Advances in Consumer Research, Volume 33

(Duluth, MN: Association for Consumer Research, 2006)

Preface

The thirty-third Annual Conference of the Association for Consumer Research (ACR) was held at the Crowne Plaza Hotel in San Antonio, Texas, September 29th-October 2nd, 2005. This volume includes reports of the presentations made at the conference in special sessions, competitive paper sessions, the working paper session, roundtables and the film festival.

The theme for the conference was “For Consumers: Steps Toward Transformative Consumer Research.” Several special and competitive sessions offered stimulating perspectives and debate around the conference theme. In addition, the program offered the usual rich, diverse and high quality array of consumer research topics. This year, we accepted 41% of the 333 papers submitted for the competitive paper track, 48% of the 91 special session proposal submissions, and over 100 working papers. In addition, the program included a film festival debuting 11 films and 8 roundtable sessions. Seven hundred people attended the conference including 200 from outside the U.S. and over 230 students. Over 120 students signed up in advance for the doctoral symposium that preceded ACR.

We want to thank the generous donors who stepped forward to support the conference including the Marketing Department and the Terry J. Lundgren Center for Retailing at the University of Arizona, The Paul Merage School of Business at University of California Irvine, General Mills, The Labovitz School of Business and Economics at University of Minnesota Duluth, and the Marketing Department at The University of Texas San Antonio. We also want to thank the Kellogg’s Foundation and Cynthia Milligan, Dean of the College of Business, University of Nebraska and President of the Kellogg’s Foundation Board of Directors for a seed grant to fund research initiatives related to the conference theme.

Many people stepped forward to help us with this conference. We want to thank the ACR program committee, working paper reviewers, film festival reviewers and competitive paper reviewers. We also want to thank Loraine Lau-Gesk, University of California-Irvine and Patti Williams, University of Pennsylvania who co-chaired roundtables, Russell Belk, University of Utah and Robert V. Kozinets, York University who co-chaired the film festival, Carolyn Folkman Curasi, Georgia State University and Dan Freeman, University of Delaware for co-chairing the working papers poster session, and Rick Netemeyer, University of Virginia and Lisa Peñaloza, University of Colorado for co-chairing the doctoral symposium. In addition, we want to thank all of the student volunteers from University of Arizona, University of California at Irvine, University of Nebraska and University of Texas-San Antonio who helped throughout to make the conference go smoothly.

Some additional people deserve gratitude beyond measure. Alex Cherfas, University of Minnesota-Duluth and Lindsey Lambert, University of California Irvine both provided service to the organization that was nothing short of extraordinary. Tina M. Lowrey and L.J. Shrum took the job of chairing local arrangements to new heights. Mark Otnes stepped in at the last minute to create a fantastic cover design. Patty Solo Downs, ACR conference coordinator, was hired into an emergency situation and handled conference arrangements with grace and tireless resolve. Rajiv Vaidyanathan, ACR Executive Director was a remarkable support to us throughout the process, always available, and always happy to help. Foremost, we want to thank David Mick, President of ACR, for trusting us with the program, bringing vision and passion to the conference theme, and working tirelessly in the face of numerous emergencies to better the association and the 2005 ACR conference experience.

Cornelia (Connie) Pechmann, University of California, Irvine
Linda L. Price, University of Arizona
2005 ACR Conference Co-Chairs and Proceedings Editors

Conference Committees and Reviewers

PRESIDENT

David Mick, University of Virginia

CONFERENCE CHAIRS

Cornelia (Connie) Pechmann, University of California-Irvine

Linda L. Price, University of Arizona

PROGRAM COMMITTEE

Rohini Ahluwalia, University of Minnesota	Ran Kivetz, Columbia University
Craig Andrews, Marquette University	Jill G. Klein, INSEAD
Dan Ariely, Massachusetts Institute of Technology	Robert V. Kozinets, York University
Eric J. Arnould, University of Arizona	Mary Frances Luce, Duke University
Susan M. Broniarczyk, University of Texas	Edward F. McQuarrie, Santa Clara University
Jim Burroughs, University of Virginia	Elizabeth S. Moore, University of Notre Dame
Scot Burton, University of Arkansas	Albert Muniz, DePaul University
Tanya Chartrand, Duke University	Steve Nowlis, Arizona State University
June Cotte, University of Western Ontario	Michel Tuan Pham, Columbia University
Robin Higie Coulter, University of Connecticut	Aric Rindfleisch, University of Wisconsin-Madison
Elizabeth Cowley, University of Sydney	William T. Ross, Jr., Pennsylvania State University
Uptal Dholakia, Rice University	Hope Schau, University of Arizona
Aimee Drolet, University of California at Los Angeles	Norbert Schwarz, University of Michigan
Laurette Dubé, McGill University	Linda Scott, University of Illinois at Urbana-Champaign
Tulin Erdem, University of California at Berkeley	Sharon Shavitt, University of Illinois at Urbana-Champaign
Eileen Fischer, York University	Baba Shiv, Stanford University
Robert J. Fisher, University of Western Ontario	Dilip Soman, University of Toronto
Güliz Ger, Bilkent University	Jan-Benedict E.M. Steenkamp, Tilburg University
Ronald C. Goodstein, Georgetown University	Brian Wansink, Cornell University
Kent Grayson, Northwestern University	Richard Wilk, Indiana University
Margaret K. Hogg, Lancaster University	Carolyn Yoon, University of Michigan
Jeff Inman, University of Pittsburgh	George Zinkhan, University of Georgia

ROUNDTABLES

Loraine Lau-Gesk, University of California-Irvine

Patti Williams, University of Pennsylvania

FILM FESTIVAL

Russell Belk, University of Utah

Robert V. Kozinets, York University

WORKING PAPERS

Carolyn Folkman Curasi, Georgia State University

Dan Freeman, University of Delaware

ACR DOCTORAL SYMPOSIUM

Richard G. Netemeyer, University of Virginia

Lisa Peñaloza, University of Colorado

LOCAL ARRANGEMENTS

Tina M. Lowrey, University of Texas-San Antonio

L. J. Shrum, University of Texas-San Antonio

COVER DESIGN

Mark Otnes

SPECIAL THANKS TO

Melinda Burke, University of Arizona
Tandy Chalmers, University of Arizona
Aleksy Cherfas, University of Minnesota-Duluth
Samantha Cross, University of California-Irvine
Patty Salo Downs, ACR conference coordinator
Amber Epp, University of Nebraska-Lincoln
Gayle Fuguitt, General Mills Corp.
Merlyn Griffiths, University of California-Irvine
Jeff Hunter, General Mills Corp.
Kjell R. Knudsen, University of Minnesota-Duluth
Lindsey Lambert, University of California-Irvine
Robert Lusch, University of Arizona
Cynthia Hardin Milligan, University of Nebraska
Dante Pirouz, University of California-Irvine
Andy Policano, University of California-Irvine
Rajiv Vaidyanathan, University of Minnesota-Duluth

WORKING PAPER REVIEWERS

Brian Brown, Georgia State University,
Mary Chacko, Georgia State University,
David Crockett, University of South Carolina,
Naveen Donthu, Georgia State University
Yancy Edwards, University of Delaware

PRESIDENTIAL ADDRESS

<i>Meaning and Mattering Through Transformative Consumer Research</i>	1
David Glen Mick, University of Virginia	

ASSOCIATION FOR CONSUMER RESEARCH 2005 ACR NORTH AMERICAN CONFERENCE

FOR CONSUMERS: STEPS TOWARD TRANSFORMATIVE CONSUMER RESEARCH

FRIDAY, SEPTEMBER 30, 2005

SCP Executive Committee Meeting

Friday Sept. 30
7:00 a.m. – 8:00 a.m.

JCR Associate Editors Meeting

Friday Sept. 30
7:30 a.m. – 9:00 a.m.

Keith Hunt Newcomers' Breakfast

Sponsored by

.....
GENERAL MILLS

Film Festival

Friday Sept. 30
8:00 a.m.– 12:00 p.m.
and
2:00 p.m. – 6:00 p.m.

Saturday Oct. 1
8:00 a.m.– 12:00 p.m.

