights into different aspects of this culture-brand dialectic.

Douglas Holt presented a historical analysis of the Patagonia brand. His brand genealogy traces the evolution of the Patagonia's branding strategies and its changing relationship to the subculture of outdoor-adventurers who had been were the brands core customers in the development of Patagonia as an iconic brand. Holt argued against the conventional view which holds that subcultural consumers act as cultural producers, who take control of the brand to create powerful brand meanings that often subvert the meanings created by the marketer. Instead, he demonstrates that Patagonia acted first as a cultural leader within the subculture, articulating the so-called "dirtbag culture" of hardcore climbers with particular skill while developing innovative climbing equipment. Once established, Patagonia then used the subculture as what Holt calls *discursive raw ingredients* to develop a myth about adventuring in nature, a myth which appealed powerfully to a mass market of liberal, ecologically minded non-adventurers.

Thompson and Arsel's presentation highlighted the influence that the Starbucks' brand exerts over the seemingly diverse cultural milieus of local coffee shops. Using a combination of phenomenological interviews and ethnographic observation, they built a case that the cultural discourses that surround Starbucks and the basic structure of its retail servicescape exert a systematic influence on the milieu of local coffee shops, regardless of whether these shops are positioned as countercultural havens or a third-place hangout (Oldenburg 1989) for middle-class professionals. They introduced the concept of a hegemonic brandscape to explain this ideological mapping of the local coffee shop scene and the centrality of Starbucks' meanings and ambiance to among local coffee shop patrons. Ironically, a key facet of the Starbucks' brandscape is a nexus of aesthetic and social criticisms commonly directed at this brand (i.e., the anti-Starbucks discourse) and which express a general cultural anxiety over the effects of globalization. The anti-Starbucks discourse imbues consumers' choices about coffee shop patronage with a set of political and moralistic meanings and it ideologically frames their experiences of local coffee culture. Reciprocally, meanings of Starbucks are constructed in relationship to the micro-market positions and customer communities of local coffee shops.

In keeping with this session's thematic core, O'Guinn and Muniz discussed the new political left's strategy of fighting market capitalism's hegemony through purchases from major corporations. While all across the spectrum brands are becoming more a part of political discourse, the new left's belief that they are striking blows against the empire by purchasing is particularly noteworthy in its oddity and paradox in the stream of modernist market critique. Their new left informants' sincere (and purchase motivating) belief that by buying an Apple MacIntosh they are actually behaving in the tradition of sixties radicals is either testament that since mid twentieth century, there is absolutely nothing one can do politically outside the consumption juggernaut (Frank 1997), or that brands are (whatever the historical trajectory) increasingly politicized and must be conceived as socio-political entities. As branded consumption becomes more and more central to contemporary social existence, so the traditional lines (real or imagined) between the political fashion and material fashion fade. This phenomenon has many causes, but easy and inexpensive social aggregation and consumer-

to-consumer communication through the WWW has made the further politicization of brands all the more inevitable. O'Guinn and Muniz develop this theoretical implication through both face-to-face and computer mediated environment data on several brands.

In her introductory comments as discussant, Susan Fournier noted the theoretical and methodological diversity of the session audience, and called for the creation of bridges from postmodernist critiques of brand phenomena to actionable, substantive contributions in the brand management domain. What does the Starbucks study, for example, suggest about theories and methods for segmentation and positioning? Do these insights suggest a way to *define* rather than *induct* perceptual dimensions for brand positioning? Fournier also called for the crossing of methodological bridges to further develop current insights, as, for example, with survey tracking research to reveal trends in the politicization of brands, or field experiments to investigate the temporality and causality of manager-created versus consumer-created brands. Finally, Fournier encouraged debate regarding the relative utility and value of critical theory to brand theory development, particularly given the anti-business Marxist roots of the perspective, and the possibility for insight creation through alternate analytic paths.

Much discussion ensued and a good time was had by all. Afterwards, everyone put on their comfy Patagonia fleeces, relaxed with a nice Starbucks' double cappuccino, and typed notes on the session into their super cool Apple iBooks.

The Polit-Brand and Blows Against the Empire: The Collectively Approved Brands of the New-New Left

Thomas C. O'Guinn, University of Illinois at Urbana-Champaign
Albert M. Muñoz, Jr., DePaul University

EXTENDED ABSTRACT

Is that a real Poncho, or is that a Sears Poncho?
Frank Zappa

O'Guinn and Muniz present theory and data regarding the "new", (actually the *new-new*, post- 1972, U.S./Western Europe) political left's *leitmotif* of fighting market capitalism's "hegemony" through purchases (as opposed to boycotts of major brands from major corporations). In other words, the new left revolutionary revolts by buying things, but only those things that are deemed appropriate to their socio-political identity, and their socio-political agenda. These are the "polit-brands" of the new left. While the use of brands in "revolution" has been discussed elsewhere, most notably in Frank's (1997) *Conquest of Cool*, we offer a significantly different take on the dynamics and meaning of the phenomenon.

Circa 1972 the old "new left," for all intents and purposes, perished (Schulman 2001). It was replaced by a more individualistic and consumption ambivalent movement. Outside of university English departments, neo-new left-revolutionary politics increasingly play out in battles no longer about consuming or not consuming, but in discourse over the identification, sanctioning, and championing of *which* brands are the best vessel for one's "alternative", albeit *comfortable* politics. The emergence of the "new" political left of the 1990's and beyond provides us with a particularly accessible opportunity to see the mixing of consumer culture and politics, right where they exist: in plain sight. The new left's oft observed belief that they are somehow striking blows against the capitalist empire by purchasing major branded goods is particularly noteworthy in its oddity and paradox in the long stream of modal modernist market critique. Yet, rather than be essential-izing in our theory, and dismissive in our tone, we hold that these acts are not necessarily inauthentic, wrongheaded, uninformed, unimportant, or ineffective.

We like others, argue that not only is consumption inherently political, but always has been. This contrasts with the noted a-historicism of critical theory. But, not desiring to be hoisted on our own designer petard, we just as quickly acknowledge the very prominent pastiche of blended branded-politics and branded-lifestyles in the contemporary consumer milieu. We further assert that it is high time to see and study these contemporary phenomena absent so much heavy-handed and bulky modernist baggage.

Modal modernist critical thought operates on the central assumption that market capitalism (and contemporary consumer culture) is problematic, and should be critiqued...and, not inconsequently should reify/deify the cultural critic along the way. Traditional social theory assumes that in-authenticity and false consciousness typify the consumption modality. So, when critical theorists encounter the new left's belief that by buying only "approved" brands they are social movers undifferentiated from sixties style radicals, these consumers are typically dismissed as duped, and the entire situation testament to the inescapable web of capitalist hegemony and consumption juggernaut (Frank 1997).

We believe that such totalizing formulations are inadequate for the task of understanding the phenomena before us. Sweeping dismissals never allow a finer grained look at brands (or anything else for that matter), contextualized by their history, as politicized

social constructions. Our paper reports both face-to-face and computer mediated data on several brands to sharpen this theoretical focus. We argue that notions of branding and their place in social thought have something to gain from the broadening border-crossing of brand and politics.

We take as given and obvious that brands are social constructions, are socio-political, and always have been. And like Frank (1997), we believe that consumers, particularly youth, play out many of their revolutionary impulses with branded products. Where we differ markedly from Frank (1997), and other critical scholars are (1) the assertion that these acts of marketplace social revolution are fundamentally inauthentic, merely fashion and the work of the duped and *hegemon-ized* masses; and (2) the assertion that they are fundamentally ineffective. We assert that one does not have to take a critical stance to either explain or appreciate this phenomenon. It is not necessary.

Polit-brand data are presented in the form of *Apple, Ben and Jerry's, Carhart, Diesel, MAC, REI, Tom's of Maine*, and most notably, *Sweat-X*. We discuss these brands in the context of "authenticity," the "alternative" label, their trajectory, their role in resolving contradictions of self interest and fashion, brand social construction and "ownership," and most importantly, achieving demonstrable and meaningful political goals.

SPECIAL SESSION SUMMARY

Corporate Social Responsibility: A Consumer Perspective

Jill G. Klein, INSEAD

Corporate Social Responsibility (CSR) has emerged in recent years as both an important academic construct and a pressing corporate agenda item. Firms have been found to engage in socially responsible behaviors not only to fulfill external obligations such as regulatory compliance and stakeholder demands, but also due to enlightened-self-interest considerations such as increased competitiveness and improved stock market performance e.g., Drumwright 1994; 1996; Waddock and Smith 2000).

Growing interest in CSR has sparked new research within marketing on the effects of CSR on consumers (e.g., Brown and Dacin 1997; Sen and Bhattacharya 2001). In this session we present three papers that address a key issue related to the topic of CSR: the impact of a firm's CSR activities on consumer judgments of the products and brands of the firm. The research presented here goes beyond the few initial studies within marketing on CSR by trying to understand the conditions under which product judgments are affected by CSR perceptions.

The first paper, by CB Bhattacharya and Sankar Sen, recognizes that our current measurements of the effects of CSR are underdeveloped. They present a framework for measuring the effectiveness of a firm's social initiatives. In doing so, they conceptually distinguishing social initiatives from the traditional marketing mix (e.g., brand, advertising). Further, they focus on the potentially multi-faceted impact of the CSR activities: beyond the "primary" impact on the brand and company to the "secondary" outcomes related to partner organizations (e.g., nonprofits) as well as the cause/issue promoted by the company.

A firm's economic benefits from CSR have been documented in the link to consumers' positive product and brand evaluations, brand choice, and brand recommendations (Brown and Dacin 1997; Drumwright 1994; Handelman and Arnold 1999; Sen and Bhattacharya 2001). Yet, existing research has usually found CSR effects on product judgments to be weak or indirect (Brown and Dacin 1997; Sen and Bhattacharya 2001). Our session includes two papers that examine factors that intensify the link between CSR and perceptions of products. Yeosun Yoon and Zeynep Gürhan-Canli find that consumers use CSR information to infer product quality only when the firm's CSR activities are relevant to judgments of corporate ability. Niraj Dawar and Jill Klein find that CSR reputation plays an important role during a product crisis. Consumers are more likely to attribute blame to the firm for a crisis when the firm has a poor record on CSR. When the record is positive, however, consumers blame other parties, and brand image remains intact. Thus, CSR activities can act as an insurance policy against the potentially damaging effects of a product harm crisis.

Corporate Social Responsibility has become a major issue for corporations, yet little research has been conducted thus far on consumer behavior aspects of CSR. The goal of this session is to increase our understanding of how consumers perceive and react to CSR activities. Craig Smith, who is an expert on corporate ethics and ethical issues in marketing will be the discussant for the session. In a brief presentation he will tie the research presented in the papers to more general issues of business ethics and recent trends in corporate social responsibility. He will then lead a discussion between attendees and presenters.

This session will appeal to a broad segment of ACR participants. Those interested in CSR issues, business ethics, non-profit

marketing and social marketing will find the papers very relevant to their work. Further the session will attract those interested in brand image, product judgments, and corporate communication.

"Measuring the Effectiveness of Corporate Social Initiatives: A Consumer-Centric Perspective"

CB Bhattacharya, Boston University
Sankar Sen, Baruch College

Today, more companies than ever before are backing corporate social responsibility (CSR) initiatives such as corporate philanthropy, cause-related marketing, minority support programs and socially responsible employment and manufacturing practices, with real financial and marketing muscle. The Web sites of more than 80% of the Fortune-500 companies address CSR issues, reflecting the pervasive belief among business leaders that CSR is not only an ethical imperative but also an economic one in today's national as well as global marketplace. Given this increasing emphasis and resource deployment on CSR, business leaders are realizing the urgent need to measure the effectiveness of various CSR programs. Not surprisingly, many companies have embraced practices such as social audits, corporate social reporting and the triple bottomline (Panchak 2002). From the academic side, there have been attempts to link corporate social initiatives to a variety of aggregate outcomes such as financial performance indices and reputation (e.g., Davenport 2000; Simpson and Kohers 2002). What is lacking, however, in both theory and practice are customer-driven measures of CSR effectiveness (the Cone/Roper studies being the sole exception). Since market forces drive much of the momentum behind CSR initiatives, taking a meaningful and accurate read of customers' reactions to firms' CSR initiatives is, from a management perspective, essential.

In this paper, we adopt a customer-centric view to propose a framework for measuring the effectiveness of a firm's social initiatives. In doing so, we start by conceptually distinguishing social initiatives from the traditional marketing mix (e.g., brand, advertising). We contend, unlike prior research (e.g., Frankental

2001), that a key distinction between marketing mix attributes and CSR initiatives lies in the potentially multi-faceted impact of the latter: beyond the “primary” impact on the brand and company (the sphere of marketing mix measurement), CSR initiatives can also influence “secondary” outcomes related to partner organizations (e.g., nonprofits) as well as the cause/issue promoted by the company. For example, the cross-sector partnership between Home Depot and Habitat for Humanity may not only influence customers’ perceptions and behaviors towards Home Depot and its products, but also influence donation and volunteering behavior towards Habitat as well as attitudes towards housing for the underprivileged. Moreover, these secondary outcomes of CSR are integral but thus far unconsidered components of CSR effectiveness. In light of the extant emphasis on the primary outcomes (albeit in different contexts) in the marketing literature, we will pay particular attention to the secondary outcomes.

Our framework, based on prior research and focus groups, will relate different types of CSR initiatives (e.g., those internal to the firm vs. those external to the firm) to expected outcomes and propose both attitudinal and behavioral measures for assessing the effectiveness of CSR initiatives. We shall conclude with an empirical example that illustrates the utilization of the measures in practice.

“The Effects of Corporate Social Responsibility (CSR) on Product Quality Evaluations”

Yeosun Yoon, Rice University

Zeynep Gürhan-Canli, University of Michigan

This research investigates the effects of Corporate Social Responsibility (CSR) on consumers’ product quality evaluations. While many studies in the CSR area show positive effects of CSR activities on consumers’ company evaluations and purchase intentions, it is not clear when and how CSR activities influence product quality evaluations. Among a few studies that investigate the effect of CSR on product quality evaluations, Brown and Dacin (1997) suggest that CSR associations indirectly affect global product evaluations through the overall company evaluations. Similarity, Sen and Bhattacharya (2001) argue that a company’s CSR activity can influence purchase intentions both indirectly and directly. However, detailed new product quality information as well as information about companies were given in both studies, while consumers often have to evaluate a new product without such clear information.

In this study, we propose that when information about new product quality is not very clear, consumers may try to evaluate product quality based on CSR information. When the area of a CSR activity is product-relevant and has direct implications for product quality evaluations, the CSR activity will have a direct effect on

consumers’ product quality evaluations. In other words, if consumers evaluate the CSR activity positively (negatively), they will infer that the product has higher (lower) quality. On the other hand, when the area of a CSR activity is not product-relevant and has no direct implications for product quality evaluations, the CSR activity will influence product quality evaluations only when consumers can infer Corporate Ability (CA) from the description of the CSR activity. Thus, we hypothesize that CA evaluations will mediate the effects of CSR on product quality evaluations.

We employ two experiments to examine when and how CSR activities affect perceived product quality. In experiment 1, we manipulate product relevancy of a CSR domain and valence of CSR activity. Specifically, the study employs a 2 (relevancy of CSR: high vs. low) X 2 (valence of CSR: positive vs. negative) between-subjects design with two control groups. We used a fictitious clothing manufacturer in a foreign country and told subjects the company was planning to introduce their products in their local area. No other information about the company was given, and subjects in two control groups received a real sample of a T-shirt made by the company and were asked to evaluate its quality at this point without CSR information. In addition to the company information, subjects in experimental groups received additional information regarding a CSR activity run by the same company. Based on the CSR literature (Sen and Bhattacharya 2001) and our pre-test results, we used the issue of labor practices (e.g., sweatshops) as a high relevance CSR activity and the issue of diversity in employment (e.g., supporting ethnic minority) as a low relevance CSR activity. We created the positive and negative CSR Record scenarios similar to the ones Sen and Bhattacharya used. The valence and specificity of CSR information of the high relevance CSR activity were comparable to those of the low relevance CSR activity. After reading the company and the CSR information, subjects received the same T-shirt that subjects in the control groups got and were asked to evaluate the quality of it. Our results suggest that product quality evaluations vary by valence of the high relevance CSR activity but not the low relevance CSR activity. The product was perceived to have higher (lower) quality when the high relevance CSR activity was positive (negative). On the other hand, consumers evaluated the quality of the product no differently after learning about the low relevance CSR activity regardless of valence of the CSR activity.

In experiment 2, we seek to enhance the findings from experiment 1 by examining when and how consumers make inferences about product quality even when a company supports a low relevance CSR activity. Specifically, we examine the extent to which CSR information affects perceptions of corporate ability (e.g., ability to manufacture high quality products) and how perceptions of corporate ability mediate the effects of CSR on product quality evaluations. We suggest that CSR information has a positive effect on corporate ability when consumers infer from such information that the company is sincerely committed to consumers’ well-being. This experiment is currently being designed and the data will be collected in the summer.

“The Role of Corporate Social Responsibility in Consumers’ Attributions and Brand Evaluations after a Product-Harm Crisis”

Niraj Dawar, *Western Ontario*
Jill G. Klein, *INSEAD*

From a marketing perspective, the firm’s economic benefits from CSR have been documented in its link to consumers’ positive product and brand evaluations, brand choice, and brand recommendations (e.g., Brown and Dacin 1997; Drumwright 1994; Handelman and Arnold 1999; Sen and Battacharya 2001). Through a variety of theoretical lenses, the important contributions of these studies have been to demonstrate that (1) CSR plays a role in consumer behavior, over and above economic or ‘rational’ considerations such as product attributes; and (2) CSR has a spillover or ‘halo effect’ on otherwise unrelated consumer judgments, such as the evaluation of new products.

Yet these studies have also shown that the effects of CSR on consumer behavior are not overwhelmingly strong. Their results indicate that while CSR plays a role, traditional constructs such as product attributes and consumption goals still account for the bulk of the variance in consumer behavior. Existing studies have sought to examine the impact of CSR on routine product and brand evaluation processes such as consumers’ new product judgments. But CSR may not be diagnostic in these situations, and therefore, CSR effects may not be prominent. Instead, CSR may have its most marked effect where ordinary information about a company and its products is deemed insufficient to arrive at an informed judgment. We look at CSR effects in non-routine consumer judgments, specifically, a product harm crisis.

Negative events such as product-harm crises tend to trigger elaborate cognitive processing, including attributions of responsibility (Fiske 1980; Folkes 1984; Weiner 1986). These attributions are important from a marketing perspective because they form the foundation of consumers’ subsequent brand perceptions and behavior. Weiner’s (1980) widely used attribution model conceptualizes three causal dimensions of attribution that lead to an overall judgment of responsibility or blame: (1) the locus of the behavior (the event that triggers the crisis), which can be internal or external to the actor (in our case, the firm); (2) the stability of the behavior, which can be unchanging or temporary; and (3) the controllability of the behavior, which can be within or outside the control of the actor. If the locus is internal, and the behavior is stable and controllable, observers (in our case, consumers) tend to attribute responsibility to the actor, and subsequent consumer behavior such as blame or anger, is directed toward the actor. If on the other hand, the locus is external, and the behavior is temporary and uncontrollable, attributions will tend to be made to external factors (Folkes 1984). The recent product-harm crisis involving Firestone tire blowouts that allegedly has led to consumer deaths, and the subsequent recall of millions of tires, helps illustrate this model of the attribution process. If consumers believe that the tires were poorly made, that Firestone has had a history of product-defects, and that they could have averted the problems with better quality control, they will be likely to attribute responsibility to Firestone. In contrast, if they believe the problems were caused by harsh driving or vehicle conditions, that this is the first time Firestone’s tires have been implicated as the cause of accidents, and that driving and vehicle conditions are in fact outside the control of the tire manufacturer, they will be more likely to attribute responsibility to external factors, such as to the vehicle manufacturer or to driving conditions. Our intention in studying attributions in a product-harm crisis setting is to establish whether CSR antecedents bias locus, stability, and controllability attributions.

In our research, we examine how consumers’ prior impressions of a firm’s CSR image affect their attributions of locus, stability and control. We conducted two studies, one using a fictitious firm and one using an actual firm, with a total of 300 subjects recruited at a shopping mall. In these studies, an oil company’s reputation related to treatment of the environment was manipulated. (In a control group, the real company’s image was measured rather than manipulated in order to control for demand effects.)

Results showed that the company’s CSR image played an important role in determining attributions, which, in turn, influenced blame (attributions acted as a mediator of blame). Further, brand image and purchase intentions were predicted by the degree to which the company was blamed. When the company’s CSR image was negative, consumers made attributions that led to blaming the firm, and this blame negatively impacted brand image and purchase intentions. When the company’s image was positive, however, consumers made attributions that implicated other parties and the firm’s reputation was left intact. Thus, a positive CSR image can be viewed as an insurance policy against suffering the full negative effect of a product harm crisis.

This research contributes to a better understanding of the role of CSR in consumer behavior. CSR effects on attributions and brand evaluations provide a promising avenue for further exploration. In particular, experimental research on consumers’ contingent use of CSR information can help define conditions under which CSR will or will not affect consumer behavior. The goal of this research is to demonstrate that strong and direct effects on consumer behavior do exist and to point future researchers to settings in which they are relatively easy to detect.

Consuming Modernities: The Global Youth Segment as a Site of Consumption

Dannie Kjeldgaard, University of Southern Denmark
Søren Askegaard, University of Southern Denmark

EXTENDED ABSTRACT

In the marketing literature youth has been held up as the prototypical example of a global segment (see for example Hassan and Katsanis 1991, Tully 1994, *Marketing News* 2002). The basis for the excitement about the youth segment (under various names such as the 'teen segment', the 'Gen X' culture', 'baby busters', 'the MTV Generation' etc.) largely stems from the allegedly uniform consumption habits of young people all over the world – their clothing, music tastes, and media habits.

This paper seeks to explore aspects of the globality of the global youth segment by analysing young consumers' discourses of identity and consumption within a system of centre-peripheries (Hannerz 1996) of the global cultural economy (Appadurai 1990). It is suggested that the global youth segment constitutes a global site of consumption in which multiple discourses of modernity are played out according to local positions in relation to the global cultural economy.

Within consumer research the main focus on young people as consumers has generally followed two strands: one which deals with the notion of adolescents and the dark side of consumption and the study of the socialization processes of consumption among young people (cf. Roedder John 1999). These two strands of research, while valuable contributions in terms of policy and to the understanding of consumer socialization, have given very little voice to the consumers in question and has not analyzed cultural or global aspects of young consumers' lives.

The study was conducted as a multi-sited ethnography (Marcus 1995). Data was collected among high school students in Denmark and Greenland and in an urban and rural context in each of the localities. From the ethnographic material we identify several discourses of identity and consumption and analyze these in relation to modernity and globalization. The material from the Danish context suggests that consumers in this context account for identity and consumption along the lines suggested by theorists of late modernity – that is, a discourse of the reflexive construction of individual identity. In the Greenlandic context we identify several discourses revolving more around collective logics in relation to ethnicity, post-colonialization and globalization, hence highlighting other aspects of modernity.

The identity discourses identified facilitate a broadening of the notions of identity in late modernity. The predominant model of identity posits the increased reflexivity of the construction of identities whose focal point is the individualized biography, due to new time and space configurations (Giddens 1991), global consumer culture (Bauman 2001), and the dissolving of traditional modern social categories such as class (Beck 2001). The presence of the relatively collective discourses in Greenland, it is argued, can be seen as (being) products of the locality's position in the periphery of the global cultural economy. This position (and the socio-cultural history of Greenland) means that other discourses are prevalent and foregrounded, pushing the discourse of individual self-realization into the background. While the discourses identified in the Greenlandic context are situated within the realm of late modernity, they are different answers to different problems of late modernity than those pointed out by late modern theorists. Miller (1996) in this respect has pointed out that while the present theorizing of identity in late modernity provides an interesting analysis of how the notion of identity itself becomes what is of

concern for individuals (which is why it is a reflexive identity), the theories do not rest well with the experiences and discourses emerging from other places in the global cultural economy outside of the Occidental sphere.

That young consumers buy the same things is taken as evidence that they have shared preferences. However, preference implies choice among alternatives. Since the institution of youth as an identity space is a relatively recent invention (primarily arising in the post-WWII era) and often one that continuously seeks to break with tradition, local culture cannot significantly provide youth cultural imagery. The only choice is Western products (or Westernized local youth cultural products such as local versions of rock music). The institution of youth, and the historically global nature of youth culture, can therefore be said to be what facilitates the apparent similarities in consumption preference.

The multiplicity of discourses identified in the ethnographic material are analyzed as emerging from localities' positions in relation to the global cultural economy, and hence the meeting with modernities. Youth as an institution is one aspect of global modernity, and it makes itself present through the market representations of youth. We argue that the global youth segment, rather than constituting a homogeneous group of consumers with similar preferences, is a site of consumption, a representation of the idea of youth which is available globally. The global youth segment is used for different purposes in different localities, and hence is a site in which locally constituted discourses of identity can be articulated.

Tastes, Distastes and Disgusts: Young Consumers' Positive and Negative Experiences of Food

Emma N. Banister, Lancaster University

Gayle J. Booth, UMIST¹

ABSTRACT

A number of authors have explored dislikes, distastes and the associated emotion of disgust, yet there has been little discussion of the development of dislikes and distastes in children. Eight children between the ages of 5 and 10 were given disposable cameras and asked to photograph their likes and dislikes. Following the development of the photographs the children discussed their selections (a third of which featured food products). We explore the photographs and the explanations offered by the children within the context of socialization and develop our analysis around a number of emergent themes.

INTRODUCTION

A limited number of authors have begun to explore dislikes, distastes (e.g. Banister and Hogg 2001; Hogg and Banister 2001; Wilk 1995; 1997) and the associated emotion of disgust (Rozin and Fallon 1987), yet little research has considered the developments of dislikes and distastes in children. This paper focuses on one aspect of a larger study, which aimed to explore children's socialization and their formation of tastes and distastes. The paper focuses on young consumers' preferences in the category of food and drink. We report the findings of a qualitative study, which focused on pupils in an infants and junior school in Yorkshire, England. Eight children were given disposable cameras and the task of taking photographs that represented their likes and dislikes. Once the films were developed, the children were interviewed individually about their choice of photographs.

LITERATURE REVIEW

Childhood

Childhood is not simply a biological state of being, but a fluid stage of the social life course. The way in which we view childhood has been subject to change. In one sense Western children are currently seen as vulnerable, innocent and passive, as compared with their past roles as active participants in industrialization, working in factories or mines. The current law and moral discourse fosters common belief systems that harbor children within a sphere of education and protection, encouraging the safe arrival of adulthood. What could be termed a suitable 'cultural pedagogy' is translated onto children, suggesting power, yet also resistance, stemming from spheres such as schools and the family environment (Steinberg and Kincheloe 1997). Ironically, against this backdrop of protection and assumed passivity is a phenomenon, which marketers term KGOY ('kids getting older younger') reflecting children's increased presence in the marketplace where they are recognized as active and savvy consumers. Children represent a market in their own right (encouraged by the pressure on parents to give ever increasing amounts of money or allowances), as well as important persuaders of family spending. Recent figures suggest that the total UK market estimate for children's spending power is £30 billion, which includes children's annual pocket money (£2.3 billion), and their parent's spending on clothes, food and even holidays (Hollis 2002:14).

Socialization

Consumer socialization refers to the "processes by which young people acquire skills, knowledge, and attitudes relevant to their functioning as consumers in the market place" (Ward 1972:2). Through socialization, consumers learn to agree on shared meanings for some symbols, but also to develop individual interpretations of their own (Elliott and Wattanasuwan 1998). During their early years, the central feature of socialization is the family (Gunter and Furnham 1998; Roedder John 1999; Turner 1970) and it is generally accepted that other major factors are age, peers, culture and mass media. With age, more personal time and space becomes available to children (Solberg 1997) which they can use independently; offering more scope for increasingly personalized activities, often initiating self-directed play (Woodhead 1997). Time spent at friends' houses expose the child to different contexts. This time and space could provide the environment within which to empower the child, as supervised, self-initiated and directed play is seen as a valuable source of learning. An 'adult world' exists, which could be considered to exclude children. However, the development of child-specific merchandise predominantly excludes adults. This provides time and space, reinforcing a permitted retreat—privacy and company with one's own kind.

Children make their own interpretations of the adult world, making decisions and presumptions about what adults do (Steinberg and Kincheloe 1997, Belk 1984). Their perspective of the adult world thrives on a somewhat limited understanding and children therefore become susceptible to stereotyping, with the (non) ownership of goods reflecting this (Gunter and Furnham 1998; Belk et al 1982). This is also highlighted in stereotypical parental choices, which emphasize the ideological inclusion and exclusion of products and brands for the child.

Taste: A Form of Classification

The goods that children consume and the differentiation they achieve through the symbolic properties of products and brands should be understood as 'socially patterned' by cultural standards (Lury 2001). This is because distinction is made relationally in comparison to others (Lury 2001) with 'membership' and 'reference groups' employed as sources of comparison and evaluation (Bearden and Etzel 1982).

Bourdieu (1984) views taste as one of the ways in which people classify and organize symbolic meaning with regard to class relations. Tastes can be fashioned in such a way that social positioning within group identities can be swayed negatively or positively by lifestyle choices (Bourdieu 1984). Bourdieu (1984) describes this process of learning through combining past and present experiences as culminating in a 'habitus', an organizing system or structure. This habitus becomes internalized and transformed into a way of thinking, which creates significant meaning to the self, within and amongst the group, serving as a pivot by which groups and individuals symbolically display their 'cultural capital'. In other words, consumption and related behavior is a way in which group hierarchies are regulated by the signs and symbols that are or are not exhibited (Oyersman and Markus 1990).

Tastes will often reflect previous experiences, suggestive of reflexive engagement with memories, triggered through current events. Through taste aversion learning and negative reactions to culprit foods, ill feeling becomes attributed towards the smell or

¹Acknowledgements: This research was funded by a grant from the Academic Development and Resources Committee's Research Initiative Fund at UMIST 2001.

taste of previously unpleasant experiences (Zimbardo and Weber 1994). New skills and knowledge acquired by children are negotiated through the recognition and splitting of good and bad experiences and attributing those experiences symbolically to products and brands (Klein 1987). Wilk (1997) argues that to learn what can be considered tasteful is basically learning what bad taste is, and in the case of food, what tastes unpleasant.

Christensen (1993) notes how children 'stare' at others, making judgments leading to inclusion or exclusion within the spatial location, highlighting how matters of distaste are located within normal appearances and then considered deviant. Research has also suggested that dislikes are easier to articulate than favorite products and this highlights the tendency of consumers to attempt to blend in with their peers (Wilk 1995). The decision not to consume is often achieved through the serious contemplation of what can be considered as 'not us' or 'not we' (tribal). Therefore, the 'not me' aspect of tribal community life equates to a certain embodiment which equates to 'them' (Maffesoli 1996).

Rozin and Fallon (1987) provide a discussion of the development of disgust in children and conclude that disgust is not present at birth, but that at some point before reaching five years of age, those negative responses to objects that are disgusting to adults appear. Disgusts and distastes can be distinguished because of the basis for rejection. Disgust is depicted as having an ideational basis for rejection (i.e. offensiveness and contamination), whereas rejection on the basis of distastes is primarily motivated by sensory factors (Rozin and Fallon 1987). The authors suggest three possible motivations for rejection. Firstly, sensory affective (the belief that the object has negative sensory properties—usually a bad taste or a bad odor); secondly the anticipation of harm following ingestion (bodily harm or social harm, perhaps relating to status); and thirdly, rejection based on the basis of ideational motives (knowledge regarding the nature or the origin of the food). These motivations could provide a useful framework for this research (Rozin and Fallon 1987:24).

Suitable context

It is an adult focus that constructs a reality whereby products and brands are evaluated in a suitable context for children. Child-specific merchandise is organized in such a way that an acceptable ownership of goods is managed. Children's products and brands can therefore be seen as signifiers, representative of adult culture, yet organized in such a way that is seen as suitable or perhaps tasteful for childhood culture. Products and brands are recruited in the light of a 'suitable pedagogy' (Woodhead 1997). Adults act as gatekeepers, with the status of adulthood signaling authority and controlling access to many products (and their entry into the home). What is seen as fit, or unfit for the ears, eyes and minds of children stems from an adult culture, and yet this is open to evaluation and scrutiny from children, and the childhood culture in which they dwell. At times there will be a clash of cultures, and aspects of power and resistance will be reorganized to find a middle ground of acceptable or unacceptable tastes (Foucault 1977; Wilk 1995; Wouters 1986).

RESEARCH DESIGN

This study aimed to explore children's positive and negative experiences of food and the influences on these interpretations. A rural village school in Yorkshire, United Kingdom, was chosen as a suitable location to investigate the overall research concerns. The village has witnessed steady development since the closure of mines in the 1980's and features high rates of geographical mobility yet with a prominent presence of long-term traditional dwellers. The development of this community has resulted in an array of

social actors from varying backgrounds and their children attend the village school.

The research reported here represents one aspect of a larger study. Eight children aged between 5 and 10 were given single-use cameras over a two-week vacation period. They were asked to take photographs of items that they liked and disliked. The children were given an open brief and took photographs of a wide-ranging subject matter, including toys, clothing, houses, scenery, family members and flowers. For the purposes of this paper we focus on food items, which provided a popular choice of subject matter.

Photography has been used in a number of studies and provides a means to provoke an emotional and expressive response (e.g. Belk et al 1982; Morrow 1998; Schratz and Steiner-Loffler 1998). Photographs can help to locate items in time and space (Emmison and Smith 2000) and provide images, which the photographer (the children) could then talk about at length. As McCauley (1997:63) says "*all photographs are representations, in that they tell us as much about the photographer, the technology used to produce the image, and their intended uses as they tell us about the events or things they depicted*". Photography has been successfully incorporated into previous studies that focus on children (e.g. Schratz and Steiner-Loffler 1998) and can provide useful visual prompts during the interview process (Morrow 1998).

The analysis of these photographs was also child-centered. Once the films were developed, one of the researchers quickly glanced through them before the interviews. However, to all intents and purposes, when the child who had taken the photographs opened the envelope containing the photographs, no prior analysis had been conducted. The child then spoke freely about why he or she had chosen to take the photographs, placing them on one of two boards, one of which represented those photographs featuring likes, and one featuring those that were disliked. The interviewer used prompts where necessary, but as much as possible the child talked about his or her photographs as independently as possible. Following this stage, the two researchers reviewed the transcript from the interview, looking for meanings in addition to those voiced by the participant. The process was therefore one of self-analysis (by the child), supplemented by the interpretation and the discussion between the researchers.

As with all research focusing on children, it was important that ethical guidelines were observed. We received written permission from the parents of all the children participating in the study. Participation was voluntary and was in full knowledge of the teachers and the head teacher of the school. The children who participated in the research were not offered any reward for their participation; they were allowed to withdraw at any time from the study; and could withdraw photographs from the study if they wanted to do so.

Findings

The use of photography provided a successful means by which to involve the children in a task, providing insight into their lives, their likes and their dislikes. The children were given a free rein to take photographs of anything they wanted, although the initial invitation gave the suggestions of food, shoes, clothes, places, shops, packets, bags, drinks, smells, trainers, toys, pictures and sweets. Children took photographs of a wide variety of subjects, with a mixed amount of success! However, it is worth noting how seriously the children took the task. They seemed to have carefully considered how to use their limited (i.e. 24 exposures) opportunity to convey their tastes in as much detail as possible.

For the purposes of this paper, we will focus on just one category of photographs, the most popular subject matter, food. A number of emergent themes (Miles and Huberman 1994) will be

TABLE 1
Children's tastes and distastes in food

Group/category	No. items mentioned	No. items positive	No. items negative
Rice/pasta/bread/' healthy' cereals	5	1	4
Snack foods	9	6	3

Fruit and vegetables	22	3	19
Dairy products	6	2	4
Processed / tinned foods	4	2	2
Chocolate / sweets	10	9	1
Home cooking	4	4	
Sauces / accompaniments	4		4
Totals	71	31	40

discussed, with the aim of reaching a greater understanding of children's reasons for disliking certain food products and liking others. These themes are natural vs. processed / healthy vs. unhealthy, adult foods vs. child foods, oral taste vs. other senses and symbolic associations and experiences.

One of the important characteristics of food and drink is the way in which it physically becomes part of the self. This provides an important distinction from some of the other subjects featured in the photographs (such as clothing and toys), although some links could be made between physical tastes (foods) and smells, with some objects featured in photographs because of the offensive smell associated with them (e.g. rubbish bins and dog faeces).

As can be seen by Table 1, food was more likely to feature in children's photographs as disliked items. However, overall the photographs depicted approximately equal numbers of positive and negative photographs. This suggested that during the photography exercise children looked to food products when considering items they disliked, or it could be that they found disliked food products more easily available (i.e. in the home).

The categories of foods selected are informative, providing us with a sense of the types of foods that were liked and disliked by these children. From these categories and the detailed responses of the children, we drew upon a number of themes, which helped to make more explicit the reasoning behind the selections. Although the photographs are not included within this paper they will form an important part of the presentation.

Natural vs. Packaged /Processed–Healthy vs. unhealthy

The distinction between natural foods and packaged/processed foods was immediately clear. In general, natural foods seemed more susceptible to negative interpretation by the children than those that were packaged and manufactured. The distinction between packaged and processed foods tended to coincide with those that could be interpreted as healthy or unhealthy, with children often rejecting or demonstrating distaste towards foods that were widely considered to be 'good for you'.

Products commonly regarded as important staples in the British diet such as rice, pasta and bread were not often included by the children in their photographs, perhaps because many children

regarded them in neither a positive or a negative light. It is likely these were items that were just accepted as part of a 'normal' diet, rather than inspiring particularly positive or negative feelings. However, there were a few children who voiced their dislikes of such products:

Kate (age 7): "Rice, I don't like any kind of rice..."

Health organizations frequently warn about the dangers of a high salt, high fat, high sugar diet, yet many of the photographs featuring children's tastes focused on products widely considered to be unhealthy. In contrast, the disliked photographs featured a number of foods, which are considered to offer more nutritional value to the children. Children seemed to favor those foods that were either sweet or featured a high fat content. In fact the 'snacks' category and the 'sweets and chocolate' category stood out as ones in which children included more positive than negative images.

The photographs provided an indication of the success of company marketing strategies, with the children selecting products that were clearly targeted towards them (providing links with the themes of adults' vs. children's foods). Tinned foods did not feature very often in the children's photographs, but it is perhaps worth noting that the two tinned items interpreted positively (out of the 4 photographed) were both baked beans with sausages, items that are primarily associated with children.

Kate (age 7): "Baked beans and sausages, they're nice"

Perhaps predictably, the children's photographs featured a large variety of sweets and chocolates. The number of sweet items photographed could be partly attributable to the time of year, which coincided with the children's Easter break from school. The festivities may have increased the children's access to chocolates and 'treat' products, and three of the eight children included photographs of Easter eggs. In general sweets and chocolates were interpreted positively by the children, in fact there was only one product in this category which was included because it was disliked, and this was the 'Manchester Tart' which is a traditional British cake, primarily popular with (older) adults.

The children often found it difficult to express why they liked or didn't like particular food items. The vocabulary and ability to describe the subtleties of oral taste is perhaps too advanced for many of these children. Likes would often be expressed with the use of sounds, such as "Ooooh..." [e.g. Easter eggs]. One of the girls in the study attempted to describe her dislike for onions. She found it quite straightforward to describe the physical reaction that they produced (i.e. the tears) but she found it very difficult to explain what it was about their actual taste that she did not welcome, initially attributing her dislike to their 'sweet' taste.

Kate (age 7): "they make me cry and they are too sweet, too much sugar in, I do like to eat things but nothing too sweet"

Researcher: "Can you think of a reason why you don't like the tastes?"

Kate: "They taste like they have got this... They taste to me as if they have this little thingy in which makes them taste horrible but I don't know what it is... that makes me feel sick..."

This in itself demonstrates the difficulties of exploring tastes and distastes with children. Although children may have clearly defined likes and dislikes, it is difficult to ascertain where these views stem from. In the following interchange, the language used by the participant would seem to reflect a consideration for the social meanings associated with food—because of the use of the word 'cool'—but it seems more likely that the word 'cool' was selected as a 'catch all' term, because of the difficulties associated with describing specific tastes.

Isla (age 7) "These are crisps I don't like, they're plain"

Researcher "Do you like other crisps?"

Isla "Yes, but I don't think these crisps are cool"

In addition many participants found it difficult to pinpoint what they liked about foods.

Lucy (age 9) "Look, I like tuna twist and I like roast potatoes"

Researcher "Do you, why?..."

Lucy "They feel nice in my tummy"

Adult foods vs. child foods

Findings from a previous study indicated that children are very aware of the importance of consuming those products and clothing, which are deemed 'appropriate' for their age (see Banister and Booth 2003), a concern that was also noted with the young adult participants in another study (Banister and Hogg 2001). This same kind of anxiety was noted here, although to a lesser extent. Many of the food products featured are clearly those which the children's parents favor, and which the children found more difficult to understand. Examples of such products were items such as coffee, sauces and meal accompaniments (e.g. pickles, salad cream).

The children were also at an age when certain products might be considered distasteful because of their association with a younger age group. For example one of the participants described baby food as 'sloppy'. Yet other products remained liked, precisely because they could be associated with the participant at a younger age (nostalgia).

Isla (age 7): "I like strawberries... I learned them when I was a baby"

The research also allowed the opportunity to consider how the children interpreted those products that were directly targeted at them. Some of these featured as liked products.

Peter (age 5): "These are my little brother's [Easter eggs]... I like Bob the Builder"

Researcher: "Why do you like it?"

Peter "Yes, I've got Pilchard he is a character, he's a cat on Bob the Builder"

Ironically, aspects of marketing that might be assumed to ingratiate products to children could sometimes have the reverse effect.

Peter (age 5) "...I don't like Sugar Puffs because the honey monster is on the video [advertisement]"

Symbolic associations and experiences

Like many consumption experiences, food products were not without symbolic meanings. Associations and previous experiences were frequently evoked by the photographs and provided explanations regarding why the food item was liked or disliked, suggesting links with Rozin and Fallon (1987).

Kate (age 7): "I don't like curry... It reminds me of being sick and it makes me feel sick"

Researcher: "Can you remember the first time it made you feel sick?"

Kate "It made me sick and daddy shouts at me and he still gives it me and he says if I don't eat it I can't have anything else and I don't like it"

Researcher "Is that why you don't like things because it reminds you?"

Kate "Of being told off"

Two types of (negative) associations were made here. Firstly the curry was found distasteful because it had made the child sick, and secondly it reminded her of another unpleasant experience—being told off by her father—which made her rejection all the more concrete. There were actually a number of instances where the children made reference to foods that had made them feel sick in the past, and by association the items remained offensive to them.

Isaac (age 8) "...when I used to like strawberries my daddy bought some and then I ate all of them and then I felt sick"

One of the participants considered mint flavors—even in foods that he generally liked, such as chocolate or ice cream—to be negative because it reminded him of toothpaste, or more specifically, cleaning his teeth, an activity he did not enjoy.

Isaac (age 8) "I bet you're wondering what this [ice cream and chocolate] is... it is mint, but you have got to put this on the bad board... It's my toothbrush, I hate brushing my teeth. I think it is a waste of time"

Another reoccurring theme was the way in which the appearance of food could be altered and made less appealing, much like Rozin and Fallon's (1987) allusion to personal contamination in food. A number of participants described how others (generally siblings) would change the appearance of food, and how this affected their perceptions of products.

Kate (age 7) "I don't like Weetabix it makes me sick. My brother makes it horrible in his mouth..."

Lucy (age 9) "I don't like the taste and feel [of bananas]... my sister does horrible things with them in her mouth...she does it with pasta too...and cheesy Wotsits...."

Throughout this study, the children made reference to items that were associated with their home life. Sometimes photographs (both positive and negative) depicted family members (especially siblings) or pictures of the home and garden. At other times the associations were less direct. Home-cooked meals fitted in with this less direct association in the sense that it reminded children of family meals—time spent together as a family. In every case that home cooking was featured in the photographs (by 4 different participants) these photographs represented positive images for the children.

Kate (age 7) "I like this macaroni cheese with tomato ketchup, my mummy does this"

'Taste' vs. other senses

It was interesting to recognize that although food is primarily associated with the sense of taste, other senses were important in the way in which the participants interpreted the food. A number of photographs were taken of things that were interpreted as dirty or smelly (e.g. dirty plates). Eggs were mentioned by a couple of the participants as foods that would be rejected because of their smell. Certain foods were consistently featured in a negative light; examples were rotten fruit and bananas, which were seen by many to be particularly disgusting. In fact the way in which certain foods changed from being inviting and positively viewed products, to ones that were viewed negatively, could explain some of the strongly held dislikes for fruits and vegetables.

CONCLUSIONS AND DISCUSSION

The method used in this study was particularly successful in encouraging children to talk about their own experiences of consumption, and can be considered a child-centered methodology. However, it was often difficult for children to verbalize their thinking behind the photographs. This partly reflected the age of the children. Between the ages of 5 and 10 children's vocabulary is perhaps not sufficiently developed to fully elaborate something as complicated as taste—something that many adults choose to be educated to achieve, as is the case with wine tasting.

However, the photographs were very effective in exploring the associations that children made with certain foods and how these affected their interpretation of these foods. Throughout the photography exercise, children talked enthusiastically about their day-to-day likes and dislikes, and food was an interesting category on which to focus, because of its everyday nature. Through exploring children's attitudes to different foods, we learnt a great deal about children's relationships with others, the influence of age, marketing and experience on children's interpretation of products and the world around them.

The findings provided support for the work of Rozin and Fallon (1987) who identified four types of rejection (distaste, danger, inappropriateness and disgust) in relation to food. In the context of this study, distaste was the most difficult source of rejection for the children to articulate, much more so than when their dislikes reflected previous experiences, or rejection on ideological grounds (e.g. adult foods or 'not cool' or for babies). Some

of the foods could be interpreted by children as representing danger in the sense of reliving past experience—for example eating food that had made them sick in the past (even if they had originally liked that food). The photographs provided the ideal means for children to identify the properties that they found offensive or disgusting about certain foods, sometimes linking food consumption with past experiences (being sick) or the future appearance of the food (e.g. rotting fruit). The children frequently used facial expressions to illustrate their arguments, screwing up their face to illustrate their distastes or disgust for certain products, which again suggests that visual methodologies were an appropriate method for this study, rather than relying on the ability of children to articulate their preferences.

LIMITATIONS

The study was not without its limitations. There were many benefits associated with using a method that encouraged enjoyment and creativity by the children. However, the data collection relied on the fact that children would be able to use the cameras, and some photographs were rendered useless for the study. In addition as images have several sites of meaning construction, someone else may have been provided with different photographs or with a different explanation for their inclusion. At times the children's explanation of why they had decided to take certain photographs was incomplete and difficult to follow, but this is a difficulty associated with all research that focuses on children. In essence this study was exploratory in nature, seeking to inform and generate interest rather than lead to conclusive results.

FUTURE RESEARCH

Future research should explore how children's tastes develop. Particularly with food products it would be interesting to chart how foods normally associated with mature tastes gradually become acceptable to children, and explore how different parenting attitudes (to children's food consumption) might affect the development of tastes (and distastes). It was interesting to note how fresh and natural foods seemed more susceptible to distastes. It is suggested that it is not always the taste of a natural product that puts children off, but the way in which the product changes with time. Bananas, although featured by one child as a liked product, were more often featured as disliked products, because of the way in which the consistency of the fruit changes when it turns from ripe to over ripe and past its best. In the interests of public policy and the promotion of sufficient fruit and vegetable intake by children, this observation needs to be studied more clearly. It would also be useful to expand the research focus to include a greater number of children from a variety of backgrounds, as this would expand the number of discoveries and conceptualization.

An Exploration of Social Influence on Dyadic Giving

Tina M. Lowrey, University of Texas at San Antonio

Cele C. Otnes, University of Illinois

Julie A. Ruth, Rutgers University

EXTENDED ABSTRACT

Most gift-giving research focuses on aspects of the giver, recipient, or their relationship, although Sherry (1983) has argued that charting gift-giving behavior over time and “as one’s social network expands and contracts” (p. 158) would illuminate the ways gifts capture the nature of social relationships. Our interpretation of the Christmas giving behavior of five informants over 12 years demonstrates how over time, givers are influenced by third parties when selecting gifts for recipients. Thus, seemingly personal, dyadic gifts perform important relational work in the social network.

Our taxonomy of 10 social influences stemmed from an exploration of these questions:

1. How do third parties in a giver’s social network influence dyadic giving?
2. What are the underlying relational processes of these social influences?

Method

We interviewed and accompanied five givers on shopping trips during four Christmas seasons from 1990 to 1997. For further details, see Lowrey, Otnes, and Ruth (2004). We began our analysis by systematically coding the text to classify and compare changes in giver/recipient relationships and other key dimensions of gift giving. While assessing the relational roles of the giver and recipient among the 70 dyads examined (five givers and their many recipients), as well as changes in their lives, we noticed how our informants adapted their giving to particular recipients in response to others in their social networks. Thus, we recoded the data to identify these social influences. Because our analysis revealed the salience of social influences, we conducted final interviews in 2001, asking informants to assess the validity of these influences. Our interpretation is centered on the five underlying relational processes associated with the 10 social influences.

Findings

The relational process underlying the first two social influences, calibrating and practicing equipollence, is that of making social comparisons. When calibrating, givers engage in social comparison across the network, categorize recipients as different from one another, and adjust their giving accordingly to symbolically express their standing vis-à-vis others. When practicing equipollence, givers signal that they regard certain recipients as similar in closeness or relational status to one another.

The next two social influences are reenacting third-party traditions and relinquishing traditions, which share the underlying relational process of adjusting to disrupted traditions. In the first, givers find themselves reenacting traditions originally created and maintained by now-absent third parties (normally family members who have died). In the second, givers may find themselves allowing a powerful third party to usurp a tradition the giver had previously enjoyed with a particular recipient.

Accessing social support underlies the two social influences of enrolling accomplices and using surrogates. Social support is emotional or instrumental assistance provided by third parties. When enrolling accomplices, givers use third parties to help accom-

plish gift tasks, but may also seek to bond with the third party through joint activities and shared tasks. In contrast, givers use third parties as surrogates when the gift-giving situation is associated with risk in some way (e.g., giving a gag gift that may be misinterpreted).

Gaining permission from gatekeepers and adhering to group norms are two social influences stemming from the desire to act within relational rules. When gaining permission, givers ask third parties (often parents) to approve of a gift item for a particular recipient (often children) in order to avoid damaging the relationship with the gatekeeper. Adhering to group norms includes setting restrictions on family giving (e.g., gifts for children only) or in workplace settings (e.g., Secret Santa exchanges), and helps to maintain satisfactory social relations among the giver, recipients, and third parties.

Finally, the relational processes of initiating and severing relationships leads to the social influences of integrating and disassociating. Integrating recipients occurs when a person important to the giver (e.g., her father) brings new associates into the giver’s social network (e.g., father’s new girlfriend), who are then new recipients for the giver. With disassociation, when such relationships are severed, ties with these types of recipients are severed as well.

These social influences expand Sherry’s (1983) model and Belk and Coon’s (1993) notion of agapic giving. In Sherry’s reformulation stage, the two basic motives of giving (altruistic and agonistic) are directed toward the recipient. We argue that givers often use gifts in altruistic and agonistic ways to manage relationships with others in the network as well. Similarly, Belk and Coon’s agapic giving is characterized by a sacrifice on the giver’s part and the attempt to singularize recipients. Our findings demonstrate that givers also make sacrifices to and attempt to singularize third parties.

We acknowledge three limitations of our study. First, we emphasize the giver’s perspective. Future studies should examine the perspectives of recipients and third parties within a giver’s social network. Second, our findings are based on interactions with females. Although women are the primary caregivers and maintainers of relationships and rituals in most societies, it would be interesting to investigate how men’s giving might be influenced by third parties. Finally, the context of giving at Christmas may not be the same as other giving occasions, which may produce different patterns of behavior. Nevertheless, we feel that social influence is likely to impact giving, regardless of the context.

Reconciling Christianity and Modernity: Australian Youth and Religion

Teresa Davis, University of Sydney

Jeaney Yip, University of Sydney

ABSTRACT

The growth of New Christian Movement Churches (such as the Pentecostal movements) in Australia is explored against a backdrop of falling attendance among the more 'traditional' churches (Catholic, Anglican etc). The powerful appeal of these New Christian Movement Churches (NCMs) to young people is studied through a series of interviews with young Australians using a phenomenological approach. The common threads from the enquiry are drawn together and mapped onto Lambert's (1999) secularization of religion model. A 'consequences of modernity' (Giddens 1991) argument is used to understand how these NCMs fulfill the need that these young people feel to reconcile aspects of modernity with their religious beliefs.

INTRODUCTION:

This paper explores the seeming contradiction of the exponential growth of young Australians (15-29) engaging with 'New Christian Movements' (with a particular focus on the Pentecostal churches) and the growing numbers of 'nominal' or 'non-religious' Australians (ABS Census 2001).

This growth in NCMs is clearly visible on City University Campuses in Sydney and other cities in Australia. The Evangelical Union of the University of Sydney for example, claiming to be the largest student union body on campus (Evangelical Union website). The reasons why the youth of Australia are attracted to these New Christian Movements (NCMs) is explored through a series of phenomenological interviews..

The motives articulated by these young people in the interviews are studied for common threads and the reasons are compared to Lambert's (1999) religion and modernity model in an attempt to better understand this 'consumer segment'. This youth segment has been found to be notoriously difficult to reach by traditional churches (Kaldor 1987). This paper also attempts to understand better the primary characteristics of such NCMs and the power of their appeal to the youth segment. The rationalization of these movements and the close resemblance they bear to commercial/marketing bodies is explored in the context of 'outcomes of modernity' (Giddens 1991; Dobbelaere 1981; Dobbelaere and Jagodzinski 1995).

BACKGROUND AND CONTEXT:

Young University students abandoning Mambo and Billabong for black t shirts with 'Absolut God' emblazoned on them were a common sight in Spring of 2002 on a major Sydney University campus. Cheerful young people wearing green and white 'Evangelical Union' T shirts were more visible than college (on campus fraternity-like organizations) colours during orientation week. University students who spend Saturday nights not in the local pub or nightclub, but crowding onto buses to attend a church in the suburbs is becoming a commonplace sight. Australian University Youth are spending a lot more time in church and church related activities than ever before (Sydney Morning Herald: Good weekend magazine).

Religion and young people are often viewed as an unlikely combination. The National Church Life Survey (NCLS) in Australia which conducts surveys every five years across most major Christian denominations provides a snapshot of church demographics in Australia. Their latest study (2001), has documented the

common under-representation of young people in church (only 14% church goers are between 15-29 year olds). Kaldor (1987) noted that since the 1960s, it has been observed that young adults in Australia are less likely to be church attenders than those who are older and this gap appear to be widening as years go by. Age profile of church goers by majority, are in the 40-49 year olds (18%), 50-59 year olds (18%), 60-69 year olds (17%), and those in the 70+ age group (21%). Some denominations appear to be more appealing to young people than others. In the 15-29 year old group, some 30% attend Pentecostal denominations, 23% the Baptist church, and 22% the Churches of Christ. This is a stark comparison to the 12% who attend the Catholic Church, 11% the Anglican Church, and 8% the Uniting church (2001 National Church Life Survey)

As highlighted by Horsfield (in Ballis & Bouma, 1999), the youth segment is a particularly difficult to attract segment among all denominations most churches have difficulties attracting and keeping youth within their ministries.

However the NCLS (2001) data clearly show that some types of churches (depending on the denomination) seem to be able to target and position themselves and their ideologies better than the more traditional churches. Are these differences in response to people's changing spiritual tastes and needs or part of a fundamental shift in religious ideology?

As revealed by the latest national census in 2001, the two major denominations in Australia are Anglican and Catholic, which accounted for 46.5% of the population. Interestingly, the 'no religion' group has increased from 0.4% in 1901 to almost 17% by 1996, and around 25% in 2001. 'No religion' also implied people who chose not to answer the question as this is a voluntary question in the census.

Several reasons can be attributed to this downward trend. The influx of migrants from South-east Asia and the Middle East has seen the growth of Buddhism, Islam, and other religions in Australia. People also seem to be moving away from 'traditional' religion into New Age beliefs and values. Ireland (1999) noted a noticeable increase in Australia in new religious movements which offers alternative spiritual practices such as horoscopes, astrology, clairvoyants, psychic healing using crystals, and Eastern meditation.

While religion diversity begins to make a presence in Australia as well as the increase in the 'no religion' group, the proportion of people identifying themselves to a Christian denomination has decreased except for the Catholics, the Pentecostals, and Jehovah's Witness. Of all Christian denominations in 1991, the most rapidly growing one are the Pentecostals. This trend is reflected worldwide as well. Brierley (1998) argues that Pentecostalism is a 20th century religious phenomenon whose rapid growth into the 21st century is unprecedented of any Christian denomination worldwide. It only represented 1% of the world's Christian population in 1960, but will have grown to 8% by 2010.

As traditional denominations experience a decline in Australia, contemporary churches which are Pentecostal or charismatic in nature are thriving. Between the 1996 and 2001 census, The number of Pentecostals were up by 10%, double that of the Anglicans or Catholic (ABS figures cited in Quinlivan, 2002).

THE NEW CHRISTIAN MOVEMENT CHURCHES

An example of these New Christian Movement (NCMs) churches is the Hillsong Church in Sydney which attracts over

10,000 people in its 6 weekend services with an annual growth rate of 40%. The church engages in multiple business ventures. It has wide tele-evangelical services as well as a thriving music business. Unusually an album (Blessed) produced, written, and recorded by the Hillsong church was hit no. 4 at the ARIA (Australian Record Industry Association) charts in July 2002 outranking the likes of Shakira, Kylie Minogue, and Ronan Keating. A gospel album to be ranked with the likes of Eminem which was the no. 1 album at that time says a great deal about the popularity of such music among Australian youth.

The Hillsong church appears to overturn all traditional perceptions of a church. The church building is more corporate centre than cathedral. The services are usually shorter, featuring live 'praise and worship' (which often can be mistaken for a music concert!) with plenty of 'performance' elements. The pastor can be mistaken for a motivational speaker or talk show host (as one member of the church described it "going in there and seeing this man in a purple suit instead of a dog collar working the crowds.. it blew me away!"). The style belongs more in the American South than urban Sydney, with faith healing, speaking in tongues and dramatic baptisms, but with a very 'trendy' modern theme to it. These churches have slick websites, some offering 'online shopping' of their books, CDs, and other Christian resources.

Many of these churches have built websites which range from simple informational brochure sites (usually only giving basic information such as the location of the church, service times, etc) to more sophisticated content sites offering extensive information, resources, online shopping, sermon audio downloads in MP3 format, and email subscriptions for regular newsletters (for example, Kenneth Copeland Ministries at www.kcm.org).

The congregation of NCM churches mainly consists of people under 50 (73%), of these 30% are in the 15-29 age group and 43% in the 30-49 age group. This differs greatly in comparison with traditional (such as Catholic, Anglican, and Uniting) churches where only 8-12% of its congregations fall in the 15-29 age groups. These NCM churches also have thriving youth ministries, and often run specific programs and conferences (for example, www.planetshakers.com.au, www.youthalive.org.au) targeted towards the youth. These churches also seem to have revolutionized the Gospel music genre by developing contemporary style praise and worship sung by groups such as Delirious, who look like any modern rock band.

These churches have many of the features of the 'Seeker' movement in the United States where the philosophy is "Just as in the marketplace, you think of products and services that people need and how you create that; to some extent we're looking at and recognizing spiritual needs that people have" (Richard Anderson of the Willow Creek Ministries, South Barrington, Illinois in Buss and Dale 2002)

METHOD:

These New Christian Movements (NCMs) have been especially remarkable in their ability to attract and retain the youth segment or 'future consumers'. This aspect of targeting and attracting youth bears closer examination.

This exploratory study attempts to understand some of the reasons why such churches attract these young people while traditional congregations appear to be losing younger members. A phenomenological approach to understanding the religious/spiritual consumption experience of these young people was taken. A setting aside of assumptions and researchers own understanding (and biases) of the phenomenon was consciously adopted. The research purpose was seen as trying to understand the subject's 'lived experience' (Goulding 1992). The recognition of the

respondent's reality of the consumption experience was allowed to lead the interpretation and analyses. Frameworks and structures of interpretation were therefore those suggested by the shape and tone of the interviews themselves.

THE RESPONDENTS:

These were chosen on a selective basis, picking subjects who have been through the particular consumption experience (affiliation with a New Christian Movement Church).

Five young people between the ages of 17-22 were recruited, comprising two males and three female respondents. They were all Sydney residents. One was in high school and one had been in the workforce for about a year; the other three were all at University. All of them could be described as high achievers (judged by the University/school and degree courses attended or the type of job held).

The interviews were carried out on campus of a major university in Sydney, Australia except in the case of the two who were not currently University students. The interviews ranged in time from 40 minutes to more than 2 hours in one case and were all audio-taped and later transcribed verbatim. Three of the interviewees belonged to or were affiliated to a single Pentecostal Church in Sydney. The interviews once transcribed were analysed for 'common threads' by identifying key 'cue phrases' were found.

These were related to or mapped onto the 'religion and modernity' model suggested by Lambert (1999) to see if these instances of religious affiliation represented the rise of rationalized and commercialized 'modern' manifestations of religious commitment.

COMMON THREADS:

In each interview six common threads were identified. These can be described as follows:

1. *I consciously chose my church:* This took various forms. All interviewees were nominally Christian (born or socialized in the first few years of life into families that were practicing but not intensely Christian), but not committed Christians before they 'chose' their current church. The element of freedom to choose and having compared churches was clearly articulated by all the respondents. R(M21) for instance described this phase in his search as follows "I went shopping around for a belief; I looked at Islam and Buddhism, but Christianity was what did it, not that it has not increased my respect for other religions.."
2. *My relationship with God:* This was a personal thing—not necessarily mediated by the church, but facilitating it. The term 'relationship' appeared to be key with three of the interviewees repeating the phrase. R(M21) described it as 'its not a social thing- many people see church as a way of socializing, For me its about knowing God, God got in touch, it was a personal connection..". J (F 22) describes it as "Makes me understand the big picture through having a relationship with God" S (M 17) said "the church is a friend". JA (F 22) went further "it's a relationship at Hills (church)" "for me its not a compromise (referring to giving up Saturday nights drinking with friends at night-clubs), its what I want to do, its about being passionately in love with the church, its been 6 years now and my spiritual needs are met and continuously being met, it keeps taking me to the next level". "It's a personal relationship with God".

3. *My spirituality not Religion*: This was quite a strongly held view amongst the respondents. JA (F 22) says “I was religious, but this is so different from the Anglican (church) its more relevant, the message was about real life, not about solemn singing in church”. R (M21) says “Religion–(corrects himself) spirituality is something people use as an alternative to religion.”
1. *My family and my beliefs*: All the interviewees had concerns about the way their parents viewed their involvement with the church or religious organization. J (J 22) said “They (parents) were a bit cautious with my involvement in the EU (Evangelical Union), thought it’s a cult that’s taking over my whole life, after my cousins explained what it was they didn’t mind”. S (M17) says “They support me, my sister is getting more Christian, but my parents don’t go”. JA (F22) sees more resistance “My parents are wary of it K (sister) loves it, I am trying to get them to go, mum does sometimes but not dad. For themselves that’s not what they want- its no problem for them I attend”. R (M 21) feels saddened by it “they (family react) differently my mother is indifferent, the opposite of love is indifference not hate. She does not care, she is never curious about it (my faith). Its not just happiness, she is indifferent because I am happy in it- its about my relationship with my mother really”
5. *My church is successful and that is not necessarily a bad thing*: This was particularly true of the three respondents who had affiliations with the Pentecostal church. Each of them felt obliged to explain the money raising aspect of the church’s activities. One respondent (I21) described it as ‘anyway money I would have spent at a nightclub drinking with friends’ and that she was getting a lot more out of this and the music and dancing were very much a part of it and the atmosphere of a ‘nightclub without alcohol’ and where there were no concerns about other people’s motives in being friendly. The church was about being ‘relevant’ to young people. The church organized skateboard contests and had games to attract the young teens on a Friday night, while the young 20s crowd were pleased by the nightclub atmosphere and social aspects of the later evening gathering. Many members entered into business ventures with co-members and the church- the philosophy being one of “give and it shall be returned to you tenfold” (Meares 2003)
6. *My belief is rational*: This aspect was particularly highlighted for the sample (four of these respondents were in a leading Australian University in courses that required a 93% or more school leaving score-putting them in the top 10% academic achievement group in their cohort). One of these respondents addressed this issue with a Cartesian logic–(God created man with reason so that this reason (as manifest in a religion cleansed by reason) would lead him back to God). R(M 21) articulated this as “My friends question it, but philosophy can reconcile the (divergent) aspects of religion and science”. The Evangelical union on the campus of a major Australian University staged a debate between leading academics on the reason versus religion question this series called ‘Absolut God’ tapping into the cult status associations that Absolut vodka has among this target segment of urban youth.

MODERNITY AND RELIGION:

Lambert (1999) identified, using the arguments of many religious scholars (Nakamura 1986; Melton 1998; Bellah 1976; Tschannen 1992; Hervieu-Leger 1986; Champion 1993, Kurtz 1995) and many religious movements (Hinduism, Buddhism, Sikhism and Christianity etc) some overlapping characteristics from newer forms of religious movements. He identifies the following as common characteristics among such new and changing movements as shaped by the forces of modernity.

1. *This worldliness*: This indicates the movement of focus from the ‘next world/reincarnation’ to this world and man as the focus with a stress on ‘human love’, including the increasing value placed on the human body, moving away from asceticism (at the expense of fear and damnation). As Kitagawa (1967) says “ all classical religions tended to take negative attitudes toward phenomenal existence and recognized another realm of reality” (p.62). This is exactly that which has been overturned and as Lambert suggests instead that all religions are compelled to “find the meaning of human destiny in this world–in culture, society and human personality”. This focus on the material, present world was repeated in many forms among the respondents: The description of the churches business ventures often took this form, the sale of CDs in the church foyer before and after the service was seen as acceptable The images of Jesus clearing the temple of commerce or the worshipping of the golden calf that the traditional churches point to as anti-materialistic teaching are not focused on in these NCMs. The Chief Pastor in a leading NCM church in Sydney is quoted in the Sydney Morning Herald’s Good Weekend Magazine (25th January 2003) as saying “If you believe in Jesus, he will reward you here on earth as well as in Heaven” and “ anyone who puts the Kingdom of Heaven first (rich or poor) can expect Bible Economics to work in their life now!”. The argument is that the money they (the churches) make comes from the promotion of Christian material and not worldly goods. In some cases it helped these churches seem more ‘relevant’-“they need to make a living” or “being successful is not a bad thing” and the quote of ‘give and it shall be returned to you tenfold’ offered as a sort of ‘fidelity in return for prosperity’ pledge, which was very much at odds with the traditional Christian churches stand on materialism.
2. *The spirituality within*: This is largely related to the idea of ‘individualization’ that is expressed by Bellah (1976) “ Each individual must work out his own ultimate solutions, and the most the church can do is provide him a favourable environment for doing so, without imposing on him a prefabricated set of answers”(p309). Thomas Paine’s “my mind is my church” symbolizes this most clearly. Among our respondents this is articulated by R (M21) when he says that ‘spirituality is something people use as an alternative to religion’. This respondent’s reconciling of the reason vs religion (specifically the Creationism vs Evolution debate) reveals this need to have worked out the detail and having satisfied that philosophy can indeed reconcile these two issues ‘he grappled with’ in his mind convinced him of its validity.
3. *Informality*: Bellah (1976) points to this reduced distance between the faithful and God and between the faithful and

the church. Dobbelaere (1991) refers to this as a dehierarchization—the bringing closer of the human and the Divine. Lambert (1999) refers to the French Catholic Church allowing the use of the ‘tu’ form when addressing God in prayer rather than the formal ‘vous’. This is illustrated both by J (F22) “It helps me understand the big picture through having a relationship with God”. JA (F22) speaks of “being passionately in love with the church.” and R (M21) speaks of God having got in touch, and it being a personal connection. The descriptions use language that is significant- these are words these young people would use to describe relationships with other people their age. This is a God and Church that is young, contemporary and relevant to them.

4. *Freedom to choose*: Roof (1993, 1995) in his study of 1400 Americans found that 76% of them chose “going to church /synagogue is something you do if it meets your needs” not “it is a duty and an obligation”. Two thirds of this group were ‘born again/ pentecostal’ Christians. The seeker church philosophy referred to earlier uses this idea to great advantage in their ‘market oriented approach’ to growing their ministries. Among the respondents of this enquiry, each of them articulated the idea of choice- none of them are presently affiliated with the church they nominally belonged to (born into, parents belonged to). There was a conscious decision about their original churches ‘not satisfying needs’ JA (F22) explained this as ‘the Anglican church was so Anglo-Saxon- everybody knew each other and anyone new got looked at; it was hard to break into; (not for me, for newcomers) not very comfortable (for newcomers); here (church of choice) you slip in and become part of it’. R (M21) ‘I shopped around for a belief..Islam, Buddhism...but this was it’ showed a certainty about the choice, and the exercise of conscious choice.
5. *Ritualism and Symbolism Transformed*: This refers to some of the earlier discussion of bringing the human and the Divine closer. Much of the ritual and symbolism of religion is intrinsically tied up with this need to demystify. However in many cases the shift has been from mystery to performance. The theatricality of faith healing, speaking in tongues or of public baptisms in a swimming pool suspended above a 3500 strong crowd creates a dramatic element of performance. Other rituals are more mundane and involve the focus on human interaction. Social interaction is a function the church has served for centuries, the rituals are transformed, but still have the same purposes. The Friday evening meetings now simulate the nightclub without alcohol instead of a community meeting place it was in the past.

The opinion of Giddens (1991) that “rather than entering a period of post-modernism, we are moving into one in which the consequences of modernity are becoming more radicalized and universalized than before” appears to hold for the Christian religious movement in Australia. While post modernism has entered other social movements in Australia, one could argue that the NCMs do not display the hallmarks of post-modernity such as the ‘disqualification’ of the great narratives. There is rather a reverting to an adapted, rationalized and transformed narrative of Christianity that is more compatible with the modernist’s ideology of endless

progression rather than a postmodern tearing down of old mythologies and narratives. In some instances it is marked by the return to some aspects of religious fundamentalism such as a conservative attitude to the homosexuality and abortion (Meares 2003). In many ways this may be seen as no more than an echo of the rise of the Pentecostal brand of Christianity in other parts of the world. In fact going by global figures, Australia lags far behind that of North and South America (Brierley 1998) in the growth of the Charismatic or Pentecostal church. Many of the NCM churches in Australia are linked to the ‘Assembly of God’ governing body which is based in the USA. These may explain some of the common features of philosophy and worship that appear in both the North American and Australian NCMs.

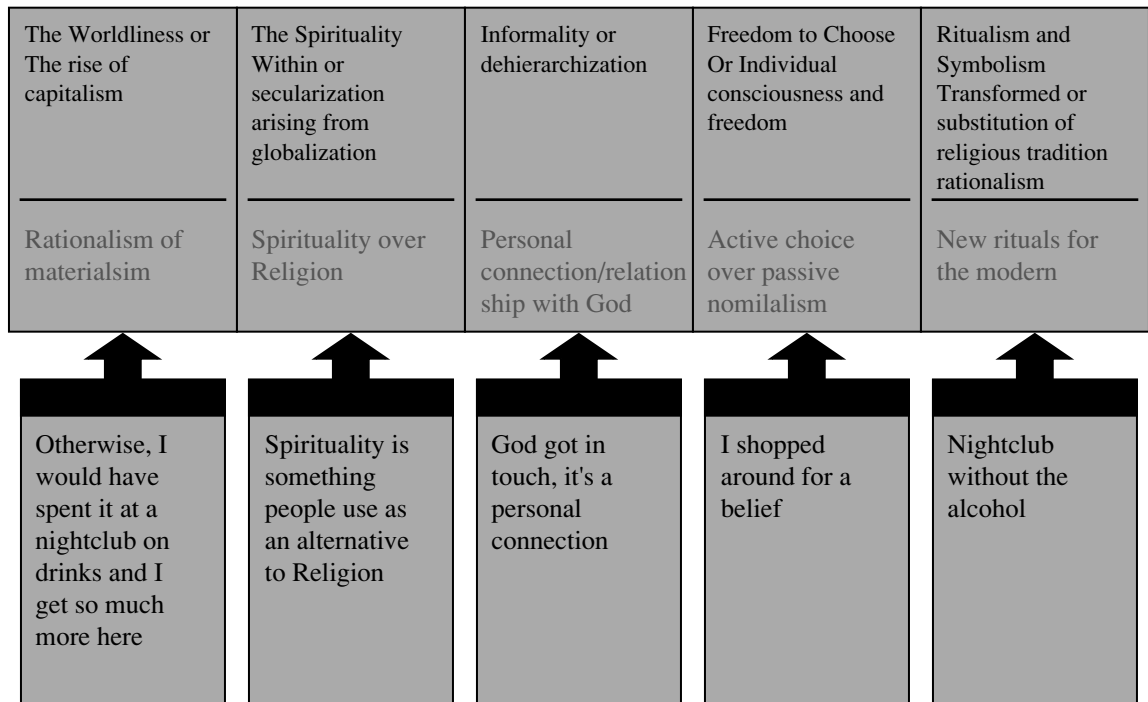

Insights

The one dominant theme that runs through all the interviews is the idea that these churches (NCMs) were helping meet their (young Australians’) need to reconcile or in some way bring the traditional Christian faith they were socialized in and their contemporary lives together. This reconciliation of modernity and Christian teaching, achieved through some broad reinterpretations of the ‘old’ church teachings and with an overlay of social accessibility and an element of ‘entertainment’ has put the NCMs in the position of seeing their young ministries grow in ways the traditional churches have not. The NCMs in Australia are no longer being dismissed as irrelevant to the spiritual and material needs of young people as they may have been in the past (by their parents’ generation) (Brierley 1998), there are significant numbers of young people being attracted to these churches. It is unclear however how many of these people will stay with the church in the long term. Some of them are positioned primarily as ‘young churches and therefore may lose current members as they grow older and move away. This is particularly true for the sample looked at. University education over, these young people will move as careers take them elsewhere. Thus retention rates may be as much of a problem as with traditional churches. It may even appear to be a ‘positioning’ and ‘segmenting’ strategy at work here. Young people being attracted to the NCMs early in life but who may in different stages of their life, move onto traditional churches or drop out of church and become nominal or non-attending members of churches.

SPECIAL SESSION SUMMARY

Drivers of Hedonic Choice

J. Jeffrey Inman, University of Pittsburgh

SESSION OVERVIEW

Utilitarian goods are characterized by high functionality or practicality, while hedonic goods are characterized by their experiential aspects. (e.g., Batra and Ahtola 1991; Hirschman and Holbrook 1982). The advent of scanner data launched considerable research examining the drivers of choice of utilitarian products (e.g., Guadagni and Little 1982), but researchers have only recently begun to explore the factors that influence the choice of hedonic goods. For example, Shiv and Fedorikhin (1999) showed that under conditions of low cognitive resource availability, affect tended to dominate choice (leading to the choice of a hedonic item), but the reverse occurred under conditions of high resources. Further, Werthenbroch (1998) finds that consumers utilize self-regulatory strategies (e.g., self-rationing) to maintain self control over their consumption of hedonic (vice) goods, while Kivetz and Simonson (2002) argue that individuals are more likely to feel guilty after selecting hedonic items over utilitarian items. Finally, detailed consumption data for hedonic goods are becoming available, offering research opportunities similar to that of scanner data.

This session sought to contribute to the increasing interest in understanding hedonic choice processes, bringing together a set of respected researchers in the area. All three papers examined the underpinnings of hedonic choice. The first, co-authored by Baba Shiv (University of Iowa), Rosie Ferraro (Duke University) and Jim Bettman (Duke University), examined the potential interactive effects of body esteem, thoughts of mortality, and gender on choice of a more hedonic good (chocolate cake) versus a more utilitarian good (fruit salad). The second paper, co-authored by Craig Fox (UCLA), Rebecca Ratner (University of North Carolina), and Daniel Lieb (Duke University) explored the dynamics of hedonic choice, building on the work of Simonson (1990) and Ratner, Kahn, and Kahneman (1999). Specifically, they argued that consumers' bias toward diversification can give rise to choices that vary systematically as a function of how the options are subjectively partitioned by the decision maker. The third paper, co-authored by Jaap Boter (Vrije Universiteit), Jeff Inman (University of Pittsburgh), and Michel Wedel (University of Michigan) sought to extend the literature on intertemporal choice (e.g., Ratner, Kahn, and Kahneman 1999; Inman 2001) by modeling the attributes that drive choice of performing arts alternatives (e.g., symphony, opera, Broadway musical) in a panel of over 14 thousand Dutch arts patrons over a three year period.

The session's discussant, Barbara Kahn, noted several strengths of the session. First, the papers complemented one another quite well. The Shiv et al. paper focused on moderators of a discrete choice between a hedonic good and a utilitarian good, Fox et al. moved to the context of choice of a portfolio of hedonic goods, while Boter et al. used panel data to model intertemporal choice among hedonic (entertainment) alternatives over an extended period. Second, the papers triangulated on the phenomena using both experimental (Shiv et al. and Fox et al.) and market data (Boter et al.). The lynchpin binding the papers was their goal of deepening our understanding of the factors that influence hedonic choice.

In sum, this session attempted to bring together three papers on the cutting edge of research in the realm of hedonic choice. That is, little is known about how people choose between hedonic and utilitarian goods, how people compose a portfolio of hedonic goods, and how they vary choices over time to satisfy their need for

variety. It is our hope that this session will spur additional work in this under-researched area.

EXTENDED ABSTRACTS

“Let Us Eat and Drink; For Tomorrow We Shall Die: Mortality Salience and Hedonic Choice”

Baba Shiv, University of Iowa
Rosellina Ferraro, Duke University
James R. Bettman, Duke University

The tragic events of September 11, 2001 seem to have led to profound changes in people's behaviors. Anecdotal evidence suggests that people began to break their diets, buy more daring clothing, drink more heavily, and take inherently more risky actions (e.g., meeting an Internet friend in person) (Barnes and Petersen 2001). Although the events of September 11th may be an extreme instance, people are confronted with their mortality on a regular basis; e.g., while driving by a fatal car accident, after hearing of the death of an acquaintance, or while hearing of a murder on the news. Given that people are exposed to death on a regular basis, it is interesting to speculate and examine whether awareness of one's mortality can lead to more disinhibited consumption behaviors.

Research on Terror Management Theory (TMT) and self-regulation provides a conceptual foundation to examine these issues. According to TMT, making people's salient mortality activates coping mechanisms that serve to shield people from feelings of anxiety. One way in which people have been found to cope is by focusing on their physical bodies as a way of boosting their self-esteem (e.g., Goldenberg et al. 2000). This coping strategy has been found to be prevalent among individuals who feel that they are successfully meeting internalized standards regarding their bodies. For example, Goldenberg et al. (2000) found that participants with high body-esteem (i.e., those who felt they met internalized standards) increased self-monitoring of their bodies following reminders of mortality, while those with low body-esteem decreased such self-monitoring. Self-monitoring, in turn, has been found to be crucial for self-regulation. For example, Heatherton and Baumeister (1991) found that compared to high levels of self-monitoring, low levels result in more disinhibited eating, particularly among dieters than non-dieters.

Taking the food category as an example, the arguments presented above lead to the following conclusions. When people become aware of their mortality, those high in body-esteem are likely to increase self-monitoring, and, therefore, increase self-regulation. Consequently, such individuals are likely to opt for products that are beneficial in the long run, such as fruit salad, rather than products that provide short-term hedonic benefits, such as chocolate cake. On the other hand, those low in body-esteem are likely to decrease self-monitoring, resulting in a breakdown in self-regulation. In the case of food products, this breakdown is more likely to occur for dieters than for non-dieters, i.e., for women than for men, based on research by Hawkins, Turrell, and Jackson 1983, which suggests that a very high percentage of women in the US tend to be dieters. Consequently, following reminders of mortality, women who are low on body-esteem are more likely to suffer breakdowns in self-regulation and choose products that provide short-term hedonic benefits such as chocolate compared to (1) men (who tend not to be high on dieting), and (2) women who are high

on body-esteem. In other words, in the context of a choice between chocolate cake and fruit salad, we predict a three-way, mortality-salience by body-esteem by gender interaction.

The above predictions were supported across two studies. For example, in one study, participants in the mortality salience condition were asked to describe their reactions and feelings regarding the September 11th tragedy while participants in the control condition were asked to describe their reactions and feelings regarding the Old Capital fire, a fire that destroyed a historic monument at the University of Iowa. Reactions and feelings to the fire were expected to be sad but mortality was not expected to be invoked as there were no deaths. Participants were later given a choice between chocolate cake and fruit salad. Each participant's body esteem was measured using the Body-Esteem Scale (BES). The results of this study indicate a significant main effect of BES, a significant interaction effect of mortality salience and BES, a significant interaction effect between BES and gender, and a significant three-way interaction between mortality salience, BES, and gender. In the mortality salience condition, females with low BES scores were more likely to choose the chocolate cake than were females with high BES scores. There was no significant difference for males with low compared to high BES scores. In the control condition (i.e., no mortality salience), there was no significant difference in chocolate cake selection between females with low BES and females with high BES. There was also no significant difference for the male participants. These results suggest that mortality salience did lead to more disinhibited choices for females with low levels of body-esteem than for males and for females high on body-esteem. We discuss the implications of our findings and present several directions for future research.

“Diversification and Partition Dependence in Consumer Choice”

Craig R. Fox, UCLA

Rebecca K. Ratner, University of North Carolina

Daniel S. Lieb, Duke University

Studies of choice behavior suggest that consumers typically seek variety among hedonic products when making multiple selections simultaneously (e.g., Simonson, 1990) or even sequentially (e.g., Ratner, Kahn & Kahneman, 1999). More generally, they seem to exhibit a “diversification bias” (Read & Loewenstein, 1995) that appears in other contexts including allocation of investment funds (Langer & Fox, 2003), benefits and burdens (e.g., Messick, 1993), and probabilistic beliefs (Fox & Rottenstreich, 2003).

The purpose of the present research is to demonstrate that consumers' bias toward diversification among hedonic products can give rise to choices that vary systematically as a function of how the options are subjectively partitioned by the decision maker. Early evidence of this phenomenon can be found in Brenner, Rottenstreich & Sood (1999), who showed that options are more popular when presented as a singleton against a group of alternatives. We introduce “partition dependence” to consumer researchers and to relate it to previously documented phenomena such as variety-seeking and grouping effects. We propose that when consumers are presented with a set of hedonic options from which they must make multiple selections, their choices are governed by some compromise between their most preferred options and a selection that is diversified over some partition of the set of options. Partition dependence can be demonstrated by manipulating the salience of alternative partitions of the option space and by observing a shift toward choices that are diversified over each subset created by the partitions.

We demonstrate partition dependence in a wide range of consumer choice settings. In several studies we group options by

levels of a particular attribute and find that respondents tend to allocate their choices more evenly across different levels of the attribute that we happen to make salient. For instance, we asked individuals which of three movies they would like to take home with them and told them that several participants would be randomly selected at the end of the semester to receive their chosen movie titles. Half the participants saw the movies grouped by movie genre (i.e., drama, comedy, vs. action) whereas half saw the same movies grouped by country of origin (i.e., British, Australian, vs. Canadian films). Our partitioning of the options strongly influenced individuals' choices: 47% chose one of each genre when they were grouped by genre, whereas only 20% chose one of each genre when they were grouped by country. Similarly 63% chose one from each country when they were grouped by country, whereas 47% chose one from each country when they were grouped by genre. In a follow-up study we find partition dependence in physical grouping of options. Participants in one study were asked to choose five candies from a set of four types (Tootsie Rolls, Starlight Mints, etc.) that were piled by type into three large bowls (two bowls contained a single type and one contained two types of candy). Diversification across this physical partition led participants to choose significantly more pieces of candy types that were presented in bowls by themselves than candy types that were presented in the mixed bowl. This occurred despite the fact that participants did not judge the singleton flavors to be more popular or better tasting.

We extend partition dependence to the domain of intertemporal choice by asking MBA students when they would like to consume three free fancy lunches (some were selected at random to receive dated meal coupons). Respondents tended to distribute their meals evenly over the periods into which we arbitrarily partitioned the upcoming school year. Hence, they were more likely to consume meals during the Fall semester (the first two terms of the MBA calendar) when the year was partitioned into {Term 1, Term 2, Spring semester} than when the year was partitioned into {Fall Semester, Spring semester}. We extend partition dependence to the allocation of money over charity funds that are organized hierarchically. When respondents were asked allocate a donation among one international fund and four local funds they gave a median 20% to the international fund. However, when they were asked to first allocate their donation geographically (international versus local) then among the four local funds, they gave a median 50% to the international fund.

In several additional studies, we find that strength and salience of preferences moderate partition dependence. In one study, we found that wine experts exhibited less partition dependence than did novices (i.e., experts' choices were less affected by whether wines were grouped by grape type or region), although we did find significant partitioning dependence among our self-reported experts. In another study, we found that partition dependence was less pronounced among participants who rated the attractiveness of the options (e.g., snack foods) *before* they made their choices compared to participants who rated the attractiveness of options *after* they made their choices. Moreover, partition dependence was less pronounced among participants who exhibited higher variance in their ratings of the choice alternatives compared to participants who exhibited lower variance in their ratings.

Our experiments collectively suggest that consumers offered multiple items from a set of hedonic options tend to diversify their choices across the groups into which options are subjectively partitioned. The partition-dependence phenomenon seems quite robust and may provide a powerful tool that marketers could use to influence consumer choices. Whereas previous researchers have focused the observation that individuals tend to spread their choices across available alternatives (Read & Loewenstein, 1995), we

extend this tradition by showing that the way in which people subjectively partition the set of options—by attribute, by physical arrangement, consumption time period, hierarchically—greatly influences the implications of such diversification strategies. Moreover, we identify strength and salience of preference as important moderators of diversification and partition dependence.

“Variety-Seeking Strategies in Hedonic Choice”

Jaap Boter, *Vrije Universiteit Amsterdam*

Jeff Inman, *University of Pittsburgh*

Michel Wedel, *University of Michigan*

Imagine you and your partner are planning an evening out. Last month's concert by the touring Boston Philharmonic was quite good and you both enjoyed their interpretation of Elgar's Enigma Variations. However, the Boston Philharmonic has moved on and although you liked their program, listening to the same pieces again seems unattractive. The brochures of the various venues in town list a great number of options: different classical music concerts as well as different genres and types of entertainment. It all looks interesting, but you both want to make sure it matches your tastes and is likely to be an entertaining evening out. What do you look for? Last month's venue usually has good performances but the other theater has an artist that is quite well known. You're also not too keen on drama that is too offensive. You want something different from last time, but you're not sure what and how.

Recent research suggests that variety seeking is quite germane to hedonic choice. For instance, variety seeking is more likely to occur on the sense of taste than on brand (Inman 2001) or when consumers derive greater hedonic characteristics from the product category (Van Trijp, Hoyer and Inman 1996). However, past research has restricted itself to simple trade-offs, such as flavor versus brand, and to single product categories, primarily food. As illustrated above, hedonic choice in real life is often more complex. In this research we address several pertinent questions vis-à-vis hedonic choice:

- Hedonic choice not only involves trading off flavor versus brand or song versus composer, but also related product categories (different types of desserts, different music genres). Is variety seeking *across* multiple related categories different from *within* category variety seeking? Is one form more likely than the other?
- Many forms of hedonic choice involve several senses in a single context. What does sensory satiety mean in a multi-sensory context? Are people more likely to resolve satiety within a sense (I want a different song), or also with a different sense (I want to switch from music to video)?
- Hedonic goods can consist of many different attributes. For instance, classical music involves sensory attributes such as instrument, historical period, and style and brand-like attributes that signal trust and quality, such as the performer, the composer or the venue. Are people heterogeneous in the attributes they seek variety on or base trust on?
- Some hedonic choice, particularly in entertainment, involves inhibiting factors, such as offensiveness. Although these are known to influence hedonic choice, they have not been considered in variety seeking research. How restrictive are factors such as complexity or offensiveness on variety seeking?

This presentation aims to address these four groups of questions using the performing arts as our focus. The Amsterdam

Central Box Office (AUB) is a collective promotion and sales initiative of all Amsterdam venues. Its annual brochure offers over 1,200 performances, bundled in more than 300 subscription series to one or more participating venues. These series represent a broad range of genres, both ‘high’ (e.g., opera) and ‘low’ (e.g., cabaret) forms of art, and are either ‘ready-mixed’ or specializing in one kind of performance. Note that clients may both seek variety within the choice for one season as well as across seasons.

In the AUB transaction system, every visitor, including every member of a group, is identified by a client number, providing us with a unique dataset with hedonic choices that can be traced at individual level. For our analysis we use client and sales data of three seasons (years) and have selected only those clients that participated all three seasons in any of the major genres. The resulting transaction database consists of approximately 14,400 clients who over the three year period chose from 3,300 events, packaged in 800 series, at 33 different venues. As clients on average buy more than one series per year, total sales accumulate to over 73,700 packages.

In addition, a panel of three expert judges rated all series on a number of variables on 100 point scales, including “brand” attributes (familiarity and perceived quality of pieces, authors, artists and venues), sensory attributes (primary sense that is addressed (visual/auditory) and sensory response that is addressed: esthetics, entertainment, excitement/arousal and empathy) and “barrier” attributes that may inhibit choice behavior (required level of arts knowledge, complexity/information load, offensiveness and unconventionalism).

The transaction data of who bought which series, combined with expert ratings of all products on several variables, allows us:

- To compare variety seeking within versus across product categories (i.e. genres).
- To investigate the role of sensory satiety within and across two senses: visual and auditory.
- To investigate heterogeneity among consumers in the different sensory and brand attributes they seek variety on or remain loyal to.
- To investigate the role of inhibiting factors by examining the role of the four barrier attributes.

The Four Dimensional Impact of Color on Shopper's Emotions

Malaika Brengman, Ghent University, Limburgs Universitair Centrum
Maggie Geuens, Ghent University

ABSTRACT

The PAD-scale has extensively been used in consumer research. Since studies on the impact of store interior color on affective responses are scarce and have focussed solely on color hue, neglecting color brightness and saturation, and furthermore only investigated a maximum of four hues, the research objective was to validate the PAD scale by means of an 8 (hue) by 2 (brightness) by 2 (saturation) experimental design. The data do not seem to underlie three, but four factors: pleasure, tension, excitement and dominance. Overall, the four-dimensional PAD-scores prove to have adequate reliability and validity, although the dominance construct is rather weak.

INTRODUCTION

It is widely accepted in psychology that the first level of response to any environment is affective (emotional) in nature (Ittelson 1973). Empirical research has demonstrated that also shopping environments can evoke emotional responses in consumers (Machleit and Eroglu, 2000) and that these emotions, in turn, influence shopping behaviours and outcomes (Donovan and Rossiter 1982, Darden and Babin 1994, Sherman, Mathur and Smith 1997). A rather neglected emotions-evoking element in the shopping environment appears to be store interior color (Turley and Milliman 2000). Although store-interior color has been demonstrated to influence feelings, store and merchandise image, simulated purchases, purchasing rates, time spent in the store and retail display attraction (Bellizzi, Crowley and Hasty 1983, Bellizzi and Hite 1992, Crowley 1993), it is still unclear which emotions can be evoked by colors in the store interior. Indeed, the color stimuli used in previous studies did not represent a broad-based and balanced sample of color stimuli. In measuring store-evoked emotions, besides neglecting two of the three dimensions of color (saturation and brightness), also only a limited number of color hues have been incorporated in previous studies. Therefore, the objective of this study was to verify the validity and reliability of an emotion scale often used in marketing, atmospheric and consumer research, namely the PAD-scale (Mehrabian and Russell 1974), for measuring store-color-evoked emotions taking into account a multitude of color stimuli varying in hue, saturation and brightness.

THEORETICAL FRAMEWORK

One approach to the study of emotions, termed "*the discrete emotions perspective*", proposes that emotions can be conceptualised as a set of discrete and phenomenologically distinct affective states (e.g. Izard 1977, Plutchik 1980). Another approach, termed "*the dimensional perspective*", has suggested that a more basic understanding of the impact of emotions can be derived from reducing the various emotion types into a set of underlying dimensions (Russell and Lemay, 2000). Indeed, emotion categories appear to be related to each other in a systematic way (Russell and Lemay 2000). This underlying structure of emotions has received some renewed interest as researchers attempt to represent the relations among the various discrete emotions (see Diener 1999, Russell and Feldman Barrett 1999, Bagozzi, Gopinath and Nyer 1999). Both, factor analysis and multi-dimensional scaling of emotion-related expressions appear to converge systematically in a two- or three-dimensional representation (Russell and Lemay 2000).

In a two-dimensional circumplex, emotions range along an 'evaluation' dimension, from unpleasant to pleasant and, according

to the degree of stimulation, along an 'activation' dimension from un-aroused and inactive to aroused and active. Whereas Watson and Tellegen (1985) originally questioned the bipolarity of such dimensions, claiming negative and positive affect to be independent of each other (see also Babin, Darden and Babin 1998), they confirmed more recently that evidence supports such bipolarity (Watson and Tellegen 1999, Russell and Carroll 1999). Also Thayer's (1989) two-dimensional view of tense and energetic arousal can be integrated into this two-dimensional space when viewed as 45° rotations of one another (Yik, Russell and Feldman Barrett 1999). The eight combinations of pleasantness and activation identified by Larsen and Diener (1992) also clearly fit this circumplex. Thus, the existence of two basic dimensions, representing respectively hedonic tone and activation, has received extensive theoretical and empirical support (Mano 1997; Russell and Feldman Barrett 1999, Yik, Russell and Feldman Barrett 1999).

From an environmental psychology perspective, Mehrabian and Russell (1974) identified three underlying dimensions of emotions: (1) '*Pleasure*', referring to the degree to which a person feels happy or satisfied in a place; (2) '*Arousal*', concerning the degree of stimulation caused by an atmosphere and (3) '*Dominance*', indicating the degree to which a person feels in control of a situation and feels to have influence over his/her surroundings and others.

Several researchers have provided evidence that these three nearly independent bipolar PAD dimensions are both necessary and sufficient to adequately define emotional states (Holbrook and Batra 1987, Mehrabian 1995, Shaver et al. 2001). However, the PAD scales appear to exhibit near independence only when tested against a broad-based and balanced sample of stimuli. Mehrabian argues (1998, p6) that "*the difficulty to develop broad-based and emotionally-balanced samples of stimuli may explain the temptation for other investigators to delete the dominance factor and to rely only on the pleasure and arousal factors, or rotations thereof, to describe emotions*".

Emotional responses to the shopping environment

Although some researchers measured emotions elicited by the store environment based on the discrete emotions approach (e.g. Dawson, Bloch and Ridgway 1990, Menon and Dubé 2000), several others followed a dimensional approach. Yoo, Park & MacInnis (1998), for example, identified retail-specific emotions, which could be reduced to a 'pleasant versus unpleasant' dimension. In the same vein, Babin and Attaway (2000) operationalized atmospheric-based affect as two separate, negatively related dimensions: positive and negative affect. They did not incorporate a separate arousal component, claiming that, while in general arousal can be either positive or negative, in a retail setting arousal indicators appear to take on rather consistent positive or negative meanings. Nevertheless, Hui and Bateson (1991) argue that the 27 emotional terms, used in their study, form a perfect two-dimensional (pleasure-displeasure; arousing-unarousing) circumplex model, as proposed by Russell and Pratt (1980). Whereas Gröppel-Klein (1998) also argues that 'arousal' and 'pleasure' seem to converge in a retail setting, as 'positive activation' appears to be implicitly registered in the arousal construct, she acknowledges that consumers in a retail setting can also experience a pleasant state of low arousal (i.e. relaxation) and that also at the point-of-sale, too much arousal can be experienced as hectic and unpleasant (i.e. tension).

Donovan and Rossiter (1982) were the first to assess shoppers' in-store emotional states using Mehrabian and Russell's (1974) PAD scale, adapted a little to the retail setting. Nevertheless, for theoretical reasons (Russell and Pratt's 1980 conceptualization) as well as for a lack of empirical support (e.g. Donovan and Rossiter 1982, Greenland and McGoldrick 1994), several researchers investigating atmospheric effects of the store environment, have disregarded the dominance dimension and simply researched the pleasure and arousal dimensions (e.g. Donovan et al. 1994, Sherman, Mathur and Smith 1997, Van Kenhove and Desrumaux 1997). However, more recently, some researchers have focused again on the influence of dominance perceived at the point of sale (e.g. Gröppel-Klein 1998).

Affective responses to color

With regard to the "effects" of colors in the environment, the literature seems to contain mostly anecdotal evidence, revealing a severe lack of systematic empirical research. In fact, most color research is based on consumer evaluations of color chips and has been noted to be weak (Beach et al. 1988, Valdez 1993). According to Valdez (1993), a major area of concern involves the failure to use sufficiently reliable, valid or comprehensive "measures of emotional responses" to color stimuli. Examining emotional reactions as a function of the dimensions of color hue, saturation and brightness, Valdez and Mehrabian (1994) found support for the PAD-scale. Nevertheless, it is still unclear whether findings concerning affective responses to color patches can be generalized to colors applied to environments, such as the store interior.

Turning to the impact of color in the store interior on retail shoppers, to our knowledge only four laboratory experiments have been published (i.e. Bellizzi, Crowley and Hasty 1983, Middlestadt 1990, Bellizzi and Hite 1992, Crowley 1993). Bellizzi and Hite (1992) used the PAD-scale and found four factors underlying their data: pleasure ($\alpha=.89$), arousal ($\alpha=.88$), dominance ($\alpha=.79$), and freedom-of-movement (α not mentioned, explaining only 5.5% of the variance). Color effects (red/blue) could be observed on the pleasure dimension only. Crowley (1993) investigated the impact of store interior color on emotions by means of 20 semantic differential items. Color effects (4 hues) were observed on (1) an evaluative dimension (i.e. positive, attractive, relaxed, comfortable, good and pleasant; $\alpha=.91$) and on (2) a non-evaluative activation dimension (i.e. motivating, modern, colorful, stimulating, cheerful, lively and bright; $\alpha=.85$). Studies thus far have relied on the use of two to maximum four color stimuli, not selected for their diverging emotion-evoking capabilities. Also, up until now the focus has been on color hues (such as blue and red). Affective responses evoked by color-saturation (purity or intensity) and color-brightness (light to dark quality) were ignored completely. Yet, these neglected color dimensions may well be the major determining factors in color effects on human feelings. Previous studies in an advertising context (Gorn et al. 1997) and concerning plain color patches (Valdez and Mehrabian 1994) have shown that saturation and brightness have a significant impact on evoked emotions in their own right.

RESEARCH OBJECTIVE

As indicated before, the PAD-measure has been widely employed in marketing, atmospherics and consumer research. Also in studies concerning the impact of store-interior color on emotional and behavioral responses the PAD scale has been introduced (Bellizzi and Hite 1992). However, the scale has never been appropriately validated in this context. Since the validity of constructs forms a foundation for scientific progress in marketing (Steenkamp

& van Trijp, 1991), the objective of the current study was to validate the PAD-scale for capturing emotional responses to store-interior colors. Unlike other studies, a broad-based and balanced sample of color stimuli was used, taking into account all three dimensions of color (i.e. hue, saturation and brightness) (Munsell 1915, Kuehni 2002).

RESEARCH METHODOLOGY

Stimuli. An 8 (hue) by 2 (saturation) by 2 (brightness) between subjects design was constructed, resulting in 32 different conditions. The 32 different colors were applied to an experimental store environment, developed in Computer Aided Design. It involved a design furniture and accessories store. Respondents were exposed to one of the 32 pictures¹ of the store-interior (16 by 16cm).

Respondents. Belgian subjects were intercepted by means of a random walk sampling procedure. About 25 respondents were selected per manipulation, according to predetermined quota for age and gender. This resulted in a total of 874 respondents, aged between 18 and 60 years, distributed almost equally among males and females for three age categories and more or less representative for the Belgian population as far as level of education, income and occupation are concerned.

PAD-measure. The three six-item semantic differential scales, measuring the PAD-dimensions of emotions elicited by the experimental store (Mehrabian and Russell 1974, Russell and Mehrabian 1977) were carefully translated in Dutch, with a forward and backward check. The items of the respective dimensions were intermixed and the direction of about half of the items was reversed.

CONSTRUCT VALIDATION OF THE PAD-EMOTION SCALE

According to previous research (Russell and Mehrabian 1977, Valdez and Mehrabian 1994) the six pleasure items, the six arousal items and the six dominance items indicate three underlying dimensions. In order to test the theoretical structure of the measurement instrument, a maximum likelihood confirmatory factor analysis with Varimax rotations is conducted using AMOS 3.62 (Arbuckle, 1997). This yielded however unacceptable goodness of fit scores ($\chi^2=1046.513$, $df=132$, $p<.001$, $\chi^2/df=7.928$) (see column 2 in table 2 for acceptable values). Therefore, we first explored the unidimensionality of the three constructs by means of Principal Component Factor Analyses (see Table 1).

The *pleasure* construct appears to be measured very well. The six items clearly underlie one pleasure construct, explaining 66.7% of the variance (Cronbach's $\alpha=.8970$).

With regard to the *arousal* construct, not one, but two factors are extracted with Eigenvalues exceeding unity, explaining together 54% of the variance (or respectively 30% and 24%). Also the Scree plot suggests at least two factors. Each item had a minimum factor-loading of .60 and no loading higher than .15 on the other factor. The reliability of the respective dimensions appears rather low (Cronbach's $\alpha=.59$ for the first factor and $r=.457$, $p<.001$ for the second factor).

The presence of two dimensions underlying the arousal construct has been encountered and rationalized in previous research (Walters, Apter and Svebak 1982, Thayer 1986, Gorn et al. 1997).

¹Their use as environmental simulations has been proven to be a valid method for studying the effects of environments on evaluations, affective responses and behavior (Russell and Mehrabian 1976, Bateson and Hui 1992, Areni, Sparks and Dunne, 1996).

TABLE 1
Principle Component Factor loadings with Varimax rotated solution

PLEASURE			AROUSAL		
	1-factor solution	$\alpha=.90$		2-factor solution	$\alpha=.59$ $r=.46$
P1	depressed–contented	.776	A1	relaxed–stimulated	.611
P2	unhappy–happy	.808	A2	calm–excited	.740
P3	unsatisfied–satisfied	.889	A4	dull–jittery	.673
P4	annoyed–pleased	.815	A6	unaroused–aroused	.651
P5	bored–relaxed	.826	A3	sluggish–frenzied	.851
P6	despairing–hopeful	.778	A5	sleepy–wide-awake	.845
DOMINANCE			DOMINANCE		
	1-factor solution	$\alpha=.58$		2-factor solution	$\alpha=.58$ $\alpha=.42$
D1	controlled–controlling	.756	D1	controlled–controlling	.763
D2	influenced–influential	.385	D2	influenced–influential	.789
D3	cared for–in control	.493	D6	guided–autonomous	.551
D4	awed–important	.608	D3	cared for–in control	.600
D5	submissive–dominant	.440	D4	awed–important	.578
D6	guided–autonomous	.675	D5	submissive–dominant	.758

Validating the PANAS-X scale², Watson and Clark (1999) encountered besides the two broad higher-order positive and negative affect dimensions, another dimension, comprising 'arousal-related' affective states as fatigue, surprise and serenity, bearing significant loadings on both the positive as well as the negative general affect factors. Reversal theory, a phenomenological theory originally proposed by Smith and Apter 1975 (Apter 1979, 1982) suggests that instead of one single curve (optimal arousal theory), there are two hypothetical curves relating arousal to hedonic tone. According to this theory, there are two optimal points or "preferred levels" of arousal positioned towards opposite ends of the arousal dimension (i.e. "reversals"), with one system being an "arousal avoiding system" and the other being an "arousal seeking system". Only one is preferred at a given moment "being the preferred level of the arousal system that is operative at that moment" (Walters, Apter and Svebak 1982). The system of emotions proposed by Wundt (1896) actually incorporates besides a hedonic ('unpleasant-pleasant') dimension, two complimentary bipolar arousal dimensions ('quiet-excited' and 'relaxed-tense'). In a retailing context, the PAD-arousal construct has also previously been shown to be rather ambiguous (e.g. Donovan et al. 1994, Van Kenhove and Desrumaux 1997, Gröppel-Klein 1998, Gröppel-Klein and Baun 2001). Consistent with the foregoing operationalization of arousal, the first dimension (relaxation-tension) appears to be negatively related with pleasure (Pearson correlation=-.732, $p<.001$), while the second dimension (boredom-excitement) appears to be positively related with pleasure ($r=.578$, $p<.001$), while the two arousal dimensions do not seem to be correlated at all ($r=.001$).

With regard to the *dominance* construct, also two factors seem to underlie the measurement instrument, instead of only one (explaining respectively 27% and 26% of the variance). The Scree plot also suggests a two-factor solution. All items could rather clearly be ascribed to one of the two factors. Each item had a minimum factor-

loading of .55 and no loading higher than .40 on the other factor. However, the reliability of the respective dimensions appears to be very low (Cronbach's $\alpha=.56$ and .42 respectively). The factor scores of both the one- and two-factor solutions are presented in table 1. Because of the low reliability of the two-factor solution and the lack of a theoretical framework to support such a multi-dimensional dominance construct, a one-factor solution will be pursued. In this case, deleting item d2 ('influenced–influential') appears to be called for because of a very low factor loading. Cronbach's α for the five remaining items is .60, which is still rather low.

Uni-dimensionality

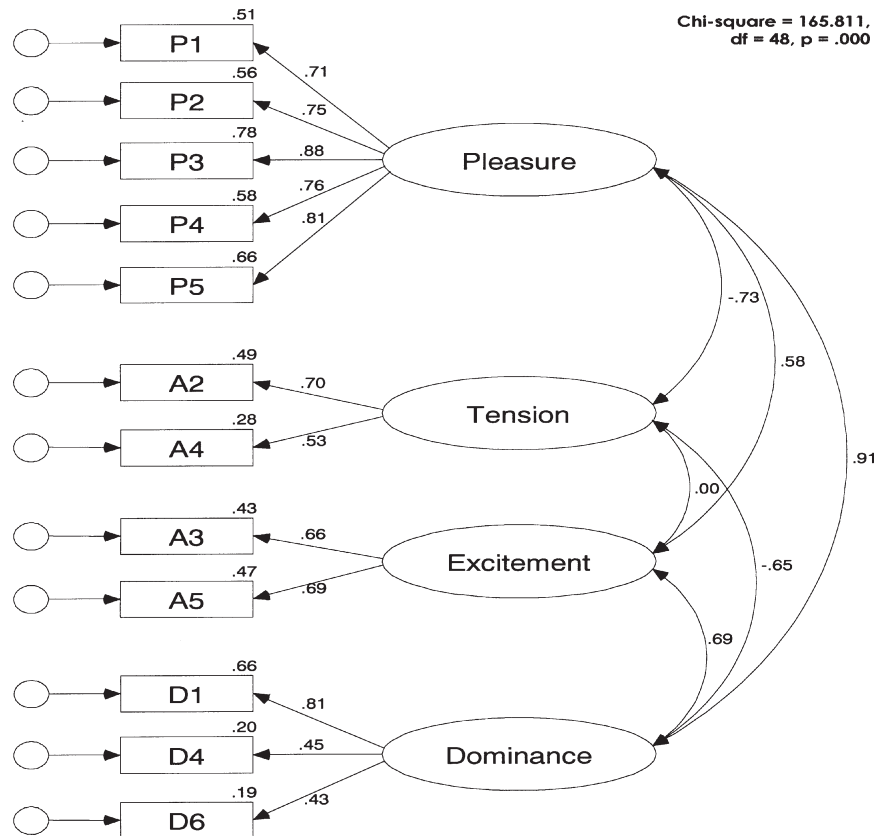

A maximum likelihood confirmatory factor analysis, conducted on each of the constructs separately, indeed reveals two separate non-related arousal dimensions within the arousal construct. The pleasure construct clearly is uni-dimensional. For the dominance construct, the one-dimensional solution performs best and appears to be highly reliable.³ In order to test the proposed theoretical structure of the measurement instrument, a maximum likelihood confirmatory factor analysis is conducted on the 17 remaining items. On the basis of the exploratory factor analyses four correlated underlying dimensions are assumed: pleasure, tension, excitement and dominance. First of all, three items (a6, d3 and d5) have to be eliminated because of extremely low standardized regression weights ($<.40$). This way a satisfactory overall fit of the model is achieved ($\chi^2=278.767$, $df=71$, $\chi^2/df=3.926$, $p<0.001$).⁴

³Correlating three pairs of error-terms (error d3–d6; error d4–d5 and error d3–d5) resulted in excellent goodness of fit scores ($c^2=.22$, $df=2$, $p=0.896$, $c^2/df=.11$) (Cote, Netemeyer and Bentler 2001).

⁴The chi square test is highly dependent on the sample size and its hypothesis of an exact reproduction of the sample covariance matrix by the implied covariance matrix of the model is often considered to be overly rigid. Models that fit the data well, often have to be rejected on the basis of the chi square value (Bollen and Long, 1993; Bagozzi and Baumgartner, 1994).

²An expanded form of the positive and negative affect schedule, designed explicitly to reflect the hierarchical structure of self-rated affect.

FIGURE 1
Path coefficients of the four-correlated factor PAD emotion construct

Nevertheless, because large standardized residuals⁵ point to possible multidimensionality (Steenkamp and Van Trijp, 1991), these were carefully examined. Five standardized residuals were detected exceeding the |2.58| norm. Dropping the corresponding items (p6 and a1) (Jöreskog and Sörbom, 1989), a very satisfactory four-factor model was obtained (see Table 2 and Figure 1). With this solution no standardized residuals exceed the |2.58| norm.

Within-Method Convergent Validity

According to Steenkamp and Van Trijp (1991) a condition for within-method convergent validity is that the factor regression coefficients on a particular item are statistically significant (weak condition) and substantial (stronger condition). With respect to the latter, it has been suggested by Hildebrandt (1987) that the correlation between the item and the construct should exceed .50. For the adapted four-factor PAD-emotion scale in this study, except for two dominance items, all of the factor regression coefficients exceed the .50 norm. Moreover, all factor regression coefficients were highly significant (critical ratio's > 11).

Reliability

To assess the reliability of the respective dimensions, the composite reliabilities were ascertained, as well as the average variances extracted⁶ The 'pleasure' factor proved to be very reliable with a composite reliability of .89 and an average variance

extracted of .62. 'Tension' scores considerably lower, with a composite reliability of only .55. The average variance extracted reached only .38. Because only two items were retained to assess this factor, also Pearson's correlation is checked, which appears to be highly significant (r=.368, p<.001). The composite reliability of 'excitement' reaches .62, with an average variance extracted of .45. We verified Pearson's correlation in this case too, as only two items are included here as well. This also proved to be highly significant (r=.452, p<.001). Finally the composite reliability for the 'dominance' construct amounts to .58, which is also rather low. The average variance extracted reached only .35. We can conclude that some random error is captured by our measures, in addition to what we intended to measure. Whereas the pleasure factor scores extremely well on reliability, the other factors score somewhat lower, but still almost meet the minimum criteria of .60. In view of the low number of items retained to capture the underlying constructs, this is rather satisfactory.

DISCUSSION

Overall, the goodness of fit indices show a good fit for the resulting four-factor model. The uni-dimensionality, within-method convergent validity and reliability of the underlying pleasure, tension, excitement and dominance constructs prove to be adequate. However, we note that dominance does not score very well with regard to reliability and that the standardized regression

⁵Standardized residuals are the residuals from the observed and reproduced covariance matrix divided by their asymptotic standard errors, and values exceeding |2.58| indicate misspecification (Jöreskog and Sörbom, 1988).

⁶For a scale to possess good reliability, its composite reliability should be between 0.60 and 0.80 and the average variance extracted at least 0.50 (Bagozzi and Yi, 1988).

TABLE 2
Goodness of fit measures for the resulting four-correlated-factor PAD scale

Goodness-of-fit indices	Acceptable values	4-correlated factor model
χ^2 , (df)	Small	165.811, (48)
p-value	>.05	0.000
χ^2/df	<5	3.454
Goodness-of-fit index (GFI)	>.90	0.965
Adjusted Goodness-of-fit index (AGFI)	>.80	0.943
Tucker and Lewis non-normed fit index (TLI)	>.90	0.957
Benler's normed Comparative Fit Index (CFI)	>.90	0.969
Root mean squared error of approximation (RMSEA)	<.08	0.056
Standardized residuals > 2.58	No	No
Factor regression coefficients > .50	Yes	10 out of 12

weights of two dominance items do not score high either. Moreover, the 'dominance' dimension appears to be extremely highly correlated with the 'pleasure' dimension ($r=.91$). In order to test whether 'pleasure' and 'dominance' do not involve in fact one and the same dimension, we investigated the discriminant validity of the dominance construct. According to Fornell and Larcker (1981) a scale possesses discriminant validity if the average variance extracted by the underlying construct is larger than the shared variance (i.e. the squared intercorrelation) with other latent constructs. Since the squared correlation among pleasure and dominance (.83) exceeds the variance extracted in both the pleasure and dominance scales (respectively .62 and .35), the discriminant validity of the dominance construct is rather questionable. Another, less stringent, analysis of discriminant validity consists of examining whether applying an additional restriction of perfect correlation between the two dimensions does not result in a better fit (Steenkamp and van Trijp 1991). This can be examined by determining the difference between the χ^2 of the nested model (i.e. the more restricted model with the constraint of perfect correlation between pleasure and dominance) and the χ^2 of the initial model (allowing for free correlation) and dividing this result by the difference in the degrees of freedom between the two models (Sharma, 1996). This test $[(180.56-165.81)/(49-48)=14.75 > 3.84 (\chi^2_{0.95, 1df})]$ reveals that the additional constraint of perfect correlation between the pleasure and dominance dimensions is not justified. The model assuming free correlation between the two factors fitted the data significantly better than the model constraining the correlation to one. Therefore, pleasure and dominance prove to be two highly correlated but separate factors.⁷

Still, because of the low within-method convergent validity and reliability, the question remains whether or not the 'dominance' dimension should be dropped altogether. In line with Russell and Pratt's (1980) conceptualisation that the 'dominance' dimension is not applicable in environments calling for an affective response, we could consider ignoring the 'dominance' dimension, as several researchers have done in the past (e.g., Van Kenhove and Desrumaux 1997, Sherman et al. 1997). However, several other researchers in the retailing context, have referred to the importance of the all too often ignored 'dominance' dimension (Gröppel-Klein 1998, Foxall 2000). Foxall (1997) proposes that the role of 'dominance' may depend on the type of consumer setting investigated. This may be

responsible for the failure of past studies to find a role for 'dominance'. In the same vein, Turley and Milliman (2000) also note that the importance of the 'dominance' dimension may be context specific, depending on the independent store environmental variables investigated. Since the specific effects of color on the 'dominance' dimension have been demonstrated before (Valdez and Mehrabian, 1994), and the adapted 4-factor model appears to have an adequate overall fit, it is suggested to retain the 'dominance' dimension. However, it has to be noted that results concerning the 'dominance' dimension should be interpreted with caution.

LIMITATIONS AND SUGGESTIONS FOR FURTHER RESEARCH

One limitation to this study concerns the measurement of the 'arousal construct'. In this study, emotional responses to the store environment were measured by means of self-report questionnaires. Gröppel-Klein and Baun (2001) however, point out that verbal scales may not be appropriate to capture arousal. Construct validation of the PAD-emotion scale revealed two separate 'tension' and 'excitement' dimensions within the arousal scale. However, purification of the scale resulted in only two remaining items capturing tension and two other items measuring excitement. For future research, we recommend the use of better 'tension' and 'excitement' scales and suggest that perhaps also electrodermal activity could be measured as an arousal indicator (cfr. Gröppel-Klein and Baun 2001).

Another important limitation to this study concerns the 'external validity' of the findings. Unfortunately, as a direct consequence of the main concern for internal validity, laboratory experiments are generally rather weak in generalizability. Therefore, an extension of this study to field experiments is called for to determine the ecological validity and generalizability of our findings. Actually 'being' in an environment where the wall colors are manipulated, would probably evoke stronger emotional reactions than 'viewing a picture' in which wall colors are manipulated.

Finally, it would be interesting to know which affective responses are evoked by specific color tones and whether these store-color-evoked emotional reactions actually influence consumers' approach and/or avoidance intentions towards the store (i.e. purchase intentions, intentions to stay longer and explore the store, intentions to spend more money and visit the store again...). The current study forms part of an encompassing study, which aims to provide answers to these managerially relevant questions.

⁷This procedure for identifying discriminant validity was also followed by Babin, Darden and Babin, 1998.

When Consumers Take Their Sense of Smell for Granted

Anick Bosmans, Tilburg University¹

EXTENDED ABSTRACT

The purpose of the present series of Experiments is to investigate the effects of ambient odor on consumers' product evaluations. The results of our studies show that ambient odor indeed has an impact on subsequent judgments. We moreover showed that when consumers have insufficient processing resources, ambient odor influenced subsequent judgments even when it is perceived as incongruent with the object of evaluation.

Consistent with prior studies (e.g. Mitchell, Kahn, and Knasko, 1995; Bone and Jantrania, 1992) our results indicate that the effect is dependent on the level of congruence of the ambient odor with the to be evaluated product: ambient odor is likely to influence subsequent judgments when it is perceived as appropriate for the evaluation. When the odor is inappropriate, it is less likely to influence subsequent judgments.

However, we were able to extend existing research on ambient odor by showing that the impact of this congruence effect is moderated by the availability of cognitive resources that consumers are willing to allocate to the judgment task. That is, while congruence of the odor has an impact when availability of processing resources is high, it seems to be irrelevant when availability of processing resources is low.

In 3 experiments, where we used a variety of factors related to a manipulation of cognitive resources (Need for Cognition, task motivation, and levels of arousal) we showed that when cognitive resources are scarce, pleasant odor has a positive impact on judgments—even when this odor is highly inappropriate for judgments.

We moreover showed (see Experiment 3) that these effects also hold when ambient odor is perceived as unpleasant. That is, when confronted with the odor of a spoiled banana, participants who had a limited amount of cognitive resources available consistently rated the to be evaluated product as more negative compared to a control condition. They could not partial out the influence of the inappropriate unpleasant odor. In contrast, when sufficient processing resources were available, evaluations were more negative when odor was congruent with the to be evaluated product (i.e. a banana), but not when it was incongruent. Here too then, availability of processing resources resulted in an appropriate discounting of the influence of unpleasant odor.

Our results are congruent with the framework of schema-congruency literature (Meyers-Levy and Sternthal, 1993; Meyers-Levy and Tybout, 1997) that explains context effects (such as ambient odor) by assuming the moderating role of both congruency of the context (ambient odor) with the target as well as the availability of cognitive resources when performing the task.

Why Consumption Vision? Understating Consumer Value in Anticipatory Consumption Imaging

Glenn L. Christensen, Brigham Young University

Jerry C. Olson, Penn State University

William T. Ross, Penn State University

EXTENDED ABSTRACT

There is a certain fascination engendered by thoughts about the future. As unrealized, unactualized space, a personal future is an open canvas upon which one may virtually create any kind of mosaic of images—a collage of past experiences; wholly novel, imaginative creations; mere extrapolations of present experience; or a rich combinatory mix of such elements. Given the central importance of the imaginative creation of possible consumption futures, the scant attention these mental process have received within the consumption literature is a bit surprising.

Within this literature, a narrow range of effects and proposed antecedents have been examined. (see Shiv and Huber 2000; McConnel, Niedermeier, et. al. 2000; Phillips, 1996; Phillips, Baumgartner, and Olson 1995). Others have looked at pre-acquisition fantasy as a type of anticipatory imaging (Fournier and Guiry 1993). The effect of anticipatory mental imaging in advertising comprehension has also been investigated (Krishnamurthy and Sujana 1999; Phillips 1996). Taken together, the brief history of inquiry into anticipatory consumption imaging (or consumption visions) is a rather piecemeal affair.

What is needed is the development of a conceptual framework for consumption visions that can unite the best of our thinking and guide future research (Christensen 2002). An important component in that larger theory of consumption visions is an understanding of why consumers create them. What value do consumers see in the process? How do they perceive that consumption visions help them? How do consumption visions fit into their lives?

We term anticipatory mental images of future product use *consumption visions* and define them as self-referent images or mental simulations of the self-relevant consequences of product consumption and the resulting phenomenological experience (thoughts and emotions) associated with those anticipated consequences.

Understanding the “why” of consumption visions marks the investigative thrust of this work. This research question dictates the choice of a Zaltman metaphor-elicitation technique (ZMET—Zaltman 1997) research method. One of the strengths of the method is its ability to elicit consumers’ meaning about the personal relevance of the topic and then map those meanings in an aggregate consensus map or mental model (Christensen and Olson 2002; Zaltman 1997; Zaltman and Coulter 1995). Understanding the personal relevance of consumption visions in the lives of consumers is the heart of the present research question and thus the ZMET method is particularly appropriate.

THE ZMET STUDY

Ten repeat informants were selected for this study from a pool of participants of a prior diary study of consumption visions. Respondents were purposefully selected to represent a range of life stages and demographics. Each participated in a semi-structured depth interview which followed closely the several steps outlined in the literature for a ZMET study (see Christensen and Olson 2002; Zaltman 1997; Zaltman and Coulter 1995).

ZMET Analysis

Analysis of the transcribed data were content coded to identify underlying themes, metaphors, constructs, and interrelationships

between codes following the grounded theory techniques of Anselm Strauss and Juliet Corbin (1990). Subsequent to this analysis and consistent with heuristics presented in the literature (Christensen and Olson 2002) a consensus map of the aggregated themes found in the data was constructed.

THE ZMET STUDY FINDINGS

Broad Meaning Themes

The consensus mapping process revealed five broad, collective orientations or themes regarding consumption visions shared among the respondents. These are:

- Consumption Visions are sometimes *Fantasy*
- Consumption Visions are often an *Escape*
- Consumption Visions are sometimes part of *Decision Making*
- Consumption Visions are part of *Planning*
- Consumption Visions are *Motivational*

Consumption Visions as Fantasy

Fantasy is closely coupled with escape. Fantasy allows a freedom for the imagination. Part of the freedom found in fantasy visions is the ability to be adventurous and try new things without fear or consequences. In the mental world, respondents can “be adventurous”, “try new things”, and see if what is imagined is desirable and/or possible. This is because consumption visions have “no consequences” and thus “no fear.” One respondent brought in a picture of ice-cream to express the idea that consumption visions are fat-free. “They are non-fattening,” she said. “They can be as indulgent as you like.” Without the fear of ramifications, fantasy consumption visions are a hedonic pursuit in which consumers actually consume the vision. At least part of what makes fantasy so enjoyable is that what is imagined is a perfected world—an ideal state.

Consumption Visions as an Escape

These participants unanimously relate that consumption visions are often used as an escape from reality. As an escape, consumption visions help consumers cope. One respondent indicated that she used consumption visions of the hedges and landscaping she wanted around her home to help “get me through labor and delivery.” An important to and from dynamic emerged. The consumption vision is an escape *from* the dysphoric current reality *to* an alternative, perfected, mental world. The great dividend of this process was a sense of relaxation and peace.

Visualizing A Goal

For these respondents, visualizing and personal goal is a central aspect of consumption visions. This mental process of goal visualization plays an important role in decision making, consumer planning, and of course as motivation.

Consumption Visions as Part of Decision Making

Consumption visions as envisioned goals are central to the process of consumer decision making. One informant said, “Forming a consumption vision helps me make decisions about what I’m going to buy.” Consumption visions are identified as an important

component of problem solving from problem recognition to solution planning and evaluating different product alternatives.

Consumption Visions as Part of Consumer Planning

One respondent said, "Consumption visions are fun. They help with planning and organizing your life." Another said, "I think my visions help me fix the future. They help me prepare."

These respondents describe a two part process to using consumption visions in planning. The process seems to begin with a macro simulation of an event—such as planning the events of the day as in the last example. As the large scale event is mentally simulated, smaller items that need attention are recognized and elaborated.

Consumption Visions and Motivation

"A consumption visions motivates me and moves me to do things. The vision makes it all worthwhile—all the extra work you have to go through to get there." There was an oft-repeated mantra in these data that echo the words of Napoleon Hill, "What the mind can conceive and believe, it can achieve." One said, "I can imagine it until I will make it happen." Experiencing the move from vision to reified event gives consumers a feeling of accomplishment that imbues confidence—"If I can do it once, I can do it again."

The Impact of Humor in Face-to-Face and Electronic Service Encounters

Willemijn van Dolen, Vrije Universiteit
Ko de Ruyter, Maastricht University
Sandra Streukens, Maastricht University

ABSTRACT

In this study we attempt to nuance the intricate interplay between the use of humor and the outcome of the service in establishing customer's evaluations of face-to-face and electronic encounters. In experiments we manipulated type of humor and outcome of the service encounter. The results suggest that the impact of the type of humor used in a face-to-face encounter is more important than the outcome, whereas in electronic encounters, the impact of the outcome of the service encounter is more important than the type of humor. Also, in electronic encounters related humor might compensate partly for an unfavorable service outcome.

INTRODUCTION

Academics and practitioners agree that the underlying premise of customer-firm encounters is to make them memorable and satisfying. This focus on creating memorable experiences by blending functionality, fulfillment and fun has recently drawn attention to the importance of hedonic aspects of the service encounter. In general, these hedonic aspects refer to the enjoyment resulting from the fun and play arising during the experience (Hirschman & Holbrook, 1982) that has been represented in the retail context by the theme of 'shopping as fun' (Babin et al, 1994). This theme has serious consequences, for it has been argued that gauges of the hedonic quality of the experience reflect future economic performance.

One important way to increase the hedonic quality of the shopping experience as well as the positive evaluation of the product or service itself is the use of humor (Childers et al., 2001; Perry & Jenzowsky, 1997). To date, most research on the use of humor in a marketing context has been conducted in the area of mass communication channels. It has been demonstrated that humor in advertising may be used to create product and service awareness as well as a favorable image and to stimulate customer purchase behavior (Alden & Hoyer, 1993; Spotts et al., 1997). Moreover, it has been demonstrated that advertising and promotion that incorporates humor does not only lead to positive product evaluations and buying intentions but also seems to have a positive effect on the way in which people enjoy the viewing experience. For instance, Perry et al. (1997, p.395) report that they find "strong support for the use of humorous commercials to boost program enjoyment levels."

With respect to service delivery formats, varying from traditional face-to-face to technology-based self-service delivery modes, the picture of the incremental value of humor as a potential source of enjoyment and determinant of customer's evaluations is less clear. From research in the social sciences, there is strong evidence that humor may serve different functions in face-to-face contact (Wilson, 1979), varying from the communication of a person's attitude in social interactions to the transformation of negative emotions into positive ones and the development of a basis for relationships between people. Furthermore, there is an accumulating body of evidence that humor is also important in electronic channels (Babin et al., 1994; Childers et al., 2001). For instance, it has been suggested that the use of humor in e-mail campaigns has a positive effect on sales (Kaye, 1999) and that for on-line customers "the best experiences will sparkle with humor" (McKeown,

2002 p. 256). Therefore, we study the influence of humor on customer evaluations with respect to two service delivery formats.

In the investigation, we take two important contingencies into account: the nature of the service outcome (e.g., favorable vs. unfavorable) and the type of humor. It is well established that customer evaluations of services depend both on the service process and outcome (Brown & Swartz, 1989). To date, the service marketing literature has focused extensively on service process. Only recently, researchers have begun to explore the role of service outcome in service evaluation. An important issue is to determine the relative importance of process and outcome in evaluations as well as the effect of the interaction between process and outcome. With respect to process, in face-to-face encounters humor is primarily associated with the attitude and behavior of the service employee, while in electronic encounters humor is an integral part of the (virtual) design of the service process.

Furthermore, in the humor research literature frequently a distinction has been made between related and unrelated humor (e.g., Zillman & Bryant, 1983). In the context of learning and advertising, studies have demonstrated that the use of related humor has more positive effects than the use of unrelated humor (Spotts et al., 1997; Zillman et al., 1983). However, no studies are reported with respect to the effect of related vs. unrelated humor in service encounters. The purpose of our study is to investigate how the interplay between the type of humor and the outcome of the service determines customer's evaluations of face-to-face and electronic encounters.

LITERATURE REVIEW

Humor is an integral part of the human condition and yet many have struggled to come up with an exact conceptualization. In order to develop a basis suitable for empirical study, various authors have suggested technique-oriented and descriptive typologies of humor. One frequently used typology is that of related vs. unrelated humor. Related humor is defined as humor that is pertaining to the particular situation, message, or product, while unrelated humor is not (c.f., Zillman et al., 1983). In general, it has been suggested that adult audiences (as opposed to children) respond well to humor that is integrated and related (Zillmann et al., 1983), but the findings with respect to unrelated humor remain conflicting and are not conclusive. It has been argued that people do not respond to humor that has no apparent connections to the message, and is obviously interspersed to liven things up. It also has been suggested that unrelated humor may be even perceived as inconsequential or distracting and may be met with impatience, if not with annoyance, whereas related humor can be an effective way to help remember examples of content (Zillmann et al., 1983). In another study (Hezel et al., 1982), it was found that teachers who use related and relevant humor were judged to be more interesting, entertaining and enjoyable than those who used unrelated humor. In general, these authors concluded that teachers using unrelated humor may well be perceived as being funny and possibly gain appeal in the sense of being liked, but at the same time the use of unrelated humor was detrimental to rapport and to be most harmful to the assessment of the teacher's competence. Furthermore, it may create a loss in attentiveness and ultimately result in reduced information acquisition from messages.

These findings are confirmed by several studies on the use of humor in advertising (Spotts et al., 1997). It has been argued that the relatedness of humor to the ad, product, or service is an important aspect that influences the effectiveness of humor in advertising. Moreover, it is concluded that the most important advantage of related humor is that the customer's attention remains focused on the core product or service, which is not the case with unrelated humor. Also, others suggest that humor related to the product is superior to unrelated humor. Scott et al. (1990) found that humor is only effective when humor is related to the product, service and event. Their results supported that related humor enhances patronage activity, but unrelated humor has either no impact or a negative impact.

The effects of humor have mainly been studied in the context of advertising and interpersonal, face-to-face interactions (primarily outside the marketing domain), and so far there has been little work on related vs. unrelated humor in the context of computer-mediated (CM) interactions. The few studies on CM interactions, though, found positive effects of humor. For instance, Baym (1995) states that humor can be accomplished in CM communication and can create social meaning on-line. She shows how humor creates group solidarity, group identity, and also individual identity in on-line encounters.

With respect to the customer evaluation of service encounters, the focus in our study is on satisfaction, enjoyable interaction, and behavioral intentions. It is well established these three constructs are critical measures of face-to-face and electronic service encounters (Meuter et al., 2000; Gremler & Gwinner, 2000; Szymanski & Hise, 2000). The concept of customer satisfaction bears relevance to both discrete encounters and to relationships. This study focuses on single encounter satisfaction; it reflects the feelings of the customer about a single interaction with the firm and consequently result from the evaluation of the events that occur during that specific period of time.

A second evaluative judgment concerns enjoyable interaction. Enjoyable interaction might be interpreted as an aspect of hedonic quality. With respect to enjoyable interaction, several researchers identified its importance in positively influencing customers' judgments in off-line (e.g., Babin et al., 1994; Gremler et al., 2000) and on-line (e.g., Childers et al., 2001) encounters. A service provider might use different strategies to create an enjoyable interaction. For example, the firm may use humor, build a colorful design, include sufficient sensory information into web-sites, increase flexibility of navigation, and personalize the service (e.g., Childers et al., 2001; Gremler et al., 2000).

A final construct that needs to be incorporated is behavioral intentions, i.e., the intention of the customer to return to the (e-)service and to make recommendations. An initial contact between two parties might result in an ongoing relationship and consequently result in a customer's return. It has been suggested that given the essence of customer choice in services, it is imperative to examine customer's behavioral intentions with respect to returning to the firm and positive word of mouth communications (Ostrom & Iacobucci, 1995).

Although the three dependent measures are well documented in off-line contexts (e.g., Oliver, 1997), recent studies suggest satisfaction, enjoyable interaction, and customer loyalty to be important in on-line environments as well (Szymanski et al., 2000; Wolfenbarger & Gilly, 2001). In summary, it can be argued that the service encounter is positively evaluated when encounter satisfaction is high, customers experience an enjoyable interaction and have positive behavioral intentions. In the next section, we develop our research hypotheses.

HYPOTHESES DEVELOPMENT

In this research, we study the effects of the service process (e.g., the use of related vs. unrelated humor) and the service outcome on the customer's evaluation of both the face-to-face and electronic encounter. Service process reflects the way the service is delivered to the customer and evaluating the process, several dimensions may be taken into account, such as the reliability, responsiveness, assurance, and empathy of the service provider. It has frequently been argued that a favorable process increases a positive evaluation (Iacobucci et al., 1994). In this study, we focus on the use of humor, i.e., the service process pertains to the fact whether the provider is using humor during the encounter with the customer. From previous studies it becomes clear that when humor is properly used it might have benefits for both provider and customer. Specifically, these studies indicate that in general the use of related humor results in more positive effects than the use of unrelated humor (Spotts et al., 1997; Zillman & Bryant, 1983).

It is well known that evaluations of services are based on what customers receive as outcome as well as on how the process of service delivery takes place (e.g., de Ruyter & Wetzels, 1998) and, therefore, in our study we focus on outcome in addition to process. Outcome refers to an evaluation of *what* the customer received from encounters with the firm, whereas process refers to *how* the outcome is performed. Outcome essentially refers to the instrumental performance of a service. It can be viewed as an end-state, which may or may not be the intended effect of a service process. For instance, when booking a holiday, the concept of service outcome pertains to the fact whether the provider is able to book the vacation or not.

Regarding the interplay between process and outcome, it has been frequently suggested in the services marketing literature that the way the service is delivered may be a more important antecedent of customer evaluations than the service outcome (e.g., Brown et al., 1989). Furthermore, Iacobucci et al. (1994) state that a favorable outcome might not increase the chance of positive evaluative judgments by customers, while a positive and favorable process may. Also, Bopp (1990) concludes that a good outcome may not be sufficient to foster perceptions of high service quality, satisfaction and loyalty. Swan and Comb (1976) found that customers become dissatisfied with a service when they perceive the outcome to be satisfactory but the process unsatisfactory. In addition, de Ruyter et al. (1998) showed that customers who experienced a favorable outcome and favorable process evaluated the service encounter more positively than customers who experienced a favorable outcome and an unfavorable process. Since related humor is supposed to be more positive than unrelated humor (e.g., Spotts et al., 1997; Zillman et al., 1983) and in line with service research, we hypothesize that:

H₁: A service encounter with a favorable outcome in which related humor is used will be evaluated more positively than a service encounter with a favorable outcome in which unrelated humor is used, in terms of a) satisfaction, b) enjoyable interaction, c) behavioral intentions.

It has been argued that particularly in the case of an unfavorable outcome, process variables are important determinants of evaluative judgments. For instance, Lytle & Mokwa (1992), in a study of medical encounters, demonstrated that when customers experienced an unsuccessful outcome, elements pertaining to the service process were considered important and significantly influenced evaluative judgements. In a retail context, Lemmink and Mattsson (1998) found that in case of non-delivery (e.g., an unfa-

avorable outcome), being pleasant and helpful still led to positive evaluations of the encounter. Lazare et al. (1975) report that the interaction of an unfavorable outcome and positive process perceptions may still result in a positive overall assessment of the service; a positive process seems to compensate for an unfavorable outcome. In line with this, it might be that a process with related humor (partly) makes up for an unfavorable outcome. Concerning the interaction between service outcome and type of humor in the service process, we hypothesize:

H₂: A service encounter with an unfavorable outcome in which related humor is used will be evaluated more positively than a service encounter with an unfavorable outcome in which unrelated humor is used, in terms of a) satisfaction, b) enjoyable interaction, c) behavioral intentions.

It has been suggested that humor with no apparent connection to the message and just included to entertain, might cause irritation. Unrelated humor may have a devastating effect on the perceptions of a provider's intelligence and may prompt appraisals of inferior informedness (Zillman et al., 1983). We argue that this effect might be especially strong in case of an unfavorable outcome. For example, in case a customer cannot make a reservation at a travel agency, while at the same time the service employee is just performing as the jolly entertainer, this might result in an extra negative evaluation. Therefore, we expect that the relative difference between a favorable outcome and an unfavorable outcome will be larger with the use of unrelated humor. We hypothesize:

H₃: The relative difference between service encounters with a favorable outcome and service encounters with an unfavorable outcome will be larger in case of unrelated humor than in the case of related humor, in terms of a) satisfaction, b) enjoyable interaction, c) behavioral intentions.

Finally, the service delivery mode might influence the relationship between the type of humor and the outcome of the service delivery, and the customers' evaluations of the service encounter. That is, it has been argued that consumers like on-line shopping when they are goal-focused and they like offline shopping when they want to enjoy the experience of being out (Wolfenbarger et al., 2001). Goal-focussed shoppers are transaction-oriented and consequently, the occurrence of the desired outcome may be more important than the type of humor. Experiential shoppers are searching for fun and consequently they might be more perceptive to and influenced by the type of humor than by the outcome. However, although there might be a difference in the importance of type of humor and the outcome, we still think the hypotheses will hold for both service delivery modes.

Next, the two experiments are described. We manipulated related and unrelated humor in both face-to-face and electronic encounters, but the stimuli used to manipulate type of humor are different for the two settings. For instance, whereas type of humor can be manipulated by the use of cartoons in electronic encounters, this is not possible face-to-face. Because these inevitable differences in the experimental situation inherent to two types of service delivery a comparison between the two modes within one analysis (e.g., 2x2x2 design) is not appropriate (Morkes, Kernal, and Nass 1999).

EXPERIMENT 1: FACE-TO-FACE ENCOUNTERS

Method

The setting of our experiment was the travel business. To determine an appropriate research setting, we choose a service that is well known in an off-line and on-line setting. The travel business was chosen for two reasons. First of all, almost everyone has experience with this service so respondents do not find it very difficult to imagine themselves in such a situation. Secondly, booking travel trips is a successful application of e-commerce. An experimental approach using a between-subjects, fixed-effects factorial design. Type of humor used by the provider was manipulated on two levels: (1) related and (2) unrelated humor. The outcome of the service interaction was manipulated on two levels: (1) favorable and (2) unfavorable outcome. Consequently, we arrived at a 2 x 2 factorial design.

Procedure

For the face-to-face encounter, we developed a video-scenario of a visit to a travel agency with the aim of booking a skiing holiday. Respondents viewed the video and were asked to imagine that they were the customer. This method has been proven to be useful in research (Lemmink et al., 1998).

The respondents were told that they had already informed themselves with the help of some travel brochures about the different possibilities, and made a priority list with which they went to the travel agency. The purpose of the video was to let the respondents experience the situation in order to test our hypotheses. We filmed the encounter in an existing travel agency to increase to realism of the video. For the role of service provider, we trained an actress to act as a travel agent, to use either related or unrelated humor, and to communicate the outcome. Regarding the use of related humor, the service provider made jokes and comic remarks related to the skiing holiday and in the unrelated condition jokes and comic remarks unrelated to skiing or any other aspect of the holiday were made. With respect to the outcome the trip could be booked (favorable) or could not be booked (unfavorable).

Four video films were composed based on the combination of the manipulated variables. In order to standardize the behavior of the service provider apart from the type of humor and outcome, a script was developed for the advisor and the customer for each encounter. These scripts were different for type of humor and service outcome, but the same for the other behaviors of the employee and the customer. The service provider in the video was talking to another person, e.g., an actress who played the role of customer. Only the customer's back was visible, to make it easier for the respondents to identify with the customer in the filmed service encounter and to enable to experience the encounter literally through the eyes of the customer. The respondents were randomly assigned to one of the four conditions. Each respondent received a booklet, which included an instruction and the questionnaire. Students were told to read the instruction and to watch the video. Next, they were asked to indicate their overall evaluation of the face-to-face encounter by rating the satisfaction, enjoyable interaction, and behavioral intention measures. Finally, demographic measures were presented (gender, age, and Internet experience).

Pre-test

Students (15) were selected for the pre-test. The subjects responded to a series of items assessing the validity of the manipulations immediately after exposure to the manipulation and were interviewed. The pre-test revealed that the manipulations were successful in creating the desired treatment effect. Only minor

TABLE 1
Results of Omnibus ANOVA Tests for the Face-to-Face Encounter

Dependent variables	Effect	F _{1,98}	p-value	Partial h ²
Satisfaction				
Main effects	Humor	44.99	<.001	.32
	Outcome	19.11	<.001	.16
Two-way interaction	Humor*outcome	.06	.809	.00
Enjoyable interaction				
Main effects	Humor	4.95	.028	.05
	Outcome	20.99	<.001	.18
Two-way interaction	Humor*outcome	1.11	.296	.01
Behavioral intention				
Main effects	Humor	58.52	<.001	.37
	Outcome	31.83	<.001	.25
Two-way interaction	Humor*outcome	3.38	.069	.03
Cell Means for the Face-to-Face Encounter				
		Related humor	Unrelated humor	
Favorable outcome		Satisfaction: 5.30 (1.13)	Satisfaction: 4.02 (.65)	
		Enjoyable interaction: 4.73 0(.86)	Enjoyable interaction: 4.50 (.74)	
		Behavioral intention: 5.19 0(.90)	Behavioral intention: 3.46 (.35)	
Unfavorable outcome		Satisfaction: 4.49 0(.66)	Satisfaction: 3.11 (.85)	
		Enjoyable interaction: 4.04 (1.08)	Enjoyable interaction: 3.40 (.86)	
		Behavioral intention: 3.83 0(.82)	Behavioral intention: 2.76 (.89)	

adaptations were necessary for the script. Furthermore, preliminary analyses indicated that the dependent measures showed sufficient reliability in terms of Cronbach’s alpha.

Sample

Hundred and two business students from a large Dutch University participated in our study. They received course credits for their participation. The sample consisted of 53% men and of 47% women. The age ranged from 19 to 24 (average of 22). Regarding Internet experience (years of use), 47% of all respondents has experience for 2-3 years, 27% between 4-5 years and 26% between 1-2 years.

Questionnaire Development

All items were measured on a 7-point Likert-type scale using ‘totally agree’ and ‘totally disagree’ as anchors. *Satisfaction* with the service encounter was operationalised by eight items as suggested by Oliver (1997). The five *enjoyable interaction* items were adapted from a scale developed by Gremler et al. (2000). The *behavioral intention* scale consisted of four items describing the customer’s intention to recommend the provider and to return to the travel agency. The items were measured using an existing scale developed by Oliver and Swan (1989). The items used for manipulation check were “In the situation put before you there is an element

of humor” and “In the situation put before you there is an element of humor which has nothing to do with a skiing holiday” for type of humor and “In the situation put before you a trip is booked” for outcome.

Results

From our manipulation checks, we can conclude that there are differences between the related humorous service process and the unrelated humorous service process ($F_{1,100}=76.81$; $p<.001$), and the favorable service outcome and the unfavorable service outcome ($F_{1,100}=922.22$; $p<.001$). The results of the ANOVA tests for the dependent variables and the cell means are presented in Table 1. We find that a service encounter with a favorable outcome in which related humor is used is evaluated more positively than a service encounter with a favorable outcome in which unrelated humor is used in terms of satisfaction and behavioral intentions (satisfaction: $t_{50}=4.73$; $p<.001$; behavioral intention: $t_{50}=9.40$; $p<.001$). Thus, for two out of the three evaluative criteria H_1 is supported.

In line with the relationship assumed under H_2 , we find that a service encounter with an unfavorable outcome in which related humor is used is evaluated more positively than a service encounter with an unfavorable outcome in which unrelated humor is used in terms of all evaluative criteria (satisfaction: $t_{48}=6.26$; $p<.001$; enjoyable interaction: $t_{48}=2.28$; $p=.029$; behavioral intention:

$t_{48}=4.50$; $p<.001$). Thus, for the face-to-face encounter H_2 is supported.

We would like to stress that the cell means we used to test H_1 and H_2 include both main effects and interactions effects. Since the interaction effect between type of humor and service outcome is not significant for all three dependent variables, the cell means can be interpreted as main effects. H_3 tests the presence of interaction effects (without including main effects) between type of humor and service outcome. Based on the results of the omnibus ANOVA tests we reject H_3 as there are no statistically significant interaction effects.

EXPERIMENT 2: ELECTRONIC ENCOUNTERS

Method

The setting and the design of experiment 2 were identical to that of experiment 1. The pre-tests (15 students) revealed that the manipulations were successful. Only minor adaptations were necessary and the dependent measures showed sufficient reliability. The effective sample size of this study is 114 respondents. The sample consisted of 45% men and of 55% women. Age ranged from 18 to 26 (average of 23). Fifty two percent has 2-3 years of Internet experience, 30% 4-5 years and 18% 1-2 years. All items were measured and operationalized as described in paragraph 4.5.

Procedure

The procedure was identical to that of Experiment 1. For the electronic encounters, the respondents surfed on a, for this study developed, web-site of a travel agency to book a skiing holiday. In the related humor condition, we included one cartoon about skiing to the web-site, a humorous, animated picture about snow and skiing, winter sport related funnies, and a joke of the day related to skiing. The unrelated humor web-site included a cartoon, an animated picture, funnies (like smileys), and a joke of the day which were not related to any aspect of the holiday. With respect to the service outcome, the respondent had to fill out a booking form and after submitting this form the respondent got the message that the holiday could be booked (favorable) or could not be booked (unfavorable). The use of cartoons and jokes to express humor was based on a review of humor research (e.g., Scott et al., 1990; Suls, 1972). Four web-sites were composed based on the combination of the manipulated variables.

Results

We found significant differences between the related humorous service process and the unrelated humorous service process ($F_{1,112}=43.25$; $p<.001$), and between the favorable service outcome and the unfavorable service outcome ($F_{1,112}=2491.60$; $p<.001$). The relationship stated under H_1 does not hold. We find no significant differences in evaluative criteria between respondents who experienced a service encounter with a favorable outcome in which related humor is used and respondents who experienced a service encounter with a favorable outcome in which unrelated humor is used. So, H_1 is rejected.

Concerning H_2 , we find small but statistically significant differences between the groups. In this case, respondents who experienced a service encounter with an unfavorable outcome in which related humor was used evaluate the service encounter more positively than respondents who experienced a service encounter with an unfavorable service outcome in which unrelated humor was used in terms of enjoyable interaction and behavioral intentions (enjoyable interaction: $t_{52}=2.72$; $p=.009$; behavioral intentions: $t_{52}=2.10$; $p=.042$). Consequently, we fail to reject H_2 for two out of

the three evaluative criteria. As described above, the cell means we used for the testing of H_1 and H_2 consist of both main and interaction effects. Since there is no significant main effect for type of humor, the differences between the cell means as found in testing H_2 can be interpreted as interaction effects.

Concerning H_3 , we find that there is a significant interaction effect (without including main effects) between type of humor and outcome for the variables enjoyable interaction ($F_{1,110}=6.06$; $p=.015$) and behavioral intentions ($F_{1,110}=4.88$; $p=.029$). The relative difference between service encounters with a favorable and an unfavorable outcome is smaller in terms of enjoyable interaction and behavioral intentions when related humor is used than when unrelated humor is used (see Figure 1).

DISCUSSION

This study was aimed at nuancing the intricate interplay between the type of humor used and the outcome of the service encounter in establishing customer's evaluations of face-to-face and electronic encounters. Various observations can be drawn from our results. Consistent with research on humor in the context of advertising and education (Spotts et al., 1997; Zillman et al., 1983), the results suggest that a related humor process increases the likelihood of a positive service evaluation by customers in a face-to-face encounter. With respect to the electronic encounters, we found that type of humor is not significant. This implies that there is no difference in effect for related and unrelated humor on customers' evaluations. Furthermore, in line with previous service research, we find that the outcome of the service is an important determinant of customers' evaluations in face-to-face encounters (e.g., Brown et al., 1989) as well as in electronic encounters.

In addition, it is found that the type of humor in a face-to-face encounter is more important than the outcome, whereas in electronic encounters, the outcome is more important than the type of humor. As suggested, this finding might have to do with the mode of service provision. As Wolfenbarger et al. (2001) suggest customers might prefer electronic encounters when they have a specific purpose in mind, and desire to purchase what they want quickly whereas they like offline shopping when they are driven by experiential and hedonic motives.

However, for enjoyable interaction a reverse result was found in the face-to-face encounter, i.e., outcome is more important than the type of humor. Gremler et al. (2000) state that enjoyable interaction is an assessment of the relational aspects of service. They suggest three strategies to achieve an enjoyable interaction; 1) relating to a customer's needs; 2) caring about the customer's service outcome; and/or 3) using humor to place the customer at ease. As it appears from our study, humor does not influence enjoyable interaction, though these other strategies might be of influence. The relative importance of outcome in our study may be an indication of the importance of the second strategy. Also, Johnson and Zinkhan (1991) demonstrate that service outcome may trigger affective reactions. Finally, with respect to the relatively small effect of type of humor on enjoyable interaction, it might well be that the sense of humor of the respondents has a moderating effect on this relationship. Previous studies have shown that various individual characteristics may differently determine humor's effectiveness (Moran et al., 1999). Kirsner (1997) describes how on-line service providers use humor to categorize users into particular types and delivers appropriate personalization on their web-site.

We failed to find interaction effects for the face-to-face encounter, e.g. type of humor and outcome do not strengthen or weaken each other in their effect on customers' evaluations. One explanation for the lack of these effects might be the type of service.

TABLE 2
Results of Omnibus ANOVA Tests for the Electronic Encounter

Dependent variables	Effect	F _{1,110}	p-value	Partial h ²
Satisfaction				
Main effects	Humor	2.36	<.127	.02
	Outcome	388.03	<.001	.78
Two-way interaction	Humor*outcome	2.45	<.120	.02
Enjoyable interaction				
Main effects	Humor	2.90	<.091	.03
	Outcome	180.89	<.001	.62
Two-way interaction	Humor*outcome	6.06	<.015	.05
Behavioral intention				
Main effects	Humor	3.18	<.077	.03
	Outcome	401.39	<.001	.79
Two-way interaction	Humor*outcome	4.88	<.029	.04
Cell Means for the Face-to-Face Encounter				
		Related humor	Unrelated humor	
Favorable outcome		Satisfaction: 5.89 (.75)	Satisfaction: 5.89 (.54)	
		Enjoyable interaction: 5.45 (.64)	Enjoyable interaction: 5.45 (.91)	
		Behavioral intention: 5.66 (.54)	Behavioral intention: 5.66 (.73)	
Unfavorable outcome		Satisfaction: 3.43 (1.98)	Satisfaction: 3.01 (.46)	
		Enjoyable interaction: 3.77 (1.87)	Enjoyable interaction: 3.15 (.61)	
		Behavioral intention: 2.95 (1.04)	Behavioral intention: 2.35 (.86)	

In the context of our study, a customer can effectively separate process and outcome evaluations, as the interpersonal and outcome elements of the travel service encounter are relatively distinct (as opposed to, for instance, medical services). Hence, it is possible for a customer to appreciate the process (e.g., related humor), but to rate the outcome negatively (and vice versa). While related humor is an important determinant of evaluative judgments in face-to-face encounters, it does not weaken the negative effect of an unfavorable outcome. Therefore, humor may be a value-added feature but may not be a substitute for outcome.

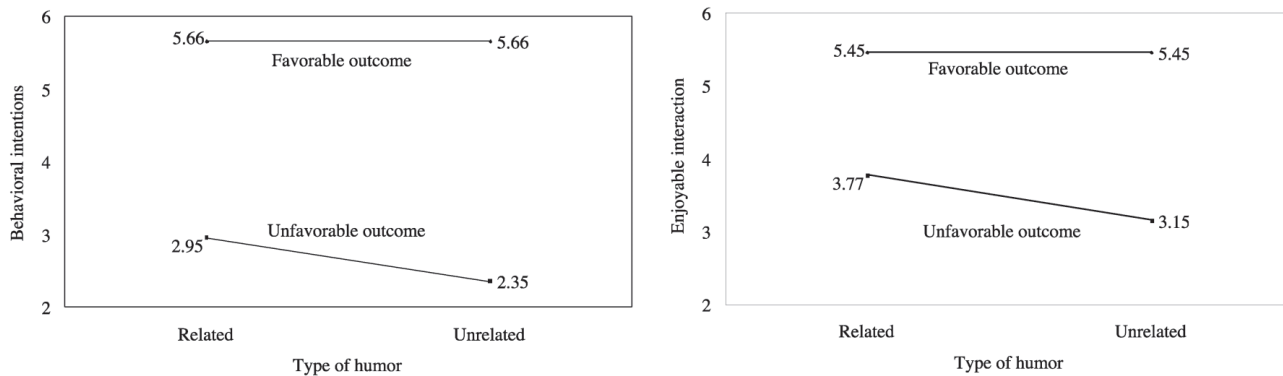

In electronic encounters, the effects of type of humor and outcome strengthen each other with respect to the customer's evaluative judgements. This suggests that the nature of the outcome of an encounter influences the way in which the humor is evaluated. The relative difference in enjoyable interaction and behavioral intentions between service encounters with a favorable outcome and an unfavorable outcome is smaller when related humor is used. This might indicate that related humor can partly compensate for an unfavorable service outcome. Therefore, although on-line customers may be likely focussed on the occurrence of a favorable outcome, in case of an unfavorable outcome, the use of related humor (compared to unrelated humor) may weaken the negative effect of the unfavorable outcome. It might be that because of the

unfavorable outcome, the customer focuses more on the site and its design, and the fun experience caused by the service-related comic strips and cartoons may create some positivity. In the same line of reasoning, we might conclude that in case of an unfavorable outcome the use of unrelated humor creates lower evaluative judgements than related humor. This might support research in the context of education which states that unrelated humor might cause annoyance (Hezel et al., 1982) and consequently magnifies the effects of an unfavorable outcome. It should be noted, however, that these patterns do not appear to apply to customer satisfaction. In other words, an unfavorable outcome lowers the customer's satisfaction and this effect can not be offset and/or will not be maximized by the type of humor used. Apparently, this type of customer evaluative judgment differs from the enjoyable interaction and behavioral intention criteria. So, in case of an unfavorable outcome, the customer is less satisfied, and the type of humor used does not influence this, but in these circumstances related humor does create a more enjoyable interaction and increase the intentions of the customer to return and to recommend the web-site.

Suggestions for Future Research

Several limitations to our research have to be recognized. These may point to future research issues. The first limitation

FIGURE 1
Graph for Enjoyable Interaction and Behavioral Intentions in Electronic Encounters

relates to our design. It pertains to a ‘laboratory experiment’ and consequently, the generalizability of the findings is limited with regards to settings outside the laboratory. Furthermore, the use of a scenario approach is subject to a possible lack of realism. Even though we built websites and used audio-visual scenarios which are more realistic than written scenario’s, it is easily conceivable that favorable and unfavorable outcomes will produce stronger emotional reactions in customers in a real-life setting compared to a simulation. While our scenario approach is valid for behavioral research purposes as the manipulation of the two outcome extremes enabled us to disentangle the influence of service outcome, future work may wish to explore perceptions of actual outcomes in a real-life setting.

The only process variable addressed in this study was type of humor. Other process variables, like the customization and responsiveness of the service provider, may be investigated in future research, since they might be important offline as well as online.

Also, future research should explore the issues introduced in our study over a broader set of services, as the focus was limited to the travel industry only. It may be that the impact of type of humor as well as output behaves differently depending on the type of service and an important question is whether the humor and outcome dimensions are significant in every service industry. For example, in our study it is possible to evaluate the outcome of the service accurately, but in case of experience and credence services this is much more difficult. Also, the measurement of personal characteristics such as sense of humor might yield a further insight into the relationships between the study variables.

Furthermore, based on advances in attribution theory (e.g., Meuter et al., 2000), it can be argued that customers’ inferences concerning the cause of an unfavorable outcome during encounters may considerably moderate service customer evaluations. For instance, in electronic encounters, s/he might interpret an unfavorable outcome caused by a server break-down differently from a non-availability of the product or service. Future research should take the impact of such attributions into account.

Also, more research is needed with respect to the determinants of enjoyable interaction. Gremler et al. (2000) suggest three strategies. Whereas we find that type of humor is hardly of influence, we find an indication of the importance of caring about the customer’s service outcome. However, we did not measure customers’ perceptions of these strategies directly. Therefore, an important contribution to the understanding of creating an enjoyable interaction could

be made by exploring the customers’ perceptions of these strategies. Future research also may investigate other dimensions of humor. In addition to related vs. unrelated humor, some research has focused on the relevance of humor. Relevant humor helps to make a critical point (Hezel et al., 1982). Although this distinction might be more useful in interactions with an instructional character, it might be important to services too. Finally, future research might include a no humor control group to more clearly show whether the results are being driven by related humor facilitating or unrelated humor inhibiting customers’ evaluations.

Affective Expectations and Uncertainty Orientation: When do Affective Expectations Stop Influencing Affective Reactions?

Elizabeth Cowley, University of Sydney
Colin Farrell, University of New South Wales
Michael Edwardson, University of New South Wales

ABSTRACT

The Affective Expectations Model indicates that how much a person *thinks* they will enjoy an experience (affective expectation) is as important as what *actually happens* during the experience in determining his or her evaluation of the experience (affective reaction; Wilson, Lisle, Kraft, and Wetzel 1989). Affective expectations may also be used to re-interpret or selectively remember the experience (Klaaren, Hodges, and Wilson 1994). We propose that an individual's approach to uncertain situations may determine the role of affective expectations.

AFFECTIVE EXPECTATIONS

Klaaren Hodges, and Wilson (1994) propose three hypotheses to describe the role affective expectations play in an individual's willingness to repeat an activity. According to the *initial effects* hypothesis, the direct role of affective expectations ends with the evaluation of the experience, no additional effect occurs as time passes. The *reinterpretation hypothesis* suggests that people continue to reinterpret aspects of the experience that were inconsistent with expectations. The event becomes more expectation-consistent either by altering the meaning of features of the experience or by adjusting the importance of a feature of the experience. Memory for the facts does not change, but the interpretation of the facts does change. According to the *selective memory hypothesis* expectation-inconsistent aspects of the experience are less accessible than expectation-consistent aspects of the experience. Since expectation-consistent memories are more accessible, affective reactions become more expectation-consistent over time. The interpretation of the fact does not change, but the ability to remember the fact does change.

Each of the three explanations is plausible. We assert that the uncertainty orientation of the consumer may determine how, and to what extent, affective expectations influence affective reactions. We propose an uncertainty orientation framework that uses of locus of control to further divide Friedland's (1998) luck versus chance orientations. Friedland found that people consistently attribute outcomes to either luck or chance.

UNCERTAINTY ORIENTATION

Luck Orientation

Luck-oriented people pay little attention to probabilities that define the decision problem. They expect carryover from one random or independent event to another. Some luck-oriented people believe that luck is a stable internal force that will influence events in their favour (Darke and Freedman 1997). For example, some people believe they have an advantage betting at the track or playing poker machines because they are lucky. Other luck-oriented people believe luck comes and goes, but it can be detected (Friedland 1998; Wagenaar 1989). For example, if something goes well in the morning, it is an indication of a lucky day. The luck-oriented people that believe outcomes depend on the luck associated with individual involved are luck internals, luck-oriented people that believe that luck is determined by external factors are luck externals.

Chance Orientation

Chance-oriented people are likely to believe that the outcome will be the same regardless of the person involved. These people also expect that chance will distribute events evenly such that all possible outcomes will occur with equal frequency (Wagenaar 1989; Wagenaar and Keren 1988; Keren 1994; Friedland 1998). Some chance-oriented people believe that there is a pattern to uncertain outcomes: a stability in external probabilistic events. Consequently, they can improve the likelihood of guessing correctly by 'seeing' the pattern. Other chance-oriented people hold the more rational belief that there is no reliable process for predicting the outcome of uncertain events (Darke and Freedman 1997).

Uncertainty Orientation and Affective Expectations

Luck internals selectively remember events because the outcome is attributable to their own luck status. Chance internals reinterpret events to defend their belief that they skilled at predicting uncertain events. Luck externals believe outcomes can be predicted by the detection of lucky streaks. Since the outcome does not reflect personally on them, expectations will have little effect during or after the experience. Chance externals view the outcome in an uncertain setting as not predictable. They pay more attention to expectation-consistent information because they hope their expectations are met, but that is where the role of expectations ends.

EMPIRICAL WORK

Participants, 152 undergraduate students, read a story about going to a restaurant. They were given an initial impression of the restaurant (positive or negative). Participants provided their estimates of the likelihood of good service, good food and an enjoyable evening eventuating. The rest of the evening was described to them (positive, negative). Participants were asked three times to provide their evaluations of the events. After the description of the outcome, they were asked whether they would be likely to return to the restaurant, whether they would recommend the restaurant, and to provide their overall evaluation of the experience. Later, participants provided their memory for the overall evaluation and the facts of the experience. Uncertainty orientations were determined with a locus of causality scale and responses to luck/chance scenarios.

RESULTS

The results indicate that luck internals assimilated expectations into the evaluation of an experience, the likelihood of repeating and recommending an experience. This group changed their affective reactions over time, but not to be expectation-consistent as hypothesised, instead they altered their reaction to the experience to be more positive as time passed, regardless of the information they received before the experience. Correctly predicting the outcome was less important than defending the belief of having the good luck trait. This group selectively remembered expectation-consistent events occurring. The data supports the selective memory hypothesis.

Chance internals were the only group to shift their affective reactions over time to be more consistent with their initial expecta-

tions. This was expected because it allows them to assure themselves that they are skilled at using the signs to predict the pattern of chance outcomes. This group also reinterpreted the events to be more consistent with their expectations.

Chance externals assimilated expectations into the evaluation of an experience and their intention to recommend the restaurant to friends. Chance externals had the most accurate memory for the service encounter and memory for their evaluation of it. The data supports the initial effects explanation.

Luck externals did show some evidence of reinterpretation. Since this group is concerned with predicting when a good or bad streak of luck will begin or end, they may have re-interpreted the events to be consistent with their initial detection of luck.

Resolving Goal Conflict: The Effect of Regulatory Focus on Product Choice

Andrew Mitchell, University of Toronto

Meng Zhang, University of Toronto

EXTENDED ABSTRACT

Considerable research has examined how a single active goal directs consumer behavior (e.g. Huffman and Houston, 1993; Garbarino and Johnson, 2001). For example, a consumer with a goal to be healthy will choose healthy food, while a consumer with a goal to use convenience products will leave the grocery store toting plastic grocery bags. Very little research, however, has examined how multiple conflicting goals interact to direct consumer behavior. Why do we select fruit salad despite the high-fat delights that catch our eye? Why do we enjoy the convenience of a non-recyclable grocery bag when this convenience conflicts with our environment values? The difficulty in coordinating multiple goals is a fundamental challenge in everyday life. This paper extends a burgeoning area of research examining the effects of self-regulatory focus on goal pursuit (e.g. Shah et al., 1998; Aaker and Lee, 2001). We propose that a consumer's regulatory focus can predict his/her choice between two different products, which satisfy different activated goals at different levels of the goal hierarchy.

Consumer goals are believed to be organized in a hierarchical structure, with "high level" goals situated above "low level" goals (e.g. Carver and Scheier, 1990; Bagozzi and Deholakia, 1999; Huffman et al., 2000). High-level goals are described as goals that represent the core concept of self, such as a consumer's life themes and life values (e.g. being healthy, being protective of life). Low-level goals, on the other hand, describe goals that are detailed and function-oriented, such as a consumer's desired product features and benefits sought (e.g. eating flavorful food, using a convenient shopping bag). High-level goals and low-level goals can be differentiated in two important respects. First, high-level goals are *abstract* while low-level goals are *concrete*. Second, high-level goals are *long-term* and accessible across many situations while low-level goals are *short-term* and constantly shaped by situational cues. The abstractness and temporal dimension of a goal are the two most important determinants as to whether a goal is at a high-level or at a low-level in the goal hierarchy (Austin and Vancouver, 1996; Huffman et al., 2000).

Interestingly, the abstract and temporal dimensions also distinguish between two different self-regulatory styles—promotion focus and prevention focus. Individuals with a promotion focus tend to think in an *abstract* way while individuals with a prevention focus tend to think in a *concrete* way (Liberman et al., 1999; Roese et al., 1999). Moreover, individuals with a promotion focus tend to focus on *long-term plans* while individuals with a prevention focus tend to focus on *immediate actions* (Freitas et al., 2002; Pennington and Roese, 2003). So although any goal can be pursued with either a promotion focus or a prevention focus (e.g. you can pursue the goal of having a healthy lifestyle by seeking out healthy foods or by avoiding unhealthy foods), goals at different hierarchical levels may be more consistent with one or the other regulatory pattern.

Based on the parallels observed between high level and low level goals and promotion and prevention focus regulatory styles, we predict that a promotion-focus will be associated more with the pursuit of high-level than low level goals, whereas a prevention-focus will be associated more with the pursuit of low-level than high level goals. To illustrate, in the opening examples, "being healthy" and "being protective of life" are high-level goals; "eating flavorful food" and "using convenience products" are low-level goals. We predict that in these goal conflict scenarios, consumers with a

promotion focus will be more likely to reject the non-recyclable bag and order fruit salad than those with a prevention focus, for whom we predict the converse will be true.

To test our predictions, we created a situation where participants have conflicting goals at different levels. To achieve this, we wanted to first identify participants with the same high-level goal and then, we placed them in a situation where they were given a conflicting low-level goal. They were asked to choose between two products. Each product would satisfy only one goal, but not the other.

Our study was conducted in two sessions. In the first session, we used a modification of the procedure designed by Ratneswar and colleagues (2001) to identify high-level consumer goals. The procedure was modified by first spending a considerable amount of time explaining the concept of high-level goals to participants. Every day examples of high-level goals were presented and questions were encouraged. Participants were then asked to list the high-level goal that came to mind when they thought about the type of food they *liked, disliked, sought and avoided* and record their answers on in a set of six stapled index cards (two of the six cards were distracters and did not ask about food-related behaviors). A score reflecting the most salient high-level goal was calculated for each participant. "Being healthy" was found to be the most popular high-level goal. Participants who have this goal when they think about food were identified and invited to participate in the second session one week later.

In the second session, participants with a salient high-level goal of "being healthy" were randomly assigned to either a promotion or a prevention focus prime condition. Regulatory focus was primed using a maze task (Friedman and Forster, 2001). Participants were then asked to imagine that they had been walking in the sun for 20 minutes on a very hot summer's day. This manipulation implicitly evoked the low-level goal of cooling off. We then pit the high level goal to be healthy against the low level goal to cool off by offering participants a choice between two different snacks: an apple or ice cream. A pretest revealed that ice cream was viewed as satisfying the goal of cooling off, but not satisfying the goal of being healthy. An apple, on the other hand, was good for one's health, but did not satisfy the goal to cool off.

As expected, the results indicated that participants primed with a promotion focus were more likely to choose the apple, while participants primed with a prevention focus were more likely to choose the ice cream. An analysis of participants' thoughts while making the choices provided further support for the predicted association between consumers' regulatory focus and consumers' goal orientation. As expected, participants primed with a promotion focus generated more thoughts centered on the high-level goal while those with a prevention focus generated more thoughts centered on the low-level goal. The results also indicated that there were no differences between participants primed with a promotion focus and those primed with a prevention focus in their attitudes toward both ice cream and apples. Consequently, the differences in choices were not mediated by differences in attitudes.

Our data clearly indicate that when both a high-level and a low-level goal are activated, but cannot be satisfied by a single product, consumers with a promotion focus tend to choose a product that satisfies the high-level goal whereas consumers with a prevention focus tend to choose a product that satisfies the low-

level goal. These findings suggest that a consumer's regulatory focus can predict their product choice when two different products each will satisfy a different activated goal.

This paper also extends recent developments on the *Compatibility Principle* identified in the regulatory focus research. Our findings suggest that *compatibility* may not just be due to the congruity between regulatory focus and information framing (Aaker and Lee, 2001; Lee et al., 2000, Lee and Aaker, 2004), but may also be related to the goal level that is most salient during the decision-making process. Specifically, a promotion focus is more compatible with high-level consumer goals whereas a prevention focus is more compatible with low-level consumer goals. Furthermore, our findings also indicate that regulatory focus can have a direct influence on consumers' product choice, without being mediated by consistent attitude changes (Aaker and Lee, 2001).

ROUNDTABLE
Trust in Consumer Behavior Research
Nancy R. Buchan, University of Wisconsin–Madison

The roundtable produced a lively discussion among 28 consumer researchers who have an active interest in trust and/or who hoped to learn more about it. We began by reference to a literature search conducted using the key words “trust” and “consumer” which resulted in a list of just six articles in the top marketing journals, only one of which appeared in the *Journal of Consumer Research*. Given this dearth of published research on trust and consumers, the first question was “what is the role of trust in consumer behavior?”

However, it was proposed that before we can suggest avenues within consumer behavior for the study of trust, we as a field need to first define what we mean by the term. Currently, there exists no agreed-upon definition of trust, and those that exist can be classified into (at least) four categories: trust as a belief, an expectation, an intention, and a behavior. Furthermore, it was suggested that as a field, we need to define trust and be explicit in its usage and measurement, if we are to advance our knowledge of the concept. For example, one researcher discussed that, although definitions of terms in economics may seem limiting and oversimplified, it is because of the parsimony of definition and the consensus in the field as to its usage, that research and understanding of core constructs advances. This is in contrast to the current state in marketing in which we are in a situation of finding conflicting results concerning trust, depending on the definition of trust employed. The perception among some of those assembled was that unless we are able to agree on what we mean by trust, research in this area will keep moving in circles—with collections of disparate definitions and results, rather than achieving a deeper level of insight.

However, this view was countered by other participants who believed that to decide on a single definition of trust would be a gross error of oversimplification because trust inherently takes on different meanings depending on the length, context, and relationship participants involved.

The discussion then moved to the multifaceted characteristic of trust, and its role in different stages of relationships. For example, whereas trust may be weighted more on Williamson-like expectations early on in a relationship, in the later stages of relationships between marketers and clients or consumers, the bond of trust possibly becomes a key aspect in “commercial friendships.” Furthermore, it was proposed that the propensity for consumers to believe advertisements may be related to general trust tendencies. Finally, we discussed whether the standard definition of trust used within the channels literature—that of “a belief in one’s honesty or benevolence”—is applicable in consumer contexts, and furthermore, whether the two conditions often described as necessary for the existence of trust—risk and interdependence—always exist in interactions with consumers—which often occur between consumers and an anonymous entity, company, or brand.

SPECIAL SESSION SUMMARY

Consumer Biases In Estimations of Product Quantity, Distance, and Currency Value

Pierre Chandon, INSEAD

Brian Wansink, University of Illinois

Consumers regularly perform lower-order quantifying judgments about quantity, distance, and value and biases in these estimations can influence a wide spectrum of consumption and purchase decisions. Errors in inventory estimates can bias in-home consumption decisions and in-store purchase timing and quantity decisions (Chandon and Wansink 2000, Chandon and Wansink 2002). Errors in distance estimation can bias home purchasing, shopping, and traveling decisions (Raghubir and Krishna 1996). Inaccurate evaluations of unfamiliar currencies can influence spending behavior and perceptions of transaction value (Raghubir and Srivastava 2002).

The objective of this special session is to present recent studies showing how all these estimations rely on a reduced number of psychophysical principles (e.g., Stevens' power law), decision heuristics (e.g., the anchoring and adjustment, the availability, and the numerosity heuristics), and statistical phenomena (e.g., the regression principle). In aggregate, these three papers provide evidence for systematic biases in three important estimation decisions, in-home product inventory level, value of foreign currencies, and length of direct and indirect paths. They also examine the processes, mediating mechanisms, moderators, and boundary conditions of these biases. In doing so, they re-introduce important findings and methods from sensory psychophysics to the consumer research community.

This session first examines the basic foundations of consumer biases in quantifying judgments. Chandon and Wansink's research, titled "Quantity and Salience Biases in Inventory Estimation," provides a foundation for this session by developing a quantity-salience model of inventory estimation that builds on sensory psychophysics research, signal detection theory, and the heuristics and biases literature. It does show, it shows how inventory estimates are systematically biased, how they influence consumption behavior, and how product quantity and perceptual salience influence these estimation biases.

The second research, by Dilip Soman, Klaus Wertenbroch, and Amitava Chattopadhyay, examines the impact of currency numerosity (e.g., high versus low nominal values) on the perceived value of transactions when people are working with unfamiliar currencies (e.g., the Euro). This research nicely complements the first presentation by showing how rescaling the measurement unit by reducing or increasing the nominal value of a quantity influences quantity estimations (e.g., measuring quantity in servings vs. weigh). It also takes into account the impact of rescaling not only on the target evaluation (e.g., the transaction expressed in the new currency), but also on the reference level (e.g., income). The research finds that consumers evaluate the numerosity of the nominal difference between the price of the transaction and the reference standard and not the ratio. This results in underspending when the new (target) currency is less numerous than the original (base currency) and overspending when the new currency is more numerous than the original one.

The third presentation, by Aradhna Krishna, examines the boundaries of estimation biases by studying the extent to which they are automatic or controllable. Her research looks at the direct distance bias, according to which paths with a shorter direct distance between end-points are estimated to be shorter than paths with a longer direct distance (the direct distance of paths varies

either due to the *angularity* between path segments or due to the paths *retracing* versus being unidirectional). She shows that the retracing bias is not moderated by people's preference for visual versus verbal styles of processing, but is moderated by their visual ability, such that individuals with higher *visualizing ability* rely less on direct distance. Her findings also rule out *motivation* as a control mechanism by showing that both the angularity and retracing biases persist even when people are highly motivated and when they believe that direct distance is an *unreliable estimator* of actual distance. These results are consistent with those of Chandon and Wansink showing that consumers are unaware of their estimation biases, which explains why they have not been able to learn from their past errors.

INDIVIDUAL PAPER ABSTRACTS

"Quantity and Salience Biases in Inventory Estimation"

Pierre Chandon, INSEAD

Brian Wansink, University of Illinois

Inventory estimations are performed frequently and influence consumption, purchase timing, and purchase quantity decisions. In this research, we examine three questions: 1) How are inventory estimates biased? 2) Do biases in inventory estimation influence consumption? and 3) How do product quantity and perceptual salience bias inventory estimation? Building on the psychophysical literature on quantifying judgments, we propose a quantity-salience model that examines how biases change across different levels of inventory quantity and perceptual salience. In the absence of different pay-offs for different biases (such as overestimating or underestimating), we build an asymmetric quantity-salience model of inventory estimation bias and test it under different contexts in six field studies and lab experiments.

In doing so, a number of conceptual contributions are made. This research extends the psychophysical literature by showing that quantity estimations exhibit an *asymmetric contraction bias*—whereby low levels of inventory are slightly overestimated and high levels of inventory are strongly underestimated, and that this bias is stronger when products are not perceptually salient. Second, we model the relationship between estimated and actual quantities (as opposed to simply testing for differences at some pre-determined levels using ANOVAs). This enables us to measure the magnitude of the quantity and salience biases for any level of inventory, and not only at a few pre-determined levels and to use model parameters to derive contraction indices enabling comparisons and generalizations across multiple product categories. Third, we provide support for two explanations of the quantity and salience biases. We show that quantity biases can be due to consumers anchoring on average inventory level and failing to adjust, and that salience biases can be caused by the higher availability of perceptually salient products. Finally, we show that consumers are aware of the effects of salience on their estimations (but unable to correct them) and completely unaware of the effects of quantity.

The presentation is organized as follows. We first review the literature on biases in quantifying judgments to derive two competing models of quantity biases (Poulton 1989; Stevens 1986). On the one hand, signal detection theory would predict an *expansion bias*, i.e., consumers underestimating low inventory levels to avoid stock

outs and overestimating high inventory levels to avoid overstocking. However, we predict that in the absence of clear payoffs for different types of estimation errors, inventory estimations will exhibit an asymmetric *contraction* bias, according to which consumers slightly overestimate low quantities and strongly underestimate high quantities. We also predict that the contraction bias will be smaller for perceptually salient products, which are easier to recall.

We test the quantity-salience model of consumer inventory estimation through six studies. The first three studies examine the quantity biases by collecting inventory estimates and actual inventory levels for 23 different products and 344 adult consumers. Study 1 establishes the basic finding of an asymmetric contraction bias with eight product categories. Study 2 replicates the asymmetric contraction bias with eight new categories and 100% response rate. Study 3 further documents the robustness of the asymmetric contraction effect with high non-countable levels of inventory measured in ounces. Study 4 is a field experiment, which shows that people with a tendency to overestimate their inventories consume stockpiled products faster than people who underestimate inventories. Study 5 is a laboratory study, which experimentally manipulates perceptual salience and inventory levels and shows how both internal and external anchors predictably bias inventory estimations. Study 6 examines how salience and quantity bias inventory estimations by influencing, respectively, the likelihood of recalling the product, and the quantity estimates given that the product has been recalled.

“Currency Numerosity Effects on the Perceived Value of Transactions”

Dilip Soman, University of Toronto

Klaus Wertenbroch, INSEAD

Amitava Chattopadhyay, INSEAD

Market transactions require individuals to make decisions about the monetary value of the goods or services to be exchanged. Shafir, Diamond, and Tversky (1997) showed that people rely on the nominal value of money rather than on its real value when making such decisions. In particular, the face value of an amount of money (in dollars) influenced consumer preferences to a greater extent than the purchasing power of that amount (accounting for interest and inflation). This focus on nominal rather than real value when making economic decisions was described in the economics literature over 70 years ago by Fisher (1928), who coined the term ‘money illusion’ to describe it. The economics literature has focused on delineating possible macro-economic implications of money illusion. The scant experimental research on money illusion has documented its existence and implications (Fehr and Tyran 2001). Less attention has been paid so far to the psychological processes that cause money illusion. Shafir et al. (1997) suggested that money illusion arises because people find it easier to think in nominal rather than real terms. Similarly, Raghubir and Srivastava (2002) proposed that consumers anchor on, and insufficiently adjust for, the face value of foreign prices when they convert these foreign prices into prices in their home currency. Their conceptualization of money illusion in terms of anchoring and adjustment processes applies to comparisons between currencies, subject to an exchange rate.

We attempt to shed more light on the psychological processes, through which money illusion operates in general. We present a theory and evidence of currency numerosity effects on the perceived value of transactions. Numerosity effects occur when consumers use the number of units into which a given stimulus is divided rather than the size of each unit in evaluating quantity

(Pelham, Sumarta, and Myaskovsky 1994). In line with standard consumer choice theory, we propose that consumers evaluate transactions vis-à-vis salient reference standards, such as a budget or the price of a competing product. However, consumers deviate from standard theory by evaluating the numerosity of the nominal difference between that reference standard and the price of the transaction in order to estimate the real value of that transaction. We test these predictions in six experiments.

Studies 1 and 2 show that consumer preferences and willingness to pay for products and services that are priced in different currencies depend on the nominal rather than the real value of the posted prices. These results are consistent with our theory but also replicate recent findings by Raghubir and Srivastava (2002). Importantly, we did not vary participants’ nominal budget in studies 1 and 2. To more specifically test the predictions of our theory, studies 3 and 4 then showed that Raghubir and Srivastava’s (2002) effect of the nominal value of prices reverses when budgets are also varied in nominal terms. These findings demonstrate that consumers evaluate transactions in line with the numerosity of the difference between budgets and prices (an approximate measure of their purchasing power), extending previous theorizing on money illusion. Similarly, study 5 showed under incentive-compatible conditions that, holding the real expected value of the bet constant, participants real willingness to bet increases with the numerosity of the difference between nominal budgets and nominal willingness to bet, again contrary to what Raghubir and Srivastava’s (2002) anchoring and adjustment mechanism predicts. Finally, study 6 applied our theory to comparisons of prices of competing products instead of prices and budgets, demonstrating that the perceived price premium of national brands over store brands shrinks the less numerous the nominal difference is between the two types of brands. Specifically, the choice share of national brands vis-à-vis store brands was higher when prices were posted in (less numerous) Euros than in (more numerous) Pesetas.

Our findings add to the fledgling literature on the psychological processes underlying money illusion by providing evidence that consumer evaluations of transactions are driven by the numerosity of the nominal difference between prices and reference standards that are salient in the evaluation context. Our findings qualify the conclusions from existing research about the role of anchoring on the face value of nominal prices in evaluating products in foreign currencies. Our reversal of the effect of numerosity on price perceptions when reference standards are salient suggests that money illusion can be explained within the framework of standard consumer choice theory (e.g., Deaton and Muellbauer 1980). Consumers evaluate transactions against their budget but they assess their purchasing power by judging the numerosity of the nominal difference between prices and budgetary or other reference standards, that is, by the number of units, into which that difference is divided.

“The Automatic and Controlled Components of Visual Perception: Examining Moderators of the Direct Distance Bias”

Aradhna Krishna, University of Michigan

Visual cues are a highly salient, vivid and strong input to many decisions. On occasion, the use of such visual cues leads to systematically biased judgments. The purpose of this paper is to examine whether such biases are controllable or automatic. We do so by examining the moderating effects of individual differences in visual imagery ability, preferences for visual versus verbal styles of processing, accuracy motivation, and de-biasing on the direct distance bias. The direct distance bias is a perceptual bias based on

visual cues, in which paths with a shorter direct distance between end-points are estimated to be shorter than equally long paths with a longer direct distance.

Given that the use of direct distance as a source of information leads to biased judgments, we identify conditions under which consumers can make more accurate judgments. If the direct distance bias is controllable, then factors such as de-biasing and training, or increasing accuracy motivation should attenuate the use of this heuristic in distance judgments. On the other hand, if the direct distance cue is used as an initial anchor in an automatic manner, then such factors may be ineffective at controlling the bias. Instead, factors that attenuate the attention paid to the direct distance heuristic may be more effective at controlling the bias.

Study 1 investigates the effect of individual differences in visual information processing ability. The study is based on earlier research proposing that chronic imagery vividness may attenuate the effects of vivid and salient information. We look at situations where subjects are given visual/pictorial information, and are asked to estimate distance in feet—a ratio scaled measure with an external accuracy criterion. We find that individual preferences for visual versus verbal processing do not reduce reliance on direct distance as a source of information to make distance judgments. In contrast, individuals with more vivid imagery ability are less likely to be prone to the direct distance bias.

The next two studies examine the role of contextual interventions designed to make subjects disregard the use of direct distance as a source of information. Study 2 examines the role of motivation. Typically, more normative processing of information can be encouraged under higher accuracy motivation conditions, for example, by increasing the stakes involved in making a more accurate decision. However, if one or more of the inputs used to make a decision are used in a non-conscious manner, outside of awareness, then respondents may not consciously be able to reduce their reliance on them. Further, if the use of such inputs is uncontrollable, then respondents may be unable to reduce their reliance on them. We find that the direct distance bias persists even when subjects are highly motivated. This pattern is consistent with the definition of uncontrollability of an effect. If the effect was controllable, higher motivation to be accurate should have led to an attenuation of the effect, even if it persisted in the high motivation condition.

Finally, Study 3 examines whether reliance on direct distance reduces when it is perceived to be an unreliable estimator of distance. Classic de-biasing techniques in the social judgment arena have shown that increasing people's attention to the biasing nature of a stimulus and encouraging them to use alternate sources of information for making a judgment lead to an attenuation of the bias. Again, this argument presupposes that if the use of the input is outside awareness, bringing it within awareness will lead to normatively appropriate processing. Increasing awareness of the biasing nature of a stimulus on a judgment and encouraging disregard of it should be extremely successful strategies if biases are consciously controllable. If they are uncontrollable, then de-biasing as a strategy may not be effective. We find that the bias persists even when subjects believe direct distance is an unreliable estimator of actual distance. This adds to the evidence that the bias is due to an inability to ignore the perceptually salient direct distance information.

We conclude that the use of direct distance due to its perceptual salience is "automatic," in as much as it appears to be uncontrollable, except when people are less likely to attend to it—while it can be reduced under some conditions, it is near impossible to eliminate. In the presentation, our three studies will be described, followed by a discussion of theoretical implications of our research.

SPECIAL SESSION SUMMARY

Language Processing, Affect, and Cognition: Word and Sentence Structure Effects Across Languages

David Luna, Baruch College

While language is ubiquitous in marketing and advertising, consumer research on language processing is still in its infancy. This session examined different aspects of how the structure of language influences the effectiveness of brand names and advertising copy. The study of language processing is crucial to understand the influence of advertising and brand naming on both affect and cognition. The research presented here aims to provide an appreciation of the effect of language structure on cognition and persuasion, particularly when targeting linguistically diverse markets.

The three studies by Yorkston and de Mello opened the session investigating the linguistic structure of brand names. Their research extends previous research on the linguistic features of brand names (e.g., Zhang and Schmitt 2001) by examining the influence of gender on brands. The studies suggest that it is not only important to consider the properties of the brand name itself (e.g., familiarity, gender), but that gender congruity between the brand and its product class must also be considered when designing brand names.

The study by Lerman also investigates the structure of brand names. The author considers the role of a brand's linguistic components on brand attitudes and other measures of brand processing. In particular, the results suggest that familiarity of brand morphemes (the smallest meaning units in language) impacts brand name preference. Lerman's research has profound implications for brand name development.

The five studies by Luna, Peracchio and Lerman investigate language at a different level. While the other two presentations focused on morphology (meaning creation within a single word or brand name), this paper examined language in sentences, and suggest that sentence structure in a slogan (i.e., its syntax) also impacts affect and cognition, especially when consumers are paying attention to the language of the ad.

Each of the presentations had a cross-linguistic dimension which is relevant to the growing diversity of consumer markets. Lerman explained that morphemic familiarity has opposite effects for native and non-native speakers. Yorkston and de Mello showed that different languages (i.e., Spanish and English) assign gender in different ways to brand names, not necessarily following the linguistic norms used to assign gender to other nouns. Luna, Peracchio, and Lerman suggested that there are structural and social constraints governing the use of mixed-language ads, a practice increasingly used in ethnic and cross-over marketing.

The contributions for consumer research are manifold. Each of the presentations is firmly grounded on linguistic theory and contributes to the small but growing corpus of research on psycholinguistics in consumer research. Also, while brand research has often focused on the nature of the psychological associations to a brand, it has often neglected how linguistic factors may influence brand name success. Additionally, the presentation on codeswitching provided a framework for researchers interested in this widespread practice, not only in ethnic marketing but also in cross-over advertising, targeting mainstream consumers.

“Sex Sells? The Effects of Gender Marking on Consumers’ Evaluations of Branded Products Across Languages”

Eric Yorkston, University of Southern California

Gustavo de Mello, University of Southern California

Brand names identify and distinguish products and are often considered the single most valuable asset a corporation possesses. Names can work together with the package graphics to communicate the product's position and image. A brand name can be designed to convey excitement, elegance, exclusiveness, and other qualities that influence the consumers' perceptions and attitudes. Good brands can evoke feelings of trust, confidence, security, strength, durability, and status. The brand name chosen for a new product can affect the brand's image, shape brand-knowledge structures, and play an important role in brand-equity formation.

In many cases brand names provide information about the product explicitly through the semantic meanings incorporated in the brand name (e.g. Windex is a product to be used upon windows). It is also possible for brand names to implicitly cue attitudes or information toward the brand through structural factors of the name itself. For example, the phonetic sounds comprising a name can influence attribute perceptions or even trigger cultural stereotypes (LeClerc, Schmitt & Dubé 1994; Yorkston 2004).

In this paper, we examine gender markers, an inherent aspect of language that implicitly affects both brand attitude formation and brand encoding. Languages assign objects to different gender classes. Members of a gender class then systematically modify other parts of speech, such as pronouns, articles, adjectives, and verbs. Depending upon the language, gender is assigned by using either semantic or formal rules. In semantic gender classifications, the meanings and properties of the object determine a word's gender. In a formal gender classification, the properties of the word instead of the properties of the represented object determine the gender. Therefore, in language, gender can act as both a classification scheme for objects as well as the agreement cue for an object's referents.

Our objectives in this paper are three-fold. First, we examine the theoretical basis for the gender classification of brand names in language. We demonstrate that brand names do not acquire gender in a similar manner to objects in a language, but instead acquire gender similarly to how an individual's name would acquire gender. Second, we demonstrate the effect that a brand name's gender can have upon consumers' judgments of a brand in a product class. Third, we provide evidence suggesting that gender (dis)agreement between brand names and products affects encoding and storage of the product's information. Stated simply, we investigate some of the consequences a gender system may have on attitude formation and brand name encoding in a brand context. In addition, we examine how the differential role of gender across languages can moderate these effects.

In Study 1, we examine the role gender classes play in product evaluations in English, a language with a semantic assignment system. English has a relatively weak gender system (i.e. there are very few semantic rules and very little agreement across parts of speech). We show that consumers readily break from the structured rules and assign non-neutral genders to both product classes and to brand names. Further, the interaction of these gender assignments

can affect judgments about the product wherein consumers bestow higher evaluations upon products with congruent genders between product class and brand name. Even more interestingly, English speakers demonstrate a remarkable flexibility in the manner in which they break the rules of gender assignment. While product classes follow semantic assignment rules, the assignment of gender to fictitious, meaningless, brand names appears to follow formal assignment rules.

In Study 2, we extend the analysis of the role gender classes play in English. Using the insights garnered from Study 1, we more systematically examine how gender markers affect product evaluation. We demonstrate that when the formally assigned gender of the brand name is congruent with the semantically assigned gender of the product class, individuals have more positive attitudes and elicit higher purchase intentions toward the brand. In addition, we provide support for our hypothesis that the primary purpose of semantic gender systems is to provide cues regarding object meaning and not to facilitate language processing. There is little direct evidence of processing interference caused by brand name/product class gender incongruencies.

Study 3 replicates the procedure of our second study, this time with a population where the primary language is Spanish, a language with a formal assignment system. Since product classes may have differing formal and semantic gender classifications in Spanish, we examine how these two classifications interact with a brand name's assigned gender. We find that while gender is formally assigned to objects in Spanish, the gender of brand names is semantically assigned in congruence to the product class. Additionally, it is this congruency that has the greater effect upon a brand's evaluation. We also report the counterintuitive finding that gender effects upon brand evaluations appear to be weaker in Spanish than in English, even though Spanish possesses a stronger gender system (i.e. words are more often assigned via specific rules and more parts of speech agree with an object's gender). We posit that since formal gender systems rely less upon semantic meanings in gender assignment, and evaluating a product and brand name relies heavily on a brand's associated meanings, gender associations are less likely to be applied to brand evaluations in a formal system. Finally, we demonstrate that gender matching plays a significant role in brand name encoding. Not only are there significant differences in recall based upon product gender/brand gender congruency, but mismatching brand name and product gender inhibits brand name recognition.

This research expands upon the recent literature that demonstrates the importance of examining individual linguistic components when developing a brand name. Additionally, by examining this cross-cultural phenomenon, we present an interesting example of how multi-national companies must not only be concerned with explicit cultural differences, but also with an implicit understanding of the language when taking their brands across borders.

“You Say Tomato and I Say Tomato: Native and Non-Native Language Processing of Novel Brand Names”

Dawn Lerman, Fordham University

The translation of brand names poses challenges to marketers operating internationally. One often-cited example is the marketing of the Chevy Nova in Mexico, where “no va” means “it doesn't go.” However, such challenges are not limited to brands marketed across countries. For example, Spanish-speakers within the United States may have made the same association. Of course, bilingualism complicates the issue. Depending on the language system used to process the name (i.e., Spanish or English), the Nova name may or may not have evoked negative brand associations among Spanish-

English bilinguals. The purpose of this paper is to investigate such language influences by comparing brand name evaluations of monolingual versus bilingual consumers.

Consumers draw on language knowledge stored in the lexicon to process brand names. When the Hydrovive brand of shampoo was first introduced in the United States, for example, English speakers were able to draw on their knowledge of phonemes (i.e., sound) to read and pronounce the name and their knowledge of morphology to make associations to the name (i.e., hydro relating to water or moisture and vive relating to life). Even when names are non-words that are not composed of known morphemes (e.g., Exxon, Xerox), consumers may apply their lexical knowledge to pronounce the name and perhaps derive some meaning from the name based on phonetic symbolism (Klink 2001). Research suggests, however, that consumers are unlikely to apply their lexical knowledge to highly novel verbal stimuli (Durso and Shore 1991). Thus, English-speaking consumers might have been reluctant to try to say “Häagen Dazs” aloud when this brand was first introduced because the name includes an umlaut and the letter combinations violate English word formation rules.

Whereas novel brand names can only activate lexical knowledge of a single language for monolinguals, they may activate lexical knowledge of more than one language for bilinguals. Although fluent bilinguals process words in their non-native language directly (as opposed to using corresponding words in their native language; Chen and Leung 1989), they should be able to draw upon this broader language knowledge when it may be helpful to do so. Presumably, then, they should have greater linguistic flexibility in processing brand names than do monolinguals. This flexibility is evident in the supposed ease of learning a third language once having learned a second language (Oldin 1989).

Linguistic flexibility among bilinguals is made possible through language transfer, or more specifically, substratum transfer. Substratum transfer refers to the influence of the native language on a subsequently learned language (Oldin, 1989). Although the effects of substratum transfer are most evident in pronunciation (Thomason 1981), such transfer also occurs at the morphological level (Ard and Homberg 1983). While substratum transfer can certainly aid brand name processing, the potential also exists for it to hinder processing. The consumer's pronunciation of the brand name may, for example, diverge from the norm among native speakers of that language (Oldin 1989). The resulting mispronunciation often results from the activation of phonological codes according to the grapheme-phoneme (i.e., spelling-sound) correspondences of both the target language and the native language (Brysbart, Van Dyck, and Van de Poel 1999). Non-native speakers may also hear phonemic contrasts when none exist in that language or miss such contrasts when they do (Lieberman, Harris, Hoffman, and Griffith 1957).

In this study, an experiment is conducted to examine the use of lexical knowledge among native (monolinguals) and non-native (bilinguals) English-speakers in the processing of novel brand names and the effect of such knowledge on brand name evaluations. Brand name novelty was manipulated by exposing respondents to one of two novel brand names, a novel name composed of English language morphemes and a novel non-morphemic name. It was hypothesized that an interaction between morphemic (un)familiarity of the name (morphemically familiar, morphemically unfamiliar) and language background (monolingual, bilingual) would exist.

Consistent with expectations, the results revealed stark differences between native and non-native English speakers in perceptions of and attitudes toward morphemically familiar and unfamiliar brand names. Overall, the results indicate a clear advantage of morphemically familiar names over morphemically unfamiliar

names among native speakers whereas the reverse generally appears true for non-native speakers. For example, among native speakers, morphemically familiar names appear more distinctive and more likeable but no easier to pronounce than morphemically unfamiliar names. In contrast, morphemically unfamiliar names appear to perform better than morphemically familiar names on distinctiveness, attitudes, and purchase intentions among non-native speakers.

The differences in perception and attitudes among native and non-native speakers present additional challenges for companies operating in bilingual communities. Previous research suggests that the use of a consumer's native versus non-native language in advertising can influence attitudes toward the ad and toward the corporate sponsor (Koslow, Shamdasani, and Touchstone, 1994). The present study offers evidence for such (non)native language effects on perceptions of and attitudes toward both the brand name and the brand. The managerial implications of these differences are discussed along with a number of alternative courses of action that marketers may consider depending on the language background of their target market.

“A Theory-Based Examination of Language Switching in Advertising to Bilingual Consumers”

David Luna, Baruch College

Laura Peracchio, University of Wisconsin

Dawn Lerman, Fordham University

Bilingualism is an important phenomenon considering that most of the world's population speaks more than one language (Grosjean 1982). The lack of research explicitly addressing how bilinguals process marketing messages is therefore surprising. In this paper, we address the practice of switching languages within an utterance (codeswitching) and, in particular, within advertising slogans, as many ads do when they target ethnic markets. For example, a recent advertisement for *Latina* magazine read: “Looking great doesn't have to cost a fortuna.” In Spanish, the word “fortuna” means “fortune.” In this case, the advertiser appears to believe that the word “fortuna” will be more compelling than “fortune” among a Latino audience.

Our research will examine whether codeswitching in advertising is an effective practice, and what variables may influence its effectiveness. Study 1 investigates the effect of structural (grammatical) constraints on attitude toward codeswitched slogans. Studies 2-5 examine the effect of social factors on attitudes toward codeswitched ad slogans.

As a theoretical base for our studies, we utilize Myers-Scotton's (1993) model of codeswitching. The model hypothesizes that there are structural, or cognitive/grammatical, constraints that dictate when codeswitching can be implemented by the speaker. These constraints constitute a “grammar” of codeswitching which describes the correct and incorrect ways of mixing languages. In addition, the model suggests that there exist socio-psychological variables that influence whether speakers will choose to use codeswitching or not. These variables could include the attitude that speakers have toward a specific language and the use of codeswitching in general.

In study 1, we examined the grammar of codeswitching. That is, we attempted to uncover the effect of syntactic (sentence structure) factors on message evaluations. We developed eight advertising slogans containing either correct or incorrect code switches according to the rules set forth by Myers-Scotton (1993). We also manipulated type of processing during exposure. For that purpose, we had respondents engage in either data-driven or conceptually driven processing (Roediger 1990). We hypothesized that

if they were in the data-driven mode, they would notice the code-switched word and they would be affected by structural constraints. If they were in the conceptually driven mode, they would ignore or not pay attention to the code-switched word and they would not be affected by structural constraints. This type of processing effect should be manifested in more (negative) elaboration on the slogans themselves and a higher likelihood that grammaticality effects would be manifested in the data-driven condition (Chaffin 1997; Elias and Perfetti 1973). The negative elaboration in the data-driven condition should result in worse slogan evaluations in the grammatically incorrect version of the slogans. In the conceptually driven condition we hypothesized that slogan grammaticality would have no effect on slogan evaluations. The findings of our experiment confirmed our expectations, showing that grammaticality of codeswitching only influences slogan evaluations in the data-driven condition. Process and memory measures provided support for the evaluation results.

In studies 2-5, we examined the social factors influencing attitudes toward codeswitched slogans. We manipulated the language that was most salient in the slogans. Minority-to-Majority slogans began in the Minority language (in this case, Spanish) and switched midstream to the Majority language (English). This provided salience to the Majority language, since it contrasted with the language being processed at that particular time. Majority-to-Minority slogans began in the Majority language and switched midstream to the Minority language, providing salience to the Minority language.

Study 2 found that, in codeswitched slogans, the attitudes associated with the salient language influence consumers' attitudes toward the advertised product. When the Majority language was made salient (Minority-to-Majority slogans), the slogans resulted in higher evaluations than when the Minority language was made salient (Majority-to-Minority slogans). We call this the *codeswitching direction effect*. Thought protocols confirm our theorizing that the Majority language is associated with more positive concepts (progress, education, integration,...) than the Minority language, which tends to be associated with marginalization, discrimination, and a feeling of inferiority (also see Koslow et al. 1994).

Study 3 manipulates attitudes toward the majority and minority languages. We find that the codeswitching direction effect is eliminated when bilingual consumers are exposed to materials emphasizing the positive aspects of the Minority language. These results suggest that the codeswitching direction effect is indeed caused by attitudes toward a particular language. Studies 4 and 5 manipulate attitudes toward the practice of codeswitching and attitudes toward a specific codeswitching direction. We find that those factors also moderate the codeswitching direction effect. These results suggest the existence of language schemas—associations that individuals have toward specific languages. These language schemas influence consumers' perception of materials written in different languages.

Our research validates Myers-Scotton's (1993) model in an experimental setting (the original model was derived through observed discourse analysis) and extends it to language comprehension in advertising. Our results represent a step forward in the understanding of language in advertising to bilinguals. In particular, we uncover structural and social constraints in the use of codeswitching in advertising, a practice increasingly used by U.S. advertisers targeting ethnic markets. We also provide some practical guidelines for advertisers considering the use of codeswitched ads.

SPECIAL SESSION SUMMARY

The Gendered Nature of the Evolving Technoscape: Evaluating Identity, Representation, and Locality

Susan Dobscha, Bentley College

Broadly defined, technology is the “tools, devices or systems designed to help users carry out specific tasks (Koerber 2000).” This definition reflects the historically neutral way in which technology is conceived: as a culturally-void tool used to accomplish otherwise mundane tasks. While technology is often discussed in culturally-neutral terms, recent work in consumer research and other disciplines has begun to place technology squarely within the socially-contested landscapes of gender, race, class, and sexuality. This work has served to create a new definition of technology that emphasizes the continuous and everyday nature of the tool and its reflection of dominant social patterns such as sexism, racism and classism. In addition, if it is believed that technology is “inextricably linked to particular patterns of power and authority” and reflective of the human condition in which it developed and used, then we can assume that the cultural dynamics that shape our interpersonal lives exist in technology-based interactions as well. The utopian notion of a genderless, raceless, and classless world that many believed would emerge from the proliferation of information and communication technologies has not happened and now many researchers are questioning the true nature of this utopian vision.

This session served as an illumination of the core issues surrounding the role of technology in the formation and maintenance of gender. This session built upon a previous special session that introduced the ACR community to the core ideas surrounding the gender/technology intersection. Whereas that session *described* the intersection, this session served to *critique* it. Many within consumer research equate sex and gender and thereby ignore or miss the continuous nature of the gender construct. This session will shed light on the dynamic construct of gender by discussing the fluid nature of gender identities, gender representation in film, and gender locality in public access technology centers.

In the first paper, Zinkhan and Close examined the reshaping of gender identities in cyberspace. Their examination attempted to confront the utopian vision of androgyny in light of the proliferation of technology for use in interpersonal relationship formation and maintenance. While many commentators predicted that gender would be rendered unimportant in the technological landscape, most research has found the opposite to be true. In fact, internet access and usage reflects the exact same gender dynamics that occur in non-technological spaces. Through diaries, long interviews, and observation, the authors shed light on this apparent paradox and provide insight into our current understanding of gender identity.

While the Zinkhan and Close’s paper reflected on the current state of and provided insight into the future of gender identity, Neilson’s paper interpreted the gender representations present in science fiction films. Neilson posited that the gender/technology tension that exists in everyday life is either reflected in or contested in the portrayal of women in sci-fi films. The emergence of the female cyborg in particular demonstrates this tension and was analyzed by the author to provide insights into technology’s role in consumers’ everyday lives.

Finally, Dobscha’s paper served to interpret gender and race relations within a certain locality. While most work on the gender/technology intersection has focused on the way in which gender identity is formed/maintained/supported in cyberspace, Dobscha attempted to understand the role of gender and race in the use of

spaces specifically designed to provide access to the internet. How participation in technology is locally situated in public spaces will provide insights into whether traditional terrains are being maintained or subverted with the introduction of technology as the new social arbiter.

Romance and the Internet: The E-Mergence of E-Dating

Angeline Grace Close, University of Georgia/North Georgia College and State University¹
George M. Zinkhan, The University of Georgia

ABSTRACT

Here, we explore the meaning and essence of a relatively new phenomenon—electronic dating (E-Dating). We define key terms (e.g., E-Dating, O-Dating, Netiquette) associated with this emerging aspect of dating. In our exploratory study, we focus on the Internet-based form of E-Dating, by tapping into the experiences of college-aged singles in the U.S. Our methods include a survey, in-depth interviews, and a series of focus group interviews. We assume that through narrative description, human experience can be consciously expressed and explained. We furthermore consider online dating as a kind of social exchange and describe emerging sociocultural, semiotic, and humanistic trends.

INTRODUCTION

“Now fate has met its match” (Yahoo personals, 2003).

Dating is the process of ritualistically courting a partner with a perceived aspect of romantic potential. As such, this set of rituals can be seen as a component of consumer behavior that is currently in a transition stage. In 2001, there were more than 5 million regular users of dating or singles websites (Stone, Rogers, and Platt 2001). Revenue from these dating sites is expected to rise more than 100 percent in the next five years— from US \$313 million (2002) to \$642 million (2007) (Higgins 2003). In 2003, online dating is a \$304 million industry, targeting primarily the younger, presumably single market (Higgins 2003).

There is a dating site for almost every conceivable religion (e.g., catholic singles.com), region (e.g., chicagosingles.com), or cultural background (e.g., globalrishta.com). The most popular online dating services (e.g., match.com, emode.com, kiss.com, matchmaker.com, lavalife.com) draw patrons and curious counterparts from all financial, economic, and social backgrounds. The category leader, match.com, reports 5.7 million hits *per month*, matchmaker.com reports 3.2 million hits per month, and five other sites are in the million-plus range. *Udate Properties* has ten-million individual subscribers (*Newsweek* 2003). Such dating sites provide a virtual opportunity for consumers to interact and, in the process, re-invent dating patterns, rituals, scripts, and motivations.

Two central questions guide the present study. First, “What themes are salient among young (college-aged) daters in the U.S., who use the Internet to initiate and/or facilitate dating relationships? Second, “What concerns and outcomes do daters experience before, during, and after searching, posting, and/or joining an Internet dating/singles site?” In pursuing these questions, we seek:

1. to understand the emergence of Internet dating via informants’ experiences
2. to present qualitative data that illustrate key themes related to Internet dating

Emergence of Netiquette-Based E-Dating

Based on our exploratory interviews and surveys, we synthesize the following definitions:

1. *O-Dater* (Offline)- One who only utilizes traditional, offline means to seek others for possible romance in person.
2. *E-Dater* (Electronic)- One who utilizes an electronic (e.g., the Internet) exchange to seek a dating relationship with another, typically with someone they have not met. This exchange is often one-way. E-Dating includes such activities as subscribing to a site, posting a personal ad or message, replying to messages, and so forth.
3. *E-Dating Success*-A mutual online interaction (exchange), which may occur instantaneously (e.g., ICQ), or be lagged (e.g., an e-mail). Success may precede an offline date, yet an offline date is not always the goal of E-Dating.
4. *Dating Etiquette*-The pre-established, societal and culturally-based set of norms, traditions, and rituals in American O-Dating history. Much dating etiquette is gender-based.
5. *Dating Netiquette*-The emerging set of norms and expectations apparent in E-Dating relationships, generally less stringent/more causal than previous dating etiquette.

American dictionaries term a *date* as “an engagement to go out socially with another person, often out of romantic interest, or “one’s companion on such an outing” (dictionary.com). We believe that there is a need for a separate component to describe non-traditional (e.g., Internet) dating. Thus, our working definition of an E-Date is:

the pre-set time to “meet” in a chatroom or on a dating/singles website to instant message (IM), or the actual online social exchange. The initiation of an E-Date may result via a personal posting, a chat room conversation, an email, some other computer-mediated communication, or even from offline correspondence.

We define E-Dating as:

the process of contact, courtship, and subsequent emotional, psychological, or spiritual bonding/ exchange at any level between persons via a singles, matchmaking, or online dating website/chatroom.

With these key concepts defined, we now explore E-Dating in more depth.

THEORETICAL BACKGROUND

Economic theory can be applied to understand social behavior (e.g., Blau 1964, Gouldner 1960, Ekeh 1974). In marketing, Belk and Coon (1993) studied economic exchanges associated with dating (e.g., gift giving). From this perspective, American dating, mating, and courtship are market exchanges, where daters ritualistically exchange and gifts and spend money as a focal symbolic

¹Acknowledgements to UGA’s *Grady College of Journalism & Mass Communication’s Faherty Lab*, Barry Hollander, Marie Carmody, Jamie Crotts, Robbie Schwartz, and the Marketing and Distribution Department for funding. The first author thanks Cara Okleshen Peters for her academic mentorship.

vehicle (Belk and Coon 1991). A social theory of exchange (e.g., Malinowski 1922), however, suggests that such exchanges are associated with prestige—something that is distinct from financial or material exchange. As a caution, viewing dating as an exchange “may threaten to commoditize and destroy the illusions provided by the romantic model of love” (Belk and Coon 1991 p. 521) Nonetheless, we continue in the tradition of social sciences and consider E-Dating as primarily a social exchange.

METHODS

In this exploratory study, we employ multiple methods to explore E-Dating to triangulation in aims of providing corroborating evidence (Lincoln and Guba 1985). Data collection consisted of: a) an exploratory questionnaire, b) preliminary semi-structured, in-depth interviews and c) a series of focus-group interviews.

Questionnaires

To explore the definitions and user perceptions associated with E-Dating, we administered a preliminary questionnaire to all focus group informants, prior to any moderated discussion. The three questions on the questionnaire asked about security, the definition of E-Dating, and e-mail. We also provided a place for informants to write any feelings, elaborations, or comments they prefer not to share with the group as a whole.

In-depth Interviews

A trained and experienced qualitative researcher interviewed three E-Daters in order to get a preliminary feel of the individual perspective of E-Dating. The individual in-depth interviews ranged from approximately 30 to 120 minutes in length. Although the findings of the current study are based on the questionnaires, preliminary depth interviews, and three sessions of focus groups, the researcher has since conducted 27 depth-interviews with E-Daters.

Focus Group Interviews (FGI)

As a primary data source, we formed temporary “small communities” to explore dating perceptions and practices. We chose to concentrate on this method, as focus groups are “less structured and free-flowing” (Zinkmund 1985) and account for the social nature of dating. There were two rounds of group interviewing, with over a year elapsing between the rounds.

FGI Recruitment/Sampling. In Round A, via criterion sampling, we found individuals with E-Dating experience. We recruited singles that have tried (posted to or responded to) E-Dating services, primarily with classified advertisements in a local newspaper. Simultaneously, we drew upon other recruitment sources: a list of study informants on a related topic (chat), and a marketing listserv. Potential informants were sent a screener to ensure their E-Dating experience. We described the study’s general nature, yet not the exact study purpose, to suspend bias. Informants received \$30 for their time and insights.

Round B informants were recruited via a “snowballing” technique, which utilized fliers posted in the downtown area as a starting point. Round B informants were compensated in one of two ways: (1) with extra credit in an undergraduate business course, or (2) community service hours. In this recruitment round monetary incentives were not required to find individuals willing to share their E-Dating experience. Thus, before the second series of research begins, we found more individuals willing to talk about E-Dating experiences.

Data Preparation and Analysis

We compiled responses from the questionnaires from all respondents. We combined these data with field notes and hours of video and audio tapes. In addition, the transcribed preliminary in-depth interviews and researcher notes were incorporated into the database. Researchers extensively watched the videos for body language, reviewed field notes, listened to tapes, and classified questionnaire items. The data analysis procedure was based on immersion into the data, which came from extensive reading/viewing, arranging, coding, and comparing of the data (Creswell 1998). We related and classified the responses according to (1) popular issues, (2) research objectives, (3) source, (4) patterns, and (5) themes.

Open coding lead to axial coding (connecting a category with subcategories). Here, researchers classified the data into categories, according to common words (e.g., confidence) or phrases (e.g., “dating is scary”). We then refined and differentiated the emerging categories. After revisions and re-groupings, subcategories (e.g., time constraints), and their depth and breadth were formed. At this point, we were able to elaborate on how each category and subcategory relates. Finally, we identified the relationships among each code and category. We viewed the data in terms of the research objectives, and rechecked interpretation against the data until we reached saturation.

FINDINGS: EMERGING E-DATING THEMES

Establishing Relationships

In addition to seeking romance, our informants use E-Dating sites and services to establish friendships, or just to find someone to communicate with infrequently. Four informants from group A each used the Internet as a direct tool to establish a new relationship. Informant (A2, M) said he utilized an “online matchmaking service” in an attempt to meet new people—not necessarily romantic, when he first moved to a new city.

Informants likewise spoke of using the sites to find romance. Interestingly, males dominated in sharing personal E-Dating experiences, in almost a brag-like manner. One informant (A3, M) used such a site to seek romance. He “met” a woman in a chat room after seeing a woman on an E-Dating site. This woman lived in Tennessee (although he lives in Georgia). The two had not previously met; however, he made the trip to Tennessee to see her twice.

E-Dating Advances Friendships

Informants noted that the Internet often does keep a pre-established friendly relationship intact via computer-mediated-communication (CMC). CMC contributes towards making a friend into more:

I would say that ICQ’ing during class and emails back and forth are probably as much as what created us going beyond friends, as time we spent together, even though we saw each other every day it was the late night humor emails and ICQs during class...that definitely created the flirtation. (A7, M)

It’s a Small, Small World

Informant (A7, M) met a woman in a dating site. In this site, he came across a woman who intrigued him with common interests, goals, and career aspirations. After initial contact and chatting, he discovered that she was his coworker in a Texas-based satellite office. They then moved their chatting sessions from the dating site to their company’s Intranet. Their online encounters lead to a three-week romantic involvement. The informant, from the Atlanta

office, told of his “business trips”, which he took three weeks in a row. Such “E-affairs” may be especially of interest to managers who supervise “business related travel”, as employees often use the Internet (or Intranet) for more than job-related tasks. We see that such work-based Internet tasks range from “paying an occasional cable bill”, to facilitating/carrying out a romantic relationship. In the instance of (A7, M), he used his company Intranet to accomplish personal goals. We see that E-Dating is a tool, even on a regulated network (e.g., a company’s Intranet), to seek an offline romance. As we reveal below, this tool often: a) facilitates offline encounters, and/or b) creates online relationships.

Facilitating Offline Encounters. In both E-Dates and O-Dates, informants seek pleasure and affirmation. The way in which they find and merit these goals is different offline than offline. In the exploratory group, six informants said they used the Internet to facilitate off-line relationships (A-2M, 3M, 6F, 7M, 9F, and 11F). These informants each used a dating site to maintain ties with people whom they had *first* met in real life. These instances consisted of romantic, platonic, and family relationships. For instance, informant (A9, F) met a man she developed romantic feelings for while studying abroad in Israel. Upon returning to the US, the international couple kept in touch through online means. CMC was the choice of keeping in touch, as international calls are “too expensive” and “the time zone differences became an issue”. However, many Internet users who reportedly maintain relationships on dating sites have found methods of supplementing their contact through phone calls or meetings in person.

Creating Online Relationships. The second round of informants expressed a new theme. The finding here is that they are *creating* meaningful personal relationships online (chat rooms, email) in addition to just utilizing the Internet to maintain existing relationships. The dating sites serve more so to introduce than to rekindle prior relationships. Relationships that have been created online are often due to common personal characteristics such as shyness or interest in common sites. Such relationships blossom on the E-Dating sites and chat rooms.

The Electronic Edge

Informants say the Internet provides an extra edge, by serving as a confidence-builder for creating romantic relationships. That is, E-Dating sites may give some individuals the confidence to pursue a date. More aggressively, one woman met a man online from halfway across the country. Two months later, they moved in together. “I was scared out of my mind...but I was enough of a hopeless romantic to do it” (A6, F). She felt the Internet aided her decision to “go for it”.

E-Dating Geographical Barrier

E-Dating is best for finding singles living in or near the same city. That is, the Internet brings new daters together from local communities much more frequently than any other search option. Informants frequently claim a key attribute of the Internet is that it “reduces geographic boundaries in both relationship formation and maintenance” (A9, F), but they do not report this in their actions. While it is possible to meet others from distant geographic boundaries via E-Dating, informants rarely spoke of such experiences in a positive note.

Resulting from solely online encounters, (A6, F) moved from North Carolina across the country (to South Dakota) for an attempted romantic relationship. This move came after two months of online contact. Not only did she go for a weekend, as the previous informant, yet she went with her belongings and intentions of permanently moving in. She did just that. Note here, e-interactions were the sole motivation for her move, as there were no additional career or familial persuasions. The informant did not consider this

move to be risky. When probed concerning the risk of such a drastic move, she replied, “I’ve been talking to him online—he is not a complete stranger” (A6, F). She was back in North Carolina after just five weeks of living with this “non-stranger”. Most other informants expressed some sense of the risks associated with making the transition from E-Dating to O-Dating.

Sacred Place. Whichever area of the country (or world) an E-Dater resides, the sacredness of the home remains. The home is a sacred place, and there are sacred relationships created in the home. (E-Dating) “is good for nights you don’t want to go out, but want some sort of social interaction” (B5, F). Most E-Daters enjoy the presence of their own home—complete with material and familiar comforts, as they E-Date. However, the Internet is a medium that can cross time barriers and space boundaries. Wireless capabilities reduce space limitations, and make E-Dating available almost anywhere (e.g., via wireless communication).

Time Wasted, Time Saved

Although technology is lessening physical space limitations, individuals’ time remains a constraint in dating. All of the focus-group informants in Round A mentioned severe time constraints in their lives, stemming from both school and other extra-curricular activities. Informants A-2M, 7M and 10F provided the best examples of how the Internet has saved them time in respect to their off-line relationships. Informant (A2, M) used an Internet dating service to meet people when he first came to Athens. He claims that the Internet is a mainstay of his current relationship, since both he and his girlfriend are “graduate students and consequently have little time.” Similarly, one informant primarily uses the Internet to maintain relationships, due to her “time constraints in life” (A10, F). We see that technology makes E-Dating appear as a time-efficient activity. Two attractive features are: a) matching services, and b) the E-Dating screener.

Matching Services. Along with real-time analysis of potential E-Dates, high-speed connections provide “sophisticated and speedy matching services”. Because of the fast-paced American lifestyle and the emphasis on career establishment, the Internet is progressively being utilized as a dating tool. As one informant shares, “there is little time available after work. I don’t want to go out to meet people; I interact with people all day. I don’t have time to do both” (B6, M). Without time to go to social events, gatherings, and the traditional places to meet dates, informants report to be “strapped for time to meet someone.” A collaborative virtual environment saves time for all parties involved. For instance, while chatting on an E-Dating site, there is no need to wait on technology, as messages are generally quickly (if not instantaneously) sent and replied to.

E-Dating Screener. The robust scalability and data archiving of personal pages allows a more time-efficient E-Dating experience. Even to one who does not “take the time” to join a specified E-Dating site (e.g., match.com), common ISPs (e.g., CompuServe, Mindspring, AOL, MSN) provide personals for the busy individual. Personals allow one “to screen” thousands in the time it would take to interact with a mere few...if any...at a social gathering or event” (B4, M). Such pages or specific personal ads can even be saved for future reference.

Recurring E-Dating Patterns

E-Dating does not necessarily follow the pre-existing courtship principles or dating patterns of earlier eras. That is, a new form of etiquette faces the generation of E-Daters with: a) less intimacy, b) community based self-disclosure, c) looks that may deceive, and d) lies.

Less Intimacy. Where traditional, offline relationships assume some physical proximity, relationships formed online are often entered into with the understanding of the limited potential for

physical contact. This limited or lack of proximity is repeatedly associated with E-Dating. Consumers are more likely to seek gratification from face-to-face communication than from the Internet (Flaherty et al. 1998). Much gratification in relationships comes from intimacy. Our informants agree: "I like the intimacy of the whole person, not a cold screen" (B7, M).

Community Based Self-Disclosure. Although E-Dating lacks intimacy, our informants do tend to be more candid more rapidly with those they have just met on E-Dating sites, as compared with people they have just met in person. However, such candid disclosure seems to occur most with E-Dating in one's community (e.g., geographical, interest-based, racial, religious). Likewise, the amount of time spent building a sense of trust with co-members of one's community, is shorter than the time taken to formulate trust with an E-Dater *outside* of one's community. This expedited sense of trust seems especially true if the chance of having the two communities cross is slim or if multiple communities are shared (e.g., finding another German Harley-Davidson member online). "We had a lot in common, so I didn't waste time explaining about my background; I could quickly tell he understood" (B8, F). Similarly, anonymity creates an opportunity for self-revelation that may not be present in the context of the traditional O-Date.

Looks May Be Deceiving. Without a photo, the aspect of attractiveness is "out of the picture", and attention focuses on written material. Hence, an E-Dater's personality may show through, without becoming overpowered by looks. The cues used in life (e.g., body language, dress, personal hygiene, tone of voice) are not available online. In addition, many deceptions occur online (e.g., via photos). A submitted photo may be outdated, doctored up, or actually represent someone else all together. Most commonly, the photo posted is from a distant perspective or just a "very good picture". "I didn't recognize her from the photo she sent me. When I met her, she had really bad skin" (B3, M).

Lies, Lies, Lies. While not always harmful or ill-intended, lies are a problem associated with E-Dating. Female informants reluctantly shared that they have lied about their weight and their age. One 20 year-old informant (B1, F) told a man she met on kiss.com that she was 21. Her rationale was to be "included in the drinking scene" on potential future O-Dates. Men reported lying about their athletic condition, income, and relationship status. Some male informants (e.g., B6, M) claimed to lie for the "entertainment value of it". One informant described how he occasionally gets together with friends and they go online (to E-Dating sites) to pretend they are interested in "ugly chicks." They pursue this prank with flattering e-mails to the girls, with no intentions of sincere communication.

E-Dating's Dark Side

Many informants reported positive experiences, yet some informants also expressed negative opinions and outcomes concerning their E-Dating experiences. Overall, negative perceptions did not outweigh the potential benefits of E-Dating, as none of the participants spoke of a negative experience that has prevented continuation of E-Dating.

Potential Danger in E-Dating. E-Dating can be dangerous, in a different manner than traditional dating. When and if one first meets an E-Date offline, it is common to feel as if the other is not a true stranger. "I felt as if I had known him for years, just after a few chat sessions" (A6, F). By chatting, information on favorite sports teams, authors and foods may have been shared with another E-Dater. Individuals seem to know many personal facts; however these "facts" are often misrepresentations. It is difficult to treat this person as a stranger, yet it is important to exercise normal precautions.

E-Daters may have a tendency to set aside precautions associated with blind dates. For example, one informant assumed that the men she met on dating sites were sincere, stable, and single. Yet, she stated that several people she had dated online were either abusive or in committed relationships. Interestingly, her offline dates did not cease after one bad experience—even with physical abuse.

He promised me everything. At first I found it hard to believe, here was someone who I would move to the other end of the country to be with. Well maybe I shouldn't have had so much faith in him. It hurts now, but I am glad for every second he gave me and for every moment I was in his arms. I know I have the capacity within to love... and one day I will love again. Only this time I will get it right! (A6, F)

Without spite, she characterizes her past negative dating experiences as "very fruitful and positive learning experiences."

Risky Business

There are always risks in dating, especially in the care of blind dates, first dates or E-Dates. The risks associated with twenty-first century dating "far exceed the risks in recent history" (B1, F). Much of the risk in E-Dating stems from: a) the unknown audience, and b) security risk.

Unknown Audience. There are social risks associated with E-Dating. For instance, while some CMC has a known audience (e.g., e-mail), E-Dating site subscriptions involve posting information or graphics to an unknown audience (e.g., personal advertisements). While E-Dating may allow one to interact with many individuals or pursue O-Dates in a "socially ascending" manner, E-Dating may tarnish one's reputation. One informant described how E-Dating is socially risky: "Anytime I type personal information, there is no telling where it may end up. My picture as well, may end up on someone's desktop or even printed and framed on their bedside table" (B11, F). This thought is disturbing to her, and is risky according to other informants—as providing personal information and photographs on a personal advertisement is, in essence, giving this information to strangers.

Security Risk. Security is an issue in online relationships: "I'm very much aware of the temptation many have to use their networking skills to look at online transactions and information that they are not privy to" (B4, M). Another informant echoes this sentiment, "I absolutely am concerned about security. I am a computer tech and know all holes in systems. I only conduct transactions with 128 bit-encryption and NEVER with my social security number" (B3, M). Most respondents are hesitant to give out their general e-mail address and instead use the address provided by the E-Dating service. One informant noted that he has two real e-mail addresses and one fake "spam account." Identity stealing is also a concern to informants (B4, M; B11, F; B3, M).

DISCUSSION

Here, we present a "snapshot" of perceptions related to E-Dating, as experienced by single, college-aged Americans. The Internet has been around for over thirty years, but it took the invention of the web browser to make it available to a wide audience. It is approximately in the last five years that E-Dating has become popular with a large segment of the population. In 2002, the market for paid Web content jumped 105% overall. Yet, the personals/E-Dating industry witnessed even higher growth. In the third quarter of 2002, the personals realm saw a 387% gain, earning higher revenues than any other segment of online paid content—even more than the business/investment and entertainment/lifestyle segments (Elkin 2002).

It has been argued that the Internet may cause every power relationship on the planet to be renegotiated. It also appears that the Internet will be both a revolutionary and evolutionary force in a variety of human endeavors. For instance, the Internet has revolutionized business practices, especially in the area of B2B marketing (Zinkhan 2002). At present, it appears that the Internet may have even more profound consequences for human dating rituals. In one sense, these rituals may be traced to the distant past, as some human courtship rituals seem to have interesting counterparts in the animal kingdom (e.g., courtship patterns among great apes, birds, or higher mammals). Nonetheless, consider the profound impact of the automobile on human courtship. The impact of E-Dating may be just as strong and far reaching as the impact of the automobile. From a postmodern perspective, the Internet will have a strong influence on human consciousness and relationships (Watson et al. 2000). E-Dating may prove to be just one example of how the Internet transforms human behavior in the immediate future.

Implications for Social Exchange Theory

Social Exchange Theory assumes individuals, in this case, E-Daters, may accurately anticipate the payoffs of different decisions (Thibaut and Kelley 1959). However, daters often do not know precisely what they are looking for in a dating partner. Sometimes, they are not looking for a commitment (e.g., just to chat). Other times, interactions may cause “instant attraction.” E-Daters make impulsive choices (e.g., no children, only blondes, medium build). An E-Dater may express a desire to avoid a date with someone with pale skin, under 5’7”, or with red hair. However, these “rules” may be disregarded for a variety of reasons.