Saturday Oct. 1
2:00 p.m. – 3:00 p.m.

SPECIAL SHOWING OF
2005 PEOPLE’S CHOICE AWARD FILM
FOLLOWED BY DISCUSSION WITH FILMMAKER

Chairs:

Russell Belk, University of Utah
Robert Kozinets, York University

(15-minute filmmaker discussion followed premier showing of each film)

FILM FESTIVAL SUMMARY

ACR 2005 North American Film Festival Overview 5
Russell Belk, University of Utah
Robert Kozinets, York University

8:00 *The Paradox Between Only Looking and Possession* 5
Yu Chen, HEC, Paris

8:29 *Not Desperate Housewives: Turkish Housewives’ Consumption Practices at “Money Day” Gatherings* 5
Ebru Ulusoy, Istanbul University

9:05: *Headbanging: As Resistance or Refuge* 6
Marylouise Caldwell, University of Sydney
Paul Henry, University of Sydney

9:46: *Burning Bock* 7
Sven Bergvall, Royal Institute of Technology
Jacob Ostberg, Stockholm University

10:41: *What Do Consumers Consume in Santa? A Comparative Study of Santa Claus in Scandinavia* 7
Junko Kimura, Hosei University

10:56: *Gearhead Pilgrimage: The Queen Mary Summit of Indiana Jones* 8
Scott Smith, Central Missouri State University
S. Jason Cole, University of Kansas
Dan Fisher, University of Tulsa
Jeff B. Murray, University of Arkansas
Molly Rapert, University of Arkansas

11:33: *There and Back Again: A Consumption Journey* 9
Robert Kozinets, York University

2:00 *The Gospel of Prosperity: Charismatic Churches in Ghana* 9
Samuel K. Bonsu, York University
Russell W. Belk, University of Utah

3:35	<i>Las Cubanias: An Exploration of Life in Cuba</i>	10
	Sindy Chapa, University of Texas-Pan American	
4:05	<i>Erasing Futures: Ethics of Marketing an Intoxicant to Homeless Children</i>	10
	Ram Manohar Vikas Indian Institute of Technology, Kanpur	
	Rohit Varman, Indian Institute of Technology, Kanpur	

<p>SESSION 1 Friday Sept. 30 8:30 a.m.: – 10:00 a.m.</p>

Session 1.1 In Harm’s Way?: The Turbulence of Adolescence

Session Chair: Julie L. Ozanne, Virginia Tech
Discussion Leader: Marvin Goldberg, Penn State

SPECIAL SESSION SUMMARY

<i>In Harm’s Way? The Turbulence of Adolescence</i>	12
Julie L. Ozanne, Virginia Tech	
Laurel Anderson, Arizona State University	

Who Thinks They Know More – But Actually Knows Less? Adolescent Confidence in their HIV/AIDS and General Knowledge
Andrew M. Parker, Virginia Tech
Baruch Fischhoff, Carnegie Mellon University
Wändi Bruine de Bruin, Carnegie Mellon University

At Risk or Out Front? Understanding the Women of the Future
Linda M. Scott, University of Illinois

The Cyborg Teen: Identity Play and Deception on the Internet
Laurel Anderson, Arizona State University
Julie L. Ozanne, Virginia Tech

Session 1.2 The Inextricability of Conscious and Nonconscious Processes In Consumer Behavior

Session Chair: Stacy Wood, University of South Carolina
Discussion Leader: Chris Janiszewski, University of Florida

Conscious versus Nonconscious Detection of Product Attribute Change
Stewart Shapiro, University of Delaware
Mark T. Spence, Southern Connecticut State University

Conscious and Nonconscious Elements in Habitual Consumption Behavior
Stacy L. Wood, University of South Carolina
Kelly L Haws, University of South Carolina

Goals in Conflict
Tanya Chartrand, Duke University
Amy N. Dalton, Duke University

Session 1.3 **Emancipation or Commercial Exploitation? Case Examples**

Session Chair: Athinodoros Chronis, California State University, Stanislaus

<i>Emancipation Through Modernist Pursuits: The Discipline of Running</i>	15
Tandy D. Chalmers, University of Arizona	
<i>Brand-Personal Values Fit and Brand Meanings: Exploring the Role Individual Values Play in Ongoing Brand Loyalty in Extreme Sports Subcultures</i>	21
Pascale Quester, University of Adelaide	
Michael Beverland, The University of Melbourne	
Francis Farrelly, Monash University	
<i>Am I What I Wear? An Exploratory Study of Symbolic Meanings Associated with Secondhand Clothing</i>	28
Dominique Roux, University Paris 12-IRG	
Michaël Korchia, Bordeaux Ecole de Management	
<i>Constructing Hortiporn: On the Aesthetics of Stylized Exteriors</i>	36
Paul Hewer, University of Stirling	
Douglas Brownlie, University of Stirling	

Session 1.4 **When Brands Join Hands: Examining the Reciprocal Effects of Brand Alliance Strategies on Partner Brand Equity**

Session Chair: Vanitha Swaminathan, University of Pittsburgh

Discussion Leader: Stijn Van Osselaer, Erasmus University

SPECIAL SESSION SUMMARY

<i>When Brands Join Hands: Examining the Reciprocal Effects of Brand Alliance Strategies on Partner Brand Equity</i>	43
Vanitha Swaminathan, University of Pittsburgh	
<i>The Reciprocal Effect of Co-Branding: A Counter-Extensions Perspective</i>	
Piyush Kumar, University of Georgia	
<i>Image Reinforcement or Impairment: The Effects of Co-Branding on Attribute Uncertainty</i>	
Tansev Geylani, University of Pittsburgh	
Frenkel ter Hofstede, University of Texas at Austin	
Jeffrey Inman, University of Pittsburgh	
<i>Spillover Effects of Co-Branded Strategies: The Role of Attribute Fit and Type of Concept Combination</i>	
Vanitha Swaminathan, University of Pittsburgh	

Session 1.5 **Positive and Negative Moods and Information Processing Biases**

Session Chairs: Nikki Lee-Wingate, Rutgers University
Meg Meloy, Pennsylvania State University

<i>Why Consumers Buy Lottery Tickets When the Sun Goes Down on Them. The Depleting Nature of Weather-Induced Bad Moods</i>	46
Sabrina Bruyneel, Katholieke Universiteit Leuven	
Siegfried Dewitte, Katholieke Universiteit Leuven	
Philip Hans Franses, Erasmus University Rotterdam	
Marnik G. Dekimpe, Tilburg University/Katholieke Universiteit Leuven	
<i>Meddling-in of Affect in Information Integration</i>	48
Arul Mishra, University of Iowa	
Himanshu Mishra, University of Iowa	
Dhananjay Nayakankuppam (DJ), University of Iowa	

<i>Why Feelings Stray: Sources of Affective Misforecasting in Consumer Behavior</i>	49
Vanessa M. Patrick, University of Georgia	
Deborah J. MacInnis, University of Southern California	
<i>When Thinking Beats Doing: The Role of Optimistic Expectations on Goal-Based Choice</i>	57
Ying Zhang, University of Chicago	
Ayelet Fishbach, University of Chicago	
Ravi Dhar, Yale University	

Session 1.6 Consumer Researchers for Public Health: Insights from Three Government-Funded Programs

Session Chair: Cristel Antonia Russell, San Diego State University

SPECIAL SESSION SUMMARY

<i>Consumer Researchers for Public Health: Insights from Three Government-Funded Programs</i>	59
Cristel Antonia Russell, San Diego State University	

Obesity and the Social Environment: A Tale of Five Cities
 Jerome D. Williams, University of Texas at Austin
 Chiquita A. Collins, University of Texas at Austin
 William J. McCarthy, University of California at Los Angeles
 Antronette K. Yancey, University of California at Los Angeles

The Impact of Media on Adolescent Sexual Development
 Martin Fishbein, University of Pennsylvania
 Amy Jordan, University of Pennsylvania

Documenting the Nature and Impact of Alcohol Portrayals in TV Programs
 Cristel Antonia Russell, San Diego State University
 Dale W. Russell, University of Amsterdam
 Joel Grube, Pacific Institute for Research and Evaluation