Limitations

In our study, there is not much age or gender diversity. There may be important differences in E-Dating perceptions depending on age, gender, occupation, motivations, interests, and geography. International comparisons, as well as cross-national differences may present further insight, especially in terms of consumer confidence (Zinkhan and Balzas 1998).

Future Research

In-depth interviews, case studies, and surveys remain promising methods for conducting research on the topic of E-Dating. Our working definitions (e.g., E-Date, netiquette) may aid in understanding this new phenomenon. Future researchers may wish to validate or amend these definitions. In addition, they may seek to discover the degree of intimacy E-Daters allow online, and how online relationships progress to off-line relationships. Our study is a pilot designed to stimulate such future inquiries.

Female Cyborgs in Film: Heeding the Siren's Call

Leighann Neilson, Queen's University

EXTENDED ABSTRACT

This paper adopts a visual consumption approach to consumer research, by analysing the role of cyborgs, especially female cyborgs, in film in order to interpret the ways in which these representations both mirror/reflect and shape possibilities at the gender/technology intersection. The analysis is structured around two guiding frameworks, the first a typology of fear of technology, and the second, the notion of a 'cyborg continuum.' Borrowing from Leiss, a typology of (western) society's fear of technology is developed that involves three inter-linked forms: 1) inversion of the machine/master relationship; 2) prosthetic fear/fear of death, and; 3) challenge to the social order. This is juxtaposed with the idea of a cyborg continuum, stretching from 'pure' machine to 'pure' human and composed of intermediate stages that represent varying forms of human-machine fusion and accord with the notion/metaphor of the cybernetic organism, or cyborg.

The female cyborg presents a threat to hegemonic beliefs about the condition of women: "In our culture, to be in command of the very latest technology signifies being involved in directing the future and so it is a highly valued and mythologized activity" (Wacjman, 1991, p. 144). Female cyborgs, who are 'in command' of, or embody, the latest technology act as metaphors for 'what cannot be spoken' and pose a threat to the social order.

The body of the paper consists of a discursive analysis of how both male and female cyborg characters in science fiction films, themselves occupying various positions along the cyborg continuum, serve as visual representations of the three levels of fear of technology. Film images are seen as not only reflecting the society within which they were produced, but also shaping conceptions of possible gender/technology roles. Johnston has suggested it is not enough to say that film acts as a mirror, or as the propaganda arm of hegemonic ideologies. Such an approach does not explain how ideology is inscribed in the process of filmmaking. Instead, we must pair a "knowledge of the way a film text functions... [with] an analysis of [the] ... ideological, political, economic and ... social relations which determine the text at the time of its production" (Johnston 1975, p. 124). Similarly, we can theorize about the effects that consumption of these visual images would have on consumers.

It is as a challenge to the social order that female cyborgs present the greatest threat to patriarchy and it is through an examination of female cyborgs in particular that we can begin to get at the constraints and opportunities that these images offer to consumers. Four films will be examined as 'case studies' of the portrayal of female cyborgs in film: *Metropolis*, *2001: A Space Odyssey*, *Star Trek: First Contact* and *Eve of Destruction*.

The role of the Borg Queen, from the film *Star Trek: First Contact*, is specifically examined in this context. The extremely gendered nature of the Borg Queen, in particular, defeats Haraway's (1985) suggestion of the cyborg as a 'potent fusion', useful for illustrating the possibility of egalitarian social arrangements in a post-gender world. However, the paper argues that the film does 'call to' a certain portion of the audience and that the female cyborg can offer the potential for liberation from patriarchal philosophical paradigms as well as from oppression experienced in everyday life.

The Gendering of Public Technology Spaces: A Feminist Analysis of a Public Internet Center

Susan Dobscha, Bentley College

“the politics of becoming virtual are not simply related to the subjective possibilities and constraints of cyberspaces. Rather, the politics of ‘becoming virtual’ are also caught up with how gendered virtual bodies and identities are inscribed and elaborated through the social locations in which virtual reality technologies are used/consumed.”

Green, 2001

The above quote serves to anchor the central ideas of this paper. Technology as it has manifested in the internet experience has emerged as a major arbiter of social relations. In its current form, cyberspace has allowed consumers to shift their embedded identities, play with otherwise immutable social markers (such as sex, race, and sexual orientation), and challenge traditional notions of time and space. Yet, as has been documented in recent years, cyberspace has not in fact created a ‘genderless’ or ‘raceless’ world; in fact, gender and race warfare online are more the norm. Stalking and hate speech occupy more bandwidth than gender- or race-tolerant zones of communication. One study found that 90% of the chatting in women-only chat rooms was submitted by men, thus, leaving feminist and other scholars to wonder if the utopian vision of a de-gendered web world was naïve upon application.

Why was a genderless world such a seductive idea? What does the pursuit of transcendence through technology really say about those groups subverted by the dominant culture? This transcendence into a genderless society reflected the relations in which dominant social relations were still embedded. The absence of body and subsequently the inability to reflect visually on sex or race, instead of leveling an unlevel playing field of communications, work relations, political power, and religious doctrine, instead actually created more polarized discourses between sexes and among races. Instead of gender fluidity we found gender warfare, where those cybercitizens who chose to gender swap (and this most often takes the shape of a man pretending to be a woman) instead chose to become angry, vengeful, and violent. Therefore, instead of a newer, better, genderless cyberworld, a world emerged that was in fact more overtly masculine and patriarchal in its communication styles and social relations. When gender dynamics were removed, a predominantly masculine space filled the void.

FEMINIST REVISIONING OF TECHNOLOGY

In light of the failure of the internet to create and maintain a space where women and other subjugated groups could communicate, organize, and mobilize, feminist scholars have gone back to the drawing board to determine how the current partial and eventual cohesive cultural embeddedness of technology will affect those groups which access and mastery of technology often miss. The last twenty years of feminist analysis of technology is grim; more boys use computers and attend computer camps, more computer games are aimed at boys (thus allowing them to master computer commands and other functions), men outnumber women in technology majors in college and technology jobs in corporations, and girls are more likely to be bullied away from public technology spaces (such as classroom terminals and shared home computers).

Even in light of these inequalities, women have still flocked to the internet in increasing numbers. While the computer game industry still ignores girls as a target market, it appears they pay attention once the girl attains a higher level of consumption status. While men predominately still view the computer as a tool to master

and assist with improving efficiency, women are more likely to use it to promote kinship work, a highly gendered activity whereby family and friend social networks are maintained through regular on- and offline communication. Email, instant messaging, and personal webpages are all means by which women are maintaining their social networks.

Even with these increasing numbers, a new illiteracy has emerged. Women and minorities are slow to enter into the more complex applications associated with the internet, such as starting a web-based business, buying and selling items on consumer-to-consumer sites, and job board searching. As public libraries emerged in the past to combat the then growing problem of traditional reading illiteracy, today, a new public space has emerged to attempt to overcome this growing information chasm that is currently in place with regard to technology access. Public internet centers are a recent phenomenon in the United States, and have risen to combat the growing public concern over uneven access to technology. This concern had a significant financial boost from Bill Gates, who recently donated \$20 million to the Boys and Girls Club of America in order to build and maintain computers in the local clubs nationwide. It is important to note that these clubs are located in predominantly poor and heavily minority neighborhoods thus leading us to believe that this issue over unequal access was at least in part the motivation for Gates’ sizable donation. Yet, it is believed that money and updated facilities will not be enough to fix this systemic problem. For it is not merely access that will solve this problem; it is also take a closer look at these public spaces to determine if in fact other factors related to the construction of physical spaces are serving to inhibit or restrict this new literacy initiative.

While many have promoted access as the panacea to all problems related to technology inequalities, few have discussed the physical spaces that this access is embedded in. People must still interact with computers in a very physical way and in the case of service organizations such as the Boys and Girls Clubs or public internet access centers such as the one observed for this paper, access is mediated by many other factors. Factors such as layout, rules for usage, presence of a tutor or helper, and age, race, and sex of the users will all serve to shape the landscape of interaction within these public technology forms. The power of these confounding variables cannot be understated, yet, may have been previously ignored or discounted by scholars in the area of technology access because of inherent biases in the view of how people interact with technology. Many of us sit in front of our computers alone or in very private settings such as offices or perhaps within a public setting such as a coffee shop but often without any friends or family nearby, thus making the interaction still take on the feeling of privacy. Yet this isolation is not universal. There are many public videogame playing spaces, public internet centers, community centers, public libraries, computer labs, and internet cafes providing access to the internet and computers.

Therefore, this research attempts to provide insight into Green’s thesis that existing in and claiming power in the world of technology is not just about entering into the subjective space of cyberspace but is also, perhaps more importantly, about understanding and critiquing those social locations where technology is both produced and consumed. My observations of a public internet center in a working class and ethnically diverse suburb of Boston, MA attempt to answer the following questions:

- How does gender affect the negotiation of public space when technology is the primary arbiter of that space?
- Do the locales in which the technology are embedded reflect the social conditions of the community or culture at large?
- Will consumers' interactions with technology and each other in these spaces still follow prescribed gender roles?
- How does the physical configuration of the space serve to strengthen or diminish hegemony?

It is my contention that, like so many other public spaces, technology spaces will occupy their secure place within the realm of the masculine.

METHODOLOGY, LOCATION, AND SETTING

The data collection for this paper consisted of a series of covert observational sessions where I entered the center without letting the patrons know that I was observing them. Upon entering the facility, I would sign in as if I were another patron in order to "blend in." Also, while I possess a laptop that would have served my purpose of taking fieldnotes, I instead opted to use the computers that were available in the center, with the understanding that I would relinquish my seat should the center become full.

While overt observational tactics seem to be more the norm in feminist methodology (see Reinharz (1992) for a discussion of feminist observation research), I concluded that to remain covert would enable me to witness patrons' interactions with the computers, each other, and the space itself in a completely unguarded way. In addition, I was interested in how patrons' interacted with the physical space, not just the computers themselves, therefore, not alerting them to my presence allowed for an uninterrupted observational session. These sessions lasted about three hours and were conducted over a two month period. I was given permission by the center's marketing director to observe the patrons in exchange for my volunteering my time as a tutor.

The center is housed within an old warehouse in a large city outside Boston. This suburb houses mostly working class Americans with several distinct ethnic enclaves interspersed throughout. The center's configuration resembles a typical computer lab setup with computers facing the wall parallel to each other. These computers rim the edge of the room. Everyone who is working on a computer is facing a wall. The welcome desk is the first artifact of the center that patrons see as they walk in. It includes a sign up sheet, general information pamphlets, and a volunteer who acts as a receptionist and a technical support person. There are other spaces within the center but they are primarily used for workshops and off-site meetings and are thus kept separate from the primary public access space.

From observations within the center and from interviews conducted with staff members, it was determined that patrons primarily use the center for checking email, conducting job searches, playing games, and reading news websites (field notes). Average time spent in the center varies based on time of day: a working crowd inhabits the space on the lunch hour for short periods of time while a different crowd, comprised of various demographic groups, use the facilities in the late afternoon (interview with staff). It is important to point out that this center sits directly behind an elderly live-in facility and that many of those residents use this center quite frequently. Every time I observed the center, there was at least one senior citizen there using one of the computers.

OBSERVATIONS ON THE USE OF A PUBLIC INTERNET CENTER

My work on technology in public spaces is informed by the extensive work in feminist theory in the construction and mainte-

nance of public spaces and how public spaces reflect the dominant masculine ideology in which they are constructed. My initial interest in public technology spaces rested in the idea that since technology is a new social mediator that has on the outside created speculation about the ability of cyberspace to create new genderless spaces where men and women could co-exist without the familiar hegemony that exists in other collective spaces, such as homes and workplaces, that these public spaces would reflect substantial movement away from the traditional constructions of space toward a new world order of space. My observations quickly affirmed what others theorized: that in fact these spaces were not genderless, were not more suitable for marginalized groups, and were not the places where the information illiteracy problem would be solved.

In fact, it is my observation from my work at this center that configuration of the space in and of itself serves to maintain the traditions of the patriarchy. While feminine tradition supports communication and community building, the masculine model favors silence and individualism. The way in which this center is physically configured as well as the rules for use serves as a (perhaps unintended) means of silencing its patrons and deterring them from building relations among other patrons.

I would like to first focus on the configuration of space and discuss how the physical setup of the center creates a masculine communication environment. The space configuration reflects Tannen's conclusions about the relationship between communication and the configuration of the space in which the communication is happening. Her research found that men were more comfortable in communication formats where they were facing forward (such as in a car), while women preferred to communicate face to face. Therefore, while men would prefer the face-the-wall setup in this room, women would find it alienating. The setup would not foster a comfortable interaction with other patrons. Therefore, the space is designed to deter communication. This is in fact mandated by the center's rules, which are posted throughout the center.

This rule is reflected in the center's adherence to the "library model" of space construction, where talking between patrons is frowned upon and is only done in hushed tones, and where interaction between patron and volunteer is also done in quiet tones and for very short periods of time. This "library model" was first outlined to me by the center's marketing director. This term struck me initially because it meant that I would not have an opportunity to observe patrons interacting with each other, which was one of the central themes I was interested in studying. Yet, when I began my observations of the center I began to notice that the library model was in full effect; patrons spoke to each other and the volunteers in hushed tones, there was no music playing, and no noise of any kind was evident. There were reading materials laid out on shelves and tables for patrons to peruse and software packages were available to be checked out for use.

Where this "library model" idea led me was to evaluate the cultural underpinnings of such a model and comment on the assumptions underlying it. The library model as such is based on the assumption that learning, reading, and studying are to be done in a quiet and individuated atmosphere. This is much like the predominant movie theater model which also expects patrons to sit quietly and only interact with or about the movie after the credits begin to roll. However, what this model ignores is the nature of being "public." What does it mean to inhabit a public space? While the aforementioned public spaces do require the omission of communication, most public spaces are designed expressly for the sole purpose of open, dyadic communication. Coffee shops, community centers, shopping malls, theme parks, and other spaces often catering to groups allow patrons to communicate openly and casually. Why then would an internet access center choose to align

with the quietness of a library versus the social interaction of a community center? Both the community and internet access center are in the business of providing a public service to the community at large. Both are non-profits that attempt to serve their particular constituencies with related activities, workshops, training sessions, and organizing space. Yet while the community center provides an open, often messy physical space in which patrons can *interact*, the internet access center provides a closed, often sterile environment which patrons can *access*.

The desire to maintain this sterility is reinforced by the volunteers and full-time staff. When asked technical questions, the staff respond to patrons in quiet tones and provide short answers. During one observational period, an elderly woman was using an email program and making very visible sounds of frustration. She finally went to the front desk to try to get an answer to her problem and the volunteer came over to her computer to try to assist her. This happened three times when finally the volunteer told the elderly woman that she had other work to do and could no longer help her. This same response to other clients with extensive needs was reflected in the director's comments about the center's "usual suspects." This referred to clients who used the center but needed extensive hand holding when interacting with the computers. These particular patrons were typically from the elderly live-in facility. These elderly patrons comprise a large portion of the center's total population, however, their needs are not being fully met because of the effects of the center subscribing to the "library model." It is widely known that many elderly feel isolated and out of touch due to their living situations and the absence of extended family. In fact, many of the elderly patrons of the center are using the computers to stay in touch with family. Therefore, it is particularly ironic that they must conform to this model of silence and isolation when it is precisely that feeling of isolation that they are attempting to escape by entering the center, learning the new technology and using it to communicate with others.

The primary question that remains from this brief analysis of this particular space is: does the library model fit the needs of patrons of computer technology in public spaces? Does deterring communication in a group setting such as this enhance or restrict the experience of the center's patrons? Why has computer interaction been equated to book reading, a time for solitary reflection? And has the assumption that this is the appropriate model deterred others who are not comfortable with this type of layout from using these centers? The key conclusion from this study is that this center serves the same people which personal computer technology serves, while alienating those people supposedly targeted by public internet sites: those who otherwise would not have access to this new form of literacy, thus furthering the chasm of techno-illiteracy.

CONCLUSIONS

Public internet spaces such as the center described above do not seem to be serving the needs of those they were initially supposed to be serving. Providing access to groups of citizens who would not normally have access (such as the poor, elderly, undereducated, etc.) is a worthy goal in this new economy of information. Instead, this center reflects the overall culture of the internet at large. While the numbers are steadily changing, the predominant demographics of cyberspace are still intact.

This paper illuminates how two facets of an internet center, the physical layout and space configuration and the rules imposed by the adherence to a library model, served to reinforce gender hegemony that also dominates the virtual space constructed by computer technology. The configuration of the space reflected masculine norms and the library model created rules that reinforced these

norms. Reconfiguring the space to reflect feminine and multicultural norms in communication may be a way to increase usage among the aforementioned under-represented groups. As mentioned earlier, the elderly are a heavy usage group in this center but their constant questions are viewed as a burden on the staff. In addition, they are discouraged from interacting with each other even if it is related to computer support. This particular group feels isolated within their living quarters, escapes to a public space to communicate via email (instant messenger is not allowed) to their loved ones in order to feel more connected and less isolated, and then are discouraged from talking to one another and the volunteers because of this strict adherence to the center's rules of conduct.

While other public spaces that once demanded quiet, such as movie theaters, have responded to changing consumer needs (such as providing a matinee where mothers are "allowed" to bring babies and kids who may make noise or cry), other public spaces have been reluctant to make similar changes. It is my suggestion to management of this center that they abandon the library model in favor of a "community center" model, briefly described above. The community center model would provide a very different service to the center's relevant publics than their current model. The center would create a more communal, affiliatory, and inclusive space by changing both the norms of the center and its physical layout as well. Just because people are working on computers doesn't mean that they want to be cut off from what could quite literally be their neighbor. Previous studies on household technology have shown that while some family members may want privacy when they engage in computer communication, others choose to interact with it in a public space in the house, notably the kitchen or family room. As Sherry notes, "world making and local place making are inextricably intertwined (2000, p. 274)." Thus the place of public internet access must reflect the world it is helping to create. This is a world where everyone has equal access to and literacy in computer technology, as well as the local place it is shaping in order to achieve its goals.

The Co-Creation of Meaning Between Marketers and Consumers; Step 1: How Marketing Creatives Interpret Consumer Motivations

Jeffrey F. Durgee, Rensselaer Polytechnic Institute

BACKGROUND

The goal of this research is to improve our understanding of the “Cultural Meaning” production system as suggested by McCracken (1986). In this system, consumption meanings are co-created by consumers and marketers through a give and take of meanings regarding advertising, product design, and names. The purpose of the present paper is to learn more about the initial phase in this process: the absorption and interpretation of consumer learning on the part of marketing creatives. While marketers today draw on their “inner voices” to come up with creative ideas for new packages, names and ad campaigns, they are also very sensitive to signals and sentiments from their targets. How do they balance their own needs to be independent and creative with needs to be sensitive to their markets? Of all the market information they receive, which helps them the most?

Kover (1995) wrote an important article in which he explored how copywriters sense and understand audience motives, and how they use this understanding to write copy. His research suggests that copywriters empathize with their audiences insofar as they carry on imaginary conversations in which they alternately become audience members, then themselves, and then audience members. Borrowing terminology from symbolic interactionism, they negotiate meaning internally, alternately taking on the roles of what Mead (1934) would call the Self (themselves as acting communicators) and the Significant Other or what Kover calls a prototypic “ideal viewer.” Gobe (2001) touches on this where he talks of the ongoing dialogue between the brand and the user.

Others who have written about meaning formation as a result of one-on-one dialogues include Pierce (1977) and Colapietro (1989). Kover goes on to wonder whether the implicit theories about consumers he found among copywriters were also true of creative workers in other fields such as novelists and product designers. In short, how do creative workers in other fields than copywriting use empathy and market understanding to come up with creative content?

The purpose of this paper is to explore implicit—and explicit—theories of consumer motivations among workers in five creative fields: interior decoration, architecture, fashion consulting, stand-up comedy and automobile design. Marketers are told to be empathic (Leonard and Rayport 1997, Hill and Rivkin 1999), but how empathic are they? Empathy might help copywriters, but does it help car designers? If they are empathic, how are they empathic? Based on this empathic understanding, what are car designers’ theories about how to make emotional connections with their buyers?

Specifically, the questions driving this research include the following:

1. How are marketing empathy and marketing creativity interrelated? How does one area inform the other?
2. Do workers in creative marketing fields use empathy to sense how to engage their audiences and make the emotional connection between audience members and their offerings?
3. What are creative workers’ implicit theories about motivational and behavioral stages buyers go through including

initial awareness of the offering and subsequent emotional connection and purchase?

This research represents the first leg of a research project interrelating artistic creativity and marketing creativity. To paraphrase Brown and Patterson (2000), my goal is less to understand what marketing can do for art—and more to understand what art can do for marketing. There is an increasing demand for creativity across all areas of business (see Florida 2002), and an important starting point to help marketers become more creative is to focus on the work of workers in marketing who rely heavily on their creativity, workers, that is, who constantly have to come up with fresh offerings. How do they do it? How do they sense and incorporate audience sensitivities?

INTERSECTIONS BETWEEN EMPATHY AND CREATIVITY

Finding intersections between empathy and creativity is not easy.

First, these subjects represent two separate research streams. The empathy literature is grounded in psychotherapy (e.g., Rogers 1957) and deals little with innovation and creativity. Kohut (1977) defined empathy simply as “vicarious introspection.” As Pluth (2002) writes, “empathy involves imaginatively and entirely entering another’s point of view in order to illuminate behavioral motivation, participating in another’s conscious existence, ‘becoming’ another’s actual subjectivity and experiencing reality, both affective and cognitive from that perspective” (p. 2). All of these relate to the need for therapists to have a deeper understanding of client psychological problems. The concept “Einfühlung” or German for “in-feeling” is used in connection with works of art but only in terms of empathic involvement with the work of art, or merging with art objects we experience aesthetically (Katz, 1963).

In contrast, creativity is defined as “the imaginatively gifted recombination of known elements into something new” (Ciardi quote in Cougar 1994, p. 14). Csikszentmihalyi says that “creativity results from the interaction of a system composed of three elements: a culture that contains symbolic rules, a person who brings novelty into the symbolic domain, and a field of experts who recognize and validate the innovation” (1996, p. 6).

The latter definition, reflected in other work by Csikszentmihalyi (1999) stresses his interest in the system-like character of creativity inasmuch as an audience is involved in appreciating the creative product. For Csikszentmihalyi, however, the audience is relatively small and consists of peers or fellow experts along with the creator.

For our purposes, a better definition might be to consider one by Arons and Richard: “Creativity involves both originality and meaningfulness. In the simplest terms, a creative project is original, that is, it is new or departs from the conventional in some major aspect. Furthermore, it also communicates; it is meaningful to others” (quote in Schneider, Bugental, and Pierson, 2001 p. 128). This definition is more interesting as it suggests a broader audience with which the creator is communicating or carrying on a dialogue. In other words, to the extent that the definition includes communication, it includes a sense of the “Other” or the possibility of an empathic relationship.

Second, the separation between the two fields—marketing research (or empathy)—and marketing action (creating new products, pricing strategies, package designs, etc.) is wide and long-standing. People in these two fields have different orientations and different world views. Researchers are focused on consumer understanding, while marketers succeed based on actions (new products, ads, price plans). In fact, balancing the needs to be empathic versus creative can be difficult. Based on many conversations I have had with marketers, if one viewpoint dominates the other, there is usually trouble. An excessive focus on satisfying stated buyer needs (usually, with the familiar and comfortable) leads to monotonous, me-too product designs and advertising. While there is not much of a concern that researchers, like Foreign Service personnel who spend excessively long periods in close quarters with foreign populations will “go native” and lose their objectivity, excessive identification with a target population can be troublesome. Qualitative market researchers know, for example, that for many product categories, a little naivete is often helpful. That way, respondents are not surprised by questions that to them are patently obvious (Langer 2002). Conversely, an excessive focus on creativity can produce interesting new products as well as advertising contest winners (see Clio awards in Ogilvy 1985)—but it can also produce notable market failures. Creativity for the sake of creativity or pure self-expression is fine in certain art circles where profits are not the issue (see “Mavericks” in Becker 1982), but can be very detrimental in a business context.

Note, however, that a number of approaches have been suggested in order to heighten marketers’ empathy with target buyers. The most obvious is to hire designers who match the target in terms of as many dimensions as possible: age, sex, education, and particularly, familiarity level with the product or item in question. At Honda, the designers who design cars for a specific age segment must themselves be from that age group.

To date, several researchers have suggested ways to empathize with target audiences through marketing research:

1. Leonard and Rayport (1997) suggests empathy through observation of target consumers.
2. Fortini-Campbell (1998) suggests a dramaturgical approaches in which marketers employ devices used by method actors to help them identify more fully with people they are to portray.
3. Keats (in Margulies 1984) describes Shakespeare’s “negative capability”, that is, his ability to subvert his own identity and get more fully into the characters he brings alive in his writings.
4. Arnould and Wallendorf (1994) suggest ethnographic approaches in which marketers live with and literally become target buyers.

To return to our original questions, do designers and developers of creative products and services empathize with their targets? If they do, how do they do it? What are their implicit theories of how their audiences experience their work? How do they envision them becoming aware of it and interacting with it?

METHOD

To explore these questions, an approach similar to Kover’s was used although a broader range of creative people were interviewed. Specifically, the research consisted of 9 in-depth interviews of creative workers. These included two interior designers,

one architect, two stand-up comedians, three automobile designers and one fashion consultant. The fashion consultant sold a line of high-end clothing out of her home on a seasonal basis to 260 women clients and had become very good at anticipating which items and combinations of items each client would find appealing based on her knowledge of that client. All respondents were at least 35 years old and had worked for at least 15 years in their respective fields. All were male except the fashion consultant and the architect. All were very successful in their fields and could point to backgrounds which included extensive training, “working their way up”, prizes and recognition. The auto designers were heads of the design departments in the three largest US car companies.

Each interview lasted about an hour and was based on these types of questions:

- How did you get into this business?
- How do you get ideas?
- How did you come up with your last design concept? Your last really successful concept?
- How do you know when your ideas will “click”?
- Which segments or types of buyers are you most comfortable creating for? Least?
- What type of information about buyers do you find most helpful in terms of creating new content they will like?

RESULTS

This research, like Kover’s, is exploratory and therefore suggestive rather than conclusive. There were, however, some interesting insights.

First, in spite of the fact that all of the respondents were creative experts, the nature of their jobs highlighted some differences. In Figure 1, there is a continuum which illustrates these differences.

In Figure 1, workers on the left side are in much more direct contact with buyers, and, very importantly, are initially *contacted by the buyers*. As one interior designer said, “Hey, they hired me.” This gives them more power, or, as one interior designer said, “It lets us drive the bus.” They have time to educate their buyers, and can form close relationships with them. In fact, if an interior decorator or fashion consultant is liked personally by a client, this has a big impact on whether the client likes the creative work. As one interior designer said, “this is basically a selling job.” The interior designers and the fashion consultant stressed the importance of buyer trust, that is, that if they had the buyer’s trust, they had a great deal of creative freedom. This issue comes up in a lot of contemporary literature on branding since high trust brands are given more leeway by consumers to come up with more varied offerings (see Kraft foods in Keller 2003). A stand-up comedian knows from his “first hit” or first successful joke if a crowd likes him personally or not. If he is liked, he has a lot of latitude, or as one comedian said, “now *you* (audience) are *mine*.”

At the other extreme, the car designers have to be intrusive to get the attention of buyers, they have to initiate the contact. Commitment on the buyers’ part is much lower because the relationship is much less personal. It is therefore harder to know what will click with individual buyers.

There were, however, some interesting commonalities across all creative workers.

All knew from a young age (about 10) that they were headed for creative careers. Even as youngsters, they had special abilities to imagine or see in their minds novel forms and combinations. One of the comedians, for example, was black. As a child in school, he was often in trouble and was assigned to clean the erasers. He could look at the erasers, see the white chalk dust, then see a funny

FIGURE 1

Relative placement of creative workers in terms of closeness to customer, initiator of sales transactions, and customer commitment.

possibility: put the dust on his face, sing an Al Jolson song for his teacher, make her laugh, and then get out of the assignment. (It worked). Similarly, the automobile designers seem to imply that their work was superior to that of artists insofar as artists "make copies of something already there, like they paint a lake" whereas designers "have to imagine a visual form first in their mind, then put it on paper." One of the interior designers noted that he has a "special ability to see in his mind how a room will look once it is completely furnished and decorated."

At the same time, all of the creative workers seemed to work in the same sequence. Nearly all of their projects followed three steps:

1. Assess
2. Create
3. Present

All seek first to understand the target, then create, then go through a big moment of truth or the major presentation of the creative work. At each of the three stages, however, there are systematic ways that all workers gather input from their audiences and use this to form theories about what will click.

1. ASSESSMENT

Note first that none of the workers spoke of using empathy with their buyers. Even when told how advertising copywriters will "become" an individual buyer and respond do their work from the buyers' perspective, none of them said they imagined themselves in the place of their buyers. The writer even spoke with a copywriter once from a large New York City agency who said "I imagine the dumbest guy in my high school class reading my lines back to me." Still this type of review of one's work is not true among the creative workers studied here.

Even the comedians, while they were very sensitive to audience responses, did not evaluate joke ideas by deliberately taking the perspective of audience members. Jerry Seinfeld recently noted that many effective stand-up comics tend to be somewhat arrogant, so it is not surprising that they are not interested in "becoming" their audience to evaluate joke reactions.

However, in the assessment phase, all creative workers use methods that are very familiar to market researchers:

Ask about needs:

Interior designers, automobile designers, and architects simply ask buyers what they want.

Use test stimuli:

Interior designers will ask clients to react to swatches of wall paper and pictures of specific rooms, and comedians have collections of test jokes they throw out at the beginning of a show, mainly in order to see how liberal or conservative the audience will be. Everyone worries about threshold points, that is, the points at which a joke is too anti-conservative, a car design is too radical, or a room plan is too contemporary.

Ask about the past:

Interior designers ask clients to tell them all of the changes in their homes they have made over the years, and auto designers probe the meanings of favorite past cars. This information tells the creative people "where people are headed in their interior decoration" and the car histories tell auto designers what were the emotional hot buttons or archetypal car styles in target owner histories.

Observe:

All creative workers were acute observers of audience reactions. Many reactions are easy to see and understand. If, for example, an audience feels that a joke was too critical of a politician, the audience will go "ooooooooohh." All creative workers look for changes in audience body language, mood level, and any other signs of interest or disinterest in the material. Comedians feel that different crowds have different personalities, and are loath to work a room where the audience has drunk too much or have been up too late. The latter audiences are usually too sluggish and too tired to get many jokes.

In short, most creative workers absorb a great deal of information about their audiences and all the things they are involved with in their daily lives. All people interviewed in this study were very well-read, all used terms from psychology and sociology to speak of their audiences, and the automobile designers were very familiar with all of the latest consumer understanding tools, from ethnographic research to the Zaltman and Higie ZMET technique (1995). Interestingly, they were also very good at remembering bits of learning about audience members and their lives. One interior designer said "I could come to your house and next week remember every piece in your living room", and one of the comics said that a year from now, he would be able to remember even the smallest bits of the interview. The more they can remember, the more fuel they can call upon to make creative associations.

Of all the information they valued in order to understand buyer motivations and sense "where they could take their audiences"

through their creativity, the most useful information seemed to deal with target self-images. *Each creative worker develops creative content mainly in terms of how it will impact individual audience member self-images or perceptions.* If they could rely on any piece of information about their audience—everything from demographics to values to socioeconomic levels— this seems to be the most important information.

The designer of the PT Cruiser automobile said that it was designed to enhance small car drivers' self-perceptions:

“(being) in the small car market is very defeating to a customer. Every time you come to a red light, because the culture is really defining you by scale, where it is status to have something larger, a large home, a larger office, large TV...all of that is defining where your position is...(so, with the PT Cruiser)..Why not create a product that’s judged on a completely different rulebook...where somebody looking at it, instead of saying ‘That’s a small car’ they say, ‘That’s a neat car’.”

The fashion consultant said her job is mainly to make women “feel good about themselves.” She said, “You are helping them feel good, and when a woman puts on an outfit and she feels good, she’s on top of the world.”

The comedians said they have to be constantly aware of who they are addressing and *how that audience views itself*. One comic said simply, “people like to laugh at themselves.” When telling funny stories to Jewish audiences, you are not going to get laughs unless you are telling jokes about Jewish people. Both of the comics were in their 40s and were generally reluctant to perform for college audiences. This is because college students, as one comic said, “do not like being hit too much with the adult world and what it’s (going to be) like when their parents stop paying for this (college life).” College students like comics that push simple prop-oriented humor (wigs, funny hats) much more than stories about adults. Black audiences prefer jokes about black people and black neighborhoods (as opposed to the “white” black humor of people like Bill Cosby). The worst audience to perform in front of would be an audience of male politicians and their wives, all in formal attire. An audience of this type, the comics said, would be too self-conscious to laugh at anything and would be a comic’s nightmare.

2. CREATIVITY

All the creative workers said they do a wide range of creative work, from routine, mundane, direct customer-oriented innovations to breakthrough, “out there”, one-of-a-kind creations. For the interior designers, working in traditional design areas (Queen Anne, Georgian) tended to be the routine, less challenging, more formulaic work. They said this work was OK, but they most enjoyed contemporary interior designs.

The car designers say their work ranges from simple redesigns of current models to completely free designs where their bosses say, “come up with a design for any type of car that you personally would want”. The latter designs are the concept cars, designs which can lead to one-off prototypes which are shown at auto shows to gauge public reactions. The comics have standard jokes—but envy famous comics such as George Carlin who can do extreme material from a very biased political viewpoint and get away with it.

As Csikszentmihalyi (1996) would say, this is when creative people get into the flow or zone. For many, this is a retreat to someplace inside themselves. One of the car designers noted how Mozart could hear music in his mind, then write it down. This designer said he can “see” new car designs in his mind which he then puts on paper. One of the interior designers said he likes contempo-

rary designs because “it’s more cerebral...more challenging...and I enjoy the challenge.” Oddly, the comics are most in the flow when they are on stage, performing. Many admit they do not write much material beforehand but rather make it up as much as half of it on stage. Apparently, improvisational comedy is a major part of many of their acts.

How does a sense of their market enter into this stage?

All creative workers rely on a set of aesthetic criteria, or, put differently, a set of criteria of well-formedness which is fundamental in their field. These criteria relate to natural human predispositions, to universal human desires for things like balance, harmony, and proportion. In a joke, the proportion of the time spent leading to the punch line must be in direct proportion to the funniness of the punch line itself. One of the car designers said,

“There are excellent proportions in the beauty of the human form. We are all sensitized (to this) because we grow up with humans..and see them all the time (so)..It is more of a subconscious recognition. There is an instant recognition of what is out of proportion (versus) there is a subconscious recognition of harmony. In the car business, there are some rules. You have to play with proportions. The market will accept very very new stuff as long as the proportions are quantified, as long as there is a harmony to the vehicle.”

One of the interior designers spoke of design “logic”:

“When you are designing a home or a room for a client—yes, it’s creative in that you have the option of selecting (from) all these different options—but there is a logic to it. Like, in western music, there are certain ways to write the sonata form. There is a basic structure...like the colors...the proportions of the furniture. That’s where the fun is.”

All designers, of course, have systems of overlays where they can sketch a new design on transparent paper, lay over a new sheet to make changes, then another new sheet, etc. to get the proportions they want (all mostly done by computer today). Interestingly, it took a long time to transcribe the interviews of the comics because of the way they spoke. They don’t speak in unbroken sentences but rather will start to say something, then start to say it again in a different way, and then a different way altogether. What they are doing is fine tuning, trying to get just the right words to communicate the best pattern of images in their story-telling.

Research by Veryzer (1993) has probed consumers’ desires for ideal forms and universal proportions. Further research in this area might be very beneficial to creative workers. Some of the car designers and the interior designers deliberately research target buyers’ feelings about proportions and aesthetics. In studying Buick buyers, for example, one car designer said he likes to look in their homes:

I find it very valuable (that) when you do in someone’s house, and the couch is always centered with the wall, and the end tables are centered to the couch, and the hierarchy of the lamp to the couch to the wall to the frame on the picture is so symmetrical and hierarchical. *That* is good information about a Buick customer.”

One way creative workers learn about ideal forms and proportions is, of course, through their artistic training. Also, all of the creative workers interviewed in this study spent a lot of time comparing notes with other creative workers in their fields.

3. PRESENTATION

According to all the workers interviewed, this stage is absolutely crucial in the success of a new design, joke, or clothing outfit. Like flying a plane, design work is full of tension, and car designers say that when their design is a hit with the public “this plane has really landed.” This is the goal for car designs, room designs, and all kinds of jokes. One of the car designers said that he does not like predictable car design evolutions but rather wants to surprise and delight:

“I call that (predictable car designs) ‘playing checkers’. In other words, the moves are very simple. (Whereas) What you really want is *chess*....where the moves are not so predictable....and you (viewer or opponent) think, ‘*Jeez*, where did that come from?’”

One of the interior designers did a project and got the reaction from his clients: “Wow! We can’t believe you came up with that!” When the other interior designer told a client “Let’s move the grand piano away from that window”, the client resisted saying, “My mother played that piano there in 1947.” After the piano was moved, the designer said, “It was like a revelation, it was hysterical...Out of nowhere, their home was reborn.”

In fact, the interior designers know they are trusting them to move them pleasantly into the “moment of presentation” (or “truth”), so these designers call this a “leap of faith” on the part of the clients. They report that clients call them and say, “I can *not* believe this is my living room...It’s beautiful...I’m thrilled to pieces!” If they are designing something radical for a client, these designers will “bring them along” slowly showing them each piece of furniture over a period of days, getting their agreement, so the final result is pleasing. When a piece of furniture is too different from expectations, they say clients experience “furniture shock.”

The comedians were scrupulous about room layout and about observing audience reactions. One was fanatical about the room he would be working in: “I can almost sense going into a room if I am going to do well that night. The biggest thing..is the physical layout.” He had a long list of requirements about which he was fanatical: the audience had to be at least 2 feet away from him, the room very dark, bright spotlight *on him*, everyone seated (no one up at bars, bathrooms), excellent sound system, tables cleared, no food, not a lot of alcohol, no distractions.” In order for him to make his “connection” he had to have the *complete attention* of the audience— as opposed to music, he said, which can get by with just being “background.” He said he can tell in the first 3 minutes of his routine if the audience will like him and his jokes. The first successful joke is called “the first hit” and sets the stage for the rest of the routine. In spite of the difficulty in seeing beyond bright spotlights, all comedians monitor audience sounds, body language, and of course laughter very carefully.

SUMMARY

This project is the first part of a large scale study of how creative workers co-create meaning with consumers. It focuses on the first step: how creatives interpret consumer motivations. If it is possible to understand how these people conceptualize audience wants and needs and reactions regarding creative offerings, this would facilitate many things:

Researchers who study consumer needs regarding creative products would have clearer direction regarding issues and information which are most helpful to creatives.

These researchers might also be better equipped to come up with creative content themselves, that is, be able to highlight findings which have leverageable creative implications.

This is an area of considerable opportunity. The heart of marketing is about correctly identifying consumer issues which creative people can leverage in creative, new advertising, package designs, pricing plans, distribution plans, and sales plans.

Based on the this research, researchers will be able to help creative workers in these areas if they help them get a deeper understanding of (1.) consumer self-concept definitions and how these change, (2.) universal consumer definitions of aesthetics, proportions and “well-formedness”, and (3.) consumer reactions at initial “moment of truth” presentations of creative offerings.

The Interplay Between Archetypes and Autobiography in Mass Media Preferences

Elizabeth C. Hirschman, Rutgers University

ABSTRACT

The present research utilized a reader-response approach to explore the preferences consumers have for motion pictures and television shows. Analytical emphasis was placed upon the semiotic features contained within consumers' favorite films and programs, especially those of an archetypic and/or mythic nature. It was found that consumers typically intertwined aspects of their autobiographical narratives with story structures and archetypic figures drawn from their favorite mass media texts. Among these were the figures of the Low Born Hero, the Corrupted Hero, the Warrior, the Good Father and Utopia. Preferred motion picture and television narratives were also used to overcome implicit oppositions consumers encountered in life, such as the Real versus the Ideal, the Self versus Others and Choice versus Chance.

INTRODUCTION

Recently, consumer researchers have directed increased attention toward the ways in which the mass media affect consumers' everyday lives (Holbrook 1999; O'Guinn and Shrum 1997; Ritson and Elliott 1999). In particular, the *reader-response* approach (Eco 1981) has been identified as having large potential for enhancing our comprehension of how mass media products, such as motion pictures and television shows, are incorporated into consumers' self identities and social interactions. (Drotner 1994; Mick and Buhl 1992; Moores 1991; Radway 1988, 1984; Scott 1994a). As Holbrook (1999) and McQuarrie and Mick (1999) propose, while *quantitative* and *text interpretive* methods of assessing mass media influence are undoubtedly valuable, they are no substitute for the rich insights that can be gained by talking directly to consumers about their media preferences and desires.

Holbrook (1999, p. 154), for example, concludes after presenting a highly detailed quantitative analysis of motion picture preferences that, "There may well be other movie characteristics not included here that tend to enhance both popular appeal and expert judgments... These factors would include the character of a movie's story line... the development of certain themes or motifs... the design of a film's semiotic structure and semiological signification, e.g., binary oppositions vs. subtle graduations, myths or archetypes, metaphoric meanings, [and] consumption symbolism...

The present research utilized a reader response approach to explore the preferences consumers have for motion pictures and television shows. Following from Holbrook's (1999) proposals, analytical emphasis was placed upon the semiotic features (Mick 1986; Holbrook and Grayson 1986) contained within consumers' favorite films and programs, especially those of an archetypic and/or mythic nature (see e.g., Scott 1994b; Stern 1995). While consumer researchers have examined the archetypic and mythic content of these mass media offerings previously (Hirschman 1987; 2000; Holbrook and Grayson 1986), they have not done so using consumer-based data. As already noted, consumers' notions concerning their own preferences are a key (perhaps *the* key) element in our understanding of those preferences.

Mass media narratives such as motion pictures and television shows may serve as carriers of contemporary cultural archetypes, according to Gibbs (1994), and Moores (1993). Filmmakers, scriptwriters and even advertising copywriters (see Randazzo 1995; Scott 1994b; Stern 1988) draw upon the pre-existing stock of these cultural images to construct their narratives.

Additionally, both Dyer (1982, 1986) and McCracken (1989) have proposed that actors and actresses could be used to personify social categories in a culture. For example, Eco (1966) argues that during the 1960's actor Sean Connery came to signify the warrior character James Bond, just as Dyer (1986) claims that Marilyn Monroe iconically represented the seductive goddess archetype during the 1950's and 1960's. Dyer (1986, p. 16-17) proposes that, "Stars represent typical ways of behaving, feeling and thinking in contemporary society, ways that have been socially, culturally and historically constructed... Stars are embodiments of the social categories in which people are placed and through which we make our lives..." Thus, film and television narratives may be texts which carry archetypal meanings with which consumers can implicitly identify (Randazzo 1995; Stern 1988).

THE STUDY

The present study explores the possibility that consumers' preferred motion pictures and television shows are chosen based upon archetypic personification, which assists the consumer in composing his/her autobiographical narrative. Archetypes may provide the shared *cognitive* and *social* context (Ritson and Elliott 1999; Zaltman 2000) through which mass media products such as motion pictures and television shows are given meaning in the consumer's life and used in his/her project of identity construction (see also; Gibbs 1994).

METHOD

Data for the study were generated by means of phenomenological interviews with 24 volunteer participants who were assured of anonymity. The participants were of diverse gender, ethnicity, age and religious affiliation. The interviewer used a six- question protocol to initiate and guide the discussion.¹ Dialogue centered around the consumer's favorite films, television shows, actors and actresses.

Each interview was conducted in the participant's place of residence with only the participant and the researcher present. The interviews began by asking the participant to simply "tell the story" of his/her favorite film. All participants were eager to do this, and often continued their initial narrative rendition for half an hour with little or no assistance by the researcher. Because of the involving and seemingly enjoyable nature of the task, participants continued through the subsequent questions and discussion enthusiastically, responding to each of the general questions in a lengthy and detailed manner. Interviews took a minimum of 1 1/2 hours, some went as long as 3 hours.

Interpretive Procedures and Logic of Analysis

The analysis of the verbatim interview transcripts involved an iterative, part-to-whole reading strategy through which I worked toward a holistic understanding of each person's transcript, while also making note of common themes, especially those of an

¹These questions were: What is your favorite motion picture? Can you tell me what it was about? What are some of your other favorite movies? Who are your favorite movie actors and actresses? What do you think about—; What does s/he mean to you? (Repeat for television shows).

archetypal and autobiographical nature, across the set of transcripts. In this process, earlier readings of a transcript were used to inform later readings and, reciprocally, later readings allowed me to recognize and explore patterns not noted in the initial analysis. The archetypal categories were compared with those developed previously by Campbell, Eliade and Jung during their extensive studies of comparative mythology. Additional metaphoric concepts were also discerned which related to recent findings on cognitive categorization (e.g. Gibbs 1994; Lakoff and Johnson 1999; Zaltman 2000) and celebrity meaning transfer (Dyer 1986; McCracken 1986) and were classified into groupings for further analysis.

Following from Bruner (1990, 1986, 1987), I was interested in learning how these 24 consumers, coming from different age cohorts, ethnic backgrounds, and sexual identities, incorporated the narratives presented by motion pictures and television shows into autobiographical narratives of selfhood. By focusing attention on their favorite texts, I hoped to gain insight into how these stories were interwoven with their own life themes and life projects (Mick and Buhl 1992). I found that respondents were especially prone to narrate particular experiences in their lives, often where there had been a breach between the real and the ideal, or the self and society.

ARCHETYPE, AUTOBIOGRAPHY AND BI-POLAR MEDIATION

To Jung, every archetype coexisted with its shadow/opposite and through the deployment of these opposites in narratives, people were able to define patterns of meaning-in-the-world. One task of a narrative, whether a widely-shared myth such as the Biblical story of creation, or a small-scale exposition, such as an episode of a television series, is to enable us to work through these oppositions—to bring them into balance. For example, consumers may use television or motion picture narratives to bring evil into balance with good or to bring personal achievement into balance with helping others (Gibbs 1994). In a particular situation, the consumer may seek out a narrative which frames a set of characters in such a way as to construct a satisfying explanatory outcome.

Across the set of interviews, three primary oppositional themes were identified: the Ideal versus the Real, the Self versus Others and Choice versus Chance. These are consistent with the autobiographical themes identified by Riessman (1993) in her ethnographic work and by consumer researchers such as Thompson (1996) and Wallendorf and Arnould (1991) in their studies on working women and Thanksgiving rituals, respectively. I demonstrate and extend them now using material from the motion picture/television show interviews.

THE IDEAL VERSUS THE REAL

Predating Plato's conception (1959) of Ideal Forms by several thousand years, the epic Sumerian myth of Gilgamesh also proposed the existence of a perfect, idealized world which contrasted with the flawed reality occupied by humans: "There was the Garden of the Gods; all around him stood bushes bearing gems. Seeing it, Gilgamesh went down at once, for there was fruit of carnelian on the vine, beautiful to look at; lapis lazuli leaves hung thick with fruit, sweet to see. Instead of thorns and thistles, there were hematite and rare stones, agate and pearls from the sea" (*Gilgamesh*, Leeming, 1990 p. 288).

The perfection, richness and beauty which Gilgamesh beheld in the land of the gods is archetypically equivalent to consumers' descriptions of utopian scenes in motion pictures such as *Easter Parade* and *White Christmas*. Rose, a 66 year old woman, recalls the musicals of her childhood, which featured Ginger Rogers and

Fred Astaire, and represented the same beauty and perfection: "I used to like to watch Fred Astaire dance with Ginger Rogers and imagine I was dancing with him in those beautiful gowns...I was a very quiet girl and those movies always made me forget myself...[I loved] the singing and dancing and the beautiful costumes, the make believe world. You forgot your real world; you forgot what was happening in your own life...It was make believe, but it made you forget and it made you happy."

Becky, a 26 year old eighth grade math and geography teacher, found the same utopian realm in *The Wizard of Oz*, "It's a fantasy. It's just so wonderful that there's such a wonderful place in this world, or not even in this world—just a place where you can go to. Like in Dorothy's song, where there's no troubles, no sorrows, somewhere over the rainbow." Although the archetype of utopia remains constant across these consumers, its autobiographical expression is personalized and unique. For each of us, different 'perfect worlds' will be found in the mass media narratives we find most resonant.

The Real versus Ideal theme expresses itself through deviation from perfection. We come to know what is perfect by encountering what is imperfect; we come to know what is good by having knowledge of what is evil; without contrast, there is no meaning (Eliade 1991). Thus, consumers told of deviations from perfection, of wrongs, of errors, of flaws in order to make more clearly defined their sense of rightness.

Daniel, age 16, recounts the story of his favorite film, *The Crow*.

Basically there's a man and his name is Eric Draven. He's going to get married. And that day his fiancée, who was going to be his wife the next day, gets raped and killed by a band of men that go around on devil's night, which is October 30th, and they loot, raid and steal, and pillage, plunder, light things on fire, blow things up and rape women in the process...They were running like a crack joint in the apartment building where she lives. And she was hindering their business, so they had to come and take care of her. So when she's getting raped, the boyfriend comes in and tries to stop it, but they both get killed, and he gets thrown out of the window and shot. One year later a crow lands on his grave, because supposedly when the person's soul comes back, the person comes back to life. And what happens is he comes back to life and he avenges those who raped and killed his wife and killed him. So, justice is served.

In this film, a terrible injustice has occurred, a major flaw in the normal course-of-life has appeared and requires an equally emphatic response to move back to a balanced state. Thus, the murdered man destroys those who acted first as destroyers—i.e., as sources of imperfection.

Interviewees also believed that balance between the Real and the Ideal could be achieved by the death/sacrifice of a good (perfect) person which served to atone for a moral deficiency. Leeming (1990) terms this the *martyr myth* and it is a structural form underlying many "dying god" texts and the source of the notion that "out of something bad, something good may come." As Leeming (1990, p. 147) notes, "the dying god or his surrogate is often a scapegoat; one who dies for the good of society, who somehow takes on the burden of society's shortcomings or sins." We see this structure in Vickie's (32) retelling of *West Side Story*:

And Maria is running in the street looking for Tony and they finally see each other and they go running towards each other

and that's when Maria's brother's best friend comes out and shoots Tony. And it's very, very sad. They sing a beautiful song together, "Somewhere", and they hope that they'll meet each other in another life, and he dies in her arms. The two gangs are standing there in the background...and then both gangs come together to carry Tony away. And that's the end... And it moved me a lot, seeing two people who cared so much about each other and how one got killed at such an early age and how the two gangs came together. After something bad happens, something good comes of it. Unfortunately something bad has to happen first, before something good happens.

The contrast between the Real and the Ideal can manifest itself also in specific pairs of archetypes, for example the Destructive Goddess and the Nurturant Goddess. The Destructive Goddess is the negative, violent aspect of the anima, the female principle (Jung 1959); it can destroy life, especially male life. Iconic forms of the Destructive Goddess include Lilith, Jezebel, Medusa, the evil Queen in *Snow White*, witches, Ann Bancroft's character Mrs. Robinson in *Graduate*, and Marlene Dietrich in *The Blue Angel*.

By contrast, the helpful, good aspect of the anima is represented by the Nurturant Goddess archetype and includes maternal icons such as Donna Reed and Betty Crocker (Randazzo 1995), the Virgin Mary, Artemis, and Ceres (Bierlein 1994). In this form, the female principle represents all that is fertile, nurturant, caring, loving and kind (see e.g., Jung 1959, Leeming 1990). One participant, for instance, saw actress Jane Seymour as representing this archetype.

Characters who begin as one aspect of the bipolar Real/Ideal archetype may be transformed into the other aspect over the course of the narrative. Lisa, 22, describes two female characters who underwent just such a transformation. The first is a teenage character, Kelly, on the television program, *Beverly Hills 90210*: "Kelly was the rich girl, and her mother was doing drugs She drove around in her red BMW convertible, and flaunted her money And she just bought whatever she wanted. She was a real spoiled brat, and she thought she was better than anybody else. But somehow her character grew, and now she's totally different...Now she's like all straight-laced and she's a good girl, and she does everything by the rules and she doesn't flaunt her money...She's generous and likes to help people." Analogously, Lisa describes how the Julia Robert's character in the film *Pretty Woman* was transformed from a hardened prostitute into a "good" woman: "She turned herself around from a prostitute into a beautiful, respected woman, and they fell in love."

In general, the motion picture and television show narratives which consumers described as their favorites were those in which the imperfect Real was moved towards the perfect Ideal over the course of the story. (Although there were exceptions; one woman described the poignant tragedy of *Leaving Las Vegas* as evidence that sometimes "things just don't work out in the end; love doesn't always fix everything.") However, the majority preferred happy endings which provided them with the psychological buoyancy and optimism to keep their own travails in perspective. Mike, a 36 year old man, saw an important "message for living" in Frank Capra's *It's a Wonderful Life*, a melodrama starring actor Jimmy Stewart.

The effect that it has had on me is based on my life; life has a lot of ups and downs. Being that I'm 36, I've gone through a lot of ups and downs...You're never riding high or you're never low all the time, but you have a lot of peaks and valleys and this movie... gave me a frame of reference to say don't just look at what's going on currently, don't look at your life in the

last day, the last week, the last month, the last year; look at all the positive things that you've experienced throughout your life and how things can be even better in the future. And being that I'm self-employed, I always have to be motivated to do well in my business...I think it's a great, great story ... that maybe you should look at your whole life and what impact you've had to help others and how maybe others have helped you.

Mike's comments bring us to the second theme discerned across the interviews: fulfilling the self versus caring for others.

THE SELF VERSUS OTHERS

The Good Mother and Good Father archetypes (Bierlein 1994; Randazzo 1995) represent the fully matured psyche which places the needs of others ahead of one's own. Often young people will envision themselves as the central focus of their autobiographical narrative; all of their emotional, mental, and physical energies are directed toward achieving personal goals. For example, one young man's autobiographical narrative was largely self-directed, aimed toward guiding him to be "the best that I can be".

Conversely, Sam, a middle-aged man who had family responsibilities, directed his self-narrative toward the Nurturant Parent motif (Lakoff and Johnson 1999). His admiration was directed toward those who risk themselves to help needy others; whose goals are concerned more with 'giving back' rather than 'getting ahead': Many of the women interviewed by Thompson (1996) exhibited this same self/others tension. This tension is perhaps especially pronounced for contemporary women, because the Good Mother/Nurturant Goddess archetype, which for so long prevailed as the female cultural ideal, has evolved into a more animus-pervaded androgyny which encourages women to set and fulfill personal goals beyond those of family care and nurturance. Women are now precariously balanced (or "juggling" as Thompson (1996) phrases it) between self-serving quests and other-serving obligations.

Among the consumers I interviewed, these same tensions were also apparent. For example, Janet, 25 and unmarried, commented upon the character played by Susan Sarandon in *Pretty Baby*. In the film, Sarandon played a prostitute with two children. Given the opportunity to marry a wealthy man and leave prostitution, she does so, taking her young son with her. But she abandons her older child, a daughter, leaving her to become a prostitute. Janet comments, "She played a hooker with children in a brothel in the South...You hated her because she was not doing the right thing by her child, but you could still understand that she had to live her own life and take care of herself."

While looking out for oneself is the initial stage in psychological development, the second one is reciprocity for which the *community* or *family* is the symbolic archetype. In this stage, the tension between self and others is brought into balance by a system of mutual support in which community members share resources, benefiting the collective whole. Lisa, age 22 and unmarried, described her favorite television show as representing the community archetype. "What I liked about *Laverne and Shirley* was that they were two independent women and they didn't have to rely on anybody else...I guess that's when the whole feminist movement was going on...I was just a little girl and it was good to see women being strong like that...And no matter what went wrong, they always had each other and they could always depend on each other...I guess it was like their little family." Lisa describes a balanced structure which blends aspects of self-serving versus other-serving behavior. Laverne and Shirley are each seeking freedom from the prior restraints placed upon women by working

and living apart from their families; but they have also formed a mutual-aid community which supports each woman in her search for selfhood.

Charles, age 21 and unmarried, belongs to a similar mutual-support community composed of both men and women. His favorite television show is *Friends*, which depicts a slightly older, mixed-gender group who are working at “first” jobs and living in an urban apartment building. To Charles, the show has both positive and negative aspects as an archetypal model for his own group’s future behavior.

Every now and then I get kind of depressed considering they are all 28, 26, 27 and they are still all single. I’m thinking they are great people. It would be nice to live like that, but by that time, personally, I would like to be in a relationship and have kids or something. At the same time, I like it because it almost mirrors my group of friends. There are 3 men and 3 women in my little group of friends. A lot of times we look at [the show] and think about it. If I do end up 28 or in a couple of years when we graduate from college, I’d like to have that common bond with my friends. They definitely care a lot for each other. “I’ll be there for you” is their theme song. They can always do things with each other and without each other as well. They always have fun when they are together, which is something I hope I have with my friends as well.

Charles views his future self down the road and realizes that eventually he will want to move away from the Community archetype toward the Nurturant Parent archetype. He does not want to remain indefinitely in a state of extended adolescence, but rather sees the time approaching when he will want to be a provider of resources to his children, rather than merely a sharer of resources with his friends (Gilmore 1997).

Mike, age 36 and married with children, has progressed in his autobiographical narrative towards the Nurturant Parent archetype. His favorite motion picture, *It’s a Wonderful Life*, tells the story of George Bailey (Jimmy Stewart), a man whose generosity and pattern of putting others’ needs ahead of his own make him an iconic exemplar.

In the first part of the movie he and his younger brother were ... sledding down a slope, and the sled tipped over and his younger brother fell into a big pile of water, like a hole with ice, and George saved his life. But because George saved his brother’s life, he lost the hearing in one of his ears....[Later] George’s father suffers a heart attack, I believe, and dies. George had plans at that time; he just got married, he was ready to go on his honeymoon with his wife, but they needed him to stay to save the Building and Loan because many people depended on him to help. So he gave up his honeymoon with his wife. And the whole movie symbolizes how he gave up a lot of his own goals and his own aspirations. He had to help his brother, his younger brother, who went to college. George didn’t have the ability to go to college, because he had to help with the Building and Loan and help his mom. So the whole movie showed how he gave up and sacrificed his life to help so many other people, and he was constantly doing that.

George Bailey is a contemporary representation of the Nurturant Parent archetype. He is a “good man”; one who can always be counted upon to assist others. George’s life also resembles the Dying God narrative pattern—for example, a significant part of him ‘died’, i.e., he lost half his hearing, in saving his brother’s life. And he has sacrificed other emotional/psychic aspects of himself (for

instance, a honeymoon, a college education) in order to rescue the town and its people from dying economically.

Mike’s retelling of *It’s a Wonderful Life* suggests that much of what happens to its protagonist, George Bailey, is caused by events that were beyond his control; for example, his brother’s near-drowning, his father’s fatal heart attack. Faced with these uncontrollable negative occurrences, George must choose either to forego his own desires and set things right again, or to pursue his own interests and walk away from the consequences of the destructive events. This narrative structure reveals a third archetypic tension described by the interviewees—that between Choice and Chance, to which we now turn.

CHOICE AND CHANCE

One young man, Julio’s, account of the film *Cool Runnings* describes with poignance the plight of the Jamaican bobsled team who, having conquered extraordinary obstacles to reach the finals in the Olympics, lose their victory to a broken screw. Julio also describes the tragic helplessness of the protagonist in *Carlito’s Way* who, despite sincere efforts to ‘go straight’, is dragged back into a life of crime and ultimately to his death. Similarly, Stern’s (1995) re-analysis of Wallendorf and Arnould’s (1992) Thanksgiving data showed how consumers’ tales could turn on unexpectedly fortuitous or destructive events that helped/hindered their holiday plans.

The consumers I interviewed described the same bipolar conflict between Choice and Chance in recounting their favorite films and television shows. Charles, age 20, tells about *Melrose Place*:

One of the characters they have now is Jane Mancini...She started out as Michael Mancini’s wife, ... they got divorced. She was pretty much a normal average housewife type woman, but she turned psychotic once he divorced her and she got raped by one of her boyfriends. She tends to go for guys who will somehow take advantage of her. It turned out she killed the guy who raped her. Now she’s discovered she’s adopted and she’s looking for her mother...Then there is her sister, Sydney. She is completely jealous of anything Jane ever had or did. When she first came on the show Jane and Michael were divorced and Sydney went right away for Michael. She had always had a thing for her sister’s ex-husband... She’s always getting into trouble. She used to be a prostitute...She joined a cult ... She’s always doing the wrong thing...She’s cunning, but still she is always getting into trouble.

Charles’ description of the two sisters, Jane and Sydney, displays a mixture of planned and unplanned events which move the story along. Sydney, for instance, purposely set out to have sex with her sister’s husband, but Jane’s psychotic response to her own divorce was not “chosen”. The presence of randomness in mass media narratives helps people deal with apparent injustices in the course of their own or others’ lives: i.e., when bad things happen to good people or when wickedness profits, one can assign it to the archetype of Happenstance/chance.

However, the lack of planning, of not at least *attempting* to control one’s destiny, is generally understood as consistently leading to negative results (Leeming 1990). Tom, age 21, finds a lesson-for-life in the film *Clerks*.

It’s basically a film based around a day in the life of a clerk of a convenience store and what happens in his life. I think one of the reasons I like it is because I related so much to the person. I mean, I have a lot of friends who aren’t moving in the same direction that I am in college, and now have these dead-end

TABLE
Possible Archetypic and Demographic Patterns

<u>Age</u>	<u>Gender</u>	<u>Marital Status</u>	<u>Archetypes</u>
16-25	Male	Single	Low-Born Hero, Prince, Corrupted Hero, Redeemed Hero
25-30	Male	Single	Cooperative Community
30-55	Male	Married w Children	Good Father, Wise Guide,
16-25	Female	Single	Justice, Martyr Warrior, Seductress, Princess, Cooperative Community, Utopia
25-45	Female	Married w Children	Nurturant Goddess, Warrior, Martyr
45-65	Female	Married, Empty Nest	Princess, Nurturant Goddess Utopia

clerk type jobs. It's pretty interesting to see the movie, because it's very true to life. It's a very good study into the lives of people who are kind of middle-class growing up, but then they kind of piss their life away working these bad jobs, living at home, never getting a career together, whereas their parents have something going for themselves. It's pretty interesting to see that.

Later in his interview, Tom recounts instances of setting goals for himself and then succeeding through trial and error in reaching them (in essence, a heroic quest). Much like Julio, Tom constructs his personal narrative as an attempt to balance planning for the future against anticipating the random, often negative, occurrences of life. His autobiographical philosophy is expressed well in his closing comments on *Clerks*.

- I. What happens at the end of the movie? It just goes on?
 T. Yeah, basically at the end of the movie he's still a clerk. It's very true to life.
 Nothing great happens. He doesn't like inherit a million dollars or anything. The only thing he realized is that there's this girl, and he realized that she's the one for him. It's no big deal really. But you never know what will happen. It's left very open ended, very true to life.

DISCUSSION

This research has explored the incorporation of archetypic figures in consumers' recounted descriptions of their favorite motion pictures and television shows. The narratives generated during discussion of these mass media preferences exhibited many autobiographical details, suggesting that consumers used archetypic imagery and mythic narrative structure, such as utopia, in viewing their own lives and social interactions.

The primary archetypic categories and story structures put forward by these consumers are shown in the Table. The patterns suggest that the type of heroic identification may shift over the life course. Young adults, both male and female, may identify with motion picture and television show characters who are struggling to establish personal identities and overcome obstacles to self-development and fulfillment, just as they themselves are doing. Older persons, who have established families and found their niches in the community, may turn to archetypic figures that portray nurturing others, protecting the community from harm, or safeguarding moral and ethical standards.

While obviously preliminary and exploratory, these findings suggest that mass media products may be chosen and valued not merely upon features such as "star power", special effects imagery, or even critical acclaim, but rather because they contain story lines and archetypic meanings which resonate with the consumer's own life experiences and concerns. As such, they may serve as vehicles of self-observation and self-projection: we come to see how we are now and how we could be in the future.

Motion pictures and television shows preferred by consumers also enabled them to grapple with certain cleavages between what they desired their lives to be and what life actually offered. One's inner imaginings do not always correspond to external reality, one's self-set goals may be impinged upon by obligations to others, and one's plans for the future may be interrupted by unforeseen events. By 'living through' conflicts between the Ideal and the Real, the Self and Others, and Choice and Chance as presented in their favorite films and programs, consumers may be able to better come to grips with these issues in their own lives.

It would be very interesting to see if similar patterns are found in consumers' experiences of sporting events (e.g., football, baseball, stock car racing), recreational activities (e.g., hiking, hunting, fishing) and even their perceptions of and preferences for political

candidates. These types of consumption also unfold over time, have elements of struggle, morality, chance, corruption, and the opportunity for heroic behaviors recognized by these informants.

The present study also suggests that we should perhaps heed the suggestions of Zaltman (2000) that most of consumers' cognitions occur on an unconscious level; if Jung and more recently Lakoff and Johnson (1999) are correct, then consumers' preferences for deeply metaphorical, image-laden products such as motion pictures and television shows may be formed not out of attribute-based, conscious thought, but rather at a much more fundamental cognitive/emotional level. Among the interviews I conducted, it was usually during the retelling of their favorite film or television program that consumers began to interject bits and pieces of their own autobiographical experience. Perhaps, as Bruner (1987) suggests, we tell our own story through the stories we have learned and which deeply moved us. Finally, the interplay between consumers' preferred cinematic and televised narratives and their own autobiographical constructions may also assist in Sherry's (2000) project of "re-enchanting" their world. Fictional heroes, utopias and struggles can, and do, assist us in leading our own lives in a more meaningful fashion.

Advertising and the Public Sphere

Ozlem Sandikci, Bilkent University

EXTENDED ABSTRACT

Critics have blamed advertising for manipulating people, creating and instilling false needs and values, promoting materialism, perpetuating stereotypes, and presenting a personal world of consumption sheltered from social problems (e.g., Haug 1986; Kellner 1990; Lasch 1979; Leiss, Kline and Jhally 1986; Pollay 1986; Schiller 1989; Schudson 1984; Williamson 1978). Many have condemned the advertising institution for its contribution to the development and reinforcement of an undemocratic social order by fostering concentration of enormous economic and cultural power in the hands of a few corporations (e.g., Jhally 1987; Kellner 1989; Schiller 1989). Although there might be some validity in these criticisms, developments during the 1990s, among which is the relocation of advertising to an explicitly political forum by companies, such as Benetton, Diesel, FCUK and Body shop, call for rethinking the role of advertising as something more than a hegemonic tool of the capitalist ideology.

In the past decade, a handful of companies began producing advertisements that carried explicit political and social messages. Pioneering this move was the Italian clothing company, Benetton, whose advertising featured, instead of product pictures, images of AIDS, wars, environmental disasters, racism, and convicts on death row. Benetton ads quickly entered into the public discourse, provoking heated discussions. So far, the discussions concerning Benetton style advertising have included two opposite views. Some blame the company for emotional manipulation and commercialization of serious social issues; others praise it for highlighting the very same issues. Whether one likes or hates them, however, they generate academic and popular debate. In this paper, I am interested in neither finding the true intent of Benetton nor judging its ethics. Rather, I explore the implications of this advertising style for the advertising institution and democracy. Given these concerns, the objectives of this study are twofold. First, I explore what makes these advertisements so controversial. Second, I discuss the possibility of a performative function for advertising, which in addition to selling products can incite public debate and dialogue on social and political issues, and foster positive notions of identity and citizenship.

Unlike ads that promote social causes, Benetton advertisements challenge representational and ideological norms of advertising. Traditionally, advertisements, given their commercial goal of creating a positive image for the brand, show the pleasurable and happy experiences associated with the product. In many campaigns of Benetton, however, the iconic images of human suffering and distress replace the images of fantasy and happiness. This conscious attempt to replace the fantasy of consumption by social and political commentary not only violates the structural norms of advertising but also problematizes the cultural codes that distinguish genres in terms of whether they represent the "reality" or the "unreality." Furthermore, these advertisements upset the assumption that advertising is confined to the personal world of consumption by invading that realm through the incorporation of political and social issues into their message.

While we can easily condemn these advertisements by arguing that they commercialize important issues to create publicity and sell products, we can also explore whether such advertisements point to a transformation of the advertising discourse in late-capitalist societies. Years of research have taught us that advertising performs several functions in addition to selling goods. It provides symbolic information about products and consumption activity; it

helps people in constructing their identities through providing lifestyle and role models; it operates as a significant site of popular cultural production. If advertising is capable of performing all of these roles, perceived as positive or negative depending on the ideological position of the researcher, then can it undertake a new role that reconciles capitalist aims and critical consciousness, however perplexing it may appear? Critical studies often consider advertising and citizenship as a contradiction, arguing that advertisements obscure the real issues of society and erode the critical abilities of people to think and act as politically and socially conscious individuals. However, by addressing highly charged social and political issues and shocking middle class values and sensibilities, these ads transform advertising to a language of conflict instead of consensus, incite debate and dialogue about social and political issues, and create almost a Habermasian public sphere (Falk 1997; Meijer 1998).

When we think of advertising as a potential site of the public sphere, three questions emerge. First, to what extent advertisements induce public debate and dialogue around issues of general interest? Second, who are the agents participating in this communicative action? Third, what effects does such public communication generate? The fame of Benetton ads stems from their ability to enter into the public discourse. These advertisements stimulate two different types of discussion. On the one hand, they incite debates around the social and political issues they portray, i.e., Benetton's "Looking At Death in the Face" campaign and the discussions it generated about death penalty. On the other hand, they incite debates about the appropriateness of advertising as a medium to voice political and social commentary. Multiple "publics" including consumers, retailers, company officials, intellectuals, interest groups, civil organizations, advertising professionals and industry organizations participate into the debate. These publics possess different levels of economic, political, and legal power, represent different interests, and voice conflicting views. The form of their participation ranges from outcry, complaint, criticism, approval and appreciation. The effects of these advertisements appear to be at two different levels: opinion formation and action taking. By inciting debate around the social/political issues they communicate and the functions of advertising institution, these advertisements motivate various publics to form opinion, be it in favor or in opposition. Second, they induce different publics to take action toward the company. The actions can range from writing complaint/appraisal letters, boycotting (by both consumers and retailers) or purchasing of the company products, and ultimately banning the advertisements.

Conceptualizing advertising as a potential site of the public sphere opens up several future research avenues. First, how do different groups of consumers read and respond to these advertisements? Second, how does social dialogue stimulated by advertisements shape identities of individuals and foster virtual communities of consumers, or "neo-tribes" (Maffesoli 1996; also see Cova 1997). Third, while these advertisements create awareness about the brands they promote, to what extent does increased brand awareness influence recall, attitudes, purchase intentions, and brand image?

Early Soviet Advertising: “We Have to Extract All the Stinking Bourgeois Elements”

Natasha Tolstikova, University of Maine, Orono

EXTENDED ABSTRACT

This paper is the first part of the ongoing project to reconstruct the history of the Soviet advertising throughout the history of the regime. It utilizes interpretive, historical and textual methods of analysis. The October Revolution of 1917 ruptured the gradual development of history in all life venues including advertising. The paper argues that in Russia, advertising underwent the stages of development similar to that of America, including industrialization and modernization.

The disastrous economic conditions that Russia found itself after the Revolution mostly replaced the market-based trade with non-monetary forms of exchange, therefore the economic purpose of advertising ceased to exist. In place of advertising of consumer goods the Bolsheviks resorted to agitation and propaganda for the new social system. However, in doing so, it employed the principles similar to that of advertising—dissemination and selling of ideas. The topics of agitation were anti-war, pro-Revolution and pro-industrialization.

The focal point of this paper is the Soviet advertising effort in the 1920s. Because of the fusion of different political and economic entities, this period was unusual for the Soviet history in many ways. To remedy the ailing economy, the government reinstated private trade and traders. As a result the period from 1921-1930, a period of “state capitalism,” was an amalgam of ideologies, norms, and cultures. The necessity to compete with private businesses forced the state to use every ideological weapon available. The special importance was placed on the state advertising that was designed to show the advantage of the Soviet-produced goods.

Famous Soviet artists were interested in creating specifically Soviet advertising that had a Revolutionary look. Visually, it consisted of angular geometric constructions that were supposed to represent people and material subjects in non-mimetic ways. They aggressively used typography, playing with different sizes, directions, and the letter appearances. Instead of creating a pleasing image and luring consumers into buying the merchandize, it emanated the Revolutionary energy and up-beat attitude.

In the 1922, *Zhurnalists* [Journalists], the new organ of print workers of Russia, began its publication. It was a lively print medium that was engaged in discussions on the nature and content of the Soviet press and the directions of its development, experimenting with various writing styles and visual aids. From its first issue, *Zhurnalists* showed interest in Soviet advertising, attempting to develop ideological and theoretical base for it. The Communist ideology propagated the clean break with the bourgeois past. Predictably, those interested in the advancement of advertising, had rejected the past advertising achievements of the czarist Russia, however accomplished they had been. Instead, they suggested turning to the American and German advertising experience—the countries that had been considered as the most efficient and technologically developed.

However, *Zhurnalists*'s authors defined Soviet advertising goals as contrasting to that of capitalist advertising goals. Instead of immersing in competition, Soviet advertising in their opinion should educate the consumers and inform them of the new habits and new ways of life and at the same time beautify life and to be the branch of art. Concentrating on differences in ideology with capitalism, the proponents neglected to see the similarities in the advertising functions of both systems: essentially the Soviet advertising goals were the existing roles of bourgeois advertising. Adver-

tising publications in *Zhurnalists* also suggested the association of propaganda and advertising which on some occasions they called “trade propaganda.” They recommended drawing upon the experience of Revolutionary posters.

The only road of the advancement of Soviet advertising for *Zhurnalists* was education of advertising cadres and mastering the methods of scientific psychology. It reported the results of original scientific experiment, reprinted articles from German advertising publications on psycho-techniques, and published essays on contemporary American advertising. *Zhurnalists* showed interest to psychology as a powerful tool for the effective propaganda. The authors of *Zhurnalists* interested in the topic, organized the Association of Advertising Workers was to develop methodology for the rational and effective advertising.

The young Soviet Russia had ambitious goals of building socialism in one country. This meant a giant leap of mostly rural communities into urban industrialized nation and transformation of Russia into modern society. Modernity for the country reflected categories similar to that of the Western world: progress, rationality, effectiveness, and science. Advertising was perceived as a tool that will help the young country to approach the gleaming ideal.

SPECIAL SESSION SUMMARY

Consumers' Beliefs about Luck and Consequent Reactions to Lucky and Unlucky Situations

Donnel A. Briley, Hong Kong University of Science and Technology
Peter R. Darke, University of British Columbia

Luck describes the influence of chance on the situations we face in life. A lucky or unlucky event, then, arises randomly. Nevertheless, individuals' implicit beliefs about luck often violate this basic assumption. For example, gamblers may kiss a pair of dice before throwing them and athletes sometimes engage in strange rituals, such as wearing the same "game-shirt," in an apparent attempt to improve their luck. Such anecdotal evidence suggests that at least some people believe, contrary to rationality, that luck represents something other than chance influences. Research verifies that people often are irrational in their interpretations of luck-related situations, and presents different conceptualizations of their views of luck's influence (see Wagenaar, 1988).

Though the topic of luck has received scant attention from consumer behaviour researchers (McDaniel, 2002), it plays an important role in a number of purchasing situations. For example, shoppers might feel lucky or unlucky if they unexpectedly find or miss a favoured brand or a sale opportunity. And, more importantly, both retailers and manufacturers use luck-based promotional games and events to boost sales, and many marketers depend on such tactics as crucial parts of their promotional strategies (Feinman, Blashek, and McCabe, 1986).

Our session seeks to clarify the nature of consumers' interpretations of lucky and unlucky events. Three papers present somewhat different conceptualizations of luck and explore the implications of these ideas for consumers' behaviours. In particular, we will examine the consumer behaviour implications of conceptualizing luck as a negatively biased force (Ofir and Simonson), a consistent personal attribute that exerts a positive influence on expectations (Darke and Freedman), and a consideration for consumers' self-expression (Briley and Price).

The Invisible Narrator: Attributes and Consumer Attitudes

Michael S. Mulvey, University of Ottawa

Barbara B. Stern, Rutgers University

ABSTRACT

Advertising research affirms the importance of the advertising narrator, whose function is to persuade consumers by attracting attention, enhancing credibility, triggering consumer-speaker identification, and conveying product meanings. However, virtually all of this research treats the effects of visible narrators rather than invisible ones. Our research reinforces the concept of consumers as co-creators of messages by showing how consumers draw from personal experiences and persuasion knowledge to imagine characteristics of invisible narrators. The paper presents a study of invisible narrators based on a theoretical framework drawn from narratological literary theory and advertising persuasion theory to fit the advertising context. Propositions about the narrator's attributes, valence, and relationship to the consumer are tested in a study that elicits quantitative and qualitative data. Findings indicate that consumers construct a narrator's attributes even when s/he is unseen and develop attitudes to the ad in terms of attitudes to the narrator.

The purpose of this paper is to extend prior research on advertising narrators by focusing on the message speaker, also called by a variety of names such as "source" (O'Keefe 1990), "persona" (Elliott 1982), "voice" (Lanser 1981), and "teller" (Abrams 1990), defined as the perceived human or humanized speaker who tells a story to consumers (Riessman 1993). The assumption that a narrator is present in advertising messages derives from literary and communication theory, in which words are assumed to emanate from *someone speaking* (Martin 1986). The narration-persuasion association that reappears in advertising dates back to the earliest extant rhetorical and literary criticism: Aristotle's *Rhetoric* (Lawson-Tancred 1991) and *Poetics* (Fergusson 1961). Aristotle's concept of speakers as orators in the *Rhetoric* and as *dramatis personae* in the *Poetics* locates narrators as the source of persuasion whose aim is to stimulate audience effects.

Recent advertising research reaffirms the link, with narrators conceptualized of as within-ad speakers (Stern 1991, 1993, 1994) whose function is persuasion to consume (Friestad and Wright 1994; Baumgartner, Sujan, and Bettman 1992; Sujan, Bettman, and Baumgartner 1993). Narrators have been found to persuade (O'Keefe 1990) by attracting attention (McGuire 1985), enhancing credibility (Joseph 1982), triggering consumer-speaker identification (Deighton, Romer, and McQueen 1989); and conveying product meanings (McCracken 1989). Specific persuasive tactics have been examined in the literature on celebrity source effects (McCracken 1989), drama/lecture (Deighton and Hoch 1993; Deighton, Romer, and McQueen 1989; Wells 1989), marketing agency (Friestad and Wright 1994), and self-persuasion (Baumgartner, Sujan, and Bettman 1992). In addition, research on consumer-constructed meanings also references persuasive narrators, relying on interview data to discover what consumers think about ad meanings (Mick and Buhl 1991; Mick and Politi 1989).

However, virtually all of this research treats the effects of *visible* narrators rather than *invisible* ones. Our study aims at extending the research stream by turning attention to the formal and substantive attributes of invisible narrators and their effects on consumers. We derive the theoretical formulation of invisible narrators from narratology theory—the study of literary narratives (stories, novels, tales)—which has been adapted to the study of

advertisements (Stern 1991, 1993, 1994). In narratology, the presence of a speaker is taken as a common denominator of all written stories, in that they rely on "some use of personification whereby character is created out of ... the words on the page" (Miller 1990, p. 75). The assumption is that when readers are faced with speakerless words, they will infer that the message comes from a speaker, "just as the words that you and I speak *are ourselves*" when we speak to others (Martin 1986, p. 51). Invisible as well as visible advertising narrators have an especially important function in advertisements, where they are needed to break through audience disinterest (Kover 1995), and function as "hooks" to pull consumers into ads (Escalas, Moore, and Edell 2003). We continue the application of the narrator-persuader nexus to invisible narrators, and begin with an overview of grammatical and evaluative attributes that delineate different narrator types.

THEORETICAL OVERVIEW: NARRATOLOGY AND PERSUASION

Narratology: Grammatical Person

Narratological theory grounds the grammatical dimension of narrative identity as either the self or another, for it examines the question applicable to both advertising and literary stories: "Who is doing the talking?" (Sutherland and Sylvester 2000). Narratology is a sub-field of literary criticism that gained prominence in the late 1960s, following Tvetzan Todorov's (1968) definition and categorization of it as a research area (Cohn 1978). Todorov's theory relies on that of the 1920s Russian Formalists, whose works were relatively unknown because they were not translated into English until the late 1950s (see Ehrlich 1981; Thompson 1971). Nonetheless, the Formalists were the first modern critics to reject Victorian subjectivism and return to an objective approach to texts based on Aristotelian principles of scientific classification. This ideological perspective appealed to the New Critics' analytical bent, and since the 1950s, narratological criticism has burgeoned. Its premise of a story that tells itself (narratorless) as logically impossible (Genette 1983 [1988]; Todorov 1968) is axiomatic in narratology, which focuses on axes of formal and substantive differentiation to classify narrator types into parsimonious categories.

The most fundamental formal distinction is the grammatical dichotomization of narrators expressed in the English pronominal difference between the self-referent pronoun "I" or the other-referent "he," "she," "it," or "they" (Kenney 1988). Grammatical differentiation is a constant across English classification systems, no matter what terminology is used (Genette 1983 [1988]), in which the first-person narrator reports personal experiences (Stern 1991), and the third-person one reports information about others.

Persuasion Theory: First/Third Person and Positive/Negative Valence

Person: In consumer research, Friestad and Wright's Persuasion Knowledge Model (PKM 1994) posits third-person narration ("s/he," "his/her"), which leads consumers to generate "beliefs about the traits, competencies, and goals of the persuasion agent" (Friestad and Wright 1994, p. 3). This relates to Wright's earlier comments on consumers' "communicator subschema," used to determine the narrator's identity by stimulating consumers to ask, "why is this person describing his/her characteristics?" and "why

was s/he chosen to deliver this message to me?" (1986, p. 1). However in the self-referencing literature, autobiographical first-person narration is posited, with consumers' autobiographical experiences defined as "memory for information related to the self; more precisely... memory for events from one's own life" (Baumgartner, Sujan, and Bettman 1992, p. 54). Thus, the first attribute is person, with a narrator conceived of either as a third-person agent or a first-person self (Baumgartner, Sujan, and Bettman 1992).

Valence. The formal dimension cannot be separated from the substantive one, for the key to story interpretation is "understanding how form and content are fused" (Martin 1986, p. 16). The second dimension is substantive, discriminating between a narrator viewed as either a positive or a negative influence on consumers. Its theoretical basis is as old as the Western cultural dualism between good (hero, helper) and evil (villain, harmer) inherited from Judeo-Christian and classical traditions, now viewed as a universal rule of narration. It is restated in Vladimir Propp's Formalist narratological work, *Morphology of the Folktale*, which appeared in 1928 but was again not translated into English until 1958. Propp's identification of essential story elements became influential in the study of folklore and then of narratives in general. The theoretical core is a classification scheme that divides all narrators into 7 role categories, with 2 fundamental ones common to all stories: the hero (seeker/victim) versus the villain (destroyer/denier). Virtually all later narratologists follow Propp's notion of a universal distinction between heroic and villainous narrators, with Jung, for example, claiming that first-person narrators are viewed positively as sincere because they reveal self-truths and do not try to put something over on readers (1968). In contrast, third-person narrators may be viewed negatively as insincere because they pretend to convey unbiased information, but instead express authorial opinions.

Both persuasion and self-referencing research follow prior theory in positing consumer perceptions of narrators as positive or negative influences on consumption. The consumer's assignment of valence to a third-person versus a first-person narrator depends on different heuristics in that a third-person agent is evaluated in terms of an appropriateness heuristic applied to others, but a first-person one is evaluated in terms of feelings about oneself. In the persuasion literature, appropriateness is the criterion whereby consumers differentiate between an appropriate third-person marketing agent who delivers a "moral or normatively acceptable" message (Friestad and Wright 1994, p. 10), and an inappropriate one who delivers a manipulative spiel. That is, marketing agents are viewed positively when they are perceived as helping consumers to make wise decisions, and viewed negatively when they are perceived as hurting consumers by persuading them to make bad decisions and go against their best interests (Wernick 1991).

In self-referencing research, on the other hand, the first-person self narrator is endowed with valence by means of an affective heuristic, whereby an emotional response is triggered by retrieval of an "intact" memory (Sujan, Bettman, and Baumgartner 1993). Similar to persuasion theory, the "affect associated with personal memories can be either positive or negative," with individuals exposed to the same stimulus able to recollect either positive or negative life episodes (Baumgartner, Sujan, and Bettman 1992, p. 58). However, most self-referencing research focuses on elicitation of positive emotions, "because there is a bias toward remembering positive episodes from one's life and because ads often encourage the retrieval of pleasant rather than unpleasant memories" (Sujan, Bettman, and Baumgartner 1993, p. 424). Nonetheless, in following this research, we claim that both positive and negative self-narrators exist, with autobiographical memories of a product or

usage situation likely to stimulate ad evaluations by means of empathetic or sympathetic (Boller and Olson 1991; Deighton, Romer, and McQueen 1989; Wells 1989) emotional responses to the storyteller and the story. Empathy is elicited when consumers vicariously experience an advertising story, and use their more affective state (feeling into the emotion itself) "as a heuristic for judgments" (Baumgartner, Sujan, and Bettman 1992, p. 78). Sympathy is elicited when consumers understand the advertising narrator's emotions and use their more cognitive state (recognizing the depicted emotion) as a parallel heuristic. To sum up so far, literary theory and consumer research converge on two common attributes, and the following section presents the propositions about the perception of narrators, their attributes, persuasive intent, and influence on attitudes to ads.

PROPOSITIONS

Perception of Narrators and Diverse Perceptions

The central theoretical assumption in multidisciplinary research is that even when no narrator is visible, perceivers are likely to imagine one to make sense out of a story (Howard and Allen 1989). They are said to construct a speaker based on the "strands of action, information, and personal traits [that] are woven together to form the thread of character" (Martin 1986, p.116), who tells a comprehensible story. However, the assumption that consumers do construct an advertising narrator has not yet been studied, even though it is crucial to determine whether or not it occurs. To do so, the first proposition posits construction of a narrator in the invisibility situation. The second proposition posits the construction of different narrators, for individuals are free to assign meaning to ads.

P1: Consumers will tell stories about an invisible narrator.

P2: Consumers will tell different stories about the narrator.

Perception of Persuasive Intent

Even though consumer stories about narrators are predicted to differ, persuasion theory assumes that consumers understand advertisements as texts designed to persuade and invoke persuasion schemas (Greenwald and Banaji 1989) to facilitate processing. Pre-existing persuasion knowledge is developed in the course of exposure to ads, and people develop criteria over time for evaluating the validity of message claims by observing its surface features. Heuristic processing enables quick assessments of a persuasion attempt's effectiveness (Friestad and Wright 1994), and the proposition states that consumers recognize ads as persuasive.

P3: Consumers will perceive narrators' persuasive goals.

Evaluation of Narrators as Positive/Negative

Proposition 4 follows from P2 (individual stories will differ) and P3 (persuasive goals will be perceived), stating that individual assessments of persuasive tactics will also differ. It treats the evaluation of narrators as positive when they speak in the consumer's best interests, or negative when they speak only for the marketer. In this regard, positive evaluations of narrators are likely to lead to the formation of favorable attitudes to an advertisement and acquiescence in the persuasion attempt, whereas negative evaluations are likely to lead to skeptical Aad and resistance to its persuasive message. Some consumers may accept the "just like me" self-narrator as true to life, whereas others may discount such narrators as sponsorship creations who fake similarity to manipulate them (Friestad and Wright 1994). Further, some consumers may perceive other-narrators as appropriate sponsorship agents, whereas others

may perceive them as “mind-screw-ers” involved in “marketplace gamesplaying” (Wright 1986, p. 1). Notwithstanding the perception of a narrator as self or other, consumers who perceive themselves to be objects of manipulative influence tactics are assumed to react negatively by invoking a “schemer’s schema” to evaluate the message (Wright 1986). We propose that consumer judgments of ad narrators will be positive/negative.

P4: Consumers will evaluate narrators as positive or negative.

Consumer-narrator Relationships and Attitudes to Ads

Theoretical support for the concept of a narrator-narratee is found in narratology (Lanser 1981; Wallace 1986), in which a reader’s perception of a narrator’s relationship to him/her is considered the basic element of a narrative transaction. The concept is reaffirmed in advertising/consumer behavior research, where the process of making sense out of a story is based on consumer decisions about the nature of the relationship (Stern 1991). Perceptions of the consumer-marketer relationship are said to influence evaluations of both the other-narrator’s behavior (Friestad and Wright 1994) and that of the self-narrator. When consumers project themselves into a story or recognize like-me narrators, they may participate emotionally in the scenario, but when they remain outside observers of a fake self or a manipulative agent, they may disengage emotionally and become more judgmental. Persuasion by self-identification is said to motivate copywriters’ creation of a like-me narrator (Kover 1995), and persuasion by other-identification to evoke vicarious participation in another’s experience (Boller and Olson 1991). Burke described successful consumer-narrator identification in itself as persuasive, stating that “you can persuade a man only insofar as you can talk his language... *identifying* your ways with his” ([1950] 1969, p.55). We propose that consumers perceive the self/other relationship.

P5: Consumers will view the invisible narrator as self/other, in relation to themselves.

Even though Aad studies do not focus on the narrator in general, we follow the suggestion that the target as interpreter is an aspect of consumer interpretations of persuasion attempts (Folkes 1988). We draw from evidence found in the self-persuasion literature to develop the connection between the narrator’s message and ad attitudes. Previous research supports the finding that messages become more persuasive when they activate consumer memories that trigger emotional responses that transfer to ad evaluations (Boller and Olson 1991; Deighton, Romer and McQueen 1989; Wells 1989). Furthermore, the persuasiveness of the narrator’s message is enhanced when it successfully activates self-relevant opinions, values and goals and creates identifications with the audience (Burke [1950] 1969; Mulvey and Medina 2003).

P6: Consumers who recognize a greater (lesser) degree of self-relevance in the narrator’s message will produce more (less) favorable ad evaluations.

THE STUDY

Data Collection

The propositions were tested in a study of consumer responses to ads lacking a visible narrator via a computerized questionnaire that used open-ended questions to elicit verbal and/or visual descriptions and traditional scale measures. The rationale for combin-

ing open-ended with scales is that the verbal/visual data captures consumers’ thoughts about ads (Walker and Dubitsky 1994), and the measures capture attitudinal effects.

Sample

Seventy-five undergraduate business students in an introductory marketing class at a large northeastern public university participated in the one-hour study for 2.5% of their grade. The sample consisted of 42 female and 33 male participants (75), with an average age of 21 years. The justification for use of a student sample is that students were the target of the stimulus ads, which appeared in the college newspaper as part of a Visa campaign to attract student users. The respondents were pre-screened to determine credit card ownership, and 93% of the respondents said that they owned one, with 87% stating that they owned two or more.

Ad Stimulus

Figure 1 shows two print ads from the Visa campaign ran in student newspapers, with two different headlines:

8 wds Ad 1: “Because all-nighters aren’t always spent in the library.”

6 wds Ad 2: “Because today is mystery meat day.”

Aside from the words in a handwritten font, there is no concrete evidence of a persona, which forces readers to invent someone responsible for the words. The first word, “because,” poses an implicit question—because why?—that calls for an answer (Stern 1991). The text is a teaser, for it is up to the readers to provide closure by inferring the problem and the solution (“use Visa”), based on the product benefit in the tagline, “It’s everywhere you want to be.” The headline catch phrases “all-nighter” and “mystery meat”, familiar to college students, are not spoken by anyone visible, forcing readers to construct a speaker, his/her motivation, actions, and outcomes.

Method

Respondents were randomly assigned a questionnaire about one ad and were seated at computers. They were given a copy of the ad in a page of the daily newspaper to heighten task realism by allowing them to view the ad in context, and were asked to respond to a 4-part questionnaire. Part 1 followed established procedures in requesting responses to four specific questions rather than a single general one (“what do you think about this ad?”) to minimize irrelevant responses (Wansink, Ray and Batra 1994). The questions were adapted from those used in prior research: “What story does the ad tell?” (Mick and Politi 1989; Deighton, Romer and McQueen 1989; Stern 1994); “How does the ad make you feel?” (King, Pehrson and Reid 1993; Walker and Dubitsky 1994); “How does the ad relate to your life?” (Mick 1992; Mick and Buhl 1992); and “Please tell us why you like or dislike the ad (Mitchell and Olson 1981; Walker and Dubitsky 1991).

Part 2 used a projective prompt to determine perceptions of the ad narrator, instructing respondents to “draw and/or describe the speaker. Please be as detailed as possible.”

Part 3 presented respondents with three scales that measured Aad, personal relevance, and normative evaluation of the ad situation. Attitude toward the ad (McKenzie, Lutz, and Belch 1986; Mitchell and Olson 1981) was measured by four seven-point semantic differential items (unpleasant/pleasant, bad/good, unlikable/likable, and boring/interesting). Cronbach’s alpha for the four items was 0.93. The four measures were averaged to form an overall measure of attitude toward the ad.

FIGURE 1
Ads Used in Study

Because
all-nighters
aren't always
spent in
the library.

It's everywhere
you want to be.

Because today is
mystery meat day.

It's everywhere
you want to be.

Respondents' evaluations of the situation depicted in the ad were measured by Rook and Fisher's (1995) 5-point scale of 10 bipolar adjective pairs (good-bad, rational-crazy, productive-wasteful, appealing-unappealing, smart-stupid, acceptable-unacceptable, generous-selfish, sober-silly, mature-childish, and right-wrong). A factor analysis confirmed scale unidimensionality, and the 10 items were averaged to form an overall evaluation ($\alpha=.88$).

The authors developed a self-report measure using a 6-item, 5-point Likert scale (1=strongly disagree; 5=strongly agree) to assess personal/other-relevance of the message. Personal relevance was measured in statements about the ad's consistency with the respondent's experiences: "This ad is a slice of my life"; "I can relate to using a credit card in this situation"; and "It was as if I wrote the ad." Other-relevance was measured by statements about the ad's representation of other people's behavior: "I have seen others come up with excuses like this before"; "Many students behave in this manner"; and "I know people who rationalize their behavior in this manner." Factor analysis using a varimax rotation yielded a two-factor structure validating the measure, with self-relevance as one factor and other-relevance as the second. The scales were averaged to provide overall measures of self-relevance ($\alpha=.85$) and other-relevance ($\alpha=.71$). Thus, the scale items were able to distinguish between two kinds of message relevance.

Part 4 requested demographic information (age, sex) and credit card usage patterns (card ownership, payment history and responsibility, purchase patterns).

Data Analysis

Verbal responses were coded independently by the authors, who classified responses on the attribute axes of self/other and positive/negative. Coding the narrator's grammatical person in a marketing context was straightforward, for the pronouns determine whether narrators are conceived of as peer/self or persuasion agent/other. Coding the narrator's positive/negative valence produced some discrepant readings, requiring discussion to negotiate meanings.

FINDINGS

Proposition 1 stating that consumers will tell stories about an invisible narrator was confirmed, with all 75 respondents producing descriptions of the narrator, and 21 producing drawings (see Figure

2 for sample illustrations). The descriptions uniformly refer to someone "who is speaking," indicating that respondents create a speaker and a story about the antecedents and consequences of credit use by making inferences that enable them to "follow" the ad's meaning. Proposition 2 stating that consumers will tell different stories about the narrator was also confirmed, and Table 1 shows the divergent responses.

Proposition 3, stating that consumers will perceive the narrators' persuasive goals, is confirmed, supporting the claim that readers are aware of ads as attempts to persuade. The majority of students recognized that they were targets, making comments such as "Visa is targeting students," and "the ad is aimed at college students." Even those who focused on the ad's persuasive message imagined a variety of types of corporate persons, mostly negative, conceived of as a manipulative corporate spokesperson who pretends to relate to students but really just wants their money. Some critiqued the ad itself by questioning the sponsor's motives for using the headline language, offering suggestions about improving the layout, and criticizing the ad's openness to multiple interpretations. Thus, support for the first three propositions indicates that different narrators are perceived and recognized as persuasive.

Propositions 4 and 5 are also confirmed, supporting the attribute dimensions out of which narrators are constructed. Proposition 4, stating that consumers will evaluate narrators as positive or negative, was confirmed. Table 2 shows the frequency of positive/negative and self/other narrators. In both ads, 17% (12) of the respondents described a positive free spirited student as the narrator. However, the mystery meat ad elicited significantly more negative descriptions (Chi-square=16.5, $p<.001$), especially those referring to a cafeteria worker who serves disgusting food. Proposition 5, stating that consumers will describe the invisible narrator in relation to themselves as self/other, was also confirmed. Respondents provided diverse descriptions of narrators in relation to themselves (participants or targets) or others who influence their actions. Confirmation of the attribute propositions thus underlies the classification of four distinct types of narrators.

Self/Positive: As self/positive figures, respondents provide autobiographical interpretations that are self-referential (Sujan, Bettman, and Baumgartner 1992). No matter whether the self is actual or ideal, s/he is always a cash-starved student who uses the Visa card to turn a situation from threat to opportunity. One

FIGURE 2
Sample Illustrations of the Ad Narrator

common pattern is that of a student who uses credit to play now and pay later. Interestingly, "all-nighter" rarely refers to studying for an exam. Rather, one variant is about a night out partying with friends, and another is about a sexual conquest by a male "big spender" who impresses a date and is thanked in a "personal way." Other positive self narrators rely on the card to overcome threatening situations, which differ for men and women. When the narrator is male, he is faced with an emergency such as a late-night car breakdown, but overcomes the threat by charging rescue and repair bills. When the narrator is female, her lack of cash prevents her from going to a restaurant with friends, but the card comes to the rescue.

Self/Negative: Most of these responses are only mildly negative, for even though the narrators are described in negative terms, their story ends happily. For example, the male narrator in the "mystery meat" ad is often someone who hates cafeteria food because of dietary restrictions or health concerns, but who manages to avoid it by using the card to pay for a restaurant meal. In contrast, the female narrator is often someone who wants to become part of a social group going out to eat, but feels guilty or lacking in self-esteem because she has to pretend that she is more affluent than she really is by relying on the card in the absence of ready cash. The point of these stories is that the narrator's attempt to impress her

TABLE 1
Characterizations of the Ad Narrator

Character Type	Description	Goals (Traits)	Frequency	
			Ad A "Library"	Ad B "Meat"
Self – Positive				
<i>The Free Spirit</i>	Pleasure-seeking, spur-of-the-moment type acts with confidence and follows his/her impulses without regret.	To experience life in the moment (Spontaneous, individualistic)	6	6
<i>The Party Animal</i>	Extroverted hedonist slurs the words, beer in hand. Not the scholarly-type, he maintains a low GPA.	To have fun (Hedonistic, rebellious)	8	0
<i>The Leader</i>	Socialite inspires peers to escape mundane routine by partaking in activities in the pursuit of happiness.	To create memorable experiences (Charismatic, kind)	6	1
Other – Positive				
<i>The Wise Advisor</i>	An empathetic voice of experience (possibly a graduate) entices students to loosen up and enjoy their college years.	To educate and guide (Wise, confident)	6	0
<i>The Caring Provider</i>	Concerned parent-type offers credit card to ensure students' safety should an unforeseen emergency arise.	To protect (Caring, compassionate)	2	2
<i>The Restaurateur</i>	Friendly food services professionals (restaurant host, waiters, or butcher) offer a solution to students' food dilemma.	To serve (Proactive, supportive)	0	3
<i>The Temptress</i>	Warm, seductive, sultry voice exhorts students to alter their credit card spending behavior.	To tempt (Flirtatious, affectionate)	2	0
Self – Negative				
<i>The Spendthrift</i>	Free spender willing to incur charges to get what they want; may rely on others to defer his/her frivolous expenses.	To indulge desires (Impulsive, irresponsible)	1	6
<i>The Victim</i>	Dejected student complains about inedible cafeteria food. Strapped for cash, he feels obliged to eat the prepaid meal.	To avoid problems (Moody, in denial)	0	5
<i>The Finicky Foodie</i>	Picky woman refuses to eat the disgusting cafeteria food. She cites health concerns to justify going elsewhere to eat.	To never compromise (Demanding, stubborn)	0	4
<i>The Dork</i>	Dorky loser tries to impress others and appear cool. Clearly, this annoying person does not get out much.	To belong, friendship (Desperate, pathetic)	2	0
Other – Negative				
<i>The Clueless Exec</i>	Out-of-touch middle-aged man dressed in a business suit tries (in vain) to relate to college students.	To connect, to convince (Alienated, yearning)	3	1
<i>The Lunch Lady</i>	An unpleasant, hairnet-donning cafeteria worker slops disgusting food onto a plate, inspiring students to leave.	To spread misery (Unpleasant, unhappy)	0	4
<i>The Profiteer</i>	Wealthy executive collects interest payments from poor college students.	To capitalize (Greedy, manipulative)	2	1
<i>The Gourmand</i>	Overweight middle-aged man salivates in anticipation of mystery-meat meal.	To indulge appetite (Gluttonous, short-sighted)	0	2
<i>The Shopper</i>	Middle-aged woman uses credit card to finance a spending binge at the local mall.	To indulge desires (Impulsive, careless)	0	2

TABLE 2
Classification of Narrators by Attributes and Ad Version

Plot Pattern	Ad "A" – Library		Ad "B" – Mystery	
	Narrator Type		Narrator Type	
	<i>Other</i>	<i>Self</i>	<i>Other</i>	<i>Self</i>
<i>Positive / Guide</i>	10	20	5	7
<i>Negative / Warning</i>	5	3	20	15

peers fails either because they mock her pretensions or she herself feels fraudulent. Despite this, she regains peer respect and affirms her real identity if she learns from her mistake and avoids overuse of credit in the future.

Other/Positive: Respondents also described other/positive narrators whose goal was to influence him/her to use credit to achieve a positive outcome. These narrators are described in terms of the respondents' personal and social values functioning as a just-like-me friend, a protective family member, or a student who triumphs over adversity. For example, the narrator may be a college graduate who represents the voice of experience, advising students to enjoy the best years of their lives or a parent who protects a child by making sure that s/he has a credit card in case of an emergency. In some cases, even if narrators are perceived as the sponsor-generated solution to a problem, they are still considered positive marketing agents.

Other/Negative: However, negative marketing agents comprise the majority of negative other-narrators, likely to be cast as sponsorial manipulators such as debt collectors who lacks empathy with students or obviously fake "students." Thus, the classification of narrators into 4 types based on 2 attributes validated the predicted four-box typology.

Proposition 6 was supported. Consumers who perceived higher levels of self relevance in the narrator's message produced more favorable ad evaluations ($R^2=.42$, $F(1,72)=51.34$, $p<.001$). The addition of normative evaluations, card ownership, and sex to the model only yielded a small increase in $R^2=.024$, for message self-relevance was the strongest predictor of affective responses to the ads. A post-hoc test found that character valence (positive / negative) did not affect ad attitudes directly ($F(1,72)=.85$, NS). However, consumers with positive (negative) views of the narrator perceived slightly greater (lower) levels of self relevance in the narrator's message ($R^2=.11$, $F(1,72)=8.7$, $p<.01$).

Despite the fact that the normative evaluations of both ads were virtually identical, attitudes to each differed. The all-nighter ad stimulated significantly more positive attitudes (4.8 vs. 4.0, $F(1,72)=6.09$, $p<.05$) than did the mystery meat ad. In the all-nighter ad, the narrator was most often conceived of as positive, and respondents found it easier to relate to this ad (3.2 vs. 2.5, $F(1,74)=7.33$, $p<.01$) than to the mystery meat ad, no matter whether the narrator was self or other (see Table 1). One possible explanation is that all-nighters are more often part of student life than compulsory food plans.

Limitations. The limitations of this study concern generalizability and verisimilitude. Insofar as the stimulus was a print ad, responses cannot be generalized to electronic ads in which cues such as voice, sound effects, and motion on TV may influence interpretations. Further, even though the ad was appropriate for the student sample, forced viewing may have influenced responses by focusing attention to the research situation and not the advertising (Kover 1995). Participation in a study for class credit may require

more involvement from respondents than everyday advertising encounters would.

Notwithstanding the limitations, the study indicates that even when ad narrators are invisible, consumers draw from personal experiences and/or cultural conventions to attach meaning to the visible words by constructing formal and substantive attributes for the narrator. Multiple interpretations of the same words reveal that even though different narrators are constructed, each reflects the consumer's tacit understanding of ads as persuasive message. In addition, consumers perceive the narrators in terms of two major attributes, with positive self/others influencing positive attitudes to the ad. Taken as a whole, the findings reinforce the concept of consumers as co-creators of messages powerful enough to engage them in a positive relationship with a narrator.

Narrative Word-of-Mouth Communication: Exploring Memory and Attitude Effects of Consumer Storytelling

Yvonne Delgadillo, University of Arizona
Jennifer Edson Escalas, Vanderbilt University

ABSTRACT

This paper explores “word-of-mouth” (WOM) communication from the perspective that this type of communication is typically structured as a narrative or story. The first study provides empirical evidence that consumer WOM communications are often structured as a narrative. The second study extends findings from psychology research to the context of a WOM story by examining two factors of story memory that may affect brand attitudes: 1) biased memory for story details and 2) recall of story gist, defined as a summary abstraction of the story. We propose that a narrative perspective will enhance the field’s understanding of WOM communication.

INTRODUCTION

For a company to be successful, it is essential that it understand consumers’ perceptions of its products, services, and/or brands. Marketing and advertising frame these perceptions, along with word-of-mouth (WOM) communication between consumers when they complain about products or recommend products to friends. Although there is not much that marketers can do to influence WOM communication, it is important for marketers to understand this phenomenon in order to develop a fuller understanding of the processes at work in consumers. Word-of-mouth communication is one of the strongest sources of information for consumers (Kotler 1988). This interaction between consumers can work against the brand or product when a consumer shares a negative experience or can work in favor of the product when a positive experience with the brand or product is communicated.

Our research extends concepts from psychology to WOM communication in order to better understand its effects on consumers. Our goal is to enhance knowledge of the structural properties of WOM communication as well as examine consumers’ memory and attitude responses to WOM communication, based on its structural properties. This research project consists of two studies. In the first study, we explore the structure of WOM communication and provide a preliminary indication that WOM communication is typically presented as a narrative, that is, in the form of a story. This knowledge about the structure of WOM communication leads to the second study, which analyzes what people remember about a WOM story and how WOM story memory affects consumer attitudes (more specifically, assessments of blame in a problematic service encounter).

THEORETICAL DEVELOPMENT

Much marketing research has been conducted on word-of-mouth communication and recommendations. For example, consumer research has examined how WOM travels through social networks (Brown and Reingen 1987), when consumers are apt to complain (Richins 1983), and how consumer attributions mediate the effects of WOM on brand evaluations (Laczniak, DeCarlo, Ramaswami (2001). Herr, Kardes, and Kim (1991) have shown that WOM communications are highly accessible because they are vivid, but their effect on persuasion is diminished in the face of more diagnostic information. Recent research has explored the factors that influence whether consumers rely more on strong-tie and weak-tie sources of recommendations (Duhan et al. 1997) and has compared WOM referral behavior in the United States to that of

Japan (and found that referral behavior is different across cultures; Money, Gilly, and Graham 1998). Smith and Vogt (1995) have examined how WOM communication interacts with information presented via advertising. Thus, marketing researchers have explored the antecedents of WOM communication, how consumers use WOM communications to make decisions, and who talks to whom and/or looks to for advice.

However, more research is needed on how consumers cognitively process WOM communications (Laczniak et al. 2001). For instance, the field has not examined the structure of WOM communications, which has theoretical implications for how WOM information is processed, how it is recalled, how it affects consumer attitudes, and how it interacts with other incoming information, such as that presented in the form of advertisements. Based on previous research on consumer narratives (e.g., Escalas 1998, Escalas and Bettman 2000), we believe that WOM communications are structured as a story. That is, when consumers relate their experiences with products, services, and brands to others, they typically tell their listener a story, with themselves as the protagonist. This proposition is developed next and empirically examined in Study 1.

Why Should WOM Communication Be in Story-Form?

People make sense of their lives by thinking about themselves and the events around them in story-form (Bruner 1990). Narratives, considered here to be synonymous with stories, organize events into a framework that establishes causal relationships between the story’s elements over time (Hastie 2003). Stories provide us with the reasons for why things happen and why people engage in particular behaviors. For example, one of the authors understands why her father has such a strong work ethic because she’s heard his many stories of how he struggled while he was growing up and was finally able to obtain everything he dreamed of by working hard and persevering. Given our narrative understanding of the world, we also think of ourselves in terms of self-stories. Moments in time are not unrelated, rather there exist goal-directed, coherent sequences linking one’s past, present, and future into a present identity (Gergen and Gergen 1988). Furthermore, when people communicate with one another, they usually do so in the form of stories (Schank and Abelson 1995). People constantly tell each other stories, matching and comparing incoming stories to stories that are already stored in memory in order to understand one another. A major focus of the stories created by consumers is to make sense of who they are and what they consume, both for themselves and in communicating with others.

The Structure of Narratives. What makes a story a story? An important aspect of narrative thought is its structure. This structure consists of two important elements: chronology and causality. While there are many theories about the necessary elements of narrative structure that vary as to the fine points of what constitutes a narrative, they consistently agree on the necessity of a temporal dimension (chronology) and defined relationships between story elements (causality; Escalas 1998). First, narrative thought organizes events in terms of a temporal dimension; things occur over time. Time is configured in narratives as episodes, each with a beginning, middle, and end, whereas time in reality is an undifferentiated, continuous flow (Bruner 1990, Polkinghorne 1991).

Second, narrative thought structures elements into an organized framework that establishes relationships between the story's elements and allows for causal inferencing. Episode schemas represent the standard sequence of events in both the real world and in stories (Pennington and Hastie 1986). To begin, an event, or series of events, initiates a psychological reaction and activates goals in a main character. The goals may be formulated in response to the initial event or may be preexisting goals that are activated by the initial event. The protagonist's psychological state and goals provide reasons for his/her subsequent actions. These actions lead to an outcome or result. Because these narrative elements are organized through time, causal inferences can be made. What happens in time one (for example, the protagonist feels jealous) causes what happens in time two (he kills his rival).

How Narrative Processing Affects Memory and Attitudes

In this paper we focus on the narrative mode of thought as a process. Narratives are constructive. A typical story consists of interrelated episodes describing human action sequences; people are willing to make inferences and even delete (or forget) information in order to make their stories coherent and complete (Baumeister and Newman 1994). Narrative thinking does not lead people to ignore contradictions, but it provides a way for the inevitable inconsistencies that people observe in human behavior to be interpreted and remembered more easily (Baumeister and Newman 1994). Building stories is an ongoing process; people fit characters and episodes together in a narrative form to render the world and their lives meaningful.

Consumer research has recently begun to look at the effects of narrative processing. Adaval and Wyer (1998) have shown that narratives improve the evaluation of vacations, compared to simple lists of features. The authors assert that the advantage of narratives comes from their structural similarity to information naturally acquired in life experiences and from their tendency to induce holistic, not piecemeal, information processing strategies. Padgett and Allen (1997) have proposed that since service encounters are experiential, they are likely to be understood via narrative processing. Therefore, these authors assert that narrative advertising may be the best way to communicate a service brand image.

In terms of memory effects, narratives can be considered an organizing framework that should enhance memory, consistent with a long stream of research in psychology (e.g., Barlett 1932, Tulving and Pearlstone 1966). In the context of television news broadcasts, Lang (1989) has shown that chronological (i.e., narrative) presentation of events in a newscast enhances viewers' memory for the events. Schank and Abelson (1995) assert that over time, narratives are remembered as abstractions or "story skeletons." This has implications for how stories affect judgments and attitudes.

A recent study on the effects of narrative processing on memory and attitudes explores these implications. In their research on storytelling effects on judgments about interpersonal relationships, McGregor and Holmes (1999) assert that storytelling has a double meaning. On the one hand, "it implies recounting experiences in a coherent narrative format with the perspective of an audience in mind," (McGregor and Holmes 1999, p. 403). On the other hand, "it can also connote a certain slippage from the realities of the episodes it supposedly portrays, if not a wholesale bending of the facts to create a 'good story'" (ibid, p. 403). This "slippage" of facts to create a good story has implications for the attitudes consumers will hold as a result of hearing a WOM story.