Session 1.7 Exploring Masculine Ideologies

Session Chair: Gokcen Coskuner, University of Wisconsin, Madison
 Discussion Leader: Craig Thompson, University of Wisconsin, Madison

SPECIAL SESSION SUMMARY

<i>Exploring Masculine Ideologies</i>	63
Gokcen Coskuner, University of Wisconsin, Madison	

Grooming Masculinities: A Poststructuralist Analysis of Masculinity Discourses in Films
 Gokcen Coskuner, University of Wisconsin, Madison

Men's Responses to Depictions of Ideal Masculinity in Advertising
 Linda Tuncay, Loyola University Chicago

The Challenge of the New Masculinity: Conservative Reactions to a New Consumption Ethos
 Jacob Ostberg, Stockholm University School of Business

Session 1.8 Brand Extensions: A Closer Look at Conflict and Context

Session Chairs: Sandor Czellar, HEC School of Management

The Clash of Personalities: The Role of the Corporate Brand in Product Brand Portfolios

Joseph Goodman, University of Texas, Austin
Susan Broniarczyk, University of Texas, Austin

Cross-Gender Brand Extensions: Effects of Gender of Brand, Gender of Consumer and Product Type on Evaluation of Cross-Gender Extensions 67

Kwon Jung, KDI School of Public Policy & Management
Winston Lee, National University of Singapore

The Effects of Line Extensions Up and Down in Quality on Initial Choice and Subsequent Switching Tendencies 75

Timothy Heath, Miami University
Michael S. McCarthy, Miami University
Subimal Chatterjee, Binghamton University

Existing Products and Brand Extension Judgments: Does Brand Category Context Matter? 76

Christopher Joiner, George Mason University

Session 1.9 ROUNDTABLE
From Defining Materialism to Outcome-Based Inquiry
A Proposed Shift in Research Emphasis

Discussion Leader: Aaron Ahuvia, University of Michigan, Dearborn

Participants: Nancy Wong, Georgia Institute of Technology
Fuat Firat, University of Southern Denmark, Odense, Denmark
Debra Stephens, University of Portland
Gary Bamossy, University of Utah and Vrije Universiteit, Amsterdam
Gulnur Tumbat, University of Utah
Stacey Menzel Baker, University of Wyoming
Jim Burroughs, University of Virginia
David Wooten, University of Michigan
Jeff Wang, University of Arizona
L.J. Shrum, University of Texas, San Antonio
Annamma Joy, Concordia University
Roz Galtz, Miami University

SESSION 2
Friday Sept. 30
10:30 a.m. – 12:00 p.m.

Session 2.1 Living Legacies: Exploring Influences on Family Consumption Behavior

Session Chair: Eric J. Arnould, University of Arizona
Discussion Leader: Suraj Commuri, University of Missouri

SPECIAL SESSION SUMMARY
Living Legacies: Exploring Influences on Family Consumption Behavior 82

Eric J. Arnould, University of Arizona
Amber M. Epp, University of Nebraska

Enacting the Family Legacy: How Family Themes Influence Consumption Behavior

Amber M. Epp, University of Nebraska-Lincoln

Eric J. Arnould, University of Arizona

Maybe It IS Your Father's Oldsmobile: The Construction and Preservation of Family Identity through the Transfer of Possessions

Carolyn F. Curasi, Georgia State University

Money and Meaning: The Role of Social Bonds and Capital in Inter Vivos Gifting

Tonya P. Williams, Northwestern University.

Session 2.2 Prediction, Postdiction and Preference in Hedonic Experience

Session Chair: Leif D. Nelson

Discussion Leader: Dan Ariely, Massachusetts Institute of Technology

When Breaks Break Down: The Irrational Rationing of Remedies

Leif D. Nelson, New York University

Tom Meyvis, New York University

Try It, You'll Like It: Experiential And Conceptual Bases of Drink Preferences

Dan Ariely, MIT Sloan School of Management

Shane Frederick, MIT Sloan School of Management

Leonard Lee, MIT Sloan School of Management

How Remembering The Past Biases Predictions of The Future

Carey K. Morewedge, Harvard University

Daniel T. Gilbert, Harvard University

Timothy D. Wilson, University of Virginia

Session 2.3 Brand Dislike: When We Love to Hate and Hate to Forgive

Session Chairs: Alokparna Monga, University of Texas, San Antonio

Allan Kimmel, ESCP-EAP

Brand Dislike: Representing the Negative Side of Consumer Preferences 87

Daniele Dalli, University of Pisa

Simona Romani, University of Pisa

Giacomo Gistri, University of Pisa

Schadenfreude as a Consumption-Related Emotion: Feeling Happiness about the Downfall of Another's Product 96

Jill M. Sundie, University of Houston

James Ward, Arizona State University

Wynne W. Chin, University of Houston

Stephanie Geiger-Oneto, University of Houston

An Exploration of Consumer Forgiveness Following Marketer Transgressions 98

Emily Chung, Monash University

Michael Beverland, University of Melbourne

The Role of Public Commitment in Shaping the Effects of Complaints and Word of Mouth on Post-Voice Satisfaction

Prashanth U. Nyer, Chapman University

Mahesh Gopinath, Old Dominion University

Session 2.4 **Go Positive or Go Negative? Message Framing Affects on Persuasion**

Session Chairs: Alan Andreasen, Georgetown University
 Ashesh Mukherjee, McGill University

<i>Regulatory Focus, Feature Positive Effect, and Message Framing</i>	100
Guangzhi Zhao, University of Kansas Cornelia Pechmann, University of California, Irvine	
<i>Does the Frame of a Comparative Ad Moderate the Effectiveness of Extrinsic Information Cues?</i>	101
Anne Roggeveen, Babson College Ghruv Grewal, Babson College Jerry Gotlieb, Kentucky University	
<i>Affect as Information: The Moderating Roles of Self-Regulatory System and Diagnosticity of Affective Valence</i>	102
Thomas Kramer, Baruch College, CUNY Song-Oh Yoon, Singapore Management University	
<i>Is a Picture Worth a Thousand Words? Influences of Graphic Illustration on Framed Advertisements</i>	104
Chun-Tuan Chang, National University of Kaohsiung	

Session 2.5 **Do I Know What You Want? Do I Care? Interpersonal Influences on Choice**

Session Chair: Pierre Chandon, INSEAD

<i>Two Wrongs Make a Right? Accidental Consensus in Predictions of Others' Preferences Under Uncertainty</i>	113
David Faro, University of Chicago Katherine Burson, University of Michigan Yuval Rottenstreich, Duke University	
<i>When Losses Loom Even Larger: The Moderating Role of Relationship Norms</i>	115
Pankaj Aggarwal, University of Toronto Meng Zhang, University of Toronto	
<i>He Wants, She Wants: Gender, Category, and Disagreement in Spouse's Joint Decisions</i>	117
Cheryl B. Ward, Middle Tennessee State University	
<i>Conceptualizing and Exploring Couple Dyads in the World of Collecting</i>	124
Nia Hughes, Keele University Margaret Hogg, Lancaster University	

Session 2.6 **New Perspectives on Compulsive Buying: Its Roots, Measurement and Physiology**

Session Chair: Nancy M. Ridgway, University of Richmond
Discussion Leader: April L. Benson, creator of Stopping Overshopping Program

SPECIAL SESSION SUMMARY

<i>New Perspectives on Compulsive Buying: Its Roots, Measurement and Physiology</i>	131
Nancy M. Ridgway, University of Richmond Monika Kukar-Kinney, University of Richmond Kent B. Monroe, University of Richmond	
<i>A Theoretical Account for Compulsive Buying: An Application of Escape Theory</i>	
Ronald J. Faber, University of Minnesota	

The Development and Validation of a Scale to Measure Excessive Buying
Nancy M. Ridgway, University of Richmond
Monika Kukar-Kinney, University of Richmond
Kent B. Monroe, University of Richmond

Biogenetics, Addiction and Novelty Seeking: A Review of Recent Research
Elizabeth C. Hirschman, Rutgers University

**Session 2.7 Consumption in Soap Operas from Brazil, New Zealand, and the U.S.:
Productions, Products and Process**

Session Chairs: Cristel Antonia Russell, San Diego State University
Barbara Stern, Rutgers University