In their relationship research, McGregor and Holmes (1999) examine two potential explanations for how stories influence judgments about who's to blame in a relationship gone awry: biased

memory for story facts and memory for the story gist, defined as the summary abstraction of the story (or story skeleton). While these two mechanisms work together to influence relationship judgments, it is story gist that has the strongest, long-term effect. Long after memory for story facts has faded, story gist still affects judgments about who's to blame in a problematic relationship. This mediation relationship is shown in Figure 1. In terms of WOM stories, biased memory for story facts and recall of story gist should be important mediators of brand attitudes. Study 2 examines the effects of these two mechanisms in the context of a WOM story about a negative experience with a service provider. The study manipulates the focus of the story as well as the length of time between the initial story writing exercise and the assessment of recall and blame. In this way, we can test for the mediational effects of biased recall of story details and story gist in the short-term condition, and story gist alone in the long-term condition.

Narrative Implications for WOM Communications

The proposed narrative structure of WOM communication has implications for some of the previously described consumer research. For example, Herr et al. (1991) find that the vividness of WOM communications leads to its being accessible. Many aspects of narrative structure have an impact on how vivid a WOM communication will be (e.g., overall story quality, compelling characters, captivating plot, etc.). Laczniak et al. (2001) find that causal attributions mediate the effect of (negative) WOM on brand evaluations. Hastie (2003) has argued that stories are the primary mental mechanism for making causal attributions, because stories structure events in goal-oriented action sequences that result in (or cause) particular outcomes. Smith and Vogt (1995) examine how (negative) WOM information is integrated with information presented in advertising. The narrative structure of WOM communications has implications for this stream of research as well. One hypothesis is that a narrative ad, that is, an ad that tells a story, may counteract negative or positive WOM story effects better than another type of ad, for example, one that provides product information in an analytical fashion.

STUDY 1: NARRATIVE WOM STRUCTURE

This study explores the structure of word-of-mouth communication to test our hypothesis that this form of communication is usually organized as a story or a narrative.

Method

Participants. Sixty-two undergraduate students at a large, public, Southwestern university participated in this study to meet an introductory marketing course requirement.

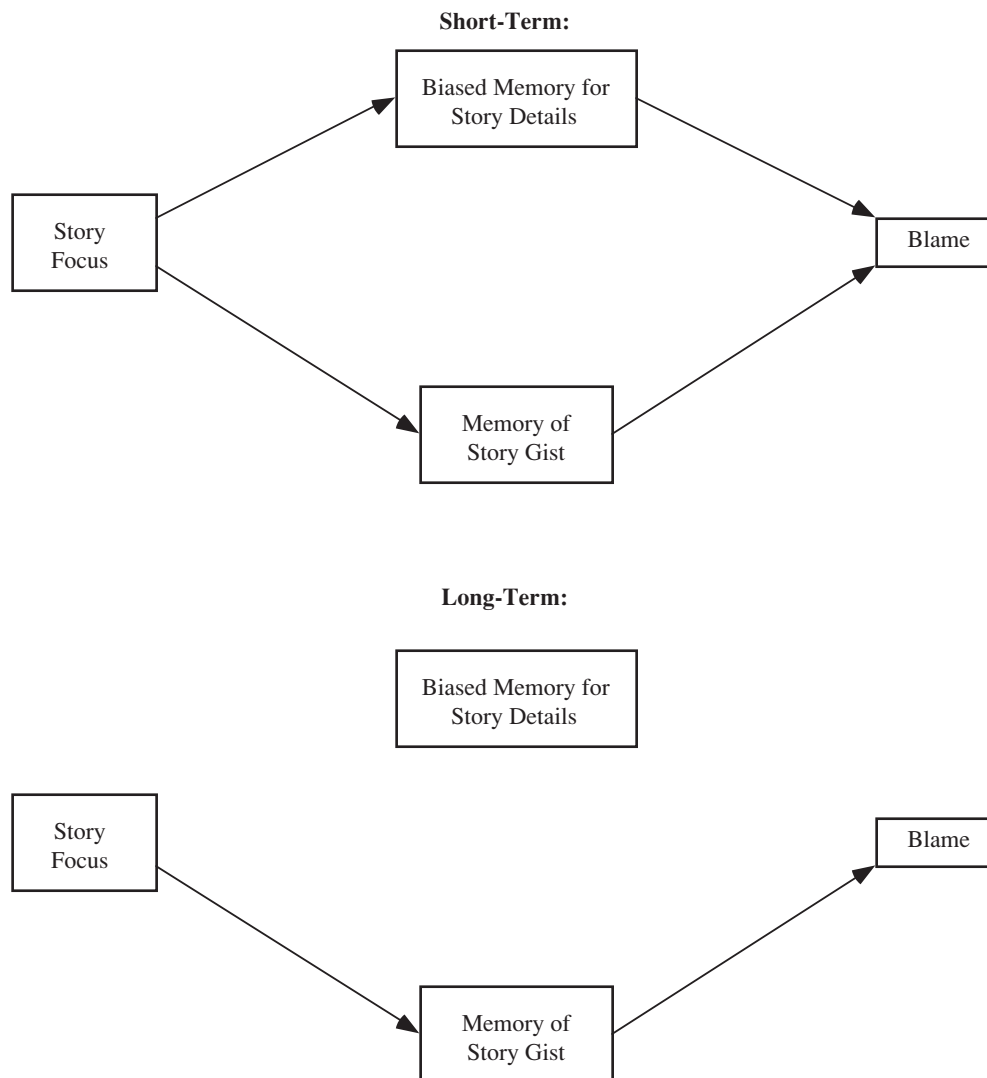

Procedure. First, participants were asked to relate a recent product, service, or brand experience as if they were talking to a friend. The instructions, which emphasized "telling" and "talking" to avoid having participants feel as if they were writing a report, read as follows:

Please tell us about a recent experience you've had with a product or brand. You may prefer to tell us about a recent service encounter you've had, that's fine too. The experience can be either positive or negative, it does not matter. Just take the next few minutes and couple of pages to tell us about the product, brand, or service situation as if you were talking to a friend.

After completing this task, participants were asked to complete a series of questions about both what they had written and the product, service, or brand they had written about. Two coders blind

FIGURE 1

McGregor and Holmes (1999) mediation model of biased recall and story gist on blame assessment

to the hypotheses later coded each participant's product experience (in its entirety) for the degree to which it told a story, using Escalas's (1998) narrative structure scale, described next.

Measuring Story Quality

Beyond the basic structure of narrative, described above, other theories have identified story characteristics that contribute to a narrative's quality, answering the question, "what makes a *good* story?" In one such theory, Bruner (1990) proposes two dimensions to narrative: the landscape of action and the landscape of consciousness. The landscape of action consists of events that are visible to the casual observer: the initiating event, resulting action(s), and outcome(s). The landscape of consciousness allows the reader/viewer to "get inside the head" of the story's character(s). The audience learns what the character is thinking and feeling. According to Bruner, a story with both a landscape of action and consciousness is a better story than one that contains only a landscape of action.

In another theory, Gergen and Gergen (1988) theorize that the dramatic engagement of a narrative depends on the evaluative slope of the story. The events in a story are evaluated over time (as it occurs in the narrative) for the degree to which they improve or worsen the state of the protagonist. Stories that have a steep incline or decline in evaluative slope and those that alternate in sign (e.g., rising, falling, then rising again) evoke the most emotion. The classical tragedy, *Oedipus Rex*, is an example of a narrative with rapidly deteriorating events, from the perspective of the protagonist.

Based on these story quality theories and others, Escalas has developed a six-item narrative structure scale to measure the degree to which an advertisement, or any type of communication, is in the form of a story (1998; Escalas, Burke, and Edell 2004). The WOM communications recounted by the 62 participants were coded by two independent coders blind to the hypotheses, using this six-item scale (see Table 1). Two items appraise the causal relationships explored by narratives (items 1 and 4). One item captures the

TABLE 1
Narrative Structure Coding Scale Items (Escalas 1998)

-
1. To what extent do these thoughts consist of actors engaged in actions to achieve goals?
 2. To what extent do these thoughts let you know what the actors are thinking and feeling?
 3. To what extent do these thoughts provide you with insight about the personal evolution or change in the life of a character?
 4. To what extent do these thoughts explain why things happen, that is, what caused things to happen?
 5. To what extent do these thoughts have a well delineated beginning (initial event), middle (crisis or turning point), and ending (conclusion)?
 6. To what extent do these thoughts focus on specific, particular events rather than on generalizations or abstractions?
-

NOTE: These items are measured on five-point scales, anchored by not at all (1) and very much so (5).

chronology of narrative; that is, whether the ad has a beginning, middle, and end (item 5). Another important element of narratives is character development (item 3). Item 2 measures the extent to which the communication reveals Bruner's "landscape of consciousness." Finally, one item addresses the characteristic focus of narrative thought on particular events rather than generalities or abstractions (item 6).

The six items were averaged for each coder to form one narrative score for each coder for each WOM communication. Each had solid Cronbach alphas (coder 1 $\alpha = .88$, coder 2 $\alpha = .72$). While the two coders' average narrative scores were only moderately correlated ($r = .43$, $p < .001$), they were averaged to form one narrative score per WOM communication (combined $\alpha = .85$). The averaged six-item scale was used as the study's primary independent variable.

Results

Based on the narrative structure coding, the WOM communications averaged 3.43 on the five-point scale, significantly above the midpoint ($t_{61} = 5.95$, $p < .001$). The WOM communications were considered to be well-developed narratives if they scored 3 or more on the combined five-point narrative structure scale (Escalas 1998). By that criterion, 75.8% (47) of the participants' written WOM responses consisted of well-developed stories. Additionally, 48.4% (30) of the responses were equal to or above the more conservative test of greater than or equal to 3.5 on the five-point narrative structure scale. Thus, the preliminary indication is that WOM communications appear to often be in the form of a story. As these numbers indicate, the responses may not be complex novels, but they do have a number of story elements that should have repercussions on how the WOM communications are processed and remembered.

Discussions of Study 1 Results

In sum, it appears that consumer WOM communications typically have many narrative elements and can thus be described as being in the form of a story. However, the written form of this study is a limitation: most WOM communication is transmitted orally, not in writing. The very process of writing down their thoughts may have influenced what participants wrote. While we believe the writing process is more likely to work against creation of a story, in favor of writing a cohesive argument for or against a product, service, or brand, we cannot rule out this alternative

explanation. Future research should include tape recording and coding oral WOM communications elicited in a more naturalistic setting, with more attention given to subsequent thought-coder training to enhance inter-coder reliability.

STUDY 2: MEMORY AND ATTITUDE EFFECTS OF NARRATIVE WOM COMMUNICATIONS

When sharing a certain experience with a product or brand, people normally communicate in the form of a story (Study 1). Memory for story facts and the story gist (the summary abstraction of the story) have been shown to affect the attitude of the listener towards the target of the story (McGregor and Holmes 1999). Study 2 examines the influence of two effects (biased memory for story details and story gist) on WOM story recall and the effect of recall on brand attitudes (more specifically, assessment of blame). In this study, we closely follow the procedure and analyses used by McGregor and Holmes (1999), in the context of a WOM communication about a problematic trip on a popular airline.

Method

Participants. Seventy-six undergraduate students at a large, public, Southwestern university participated in this study to meet an introductory marketing course requirement.

Procedure. This longitudinal study consists of two parts. In Part I, participants were asked to read a vignette about a character named Greg who flew on Delta Airlines on his way back to the university to begin the semester. This simulated hearing a WOM communication from a friend, with the characteristics of being an indirect WOM communication, in a weak-ties situation, presenting second-hand information (Smith and Vogt 1995). The vignette told the story of a trip with a number of problems as well as solutions, with an equal number of positive and negative attributes for both parties (e.g., Greg arrive late to the airport, the Delta connecting flight was delayed). Next, participants listed all the story details that favored Greg on one page, followed by a second page where they wrote the story details that favored Delta Airlines, in order to provide us with an indication of their initial perspective of the story. Then, the students were instructed to write a biased story in favor or against one of the parties, based on what they remembered about the story (half were asked to support Greg, the other half Delta Airlines, regardless of their own personal feelings after reading the vignette). Next, participants were asked whom they blame more for

TABLE 2
Blame Scale Items (McGregor and Holmes 1999)

-
1. Who showed the most reasonable behavior?
 2. Who acted most unfairly?
 3. Who made the most effort?
 4. Who was most responsible for the difficulties?
 5. Who was most at fault?
 6. Who had the most acceptable behavior?
 7. Who was most to blame?
 8. Who had the worse attitude?
-

NOTE: These items are measured on seven-point scales, anchored by Delta Airlines (1) and Greg (7).

the problems that arose in the story, using a eight-item scale developed by McGregor and Holmes (1999; see Table 2). By examining whom participants blamed after writing their biased stories in response to the WOM communication, we are able to determine the influence of the two manners in which story recall affects attitudes (biased memory and story gist) on subsequent blame assessments.

Part II was completed at two different time frames. Approximately one-half of the participants completed Part II eight to nine weeks later, while the other half completed it 17 to 18 weeks later. In Part II, participants are asked to reassess blame, again using the eight-item, seven-point McGregor and Holmes scale (1999), and complete a series of recall and recognition items, described in the next section.

Variables. The eight-item McGregor and Holmes (1999) blame scale has solid reliability in our data ($\alpha_{\text{time one}}=.88$, $\alpha_{\text{time two}}=.91$). In our study, higher numbers on the blame scale correspond to greater blame being placed on Delta Airlines. Additionally, three recall and recognition items were collected in Part II: biased recall, false recognition, and story gist. We asked that participants 1) record all the details they were able to recall from the original story, 2) judge whether ten items were true or false based on the story (all were false), and 3) indicate whether there was anything they remembered particularly well about the story. The recall items were coded for the number of items that favored Greg or Delta Airlines and an index was created by using the residual of the pro-Greg details regressed on the pro-Delta details as a measure of biased recall.¹ Next, five of the false recognition items favored Greg, while five favored Delta Airlines. We created our false recognition variable by taking the residual of false recognition of pro-Greg items regressed on pro-Delta items. Finally, an independent coder blind to the hypotheses assessed the evaluative implications of what participants reported they remembered particularly well about the story. Thus, the value of the story gist variable ranges

from -1 to +1 (-1 if the story gist favored Delta Airlines, +1 if the story gist favored Greg, and 0 if it didn't favor either party).

Covariates. While care was given in creating the vignette to make sure that both Greg and Delta Airlines each contributed equally to the problematic flight scenario, a variable reflecting the initial perspective of each participant was created as a covariate to remove any variance in the data that emerged as a result of a perception that one of the two parties was more at fault than the other. We created an initial perspective index by using the residual of the pro-Greg story details regressed on the pro-Delta story details written by subjects in Part I when they first read the vignette. This covariate is included in all the ANCOVA models conducted for this study.

Results

The basic hypothesis in this study is that biased memory for story details and the story gist remembered will mediate the effect of storytelling on blame assessment in the short-term, while only story gist will mediate in the long-term (see Figure 1). In order to test this hypothesis, we used the Baron and Kenny approach (1986), where to demonstrate mediation, four relationships must hold. First, the focus of the story written by each participant must have a significant effect on whether that participant primarily blamed Greg or Delta airlines for the problems that occurred. Unfortunately, we only find directional support for an effect of story focus on blame (pro-Greg=5.21, pro-Delta=4.94, $F(1, 71)=2.35$, $p<.07$, one-tailed). However, even when the first step in testing for mediation is not statistically significant, the possibility still exists for an indirect effect of story focus on blame assessment through biased memory of story details and story gist. To test for an indirect effect, we look the second and third relationships described by Baron and Kenny (1986). The second relationship is that story focus must affect the two biased memory variables (biased recall and false recognition) and story gist. While we find a significant effect of story focus on story gist ($F(1, 44)=2.81$, $p<.05$, one-tailed),² we do

¹We conducted square root transformations on all the variables contributing to the aggregate indices to normalize their potentially skewed distributions before the indices were calculated.

²Only 44 of the 76 participants completed the story gist questionnaire item, 77% in the short-term condition and 47% in the long-term condition.

FIGURE 2
Interaction of Time Frame and Story Gist on blame assessment

not find an effect of story focus on either biased recall ($F(1, 75)=1.0$, $n.s.$) or false recognition ($F(1, 74)<1.0$, $n.s.$). Thus, we do not replicate McGregor and Holmes's (1999) biased memory findings in this consumer WOM context.

We find that story focus has an indirect effect through story gist on blame assessment. When added to the model of story-focus on blame, story gist remains significant ($F(1, 44)=2.98$, $p<.05$, one-tailed), while story focus does not ($F(1, 44)<1.0$, $n.s.$). Furthermore, the indirect effect of story focus on story gist on blame is significant ($Z=2.12$, $p<.05$; Kenny, Kashy, and Bolger 1998). We also find a significant interaction effect of time frame (short-term versus long-term) by story gist on blame ($F(1, 44)=4.60$, $p<.05$). Figure 2 presents these results graphically, using a median split of story gist to dichotomize the data (story gist median=-1.0). Consistent with the idea that while biased memory effects fade over the long-term, story gist does not, we find that story gist has a greater impact on the extent to which participants blamed Delta in the long-term condition than in the short-term condition. Simple main effects reveal that the difference within long-term is significant ($F(1, 44)=2.75$, $p<.05$, one-tailed) and the effect within very pro-Delta story gists is marginally significant ($F(1, 44)=2.20$, $p<.07$, one-tailed). The other two contrasts are not significant ($F_s<1.36$, $p>.25$).

Discussion of Study 2 Results

While the story gist results found in Study 2 are encouraging, the results for biased memory are disappointing. Our goal was to demonstrate that while WOM story gist affects blame assessments in both the short-term and the long-term (supported), biased recall of WOM story elements only has an effect in the short-term (not supported). We believe our lack of results stems from two problems in our study. First, lack of subjects limits our power to detect mediation. For example, in the long-term condition, only 27 individuals answered the story gist question, 14 in the Greg-focused story and 13 in the Delta-focused story conditions. Second, the length of time between sessions is too long for the attention span of our student subjects. McGregor and Holmes (1999) used three conditions: two weeks, six weeks, and 40 weeks. We used eight weeks and 18 weeks. There are other indications that the subjects were not engaged in the task over the experimental time frame. For example, the average number of pro-Greg and pro-Delta thoughts

recalled at time 2 are only one apiece (averaging over both the short-term and long-term conditions).

Future research could modify the approach used in this paper. First, it would be advisable to shorten the short-term condition to two weeks and the long-term condition to 10 weeks. Our student subjects should be able to recall something of the WOM story over two weeks, but will also most likely forget the story details (except the story gist) in 10 weeks time. In addition to blame assessments, it would also be beneficial to include the marketing variable brand attitude, since this is the standard measure of whether or not consumers like a brand in our field.

CONCLUSION

This stream of research is a first step towards increased understanding of WOM communication. The results of Study 1 reveal that WOM communications are often in the form of a story. With this information, we can apply theoretical insights on how narratives are processed, recalled, and used in attitude formation towards understanding what happens in consumers' minds when they are exposed to other consumers' WOM communications. For example, our results for Study 2 indicate that even when there is little to no biased memory for story events, story gist mediates the effect of the focus of a WOM story on subsequent attitudes about the story's characters and/or brands. Thus, it will be important to examine how story gist memories are formed, stored in memory, and instantiated in subsequent consumer contexts.

Directions for Future Research

In addition to the future research described throughout the paper, future studies should expand on our understanding of the interactive effects of WOM stories and advertising. As we noted above, marketers cannot directly affect WOM communications. However, they do control the content and structure of their advertising campaigns. Therefore, our future research goal is to apply what we have learned about WOM memory mechanisms to how consumers, who have heard WOM stories, interact with advertising for a given company or brand. This research will build on the work of Smith and Vogt (1995), who have examined order effects in information learned sequentially from WOM and advertising. They find that when the ad is processed first, it inoculates consumers

against future negative WOM communication, and when the ad is processed second, it can help attitudes and retentions recover from the negative WOM information presented earlier. In this paper, we have presented some preliminary evidence that WOM communication is narratively structured and that over the long term, only story gist is recalled and therefore is able to influence attitudes. It would be interesting for future research to investigate how story gist interacts with ad information presented in the form of a story (i.e., narrative ads), compared to ads that present information in a more analytical fashion (e.g., drama versus lecture ads, Wells 1988).

Living in Another World: The Role of Narrative Imagination in the Production of Fantasy Enclaves

Athinodoros Chronis, California State University, Stanislaus
Ronald D. Hampton, University of Nebraska-Lincoln

EXTENDED ABSTRACT

While there are multiple manifestations of consumers' imagination in the marketing literature, very little is known about its nature and the role that it plays in consumption experiences. The purpose of this paper is to investigate the concept of imagination, especially as it relates to the construction of alternative consumption realities or what Belk and Costa (1998) call "fantastic consumption enclaves." In this regard, we address two pertinent issues that are of interest to consumer researchers. First, we explore *the nature of consumer imagination* in consumption experiences and second, we provide insight into *the role that imagination plays* as a source of pleasure and as an indication of consumers' playful, voluntary participation in experiential consumption.

Two major existing streams of literature are identified. First, mental imagery research (Atwood 1989; Childers and Houston 1983, 1984; Gutman 1988; Mitchell 1986) treats consumer imagination as an information-processing mode that, compared to non-imagery processing, can be a strong mnemonic device and enhance incidental learning (MacInnis and Price 1987). In general, the more vivid the image of a stimulus, the stronger the effect on memorability and cognitive structure will be (Kisielius and Sternthal 1984). Since imagery processing assists elaboration and product visualizations, it can render product use more likely, consumption events more probable, and consequently, it is argued that it can have a positive effect on decision strategies, purchasing intentions, and satisfaction (MacInnis and Price 1987, 1990). This research tradition conceives mental images as "static pictures" that more or less vividly reflect the external reality. Also, it is restricted in the images of certain objects, sounds or smells, de-contextualized from their larger environment. The more encompassing mental activity of elaboration that is subsumed under the same literature does not evade these limitations, since new images are treated as pieces of information that are added to the existing imagery structure in order to provide a better "static picture" of the stimulus object and enable consumers to make more informed decisions. While the information processing view of consumption has greatly enriched marketing thought, it is mostly focused on consumer decision making and thus, it falls short in addressing experiential modes of consumption like tourism, leisure, and various playful activities.

On the other hand, the phenomenological tradition treats imagination as an entity separate from the external sensation, constituting an experience by itself (Giorgi 1987). In this respect, it addresses some of the problems encountered by the mental imagery perspective. This perspective is in accordance with the experiential view of consumption (Hirschman and Holbrook 1982; Holbrook and Hirschman 1982), where imagination is seen as a form of human experience. However, there is no work that examines how imagination as an experience plays out in consumption contexts. Both of the above perspectives seem incomplete in addressing the phenomenon of imagination during consumption experiences and its role in constructing fantasy worlds.

Ethnographic research was conducted at Gettysburg, one of the most significant Civil War sites in the United States. Not only does Gettysburg attract the largest number of visitors from all other war sites in the United States, but it also provides an ideal context to study consumers' interaction with a world that is 140 years in the past, during the most fierce civil war battle ever waged in the

western hemisphere, and with a major role to play in the future conception and structure of the nation. Data collection methods included 75 personal interviews with 121 visitors, business owners, managers, and licensed guides, participant and non-participant observation, and photo-elicitation.

The findings show that consumers' imagination is an essential element of the visitors' experience and it operates in assisting consumers' to visualize scenes of the past, to vicariously participate in the battle, and to experience what it feels like to live in the past. In addition, this imagination extends beyond a visual picture" into all the forms of sensory experiences: acoustic, olfactory, tactile, and gustatory. Consumers are able to hear noises, smell odors, and feel the mid-summer heat penetrating their skin. Under this property, their imaginings include the environmental conditions and they offer a holistic view of life in the past, rather than an isolated "image." In this sense, consumers' imaginings imitate life. Imagination includes *actors* (people lived in the past) who *perform acts* (fight, charge, being killed) at specific *scenes* (authentic locations). Actors, acts, and scenes are intertwined in consumers' imagination in a dynamic whole. Thus, their imagination is not restricted to a static, visual picture. Rather, it is an encompassing, moving scene that develops like a narrative: from a beginning, through a middle, to an end (Ewick and Silbey 1995). In addition, this dynamic nature of imagination is life-like: it imparts sensory elements in the form of "believed-in imaginings" (Sarbin 1998). It is this dynamic character of consumer imagination that differentiates it from previously discussed notions of a mental image and makes it dramatic. It is this dramatic perspective of what visitors visualize that renders their imagination a *narrative imagination*.

Our data illustrate that one impact that narrative imagination has on the consumption experience is in providing consumers a better understanding and a deeper insight into the life of the past. Furthermore, narrative imagination assists consumers to connect with the past. We define *connection with the past* as a deeper cognitive and emotional understanding of life in the past according to which someone vicariously experiences what it must have been like to live in the past. What is very characteristic about this experiential state is that during certain moments *the past becomes alive*. Data collected at Gettysburg show that during these moments "people come up closer to the actual event" and that the whole experience "brings you closer to what has happened."

Marketers can perceive this connection as a major payoff for the consumption of products related with the past. It is this connection that brings consumers close to events that happened hundreds or thousands of years ago and endows them with value. In a more generalized sense, consumer imagination operates as a time machine (Anderson 1982, 1984) that transfers consumers into alternative worlds and makes them "really, really real" (Brown, Hirschman, and Maclaran 2000).

Self-Brand Connections: An Exploratory Study into Construct Validity and Gender Effects

David J. Moore, University of Michigan

Pamela Miles Homer, California State University, Long Beach.

EXTENDED ABSTRACT

The fundamental premise of the Self-Brand Connection construct is that when brand associations are used to construct one's self or to communicate one's self to others, a strong connection is formed between the brand and the consumer's self identity (Escalas 2004). The purpose of this study was threefold: first, we test the reliability and the validity of the Self-Brand Connection Scale (Escalas 1996; Escalas 2004), designed to measure such types of self-brand associations. The second objective was to examine the extent to which self-brand connections are positively related to brand evaluations as well as the interesting concept of attitude strength (Krosnick and Schuman 1988; Krosnick et al. 1993). Lastly, we test the impact of the Self-Brand Connections scale within the context of a *gendered* brand. For this purpose we selected the Women's National Basketball Association (WNBA), a sub-brand of the parent brand, the NBA. This brand has been strategically crafted to appeal to female consumers and thus provided an ideal opportunity to examine whether females will show stronger self-brand connections for this type of brand than their male counterparts.

Hypotheses

- H1: *Self-brand connections are positively related to brand evaluations.*
- H2: *Females will exhibit higher self-brand connections relative to their male counterparts.*
- H3: *Self-brand connections are positively related to attitude strength.*
- H4: *Higher self-brand connections will enhance brand evaluations and attitude strength for both males and females, but the incremental contribution of increased connections will be greater for females when evaluating a female-gendered brand (i.e., there will be a significant interaction between self-brand connections and gender on brand evaluations and attitude strength).*

Method and Results

Two separate (survey) studies (N=150 and N=260) measured brand evaluations (i.e., brand attitudes and brand beliefs), Self-Brand Connection, and attitude strength.

First, the results (using Confirmatory Factor Analysis, Lisrel 8.53) showed that a single factor structure representing the Self-brand Connections scale emerged in both studies and factor item loadings were impressively high. Nevertheless, relatively low AVEs (average variance extracted) seemed to indicate that the self-brand connections construct may be in need of further refinement. Attempts to establish discriminant validity suggest that the self-brand concept was differentiated from brand attitudes only in the second study.

Second, the results confirm that self-brand connections are positively related to *brand attitudes* and *brand beliefs*, a finding that is consistent with the work of Escalas (2004) who provided a conceptual basis for the distinction between self-brand connections and brand attitudes. She points out that whereas consumers may agree that a certain brand possesses a high level of quality, that brand itself may not be linked to one's self concept and may therefore receive a low self-brand connection rating. Our study has

therefore provided some degree of support for the discriminant validity of the self-brand connections construct.

Third, self-brand connections showed a very strong relationship to *attitude strength* (Krosnick and Schuman 1988; Krosnick et al. 1993). According to Krosnick and Petty (1994), strong attitudes tend to be: (a) persistent over time, (b) resistant to change, (c) likely to have strong impact on information processing, and (d) more likely to have a strong impact on behavior. If this relationship between self-brand-connections and attitude strength is valid, one should predict a range of important hypotheses in future research. For example, consumers with strong self-brand connections should be characterized as having more persistent attitudes to their favorite brands and these attitudes may be more resistant to change. Consequently, these consumers may therefore be more loyal to the brand that is closely linked to their self-concept.

Fourth, *Gender Differences in Response to the 'Gendered Brand*. Females exhibited higher self-brand connections relative to their male counterparts. Higher self-brand connections did enhance brand evaluations and attitude strength for both males and females, but the incremental contribution of increased connections was greater for females when evaluating the female-gendered brand. In other words, there was a significant interaction between self-brand connections and gender on brand evaluations and attitude strength. These findings showing a linkage between the female *gendered* brand and the female respondents of this study are consistent with the notion of a 'match' or 'gender fit' reported in previous research on the 'matching' requirements for celebrity effectiveness (e.g., Kahle and Homer 1985; Kamins 1990).

Future Directions

Our results regarding the relationship between self-brand connections and gender represent an important contribution to the emerging literature on self-brand connections (Escalas 2004, Escalas and Bettman 2003) and other areas of brand attachment (Fournier 1998). The most obvious extension would be a study whereby *product gender* is manipulated to determine if both males and females form self-brand connections to gendered brands, which in turn enhance brand evaluations and attitude strength. If the 'gender match' we found for females is robust, males should exhibit stronger self-brand connections to a male 'gendered' brand, which in turn, impact brand evaluations. More basically, future research may investigate whether for certain types of brands, self-brand connections may be stronger for one gender versus the other. As mentioned above, research on self-brand connections might also focus on attitude strength and its relationship to brand loyalty.

Nonverbal Cues-based First Impressions: What Can Static Images of Salespeople Tell Us About Their Success at Selling?

Rebecca E. Walker, The University of Texas at Austin
Rajagopal Raghunathan, The University of Texas at Austin

EXTENDED ABSTRACT

On average, people rely on nonverbal cues than on verbal cues in interpersonal exchanges (Burgoon, Buller, and Woodall 1996). The impact of nonverbal cues appears particularly potent in the context of first impressions (Ambady and Rosenthal 1993; Riggio and Friedman 1986). Given the widely accepted belief that first impressions created by a salesperson lay the foundation for all subsequent interactions with a customer (e.g., Jacobs et al. 2001; Macintosh et al. 1992), it is important to assess the generality of this phenomenon in the context of customer-salesperson interactions, that is, whether and to what extent, nonverbal cues influence customers' first impressions of salespeople. We address three questions pertaining to nonverbal influences on judgments of salespeople: (1) are nonverbal cues-based impressions formed only after lengthy and meaningful interactions with salespeople or can they be formed on the basis of brief or even fleeting interactions (e.g., through exposure to photographs of the salespeople)?, (2) is the impact of nonverbal cues on first impressions independent of the physical attractiveness of the salesperson?, and, finally, (3) do salespeople who create good (vs. bad) first impressions (on the basis of their nonverbal behavior) turn out to be more successful at selling?

Based on our review of recent relevant research, we propose the following hypotheses:

- H1:* Nonverbal cues embedded in static images of targets offer sufficient basis for making evaluative judgments about the targets.
- H2:* The influence of nonverbal cues embedded in static images on target judgments will be independent of physical attractiveness of the target.
- H3:* Nonverbal cues-based judgments will be significantly correlated with real-world measures of target performance
- H4:* The influence of nonverbal cues on judgments takes place outside the awareness of the individual making them.
- H5:* The valence of initial nonverbal cues-based judgments of salespeople will color judgments of the salespeople's subsequent behavior.

In this paper, we conduct two experiments to examine these issues. In the first experiment subjects were asked to judge the personality and likelihood of success of salespeople based only on static images of the salesperson. These judgments were then correlated with assets under management (an objective measure of actual sales success). Ratings of target attractiveness were also obtained. Results from this experiment indicate that: (1) exposure to even a static image of a salesperson is sufficient to evoke judgments, (2) these judgments are independent of the physical attractiveness of the salesperson, and (3) judgments based on nonverbal cues are accurate in the sense that they are significantly correlated with the real-life success of the salesperson (r for global personality variable = .35, $p < .01$; r for overall salesperson variable = .31, $p < .01$).

In the second experiment, subjects were first asked to judge the personality of the highest and lowest rated salespeople from experi-

ment 1. In the second stage, both groups of participants participated in a distracter task (unrelated to this experiment) intended to eliminate short-term memory for the exact target judgments but not to eliminate the valence of the initial impression. In the third stage, participants read a paragraph—adapted from Srull and Wyer (1979) and designed to be ambiguous with respect to the hostility of the target—that detailed the targets' purported interaction with an acquaintance. It is important to note that both groups of participants read the same paragraph. After reading the paragraph, participants judged the target's hostility. Consistent with our prediction (hypothesis 5), the target who elicited more favorable nonverbal cues-based judgments was judged as less hostile than the target who elicited less favorable nonverbal cues-based judgments (M 's = 5.97 and 2.58, $t(68) = 5.08$, $p < .05$).

These results suggest that people interpret a target's behavior in a manner consistent with initial impressions formed on the basis of the target's nonverbal cues. Our findings are thus consistent with recent findings (e.g., Ambady and Rosenthal 1993) and also contribute to the literature on nonverbal influences in the following significant ways.

The finding that target judgments can be made on the basis of nonverbal cues embedded in just physical appearance cues (hypothesis 1), in conjunction with the finding that first impressions color subsequent judgments of the target (hypothesis 5), raises the possibility that judgments made on the basis of dynamic nonverbal cues—documented in earlier research (e.g., Ambady and Rosenthal 1993; Dabbs et al. 2001; Gangestad et al. 1992)—may have been driven primarily by nonverbal cues embedded in the physical appearance (vs. kinesic) channel. That is, our results suggest that the very first judgments of targets are made on the basis of the target's physical appearance and that all subsequent impressions of targets are colored by this initial impression.

A second theoretical contribution of our research stems from establishing the independence of the influence of nonverbal cues from that of physical attractiveness of the target. Results from both experiment 1 of this research indicate that whatever advantages the better looking targets may derive from their looks, these effects are independent of the influence of the nonverbal cues embedded in their physical appearance, as evidenced by the finding that the relationship between personality judgments and real-life success at selling was not mitigated by the addition of physical attractiveness of the target as a covariate.

Our final theoretical contribution is the proposal of a nonconscious halo effect mechanism as an explanation for the accuracy of nonverbal cues-based judgments in this research. In our view (see hypothesis 5) the initial impressions of targets bias subsequent target-judgments, thereby producing a spurious correlation between the two.

Consistent with our hypothesis (hypothesis 4), results from experiment 1 indicate that the influence of nonverbal cues on judgments takes place outside the awareness of the individual making the judgments. Participants were asked to make, on the basis of nonverbal cues, two types of judgments about targets: personality and likelihood of sales success. Since the latter judgment is a higher-order judgment, we should expect to see differences in the predictive validity of these judgments if the process by

which nonverbal cues are used to make judgments is deliberate. Our results indicate, however, that both judgments were equally accurate in predicting the actual success at selling. More direct evidence in support of our hypothesis was obtained in experiment 2, results from which showed that initial impressions formed on the basis of nonverbal cues biased interpretation of the target's purported subsequent behavior.

A Social Perception View of Business Relationships in the Service Sector

Joachim Vosgerau, INSEAD

Erin Anderson, INSEAD

William T. Ross, Jr., Pennsylvania State University

EXTENDED ABSTRACT

Current theories of business relationships—for example the buyer-seller relationship model (Dwyer, Schurr, and Oh 1987)—characterize these relationships in terms of characteristics such as trust, commitment, mutuality, flexibility, information exchange etc. Differences in these characteristics within a dyad, for example two parties being unequally committed to the relationship, are then thought of as providing the basis for opportunism, power differences, and the incentive to employ safeguarding mechanisms. It is implicitly assumed that even though parties do not necessarily display the same levels of relational characteristics, they know the true level of relational characteristics of the counterpart. In other words, the parties involved are accurate in their perception of the other party's level of commitment, trust, information exchange, etc. But is this assumption justified? Social psychology has produced powerful demonstrations of how inaccurate people are in their perceptions, leading to poor forecasting of the behavior of others.

In this paper we investigate the effects of perceptual (in)accuracy in dyadic business relationships. Drawing from social perception theory, we propose that business partners a) do not necessarily accurately perceive their counterpart, and that parties b) personify their counterpart. Personification means they form the counterpart's image as if it were a person, not an organization. In other words, the other party (organization) is described in terms of personality traits such as "reasonable," "trustworthy," "forgiving," "consistent," or "flexible." The level of perceptual accuracy then influences how favorable the counterpart's image will be, and how much goal congruence will be experienced with the counterpart. Perceptual accuracy influences the counterpart's image and goal congruence through two psychological mechanisms: surprises (positive and negative), and self-fulfilling prophecies (positive and negative).

We will start with the easy case, that is party A is accurate in the perception of party B. In other words, party A correctly perceives party B as—for example—highly committed. This will lead A to form a positive image of B and to experience a high degree of goal congruence with B. Alternatively, party A may perceive party B correctly as little committed. This will certainly have negative consequences, leading A to form a less favorable (negative) image of B and to experience less goal congruence. What about when A is inaccurate in its perception of B?

Again, there are two ways that A can perceive B's commitment level inaccurately. First, A thinks B is highly committed when B is not: A is *overly optimistic*. In this case, A will on the one hand often be negatively surprised by B because B does not live up to A's expectations. On the other hand, the self-fulfilling prophecy mechanism causes A to behave in ways that induce expectation confirming behavior on B's part, that is high commitment behavior. What will be the effect on the image A forms about B? In general, negative information is weighted heavier than positive information, and hence the negative surprises are likely to outweigh the positive consequences from the self-fulfilling prophecy mechanism. Hence, when A is *overly optimistic*, A is likely to form a negative image of B and to experience little goal congruence with B.

Alternatively, A thinks B is not committed when B is highly committed: A is *overly pessimistic*. In this case, A will on the one hand often be positively surprised by B because B often exceeds A's

expectations. On the other hand, the self-fulfilling prophecy mechanism causes A to behave in ways that induce expectation confirming behavior on B's part, that is low commitment behavior. What will be the effect on the image A forms about B? Again, since negative information is weighted heavier than positive information, the negative consequences of the self-fulfilling prophecy mechanism are likely to outweigh the positive surprises. Hence, in the case A is *overly pessimistic*, A is likely to form a negative image of B and to experience little goal congruence with B.

Concluding, regardless in which direction A is inaccurate in its perceptions of B, this inaccuracy has negative effects on the image A forms about B and the goal congruence A experiences with B. In contrast, an accurate perception of the counterpart improves the image and experienced goal congruence, unless one party perceives the other party correctly as low in commitment, investment in the relationship etc. Perceptual accuracy of course regards all aspects of a relationship, not only commitment, but also trust, mutuality, etc.

In turn, the image a party holds about the counterpart, and the goal congruence experienced with the counterpart, act like a frame for subsequent behavior. That is, if one holds a positive image of the counterpart and experiences a high degree of goal congruence, little conflict will arise and the relationship will prove economically rewarding. If in contrast, one holds a negative image of the counterpart and little goal congruence is experienced, conflict is preprogrammed and the relationship is not profitable.

We test this social perception view of business relationships in the insurance sector, using dyadic data from 242 pairs of independent insurance agents and their underwriters. A non-recursive system of equations is estimated using seemingly unrelated regression estimation. The results indicate that inaccurate perception of the counterpart can indeed damage the relationship by decreasing the sense of goal congruence experienced and by creating a negative persona of the counterpart. These factors in turn increase conflict and lower the profits of either side of the dyad. Thus, insurers and agents alike benefit from realistic assessments of each other's relational behaviors and intentions: perceptual accuracy is rewarded in the marketplace.

Effect of Cultural Distance on Customer Service Satisfaction: A Theoretical Framework and Research Agenda

C. Fritz Reichert, The Reichert Company
Tripat Gill, Case Western Reserve University

The topic of customer service satisfaction (CSS) has received extensive attention in the marketing literature, motivated by the fact that when customers perceive a high level of satisfaction they become repeat customers, and that also helps a firm attract new customers through word-of-mouth. Even small increases in CSS can have a significant positive impact on a company's profits because satisfied customers tend to increase their amount and frequency of spending, while the marketing costs of retaining these customers are much lower than acquiring new ones (Dawkins and Reichheld 1990; Fornell and Wernerfelt 1987; Payne and Rickard 1993; Reichheld and Sasser 1990; Rose 1990). Several researchers have thus focused on identifying the key drivers of CSS (e.g. service performance and service expectations models of Oliver, 1997 and Zeithaml, Berry, and Parasuraman, 1993) and potential moderators to this process (cf. Smith, Bolton, and Wagner, 1999 for the relative effect of service interactions vs. service outcomes).

That being said, within the existing literature on CSS, relatively little research has focused on the effect of culture on service satisfaction (see Winsted 1997 and Stauss and Mang 1999 for exceptions). This seems to be a striking deficiency given that in the contemporary multi-cultural society of North America and the increasingly global presence of business firms, a service provider is often confronted with customers from different cultural and ethnic backgrounds. Cultural differences often cause miscommunications, and conflicts are more likely when the two cultures are very different than when they are similar. Technically, this difference is called "cultural distance" (Triandis 2000). In the context of services, cultural distance can affect satisfaction in two ways. Firstly, since customer expectations are culturally based, cultural distance between the customer and provider can affect the evaluation of service performance. Secondly, in the case of service failures, either due to the disconfirmation of expectations or due to the actual service performance, customers may attribute the causes of failure differently depending on their culture. For instance, it has been found that customers from individualist (western) cultures tend to attribute failures more to the service provider; whereas, those from collectivist (eastern) cultures tend to attribute failure to the service context or situation (Krull 1993). The latter difference in attributions would affect service satisfaction.

Thus, adapting the policies and systems to fit the expectations and dispositions of culturally diverse customers can help global service firms (e.g. airlines) achieve a higher level of service satisfaction. Similarly, understanding the effect of culture on service satisfaction would also aid local firms operating in the North American context of customers from diverse cultures and ethnicities. Finally, understanding the responses and biases of culturally diverse constituencies also has broader policy implications for government and community services.

Stauss and Mang (1999) were the first to empirically investigate the role of culture in the context of services. They found that the cultural distance between the service provider and the customer had a significant impact on CSS. Specifically, they found that customers from Germany, the United States, and Japan, while traveling with the same international airline, had significant differences in their satisfaction with the service provider (i.e. airline staff). Stauss and Mang suggested that the differences in the culturally biased service expectations of the customers, and their

subsequent attributions of the service providers' responses, might have been a cause for these discrepant findings. However, they did not investigate the underlying mechanisms and the cause for these differences in CSS in inter-cultural service encounters.

In this paper, building on the initial findings in inter-cultural service encounters, we present a theoretical framework for explaining how CSS is affected by cultural distance between the customer and the service provider. We propose a theoretical model to investigate the effect of culture on consumer's responses to service failures and the ensuing effect on their satisfaction judgments. To empirically test the model we propose a unique quasi-experimental, web-based research design. The design employs a projective technique wherein respondents view hypothetical scenarios of service failures occurring in a restaurant. The scenarios manipulate the cultural background of the service provider and assess the impact of cultural distance on customers' responses to these failures, and the resulting effect on CSS. We also propose to investigate the moderating effect of the type of service failure (outcome vs. process) and service context (strong vs. weak) on the customer's response to service failure. To make the scenarios more realistic, and thus increase the validity of the research, multi-media stimulus material (viz., video clips of hypothetical service encounters in a restaurant) will be used in contrast to conventional paper-and-pencil studies that employ text-based scenarios. These multi-media stimuli will be integrated with an on-line questionnaire, and the entire study is to be conducted via the Internet.

In the sections to follow, the model and a set of hypotheses pertaining to the effects of cultural distance on CSS in service encounters are first presented. Thereafter, the research design is discussed in detail, including methodology, sampling procedure, factor manipulations, and the development and pre-testing of the multi-media stimulus materials. Finally, we discuss the managerial implications and theoretical contributions of our research agenda.

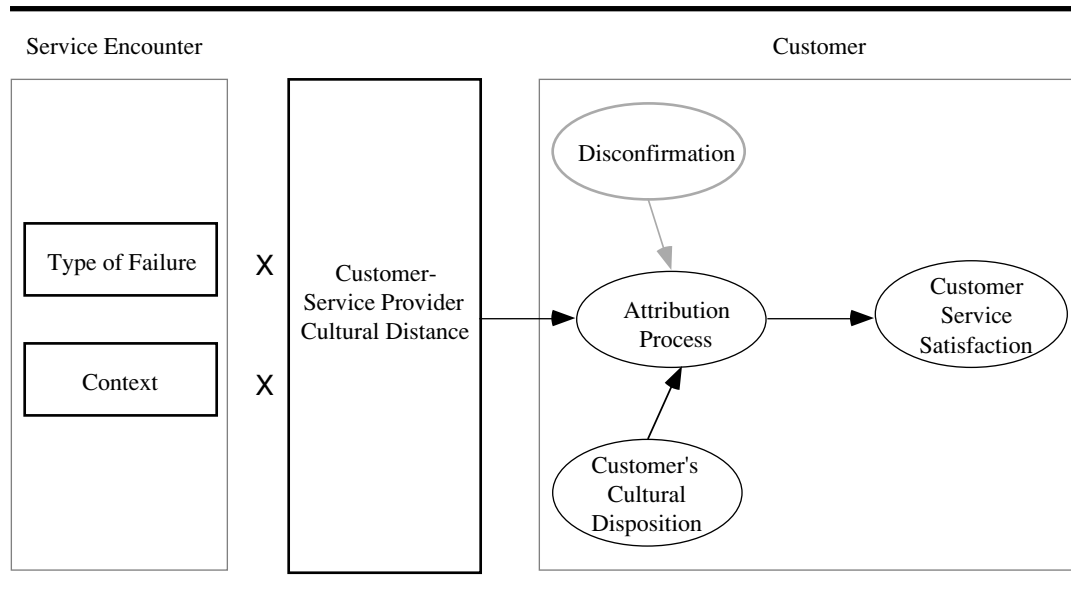

THEORETICAL FRAMEWORK

Theoretical Model and Hypotheses

Figure 1 depicts our model for understanding CSS in inter-cultural service encounters. We propose to investigate the model in the context of service failures and show how the customer attribution process mediates the effect of cultural distance on CSS. In other words, we contend that when a service failure occurs in inter-cultural service encounters, CSS depends on the extent to which a customer attributes the failure to the service provider.

In our model we propose that when the cultural distance is large (e.g. an Anglo-American customer interacting with a Hispanic waiter in a restaurant), service failures would elicit more situational attributions (e.g. blaming failures on the cultural disparity with the service provider) than dispositional attributions (e.g. blaming failures to the person). In contrast, when cultural distance is small there are more dispositional attributions than situational ones. Thus, it can be expected that CSS would be positively related to cultural distance. The model also suggests that the attribution process would be affected by the culturally biased dispositions of the customer. Specifically, while customers with idiocentric dispositions (from individualist cultures, like Americans) who tend to use traits in describing other people (Duff and Newman 1997)

FIGURE 1
Theoretical Model for the Effect of Cultural Distance on Customer Service Satisfaction

Note: The “X”s denote interaction effects of *type of service failure* with *cultural distance*, and *service context* with *cultural distance*.

would focus on internal dispositions in making attributions (Menon, Morris, Chie, and Hong 1999), those with allocentric dispositions (from collectivist cultures, like Hispanics) would make attributions using the context, the situation, and group dispositions (Choi, Nesbett, and Norenzayan 1999). Finally, also included in the model are the potential effects of variables specific to the service encounter, namely the type of service failure (process vs. outcome) and, the service context (weak vs. strong). The model suggests that these two factors would interact with cultural distance to either enhance or attenuate situational versus dispositional attributions, and thus have a moderating effect on the resulting CSS. To be consistent with the literature, the model also includes the effect of expectancy disconfirmation (i.e. the differences between customer expectations and the actual performance) on CSS (cf. Oliver 1997). However, that is not the focus of this model and is only employed to control for variations in CSS due to differences in customers’ a-priori expectations.

Each of the different constructs included in the model is now elaborated upon, and hypotheses for their effect on the attribution process and on CSS are proposed.

Effect of Cultural Distance on CSS

Service satisfaction (or dissatisfaction) is the customer’s response, based on his/her personal judgment, that a service encounter provided a pleasant (or unpleasant) experience (Oliver 1997). A service encounter is a period of time during which a customer directly interacts with a service (Shostack 1985), and with a few exceptions, always involves an interpersonal, interaction between a customer and a service provider (Norman 1991). Since service encounters are interpersonal social encounters, a customer’s personal judgment of satisfaction or dissatisfaction is based on rules and expectations that vary from culture to culture (McCallum and Harrison 1985; Czepiel 1990). A customer therefore attaches meaning to a service encounter by comparing it to his/her culturally based standard or expectation.

Culture is a shared meaning system. It is a learned phenomenon that simultaneously determines the perceptions of an individual and affects his/her behavior. Customers and service providers can each be expected to automatically act in ways that are specific to their respective cultures. Cultural differences between customers and service providers can often cause miscommunications and conflicts, due to the differences in their culturally biased norms and scripts of appropriate behavior. Such conflicts are likely to be greater when the two cultures are very different than when they are similar, referred to as “cultural distance” (Triandis 1994). While Hofstede (2001) classifies cultures along five dimensions (individualism/collectivism, masculinity/femininity, power distance, uncertainty avoidance and time orientation), according to Triandis (1996) the individualism-collectivism syndrome appears to be the most significant cultural difference among cultures. As per Triandis (2001), Shweder and Bourne (1984), and Mills and Clark (1982) individualist societies (i.e. “Western” societies) value personal initiative, autonomy, leadership, and achievement over social harmony, conformity, cooperation, and tradition. Individualist societies also give priority to personal goals over the goals of in-groups and people behave primarily on the basis of their attitudes rather than the norms of their in-groups. On the other hand, collectivist societies (i.e. “Eastern” societies) value social harmony, conformity, cooperation, and tradition over personal initiative, autonomy, leadership, and achievement. Collectivist societies are especially concerned with relationships and people are interdependent within their in-groups, give priority to the goals of their in-groups, and shape their behavior primarily on the basis of in-group norms. The latter aspect of cultural differences (i.e., individualism-collectivism) would be the focus of our conceptualization of “cultural distance” between the customer and the provider in inter-cultural service encounters.

Beginning with Winsted’s (1997) observation that customers from different cultures evaluate services differently, Stauss and Mang (1999) hypothesized that “problematic encounters” would be

more frequent among inter-cultural service interactions involving a large cultural distance between customer and service provider than among those involving a small cultural distance. They tested their hypotheses by conducting an empirical study with German, Japanese, and American passengers during the airport check-in process in Tokyo, Frankfurt, and Atlanta. The results of their study were in direct opposition to their hypotheses. They concluded that, "In the study, negative critical incidents do not prevail among inter-cultural encounters but—against all expectations—among intra-cultural encounters" (p. 340).

To explain their discrepant findings, Stauss and Mang (1999) conjectured that the higher level of service satisfaction in inter-cultural service encounters might be explained by considering the effect of cultural distance on the expectancy disconfirmation (ED) process. Customer service expectations are established based on the customer's cultural standards. It is against those standards that expectations are established, and against which actual service is compared in the ED process. With small cultural distance, the customer may feel that the service provider should know his/her standards and therefore feel that the service provider should provide service accordingly. With large cultural distance, however, the customer may feel that performance failure by a service provider is partly due to a mismatch between his/her cultural standards so that the service provider did not know the a-priori standards in the customer's culture. The following hypothesis is suggested by Stauss and Mang's (1999) finding:

H1: The cultural distance between the customer and service provider would have a positive effect on CSS, such that satisfaction would be higher when the cultural distance is large than when it is small.

Effect of Customer's Cultural Disposition on the Attribution Processes

Although Stauss and Mang's (1999) arguments about the role of ED in inter-cultural service encounters is important, it is not sufficient to explain its effect on satisfaction judgments. After ED occurs there is an intermediate attribution process that leads customers to make satisfaction/dissatisfaction judgments. Positioning of the attribution process after ED and before CSS is consistent with work in consumer behavior by Bitner (1990), Folkes, Koletsky, and Graham (1987), and Oliver and DeSarbo (1988). Attributions are what people perceive to be the causes of their own behavior, the behaviors of others, and the events they observe. Weiner (1985) found that people make spontaneous causal attributions, particularly in cases of unexpected and negative events such as in service failures. According to attribution theory, a customer (i.e. the observer) attributes the cause of a service failure to either the service provider or to the situation (e.g. the management or someone or something other than the service provider such as the situation or environment). Attribution to the service provider is referred to as a dispositional attribution and attribution to the management, situation, or environment is referred to as a situational attribution. Does culture affect customer's attributions of service failures?

An extensive body of research (e.g. Crittendon 1991; Fletcher and Ward 1988; Miller 1984, 1986; Schuster, Fosterling, and Weiner 1989; Shweder and Bourne 1984; Smith and Whitehead 1984) has found that people from collectivist cultures tend to make more situational attributions (i.e. attribute the cause to the context or environment), whereas those from individualist cultures make more dispositional ones (i.e. attribute the cause to the person's attitudes and intentions). Thus, it can be expected that in the context of service failures, people from individualist cultures would tend to make disposition-heavy attributions and those from collectivist

cultures would make situation-heavy attributions. A dispositional attribution would correspond to a customer blaming the service provider, either his competence or motivation in performing the service; whereas a situational attribution would correspond to attributing the discrepant service performance to the provider's cultural norms or to the lack of understanding of the customer's culturally biased expectations.

Recently it has been suggested that while individualism-collectivism are appropriate constructs to discriminate cultures at the societal level, they do not capture the individual-level differences within a culture. Traindis, Leung, Villareal, and Clack (1985) and Smith and Bond (1999) have proposed the concepts of *idiocentrism* and *allocentrism* to describe individual-level attributes of cultural values. Individuals who are more individualist in self-concept have been termed "idiocentric," whereas those who are more collectivist are "allocentric." Both of these self-concepts have horizontal and vertical dimensions based on social relationships. Horizontal patterns accept equality as a given (i.e. assume that one self is more or less like every other self). Vertical patterns accept hierarchy as a given (i.e. accept that one self is different from other self). Individuals within a culture may differ on the extent to which they are idiocentric or allocentric, but at the societal level people from individualist cultures are higher on idiocentrism and those from collectivist cultures are higher on allocentrism. Corresponding to the differences in predispositions described earlier for individualist versus collectivist cultures, idiocentrics tend to focus on internal dispositions in making attributions (Menon, Morris, Chiu, and Hong 1999), while allocentrics tend to use the context, situation, and group dispositions (Choi, Nisbett, and Norenzayan 1999). The following hypotheses pertain to the effect of the customer's cultural disposition:

H2: The customer's cultural disposition will affect the attribution process such that:

- a) Idiocentrism will have a positive effect on dispositional attributions.
- b) Allocentrism will have a positive effect on situational attributions.

Furthermore,

H3: The customer's cultural disposition will moderate the effect of cultural distance on the attribution process such that:

- a) Cultural distance will have a greater positive effect on situational attributions in the case of customers with an allocentric cultural disposition compared to those with an idiocentric cultural disposition.
- b) Cultural distance will have a greater negative effect on dispositional attributions in the case of customers with an allocentric cultural disposition compared to those with an idiocentric cultural disposition.

Effect of Service Failure Type and Service Context

Service failure type. When the results of a service encounter are below the customer's expectations, the service encounter may be termed a failure, of which there are two general types, outcome and process (Bitner, Booms and Tetreault 1990; Hoffman, Kelley and Rotalsky 1995; Keaveney 1995; Mohr and Bitner 1995). Outcome is what customers receive from the service, and process involves the manner in which the service is delivered. In an outcome failure the organization does not fulfill the basic need of the customer (e.g. a restaurant does not provide a meal of the type or quality that a customer orders). In a process failure the delivery of

the service is flawed or deficient in some way (e.g. a waiter in a restaurant provides slow or inattentive service). Smith, Bolton, and Wagner (1999) found that in both restaurant and hotel service encounters, customers who experience process failures were more dissatisfied than those who experience outcome failures, suggesting that face-to-face encounters which are directly attributable to the behavior of the service provider result in a lower level of CSS than outcome failures which result from events not directly observed by the customer. This finding is also consistent with reports by Bitner, Booms, and Tetreault (1990) and Keaveney (1995) that customers often cite process failures more frequently than outcome failures for evaluating service encounters. Hence it is proposed that:

- H4:* The type of service failure will moderate the effect of cultural distance on the attribution processes such that:
- a) Cultural distance will have a greater positive effect on situational attributions when there is an outcome failure as compared to a process failure in service performance.
 - b) Cultural distance will have a greater negative effect on dispositional attributions when there is an outcome failure as compared to a process failure in service performance.

Service context. The context, or setting, of a service interaction may possibly influence the attribution processes. In a strong context wherein the customer's culture and the ethnic ambience of the service setting are dissimilar (e.g. an Anglo customer in a Cuban restaurant), cultural distance with the service provider may be more salient to the customer, and this would amplify its effect on attribution and CSS. In a weak context wherein the customer's culture and the ethnic ambience of the service setting are similar (e.g. an Anglo customer in an American restaurant), cultural distance would attenuate the effects of cultural distance. Therefore, it is posited:

- H5:* The service context will moderate the effect of cultural distance on the attribution processes such that:
- a) Cultural distance will have a greater positive effect on situational attributions when the service context is strong as compared to when it is weak.
 - b) Cultural distance will have a greater negative effect on dispositional attributions when the service context is strong as compared to when it is weak.

We propose to test our theoretical model using a web-based study with a quasi-experimental design employing video-clips of hypothetical service encounters. We now describe the research design and methodology in detail.

RESEARCH DESIGN AND METHODOLOGY

Research Design

The proposed study will utilize a 2 x 2 x 2 between-subjects design, in which the cultural distance (small vs. large), service failure type (process vs. outcome), and service setting context (weak versus strong) would be manipulated using scenarios of hypothetical service encounters in a restaurant. Respondents would be asked to project themselves into the scenario and then respond to questions on a computer-mediated questionnaire administered over the Internet.

Stimulus Development

The selection of service encounters in a restaurant setting was the result of extensive pretesting of scenarios in text form. Scenarios were created that involved an American customer in super-

market, restaurant, bank, and lawyer's offices contexts in both Canadian and Japanese settings. Scenarios were tested for realism using a convenience sample of MBA students at a Midwestern US University, with the restaurant context appearing to be the most credible. In order to make the study more relevant to contemporary society in the United States, the settings for the restaurant interactions were revised to be Cuban and American, and the number of scenarios expanded to eight versions with manipulations of the three factors of interest (i.e. cultural distance, service failure type, and context). Cultural distance was manipulated by the cultural differences between the customer and the provider, namely the waiter in the scenarios (American vs. Hispanic) and the respondent's reported ethnicity (Anglo vs. Hispanic). Service failure type was manipulated by varying the service performance in the scenarios, such that in one condition the service delivery is slow (a process failure) and in the other condition the delivered food is inconsistent with what was ordered (an outcome failure). Context manipulation was achieved by the match/mismatch between the waiter's cultural background (American vs. Hispanic) and the type of restaurant (American vs. Cuban). Thus, for example, a Hispanic waiter in an American restaurant would be a weak context and a Hispanic waiter in a Cuban restaurant would signify a strong context. The eight scenarios were pre-tested in a think-aloud exercise with a convenience sample consisting of both Hispanics and White Anglos. The pre-test consisted of a "think-aloud" exercise wherein respondents were asked to read aloud the scenarios and provide a verbal assessment and interpretation of the scenario situation. There were no major problems with the clarity of the scenarios and the different factor manipulations. Students of the National Broadcasting Society's Alpha Epsilon Rho national honor society (under the supervision of a faculty member) then filmed the text-based scenarios in a television production studio at the University of Miami's School of Communication. The raw film clips were edited to produce eight broadcast quality videos, each of four to five minute duration. These digital videos were then integrated into a web-based electronic questionnaire. The web-based questionnaires were then pretested for their ease of use, downloading time, and clarity of instructions using a convenience sample in Miami-Dade County, Florida. No significant problems were identified in the web-based administration of the questionnaire.

Methodology

Procedure. Using a personal computer, respondents would log on to a website dedicated to our research and complete the survey on-line. Pretesting indicates that approximately ten minutes will be required for each respondent to complete the survey.

Respondent population. Respondents would be recruited from the middle class population of White Anglos and Hispanics in culturally diverse Miami-Dade County M-DC), Florida. M-DC's population of 2,246,000 is an amalgamation of three major cultural groups, 57.6% Hispanics (including Cuban and non-Cuban), 21.5% White Anglos (White non-Hispanics), and 20.9% Black (African American and Haitian). This population has been chosen to enhance the external validity of the study such that the respondent sample is representative of the actual customer response in intercultural service encounters.

Respondent recruitment. Respondents will be recruited by distributing flyers at various locations in Miami-Dade County, Florida and by direct e-mail solicitation. Both the flyer and the e-mail solicitation will invite prospective respondents to log on to the web site dedicated to the study. An incentive will be offered in the form of an opportunity to participate in a raffle, if desired, in which five prizes of \$100 each will be offered.

CONTRIBUTIONS

The theoretical contributions of our proposed research agenda are twofold. First and foremost, we will shed light on the role of culture in customer satisfaction with service encounters. Although the concept of culture has a long and rich history of research in social psychology, it has hitherto not been given adequate attention in the CSS literature. We hope to fill this gap by examining the effect of culture at both an individual level (i.e. attribution process) and at an inter-personal level (i.e. cultural distance). We propose that at an individual level, cultural dispositions can directly affect the extent to which a customer attributes a service failure to the provider, thus decreasing CSS. On the other hand, at an inter-personal level, cultural-differences between the customer and provider can decrease these attributions to the service provider and thus attenuate the effect on CSS. Integrating the effect of cultural differences and attributions with the current CSS literature would enrich our understanding of service encounters in the multi-cultural context of the US society. Secondly, we also hope to make a methodological contribution by enhancing the efficacy of using projective techniques in studying service interactions. Specifically, our use of enriched multi-media stimuli would help circumvent the criticisms about the validity of hypothetical scenarios as an investigative technique. Moreover, the web-based administration of the study among representative populations highlights how technology can enhance the external validity of academic research. The latter is particularly valuable to managers who are often skeptical about the applicability of research that utilize convenience sampling (e.g. undergraduate students).

The proposed research agenda also has important practical implications. The insights provided by this research could help firms to effectively manage the service delivery process, particularly those services that include inter-personal interactions. Firstly, by being cognizant of the culturally biased expectations of different cultural or ethnic groups. For instance, while Anglo Americans—idiocentrics—might prefer to have more instrumental, goal-based expectations from the provider, Hispanics—allocentrics—may want the provider to be more friendly and approachable. The service provider could differentially emphasize these two elements in the performance as well as advertisements. Secondly, by understanding the culturally predisposed attribution processes, and accordingly adapting the service delivery (e.g. bank or restaurant in a Hispanic neighborhood) to avoid dispositional attributions of slow service, marketers could emphasize the contextual elements by creating a distinctive cultural ambience in the premises.

To summarize, it is our hope that this research would provide a theoretical framework to incorporate culture into the extensive body of knowledge in the CSS literature. From a more pragmatic standpoint, we hope to sensitize service providers to specific elements of the cultural or ethnic background that affect customer satisfaction judgments.

Antecedents and Consequences of Service Quality in Online Banking: An Application of the SERVQUAL Instrument

Sang-Lin Han, Hanyang University
Seung Baek, Hanyang University¹

INTRODUCTION

During the past decade, the online service industry has witnessed tremendous growth, much of it spurred by the Internet revolution (Keaveney and Parthasarathy, 2001). Especially, the potential of the Web as a commercial medium is widely recognized and the growth in online service industries such as online banking has increased rapidly. In addition to Internet companies, traditional organizations are investing a huge amount of money and effort in information systems to provide online services through the Web. The underlying assumption of their investment is that, because online services provide their customers with convenience, interactivity, relatively low cost, and a high degree of customization/personalization, they will enhance customer satisfaction and retention more effectively than offline-based services (Khalifa & Liu, 2001). To justify their investment in online services, many organizations are trying to measure the quality of their online services and investigate the relationships between service quality and customer satisfaction. However, a formal methodology for measuring online service quality is not well developed yet.

Traditionally, many studies of service marketing have tried to define service quality and develop instruments to measure it. Since Parasuraman et al. (1988) introduced a service quality instrument, called SERVQUAL, many studies have used SERVQUAL to measure service quality in various domains, ranging from financial services (Lin, 1999), health services (Dean, 1999), travel agent services (Kaynama, 2000), and retailing services (Mehta, 2000), to restaurants (Lee and Hing 1995). However, since SERVQUAL was originally developed to measure service quality delivered through regular offline channels, its use in the Information System (IS) domain could be somewhat problematic (Van Dyke et al., 1999). Recently, a few studies have begun investigating the suitability of SERVQUAL in assessing the quality of online services (Gefen & Devine, 2001).

The main objective of this study is to investigate the usefulness and applicability of SERVQUAL in measuring online service quality and its relationships to customer satisfaction and customer retention. By exploring the suitability of SERVQUAL and the outcome of service quality, this study enhances understanding of the causal relationships among service quality, customer satisfaction, and customer retention, in the context of online banking services.

THEORETICAL BACKGROUNDS

Online Banking

Internet has emerged as a key competitive arena for the future of financial services (Cronin, 1998) in that online banking offers customers more features with lower cost than traditional banking activities. Since the Security First Network Bank (SFNB) first started its Internet bank on the web site (www.SFNB.com), more than 1,500 financial institutions have made plans to offer certain forms of Internet banking in 3 years. Advanced technologies enable banks to utilize new banking products, such as a smart card and

electronic money, through the Internet. Internet banking is easier, more convenient and offers more features with lower cost than home banking in the 80's. Customers' responses to the Internet banking system have been so much different from the home banking due to its easy accessibility. Customers can access their account from anywhere in the world and at any time. To secure loyal customers, many banks try to provide customers with unique online experiences that customers cannot access through the offline channels. Considering that enormous capital investment is needed for developing these online banking services, it is very critical for them to measure the service quality produced by online banking systems.

Service Quality

Service quality is generally perceived to be a tool that can be used to create a competitive advantage and therefore, substantial research into service and service quality has been undertaken in the last 20 years. Bitner et al. (1990) define service quality as "the consumers' overall impression of the relative inferiority/superiority of the organization and its services." The most common definition of service quality is the discrepancy between consumer's expectations and perceptions of the service received. Accordingly, service quality is defined as how well a delivered service level matches customer's expectation. Parasuraman et al. (1988, 1991) identified more detailed dimensions of service quality and developed a well-known instrument, called SERVQUAL, to measure customer's perceptions and expectations from service. The SERVQUAL instrument consists of five underlying dimensions, with two sets of 22 item statements for the 'expectation' and 'perception' sections of the questionnaire. Perceived service quality is measured by subtracting customer perception scores from customer expectation scores, both for each dimension and overall. The five dimensions of SERVQUAL are (Parasuraman et al., 1988, 1991):

- (1) Tangibles, which pertain to the physical facilities, equipment, personnel and communication materials.
- (2) Reliability, which refers to the ability to perform the promised services dependably and accurately.
- (3) Responsiveness, which refers to the willingness of service providers to help customers and provide prompt service.
- (4) Assurance, which relates to the knowledge and courtesy of employees and their ability to convey trust and confidence.
- (5) Empathy, which refers to the provision of caring and individualized attention to customers.

Since the SERVQUAL was developed in 1988, various researchers have recognized that both the instrument itself and the conceptualization of service quality may benefit from further refinement (for example, Finn and Lamb 1991, Lee and Hing 1995). They have argued that the SERVQUAL instrument needs to be customized to the specific service area. Cronin and Taylor (1992) have developed instruments to measure service quality based only on customer perceptions. After many studies have examined the suitability of SERVQUAL in measuring service quality in different types of service, they tried to adapt the original SERVQUAL items to various service contexts by slightly changing the original items.

¹This research was supported by the research fund of Hanyang University.

Online Service Quality

During the past several years, some conceptual and empirical studies have attempted to address the key attributes of service quality directly or indirectly related to online service and, SERVQUAL has been widely accepted and used in measuring Information System service quality (Van Dyke et al., 1999). Yang & Jun (2002) redefined the traditional service quality dimensions in the context of online services, and suggested an instrument consisting of seven online service dimensions (reliability, access, ease of use, personalization, security, credibility, and responsiveness). In addition, Barnes & Vidgen (2002) introduced a method for assessing the service quality of e-commerce web-sites, called WebQual. Many studies, including these two, have introduced a variety of instruments without testing the suitability of SERVQUAL as an online service measure. The objective of this study is to explore the suitability of SERVQUAL in the context of online banking services, and examine the relative importance of the service quality dimensions of SERVQUAL to overall customer satisfaction and retention.

RESEARCH HYPOTHESES

The growing importance of service quality leads us to examine the following questions concerning the relationships among service quality, customer satisfaction, and customer retention in the online banking service area.

- Is service quality significantly associated with customer satisfaction?
- Does the level of service quality influence customer satisfaction, and increase the level of customer retention?

Mummalaneni and Wilson (1989) argue that satisfaction leads to binding the customer and the seller together and strengthening their relationship. Once a customer has decided that he or she is no longer satisfied with the product or service, the process of the dissolution of the bonding between the customer and the provider becomes salient. Also, there is widespread consensus among scholars (e.g. Wilson, 1995) that greater satisfaction increases the level of a customer's commitment to the seller. Recently, in the information system area, some researches began to try to investigate the relationship between web site quality and customer satisfaction. For example, McKinney et al. (2002) found that Web-customer satisfaction is determined by the nine quality-related constructs. In a study of electronic commerce channel preference, Devaraj et al. (2002) also showed that service quality is one of the major determinants of consumer satisfaction.

One of the key issues for online service providers as a result of the increased competition is "churn," or customer movement to the competing company. Therefore, how to increase the level of customer retention has been one of the key questions to most marketing managers in the online service industry. Some marketing researchers have showed that customer satisfaction is the key factor for determining the service switching intentions (Keaveney and Parthasarathy, 2001). Using data on the online industry, Chen and Hitt (2002) investigated how service characteristics affect the level of customer switching and retention. Similarly, Zeithaml, Berry, and Parasuraman (1996) emphasize the importance of measuring future behavioral intentions of customers to assess their potential to remain with or leave the service organization. On these grounds, we have the following research hypotheses regarding service quality, customer satisfaction, and customer retention.

- H1: Service quality of online banking is positively related to the level of customer satisfaction.

H2: Customer satisfaction is positively related to the level of customer retention.

H3: Service quality of online banking is positively related to the level of customer retention.

RESEARCH METHOD

Research Design and Sample

Prior studies (Kettinger & Lee, 1994, Van Dyke et al., 1997) empirically tested whether SERVQUAL is an appropriate instrument to assess IS (Information System) service quality. In this study, online-bank-adapted SERVQUAL was designed to deal with the unique features of online banking services. The basic methodology was to apply the modified SERVQUAL instrument to the study sample, and then validate the measurement model and structural equation model. The relationships among service quality, customer satisfaction, and customer retention were also investigated and the research hypotheses were tested.

Data for model testing were obtained through an online survey. With the help of one of the major commercial banks in Korea, a survey was administered via the bank's website. From the perspectives of the five dimensions of SERVQUAL, the survey measured user expectation for the online bank in general and perceived performance of the online bank. The appendix shows the questionnaire items used in the survey. In all, 740 responses were used for the statistical analysis and model testing.

Data Purification

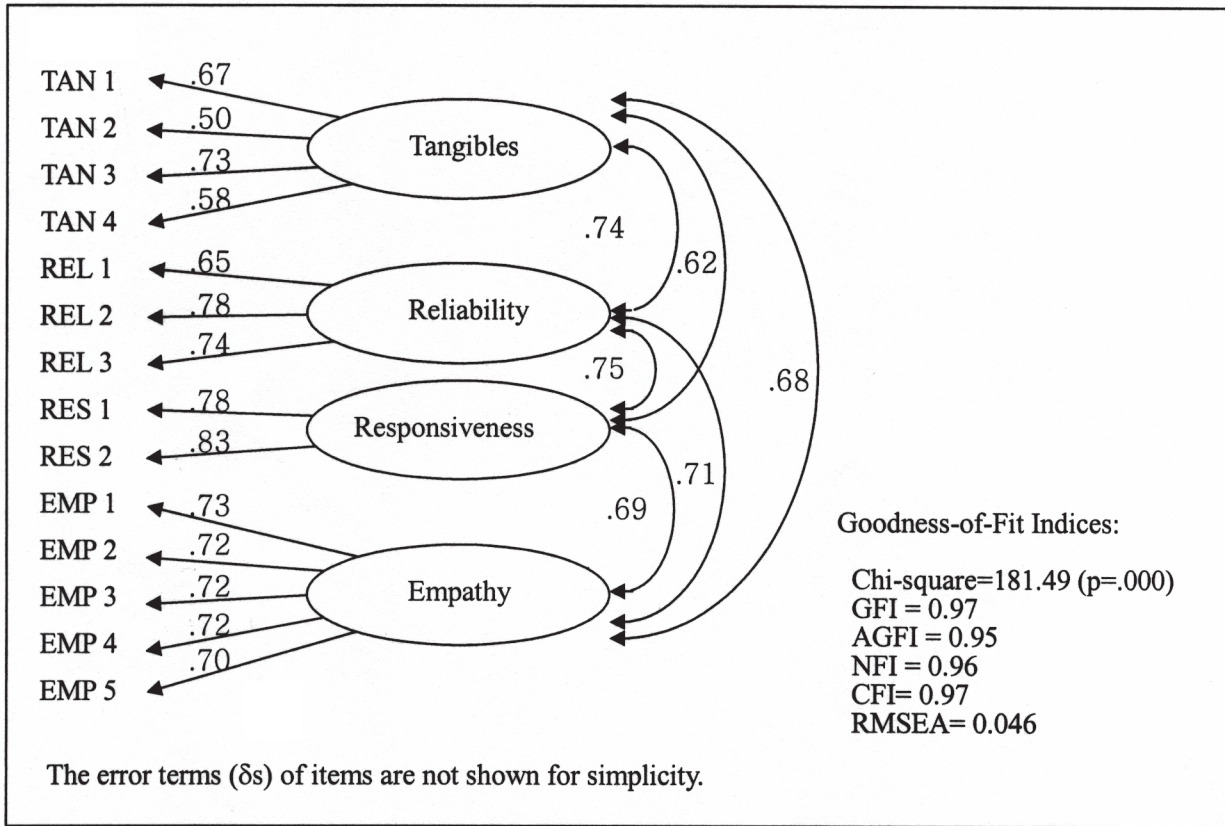

In this research, we followed the updated measure development paradigm proposed by Gerbing and Anderson (1988) as well as the traditional procedure suggested by Churchill (1979) to develop better measures of marketing constructs. Exploratory factor analysis (EFA) was conducted for data screening and dimensionality check. Nine items were dropped after the EFA procedure because they are cross-loaded onto more than one factor. The measurement items of the 'assurance' dimension were not properly loaded resulting in the complete deletion of this dimension. Therefore, four dimensions of SERVQUAL, Tangibles, Reliability, Responsiveness, Empathy, were used for the final analysis. As one of the major problems of SERVQUAL, Van Dyke et al. (1997, 1999) pointed out the dimensional instability of SERVQUAL. The service quality factors or dimensions originally defined by Parasuraman et al. (1991) have not emerged as such in subsequent researches. Especially, past research has shown that the Information Service(IS)-context-modified version of the SERVQUAL instrument produced four dimensions (Kettinger and Lee, 1994).

In this study, the assurance dimension of SERVQUAL was dropped in the context of online banking. One possible explanation for this result can be found from the unique features of online services. Instead of interacting with IS personnel or systems through offline channels, online service users heavily rely on the non-human interface of banking services. Consequently, customers' evaluations for service quality are mainly influenced by the features and the security of online bank web sites. In other words, in online banking, customers would not accurately evaluate the assurance dimension of SERVQUAL which is defined by the knowledge and courtesy of administrators. Instead, they are more concerned about the security of their financial transactions and, therefore, reliability would be the most representative dimension of service quality.

Measurement Model and Second Order Confirmatory Factor Analysis

In an effort to achieve reliability and validity of the measurement model, first-order and second-order confirmatory factor analysis

FIGURE 1
First Order Model of Online Banking Service Quality

sis (CFA) were conducted for the four-dimensional model of SERVQUAL using gap scores calculated from the 14 pairs of items, and this produced satisfactory results.

Figure 1 and Table 1 illustrate the estimated parameters of the four-construct, first-order factor model. As shown, the indicator loadings of items to their respective constructs are strong. The t-scores range from 11.37 to 19.46, indicating that all factor loadings are significant and providing evidence to support the convergent validity of the items measured (Anderson and Gerbing 1988). Composite reliability, a measure of internal consistency comparable to coefficient alpha (Fornell and Larcker 1981), is in excess of 0.70, implying acceptable level of reliability for each of constructs. As also illustrated in Figure 1, the first-order constructs exhibit a moderate amount of correlation among themselves. To assess the degree of these associations, a formal test of discriminant validity was conducted by using chi-square difference test. This suggests that the better model will be the one in which the two constructs are viewed as distinct, yet correlated, factors (Anderson and Gerbing 1988, Bagozzi et al. 1991). In all six paired comparisons, the chi-square difference test was significant, suggesting that the constructs are distinct. Figure 2 illustrates the structure and estimated parameters of the second-order factor model of online banking service quality. Consistent with the first-order model, the items show strong measurement properties. The paths from the second-order factor of service quality to the first-order dimensions are strong and significant. Hence, we conclude that the higher-order concept of the service quality of online banking seems to be well represented by a second order factor model. In sum, all these diagnostics suggest that the measurement model of online banking service quality should be accepted as a good representation of the data.

Structural Model and Hypotheses Testing

To test the research hypotheses and investigate the relationships among online service quality, customer satisfaction, and customer retention, we conducted covariance structure analysis by using LISREL 8. The final structural model of online banking service was tested and, as seen in Figure 3, the results showed that service quality has positive impact on customer satisfaction (b=0.41) and that customer satisfaction increases the level of customer retention (b=0.80) accordingly. Therefore, research hypotheses 1 and 2 were supported with strong statistical significance. However the direct impact of service quality on the level of customer retention was not statistically significant and hypothesis 3 was not supported. This means that service quality influences customer retention level indirectly through the level of customer satisfaction. Some researches have suggested that customer satisfaction is an antecedent factor of service quality (Bolton and Drew 1991). However our research model indicates that this may not be the case and provides the empirical support for the notion that service quality in fact leads to customer satisfaction and, furthermore, an increase in customer retention. This confirms the recent results of Keaveney and Parthasarathy (2001) that online service continuers show a higher satisfaction level than online service switchers. Cronin and Taylor (1992) also showed that service quality influences customer satisfaction, even though they measured service quality with perception only.

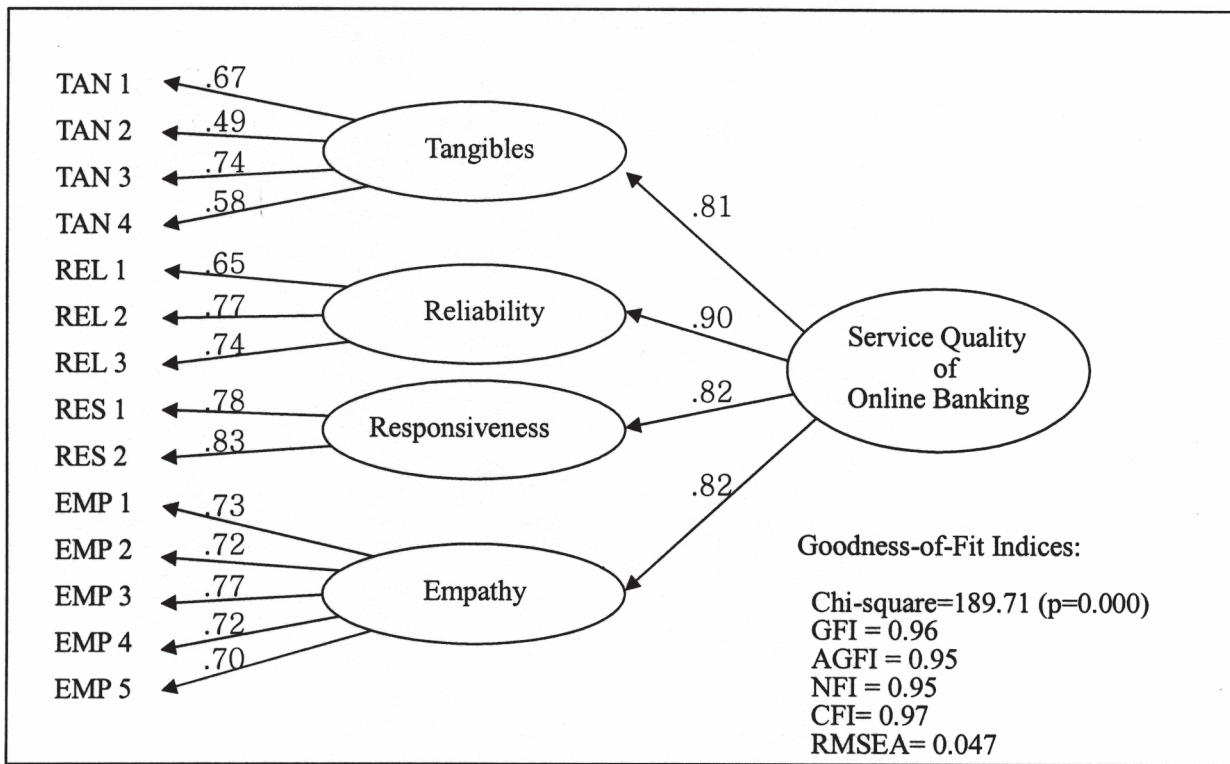

The results of model testing showed satisfactory goodness-of-fit indices. In general, the goodness-of-fit was high (GFI=0.94) indicating that a major proportion of the variances and covariances in the data was accounted for by the model. More specifically, the root mean square error of approximation (RMSEA=0.046) is below

TABLE 1
Properties of Measurement Model of Online Banking Service Quality

Construct Item	Standardized Loading	t- value	Composite Reliability	Cronbach' s Alpha
Tangibles			0.72	0.72
Q1	0.67	-		
Q2	0.50	11.37*		
Q3	0.73	15.34*		
Q4	0.58	12.93*		
Reliability			0.78	0.76
Q5	0.65	-		
Q6	0.78	16.59*		
Q7	0.74	16.17*		
Responsiveness			0.79	0.78

FIGURE 2
Second Order Model of Online Banking Service Quality

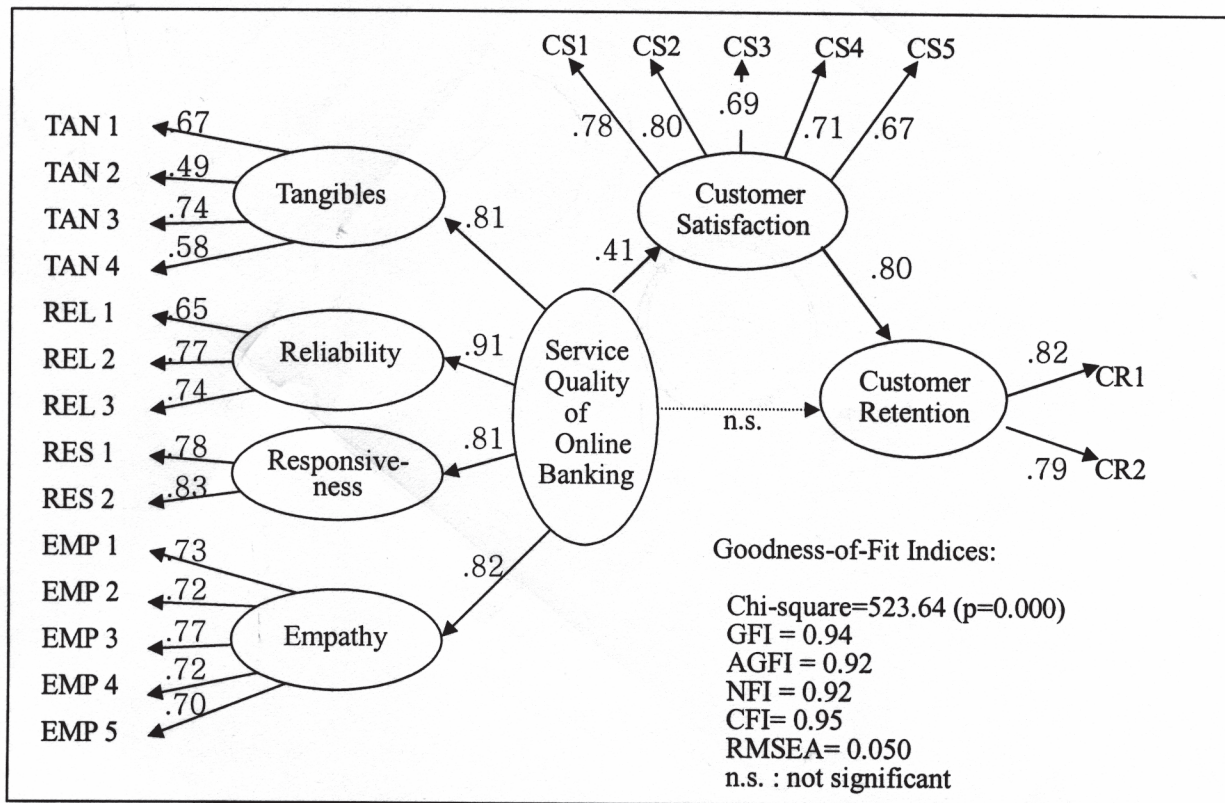

the .08 cutoff recommended in the literature (e.g. Browne & Cudeck 1993). The adjusted GFI and other fit indices (AGFI=0.92, NFI=0.92, NNFI=0.95, CFI=0.95) clearly meet the requirements recommended in the literature (Bagozzi and Yi, 1988, Baumgartner

and Homburg, 1996) and these magnitudes indicate that the model fits the data adequately.

Finally, to make sure of the order condition of the causal structure of service quality, satisfaction, and retention, we analyzed

FIGURE 3
Structural Model of Service Quality, Customer Satisfaction, and Customer Retention

other alternative models. For example, we examined the direct effect of service quality on customer retention without including customer satisfaction in the model. We also ran the model where the effects of satisfaction are mediated by customer retention. Testing all these alternative models did not violate the causal structure of the proposed model and we accepted this as a final model.

Conclusions and Implications

Many studies have emphasized the need to develop valid and reliable measures of the quality of Information System (IS) service. Most of them have made much efforts to apply SERVQUAL, a commonly used measure of service quality, to IS-specific environments. They have introduced the IS-adapted SERVQUAL, and examined its usability in different IS settings. Since many companies have heavily used the Internet to interact with their business partners and customers, the online service quality that they provide has become a primary concern in Internet business area. We introduced the modified version of the SERVQUAL instrument for online banking and, from the exploratory and confirmatory factor analysis, our study suggested a four-factor model of SERVQUAL including Tangibles, Reliability, Responsiveness, and Empathy. Furthermore, we explored the relationships among customer satisfaction, customer retention, and service quality. This study reveals that SERVQUAL is an appropriate instrument for measuring the quality of online banking services.

The results from the present study suggest several implications for the use of SERVQUAL in the online banking area. This study has the potential to make theoretical, managerial, and methodological contributions to the analysis of service quality. Theoretically, we attempted to investigate the causal relationships among

service quality, customer satisfaction, and customer retention. As seen in the Figure 3, the level of service quality has positive impact on customer satisfaction and, the level of customer satisfaction influences the level of customer retention accordingly. Against the study of Bolton and Drew (1991), our study shows that service quality is an antecedent factor of customer satisfaction and retention. It is an interesting finding that service quality does not directly influence the level of customer retention. Managerially, this research provides company managers with a scale to assess the quality of their service from the perspective of the four underlying dimensions. This study also provides marketing managers, especially in the online banking area, with an insight to understand how to increase customer retention level. Methodologically, this research attempted to examine the suitability of SERVQUAL to measure the service quality in the online banking area. The assessments of reliabilities and validities of SERVQUAL through LISREL analysis confirm the correspondence rules between the empirical and theoretical concepts (Bagozzi 1984). These methodological attempts and the purified measurement items of the study will provide a valuable guidance to the future empirical research into online service quality.

APPENDIX
Questionnaire Items of Online Banking Service Quality

Dimension	Item (Performance items only)
Tangibles	Q1) XYZ online bank has up-to-date equipment & technology. Q2) The web-site of XYZ online bank is visually appealing. Q3) The web-site of XYZ online bank makes you find information easily. Q4) The web site of XYZ online bank provides you with valuable information. Q4-1)* The web site of XYZ online bank is easy to use and navigate.
Reliability	Q5) When XYZ online bank promises to do something by a certain time, it does so. Q6) When there is a problem, XYZ online bank shows a sincere interest in solving it. Q7) XYZ online bank performs the service right first time. Q8)* XYZ online bank provides its services at the time it promises to do so. Q9)* XYZ online bank insists on error-free records.
Responsiveness	Q10) Administrators of XYZ online bank tell you exactly when the service will be performed Q11) Administrators of XYZ online bank give you prompt service. Q12)* Administrators of XYZ online bank are always willing to help you. Q13)* Administrators of XYZ online bank are never too busy to respond to your questions.
Assurance	Q14)* Administrators of XYZ online bank show the confidence in customers. Q15)* You feel safe in your transactions with XYZ online bank. Q16)* Administrators of XYZ online bank are consistently courteous with you. Q17) *Administrators of XYZ online bank have the knowledge to answer your questions
Empathy	Q18) XYZ online bank gives you individual attention. Q19) Help desks or call centers of XYZ online bank have operating hours convenient to all its customers. Q20) Help desks, call centers, and web administrators of XYZ online bank give you personal attention. Q21) Help desks, call centers, and web administrators of XYZ online bank have your best interests at heart. Q22) Help desks, call centers, and web administrators of XYZ online bank understand your specific needs

SPECIAL SESSION SUMMARY

Branding Across Cultures: The Role of Analytic and Holistic Thinking

Deborah Roedder John, University of Minnesota

Understanding how consumers in different parts of the world respond to branding activities is an important issue in marketing today. However, most of the existing research on branding has been conducted with only American consumers. There are indications that culture may influence how branding activities are interpreted. Bottomley and Holden (2001) used existing data sets to suggest that brand extension evaluations may vary across countries. Roth (1995) showed that individualism and power-distance, two of the key dimensions of culture, can influence whether a functional or a social brand image positioning is successful. As these studies suggest, culture may influence branding in many ways.

In this session, cultural differences in responses to brand extension were examined using a recent framework from cultural psychology. Specifically all three papers adopted a framework proposed by Nisbett et al (2001), which suggests that Western cultures tend to engage in analytic thinking, while Eastern cultures tend to engage in holistic thinking. Holistic thinking is defined as "involving an orientation to the context or field as a whole, including attention to relationships between a focal object and the field." Analytic thinking "involves a detachment of the object from its context, a tendency to focus on attributes of the object to assign it to categories."

Each paper addressed a different aspect of the analytic-holistic thinking process and its impact on brand extension evaluations. The first paper, by Alokparna Monga Basu and Deborah Roedder John, used the analytic-holistic thinking framework to hypothesize that differences in styles of thinking influence the way in which consumers from an Eastern culture versus a Western culture evaluate brand extension fit. They proposed that *Westerners focus on attributes of the extension whereas Easterners take a broader view*. Findings from two studies found that, under certain conditions, consumers from an Eastern culture (India) perceived a higher fit between the brand and the extension than did consumers from a Western culture (United States), leading to more favorable brand extension evaluations for Easterners.

The second paper, by Sharon Ng and Michael Houston, expanded on the theme of cultural influences on branding by addressing how consumers in different cultures vary in the accessibility of brand exemplars versus brand attributes. Drawing upon the analytic-holistic and the independent-interdependent frameworks, the authors found that *brand attribute information is more accessible among westerners, whereas brand exemplars are more accessible among easterners*. In addition, they found that when evaluating brand extensions, consumers in different cultures differ in the way they perceive fit between the brand and the extension category.

The third paper, by Yeosun Yoon and Zeynep Gurhan-Canli, also used the analytic-holistic framework to examine how consumers in different cultures use diagnostic versus non-diagnostic information in evaluating brand extensions. The authors found that when exposed to low and moderate fit brand extensions, *East Asians (compared to Westerners) provided more favorable brand extension evaluations because they took into account a variety of non-diagnostic information*.

The session concluded with a discussion of conceptual and methodological issues in studying cultural differences, lead by the session discussion leader, Durairaj Maheswaran. Topics included

experimental methods for examining processes responsible for cultural differences, issues in applying the analytic-holistic thinking framework in consumer behavior, and questions regarding sample selection and composition.

Consumer Response to Brand Extensions: Does Culture Matter?

Alokparna Basu Monga, University of Minnesota
Deborah Roedder John, University of Minnesota¹

ABSTRACT

One of the most compelling findings from brand extension research is that consumers evaluate brand extensions on the basis of similarity or “fit” with the parent brand, with better fitting extensions receiving more favorable overall evaluations. The purpose of this paper is to assess whether this finding can be generalized to other cultures. We propose that cultural differences may exist based on recent cross-cultural research demonstrating that cultures have different styles of thinking, which could affect the way consumers judge brand extension fit. Two studies conducted with individuals from an Eastern culture (India) and Western culture (U.S.) support the existence of cultural differences in brand extension evaluation.

INTRODUCTION

Research aimed at understanding how consumers respond to brand extensions has been an important area of inquiry in the past decade. A number of factors have been identified that influence whether consumers will evaluate brand extensions in a favorable manner. Key among them is the degree to which a brand extension “fits” with the parent brand, which consumers judge in a variety of ways, including whether the extension is in a product class similar to other products produced by the parent brand and whether an attribute associated with the parent brand could be beneficial in the extension product class. Brand extensions that fit well with the parent brand are usually evaluated quite favorably (for a review, see Keller 2002).

However, it is unclear whether these findings are applicable to consumers from other countries and cultures. Although comparative studies are lacking, there are preliminary indications that cross-cultural differences may exist. In a secondary analysis of eight studies conducted in the U.S. and abroad, Bottomley and Holden (2001) found that brand extension evaluations seemed to vary across cultures. They suggest that consumers from different cultures may place more or less emphasis on factors such as extension fit or product quality in arriving at their overall evaluation of brand extensions. Differences of this nature seem quite plausible given the variety of contexts in which culture has been found to influence consumer behavior, including brand positioning (Roth 1995), persuasion (Aaker and Maheshwaran 1997), and decision making (Briley, Morris, and Simonson 2000).

The purpose of this paper is to examine whether cross-cultural differences exist in consumer perceptions of brand extension fit and extension evaluation. Different cultures, with different orientations and ways of thinking, may well have different views of what constitutes “good fit” for brand extensions, thereby influencing brand extension evaluations as well. We explore this possibility by comparing consumers from a Western culture (U.S.) with ones from an Eastern culture (India). In two studies, we assess whether cross-cultural differences in brand extension evaluations exist and if these differences can be accounted for by cross-cultural differences in perceptions of brand extension fit.

CONCEPTUAL BACKGROUND

An emerging body of literature in cultural psychology offers several conceptual frameworks for predicting cross-cultural differ-

ences. In this paper, we focus on the most recent framework, proposed by Nisbett, Peng, Choi, and Norenzayan (2001). They argue that social differences between cultures promote certain cognitive processes more than others. Individuals in Eastern cultures, who are embedded in many social relations, have beliefs about focusing on the field and paying attention to relationships among objects. In this way, Eastern cultures promote holistic thinking, defined as “involving an orientation to the context or field as a whole, including attention to relationships between a focal object and the field, and a preference for explaining and predicting events on the basis of such relationships” (Nisbett et al. 2001, p. 293). In contrast, individuals in Western societies, who have relatively fewer social relations, have beliefs that the world is discrete and discontinuous and that an object’s behavior can be predicted using rules and properties (Nisbett et al. 2001). Western societies promote analytic thinking, which “involves a detachment of the object from its context, a tendency to focus on attributes of the object to assign it to categories, and a preference for using rules about the categories to explain and predict the objects behavior” (Nisbett et al. 2001, p. 293). A considerable body of research supports this view (e.g., Choi, Nisbett, and Smith 1997; Ji, Peng, and Nisbett 2000).

Cultural differences in styles of thinking may influence the way brand extensions are interpreted across cultures. Consider first the analytic style of thinking characteristic of Western societies. Analytic thinkers focus on the attributes of objects and on category-based induction to draw inferences and make judgments. This style of thinking is consistent with findings from current brand extension literature that (American) consumers judge brand extension fit on the basis of product class similarity (e.g., is the extension in a product category similar to those associated with the parent brand?) and attribute relevancy (e.g., is there an attribute associated with the parent brand that is relevant for the extension product category?). Brand extensions that stray too far from the types of products sold under the parent brand are typically deemed to be a “poor fit,” unless there is a redeeming attribute that ties the extension to the parent brand (e.g., “breath freshening” for Close-up mouthwash) or a prestige brand image that can be transferred to the extension (e.g., Rolex purses).

Now, consider the holistic style of thinking characteristic of Eastern societies. Holistic thinkers focus on relationships between objects and the field as well as relationships between objects (Masuda and Nisbett 2001). Because Easterners pay attention to the field, they may be able to identify other relationships between the parent brand and the extension. For instance, Easterners often focus on the situation rather than the focal object (Choi, Nisbett, and Norenzayan 1999), suggesting that they may be more able to use complementarity of use as a basis of fit. Easterners might pay more attention to the complementary usage relationships between brand extensions and products sold by the parent brand. They might also consider relationships between the extension and parent brand in terms of the overall reputation or feeling they have for the parent brand. These types of relationships are likely to result in judgments of better brand extension fit than would ordinarily be the case if product class similarity or attribute transfer were employed as the basis of fit. Although U.S. consumers may be able to generate similar relationships on occasion, we would expect them to be more prevalent for Easterners.

¹The authors wish to thank Raghunath Rao for his assistance in data collection for study 2.

Thus, we propose that individuals from Eastern cultures will perceive a higher degree of brand extension fit than consumers from Western cultures, especially for extensions that are relatively “far” from product categories associated with the parent brand. Brand extensions that are viewed as being rather far away from the domain of the parent brand could be viewed as a better fit if consumers were able to link them on a more holistic basis, which is a way of thinking more characteristic of Eastern consumers. This idea is consistent with findings from cross-cultural research that Easterners tend to perceive stronger relationships (covariation) among pairs of objects than do Westerners (Ji, Peng, and Nisbett 2000). Accordingly, we hypothesize:

H1: Easterners will perceive a higher degree of brand extension fit than Westerners, particularly for brand extensions deemed to be poor fitting by Western standards.

As a consequence of cultural differences in perceptions of brand extension fit, we would also expect to see concomitant differences in brand extension evaluations. If the relationship between brand extension fit and brand extension evaluation holds across cultures, we should observe more favorable brand extension evaluations from consumers from Eastern as opposed to Western cultures. Because consumers from Eastern cultures perceive a higher degree of brand extension fit in many situations, we predict:

H2: Easterners will evaluate brand extensions more favorably than Westerners, particularly for brand extensions deemed to be poor fitting by Western standards.

STUDY 1

Overview

Cultural differences in brand extension evaluations were tested by comparing a sample of consumers from the U.S. (Western culture) with one from India (Eastern culture) in a 2 (culture: Eastern, Western) \times 2 (extension fit level: low, moderate) \times 2 (extension replicate) mixed design. Culture was a between subject factor, with the remaining factors varied within subject. Two levels of extension fit were included to explore whether cultural differences might be more evident for low versus moderate fit extensions, with the level of fit calibrated on the U.S. sample to provide for a baseline of comparison. Two replicates were selected for each level of extension fit: low fit (Coke popcorn, McDonald’s chocolate bar) and moderate fit (Mercedes Benz watch, Kodak greeting cards). Thus, extension replicates were nested within extension fit levels.

Sample

Twenty-nine American subjects and thirty-five Indian subjects were recruited from the same university community. Indian students residing in the U.S. were selected to minimize differences between Indian and U.S. subjects that might provide an alternative explanation for findings of cultural differences, such as differences in brand familiarity, brand advertising exposure, and brand breadth. The ad specified that participants needed to be in the U.S. for less than three years to ensure that acculturation had not occurred to a marked degree.

Stimuli

Subjects saw four brand extensions: Coke popcorn, McDonald’s chocolate bar, Mercedes Benz watches, and Kodak greeting cards. These extensions were selected on the basis of two criteria. First, parent brands used in the study needed to be well known and familiar to subjects from both countries. We examined reports of the top brands in each country (Business Week’s Top 100

Brands, 2001; The A&M’s India’s top brands, 1999, 2001), explored websites for brands on both lists, and assessed familiarity in a small pretest with Indian respondents. Four brands were selected: Coke, Kodak, Mercedes Benz, and McDonald’s.

Second, we needed extensions for each of these parent brands that would be judged as low or moderate in fit by U.S. standards. For this purpose, we tested hypothetical extensions of selected brands with a sample of 28 U.S. students, similar to those included in the main study. Subjects judged the perceived fit of each brand extension on a seven-point scale for three items (inconsistent-consistent with the brand’s image, different from-similar to the brand’s image, not typical-of-untypical of the brand’s image), where higher numbers indicate a higher level of fit. The three items were summed to obtain an overall fit measure for each extension (α =.89, .85, .91, .91 for Coke popcorn, McDonald’s chocolate bar, Mercedes Benz watch, and Kodak greeting cards, respectively). Two brand extensions were rated below the scale midpoint ($M_{\text{Coke popcorn}}=2.17$; $M_{\text{McDonald’s chocolate bar}}=3.33$) and two were rated above the scale midpoint in perceived fit ($M_{\text{Mercedes Benz watch}}=4.11$; $M_{\text{Kodak greeting cards}}=5.61$). A Manova, with the four brand extensions as a within subjects factor and fit ratings as the dependent variable, indicated significant fit differences among brand extensions (*Wilks’* $\lambda=0.23$; $F(3,25)=27.88$; $p<.01$). A comparison of means indicated that Coke popcorn and McDonald’s chocolate bar were both significantly lower in fit than either Mercedes Benz watches and Kodak greeting cards (all p ’s<.05).

Procedure and Measures

Subjects were given a survey that asked for their opinions about “a number of new products and services that are being developed and may be available in your area in the future.” First, subjects were asked to give their opinions about the parent brands included in the study on a seven-point scale (1=poor and 7=excellent). Then, participants were shown the name of each brand extension and asked to give their evaluation of it on a seven-point scale (1=poor and 7=excellent). This was followed by an open-ended question about why they rated the brand extension in this manner (“Even though you have never tried this product, what went through your mind when you were deciding if it would be a good product or a bad product? What reasons came to mind in trying to decide what kind of product it would be?”). Next, subjects were asked to evaluate the fit of the brand extension with respect to the brand’s overall image on a scale ranging from 1 (“inconsistent with brand X’s image”) to 7 (“consistent with brand X’s image”), consistent with scales used in pretesting as well as prior brand extension research.²

Participants were then asked about their familiarity with the brands used in the study on a four-point scale (1=not at all familiar; 2=somewhat familiar; 3=familiar; 4=extremely familiar). Subjects were asked to list “whatever positive or negative things that come to your mind when you think about the brand.” Next, respondents completed a set of demographic questions about their nationality, number of years in the U.S., language spoken at home, and ethnicity of their mother and father. These questions were used to screen students from the U.S. sample who were of a different nationality or bicultural.

²One-item scales were used for measuring brand attitude, brand extension attitude, and brand extension fit to reduce respondent fatigue associated with competing a number of items for each measure for each brand extension. Prior brand extension research reports high inter-item correlations for multi-item scales, suggesting that single items can be appropriate measures of these constructs.

TABLE 1
Study 1: Means and Standard Deviations

Measure	Coke popcorn		McDonald's chocolate bar		Mercedes-Benz watch		Kodak greeting cards	
	U.S.	India	U.S.	India	U.S.	India	U.S.	India
Parent brand:								
Brand familiarity	3.90 (0.31)	3.89 (0.32)	3.86 (0.44)	3.63 (0.60)	3.10 (0.77)	3.03 (1.01)	3.52 (0.63)	3.63 (0.60)
Brand attitude	5.31 (1.58)	5.03 (1.62)	4.28 (1.75)	3.93 (1.60)	6.21 (1.29)	6.37 (1.14)	5.59 (1.05)	5.71 (0.89)
Brand extension:								
Extension fit	2.28 (1.83)	4.44 (1.56)	3.17 (1.89)	5.00 (1.50)	5.14 (1.68)	4.51 (2.16)	5.48 (1.43)	5.09 (2.02)
Extension evaluation	2.76 (1.84)	4.70 (1.30)	3.00 (1.62)	4.04 (1.49)	5.07 (1.75)	5.40 (1.48)	5.17 (1.31)	5.21 (1.62)

Note.- N=29 for U.S. and N=35 for Indian sample.

Results

Preliminary Analysis. First, we examined whether there were cultural differences in perceptions of or familiarity with parent brands that might provide an alternative explanation for cultural differences in brand extension responses. Parent brand attitude and familiarity did not vary by culture (see table 1 for means and standard deviations). A MANOVA with culture as the independent variable and parent brand attitude for all four brands as dependent variables revealed no significant effect of culture (*Wilks' λ*=0.97; $F(4,59)=0.45, p>.05$). This was corroborated by a univariate analysis of these data, finding that culture did not have a significant effect on brand attitudes for any of the four parent brands included in the study (all $p's>.05$). An analysis of brand familiarity yielded similar results. A MANOVA with culture as the independent variable and parent brand familiarity for all four brands as dependent variables revealed no significant effect of culture (*Wilks' λ*=0.93; $F(4,59)=1.12, p>.05$). A univariate analysis of these data also found culture to have no significant effect on brand familiarity for all four brands (all $p's>.05$).

We also examined whether different parent brand associations might be salient for the U.S. and Indian samples. Thoughts listed about each parent brand were coded into categories and a frequency count of brand associations for each parent brand by culture was obtained. The results point to very similar brand perceptions for all four parent brands. For McDonald's, the top two brand associations mentioned by both cultures were unhealthy and fast food/convenience. For Mercedes Benz, the top two brand associations for both cultures were good and luxury. For Kodak, the top three brand associations in both cultures were films, positive affect, and pictures. Minor differences were found for Coke, where the Indian sample mentioned positive affect, unhealthy and company-related thoughts as the most frequent brand associations, whereas Americans mentioned positive affect, Pepsi, and unhealthy as the most frequent associations.

Hypothesis Tests. Next, hypotheses pertaining to cross-cultural differences in perceptions of brand extension fit (H1) and brand extension evaluation (H2) were tested. Means and standard deviations for these measures for both cultures are provided in table 1.

A 2 (culture) x 2 (extension fit level) x 2 (extension replicate) MANOVA, with extension fit level and extension replicate (nested

within fit level) as repeated measures, revealed the existence of cultural differences in perceptions of *brand extension fit*. As expected, there was a significant effect of culture ($F(1,61)=7.20, p<.01$) and a significant culture x extension fit level interaction ($F(1,62)=25.46, p<.01$).³ Contrasts pertaining to this interaction indicated that cultural differences were evident for low fit extensions ($F(1,62)=33.49, p<.01$) but not for moderate fit extensions ($F(1,62)=1.77, p>.05$). Recalling that extension fit was calibrated on a U.S. sample, these findings support the hypothesis that consumers from Eastern (India) and Western (U.S.) societies perceive extension fit differently, with Easterners perceiving greater fit for extensions viewed as poor fitting from the vantage point of Western consumers.

To examine each brand extension replicate individually, a 2 (culture: Eastern, Western) x 4 (brand extension: Coke popcorn, McDonald's chocolate bar, Mercedes Benz watch, Kodak greeting cards) MANOVA, with brand extension as a repeated measure, was pursued. Note that the presence of a nested design in the previous analysis precluded an analysis of each individual brand extension. Findings from this analysis corroborate our earlier results. Examining univariate effects, the effect of culture on brand extension fit reaches significance for Coke popcorn ($F(1,61)=24.21, p<.01$) and McDonald's chocolate bar ($F(1,61)=17.98, p<.01$), with both brand extensions receiving higher fit ratings among Indians. Consistent with our prior analysis, there are no cultural differences for either Kodak greeting cards ($F(1,61)=0.97, p>.05$) or Mercedes Benz watches ($F(1,61)=1.35, p>.05$).⁴

³Findings not germane to our hypothesis tests were as follows. As expected, the main effect of extension fit level was significant ($F(1,62)=28.75, p<.01$), indicating that perceptions of brand extension fit were higher for extensions in the moderate as opposed to the low fit level. The culture x replicate (nested within extension fit level) interaction did not reach significance ($F<1$), indicating that individual extension replicates exhibited similar cultural differences. Finally, a covariate for gender effects did not reach significance ($t<1$).

⁴The multivariate tests indicated a significant main effect for culture (*Wilks' λ*=.64, $F(4,58)=8.27, p<.01$). A covariate for gender effects did not reach significance ($F<1$).

Similar findings were obtained for *brand extension evaluations*. A 2 (culture) x 2 (extension fit level) x 2 (extension replicate) MANOVA, with extension fit level and extension replicate (nested within fit level) as repeated measures, revealed the existence of cultural differences in brand extension evaluations. As expected, there was a significant effect of culture ($F(1,61)=13.49, p<.01$) and a significant culture x extension fit level interaction ($F(1,62)=7.48, p<.01$).⁵ Contrasts pertaining to this interaction indicated that cultural differences were evident for low fit extensions ($F(1,62)=21.86, p<.01$) but not for moderate fit extensions ($F(1,62)=.30, p>.05$). Recalling that extension fit was calibrated on a U.S. sample, these findings support the hypothesis that Eastern (India) and Western (U.S.) consumers evaluate brand extensions differently, with individuals from an Eastern culture providing more favorable evaluations for extensions considered to be poor fitting by Western standards.

To examine each brand extension replicate individually, a 2 (culture: Eastern, Western) x 4 (brand extension: Coke popcorn, McDonald's chocolate bar, Mercedes Benz watch, Kodak greeting cards) MANOVA, with brand extension as a repeated measure, was pursued. Findings from this analysis corroborate our earlier results. The effect of culture on brand extension evaluation reaches significance for Coke popcorn ($F(1,61)=22.67, p<.01$) and McDonald's chocolate bar ($F(1,61)=6.48, p<.05$), with higher evaluations given by Indian respondents. Once again, there is no effect of culture on evaluations of Kodak greeting cards ($F(1,61)=0.04, p>.05$) and Mercedes Benz watches ($F(1,61)=0.88, p>.05$).⁶

Discussion

Our results indicate that cultural differences exist in the way consumers evaluate brand extensions. Brand extensions judged to be a poor fit by U.S. respondents, such as Coke popcorn and McDonald's chocolate bars, were perceived much more positively by Indian respondents, which translated into more positive evaluations of these brand extensions. Brand extensions judged to be moderate in fit by U.S. standards, Mercedes Benz watches and Kodak greeting cards, did not exhibit cross-cultural differences of this nature.

These findings were corroborated by the types of thoughts that respondents generated for each brand extension. Cultural differences were evident for Coke popcorn and McDonald's chocolate bar, but less noticeable for Mercedes Benz watches and Kodak greeting cards. For Coke popcorn, Americans thought about it in terms of product class similarity, stating that a soft drink company making food did not make sense, as well as attribute/feature transfer, with many respondents imagining the extension as "Coke-flavored" popcorn. Indian respondents also expressed ideas about product class similarity, although they saw Coke and popcorn as similar because they were both "food." Indian subjects also related the extension to brand affect, noting that they would like the

extension because they liked Coke products, as well as complementarity, with mentions of Coke and popcorn being consumed together. For McDonald's chocolate bar, Americans thought about it in terms of product class similarity, noting that a fast food company wouldn't be able to make good chocolates, as well as the "low quality-cheap" brand concept they associate with the McDonald's brand. Once again, Indian respondents also thought about the extension in terms of product class similarity, but thought chocolate was consistent with McDonald's fast food, desserts, and treats. References to brand affect were even more frequent, with many Indian respondents noting the reputation of the McDonald's brand and their own liking for its products.

In sum, Americans used product class similarity and attribute/feature transfer as dominant modes of thinking, consistent with an analytical style of thinking. Indian respondents used some of the same bases as Americans, such as product class similarity, although they tended to see greater similarity and found ways to relate the parent brand and extension categories. However, Indians often used brand affect and complementarity as additional ways to think about brand extensions. Recall that these categories are consistent with a holistic style of thinking, involving general relationships between the extension and parent brand not tied to categories or attributes.

Overall, these results support the general hypothesis that brand extension evaluations are influenced by culture. Less clear is how extensive these cultural differences are in brand extension evaluations. Cultural differences were found for extensions judged as low fitting by U.S. standards, but no differences emerged for extensions judged to be moderate in fit. Perhaps we inadvertently dampened the level of cross-cultural differences by selecting a sample of Indian respondents residing in the U.S. Given this possibility, we conducted a second study to compare our U.S. sample with a new sample of Indian residents.

STUDY 2

Sample and Procedure

A sample of resident Indian consumers was compared to the sample of U.S. consumers collected in study 1. Twenty students were recruited for the Indian sample from a university in central India and paid \$3 for participating. All were fluent in English. Survey instructions and dependent measures were identical to study 1, with two minor exceptions. Indian participants filled out the survey in a group class setting to allow more students to participate and measures of parent brand associations were eliminated to shorten the survey.

Hypotheses regarding brand extension fit and evaluation were tested in a 2 (culture: Eastern, Western) x 2 (extension fit level: low, moderate) x 2 (extension replicate) mixed design.

Results

Preliminary Analysis. We examined whether there were cultural differences in perceptions of or familiarity with the parent brands that might provide an alternative explanation for cultural differences in brand extension evaluations. Parent brand attitudes and familiarity were similar across cultures, with the notable exception of McDonald's (see table 2 for means and standard deviations). A MANOVA with culture as the independent variable and parent brand attitude for all four brands as dependent variables showed a significant effect of culture ($Wilks' \lambda=0.81; F(4,44)=2.58, p=.05$), with univariate tests revealing a significant effect of culture on attitudes toward McDonald's ($F(1,47)=4.61, p<.05$) but no other brands (all $p's>.05$). Indian respondents had a more favorable attitude toward McDonald's than did Americans.

⁵Findings not germane to our hypothesis tests were as follows. As expected, the main effect of extension fit level was significant ($F(1,62)=44.26, p<.01$), indicating that brand extension evaluations were higher for extensions in the moderate as opposed to the low fit level. The culture x replicate (nested within extension fit level) interaction did not reach significance ($F(1,124)=2.5, p>.05$), indicating that individual extension replicates were subject to similar cultural differences. Finally, a covariate for gender effects did not reach significance ($t<1$).

⁶The multivariate tests indicated a significant effect of culture ($Wilks' \lambda=.69, F(4,58)=6.38, p<.01$). A covariate for gender effects did not reach significance ($F<1$).

TABLE 2
Study 2: Means and Standard Deviations

Measure	Coke popcorn		McDonald's chocolate bar		Mercedes-Benz watch		Kodak greeting cards	
	U.S.	India	U.S.	India	U.S.	India	U.S.	India
Parent brand:								
Brand familiarity	3.90 (0.31)	3.90 (0.31)	3.86 (0.44)	3.00 (1.12)	3.10 (0.77)	3.15 (1.04)	3.52 (0.63)	3.80 (0.41)
Brand attitude	5.31 (1.58)	5.05 (1.54)	4.28 (1.75)	5.20 (0.95)	6.20 (1.29)	6.60 (0.68)	5.58 (1.05)	5.35 (1.27)
Brand extension:								
Extension fit	2.28 (1.83)	4.10 (1.94)	3.17 (1.89)	5.10 (1.55)	5.14 (1.68)	5.80 (1.51)	5.48 (1.43)	5.05 (1.43)
Extension evaluation	2.76 (1.84)	4.20 (1.74)	3.00 (1.63)	4.75 (1.37)	5.07 (1.75)	5.95 (1.23)	5.17 (1.31)	5.20 (1.36)

Note.- N=29 for U.S. and N=20 for Indian sample.

The same pattern emerged for parent brand familiarity. A MANOVA with culture as the independent variable and parent brand familiarity for all four brands as dependent variables showed a significant effect of culture ($Wilks' \lambda=0.61$; $F(4,44)=7.04$, $p<.01$), with univariate tests revealing a significant effect of culture on familiarity with McDonald's ($F(1,47)=14.04$, $p<.01$) but not other brands (all $p's>.05$). Americans indicated higher familiarity with McDonald's. With these results in mind, parent brand attitude and familiarity were employed as covariates in subsequent hypothesis tests involving the McDonald's brand extension.

Hypothesis Tests. Next, hypotheses pertaining to cross-cultural differences in perceptions of brand extension fit (H1) and brand extension evaluation (H2) were tested. Means and standard deviations for these measures for both cultures are provided in table 2.

A 2 (culture) x 2 (extension fit level) x 2 (extension replicate) MANOVA, with extension fit level and extension replicate (nested within fit level) as repeated measures, revealed the existence of cultural differences in perceptions of *brand extension fit*. As expected, there was a significant effect of culture ($F(1,46)=13.33$, $p<.01$) and a significant culture x extension fit level interaction ($F(1,47)=9.34$, $p<.01$).⁷ Contrasts pertaining to this interaction indicated that cultural differences were evident for low fit extensions ($F(1,47)=17.94$, $p<.01$) but not for moderate fit extensions ($F(1,47)=0.12$, $p>.05$). Recalling that extension fit was calibrated on a U.S. sample, these findings support the hypothesis that consumers from Eastern (India) and Western (U.S.) societies perceive extension fit differently, with Easterners perceiving greater fit for extensions viewed as poor fitting from the vantage point of Western consumers.

⁷Findings not germane to our hypothesis tests were as follows. As expected, the main effect of extension fit level was significant ($F(1,47)=35.05$, $p<.01$), indicating that perceptions of brand extension fit were higher for extensions in the moderate as opposed to the low fit level. The culture x replicate (nested within extension fit level) interaction did not reach significance ($F(2,94)=1.80$, $p>.05$), indicating that individual extension replicates exhibited similar cultural differences. Finally, a covariate for gender effects did not reach significance ($t<1$).

To examine each brand extension replicate individually, a 2 (culture: Eastern, Western) x 4 (brand extension: Coke popcorn, McDonald's chocolate bar, Mercedes Benz watch, Kodak greeting cards) MANOVA, with brand extension as a repeated measure, was pursued. Note that the presence of a nested design in the previous analysis precluded an analysis of each individual brand extension. Findings from this analysis corroborate earlier results. Examining univariate effects, the effect of culture on brand extension fit reaches significance for Coke popcorn ($F(1,46)=11.23$, $p<.01$) and McDonald's chocolate bar ($F(1,46)=13.95$, $p<.01$), with both brand extensions receiving higher fit ratings among Indians. For McDonald's chocolate bar, culture remained significant even after covariates for McDonald's attitude and familiarity were entered into the analysis ($F(1,45)=5.42$, $p<.05$), with neither covariate attaining significance (both $p's>.05$). As before, there were no cultural differences for either Kodak greeting cards ($F(1,46)=0.78$, $p>.05$) or Mercedes Benz watches ($F(1,46)=1.37$, $p>.05$).⁸

Similar findings were obtained for *brand extension evaluations*. A 2 (culture) x 2 (extension fit level) x 2 (extension replicate) MANOVA, with extension fit level and extension replicate (nested within fit level) as repeated measures, revealed the existence of cultural differences in brand extension evaluations. As expected, there was a significant effect of culture ($F(1,46)=17.71$, $p<.01$) and a significant culture x extension fit level interaction ($F(1,47)=4.42$, $p<.05$).⁹ Contrasts pertaining to this interaction indicated that cultural differences were evident for low fit extensions ($F(1,47)=17.69$, $p<.01$) but not for moderate fit extensions

⁸The multivariate tests indicated a significant main effect for culture ($Wilks' \lambda=.63$, $F(4,43)=6.22$, $p<.01$). A covariate for gender effects did not reach significance ($F<1$).

⁹Findings not germane to our hypothesis tests were as follows. As expected, the main effect of extension fit level was significant ($F(1,47)=37.85$, $p<.01$), indicating that brand extension evaluations were higher for extensions in the moderate as opposed to the low fit level. The culture x replicate (nested within extension fit level) interaction did not reach significance ($F(2,94)=1.33$, $p>.05$), indicating that individual extension replicates were subject to similar cultural differences. Finally, a covariate for gender effects did not reach significance ($t<1$).

($F(1,47)=1.80, p>.05$). Recalling that extension fit was calibrated on a U.S. sample, these findings support the hypothesis that Eastern (India) and Western (U.S.) consumers evaluate brand extensions differently, with individuals from an Eastern culture providing more favorable evaluations for extensions considered to be poor fitting by Western standards.

To examine each brand extension replicate individually, a 2 (culture: Eastern, Western) x 4 (brand extension: Coke popcorn, McDonald's chocolate bar, Mercedes Benz watch, Kodak greeting cards) MANOVA, with brand extension as a repeated measure, was pursued. Findings from this analysis corroborate our earlier results. The effect of culture on brand extension evaluation reaches significance for Coke popcorn ($F(1,46)=7.66, p<.01$) and McDonald's chocolate bar ($F(1,46)=15.38, p<.01$), with higher evaluations given by Indian respondents. For McDonald's chocolate bar, culture remained significant even after covariates for McDonald's attitude and familiarity were entered into the analysis ($F(1,45)=5.86, p<.05$), with neither covariate attaining significance (both $p's>.05$). As before, there are no cultural differences for evaluations of Kodak greeting cards ($F(1,46)=0.01, p>.05$) and Mercedes Benz watches ($F(1,46)=2.89, p>.05$).¹⁰

Discussion

Our results are consistent with the first study in finding cultural differences in brand extension evaluations. As before, these differences were only evident in the case of brand extensions judged by U.S. standards as being a poor fit with the parent brand, Coke popcorn and McDonald's chocolate bar. Thus, similar cultural differences were observed with Indian samples from study 1 (U.S. residents) and study 2 (Indian residents).

GENERAL DISCUSSION

Brand extension research has yielded a number of important insights. Among the most important is the finding that consumers evaluate brand extensions on the basis of the fit they perceive with the parent brand. Studies conducted in the United States consistently show that extensions are evaluated poorly if they are perceived as being a poor fit with the parent brand.

Our results indicate that culture is also an important factor in understanding how consumers evaluate brand extensions. Although consumers around the world consider fit when evaluating brand extensions, those from Eastern cultures judge brand extension fit differently than consumers from Western cultures on occasion. Easterners viewed even poorly fitting extensions (by U.S. norms) as at least moderate fits with the parent brand by finding different ways to relate the poor fitting extensions to the parent brand. Our results suggest that these differences may be due to cultural differences in styles of thinking. Westerners are analytic thinkers, who tend to judge brand extension fit primarily on the basis of product class similarity and transfer of individual attributes; Easterners are holistic thinkers, who judge brand extension fit on the basis of additional factors, such as brand reputation/affect and complementarity of use.

Thus, culture needs to be carefully considered before generalizing current findings to consumers in other countries. Prior research has yielded a number of important findings about how consumers evaluate brand extensions depending on the nature of the extension (e.g., poor vs. good fit, downward vs. upward stretch) and the parent brand (e.g., functional vs. concept oriented; broad vs.

narrow). These results have been explained in terms of cognitive processes that may not reflect how consumers from other cultures would process the same stimuli.

Further explorations could also provide much stronger evidence about the scope and nature of cross-cultural differences in responses to brand extensions. Additional research is warranted to better understand those situations where cultural differences exist (e.g., Coke popcorn) and do not exist (e.g., Kodak greeting cards). One possibility that we explored is that cultural differences will be stronger with extensions that are further away from the parent brand, which we referred to as "low fit" extensions. Another hypothesis is that cultural differences are weaker for extensions with parent brands that possess prestige brand concepts (e.g., Mercedes Benz) rather than functional brand concepts (e.g., Toyota).

Also warranted is further research to better understand the process that produces cross-cultural effects. In this study, we used the analytic-holistic thinking distinction to motivate a discussion of why brand extension responses may differ for Easterners versus Westerners. We provided some exploratory data in the form of thoughts that consumers generated about brand extensions, showing marked differences for extensions such as Coke popcorn and McDonald's chocolate bar. Additional research is necessary to provide strong evidence that differences in style of thinking are responsible for cultural differences in brand extension fit and evaluations. Although we were able to rule out parent brand attitudes and familiarity as factors, we did not rule out other sources of cultural differences that might contribute to the data patterns observed. To do so, studies are needed to pin down the process explanation, perhaps by priming different styles of thinking or comparing intact groups of consumers with different styles of thinking.

Exemplars or Beliefs? Implications of Representational Differences on Brand Evaluations Across Cultures

Sharon Ng, University of Minnesota
Michael Houston, University of Minnesota

EXTENDED ABSTRACT

In an era of increasing globalization, the importance of understanding how consumers across cultures characterize a brand cannot be overemphasized. Successful branding strategies in foreign markets require sufficient understanding of the impact of different types of brand associations in consumers' purchase decision in each culture. However, no research in the brand literature has tackled this issue. The question whether different types of brand associations are differentially accessible and important in different cultures remains unanswered. This paper proposes to fill this void in the literature.

Recent advances in the culture and cognition literature provide compelling evidence that easterners and westerners do not process information similarly. Nisbett et al (2001) argue that easterners process information holistically while westerners process information more analytically. Holistic processing involves paying greater attention to contextual information, as opposed to analytic processing, which focuses on the object itself.

Adapting from the findings in this stream of research, we propose that brand associations might not be similarly accessible in different cultures. Since the retrieval of exemplars, by definition, requires people to retrieve information about the context to which the exemplars are used in, easterners' chronic tendency to do so should increase the accessibility of exemplars in their mind. On the other hand, westerners' tendency to focus on the attributes of the object and to use rules to categorize things mean that brand beliefs should be more accessible in their mind.

To test this hypothesis, in study 1, subjects from Singapore and United States were shown a number of brands and asked to do a free association task and brand concept map. Findings from the study provided strong support for our hypothesis. We found that Singaporeans are more likely to list exemplars while Americans are more likely to list beliefs.

However, as study 1 used country as a proxy for culture, we were unable to identify the dimension of culture that was driving the results. Extant research suggests that self-view (independent self and interdependent self) could be one dimension that might explain the results. Various researchers have shown that self-view priming leads to the processing differences observed by Nisbett et al (2001) earlier (Kühnen et al, 2001, Kühnen and Oyserman, 2002). Thus, Study 2 had 2 objectives. First, we attempted to provide a more direct test of the impact of self-view on the accessibility of brand associations through the use of a priming technique. Two, study 2 also examined the impact of the different types of associations on consumers' brand attitude.

Consistent with Study 1, Study 2 showed that subjects primed with an independent self-view retrieved more beliefs or attributes about the brand while subjects primed with interdependent self-view retrieved more exemplars. More interestingly, the results also showed that not only did the number of exemplars retrieved differ between conditions; the types of exemplars retrieved also differed. Subjects in the independent prime condition retrieved more sub-category exemplars while subjects in the independent prime condition retrieved more specific exemplars. In addition, we also found that exemplars evaluation had a greater impact on category attitude for those in the interdependent prime condition while beliefs had a greater impact on category attitude for those in the independent

prime condition. This provided evidence that people with different self-views differ starkly in the information they consider in brand evaluation.

The notion that exemplars have differential impact on independents' and interdependents' brand attitude is intriguing. Study 3 extended the findings from Study 1 and 2 by focusing on the impact of exemplars on brand extension evaluation across cultures. Similar to Study 2, we primed subjects' independent or interdependent self so as to make that self-view temporarily more accessible. Next, we provided subjects with information about some products owned by a fictitious brand. The product information was manipulated such that one set of products had greater variance than the other. Both independent variables were between-subjects factors. The dependent variable was attitude towards an extended product. Results showed that interdependents rated the extended product more favorably when the new product could be used in the same usage occasion as the existing list of products. Independents rated the extended product more favorably when the new product belonged to the same taxonomic category as the existing list of products.

Thus, data from all three studies provided converging evidence that different types of representations are differentially accessible across cultures and this has important implications for brand attitude and brand extension evaluation.

Cross-Cultural Differences in Brand Extension Evaluations: The Effect of Holistic and Analytical Processing

Yeosun Yoon, Rice University
Zeynep Gurhan-Canli, University of Michigan

EXTENDED ABSTRACT

Extant research suggests that consumers are likely to transfer their family brand attitudes to a new extension if the perceived fit between the parent brand's existing products and the extension is high (Aaker and Keller 1990; Boush and Loken 1991). When the perceived fit is high, consumers are likely to infer the quality of the extension as similar to the quality of the parent brand. On the other hand, when the perceived fit is low, the extension is less likely to be evaluated by the overall attitude toward the parent brand, because consumers fail to categorize the extension as similar to the parent brand and are likely to engage in attribute-based processing. However, these studies have been done exclusively in the U.S., and it is not clear whether consumers in different cultures evaluate brand extensions in the same way. Recently, Nisbett et al. (2001) suggest that Americans are more analytic, pay attention to attributes of the objects and use those attributes to categorize the objects, whereas East Asians are more holistic, are likely to attend not only to the attributes of the objects but also consider non-diagnostic contextual or background factors.

We extend the theory of holistic-analytical processing to the brand extension context. When the perceived fit is high, we expect evidence for analytic processing and no difference in brand extension evaluations across cultures. When the perceived fit is moderate or low, we expect that East Asians (versus Americans) are more likely to engage in holistic processing.

We employ two experiments to examine this possibility. Experiment 1 employs a 2 (culture: Western vs. Asian) X 3 (perceived fit: high, moderate vs. low) X 2 (brand breadth: broad vs. narrow) between subjects design. Korean and the U.S. represent cultures in which people incline toward holistic and analytic thoughts, respectively. The brand breadth factor is included to increase the generalizability of our findings as well as to rule out an alternative explanation. Since several big corporate names in Korea (e.g., Samsung, LG, etc.), it is possible to argue that Korean consumers are more familiar with broad brands and low fit extensions. Thus, we replicate our findings using both broad (Canon) and narrow (Nikon) brands. Our extension categories include a new digital camera (high fit), sunglasses (moderate fit) and running shoes (low fit). Our results suggest that both American and Korean consumers evaluate the high fit extension similarly. When the perceived fit is relatively low, Korean (vs. American) consumers evaluate the extension more favorably. These findings are consistent with our predictions and replicated across both broad and narrow brands. However, we did not find any difference between American and Korean consumers when the perceived fit was moderate. In order to explain this unexpected finding and to provide direct evidence regarding the processes underlying these effects, we conducted another experiment.

In experiment 1, we used two brands that consumers were highly familiar with and had prior knowledge about. In other words, we had little control over the non-diagnostic information. In experiment 2, we use a fictitious brand with which subjects do not have any pre-existing associations and we manipulate both diagnostic (e.g., perceived fit) and non-diagnostic information (e.g., characteristic of the CEO). Also, in order to provide direct evidence of holistic and analytic processing, we measure not only brand extension evaluations but also include a thought-listing task in experi-

ment 2. The study employs a 2 (culture: Western vs. East Asian) X 3 (perceived fit: high, moderate vs. low). Once again, Korean and the U.S. represent cultures in which people favor holistic and analytic thoughts, respectively. The fictitious brand (Zenet) was described as a leading brand in manufacturing high quality cameras and lenses. Our extension categories included digital cameras (high fit), sunglasses (moderate fit) and vacuum cleaners (low fit). All non-diagnostic information was negative in this study. Our results suggest that when the perceived fit (diagnostic information) between the parent brand and the extension is high, consumers in both Western and East Asian cultures evaluate the extension equally favorably. However, as the perceived fit decreases, consumers in East Asian cultures are likely to incorporate more non-diagnostic information (negative) and evaluate the extension less favorably than consumers in Western cultures. Consistent with our expectations, we found no difference between Korean and American consumers' extension evaluations when the perceived fit was high. Importantly, we also found that Koreans evaluated the extension less favorably than the Americans under both moderate and low fit conditions. Consistent with our expectations, the proportion of diagnostic thoughts was higher for Americans (vs. Koreans) under both moderate and low fit conditions.

ROUNDTABLE

Is it Worth It? If So, Research It: Exploring the Place of Diversity Research in Marketing

Discussion Leaders:

Geraldine R. Henderson, Howard University

Carol M. Motley, Howard University

As we all know, Marketplace Diversity has become one of the most important pursuits in marketing practice as of late. Given the changing demographics of the U.S. in particular, and the world, in general, it is no surprise that profit-maximizing firms would seek to make themselves as attractive as possible to previously underrepresented global consumer segments (as defined by race, gender, sexual orientation, etc.).

Although it has not been our practice as marketing academics to concern ourselves with the currency of marketing practices, many have paused (individually and/or collectively) to wonder why multicultural research has not found a bigger place in the marketing literature. In this ACR Roundtable, it is our interest to understand why such research has not found a firmer footing in our field as it has in sociology, psychology, economics, anthropology, and even marketing practice.

One of the primary issues to be discussed will be what marketing scholars think is “valid” or not—also known as “what’s the underlying construct?” Currently, there is no consensus on what some of these acceptable constructs and theories are that adequately account for observed marketplace diversity phenomena. Those who do research in this area need to talk about to make sure we are handling culture, race, ethnicity, gender constructs in rigorous ways and ensure that these have broader understanding, recognition, and application.

SPECIAL SESSION SUMMARY

Context Effects in Choice

Alexander Chernev, Northwestern University

The importance of context effects has been underscored by numerous researchers in the field (Bettman, Luce, and Payne, 1998; Simonson and Tversky 1992). Building on the existing literature, this session investigates the impact of context on choice from three different theoretical perspectives.

The first presentation by Chernev examined how traditional context effects, such as extremeness aversion, are affected by the internal properties of choice alternatives. It was proposed that the compromise effect is not only a function of the relational properties of the choice alternatives but also depends on the proximity of the attribute ratings describing each of the alternatives. This proposition was tested in a context in which one of the choice alternatives was scale-equivalent, that is, it had equal values on both attributes. The data from two experiments showed that the presence of such alternatives can fundamentally change consumer evaluations of the extremeness of the options in the choice set.

The second presentation by Nowlis, Dhar, and Simonson examined the impact of context effects by focusing on the role of different types of tradeoffs that consumers must make when deciding how much of an item to buy. For example, consumers must often make tradeoffs between different levels of brand equity, price, flavor, size, and nutritional information. It was proposed that when consumers make multiple tradeoffs, the order in which these tradeoffs are considered can affect the overall amount that is chosen, due to differences in the manner in which different types of tradeoffs are resolved. In this context, it was argued that tradeoffs involving positive associations are likely to be resolved by purchasing several options whereas tradeoffs involving negative associations might lead to a lower purchase incidence.

The third presentation by Gershoff and Kivetz investigated the role of context effects in choice by examining how existing products may serve as the reference for fairness evaluation and choice of newer versions. The authors show that fairness perceptions and choice are highly sensitive to differences in common production methods: disabling alternatives (i.e., “versioning”), enhancing alternatives, or producing alternatives using different processes. Three studies demonstrated that the interaction between marginal costs and counterfactual thinking underlies the detrimental effect of versioning on fairness judgments and subsequent purchase behavior.

At the end of the session, Joel Huber led the discussion to integrate the individual presentations into a more general framework. He noted that the research presented defines three novel context effects that can be easily characterized: The first paper tells us that balance matters, the second that the agenda matters, and the third that the story matters. He further noted that these are all interesting and compelling context effects in their own right. The discussion underscored the importance of developing a broader perspective on the role of context effects to investigate the impact of the decision context on consumer choice.

“Context Effects without Context: Scale-Equivalence and Attribute Balance in Choice”

Alexander Chernev, Northwestern University

One of the major findings that have emerged from recent decision research is the presence of extremeness aversion in choice (Simonson and Tversky, 1992). The principle of extremeness aversion predicts that adding an adjacent nondominated alternative

will draw a larger share from the extreme than from the middle alternative. To illustrate, consider a set of two-dimensional alternatives $\{x, y, z\}$ such that y is between x and z (e.g., $x_1 < y_1 < z_1$ and $x_2 > y_2 > z_2$). The extremeness aversion principle predicts that because y has smaller advantages and disadvantages with respect to x and z , whereas both x and z have larger advantages and disadvantages with respect to each other, y will be preferred in the choice set $\{x, y, z\}$ relatively more than in either of the sets $\{x, y\}$ and $\{y, z\}$.

An implicit assumption of the extremeness aversion principle is that decision makers rely exclusively on the choice context to determine the extremity of each alternative, such that advantages and disadvantages of each alternative are defined relative to each other. In this context it is assumed that the middle option, defined such that its attribute values are between the values of the other alternatives, is always the option that becomes the compromise choice. The assumption that the middle option becomes the compromise is also very intuitive because the values of the middle alternative on each of the attributes lie between the values of the other, more extreme options.

Research presented in this article challenges the assumption that extremeness aversion is based only on the relational properties of the choice alternatives. It is argued that in certain cases individuals can use the available attribute ratings to construct reference points that are in turn used to evaluate the extremity of the choice alternatives. In this context, I propose that the middle option is not always the compromise alternative, and that in some cases one of the adjacent options can actually become the compromise. The viability of this proposition is tested by identifying a scenario in which individuals are likely to form a reference point that differs from the reference point implied by the relational properties of the alternatives. To illustrate this scenario, I introduce the notion of scale equivalence and discuss how the presence of scale-equivalent alternatives might affect extremeness aversion in choice.

Consider four alternatives, each described on two attributes as follows: A (50,70), B (60,60), C (70,50), and D (80,40), where the numbers in parentheses reflect an option's ratings on each of the two attributes. Note that option B has a unique property: it has equal values on both attributes. I refer to this option as the scale equivalent and argue that it can fundamentally change consumer evaluations of the extremeness of the options in the choice set.

How might scale equivalence of an option in the choice set affect consumer decisions? This research argues that scale equivalence is likely to make the adjacent option B a reference point in extremeness judgments and, as a result, this option will be perceived to be less extreme relative to the other alternatives in the set. This argument leads to the counterintuitive prediction that in the set BCD the compromise alternative is not option C, as predicted by prior research, but the scale-equivalent option B. Consequently, it is argued that adding option D to the set BC will not necessarily increase the share of option C because the latter might not be perceived as the compromise option.

Data from two studies document the impact of scale equivalence on extremeness aversion in choice. It is shown that scale equivalence of an alternative increases the likelihood of this alternative being perceived as the compromise option and subsequently being chosen by an extremeness-averse person. Both qualitative and quantitative analyses of consumers' rationale for selecting the compromise option suggest that the scale-equivalent alternative is

likely to become the compromise alternative due to the parity of its attribute ratings. In fact, the scale-equivalent alternative was commonly referred to as the middle option even when it was one of the adjacent alternatives in the set. Consumers also indicated that the selection of the scale-equivalent alternative is both easier to justify and less likely to be criticized.

The data offered by the second experiment provide insights into the boundary conditions of the scale equivalence effect, documenting its contingency upon individuals' information-processing strategy. In this context, the scale equivalence effect was found to be less pronounced in the context of a decision task designed to induce attribute-based processing of the available information. This finding offers a new perspective on the common assumption that, when evaluating an option's extremeness, consumers compare its values attribute-by-attribute across all alternatives. Contrary to that assumption, the data show not only that within-alternative attribute comparisons can occur, but also that the effects of these comparisons on extremeness aversion can be stronger in relative terms than the cross-alternative attribute comparisons. More generally, this finding suggests that the evaluation of an option's values on a given attribute can also be a function of how its scaling properties relate to the scaling properties of the other attributes describing the same option.

“The Effect of Tradeoff Resolution Order on Consumer Choice”

Stephen M. Nowlis, Arizona State University

Ravi Dhar, Yale University

Itamar Simonson, Stanford University

Consumer choice consists of brand, incidence, and purchase quantity decisions. In contrast to standard choice models, both brand choice and choice incidence have been shown to be influenced by the context (e.g., Nowlis and Simonson 1997; Dhar and Nowlis 1999). However, while there has been some prior research on how much is chosen (e.g., Wansink, Kent, and Hoch 1998), a question that is still unanswered in the literature is whether the purchase quantity decision will also be systematically influenced by the choice context. In this research, we focus on how the order in which attribute tradeoffs are resolved can impact the amount and variety of a product that is chosen. Since consumers typically consider incidence, brand choice, and purchase quantity decisions, the interaction between them is important to get a better understanding of consumer choice in the marketplace.

Prior work on brand choice and choice incidence has shown that decision conflict is an important variable in determining what is chosen and whether a choice is made. This research has found that increased conflict can result in the greater choice of a status quo option (Luce 1998) or an increased tendency to defer a choice (Dhar 1997). In our research, we build on this work to suggest another important consequence of decision conflict; namely, that it can also affect the amount that is chosen. In particular, we propose that as the decision becomes more difficult, consumers will resolve this difficulty by choosing a greater overall amount and greater variety. By spreading out the choice of options among several different product configurations, consumers can reduce the difficulty of the decision.

If the purchase quantity decision is affected by decision difficulty, this can have important consequences for decision making that occurs in stages. In particular, consumers often resolve attribute conflict in a specified sequence. For instance, a consumer in a store might see products organized by one type of attribute (e.g., brands), and then decide among different levels of that attribute before deciding on the next attribute (e.g., sizes). We propose that the order in which these tradeoffs are resolved will have a system-

atic effect on the amount that is chosen. In particular, if a more difficult attribute is faced in the first stage of a decision, we predict that the consumer will then choose more of this attribute than if an easier attribute were considered in the first stage of the decision. When more of an attribute is chosen in the first stage, this will translate into more chosen in the second stage as well. For instance, if a consumer decides among different brands before deciding among different sizes, that consumer might choose more than if the size decision preceded the brand decision.

We conducted a number of studies which support our framework and predictions. These studies manipulated the order in which tradeoffs were considered, and the types of tradeoffs that were required. Across the experiments, we find that when a more difficult attribute is encountered in the first stage rather than the second stage of the decision, more overall is chosen and more variety is chosen. Furthermore, this effect is mediated by the amount of conflict felt in the decision. We also show that when the conflict in an attribute decision is reduced, this eliminates the effect of order on amount chosen. Finally, we extend our results to situations involving negative tradeoffs, and examine the implications of our findings for the way in which products are organized on store shelves.

“The Psychology of Versioning: Context Effects and Counterfactual Thinking as Determinants of Fairness Perceptions and Choice”

Andrew D. Gershoff, Columbia University

Ran Kivetz, Columbia University

Firms often produce an assortment, or line, of different versions of their products to offer to consumers. For example, HP sells computer printers that print at 15, 19, and 25 pages per minute. There are a number of ways that firms can manufacture these different versions of their products (Shapiro and Varian 1998). First, firms may use entirely different production processes. Alternatively, firms may create different versions using largely the same processes by producing a base product and making adjustments to it. For example, firms may produce value-enhanced versions by taking an existing product and augmenting it in some way to make a new version of the product. Firms may also create value-subtracted versions by taking an existing product as a base and offering it as a new product with some of its features disabled. This method, labeled by Shapiro and Varian (1998) as “versioning,” is commonly used to produce different versions of software and often hardware. Note that while value-enhancing costs the firm more to produce a more preferred alternative, value-subtracting costs the firm more to produce a less preferred option. The present research proposes that consumer preference and perceptions of product alternatives will be systematically affected by the method employed to create the product version.

Prior research has shown that a consumers' willingness to pay for an alternative may be influenced by the perception of the fairness of the alternative's price (Campbell 1999; Kahneman, Knetsch and Thaler 1986). Consumer perception of price fairness is proposed to be governed by a rule of “dual entitlements” that suggests that buyers are entitled to a price and sellers are entitled to a profit (i.e., price minus marginal cost) associated with a reference transaction (Kahneman et al. 1986). Higher prices compared to the reference transaction are perceived as unfair if the firm's costs have not changed. However, when a firm's costs increase, a higher price is perceived as fair.

Recent research has suggested that consumers may use a number of potential reference transactions in their evaluation of fairness including past prices, competitors' prices, and vendor costs (Bolton, Warlop, and Alba 2003). We suggest that alternative

versions of a product offered by a firm will also serve as a reference, allowing consumers to use one version of the product to evaluate the fairness of the exchange for another version. For instance, an original version of the product may become the reference transaction against which the fairness of the exchange for a newer version can be judged. Further, using theory on counterfactual reasoning (e.g., Kahneman and Miller 1986) and fairness to develop hypotheses, it is proposed that compared to versions that are created by different processes and by value-enhancement, value-subtracted versions reduce (or even reverse) the perceived differences between the versions in terms of the marginal cost, effort, and time for the firm to produce. Thus, consumers will perceive the manufacturing process to be less fair and be willing to pay less for value-subtracted versions compared to identical alternatives that are described as being produced by different processes or value-enhancement.

Three completed studies test the robustness of the effects in terms of evaluation of products within a firm as well as choice of alternatives between firms. In study one, one hundred and seventy six respondents were provided with "Consumer Reports" information about identical computer printers that differed only in terms of pages printed per minute and a description of the manufacturing process. The descriptions were based on actual processes used in the industry. Depending on condition subjects were told either that the company added a computer chip to the slower printer to produce the faster printer (enabled condition), that the company added a chip to the faster printer to produce the slower printer (disabled or versioning condition), or that the two printers were made with different circuitry (different process condition). Respondents preferred the slower printer less, were willing to pay less for it, and rated the manufacturer as less fair in the disabled (versioning) compared to the enabled or different process conditions. No such difference was found for the faster printer.

Study two further investigated versioning effects in a choice setting as well as explored the asymmetry found in study one. Specifically, study two examined how perceptions of fairness depend on whether consumers are considering purchasing the base product from which a new version has been created or the new version that has been created from a base product. One hundred and forty six respondents participated in the between-subjects 3 (production method: different processes, enabling, disabling) X 2 (consumer perspective: considering the base vs. new product) design. In all conditions, respondents made a choice between two brands of printers that were both described by "Consumer Reports" as printing 15 pages per minute (X-15 and Y-15). Additional information described the "Brand X" manufacturing process as well as another "Brand X" printer that was not under consideration by the respondent. Depending upon condition, either the X-15 printer under consideration was a base for the other printer, the other printer was a base for X-15 printer, or the two were described as being independently produced. Additionally, the production method was described as either changing the circuitry to enable the printer to print faster (enabling condition), disable the printer so it prints slower (disabling or versioning condition), or using separate circuitry (different process condition). Results indicated an interaction between production method and consumer perspective. Choice share, preference, and ratings of fairness were lower for respondents considering an otherwise identical printer in the versioning condition when the printer was described as being the result of a disabled faster printer compared to being the base used to produce a disabled slower printer. No similar differences in choice share, preference, or ratings of fairness were found between printers in the enabling conditions.

Study three examined the key role of counterfactual reasoning and marginal costs in determining perceptions of fairness and subsequent purchase of versioned products. The results indicate that the violation of a basic principle—that lower quality products should cost less to produce—underlies the detrimental effects of versioning tactics. Further, when the relationship between quality and marginal cost is (counterintuitively) negative, consumers engage in increased counterfactual thinking, which mediates these effects. Additional studies are currently being conducted to further explore the underlying mechanisms and boundary conditions of the effect of versioning on perceived fairness and consumer choice.

How Regulatory Focus Influences Consumer Evaluations, Judgments and Choices

Utpal M. Dholakia, Rice University

“Factors Determining the Persuasiveness of Promotion- and Prevention-focused Appeals”

Ginger L. Pennington, Jennifer L. Aaker, & Neal J. Roese

An increasing amount of empirical evidence points to the important role of consumers' underlying motivational states in shaping reactions to marketing stimuli. Advertisements and persuasive messages often convey “motivationally loaded” information that may encourage consumers to view a product or service in either approach or avoidance terms. For example, promotion-focused advertisements emphasize the attainment of optimal outcomes (such as getting a great deal), whereas prevention-focused messages emphasize safety from unwanted outcomes (such as paying too much). An important issue for marketers is to understand the conditions under which messages of each type are most likely to result in favorable consumer attitudes. The present research examines two factors that influence the effectiveness of promotion-versus prevention-framed messages: a consumer's temporal perspective and level of construal (i.e., emphasis on concrete versus abstract ways of thinking).

Recent findings (e.g., Pennington & Roese, *in press*) suggest that a promotion focus on potential gains tends to predominate when a goal lies in the distant future. As the time to goal realization nears, however, emphasis on promotion declines to a level on par with prevention concerns. The current research examines the implications of this process for consumer evaluation. In the first study, we examined whether the amount of time until a purchase would influence the persuasiveness of promotion and prevention-framed messages. Based on the previously observed temporal pattern of regulatory focus, we hypothesized that consumer attitudes towards persuasive messages would be most positive under conditions of “fit” between regulatory focus and temporal perspective (i.e., promotion-focused ads /distant purchases, and prevention-focused ads /proximal purchases).

In Study 1, participants imagined themselves in a purchasing situation (automobile purchase) that was described as distant (one month away) or proximal (2 days away). Participants were then presented with a promotion- or prevention-framed persuasive message. The promotion-framed message emphasized the presence of positive outcomes (e.g., “the satisfaction of getting a good deal”), whereas the prevention-framed message presented the same information but focused on the absence of negative outcomes (e.g., “the satisfaction of never paying too much”). As expected, the promotion-framed message resulted in higher purchase involvement and more favorable attitudes than the prevention-framed message for participants in the distant condition. When participants anticipated a more immediate purchase, however, the opposite pattern of preferences emerged. These results suggest ways in which managers might effectively target consumers at different stages in the purchasing process.

A factor closely intertwined with temporal perspective is the extent to which individuals construe events on an abstract versus concrete level. Recent work by Liberman, Trope, and others (e.g., Liberman et al., 1999), for example, has shown that increasing temporal distance broadens individuals' thinking, leading people to focus more on the ultimate meaning of an event as opposed to its concrete details. Given this correspondence between temporal perspective and cognitive construal, we hypothesized that cogni-

tive construal would serve as an important moderating factor in determining the persuasiveness of promotion- and prevention-focused appeals. A second study was designed to test whether consumer attitudes towards advertisements would be most positive under conditions of “fit” between regulatory focus and construal. Study 2 examined the hypothesis that promotion-focused messages would be most persuasive when framed at an abstract level (the type of thinking typically adopted for distant events), whereas prevention-focused messages would be most persuasive at a concrete, detail-oriented level (the type of thinking adopted for proximal events).

In Study 2, participants evaluated one of four types of advertisements for athletic shoes. The text of each message was altered to manipulate regulatory focus (promotion/prevention) and construal (abstract/concrete). The predicted interactive effect of regulatory focus and cognitive construal was confirmed for consumers' attitudes towards the brand, attitudes toward the advertisement, and behavioral intentions. Results indicate that this effect was driven primarily by the preference for low- versus high-level construal in the prevention-focus condition. Consistent with our hypotheses, consumers appear to react most favorably to detail-oriented product appeals when prevention or loss-avoidance goals are emphasized.

The results of this research emphasize the importance of regulatory focus in shaping consumer responses to persuasive messages and identify two key factors that moderate the influence of promotion and prevention-framed messages on consumer attitudes. Our results suggest that marketers should pay careful attention to emphasizing “fit” between regulatory focus, temporal framing, and cognitive construal when designing persuasive appeals.

“When Do Consumers Use Conceptual Versus Experiential Processing Heuristics?”

Rui Zhu & Joan Meyers-Levy

Existing literature suggests that there are at least two ways in which consumers may render product judgments when their processing motivation is limited. One means entails relying on common-sense implications associated with a salient conceptual cue. For example, research indicates that relatively unmotivated consumers often focus on conceptual cues consisting of salient consensual data (Maheswaran and Chaiken 1991), such as a summary statistic that reflects the general public's views about the focal issue (e.g., 70% of consumers prefer Coke). In such a case, they generally base their judgments on the perceived favorableness of this conceptual cue (e.g., they simply reason that if 70% of consumers prefer this brand, it must be good). We refer to these sorts of salient logic-based cues that can serve such a heuristic purpose as conceptual heuristic cues.

A second far less investigated means of judgment formation entails relying on individuals' internal, experiential sensations that they happen to feel at the time of judgment formation (e.g., Meyers-Levy and Malaviya 1999). Here, individuals base their judgments on nonsemantic, subjective body sensations that they may experience upon exposure to some data. This occurs frequently because they (mis)attribute the sensation to the appeal of the focal issue or object. For example, exposure to a product message that contains pictures of highly attractive people may induce the consumer to experience spontaneously a very positive visceral sensation. This

sensation, then, may be misattributed to the actual attributes of the target object, prompting the individual to ascribe a highly favorable judgment to the product. We refer to the data that engenders such experiential sensations as experiential cues.

Using regulatory focus theory as the conceptual framework, the current research explores whether these two mechanisms are indeed distinct and aims to identify moderating factors. A growing stream of empirical studies suggests that people's regulatory focus influences their strategic inclinations, including their risk preferences. For example, Crowe and Higgins (1997) showed that individuals with a promotion focus apparently experienced a visceral state of eagerness or zeal, which caused them to use relatively risky strategies. In contrast, individuals with a prevention focus appeared to be cool-headed, vigilant and possibly conceptually focused, which prompted them to employ conservative strategies. Yet another instance of support is offered in the research of Meyers-Levy and Peracchio (1996). They found that individuals who focused on positive outcomes, responded in a similar manner as did those who by disposition tended to rely on their experiential sensations. By contrast, individuals who focused on negative outcomes, responded in a like manner as did those who by disposition relied on more rational, conceptual material.

The preceding findings suggest the possibility that promotion and prevention focus individuals may be differentially sensitive to experiential data versus conceptual information. Specifically, we hypothesize that under fairly low motivation conditions, individuals who adopt a promotion (prevention) focus will be more sensitive to and base their judgments on the implications of experiential (conceptual) cues versus conceptual (experiential) cues.

To test the proposed thesis, the following study was conducted. First, to limit processing motivation, participants took part in a computer survey in large groups and were informed that they could leave as soon as they finished the study. Next, participants performed an initial task intended to manipulate their adoption of either a promotion or prevention focus. Following this, participants were shown several ads. The target ad touted a new brand of athletic shoes. The target ad displayed a salient headline, a clear picture of the shoes, several claims about the shoes' features, and pictures of a number of people who presumably used the shoe, each annotated by a quote that extolled a shoe benefit. Both a conceptual and an experiential heuristic cue were represented in the ad, which were otherwise identical. Specifically, these two types of cues varied in favorableness orthogonally such that when the conceptual (experiential) cue was positive, the experiential (conceptual) cue was negative. The ad headline presented the conceptual heuristic cue. In the positive conceptual cue condition, it stated that in tests, 7 out of 10 consumers preferred the target brand of shoe. In the relatively negative conceptual cue condition, this statistic was 5 out of 10. The experiential cue came in the form of the pictures of the presumed users of the shoe. The favorableness of this cue was manipulated by varying the visual attractiveness of the users. Either they looked like the type of attractive people typically displayed in ads (e.g., well groomed and fit) or they appeared more average looking and realistic (e.g., less perfect facial and body appearance). Next, participants were administered judgment as well thought-listing measures. Finally, they completed an individual difference scale on private self-consciousness (Fenigstein, Scheier, and Buss 1975), which assessed the extent to which one attended to his or her inner feelings or sensations. We anticipated that the aforementioned predictions might only occur for participants who, by disposition, are relatively high versus low in private self-consciousness.

Consistent with our theorizing, findings revealed that promotion focus individuals based their judgments on the favorableness of the

experiential cue and judged the target product more favorably when this cue was more favorable (and the conceptual cue was relatively unfavorable), whereas prevention focus individuals based their product evaluations on the favorableness of the conceptual cue, producing more favorable judgments when that cue was more favorable (and the experiential cue was relatively unfavorable). Moreover, such effects only occurred for participants who were chronically high versus low in private self-consciousness.

“Sequent Impulsive Choices Within a Consumption Episode: The Role of Regulatory Focus”

Utpal M. Dholakia and Richard P. Bagozzi

Trips to the mall or the supermarket are examples of *consumption episodes*, in which consumers make many purchase or consumption decisions within a short and contiguous window of time (Dhar and Simonson 1999). *Sequent choices* in such consumption episodes, i.e., choices made soon *after* one or more prior choices, have generally been studied by researchers using a *cognitive lens*. For instance, a large body of research on context effects shows that information processed during prior choices influences such aspects of a sequent choice as which attributes are used, how they are weighted, and which alternative is chosen by consumers (e.g., Dhar and Simonson 1999; Simonson and Tversky 1992).

But such choices are also influenced by the consumer's motivational state. For instance, when many tempting products and offers are encountered by the consumer one after the other during a shopping trip, choices to purchase or not purchase may often times be impulsive in that they are made without any prior planning, springing instead from a sudden and intense desire to act (Baumeister 2002; Rook 1987). In this paper, our interest is in studying how sequent impulsive choices are influenced by prior impulsive choices within a consumption episode, from a motivational perspective.

In contrast to research on cognitive contextual influences, we argue that independent of the attributes or strategies of prior choice, *the motivational state of the consumer* is influenced through the process of engaging in the prior choice within a consumption episode, and this in turn, can influence how sequent choices are made afterward. Specifically, we hypothesize that participating in a prior impulsive choice will mitigate the impulsivity of choice in the sequent task within a consumption episode. We call this the *sequent mitigation effect*, and argue later on that the basis of its influence is motivational, in that it occurs because the sequent choice task *musters a lower level of desire on account of having participated in a previous impulsive choice beforehand*. In Experiment One, we provide evidence of this effect by showing that participants responding to an impulsive choice scenario choose significantly less impulsively when it is presented *after a prior impulsive choice scenario* relative to when it is presented first.

Further, in seeking to understand possible mechanisms underlying this effect, we consider the role of the consumer's regulatory focus as a moderator. We hypothesize that a promotion focus should maintain the consumer's desire to choose impulsively in the sequent choice, whereas a prevention focus should reduce the consumer's desire in the sequent choice. Our emphases in this research is on those aspects of the two regulatory foci that influence the experience of desires. Emerging research shows that under a promotion focus, the individual's strategic inclination is to *approach matches to desired end-states*. Such individuals are therefore more eager to avoid *errors of omission* (i.e., missing an emerging opportunity for accomplishment), resulting in a reflexive inclination to act. In contrast, a prevention focus fosters a tendency to *avoid mismatches to undesired end-states*, with an orientation toward maintaining the status quo. Such individuals prefer cogni-

tive or behavioral courses that avoid *errors of commission* (i.e., making a mistake from acting rashly). Several studies support these differences (e.g., Crowe and Higgins 1997; Liberman et al. 1999).

These findings all provide support for our reasoning that the orientation of open-mindedness, the preference for change and risk-seeking all fostered by the promotion focus, should be conducive to triggering desire again in the sequent impulsive choice, even after having participated in a prior choice. In contrast, an orientation of risk-aversion, the preference for stability and caution supported by the prevention focus, should lead to a reduced desire in the sequent choice task. As a result, those with a promotion focus should show little or no mitigation of impulsivity, whereas those with a prevention focus should show a marked mitigation, in the sequent choice task.

We consider both, dispositional and situational aspects of regulatory focus, studying its role as a situational variable in Experiment Two, and as a dispositional characteristic in Experiment Three. In Experiment Two, we tested these hypotheses by temporarily increasing the accessibility of regulatory focus among our participants through emphasizing either potential gains or potential losses. In Experiment Three, where participants were shoppers in malls in six US cities, we conducted the study through self-administered computer kiosks used for commercial marketing research. In this case, we measured the participants' regulatory focus through the elicitation of their chronic sensitivities to positive and negative outcomes.

In all three Experiments, our hypotheses were generally supported. Interestingly, we also found that the first choice of participants responding to both choices did not significantly influence impulsivity of second choice, ruling out a strictly cognitive explanation for our results. We wish to present the results of these three experiments at ACR.

SPECIAL SESSION SUMMARY

The Positive and Negative Consequences of Materialism: What Are They and When Do They Occur?

Marsha Richins, University of Missouri

SESSION OVERVIEW

This session explored how materialism, defined as the value placed on material wealth and possessions, results in poor outcomes for the individual, and why, nonetheless, this value persists. In the first paper, Shaw et al. developed and tested a model based on judgment theory to explain how materialism results in reduced life satisfaction and emotional well-being. According to judgment theory, the gap between an individual's current standard of living and his or her reference standards may be presumed to have a direct effect on satisfaction with standard of living. However, little research has sought to determine whether individuals readjust their expectations for standard of living over time or how this process is influenced by materialism. In the second paper, Wang and Wallendorf sought to test how materialism affects the re-setting of product expectations and other reference standards, thus influencing the duration of satisfaction with purchases. The third paper (Bhojwani and Frost) examined how culture may moderate the effect of materialism on compulsive behaviors, including hoarding.

This session provided an interdisciplinary forum for the evaluation of materialism's outcomes. The authors included scholars from fields such as marketing, communications, pharmacy, and psychology. The target audience included researchers interested in materialism and its consequences; those working on macro-level issues; those interested in values, consumer satisfaction and dissatisfaction, consumer culture, and cross-cultural issues; and those interested in consumer behavior's broader consequences.

Taken together, the results of these papers provide the foundation for a discussion of recurring puzzles, such as how and when materialism persists in individuals and in societies despite many negative physical, emotional, consumption, and social outcomes. O'Guinn has suggested that the paradoxical persistence of materialism is due in no small part to the construct itself being a product of modernist critiques of market capitalism. Stepping outside of that 150-year old perspective may allow us to better understand why materialism is much more than the problematized "*-ism*" of the therapeutic ethos.

"The Effect of Materialism on Emotional Well-Being and Life Satisfaction: An Application of Multiple Discrepancies Theory"

James W. Shaw, Ada Leung, and Melanie Wallendorf, The University of Arizona

Materialism has been defined as an orientation that reflects the importance a consumer attaches to worldly possessions. Belk (1985) and others have suggested that it is a manifestation of psychological traits such as envy, non-generosity, and possessiveness. However, Richins and Dawson (1992) have argued that materialism is better characterized as a value that guides people's choices and conduct in a variety of situations. According to these researchers, it is the value that an individual places on the acquisition and possession of material goods. Most recent studies, in addition to this work, have adopted the value concept of materialism over earlier trait-based concepts.

According to Belk (1984, 1985), the three traits that best characterize materialism (i.e., envy, possessiveness, and non-generosity) bear weak to moderate negative correlations with happiness and life satisfaction. Others using Belk's definition have

reported materialism to be negatively correlated with material satisfaction (Dawson 1988) and positively correlated with social anxiety (Schroeder and Dugal 1995) and measures of depression (Wachtel and Blatt 1990). Studies that have treated materialism as a value as opposed to a negative trait (e.g., Richins 1987; Richins and Dawson 1992) have generally yielded similar findings.

Most researchers have reported a direct empirical relationship between materialism and subjective well-being. However, a direct association seems theoretically implausible if one defines materialism as a value instead of a trait. Guided by the work of Michalos (1985, 1991), a model was developed using multiple discrepancies theory (MDT) to explain why materialistic individuals report high levels of depression and anxiety as well as dissatisfaction with life. Consistent with the concept of vertical spillover, this theory posits that material well-being (i.e., an individual's happiness or satisfaction with his or her standard of living) has direct effects on life satisfaction and emotional well-being. Material well-being is influenced by the individual's evaluation of his or her perceived standard of living against set aspirations. These aspirations, in turn, are a function of evaluations of perceived standard of living against social referents and perceived needs. It is argued that materialists evaluate their standard of living poorly due to unreasonably high goals and expectations. This leads to reduced material well-being, which exerts negative effects on emotional well-being and life satisfaction.

A cross-sectional survey was conducted to collect data to test the model. Ninety students enrolled in an undergraduate marketing class at The University of Arizona administered a questionnaire battery to a quota sample of community respondents living in Tucson, Arizona. The sample was stratified by sex (male, female), age (21-40, 41-65), and social class (working, middle, upper middle).

The measures included in the questionnaire were selected or developed after a careful review of the extant literature. Materialism was assessed using Richins and Dawson's (1992) Material Values Scale. Emotional well-being was measured using the 18-item RAND Mental Health Inventory (Veit and Ware 1983). Life satisfaction was assessed using the five-item Satisfaction with Life Scale (Diener et al. 1985). A suitable measure of material well-being could not be found in the literature. Ergo, a new measure (the Material Well-Being scale) was constructed to assess positive affect, negative affect, and satisfaction related to standard of living. Perceived discrepancies between current standard of living and eight reference standards were assessed using modified versions of items employed by Michalos (1985, 1991) in validating MDT. Social support and self-esteem, which were treated as mediators in the model, were measured using the six-item Social Support Survey (Sarason et al. 1987) and four items from the Rosenberg Self-Esteem Scale (1965), respectively.

A total of 737 questionnaires were completed, of which 405 (55%) were checked for data integrity. The structural model was tested using a generalized method of moments instrumental variables estimator. Materialism, material well-being, emotional well-being, life satisfaction, social support, and self-esteem were treated as latent variables. The variables were centered prior to estimation to reduce multicollinearity and to facilitate the interpretation of the coefficients.

The quota sampling approach appeared to work as expected. The mean (SD) age of respondents was 38 (12.4) years, and 55.8% of the sample was <41 years of age. Females comprised 51.4% of the sample. The distribution of respondents among social classes was fairly even, with 28.2% working class, 33.4% middle class, and 38.4% upper middle class. The Material Well-Being scale demonstrated excellent internal consistency (Cronbach's alpha of 0.90) and bore expected correlations with materialism ($r=-0.39, p<0.001$), emotional well-being ($r=0.50, p<0.001$), and life satisfaction ($r=0.59, p<0.001$).

Materialism was found to be negatively related to evaluations of standard of living against social references and perceived needs. These evaluations were positively related to material well-being. Material well-being was positively related to emotional well-being and life satisfaction, and the latter two constructs were also positively correlated. However, there continued to be a negative association between materialism and global measures of quality of life even after controlling for a direct relationship with material well-being.

While most of the model's hypothesized associations were validated, the results of this investigation suggest that MDT does not fully explain the relationship between materialism and global measures of quality of life. The authors' findings suggest that other theories, such as value conflict, should be used to supplement judgment theory when attempting to explain the materialism/quality-of-life relationship.

"The Influence of Materialism on Product Satisfaction"

Jianfeng Wang and Melanie Wallendorf, The University of Arizona

In the past two decades, materialism has become a widely-studied concept in the marketing field (e.g., Belk 1985; Burroughs and Rindfleisch 2002; Richins and Dawson 1992). Materialism has been connected to many constructs both as causes and as consequences (e.g., Fournier and Richins 1991; Rindfleisch, Burroughs, and Denton 1997; Sirgy 1998). In the consumer research realm, materialism has been defined as a personality trait (Belk 1985) or a value (Richins and Dawson 1992). The present paper treats materialism as a value and proposes that materialism impacts consumers' reasoning in evaluating their purchases, and thus impacts their post purchase satisfaction.

Consumer satisfaction has been defined as "the consumer's fulfillment response" (Oliver 1996, p. 13). A dominant theory of consumer satisfaction is expectancy disconfirmation (e.g., Oliver 1980; Oliver and DeSarbo 1988), which states that consumers' satisfaction/dissatisfaction is judged by whether the actual performance is better/worse than their a priori expectations (Oliver 1980). Spreng, MacKenzie, and Olshavsky (1996) argue that, in addition to expectations of products prior to purchase, the extent to which a person's desires are fulfilled by products is also important in evaluating satisfaction. It implies that satisfaction is not simply the result of comparisons of attributes or effects of ongoing emotions, but may also involve persistent individual values (e.g., materialism). The current paper integrates materialism, a crucial individual value, into the consumer satisfaction process in order to see its effects on consumer satisfaction over time. More specifically, we examine the extent to which materialism influences the duration of product satisfaction.

It has been suggested that although acquisitions enhance individuals' satisfaction temporarily, the pleasure derived from such improvements may wane quickly such that one's satisfaction reverts to its previous level (Richins and Rudmin 1994). Materialistic individuals have been found to have lower levels of satisfaction

with their lives in general and with their standard of living in particular (Richins 1987, Sirgy 1998). It is hypothesized in the current paper that consumers' satisfaction with purchased possessions wanes more quickly as materialism increases. It is not because they are dissatisfied in the beginning (right after the purchase), but because they have high (unrealistic) desires and thus expect more from the products. That is to say, high levels of materialism lead consumers to keep searching for products to bring them happiness and manifest their success. However, It becomes difficult for such consumers to remain satisfied with products over the long term due to their consciousness and awareness of the "better" ones that can optimally manifest their success and prestige.

Two hypotheses are proposed in this article. For products whose public meaning highly represents social and financial status, high-materialistic consumers' satisfaction with formerly purchased products should be significantly lower than that of low-materialistic consumers. However, the satisfaction difference should not be significant for recently purchased products. On the other hand, for products whose public meaning hardly represents social and financial status, there should be no significant difference between high-materialistic and low-materialistic consumers' satisfaction with either recently purchased or formerly purchased products.

A pretest was first conducted to find out what product categories should be used for this study. 54 undergraduate students were asked to evaluate to what extent the given 14 product classes have the ability to form impression of owners, tell owner's discretionary income, and show owner's social status. From the results of this 7-point scale, sunglasses ($M=5.14, SD=1.24$) and jeans ($M=4.60, SD=1.34$) are selected as "high status" product categories and sweatshirt ($M=2.81, SD=1.21$) is chosen as "low status" product category.

The *material values scale* developed by Richins and Dawson (1992) is selected for the current research. In the consumer behavior context, Richins and Dawson's (1992) definition of materialism (i.e., a life value) is more applicable than Belk's (1985) one in that materialism can be viewed as a value that consumers place on their acquisition and possession of material objects (Burroughs and Rindfleisch 2002). Oliver's (1980, 1996) universal product/service consumption satisfaction scale is used in the current research due to its high reliability and applicability to various product categories.

The study consists of 211 undergraduate students who did not participate in the pretest. For the product categories with high-status signaling capabilities (i.e., sunglasses and jeans), materialism has a marginally negative relationship with product satisfaction ($\beta=-.065, p<.07$). More interestingly, the interaction of materialism and duration of possession has a significant impact on product satisfaction ($\beta=-.261, p<.01$). The interaction of materialism and standardized price also has a significant impact on product satisfaction, but in a different direction ($\beta=.136, p<.01$). The interaction effects demonstrate that the (moderately) negative relationship between materialism and product satisfaction is amplified by longer the possessions or by lower the price paid. In contrast, for the low-status product category (i.e., sweatshirts), only the interaction of materialism and duration of possessions has a significant impact on product satisfaction ($\beta=-.170, p<.01$).

The results clearly manifest different patterns of satisfaction with high-status versus low-status product categories. Product meanings derived from high-status products may share differently with consumers of different materialistic beliefs. In comparison, low-status products' satisfaction may mostly come from utilitarian values that are evaluated similarly by consumers across materialistic measures.

“The Relationship of Materialism to Compulsive Hoarding and Indecisiveness in Indian and American College Students”

Kaamna R. Bhojwani, University of Illinois at Urbana-Champaign

Randy O. Frost, Smith College

Research on the construct of materialism has increased substantially in the last decade (Graham 1999). Much of this research has focused on two conceptualizations, the first by Belk (1985a, 1985b) and the second by Richins and Dawson (1992). Belk (1985a) views materialism as an object-oriented construct in which possessions are considered as a means to self-enhancement. According to Belk, materialism manifests itself in three traits: possessiveness, nongenerosity, and envy. He defines possessiveness as “the inclination and tendency to retain control or ownership of one’s possessions” (Belk 1985a, p. 291). Nongenerosity refers to “an unwillingness to give possessions to or share them with others” (Belk 1985a, p.291), while envy is “an interpersonal attitude involving displeasure and ill will at the superiority of (another person) in happiness, success, reputation or possession of anything desirable” (pg. 292). The Belk Materialism Scale was developed to measure these dimensions and is arguably the most widely used measure for that purpose (Ger and Belk 1990).

In contrast, Richins and Dawson (1992) define materialism as an organizing, central value leading to value orientations of three types: acquisition centrality, acquisition as the pursuit of happiness, and possession-defined success. Acquisition centrality occurs when people place possessions and their acquisition at the center of their lives. Acquisition as the pursuit of happiness suggests that acquisition is carried out for pleasure or self-satisfaction. Richins and Dawson (1992) explain that individuals are always in the pursuit of happiness. The pursuit of happiness by way of acquisition rather than any other means constitutes this aspect of materialism. Finally, possession-defined success refers to the tendency to judge one’s own and others’ success in terms of the quality of possessions had.

In order to understand the nature of materialism, the investigators sought to explore its relationship with another construct that also has the possession and acquisition of goods at its center. Compulsive hoarding, the acquisition of and failure to discard possessions that appear to be useless or of limited value (Frost and Gross 1993), has been found to be a significant subtype of obsessive-compulsive disorder in the United States (Leckman et al. 1997).

Several studies suggest that materialism exists throughout the world and that it is related to life satisfaction and general well-being (Dawson and Bamossy 1991; Keng et al. 2000; La Barbera and Gurhan 1997; Richins and Dawson 1992; Swinyard et al. 2001). However, the measurement of the construct of materialism in different countries has posed a problem. Similarly, few studies of hoarding behavior exist outside of the United States. This study sought to explore the relationship between materialism and compulsive hoarding in the United States and India, two large consumer societies. A construct related to hoarding, indecisiveness, was also studied in relation to materialism

Two hundred one college students from India and 130 from the United States completed the Belk Materialism Scale (Ger and Belk 1996), the Savings Inventory-Revised (SI-R; Frost et al. 2002), and the Frost Indecisiveness Scale (FIS; Frost and Shows 1993). The Materialism Scale had low to moderate reliability in both samples (alphas ranging from 0.57–0.65). The SI-R and its four subscales—clutter, difficulty discarding, acquisition problems, and interference—as well as the FIS were internally consistent in both samples (alphas ranging from 0.50 to 0.89). All scale scores were standard-

ized to reduce multicollinearity. An interaction term was created by multiplying the overall materialism score by nationality (dummy coded) to determine whether the relationship of materialism with hoarding and indecisiveness varied by culture. The authors elected not to include nationality as a main effect in their regression models since they were unsure that the absolute numbers would mean the same thing in India as in the United States. The poor reliability of the materialism scale reinforced this.

Regression analysis revealed significant associations of materialism with the hoarding scale and its four subscales as well as with indecisiveness. There were, however, no significant interactions, indicating that the relationship did not vary by country. These findings suggest that materialism in India relates to important constructs in the same way that it does in the United States. Further research on the development of a more reliable materialism scale as well as its relationship to other constructs in India is warranted.

DISCUSSANT'S COMMENTS

Hail, Hail Materialism

Thomas C. O'Guinn, University of Illinois at Urbana-Champaign

Let me start by saying that these are very good papers. They are careful, well thought out, and beautifully executed. As both sets of authors have noted, the philosophical traditions of materialism are long, complex and varied. The data do not fit ideologue's swollen form so smartly.

Having said that let me introduce some fairly heretical thought.

Suppose there is no such thing as materialism. By this, I mean that it is merely another -ism, socially constructed in the fine modernist tradition of the therapeutic ethos (Jackson Lears 1983, Marchand 1985). As such, it cannot meaningfully be separated from the traditional (meta-mantra) critique of modernity and market capitalism. It is the inevitable by-product of that discourse...and outside of that very particular discourse it is historically something different. As Michael Schudson (1984) so famously pointed out, there has never been a society that did not possess luxuries, or where things were just things. The entire human record consists of no place where materiality and luxury are absent. Such a place, such a time, are fictions. Tales of modernity's creation of materialism are a-historical and fictitious, but the flavor and nature of the critique itself is peculiar to modernity.

But is it not true that the modern marketplace, particularly branded objects, have brought materiality more to the center of society and culture? The answer appears to be, yes. Then, can we not discuss materialism in a meaningful way without running afoul of history? I think so, and I think these authors do that, but I still caution others.

So, just how meaningful is materialism, then? Should we care? How concerned should we be? Is this just an individual difference variable, normally distributed throughout contemporary society? Or, is it something much larger, something more endemic? Well, I believe it to be both, but the latter to be much more interesting. It is the historical trend, the epoch-flavored phenomenon, and the historically situated dynamics that really matter, at least to me. Of course, the really interesting questions are the political ones: who cares, how much do they care, and why do they care? That last one might actually keep you up at night.

Who benefits most from the charge and invocation of "materialism"? Given that all utterances are at some level political, there are beneficiaries to creating and sustaining -isms. I believe that we find our answer in those who have over time most often warned us about liking things too much, and jealously guarded adoration in general. Over the human record, it has most often been gods and kings who objected to materialism.. Gods and other rulers have historically guarded who and what one could worship. If one is to put no god before the real god, then the real god would have to be a jealous god...offering strict sanctions for the worship of things. Kings, by the way, are the same. They have historically preached against the people placing too much emphasis on things so as not to divert proper attention from just who should be worshipped and adored. This is Social Control 101. In American culture this institutional control is also deeply intertwined with our puritanical asceticism and guilt.

Further, all -isms are essential-izing. They reduce humans to pathology. The American Progressive movement used this to stigmatize a broad swath of human pleasures. And now, most post-modern puritans do the same.

Finally, if materialism exists...it may be a very good thing. One does not have to be Adam Smith to see the good emanating

from the pursuit of things.. Like it or not, things can lead to better and more pleasurable lives. Further, there is no pure pursuit of things...never has been, never will be... all material things come with meaning and social context. People never pursue just things.

I close by quoting James Twitchell (1999, p. 286):

We have not been led into this world of material closeness against our better judgment. For many of us, especially when young, consumerism is our better judgment. And this is true regardless of class or culture. We have not asked to go this way, we have demanded. Now most of the world is lining up, pushing and shoving, eager to elbow into the mall. Woe to the government or religion that says no.

Getting and spending has been the most passionate, and often the most imaginative, endeavor of modern life. We have done more than acknowledge that the good life starts with the material life, as the ancients did. We have made stuff the dominant prerequisite of organized society. Things "R" US. Consumption has become production. While this is dreary and depressing to some, as doubtless it should be, it is liberating and democratic to many more

WORKING PAPERS

Paradoxes, Ambivalences, and Consumer Coping Strategies of Food Biotechnologies

Ahmet Ekici, Bilkent University

Even though the concept of consumption paradoxes and its consequences such as consumer ambivalence and coping strategies have been studied in marketing and in other social sciences, as will be argued in this paper, the theory of paradoxes of consumption remained underdeveloped. The objectives of this paper are to review the relevant literature and identify gaps within the existing body of knowledge on consumption paradoxes, ambivalences and consumers' coping strategies. We also offer a specific consumption context (food biotechnologies) and argue that studying consumption of food biotechnologies can broaden our understanding of consumption paradoxes, ambivalences and consumers' coping strategies. Our long-term objective is to develop a more comprehensive theory of paradoxes of consumption.

Social scientists have argued the paradoxical nature of technology. Winner (1994), for example, argues that the same technology that creates radiant feelings of intelligence and efficacy also precipitates feelings of stupidity and ineptitude. In marketing literature, Mick and Fournier (1998) indicated that none of these arguments about technology paradoxes had been "corroborated or modified by consumer data" (p.125), and based on their research the authors noted that consumers' response to technology is paradoxical. An important area that did not emerge from Mick and Fournier (1998) research on technology consumption is the paradoxes that involve the relationships between self and the other (*society-based* paradoxes). In other words, paradoxes related to values, mores, and ethics have been left out in the previous models and conceptualizations of technology paradoxes. There may potentially be two reasons for these society-based paradoxes to be left out from the previous models: 1-Consumers do not recognize or feel such paradoxes, and 2- characteristics of the context used in previous works didn't evoke such paradoxes. Therefore, it becomes an empirical inquiry to find out if consumers recognize *society-based* paradoxes given a different context.

Research on paradoxes (technology or otherwise) has also dealt with coping strategies associated with these paradoxes. Conceptually, once individual recognizes a paradox related to the choice, this paradox produces mixed feelings (also known as ambivalence) and that conflict or ambivalence leads to a state of stress and anxiety. Finally, produced stress and anxiety lead to the selection of a particular (or a set of) coping strategy (see Mick and Fournier 1998). In previous conceptualizations, even though ambivalence emerges as a crucial (mediating) factor between paradoxes and coping strategies, no in-depth treatment to these feelings of ambivalence has been given. In other words, the role of ambivalences in connecting paradoxes to coping strategies has not been studied.

Prior research offers mixed results about the effect of ambivalence on consumer decision-making. More specifically, Celsi, Rose and Leigh (1993) reported that the desire to experience mixed emotions may actually motivate individuals to participate in certain activities. On the other hand, Lowrey and Otnes (1994) indicated that mixed emotions often result directly from interactions in, or structural features of, the marketplace and that ambivalence may in fact be a hindrance to consumers during the purchase process. Our knowledge about consumer actions (consumer behavior) when they are ambivalent is still in infancy, and therefore, when consumers experience ambivalence, their reaction to the situation (e.g. resolution of their mixed emotions through coping strategies) is equally important and interesting area for consumer researchers.

As mentioned earlier, Mick and Fournier (1998) argued that ambivalence produces stress and anxiety and such produced stress and anxiety lead to selection of particular coping strategy. A review of their study suggests that the identified coping strategies are essentially individual (or micro-level) strategies. However, as will be argued in this paper, coping strategies may not necessarily be limited to micro level, but may also include macro-level (social and cultural) strategies.

In summary, the purpose of this research is to study a consumption context that would allow us to inform our understanding of the paradoxes of technology consumption in a different way. Our long-term objective is to develop a theory for paradoxes of consumption by incorporating our findings within the existing body of knowledge. Some of the more specific research objectives are to understand: 1- whether consumers recognize society-based paradoxes, 2- the role of ambivalence in connecting paradoxes to coping strategies, and 3- macro as well as micro level coping strategies with paradoxes.

Potential contributions of the proposed study would be 1-incorporating society-based (moral, ethical) paradoxes with the earlier conceptualizations of technology paradoxes, and 2- exploring the relationship between paradoxes of technology consumption and other paradoxes of consumption that may combine in a particular decision domain. In addition, as indicated earlier, technology paradoxes lead to feelings of ambivalence and conflict, and to the selection of coping strategies. There is, however, no explanation of these feelings of ambivalence and the specific ways they link to the consumption paradoxes. Therefore, the proposed study would also offer 3- a new view for consumer ambivalence by exploring the direct linkages to paradoxes.

Tailoring the Design of Web Shopping Sites for both Product Browsing & Product Searching

Allan Harold, McMaster University

Brian Detlor, McMaster University

This paper reports preliminary results of the design requirements for Web shopping sites that wish to support both experiential browsing and goal-directed search. Information seeking is one of the five processes or stages in consumer buying behavior. However, implicit in this process is the idea that consumer information seeking largely comprises goal-directed behavior. This paper posits that consumer information seeking is inherently broader in nature, comprising both search and browsing activities. *Search* refers to occurrences where consumers actively seek out information pertaining to specific products or product categories with an intention to make a purchase decision. In contrast, *browsing* occurs when a consumer's objective is not necessarily an intent to buy, but rather an information seeking behavior that may be for informational or recreational purposes.

The central argument of this paper is that there is a need to support both goal-directed search and experiential browsing in online pre-purchase consumer behavior. It is suggested that the design of Web retailing sites must accommodate the primary information seeking mode of the online consumer to help users carry out their shopping activities. For marketers, doing so may result in more effective and efficient consumer interactions with Web-based shopping sites, leading to an increase in their perceived usefulness and ease of use, and greater consumer satisfaction.

At issue is how to do this. What are the best Web shopping site design scenarios that support product browsing and searching? What types of information are required in each mode? Are they the same or different? How should this information be displayed and presented to consumers in each of these modes? Do consumers have different expectations of information quality across these modes?

This paper explores answers to these questions. First, it presents a theoretical model derived from both the information systems and consumer behavior literatures of the constructs of Web shopping site design that might influence consumer behavior in browsing and search modes. The study's model consists of four dependent variables (perceived usefulness, perceived ease of use, satisfaction, and navigation metrics), two independent variables (browse and search), and two mediating variables (information focus, and information presentation).

Perceived usefulness is the degree to which an online consumer believes that using a particular Web shopping site would enhance his or her performance. *Perceived ease of use* refers to the degree to which a person believes that using the site would be free of physical and mental effort. *Satisfaction* pertains to the extent to which consumers are pleased or happy with utilizing the Web shopping site. *Efficiency* pertains to how fast a Web shopping site facilitates consumer browsing and search, while *effectiveness* concerns how well a Web shopping site supports consumers in their information seeking tasks.

In terms of *information focus*, Research suggests that when an individual is in a searching mode, the type of information they prefer has a narrow, precise focus, and often refers to the specific details of a single product, such as product specifications. This is in contrast to when they are browsing, where more general, diffuse product information about multiple products is important. Information is broader in focus when it provides diffuse information about a larger number of products. Information is narrower in focus when it pertains to a single product and provides extensive information about that product. It is hypothesized that when a Web shopping site with an information focus corresponding to a consumer's search or browsing mode, consumers will rate the Web shopping site higher in perceived usefulness, perceived ease of use, satisfaction.

With respect to *information presentation*, how information is displayed and formatted may have a different effect depending upon whether consumers are browsing or searching. It is hypothesized that when a Web shopping site presents information in a way that is conducive to a consumer's search or browsing mode, consumers will rate the Web shopping site higher in perceived usefulness, perceived ease of use, satisfaction, and attain higher efficiency, and effectiveness.

Next, the paper discusses an experimental design that places the consumer into either a browsing or searching mode, and manipulates the mediating variables outlined above and measures the extent to which these manipulations lead to improved outcomes within a simulated Web shopping environment, called Sparky's Electronics Online Store. This environment makes use of Amazon's Associates Web Services program to retrieve and display product information.

From there, the design a pilot study detailed. In this pilot, subjects are randomly placed in product browsing and searching modes and asked to utilize the Sparky's Electronics site to conduct their shopping tasks. Later, subjects are asked to rate their experiences with the Web site via a questionnaire. The Sparky's Electronics site manipulates the study's two mediating variables and measures consumers' navigation metrics while shopping. The questionnaire measures consumer reactions to these manipulations in terms of the study's remaining three dependent variables (perceived usefulness, ease of use and satisfaction). As such the experiment tests various potential layouts of information and features of a Web-based shopping site across scenarios of browse and search activities in order to determine the best layouts of Web design for shopping and the more salient mediating variables affecting consumer behavior with such designs.

Currently, the Sparky's Electronics online store and the survey instrument are under development. A pilot study will be conducted in the fall of 2003 in order to test the viability of the online store and the study's data collection and analysis method.

Creative Conversation: An Allegorical Perspective on the Parallels between Developing Meaningful Advertisements and Conducting Meaningful Research

Andrea Scott, University of South Florida

Paul Solomon, University of South Florida

In response to a call for research that investigates creative phenomena (Zinkham 1995), this paper represents an exploration into creativity within advertising practice with inferences for academic research. The goal is to appreciate the nuances of the creative process by listening to the voices of creative professionals. Based on a series of conversations with creative personnel, the paper takes the form of traditional academic prose interspersed with an allegorical conceptualization of the main findings. Emerging parallels between developing meaningful advertisements and conducting meaningful research include a profound understanding of the target consumer, a willingness to challenge existing norms, and unapologetic obedience to personal conscience. Research implications aid in generating

advertisements and research that improve consumers' experiences with a given brand by appreciating a greater sense of connection between interested parties.

In keeping with the spirit of the personally demanding nature of creativity and in an effort to incorporate writing as a form of inquiry (Richardson 2000), the findings and premise of this paper, which revolve around a quest for understanding the creative process, are expressed in allegorical form. Verbatim comments from the study participants are emboldened and participants are identified with superscript throughout both the story and the more traditional academic prose. Using the characters of Writing Art and Towering Ivory who are journeying to Creatopia, an allegorical story is crafted and interspersed through the paper to demonstrate the findings and premise.

According to Webster's Dictionary an allegory is a literary, dramatic, or pictorial device in which each literal character, object, and event represent symbols illustrating an idea or moral or religious principle. As with most allegorical expositions the characters and places in this manuscript are thinly veiled abstractions of existing ideas and principles (Columbia Electronic Encyclopedia). Therefore, it becomes incumbent on the reader to intentionally interact with the story's progression in order to discern meaning. In so doing they personally exercise their own creative ability to concoct mental images and to generate reasonable synthesis of the ideas presented. An excerpt is below.

Our story begins in the Fields of Ambition. Here the people are strong and sensible while still espousing a sense of play and wonder. It's an impressive combination, but in keeping with the spirit of the Fields, one is never encouraged to stay here. It is a seasonal location and so at some point, you must depart to take a series of journeys.

The most hallowed excursion leads to Creatopia. Creatopia is just as far away as it is close. Some people spend a lifetime in search of it; others get there, but have no idea how they reached it; many claim to know the way, but still aren't quite sure if they've ever been; and a handful, go and come freely—the most noble are always looking for company.

Methodology

Four conversations were held with one woman and three men who are advertising creative professionals in the US. Three were creative directors and one was a copy writer. Sample questions included the following:

- How do you show empathy so that it registers with consumers?
- Describe how you communicate a profound sense of understanding to consumers?
- How do you let consumers know that you are on their side?
- What are some executional "must haves" for meaningful advertisements?

Before constructing the allegory, Thompson's (1997) interpretive approach to analysis was employed. Multiple readings of the text uncovered a few themes that reflected "holistic understanding... of the participant's personal history" including human truth moments and everyday relationship, an emphasis on the experiential nature of creativity, strategic personalization, and the challenge of balancing integrity and entertainment.

Findings

Although participants were asked to reflect on creating "meaningful" advertisements (e.g., ads for products and services that reflected deeply held emotions), the theme of authenticity emerged as the primary route to achieving connection with consumers via advertisements. Repeatedly, participants mentioned wanting to guard and convey tactile credibility. In addition to contextual considerations such as physical settings and wardrobe, model selection and dialogue were the main areas of authentic influence.

Discussion

The absence of references to time and the preeminence of intuition are notable observations. From the verbatim found in the allegorical text, no participant spoke in distinctively chronological, progressive, or systemic terms and this mirrors the full interview corpus. Because the construction of an advertisement is often an iterative process, they tended to speak more about experimenting, playing, and reworking until it "felt right". Using allegory triggers the abstract thinking that is required to make sense of the story and gives the reader entry into creativity's dependence on gut feelings for full comprehension.

Implications

Overall, the implications of this study rest in the executional details that creative personnel must incorporate in designing advertisements that can successfully achieve a sense of connection with the advertiser. In demonstrating authenticity, advertisers draw primarily from their own daily lives look to everyday occurrences for inspiration. By offering consumers a vicarious experience of reality, they can potentially enhance receptivity of a given advertisement.

Conclusion

This initial undertaking responds to a call for research that investigates creative phenomena by employing an allegorical abstraction. The insights gleaned in the pursuit of creative authenticity such as attention to detail and a commitment to gut reactions, resonate for academic research.

How Brands Guide Innovation—and Leave Room for the Schumpeterian Entrepreneur

Andreas Strebinger, Vienna University of Economics

Relentless innovation is the very essence of economic development and lies at the core of any sustainable business strategy. But is it the entrepreneur of Schumpeter's early theorizing who is responsible for this "creative destruction" or is it the trained specialist in the R&D departments of large companies (Schumpeter 1942/1947)? Although there is some plausibility in the Schumpeterian argument that large bureaucratic organizations are powerful engines of innovation, both research findings and practical experience indicate that excessive bureaucracy constitutes an obstacle to technological innovation and that small companies still contribute significantly to the innovativeness of an economy (e.g., Baum 1986; Burns and Stalker 1961; Kitchell 1995; McKenna 1988).

As an evolutionary process, innovation may be analyzed within its historical context only. Past innovations of a company create their own substratum of tangible assets (e.g., buildings, machinery) and intangible goods (e.g., knowledge, corporate culture) that set that stage for future innovation. This applies to factors both inside and outside the company. One of the most important external remains of past innovation is the goodwill the company has acquired among its customers. The success of past inventions imparts an image of innovativeness and trustworthiness to the company and facilitates the introduction of new products. Most companies try to capitalize on this "brand equity" (e.g., Aaker 1991; Kapferer 1999; Keller 1998): Today, nearly 90% of all new products are introduced to the market under an existing brand name instead of carrying a new brand name (Aaker 1991).

Drawing on marketing theory and organizational behavior, this theoretical paper analyzes the role that brand-architecture strategy plays in determining the level of innovativeness of a company. Strong corporate brand names are assumed to guide innovation by lowering the costs of introducing products that are similar to the existing ones and by increasing the anticipated marketing costs of innovations that – from the customers' point of view – diverge from the current product range of the company (e.g., Smith and Park 1992). Thus, a corporate-branding strategy should enhance the innovativeness of a company by facilitating the introduction of new products, provided that the fit between the new product and the corporate brand is sufficiently large. On the other hand, a corporate branding strategy is supposed to increase reciprocal interdependence between the units of the company, heightening the need of formalization, hierarchical control, and centralization within the company (e.g., Thompson 1967). Corporate-branding strategies thus are assumed to make corporate culture more inner-directed and mechanistic (e.g., Berthon, Pitt, and Ewing 2001, p. 139; Cameron and Ettington 1988, p. 356), which in turn has a negative effect on innovativeness.

In the end, the positive effects that a corporate-branding strategy exerts on innovativeness by lowering the costs of marketing really innovative new products could at least partly be counterbalanced by the negative influence that a corporate-branding strategy has on innovativeness by making the corporate culture more bureaucratic and inflexible. Among other factors that all bear the dilemma between exploiting past success and generating future innovation, this effect could be one of the explanations of why there is apparently still enough room for small companies and the Schumpeterian entrepreneur to succeed with path-breaking innovations.

The Manufacturer's Website as a Product Information Channel: A Situation-Based Consumer Perspective

Sonja Wendel, University of Maastricht

Benedict G.C. Dellaert, University of Maastricht

The advance of the Internet as a relatively low-cost and flexible communications channel has greatly increased the opportunities for manufacturers to communicate directly with consumers (e.g., Ghosh 1998). An important type of manufacturer-consumer communications for which the Internet is used increasingly often, are product information exchanges. Software firms such as Microsoft (www.microsoft.com/catalog) and Symantec (www.symantec.com) use their websites to provide detailed product information to consumers, and also more traditional manufacturers such as Sony (www.sony.com) and Nestlé (www.nestle.com) use the Internet to share new product information with consumers as well as information about product usage such as movie tips and cooking suggestions. Consumers also may benefit from using the Internet as a product information source because it improves the efficiency of their information search (e.g., Ratchford, Talukdar and Lee 2001). A recent survey by the PEW Internet & American Life Project (Horrihan and Rainie 2002) showed that 63% of the study's respondents (a nationwide sample of 2,092 individuals in the continental US) expected companies to have a Web site that would give them relevant product information if they were considering buying one of the company's products.

Given these developments, it is important to understand consumer preferences with respect to product information channels and how manufacturers' Web sites can meet these preferences. One challenging suggestion made in the literature on consumer-firm interactions is that consumers' product and information needs depend less and less on systematic differences between consumers (e.g., demographics) and more and more on the specific situation in which the consumer operates and the goals he or she is trying to achieve within that situation. For example, Seybold (2001) stressed the importance of understanding the unique customer scenario when developing new service value proposals.

This paper builds on this and earlier research on situational variation in consumer preferences (e.g., Belk 1974, Belk 1975, Dubois and Laurent 1999, Lutz and Kakkar 1975, Ratneshwar and Shocker 1991, Srivastava, Alpert and Shocker 1984, Srivastava, Leone, and Shocker 1981) to develop a conceptual model of consumer product information channel preference in different situations. Our central thesis is that consumer usage situation is a key driver of differences in product information channel requirements of consumers therefore also affects consumer product information channel preferences.

We test the proposed approach by investigating variations in consumer preferences for using a food manufacturer's website as a product information channel in different hypothetical situations. We use survey data from 453 consumers who are responsible for most of the food purchases in their household.

The survey was constructed on the basis of the Association Pattern Technique (APT) (Ter Hofstede 1998, 1999) to map the different connections between product information channels, channel properties and situations. This approach was originally developed to study the relationships that consumers see between different products, product benefits (e.g., low in calories), and their own personal objectives (eg., to be healthy). The use of the APT allowed us to quantify the types of relationships between we channels and their properties and between situations and properties that we were interested in.

Based on 4 focus groups and discussions with industry experts we identified fourteen relevant product information channels, seven channel properties and three usage situations for use in the study. Besides the manufacturer website the following other product information channels were studied: a third-party website about cooking, a food information website by an independent agency, and eleven non-Internet channels: television advertising, television program, radio advertising, radio program, magazine advertising, magazine article, newspaper advertising, newspaper article, store magazine, product label, educational brochure, Internet website of the vegetable producer, Internet. Seven channel properties were included in the study. They included whether or not a channel was trusted, detailed, time saving, easy, personal, stimulating, informative, and relaxing. Finally, three usage situations were selected that were appropriate for a context in which a consumer would be looking for product information on a food product. They were: (1) a food scare in which an ingredient of one of the manufacturer's food products would be contaminated, (2) a new product introduction, (3) a situation in which the consumer is looking for a recipe to prepare a meal that includes one of the manufacturer's products.

In our analysis we contrasted the manufacturer website to two other websites and to the three best competing other channels. The results provided strong support for the fact that product information channels differ in terms of perceived channel properties. Furthermore, we investigated the role of usage situation as a driver of consumer channel property requirements. A comparison was made between the three situations (a food scare, a new product introduction and a recipe search) and the results revealed that usage situation had a significant effect on the channel properties that consumers require. For example, comparing the food scare situation vs. situation in which consumers were search for a recipe illustrated that consumers required the properties trusted and informative in case of a food scare, whereas they required properties such as stimulating and relaxing in case they were searching for a recipe.

Capturing the Within-Episode Dynamics of Consumption Emotions and Its Impact on Perceived Quality and Satisfaction

Catherine Paquet, McGill University

Laurette Dubé, McGill University

The last decade has seen an increasing recognition of the importance of emotions in consumption experiences, and specifically, as predictors of satisfaction. However, most studies that have investigated the link between consumption emotions and perceived quality and satisfaction with consumption experiences have focused on retrospective measures of emotions, which are not without bias. Moreover, existing literature on consumer dis/satisfaction have considered emotions as arising from one's perceived quality of product or provider performance, while providing limited insights into how consumers' emotions could in turn impact the perceived provider performance. Such a modulation is likely to happen in service contexts, where providers and customers interact to "co-produce" the service experience. Given this mutual interaction, both consumption emotions and service performance are expected to vary in parallel over the course of the consumption episode. We therefore argue that within-episode fluctuations in emotions represent important aspects of the service experience, and that such complex dynamics cannot be captured in a single general measure of retrospective emotions. Existing studies that have attempted to capture emotion dynamics have been limited in number, and often limited in their contexts or in their

operationalization of emotion dynamics. For instance, most of these studies have primarily considered changes in emotions from one episode to another, or the impact of discrete fluctuations in one facet of emotions on perceived quality of provider performance and satisfaction within a given service episode. None of them have directly assessed the change in momentary emotions over the course of a given episode.

Study Objectives

The present study investigates the dynamics of emotions experienced within a discrete service episode and its impact on subsequent service satisfaction and perceived quality. Dynamics of emotions were captured by the change in reported momentary emotions from the beginning to the end of the service episode. We also have for objective to determine whether the impact of emotions on perceived quality and satisfaction is the result of changes in interpersonal aspects of the episode due to providers' response to consumers' emotions, or to general "biasing" effects of emotions on judgments.

Methods

The study was conducted in the context of healthcare services to elderly consumers. The service episode consisted in a meal, and meal-related food and nursing services were the observed health services. The design followed an event-sampling approach whereby 30 participants (Age: $M=78.8$ $SD=6.3$ years; 20 females, 10 males) were observed on repeated care episodes ($M=46.8$ care episodes per participants). Participants' self-reports of emotions were collected before (pre) and after (post) each care episode, while satisfaction with and perception of the sensory and interpersonal quality of the service episode were reported immediately after each care episode. Participants' self-reports of emotions were subjected to intra-individual factor analysis (P-technique), from which two to five factors emerged. Factors scores were obtained for each participant's emerging factors, estimated separately for pre- and post- episode emotions. Average change in positive and negative valence factors over the episode were used to predict the subsequent measures of satisfaction and perceived quality.

Results

Random coefficient regression analyses revealed that the dynamics of emotions significantly predicted satisfaction with and perception of the interpersonal quality, but not sensory quality. Moreover, the effect was limited to positive-valence emotions, with an increase in intensity of positive emotions over the course of the episode being positively related to interpersonal quality satisfaction and perception.

Discussion

The absence of a relationship between satisfaction and perception of quality of tangible (sensory) aspects of the episode suggests that the results cannot be explained by pure biasing effects, but are rather thought to reflect a successful response to consumer emotions by service providers. This interpretation is consistent with the interpersonal view of emotions, according to which interactions between individuals allow them to encode, decode and respond to emotions. In addition to alter the objective nature of the service provided and hence indirectly influence the perceived quality and satisfaction with the service, provider's capacity to respond to the emotions displayed by consumers in their expected way may lead to further (dis)satisfaction. In order to provide stronger support for the above interpretation, we plan to extend the current study by assessing the relationship of dynamics variables with objective values of interpersonal components of the episode. Specifically, we plan to use provider's perception of the interpersonal quality of the episode (collected in parallel with participant's reports) as a proxy for its objective interpersonal quality in order to rule out the perceptual bias hypotheses, and provide further support for the interpersonal view alternative.

Conclusion

In conclusion, the results of this study suggest that in order to achieve optimal consumer responses, design and management of services and experiential products should explicitly consider the emotional content of the service/product, as well as the degree to which the service/product responds or can respond to the emotional expectancies of the consumers.

Consumers in Wonderland: Mirror Reversal of Atypical Pictorial Stimuli as Recollection Enhancers

Chris Houliez, Arizona State University

The effect of the mirror reversal, between study phases and a test phase, of a pictorial ad featuring a well-known endorser on viewers' recollective experience for, and attitude toward such pictorial ad is the object of two pretests and a proposed experiment. It is posited that such effect is moderated by the level of typicality of the endorser's pictorial representation. Using Chi-Square testing, a theoretical framework focusing on the distinctiveness vs. fluency of stimulus processing will be shown to be the source of the observed differences across conditions.

On the one hand, if the ad endorser's pictorial representation is typical, i.e., does match ad viewers' existing mental representation of the endorser, its mirror reversal, once presented, will be processed effortlessly by the viewers. This is explained by the fact that any familiar/typical percept (e.g., a famous endorser's face) has its mirror reversal automatically mentally encoded over time (Corballis 1974). Consequently, the mirror-reversed representation of the endorser, when shown to the viewers, will not significantly differ from the already mentally encoded representation of the endorser, due to its high level of typicality. The resulting fluent processing of the presented mirror reversal will lead to an increased feeling of familiarity with the pictorial ad, but will have a deleterious effect on the recollective experience attached to the presentation of the ad (Roediger 1996; Rajaram 1996; Mantyla and Cornoldi 2002).

On the other hand, if the ad endorser's pictorial representation differs from ad viewers' typical mental representation of the endorser (e.g., the endorser is represented at an age that does not correspond to his/her period of fame), presentation of the ad's mirror reversal will trigger a distinctive processing due to (1) the perceptual novelty of the percept (due to its lack of typicality, the mirror reversal of the percept

had not been mentally encoded prior to the presentation of the ad—Corballis 1974), and (2) the perceptual differences between the mentally-encoded mirror reversal of a typical representation of the endorser, and the presented mirror reversal of an atypical representation of the same endorser. The double distinctive nature of the processing, by warranting viewers' attention, will foster a feeling of recollective experience (Mantyla and Cormoldi 2002; Mantyla 1997; Roediger 1996).

Beside its impact on the nature of ad recognition (i.e., semantic/Knowing, or episodic/Remembering), the mirror-reversed presentation to ad viewers of an atypical pictorial representation of a well-known endorser is also posited to affect ad viewers' liking for such percept. Because the process of successfully resolving a slight pictorial ambiguity produces positive affect that can enhance viewers' evaluation of a percept (Meyers-Levy and Tybout 1989; Peracchio and Meyers-Levy 1994), it is hypothesized that, when presented with the mirror reversal of an atypical representation of a well-known endorser, and mentally comparing it with the (already mentally encoded) mirror reversal of the corresponding typical face, viewers will strive for the resolution of the discrepancy, which will bring some satisfaction upon closure, hence should increase viewer' attitude toward the ad (and the advertised product itself, through a direct transfer of affect from the picture to the advertised product—Stuart, Shimp and Engle 1987).

Such positive effect, however, will depend on the level of atypicality of the presented pictorial stimulus. If the pictorial representation is too different from the original, well-known representation of a familiar face, i.e., too atypical, the discrepancy might not be successfully resolved by the viewer, or resolved at an exceedingly high cognitive cost, which will negatively affect viewers' attitude toward the ad (Peracchio and Meyers-Levy 1994).

The present research endeavor is seen as significantly contributing to the existing marketing literature, as few researchers have investigated pictorial stimuli in advertising, especially within a framework focusing on memory for and attitude toward an ad. The mirror reversal of a pictorial advertising is seen as a potentially highly effective attention-catching device which can be paralleled with other, previously-studied picture-enhancement strategies (e.g., color enhancement in print ads—Meyers-Levy and Peracchio 1995). More specifically, adopting as a corporate logo or ad a slightly modified, i.e., slightly atypical representation of a well-known endorser's face, may allow advertisers to subsequently use the mirror reversal of that logo or ad to single out a new or distinctive product line, and attract consumers' attention to the new product offering (and increase in the process viewers' attitude toward the ad—and the advertised product). If such advertising method has already been adopted by some corporations (e.g., Whiskas for its "favorites" product line), this is the first time, to the author's knowledge, that the effect of mirror reversal on consumer recollection has been studied.

Brand Names as Sources and Targets of Tangential Implicit Associations

Claudiu Dimofte, University of Washington

Richard F. Yalch, University of Washington

Anthony G. Greenwald, University of Washington

Mere exposure research has shown that individuals often engage in learning without explicitly allocating cognitive resources for this purpose. Moreover, they often build positive affective associations with incidentally or even subliminally encountered stimuli, phenomena conceptually captured within the mere exposure paradigm (Zajonc 1980). Although knowledge elaboration involves associating new information with knowledge already stored in memory (Greenwald and Leavitt 1984), consumers often assess the validity of advertising claims without much elaboration. Even when individuals are aware of the non-diagnostics of this mere-exposure based strategy, they are still influenced by the perceptual fluency emanating from initial exposure (Jacoby, Kelley, Brown, and Jasechko 1989).

Not only does mere exposure cause low-involvement learning, but mere exposure to a brand name or product package may also produce more favorable attitudes even when the consumer does not recollect the initial exposure. Janiszewski (1993) proposes that during incidental exposure "there is a feature analysis, memory access, implicit memory formation, and perceptual construction." The author finds evidence that the feature analysis may be automatic and independent of the operations associated with attentive processing, concluding that perceptual fluency created via exposure brings about a feeling of familiarity that is sufficient to impact consumer attitudes.

Winkelman, Schwartz, Fazendeiro, and Reber (2002) note the clear effects of perceptual fluency on subsequent judgments even under conditions of strained cognitive resources. Proposing that automatic processes play an important role, they make a conceptual distinction between objective fluency (high-speed, efficient mental processing) and subjective fluency (associated with a conscious

experience). As the two types of fluency often become dissociated along conceptual lines reminiscent of the implicit-explicit dichotomy, measuring them arguably requires distinct types of procedures.

Two arguments exist for maintaining the distinctiveness of explicit and implicit techniques as measures capturing these transitive relationships. First, Wagner, Gabrieli, and Verfaellie (1997) address the fact that dual-process theories of recognition posit that a perceptual familiarity process contributes to both explicit recognition and implicit perceptual memory. Second, Holden and Vanhuele (1999) show that a single exposure to fictitious brand names is sufficient to create the impression that these brands actually existed. The authors argue that measurement of explicit memory of marketing communications may understate their influence, and implicit measures are better equipped to capture it. The present research makes use of one specific implicit measure—the Implicit Association Test (Greenwald, McGhee, and Schwartz 1998).

Are all individuals susceptible to the priming necessary to build implicit associations? Musen, Szerlip, and Szerlip (1999) used an experimental paradigm wherein implicit memory was tested after priming subjects with words, novel shapes, non-words, and colors. New-association priming occurred between words and colors but not between abstract shapes and colors or between non-words and colors, suggesting that new-association priming occurs for familiar but not for unfamiliar stimuli. An immediate extension of these results suggests that consumer familiarity with each of the to-be-associated concepts is necessary before novel implicit relationships are constructed.

Based on the previous theoretical accounts from both cognitive and consumer psychology, it was hypothesized that incidental exposure is a sufficient source of perceptual fluency to produce novel implicit associations of concepts, but only for individuals familiar with the respective category. In the first case, a specific brand name was proposed as the concept that mediates the novel relationship, while in the second the newly formed relationship involved brand name associations created via perceptually fluent concepts.

In Study 1, a concept was chosen that represented both the brand name of a “party”-related product and the mascot of a major American university. After incidental exposure to the brand name and logo, subsequent implicit associations of the specific university with the “party” concept (relative to a comparable school) emerged robustly among subjects familiar with both the university and product category. Furthermore, these post-priming implicit associations actually reversed the pattern of pre-priming explicit evaluations of the two colleges in terms of their reputation as party schools.

In Study 2, a brand name was chosen with perceptually similar concepts that could trigger different valence connotations depending on the context. After incidental exposure to these concepts under different priming valence, subsequent implicit associations of the brand name and the valence suggested by prime (“good” or “bad”) emerged clearly among subjects familiar with the brand.

The present work shows that incidental exposure to brand names is powerful enough to produce novel implicit associations among individuals susceptible to such occurrence. It also suggests that incidental exposure to valenced concepts that are perceptually similar to brand names are sufficient to trigger implicit associations of brands with primed valence attributes. The current research also quantifies the above-mentioned priming power of concepts, as the processes involved were shown to effectively change implicit associations from their original direction in the explicit measure to their reverse image in the implicit measure. This article adds to the growing body of cognitive and consumer research literature addressing issues of dissociation in terms of knowledge representation.

Differentiating Hedonic Consumption On the Basis of Experiential Qualities and Emotional Make-up

Donna Sears, McGill University

Jordan Le Bel, Concordia University

Laurette Dubé, McGill University

As an ever-increasing number of firms compete for the consumer’s mind, heart, and wallet, even manufacturers of commodity products need to weave experiences around their brands in order to gain competitive advantage (Pine and Gilmore 1999; Schmitt 1999). This requires an intimate understanding of the exact pleasure delivered by brands that are positioned along a hedonic promise.

Conventionally, consumption goals, and brand positioning strategies designed to appeal to those goals, have been described as either hedonic or utilitarian. Utilitarian consumption is task-oriented, and focused on efficiency (Babin, Darden, and Griffin 1994; Wolfinger

and Gilly 2001). Hedonic consumption focuses on the pleasure that arises from the consumption experience and the enjoyment it produces (Babin et al. 1994; Dhar and Wertenbroch 2000; Lofman 1991). Utilitarian consumption, then, is focused on outcomes while hedonic consumption seeks fun during the experience.

The objectives of the present study were three fold. First we wanted to explore whether consumers would reliably associate specific types of products with the four pleasure prototypes (physical pleasure, social pleasure, emotional pleasure, and intellectual pleasure) in a commercial context. Results from studies by Dubé and Le Bel (2003) showed that people associated particular product categories with the four prototypes, but would the same finding hold for a specific consumption experience with a particular product or service?

Second, we wanted to explore further the experiential descriptors or qualities of the four prototypes; to build on existing knowledge about the makeup of the types of pleasure. Physical (sensory) pleasure arises from things that predominantly stimulate some or all of the body's senses. Social pleasure arises from enjoying various aspects of relationships with others. Emotional pleasure arises from feelings triggered by objects, events or people. Intellectual pleasure arises from the appreciation of objects, events, or people that present a high degree of complexity and challenge.

Third, we wanted to assess the link between experiential descriptors and the specific emotions arising with each type of pleasures to see whether the differences in the emotional make-up of the four prototypes of pleasurable experience observed by Dubé and Le Bel (2003) in non-commercial contexts would be replicated in commercial settings.

Two hundred forty-eight young adult consumers were surveyed on the campuses of two large Canadian universities. Each participant described his/her consumption experience with a self-chosen product on the basis of the pleasure type elicited and a series of experiential descriptors and emotion statements. The sets of experiential descriptors and emotion statements evolved from research by Dubé and Le Bel and extensive reviews of the literature (e.x. Richins 1997).

The results were consistent with Dubé and Le Bel (2003), demonstrating that: participants could retrieve an example of a recent consumption experience from memory and associate it with one of the four pleasure types. Our analyses of participants' responses regarding that consumption experience further explicate the unique affective and experiential composition of each of the four types of pleasure. Finally, relationships between the experiential and affective qualities of a consumption experience begin to emerge.

Physical pleasure was primarily associated with food, beverages, sports equipment, massage and fragrance. This pleasure type is characterized by experiences such as 'pleases all senses' and 'sexy.' The emotional makeup of physical pleasure is illustrated by positive, high arousal emotions.

Social pleasure is commonly associated with friends (Dubé and Le Bel 2003) and products and services such as ground transport, travel agency, car rental, hotels/resorts, and games. The unique composition of social pleasure includes experiential descriptor 'forge bonds' and emotion statements 'relaxed' (low arousal, positive emotions).

Emotional pleasure is more affectively complex than physical or social pleasure, nonetheless it shares several characteristics with social pleasure: experiential descriptors 'lose sense of self,' 'independence,' 'pleases all senses,' and 'sexy.' Products such as music, greeting cards, flowers, jewelry/accessories, clothing, home furnishings, and movies typify emotional pleasure.

Intellectual pleasure is the most complex of the four pleasures, and the most clearly differentiated from physical pleasure. The experiential makeup of intellectual pleasure comprises 'lose sense of self,' 'independence,' 'good human nature,' when compared to physical pleasure. The emotional descriptors 'irritated' (negative emotions) and 'accomplished' typify intellectual pleasure.

Our results supporting the existence of the four differentiated pleasure types provides a parsimonious framework for planning the experiential branding strategy for a given product or service. Using this framework, firms can focus on the specific types of pleasure, and their underlying affective qualities, that would add real value to their product and differentiate it from competitor offerings. It is hoped that future research and scale development in this field will eventually allow us to reliably identify the nature of pleasure experienced by a consumer in any specific situation.

A New Classification of Uncertainty Orientation: Exploring the Susceptibility to the Hindsight Bias in a Gambling Context

Colin Farrell, University of New South Wales

Elizabeth Cowley, University of New South Wales

Michael Edwardson, University of New South Wales

Previous research has shown that individuals who tend to attribute the outcome of random events to chance (chance oriented individuals) compared to luck (luck oriented individuals), react differently when making decisions under uncertainty. This exploratory study proposes that not only do luck and chance-oriented people react differently, but within these groups responses to uncertain stimuli vary.

Chance and Luck Orientations

Luck is used to explain successes and failures not attributable to personal factors like ability and effort, or to more situational factors like task difficulty (Weiner et al. 1972). Chance refers to the fact that precise future outcomes cannot be predicted (Wagenaar & Keren 1988). Chance is also often misconceived, as people believe that equally probable events are distributed fairly and evenly (Wagenaar 1989; Wagenaar & Keren 1988; Keren 1994; Friedland 1998), leading to the belief that uncertain outcomes are dependent on one another.

We use an uncertainty orientation framework that divides consumers into four groups based on Rotter's (1966) locus of control (internal locus of control and external locus of control) and Friedland's (1998) luck and chance orientations. The purpose of this study is to explore whether individual luck and chance beliefs affect the susceptibility of individuals to apply decision heuristics when making judgments under uncertainty.

Uncertainty Orientation*Luck Internals & Luck Externals*

Luck-oriented individuals pay little attention to salient probabilities that define the decision problem (Friedland 1998). They believe in "lucky streaks," expecting carryover from one random event to another. *Luck Internals* feel personally lucky and have more positive expectations for outcome of events (Darke & Freedman 1997). As *Luck Internals* rely on faulty personal luck attributions, they are expected to be most susceptible to the hindsight bias. *Luck Externals* believe that luck is an external phenomenon as luck cannot be made to happen, but can be detected and used to one's advantage. As *Luck Externals* have a lower sense of perceived control, they are expected to only be somewhat susceptible to the hindsight bias.

Chance Internals & Chance Externals

Chance-oriented people believe outcomes will be the same regardless of the person involved. *Chance Internals* are expected to be very susceptible to the hindsight bias, as they believe that random outcomes are dependent and expect a pattern in external probabilistic events, which can be detected. *Chance Externals* are proposed to have an increased ability to avoid the hindsight bias, as they hold the more rational beliefs that luck and chance are external and unreliable phenomena.

Method

Two hundred thirty five undergraduate students were asked to make a foresight prediction of the final outcome (heads (H) or tails (T)) of the coin tosses in each of 5 random sequences of coin tosses. The participants then handed their predictions to the investigator and spent 30-40 minutes completing other items. At the end of the questionnaire, the same five coin toss sequences were presented in a different order with the actual final outcome, which they had predicted earlier. The participants were then asked to make a hindsight prediction of the final outcome they would have chosen, had they not been shown the final outcome. The participants were divided into the uncertainty orientation based on a locus of control scale and responses to four luck/chance orientation scenarios adapted from Friedland (1998).

Major Findings

To investigate how the uncertainty orientations explained susceptibility to the bias we ran a General Linear Model on the susceptibility score with the two independent factors, locus of control and luck/chance orientation. No significant main effects were found for either luck/chance ($F(1,231)=.37, p=.54$) or locus of control ($F(1,231)=.48, p=.49$). However, there was a significant interaction between luck/chance and locus of control ($F(1,231)=3.81, p<.05$), revealing differences between the uncertainty orientations.

Previous research into the hindsight bias has shown that its effects are quite pervasive with research efforts focusing on factors that can moderate the degree to which a person exhibits the bias (Christensen-Szalanski & Willham, 1991). Our research contributes to this area by devising a framework that displays differences in hindsight bias susceptibility. In fact, had we used Friedland's luck orientation only, we would have found that everyone was equally susceptible to the bias. Had we used the locus of control scale only, we would have found that everyone was equally as susceptible to the bias. By using both measures we found differences between groups based on their uncertainty orientation.

As expected we found that *Luck Internals* were susceptible to the bias and *Luck Externals* were less susceptible. Contrary to our expectations, *Chance Internals* were found to be susceptible to the bias, with *Chance Externals* to be most likely to change their recollection of their foresight prediction.

Deception in Interpersonal Consumer Exchanges
Florian v. Wangenheim, University of Dortmund
Tomás Bayón, International University in Germany
Christof Lauffer, International University in Germany

Word of mouth (WOM) has been extensively researched in the last decades. A tacit assumption underlying virtually all studies that investigate its determinants is that the valence of the information provided is triggered by the level of satisfaction of the informant with the referred product or service. In other words, positive WOM is given when satisfaction with the consumed product or service is high, while negative WOM will be given after a dissatisfying experience (e.g. Anderson, 1998). This intuitive assumption has been validated in a number of empirical studies (e.g., Richins, 1983; Westbrook, 1987).

However, sometimes, WOM may not reflect the informant's true perception about a consumption experience. For example, some people may be unwilling to publicly admit that they have chosen a "bad" brand or product, because they fear this may reflect on them as not being able to make good choices. In other cases, consumers may be hesitant to admit negative experiences with a chosen service because it may negatively affect other people's assessment of them. For example, even a dissatisfied college student will be very careful to speak negatively about his school or program, because the diffusion of negative information about those issues may weaken his opportunities on the job market.

The examination of WOM communications in which inaccurate consumption information is exchanged, is completely lacking. This paper deals with such "opportunistic WOM" (OWOM) which we define as consumers lying, cheating, or withholding important market information in order to achieve an end when giving experience-based referral information to other consumers. In particular, this paper focuses on OWOM conversations that are subject to a WOM source's intention to conceal a purchasing failure by distributing OWOM information after a negative consumption experience.

Theoretical and Conceptual Background

The paper mainly builds on Frenzen and Nakamoto (1993), who show that when the transmission of information is associated with financial disadvantages, WOM is inhibited. In contrast to Frenzen and Nakamoto (1993), though, we are not concerned with an inhibited information flow, but with the transmission of false information. It is therefore necessary to investigate potential benefits of engaging in OWOM.

Benefits of OWOM Information Giving

Reporting a dissatisfying or disappointing consumption experience will not help the communicator appear as "sophisticated consumer". It is, on the contrary, sometimes associated with considerable psychic costs. Frenzen and Nakamoto (1993, p.373), argue that "... consumers may be reluctant to reveal information that bears a social stigma and imposes psychic costs such as embarrassment or shame." Similarly, Saarni and Lewis (1993) argue that the deception of others occurs in cases where the cost of shame, humiliation or embarrassment exceeds the cost of deception.

Communications literature typically refers to two groups of factors that may influence a communicator's decision to act opportunistically in an exchange situation. First, perceived product category characteristics (such as the perceived value of information), and second, perceived characteristics of the exchange partner (such as the closeness of the relationship). An exploratory study was conducted to shed more light on those two factors.

Results of an Exploratory Study

94 undergraduate students of a Western European university (45 females, mean age ≈ 22 years) participated in a two-page qualitative survey. After the introduction of an exemplary OWOM case scenario (a person disseminating false information about a recent consumption experience was described), respondents were asked (a) whether they had already behaved in a similar manner and what the reasons for doing so were, (b) whether they believed that certain properties of their exchange partner would influence the decision to engage in such deceptive behavior, and (c) whether they believed that certain product classes or categories were more likely to be subject to such behavior. Responses were analyzed using critical incident technique (CIT). The results of this initial study made apparent that indeed self-esteem or the avoidance of shame acted as main influencers of opportunistic WOM behavior (≈ 67,5% of all given answers). Further, concerning the influencing character of the social context, results suggested that to a vast majority, people with whom a strong relationship is shared are less likely to be deceived or betrayed (≈ 85% of all given answers). Regarding product class characteristics, it became apparent that especially product categories that are important for a respondent's self-perception (among them many high-priced or luxury product categories) were named (≈ 34,5% of all given answers).

From the exploratory study, product involvement was derived as the key product-category level variable (e.g., Celsi and Olson, 1988) and tie strength (e.g., Granovetter, 1973) as the key exchange partner characteristic that should be related to OWOM behavior. Further research, currently undertaken, is needed to investigate OWOM behavior more thoroughly.

A Multi-Attribute Multi-Stage Model of Online/Offline Shopping Preferences

Irwin Levin, University of Iowa

Joshua Weller, University of Iowa

Aron M. Levin, Northern Kentucky University

Consumers may decide to shop online or offline for a variety of reasons that may differ across products and across different stages of the shopping experience. Our first study (Levin, Levin and Heath 2003) aimed at determining factors that lead to differential preferences for online and offline sources at different stages of the shopping experience for different products. We asked participants to indicate whether they would prefer to shop online or offline for different products at different stages of the shopping experience. We found that for "low-touch" products such as airline tickets and computer software, most consumers prefer to search and compare options online but only about half preferred to make the final purchase online. For "high-touch" products such as clothing and health and grooming products, most consumers preferred offline (brick-and-mortar) services at all stages. Other products, like books and CDs, fell in between.

We then asked our participants to rate the extent to which a variety of shopping features were better delivered online or offline. The ability to see-touch-handle the product, personal service, no hassle exchange, speedy delivery and shopping enjoyment were rated higher for offline services. The ability to shop quickly, have a large selection, and get a better price were rated higher online. Finally, participants were asked to rate how important each of these features is for each product. For example, fast search and better price were especially important for airline tickets while personal service, being able to see and handle the product and shopping enjoyment were especially important for purchases of clothing. At the qualitative level, these attribute-specific findings helped explain the different online/offline preferences for the different products.

It was clear, however, that this analysis needed to be supplemented with more data for testing a quantitative model of online/offline preferences for different products. In particular, more attribute-level evaluations were needed. In order to provide a real test of a multi-attribute model, we need estimates of both the importance of different attributes for different products and how each attribute is evaluated on online/offline superiority. Our new study will provide these estimates. We developed a model of online/offline shopping preferences where various attributes of the shopping experience such as price, selection, speedy delivery, and no hassle exchange are each assumed to vary along a dimension of "shopping offline is much better" to "shopping online is much better," with each taking on different importance for different products. The essence of the model is that to the extent that a consumer perceives a product's main features to be delivered better online, the consumer will prefer to shop online for that product. Conversely for products whose important attributes are better served offline. We assume that the overall preference for shopping online or offline for a given product is a weighted average of attribute values where weights are obtained from separate ratings of attribute importance for each product. Formally, the model can be stated as $P_{online/offline, p} = \frac{S w_{ip} v_{ip}}{S w_{ip}}$ where $P_{online/offline, p}$ is the relative preference for online or offline sources for product p , w_{ip} is the importance weight of attribute i for product p , and v_{ip} is the value of attribute i for product p on a scale from "shopping online is much better" to "shopping offline is much better." (See Anderson 1981 and Gaeth et al. 1990 for previous applications of weighted averaging models.)