Discussion Leader: Marilyn Lavin, University of Wisconsin

SPECIAL SESSION SUMMARY

Consumption in Soap Operas from Brazil, New Zealand, and the U.S.: Production, Products, and Process 134
Cristel Antonia Russell, San Diego State University
Barbara Stern, Rutgers University

Soap Operas in New Zealand and the U.S.: Product Placement Strategy and Consumption Imagery
Simon J. Pervan, Law Deakin University Geelong
Brett A. S. Martin, University of Auckland

Product Placement in Brazilian Telenovelas: Selling Soaps and Social Causes
Antonio C. La Pastina, Texas A&M University

Aspirational Consumption in U.S. Soap Operas: The Process of Parasocial Attachment to Television Soap Characters
Cristel Antonia Russell, San Diego State University
Barbara Stern, Rutgers University

Session 2.8 How and Why Consumers (MIS)interpret Financial Information

Session Chairs: Suzanne Shu, Southern Methodist University
Sharmistha Law, University of Toronto

Discount Rates for Time Versus Dates: The Sensitivity of Discounting to Time-Interval Description 138
Robyn A. LeBoeuf, University of Florida

*Balancing Giving-Up Vs. Taking-In: Does the Pattern of Payments and Benefits Matter to Customers in a
Financing Decision Context?* 139
Seigyoung Auh, Yonsei University
Chuan-Fong Shih, Wake Forest University

Adding Exchange to Charity: a Reference Price Explanation 146
Barbara Briers, K.U. Leuven
Mario Pandelaere, K.U. Leuven
Luk Warlop, K.U. Leuven

When You Can't Count on the Numbers: Corporate Fraud, Generalized Suspicion and Investment Behavior 147
Peter R. Darke, University of British Columbia and Florida State University
Jennifer J. Argo, University of Alberta

Session 2.9

ROUNDTABLE

Anthropomorphism and Consumer Behavior 149

Discussion Leader: Tina Kiesler, California State University, Northridge

Participants: Russell W. Belk, University of Utah
Tanya L. Chartrand, Duke University
Deborah Cours, California State University, Northridge
Gavan J. Fitzsimons, Duke University
Eric Greenleaf, New York University
Katrin Harich, California State University, Fullerton
Deborah D. Heisley, California State University, Northridge
Vicki G. Morwitz, New York University
Debra Lynn Stephens, University of Portland

ACR Luncheon and Presidential Address

Friday Sept. 30
12:00 p.m. - 1:30 p.m.

Meaning and Mattering Through Transformative Consumer Research
David Glen Mick, University of Virginia

SESSION 3
Friday Sept. 30
2:00 p.m. - 3:30 p.m.

Session 3.1 Understanding Our Behavior As We Age: Effects of Memory and Time Horizons on Beliefs, Preferences and Choices

Session Chair: Ian Skurnik, University of Toronto
Discussion Leader: Cathy Cole, University of Iowa

SPECIAL SESSION SUMMARY

Understanding Our Behavior as We Age: Effects of Memory and Time Horizons on Beliefs, Preferences, and Choices 150

Ian Skurnik, University of Toronto
Carolyn Yoon, University of Michigan

Educating Older Adults About the Flu Can Reduce Their Intentions to Get a Vaccination

Ian Skurnik, University of Toronto
Carolyn Yoon, University of Michigan
Norbert Schwarz, University of Michigan

Age Differences in Consumer Decision Making

Sanjay Sood, University of California, Los Angeles
Loraine Lau-Gesk, University of California, Irvine
Aimee Drolet, University of California, Los Angeles

Modeling Long-Term Determinants of Brand Choice by Older Consumers

Raphaëlle Lambert-Pandraud , Négocia
Gilles Laurent , HEC School of Management, Paris

Session 3.2 I Feel Therefore I am (or not)- The Role of Affect in Decision Making

Session Chair: Deborah Small, University of Pennsylvania
Monica Wadhwa, University of Iowa
Discussion Leader: Antoine Bechara, University of Iowa

A Bite to Whet the Reward Appetite: Influence of Sampling on Appetitive Behaviors 154
Monica Wadhwa, Stanford University
Baba Shiv, Stanford University
Stephen Nowlis, Arizona State University

Repenting Hyperopia: An Analysis of Self-Control Regrets
Ran Kivetz, Columbia University
Anat Keinan, Columbia University

Sympathy and Callousness: The Impact of Deliberative Thought on Donations to Identifiable and Statistical Victims
Deborah A. Small, University of Pennsylvania
George Loewenstein, Carnegie Mellon University
Paul Slovic, Decision Research

Session 3.3 Movies, TV and Sports: Bring Us Together or Pull Us Apart?

Session Chairs: Robert Madrigal, University of Oregon
David Moore, University of Michigan

“You’re A Wizard, Harry!” Consumer Response to the Harry Potter Phenomenon 155
Stephen Brown, University of Ulster
Anthony Patterson, University of Liverpool

What Do They Say About “Friends?” 161
Jyh-Shen Chiou, National Chengchi University
Jasi Lee, Proctor & Gamble

Pretty Woman or Erin Brockovich? Unconscious and Conscious Reactions to Commercials and Movies Shaped by Fairy Tale Archetypes—Results from Two Experimental Studies 163
Andrea Groeppel-Klein, European University Viadrina
Anja Domke, European University Viadrina
Benedikt Bartmann, European University Viadrina

Support Your Local Team: Resistance, Subculture, and the Desire for Distinction 175
Brendan Richardson, University College Cork
Darach Turley, Dublin City University

Session 3.4 Consumer Response to Price Presentation Formats: Implications for Partitioned Pricing and Transaction Bundling

Session Chair: Rebecca Hamilton, University of Maryland
Discussion Leader: Eric Greenleaf, New York University

SPECIAL SESSION SUMMARY

Consumer Response to Price Presentation Formats: Implications for Partitioned Pricing and Transaction Bundling 181
Rebecca Hamilton, University of Maryland

Consumer Reactions to Partitioned Prices: Variations in Price Sensitivity Across Components
Rebecca Hamilton, University of Maryland
Joydeep Srivastava, University of Maryland

How Attributions and the Product's Price Impact the Effectiveness of Price Partitioning

Anne L. Roggeveen, Babson College
Lan Xia, Bentley College
Kent B. Monroe, Richmond University

Transaction Bundling: Effect of Price Presentation on Consumer Perceptions

Joydeep Srivastava, University of Maryland
Dipankar Chakravarti, University of Colorado

Session 3.5 Information Overload: When Less is Better Than More

Session Chair: S. Adam Brasel, Boston College

Effects of Amount of Information on Overconfidence

Claire Tsai, University of Chicago
Joshua Klayman, University of Chicago
Reid Hastie, University of Chicago

Bringing Cognitive Load to Daily Life. Cognitive Demand has Negative After-Effects on Consumer Decision Making

Siegfried Dewitte, University of Leuven
Barbara Briers, University of Leuven
Luk Warlop, University of Leuven
Mario Pandelaere, University of Leuven

Effects of Procedural and Outcome Accountability on Perceived Decision Difficulty

Yinlong Zhang, University of Texas, San Antonio
Vikas Mittal, University of Pittsburgh

Scale Development for Consumer Confusion 184

Markus Schweizer, University of St. Gallen
Alexander J. Kotouc, University of St. Gallen
Tillmann Wagner, Texas Tech University

**Session 3.6 SPECIAL PRESIDENTIAL SESSION
For Consumers: Steps Toward Transformative Consumer Research**

Organized by: David Glenn Mick

Co-chairs: Cornelia (Connie) Pechmann
Linda Price,

Panelists: Ron Faber, University of Minnesota
Marv Goldberg, Pennsylvania State University
Ron Hill, University of South Florida
Julie Ozanne, Virginia Tech
Simone Pettigrew, University of Western Australia
J.B. Steenkamp, Tilburg University
Brian Wansink, Cornell University

Session 3.7 Coming Home: The Role of Consumption in the (Re)Construction of Heritage Among African Americans

Session Chair and Discussion Leader: Laura Oswald, ESSEC Business School

SPECIAL SESSION SUMMARY

Coming Home: The Role of Consumption in the (Re)Construction of Heritage among African Americans 195
Laura R.Oswald, ESSEC Business School

Constructing Pasts, Serving Today: Appropriating Collective Memory for Identity (Re)Presentation
Tonya P. Williams, Northwestern University
John F. Sherry, Jr., University of Notre Dame

Wearing Identity: The Symbolic Uses of Native African Clothing by African Americans
Benét DeBerry-Spence, University of Illinois at Chicago
Elif Izberk-Bilgin, University of Illinois at Chicago

How African Americans Use Relationships with Kenyan Immigrants in the Heritage Quest
L. Wakiuru Wamwara-Mbugua, Wright State University

Session 3.8 Consumers' Online Purchase Behavior: Do They Perceive Risks That Aren't There?

Session Chair: Anu Sivaraman, University of Delaware

Situation Variation in Consumers' Media Channel Consideration 195
Sonja Wendel, Maastricht University
Benedict G.C. Dellaert, Maastricht University

Perceived Risk and Deliberation in Retailer Choice: Consumer Behavior towards Online Pharmacies 197
Oliver B. Büttner, Georg-August-Universität Göttingen
Sebastian Schulz, Georg-August-Universität Göttingen
Günter Silberer, Georg-August-Universität Göttingen

The Moderating Effect of Online Purchase Experience on the Evaluation of Online Store Attributes and the Subsequent Impact on Market Response Outcomes 203
ByoungHo Jin, Oklahoma State University
Jin Yong Park, Dong-Eui University

Consumers' Privacy Concerns and Willingness to Provide Marketing-Related Personal Information Online 212
Changi Nam, Information and Communications University
Chanhoo Song, Information and Communications University
Euehun Lee, Information and Communications University
Chan Ik Park, Information and Communications University

**Session 3.9 *ROUNDTABLE*
Qualitative Data Analysis**

Discussion Leader: Eric J. Arnould, University of Arizona

Participants: Melanie Wallendorf, University of Arizona
Amber M. Epp, University of Nebraska
David Crockett, University of South Carolina
Carolyn Curasi, Georgia State University
Chuck McMellon, Hofstra University
Jianfeng (Jeff) Wang, University of Arizona
Karen Fernandez, University of Auckland
Hope Jensen Schau, University of Arizona
Fleura Bardhi, Northeastern University

<p>SESSION 4 Friday Sept. 30 4:00 p.m. -5:30 p.m.</p>
--

Session 4.1 Understanding and Interpreting Consumer Vulnerability

Session Chair: Ron Hill, USF St. Petersburg
 Discussion Leader: Lisa Penaloza, University of Colorado

Consumer-Driven Definition and Model of Consumer Vulnerability
 Stacey Menzel Baker, University of Wyoming
 Jim Gentry, University of Nebraska

Intimate Partner Violence and the Damaged Self: How Can Service Providers Facilitate Reconstruction?
 Debra Stephens, University of Portland
 Ron Hill, USF St. Petersburg

The Role of Personal Uncertainty and Product Involvement in Consumer Vulnerability
 Marlys Mason, Oklahoma State University
 Debbie Scammon, University of Utah

Session 4.2 Understanding Consumer Enjoyment and Happiness

Session Chair: Tonya Williams, Northwestern University
 Angela Y. Lee, Northwestern University
 Discussion Leader: Dipankar Chakravarti, University of Colorado, Boulder

SPECIAL SESSION SUMMARY

Understanding Consumer Enjoyment and Happiness 218
 Tonya P. Williams, Northwestern University
 Angela Y. Lee, Northwestern University

Benjamin My Friend or My Money: Wealth and Subjective Well-Being
 Tonya P. Williams, Northwestern University
 Angela Y. Lee, Northwestern University

The Effect of Prediction on the Enjoyment of a Consumption Experience
 Naomi Mandel, Arizona State University
 Stephen M. Nowlis, Arizona State University

A Sunny-Day Measurement Of Happiness
 Christopher Hsee, University of Chicago

Session 4.3 Transformative Consumer Research: Unrealized Potential

Session Chair: Jonathan Schroeder, University of Exeter

The Transformative Potential of Feminist Critique in Consumer Research 222
 Miriam Catterall, The Queen’s University of Belfast
 Pauline Maclaran, DeMontfort University
 Lorna Stevens, University of Ulster

<i>Steps Towards Transformative Consumer Research Practice: A Taxonomy of Possible Reflexivities</i>	227
Shona Bettany, University of Bradford	
Helen Woodruffe Burton, University of Lancaster	
<i>Transformational Products and Everyday Consumption Contexts</i>	
Cele C. Ottes, University of Illinois at Urbana Champaign	
Julie A. Ruth, Rutgers University	
Linda Tuncay, Loyola University-Chicago	
<i>Enabling Consumers To Specify Risk Preferences Directly as an Example Of Transformative Consumer Research</i>	
Daniel G. Goldstein, London Business School	
Eric J. Johnson, Columbia University	
William F. Sharpe, Stanford University	

Session 4.4 Are Prices Recalled? Are Prices Fair? Consumerism and Pricing

Session Chair: Susan Harmon, Middle Tennessee State University

<i>Remembering Prices: Numeric Cognition, Language, and Price Recall</i>	235
David Luna, Baruch College	
Hyeong Min Kim, Baruch College	
<i>The Principle Matters: Antecedents and Consequences of Procedural Justice in the Context of Pricing</i>	236
Laurence Ashworth, Queen's University	
Peter R. Darke, University of British Columbia	
<i>The Presence of Reference Price: How Value Can Appear Convergent to Buyers and Sellers</i>	237
Chien-Huang Lin, National Central University	
Shin-Chieh Chuang, Chao-yang University of Technology	
Chaang-Yung Kung, Chao-yang University of Technology	
<i>Price Skimming Paradoxes</i>	242
Gary F. Gebhardt, University of South Florida	

Session 4.5 Information Processing Biases: Inevitable or (Possibly) Avoidable?

Session Chairs: Alexander Chernev, Northwestern University
Timothy Heath, Miami University

<i>Overvaluation Bias in the Valuation and Utilization of Novel Technological Attributes</i>	244
Shenghui (Jerry) Zhao, University of Miami	
Robert J. Meyer, University of Pennsylvania	
Jin Han, Singapore Management University	
<i>Regulating the Depletion Effects</i>	
Wen (Echo) Wan, Northwestern University	
Brian Sternthal, Northwestern University	
<i>Precommitment Bias in the Evaluation of a Single Option: The Importance of Evaluative Disposition</i>	245
Samuel D. Bond, Duke University	
Kurt A. Carlson, Duke University	
Margaret G. Meloy, Penn State University	
J. Edward Russo, Cornell University	
Robin J. Tanner, Duke University	

<i>The Illusory Truth Effect: Exploring Implicit and Explicit Memory Influences on Consumer Judgments</i>	247
Maria L. Cronley, Miami University	
Frank R. Kardes, University of Cincinnati	
Scott A. Hawkins, University of Toronto	

Session 4.6 Affect and Its Effects on Compensatory Consumption

Session Chair: Nitika Garg, University of Mississippi
Discussion Leader: Michel Pham, Columbia University

SPECIAL SESSION SUMMARY

<i>Affect and Its Effects on Compensatory Consumption</i>	248
Nitika Garg, University of Mississippi	

The Effect of Moods on Comfort Food Consumption
Junyong Kim, University of Central Florida
Brian Wansink, University of Illinois at Urbana-Champaign
Meryl P. Gardner, University of Delaware
Se-Bum Park, Northwestern University
Collin Payne, Cornell University

Emotion Effects on Compensatory Consumption
Nitika Garg, University of Mississippi
Jennifer S. Lerner, Carnegie Mellon University

Feeling Ashamed or Guilty? The Emotions and Consequences of Violating Consumption Norms
Vanessa M. Patrick, University of Georgia
Deborah J MacInnis, University of Southern California
Shashi Matta, University of Southern California

Session 4.7 Historical Perspectives on Consumption

Session Chair: Katherine Sredl, Univ. of Illinois
Discussion Leader: Russell Belk, Univ. of Utah

Cultural Prejudice and the Construction of Rhetorical Pasts
Katherine C. Sredl, University of Illinois
Linda M. Scott, University of Illinois

Brands as Historical Actors
Douglas B. Holt, University of Oxford

Historicizing Consumer Culture Theory
Craig J. Thompson, University of Wisconsin-Madison

Session 4.8 Various Responses to Price Discounts?