Recently, attention has been called to individual differences in lifestyle related to the tendency to shop online (Breneman, Geuens, Smith and Swinyard 2002). This is consistent with our observation of mixed preferences for shopping mode within a number of our product categories. Thus, our extended model test will not only use product-related attributes to differentiate online/offline preferences for different products, but will include measures of consumer traits such as introversion-extraversion, social-identity and need for cognition to differentiate those consumers who prefer the solitary but more information-laden experience of internet shopping or the more social experience of shopping with other customers and service providers. The ultimate goal is to understand the customer-product interactions that drive the decision to shop online or offline.

The Objectification of Moral Support: An Ethnography of Networks in the Making

Jean-Sebastien Marcoux, HEC Montreal

This paper examines the formation of support networks in a North American context. Starting from an ethnographic examination of the circulation of physical help on occasions like a move, it demonstrates the importance of mundane crisis situations as catalysts for the formation of support networks. As it appears, networks cannot be reified. They are built over time, through a dynamic process of objectification which incorporates the particularity of the object of exchange, and from which emanates, as a result, an idea of social class. By adopting a material culture perspective borrowed from the anthropology of consumption, this paper shows how crisis events become occasions for asserting class. Indeed, class is not important in a determinist fashion, but at the performative level.

Using ethnographic evidence, this paper shows how moving day is a bodily experience embedded into broader social networks. It describes the importance of support networks in a crisis context like a move, and shows how the move may become an occasion for measuring the size of support relations, not to say a catalyst for the shaping of networks. In trying to understand the significance of support networks, it is important to move beyond the utilitarian understanding of network. As such, this paper brings into focus a gift giving perspective on network, highlighting how network may assert itself as supportive from a moral point of view. It shows what is to be gained by adopting such a perspective for understanding network mobilization, while stressing how the assumptions of gratuity describe a middle class reality. If we push this line of argument further, the provision of physical help is intertwined with class. As much as it is related to class, the materiality of help cannot be dissolved and reduced to a symbol of solidarity or mutual aid. This physically demanding form of help is also socially consuming, or even enslaving from a middle class perspective. In fact, the physical help objectifies a threat to the middle class valorization of autonomy for it entails relational costs, creates obligation and potentially leaves traces. The question remains nonetheless as to how autonomy should be interpreted. Can the middle class' refusal to be helped be taken as an altruistic gesture, not to say a gift? The conclusion examines how divesting networks may become a means for performing class, and for re-establishing differences. This discussion pushes the work of Holt (1997, 1998) further, while unveiling the limitations of his approach. It reveals what is to be gained by re-considering the philosophical distinction between people and things, and by considering network formation through a process of objectification (Miller, 1998). Support networks evolve over time. They take shape in day to day activities, along the different crises that people go through. As such, we should not reify them at the expense of their dynamic character. This paper demonstrates what can be gained by adopting a material culture approach and getting access to social reality in the making. It shows how support gets objectified in the network mobilized. A material culture perspective does not only praise the re-enchantment of popular cultural manifestations, however. Instead, it forces us to transcend the opposition between things and relations. It requires us to recognize the importance of situations that are taken for granted and often conceived as obvious, so obvious that they are relegated to the realm of the mundane. As a matter of fact, such an approach allows us consider different and deeper levels of meaning; sometimes the most important ones.

Persuasion and Haptic Properties: There's More to Touch than Meets the Eye

Joann Peck, University of Wisconsin-Madison

Jennifer Wiggins, University of Wisconsin-Madison

Persuasion appeals often include verbal descriptions of products, pictorial representations of products and their features, and more recently, appeals imploring customers to touch. For products that have an instrumental touch element, for example, a sweater for which softness is a key desirable attribute, providing individuals with touch information has been shown to increase positive attitude toward the product and purchase intention. These effects have been found to be greater for individuals who are high in Need for Touch (NFT) than individuals who are low in NFT. However, touch appeals have begun to be seen for products that have no instrumental touch element, even in abstract contexts like appeals for charitable donations to causes. The goal of this research is to examine whether a touch-based appeal using a more abstract touch concept not directly related to a product attribute can influence persuasion.

We suggest that appeals that include a touch element will be more vivid than appeals without touch elements, which previous research in persuasion has suggested may facilitate or inhibit persuasion, depending on the congruence of the touch element with the appeal's message and on individual differences in message processing. Specifically, we predict that a touch based appeal will be more persuasive than a non-touch based appeal, and that this effect will be significantly higher for those individuals who are high in NFT than for those who are low in NFT. Further, we predict that when the touch element is congruent with the appeal's message, persuasion will be higher than when the touch element is not congruent, and that this difference will be greater for high NFT individuals than for low NFT individuals. Finally, we will examine the impact of the valence of the touch element on the effectiveness of the appeal. We predict that incorporating a positive touch element, such as silk, will be more persuasive than incorporating a negative touch element, such as sandpaper, except when the negative touch element is highly congruent with the appeal's message.

This paper will incorporate two lab studies that will allow us to control aspects of the situation to look carefully at process factors. A third study moves into the field to increase the external validity of the findings as well as to examine the effect of actual charitable donation behavior by appeal type. We have selected appeals by charitable organizations as our context for several reasons. First, this is a natural setting in which individuals are familiar with persuasive appeals. Second, in this context, both attitudes toward the appeal and toward the organization, as well as behavior measures, are easily obtainable. Finally, using non-profit organizations also allows us to extend the research using a field study for a third study to look at actual donation behavior by type of appeal.

The first study examines the effects of the type of appeal as well as the individual difference NFT on attitude toward the organization as well as behavioral measures of willingness to donate time or money to the organization. Study 1 is a 2 (NFT, high/low determined by a median split) x 3 (type of appeal; no haptic information, haptic congruent information, haptic incongruent information) x 3 (valence of haptic information; positive, neutral, negative) with the first factor measured between subjects and the second and third factors manipulated between subjects. Congruency and valence of touch information was determined by a pretest. The context for this study is an appeal for donations to the local arboretum; one example of congruent touch information is a piece of tree bark, while a piece of steel wool would be an example of incongruent touch information. The second study replicates Study 1 with an additional manipulation of motivation to process information. Past research has found greater effects for vividness under lower motivation to process conditions. Controlling for this in a lab study may allow additional insights.

In Study 3, we will work with two non-profit organizations, one that is highly congruent with the idea of touch (a "hands-on" children's museum) and one that has considerably lower congruence with the idea of touch (a symphony orchestra). Each organization will mail out three versions of an appeal designed to solicit either ticket sales or charitable donations. In order to make the haptic information congruent to the organization's message, the message must be phrased in a manner that evokes haptic imagery, particularly for the symphony where the organization is not highly haptic congruent. In order to control for the potential effects of the haptic imagery itself, the three versions of the appeal will include one with a touch element as well as haptic imagery in the text, one with only haptic imagery in the text, and one with no haptic information. The 12-item NFT scale and additional control questions about familiarity and past donation behavior, gender, and age will be included in a separate questionnaire included with the appeal with the cover story that the questionnaire is a separate research project the organization is participating in for researchers at the university. Actual ticket sales or donation behavior will be tracked at the individual level by the organizations.

The purpose of this paper is to examine the persuasiveness of touch information in an abstract context, where touch is not instrumentally related to the product. By tracking actual behavior in response to touch based appeals at these two organizations, we will be able to test the boundaries of the touch based appeal and determine if and when the abstract touch information becomes too abstract to be persuasive. Working with the symphony, for example, will allow us to examine whether the haptic appeal type will be persuasive even when it does not easily match the organization. The results of these studies will help us to predict under what circumstances organizations should and should not use touch-based appeals.

Globalization of Consumption and Advertising in a Transitional Market

Katherine C. Sredl, University of Illinois at Urbana-Champaign

Goods and advertising play large roles not only in accelerating change in contemporary societies but also in surviving change (Fox 1985; McCracken 1988). This research investigated how consumers and advertisers use goods and advertising in the post-socialist transformation in Croatia. Fieldwork was conducted using naturalistic inquiry methods from June 2002-August 2003, involving depth interviews and focus groups with fifty two consumer and advertising agency respondents (Belk, Wallendorf, and Sherry 1989). Triangulation was sought through content analysis of a representative number of advertising campaigns, photography, and measures of materialism surveys (Walendorf and Belk 1989; Ger and Belk 1996). This abstract presents the preliminary research findings.

Primary themes which emerge from the data include consumption and advertising symbolism and their relation to citizenship, ethnicity, and creation of differences. The themes suggest that the transformation brings increased opportunities for the symbolic use of goods, but that the meanings and interpretations are often a continuation of Yugoslav socialist consumer culture. These findings question the approach of previous research on post-socialist consumption and advertising in Europe, which views it as a transition from socialism to capitalism, and East to West, when in fact it is not a transition but a transformation with undetermined and perhaps unprecedented outcomes. It also ignores socialist consumption and advertising, analogous to ignoring much of the socialist experience (Verdery 1996).

Clearly, it is time to revisit post-socialist consumer culture in Europe with an empathetic and informed understanding of the ambiguities and qualitative changes of the current phenomenon. In the confusion of applying American marketing models and advertising in the region, it is clear that a reorientation is needed in understanding consumer behavior and marketing in the region. My research contributes to a new approach to understanding global marketing since the Cold War.

A Case of Pre-Consumption: How Critical Schools Shape “Ordinary” Viewers’ Consumption of the Artist Caravaggio

Kent G. Drummond, University of Wyoming

CONCEPTUALIZATION

Both personally and professionally, the Italian painter Caravaggio was a controversial figure even during his lifetime (1573-1610), much less after it. Brawls, robberies, relations with prostitutes both female and male, murder, exile, shipwreck, imprisonment and escape—the events of Caravaggio’s life read like a postmodern version of a Robert Louis Stevenson novel. Professionally, his accomplishments met with equal controversy: many of his paintings, graphically depicting crucifixions, decapitations, and conversions, were refused by their patrons; those that were accepted were often hung so high on chapel walls that they could only vaguely be seen in the candle-lit shadows.

After his death, Caravaggio’s reputation lay fallow for 300 years. It was not until the 1930’s that the art historian Robert Longhi revived the artist’s work by organizing an extensive exhibition and making pronouncements such as this:

People speak of Caravaggio, calling him now a master of shadow, now a master of light. What has been forgotten is that Ribera, Vermeer, la Tour and Rembrandt could never have existed without him.

(Lambert, p. 15)

While many critics agreed with Longhi, an equal number did not. To this day, many critics see his paintings as vulgar, excessive, and sadomasochistic.

METHOD

By using the textual-interpretive method advanced by McQuarrie & Mick (1999) as well as Stern (1988), I am in the process of examining the interplay of Caravaggio’s art and the critical response to it. For example, what can explain such a clearly-drawn distinction between Caravaggio’s admirers and detractors? Why are reactions to his work so polarized? Analyzing the interpretations of Caravaggio’s “texts” has allowed me to identify three distinct schools or strand of thought surrounding his work: the Spiritual, the Erotic, and the Psychological.

The Spiritual

Because many of his subjects were religious in nature, it is hardly surprising that some critics respond to Caravaggio’s work in a spiritual vein. This is certainly the case with *The Ecstasy of Saint Francis*. In this painting, Saint Francis appears to have fallen back on the ground, lying gently in the arms of a protective angel. In her meticulously-researched biography of Caravaggio, Helen Langdon makes the connection between the ecstasy of religious conversion and the ecstasy of romantic love. She cites the love poetry of the period that likens ‘the light of the stars and flames with the mystic light of God.’

The Erotic

It is this response, more than any other, that makes Caravaggio’s work so sensational to contemporary eyes. Whether observing *Saint John the Baptist*, *Sick Bacchus*, or *The Entombment of Christ*, some critics become most sensitive to what they believe are homoerotic elements in Caravaggio’s paintings. One painting that often draws such a reaction is *Boy with a Basket of Fruit*. Donald Posner’s reaction is typical of this school. Describing *Boy Bitten By A Lizard*, he notes: ‘the boy’s hands do not tense with masculine vigor in response to the attack; they remain limp in a languid show of helplessness.’

The Psychological

Critics in this interpretive mode, typified by Bersani and Dutoit in *Caravaggio’s Secrets*, begin with relations of bodies to one another, then quickly move to the deeper psychological meanings such juxtapositions may symbolize. They speak of fantasies, and Caravaggio’s sense of options in space—and how such options relate to the ego and consciousness.

MAJOR FINDINGS

Having identified these three strands of interpretation, I develop five axioms that explain how such criticism both reflects critics’ prejudices, and shapes ordinary viewers’ consumption of the artist.

AXIOM 1: Critics see what they “want” to see, and often what they want to see will determine which paintings they choose to discuss.

AXIOM 2: Critics represent an important step along the path of consumption. Like some animals and birds, they pre-consume the product first, then pass along—regurgitated—the outcome to their offspring.

AXIOM 3: While the visual image itself contains great persuasive power, critics need language to construct an argument as to the nature of the image’s persuasion. In so doing, they instruct the viewer what to see and what not to see, what to connect and what not to connect. Critics construct reality.

AXIOM 4: Caravaggio’s work, like that of many artists, offers a number of what Gibson calls “affordances”—images of potential utility or danger. The more affordances provided by an artist, the more footholds a critic may gain into his work.

AXIOM 5: The more “ways of seeing” that critics can attach to an artist, the longer the artist lives. As Proust wrote in *Sodom and Gomorrah*, ‘Theories and schools, like microbes and globules, devour each other and, through their struggle, ensure the continuity of life.’

Environmental and Ethical Consumers’ Concerns for Food Products

Lucie Sirieix, Ecole Nationale Supérieure Agronomique de Montpellier

Jean-Marie Codron, Ecole Nationale Supérieure Agronomique de Montpellier

New expectations have emerged among consumers over the past twenty years. They first oriented towards the environment, now also concern ethical issues, and already express themselves through an interest for fair-trade products and “social” labels. Four movements have allowed food product quality to emerge in these new fields: organic and integrated agriculture in the environmental field ; fair-trade and ethical trade in the field of social ethics. The typical attributes of these products can be called “pro-social” credence attributes (Nelson, 1970, Osterthus, 1997).

Environmental and ethical consumers’ concerns: similar problems and differences

In order to know if these new expectancies can converge, several questions must be asked. Do consumers who buy “green” products share common values with those consumers who buy “ethical” products? Is the concern-behavior link the same in both cases? Finally, do they perceive the same kind of proximity with environmental and social problems?

Our hypothesis is that some issues are common to both fields (e.g. problems of awareness and institutional credibility, and little consumer concern about environmental and ethical aspects), but most problems are different.

The field of environment is perceived as being relatively homogeneous by consumers, who do not really see any difference between products from organic and integrated agriculture. In the field of ethics, consumers supporting fair-trade are specifically interested in helping small producers in developing countries, whereas consumers who care about social ethics have much more varied concerns, going from labor conditions to more global issues, such as respect of human rights.

According to several authors, consumers who buy products for environmental or ethical aspects share common concerns (Murray and Reynolds, 2000), but studying the consumers motivations and the values linked to these motivations, reveals differences: the values associated to the social ethics dimension are homogeneous, whereas those associated to environmental aspects are heterogeneous. Indeed, the field of ethics seems to be related to almost only universalist values, whereas that of environment also refers to egocentric-type values, such as health, tradition or pleasure.

The third difference deals with the link between purchase and the consumers’ values. The link seems to be stronger in the ethical field than in the environmental field. If the market for organic products has recently developed, it is not mainly due to an increasing concern for environmental issues, but rather to a reaction to the recent food crises. Fair-trade being more strongly linked to the ethical dimension than organic production is to the environmental dimension, it must be feared that it will not develop in the same way.

Finally, a great difference between both fields comes from the importance of the problems and their proximity. The proximity to environmental problems has contributed to develop consumer awareness ; but since social problems are perceived as far-off and diffuse, social ethic signs do not touch consumers as much.

Marketing and communication implications

The relative importance of environmental and ethical concerns against other self-oriented attributes is small. Does it mean that to increase the consumption of “green” and “ethical” products, it would thus be relevant to communicate on self-oriented attributes instead of communicating only on such pro-social attributes ?

The social dilemma theory (Wiener and Doescher, 1995) may suggest other ways of communicating to consumers. Some consumers may refuse to cooperate because they want to maintain their freedom ; others refuse to make efforts to save a resource and see this resource destroyed, being so a “sucker ”. A third reason can be self-interest ; lastly, some consumers may not trust others to cooperate.

Most environmental problems can be studied within this frame ; but is it relevant for the study of ethical products ? Both deal with concern for others, but while environment problems only deal with the community’s good, ethical products deal with a larger group which gets benefit from them: the community, but also producers, workers, even animals, ... A second difference is due to the possible association, within a product, of pro-social and self-oriented attributes, as it is the case in the environment field: the first and third barriers thus do not exist. Therefore, to communicate on ethical products, solutions will be different from those used in environmental marketing. To overcome the sucker barrier, communication strategies could emphasize that the goal will be achieved, and for consumers who do not trust others to cooperate, communication could be oriented on efforts made by other groups, i. e. retailers, producers...

Research avenues

This analysis finally leads to the conclusion that from an academic point of view, some questions remain to be treated more in detail. How does the consumer integrate the environmental and social dimension of food product quality ? Do we have to think in terms of distinct attributes (environmental versus social) or in terms of ethical or “societal” sensitivity, which includes both dimensions ?

Methodological questions also have to be answered: how to measure environmental and ethical concerns without bias ? How to measure consumers’ willingness to pay an ethical premium ? Conjoint analysis could be used to estimate this consumers’ willingness, but it raises the problem of the validity of non-observed choices. Vickrey or BDM auctions bring an interesting alternative to hypothetical approaches, and will thus be used in our research to reveal true consumers’ willingness to pay (Wertenbroch and Skiera, 2002).

Images of Black Women in U.K. Magazine Advertising

Margaret K. Hogg, Manchester School of Management

Samantha Clarke, Manchester School of Management

Introduction

In consumer behavior research there has been almost total silence about the representation of black women in advertising; and the implications for social comparison. White women have been the traditional focus of studies undertaken in response to critiques of the representation of women in advertising. However women's magazines are an important influence on ideas about beauty, race and gender. Where black women's images in advertising have been explored their looks have often been homogeneously classified as 'sensual/exotic'; whereas differentiation has been noted for the white models. This study examines how black women are portrayed in U.K. advertising.

Social comparison

How black women are portrayed is important because advertising affects both how women are viewed, as well as how they view themselves. The images generated by U.K. advertising represent a significant environmental influence which women draw on in the social comparison process. Early social comparison theory suggested that the environment played an essentially passive and co-operative role. Subsequent research showed that the environment can play a very active role in providing comparisons which shape individuals' self-evaluations. In the U.S.A. social comparison theory has been used to examine the 'short-term effects of advertising stimuli' in order to contribute to understanding the 'long-term cumulative effects of exposure to advertising' (Richins 1991:72), and in particular how women often set their frame of comparative reference drawing on advertising images. Social comparison theory has been used to explore the effects of advertising images on women's self-perceptions of their physical attractiveness and their levels of self-esteem. Moses (1999) researched the effect of body images of Caucasian and Afro-American models on Afro-American college girls. She identified that firstly, low self-esteem and the drive for thinness go hand in hand, supporting earlier research; secondly, images of underweight black females led to an apparent decrease in intellectual confidence; thirdly, the portrayal of racialized and underweight models has a significant impact on social comparison; and fourthly images of overweight models elicited fewer upward comparisons and generated more downward comparisons.

Research questions

The research question was: how are black women represented in the U.K. media? The specific objectives were: firstly to determine what types of images are used to portray black women in women's magazine advertising in the UK; secondly to interpret some of the images of black women; and thirdly to discuss the potential implications of these images on black women's self-esteem in the social comparison process.

Method

Advertisements were selected from three women's magazines (1996-2002): *Vogue* (4 ads); *Cosmopolitan* (3 ads); and *Pride* (3 ads). The main criteria were that the models in the ads should be of ethnic origin; their image should appear as full page advertisements or covers; and the images should be in colour. An interpretive approach was used, beginning with an initial description of the advertisements, which was followed by the application of visual rhetoric and semiotics for further analysis and interpretation.

Discussion

Initial findings largely confirmed firstly Simonton's (1995) research which suggested the use of a limited range of stereotypical images; and secondly Fears' study (1995) of colourism, where black women's images were characterized by differences in hair textures, skin tones and facial features in terms of euro-centricity and afro-centricity. However a more careful scrutiny suggested some variation and mixing between the two general types identified by Fears (1995) with different combinations of skin colouring, facial features and hair. Ethnicity was often downplayed (e.g. hair was straightened and/or lengthened with weaves), confirming Simonton's earlier research (1995). There was scope to start to identify a wider range of 'looks' among black women and thus extend Solomon, Ashmore and Longo's (1992) classification of beauty types of black women beyond 'exotic/sensual'.

The potential implications for black women's self-perception, self-esteem and body imagery of the limited range of black women's images represented in the U.K. media have to be understood within the context of social comparison (Festinger 1954) and the goal (i.e. self-evaluation, self-improvement or self-enhancement) in the social comparison process (Wood 1989:231). The positive or negative impact of advertising images on women's level of self-esteem varies according to their goal in using advertisements for social comparison.

Conclusion

This study was limited to a small range of U.K. magazines over a fairly short time period. It would be valuable to use advertisements from a longer time period and from a greater range of magazines to see how the representation of black women in the U.K. media has evolved and changed over time, and across different types of media. It would also be valuable to collect consumer interpretations of the images of black women in U.K. advertising.

The Double-sided Consumer: Ambivalence, Duality and their Link to Behavior, a Review and Conceptual Framework

Marie-Cécile Cervellon, McGill University

Laurette Dubé, McGill University

This working paper defines two attitude constructs rather new to consumer psychology, ambivalence and duality. Ambivalence is described as inconsistencies in the evaluations of an attitude object (i.e. having both explicit positive and negative evaluations of the same attitude object; Thompson, Zanna, and Griffin, 1995). Typically ambivalence has been measured through the separate assessment of the positive and negative components of the attitude on unipolar scales, combined into an index reflecting differences in similarity and intensity of these evaluations. On the other hand, duality involves inconsistencies between the implicit and explicit evaluations of the attitude object (e.g., having both an unconscious negative attitude and a conscious positive one; Wilson, Lindsey and Schooler, 2000). Whereas explicit attitudes are measured through traditional attitude scales, implicit attitudes are assessed unobtrusively through a variety of priming techniques or more recently through the Implicit Association Test and its variants (Greenwald, McGhee and Schwartz, 1998).

Ambivalence and duality share several common characteristics, especially as both are based on the coexistence of discrepant evaluations in memory for the same attitude object, and both might create conflict in the attitude. Yet, we propose major differences in the differential strength of conflicting evaluations as the source of either ambivalence or duality. Ambivalence supposes that positive and negative evaluations are equally accessible, important and viewed as legitimate to the holder, resulting in a conscious experience of conflict in the attitude (Newby-Clark, McGregor and Zanna, 2002). In contrast, duality should involve the predominance of one evaluation over the other (accessibility, importance, and legitimacy). Yet, duality might also involve introspectively unidentified discomfort when the behavior is performed, due to diverging spontaneous and controlled reactions. For instance, Dovidio et al. (1997) found that the response-latency measure of implicit negative racial attitude was the best predictor of non-verbal reactions related to negative arousal, specifically differences in rates of blinking and percentages of visual contact with a black relative to a white interviewer.

The paper also proposes different consequences on the overall summary evaluation as well as on the attitude-behavior relations when holding either or the other structure (ambivalent or dual attitudes). Ample literature provides evidence that ambivalence creates summary evaluations that are low in accessibility and certainty, unstable and poor predictors of subsequent behaviors. We suggest on the contrary, that explicit attitudes based on duality should be well established, more stable and held with more confidence to serve as competitive responses to the automatically activated attitude. In turn, we expect these explicit attitudes to be strongly related to behavioral intentions and controlled behaviors, the implicit attitudes driving nonetheless impulsive behaviors and more spontaneous responses. For instance, several researches on racial prejudice (e.g., Dovidio et al., 1997) tend to demonstrate that explicit attitudes are strongly related to overt and controlled behavior whereas implicit attitudes are better predictors of spontaneous responses that lie outside of conscious awareness and control.

Two main consequences are suggested for consumer psychology. First, the importance of developing alternative measures of attitude to the current self-report bipolar scales for consumer research is discussed. Second, the implications in the domain of persuasion and attitude change when ambivalence and duality are at play (e.g. unhealthy diets, condom use etc.) are highlighted.

When do Others' Opinions Matter? Moderators of Implicit Interpersonal Influence on Attitudes

Martin Zemborain, Columbia Business School

This paper analyzes the effect of implicit interpersonal influences on an individual's attitudes toward an object. By implicit interpersonal influence we refer to situations in which an individual is influenced by significant others' attitudes, without being explicitly exposed to them.

Balance theory, originally formulated by Fritz Heider (1958), gives a nice framework to understand in which direction significant others' attitudes toward an object may influence an individual's attitudes toward that object. Basically, Balance theory proposes that people will tend to agree with liked others and to disagree with disliked others.

We propose that an individual's attitudes toward an object will be implicitly influenced by significant others' attitudes in the direction predicted by Heider's Balance theory. That is, people will tend to agree with liked significant others and to disagree with disliked significant others. However, this influence may be moderated by many factors. We analyze individual's Attitudinal Ambivalence toward the object as one of such factors. Specifically, we propose that individuals who score Low on Attitudinal Ambivalence will not be influenced by significant others' attitudes; while scoring high on Attitudinal Ambivalence will make the individual react in the direction predicted by Balance theory. We also tested people's awareness of this implicit interpersonal influence.

One hundred and twenty undergraduate students participated in Experiment 1, which was adapted from that of Priester and Petty (2001). In a between-subjects design, we measured subjects' overall attitudes, attitudinal ambivalence, and their perception of their parents' attitudes toward voting in the New York Governor's elections. We also measured how relevant subjects considered their parents' attitudes for their own decision to vote.

To test the hypothesis regarding the conditions under which the participants would recruit their parents' attitudes in order to report their own, we analyzed the data using a 2-way ANOVA with Participants' overall attitudes toward voting as the D.V. in a 2 (Attitudinal Ambivalence toward voting: High vs. Low) x 2 (Perceived parents' attitudes toward voting: Positive vs. Negative) between subjects design. As predicted, planned contrasts showed that parents' attitudes affected subjects' attitudes only when the latter experienced high ambivalence toward voting in the New York Governor's elections (High ambivalence: $F(1, 116)=9.60, p<0.003$; Low Ambivalence: $F(1, 116)=2.64, p<0.11$ n.s.).

Also, if parents' attitudes affect subjects' attitudes only when the latter experience High Ambivalence, then the correlation between own and parents' attitudes toward voting should be significantly stronger when participants experience High attitudinal ambivalence than when they experience Low attitudinal ambivalence. To test this proposition, we ran two bi-variate correlations between parents' and subjects' overall attitudes, one using data of subjects experiencing Low ambivalence and the other using data of subjects experiencing High ambivalence. Results were consistent with our prediction, the correlation between parents' and subjects' attitudes were significantly stronger under High ambivalence than under Low ambivalence ($r_{\text{High}}=0.565, p<0.0001$; $r_{\text{Low}}=0.29, p<0.03$; Fisher's $z=1.82, p<0.035$ (one-tailed)).

In order to test the hypothesis regarding participants' awareness of the implicit influence of their parents' attitudes, we analyzed the data using a 1-way ANOVA with Relevance of parents' attitudes toward voting on one's own decision to vote as the D.V. and Attitudinal Ambivalence toward voting (High vs. Low) as the I.V.. Results were consistent with the prediction that people seem to be unaware of their parents' influence on their own decision to vote. Although participants experiencing High or Low ambivalence rated their parents' attitudes toward voting as somewhat relevant to their own decision to vote; the 1-way ANOVA showed that mean differences of Perceived parents' attitudes relevance between High and Low ambivalence were not significant ($\text{Mean}_{\text{LowAmb}}=4.68$; $\text{Mean}_{\text{HighAmb}}=4.93$; $F(1, 118)=0.215, p<0.65$ n.s.).

We agree with prior research that the influence of others is an important determinant of an individual's judgments and behaviors. However, most prior consumer research focused on the effects of explicit interpersonal influence on consumers, such as word-of-mouth effects.

We proposed, and results from Experiment 1 suggested, that individuals may be implicitly influenced by others' attitudes, even if they are not aware of it.

Under certain conditions, people may spontaneously recruit significant others' attitudes from memory and use them as cues to report their own attitudes. Uncovering conditions under which this attitude formation process occurs is the focus of this research program. Research on this phenomenon may contribute to increase our understanding of how interpersonal influences may be present in consumers' everyday life.

Some limitations of Experiment 1 need to be acknowledged. In this first study, we measured the independent variables. A cleaner test of the hypotheses requires manipulations of the independent variables. Also, we did not assess the relevance of the topic for the participants. A key aspect of our predictions relies on the fact that people should be motivated to solve their ambivalent attitudes. The study was conducted the week before the New York Governor's elections and for this reason the topic should have been relevant for the participants. Also, results suggested that the New York State Governor's elections were sufficiently relevant for the subjects to recruit their parents' attitudes. However, a proper measure of topic relevance would bring insights regarding the motivation issue.

Future research involves looking for the conditions under which implicit interpersonal influence takes place. Other sources of motivation besides topic relevance are worth studying (e.g.: involvement, accountability, etc.). Also, other factors may moderate the effect. For example, self-construal differences (i.e.: independent or interdependent) may also moderate implicit interpersonal influences. Finally, it would be interesting to properly disentangle the psychological processes that drive this phenomenon.

Consumer Credit Behavior: A Conceptual Model and Proposed Research Agenda

Phylis M. Mansfield, Pennsylvania State University

Mary Beth Pinto, Pennsylvania State University at Erie

The use of credit cards has become an area of social and economic concern, particularly in the past ten years. The development of a model to study consumer credit behavior appears to be an important issue given the recent increase in use, and misuse of credit cards. This paper proposes a research model of consumer credit behavior, identifying the antecedents contributing to one's level of credit consciousness, and the resulting credit behavior activity. Previous studies have been identified that addressed various aspects of consumer behavior, including those that have dealt with credit card activity. These studies are utilized as a basis for the development of an overall contextual model of consumer credit behavior.

The antecedents to one's level of credit consciousness include: (1) Background Factors such as gender, age, socioeconomic status, ethnicity, and culture; (2) Socialization Factors such as socialization agents, parenting styles, learning mechanisms, and family communication; and (3) Individual Factors such as materialism values, personality characteristics, and credit knowledge.

These antecedents are proposed to impact one's level of credit consciousness. Credit Consciousness addresses both an individual's awareness of the usefulness and problems associated with using credit cards, as well as their usage behavior. In the credit consciousness scale, individuals who have a high level of credit consciousness are defined as having a greater level of awareness and acknowledge both its usefulness and its problems.

We also propose that a variety of situational factors may have an impact on an individual's level of credit behavior. For example, credit card companies act as aggressive marketing agents in the promotion of credit cards to college students and other market segments. In addition, technological factors have impacted credit behavior in the marketplace. The proliferation of payment options through the use of technology has provided opportunities for consumer to make more impulse decisions and pay for them with credit. Finally, one's social surroundings or the particular context of the shopping experience may impact the credit behavior exhibited.

The final outcome in our model is one's level of credit behavior. Credit behavior is defined as the individual's level of usage activity, reported as the number of credit cards possessed, the balance on those cards, and the percentage of total credit limit that is used. The difference in credit behavior and credit consciousness is that credit behavior is the actual usage of a credit card, while credit consciousness is the individual's perceived overall usage of a card.

This model offers several avenues for testable hypotheses. Specifically, what are the direct and indirect relationships among the constructs proposed in the model? How do these constructs interact with each other and ultimately, credit behavior? How do the situational factors moderate the relationship between credit consciousness and credit behavior? An additional question of interest is an individual's ability to discriminate between credit consciousness and credit behavior.

The Culture of Voluntary Simplicity

Mary Huneke, University of Washington at Bothell

The social movement known as Voluntary Simplicity "...means singleness of purpose, sincerity and honesty within as well as avoidance of exterior clutter, of many possessions irrelevant to the chief purpose of life..." according to Richard Gregg (quoted in Elgin, 1993). There is no single correct way of simplifying and no sanctioned level of affluence. The literature of the movement encourages a deliberative approach to purchase decision-making and often decries the "culture of consumerism". Interest in Voluntary Simplicity has waxed and waned throughout U.S. history. The most recent resurgence dates back to the early 1980's and roughly coincides with growing worldwide interest in sustainability in consumption and development. Much simplifying behavior is directly related to consumption. Simplifiers strive to rid their homes of clutter, including direct mail advertising, newsletters and magazines. They turn down their thermostats; buy in bulk to avoid over-packaging, buy locally grown produce. They also read labels and product information more carefully, seeking information about how the product was produced and how using it might impact the natural environment.

According to the theory of Diffusion of Innovation a relatively small proportion of the population will initially adopt new practices. These people are often opinion leaders and role models. Their experience and recommendations will influence a larger, but still relatively small proportion of the population who are called Early Adopters. They, in turn, influence an increasingly large proportion of adopters until the practice has reached its ultimate level of adoption (Rogers 2003). The purpose of this research is to begin to explore the premise that the practices of voluntary simplifiers, if diffused more widely through the population, would lead to more sustainable levels of consumption. This initial study identified the most important practices and those that were most disruptive to adopt

The research was conducted online during late summer of 2003. Those who responded to the survey were overwhelmingly female (73.5%). They were roughly evenly divided among three ten-year age spans between 25 and 54 while 12.4% were over 55 and 8% under 25. They were highly educated, with more than 65% holding at least a four-year degree and 22.1% holding graduate degrees. About a third of respondents had annual household incomes below \$45,000. Another 52% had incomes over \$45,000. The rest of the respondents declined to answer the income question.

Avoiding impulse purchases was rated the most important of the 21 simplifying practices. This was followed by recycling and eliminating clutter, which was also considered the most disruptive practice to adopt. Five of the ten most important simplifying practices relate directly to consumer behavior, including limiting exposure to advertising, buying from local merchants, buying locally grown produce, buying environmentally friendly products, and buying products produced by socially responsible companies. Both limiting exposure to ads and limiting clutter impact the respondents' exposure to marketing communications, since limiting clutter usually includes limiting or eliminating magazines, newspapers, catalogs, and direct mail pieces.

The respondents indicated that most of the practices they adopted as part of their efforts at simple living required a moderate to moderately high level of change in their behavior. Recycling required the least behavioral change, presumably because many communities have put curbside recycling systems in place. Respondents also noted that simplifying practices sometimes work against one another. For example, moving to a rural community in search of a slower-paced lifestyle also means more dependence on a car.

Technology and the Media: Utopian Promises in a Dystopian World

Matthew Lancellotti, University of Southern California

The current research hypothesizes dual causes for “technophobia,” or fear of and discomfort with technological products. Contrasting Modern and Postmodern views of technology combine with differing levels of consumer expertise regarding technology to result in unmet expectations and subsequent self-blame in the face of technological failure, on the one hand, and a severely negative assessment of the power of technology on the other. This strong influence of the media on perceptions of technology is supported by previous work on the influence of television on perceptions of violence and other social factors.

Technology has become pervasive in our society. Technological products are often viewed with a certain reverence for what they enable consumers to do and achieve. Understanding how consumers interact with technological products is of critical importance. Consumers can accomplish goals much more easily and quickly than they would without technology. Technological products also serve to level the playing field across disparate consumers and groups. Less knowledgeable consumers may use technology to help them keep up with better-trained peers (tax preparation software), or consumers in underdeveloped areas may use technology to achieve a more equitable existence relative to their contemporaries in more developed areas (solar powered electricity and water pumps). Hence technological products are of great importance to consumers, are often met with high hopes and expectations, and so can have significant negative impact when they don’t live up to them.

Beyond the goal-achievements and equity enablement associated with technology itself, the media also has a great impact on consumer perceptions of technology. It is suggested here that the media actually distorts the reality of what technology can do, leading to detrimental consumer interactions with it. One way to examine consumer relationships with technology is via their perspectives on it, and much has been written about a shift in consumer viewpoints over the past few decades from a Modern perspective to a Postmodern one. The Modern perspective views technology as benignly helpful. Consumers use and control technology to accomplish goals and advance their lives. Prominent in the Modern view is a positive outlook on technology, and a perception that we control it.

Recently we’ve seen a more Postmodern view of technology. This view is associated with greater distrust of technology, and acknowledgement of its dangers. Prominent in this view is the concept of technology as interactive, and something that has significant potential to control us, rather than we it. Both the Modern and Postmodern views of technology shape how consumers feel about technological products—and the media has had great influence in determining which of those views we subscribe to.

Prior work has documented the effects of the media on viewers’ perceptions of a variety of societal factors, including judgments about the level of violence in society, the prevalence of certain occupations, and the incidence of affluence and its symbols. Cultivation theory, which argues that viewers of television cultivate a view of society that is biased towards what they see on the screen, has been used to explain the mechanism behind these effects. The theory does not, however, show causality. More recent research has applied the Availability Heuristic as a means of explaining the psychological processes at work behind cultivation theory. The current research extends this work to explain the effects of media representations of technology on consumers’ fear and distrust of it.

A key avenue through which the media influences consumer perceptions is via the placement of technological products within television shows—product placement. This is becoming a more popular form of advertising. In the past product placements were subtle—a well-placed can of soda here, a new brand of cereal there. Now products are more frequently interacted with and discussed by the show’s characters. Given the nature of the placement relationship it is not surprising that such interactions are usually positive—and in the case of technology, show the character using the product to achieve their goal (think James Bond and BMW). The result: consumers have very high expectations for these products which apparently perform so well when needed most.

The current research proposes there is a moderating factor to the effects of the media on consumer perceptions of technology—expertise. Research has shown that novices, among other things, take information provided at face value—as opposed to experts who are more likely to question information and search more deeply. Prior work on the effects of television viewing has found that heavy television viewers tend to have lower incomes and less education than light television viewers. It is argued here that they will therefore have less expertise with technology, as an understanding of technology requires by definition certain scientific knowledge, and possession of technological products is greater among those who can more easily afford them.

Thus, it is hypothesized that heavy television viewers are more likely to be novice with technology than light viewers, and so take its portrayal at face value. Given the above discussion about the positive bias and modern perspectives on technology in the media it is also likely that heavy television viewers will be exposed to more positive biases in representations of technology than light viewers. Thus it is hypothesized that heavy television viewers will have higher expectations of technological products in general than light television viewers. Given their lack of expertise, if the technological products do not work as expected—which is likely given the positive bias of their portrayal in the media—heavy television viewers (novices) are hypothesized to be more likely to blame themselves for the failure. Finally, in face of this failure, attributed to themselves, heavy television viewers are more likely to exhibit “technophobia” than light television viewers. Indeed, it is argued that the heavy viewing of television, at least in part, leads to the technophobia via the above process.

These hypotheses will be evaluated in three studies: An examination of technological product frequency and valence, an exploration of consumer perceptions of technology as represented in the media, and a formal test of the hypotheses using a survey methodology.

Do Old Habits Die Hard? The Impact of Time on Consumer Responses to Pricing Information in a New Currency Denomination*Michael Callow, Morgan State University**Dawn Lerman, Fordham University*

The launch of the euro has caused significant consternation among consumers in the twelve participating countries. This paper examines whether Italian consumers have successfully adapted to the new currency, and whether they have substituted their old internal price references with a new set of prices that reflects a low-denomination currency.

According to the information-processing literature, consumers develop acceptable price ranges for products based on a subjective or psychological judgment that is influenced in part by previous pricing experiences (Monroe and Lee, 1999). The consumer uses these internal price references along with external price references to evaluate new pricing information. Thus, they can determine whether a price differential between two offers is substantial or not. Cross-cultural research, however, suggests that consumers are less adept at evaluating pricing information when it is presented in foreign currencies that are a fraction or multiples of the domestic currency (Raghubir and Srivastava, 2002; Dehaene and Marques, 2002). In a previous study, we found that Italian consumers, with a traditionally high-denomination currency in the lira, were still evaluating foreign prices using a high-denomination internal pricing reference system. The original study was conducted in February, 2002, one month into the launch of the euro.

The current study is a follow-up of the previous study, examining whether the Italian consumer has successfully adjusted to the low-denomination currency. We propose that consumers facing an unfamiliar currency can either use currency conversion tactics that keep their existing internal price references intact, or they can adjust these internal price references by substituting old pricing information with new prices. We propose that over time the Italian consumer will adjust their internal price references to the low-denomination currency, since this is the most effective method for evaluating prices in euros.

We develop a 2 x 2 between-subject experimental design to test our hypotheses. We compare responses to foreign pricing information in high-denomination and low-denomination currencies. The initial data set was collected from Italian students in February 2002, one month after the arrival of the euro. The second data set was collected nine months later using different Italian students from the same university. Our findings suggest that Italian students have become more comfortable with the low-denomination framework over time, since the respondents from the second sample viewed price reductions in a low-denomination currency more favorably than those in the first sample. In addition, the Italians who had been exposed to the euro for ten months were generally less impressed than the other group with the price reduction in the high-denomination condition.

Our results suggest that the single currency experiment has been successful in terms of how quickly the new generation of Italian consumers has adjusted its internal price references to a low-denomination numerical system. The implementation of a single currency has standardized to a certain extent the manner in which new pricing information is processed, and is a significant first step in creating a unique European culture and consumer.

Materialism and Basic Food Groups: The Effects of Status Enhancement and Survival Security Motivations on Materialists'***Choice of Food Groups****Michael W. Allen, University of Newcastle**Sik Hung Ng, City University of Hong Kong**Marc Wilson, Victoria University New Zealand**Shaun Saunders, University of Newcastle*

The aims of the present studies are to investigate if materialism manifests in food group choice, and if so, if the motivation for doing so is status enhancement or survival security. The issues are important for several reasons. First, theorists are divided on whether materialists are motivated primarily by status enhancement or survival security (i.e., Belk, 1984; Inglehart, 1977/97; Richins & Dawson, 1992). Second, many people's diets fall short of that recommended in health campaigns (i.e., National Diet and Nutrition Survey of 1995, 1998), implying to us that the psychological motivations underpinning food choice could be better understood. Finally, although it is obvious that a food such as caviar may appeal to materialists, no systematic framework has been developed that details the extent to which the everyday, seven basic food groups may appeal or be rejected by materialists. Our framework suggests that the status values of the seven basic food groups, from highest to lowest, are: red meat, white meat, fish/seafood, dairy products, vegetables, fruit, and cereals, respectively. Consequently, if materialism is expressed in food choice and the motivation for doing so is status enhancement, then materialists' food preferences should co-vary with each food's status value. In contrast, if materialism is expressed in food choice and the motivation for doing so is survival security, then materialists should prefer, hoard, and consume all seven food groups heavily but equally because most foods are equally required for survival.

Most theorists agree that one motivation driving materialists is status enhancement (i.e., Inglehart, 1977/97; Richins & Dawson, 1992). Status enhancement or prestige seeking is choosing products and possessions that will increase or maintain one's social status in order to impress others, be distinct from others, to keep up with a reference group, to arouse feelings and affective states, or to achieve perfectionism (i.e., Vigneron & Johnson, 1999). Richins and Dawson (1992) suggest that materialists use possessions to increase social status and differentiation, and Inglehart (1977/97) suggests that materialism is an outcome of modern culture in which economic growth is a culture-level goal that is internalised as achievement motivation and materialism.

Although there is a consensus among theorists that one motivation compelling materialists is status enhancement, the other motivations of materialists are debated. For instance, Inglehart (1977/97) suggests that materialists are driven by survival insecurity. Modern culture is typified by survival insecurity regarding economic self-sufficiency and fear of military or national conflict. Inglehart suggests that survival insecurity during the formative years of socialisation motivates individuals to seek survival security later in life, including acquiring possessions. However, empirical research has reached inconsistent conclusions on the subject (i.e., De Graaf & Evans, 1996; Marks, 1997; Warwick, 1998). Moreover, no research has investigated whether materialists favour a product because the product brings them survival security.

Likewise, no previous study has investigated the ways in which materialism might be expressed in food choice, though the connection seems reasonable. The two theoretical motivations that compel materialists, survival security and status enhancement, could be satiated by food. Food is necessary for survival and so individuals motivated by survival security would likely strive to ensure that food is plentiful. In terms of nutritional values, foods such as meat, fish and dairy products are higher in protein and some minerals than most fruits, vegetables and cereals (except legumes and beans)(ie., Piper, 1996). However, most fruits, vegetables and cereals are higher in carbohydrates, vitamins, some minerals, fibre, and polyunsaturated fat. Thus, in our view, the survival benefits of the various basic foods seems to be evenly distributed among the seven food types, and so individuals concerned about survival security should favour all seven foods strongly but equally. Likewise, if materialism is expressed in food choice and the motivation for doing so is survival security, then materialists should prefer all seven food types strongly though equally.

In contrast, if materialism is expressed in food choice and materialists' motivation is status enhancement, then materialists should prefer high status foods and reject foods of low status. In particular, materialists' food preferences should be in the following order, from most to least: red meat, white meat, fish/seafood, eggs and dairy products, fruit, vegetables, and cereals, respectively. This inference is based on observational research carried out by sociologists and anthropologists pursuing the Structuralist approach, which examines how food habits are maintained by broader social structures and forces (cf., Cuff & Payne, 1977; Lupton, 1996). Structuralist sociologists and anthropologists have mainly examined one dimension or ordering of basic foods; that is, red and white meat at one end, fruits, vegetables and cereals at the other end, and dairy and seafood in the middle (Adams, 1990; Caplan, 1997; Fiddes, 1989; Fieldhouse, 1995; Heisley, 1990; Lupton, 1996; Twigg, 1983). These researchers suggest that this dimension or ordering may be the predominant way Western culture conceptualises and organises foods, and that at its most elementary level represents high vs. low status.

To test these ideas, Study 1 employed a survey/correlational design and Study 2 an experimental one. Study 1 found that materialism was not correlated with a generalised preference for all foods. Instead, materialism was correlated with the preference, consumption and hoarding of foods in the following order, from most to least; red meat, white meat, fish/seafood, dairy, fruits, vegetables, and cereals, respectively. Factor analyses revealed that this food sequence underpinned all participants' food preferences, and that the ordering distinguishes high from low status foods. SEM in Study 2 found that lessening the treatment group's status enhancement motivation (by increasing their support for Equality via the Value Self-confrontation Procedure) decreased support for materialism that in turn diminished preferences for higher status foods in favour of lower status foods. Taken together, the results suggest that materialists' food choices are driven more by status enhancement than survival security.

Only Fools Pay More?: Incorporating Behavioral Regularities Into Pricing Decision

Min Ding, Pennsylvania State University

While the classic economic theory has maintained that price only generates disutility and that a consumer is generally better off with a lower price, consumer behavior research has firmly established that the individual consumer often infers information from price even when the price information carries no real information whatsoever (what is known among economists as cheap talk). For instance, a consumer might infer that a higher price represents higher quality and thus derive positive utility from paying a higher price. This observation, while well accepted in the consumer behavior literature, has not yet been incorporated into the classic economic theories for descriptive purposes. This paper takes the so-called behavioral-based analytical modeling approach, and develops a parsimonious, yet rigorous, mathematical model that captures two key behavioral regularities: (1) consumers infer quality from price even when price information is cheap talk, and (2) consumers make decisions relative to a reference price. The new theory provides interesting insights on consumers' choice behavior when given otherwise identical products at different price levels. We have shown that, in many cases, an individual has a utility-maximizing price that is not zero. The key theorem states that the behavioral effect of pricing (inferring quality from price) is only relevant when the following two conditions are true: (1) consumers are sufficiently sensitive to price information for a given product, and (2) consumers have a medium default utility for the product (that is, they neither completely distrust nor blindly believe in the product in the absence of pricing information). The nature of this utility-maximizing price changes across individuals as well as across products. A consumer will have a higher ideal (optimal) price for a given product if his reservation price is higher, or if he cares more about quality, or if he is more sensitive to the price-quality relationship when he does not care too much about quality and less sensitive to the price-quality relationship when he cares a great deal about quality. Further, a consumer will have a higher ideal (optimal) price for a given product if the product category is inherently more valuable. When a consumer does not care too much for quality, ideal price is higher if a larger percentage of the price carries quality information. When a consumer cares about quality, however, ideal price is lower if a larger percentage of the price carries quality information. Finally, the new theory allows us to divide consumers into four different types: (1) Bargain hunters or super rationals (who always prefer a lower price), those who will either not buy anything, or only buy when price is very low; (2) Quality conscious (those who will pay a premium for a product); (3) Quality conscious unless the product is dirt cheap (those who seek a medium price unless the price is really low); and (4) Bargain hunter unless quality is high enough (in which case, the consumer will be willing to pay a little more). Both hypothetical (subjects' choices are not fulfilled) and real (subjects' choices are fulfilled) experiments were conducted to test the existence of the four consumer types in the context of purchasing a variety of food for lunch (eggroll, soup, and pizza). We proposed a Ranking Order Preference Elicitation (ROPE) method using Random Allocation of Scarce Inventories (RASI) that, if understood, should ensure that it's incentive compatible for subjects tell us their true preference order for the alternatives. The empirical data provide strong evidences that consumers can indeed be categorized into the four types predicted by our model.

Impulse Buying and Variety Seeking: Two Faces of the Same Coin? Or, Maybe Not!

Piyush Sharma, Nanyang Business School

Bharadhwaj Sivakumaran, Nanyang Business School

Introduction

Impulse buying (IB) and variety seeking (VS) are both classified as spontaneous hedonic purchase behaviors influenced by feelings rather than logical thinking (Baumgartner 2002). However, there is little empirical research into their similarities and differences. We address this gap by investigating the association of both these behaviors with relevant consumer traits (consumer impulsiveness, optimum stimulation level and self-monitoring) and situational factors (involvement, product type, time availability and mood).

Similarities Between IB & VS

Consumer Impulsiveness (CI) and Optimum Stimulation Level (OSL): IB is a spontaneous purchase behavior without any deliberate consideration of alternatives/future implications (Rook and Fisher 1995), somewhat similar to the definition of VS, an urge to seek change for the sake of pleasure drawn from the process of seeking change and not for any rational benefit (Van Trijp et al 1996). Traditionally, CI trait is associated with IB and OSL with VS (Puri 1996, Baumgartner and Steenkamp 1996). However, based on the above similarities in their motivations we hypothesized a positive association between these traits and both IB and VS.

Time Availability and Mood: Greater time availability leads to more in-store browsing and hence, more IB (Beatty and Ferrell 1998). We suggest a similar association for VS because of the inherent similarity between their motivations. Similarly, positive mood leads to more IB and VS (Rook and Gardner 1993; Kahn and Isen 1993). Hence, more IB and VS under higher time availability and positive mood.

Differences Between IB & VS

Self-Monitoring: High self-monitors seek more variety in public to appear as interesting and creative people (Ratner and Kahn 2002), but they also try to appear rational when their decisions may be scrutinized by others (Lerner and Tetlock 1999). IB is commonly associated with post-purchase negative affect and guilt, which may make high self-monitors less impulsive in their purchase decisions. Therefore, more VS (IB) for high (low) self-monitors.

Involvement: Consumers indulge in more VS for low involvement products (Van Trijp et al 1996) but high involvement coupled with greater argument quality also leads to increase in persuasion (Petty et al 1983). We suggest that under high involvement consumers may develop better quality arguments supporting their impulsive decisions and hence, more VS (IB) under low (high) involvement.

Product Type (Utilitarian vs. Hedonic): Consumers seek more variety in hedonic products (Van Trijp et al. 1996) but they guard against impulsive urges and develop strategies to resist these (Dholakia 2000). Therefore, faced with an impulsive urge for a hedonic product, they may be more cautious and less impulsive but for utilitarian products they may discount the negative normative associations and be more impulsive. Hence, more IB (VS) in utilitarian (hedonic) products.

Moderating Role of Self-Monitoring

Consumer traits have a greater influence on behavior among low versus high self-monitors. Hence, we expected self-monitoring to moderate the influence of impulsiveness and OSL traits on level of impulsiveness and variety seeking in purchase decisions, but because of their opposite normative associations we hypothesized a positive (negative) moderation for VS (IB).

Methodology

We used an experimental approach with 160 undergraduate student subjects. We first administered a questionnaire with all the trait scales, then exposed the subjects to different shopping scenarios (adapted from Rook and Fisher 1995) and finally measured our dependent variables i.e. level of impulsiveness and variety seeking in the purchase decisions. Each subject was exposed to four different scenarios, two each for IB and VS, covering all four situational factors (counterbalanced).

Results & Discussion

All scales used in our study showed high reliability and all manipulations worked. Subjects' age and gender had no significant impact on the findings. We used multiple regression analysis and mean comparison using T-test. Regression models represented a good fit for both, IB ($R^2_{adj}=0.279$, $F(5,155)=20.563$, $p<0.001$) and VS ($R^2_{adj}=0.215$, $F(5,155)=12.397$, $p<0.001$). Most hypotheses were supported with significant beta-coefficients and mean differences ($p<0.01$).

Our research makes several important contributions. First, we empirically demonstrate the similarities and differences between IB and VS, in their associations with relevant consumer traits and situational factors. Second, we show the opposite moderating influence of self-monitoring on these two behaviors. Thus, our conceptual framework may lead to a better understanding of the general category of hedonic purchase behaviors.

How Do Consumers Learn to Extract Utility from Really New Products?

Qing Wang, University of Warwick

BACKGROUND

"Really new" products (RNPs) are important sources of growth for many companies. They create new product categories, and have the ability to reshape the competitive landscape (Lehmann, 1997). The growing literature on RNPs has focussed on how consumers think about really new products *before* they buy them. However, little is known about how consumers put them in actual use (or disuse). This is a critical knowledge gap for marketers. This paper seeks to examine two issues. First, do consumers chronically overestimate the degree to which they will use a really new, durable product? Second, what explains why usage patterns change from the initial period to later periods? The paper proposes a set of hypotheses for further empirical studies.

OVERESTIMATION OF USE AT THE TIME OF PURCHASE

The general tendency to overestimate the extent of use at the time of purchase can be explained in terms of temporal construal theory (Liberman and Trope 2003). The construal level theory specifically proposes when individuals represent information about the consumption of a new product prior to use, they are likely to use more abstract mental models, or high-level construal, which consist of general, superordinate, and essential features of the consumption process. However, when individuals represent information about the consumption of a new product at the time of use, they are likely to use low level construal, which tend to be more concrete and include subordinate, contextual, and incidental features of the consumption process. There is therefore a general tendency to overestimate the extent of use at the time of purchase for all durable products. We conjecture that this overestimation is especially great for RNPs. RNPs differ from normal durable products particularly because consumers lack detailed information about the relevant tradeoffs associated with RNP domains. This is likely to cause mental construal at the time of purchase to be even more focussed on abstract benefits rather than on concrete constraints on use than might be true for incrementally new durables, hence resulting in even greater overestimation of the extent of use. Therefore we hypothesize that:

H1: Consumers buying new products will construe their future use of those products at a higher level than when they use them, and this difference in construal will be greater for RNPs due to higher perceived uncertainty.

H2: Consumers will overestimate their likely use of new durables, and this overestimation will be greater for RNPs due to greater difference in construal.

THE TRAJECTORY OF USE OVER TIME

Initial use

Studies in analogical learning show that consumers use analogy to learn about a new product category. Analogical learning involves mapping prior knowledge in an existing product domain to the new product domain (Gregan-Paxton and Roedder John, 1997). However, for RNPs, consumers have little relevant objective knowledge. Instead individuals may have different levels of subjective knowledge (i.e. the perceived relevance of their prior knowledge to an RNP) influenced by factors such as advertising and over-confidence. This subjective knowledge is likely to have a significant effect on the persistence of use at an initial period. According to the literature of self efficacy (Bandura, 1989; Elliot and Church, 1997), people's perception of their self-efficacy, rather than their objective ability, determines their

level of motivation, as reflected in how much effort they will exert in an endeavour and how long they will persevere in the face of obstacles. We conjecture that individuals with high subjective knowledge are more likely to have high initial self efficacy and high approach orientation than individuals with low subjective knowledge. High initial self efficacy and approach goal orientation in turn increase consumer's persistence to use the new product and enable them to obtain new objective knowledge.

H3: Individuals with higher subjective knowledge at the time of purchase will have higher self-efficacy at the initial use of an RNP, in comparison to individuals with lower subjective knowledge.

H4: Individuals with higher subjective knowledge at the time of purchase will have higher approach motivation and lower avoidance motivation at the time of initial use than will individuals who have lower subjective knowledge.

H5: Persistence of initial use of an RNP will be a positive function of subjective knowledge, self-efficacy, and approach motivation and a negative function of avoidance motivation at the time of purchase.

H6: Persistent use in the initial period increases the amount of new domain knowledge acquired in the same period.

Later use

The foregoing analysis explains the patterns of use in an initial period. The same principles outlined in H3-H6 determine how usage evolves from initial use to use at some later period of time. We conjecture that the main additional factor that influences the pattern of use beyond the initial period is the negative or positive feedback of surprise from the initial use.

Internet Usage Across Latino Acculturation Patterns

Rachel Maldonado, Eastern Washington University

The Internet is one of the fastest growing communication media in the marketing arena. As consumer use of the Internet has grown, there has been some concern that the Internet would create a greater divide between the social/economic standing of Internet users and nonusers. Of special concern has been the potential impact on ethnic markets that may be slower in adopting Internet usage. While the Latino market is one of the fastest growing ethnic markets in the U.S., Latino usage of the Internet has lagged behind that of the general population. Recent reports, however, indicate that Internet usage among Latinos is rapidly growing, making them the fastest growing ethnic Internet users in the U.S. The demographic penetration of the Latino Internet market has become so great that the question has shifted from digital access to determining why some would use the Internet and not others, and how to best meet the needs of online Latinos. This paper seeks to address these questions by studying Internet usage across Latino consumer acculturation categories.

Consumer Acculturation and Internet Usage

Consumer acculturation is the process of adapting to a different consumer cultural environment. When adjusting to a different culture, consumers may settle into routines or lifestyles heavily influenced by strong ethnic attitudes and behaviors, or they may become like the dominant culture. Acculturation recognizes that the adaptation process may result in a variety of lifestyle patterns. These lifestyle patterns are called acculturation categories. Four potential acculturation categories are assimilation, integration, segregation, and marginalization. These categories are distinguished by attitudinal and behavioral dimensions associated with strength of ethnic identity and participation in host versus ethnic related behaviors. The hypotheses in this paper predict that Internet access and usage rates will be lower among Latinos in the segregation category, involvement with the Internet will also be lower in this category and the purpose for which these individuals use the Internet will differ from those in the assimilation category.

Methods

The sample for this study consists of 162 Latino high school students attending a Latino student organization conference sponsored by a university in the northwestern United States. Acculturation categories were determined by using a 29 item acculturation scale designed to place respondents in either assimilation, integration, or segregation categories based upon their responses to attitudinal and behavioral questions. The Internet questions asked about points of access to the Internet (in and out of the home), the number of hours spent on the Internet per day, and the reasons why respondents used the Internet. Internet involvement was measured using two scales, one measuring knowledge of the Internet, and Zaichkowsky's Involvement Scale.

Results

The data indicate that these young Latinos are accessing the Internet at a rate higher than anticipated by earlier research. The data, however, did not provide the information needed of hypothesis testing. Thirty-five percent of the respondents aborted the survey after completing all or part of the Internet usage questions. The remaining 105 respondents were disproportionately spread across the acculturation categories with only ten in the assimilation category. This made hypothesis testing involving this category unreliable. The data however, did indicate that the expected patterns may appear in larger and more evenly distributed data sets. It appears that individuals in the segregation category may not have as much access to the Internet as those in the assimilation category, and their usage rate may be lower. However, the data did not show support for differences across categories for knowledge of and involvement with the Internet. This may be due to the extensive inclusion of Internet skills in high school curriculum. It appears that individuals in the segregation category may be more likely to use the Internet for communication purposes than those in the integration category and less likely than those in the integration category to use the Internet for research purposes.

Contributions and Suggestions for Further Research

The patterns exhibited in this data set indicate that consumer acculturation categories may provide some understanding for who is and who is not using the Internet and for providing some guidance for meeting the needs for online Latinos. A larger and more equally distributed sample will be needed to adequately test the hypotheses, as well as samples from other Latino demographic groups such as college students, young adults who are not in school and older Latinos. If the expanded data set exhibits and confirms the expected patterns, marketers can use the information to design Internet sites consistent with the characteristics of Latinos in the various acculturation categories and determine the most effective ways of increasing Latino patronage of their web sites.

Do Females and Males Evaluate Promotional Emails Differently?

Rajneesh Suri, Drexel University

Marissa V. Phillip, Cornell University

Along with the growth of the Internet, there has been an increase in the number of females going online. This research investigates the effectiveness of components of promotions communicated via emails that are targeted to the two sexes. The results from a survey suggest that women and men differ in their evaluations of information content and visual presentation used in promotional emails. Compared to men, women were also more concerned about privacy and preferred to use the new media to build social contact. Implications for using promotional emails are discussed.

Differences in Information Processing from Print Ads and Web Pages

Ramaprasad Unni, Portland State University

There is a growing body of research on information processing in interactive media such as web pages (e.g., Ariely 2000; Hoffman and Novak 1996). While there is a broad appreciation of differences between new media like the Web and traditional media sources such as print advertising, barring a few exceptions (e.g., Bezjian-Avery, Calder, and Iacobucci 1998), there is a dearth of research comparing information processing effects between new and traditional media sources.

Interactivity is conceptualized as the key difference between web pages and print ads Bezjian-Avery et al 1998; Coupey 1999). We adopt a commonly used conceptualization that views interactivity as the ability of the consumer to control information flow in a medium (Bezjian-Avery et al 1998). In print ads, interactivity is usually perceived to be low because the information is typically linearly structured (left-to-right and top-to-bottom) and consumers would typically process the information in the sequence found in the ad. This does not necessarily mean that this medium has negligible interactivity. Consumers have relatively more control over the sequence, and amount of time spent on different aspects of a print ad than a TV ad, where the control is limited to changing the channel or switching it on or off (Ariely 2000). On the other hand, web pages can typically offer far higher levels of interactivity. Consumers are not constrained by a linear traversal of product information. The medium allows consumers to pick and choose information in any sequence.

A potential drawback of interactivity is the increased processing cost associated with control over information flow. Increased effort is experienced when consumers lack the experience or knowledge to navigate and acquire relevant information in a web page (Ariely 2000). The impact of cognitive effort to acquire product information is compared between these two sources.

The effects of interactivity in source and cognitive effort are examined within existing frameworks of information processing (e.g., MacInnis and Jaworski 1989). Information processing from a source produces affective responses, brand cognitions, and source cognitions which are integrated to shape brand attitudes. The higher level of interactivity in web pages is hypothesized to result in greater message strength, more favorable affective responses, and favorable source evaluations. These would lead to more favorable brand attitudes from web page than from print ad.

Increased cognitive effort to process product information has been shown to produce negative affect (Garbarino and Edell 1997). Increased costs of acquiring information would also adversely affect message strength, attitudes toward the source and brand attitudes (MacInnis and Jaworski 1989).

Method

A 2x2 between-subjects laboratory experiment was used to test the hypotheses. The two factors—*type of information source* (print ad and web page), and *cognitive effort* (high or low) were fully crossed. Subjects were undergraduate students enrolled from a subject pool.

Identical product attribute information of an inflatable chair was used to construct web pages and print ads. The ads were professionally produced in full color with relevant copy about the salient attributes and appropriate execution elements. Cognitive effort manipulation was operationalized by varying the readability of the information provided in the ad. For both levels of cognitive effort, the same information on salient attributes of an inflatable chair was provided. In the *low cognitive effort* condition, the layout facilitated easy access to information on salient attributes. In the *high cognitive effort* condition, layout and font colors and style made it difficult to learn the salient attributes of the product.

For the web pages, in the *low cognitive effort* condition, all the information was laid out under sub-headings of salient attributes in a tabular layout with an image of the chair. Details of each attribute would appear when the cursor was panned over the attribute. All the information appeared in one screen thereby precluding the need to use the vertical scroll bar. In the *high cognitive effort* condition, the web page layout made it inconvenient to get information. Subjects had to use the vertical scroll bar to view all information on a page. There were separate windows that contained salient attribute information. This window would open up when the link on the salient attribute was clicked.

Results

Manipulation checks confirmed the validity of the manipulations. The hypotheses were tested within a MANCOVA analysis with product relevance as the covariate. Significant multivariate main effects of effort and source x effort interaction effects were observed. Univariate comparisons revealed support for hypotheses regarding main effects of cognitive effort on source cognitions and affect. However, the strong source x effort interaction suggest a disproportionate effect of increased cognitive effort on web pages. Managerial implications of creating efficient web pages that have high usability are evident from these results

The Private World of the internet Shopper: An Exploratory Study of Product Conspicuousness, Self-Congruity and On-line Purchase Behavior

Roger Marshall, Nanyang Technological University

Kathleen Tan Siok Lin, Nanyang Business School

Internet consumer behavior research has to date generally centered on investigating the type of people who would be more likely to use the Internet for information and transactions (Goldsmith, ; Lynch, Kent, & Srinivasan, ; Smith & Whitlark) and the types of products that lend themselves to online purchasing (Kwak, Fox, & Zinkhan). The investigation reported here explores the effect of purchasing online on consumers' self image and purchase intention.

The Internet usually affords consumers a measure of privacy and it is proposed here that it is this feature of the Internet and not the technology itself that affects purchase behavior. Further, as collectivistic persons are more likely to consider the opinions of others (Parkes, Schnieder, & Bochner, 1999; Triandis, 1994), this difference in purchase behavior for private versus conspicuous goods will be greater for allocentrics than idiocentrics. A number of hypotheses are developed to represent these ideas.

METHOD

Subjects were first asked to complete a validated collectivism scale. Four fictitious advertisements representing two conspicuously consumed products (mobile phone and watch) and two privately consumed products (underwear and a self-improvement program called "Confidex") were then developed. Each advertisement contained a gender-neutral visual image, a fictional brand name and a tagline that highlighted the personality of the product.

Each advertisement was accompanied by five questions. First the congruity of the product's image and the respondent's image was measured, using Sirgy's self-congruity scale (Sirgy, 1985). Next, respondents' purchase intentions were measured using a three-item bipolar adjective scale used by Gotlieb and Sarel (1988) and Yi (1990).

Subjects were divided into four groups with equal numbers of individualists and collectivists in each. Two groups carried out the experiment in private and two in public. One private group and one public group used a computer to submit their survey, while the remaining private and public groups filled in an identical paper survey.

RESULTS

Scales

353 good responses were obtained. Reliability tests for the three-item purchase intention scale for each product and the collectivism scale were run and a high Cronbach's alpha was obtained for all.

Hypothesis testing

The correlation between self image and purchase intention was found to be high for each product, supporting H1 and lending validity to the measures.

Analysis by one-way ANOVA found no significant differences in on- and off-line behavior with image congruity or purchase intentions for the four products, thus supporting H2. Similarly for H3, as there were no significant differences found between behavior (image congruity and purchase intentions) of people buying publicly-consumed goods in either a private or a public purchase situation.

However, there is a significant difference in image congruity between private and public purchasers of the underwear line ($F=7.17$, $p=.008$, $\text{Mean}_{(\text{private})}=3.40$, $\text{Mean}_{(\text{public})}=3.68$; $\omega^2=0.017$). The confidence-building product test revealed no statistical differences, however, thus limiting the support that can be claimed for the major hypothesis, H4.

The same Hypothesis is also concerned with purchase intentions under private purchase/private consumption conditions. Again, results for underwear are significant ($F=12.73$, $p<.001$, $\text{Mean}_{(\text{private})}=3.31$, $\text{Mean}_{(\text{public})}=3.69$; $\omega^2=0.032$) and the "Confidex" product failed to yield the expected results.

Collectivism was found to act as a mediator in the predicted way. When the 122 (relative) Collectivistic respondents are selected there is a significant effect for underwear ($F=3.87$, $p=0.051$, $\text{mean}_{(\text{private})}=3.43$ and $\text{mean}_{(\text{public})}=3.79$, where a low score indicates greater image congruity). No effect is found for Individualists.

When purchase intentions are substituted for image congruity, there is a significant effect for both individualists and collectivists, but the effect is larger and stronger for the former than for the latter (Individualists, $F=5.94$, $p=.016$, $\text{Mean}_{(\text{public})}=3.65$, $\text{Mean}_{(\text{private})}=3.19$; Collectivists, $F=9.13$, $p=.003$, $\text{Mean}_{(\text{public})}=3.87$, $\text{Mean}_{(\text{private})}=3.28$). Again, the "Confidex" product manipulation failed.

DISCUSSION

This is an exploratory study that does seem to have found some support for the basic idea that it is the privacy of consumption and purchase that drive differences in on-line purchase behavior rather than the being on-line *per se*. Implications for management and further research are discussed.

The Moderating Effect of Context on Consumer Evaluations of Restaurant Menu Items

Scot Burton, University of Arkansas

Elizabeth H. Creyer, University of Arkansas

Jeremy Kees, University of Arkansas

Study Background

The epidemic of overweight and obese Americans costs the U.S. over \$117 billion a year in medical and related expenses, but these financial expenses pale in comparison to the costs to human life and consumer welfare. Within the context of restaurant menu items, this research examines how attitudes, intentions, and disease risk perceptions, are affected by 1) the provision of nutrition information, 2) a health claim, and 3) the nutritional frame or the context within which a menu item is evaluated. Since the percentage of food dollars spent on food prepared outside the home continues to increase, and since many restaurant offerings are high in calories and fat, improving restaurant food choices may improve the health of millions of Americans.

While several streams of research provide insight into how consumers construct evaluations of restaurant menu items, prior research on "context effects" is particularly relevant. We anticipate that main effects of both target item nutrition information and health claims focusing on the link between diet and the risks of cancer and heart disease will be moderated by the nutrition frame created by alternative (non-target) menu items. For example, provision of a frame that presents very negative nutrition information (compared to the control), will have a more positive effect on attitudes and intentions for a target item with relatively unfavorable nutrient levels, compared to when there is either no target item nutrient information or relatively favorable information. In contrast to many studies examining context-related effects, we also consider how information presented for the target option affects evaluations of other choice alternatives.

Method and Results

A 3 (nutrient levels of the target menu item: control, favorable or unfavorable) X 2 (nutritional frame: nutrition information for three non-target menu items present or absent) X 3 (health claim for the target menu item: cancer claim, heart healthy claim, or no claim) between-subjects experiment was conducted. The nutrition information provided for the alternative items, based on tests of actual restaurant foods conducted by the Center for Science in the Public Interest, indicated that the alternatives were unhealthy choices. All experimental conditions were presented on a four-color menu stimulus.

Participants in the study were 377 members of a consumer household research panel who completed mail surveys (response rate of 58%). Multi-item dependent measures included: nutrition-related attitude, overall attitude towards the product, source credibility, and purchase intention. All coefficient alphas exceeded .90. Disease risk perceptions and nutrient value estimates were also collected. All dependent variables were assessed for both the target item and one non-target (chicken fajitas) menu item.

Attitude and purchase intention measures for the target and non-target items show both multivariate main effects of the nutritional frame and the nutrition information manipulation. (However, at times these effects must be interpreted with caution because there are

several significant univariate interactions between the independent variables.) There are also consistent univariate main effects of the nutritional frame across the dependent variables. When the nutrition information for the non-target items is provided, nutrition-related attitude ($F=23.9; p<.001$), overall attitude towards the product ($F=27.3, p<.001$), and purchase intentions ($F=19.5, p<.001$) decrease. Because the nutrient values (when provided) were based on CSPI testing, these findings show that effects of awareness of the (unfavorable) nutrition information for the non-target item affects important measures of consumers' attitudes and purchase intentions.

However, nutritional frame and nutrition information interact to influence target item purchase intentions and product attitude. Relevant plots indicate when there is no nutrition information for the target item, both the purchase intentions and attitude toward the target item are essentially identical ($p's>.50$), regardless of the presence of the frame. When the target item nutrition information is unfavorable, provision of the negative nutrition frame increases purchase intentions and leads to more favorable product attitudes ($p's<.01$). For the favorable target information condition, neither attitudes nor purchase intentions differ significantly ($t's=1.14$ and 0.20 , respectively, $p>.15$) across the frame conditions.

Brief Discussion

The significant two and three way interactions illustrate the complexity of the evaluation task presented to consumers, and extends current knowledge on the effects of a contextual frame created by competing products on target and non-target attributes (e.g., nutrients) and general evaluations (attitudes, purchase intentions, and source credibility). Specifically, findings demonstrate the manner in which a frame created by objective (nutrient) information for non-target items can interact with both a claim and objective nutrition information about the target item.

Results show that providing the (unfavorable) nutrition information for the non-target items affects nutrient evaluations and, more importantly, extends to important product attitude and purchase intentions dependent variables. These results suggest that consumers are not aware of the higher levels of fat, saturated fat, and cholesterol contained in the non-target product. When exposed to these unfavorable nutrient levels, consumers' disease risk perceptions increase, and attitudes toward the product and purchase intentions decrease, relative to when no nutrition information is presented. Such findings reinforce concerns of policy-makers and consumer welfare advocates that few consumers are aware of the high levels of fat and saturated fat contained in the often large serving sizes offered by restaurants. These findings suggest that consumers who frequently eat outside the home may not consider the long-term disease risk associated with their diet. Our findings, coupled with recent court cases about the disease-related effects of fast food consumption, indicate that further research addressing the implications of inclusion of nutrition information on menus is warranted.

One-Sided vs. Two-Sided e-WOM: Does it Matter?

Shahana Sen, Fairleigh Dickinson University

The impact of word-of-mouth on consumer decision-making has long been established (Brown and Reingen 1987; Feldman and Spencer 1965; Herr, Kardes and Kim 1991; among others). WOM information has been described as the most powerful form of marketing communication and studies have shown that users find WOM more believable than commercially generated information (Hutton and Mulhern 2002). Recently consumer reviews on the Web or e-WOM has become a ubiquitous phenomena, and an integral aspect of the information revolution impacting consumers' behavior, particularly with respect to their search for and evaluation of information. Due to eWOM, consumers now have easier access to information from sources other than the marketer of the product.

As with other information on the Web, this kind of information is prolific and it is hard for the consumer to go through all that is available. Besides, there is the issue of legitimacy. In the physical world word-of-mouth is received from family or friends, i.e. people who the receiver knows and has a level of trust, based upon which the receiver decides whether or not to accept the advice (Hutton and Mulhern 2002). But how does a consumer evaluate WOM coming from a virtual person?

While e-WOM has characteristics common with the traditional WOM domain, it also shares characteristics with marketer generated communications such as advertising. For example, the consumer Web reviews are written by consumers and not by the marketers of the product or service itself, and this makes them more believable to the reader. On the other hand, the reader is not familiar with the credentials of the reviewer and has to infer this by the cues that are present within the review and associated with its environment (e.g. the credibility of the Web site can be one important surrogate). Besides that, quite often the review is featured on the marketers Web site, such as in the case of Amazon.com, Barnes and Noble.com, rather than an independent third party, such as *epinions.com*, *consumerREVIEW.com* and *dooyoo.com*. Traditional WOM communications have been shown to have a strong impact on product judgments because information received in a face-to-face manner is more accessible than information presented in a less vivid manner (Herr, Kardes and Kim 1991). We believe that e-WOM would fall in the latter category and therefore their impact will not be the same as that of traditional WOM.

Considering the above, one may characterize the e-WOM domain as a hybrid of traditional WOM and commercial communications, with interesting emerging consumer behavior questions. Though there has been relatively little studied of this phenomenon so far (Bickart and Schindler 2001; Chatterjee 2000; Sen and Lerman 2002), there is a growing interest in this area.

In this research we are interested in understanding how the reader evaluates the review posted on the Web site by another consumer. In particular, we ask the question—whether the usefulness of a review is affected by whether the arguments presented are one or two sided. We select this aspect since past studies have found this as an important dimension in determining the persuasiveness of advertising communication (Kamins and Assael 1987; Settle and Golden 1974; Swinyard 1981).

Using the consumer reviews from a real Web site where readers rate the reviews on its usefulness, we study whether the usefulness rating covaries with the argument type, i.e. one-sided vs. two-sided. Our methodology consists of a content analysis of selected reviews for fiction and non-fiction books to determine the argument type. We analyze the covariance of argument type and the usefulness of the reviews using a regression analysis. Our results suggest that two-sided reviews are deemed more useful than their one-sided counterparts by readers. Additionally, we also find that the length of the review is also positively correlated with usefulness.

Pyrrhic Victories in Consumer Choice: How the Rejection of Inferior Alternatives Weakens the Prevailing Option

Sooyeon Nikki Lee, New York University

Tom Meyvis, New York University

"One more such victory and I am lost"

— Pyrrhus of Epirus

Consider the following scenario. You are moving to a new town and you are looking for an apartment. After spending several days visiting apartments, you've finally found an apartment that meets your requirements. However, just before you sign the lease, you learn about another available apartment. This apartment is a lot smaller than the first one, but it is located in a slightly better neighborhood. Given that this apartment is clearly inferior to your original option, you decide to reject it.

More generally, consumers often find themselves in situations in which they decide to stick with their current option and reject an inferior, but not completely dominated, "challenger." The question we want to address in this paper is how the rejection of this inferior alternative affects the evaluation of the original option.

To address this question, we rely on the phenomena of cognitive dissonance (Festinger 1957) and the feelings-as-information heuristic (Schwarz 1990). As prior studies have shown, consumers may increase their evaluation of the chosen option to reduce any cognitive dissonance created by the rejection of a not completely dominated alternative. However, we argue that in some cases, reducing dissonance may be problematic and, instead, consumers may use the experienced dissonance as information, thus reducing the evaluation of the chosen option. This effect is similar to the effect of prefactual endorsement on the evaluation of the rejected alternative (Carmon, Wertenbroch, and Zeelenberg 2003; Sen and Johnson 1997).

In the first study, the inferior alternative was characterized by a large difference (presence vs. absence) on an unimportant dimension. For example, subjects chose between a large apartment without a fitness center in the building and a small apartment with a fitness center in the building. We expected that subjects could easily trivialize differences on an unimportant attribute, thus enabling them to reduce dissonance and increase their liking of their chosen alternative. There were three between-subjects conditions: information, temporary rejection, and sure rejection. Subjects in the information condition received information about the inferior apartment, but were told that this alternative was unavailable. Subjects in both rejection conditions chose to reject the second apartment before evaluating the apartments, but were given different instructions regarding their ability to reverse the decision. There were no differences between the rejection conditions, suggesting that reversibility of the outcome is not a factor.

However, subjects in both rejection conditions did evaluate the chosen alternative more favorably than did those in the information condition, suggesting that the rejection lead to the bolstering of their choice, consistent with dissonance reduction.

However, in the second study, the rejection of the inferior alternative decreased the evaluation of the chosen alternative. In this study, the inferior alternative was characterized by a small difference on an important attribute. For example, subjects chose between a large

apartment with a mediocre view and a much smaller apartment with a slightly better view. We expected that it would be harder for subjects to trivialize a small difference on an important attribute than a large difference on an important attribute, thus decreasing the likelihood of dissonance reduction. There were three between-subjects conditions: control, information, and rejection. Subjects in the control condition did not have access to the second apartment, while the information and rejection conditions were the same as in the first study. In contrast to the first study, subjects in the rejection condition evaluated the chosen option less favorably than those in the information condition.

We hope that our results will contribute to a better understanding of the consequences of consumer choice in general, and of the rejection of inferior alternatives in particular. Whereas our current understanding of consumer choice suggest that the rejection of inferior alternatives should bolster the evaluation of the surviving option, our data indicate the rejection may sometimes constitute a pyrrhic victory and reduce the evaluation of the surviving option. Which effect will ultimately hold seems to depend on the nature of the inferiority of the rejected alternative.

Gender- and Context- Specific Beliefs about Anxiety and Anger Episodes

Sophie Bélanger, McGill University

Renaud Legoux, McGill University

Laurette Dubé, McGill University

With the recent research and practice developments on engineering of provider responses to negative consumer, there has been a growing interest to specify and understand precisely how these scripts of emotional episodes are represented in the consumer mind. Building on what is known as a componential approach to emotions, this study focuses on the organized response patterns of anger and anxiety, including agency appraisals, action tendencies and interpersonal components. In order to help marketing and managers to design more effectively their consumer experiences, it is necessary to move beyond these generic representations of emotional experience. We should start to address factors that could modulate this experience in such a way that a more specialized representation of emotional episodes would be called for.

This research is based on the premise that, to provide more insights for emotion engineering in the context of service consumption, generic scripts of emotional episodes may need to be differentiated on relevant bases. This paper focuses on anxiety and anger episodes and studies the possible modulating effects of the gender of the protagonist experiencing the emotional episode (male, female) and of the context in which the episode has arisen (daily life, service consumption). Modulating effects of these two factors are considered on the emotion components: agency appraisal, action tendencies, and interpersonal reactions.

The modulating effect of protagonist gender. Gender differentiation is closely related to agency appraisal, the ability and striving for control and power, in which the male gender is associated to high agency and the female gender to low agency. These distinct patterns of agencies as a function of gender point to the possible divergence among the other components of the scripts of anxiety and anger, since appraisals impact the remaining sequence of script episode (Reisenzein 2000). Therefore, we expect that the protagonist gender will influence the components of anxiety and anger scripts.

The modulating effect of elicitation context. Most studies on emotional scripts and their components were done in non-commercial contexts. By nature, emotions are very context specific (Reisenzein 2000). In comparison to a daily life event, a service context involves more goal-oriented behavior, boundaries of consumer-provider role, higher level of uncertainty and temporary relationships. Consequently, we expect the emotional scripts of anger and anxiety in a daily life event to differ from those in a service context.

Methods. The effects of protagonist gender and context modulators were tested with an experimental factorial design with 143 undergraduate students from an Eastern Canadian university. Participants were presented with the face-picture of a protagonist conveying a clear emotional expression and they were asked to imagine the emotional episode during which such picture could have been taken. Each participant was assigned to one of the eight cell of a full-factorial 2 X 2 X 2 between-participants design that combined emotions (anxiety/anger), gender of the protagonist (male/female) and elicitation context (everyday life/service consumption). Beliefs were elicited in terms of agency appraisals, action tendencies, and interpersonal responses and collected with a questionnaire.

Results. Research propositions were tested in a set of analysis of variance (ANOVAs) conducted separately on each dependant measure. Gender- and context-specifics beliefs were further disentangle for each negative emotion with subsequent mean comparison. Replicating prior research, the generic script of anxiety involved low-agency appraisal, coping actions reflecting lower potential, and attracted more interpersonal support than the script of anger. Results show that across both emotions, protagonist gender and context both modulate all episode script components, in particular for agency appraisal and action tendencies. Gender-specific beliefs on anxiety (a low-agency emotion) and anger (a high-agency emotion) for all three components of emotions were in line with expectations derived from gender stereotypes (i.e. low-agency for females and high-agency for males). Beliefs about a male protagonist experiencing anxiety reflected a higher degree of agency than when the same emotion was experienced by a female protagonist, with the converse being observed to a lesser extent for anger. Context-specific beliefs were also observed in the three components. Anxiety beliefs tied to services, describe episodes being appraised lower in submissiveness, action tendencies reflecting more agentic actions, and probabilistic expectation for less

supportive responses. Anger beliefs were differentiated by context only for action tendencies, with more confrontation and less controlled responses in episodes that arose in service consumption than in daily life.

Brands as Complements to the Self

Suzanne Kalar, University of Texas at Austin

The purpose of this research is to achieve a better understanding of how consumer-brand relationships work. Much of the previous research in this area focuses on brands as expressions of the self or ideal self. The prevailing thought is that brands with personalities similar to, or desired by, the consumer will be preferred. Research merging relationship theory into consumer-brand study provides a framework for defining and categorizing consumer-brand relationship forms. This research advances the idea that consumer-brand interaction is a two-way street—that the brand is not merely an adornment of self, but also has responsibilities within the context of a meaningful relationship.

Through exploration of consumers' human-human relationships, it is hoped that insight into consumers' relationships with their brands can be gained. The underlying construct is that consumers form relationships with brands, not exclusively as an expression of self, but also as a way to fill utilitarian and social needs in their lives. This theory merges the idea of the malleable self with consumer-brand relationship theory. The premise is that the self doesn't necessarily change with the situation, but that different situations evoke different needs and that consumers may seek different qualities in a companion depending on that need.

The conceptual foundations for the research fall into four areas of study: the construct of brand personality, relationship/friendship theory, brand as an extension of self (malleable self), and situational influences.

The objectives of this research are twofold. The first goal is to demonstrate that consumers' choices for personality traits in a human partner in a given situation are similar to those traits desired in a brand preferred in that situation. The second goal is to explore the idea that consumer choices may not necessarily be based on self-expression but serve to complement the self as required.

Participants selected one human and several brand companions for each of five situations. First, participants were presented with each of the five situations and asked an open-ended question to identify (by first name) a person to accompany them in that situation (a unique person was required for each situation). After writing a name, participants then selected one brand of watch and one brand of jeans they would prefer for each situation. The brands were selected from preset alphabetical lists consisting of five brand choices for each product category. The five situations were developed to correspond with each of the targeted brand personality dimensions (Exciting, Sophisticated, Competent, Sincere, Rugged). Participants then assessed the personalities of both the persons and brands selected using Aaker's "Brand Personality" scale. Finally, subjects answered a series of questions assessing the aspirational aspects of their human-human relationships. The subject pool consisted of 59 undergraduate women from the business school at a large state university. Previous studies of brands in conjunction with relationship theory have established precedence for using women for this type of exercise.

Prior to attempting to test the hypotheses, a check of the situational manipulation was performed. The purpose of this check was to insure that the situations presented in the study did indeed cause the respondents to perceive a need for employing varying brands to accompany them across the five scenarios. Results of the manipulation check show that sixty-six percent (66%) of the respondents selected more than one watch across the five situations. Seventy-five percent (75%) of subjects selected more than one brand of jeans. Overall, 85% of the respondents varied on either watches or jeans. These results show, not only that the manipulation was successful, but also that consumers are potentially willing to employ multiple brands within a product category if the situational cues invoke a need to do so. The current findings indicate that the situation can be the impetus to induce choice, beyond merely providing a context in which the choice is made.

Results for the hypotheses were encouraging. Overall there was support for respondents selecting the human and brand companions with the highest overall ranking on the salient dimension. Results for the "Rugged" situation were remarkable—with 54% of the respondents selecting their most rugged companion to accompany them. Additionally, outcomes in 4 of the 5 scenarios were favorable, with respondents selecting the highest ranked human companion for the cued personality dimension at a proportion greater than chance. For H_{1b} , the strongest results were for the jeans product category for which 3 of the 5 situations (Sophisticated, Sincere, and Competent) yielded excellent results—where more than 40% of respondents selected the brand of jeans with the highest ranking on the salient personality dimension. Results for the watch category were mixed, with moderate support for the "Sophisticated", "Sincere", and "Rugged" situations (34+%).

Results for the main hypothesis are favorable. The results were obtained by "matching" the personality dimensions of respondent's selection of a human companion with the personality dimensions of chosen brand companion. Results for the friend-watch personality match are encouraging. In three (Rugged, Sophisticated, Sincere) of the five scenarios, the largest percent agreement was found for the salient dimension. For the Hiking situation, 58% of the respondents selected both a person and a watch ranked highly on the "rugged" personality dimension. Results for the friend-jean personality match are similar. Perhaps most supportive of the main hypothesis are the results for the combined friend-brand personality match. In this case the respondent had to select a highly ranked person, watch, and jean for a "match" to be tallied.

The results of this study suggest that people can show preference for several brands within a product category, depending on the usage situation. Findings also support the notion that brand personality comes into play—not only when the personality fits the person—but when the personality fits the situation. It is hoped that the merging of friendship theory with the brand personality construct will open up new avenues of inquiry that explore the idea of a brand as an instrumental friend or companion.

Impact of Information Organization and Presentation on Visual Attention to Target Stimuli in Online Content and E-Tailing Web Sites

Wenyu Dou, University of Nevada-Las Vegas

The Internet economy has been dubbed as the “attention economy” as net users are glutted with gigantic amount of information and their attention grows scarcer with the continuing information overload (Davenport and Beck, 2001). At the individual site level, the challenge is even more conspicuous as online publishers occupy every possible screen real estate with online ads and e-tailers peddle their sales items in their already crowded homepages. Thus, it is not surprising that stories about net users who complain about intrusive online ads or online shoppers irritated by poor design continue to make headlines in e-commerce reports (Nielsen Norman Group, 2002).

To win the fierce fight to catch Internet users’ attention, online publishers (e.g., msn.com) and e-tailers (e.g., outpost.com) are starting to recognize that they need more than just flashy images or eye-popping for-sale signs: these tactics annoy users and often are applied at the expenses of other web site content worthy of users’ attention. Consequently, web usability principles (e.g., Nielsen, 2002) have gained wider acceptance in the industries. In particular, focus has been gradually placed on how to developing effective information architecture of web sites (Morville and Rosenfeld, 2002), which referred to how information should be organized or presented. Nonetheless, as a relatively young field, this interdisciplinary discipline is in dire needs for solid theories that can guide the construction of effective web interface (Dillon, 2002).

While studies about web interface design have made significant progresses within the past several years, much are still left to be done in order to elevate its status to the next level. The lack of sound theoretical framework has hindered its adoption among interdisciplinary researchers from computer science, information systems, and marketing. In fact, there is a growing consensus among researchers (e.g., Dillon, 2002) that it is imperative to enhance the rigor of this field through theory-building and empirical testing of existing theories.

A promising candidate for such theories comes from the Visual Information Search field, which has attracted the attention of psychologists, computer scientists, and engineers since the 1970s with the rapid advanced in computer technology and mass adoption of computers. Within this domain, several theories have emerged as prevalent views, including *Attention Engagement Theory* (Duncan and Humphrey, 1988, 1992), *Feature Integration Theory* (Treisman, 1980, 1988), and *Guided Search Model* (Wolfe, 1994, 1998.). While these theories differ in the exact perspectives they take in analyzing visual search, they also share considerable common grounds. The proposed study focuses on the application of *Attention Engagement Theory* in examining how to stimulate attention to target objects via visual cues on Internet web sites. In a nutshell, the *Attention Engagement Theory* predicts that the maximum attention given to the target object are likely to be obtained when similarity between target and non-target items is low but similarity among on-target items is high. The similarity measure can be defined along a variety of object dimensions, such as color, size, image vs. text, etc. A graphic illustration for one of the possible study scenarios for web sites is shown in Figure 1. The prediction and the associated operationalizations of similarities also have clear implications for advertising effectiveness measures (e.g., recall, recognition, preference) as well as for consumer choice measures (e.g., regular vs. sale items).

The study represents a first step in the right direction as it sets to synthesize theories from Visual Search in psychology, Consumer Information Processing in Marketing, and Information Architecture in Information Sciences to probe how web site information organization and presentation should be planned so as to maximize user attention to target stimuli, such as advertising display in content sites or featured items in e-tailing sites.

The topic of investigation is important in both the theoretical and practical front. From a managerial perspective, the study results are expected to provide concrete design guidelines to online content and e-tailing sites on the optimal choices of information presentation format (e.g., color, size, position, text vs. image option), which may stimulate the most attention to the target stimuli without jeopardizing the attention to other objects of interests in the web sites. At the theoretical level, the study established a novel application of existing Visual Search theories in the e-commerce setting with real Internet consumers. This theory-testing approach not only enriches the theory-repertoire of consumer researchers but it also renders a more realistic and contemporary testing ground by using real world stimuli (e.g., online ads), which are often missing the abstraction of typical psychology studies. Consequently, the proposed study shall advance knowledge in both the conceptual and empirical domains of visual information search online.

The Impact of Social Satisfaction on Consumer Satisfaction Judgment

Xiaojing Yang, Indiana University, Bloomington

H. Shanker Krishnan, Indiana University, Bloomington

In a recent article, Bagozzi (2000) pointed out that the social aspects of consumer research have been overlooked (e.g. the effects of societal forces on intraindividual processes, interpersonal behavior and relationships among social collectivities/groups). He also mentioned that the level of consumer studies should also be extended to include groups of consumers (i.e., two-person dyads, families, peer or friendship groups, teams, organizations, and other social units). Consistent with Bagozzi’s concerns, most previous satisfaction research studies consumer satisfaction at an intra-personal level and seldom takes interactions among consumers into consideration. This impact of consumer interaction on consumer satisfaction remains largely unexplored with a few exceptions (e.g., Fournier and Mick 1999; Oliver 1999). The primary goal of the present paper is to study consumer satisfaction and brand loyalty in a group context. Namely, social satisfaction and attribute satisfaction are predicted to impact overall satisfaction and brand loyalty in a group context. In addition, the mediating process of the above relationships is explored. A second goal is to study whether individual difference variables impact the above relationships.

In order to account for the importance of social aspects of satisfaction, social satisfaction is proposed and used to compare with attribute satisfaction in terms of their impact on overall satisfaction and brand loyalty. *Social satisfaction* is defined as an affective state as a result of interacting with other consumers. *Attribute satisfaction* is defined as the consumer’s subjective satisfaction judgment resulting from observations of attribute performance (Oliver 1993). *Overall satisfaction* is defined as an affective state that is the emotional reaction to a product or service experience. Overall satisfaction is viewed at a global consumption level while attribute satisfaction is viewed at an attribute level, and the latter is not the only determinant of former (Spreng et al. 1996). To illustrate the importance of social satisfaction,

consider the following scenario: a bunch of friends went to see a movie together and it turned out to be a terrible movie (low attribute satisfaction). However they interacted with each other in a happy fashion (high social satisfaction). They may feel happy anyways about the entire consumption experience, despite the fact that the movie was horrible.

It is proposed that both attribute satisfaction and social satisfaction predict overall satisfaction and consumer loyalty. Specially, social satisfaction contributes to overall satisfaction through two routes. In the indirect route, social satisfaction affects attribute satisfaction, which in turn leads to changes in overall satisfaction and brand loyalty. In the direct route, social satisfaction contributes to overall satisfaction and brand loyalty directly, over and beyond the impact of attribute satisfaction. In addition, it is proposed that the above relationships are moderated by consumer's self-construal levels (Singelis 1994). The direct impact of social satisfaction on overall satisfaction and brand loyalty should be stronger for consumers of an interdependent self-construal than for those of an independent self-construal.

Our theory was tested by asking participants to recall a recent dining-out experience with other consumers and complete measures of constructs of interests. Analysis was performed on the overall sample, interdependent self-construal sample and independent self-construal sample. Results show the relationship between social satisfaction and overall satisfaction is partially mediated by attribute satisfaction in all three samples. That is, the impact of social satisfaction on overall satisfaction judgment toward the consumption experience can be partially explained by the fact that social satisfaction influences consumers' satisfaction judgment toward the product attribute performance, which in turn leads to changes in overall satisfaction judgment. And this mediating effect exists regardless of consumers' self-construal levels. However, when comparing the direct impact of social satisfaction on overall satisfaction across the independent self-construal sample and interdependent self-construal sample, social satisfaction plays similar roles. Therefore, when using overall satisfaction as a dependent variable, the results show support for our mediating hypothesis, though the individual difference hypothesis did not come out.

The impact of social satisfaction on brand loyalty is partially mediated by attribute satisfaction in overall sample and interdependent self-construal sample, but completely mediated by attribute satisfaction in the independent self-construal sample. For consumers with an independent construal, although they tend to use their own satisfaction judgment about the product as a criterion to determine such behaviors as repurchases and recommendations, this satisfaction judgment already factors into (internalize) social satisfaction judgment. The partial mediation results obtained in the interdependent self-construal sample and overall sample indicate that satisfaction judgment regarding social interaction will directly transfer to consumer's decision framework of such behaviors as repurchases and recommendations, over and beyond the effect through attribute satisfaction judgment. Therefore, when using brand loyalty as a dependent variable, the results show support for our mediating hypothesis and the individual difference hypothesis.

The Interplay of Gender and Masculinity Schema in Consumer Responses to Emotional Advertising

Zhenfeng Ma, McGill University

Laurette Dubé, McGill University

This article builds on the existing knowledge of gender, sex role socialization and negative emotional appeals to explore the interplay of gender and masculinity schema in consumer responses to anger- and anxiety-based emotional advertising. The quality of service industries (such as airline) has been generally recognized as in a chronic state of deterioration. The impact of negative emotions arising from aversive experiences on service evaluation has naturally become a source of concern for both managers and researchers. Concurrent with this concern is the growing interest in using negative emotions as advertising appeals in service marketing. However, up to now there has been little theoretical and empirical development in understanding how negative emotional appeals operate to influence evaluations and what factors moderate their effectiveness.

This study focuses on anger and anxiety, which have been identified as the two most prevalent negative emotions. Building on our existing knowledge of emotions, we assume that although being of the same valence, anger and anxiety nonetheless differ in important underlying appraisal dimensions, particularly in the appraisal dimension of power and agency. Specifically, anxiety is tied to appraisal of low power and agency and is stereotypically regarded as a "powerless" emotion. On the contrary, being viewed as a "powerful emotion", anger is often tied to appraisal of high power and agency.

Linking gender to emotion, we observe the operation of gender-emotion stereotype. Earlier research has found that "powerful" emotions such as anger are stereotypically regarded as masculine while "powerless" emotions such as anxiety are typically perceived as feminine. Other things being equal, both genders will seek gender-congruent emotions and avoid gender-incongruent emotions. In other words, males will generally feel more at ease with expressing "powerful emotions" such as anger while females are more predisposed to expressing "powerless" emotions such as anxiety.

However, while acknowledging the existence of gender-emotion stereotypes, we must allow for the gender difference in emotional expertise or intelligence. Past research has identified females as the more expert gender in experiencing and expressing emotions and in

adapting to diverse emotional contexts. Compared with males, females are more flexible in handling emotions and less constrained by the social rules imposed upon by emotion-gender stereotypes. Along this line of argument, we expect that females will be equally sensitive to both anger- and anxiety-based advertising appeals while males' responses will differ as moderated by the gender-emotion stereotypes.

Beyond gender, sex role difference is another powerful factor that determines individual differences in which response to emotional cues is stereotypically appropriate. Sex role differences are often measured in term of masculinity and femininity, each being regarded as representing a gender (or masculinity) schema. Whereas men are generally socialized to be masculine and women are generally socialized to be feminine, the constructs of gender and gender schema do not have to be equated with each other. Individuals can possess high or low value on each gender schema within both genders. Linking this argument to our present experiment, we expected the males' responses to emotional appeals to differ as a function of their individual gender schemas. Specifically, we expect high-masculinity males to have more positive reactions to anger appeals and low-masculinity males to report more positive experience in the anxiety appeal condition.

To test the above hypotheses, we conducted a laboratory experiment that used a 2x2x2 between-participant factorial design with participant gender (male vs. female, masculinity schema (high vs. low) and emotional appeal (anxiety vs. anger) as factors. 220 undergraduate students (107 males and 113 females) participated in this study.

A series of 4 poster ads promoting an airline service was developed as the stimuli. The poster ads manipulated emotional appeals (anger vs. anxiety as of the facial expression of the protagonist) and the gender of the protagonist (male vs. female). Participants were randomly assigned to the four treatment conditions. After taking time to view the ad, participants were instructed to report their attitude toward the ad, attitude toward the brand (the specific airline) and purchase intent, which constitute the set of dependent variables. Participants were also asked to report their masculinity score on a four-item scale (forceful, assertive, dominant and in control). These four items were selected from the BSRI with the high loading on the masculinity dimension.

ANOVA with emotional appeal type (anxiety vs. anger), gender of the participant (male vs. female), and masculinity schema (high vs. low) as between-subject factors were performed on dependent variables.

For all three dependent variables, results show a 3-way interaction between type of appeals, gender and masculinity schema, with follow-up two-way interaction between type of appeal and masculinity schema being significant for male participants only. Consistent with our expectation, analyses revealed that high-masculinity males preferred anger over anxiety appeals for all three dependent variables. Specifically, high masculinity males expressed a more positive attitude towards the ad, toward the brand and stronger purchase intent in the anger appeal condition. On the contrary, low-masculinity males reported higher scores on the three dependent variables in the anxiety appeal condition. The results of the study supported our hypotheses about the effect of gender and masculinity schema on consumers' response to emotional ads.

Our study is among the first to explore the interplay of gender and masculinity schema in consumer responses to emotional advertising. We believe that among other things, this study contributed to our existing knowledge by confirming gender and masculinity schema as dichotomous constructs that do not necessarily go hand in hand in moderating consumer responses to emotional advertising. While previous research indicated that reactions to emotional advertising differ between genders due to gender differences in emotional expertise, this study further shows that reactions to emotional advertising also differs within gender (males) due to differences in masculinity schema.

Our finding also has practical implications. This study suggests that in designing and executing emotional advertising, marketing practitioners should give adequate consideration to the effect of masculinity schema as well as the gender of their targeted audience. Failure to differentiate male audience in term of masculinity schema could compromise persuasive effects.

Men and Their Machines

Russell W. Belk, University of Utah

ABSTRACT

Extreme identification with automobiles is a predominantly male fascination. This paper reports on depth interviews with such men as well as observations conducted at various car shows in order to understand what these vehicles mean to American automobile enthusiasts. They see their cars as both extensions of themselves and as animate beings. The care they lavish upon these vehicles is both fetishistic and sacralizing. The paper concludes with an assessment of the positive and negative effects of their "auto-eroticism" on their lives and the lives of other family members.

There are few possessions as important to many adult American men as their cars. They often lavish more time, money, emotion, and effort on acquiring, learning about, and caring for these vehicles than they do on other family members. Those who are most involved in their vehicles include restorers of old automobiles, automobile collectors, members of car clubs, and those who show their vehicles at special auto shows and concours d'élégance. The present study involved both observation at such venues and depth interviews with 40 such men.

Love of automobiles, motorcycles, and trucks is an overwhelmingly male preoccupation (Bayley 1986, Marsh and Collett 1986, Miller 2001; Schouten and McAlexander 1992, Stone 1966, Stotz 2001; Weiland 1955), despite the fact that females buy nearly half of the cars sold in the U.S. (Lane 1991, Sanford 1983, Simmons 1983). The greater male passion for automobiles is less surprising given the association of such vehicles with power, danger, mobility, status competition, and industrial dominance over nature, all of which are stereotypically male fixations as well. But motor vehicles are more important to some men than others, and it is the more extreme automobile enthusiast who is the subject of this study. The research is based on depth interviews with 40 such men, and observations conducted at four concours d'élégance, two automobile show competitions, and a professional monster truck mud racing competition.

The men studied range in age from 19 to 70 and range in experience with cars from those who have recently purchased their first vehicles to those who have more than two dozen in their current collections. The cars and trucks they own are diverse as well and include a "monster truck", a 1905 Cadillac, a 1979 Subaru, a 1964 Bentley, a 1974 Pantera, and a 1990 Corvette. Nevertheless, a number of common themes emerged in analyzing these interviews and observations. Together they help understand the potency of the symbolism than many men invest in their machines.

CARS AND PEOPLE, CARS AS PEOPLE

Cars as Prosthetic Extensions of Self

In Thomas Pynchon's (1966) *The Crying of Lot 49* used car salesman Mucho Maas is an observer of lives as he watches customers "exchange a dented, malfunctioning version of himself for another, just as futureless, automotive projection of somebody else's life." For like clothes and houses, vehicles appear to act as prosthesis for many men (Belk 1988). As with our bodies, we control our car, we feed it, we recognize its waste products; we bathe it and apply cosmetic pastes; we attempt to nurse it through breakdowns, fits of coughing, and other ailments; and we inevitably observe its aging, perhaps to the point where only cosmetic surgery and parts transplants can prolong its life. No mere anthropomorphism, we identify our cars with our selves (Richards 1994).

We also personalize our vehicles in various ways in order to bond more fully with them (McCracken 1988) and make them a more direct expression of who we are (e.g., de Pyssler 1992; Hebdige 1988; Lefebvre 1989; Solomon 1992; Stern and Solomon 1992). A 33-year-old man who customizes his cars and trucks noted:

I kind of feel like if you are not driving anything that is you, nobody recognizes you, nobody knows who you are. [So you like to build your car like you?] Yes. That orange truck back there, all I would have to do is pull that out, drive it around the block, and I'll bet I would have five or six people telling me that they saw my truck the other day. I don't know, it starts to become you. Somebody knows that is your truck. There isn't any others running around that color, that way, that clean. Then you're noticed. People picture you that way. That is what you do and that is what you are.

In one common version of this identification with vehicles, the man takes on the characteristics of the cathected vehicle. Thus a powerful engine gives the owner who controls it a feeling of enhanced power, a beautiful automobile body provides the man a beautiful body, and high performance handling makes the man feel capable of high performance as well (see Bloch and Bruce 1984). Such identification with the car-as-body is also seen in the pain some men claim to experience when their beloved automobile is scratched, dented, or otherwise harmed (Neiderland and Sholevar 1981).

Sex Appeal. For those who see their cars as a sexual extension of themselves, damage to their vehicle can represent castration (Lane and Sternberg 1985). At the concours d'élégance held each year in Salt Lake City, the judges (all male) are careful to inquire of those whose cars they inspect whether there are any parts of the car they do not want touched or opened. If, this is an expression of aversion to homosexual approach, then the tactic of many concours entrants of placing mirrors under their automobiles in order to show their undersides can be seen as sexual exhibitionism. In a common variant of the sexual version of vehicle identification, certain men see possessing the right car as offering them a magical sexual charm that will make them irresistible to women. Jim, a 32-year old automobile mechanic, explains his belief in such magic:

[I] got a lot more woman in those cars. I picked up my girlfriend in that car... The MR2. I picked up a lot of girls in the Porsche too! ...*Definitely* a womanizing device, but only from the fact that my MR2 was so much different than standard [And that drives woman crazy?] It does. Their tits get hard. [He laughs.] [Would these woman go for you only after seeing your car?] Well of course before, because I have a magnetic personality. But after they saw the car that just cinched it up so they would want to take me to bed. Women have this thing with cars. What it is I don't know, but they go after guys that have the cars. If I wouldn't have had my little truck, my girlfriend wouldn't have taken me home with her—well, she would have anyway, but she wouldn't have stuck around if I didn't have the MR2.

In another view the automobile is an advertisement of male wealth rather than sex appeal and in the traditional equation men

offer (and women seek) wealth and power in dating while women offer (and men seek) youth, beauty, and sex (Belk and Coon 1991; Hirschman 1987). Others (e.g., Marsh and Collett 1986) suggest that women judge men by their cars because they see these automobiles as an expression of the owners' personalities. With only men in the current study, these alternate interpretations, as well as the underlying assumption that men's cars are important to women, await further work.

Status Symbolism. The power struggle Jim refers to near the end of the preceding quotation involves status competition through the conspicuous consumption of motor vehicles. Many men seek prestige through automobiles in order to enhance their self image without necessarily seeking to exchange this prestige for something else. Thus, Bill, a 34-year-old owner of a small restaurant, explains:

[Why weren't you satisfied with the Volkswagen?] Wasn't fast enough—not enough status, or speed. [Status and speed,—is that what you are looking for?] Yeah. [What car do you want to have?] A 928 [Porsche]. [How come?] Status and speed [laughs]. You need a car, because cars kind of like set you apart from anyone else. It shows where you have got in life, you know? Get in that fucker and you're either a Pinto driver or you're a Porsche driver. Same way in life. ... you want to be successful you've got to look successful. So you get in the car that gives you that look and you naturally become what you think you are.... Cars separate you from mediocrity. ... people treat you differently just through the car you drive. You are where they want to be right now. They will get out and say, "Fuck, this guy has a Porsche! What's he doing that I'm not? Why is he enjoying all this shit and I'm not?" Then they fuckin' treat you like "Come on in." instantly you can have more respect. ... No one is going to walk down the street to look at your portfolio. You either have a Rolex or a Porsche—and that sets you apart.

Auto-biography. In several cases the car marque becomes a heraldic device, as with a man in his forties who has restored several MGs, Jaguars, and a Sunbeam (all British) because his family ancestry is British. Often the purchase of old automobiles becomes a means of reclaiming a more immediate past. Two men in their seventies restored Ford Model A's because they used to have such cars when they were in high school. A 50-year-old owner of a wrecking yard has restored a 1947 Mercury that reminds him of one that a friend owned in high school and a 1957 Ford Sunliner like the one he had when he got out of the Army, even customizing them in the same ways as their predecessors. Another 60-year-old restored an MGTF like the one that was his first car when he was in college as well as an XKE like the one he wished he had in the 1960s. He explained: "People buy the cars they wanted to own when they were in school and couldn't." Another man has a replica of a 1966 AC Cobra (a \$25,000 reproduction of an original that costs ten times as much) and explained that the car came out when he was a senior in high school and he always wanted one: "It was every school boy's dream back then." This is consistent with observations by Dannefer (1980, 1981) and seems to be an attempt, especially by middle-aged men, to reclaim lost youth and all the excitement they associate with the period from their late teenage years through their early twenties. It was during this age period that they remember their first all-consuming interest in an automobile. The intensity of their present automobile involvement does not seem contingent on whether or not they were able to consummate their first auto purchase desires. A Freudian interpretation suggests that this is a transference or sublimation of sexual desires that also peak during this period of life (e.g., Weiland 1955).

Another way in which autos serve as autobiography for the men studied is as cues for recalling personal history, often aided by photographs of prior cars. Just as others use photographs of people in their family albums, automobiles are found to be prominent in family photo albums even for those not obsessed with automobiles (Belk 1991, Chalfen 1988, Lesy 1980), suggesting that they may serve more generally as temporal milestones in American society. Several men in the present study had photo galleries on their walls showing cars they once owned. Others had photos of cars they had restored, showing various stages of the restoration. Thus one man (age 58) looking at photos of his cars reflected, "Each car reminds me of a special time in my life." He later assessed his involvement with cars *in toto*: "It's my whole life." For if you are what you drive (Couch 1987), then prior autos and auto activities should be key building blocks for a sense of past to those men who believe this.

Cars as Beings

Cars as Children, Lovers, and Friends. Cars, for a number of men, are also regarded as if they were alive, and not mere machines. They often see cars as lovers or children. "It's my baby" said one man, while a prior owner of exotic Jaguar referred to its being "adopted" by a man in Geneva (see also Schneider 1971). The man with the Cobra replicar said, "It's kind of like my baby. I wouldn't sell the car to just anyone. They must take care of the car or it would be like child abuse—execution would be too good for someone who didn't take care of it." And another man claimed "I could not take [my cars] to the movies and leave them. I am very protective, like a mother with her children."

Others named their cars or trucks in ways that suggest it is seen as a lover more than a child: "My Cheree," "Shot Through the Heart," or "Candy," for instance. One car collector explained, "When I see a car I want, it's love at first sight. That's how it was with the Lamborghini. I saw one race in Europe and I just had to have one."

Having a collection of automobiles provides people with a second love—like a mistress. These men slip away from their wives and families to spend time alone washing, waxing, babying, and admiring their cars:

spending countless hours with a toothbrush and soap, cleaning under every inch of each rim, because of the uncontrollable emotional investment. This is why very few spouses condone their husband's addiction—they feel like they are competing with the cars for their husband's attention. These cars are also like an old friend. They are always there and always seem to listen and understand your problems. They're like an old familiar face you can turn to when you have nowhere else to turn.

And one man recognized the car-as-mistress analogy, but explained the "My wife would rather I work on it than on her girlfriend."

Car Personalities. Both particular cars and makes of cars are seen as having personal characteristics. Several men consistently referred to their cars as "she," noting "She's cranky," "She handles well," and so forth. One exception in assigning cars feminine personalities was the mud-racing and car-crushing monster trucks, where a masculine name is much more common, because of the emphasis on performance and power rather than just appearance. Here names included "Taurus," "Steamboat Willie," and "The Mud Stud." There were often inferences made about owner personalities based on the kind of car they drove. Bill, the 34-year-old Porsche owner explained:

I would not get into a Corvette. It performs maybe better than a Porsche, but it has the wrong status, wrong image! [What kind of image does the Corvette have?]

Polyester and gold chains, [laughs] leather jackets. They walk into a gas station, wing the gas card down, keep looking back at your car like yeah, I'm bitchin'. Porsche owners don't have to do that. [How does the Porsche owner behave?] Its either you or me pal, that kind of deal. Never looks at anybody; kind of more secure. Corvette owner, man he will wax his car out in the park first time he gets a chance, just to show everybody, "Hey look at me!" The 'Vette owner is someone who wants everyone to know that he has a Corvette. Where a real Porsche owner is secure about himself.

Nor did Bill find all Porsche owners to be admirable:

[So what do you think of the 944 driver?] Garbage, ego problem, punk: hangs out at Bourbon Street, hangs out at the Dead Goat, hangs out at Oscar's. People that buy 944's or 928's have major massive ego problems. They know nothing about Porsche. They buy them for the ego trip.