Session Chair: Koert Van Ittersum, Georgia Tech

<i>The Price of 'Free'-dom: Consumer Sensitivity to Promotions with Negative Contextual Influences</i>	250
Sucharita Chandran, Boston University	
Vicki G. Morwitz, New York University	

<i>Influence of Price of Coupons on Redemption Rates</i>	251
Vishal Lala, University of Wisconsin	
<i>The Role of Consumer Inferences About Price Discounts in Influencing Switching Behavior</i>	252
Beomjoon Choi, University of Kansas	
Rohini Ahluwalia, University of Minnesota	
<i>How Small is Zero Price? The True Value of Free Products</i>	254
Kristina Shampner, MIT	
Dan Ariely, MIT	

Session 4.9 *ROUNDTABLE*
Exploring the Co-Evolution of Possession Constellations, Self, and Identity 256

Discussion Leader: Rob Kleine, Ohio Northern University

Participants:

- Eric J. Arnould, University of Arizona
- Stacey Menzel Baker, University of Wyoming
- Dwayne Ball, University of Nebraska-Lincoln
- Terry Bristol, Arizona State University-West
- Carolyn Curasi, Georgia State
- Kent Grayson, Northwestern
- Susan Kleine, Bowling Green State University
- John Lastovicka, Arizona State
- James McAlexander, Oregon State
- Radan Martinec, London School of Communication
- Americus Reed, University of Pennsylvania
- Marsha Richins, University of Missouri
- Shay Sayre, Cal State Fullerton
- Michael Solomon, Auburn University
- Darach Turley, Dublin City

JCR Editorial Review Board
 Friday Sept. 30
 4:30 p.m. - 6:30 p.m.

Working Paper Session and Reception
 Friday Sept. 30
 6:00 p.m. - 8:00 p.m.

Sponsored by

UCIrvine

SATURDAY, OCTOBER 1, 2005

JCP Board Meeting
 Saturday Oct. 1
 7:30 a.m.- 9:00 am

SESSION 5
 Saturday Oct. 1
 8:30 a.m.- 10:00 am

**Session 5.1 The McDonaldization of Enchantment and Consumers Practices of Re-enchantment:
 A Dialectic View of Transformative Consumption**

Session Chair and Discussion Moderator: Craig Thompson, University of Wisconsin-Madison

SPECIAL SESSION SUMMARY

*The McDonaldization of Enchantment and Consumers Practices of Re-enchantment: A Dialectic View of
 Transformative Consumption* 352
 Craig J. Thompson, University of Wisconsin-Madison

Is Re-Enchantment Just Enchantment?: Towards an Understanding of a Second Order Enchantment
 Per Ostergaard Southern Denmark University
 Christian Jantzen, Aalborg University

Politicized Consumption Community and Consumers' Practices of Enchantment
 Craig Thompson, University of Wisconsin- Madison
 Gokcen Coskuner, University of Wisconsin- Madison

New Religions, Temple Burns, and the Reenchantment of Belief
 Robert V. Kozinets, York University
 John F. Sherry, Jr., University of Notre Dame

Session 5.2 What’s On Your Mind? Neuroscientific Approaches to Studying Consumer Choice

Session Co-Chairs: William Hedgcock and Akshay Rao, University of Minnesota
Discussion Leader: Eric Johnson, Columbia University

SPECIAL SESSION SUMMARY

What’s On Your Mind? Neuroscientific Approaches to Studying Consumer Choice 355
 William Hedgcock, University of Minnesota
 Akshay Rao, University of Minnesota

Inferring the Role of Outcome Feedback on Choice using Neuroscientific Techniques
 John Dickhaut, University of Minnesota

The Neuroscience of Trust
 Kevin McCabe, George Mason University

Brain Activation: Shedding Light on the Decoy Effect
 William Hedgcock, University of Minnesota
 Akshay Rao, University of Minnesota

Session 5.3 Holidays and Getaways: Loved or Loathed?

Session Chair: Stacey Menzel Baker, University of Wyoming

A Holiday Loved and Loathed: A Consumer Perspective of Valentine’s Day 356
 Angeline Close, University of Georgia
 George M. Zinkhan, University of Georgia

A Halloween Community: The Role of the Marketplace in Response to Social Isolation 366
 Garth Harris, Queen’s University

Authenticity at Gettysburg 367
 Athinodoros Chronis, California State University-Stanislaus
 Ronald D. Hampton, University of Nebraska-Lincoln

You-Can-Do-It-We-Can-Help: Emancipation Within the Marketplace? 370
 Tiebing Shi, Queen’s University
 Jay M. Handelman, Queen’s University

Session 5.4 Consumers’ Sense Making of Advertising and Branding Strategies

Session Chair: Mickey Blech, San Diego State University
 Torsten Ringberg, Vanderbilt University

Brand Literacy: Consumers’ Sense-Making of Brand Management 375
 Anders Bengtsson, Suffolk University
 A. Fuat Firat, University of Texas-Pan American

How Do Consumers Interpret Market Leadership Claims in Direct-to-Consumer Advertising of Prescription Drugs? 381
 Anu Mitra, American University
 Jack Swasy, American University
 Kathryn Aikin, Food and Drug Administration

Field Experiments in Nonprofit Marketing: The Impact of Social Information
 Yue Shang, University of Pennsylvania
 Rachel Croson, University of Pennsylvania

Subjective Impressions of Minority Model Frequencies in Advertisements
Donnel Briley, Hong Kong University of Science and Technology
L.J. Shrum, University of Texas, San Antonio
Robert Wyer, Hong Kong University of Science and Technology

Session 5.5 Impulsivity: When You Just Can't (Or Won't) Resist The Urge

Session Chair: Siegfried Dewitte, Catholic University, Leuven

- Investigating Impulse Buying and Variety Seeking: Towards a General Theory of Hedonic Purchase Behaviors* 388
Piyush Sharma, Nanyang Business School
Bharadhwaj Sivakumaran, Indian Institute of Technology
Roger Marshall, Nanyang Business School
- Binge Drinking—Do They Mean Us? Living Life to the Full in Students' Own Words* 390
Emma N. Banister, Lancaster University Management School
Maria G. Piacentini, Lancaster University Management School
- When Temptation Hits You: The Influence of Weak versus Strong Food Temptations* 399
Kelly Geyskens, K.U.Leuven
Siegfried Dewitte, K.U.Leuven
Mario Pandelaere, K.U.Leuven
Luk Warlop, K.U.Leuven
- Excessive Buying: Conceptual Typology and Scale Development* 401
Lan Wu, Georgia Institute of Technology
Naresh K. Malhotra, Georgia Institute of Technology
Koert van Ittersum, Georgia Institute of Technology

Session 5.6 Psychological Processes in Financial Decision-making: A Consumer Perspective

Session Chair: Eric M. Eisenstein, Johnson School of Management, Cornell University

Discussion Leader: Andrew Gershoff, University of Michigan

SPECIAL SESSION SUMMARY

- Psychological Processes in Financial Decision-making: A Consumer Perspective* 403
Eric M. Eisenstein, Cornell University

Intuitive Compounding: Framing, Temporal Perspective, and Expertise

Eric M. Eisenstein, Cornell University
Stephen J. Hoch, University of Pennsylvania

Choosing for the Long Run: Making Tradeoffs in Multi-period Borrowing

Suzanne B. Shu, Southern Methodist University

Bursting Another Financial Bubble: The Influence of Ability Perception on Choice Satisfaction

Katherine A. Burson, University of Michigan
Simona Botti, Cornell University

Session 5.7 **Lost in the Story: Factors that Affect Narrative Transportation and Advertising**

Session Chair: Jing Wang, Northwestern University
Discussion Leader: John Deighton, Harvard University