CARS AS SACRED OBJECTS

Great devotion is directed to activities involving automobiles for these men, such that, for them, automobiles can often be regarded as sacred (Belk, Wallendorf, and Sherry 1989). For these men the cars and car activities in which they are absorbed are revered and regarded as fundamentally set apart from the ordinary profane world. Processes by which objects can be made sacred or kept sacred include ritual, sacrifice, pilgrimage, and separation from the profane world of commodities (Belk, Wallendorf, and Sherry 1989). Each of these processes was observed among the automobile enthusiasts studied.

Ritual

There is some evidence that when greater importance is attached to cars, they are better cared for (Belk 1987). When performed with proper reverence, such washing and waxing of a car can be regarded as a baptismal ritual (Mol 1976). The importance of this ritual was suggested by Jim who washed his car every Saturday for the past 16 years:

[How much time would you spend driving it and working on the car?] On my own, probably every Saturday for a half day. [Every week?] Every week, religiously. [How important was this, would it come before a date or something like that?] Oh yeah, I did not go anywhere unless it was clean. Nowhere! But I think that's the same for most guys. ... But before, sometimes I would wash it everyday. Every day boy! That's the thing, you don't want to be in a dirty car.

Similarly, Bill explained the care rituals he performed on his Porsche:

On a good day, if I didn't have anything to do I could spend 4 hours cleaning it. Then jump in it, drive it to the gas station and feel good about it. ... Get a Q-tip with Armor-All on it and slide it down the seams, pull off the wheels polish them up, shampoo the carpet, all that stuff.

The most extreme care rituals are enacted by those who enter their cars in automobile shows. At one concours, every time a line of cars being driven or pushed to their assigned display locations stopped, one man jumped out and polished his wheels. Using soft paint

brushes, cotton swabs, toothbrushes, and toothpicks to remove stray dust is common. The "white glove" inspection by the judges in special white garments is a separate ritual by these designated "priests" and also highlights the sacred status of the cars and reinforces the care rituals their owners have performed on them. It is no wonder that after the rituals of restoration, care, and devotion performed on these cars, many who show them place "hands off" and "please to not touch" signs on their cars.

Perhaps a more widely shared ritual is the annual automobile show, as described by Greeley (1962):

The cult of the sacred car has its adepts and initiati. No gnostic more eagerly awaited a revelation from an oracle, than does an automobile worshipper await the first rumors about the new models. It is at this time of the annual seasonal cycle that the high priests of the cult—the auto dealers—take on a new importance as an anxious public eagerly expects the coming of a new form of salvation.

Fewer and less dramatic annual style changes in automobiles may have rendered these particular public rituals less frequent, but surely no less intense. Besides the anticipation of seeing new models in person, informants report scrutinizing automobile magazines and Internet sites for sneak previews and annual reviews of new models.

The rituals of automobile enthusiasts also involve secret or special knowledge shared by all "true believers," as Plascencia (1985) found among "low riders" in the American Southwest. This knowledge may be gained from definitive publications on a type of car (called "bibles" by their readers), but must often be supplemented by other magazines, Internet bulletin boards, and discussions interpreting and updating the classic sources. When men meet at auto shows as strangers they are then united by ritual discussions disclosing their shared esoteric knowledge of the automobiles they love. The litany of these discussions and the beliefs that constitute the dogma of automobile sects is illustrated by Jim, a Porsche owner and a true believer:

The original Porsche and the originator, Dr. Ferdinand Porsche was incorporated by Hitler to build the peoples' car, the Volkswagen. Since he has died his son took over and totally fucked up the company by building 928's and 944's. His father, Dr. Ferdinand Porsche was only interested in building the rear engine cars. A True Porsche enthusiast that has a basic knowledge of what the history of the car was, the history of Dr. Ferdinand Porsche—who he was, who he worked with—how the car performs, how the car treats them; a performance-oriented person that wants a car that handles, accelerates, brakes, and corners to the driver's ability. He is an enthusiast!

Another such automobile cult (there are many) is that of the Volkswagen 1300 or "bug" (Klapp 1969, Hammond 1970).

Salvation and Sacrifice

If Jim sounds a bit like an evangelical preacher, the sacred metaphor also includes a healing process in which enthusiasts are able to rescue and save damned automobiles from the abyss of decay and corruption by laying their skilled and caring hands upon them. The metaphor of saving these cars is one often employed by those who restore them. The process of restoration can also be seen as one of sacrifice and commitment of time, money, skill, and effort. For one 65-year-old who loves Model A's, it was an abomination to see one that had been turned into a street rod. He bought it in 1965 with the intent of restoring it to "the way it should be." Over the next

seven years he spent an estimated 4400 hours and \$20,000 stripping it down and rebuilding it into a 1929 Model A. Another man who had restored five vehicles spoke with pride of finding them in fields with only weeds and field mice attending them, and then bring them back to their former glory. Others spoke with similar pride of their restored cars and trucks as having started out as literal basket cases—mere baskets of parts. Bringing the dead back to life is the implicit metaphor in all of these accounts.

Pilgrimage

One man who shows the Corvettes he restores at Corvette shows around the U.S. refers to these shows as “heavens.” The greatest pilgrimage site for automobile believers is the annual show in Hershey, Pennsylvania, which is the largest in the country. The other prominent type of pilgrimage site for car restorers is automobile museums, such as the former Harrahs’ collection. When this collection was sold off, enthusiasts saw this as a great sacrilege.

Not all automobile restorers bring their cars out of their protective wrappings only for shows. Another type of enthusiast makes a different sort of pilgrimage by taking their cars, along with fellow enthusiasts, on special tours. These tours are for specific categories of cars such as one- and two-cylinder cars and the participants all dress in appropriate vintage clothing for the tours. As with religious pilgrims traveling by foot, the going can be slow. The smaller engine cars slow to 5 miles per hour on hills and traveling 70 miles takes all day. Being in the company of fellow pilgrims is an important part of these tours and results in a great feeling of kinship or *communitas*, as is typically the case with religious pilgrimages (Turner and Turner 1978). The automobile clubs to which many of these men belong offer a similar spirit of *communitas*. But the clubs are careful to include only true believers, and thus the president of a Jaguar club says, “Replicars [reproductions with non-original parts] aren’t real. A replicar [owner] could never get into our club.”

POSITIVE AND NEGATIVE EFFECTS

Social and Asocial Aspects

Cars and sports are so much a part of men’s conversational repertoires that some efforts to get men to really relate to one another have found it necessary to ban these topics of conversation (Adler 1991). Besides providing an external focus for conversations between men, cars and trucks are often cited by enthusiasts as a common interest that brings the members of their family together. While this is sometimes true, most often in the case of men and their sons, because men are the primary enthusiasts in most families and because these men seldom let others in the family drive their cars, the extent of participation by other family members is in most cases restricted to helping clean the car and attending shows. The wife of a man who restores Ford Thunderbirds proclaimed that she and her husband shared in this hobby. When I asked her for details, she said she helped clean it and, after pausing for a moment to reflect, added enthusiastically, “and sometimes he lets me ride in it.” Even this may be more social than other men who spend countless solitary hours in their garages with their cars. These men’s photo albums and wallets are full of pictures of cars and car shows, rather than people. This is not to say that all men studied preferred cars to people, and for younger men this was rarely the case. But for many men the car is more an escape from people than it is a focus of interaction with people. One man explained how escaping to work on his car provided him with therapeutic benefits: “Its nice because an inanimate object can’t talk back to you. I deal with a lot of rude customers all day and working on the car sort of helps to restore me to sanity.” The solitary nature of driving in an automobile provides

a similar benefit for others, and several men noted that when they are feel stress they jump in their cars and go for a drive.

Addictive and Compulsive Potential

Addiction is both clinically and culturally defined such that labeling something as an addiction requires both dependence and the cultural judgment that this dependence is undesirable (Walker and Lidz 1983). Contemporary Western culture does not commonly describe dependent love of another person as an addiction and it has also generally been willing to exempt dependent love of objects from this label as well (Belk, Wallendorf, Sherry, and Holbrook 1991). Nevertheless the self-diagnosis of addiction and being a “car nut” came up in a number of interviews to describe the restoration, maintenance, and collecting activity of these men. According to one collector:

The collecting of cars is also like an incurable disease. Once it gets inside of you, you can’t stop looking for a new car. Then once you find one you really like, you’ll go to extremes to get it, even if you can’t use or even sometimes afford it.

For another man who has been collecting and showing cars for 25 years,

It’s [my continued involvement] not for prestige or trophies anymore, but rather it’s more like a disease—like alcoholism. It’s something you just can’t shake. This is what caused the snowball effect in the first place. You start innocently enough in the beginning and before you know it, you’re hooked. That’s why I’ll be playing with my cars until the day I die.

For others, it is working on the cars that has addictive and compulsive aspects. A 25-year-old who is in college saw this danger and disciplined himself accordingly:

Because of school, I only get to work on them [his three cars] during the summer and on breaks. I have to avoid them during the quarter because if I ever started working on them I’d flunk my courses. Once I get started working on them, I can’t stop.

Thus, even though society may not label their behavior addictive, automobile involvement has a seemingly unavoidable attraction to a number of those studied.

Justifications

Given their absorption in their automobiles, these addictive explanations offered by auto enthusiasts might also be seen as justifications to others for what might well be regarded as self-indulgent behavior: I can’t help it; I’m addicted.” But other justifications are offered as well. One theme emphasized by several of those who restore cars is that, “It’s preserving history—our country’s history.” This justification was offered by one collector with 25 cars who was building a museum in order “to give the public an opportunity to enjoy my cars.” Most often such justifications invoke the cloak of science and attempt to suggest that the collector is trying to preserve rare examples of technologically significant accomplishments of civilization (Carter 1978). Less frequently an artistic cannon is invoked with the implicit or explicit rationalization that a thing of beauty is a joy forever. And in cases where the automobile or truck originated in the collector’s family, a more sentimental criterion of preserving family heritage and traditions is offered. One further justification or admission was offered by three of the automobile enthusiasts studied: the difference between a man and a boy is the price of his toys. Rationalizations aside, this playful

ludic aspect of automobile enthusiasm seems to underlie much of the behavior observed in this study.

Process and Meaning in 'Getting a Tattoo'

Christina Goulding, University of Wolverhampton
John Follett, University of Wolverhampton
Michael Saren, University of Strathclyde
Pauline MacLaren, De Montfort University

ABSTRACT

This paper explores the nature of customer interactions and the development of client/provider relationships in the tattoo industry, a rapidly growing service that has seen an increase in demand for its 'products' over the last two decades and a cultural shift from the deviant to the mainstream. Through the use of a qualitative methodology the identified themes of 'information search', 'approval', 'interpersonal skills', 'trust building and mutual involvement' 'becoming a collector' and 'developing a sense of loyalty' are discussed.

INTRODUCTION

Over the last two decades there has been increasing interest on the part of consumer researchers in the relationship between identity and consumption. This interest has instigated a wide range of investigations (Featherstone, 1992; Firat and Venkatesh, 1995; Douglas, 1996) many of which are predicated on the view that in contemporary society the identity of an individual is in part a construct of his or her consumption. This is due not only to the physical and non-physical objects a person can consume, but also the symbolic nature of these products (Schouten, 1991; Sarup, 1996). Linked to the creation of identity are issues concerning the body, and in particular the role of the embodied self (Featherstone, 2000; Joy and Venkatesh, 1994; Mauss 1979/1936). The relevance of this can be clearly seen in the growing literature on consumer behaviour relating to the body (Thompson and Hirschman, 1995; Falk, 1994; Featherstone, 2000; Featherstone *et al* 1991; Joy and Venkatesh, 1994; Sweetman, 2000; Synott, 1993) which includes a relatively recent focus on body modification such as cosmetic surgery (Schouten, 1991; Seebarsingh *et al*, 2001) and body art (Sanders, 1989, 1991; Goulding and Follett, 2002; Valliquette and Bamossy, 2001).

One popular form of body adornment which has a long and well documented history is that of tattooing. However it is fair to say that until recently tattooing has been regarded as socially unacceptable and excluded from mainstream fashion in western society. Nevertheless, as a consequence of celebrity role models such as Angelina Jolie and Johny Depp sporting tattoos, and shifts in fashion towards body adornment, including body piercing and tattooing, attitudes have changed, to such an extent that acquiring a tattoo is now seen as part of contemporary popular culture (DeMello, 2000; Camphausen, 2000; Mercury, 2000). Moreover the growing popularity of 'body art' has seen the development of a global multi-billion pound industry (Vale, 1999). In other words, the acquisition and meaning of tattooing has undergone a process of appropriation, first from the tribal, by sailors who used tattooing on particular parts of their bodies as a means of both spiritual and physical protection, and later by working class males (and some women), prisoners and gang members. As a result, tattooing came to be generally associated with criminal or deviant behaviour and carried with it a social stigma. Today, however, tattooing has not only been appropriated, but commodified as the choice of design, meaning, and quality, increases to meet accelerated demand for variety and variations on symbolic representations (Vale, 1999). Moreover, it is no longer possible to classify consumers of tattoos on the basis of age, gender, subcultural activity or class, as increas-

ing numbers from across the social spectrum are acquiring tattoos, all be it in varying quantities and for different reasons (Goulding and Follett, 2002; Armstrong and Murphy, 1997; Millner and Eichold, 2001). According to Irwin (2001) 7 million adults in the USA now have tattoos and they have now become so "thoroughly middle class that the only rebellious thing about them may be the decision not to get one" (p49). In effect there has been a cultural shift and a gradual destigmatization of deviance. Yet despite this, tattooing has received little attention from consumer researchers. Indeed there has only been one study, which specifically interpreted tattooing as a service industry (Sanders, 1985), despite the fact that a survey reported by Vale (1999) indicated that the tattoo sector was one of the fastest growing service industries in the US. Indeed tattooing may validly be classified as a service due to the fact that it has providers (the tattoo artists), clients (those who purchase the tattoo), and involves payment. However, the tattoo, the 'object' that is purchased is unique both in its concept and practice, and has very few comparisons, largely due to the permanency of the act. This brings into question the nature of the relationship, the experience, and importantly, the role of trust due to the very high risk and high degree of involvement surrounding the exchange. This paper explores the nature of this relationship and the factors influencing choice of tattooist, the nature of the experience, and the development of enduring relationships.

METHODOLOGY

The main aims of the research were to gain insights into the nature of the tattoo experience from a range of tattooees, varying in their commitment to adorning their bodies with permanent markings. Rather than starting with a predefined framework the authors adopted an emergent methodology (Glaser and Strauss, 1967) that consisted of the collection of qualitative data in the form of informants stories. Some areas of behaviour are notoriously difficult to research from an 'outsider looking in' perspective and may consequently involve the researcher going 'native' in order to gain access to informants and collect credible data (see for example Schouten and McAlexander, 1995). In the case of tattooing and tattooees Vale (1999) addresses some of the problems faced by the researcher, notably gaining access, trust and dispelling suspicion surrounding the motives of the researcher. Consequently one off interviews were not deemed to be adequate for the purpose of researching the tattoo experience. In order to collect data, one of the authors who is himself very heavily tattooed embarked on a relationship building exercise with a number of key informants including tattoo artists and tattoo consumers, ranging from moderate to heavily tattooed. Tattooists provided client contacts and a total of fifteen in-depth interviews were conducted over a three month period with eight males and seven females ranging in age from 18-38. These were followed up with further meetings and discussions in order to capture the breadth of the experience. In addition to this, one of the researchers joined a discussion list dedicated to extreme body modification. In order to become a member, the applicant is required to write their story or history of becoming a 'tattooee' and submit a photograph of their tattoos. This vetting process is carried out to exclude the 'voyeur'. However, once accepted the new member is given access to all the stories,

pictures and email addresses of the list membership which allows him/her to enter into individual dialogues with informants. These stories helped to inform the analysis and supplemented the interview data. In terms of interpretation, all interviews were transcribed and subjected to a process of coding as described by Glaser and Strauss (1967) which involved descriptive analysis through the use of 'open coding' through to the identification of patterns or concepts based on their relationship to each other. This stage involved the use of 'axial coding' which moved the interpretation beyond the level of description to the identification of interrelated themes.

FINDINGS AND KEY THEMES

The tattoo market

Loosely defined, the market for tattoos may be divided into three types, namely:

- 1) *Fashion and aesthetic tattooees*: These individuals usually acquire a tattoo for aesthetic purposes with little thought given to the symbolic or 'tribal' meaning. For example, a flower on the hip or shoulder which can be easily concealed. They are largely influenced by peer group referents and fashion trends and do not see themselves as part of a tattoo community.
- 2) *Committed but concealed tattooees*: This label covers the experienced tattooees who have embarked on a tattoo career, often covering their entire bodies from the neck down with permanent images. Often, each tattoo marks a particular event in the individual's life and may have personal as well as symbolic meaning. However, there is a reluctance to go 'all the way' by tattooing those parts that cannot be concealed, such as the hands and face. This allows the individual to engage in mainstream social and economic activities without incurring the prejudice and stigma that still accompanies extensive body modification (Pitts, 1999). On the other hand the extensive nature of the body art also allows acceptance into one or a number of the tattoo subcultures, such as 'modern primitives', that exist in Western society today.
- 3) *Committed collectors*: These individuals do not see themselves as having a tattoo, but 'being tattooed' (Vale, 1999). Being tattooed is part of an ongoing career of becoming a 'collector' of tattoos whereby the individual's life history is symbolically coded and written on the body. With regard to this group there are few boundaries or limitations to the placing of tattoos. Most cross the line and have facial and hand markings which cannot be concealed. Consequently, many take a conscious and voluntary decision to exclude themselves from the mainstream opting into an alternative subcultural grouping, making their living, often in the industry, and socializing with like-minded individuals. Whilst work from consume behaviour has tended to centre on the notion of regret (Valliquette and Bamossy, 2001), it appears to be those individuals who have impulsively purchased a tattoo and have taken it no further who are more likely to experience regret than those who have consciously developed a personal 'body career'. Nevertheless, longitudinal studies of life-passage may reveal different reactions. After all, having taken the decision to reject the mainstream, the permanency of the act does not easily allow re-entry.

However, having acknowledged that the tattoo market is diverse in terms of motivations and usage, there are a number of common features of the experience, which will of course vary depending upon which stage of the process the individual is at. These include the following:

Information search

Whilst information search is a key aspect of many service encounters, the nature of tattooing probably provokes a greater degree of investigation, time and involvement. Tattoos are permanent. They are considered by most recipients to be works of art, to be created by 'artists' upon a canvass, the body. They are both public and private statements about the individual's identity, and, significantly, the act involves an often extended period of pain and potential risk of infection. Consequently information search is usually extensive, involving the internet and website analysis, personal inspection of premises and tattooists at work, levels of hygiene, a study of portfolios of previous tattoos carried out by the tattooist, and most importantly, discussions with past and existing clients. For example:

Mark aged 18: Having decided to have a tattoo: "The next step was to find an artist to do this for me. It wasn't too hard. My sister had a tattoo done at Addictive Ink and was very happy with the work and general environment of the shop. I'd heard nothing but good things about this place. My sister and I decided to go up and talk to the artist, look around the shop one evening. I went over a few fact sheets that had information on what sort of thing to look for in a shop. I'd read them many times before, but I wanted to be as informed as possible."

Sarah aged 20: "I searched online for what I should look for in a studio, and sure enough I found what I was looking for in seconds. I was told that the best thing to look for is an example of work carried out by the artist, and sure enough an example was right before me! My Mum had gotten a small flower design on her wrist that looked neat and tidy, so I asked where she got it (It was a Devil Bitch)."

First impressions are of vital importance in the decision to proceed and negative images can be an immediate deterrent:

James aged 26: "After what seemed an eternity I went to a tattoo studio in my area (I won't mention any names here). This place really put me off having a tattoo, it was so bad. The artists didn't wear gloves, wash their hands, and were eating and smoking while tattooing. If that didn't make me run for the door, the attitude of one of the owners did!"

The tattooing industry has come a long way since the early days of back street 'scratchers' (unregulated, unlicensed tattooists operating from shabby premises or from home). It is now possible to find tattoo studios that resemble fashionable beauty parlours with highly skilled staff who have undergone extensive apprenticeships. Quality is a matter of expectation and tattooists have to compete for customers in the same way that any other service does.

Approval

Schouten (1991) in his study of cosmetic surgery describes it as 'irreversible, expensive, painful, potentially dangerous, and, nevertheless, increasingly popular..' (p412). Words that could equally apply to the acquisition of a tattoo. Therefore having made a decision to go through with the tattoo, the next vital factor is that

of reassurance that the individual has made the right choice with regard to the tattooist and the parlour. The client needs to be supplied with information that will dispel any doubts that may be lingering as indicated by Rob:

Rob aged 30: "As far as the choices I made that evening I think that the place I went to was the most important. All the guys in the shop were more than helpful, answering any questions I had, joking around with me, and all in all making me feel real confident about choosing to go to Lucky 7. After finishing, all the guys that were in the shop came over to look at my back. I felt so proud when I heard how impressed they all were with the results. I mean these guys do tattoos for a living so the simple fact that they can still see a tattoo that impresses them meant a lot. Then Bob took me over to the other side of the room and took a couple of pictures of it to display in the shop"

Tattoos are individual, they are a supreme mode of self expression. However, they are also judged and interpreted by others both inside and outside the tattoo community. By the aficionados they will be deconstructed and read for symbols which are linked to individual and collective identity and may result in acceptance or rejection by a subcultural group. Maffesoli (1996) talks about the rise in what he terms 'neo-tribes' or the transitory group which is neither fixed or permanent, but involves a constant back and forth movement between tribe and the masses. These neo-tribes may be "effervescent, aesthetic, oriented toward the past or future; they have as their common characteristic on the one hand, a breaking with the commonly held wisdom and, on the other, an enhancing of the organic aspect of the social aggregation" (p96). Moreover, solidarity is expressed through lifestyles that favour appearance and form. According to Sanders (1988), fellow tattooees commonly recognise and acknowledge their shared experience, decorative tastes and relationship to conventional society. Tattooing has an affiliative impact in that it is routinely employed to demonstrate one's indelible connection to primary associates or groups whose members share special interests and activities (Sanders, 1988).

"Becoming tattooed is a highly social act. The decision to acquire a tattoo (and the image that is chosen), like most major consumer products is motivated by how the recipient defines him or herself. The tattoo becomes an item in the tattooee's personal 'identity kit', and in turn is used by those with whom the individual interacts to place him or her into a particular interactions-shaping social category"

Sanders, 1988, p405)

However, unlike the temporary neo-tribe discussed by Maffesoli, the wearing of a tattoo is not temporary, but permanent. It denotes a strong commitment to a particular group or lifestyle, and the larger or more prominent the tattoo, the greater the commitment.

Interpersonal skills, trust building and mutual involvement

Consequently, a least to begin with acquiring a tattoo is not a decision that is taken lightly and relies heavily on reassurance. The degree of reassurance rests largely on the extent of interpersonal skills displayed by the tattooist. Qualities such as honesty, previous experience and humour make the individual feel relaxed, important and create good customer relations. In effect the relationship is not unlike that of doctor/patient. The customer is literally putting his/her skin in their hands to be marked for posterity. As a result a strong sense of confidence needs to be built and expertise in terms of

artwork, range (for example skills in 'nu skool', 'old skool' 'tribal' decorations) and symbolic meaning demonstrated. For example:

Peter, aged 21: "Let me tell you that if you find a good tattoo artist with a sense of humour you are set. My nervousness melted away. Jeff was great. I just sat back and talked with him while he waited for his friends to bring dinner, I came a little early. He was one of the funniest guys I'd met. Right then I was comfortable. I looked through some flashes and photos of his work I was impressed by this. I looked around the room and saw all kinds of various awards and certifications. I knew this was a good one."

Tattoos are more than mere objects of consumption. They are extreme statements which are highly symbolic and riddled with meaning. Mcabbe (1997) discusses the symbolism inherent in tattoos and the current process of commodification and popularisation of body adornment. Accordingly, classic images such as the eagle, the snake, the anchor or the heart are deceptive in their directness and simplicity. Hidden behind these designs are years of technical and artistic experimentation that combine to make an art form. Indeed tattooing has always been closely related to the variety of the culture that surrounds it. However, the current explosion of interest in tattooing has pressed the art-form into a transitional period which challenges many time-tested values of the tattoo community. There is a process of gentrification occurring as new people from different walks of life become involved. Along with this, the aura of store bought has 'muscled' its way into what was once a personal hand made approach (Mcabbe, 1997). However, the personal approach remains a paramount part of the experience.

Linked closely to interpersonal skills is the issue of mutual involvement in the process. The extent to which the artist becomes involved gives the individual confidence in his/her abilities. It also demonstrates commitment on the part of the tattooist, which further helps to alleviate anxieties and allows for a more enjoyable experience.

Jenny aged 20: "I am overjoyed at my new ink, and cannot recommend Mike or Atomic Tattoo more highly. He is a phenomenal artist, who lends a huge amount of artistic consideration to his work. He's also very nice, funny, and not intimidating in the least. I felt that this tattoo was very much a collaboration between Mike and myself, rather than just a business transaction. He put a lot of himself into this tattoo, and I really appreciate that."

Jane aged 22: "The first time I realized that I was getting an awesome tattoo was when Bob (the artist) spent like half an hour just mentally planning out how he was going to do it. I was a little nervous when he said "I'm not going to lie to you, this is going to be a motherf...r" but like I said I had confidence in his abilities."

The tattooist needs to wholeheartedly demonstrate a high degree of self investment in the act, virtually to the same degree as the recipient. Their role goes beyond that of an artist, often, over time developing into educator, advisor and guru. Indeed some of the sample reported feelings akin to falling in love with their tattooist, so intimate is the relationship, whilst others felt the need to gain permission from their tattooist before they would speak to us. This of course brings into question the nature of the experience itself.

Becoming a collector

The act of getting tattooed is highly ritualistic (Irwin, 2001; Vale and Juno, 1989; Klesse, 1999). It involves planning, preparation, sometimes role transitions and a reconceptualisation of identity (Schrouten, 1991). Vail (1999) discusses the process of becoming a collector; a transformation which is physical, due to the alteration of the skin, psychological and sub-cultural. It also alters how the individual perceives his or her skin, and in turn how that skin is perceived by others. Being heavily tattooed still stands outside of conventional norms, and becoming a collector requires devotion to a lifestyle that might be considered marginal. "In short one must want to become a collector". Becoming a collector, or someone who is 'tattooed' as opposed to having a tattoo, is also an educational process, through which the individual learns about the appropriate designs, their meanings and their aesthetics on the individual's canvas.

Angie: "I have been into tattooing for as long as I can remember, I have always been interested in art, my background is in jewellery manufacture, I have always been arty and to me it was just another form of artwork. I had my first tattoo when I was twenty five, it was a tiny spiral, I have always been into spirals and Celtic artwork, I had always wanted one, I didn't want it normal, I wanted it more cartoon like, more free form. I got it when my boy friend at the time went to get one (a tattoo), and the tattooist had some spirals in his flash, but they were too perfect, too regular. I told him to **** it but I've never been too happy with it as it is too regular. At this point in time I have five tattoos in all, the spiral on my ankle, stars and flames on my abdomen, hot rod flames on my wrist, stars behind my ear, and the white tattoo on my back. I have lots of different stories that I tell people, some times if they are annoying me, I tell them it was done with needles dipped in bleach. Everything I have I have drawn myself, I like some tribal stuff but not the spikey stuff. I sketch what I want every time, I know what I want and I know what I like. But with the white one I really wanted that one to look like a Scarification, you know the whiteness of a scar, it was a bit of an experiment. I first got it done by the person I used to work for, he used to say that you couldn't do just white tattoos and when I saw a photo in a magazine I showed him and said to him I told you so! So I got him to do it, Winston has just gone over it again.: I have recently got into traditional body decoration, like the stars behind my ear and flames up my left arm, I wouldn't want pictures, traditional designs seem to flow with the body. The same with old skool designs, my views on them have developed over the last few years, I didn't use to see the appreciation in traditional tattoos before, but all of them are personal."

Joanne: "I was 17 when I got my first tattoo done it was not very good and it was done as part of a thing where every one in the crowd got one. Unfortunately I chose through price instead of quality, it was a small supposed Celtic design on my left arm. As you can imagine it is now covered up with a better design. This sort of put me off getting anything else till I was 25, this was a good thing because it allowed my taste to develop. Otherwise I would have got just the usual sort of crap that everyone gets instead of something that means something special to me and no-one else. I decided to go get another tattoo as I said when I was 25, I was working down south at the time and two of my male work colleagues had absolutely beautiful designs, the work was so intricate it was unbelievable. I asked

were they got it done and they told me. This tattooist was literally world class, he had at least 20 years experience, this was all evident when I went to his shop for the first time. I chose a design paid my money and then had to wait six weeks, this was how good he is there was and still is a four to six week waiting list to get a tattoo from him. I mean he isn't your usual 'mom and dad' or little itty bitty rose tattooist. After I got my first big one, on my right shoulder, I thought well I can take the pain, what about another, this was due to the fact that I came out of the tattooist with a huge grin on my face, but at the same time I wanted more, not just due to the fact that I actually enjoyed the tattoo (apart from the pain) but I felt that a large tattoo on one arm and a small one on the other would not balance out right. This way of thinking has continued to the present day where I am just going to get my lower left arm finished sometime in the near future, I have already planned how to finish the corresponding part of my right arm so that they are not lopsided. I have heard other people that are heavily tattooed feel an itch on an area that makes them feel where they need to get another tattoo. I have never felt like that but I do feel I know where *the next one is going to be placed.perhaps it is subconscious?"*

This process of collecting and becoming a collector may be considered a form of what Van Gennep (1960) describes as a contagious rite of passage. This is based on the belief that natural or acquired characteristics are material and transmittable. Within the sub-culture, tattoos mark the individual as a member, and the more extreme, symbolic or complicated the tattoo, the higher the position in the hierarchy. However, there is one aspect closely related to the tattoo ritual or rite of passage, and that is the actual experience of being tattooed which involves physical pain and reportedly, pleasure.

Joanne: "When I am getting a tattoo done it is a very strange experience as to begin with you have pain, this pain diminishes as the tattooing continues. Not just of that tattoo you are getting done but as you get tattooed more you get used to the experience and it hurts less...the pain diminishes as the tattooing progresses. As I said, for me personally it gets to about a third of the way through and I start to actually enjoy the process and by two thirds of the way through I'm usually high as a kite. I think this is partially to do with the excitement of getting tattooed; you are actually getting something that you really want that really means something to you as an individual, and can show off later; it is also partially to do with the amount of endorphins that are pumping round my body. I said that it gets less painful, well this also depends on where you get the tattoo done, some places are more painful than others; for example the tattoos on my shoulder blades were really sore. This is due I think to the differences in skin thickness. The body is very strange, when I got the inside of my left arm done I was getting tattooed about 3-4 inches away from my armpit yet it felt that I was actually getting tattooed there. It felt that real I had to have a look to see what the hell the tattooist was doing; the body does some strange things to you when you get tattooed."

Developing a sense of loyalty

Whilst there is an intensely physical side to the experience which some report as 'addictive' commitment to a particular tattooist rests largely on a number of personal skills and the ability to make the experience enjoyable. These social skills, high information, commitment and involvement, and the quality of the work

combine to create loyal customers who tend to remain loyal over a period of time. However, possibly more important, they are 'walking' advertisements for the tattooist.

Simon aged 18 "Gash is the most experienced tattoo artist in the area. He has several competitors in our city.....and ironically they are all on the same street, isn't that funny, but, Gash is the most talented out of all the artists, so I highly recommend him.....Gash is the only person I trust to do my tattoo's. So far he has done 11 of my 12 tattoos, and he has even sparked my interest in doing tattoos myself. It is hard to find such a talented artist in these times...but they are out there, you just have to look."

Tattooists rarely resort to traditional means of advertising and communication. Their clients do it for them to a large extent. Prospective tattoo collectors talk to experienced tattooees and word of mouth is by far the most potent weapon with regard to recommendations.

James aged 30: "After being tattooed at Heads, I now realise how clean and good the last place I went was. I don't plan on ever going to Heads again and told Ian not to get his done there. Why would anyone recommend somewhere that isn't even that great? Clearly they didn't research the studios to find the best one. So here's my advice to anyone thinking about getting a tattoo, visit shops and look at work the tattooist has already done, and make sure the place is clean and professional."

Claire aged 26: "I got my first tattoo 3 years ago at the same studio, he is a great artist known both for his work and personality. I would definitely recommend him to anyone. More seriously though, I trusted Shane's judgement as an artist."

Reliability is also central to the relationship and becomes even more important if the tattoo is to be completed over a period of time. Failure to meet expectations can result in negative associations and condemnations, as the following illustrates.

Martin aged 33: "Almost a year had past since I first started my devil girl and the convention where I had got it started was soon to be upon us again. I still wanted E to finish what he started so I rang his shop to confirm an appointment for the Sunday of the convention. Their receptionist told me that he was only doing "first come first serve" and to get hold of him when he gets there. And that's what I did. I confirmed, what I hoped was to be, the appointment to finish my arm.....Sitting in the lobby before the convention I see E strolling in with bag in tow, I approached him, asking if we would be able to finally finish my arm. He gives me a yes and we set up our appointment for Sunday. So there I am, actually sitting in the chair, early Sunday morning, ready to get this tattoo finished, unbelievable, huh? . As you might assume, we were not as chatty as in the first sitting. I just sat there, waiting for the finished piece of art. But then the unexpected, he has to STOP. He has an important appointment to show up to and we'll have to finish another time. I thought you have to be kidding. A huge upper arm piece, lined shaded, and coloured everywhere but the head, the wings, and the shoes. I was steaming and had to leave the convention for fear of my sometimes short fused temper taking over.

A few months down the road I had my artist Vinz finish what E had started. Doing a better job might I add. A few months

after that I heard from people who asked E about my arm and why he acted like he did. The explanation he gave was that I called and made appointments at his shop a couple of times and then No-showed. It's sad that he can't even tell the truth, I'd really like to know. Actually, the really sad truth is I now sit here with a beautiful tattoo, a top notch piece of art. And all I can think about when I look at it now is should I get it lasered to lighten it up first before I get it covered up. I love the look of great work, I can't wait to have much, much more, but, in the end, what is great work if it's an asshole who put it on you. This experience has not deterred me from seeking other talented artists. It has opened my eye's though. Get to know your tattoo artist, it may take a while, but you'll thank yourself for it.

Reliability and customer interactions are vitally important as they emphasises the personal relationships that are created and then reinforced by the actual act of tattooing. In this case the association with the tattoo and the artist is so strong that the client felt compelled to have it removed, despite the fact that he considered it a 'beautiful tattoo' and a 'top notch piece of art'. This highlights the importance of customer interactions which are often valued over and above the actual art work that is being performed. This relationship is built heavily on trust, and once formed tends to be of an enduring nature resulting in recommendations and repeat visits as the canvas is developed and worked upon.

CONCLUSION

The rapid growth since the 1990s of tattoo culture which has brought a once perceived deviant activity into the mainstream, breaking down class, age and gender boundaries, raises some interesting questions for consumer researchers. To begin with, tattooing can now legitimately be classified as a service industry with clients and providers. However, the nature of this service is fairly unique due to the permanency of the act and the intimacy of the relationships involved. This relationship may also be of a long term and enduring nature and is dependent upon trust, confidence, liking, the ability to deliver an enjoyable experience and reliability. It is also closely linked to issues of identity, symbolic representation, and in some cases group membership. This paper has provided some exploratory factors which are largely mutually dependent, but would also benefit from a greater in-depth analysis in their own right. For example, the nature of exclusion and inclusion would make an interesting study and is open to a number of theoretical interrogations, as is the role of ritual in the process, particularly with regard to the changing nature of the contemporary 'consumer tribe'.

New Clothing: Meanings and Practices

Gokcen Coskuner, Auburn University
Ozlem Sandikci, Bilkent University

ABSTRACT

This paper explores feelings, experiences and practices related to new clothing. Specifically, we seek to answer two main questions: What does constitute newness of a clothing item? What is the motivation for a new clothing purchase? The study utilizes qualitative research methods and draws upon data collected from 24 informants of different age, gender and cultural capital. The paper argues that unlike technologically oriented new products, symbolic meanings, motives and practices predominantly characterize new clothing consumption.

In the era of mass production and consumption, we experience multiplication of objects (Baudrillard 1998). Furniture, books, cars, clothes etc. are all produced in vast numbers and in new variants. In such a context what the consumers perceive as “new” and what kind of experiences and feelings new products render emerge as important questions to explore. Within the field of marketing, the concept of newness has received substantial research interest especially since the early 1960s. Over the years, the concepts of newness and innovation have been explored, the constituents of newness as perceived by consumers and producers have been analyzed and models have been proposed for predicting consumers’ behaviors in relation to new products.

We aim to contribute to the existing literature by examining meanings and practices related to consumption of a highly symbolic product category, clothing. We first offer a brief review of the literature on new products and innovations and explain the motivation behind our research. Next, we present data collection methods and discuss our findings. We conclude with a discussion of contributions and future research areas.

BACKGROUND AND MOTIVATION

The literature on new products and innovations can be grouped under two major categories: product level and consumer level studies. At the product level, research is primarily concerned with examining product-related factors affecting the acceptance of an innovation—an idea perceived as new by the individual (Rogers and Shoemaker 1971)- without taking into consideration behavioral and perceptual characteristics of the individual consumer. These studies propose continuums that classify new products in terms of how continuous or discontinuous their effects are on established consumption patterns and discuss product related factors that effect the adoption of new products, such as price and advertising (e.g., Firth and Narayanan 1996; Gobeli and Brown 1987; Kleinshmidt and Cooper 1991; Robertson 1971; Veryzer 1998).

At the individual level, studies focus on psychographic and demographic traits that make an individual more adept to adopt new products. Among psychographic traits innovativeness is the most discussed one in relation to new product adoption. Studies suggest that innovativeness is related to income and spending level (Baumgarten 1975; Goldsmith and Flynn 1992; Mason and Bellenger 1973-4) level of product involvement (Goldsmith et al. 1987; Mason and Bellenger 1973-4; Reynolds and Darden 1973, 1974; Schrank and Gilmore 1973) nature of the communicated product experience (Goldsmith and Flynn 1992; Mason and Bellenger 1973-4; Painter and Granzin 1976; Reynolds and Darden 1973, 1974), and perceptions of innovation attributes (Holak 1988; Holak and Lehmann 1990; Labay and Kinnear 1981). The literature demonstrates that early adopters have more education, more in-

come, and higher occupation status than non-adopters (Adcock, Hirschman and Goldstucker 1977; Bell 1963; Feldman and Armstrong 1975; Kegeries and Engel 1969; Labay and Kinnear 1981; Plummer 1971; Robertson 1971; Rogers and Shoemaker 1971; Rogers and Stanfield 1968). Innovators are reported to be more inner directed (McDonald and Jacobs 1992) and driven by sensation-seeking and uniqueness-seeking motives (Burns and Krampf 1992). Consumers are also classified based on the rapidity of their adoption; namely as innovators, early adopters, early majority, late majority, and laggards (Rogers and Shoemaker 1971).

Despite the existence of a substantial amount of literature on new products and innovations, however, we believe that there remain two overlooked areas. First, most of the research focuses on technological innovations and tangible attributes of new products, leaving symbolic products and intangible attributes aside (for an exception see Hirschman 1982). As Hirschman (1982) argues, symbolism constitutes an important source of innovation, and by communicating new and different social meanings, a product can operate as a symbolic innovation. Second, while existing studies discuss demographic and psychographic traits that characterize innovativeness behavior in detail, they tend to neglect the actual experiences and practices of the consumers with new products.

Motivated by the gaps in the existing literature, this study offers an emic understanding of meanings and practices related to new product consumption in a symbolic product category, clothing. Two reasons underlie our selection of clothing category. First, clothing constitutes a signifying system through which meanings about class (Marx 1954; Veblen 1899); subcultural identity (Hebdige 1979), religion (Brown 2001; Crawley 1965b, Poll 1965; Sandikci and Ger 2001), sexual identity (Rolley 1992), gender roles (Crawley 1965a; Oakley 1981; Rouse 1989; Steele 1989), ethnic identity (Griebel 1995), and nationality (Ger and Ostergaard 1998) are communicated. Second, clothing, and in extension, fashion is characterized as ephemeral (Faurshou 1997; Fox-Genovese 1987). Clothes and fashion change continuously; the fashion industry always introduces new collections that aim to offer more allure and excitement to consumers.

METHODOLOGY

Given the exploratory nature of our study we adopted qualitative research methods, which are deemed more appropriate when the goal is to obtain in-depth understanding of the phenomena under investigation (Denzin and Lincoln 1994). The study was conducted in Ankara, Turkey in the summer of 2002 with 24 Turkish respondents selected through purposeful/purposive sampling (Berg 1998; Patton 1990). The informants were recruited on the basis of their gender, age and cultural capital levels. The sample consisted of equal numbers of females and males and low and high cultural capital informants who were either within the ages of 20 to 35 or 35 to 65. In order to assess the cultural capital level of the informants we used a modified version of Holt’s formulation¹ (Holt 1998; also see Bourdieu 1984).

¹Holt’s (1998) cultural capital level assessment method was modified in order to make it relevant to the Turkish context. Unfortunately, space limitation prevents us to give a more detailed explanation of the sample selection process.

Data collection procedure involved three steps. The first two consisted of projective techniques and the last one involved semi-structured interviews. Projective techniques, such as collage making and metaphoric portraits, are based on the premise that when people attempt to understand a relatively ambiguous stimulus, their interpretation and response reveal their personality, feelings and socio-cultural experiences (Lindzey and Thorpe 1968). Such unstructured techniques help generate data that would be harder to obtain through more structured approaches. At the first stage of data collection, the informants were instructed to prepare collages of new clothing. All the informants were given a four magazine set and briefed about the task. In the next stage, the respondents were asked to associate new and old clothes with a color, taste, sound, feeling and emotion. Metaphoric portraits helped us understand the feelings and associations that our informants had in relation to new and old clothes. In the third stage, semi-structured in-depth interviews were conducted. During the interviews, the informants were first asked to describe their collages and then additional probing questions were administered. The length of the interviews ranged from 40 minutes to 1 hour and all were tape-recorded. The first author was responsible for all the stages of the data collection process and translation of the interview transcripts into English.

Our analysis sought to identify conceptual categories and themes, following the discovery oriented aims and procedures of grounded theory (Glaser and Strauss 1967). Each interview was read many times to gain a perspective of consumers' interpretations of and experiences with new clothes. Once themes and categories were identified and agreement among the authors was attained, we searched for similarities and differences between different groups of respondents. The patterns emerging from the data directed us toward theoretical constructs generated by previous research that may offer relevant insights into interpreting the patterns.

FINDINGS

In this section, we discuss two major groups of findings. First, we briefly analyze what constitutes "newness" in the clothing category. The data reveals that the meanings attached to new clothing derive from both tangible and intangible sources. Next, we discuss in detail the motivations behind new clothing consumption and consumers' experiences with them.

So what is new?

The newness of clothes derives from both tangible and intangible features. Unlike the emphasis given to the tangible attributes in the case of technologically oriented new products, however, intangible sources seem to play a more important role in consumers' assessment of newness of clothing items. Among the main tangible constituents of new clothing are the item's physical condition, technology and design. Physical condition refers to the material form of the item. If the garment is not torn, worn out and/or stained than it is considered as new. The informants also refer clothes that offer new technical benefits as new. One of the respondents, for example, regards an Adidas's t-shirt for bikers as a new product because it offers better protection from cold due to the cross-knitting technology used in its manufacturing. Apparels that are different in design are also perceived as new. Examples include Levi's engineered jeans, athletic shoes, and asymmetrically shaped tops and skirts.

We identify two intangible constituents of newness: social visibility and fashion. Social visibility refers to the extent the garment is seen by others. Irrespective of the purchase timing, a garment can still be regarded as new if it is not seen by socially significant others. As soon as a garment is worn to a social gathering, its newness erodes. However, the same garment can be

worn in the presence of another social group and still be viewed as new. Fashion trends also influence what is regarded as new clothing. The collages contain images of clothes and accessories that the informants think represent the fashion of 2002. As fashion trends change rapidly, items purchased recently may become "old" if the style turns out to be out-of-date quickly. Oppositely, previously purchased items that have become out of fashion can be perceived as new if the style becomes popular again.

Clothing as Celebration, Power and Play

In order to understand the dynamics of consumption of new clothes we also explored why people purchase new garments and how they experience them. Our analysis suggests that a new clothing purchase is motivated by a combination of utilitarian and symbolic reasons. As in the previous case, however, symbolic motives play a more important role than utilitarian motives. When existing garments are worn, torn and thus not wearable any longer, the consumer buys a new one. Yet, while such purely utilitarian purchase instances do happen, they constitute only a small set of the informants' new clothing purchase episodes. More often, the symbolic motives trigger purchase of a new garment. The purchase and consumption of new clothing contribute to moments of celebration, prompt feelings of power and status, and render excitement through exploration and play.

Celebration

Ritual artifacts often take the shape of consumer products—food, drinks, jewelry, diplomas, candles, ceremonial garments, etc. (Douglas and Isherwood 1979; Rook 1985). When used in a ritual context, such artifacts often communicate specific symbolic messages that are integral to the meaning of the total experience. Our data suggests that clothing is one of the ritual artifacts of celebrations. Irrespective of their gender, age and cultural capital level, all informants mention that they wear or wish to wear new clothes on special occasions. For the high cultural capital group these special occasions typically involve weddings, work parties, formal events of the clubs they are members of, birthdays of themselves and their relatives or friends, and new year celebrations. Low cultural capital informants, on the other hand, cite weddings, anniversaries and religious holidays as celebration occasions. In such symbolically significant occasions, grooming becomes very important and informants want to feel special by wearing new clothes. The new cloth worn signals the degree of importance given to the occasion:

"If it is a special night for me, if I am going to go for a meal ... I buy some nicer things. Instead of choosing among the existing ones, I prefer to wear something different and I buy. For example, my wedding anniversary is special to me. It has been 19 years and that day is always special. Birthdays are special and not forgotten, birthdays of the ones I love. ... I think I have to be very special at very special days."

(HCC, F, 42)

Religious holidays—bayram—constitute a major celebratory occasion for low cultural capital informants and, to a certain extent, for older high cultural capital respondents. Traditionally, it is customary to wear new clothes during religious holidays in Turkey. This custom continues among low cultural capital informants; they celebrate these days and, as much as they can afford, they prefer to wear new garments:

"I love to wear new clothes for bayram. New shoes, new handbag, all I just love it."

(LCC, F, 56)

“Bayram is of course an important day. One sure wants to wear new clothes. We continue our traditions.”

(LCC, M, 36)

Among older high cultural capital informants this custom tends to continue. These people reflect upon their childhood memories and remember the days that religious holidays were important rituals not occasions for holidays as they increasingly turn into nowadays. They try to continue the custom of wearing new clothes and expect their children and grandchildren to do so:

“I try to get well dressed for bayram. Both new and clean. Because bayram is a very special day. We still continue to do that within Turkish traditions. I pay attention to be well dressed I also expect my children to be so.”

(HCC, M, 62)

“I used to wear but in the last years I don’t really. Isn’t it something traditional to buy and wear something new during bayram? But for the past few years I can say that I do not. Still I care for my clothing at bayram. I do not wear something that I wear everyday but rather prefer something that I wear seldom, that I have not appeared in it to people a lot, or I buy something. I mean it still exists as a tradition.”

(HCC, F, 54)

The social significance of bayram and the custom of wearing new clothes, however, are largely lost among young high cultural capital informants. These respondents find the practice of wearing new clothes during bayram absurd and ridiculous. While they distance themselves from such traditional rituals, they, nonetheless, create new celebratory occasions, such as new year’s eve, Valentine’s day and birthdays, during which they get the chance to show off their new clothes. These findings support the suggestion that like most marketplace products, rituals are subject to life cycle forces (Rook 1985) and that while some rituals decline in popularity, new rituals emerge (Erikson 1977). However, the decline of the importance of a ritual does not occur evenly through all groups of the society. Furthermore, rituals that replace bayram, such as Valentine’s Day, highlight the effects of globalization.

Power and Status:

Clothing has long been associated with power and status. According to Marx (1954), fashion and clothing reflect the class relations within the society. Marx regards fashion and clothing as the most significant means through which social distinctions and inequalities among people are constructed, experienced and legitimized. Historical accounts document that, as early as the fourteenth century, clothes were used for the status competition among the nobility and the emerging bourgeoisie (Batterberry 1977; Hollander 1980; Konig 1973). As Veblen (1899) explained succinctly, clothes helped upper classes to distinguish themselves from the lower classes. Through excessive and obsolesce consumption of clothing, upper classes could symbolically establish their superiority over people of less means.

Our data suggests that not only the type of garment worn but also its newness signifies power and status. Independent of their age, gender and cultural capital our informants told us that they want to appear in new outfits in social occasions where they want to impress the group they will appear in. When attending to socially or professionally important meetings, it becomes almost embarrassing to show up with garments that were worn before. Not only people wear new clothes to impress other people, they also judge others by the clothes they wear in those occasions. It appears that the

ability to wear a new outfit for each meeting evinces one’s wealth, or pecuniary strength as Veblen (1899) has put it:

“... if there is a group that I want to impress. For, example, I go to a wedding, then something new. For example, if it is a wedding in Istanbul, not at an ordinary place, of someone I don’t really care. As I have said the place and the people are important.”

(HCC, F, 29)

“For instance my daughter is taking classes, when I go there I always get specially dressed. Because I represent my daughter there I want to leave a good impression.”

(LCC, M, 38)

“And also at business related important meeting days I wore my newest tie, shirt and suit. I wear my newest outfits, at special days for business and for me.”

(HCC, M, 28)

While all the informants mention that they prefer to wear new clothes when participating in activities that are important to them, the nature of such occasions differ along cultural capital level. For informants with high cultural capital formal business meetings and cocktails appear as important occasions. For those with low cultural capital, on the other hand, home visits are important. In these gatherings, it is important to show that they are of no worse situation than any other member of their social group. Furthermore, while both female and male informants express their will to wear different outfits to important occasions, females seem to need to purchase new clothes more frequently than men do. It seems plausible that two reasons underlie this. First, women’s fashion changes more frequently than men’s fashion. Thus, it requires women who want to appear fashionable in these social gatherings to shop more frequently than men do. Second, men can create variety with minor differences in their outfit, such as complementing their existing suit with a new tie or shirt. Such accessory changes and additions give more flexibility and remove the burden of purchasing a whole line of new clothes:

“There is a club that I am a member of. I need to wear something different at special occasions of that club. I mean not wearing the same thing all the time. I mean my jacket and trousers remain the same but I make purchases in terms of variety in accessories, ties.”

(HCC, M, 62)

Many informants explain that wearing different and new outfits to every meeting they attend is almost a requirement. In order to eliminate social embarrassment by not complying with this requirement, some even borrow clothes from friends or relatives:

“This generally happens if I have not shopped recently, if I do not have something new, if my clothes are seen by everybody and if I want to wear something new. It happens when I go out at night. I wear the things I like very frequently. I avoid wearing those that I think I have worn too frequently and I go and borrow from his [roommate’s] wardrobe.”

(HCC, M, 28)

Play and Exploration:

Gabriel and Lang (1995) argue that purchasing of a new product signals the start of a new phase of exploration, the explo-

ration of the owned object. Similarly, Holt (1995) discusses consuming as play. He maintains that the consumption object provides an interaction between consumers that has no ulterior end. The consumption object is essential for playing because it provides the materials through which playful interaction is enjoined. Our data suggests that there is a playful mode associated with new clothes. The excitement of bringing a new acquisition back from the shop, trying it on with other garments, showing it to friends and family members are important dimensions of experiencing new clothes. The feelings related to new clothes in the metaphoric portraits include excitement, happiness, joy, and curiosity. When the informant purchases a new cloth, a period of exploration begins. S/he shows the newly purchased garments to friends and family to get their opinions. Some wear the garment right away and begin experiencing what it has to offer. Others extend the exploratory phase and deliberately wait for a while until the item is fully personalized and ready to be worn.

Especially the female consumers tend to share their experiences of new clothes with each other. Such an interaction transforms new clothing consumption into a socializing act among females where experiential practices inform each other:

“Let me tell you about Banu. She likes fashion a lot. Her new clothing is the mostly discussed topic between us. She goes and dyes her hair into blonde, we decide on the color that goes best with her skin. It is fun actually. She has this habit. She buys lots of things and when I go to hers she shows them all. And we decide upon where to wear which items etc.”

(HCC, F, 30)

The fact that female informants enjoy both shopping for new clothes and talking to friends about them more than men supports the view that the interest in fashion and the pursuit of fashionability are perceived mainly as female characteristics (Sparke 1995; Thompson and Haytko 1997).

The purchase of new clothing also adds to the feelings of exploration and play through elimination of boredom and fatigue. Informants indicate that they give away their old clothes and buy new clothes when they get bored wearing the same item over and over again. The feelings associated with the old clothes in the metaphoric portraits include sorrow and unhappiness. In order to ease these negative feelings and evoke happiness, excitement, and joy again one has to purchase new clothes:

“When do I buy new clothes? When I got bored from the existing ones”

(HCC, M, 28)

“If it is worn out I give it to the cleaning lady or someone ... I give away the old fashioned ones or the ones that I got tired of seeing.”

(HCC, F, 52)

The feelings of boredom can be triggered as a result of peer group or family pressure. Even if the person himself or herself does not experience boredom from his/her cloth socially significant others such as spouses may get tired of seeing the same outfit and encourage him or her to wear something new:

“I give away his [her husband’s] suits very easily, ... I give away his shirts that I do not like on him anymore, that I got tired of seeing on him”

(HCC, F, 42)

“When I feel really lousy or when I want to make a change. Sometimes I stick to a cloth, my wife warns me about it, she says don’t wear it, wear something else. Then I change.”

(LCC, M, 39)

The frequency of purchase of new clothes, however, is related to economic capital. People feel freer to explore and purchase new garments when they can afford to do so. Informants who are economically well off present a rather blasé attitude (Simmel 1978) towards purchasing of new clothes. They believe that they work hard and earn the right to spoil themselves with new clothes. For informants with lesser financial means, an opposite case emerges. Among this group, frequent purchase of new garments is criticized and condemned. Since spending the limited budget of the family on clothing is not deemed appropriate, such excessive consumption behavior is typically disapproved. When confronted with such negative reactions, people may end up hiding the new outfits they purchase. One informant, for example, tells us that, she does not mention her new clothes to her husband; another states that she hides her new outfits from her mother-in-law with the fear that she will condemn her behavior and complain to her husband.

CONCLUSIONS AND FUTURE RESEARCH

Scholars studying fashion point at the ephemeral nature of fashion (Faurshou 1997; Fox-Genovese 1987). Fashion in the capitalist era is characterized by novelty, rapid changes, proliferation of styles and mass consumption. Fashion changes continuously and new garments offer more allure and excitement (Wolf 1980). Furthermore, clothing and fashion operate as a major symbolic system through which meanings about identities and social relationships are constructed and communicated. The ephemeral and symbolic nature of clothing offers an interesting case to study meanings and experiences associated with new product consumption. The findings of this paper indicate that unlike technologically oriented new products, symbolic meanings, motives and practices predominantly characterize new clothing consumption.

Firat (1997) suggests that consumer’s motivation for consumption in the contemporary era stem from the symbolic meanings derived from the process rather than satisfaction of needs in the traditional sense. Hirschman and Holbrook (1982) similarly argue that experiences and feelings of consumers have become more dominant and important aspects of consumption process. The results indicate that, in the case of new clothing consumption, symbolic meanings and experiences surpass utilitarian meanings and experiences. While physical condition and technological features of garments contribute to the newness of a garment, it is more often factors such as social visibility and fashion that determine whether an outfit is perceived as new or not by the consumer. Similarly, new clothing purchase is often triggered by symbolic motives such as celebration, power and status, and exploration rather than merely utilitarian reasons.

The findings of this study point to several future research areas. First, more research is needed to better understand how symbolic new products are experienced and consumed. Research on new music, literature and films is likely offer interesting insights to the existing literature on new products. Second, follow up studies on consumption of new clothing is needed. Due to the limited sample size and its exploratory nature our study offers only an initial understanding of the phenomena. While some differences along gender, age and cultural capital emerge, future studies need to investigate such variations more in depth. It is also likely that cross-cultural investigations will offer exciting insights, as our results indicate rituals and practices specific to a particular cultures’

motivations for the consumption of new clothes. Finally, future studies need to pay attention to the production side and the media. Exploring the perceptions of producers as well as the discourses in the media that shape what is fashionable and new can provide a more comprehensive understanding of new clothing consumption.

“Let’s Make a Trip Together”: An Exploration into Decision Making within Groups of Friends

Alain Decrop, University of Namur
Claude Pecheux, LABACC, Catholic University of Mons
Geraldine Bauvin, Unilever

ABSTRACT

This paper presents an exploratory interpretative study of decision making within groups of friends. Eighteen groups were observed and interviewed while making leisure decisions. Emerging findings highlight the functions related to friend parties and their decision-making process. A conceptualisation with four major decision-making steps (i.e., suggestion, discussion and evaluation, organization, and post-experience evaluation) is suggested, which departs from traditional models such as the EKB model. Further, the major issues of conflict and role distribution are discussed. An original typology of groups of friends closes the paper.

INTRODUCTION

Group decision making has benefited from substantial consideration in many disciplines (social psychology, law, political sciences, etc.). In marketing and consumer behavior, many studies have been conducted on family decision making. The focus was first on couples (Davis and Rigaux 1974; Davis 1976; Green et al. 1983; Nichols and Snepenger 1988) while children were later included (Darley and Lim 1986; Howard and Madrigal 1990; Thornton, Shaw, and Williams 1997). Organizational buying behavior is another domain in which groups have been investigated as decision-making units (DMU’s; Dwyer, Schurr, and Oh 1987; Webster and Wind 1972).

A group involves members who share something in common: “two or more persons who are interacting with one another in such a manner that each person influences or is influenced by each other person” (Shaw 1976, p. 11). According to Blackwell, Miniard, and Engel (2001), groups may have a normative, a value-expressive, or an informative influence on decision making. Three dichotomies are suggested: primary versus secondary; formal versus informal; and aspirational versus dissociative groups. Primary groups are regarded as “a social aggregation that is sufficiently intimate to permit and facilitate unrestricted face-to-face interaction” (p. 397) and are characterized by a high level of cohesiveness. In contrast, secondary groups are more occasional, “more sporadic, less comprehensive, and less influential in shaping thought and behavior” (p. 397). Formal groups have a defined structure with (most often written) rules, a known list of members and requirements for membership, while informal groups have a looser structure and are likely to be based on friendship ties or common interests. Finally, aspirational groups refer to parties with which the individual aspires to associate by adopting its norms, values, and behavior whereas, in contrast, s/he will try to avoid any association with dissociative groups.

Group decisions may be defined as decisions “made by two or more individuals who have the inclination and ability to influence the outcome and who are subject to a constraint or constraints preventing them from making independent decisions” (Corfman 1987, pp. 229-230). A distinction can be made between three types of DMU’s for consumer goods and services: singles, families (couples with or without children), and friend parties. A lot of decision-making models incorporate friends as part of the social environment, which impacts on decisions and purchases in terms of information, norms, and socialization. As a reference group, friends exert a major influence on most aspects of consumer behavior and,

more particularly, on the decision-making process (DMP; Frenzen and Nakamoto 1993; Peter and Olson 1994). They provide information, reward or punish the decision maker for something s/he has done, and influence the decision maker’s values and self-concept. Those three classical roles of friends have been well documented. However, few studies have focused on the group of friends as a DMU in itself (how friends make decisions together; what are the major characteristics of friend DMU’s...). Gitelson and Kerstetter (1994) have considered the DMP of travel parties visiting friends and relatives and the particular influence of the latter on the decisions made during the vacation stay. In a sociocognitive study of group DMP’s among the members of a sorority, Ward and Reingen (1990) concluded that social structure influences individual cognitive structure. Finally, Campbell (1998) has investigated decision-making processes between friends from a gender perspective. However, those works do not focus on friends as a DMU.

The first goal of this paper is to fill this gap by exploring decision making among friends. A group of friends can be defined as a set of persons sharing a mutual feeling of affection or sympathy which is not based on blood ties, nor sexual appeal. This is in line with Price and Arnould’s (1999) definition of friendship as “a voluntary, personal relationship, typically providing intimacy and assistance, in which the two parties like each other and seek each other’s company” (p. 39). Similar to what has been done for families, the objective is to understand how decisions are made within the group of friends, which role(s) each group member plays, how conflicts are solved, etc.

Friend parties may be involved in two major decision domains. The first involves “inside” decisions which arise out of a need recognition by one or more members of the group. Those decisions may include convenience goods such as cigarettes or alcohol, durables such as a car or an apartment; but most decisions actually pertain to services and leisure activities: travel and vacation, restaurants, sport and cultural activities, evening or night out parties. In contrast, other decisions are triggered by “outsiders” which require the group to make a decision. Those “outside” decisions may include school tasks or activities related to youth movements, charities, or sororities. Of course, the DMP is not likely to be the same for those two types of decisions. This is why this paper will focus on the first decision domain (i.e., decisions involving a friend party held together spontaneously and not externally controlled) and, more particularly, on leisure decisions. Friend parties indeed represent large markets for the travel, movie or catering industries.

METHODOLOGY

A naturalistic interpretative approach (Erlandson et al. 1993) seems to be the best option to explore the DMP of friend parties in all its complexity. It avoids some drawbacks of both survey and experimentation methods when studying group processes (see Chebat 1983; Kim and Lee 1997). The study was carried out in two parts. First, the actual vacation DMP of three groups of friends has been followed for a whole year in the framework of a broader project on vacation decision making (Decrop, 1999). They were interviewed in depth three times before and once after the summer

TABLE 1
Major Characteristics of the Interviewed Friend DMU's

	Group Size	Age	Gender	Family situation*	Decision domains
1.	2	25-50	F	S	Vacation, trips, sport, culture, scouting
2.	4-6	25-50	M	S+MNC	Vacation, going out
3.	6	<25	M/F	C	Vacation, going out
4.	4-6	>50	M/F	MC+MNC	Vacation, restaurants
5.	4	>50	M/F	MC+MNC	Restaurants, trips
6.	13-14	25-50	M/F	S	Charities, going out
7.	4	<25	F	S	Sport, going out, vacation, apartment
8.	3-4	25-50	F	MC	Cultural activities, trips, vacation, restaurants
9.	12	25-50	M/F	S+C	Trips, going out, restaurants, sport
10.	6	>50	M/F	MC	Trips, restaurants
11.	5+	<25	M/F	S	Going out, trips, scouting
12.	7	25-50	M/F	S+MC	Role play, going out, restaurants
13.	4	<25	F	S	Vacation, going out, school works
14.	4-12	25-50	M/F	S+MC	Trips, restaurants, cultural activities
15.	10	25-50	M/F	MC	Restaurants, going out
16.	3-6	<25	M	S	Going out, games
17..	6+	25-50	M	S+C	Going out, restaurants, vacation
18..	4	<25	M	S	Going out, vacation

*Legend: S=single; C=non married couple; MC=married with children; MNC: married without children

vacation. The second study focused on the DMP of friend parties as such. Although different types of decisions were evoked, leisure decisions were investigated in more depth. Friend parties were interviewed (most members participating) and observed in their natural settings: while gathering for a talk or a drink, or during activities inside and outside their favorite meeting places. This second study involved 15 DMU's with 42 participants. Informants were French-speaking Belgians and showed varied socio-demographic profiles such as illustrated by Table 1.

In those two studies, informants were recruited according to theoretical sampling, which means looking for cases likely to yield rich and varied information in order to maximize theory development (Strauss and Corbin 1990). The analysis and interpretation of the interview and observation transcripts was based on thematic inductive analysis. Categories, patterns, and propositions emerged from systematically coding, memoing and diagramming the data (Miles and Huberman 1984).

EMERGING FINDINGS

Functions of groups of friends

Different functions may be related to groups of friends. Data analysis and interpretation reveal one generic function, social integration, and three specific functions: having fun ("fun and play"), sharing opinions and emotions ("sit and talk") and experiencing new things ("see and learn"). Of course, there is no boundary between those three functions which often come across together and have an important influence on decision making.

First and foremost, groups of friends play a major *socialisation and integration role*. For many informants, friends are vital and the best way to live a valuable social life. Having no friends is seen as a void such as illustrated by the following quotation:

Hugues (M, 28, mechanist): You know, my friends are really important; my life wouldn't be the same without my friends.

You see, I know some guys who have no friends so to say, you see, guys who only live for their couple, things like that, and I believe that they really miss something...

This aspiration after friends can be connected with Maslow's (1970) social needs of companionship, belonging and love. Being part of society is important for most consumers and friendship clearly helps this.

Fun and play. In many situations, the group is seen as a source of relaxation and pleasure. Having fun and playing enhance the affective nature of the relationships on which most groups of friends are grounded. Sharing similar hobbies and passions, living new and varied experiences, and feeling big thrills are leading motives. This hedonistic function is typical for younger groups of friends and is in line with the experiential nature of the leisure activities in which friends are involved (Holbrook and Hirschman 1982).

Sit and talk. The group is considered as the best place for sharing positive emotions or confessing problems and disillusion. In three older groups of friends without children, the group even acts as a surrogate family. Those highly cohesive groups with a longer "history" are characterized by a need to relive the relationship they experienced before or they would have lived within a family. The group clearly serves an affective function which tends to be authentic and disinterested, such as explained by this retired woman: "What we are looking for... That's friendship, brotherhood, exchange... As we don't have any children, we like to see other people and, if possible, people who have children and little children."

See and learn. A last emerging function is to acquire knowledge, to discover and learn new things. The group of friends fulfills a more cognitive and utilitarian role: there is a well-defined benefit in participating in group relationships and (most of the time cultural) activities. The simple pleasure of being together is not enough. This function is more relevant for adult and opportunistic (see later) groups of friends.

The previous functions are much in line with Saint Arnaud's (1974) early typology of interpersonal relationships of warmth, cooperative and heuristic relationships. The warmth relationship can be connected with the "sit and talk" function. People strike up a friendship in order to satisfy their need to love and to be loved. The cooperative relationship pertains to individuals looking in others for a specific ability/skill, which will allow them to change their environment. Group members strive to enhance their knowledge and cognitive arousal. The more flexible nature of the group of friends prevents them from being caught in a structure which is too patronizing such as their family. This is much in line with the "see and learn" function described above. Finally, groups of friends may be bonded by a heuristic relationship, which bolsters discovery and newness. In this type of relationship, individuals try to understand the deep meaning of their own experience, the experience of their selves or of their environment, which may be related to the "fun and play" function.

The process of group decision making

The process of decision making among friends is quite complex and varies a lot from one group to the other and from one situation to the other. Therefore, it is almost impossible to come to an overall scheme with isolated and structured decision-making variables. However, a few typical steps emerge from the data analysis.

Suggestion is the first typical step: someone suggests an idea or an activity and submits it to the group through a phone call or as soon as the group meets. It should be noted that all members do not need to be present at this stage. It often happens that the initial suggestion spreads all over the DMU through the grapevine: A informs B, who informs C and so on. Daydreaming and fantasies prove to be important in friend decision making, especially at the outset of projects. The first ideas often pertain to dreamt activities or ideal vacation destinations that are spontaneously elicited without considering potential inhibitors.

The second step is much more complex as it involves *discussing the initial suggestion and finding a solution* that suits most group members. Each member reacts to the proposition either by a direct agreement, by reminding of particular constraints, or by proposing amendments to the proposition. Sometimes, the decision is made very quickly whereas in other cases, a longer time elapses between the first discussion and the final decision as each member reflects on the proposition, and considers individual contingencies (such as time and money resources) before making a final decision:

Ludivine (F, 22, student): Well overall, when we decide about something, be it an evening out or skiing, it doesn't take a lot of time. Someone launches an idea and we use to discuss it during four hours; but sometimes it's hard. We speak about it and if everyone is ready for it, we meet again after... [...] Yes, then everyone thinks about it apart and gives his decision. And after that, it goes quickly. A more concrete idea has just been put on the table and we try to implement the project with those who are interested...

While groups of friends tend to be optimistic and idealistic in the first discussions and evaluations (they are still daydreaming), they become more realistic over time as the commitment to choice grows. This is in line with Mansfeld's (1994) adaptation of Rodman's (1963) value stretch model. Plans are moving from a preference or ideal level (dream) to an expectation level (reality) as the time period before the activity shortens. Sometimes, expected decision aspects are even replaced by second-rate choices (but not under a certain tolerance level) or spare solutions. The intervention of contextual factors is the major reason for this shift: contextual

facilitators (e.g., time resources) are first considered while contextual inhibitors (e.g., money) are taken into account later (Um 1990). As it will be discussed in the next section, conflicts often occur at this stage because it is seldom possible to conciliate all members' wishes and constraints (budget, timing). Finding a solution that suits most members is the critical stage of the DMP, such as illustrated by the following example:

Jacqueline (F, 49, teacher): [...] That's sometimes complicated: the dates, there are some people for whom it doesn't fit... There is also the financial issue because not everybody likes to spend a lot of money in travel. So, finally, when all those conditions are met, eh... That's ok but it's not always obvious... It's not always easy to come to an agreement.

Once decisions are made, the roles in *organizing the activity* are distributed, most of the time according to a well-established scheme. Lesser involved members use to delegate most tasks to one or more members who act on behalf of the others. Information search is not very extended in the groups of friends of this sample. It is limited to finding relevant information about alternative solutions for the suggested idea or activity. Most often, only involves the person who came up with the initial suggestion or the organizer(s).

After the activity, members *evaluate its performance*. At this point, a distinction should be made between the evaluation of the consumed product or service, on one hand, and the evaluation of the group process, on the other hand. This second dimension seems to prevail over the first one: many groups keep meeting again, sometimes on a regular basis, although they are dissatisfied with some activity choices. Again, friendship appears to be stronger than the individual satisfaction and dissatisfaction of group members.

Of course, suggestion, evaluation and organization stages often intermingle and do not always follow the same sequence. Scheidel and Cromwell (1964) already contended that group interactions do not fit a linear sequence. Very often, a member suggests an idea and the other members agree or disagree with it. They also extend or revise it in such a way that the initial idea is modified over time. When the idea reaches its ultimate state, it looks like a summary of all the agreements and amendments generated during the discussion. In conclusion, decision making in groups of friends departs from traditional models such as the EKB model (Engel, Kollat, and Blackwell 1973). Differences may be explained by two major factors: interpersonal constraints within the DMU and the affective basis of most groups of friends.

Conflict and consensus in friend parties

The members of a given friend DMU may have very different backgrounds resulting in different motives, expectations, and preferences. Moreover, group life, intimacy and promiscuity are sources of tension. In many decision situations, those personal and interpersonal constraints do not matter that much and a general *consensus* emerges quite easily after the initial suggestion. No extensive discussion is needed even though some members have to sacrifice some of their wants and wishes. Participating in the group is more important than the particular alternative that will be chosen. This may be related to altruism and "groupthink" (Janis 1983). One consistent finding about groups is that group consensus changes individuals' opinions and preferences (Moscovici 1985): "when a group is cohesive and in strong agreement about a decision, the opinions and preferences of the individuals in the group change to conform more to the preferences of the group as a whole. The members are so committed to the group that they use it as a basis for their own opinions, suspending their own critical thinking in favor

of the group's opinions [...]. And because individuals value their membership in the group and feel a strong sense of commitment, they conform quite easily" (Ellis and Fisher 1994, p. 28). So groupthink may lead to more extreme or poorer decisions because members suspend their critical faculties in favor of consensus. The group is more concerned with agreement and consensus than with the quality of the decision to make. This finding is confirmed by a lot of data chunks.

However, other decision-making situations are punctuated with conflicts, which may leave (sometimes enduring) marks on the group structure and on future decision making. From the data, a distinction can be made between two types of conflicts as whether they involve structural or organizational problems. First, *structural conflicts* are triggered by factors external to the friend party. Being part of several DMU's at the same time leads to conflictual situations. The informal structure of the group of friends may be confronted with a more formal structure, which leads to "orientation problems" (Bales and Strodtbeck 1951). Most of the time, this type of conflicts is solved by adapting the formal norms to fit the informal nature of the group of friends. For example, a group of friends once decided to participate in a scouting staff. This institutional type of group involves rigid rules (i.e., planning and organizing activities for the children, looking for places for the camps, keeping accounts for the group...) which depart from the group of friends' informal norms (having fun, sharing emotions, learning new things...). In this case, the conflict was solved by the staff members holding their preparation meetings in a bar. Structural conflicts also occur because statuses and roles may differ in the two types of groups. For example, Madeleine avoids her friends to become members of her social association because this would mean that she should command them, which could lead to conflicts. Again, this is an example of a norm or value conflict between fun, pleasure, friendliness on the one hand and rigor, order and discipline on the other hand. Value conflicts arise when the DMU members show fundamental differences in their goals resulting from different personality traits, product involvement, values, definitions and motives (Kirchler 1995).

Second, *organizational conflicts* occur when members are not happy about the way group activities take place. Following Kirchler (1995), one could speak about preference conflicts: members share the same motives and involvement in the decision domain but have different assessments about the attributes and alternatives involved in the choice. Distribution conflicts also occur when the costs and benefits are perceived to be distributed unequally across the members of the DMU. Some friends complain that they do not or are not likely to benefit from activity choices as much as other members. Those distribution conflicts may be related to equity theory in social psychology (Oliver and Swan 1989; van Raaij and Francken 1984). If unresolved, a distribution conflict may result in dissatisfaction.

Because conflicts lead to unstable situations, strategies are developed in order to solve them and to come to a final decision. Three major strategies are emerging from the data analysis and interpretation: avoidance, negotiation and vote. *Avoidance* means that group members strive to avoid any conflict in order to save friendship ties. If the suggestion does not fit some members, the project is directly abandoned or those members willingly leave the group decision process. The initial project will not be revised. Delegation (letting another person decide for oneself) is another important phenomenon related to the avoidance of conflicts. *Negotiation* is a more complex strategy, which happens more frequently in the observed groups. After the project has been submitted to the group, each member gives his/her opinions and constraints, and negotiations take place in order to try to conciliate the different

views. The objective is not to come to the best possible decision but to an acceptable solution for everyone ("one sees if it suits everyone"). The initial project sometimes undergoes significant changes as far as new suggestions are made, and constraints are acknowledged. There is a shift from an optimizing rule to a satisfying one. Each member makes some effort in order to come to a compromised solution and tries to please others while defending his/her own interests ("give and take"). In a few cases, divergent opinions and preferences cannot be reconciled through negotiation. The group then comes to *vote* to make a final decision.

The use of a particular strategy appears to be a function of factors such as the group size and cohesiveness, the involvement of the members in the decision process, the constraints that need to be considered, or the expected consequences of the decision. However, nine of the interviewed groups use to negotiate when making decisions.

Role distribution

The distribution of roles within the DMU is an important aspect of group decision making. All classical roles involved in group decision making (i.e., initiator, influencer, decider, buyer and user) can be found in friends' DMU's. However, in most cases, the distribution of roles is limited to a dichotomy: the organizer and the participants. One person, the organizer, combines the roles of initiator, decider, buyer and practical organizer while the other members of the group satisfy themselves with participating:

Marcel (M, 65, retired): No, everything goes very well, suggestions are made which are appreciated or not [by the group members]. But it's very good to get comments because often, there are things we haven't thought about... Pay attention that not everybody decides; only those who have responsibilities or are more interested take actually part. There are never really big conflicts, I would say. Yes, because everybody knows what he must do, we know how it works. People who are more involved care for everything and the others are happy with this...

Again, for most members, choosing the activity is not as important as being together. Usually the organizer is the member who is the most involved in the decision domain (e.g., someone who is fond on travel) and/or in sustaining friendship ties. S/he is also called the "driving force" of the decisions by the informants themselves. In contrast with families, there is no traditional role distribution due to generational or gender differences. The organizer could be paralleled with a kind of leader of the group. However, leadership is not connected with dictatorship as the member who is considered as the leader does not make all decisions alone and often denies his/her leading status in order to respect group norms. S/he bolsters the whole DMP and avoids the group breaking up. This is not far from Ellis and Fisher's (1994) identification of four functions related to the leader of a group: advancing the purpose of the group, inspiring greater activity among members, administrating procedural matters, and building group cohesiveness. The leader is not a person who imposes his/her opinions and preferences on the group but someone who acts as a mediator or a gatekeeper in order to make sure that plans become concrete (that dreams become reality) and that the solution suits everyone, as illustrated by the following quote:

Hugues (M, 28, mechanist): Well, there is never someone who imposes his decision because it must suit everybody. You see, we discuss in such a way that we are sure that it fits everybody,

that it pleases everybody, otherwise it doesn't work. I mean, if there were someone in the band saying: "tonight, we do that, that way" and all that, we would laugh at him because, well, your friend party, that's not a question of dictatorship but of pleasing everybody. There are some concessions from everybody. Yes, concessions, or people who trust the opinion of two or three members of the group and who agree in doing whatever we do. But you never have a guy who manages the group, oh no...

EMERGING TYPOLOGY OF GROUPS OF FRIENDS AS DMU'S

To summarize this paper, a empirical distinction between three types of structures is proposed: the surrogate family, the experiential band and the opportunistic group. *The surrogate family* is the most conventional group type because it is characterized by a set of norms and habits firmly anchored in the group, which both help defining the group itself and its friendship ties, and influence the DMP. Those norms give a structure to the group's life and an orientation to the group's decisions. This type of group involving older consumers proves to be more formal and more stable. Cohesiveness is high as members do know each other very well, the role(s) they have to play and the way the group works. Rituals are developed to enter the group: one has to prove others that one is deserving friendship and worth incorporating the group ("groupworthy"). In one group, the term "little trainee" is even used to qualify a new member who "has to prove himself" before becoming a full member, as if there were a trial period.

The experiential band is a more circumstantial type of group, where norms and rules are changing according to circumstances and situations (e.g., the decision domain at hand or the members who are involved in the decision process). Being together to have fun and living strong experiences is the prevailing drive of that type of groups. As a consequence, decision roles and strategies may vary whereas there is no compromise about the basic norms related to friendship. Friendship ties are strong and the socio-affective relationship is of paramount importance, even though, as contrasted with traditional groups, they are not enough to give the group a stable structure. This is the most frequent type of groups in this study.

In contrast with the two first types, there is no fixed set of roles and norms in the *opportunistic group*, which makes this third type a more precarious and less stable type of group. Sometimes members even find it hard to justify the roots of the group's ties. Although friendship lies at the core of the group, friends play a second role in comparison with the partner or the family, or with the decisions and the activity to make. Therefore, group cohesiveness is weaker: togetherness is limited to people gathering at one place in space and time because of a common interest. The group serves a more utilitarian than affective function. As a result, activity choices may prevail over being together, which is in contrast with the two previous group types.

CONCLUSION: GROUPS OF FRIENDS, A SPECIAL CASE

It has already been stressed that groups of friends are usual DMU's for particular products and services such as leisure activities. Groups of friends are typical because they are based on informal friendship ties, which are less stringent than love and blood ties. Moreover, any member of a group of friends is simultaneously involved in other DMU types. As a result, group decision making in the friend parties of this sample dramatically differs from group decision making in their families. First, most decisions

involve all members of the friend party and not a subgroup of it; these are syncretic or joint (as opposed to autonomic) decisions. Second, communication tends to be less extensive. The observed groups of friends do not gather on such a regular basis as their family does, which makes decision making (i.e., sharing ideas, information, making plans) not so "easy." Decision timing and the predictability of choices are affected as well. Moreover, personal and situational factors may strongly vary within the DMU, making it very troublesome to find compromising solutions. Problems of conflicting time schedules, budgets or interests may lead to very late decisions and to the emergence of a leader who takes the bull by the horns and triggers major decisions. This does not imply that the other members are not consulted before final decisions are reached, but in the end, the leader makes choices on behalf of the group. In contrast with family DMU's, unilateral decision making does not result in frustration and angry moods for two major reasons. First, friends are just willing to sacrifice all their wishes for letting someone else organize things and do all the work for them (i.e., they delegate the organization). Second, individual preferences are upset as for most informants belonging to the group is the major objective. The content of the activity (e.g., vacation) is far less relevant:

Patrick (M, 45, attorney): Well every year, it is a group boss who decides: "I would like to take you there, does that interest you?" In general, we say yes even though it is a place where we did not think of going. I would even say, it's, it's because we would not go individually that we accept to go in group because the work is done, thus that's it. For example, I would not willingly go to Scotland even though all the good things they say about it... well about the weather etc. ...about the sights.

Michèle (F, 43, employee): It is actually due to the weather [laugh].

Patrick: But since the group is going to Scotland, it is the opportunity to go to Scotland, well there you go.

This finding indicates that it is not wise to predict choice on the basis of individual preferences as far as groups of friends are concerned. "Groupthink" (Janis 1983) may lead members to revise their individual preferences in order to keep friendship ties alive.

Decision making in groups of friends is far from being effective in the sense that the group fulfills tasks in order to achieve well-defined objectives. Decision making often lasts long and timing is difficult. Moreover, a lot of plans are abandoned or postponed due to a lack of involvement or resources (time, money or material conditions). Many collective fantasies come across: members dream of plans but when they have to act, they suddenly become aware of several constraints which lead them to leave or change plans. However it should be reminded that achieving some specific goal is not the only group objective. An equally (and sometimes even more) important objective is to maintain or strengthen the group itself. Cartwright and Zander (1968) give a few examples of the functions related to group maintenance: keeping interpersonal relations pleasant, arbitrating disputes, providing encouragement, giving the minority a chance to be heard, stimulating self-direction or increasing the interdependence among members. Groups of friends first strive to preserve the affective ties between members. The paramount objective is to meet again and to spend a nice time together whatever the decisions taken. This perspective explains why the DMP's, distribution of roles and decision strategies are simplified. There is a major difference between formal and informal groups: a formal structure such as a family needs efficiency and

productivity (optimal decisions) to justify its existence whereas in an informal structure such as a friend party, group cohesiveness prevails and satisfying decisions are enough.

This research has explored the way groups of friends make decisions together. Friends prove to be major players in a broad range of decisions. In a lot of cases, friends act as a reference group which may help triggering a DMP, such as illustrated by this young woman: "I did not plan to go, but after talking to my friends, they told me 'listen, make an effort, ask your parents for some money, do something, leave a few days.'" But sometimes friends serve more than information and social comparison purposes; they act as a DMU in itself, which has been neglected by the literature so far. Of course, this research has just scratched the surface of a fascinating iceberg. This exploratory study of decision making within groups of friends calls for other studies. More particular decision-making aspects should be investigated, such as decision strategies, influence tactics, the distribution of roles,... In addition, it would be worthwhile to look into the interconnectedness of different decision levels, including personal and interpersonal factors, individual and group preferences/decisions,... (Ariely and Levav 2000).

From a managerial point of view, a good understanding of decision making by groups of friends is of the utmost importance. Indeed, a good knowledge of who does what in the group and of how the group evolves toward a decision is helpful for marketing strategy and especially for positioning and communicating products that specifically target parties of friends.

SPECIAL SESSION SUMMARY

Bliss is Ignorance? Emotion, Evaluation, and the Feeling Brain

Stacy Wood, University of South Carolina

SESSION OVERVIEW:

“Given the ubiquity of feelings, one would have thought that their science would have been elucidated long ago—what feelings are, how they work, what they mean—but that is hardly the case. Of all the mental phenomena we can describe, feelings and their essential ingredients—pain and pleasure—are the least understood in biological and specifically neurobiological terms.” (p.3)

Antonio Damasio

Looking for Spinoza: Joy, Sorrow, and the Feeling Brain

Consumer behavior is not the only field to experience a recent and fast-growing interest in the nature and influence of emotions. For decades, neuroscience regarded emotions and feelings as intangibles beyond the range of empirical investigation. Neuroscientists might study the sensory processes of vision or the cognitive patterns of memory, but emotions remained elusive. However, as new research explicates the role of emotions as biologically-driven survival and advancement mechanisms, the fields of neurobiology and consumer behavior intersect in the following questions: How does emotion impact choice? And, more importantly, is the impact of emotion beneficial or detrimental to the choices made?

“Emotions provide a natural means for the brain and mind to evaluate the environment within and around the organism, and respond accordingly and adaptively. Indeed, in many circumstances, we actually evaluate consciously the objects that cause emotions, in the proper sense of the term “evaluate.” We process not only the presence of an object but its relation to others and its connection to the past. In those circumstances the apparatus of emotions naturally evaluates, and the apparatus of the conscious mind thinkingly coevaluates.” (Damasio, p. 54)

This idea of the adaptive integration of hot and cold processing is not reflective of historical consumption views. As Bakamitsos and Lee note in their paper, “happy processors” have been labeled as mindless, distracted, or operating under reduced resources. Consumers’ naïve theories of choice frequently resonate with the “mindless” categorization; one often hears individuals state that they struggle to “make logical, not emotional choices,” make optimal choices by ignoring “short term feelings,” and that poor choices were made “in the heat of the moment.” Bakamitsos and Lee offer here evidence that counters this assumption of positive affect’s negative consequences. They show that observed persuasion phenomena—previously taken to be evidence of mindless processing—is instead indicative of increased mindful processing.

“Among these emotions/feelings, I accord special importance to those that are associated with the future outcome of actions, because they come to signal a prediction of the future, an anticipation of the consequences of actions. This is a good example, incidentally, of how nature’s juxtapositions generate complexity, of how putting together the right parts produces more than their sum. Emotions and feelings have no crystal ball to see the future. Deployed in the right context, however, they become harbingers of what may be good or bad in the near or distant future.” (Damasio, p. 147)

If we assume, then, that emotion is inextricably intertwined with evaluative processes and, given new evidence, that the influence of emotions is not necessarily negative, we must still address the perception of emotion over time, speaking specifically of prediction and recall. Emotions are dynamic and, as Wood and Bettman note here, especially prone to temporal biases of perception. One robust bias (with wide-ranging consumption implications) is *durability bias*, the tendency to overestimate the duration of emotions experienced in conjunction with future events. As adaptive processors, it is curious that human experience does not debunk the myth of extended emotional duration. In their paper, Wood and Bettman offer an explanation based on norm-congruent recall of emotion—an explanation that fits with current neurobiological studies of emotions and social behavior. Sexual arousal is an affective state commonly used to describe the primary “pleasure versus pain” basis of positive and negative emotion, yet it also clearly has learned social and normative components. In their paper, Ariely and Loewenstein address the interplay of biological and learned feeling head-on. They examine the influence of high and low arousal on prediction of future preferences and choices (which are likely, one assumes, to be enacted in a state of high arousal). Their findings suggest that preferences may be state-dependent, therefore resulting in mispredictions of future actions.

In conclusion, we must note that the question, “Do emotions lead to better decisions?” is not simply answered. Emotions may increase certain kinds of information processing and may provide important information about physical states, desires, and preferences. However emotions themselves are difficult to predict, perhaps because they are difficult to recall. Is this a bad thing? If emotion-seeking is a powerful motivator, perhaps it is good that we overestimate our happiness at successes and our sadness at failures. (Dissertations might never be finished if we didn’t overestimate our anticipated joy at seeing our advisors sign off.) In the final analysis, we must consider both the strengths and weaknesses of our feeling brain.

“Predicting Happiness: Social Norms and the Durability of Durability Bias”

Stacy L. Wood, University of South Carolina

James R. Bettman, Duke University

Affective forecasts guide many consumption decisions, large and small (Baron, 1992; Kahneman & Snell, 1990). In a broad sense, people strive to achieve those objects and events that they think will make them happy. However, people are poor affective forecasters; they frequently overestimate how long they will feel good after a future positive event (e.g., winning the lottery, getting tenure). This phenomenon, called durability bias, has been well-established in extant social psychology research (Wilson, Gilbert, & Centerbar, 2003). Our current research investigates the role of social norms in affective forecasts. Consideration of the influence of social norms provides insight into why individuals do not learn—as they grow in life experiences—that emotions rarely last as long as expected and thus do not alter their subsequent predictions of emotional longevity accordingly. The idea of culturally-mandated expectations of emotion is not new. Hochschild (1983) refers to these expectations as *feeling rules*, defining them as social norms that prescribe how a person should feel in the event of a specific occurrence. Social norms may also influence the overt demonstra-

tion of the expected emotion. Cultures not only influence norms for experiencing emotions (Eid & Diener, 2001), but also norms for expressing them (Frijda & Mesquita, 1995). If an individual is motivated to convey to a social audience that he or she is feeling a certain emotion, then the individual will be likely to engage in emotion-consistent behaviors (Schlenker, 1992).

Thus, prediction and, more importantly, recall of emotion duration may be tied to expected or enacted behaviors appropriate to the event. Wilson et al. (2001) suggest that another reason for people's failure to learn about the short-lived nature of emotional reactions is that they forget that their reaction was shorter than expected after an event. Why might people forget? The intensity of emotions is often difficult to recall with a high degree of accuracy. Retrospective accounts of emotion are particularly prone to bias (Dube & Morgan, 1996; Hsee & Abelson, 1991). If direct emotional judgments are relatively inaccessible in memory, people may rely on memories of behavior if they are relatively more accessible and diagnostic (Lynch, Marmorstein, & Weigold, 1988). That is, in order to judge the emotional impact of a past event, one may rely on memory for behaviors ensuing from the event (e.g., I must have been miserable, I didn't go to work for a week). In addition, if recall of behaviors is encouraged prior to making a retrospective judgment of experienced emotion, the judgment should be more norm-congruent than if recall of behaviors follows making the retrospective judgment (because we expect behaviors to be more salient and easily recalled than the individual's feelings).

Two studies were conducted to test the influence of norms on durability bias using participants involved in a real consumption experience. In Study 1, participants were university students attending the university's home football games who participated at three points in time over the course of an eight week period. We sought a natural environment in which opposing norms might be simultaneously tested. We manipulated social norms for the "true fan" advocating high excitement or low excitement. Each of these two norms was communicated to a subset of the participants; in addition, there was a control group to whom no norm was communicated. Predicted feelings about the outcome of the game and the duration of those feelings, actual feelings and their duration, and retrospectively recalled feelings and their duration were measured. As hypothesized, norms for high celebration led to a longer predicted duration and longer recalled duration than norms for low celebration, but there were no differences in actual duration. In Study 2, participants were university students (at a different university) participating in a camp-out for the chance to get season basketball tickets. The university's basketball team has been historically dominant, however, the current year's team was not expected to be as successful as the previous seasons. Some participants were exposed to a normative statement about a "true fan" always being "really excited" about season tickets even for a "non-championship" year and some participants were exposed to a counter statement that a "true fan" would only be "really excited" about season tickets in a championship year. Further, there was a control condition in which no normative statement was included. Further, when later asked to recall feelings about getting tickets, half the participants were asked to recall their behaviors before recalling emotion duration and half were asked to recall their behaviors after recalling duration. Again as predicted, the average duration prediction was longer in the "be excited" norm. There was also a significant interaction in recalled duration judgments between the norm and behavior-listing conditions ($F(1,17)=30.68$, $p<.001$, one-tailed) in which recalling behaviors first led those participants who thought they should be excited to recall longer (more norm-congruent) durations.

Taken together, the results suggest that people continue to mispredict how happy future positive events will make them because of errors in recalling past happiness and that these recall errors are influenced by recall of norm-congruent behaviors.

"Are Happy People Mindless or Mindful Processors of Information?"

Yiorgos A. Bakamitsos, Dartmouth College

Angela Y. Lee, Northwestern University

One of the claims that had a significant influence in the domain of affect research is that people in a positive mood tend to process information in a superficial, heuristic manner rather than systematically. The origin for this claim seems to stem from research on the effects of affect on memory. According to research findings previously reported, positive mood activates other positive materials in memory. Such activation of materials is thought to consume cognitive resources and thus pose a capacity constraint on the individual's ability to process information. In an attempt to shed light on the effect of affective states on information processing, Mackie and Worth presented findings to support the claim that positive mood tends to decrease systematic processing of information and increase reliance on peripheral cues in decision making, and proposed a resource allocation explanation to account for these findings (Bless, Mackie and Schwarz 1992; Mackie and Worth 1989).

Although these findings seem to provide evidence that positive mood impairs individuals' ability to allocate cognitive resources, they fail to account for other findings reported in the literature that do not support the notion of "happy but absent-minded people". For example, it has been demonstrated that individuals in a positive mood are able to outperform those in a neutral mood in creativity tasks (Isen, Daubman and Nowicki 1987), categorization, and free recall (Lee and Sternthal 1999), suggesting that positive mood leads to enhanced relational processing. Furthermore, findings reported by Bless et al. (1996) provide evidence that contradicts the capacity deficit claim. Specifically, Bless and his colleagues asked research participants who were in either a happy, neutral or sad mood to read two stories that were familiar to them, and at the same time perform a secondary task that was a standardized test for measuring concentration. Their findings indicate that respondents in a positive mood were more likely to rely on schematic information in a recognition task to identify whether items presented to them were part of the stories they heard earlier; however, they also outperformed participants in the other mood states in the secondary task. If positive mood were to impair resource allocation and thus result in greater use of scripts, it should also negatively impact on respondents' ability to perform the secondary task. The authors suggest that, by relying on the use of scripts, respondents in a positive mood might have been able to free-up cognitive resources, which they allocated to the benefit of the secondary task.

Based on these findings one may argue that positive mood does not impair individuals' cognitive capacity, rather, it seems to enhance relational processing and prompts strategic allocation of cognitive resources. Thus, one plausible explanation for positive mood participants not discriminating between strong versus weak arguments may be the result of their being persuaded by arguments that they generate rather than by arguments provided. That is, if people in a positive mood are more likely to engage in relational elaboration, they would be generating more thoughts that in turn affect their attitude. If this is true, then the judgment rendered by positive mood respondents may not reflect simply the outcome of the evaluation of information provided to them by the experimenters, but also arguments that they generated. The notion that positive

mood participants may be accessing and using additional information that they generate runs afoul of the theorizing that positive mood reduces the amount of cognitive resources that people have available in rendering judgments, thus resulting in heuristic processing.

The objective of the present research is to determine if those in a positive mood may be persuaded by their own arguments. The results of Study 1 provide support for the notion that happy people may be supplementing the weak arguments by their own thoughts. In particular, while all participants generated more additional support arguments in the weak vs. strong argument strength condition, those in positive mood generated more support arguments than their neutral mood counterparts. Study 2 is currently underway to further test the hypothesis that happy people may be persuaded by arguments that they generate rather than rely on reasons provided in the message, hence their judgment may not reflect the strength of the arguments in the message.

“The Heat of the Moment: The Effect of Sexual Arousal on Sexual Decision Making”

Dan Ariely, *Massachusetts Institute of Technology*
George Loewenstein, *Carnegie Mellon University*

The sex drive is a vitally important motivational force in human behavior, both from the perspective of the individual and society. Yet there has been surprisingly little research examining the effect of activation of the sex drive on judgment and decision making. In this paper we examine the effect of high levels of sexual arousal in young male adults on two aspects of judgment and choice: (1) what types of stimuli and activities are regarded as sexually attractive, and (2) the measures one is willing to take, and risks one is willing to incur, to obtain sexual gratification.

During the experiment subjects were given a laptop computer, and were asked to answer a series of questions. The notebook computer was controlled by a small handheld keypad with a number of color-coded keys. The keypad and the program that administered the questions were designed so they could be operated easily with the non-dominant hand. In the control treatment, subjects answered these questions while in their natural state. In the arousal treatment, subjects were first asked to self-stimulate themselves (masturbate), and once they achieved a high level of arousal, they were presented with the same questions as the subjects in the control treatment.

The questions asked by the computer included two modules that were designed to address the two issues mentioned earlier (attractiveness of different stimuli / activities and willingness to take risk to obtain sexual gratification). The set of questions that asked subjects to evaluate the attractiveness of different stimuli and activities included questions about the attractiveness of: women's shoes, a 12-year-old girl, an animal, a 40, 50 and 60 year old woman, a man, an extremely fat person, someone you hated, a threesome including a man, a woman who was sweating, cigarette smoke, getting tied up by your sexual partner, tying up your sexual partner, a woman urinating, getting spanked by a woman, spanking a woman, anal sex, contacts with animals, having sex with the lights on, and reactions to “just” kissing. The set of questions that asked subjects to assess their own willingness to take measures to have sex included questions about the likelihood of their: encouraging a date to drink, slipping her a drug, taking her to a fancy restaurant, telling her you loved her, and trying to have sex even when the date says “no.” Other items elicited the respondent's self-reported likelihood of using birth control and of the likelihood of negative consequences if one failed to do so.

The results showed that under high arousal individuals found a variety of sexual related activities to be more attractive (aside

from “just kissing” which was rated as more frustrating and less fun). Overall we asked respondents to react to 21 questions. All 21 questions were in the expected direction but not all of them were individually statistically significant. Of these questions, 17 questions were statistically significant, 2 questions (would you participate in a threesome and is the smell of cigarette smoke arousing) were marginally significant, and 2 questions (would it be fun to watch an attractive woman urinating and do you prefer to have sex with the light on?) were not significant. A one-sample sign test for these differences revealed a highly significant effect ($p < 0.001$), indicating that overall arousal fundamentally changes predicted enjoyment and liking for different sexual related activities. Arousal also had a strong influence on the reported probability to engage in a set of behaviors that are not morally desirable but can increase the likelihood of sexual encounter. In this set of questions all five individual questions were statistically significant. Finally, the results for the questions regarding the tendency to use and not to use birth control are not as clear-cut as in the other cases. At least for some questions there were no differences between the aroused and non-aroused subjects. These questions included their understanding of the method of pulling out before ejaculating, their understanding that even a friend can transmit STDs, trusting someone they have just met, and allocating the responsibility for both controls to women. It is clear that sexual education has had an impact even at a state of arousal. Yet, when answering the four questions about condoms, the aroused and non-aroused subjects answered very differently. For all four condom related questions, subjects in the aroused condition indicated a lower likelihood to use condom compared with subjects in the non-aroused condition.

In summary these results provide additional evidence that decisions about preferences, health, safety and morality are largely influenced by the emotional state of the consumer, and moreover that when they are not in this state consumers cannot predict their own preferences and attitudes.

See How 'Good' We Are: The Dangers of Using Corporate Social Activities in Communication Campaigns

Valérie Swaen, Catholic University of Louvain (FNRS) and IESEG School of Management
Joëlle Vanhamme, Erasmus University Rotterdam-ERIM, LABACC

EXTENDED ABSTRACT

Corporate Social Responsibility (CSR) has become an increasingly popular concept. More companies than ever engage in CSR activities (e.g., socially responsible employment, see Drumwright, 1994). Recent research in marketing, however, shows that communicating about CSR activities does not necessarily result in positive effects for companies (Sen and Bhattacharya, 2001). In addition, many studies clearly report that perceived socially irresponsible corporate activities lead to negative perceptions of the company and its products (e.g., Brown and Dacin, 1997). Lastly, it seems that companies that are doing the most in the area of CSR are also the ones that are criticized the most whereas the ones that are not doing anything are the least criticized (*SEE Newsletter*, 2001). As a result companies—promoting themselves as socially responsible—need to know how detrimental to their business accusations of irresponsible behaviors will be.

Hypotheses

Communicating about CSR activities is likely to create higher expectations with regard to the company's social involvement. It was therefore hypothesized that customers—learning that the company has committed socially irresponsible acts—would experience a strong 'negative surprise' (i.e., surprise followed by negative emotions) and, as a result, would react even more negatively than if the company had not promoted itself as a socially responsible company (see Vanhamme and Snelders 2003). More precisely—after accusations of irresponsible acts—deterioration with respect to the perceptions of the company and its products, trust in the company and purchase intentions were hypothesized to be larger for companies promoting themselves as socially responsible than for companies not using this element in their communication campaigns (H1). It was also hypothesized that surprise would have a direct and indirect influence (via its amplification of negative affective reactions) on these 'deterioration' variables (H2).

Methodology

The hypotheses were tested via a 2 (pre/post measure vs. post measure only) by 2 (CSR vs. NO CSR) design. Two out of the four conditions involved a measure of dependent variables (i.e., company and product perceptions, purchase intentions, and trust in the company) *before and after* respondents read a newspaper article accusing the company of committing irresponsible acts. In one of the two conditions, respondents read—before the newspaper article—a company's public relations (PR) press release mentioning several CSR activities whereas no information about CSR activities was mentioned in the other condition. The last two conditions replicated the first two conditions but measures of the dependent variables were only collected *once; after* the negative information about the company's irresponsible acts (i.e., newspaper article). 244 respondents were randomly assigned to the four conditions.

Results

The analysis of the results showed that the respondents who read the PR press release with CSR elements had a more positive perception of the company and a higher score for credibility and integrity (i.e., trust) than the respondents who read the PR press release without CSR elements.

Moreover—after the respondents read the newspaper article with the negative CSR-related information—scores for the perceptions of the company and its products, purchase intentions, credibility and integrity were significantly lower in all four conditions.

In addition—after the negative CSR-related information—no significant difference was found with respect to the perceptions of the company and its products, purchase intentions, and credibility scores between respondents who read the description with CSR elements and those who read the description without CSR elements. Integrity, however, was significantly lower for the former group of respondents.

Lastly, as expected, the *deteriorations* (difference between the pre-measure and the post-measure) with respect to 'company perception', and 'integrity' were larger for respondents who received the PR press release with CSR elements.

Results for the mediation analysis further showed that fear and disgust partially mediated the influence of surprise on the deterioration of the company and product perceptions; anger, disgust and fear partially mediated the influence of surprise on the deterioration of purchase intentions; and anger and fear partially mediated the influence of surprise on the deterioration of integrity. Moreover, the direct influence of surprise on the deterioration of the company perception, purchase intentions and integrity seemed to be systematically stronger for the respondents who received the PR press release with CSR elements than the others.

Conclusions

The results of our study show that companies promoting themselves as socially responsible are perceived more positively and trusted (integrity and credibility) more. However, it also highlights that the more positive perception and increased trust disappear if the company is accused of behaving non socially. For trust, the result even show that—after customers have been exposed to the negative information—they seem to trust (integrity dimension) companies promoting themselves as socially responsible even less than companies not using CSR elements in their communication campaigns.

The present research also emphasizes that surprise seems to play a role with respect to the factors underlying the stronger deterioration encountered for companies promoting themselves as socially responsible. However, these stronger deteriorations could alternatively be explained by a contrast effect (Sherif and Hovland, 1961): when a company overtly promotes itself as socially responsible, it creates a more positive context than when it does not mention its CSR activities. As a result, negative information about the company's alleged irresponsible acts comes across as more discrepant with the context in the former case and may thus result in more negative judgments (contrast effect) than in the latter case.

It is worth noting that our results are subject to some limitations. Besides the limitations related to the scenario method, other limitations are the type and number of CSR elements used in the press release and journal article. Furthermore, this study only considered high quality products and a fictitious company. Eventually, the type of sources may also limit the external validity of our results (sources that are perceived as more objective might lead to a different pattern of results). Lastly respondents' reactions and perceptions were measured just before and then right after the

accusation of irresponsible acts. A real longitudinal study could better highlight how consumers' reactions evolve as time goes on.

Customers or Sellers? The Role of Persuasion Knowledge in Customer Referral

Peeter W. J. Verlegh, Erasmus University Rotterdam
Céline Verkerk, Erasmus University Rotterdam
Mirjam A. Tuk, Erasmus University Rotterdam
Ale Smidts, Erasmus University Rotterdam

EXTENDED ABSTRACT

Word of mouth and customer referral have become veritable buzzwords in the world of business, as illustrated by popular management books on these topics (e.g., Godin 2000, Rosen 2000, Silverman 2001). "Word of mouth promotion has become an increasingly potent force, capable of catapulting products from obscurity into runaway commercial success" (Dye, 2000, p.139). Increasingly, marketers attempt to stimulate and accelerate word of mouth, a practice known as buzz marketing (Rosen, 2000). Academics have long recognized the importance of word of mouth (e.g., Katz and Lazarsfeld, 1955, Dichter, 1966, Herr, Kardes & Kim, 1991, Duhan et al., 1997, Gilly et al, 1998), and several recent papers address the issue of referral management (Buttle 1998, Biyalogorsky, Gerstner and Libai 2001). There is, however, little research into the effectiveness of referral management strategies at the consumer level (see Verlegh, Peters and Pruyn, 2003 for an exception).

The present study attempts to fill this gap, investigating whether marketers' use of financial incentives to stimulate customer referral triggers a "change of meaning", so that consumers perceive the referral as a persuasion attempt in stead of friendly peer-to-peer advice (cf., Friestad and Wright 1994). This change of meaning is likely to diminish the impact of the word of mouth. Whether or not this change of meaning occurs, depends on various factors. Campbell and Kirmani (2000) propose that consumers use of persuasion knowledge is determined by the accessibility of ulterior motives, such as the motive to persuade or make a profit. Accessibility of ulterior motives increases when consumers are faced with a situation, person or tactic that is strongly associated with persuasion. In the present study, we examine accessibility of ulterior motives as a function of the source and content of word-of-mouth. We extend earlier work by looking at the impact of "buzz marketing" tactics which are used to stimulate referral.

We conducted two experiments. The first investigated how the accessibility of ulterior motives is affected by the source and content of word-of-mouth. We hypothesize that accessibility of ulterior motives is higher for salespersons than for friends, and that consumers' evaluations of the source become less favorable when ulterior motives are inferred (cf., Campbell and Kirmani, 2000). We also examine whether ulterior motives are more accessible when the persuader's behavior is congruent with the persuader's self-interest (i.e., maximizing profit) rather than the consumer's interests (cf., Vonk 1998).

For experiment one, 106 student participants filled out a questionnaire containing a brief scenario about the purchase of a second hand car, in which they were advised by a second person. Source and content of the advice were constructed according to 3 x 2 design. Source was manipulated at three levels, i.e., non-commercial (knowledgeable friend), commercial (salesperson at the car store), and ambiguous (friend with a weekend-job at this store). The source recommended either the least or the most expensive alternative. Participants listed the thoughts evoked by the scenario, and rated the source's likeability and the extent to which the source was perceived to act out of self-interest on multi-item scales.

We found that perceived self-interest varied between sources. The commercial source (salesperson) was rated highest on self-

interest, and the non-commercial source (friend) was rated lowest. The commercial source also evoked the largest proportion of thoughts related to self-interest, and rated lowest on likeability. We found a significant interaction between source and advice for source likeability and for self-interest: for commercial and ambiguous sources, we find that perceptions of self-interest are highest when they advise to buy the most expensive car. As expected, the results for liking display a reversed pattern. It is noteworthy that the effects are largest for the ambiguous source. Apparently, consumers rely more heavily on the perceived behavior when their perceptions of the source are ambiguous. Perceptions of the noncommercial source (friend) are not affected by the nature of his advice.

Marketers often use financial or other incentives to stimulate word of mouth (cf., Godin 2000). In experiment two, we examine how this affects the accessibility of ulterior motives. We examine source evaluations and perceived ulterior motives for noncommercial sources that have strong and weak ties with a consumer. We expect that strong tie sources are perceived as more sincere, and less driven by ulterior motives. In experiment two, 243 consumers filled out a questionnaire containing a brief scenario about word of mouth on providers of mobile telephone services. The sample was composed of friends and families of student assistants, and consisted of 49 % females, with ages varying between 18 and 67 (median=30). A 3 x 2 design was used to construct the scenarios: Three levels of accessibility of ulterior motives were created by altering the behavior of the referring consumer. Tie strength was varied at two levels (friend vs. stranger). We collected valenced thought listings, and measures of trial intent for the provider, perceived sincerity of the source, and the extent to which the source was perceived to have ulterior motives.

We find significant effects of tie strength and accessibility of ulterior motives. The perceived strength of source's ulterior motives decreases with social tie strength, and increases with the accessibility of ulterior motives. Inversely, perceived sincerity of the source increases with tie strength, and decreases with the accessibility of ulterior motives. We also find an interaction of tie strength and accessibility of ulterior motives: an increase in tie strength reduces the impact of accessibility of ulterior motives on consumers' perceptions of the source and their responses to the referral.

Experiment one showed that the accessibility of ulterior motives is affected jointly by the source and content of referral. Experiment two showed that increased accessibility of ulterior motives decreases the impact of word-of-mouth recommendations, and has a negative impact on the perceived sincerity of the recommending peer. These effects are moderated by the strength of the social ties between source and receiver of word of mouth. These experiments illustrate the importance of persuasion knowledge in word-of-mouth, but more research is needed to better understand cognitive and affective processes involved (cf., Hamilton 2003).

Who Are You and Why Are You Being Nice?: Investigating the Industry Effect on Consumer Reaction to Corporate Societal Marketing Efforts

Lisa R. Szykman, College of William and Mary

ABSTRACT

Corporations are turning to all forms of corporate societal marketing programs to help build, and in some cases, repair their brand images. Past research suggests that the cause-related marketing programs have both potential dangers and rewards for the firms. This paper investigates how consumers evaluate different types of cause-related marketing efforts in five different industries. The results suggest that the harmful nature of the firm's products and production methods may influence the consumers' evaluation of their cause-related marketing efforts.

Corporate Societal Marketing (CSM) programs¹ are becoming extremely popular because corporate leaders believe that it is good business to be viewed as a socially responsible company (Business in the Community 2001). For the most part, these leaders are correct. A 2001 Cone/Roper report found that 80% of Americans believe that companies have an obligation to support good causes, and 81% said that, when price and quality are equal, they would switch brands to support a cause (Oldenburg 2001). However, past research suggests that, while CSM may be effective in improving brand equity and increasing market share, there are limits to the effectiveness of these initiatives. First, supporting the Cone/Roper findings, researchers found that consumers are not willing to forgo better quality products or lower prices in order to support a cause (Barone, Miyazaki, and Taylor 2000; Sen and Bhattacharya 2001; Brown and Dacin 1997). For example, Sen and Bhattacharya (2001) found that corporate social initiatives adversely affected purchase intentions if consumers perceived that the company would forgo product quality in order to be socially responsible. Secondly, Strahilevitz and Olsen (1998) showed that donations to charity are more effective in influencing the purchase decisions for frivolous rather than practical products. Thirdly, Webb and Mohr (1998) showed that consumers can be skeptical of corporate cause-related marketing efforts, which can have a negative impact on the corporation and its brands. Finally, Pracejus and Olsen (2004) found that the "fit" between the cause and the corporation was important. In their studies, they found that consumers were willing to pay more for products/services that were tied to causes that were somehow related to each other versus products/services that were tied to unrelated causes. However, despite this willingness to pay more, there was no impact on short-term sales.

While researchers agree that choosing the "right" cause is important to a successful corporate-cause partnership, we know little in terms of what constitutes a good fit. Hoeffler and Keller (2002) suggest that causes that are relevant to the consumers and similar to the corporation would be better at building brand equity. However, researchers have not fully addressed the issue of what makes a good fit for different types of firms. The purpose of this paper is to further the investigation of corporate-cause "fit" by investigating how perceptions of an industry influence the evaluation of four different types of CSM campaigns. Results from a preliminary study suggest that industry effects do exist in consum-

ers' evaluations of corporate societal initiatives and should be considered in future research.

The Role of Motives

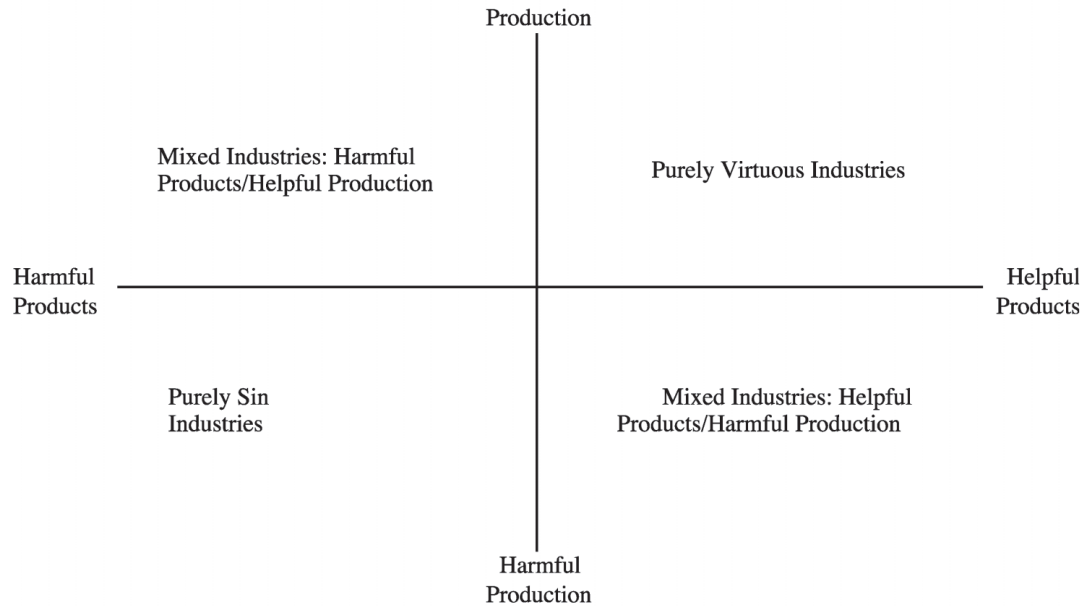

In general, studies have shown that consumers are skeptical of corporations, and will make inferences about the benefits a firm hopes to gain from their marketing efforts (Kirmani and Wright, 1989; Kirmani, 1990; Campbell and Kirmani, 2000). Essentially, past research suggests that corporate actions more obviously tied to profits would trigger consumers' persuasion knowledge, leading them to discount/discredit the action. For example, when a firm runs an ad, consumers would immediately recognize it as an attempt to sell a product and would utilize their existing persuasion knowledge to process the ad accordingly.

In the case of CSM campaigns, we can expect consumers to also infer motives. However, depending on the nature of the CSM program, the intent of the corporation may not be as obvious to the consumer. This is particularly true if the benefits to the corporation are not apparent or conflicts with what the consumer already believes about a specific firm or industry. This may be particularly true for a CSM effort that would hurt a company's profits if it were successful. In these situations, consumers may become suspicious of the underlying motives of the corporation. This suspicion would trigger an attribution process where the consumer attempts to uncover the underlying ulterior motive of the firm that would make sense to them. Since firms exist to make a profit, consumers may spend considerable energy in an attempt to infer motives related to the profit-oriented goals. While these attributions do not necessarily have to be distrustful in nature, they do typically result in a less favorable evaluation of the firm (Fein et al., 1990; Vonk, 1998, 1999). For instance, consumers may be suspicious of a tobacco company that undertakes a campaign to prevent underage smoking because, if successful, the campaign would hurt cigarette sales. In this case, consumers' suspicions may lead them to infer motives that would actually protect the company's financial position such as trying to improve their image to sell more cigarettes to adult smokers or perhaps an attempt to protect themselves from potential lawsuits connected to underage smokers. This would lead to a less favorable attitude toward the partnership. However, if a tobacco company undertook a CSM campaign that would sustain their business (such as advocating against child labor in the planting and harvesting of tobacco) consumers may be able to infer profit motives more easily and then have a more favorable attitude toward the partnership. This would prevent suspicion and may actually result in a more positive evaluation. This suggests that, under some situations, consumer attitudes towards the company may be more positive if profit motives were more obvious. Since the overall attitude toward the partnership, and ultimately the firm, may suffer from certain corporate-cause connections, corporations need to be aware of the types of CSM campaigns that would more likely trigger suspicion in their target market.

Moreover, Ellen, Mohr and Webb (2002) have shown that it may not be necessary for companies to be perceived as purely altruistic in their CSM efforts. In fact, when corporate profit opportunities were obvious, consumers had more positive evaluations of the cause-related offer. This suggests that it is acceptable for at least some organizations to be more profit-driven, even when they are undertaking a CSM effort.

¹The term corporate societal marketing is used to include all different types of corporate social initiatives. See Drumwright and Murphy (2001) for an explanation of the different varieties of corporate societal marketing efforts.

EXHIBIT 1

This leads to the following proposition:

- P1: CSM campaigns that trigger less suspicion will be viewed more positively than CSM campaigns that trigger more suspicion.

The Corporation

Another aspect that may cause suspicion with consumers is the amount of harm that a company has already done, either because of unsafe products or harmful production practices. Consumers may be more suspicious of CSM efforts for firms in industries known to be harmful. For example, alcohol and tobacco companies routinely meet resistance from consumers when they undertake socially-oriented campaigns aimed at mitigating the effects of their products (Hoeffler and Keller 2002). Likewise, oil companies may encounter similar resistance if they undertook an environmentally related cause in order to overcome harmful production practices.

While the Persuasion Knowledge Model (Friestad and Wright 1994) posits that consumers use their existing knowledge structures about corporations when evaluating marketing actions taken by firms, many consumers have limited knowledge about specific firms in various industries. However, this does not mean that consumers do not make attributions about a firm's motives; instead, it implies that consumers use very broad, general industry information when inferring motives about specific firms. For instance, while a person may know nothing about a specific pharmaceutical manufacturer, they may still make attributions about why a firm donates free medication to inner city clinics based on what he/she know about the pharmaceutical industry. Therefore, when categorizing industries, two very general dimensions were used—the harmful nature of the products and the harmful nature of the production methods. Exhibit 1 shows the classification of firms on these two dimensions. Firms in Quadrant I are perceived to be included in the virtuous industries that produce helpful products in a way that is considered helpful to society. Consumers would view firms in Quadrant III as members of sin industries who produce

harmful products and harm society in production. Quadrant II and IV contain firms that belong to industries that have mixed perceptions; either the products or production of these products are perceived to be helpful to society.

These classifications of industries may affect how consumers react to various CSM efforts. Specifically, virtuous firms, those that are perceived as already helping society in both their products and the production of these products, are already considered to be good corporate citizens who would probably not raise suspicion in anything they pursue. Firms that operate in sin industries may not be as fortunate since consumers may be suspicious of *any* societal efforts the firm attempts to undertake. Firms that operate in mixed industries may or may not be met with suspicion, depending on which sort of societal effort they undertook. This leads to the following proposition:

- P2: Consumers will infer less society-serving motives and more self-serving motives for corporate societal marketing programs undertaken by firms that operate in mixed or sin industries.

The corporate societal marketing programs

The types of CSM campaigns were classified based on how easily consumers could infer profit-driven motives. Based on an evaluation of the types of campaigns typically undertaken, four classifications were created:

- (1) *Positively tied to product sales.* This would include all CSM campaigns that would increase sales of the company's product if successful. Profit-driven motives would be the easiest to infer with this type of campaign. For example, a credit card company that donates a certain amount to a charity based on each time their card is used.
- (2) *Negatively tied to product sales.* This category would include all campaigns that would actually decrease sales of a

product if it were successful. Profit-driven motives are less obvious with this category, making it harder for consumers to infer them. For example, a beer manufacturer sponsors a campaign that discourages underage drinking.

(3) *Not directly tied to sales but aimed at sustaining the company's business.* Campaigns in this category would include those that are not directly tied to a company's sales, but are strategic in that they sustain the business in some way. Profit-driven motives would be fairly easy to infer with these campaigns, although not as obvious as those that are positively tied to sales. For example, a lumber company that invests in reforestation programs or a clothing manufacturer that partners with child labor advocacy groups to eliminate the use of child labor in their factories located in developing countries would all be classified as sustaining a company's business.

(4) *Completely unrelated.* There are a number of corporate cause-related marketing programs that are not associated with a company's core business at all. Profit-driven motives may be more difficult to infer with this category than with others. For example, a firm that donates computers to local schools would be classified as unrelated for all firms that do not manufacture or sell computers.

Depending on the industry involved, these different types of CSM efforts may be met with skepticism and suspicion, which could eventually have a negative effect on the firm. This leads to the following proposition:

P3: Consumers will evaluate the various CSM campaigns differently based on which industry was involved. These differences will appear in both overall attitudes as well as the nature of the inferred motives.

METHOD

In order to test differences in the evaluation of corporate societal marketing initiatives, a 4 x 5 between subject design was used. Four industries were selected to represent each quadrant shown in Exhibit 1 and one industry was chosen to serve as a baseline case that was perceived to be average on harmful products and production. To identify which industries fit the quadrants, pretests were conducted.

Pretest

One hundred students collected pretest data in exchange for course credit. During a brief semester break, each student was given the opportunity to administer six to twelve questionnaires in exchange for course credit. Using a seven point scale, participants rated 15 different industries on the harmfulness of the industry's products as well as the harmfulness of the production of these products. Five industries were identified as being different on the two dimensions. Pretest results are presented in Table 1.² In addition, participants were asked to evaluate the typical companies

in each industry on their concern for protecting the well-being of their customers and their concern about having a positive impact on society (1=not at all concerned, 7=extremely concerned). These two questions were averaged to obtain the positive impact scale reported in Table 1 ($\alpha=.8219$). It should be noted that all the industries tested were perceived to be somewhat harmful in the production of their products. The pharmaceutical industry was viewed as one of the least harmful even though their mean was fairly moderate. However, given that this industry was rated as the one most concerned about having a positive impact, it was chosen to represent the virtuous industries in Quadrant I.

Experiment

Four scenarios were developed for each industry, each representing one of the classifications of CSM efforts described earlier. These scenarios appear in the Appendix. Once again, one hundred students administered questionnaires in exchange for course credit. The data collection followed the same procedure described in the pretest. Each subject read one scenario and answered a series of questions. Overall attitude toward the partnership was measured using a seven-point scale ranging from 1 (extremely unfavorable) to 7 (extremely favorable). Inferred motives were measured using a modified version of the inferred motive scale developed by Szykman, Bloom and Blazing (2004). This scale measures motives by asking participants to describe reasons for the partnership using a seven point scale anchored by pure/unpure (RS), selfish/selfless, caring/uncaring (RS), society-serving/self-serving (RS), uninvolved/involved, proactive/reactive (RS). A principal components factor analysis was performed to confirm the unidimensionality of the scale. Based on the scree plot as well as the eigenvalues >1, a one factor solution was confirmed ($\alpha=.8315$). Importance of the cause to the company's customers was also measured using a seven point scale ranging from 1 (extremely unimportant) to 7 (extremely important). Finally, demographic information was collected.

To test whether the different cause-related marketing campaigns were evaluated differently based on the industry; the following regression equation was used:

$$\begin{aligned} \text{Attitude}_{\text{Partnership}} = & a + b_1 \text{Tob} + b_2 \text{Brew} + b_3 \text{Pharm} + b_4 \text{Gas} \\ & + b_5 \text{PosSales} + b_6 \text{NegSales} + b_7 \text{Sustain} + \\ & b_8 \text{PosSales} * \text{Tob} + b_9 \text{PosSales} * \text{Brew} + \\ & b_{10} \text{PosSales} * \text{Pharm} + b_{11} \text{PosSales} * \text{Gas} \\ & + b_{12} \text{NegSales} * \text{Tob} + b_{13} \text{NegSales} * \text{Brew} \\ & + b_{14} \text{NegSales} * \text{Pharm} + \\ & b_{15} \text{NegSales} * \text{Gas} + b_{16} \text{Sustain} * \text{Tob} + \\ & b_{17} \text{Sustain} * \text{Brew} + b_{18} \text{Sustain} * \text{Pharm} + \\ & b_{19} \text{Sustain} * \text{Gas} + \text{Importance} + \text{Age} + \\ & \text{Gender} + \text{Education} \end{aligned}$$

Where: $\text{Attitude}_{\text{Partnership}}$ = Attitude toward the partnership described in the scenario;

Tob, Brew, Pharm, Gas = Industry identifiers—1 if the identified industry was included in the scenario, 0 otherwise;

PosSales, NegSales, Sustain = CSM initiative identifiers—1 if the identified CSM initiative was included in the scenario, 0 otherwise (for example, if the CSM effort described in the scenario was positively linked to the corporation's sales, then PosSales=1);

PosSales*Tob...Sustain*Gas = Interaction terms between the industries and the type of CSM campaigns. These were included to determine if participants did evaluate the different types of CSM campaigns differently based on the industry included in the scenario.

Importance = the participant's evaluation of whether the cause was important to the corporation's customers.

²Each industry was compared to each other using one-way ANOVAs and Scheffe Post-hoc tests. All five industries were different from each other in the harmful nature of their products $p < .05$. However, according to the Scheffe tests, brewers were not different from either pharmaceuticals or fast food in their production methods (brewers=4.04, pharmaceuticals=4.25, $p < .733$; brewers=4.25, fast food=3.72, $p < .273$).

TABLE 1
Pretest Means

Industry	Product	Production	Positive Impact Scale	Classification
Tobacco	1.83 (n=313)	3.08 (n=315)	1.97 (n=461)	Purely Sin
Oil/Gas	4.92 (n=229)	2.58 (n=226)	3.74 (n=232)	Mixed
Pharmaceuticals	5.92 (n=234)	4.25 (n=232)	5.03 (n=232)	Purely Virtuous
Brewers	3.91 (n=228)	4.04 (n=225)	3.49 (n=235)	Mixed
Fast Food	3.29 (n=23)	3.72 (n=237)	3.24 (n=230)	Base case: neither overly helpful or harmful

Age, Gender, Education=these demographic variables were included as control variables (Gender=1 of male, 0 otherwise).

A similar regression equation was utilized to investigate differences in the motives inferred by the participants:

$$\begin{aligned} \text{Motives} = & a + b_1\text{Tob} + b_2\text{Brew} + b_3\text{Pharm} + b_4\text{Gas} + b_5\text{PosSales} \\ & + b_6\text{NegSales} + b_7\text{Sustain} + b_8\text{PosSales*} \text{Tob} + \\ & b_9\text{PosSales*} \text{Brew} + b_{10}\text{PosSales*} \text{Pharm} + \\ & b_{11}\text{PosSales*} \text{Gas} + b_{12}\text{NegSales*} \text{Tob} + \\ & b_{13}\text{NegSales*} \text{Brew} + b_{14}\text{NegSales*} \text{Pharm} + \\ & b_{15}\text{NegSales*} \text{Gas} + b_{16}\text{Sustain*} \text{Tob} + \\ & b_{17}\text{Sustain*} \text{Brew} + b_{18}\text{Sustain*} \text{Pharm} + \\ & b_{19}\text{Sustain*} \text{Gas} + \text{Importance} + \text{Age} + \text{Gender} + \text{Edu-} \\ & \text{cation} \end{aligned}$$

RESULTS

Regression results are contained in Table 2. As shown, there are significant main effects and interactions. Looking at the standardized betas reported in the table, we find some interesting results. When compared to the base case of an unrelated CSM campaign done by a fast food company (the “average” industry), tobacco companies and brewers (harmful products) had less positive attitudes towards the partnership and more self-centered motives (Attitude: $b_{\text{tobacco}} = -.238$, $b_{\text{brewers}} = -.126$ $p < .05$; Motives: $b_{\text{tobacco}} = -.284$, $b_{\text{brewers}} = -.178$ $p < .01$). Alternatively, the two industries that were perceived to have helpful products ($b_{\text{gas}} = .124$ $p < .05$, $b_{\text{pharm}} = .091$, $p < .085$) had more positive motives associated with them, but the overall attitudes toward their CSM campaigns were not statistically different from the base case. There were also very interesting effects for the different types of CSM campaigns. All four campaigns that were more closely tied to the company’s core business (linked positively to sales or sustainability of the company), had significantly less altruistic, society-serving motives associated with them. This result would be expected since profit motives were more obvious in these cases. The two CSM campaigns that were directly tied to product sales (either positively or negatively) had significantly less positive attitudes toward the partnership ($b_{\text{possale}} = -.145$ $p < .01$; $b_{\text{negsale}} = -.25$ $p < .001$), while the campaign designed to maintain the sustainability of the firm was not statistically different from the base case ($b_{\text{sustain}} = -.021$ $p < .736$).

The interaction effects between the types of CSM campaigns and industries provide us with evidence that there are statistically

significant differences between them, particularly for the industries that produce more harmful products. Specifically, for both tobacco and brewers, participants had significantly more positive attitudes towards those campaigns that would reduce the sales of the products if successful ($b_{\text{negsale*tob}} = .161$ $p < .001$; $b_{\text{negsale*brew}} = .190$ $p < .01$). These two conditions also generated more society-serving, altruistic motives from the participants ($b_{\text{negsale*tob}} = .128$ $p < .001$; $b_{\text{negsale*brew}} = .260$ $p < .0001$). For the purely sin industry (tobacco), there is an additional interaction effect in that the campaign that was designed to sustain the firm generated more society-serving motives ($b_{\text{sustain*tob}} = .149$ $p < .05$) as well as a more positive attitude ($b_{\text{sustain*tob}} = .135$ $p < .05$) than the base case.

The control variables also yielded significant results. The more important the cause, the more positive the attitude toward the partnership ($b_{\text{importance}} = .295$ $p < .001$) as well as the inferred motives being more altruistic ($b_{\text{importance}} = .232$ $p < .0001$). In addition, women were likely to generate more society-serving motives ($b_{\text{gender}} = -.042$ $p < .05$) as well as form more positive attitudes towards the partnership ($b_{\text{gender}} = -.048$ $p < .05$).

Cell means for Attitude toward the partnership and Motives are reported in Tables 3 and 4, respectively. While these means are consistent with the regression results already presented, looking at differences within each industry also supports the notion that consumers evaluate the various types of CSM campaigns differently, based on the industry participating in the campaign. Scheffe tests were performed within each industry to find which groups differed from each other. Groupings significant at $\alpha = .05$ are reported in the final column of both tables. Based on these post-hoc tests, we find the following differences among the various sorts of CSM campaigns. In the tobacco industry, the corporate sustainability CSM campaign is viewed as the most positive, and is different for both the campaign that are positively tied to sales and the one that is completely unrelated to the core business. In the gas industry, the unrelated CSM campaign is the most positively evaluated, which is statistically higher than the campaign aimed at corporate sustainability. The pharmaceutical industry appears to be the only industry where differences among the various types of CSM campaigns do not exist in the attitude towards the partnership; all efforts are positively evaluated. For brewers, the CSM effort that is negatively tied to sales is the most positively evaluated, and is different than the campaign that would increase sales. Finally, for the fast food industry, the lowest evaluation exists for the campaign

that is negatively tied to sales. This is significantly different than the campaign focused on sustaining the business as well as the campaign that is completely unrelated.

As shown in Table 4, differences also exist in the motives inferred by the participants. For the tobacco industry, the most self-serving motives are generated for the CSM campaign positively tied to sales; this mean is different than the three other types of campaigns. In the gas industry, motives for all campaigns are similar, except for the unrelated category, which has significantly more society-serving motives associated with it. The pharmaceutical industry exhibits a difference between the CSM campaign that would increase sales (which has the most self-serving motives) and the CSM campaign unrelated to the core business (which has the most society-serving motives). The brewing industry has the most society-serving motives inferred with the negative tie to sales campaign, which is different than the campaign that had a positive tie to sales and the campaign aimed at sustainability. Finally, the fast food industry has the most society-serving motives associated with the unrelated condition, which is different than the CSM that is negatively tied to sales and the CSM efforts that are aimed at sustainability. Exhibit 2 graphically shows each industry with the CSM effort that generated the most positive attitude as well as the most society-serving motives. As shown in this exhibit, there are distinct differences among the various industries.

DISCUSSION

This study shows that differences do exist in how types of CSM campaigns are evaluated based on the type of industry associated with the firm undertaking the campaign. Specifically, two dimensions are considered in describing various industries—the helpful/harmful nature of the products and the helpful/harmful nature of the production of the products. Virtuous industries are those industries that are perceived to produce helpful products using less harmful production methods. As shown in the results, participants evaluate all of their CSM campaigns fairly positively, even though the nature of the motives varied across the different conditions. This supports the notion that these good corporate citizens are given the benefit of the doubt when undertaking all sorts of campaigns. Alternatively, the sin industry (perceived to produce harmful products in more harmful ways) generate the more positive evaluations when they undertook campaigns targeted at sustaining

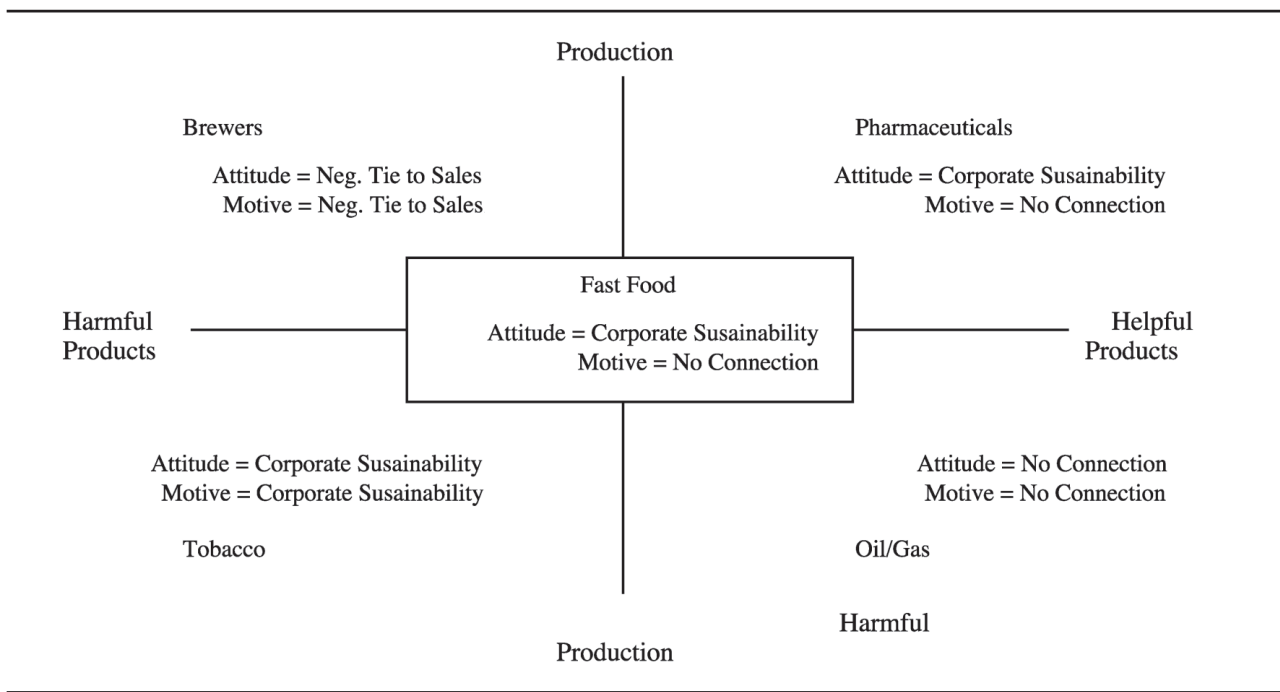

their business or decreasing overall sales of their products. Our mixed industries (gas and brewers) exhibit mixed results in their evaluations as well. The gas industry (helpful products/harmful production) generates the most positive attitude in the condition that is completely unrelated to the business, while the brewers are most successful with a negative tie to sales. Perhaps it is the decreased use of harmful products that are driving the results for both tobacco and breweries. The fast food industry, our “mid-range” industry has the lowest attitude with the CSM efforts that are negatively tied to sales.

The motive results support the findings presented by Ellen et al. (2002) in that firms do not have to be perceived as purely altruistic and society-serving in their motivations behind CSM campaigns. While the CSM types that generated the most positive attitudes also generated some of the most society-serving motives; in many circumstances, these motives would not be classified as altruistic or pure. For example, the sustainability condition in the tobacco industry generates motives that averaged 3.91 on a seven point scale. The overall attitude toward this partnership is a 5.11 (on a seven point scale). While these motives are clearly just above average, the overall attitude is fairly high.

These findings hint at some promising uses of CSM initiatives to improve the image of a brand or an entire industry. Specifically, those findings associated with the tobacco industry suggest that these firms do not only have to undertake campaigns that would lead to a reduction in sales, campaigns aimed at sustainability may have an impact on the company that is just as positive. The regression results show that differences continue to exist when controlling for the importance of the cause and demographic differences.

Obviously, no clear recommendations can be made to various corporations based on this one study, but these results do show a promising area for future research. Many firms are turning to CSM campaigns to build and repair their brands. This study points to the importance of how existing perceptions about industries influence the motives inferred by customers as well as the evaluation of the partnership. More research is needed to investigate these relationships further. For example, in a sin industry such as tobacco, is it even possible for a firm to rise above the industry’s negative perceptions and be perceived as a more socially-responsible company? Does it even matter to the bottom line? Additionally, for

EXHIBIT 2
CSM Efforts Linked to Most Positive Attitudes & Most Altruistic Motives

those “mixed” industries, is it possible to use CSM to change perceptions about their firm’s products or production methods? Is it better for a gas company to focus on minimizing harm to the environment or should they focus on CSM campaigns that are important to their customers, but unrelated to their core business? These results suggest people have more positive attitudes towards unrelated campaigns. However, if long-term brand equity is considered, consumers may actually prefer the efforts that would improve the harmful production practices. Moreover, further study is needed to determine if attitude toward the partnership transfers to attitude toward the corporation.

While this study does not provide explicit guidelines for corporations to follow, it does provide the preliminary evidence that there is no one type of CSM campaign that works for every firm. Uncovering when each of these different campaigns would be most effective at building different types of brands is critical information that many corporations can use.

APPENDIX A
Scenarios

	Positive Link to Sales	Negative Link to Sales	Strategic Sustainability	Not Related
Tobacco	Every year, a major tobacco company donates a percentage of customer sales during a three month period to medical research on tobacco-related illnesses such as cancer, emphysema and asthma.	A major tobacco company sponsors a number of activities targeted at preventing youth smoking. These programs include MTV's "Don't Smoke" advertising campaign and Operation ID, which encourages retailers to only sell tobacco products to adults.	A major tobacco company has taken aggressive action to eliminate child labor in the growing and production of tobacco products in developing countries.	A major tobacco company donates computers to local schools.
Gas	A major gas company will donate free gas to needy families based on a percentage of their annual sales.	A major gas company sponsors programs aimed at educating consumers in energy conservation.	A major gas company partnered with a wildlife advocacy group to limit the environmental impact of drilling and the production of their products.	A major gas company donates computers to local schools.
Pharmaceuticals	A major drug company donates free drugs to clinics in developing countries based on a percentage of their annual sales.	A major drug company sponsors educational programs designed to educate people on how to live a healthy lifestyle to avoid chronic illness later in life.	A major drug company donates to research funds for the treatment of life-threatening diseases.	A major drug company donates computers to local schools.
Brewers	A major beer producer sponsors sporting events where their products are sold.	A major beer producer sponsors "We Card" programs aimed at the prevention of underage drinking.	A major beer producer has a "Don't Drink and Drive" Program.	A major beer producer donates computers to local schools.
Fast Food	A local fast food restaurant hosts an annual school event where teachers work in the restaurant for two hours and all proceeds are donated to the school.	A fast food company sponsors an educational program designed to teach children the importance of healthy eating.	A major fast food company partners with environmental groups in developing new, environmentally friendly packaging.	A major fast food restaurant donates computers to local schools.

Community Oriented Corporate Social Responsibility: Consumer Evaluation of Community Attachment

Jay M. Handelman, Queen's University
Roberto Bello, University of Lethbridge

EXTENDED ABSTRACT

Introduction

Many studies from the sociology literature have noted the importance of communities and feelings of community attachment on individual decision making (Goudy 1990; Kasarda and Janowitz 1974). In an age of globalization, increasingly mobile populations, and growing urban sprawl, the character of social interactions are altered away from communal attachments and more towards primarily economic based contacts through work and shopping (Putnam 2000). The ensuing sense of emptiness and dissatisfaction with everyday life may lead people in these situations to regain some sense of balance by seeking social-collective activities, (Bellah et al. 1986). Arnold, Kozinets, and Handelman (2001) suggest that individuals may turn to businesses in the community, such as retailers, to provide a sense of community. As such, through their community oriented Corporate Social Responsibility (CSR) initiatives, businesses might attempt to portray themselves as attached to the community (Besser 1999; Miller and Besser 2000).

Theoretical Development

Drawing on Oliver (1991), organizations may employ different CSR strategies that demonstrate their attachment to the community. This study empirically examines three of these strategies. The first is acquiescence whereby the organization presents a direct and unquestioned acceptance and compliance to community rules. Here, the organization contributes directly to community causes with no economic based expectations in return. The second strategy is compromise whereby the organization's contribution to a community cause is directly linked to an economic return. Cause-related marketing is an illustration of this where a community contribution is directly linked to the sale of a product. The third strategy is symbolic acquiescence where the organization creates a façade of acquiescence by symbolically linking itself to a community cause, but not making a tangible contribution. It is hypothesized that the type of strategy will have a significant impact on a consumer's evaluation of the business' community attachment whereby an acquiescence strategy will be most effective and the symbolic acquiescence strategy will be least effective.

An important variable that is hypothesized to moderate the effectiveness of these strategies on the consumer's assessment of the organization's community attachment is the type of ownership of the business employing the strategies. In particular, large, non-local businesses are typically regarded by consumers as strictly economic-oriented operators and unaware of local issues (Brennan and Lundsten 2000; Miller and Besser 2000). As such, it is hypothesized that an acquiescence community oriented strategy will be more effective for non-local businesses than local businesses in that consumers would not expect non-local businesses to comply so directly with community norms.

A final hypothesis is that community attachment will mediate the impact of strategy and ownership type on a consumer's patronage intention. In other words, community oriented CSR strategies and ownership type do not lead directly to a patronage decision. Instead, they help the consumer assess the degree of attachment that business has to the community. It is this assessment that is hypothesized to influence patronage decisions. Of course, this hypothesis must be

put in context. Community attachment is but one variable that resides alongside other important variables, such as price, quality, etc., in influencing patronage decisions. However, the purpose of this study is to highlight the potential impact that community attachment may have on a consumer's patronage decision.

Empirical Research

Results from a 3 (acquiescence, compromise, and symbolic acquiescence strategies) x 2 (local versus non-local ownership) between subjects experimental design in a retailing context support the importance of considering the community attachment construct. First, it was found that the type of ownership had a significant effect on the consumer's evaluation of the retailer's community attachment. A locally owned retailer was regarded as significantly more attached to the community than a non-local retailer. In addition, type of ownership also moderated the effect of strategy on assessments of community attachment. For local retailers, there was no significant difference between the effectiveness of the three different types of strategies on the consumer's assessment of the retailer's community attachment. This included the use of symbolic acquiescence. However, for non-local retailers, the type of strategy used made a significant difference. For non-local retailers, an acquiescence strategy was significantly more effective at building an evaluation of community attachment than a symbolic acquiescence strategy. The effectiveness of a compromise strategy fell in between the two.

Finally, community attachment is shown to completely mediate the impact of strategy and type of ownership on a consumer's patronage intentions. This mediating role speaks to the possibility of the community attachment construct as being another contributor to consumer patronage decisions. Community attachment also helps explain how an organization's community-oriented CSR strategies might translate into consumer patronage. In particular, community attachment may serve as an important objective in guiding marketers as they develop CSR initiatives. In designing these initiatives, marketers must also take into consideration the nature of their organization. For non-local businesses, the use of an acquiescence strategy is the most effective means to convince consumers of community

A Motivational Framework for Self-Directed Hedonic Consumption

Monica C. LaBarge, University of Oregon

Peter A. Dacin, Queen's University

EXTENDED ABSTRACT

Marketing researchers view both play and adventure as forms of self-directed hedonic consumption (Holbrook and Hirschman 1982) and investigate the various motives for certain types of this consumption, especially when it is voluntary and high-risk (Celsi et al. 1993, Shoham et al. 2000, Ewert and Hollenhorst 1989, Arnould and Price 1993). In everyday play and adventure, however, most consumers do not assume this level of risk taking yet we know considerably less about the motives for less-risky and non-risky forms of hedonic consumption. To our knowledge, there is little research in the marketing literature that examines motivations for non-risky, habitually-practiced hedonic activities (i.e. hobbies), such as training for triathlons or marathons, yet these are among the fastest growing leisure activities in North America, increasing rapidly in participation year after year (Woodrow 2000).

The objective of this paper was to address this gap in our understanding of the motives driving participation in these non-risky, habitually-practiced hedonic activities by developing a framework for better insight into the complex hedonic consumption motivations behind participation. We developed this framework by integrating and extending existing research in marketing, sports psychology and leisure studies. We then discussed several expectations for this framework and provided an initial, exploratory application of it in the context of a low-risk activity. We concluded by discussing the results of this study, providing general recommendations and directions for future research.

Celsi et al.'s (1993) framework has served as a fundamental starting point for marketing researchers interested in consumers' participation in risky hedonic consumption (Arnould and Price 1993, Dodson 1996, Shoham, Rose and Kahle 1998, 2000). A common element in this extended research is the repeated identification of the three general categories of motives: Self-Efficacy, Normative and Hedonic. The validity of these three categories finds support in Arnould and Price (1993), Shoham, Rose and Kahle (2000) and Hopkinson and Pujari (1999). More interestingly, several studies in the fields of sports psychology and leisure studies, while not specifically referring to these three categories of motives, present results that can be interpreted as supporting the existence of similar categories of motives in less risky hedonic consumption contexts (Brannigan and McDougall 1983, Ewert and Hollenhorst 1989, Gill et al 1996, Ogles, Masters and Richardson 1995). While research in the marketing, leisure studies and sports psychology fields appear to independently arrive at similar findings, there is no existing research that integrates the fields with respect to commonalities that exist between risky and non-risky activities.

To fill this gap, we proposed a general framework of motivations for participation in habitually-practiced, self-directed hedonic consumption. While largely based on Celsi et al.'s (1993) framework, we made several important adaptations, with the primary goal of bringing the model out of the specific context of risky activities into a more general application which would be of interest to a broader group of marketers. We maintained the same structure proposed by Celsi et al., with three categories of motivation: Self-Efficacy, Normative, and Hedonic. The pattern of movement along the continua of motivations also remained the same as in the Celsi et al. model; people move between stages depending on the level of two moderating factors. However, two necessary changes in expanding the model beyond risky activities were: 1) to

reconsider the dimension of "Acculturation of Risk" and replace it with "Desire for Challenge" and 2) to replace Celsi et al.'s label of "Survival" with that of "Completion." We discussed the rationale for these suggested changes, the assumptions of the resulting framework, and developed some expectations based on its application in a non-risky context.

We investigated a preliminary application of the proposed framework through a convenience sample, where participation in an Internet-administered self-report survey was solicited from various local groups of adult runners, triathletes and swimmers. All respondents participated, to different degrees, in these habitually practiced activities and received no compensation (i.e., sponsorship, scholarships, etc.) for their participation. We constructed a survey measuring our theoretical constructs based on a combination of sources, including Ewert and Hollenhorst (1989), Shoham et al. (2000), Arnould and Price (1993), Masters et al. (1992), and Dodson (1996). Based on comments received in the pretest and our psychometric analysis of the scales, we made several revisions to arrive at our final survey. In the final survey, one set of questions gathered information about each respondent's level of participation and their individual level of Desire for Challenge; another set of questions addressed each of the three categories of motivations (Self-Efficacy, Normative, and Hedonic); and a final set of questions collected various demographic data on the respondent.

The results of our analyses suggested, as expected, that there are changes in the characterization of motives as Desire for Challenge and Experience (the two dimensions of the model) change. Additionally, we found that it is important to measure experience both as a function of total experience (measured in years) and frequency of participation (measured in hours a week) in order to get at both the internal and external motives for participation. Finally, we determined that it is highly likely that the relationships between the constructs are not linear, which suggests a need for further investigation and more sophisticated modeling techniques in order to determine the exact pattern of changes.

In the final section, we discussed several limitations of our study and suggested directions for future research. We concluded with a discussion of managerial implications, including the potential to use the measures of Desire for Challenge and Experience to predict motivations of participants in non-risky activities, implying an enhanced ability to profile and target consumers of these activities.

An Elaborated Model of Satisfaction With Live Musical Entertainment

Michael S. Minor, University of Texas-Pan American
Angela Hausman, University of Texas-Pan American¹

EXTENDED ABSTRACT

Live musical performances permeate and give meaning to our existence, in some cases allowing us to transcend the stresses and sameness of our lives. The paucity of extant research looms large when compared with the vast number of local bands, gospel choirs, even highly paid professional performers who perform around the country in corporate and non-profit fund-raisers, clubs and restaurants, and concert halls. Moreover, understanding the relationship between music and consumptive motives surrounding achievement of transcendent experience is in its infancy. This paper seeks to redress this deficiency by introducing the concept of hyper-involvement and testing linkages between this construct and other evaluations of live musical performances.

The literature clearly identifies several states of involvement, including situational and enduring, and a continuum from low involvement to high involvement. However, there are occasions when our involvement conceivably becomes all-consuming and overwhelms us. In this condition, we are totally focused on a single act or experience. "Mesmerized," "consumed," "in the zone," "in a stupor" might be everyday expressions for this state. If this state is reached in a religious context, it might be described as "rapture." We believe this state is so frequently the goal of consumptive behaviors that a separate analysis of this state is justified. Hyper-involvement and flow are related. Csikszentmihalyi (1991) defines flow as "the state in which people are so involved in an activity that nothing else seems to matter." We characterize "flow" as an active state, such as Michael Jordan "in the zone". It is this state of active control, and the lack thereof, that separates the two constructs. By comparison, we characterize hyper-involvement as a passive state, e.g. a person who is "in a stupor" at a rock concert or is swept up in religious "rapture."

Mizerski and his colleagues (1988) suggest an "aesthetic experiential processing scale" which contains a few elements related to our hyper-involvement construct. Their results suggest that experiential processing does exist, and is a condition necessary for the existence of hyper-involvement. However, and importantly, this scale fails to capture the escape from reality as conceptualized in hyper-involvement. In prior work, Minor and colleagues (2002) developed a preliminary model of customer satisfaction with live musical performances. The six factors were musical ability, musician appearance, musical sound, stage appearance, facilities, and audience interaction.

Minor et al. (2002) proposed a relationship between the six factors and overall satisfaction with live musical experiences, although this was not empirically tested in that paper. By using music as a situation within which to investigate hyper-involvement, we can integrate hyper-involvement with the earlier model of satisfaction with musical performance. This discussion leads to a series of hypothesized relationships between the six-factor model developed by Minor et al. (2002), satisfaction, and hyper-involvement. In addition, relationships can be postulated between satisfaction and behavioral intentions.

To test these relationships, a new scale was developed to assess hyper-involvement. This scale, along with existing measures for satisfaction, the six-factor model, and behavioral intentions

were combined to form a survey instrument. This instrument was pre-tested and subsequently administered to undergraduates at a regional southern university. This sample is appropriate considering 90% of music is consumed by this age group.

The reliabilities were well within the guidelines established by Nunnally and Bernstein (1994). CFA results from analysis of the six-factor music satisfaction model were acceptable, especially when compared to a unidimensional representation of the factors (RMSEA=.05; CFI=.99; NFI=.99). CFA results also suggested good convergent and discriminant validity for the six-item hyper-involvement scale when compared with situational involvement. Path analysis was used for hypothesis testing. Results did not support the hypothesized relationships between the six-factor model of music satisfaction and satisfaction or hyper-involvement. Using the modification indices, a pattern began to emerge whereby most of the effects of four of the factors were mediated through the staging and audience interaction factors (see Figure 1). The complex pattern of relationships also shows that factors affecting hyper-involvement, again with the exception of musician ability, were mediated through staging. Due to the atheoretical process used in modifying the model, validation was conducted using pre-test data and demonstrated the good fit between the data and the model (RMSEA=.06; CFI=.99; NFI=.96). As hypothesized, the relationship between satisfaction and behavioral intentions were significant based on path coefficients and fit statistics. This provided support for H₇.

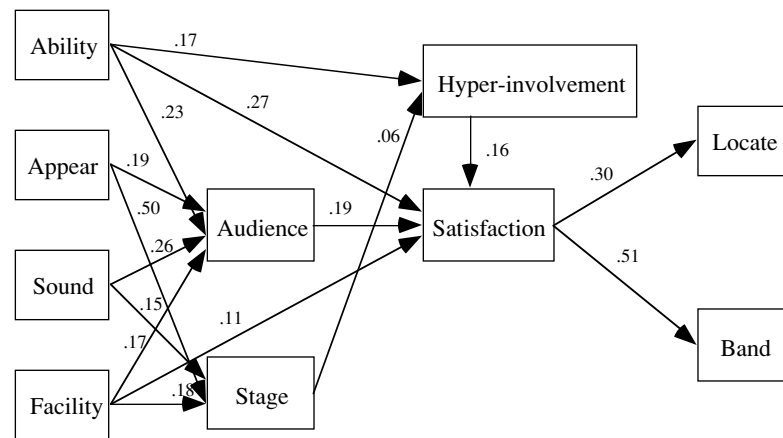

The most important finding from this study is the relative importance of musical ability in forming satisfaction and behavioral intentions with respect to live musical performances. The complex pattern of relationships between the six-factor model of music satisfaction and satisfaction suggests other managerially relevant considerations. The second impact of the study is the generation of the hyper-involvement construct and understanding of the relationship between this construct and satisfaction. An important consideration in this research is its possible application to other contexts, specifically impulse buying, consumption of fantasy enclaves, and consumption of certain types of leisure and recreation.

Falling in Love with a Product: The Structure of a Romantic Consumer-Product Relationship

Yun-Oh Whang, University of Central Florida

Haitao Zhang, University of Central Florida

ABSTRACT

Consumers often say they are “in love with a product or brand,” but what does being in love with a product really mean? Do consumers actually find themselves in a romantic product relationship that resembles a love relationship with another person? To address this question, a sample of male bikers ($n=179$) was surveyed with an instrument used in psychology to study different styles of interpersonal love. Findings suggest that bikers’ love toward their motorcycles resembles an interpersonal love that is passionate, possessive and selfless in nature. Only the passion component of interpersonal love had an impact on loyalty to their bikes.

Consumers frequently ascribe existence to relationships they form with products and/or brands. As examples, some consumers name their automobiles while others insist on Harley motorcycles or demand “the real thing” over New Coke. Obviously, the vehicles are not just viewed as transportation and even classic Coke means more to loyal followers than simply a can of refreshment. What is more, consumers often say they are “in love with a product or brand,” but what does being in love with a product really mean? Is love for a product a strong expression of attachment or loyalty, or do consumers actually find themselves in a romantic relationship resembling love toward another person? If product love is romantic in makeup, then theories in psychology regarding different types of interpersonal love may be useful in capturing the fundamental nature of this phenomenon.

Some researchers in psychology argue that “falling in love is something that happens to us, not something we make happen” (Walsh 1991, p.186), suggesting that marketers cannot induce consumers to fall romantically in love with products. At the same time, proposed theories explaining why people fall in love provide insight on how close interpersonal relationships are formed (see Sternberg 1987 for a review). One study in particular (Lee 1977) developed a typology identifying six styles of love, one or more of which may explain the type of the love consumers develop with products. Marketers desire to form close consumer-product relationships because it leads to customer retention through brand loyalty. One organization recognized for having extremely loyal customers is Harley-Davidson (see e.g., Berry 1995; Schouten and McAlexander 1995; Spethmann 1998). For that reason, the Harley brand of motorcycle appears to be well suited for exploring the existence and structure of romantic consumer-product relationships.

Borrowing from the literature on interpersonal love, the primary objective of the study is to develop a theoretical framework for understanding the structure of love toward a product. Is consumers’ “love” for a product similar to or different from romantic love toward another person? Secondary objectives are to identify different love styles and any demographic features that might be related (see e.g., Lee 1977; Taraban and Hendrick 1995). The study’s findings should not only provide marketers with an understanding of the fundamental nature of product love, but also offer some insight into the formation of romantic product/brand relationships. The next section reviews previous literature and discusses a theoretical framework linking interpersonal with product love.

THEORETICAL FRAMEWORK

Although there is no universally accepted definition of love, anyone knows when s/he is in love with another. Love is an outcome of bi-directional interaction between two partners, yet its highly dynamic interactivity makes it challenging for researchers to study. But, when the target of love is replaced with an object (e.g., a product or brand), love becomes unidirectional and thus less dynamic. In this way it is perhaps easier to study product rather than interpersonal love. Unfortunately, to date there has been little research on this issue. This also raises a fundamental research question; can product love be described as romantic even though it is not directed toward another human being? Consider Branden’s (1980) definition of love quoted below.

“The origin of our desire to love lies in our profound need to value, to find things in the world which we can care about, can feel excited and inspired by. It is our values that tie us to the world and that motivate us to go on living. Every action is taken for the purpose of gaining or protecting something we believe will benefit our life or enhance our experience” (p.67).

From this definition, it can be concluded that the target of a romantic relationship (i.e., love) is not limited to another human being.

The term love has been applied in the marketing literature in several ways. Extending resource exchange theory (Foa and Foa 1974), Brinberg and Wood (1983) suggested six resource categories for market exchange that included love; the others are status, information, money, goods, and services. More recently, Fournier (1998) proposed an integrated framework for brand-consumer relationships categorizing relationship quality as love/passion, commitment, and intimacy, categories that correspond to the proposed dimensions of Sternberg’s (1986) triangular theory of interpersonal love.

Concepts similar to love have also been studied in the marketing literature. Individual self-expression (e.g., Kopytoff 1986; McCracken 1986) and identity development (e.g., Kleine, Kleine III, and Allen 1991) have been suggested as key drivers of emotional attachment to an object. Ethnographic research on the extremely loyal customers of Harley-Davidson motorcycles (Schouten and McAlexander 1995) and the television series *Star Trek* (Kozinets 2001) has introduced the idea of “brand communities” (e.g., McAlexander, Schouten, and Koenig 2002). Brand communities refer to groups of consumers “based on a structured set of social relationships among admirers of a brand” (Muniz Jr. and O’Guinn 2001, p.412). These and other studies have investigated consumption phenomena akin to “being in love” with a product or brand. Although these studies intimate the possibility of a romantic consumer-product relationship, none have attempted to directly link theories of interpersonal love with love toward a product.

Numerous studies on interpersonal love in psychology have proposed various theories on the nature of love and developed suitable scales to empirically test these frameworks. Table 1 presents a summary of five prominent theories and their dimensions or styles of love.

Conducting a comprehensive factor analysis of all five theories, Hendrick and Hendrick (1989) reported that Lee’s (1977)

TABLE 1
A Summary of Interpersonal Love Relationship Theories

Theory	Dimension	Source
Love Attitude Scale	Eros, Ludus, Storage, Pragma, Mania, Agape	Lee (1977)
Relationship Rating Form	Viability, Intimacy Passion, Caring Satisfaction, Conflict	Davis and Todd (1982, 1985)
Triangular Theory of Love	Intimacy, Passion Commitment	Sternberg (1986)
Passionate Love Scale		Hatfield and Sprecher (1986)
Attachment Styles	Avoidant Anxious-Ambivalent Secure	Shaver and Hazan (1987), Hazan and Shaver (1987)

TABLE 2
Descriptions of Each of Lee’s Love Attitude Styles

Style	Definition	Description
Eros	Romantic, Passionate	The search for a beloved whose psychical presentation of self love embodies an image already held in the mind of the lover.
Ludus	Game-Playing Love	Playful or game love. Permissive and pluralistic. The degree of ‘involvement’ is carefully controlled, jealousy is eschewed, and relationships are often multiple and relatively short-lived.
Storage	Friendship love	Based on slowly developing affection and companionship, a gradual disclosure of self, an avoidance of self-conscious passion, and an expectation of long-term commitment.
Mania	Possessive, Dependent Love	An obsessive, jealous, emotionally intense love style characterized by preoccupation with the beloved and a need for repeated reassurance of being loved.
Agape	All-giving, Selfless Love	Altruistic love, given because the lover sees it as his duty to love without expectation of reciprocity. Gentle, caring, and guided by reason more than emotion.
Pragma	Logical, ‘shopping list’ love	Conscious consideration of ‘vital statistics’ about a suitable beloved. Education, vocation, religion, age, and numerous other demographic characteristics of the potential beloved are taken into account in the search for a compatible match.

(Taken from Lee 1977; Hendrick and Hendrick 1986)

typology showed the most independency among the six purported styles of love. The triangular theory of love (Sternberg 1986) and the Relationship Rating Form (Davis and Todd 1982, 1985) showed significant interdependency among dimensions. By contrast, the Passionate Love Scale (Hatfield and Sprecher 1986) and Attachment Styles (Shaver and Hazan 1987; Hazan and Shaver 1987) were unidimensional, resulting in a single factor. Because of the high

level of independency, Lee’s structural typology of readily distinguishable love styles was chosen to assess consumers’ love toward a product. Table 2 contains definitions and descriptions of each of these love attitude styles (see also Hendrick and Hendrick 1986).

In addition to the independency of love styles demonstrated by Hendrick and Hendrick (1989), Lee’s (1977) typology has another major advantage over competing theories. Building on Lee’s origi-

nal work, a series of studies has linked different love styles to various demographic and personality traits (e.g., Hendrick and Hendrick 1986; Taraban and Hendrick 1995).

METHODS

Sample

A sample of male bikers attending Biketoberfest, a large bike rally held in Daytona Beach, Florida, was used for the study. Biketoberfest attendees were selected because of the strong bond they exhibit with their bikes, especially the Harley-Davidson brand. It is an ideal group of consumers with much potential for a romantic product relationship. In addition, bikers at Bikeoberfest are known to have a wide range of demographics so that the effects of these variables on the consumer-product relationship can be assessed.

The demographic profile presented in Table 3 reveals that the majority of respondents (68.2%) were between 35-54 years of age and married (55.3%). Respondents' education level was fairly evenly distributed: a high school education (27.4%), 2 years of college (24.0%), and either 4 years of college or graduate school (27.4%). The two predominant categories for occupation were professional (29.6%) and skilled/semi-skilled (22.3%). Percentages of income <\$20K (2.8%), between \$20K-39,999 (23.5%), \$40K-59,999 (25.2%), \$60K-79,999 (16.8%), \$80K-99,999 (9.5%), and >\$100K (17.3%) were also reported. The vast majority of the sample owned a motorcycle that was a Harley-Davidson (73%) and had previously attended Biketoberfest an average of four times (mean=3.9).

Survey Instrument

Data for the study was collected by means of a self-report questionnaire. Based on Lee's (1977) love typology, the short form (Hendrick, Hendrick, and Dicke 1998) of the Love Attitude Scale (Hendrick and Hendrick 1986) was applied to identify which of the six styles of love consumers develop with their favorite brand of motorcycle. The short form was used because Hendrick, Hendrick and Dicke (1998) reported that the abbreviated Love Attitude Scale accounted for more systematic variance than the original 7-item scales. The shortened 18-item version of the scale is composed of six 3-item subscales representing Eros, Ludus, Storage, Pragma, Mania, and Agape love styles (refer to Table 4). Items were each measured on a 9-point scale ranging from 1="Strongly Disagree" to 9="Strongly Agree."

The two dependent variables in the study were overall love and brand loyalty. Overall love was gauged with three items: "I am in love with my bike," "I feel very possessive toward my bike," and "If I could never be on my bike, I would feel miserable", taken from Rubin's (1970) multi-item Romantic Love Scale. Four items were used to assess active and passive brand loyalty (see Ganesh, Arnold, and Reynolds 2000). Two items measuring active brand loyalty were: "I would highly recommend my bike to my friends" and "I often make positive comments about my bike to my friends." Two items: "Even if my bike were costly to maintain, I would still ride it" and "In the near future, I intend to ride my bike more" were used to measure passive loyalty. Items in these scales were also measured on a 9-point agreement scale identical to that used above.

Demographic information on respondents' age, marital status, education level, occupation, household income, and previous Biketoberfest attendance was also collected. Two other classification questions queried respondents on their favorite brand of motorcycle and the length of time they had owned it.

Data Collection

An intercept technique was used to distribute the questionnaires along a one-block area on Main Street in Daytona Beach, the central gathering place for attendees. Male respondents were provided with clipboards and pens to facilitate filling out the questionnaire and, as an incentive, received a "sew-on" Biketoberfest patch. On average, the questionnaire took about 12 minutes to complete and approximately two out of three individuals that were approached agreed to participate for a response rate of over 60%. Overall, the procedure resulted in 179 questionnaires that were usable for analysis.

ANALYSIS AND RESULTS

Scale Development

A principal component analysis with varimax rotation was performed on the 18 items representing the six different styles of love. Applying the eigenvalue-one criteria, the item-set was factored to ensure that items loaded on respective dimensions ($\geq .50$) and did not cross-load ($< .35$), and to estimate the percentage of variance explained. To assess the appropriateness of the correlation matrix prior to factoring, Bartlett's test of sphericity and the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy were computed. Bartlett's test led to a clear rejection of the hypothesis of independence ($p < .001$) and the KMO measure of .74 (in the middling range) indicated that the application of factor analysis was appropriate.

Factoring the battery of items produced a 6-factor solution that did not entirely reproduce the six styles of love found in previous studies on interpersonal relationships (see Table 4). Six items representing both the Mania and Agape styles of love loaded on the first factor, suggesting that these two love styles are perceived as similar. One Mania item, "If I imagine someone else is riding my bike, I feel very uncomfortable," was dropped from the analysis because of a poor loading (.42). The next three factors extracted contained the 3-item subscales representing Eros, Pragma, and Storage. Loadings for the three items representing Ludus were divided among the last two factors, two items loaded on the next to last (Ludus 1) and a single item on the last factor (Ludus 2). Together, the six factors accounted for 73% of the variance in the complete set of items. It should be noted that components analyses using varimax, equimax, and oblique rotations produced the same factor profile, indicating stability in the 6-factor solution obtained.

Separate factor analyses of the 3 love and 4 loyalty items indicated that the scales are unidimensional, in both analyses all items loaded on a single factor (see Tables 5 and 6). The unidimensionality of the four loyalty items implies that respondents do not distinguish between active and passive loyalty regarding their favorite motorcycle.

Reliability and Validity

Scale reliability for each of the multi-item scales was assessed using Cronbach's alpha (α). Applying Nunnally's (1978) criterion of .70 for exploratory research, α 's ranging from .80-.89 indicate that the scales representing Eros, Mania/Agape (i.e., the combined Mania and Agape scale), and Pragma are internally consistent. Items in these scales were summed to form composite indicators of their respective constructs. Table 4 presents loadings from an exploratory factor analysis and percentages of variance explained along with item-total correlations and α 's for the corresponding love subscales. Alpha's for the 3-item Storage scale involving long-term relations ($\alpha = .64$) and the 2-item Ludus 1 scale ($\alpha = .52$) did not

* Excluded in the regression analyses.

** Ordinal index variable is used due to equal scale intervals.

meet the criterion, so these subscales were omitted from further analysis. Alpha's for the two dependent variables Love ($\alpha=.75$) and Loyalty ($\alpha=.76$) were acceptable. Tables 5 and 6 summarize the results of the factor and reliability analyses for the love and loyalty scales.

Having been successfully applied in a number of other studies (e.g., Hendrick and Hendrick 1989; Hendrick, Hendrick, and Dicke 1998; Taraban and Hendrick 1995), the Love Attitude Scale is well established as a reliable and valid measure of interpersonal romantic relationships. The instrument was field-tested on a convenience

TABLE 4
A Summary of Exploratory Factor Analysis and Scale Reliability: Styles of Love (Independent Variables)

Item/Scale	Mean	Factor Loading	Explained Var. (%)	Item-Total Corr.	Alpha (α)
Mania/Agape:	4.07		21.10		.88
Sometimes I get so excited about my bike that I can't sleep.	4.05	.75		.66	
When I think about my bike, I have trouble concentrating on anything else.	3.88	.86		.81	
I would rather go without than let my bike have problems.	5.11	.77		.60	
Placing my bike's well-being before my own makes me happy.	4.06	.84		.74	
I would endure all things for the sake of my bike.	3.68	.83		.79

I can get over my old bike without much problem.	5.51	.91		-	

sample of 21 attendees several days before Biketoberfest was scheduled to begin. The wording of several questions was modified slightly for clarification purposes, otherwise no sign of ambiguity or misinterpretation was indicated.

Regression Analysis

Multiple regressions, with and without demographic variables, were performed using Lee's (1977) love subscales as independent variables and the overall Love and Loyalty measures as dependent variables. To facilitate interpretation of the results, many of the polychotomous classification variables were dummy coded. For example, respondents' age was recoded into three categories representing those <35, 35-54 (i.e., Boomers) and >55 (i.e., Matures) years of age, with >35 as the reference category. Table 3 also includes the coding of demographic variables used in the analyses.

Multivariate F-tests for each of the overall models reported below were significant at the .01 level or beyond. For the model without demographic variables, Mania/Agape ($\beta=.59$, $p<.001$) and Eros ($\beta=.32$, $p<.001$) were positively related to overall Love.

Length of bike ownership was significant ($\beta=.08$, $p<.05$) in addition to the love styles of Eros and Mania/Agape when demographic variables were entered. Harley-Davidson owners showed a higher level of loyalty than others ($\beta=.75$, $p<.05$) and the Eros ($\beta=.41$, $p<.001$) love style was positively related to overall Loyalty. A similar effect was obtained with respect to Eros when demographic variables were removed. None of the other variables tested were significantly related to either overall Love or Loyalty at the .05 level.

DISCUSSION AND IMPLICATIONS

The primary objective of the study was to develop a basic framework for understanding the structure of love for a product. The study's results are largely consistent with findings on interpersonal love where Eros, Mania, and Agape were found to have the most positive impact on successful romantic interpersonal relationships (Sternberg and Grajek 1984). Overall, the findings imply that relations between bikers and their bikes is indeed a form of romantic relationship. Discussion of the findings is divided into two interre-

In the near future, I intend to ride more.	7.57	.75		.54	

lated parts, theoretical and practical implications for the development of romantic consumer-product relationships.

Theoretical Implications

The results of the study are interesting for two reasons. First of all, bikers do not distinguish between possessive (Mania) and selfless love (Agape), styles of love that generally do not co-exist in interpersonal love. One possible explanation is that the relationship between a product and its owner is unidirectional. Possessive love involves the assurance of love and jealousy can arise if a partner does not meet this need. Contrary to a possessive type of love, selfless love does not expect any reciprocity. These two love styles can co-exist in product love because products do not argue, get angry, or cheat on their partners. The unidirectional nature of relations with a product puts the owner in total control and reduces the anxiety about not being loved in return.

Secondly, finding that measurement items representing Ludus (game-playing love) failed to load on a solitary factor suggests that product love has a different commitment component from interpersonal love. The Ludus subscale measures openness to multiple partners (i.e., owning more than one bike) and the acceptance of a breakup (e.g., selling the bike). In interpersonal love, one who is more open to multiple partners is more likely to accept a breakup. In product love, owning multiple bikes and tolerance of a breakup are not the same component. Mean scores show that, on average, bikers have no problem owning multiple bikes, but may have some difficulty breaking up with an old bike.

Eros was a significant predictor in the regression models for both product love and loyalty. The combination Mania and Agape love style was the most important predictor of overall love, but neither style influenced loyalty. In other words, being “in love with a bike” does not necessarily imply strong attachment. Bikers love for their bikes involves feelings that are possessive (Mania), caring

(Agape), and passionate (Eros), but loyalty depends only on passionate feelings (Eros). Recall that the commitment component of product love is different from interpersonal love, owning multiple bikes and acceptance of a breakup are separate components. As a whole, then, it can be concluded that bikers are capable of loving multiple bikes simultaneously, but love for a favorite bike does not prevent falling in love with another attractive bike, even though it bears a different brand.

To some extent it is surprising that the Pragma style of love was neither related to product love nor loyalty. The Pragma love style represents self-expression and compatibility between self and the beloved, similar to symbolic or conspicuous consumption. Although bikes typically communicate the owner’s values and ideals, the compatibility component appears to be irrelevant to feelings of love or attachment.

Practical Implications

The findings also suggest marketing implications for firms wishing to form romantic consumer-product relationships. Our results suggest that products with a passionate (Eros), possessive (Mania), and selfless (Agape) image are more likely to succeed, depending upon whether love or product attachment is the desired outcome. For instance, Eros, which is often referred to as the pursuit of a lover’s “physical type” (Lee 1977, p.174), would readily translate into the design and hedonic elements of a product. It would represent the extent to which the product is perceived to fit consumers’ ideal image of beauty.

Interpreting the coexistence of Mania and Agape is more complicated. As discussed earlier, Mania is an emotionally intense love style, while Agape is guided more by reason than emotion (Lee 1977). To suggest marketing implications independently avoids explaining what a combined style of Mania and Agape love is. One possible explanation is a common denominator between Mania and

Agape, the interaction between user and product. While other styles of love focus on appearance (Eros), the number of relationships (Ludus), the length of relationship (Storage), and attribute composition (Pragma), characteristics of the interaction (e.g., functional vs. hedonic interaction, need for regular maintenance, etc.) seem to be associated with how a romantic consumer-product relationship develops. Future research is required to clarify this issue.

In sum, this study offers a structural framework for understanding romantic consumer-product relationships. The application of Lee's (1977) love style typology provides a suitable departure point for a more complete understanding of the structure of product love. Empirical evidence here shows that several styles of interpersonal love apply to product love. Of course, replications of the study, namely testing the model on other products and/or categories are necessary to determine if differences or category effects exist. Other studies might focus on the personality traits associated with different love styles in Lee's typology. In this way, findings on products could be compared and contrasted with those

of interpersonal love studies in psychology. An interesting extension would an investigation of the three dimensions of love: intimacy, passion, and commitment (see Sternberg 1986) to further understand the building and structure of romantic consumer-product relationships.

Just for Fun

A History of Mentality based Analysis of Hedonic and Experiential Consumption

Christian Jantzen, Aalborg University
Per Østergaard, University of Southern Denmark
James A. Fitchett, Nottingham University Business School

EXTENDED ABSTRACT

We call attention to experience orientation (Hirschman and Holbrook 1982; Holbrook and Hirschman 1982) as an important dimension in consumer research. We do not claim that this striving for experiences is the dominant or only factor of motivation when consumers behave in the market place. But we claim that experiences have an important function for consumers when they have to evaluate the significance of products for their life. Experiences are an important component in the current perception of 'the good life'. Demographically, we assume that this striving has become much more widespread during the last decades. The reasons for this are increased economic possibilities for a greater proportion of the population and a modern form of hedonism. The experience orientation is moreover stimulated by the aesthetization of commodities that has taken place during the last century. In a sense the experience orientation is the concise answer to this aesthetization, since the consumer can use aesthetics in the construction of a coherent self.

The feelings and fantasies from which experiences originate are, however, double edged. Experiences can be joyful, but longing after experiences can result in existential doubts and a fundamental uncertainty. Actual experiences will frequently fail to match prior expectations. We have tried to reflect upon the troubles which the self-actualisation process creates for the individual and the dilemmas that the experiences-seeking individual faces. Hedonism has been given only sporadic attention in consumer research and these scarce contributions do not relate experience orientation to the constitution of the self in modern post-industrial societies. If we want to gain a more profound understanding of the importance of the construction of the consumer in the buying decision and in consumption in general, then we have to reconsider hedonism and the experience orientation. This is done through an analysis of the history of mentality with special attention to the concept of hedonism. Elias (1982, 1989) and Schulze (1992, 1997) are main sources for our inquiry into the history of mentality. It is shown that hedonism has to be divided into a traditional and a modern form (Campbell 1987). The latter represents the hedonism we are dealing with in our culture. This kind of hedonism is not just irrational behavior. Instead is it possible to get a reasonable conceptualisation of modern hedonism. This will give new insights into the sociological theory on consumption. In addition greater attention towards hedonistic aspects of consumption illuminates several areas of consumer research. We will conclude by drawing attention to four areas where the perspectives from this study can be used. Firstly, we need a systematic investigation of how daydreams influence the consumer. What does it more precisely mean for decision-making and for the evaluation of an acquisition? Secondly, there is a variety of consumer behavior that could be investigated from this perspective. What does it mean to browse in shops without buying, to haggle, or to buy second hand objects? For many these are very relevant and meaningful ways of dealing with the world of goods. But why is browsing in shops a significant joyful behavior? What do consumers expect from such behavior? What turns it into a disappointing experience? Thirdly, it is significant to throw light on when and why fantasies turn into mania, where a certain feeling is

isolated and grows into a compulsive behavior. This is known from collecting mania and compulsive buying. These obsessions could have the origin in a longing for experiences. Fourthly, it would be fruitful to investigate what a meaningful experience means for different groups of consumers. What kind of qualities do they find significant in an experience? And what kind of products do they perceive as especially suitable experiences?

SPECIAL SESSION SUMMARY

Consumer Reactions to Marketing Practices: Skepticism, Suspicion, and Payback

Peter R. Darke, University of British Columbia

SESSION OVERVIEW

There are a number of reasons to believe that consumers have become increasingly concerned about the practices of marketers. For instance, books criticizing common marketing practices, such as Eric Schlosser's *Fast Food Nation* and Naomi Klein's *No Logo*, have become best sellers. Political groups have generated considerable consumer awareness about business practices they view as questionable. Even well-known companies that normally hold positions of high esteem have found themselves in the midst of controversy. For instance, Nike was accused of using child labor to manufacture its products, while McDonalds and Starbucks have been accused of paying their employees less than a living wage. Similar criticisms have focused on the advertising of companies like Walmart, who are accused of misleading consumers with their claim, "Always the low price—always."

Consumer trust in business has also declined noticeably. For instance, Nye et al. (1997) found that the proportion of people who are cynical of major corporations has doubled in the past 30 years. Other evidence suggests that consumer distrust focuses more on some industries than others. A recent poll by Ipsos-Reid (2003) found the advertising industry was close to the bottom in terms of consumer trust (only 17% of respondents trusted this industry), whereas the medical research industry (62%) and the tourism industry (57%) were trusted by the majority of consumers. *Advertising Standards* (a regulatory group in Canada) recorded a two fold increase in consumer complaints about advertising between 1997 and 2001 (www.adstandards.com). A similar trend has been observed in the willingness of consumers to withhold patronage from companies they perceive as engaging in political or social abuses. In fact, over 800 products are currently the target of consumer boycotts around the world.

The scrutiny that consumers exercise towards marketing can take many forms, ranging from healthy skepticism involving increased attention to the activities of the marketer, to more negative reactions involving general suspicion towards marketers, or even action against companies in the form of boycotts. Recent trends suggest a need to better understand the types of reactions consumers have towards marketing tactics. This special topics session examined consumer awareness of different marketer tactics. Each paper paid particular attention to the underlying psychological mechanisms involved. Specifically, the papers described in this session examined the skepticism, suspicion, and blame that can result when consumers learn or suspect that marketers are behaving in questionable ways. The papers also examine the behavior directed towards the target company, as well as towards marketing in general. Finally, some of the papers also examine counter-measures that marketers can use to stem these reactions.

The discussant, Meg Campbell, helped to integrate the findings of the three papers. This discussion focused on distinctions between the types of consumer reactions that tend to be evoked by ulterior motives attributed to marketers, versus the more negative reactions that tend to be evoked when marketers break important social norms of being truthful, or when they break other ethical principles. Particular attention was paid to the information processing involved in the effects that skepticism, suspicion and blame have on consumer judgment and behavior, especially the similarities and important distinctions between these processes.

"The Skeptical Shopper: How Default Options Affect Choice By What They Tell Consumers"

Christina L. Brown, *The University of Michigan*

Aradhna Krishna, *The University of Michigan*

Almost every consumer has encountered "defaults" when choosing among alternatives: the "default" option is the one the consumer will automatically receive if he/she does not specify otherwise. Although default options are not restricted to the Internet, the operational advantages of the Internet have made them more pervasive over the past few years. For example, on the Dell Computer website, computer systems come in a pre-packaged combination of RAM memory, hard drive size, disk-drive options, monitor, software, etc. However, if the consumer prefers a bigger hard drive, or a small monitor, she may adapt the package to her preferences by selecting her preferred attribute option from a menu. More notoriously, almost every reader of this article will have encountered the "opt-out" e-mail list, in which the consumer condemns herself to a lifetime of promotional emails unless she takes the time to "deselect" the "send me emails" box.

In this article we argue that consumers may also treat default designations *as though they contain relevant information about the value of the product* (Prelec, Wernerfelt, and Zettelmeyer 1997; Wernerfelt 1995); i.e., when our preferences are uncertain, we look to defaults to tell us something about them. In particular, in some important circumstances a consumer might conclude that the default option *is the one the marketer prefers to sell*. In other words, the default is a marketing tactic that is interpreted by a consumer's "marketplace metacognition" (Wright 2002), his/her social intelligence about marketplace behavior (for example why and how marketers attempt to manipulate the behavior of consumers). We demonstrate that how the consumer responds to the default depends on whether this social intelligence is invoked and *what it means to the consumer* once invoked. Specifically, we show that how the consumer responds to the default will depend on 1) the ordinal position of the default (i.e., whether or not a less-expensive or more-expensive alternative is the designated default), 2) whether or not a consumer's marketing metacognition is readily accessible, and 3) whether or not a consumer is motivated and able to use marketing metacognition to interpret the meaning of the default.

Importantly, our view of "defaults as a source of marketplace information," filtered through a consumer's prior knowledge of the marketplace, suggests different empirical results than would default effects generated by inattentiveness on the consumer's part (Johnson et al. 2002) or by processing biases such as loss aversion, anchoring-and-adjustment (Park et al. 2000), and focus-of-comparison effects (Dhar and Simonson 1992). A story based on inattentiveness, anchoring, or focus-of-comparison should apply equally to low (less expensive) and high (more expensive) defaults. A story based on loss aversion suggests that a high default will be more powerful (i.e., more effective in changing choice) than a low default. These previous researchers are undoubtedly correct in their assessment that incomplete or biased processing helps make consumers more likely to choose default items in many circumstances. However, when defaults are information-based, we will show that *low (i.e., less expensive) defaults can sometimes be more powerful than high (more expensive) defaults*. Even more remarkably, information-based defaults may create negative or "backfire" effects: if

a consumer believes a marketer is suggesting a default that appears to be in the firm's best interests but not the consumer's interests, consumers may be *less* likely to choose an alternative when it is the default than when no default is indicated.

In our story about default effects, then, the consumer is not inattentive but skeptical and alert, reflecting that defaults can invoke the marketplace metacognition of the consumer to help him/her better predict the value of each alternative (Friestad and Wright 1994, Wright 2002). We present three studies to support our information-based explanation for default effects. In Study 1, we suggest circumstances in which low (less expensive) defaults may be more powerful than high (more expensive) defaults. In Study 2, we show that the strength and direction of the default effect depends on whether or not "marketplace metacognition" is clearly invoked, and whether or not subjects see the marketer as acting for or against the self-interest of the consumer. In Study 3, we distinguish marketplace metacognition from expertise, and show that information-based default effects depend on whether the consumer is motivated and able to use his/her marketplace metacognition to interpret that information.

"One Rotten Apple Spoils the Barrel: Advertising Deception, Defensive Processing, and Consumer Suspicion"

Peter R. Darke, University of British Columbia

Robin J. B. Ritchie, University of Western Ontario

Prior research has identified a number of types of advertising claims that are capable of misleading consumers, such as incomplete comparisons and implied superiority claims (Burke et al. 1997; Johar 1995; Shimp and Preston 1981). The current research builds on this work by examining how consumers respond once they discover they have been misled by an ad. In everyday life, consumers may discover an ad is misleading in a number of ways, for instance by detecting the falsehood on the basis of prior experience with the product, by examining the product after seeing the ad and discovering it does not live up to claims, or by learning of the deception through corrective advertising. In general, we propose that such claim-fact discrepancies (Gardner 1975) are likely to lead consumers to become *defensive*, in the sense they become broadly *suspicious* towards future advertising claims.

We investigated this idea in a series of experiments. The general procedure used in all studies was to manipulate the deceptiveness of an initial ad, and then examine the effects this deception had on attitudes and information processing relating to a second advertisement. According to the procedure, all subjects were given an initial ad that included claims suggesting the target product was of high quality. Subjects evaluated the product by rating its quality on a number of dimensions, and their responses indicated they generally viewed the product positively. Then, under the guise of an apparent debriefing for the first part of the study, the experimenter told subjects in the *deception condition* that *Consumer Reports* had tested the target product and found that it was actually one of the worst models on the market. Control subjects also saw the initial ad and evaluated the product, but this group was not given any additional information about the target product's performance. Manipulation checks confirmed that the initial ad was viewed as deceptive and also led subjects to feel fooled by the ad, relative to controls. Finally, all subjects were asked to evaluate a second ad. The main measures were attitudes towards the target product in the second ad, and cognitive elaborations of the contents of the ad. Measures of consumer suspicion were also included to test for mediation.

According to dual process theory (Chaiken and Trope 1999), the initial deception was likely to cause consumers to become

defensive towards further attempts at persuasion. That is, having been fooled once should make consumers more wary of being persuaded later. Five experiments generally confirmed this prediction by showing that deceptive advertising produced a negative bias in attitudes towards subsequent advertising messages by causing consumers to engage in a combination of *defensive systematic processing* and *defensive heuristic processing*. The findings further showed that consumer defensiveness not only applied to the original source of deception, but was also capable of generalizing from one advertiser to the next. These more generalized effects of deception occurred by increasing the level of suspicion consumers felt towards advertising as a whole, in accordance with a heuristic process known as *defensive stereotyping* (Kunda and Sinclair 1999). The evidence also argued against other potential mediators, such as negative affect and uncertainty. Evidence for the self-protective nature of these reactions was provided in a final experiment, which showed that the negative bias in judgment occurred only when the subjects were the direct victims of advertising deception, and not when subjects learned that other consumers had been the victims of deception.

We also varied the characteristics of the second ad, as well as the source of that ad, in order to identify whether consumer suspicion was more or less likely to generalize under these circumstances. These manipulations included: the strength of supportive advertising claims given in the second ad (strong vs weak arguments), the plausibility of a price discount claim (plausible vs exaggerated), and the prior reputation of the second advertiser (trusted vs unknown). In general, the suspicion that was induced by the initial advertising deception was rather robust, in that a negative bias was observed for every version of the second ad we used. Consumer suspicions also generalized to different product categories, to brand name products, and to ads from a different geographical location.

These findings largely supported the predictions of the dual process framework (Chaiken and Trope 1999), and the heuristic-systematic model in particular (Chen and Chaiken 1999). The results are also compatible with predictions made by other information processing models, especially the Persuasion Knowledge Model (PKM; Friestad and Wright 1994). This concerns the ways in which consumers interpret, evaluate and respond to marketers' persuasion attempts, as well as the idea that consumers can be defensive towards marketers. The current research provides empirical verification of that consumers can be defensive, and further shows that the scope of these effects can be rather broad. Our research also adds to PKM by identifying deceptive advertising as an important source of consumer defensiveness, and by providing additional ideas about the processes by which such effects may occur (e.g., through defensive stereotyping).

The implication for marketers is that false advertising can seriously undermine the effectiveness of further advertising communications. Given the extent to which consumer suspicions are shown to generalize, marketers should be concerned about the deceptive practices of other advertisers, not only with respect to their immediate competitors, but also with respect to deception that occurs in other product categories, and even in other markets. Our results show that suspicion can generalize across these factors. The findings also imply marketers cannot simply assume they are immune to the effects of false advertising so long as they avoid such practices themselves, or because they have built a positive reputation with consumers in the past. The suspicions of consumers were also shown to apply to such marketers. A potential solution to avoiding consumer suspicion in the first place is for advertisers to use an *expectations screening procedure* similar to the one pro-

posed by Gardner (1975), to help ensure that the products live up to the expectations created by ads, and thereby avoid generating consumer suspicion.

“The Effects of Pro-Boycott and Anti-Boycott Communications on the Individual Boycott Decision”

Vicki Morwitz, New York University

Sankar Sen, Boston University

Boycotts have become a pervasive and potent expression of consumer discontent in today's marketplace. Consumers are increasingly willing to withhold patronage to curb perceived market abuses and/or increase corporate sensitivity to their economic, political, and social concerns. Today, over 800 products, not to mention whole states and countries, are current targets for boycotts worldwide. Prior research (Sen, Gurhan-Canli and Morwitz 2001) has drawn on social dilemma theory and reference group theory to demonstrate that consumers' likelihood of participating in both economic and social-issue boycotts is jointly determined by their perceptions of the boycott's likelihood of success, their susceptibility to normative influence and the costs they incur in boycotting. More specifically, consumers' success perceptions are determined by factors such as their expectations of overall participation and efficacy, as well as the message frame inherent in pro-boycott communication whereas the costs they incur in boycotting are determined by their preference for the boycotted product and the availability of substitutes.

This paper builds on our understanding of the individual boycott decision by examining the effects of both pro-boycott (i.e. from the boycotting organization) and anti-boycott (i.e. from the boycott target) messages on consumers' boycott decisions. The importance of understanding such communication effects is underscored by both marketers' (i.e. the boycott targets) and boycott organizers' scant knowledge about the characteristics of effective boycott-related communication, which is perhaps the most important and often only instrument of persuasion at their disposal. Like prior research in this domain, this paper draws on social dilemma theory to test the relative effectiveness of three different types of pro-boycott messages on consumers' willingness to participate in an actual boycott of a prominent U.S. package-goods company over the issue of animal testing. The three messages focus on the benefits of boycotting, the likelihood of boycott success, and the costs (or lack thereof) of boycotting (i.e. by stressing the availability of substitutes) respectively. Moreover, we examine the effects of both consumers' exposure to an anti-boycott message from the marketer as well as its order relative to the pro-boycott message. We also build on past research on corporate social responsibility (Sen and Bhattacharya 1991) by examining how consumers' perceptions of the degree of congruence between them and the boycotted firm affects their willingness to boycott and their reaction to boycott-related communications.

We test for these effects in an experimental study that has a 3 (pro-boycott message type: 1=boycott benefits, 2=boycott success likelihood, 3=product substitutability) x 3 (anti-boycott message order: 1=no anti-boycott message, 2=anti-boycott message *before* pro-boycott message, 3=anti-boycott message *after* pro-boycott message) between subjects design. Aside from obtaining respondents' boycott intentions, we also obtained their ratings of boycott issue importance, their attributions regarding the cause(s) underlying the boycott call, their beliefs, in general, about boycotts and their beliefs about the relationship between socially responsible actions on the part of marketers and their ability to make high quality products. In a survey administered separately from and prior to the main experiment, we also obtained the same respondent set's preference for and loyalty to the boycott target's products, its

susceptibility to interpersonal influence and its identification with both the boycotting organization and the boycott target (i.e. the company).

Our results suggest that pro and anti-boycott communications can influence consumers' boycott participation decisions. We find that pro-boycott communications are most effective when they provide information about how to reduce the costs associated with boycotting (i.e., by providing information about available substitutes). However communications provided by the boycotted firm can reduce or in some cases eliminate the effect of pro-boycott communications. In addition, consistent with past research on corporate social responsibility, we find consumers' perceptions of congruence between their own characteristics and that of the boycotted firm also affect their willingness to boycott. Although intuitively one might expect customers who perceive high congruence to a boycotted firm to be more immune to pro-boycott communications, we find instead that customers who perceive a high degree of congruence with the boycotted firm are more likely, in the face of pro-boycott communications to participate in the boycott. Finally we find that consumers' attributions concerning cause(s) underlying the boycott call mediate the effects of pro- and anti-boycott communications and consumers' perceptions of congruence with the boycotted firm on consumers' likelihood of boycotting. Specifically consumers' perceptions of congruence with the boycotted firm affect their attributions (the greater the overlap with the boycotted firm the more likely consumers are to believe the cause of the boycott is controllable by someone, related to factors inside of the boycotted firm and says something about the boycotted firm). Pro- and anti-boycott communications affect whether consumers believe the cause of the boycott is related to factors inside of the boycotted firm. These attributions in turn affect consumers' willingness to boycott. Overall consumers are more likely to boycott when they believe the cause for the boycott call is controllable by someone, related to factors inside the boycotted firm and when it says someone about the boycotted firm.

ROUNDTABLE
Planting the Seed of Consumer Behavior in Latin America: Is it Time for ACR-Latin America?

Silvia Gonzalez, ITESM
David Luna, CUNY

Participants in this roundtable session discussed the roles that ACR-Latin America would play in the development of academic consumer research in Latin American countries. There seems to be some interest among academics in the area, but there are barriers to the development of consumer research. For example, there is a lack of funds to travel to the United States for conferences like ACR and a lack of experience with social science research.

Attendees to the session discussed, among others, a possible role for the organization in coordinating doctoral student and faculty exchanges, workshops, and symposia in Latin American countries held jointly by U.S. and Latin American scholars. The session focused on brain-storming regarding a possible Latin American conference in 2006. It was concluded that holding a conference in Latin America is crucial to attract attention and get people involved. Pros and cons of different locations for the conference were discussed. The attendees suggested that a research symposium and a doctoral consortium should be held in conjunction with the conference. Also, we discussed the possibility of tapping into other fields (psychology, anthropology,...) in Latin-American universities in order to attract academics trained in social science research methodologies to consumer research.

The session concluded with the objective of setting up a discussion forum to further discuss possible conference locations. A Program Committee should be formed by early 2004. Also, we should propose reserving a special session in the 2004 North American ACR conference for Latin-American scholars to present their work. This last point would address the perception among marketing academics that Latin American researchers should have a better representation in ACR.

SPECIAL SESSION SUMMARY

The Role of Unconscious Processes in Consumer Choice and Decision Making

Kyeongheui Kim, University of Minnesota

Robert S. Wyer Jr., Hong Kong University of Science & Technology

SESSION OVERVIEW

Despite the growing evidence of unconscious influences in social cognition research, this new stream of research has only recently been applied in consumer contexts. This session intended to provide an integrative view of the current work in this area and to serve as a catalyst to spark collaborative research among people in consumer behavior and psychology.

The session had two major objectives. The first was to uncover the role of unconscious processes in consumer behavior by investigating the behavioral effects of unconscious processes, assessing the cognitive mechanisms that underlie the unconscious influences, and identifying boundary conditions for the effects. The three papers in this session combined diverse theoretical approaches in an effort to achieve this objective. The second objective was to encourage research on this issue. This session had been developed to appeal to a variety of perspectives and research approaches by examining the issue from different angles. Two of the papers employed conscious priming methods and experiments, while one used subliminal priming and experimental games. Moreover, each paper used different styles of primes such as goals, stereotypes, and traits, and incorporated several moderating factors such as the types of choices (choice for the self vs. for others) and dispositional factors (social value orientation and consistency).

Theoretically, the proposed session should advance the research on consumer choice and decision making by shedding light on the important and substantial role played by unconscious processes in consumer contexts. Moreover, three papers, each of which was collaborated by consumer researchers and psychologists, should benefit to broaden our perspective on unconscious processes in consumer contexts. Furthermore, by incorporating different types of priming and experimental methods, it should make a significant methodological contribution to consumer research on behavior.

“Effects of Nonconscious Goal Priming on Consumer Choice Behavior”

Baba Shiv, University of Iowa

Joel Huber, Duke University

Tanya Chartrand, Ohio State University

What sets goal pursuit into motion? Perhaps the most intuitively appealing and compelling answer is that we do. Reflecting this, most models of self-regulation posit continuous, conscious choice and guidance as a central feature, if not the core foundation, of goal pursuit. However, goal pursuit does not always involve deliberate direction of goal-driven behavior. Sometimes goal pursuit occurs outside of one's awareness, intent, and even control. In the current research, we explore whether consumers can have goals related to purchasing behavior that are nonconsciously activated, and automatically guide subsequent consumer cognition and behavior. Our results suggest the answer is a clear yes.

“About Prisoner's and Dictators: The Role of Subliminally Presented Stereotype Primes and Social Value Orientation in Shaping Cooperative Behavior”

Dirk Smeesters, Tilburg University

Luk Warlop, Katholieke Universiteit Leuven

Vincent Yzerbyt, Université Catholique de Louvain

Olivier Corneille, Université Catholique de Louvain

Eddy Van Avermaet, Katholieke Universiteit Leuven

The present research examines the effects of situation (stereotype primes) and person factors (social value orientation and consistency) on cooperative behavior in various experimental games. Results indicated that the main and joint influences of these situation and person factors on cooperative choices depend on the nature of the game (prisoner's dilemma vs. dictator game). Social value orientation, consistency, and primes only affect cooperative behavior in a dictator game, while these factors also lead to rumination about partner's personality (and therefore to different cooperative choices) in a prisoner's dilemma game. Differences between these games were explained in terms of other- and self-focus.

“Effects of Priming on Product Choices for the Self versus for Others”

Jongwon Park, Korea University

Kyeongheui Kim, University of Minnesota

Junsik Kwak, Korea University

Irene Blair, University of Colorado at Boulder

It is well documented that priming can have a substantial effect not only on perceptions of other persons, but also on one's own behavior. For the most part these two effects have been considered separately. The goal of our present research is to investigate priming effects on both social perception and self behavior in a single experiment using a consumer choice paradigm. Participants in Study 1 were administered an initial task in which either concepts associated with “wasteful” was unobtrusively primed or not. Then, in an ostensibly unrelated study, they read information about two automobiles (“luxury” model and “basic” model) with an objective of making a choice between the two either for themselves or for someone else unknown (*choice objective*: self/others). The results confirmed that priming can have different effects on choices made for the self versus for others. Finally, Study 2 is to provide insights into the underlying processes that mediate the findings in Study 1.

SPECIAL SESSION SUMMARY

When What I Think Feel And Do Depends on Who I Am: Identity Effects on Judgment, Choice and Self-Reinforcement

Americus Reed II, University of Pennsylvania

SESSION OVERVIEW

Every consumer has the potential to socially identify with others on a multitude of variables including shared traits, matching avocations, common political affiliations, similar religious beliefs, and common ethnic heritage (cf. Deaux, Reid, Mizrahi, and Ethier 1995). In fact, throughout the life course, socialization within a culture causes a person to become aware of the infinite number of social identities that may be potential bases for self-definition. Some are more permanent (e.g., mother, daughter, friend, African-American, etc.) while others may be more transitory (e.g., Republican, athlete, graduate student etc.). These identities can influence judgment, behavior and performance. For example, black females for whom ethnic (female) identity was salient had more favorable (unfavorable) perceptions of OJ Simpson's innocence (Newman, Duff, Schnopp-Wyatt, Brock & Hoffman, 1997). Similarly, Asian-American women's math test scores improved when their ethnic identity was activated, but worsened when their gender identity was activated (Shih, Pittinsky & Ambady, 1999).

Social identity may be the basis by which consumers think about various actions or judgments (Reed II 2002). Past research suggests that identity effects on judgment appear to depend upon the salience of the identity, its self-importance (or strength of identification), and its relevance to the judgment object. Although more and more research on identity is continuing to emerge, the implications of identity for consumer judgment and decision-making are only beginning to attract conceptual and empirical investigation (cf. Flemming & Petty, 1999). Several important questions remain. For example, what are the implications of forming a consumer judgment based on identity in terms of belief perseverance and attitude change? How and when do potentially differentially salient identities impact consumer choice? Finally, how does a judgment based on a consumer's identity bi-directionally reinforce the structure of the person's social self-schema? These three questions are directly addressed in the three papers in this special session.

The first paper (Bolton and Reed) examines the fundamental proposition that identity judgments can create sticky priors than analytic thinking; i.e., a procedural bias in favor of the initial identity judgment. Moreover, the authors investigate the effectiveness of various techniques to undo identity-driven judgment effects, including counter-reasoning, counter-identification and social influence. Their findings attest to the power of identity in judgment. The second project (LeBoeuf & Shafir) examines the effects of identity salience on choice. The current results paint a picture of malleable preferences that is quite inconsistent with the normative requirement that preferences be globally-considered and unaffected by irrelevant particulars of a given consumer decision situation. These findings extend prior work by demonstrating that even when the choice description, method of elicitation, and number of alternatives are held constant, preferences remain malleable due in part to peoples' malleable self-concepts. The final paper (Forehand, Reed & Perkins) uses the implicit association test in an identity context to capture identity accessibility as a function of the social context and to test how the extent to which expressing a particular identity-driven consumer judgment reinforces or diffuses the strength of association between evaluative traits linked to the identity and the consumer's implicit sense of self.

"Sticky Priors: Identity Effects on Judgment"

Lisa Bolton, *The Wharton School*

Americus Reed, II, *The Wharton School*

Extended Abstract

Social cognition research suggests that the self and its multiple identities represent a complex and highly elaborate knowledge structure in memory (cf. Kihlstrom & Kleine, 1995). The assumption is that identity activates an elaborate and integrated schema that is relevant to the self, frames the target of judgment and drives thinking that incorporates aspects of the self that are linked to the social category. Because people gain subjective validity that their judgments are "correct" to the extent that similar others agree with them, identity-driven processing is likely to lead to judgments in which people are more confident in predictions about future self-relevant attitudes and behavior (Markus, Smith & Moreland, 1985). Hence, identity-driven judgments may be resistant to change (Markus, 1977). The aforementioned arguments suggest that identity driven processing may reflect one-sided reasoning driven by the perspective linked to a single identity—in contrast to more analytic judgments that apply reasoning in a relatively evenhanded manner. We examine whether identity-driven thinking and subsequent identity-based judgments are a source of sticky priors. Once an elaborate and self-integrated schema triggers an initial identity-based judgment, it may be difficult to "undo" by reasoning from an alternative perspective.

We examine this question in four experiments. In all experiments, people are asked to reason about a judgment object or an issue from the perspective of a salient social identity. We employ various kinds of identities (e.g., parent, teenager; businessperson, environmentalist) linked to different objects and issues (e.g., Internet censorship; pollution credits, electronic books). We examine the persistence of identity-based judgments after engaging in subsequent analytic thinking intended to counter the initial identity-driven judgment. In experiment 1, we investigate "inoculation" and test whether identity effects are reduced if preceded by analytic thinking. In experiment 2, we examine the extent to which self-generated analytic reasoning can counteract an initial identity-based judgment. In experiment 3, we explore the use of "dueling identities" in judgment of diagnostic and non-diagnostic targets. Finally, in experiment 4, the perseverance of identity-based judgments in the face of social influence from others is investigated.

Overall, our findings support the perseverance of identity effects on judgment. Strong identities lead to identity-driven thinking and judgment that resists subsequent corrective analytic techniques. Our findings are consistent with several aspects of the literature. For example, van Knippenberg and Wilke (1992) suggested that people are more interested in information expressing in-group attitudes than information not about their group (Flemming & Petty, 1999). This research suggests that people should perceive self-generated identity-based arguments as stronger and more valid and thus more persuasive than non-identity-based arguments—when identification is strong. For example, in the attitude literature, Terry and Hogg (1996) found that perceived norms linked to a behaviorally relevant reference group ("regular exercisers") influenced intentions to engage in exercise, but only for subjects who identified with the group (Terry and Hogg 1996, experiment one;

see also Madrigal, 2001; Ybarra and Trafimow 1998; Gerald and Hoyt 1974; Cota and Dion 1986). Not only will strength of identity influence the effect of group norms on attitudes and intentions, but also the extent to which such attitudes are resistant to counter-influence. For example, Markus argued that some people are highly schematic on certain trait dimensions and people who are self-schematic are more resistant to information that contradicts their self-concepts (Markus & Wurf, 1987). Our results confirm the perseverance of judgments driven by a social identity strongly linked to the self and the relative ineffectiveness of subsequent efforts to counteract the stickiness of identity judgments.

"Preference Reversals from Identity-Salience Shifts"

Robyn A. LeBoeuf, University of Florida
Eldar Shafir, Princeton University

Extended Abstract

People hold numerous social identities that stem from a variety of sources, including group memberships, societal roles, and demographic characteristics. For example, a working woman may be a lawyer, but may also be a mother, a daughter, an American, a

Christian, and so on. The salience of these identities is thought to fluctuate, with certain cues having the ability to alter the salience of a person's identities at any given time. Theories of the self-concept, particularly self-categorization theory (e.g., Turner, 1987), predict that attitudes and values will align with the momentarily salient identity. Thus, a person may adopt "motherhood" values when her "mother" identity is salient, but her work environment, for example, may provoke a shift in salience, leading values to align instead with a professional identity. In line with such theories, we predict that people's expressed preferences will fluctuate as identity salience fluctuates; this is in contrast to standard assumptions that a person carries around a unique, and fairly consistent and stable, preference ordering.

An initial demonstration took advantage of two conflicting identities held by our participants, undergraduate college students. On the one hand, these students are novice academics who wish to engage in intellectual pursuits; on the other hand, they form part of social groups devoted to leisure and fun. Participants completed a variety of unrelated tasks over the course of an hour; among these were an identity-salience manipulation and a preference assessment task (these were structured to look quite different from each other to prevent any suspicion of connection between the tasks). A series of open-ended questions was designed to highlight for students either their scholar or their socialite identities. In a seemingly unrelated task, participants were then invited to make several choices among newspapers, magazines, and movies. Across four different choices, preferences assimilated to the salient identity; that is, preferences were reliably more scholarly and serious when a scholar, as opposed to a socialite, identity had been made salient. A follow-up study replicated this effect using a different identity-salience manipulation and slightly different dependent measures.

We then expanded on the initial findings by investigating whether cultural identities could be manipulated to effect preference change. The participants, who had been born in China but had lived approximately half of their lives in the US, responded to questions designed to trigger either their American or their Chinese identities. They then completed several choice tasks, including a Prisoner's Dilemma game, that assessed preferences for individualism versus collectivism. Overall, those for whom the American identity had been made salient expressed preferences congruent with an American stereotype (e.g., preferences for individualism), whereas those for whom the Chinese identity had been evoked expressed preferences congruent with a Chinese stereotype (e.g., preferences for conformity and collectivism).

Two other experiments explored whether *identity* plays a privileged role in these identity-salience effects. To the extent that identity plays a pivotal role, the pattern of effects should depend upon participants' levels of identification with the evoked identities. To investigate this, we manipulated the salience of undergraduates' scholar and socialite identities and separately measured these students' levels of identification with those identities. Preferences for consumer goods only assimilated to the salient identity for those who identified with at least one of the two target identities. For those low in identification with both identities, there was a reliable contrast effect, with preferences being more stereotypically social after the scholar, as opposed to the socialite, identity was made salient. Level of identification therefore moderated the incidence of identity-congruent preference reversals.

We continued the exploration of the role played by identity by investigating the impact of an identity-salience manipulation for people who do not actually hold the evoked identity. We recruited businesspeople, all of whom had an occupational identity, but only half of whom had a nuclear family (i.e., were married or had

children). We attempted to make salient either family or occupational identities, and we then assessed preferences for spending time at work or with family. Preferences were indeed more family-oriented following the family-identity elicitation than the occupational-identity elicitation, but this was true only for those who had nuclear families, and thus, family identities. This suggests that a person actually needs to hold the evoked identity before preferences can assimilate to it; this is in contrast to certain behavioral priming effects in which behaviors (e.g., walking speed, Bargh, Chen, & Burrows, 1996) assimilate to all manner of non-held identities. These last two experiments suggest that identity plays a key role in the observed preference assimilation patterns, as the pattern of effects will depend upon a person's relationship to the evoked identity.

Taken together, these studies show that preferences are affected by identity-salience manipulations; in particular, when an identity that a person holds and identifies with is evoked, preferences will assimilate to that identity. While these findings are clearly relevant to self-categorization theory, they also inform research on preference inconsistency, as they paint a picture of malleable preferences that contrasts with standard assumptions of preference stability. The findings extend prior work in the area of behavioral decision making by demonstrating that even when choice description, method of elicitation, and number of alternatives are held constant, preferences remain malleable due in part to peoples' malleable self-concepts.

"Identity Reinforcement: The Dynamic Effects of Evaluation on Implicit Self-Concept"

Mark Forehand, University of Washington
Andrew Perkins, University of Washington
Americus Reed II, The Wharton School

Abstract

A great deal of research demonstrates that accessible and self-important social identities affect judgments in predictable ways, but relatively less research has investigated the processes that underlie the accessibility of one's identity and the likelihood that an identity will be utilized in the formation of consumer preferences. Recent research has identified three main classes of variables that may influence identity accessibility: enduring traits such as strength of identification with a specific identity, aspects of the social context in which a consumer resides, and contextual primes that can activate or prompt identity-based processing (Forehand & Deshpande 1999). The present research attempts to expand our understanding of the interactive nature of these disparate sources of identity accessibility. Moreover, it proposes that the use of accessible identities in the evaluation of consumer products and services can create a feedback loop that reinforces the core identity itself. The interactive nature of these sources of identity accessibility and the process by which identity-based attitude expression reinforces

identity are demonstrated in three experiments using both explicit measures of identity accessibility and the Implicit Association Test or IAT (Greenwald, McGhee, & Schwarz 1998).

In the first two experiments, consumer sensitivity to situational manipulations of distinctiveness (McGuire, McGuire, Child, & Fujioka 1978) was assessed using standard explicit self-report measures and using IATs. The IATs measured the degree to which each participant associated the self with identity-related concepts and thereby provided implicit measures of identity accessibility. Specifically, both experiments conducted two sets of IATs, one to assess the accessibility of gender as a component of the individual's self concept and one to assess the accessibility of ethnicity as a component of the individual's self-concept. In these first two experiments, participants initially completed a battery of demographic items, personality scale items, and self-identity IATs to provide baseline measures of their prevailing identity accessibility. Several weeks after this initial measurement, the respondents participated in an ostensibly unrelated experiment in which the composition of the participant's immediate social environment was either measured (Experiment 1) or manipulated (Experiment 2). It was hypothesized that participant identity accessibility during this second session would be influenced not only by the respondent's distinctiveness within their immediate social context, but also by their general sensitivity to such social information (as measured using Snyder's self-monitoring scale). The results confirmed that the social distinctiveness did influence both explicit and implicit identity accessibility, and that the influence of distinctiveness on identity accessibility was moderated by the respondent's predisposition toward self-monitoring. Specifically, high self-monitors were influenced by social cues to a greater extent than were low-self-monitors. This pattern of results was observed on both explicit and implicit measures of identity accessibility.

In the third experiment, we assessed the degree to which the expression of an identity-based preference reinforces identity accessibility. It is hypothesized that the use of one's identity as an informational cue in attitude expression reinforces the accessibility of that identity and thereby increases the likelihood that the identity will be used in subsequent judgments. To test this hypothesis, an experiment was conducted in which participants evaluated identity-relevant stimuli (an advertisement for vitamins intended for either children, young adults, or seniors) and then completed an Implicit Association Test that measured the participant's self-association with youth. Compared to participants who evaluated the young adult version of the ad (the control condition), participants who evaluated either the children-focused ad or the senior-focused ad demonstrated stronger associations between the self and youth. This finding suggests that the use of an identity in an evaluation activates pre-existing identity associations. Since the majority of consumers possess pre-existing strong associations between the self and youth (Nosek, Banaji, & Greenwald 2002), this identity activation increased the observed association between self and youth.

SPECIAL SESSION SUMMARY

You Done Me Wrong (And That Ain't Right): The Role of Betrayal in Consumer Behavior

Andrew D. Gershoff, Columbia University

SESSION OVERVIEW

When pivotal expectations of a trust are violated then betrayal may be experienced (Elavgovan & Shapirio 1998). While betrayal has been studied in relationships among individuals (Buunk 1982) and between individuals and employers (Morrison & Robinson 1997), only recently have we begun to examine the role of betrayal in consumer behavior (Koehler & Gershoff 2003; Price, Bardhi & Arnould 2002).

This session contributed to our understanding of role of betrayal in consumer behavior by investigating antecedents of betrayal (violations of expectations and relationship norms), moderators of effects of betrayal (degree of norm violation, type of norm violation, betrayers' recovery attempts, type of betrayal experienced, decision frame factors, and deciding for oneself or for others), and consequences of betrayal (fleeing the relationship, negative word-of-mouth, and acceptance of increased risk).

Keith Niedermeier, first presented a paper coauthored with Yoshinori Fujikawa and William T. Ross, Jr. entitled *Betrayal in Consumer-Retailer Relationships*. This paper investigates expectations of relationship norms associated with price setting policies by retailers, and how the extent and type of relationship norm that is violated influences the betrayal experienced and subsequent behaviors. Two completed studies were presented. In the first study they find that post-purchase discovery of a lower price leads to greater intention to voice complaints, exit the relationship, and spread negative word of mouth when the lower price is found to be offered by the retailer in a separate channel as opposed to by a competitor. These behaviors are found to be mediated by feelings of betrayal. In the second study they find that the degree of norms violated moderates the feelings of betrayal while the type of norms violated moderates the subsequent behavioral intentions.

Linda Price then presented a paper coauthored with Eric Arnould and Fleura Bardhi entitled *Service Providers' Road to 'Hell': Service Betrayal, Consequences and Recovery Attempts*. This paper examines the effects of service failures involving betrayal on the effectiveness of service recovery attempts. Two completed studies were presented. In their first study they manipulated whether or not the service failure involves a betrayal and whether or not there is an existing commercial relationship with the provider. Betrayal had a substantial impact on negative emotions, feelings of injustice, dissatisfaction, revenge and other behavioral intentions. A pre-existing relationship tempered responses to both failure and betrayal. A pre-existing relationship also influences the type of negative emotions experienced following failure and betrayal. Study 2 examined whether service organizations can recover from betrayal by employing a full recovery strategy of apology, compensation and taking responsibility as suggested in the services management literature. Recovery had a significant positive impact on emotions, feelings of justice, satisfaction and behavioral intentions for both service failure and betrayal. However, significant differences between failure and betrayal remain even following a full recovery attempt. This has important implications for how organizations avoid and recover from service betrayal, as compared to service failure.

The third paper entitled *Avoiding Betrayal Over Choosing Safety? The Moderating Effects of Type of Betrayal, Type of Choice, and Choosing for Others on Betrayal Aversion* was presented by Andrew Gershoff, coauthored with Jonathan Koehler.

While the first two papers examined how betrayal affects consumers' behavioral intentions after a betrayal occurs, this paper examined consumer decisions prior to the occurrence of betrayal where only a probability of betrayal exists. Three studies were presented that examined how consumers make choices for safety products that have a very small risk of betraying by causing the very harm for which they are employed to prevent. In the first study they replicate their prior betrayal aversion finding: Consumers choose and prefer safety devices (airbags) with higher overall risks of death in order to avoid very small probabilities of betrayal. This study also makes the distinction between an active betrayal (an airbag with a small probability of causing death by the force of its deployment) and a passive betrayal (an airbag with a small probability of causing death by failing to deploy) and finds that active compared to passive betrayals are perceived as more egregious and are more avoided in choice. A second study finds that betrayal aversion can be attenuated when avoiding the betrayal means choosing no safety device at all. The third study finds that betrayal aversion is decreased and overall safer options are selected when the consumer chooses for someone other than him or herself.

"Betrayal in Consumer-Retailer Relationships"

Yoshinori Fujikawa, Penn State University

Keith E. Niedermeier, Penn State University

William T. Ross, Jr., Penn State University

The present research investigates the role of betrayal in consumer-retailer relationships. Betrayal has been studied primarily in person-person and employee-organization relationships, but less in consumer-firm relationships (with a few exceptions, e.g., Price, Bardhi & Arnould, 2002). Extant literature on close relationships and organization behavior defines betrayal as a perceived violation of a psychological contract by another (Morrison & Robinson, 1997). A psychological contract is one's belief about reciprocal obligations between oneself and another. Research further indicates that a psychological contract is often assumed by one side (e.g., employee), without the need for agreement by the other (e.g., employer). Applying this conceptualization to the current context, we define consumer betrayal as a perceived violation of a consumer's psychological contract with a retailer.

In the current research, we focus on investigating the role of betrayal in consumers' post-purchase reactions to cross-channel price differences, which is an increasingly common phenomenon. As many retailers now operate across multiple channels (e.g., stores, websites, and catalogs), they often do not standardize their marketing offerings across channels for strategic, organizational, or operational reasons. Compared to finding a lower price at a different retailer (the between-retailer condition), we argue that consumers are more likely to perceive a lower price at a different channel of the same retailer (the within-retailer condition) as violation of their psychological contract with the retailer and therefore experience feelings of betrayal. Betrayed consumers should react to the retailer by engaging in voice, exit, and negative word-of-mouth behaviors (Richins 1983). In other words, we predict that betrayal mediates the effect of post-purchase price differences on behavioral intentions.

We further theorize that consumers' feelings of betrayal and behavioral consequences will be moderated by perceived relationship norms that consumers apply to a particular retailer. Past

research in social psychology has identified two types of relationship norms: communal and exchange (Clark & Mills, 1979). Communal and exchange relationships differ in terms of the norms that govern reciprocal behaviors. In communal relationships, a person gives benefits to improve the welfare of the other, while expecting the partner to follow the same norm. In contrast, in exchange relationships, an individual provides benefits in response to past favors or in expectation of future repayments, while expecting the other to reciprocate similarly.

By applying relationship norms to consumer-retailer context, we predict that the *degree* of relationship norm will moderate consumers' feelings of betrayal, whereas the *type* of relationship norm will moderate behavioral consequences. First, in both communal and exchange relationships, the more strongly consumers expect a retailer to follow the norm, the more betrayed they should feel in the within-retailer condition. Our rationale for this prediction is that consumers in both types of relationship perceive the within-retailer price differences as a violation of the retailer's reciprocal obligation (i.e., expectation of the retailer's caring about consumer welfare in a communal relationship or expectation of the retailers' reciprocating past or future favors in an exchange relationship). Second, we further hypothesize that betrayed consumers behave differently in the two types of relationship. That is, consumers who perceive a communal relationship should engage in constructive behaviors such as voice because such behaviors are consistent with the norms of improving mutual welfare. In contrast, customers who perceive an exchange relationship should resort to destructive behaviors such as exit and negative word-of-mouth because such behaviors serve the goal of restoring relationship equity.

We conducted two scenario-based studies. Study 1 was carried out to test the mediational role of betrayal. Participants in the within-retailer price difference scenario imagined a situation in which they purchased a PC at a fictitious retailer's store (\$1,000) and later found a lower price (\$900) at the same retailer's website. In the between-retailer scenario, consumers purchased a PC at a retailer's store (\$1,000) and later encountered the lower price (\$900) at a different retailer's website. Betrayal was measured based on three descriptors identified in a pilot study—"betrayed," "deceived," and "exploited."—anchored with "1. not at all" and "7. very much." ($\alpha_{\text{Betrayal}}=.93$). Behavioral intentions were also measured with seven-point single-item scales for voice (complaining, demanding apology), exit (reducing repurchase, switching retailer), and negative word-of-mouth. As expected, consumers in the within-retailer condition felt more betrayed than those in the between-retailer condition ($M_{\text{Within-Retailer}}=4.99$ vs. $M_{\text{Between-Retailer}}=2.71$, $F(1, 59)=27.10$, $p<.01$). In addition, consumers in the within-retailer condition were more likely to voice, exit, and spread negative word-of-mouth. Furthermore, mediation analyses suggest that feelings of betrayal mediated the effect of cross-channel price differences on behavioral intentions.

Study 2 was conducted to test the moderating effects of relationship expectation norms. Study 2's design was identical to Study 1, except that we used a real-world retailer (Wal-Mart) and an ink-jet printer in the cover story. Relationship expectation norms were measured with a 20-item scale ($\alpha_{\text{Communal}}=.72$, $\alpha_{\text{Exchange}}=.81$). We developed this scale by modifying existing relationship norm scales to reflect consumer's relationships with Wal-Mart (Clark, Oullette, Powerll, & Milberg, 1987; Chen, Lee-Chai, & Bargh, 2001). First, results replicated the findings from Study 1 such that participants in the within-retailer condition, versus those in the between-retailer condition, felt more betrayed and had more intentions to voice, exit, and spread negative word-of-mouth. Furthermore, moderated regression analyses revealed that, in both communal and exchange relationships, the higher the

relationship norm scores, the higher the level of betrayal in the within-retailer condition, supporting the predicted moderation by *degree* of relationship norms. In addition, consumers with higher perceived communal relationship norms, compared to those with higher perceived exchange relationship norms, were more likely to voice but less likely to exit in the within-retailer condition, supporting the predicted moderation by *type* of relationship norms. Negative word-of-mouth behavior did not differ.

Results across these studies indicate that consumers perceive the same retailer's cross-channel pricing as a violation of relationship norms, and betrayed consumers reacted differently depending on specific types of perceived relationship norms they apply to a given retailer.

“Service Providers’ Road to ‘Hell’: Service Betrayal, Its Consequences and Recovery Attempts”

Linda Price, University of Nebraska

Eric Arnould, University of Nebraska

Fleura Bardhi, University of Nebraska

Understanding service failures has recently garnered wide attention in the marketing literature. Service failures are viewed as a major cause of customer dissatisfaction (Maxham & Netemeyer 2002; Smith, Bolton & Wagner 1999); customer switching (Keaveney 1995), customer complaints (Colgate & Norris 2001); negative word-of-mouth (Richins 1983); and exhaustion of customer loyalty (Bejou & Palmer 1998; Mattila 2001). Theory and research has been directed at identifying different typologies and magnitudes of service failures (Bejou & Plamer 1998; Bitner, Booms & Tetreault 1990; Keavney 1995; Kelley, Hoffman & Davis, 1993; Mack, Mueller, Crotts & Broderick 2002; Mattila 2001; Richins 1983; Smith, Bolton & Wagner 1999). These inquiries have opened the way to a more recent stream of research that examines interactions between service failure type and magnitude of service providers' recovery attempts (e.g. Smith et al. 1999).

This paper is part of a broader program of research focused on consumer feelings of and responses to betrayal in service encounters. In previous work, we identified and differentiated service failures that feel like betrayal (Price et al. 2002), and differentiated commercial from interpersonal betrayal (Price et al. 2001). Some extreme service failures are perceived as incidents of betrayal because they damage relationship components and influence consumers' self-esteem and identity. Commercial betrayal is similar to interpersonal betrayal in several respects, but also has unique characteristics. As with interpersonal betrayal, commercial betrayal violates relationship norms and as such can be represented as a specific case of a breach of interactional justice (Price et al. 2001). Consumers perceive service betrayal as an extreme service failure with dramatic consequences for consumer satisfaction, intentions and behavior.

In this paper, we report results of two experiments. Our first experiment explored the consequences of commercial betrayal as compared to service failure, asking whether relationships make a difference in feelings of betrayal and the consequences of betrayal. A convenience sample of students responded to scenarios in a 2 x 2 between subjects design that manipulated the relationship with the service organization and service failure versus service betrayal. The experimental scenarios were based on interview data and constructed to map to several actual incidents of service betrayal. There was a significant main effect for betrayal versus failure and a weaker main effect for relationships across the set of dependent measures. Although the outcome was the same for failure and betrayal, ratings on distributive justice, interactional justice, satisfaction and repurchase intention were significantly lower for betrayal. Negative emotions, revenge and negative word of mouth

were significantly higher for the betrayal scenario. A pre-existing relationship with the service organization tempers consumers' response to both failure and betrayal.

In experiment two, we ask whether service organizations can recover from betrayal. We replicated experiment one but added in a complete recovery strategy as recommended in the services literature (Smith et al. 1999). That is, we used a 2x2 between subjects, repeated measures design. This study shows that service recoveries that include apology, acknowledgement of the cause of the incident, and express responsibility mitigate the negative consequences of service betrayal. The full recovery strategy had a positive impact in both the failure and betrayal scenarios, but even after the recovery attempt significant differences in consumer responses remained between failure and betrayal. A full recovery strategy was not able to close the distance between a service failure and a service betrayal. Specifically, even following the recovery strategy, consumer satisfaction is lower in the betrayal incidents compared to the service failure incident. Moreover, in the case of service failure, consumers perceived the recovery strategy as fair, did not express negative feelings or intention to revenge, and expressed future purchase intentions. In incidents of betrayal, after attempts to recover consumers still experienced feelings of anger and discontent and expressed intention to engage in negative word of mouth, revenge, and no future purchase intentions. Overall, this result shows that incidents of betrayal can have uncorrectable negative consequences in customer-organization relationships leading to their dissolution. An especially difficult challenge is to recover from consumers' attributions of intentionality that are a common factor in feelings of betrayal. We end our paper with a discussion of how organizations can alleviate instances of betrayal and enhance likelihood of recovery.

“Avoiding Betrayal Over Choosing Safety? The Moderating Effects of Type of Betrayal, Type of Choice, and Choosing for Others on Betrayal Aversion”

Andrew D. Gershoff, Columbia University

Jonathan J. Koehler, University of Texas at Austin

A form of betrayal occurs when agents of protection cause the very harm that they are trusted to guard against. In choosing safety products consumers may experience betrayal when products intended to protect them, such as airbags trusted to save lives explode with such force that they cause death and when vaccines cause illnesses (Wald 1996).

Recently, Koehler & Gershoff (2003) demonstrated a betrayal aversion such that for identical negative outcomes, individuals request more punishment for, have more negative emotions toward, and more frequently seek to avoid potential betrayers compared to non-betrayers, even when doing so means accepting a greater overall risk of injury. For example, most subjects were willing to double their risk of death from automobile crashes, fires, and diseases to avoid a small possibility of death by airbags, vaccines, and faulty wiring in smoke detectors. Greater feelings of betrayal were found to be caused by a reaction to violations of positive expectations, or broken implicit or explicit promises, associated with the trust relationship. Negative emotions, such as anger and resentment, caused by the violation of expectations in a betrayal were found to be mediated by feelings of disorder and unpredictability in the social order.

The present research expands on this prior work by examining moderators of the effects of betrayal on consumer choice for protective, or safety products. Three completed studies examine the type of failure (passive or active), the type of choice (status quo present versus absent) and the decision maker frame (self versus other). Our results replicate and expand on our prior findings.

No safety product can always guarantee protection, but there are a number of ways in which they have the potential to fail. For example, an airbag that usually saves lives may fail by not deploying in an accident, allowing a passenger to die who might have otherwise been saved. Alternatively, an airbag may deploy with such force in an accident that it causes the death of a passenger. The unfortunate outcome of the failures is identical. However, while both violate expectations of trust (Rousseau, Sitkin, Burt & Camerer 1998), in the first case the failure is passive and in the second case the safety device is active in causing a death that otherwise would not have occurred.