SPECIAL SESSION SUMMARY

Lost in the Story: Factors That Affect Narrative Transportation and Advertising 406
 Jing Wang, Northwestern University

Narrative Transportation and Advertising Effectiveness
 Jing Wang, Northwestern University
 Bobby J. Calder, Northwestern University

Narrative Self-Referencing
 Jennifer Edson Escalas, Vanderbilt University

The Impact of Prior Thinking on the Enjoyment of Experiences
 Daniel Lieb, Duke University
 Joel Huber, Duke University

Session 5.8 **Consumers' Participation in Service**

Session Chairs: Shashi Matta, University of Southern California
 Patricia Warrington, Purdue University

Interpersonal Behaviors during Service Encounter and Their Impact on Service Outcome: An Application of the Interpersonal Circumplex Model 409
 Zhenfeng Ma, McGill University
 Laurette Dubé, McGill University

The Convincing Chameleon: The Impact of Mimicry on Persuasion
 Rob Tanner, Duke University
 Tanya Chartrand, Duke University
 Rick van Baaren, University of Nijmegen

The Waiting Game: The Role of Predicted Value, Wait Disconfirmation, and Providers' Actions in Consumers' Service Evaluations 412
 Ruoh-Nan Yan, Colorado State University
 Sherry Lotz, University of Arizona

Customer Participation Strategies and Associated Goals: A Qualitative Investigation 419
 Melissa Markley, University of Alabama
 Lenita Davis, University of Alabama

Session 5.9

ROUNDTABLE

The Manipulation and Measurement of Regulatory Focus in Consumer Research

Discussion Leader: Yun-Oh Whang, University of Central Florida

Participants: Nidhi Agrawal, New York University
Hans Baumgartner, Penn State University
Miguel Brendl, INSEAD
Susan Grant, University of Colorado
Shailendra Pratap Jain, Indiana University
Punam A. Keller, Dartmouth College
Junyong Kim, University of Central Florida
Angela Lee, Northwestern University
Sunghwan Yi, University of Guelph
Charles Lindsey, Indiana University
Kyeong Sam Min, University of South Dakota
Connie Pechmann, University of California, Irvine
Terry Zhao, University of California, Irvine

SESSION 6
Saturday Oct. 1
10:30 a.m.- 12:00 p.m.

Session 6.1 A Sociocultural Investigation of Consumer Credit and Consumer Debt

Session Chair: Craig Thompson, University of Wisconsin
Discussion Leader: Eric J. Arnould, University of Arizona

SPECIAL SESSION SUMMARY

A Sociocultural Investigation of Consumer Credit and Consumer Debt 421
Jeff Wang, City University of Hong Kong

Consumers and Credit Cards: Building “The Good Life” with Plastic Tools
David Crockett, University of South Carolina
Randall L. Rose, University of South Carolina

It’s Not Who You Owe That Counts: Social Relationships and Consumer Debt
Jianfeng (Jeff) Wang, University of Hong Kong
Melanie Wallendorf, University of Arizona

Credit Card Advertising and Revolving Debt Management: A Poststructuralist View
Nina Diamond, DePaul University
Suzanne O’Curry, DePaul University

Session 6.2 Goal Distance and Consumer Choice

Session Chair: Ran Kivetz, Columbia University
Discussion Leader: Drazen Prelec, Sloan School M.I.T.

SPECIAL SESSION SUMMARY

Goal Distance and Consumer Choice 424
Ran Kivetz, Columbia University
Oleg Urminsky, Columbia University

Temporal Construal and Self-Consistent Choice
Yaacov Trope, New York University

The Goal-Gradient Hypothesis Resurrected: Purchase Acceleration, Illusionary Goal Progress, and Customer Retention
Ran Kivetz, Columbia University
Oleg Urminsky, Columbia University
Yuhuang Zheng, Columbia University

Mindset over Matter: The Interplay between Goals and Preferences
Anastasiya Pocheptsova, Yale University
Ravi Dhar, Yale University

Session 6.3 Consumer Migration and Acculturation: Making It Our Of the 3rd World

Session Chairs: Teresa Davis, University of Sydney
Jim Hunt, Temple University

Triple Acculturation: The Role of African Americans in the Consumer Acculturation of Kenyan Immigrants 428
L. Wakiuru Wamwara-Mbugua, Wright State University
T. Bettina Cornwell, University of Queensland
Gregory Boller, University of Memphis

Consumer Acculturation as a Dialogical Process: Case Studies from Rural-to-Urban Migrants in Turkey 429
Ozlem Sandikci, Bilkent University
Ahmet Ekici, Bilkent University
Berna Tari, Bilkent University

Poverty Consumption: Consumer Behaviour of Refugees in Industrialized Countries 435
Elisabeth Kriechbaum-Vitellozzi, Salzburg University of Applied Sciences
Robert Kreuzbauer, University of Illinois UC

Consumer Market Orientation: Measurement and Prediction in a Developed and a Transitioning Economy 445
Simona Stan, University of Oregon
David Boush, University of Oregon
Carmen Barb, Sibiu University
Helder Sabastiao, University of Oregon

Session 6.4 It Matters Who You Are: New Perspectives on the Role of Individual Differences in Brand Behaviors and Evaluations

Session Chair: Rohini Ahluwalia, University of Minnesota
Discussion Leader: Deborah John, University of Minnesota

SPECIAL SESSION SUMMARY

It Matters Who You Are: New Perspectives on the Role of the Individual Differences in Brand Evaluations 447
Rohini Ahluwalia, University of Minnesota

Two Roads to Updating Brand Personality Impressions: Trait versus Evaluative Inferencing
Gita Johar, Columbia University
Jaideep Sengupta, Hong Kong University of Science and Technology
Jennifer L. Aaker, Stanford University

Consumer Evaluation of Brand Extensions: Role of Cultural Orientation
Rohini Ahluwalia, University of Minnesota

Consumer Heterogeneity in Brand Relationships: An Attachment Perspective
Susan Fournier, Boston University
Marcel Paulssen, Humboldt University

Session 6.5 Tastes: The Misunderstood and Understudied Sense

Session Chairs: Peeter Verlegh, Erasmus University
 Meera Venkatraman, Suffolk University

Wanting a Bit(e) of Everything. The Role of Appetitive Desire in Variety Seeking 448
Caroline Goukens, K.U.Leuven
Siegfried Dewitte, K.U.Leuven
Mario Pendelaere, K.U.Leuven
Luk Warlop, K.U.Leuven

The Unhealthy = Tasty Intuition and its Effects on Taste Inferences, Enjoyment, and Choice of Food Products 450
Rajagopal Raghunathan, University of Texas at Austin
Rebecca E. Walker, University of Texas at Austin
Wayne D. Hoyer, University of Texas at Austin

Taste Discrimination: The Influence of Visual and Verbal Cues 452
JoAndrea Hoegg, University of Florida
Joseph W. Alba, University of Florida

Sensory Metaphor and Meanings: Development of a Cross-Sensory Hetrogeneity Index 453
Robin Coulter, University of Connecticut
Tilottama G. Chowdhury, Quinnipiac University

Session 6.6 When Increasing Control Decreases Consumers' Well-Being: The Negative Psychological Consequences of Choosing

Session Chairs: Simona Botti, Cornell University,
 Tom Meyvis, New York Univeristy

Discussion Leader: Rik Pieters, Tilburg University

SPECIAL SESSION SUMMARY

When Increasing Control Decreases Consumers' Well-Being: The Negative Psychological Consequences of Choosing 455
Simona Botti, Cornell University
Tom Meyvis, New York University

Avoiding Pain: Choice Preferences and Emotional Responses in Medical Decision Contexts
Simona Botti, Cornell University
Sheena S. Iyengar, Columbia University
Kristina Orfali, Columbia University, ISERP

When Consumers Choose to Restrict Their Options: Regret and Choice Set Size Preference
Cenk Bülbül, New York University
Tom Meyvis, New York University

Choosing Inside The Box: When More Choice Narrows Our Thinking
On Amir, University of California at San Diego
Sheena S. Iyengar, Columbia University

Session 6.7 **Representations in Consumer Research**

Session Chair: Julien Cayla, Australian Graduate School of Management
Discussion Leader: Fuat Firat, University of Southern Denmark

SPECIAL SESSION SUMMARY

The Production of Consumer Representations 458
Julien Cayla, Australian Graduate School of Management
Lisa Peñaloza, University of Colorado

Domesticating the Indian Imagination
Julien Cayla, Australian Graduate School of Management

Representing the Islamist Consumer: Transformation of the Market
Ozlem Sandikci , Bilkent University
Güliz Ger, Bilkent University

Consumer Representation: The Age Of Database Marketing
Detlev Zwick, York University
Jacline Nyman, York University

Session 6.8 **Consumers' Cultural Orientation and Receptivity to Marketing Offers**

Session Chair: Dawn Lerman, Fordham University

Individual Preferences versus Group Preferences: The Effect of Cultural Orientation on Consumer Receptivity to Customized Offers 462
Thomas Kramer, Baruch College / CUNY
Suri Spolter-Weisfeld, Baruch College / CUNY
Maneesh Thakkar, Baruch College / CUNY

Revisiting the Cultural Identity Model: Sojourners' Negotiations of Identity and Consumption Experiences 464
Siok Kuan Tambyah, National University of Singapore
Raymond Chng, National University of Singapore

The Effects of Cultural Individualism on Consumer Self-Confidence for Marketplace Interfaces 466
Piotr Chelminski, Providence College
Robin Coulter, University of Connecticut

Netnographic Study of a Community of Beauty Product Enthusiasts in China: Consumer Reflexivity and Social Concerns 469
Stella Yiyan Li, University of Hong Kong
Kineta H. Hung, University of Hong Kong

Session 6.9 **ROUNDTABLE**

Beyond Individualism/Collectivism: New Theoretical Perspectives in Culture Based Research 470

Discussion Leaders: Sharon Shavitt, University of Illinois, Urbana-Champaign
Ana Valenzuela, Baruch College

Participants:
Donnel Briley, Hong Kong University of Science and Technology
Shailendra Pratap Jain, Indiana University
Angela Y. Lee, Northwestern University
David Luna , Baruch College
Durairaj Maheswaran, New York University
Cristel Antonia Russell, San Diego State University
Sharon Shavitt, University of Illinois, Urbana-Champaign
Robert S. Wyer, Hong Kong University of Science and Technology

ACR Luncheon and Business Meeting

Saturday Oct. 1
12:00 p.m. - 1:30 p.m.

Sponsored by

Labovitz School
OF BUSINESS AND ECONOMICS

SESSION 7

Saturday Oct. 1
2:00 p.m. - 3:30 p.m.

Session 7.1 Children's Obesity: Is Consumer Research Relevant?

Session Chair: Elizabeth S. Moore, University of Notre Dame
William L. Wilkie, University of Notre Dame
Discussion Leader: Jerome D. Williams, University of Texas, Austin

SPECIAL SESSION SUMMARY

Children's Obesity: Is Consumer Research Relevant? 471

Elizabeth S. Moore, University of Notre Dame
William L. Wilkie, University of Notre Dame

Consumer Research Inputs to Public Policy: The Case of Children's Obesity

Elizabeth S. Moore, University of Notre Dame
William L. Wilkie, University of Notre Dame

Researching the Link between Food Advertising & Childhood Obesity

Debra M. Desrochers, University of Notre Dame
Debra Holt, Federal Trade Commission

A Model of Children's Preventive Health Behavior: Understanding the Role of Individual, Contextual, and Attitudinal Determinants

Kathleen Seiders, Boston College
Elizabeth G. Miller, Boston College
Maureen E. Kenny, Boston College
Mary E. Walsh, Boston College

Session 7.2 Thinking About the Future: Positive and Negative Effects on Consumer Judgment and Well-Being

Session Chairs: Cecile Cho, Columbia University
Gergana Yordanova, University of Pittsburgh
Discussion Leader: Peter Gollwitzer, New York University/University of Konstanz

SPECIAL SESSION SUMMARY

Thinking about the Future: Positive and Negative Effects on Consumer Judgment and Well-Being 475

Cecile Cho, Columbia University
Gergana Yordanova, University of Pittsburgh

Motivational Impact of Thinking about the Future: Expectations versus Fantasies
Gabriele Oettingen, New York University / University of Hamburg

Expectations About the Future: Examination of Consumers' Tendency to Elaborate on Potential Future Outcomes
Gergana Yordanova, University of Pittsburgh
J. Jeffrey Inman, University of Pittsburgh
John Hulland, University of Pittsburgh

Motivated Expectation Setting and its Unintended Consequence on Satisfaction
Cecile Cho, Columbia University
Gita V. Johar, Columbia University

Session 7.3 Consumer Activism in Online Communities: Can David Become Goliath?

Session Chairs: Dipyan Biswas, Bentley College
Kirsten Grasshoff Passyn, Salisbury University

<i>Consumer Activism on the Internet: The Role of Anti-brand Communities</i>	479
Candice R. Hollenbeck, University of Georgia George M. Zinkhan, University of Georgia	
<i>Brand Community Under Fire: The Role of Social Environments for the HUMMER Brand Community</i>	486
Marius K. Luedicke, York University	
<i>When David Becomes Goliath</i>	
<i>Ideological Discourse in New Online Consumer Movements</i>	494
Andrea Hemetsberger, University of Innsbruck	
<i>Uncovering Rhetorical Methods of Word-of-Mouth Talk in an Online Community</i>	501
Anat Toder Alon, Boston University Frédéric F. Brunel, Boston University	

Session 7.4 Consumers' Self Perceptions as Moderators of Advertising Effects

Session Chair: Alan Malter, University of Arizona
Priyali: Rajagopal, Southern Methodist University

<i>The Mirror Has Two Faces: Positive and Negative Media Image Effects</i>	
Dirk Smeesters, Tilburg University Naomi Mandel, Arizona State University	
<i>Enhancing Self-consciousness: Implications for the Effectiveness of Ad Appeals</i>	503
Chingching Chang, National Chengchi University	
<i>The Role of Self-Affirmation in Consumer Persuasion</i>	509
Pablo Briñol, Universidad Autónoma de Madrid Richard E. Petty, Ohio State University Ismael Gallardo, Universidad Autónoma de Madrid Kenneth G. DeMarree, Ohio State University	
<i>Mothers, Food, Love and Career: The Four Major Guilt Groups? The Differential Effects of Guilt Appeals</i>	511
Monica C. LaBarge, University of Oregon John Godek, University of Oregon	

Session 7.5 Satisfaction and Regret in Consumer Decision-Making

Session Chair: Eric Shih, Wake Forest University

<i>When Choosing Is Not Deciding: The Effect of Perceived Responsibility on Choice Outcome Satisfaction</i>	512
Simona Botti, Cornell University Ann L. McGill, University of Chicago	
<i>Effect of Response Time on Perceptions of Bargaining Outcomes</i>	514
Joydeep Srivastava, University of Maryland Shweta S. Oza, University of Maryland	
<i>Bidders' Regret in Auctions</i>	516
Shuili Du, Boston University Lisa Abendroth, Boston University Sucharita Chandran, Boston University	
<i>The Mediating Role of Arousal in Brand Commitment</i>	517
Sekar Raju, University at Buffalo H. Rao Unnava, Ohio State University	

Session 7.6 Does Knowledge of the Marketplace Really Help Consumers?: The Case for (or against) Persuasion Knowledge

Session Chair: Christina L. Brown, University of Michigan

Discussion Leader: Ian Skurnik, The University of Toronto

SPECIAL SESSION SUMMARY

<i>Does Knowledge of the Marketplace Really Help Consumers? The Case for (or against) Persuasion Knowledge</i>	519
Christina L. Brown, University of Michigan	

Vigilance Against Perceived Manipulation: The Effect of Regulatory Focus on the Use of Persuasion Knowledge
Amna Kirmani, Southern Methodist University
Rui Zhu, University of British Columbia

Fortification or Trojan Horse? The Impact of Warnings on the Effectiveness of Product Placements
Margaret C. Campbell, University of Colorado – Boulder
Peeter W.J. Verlegh, Erasmus University – Rotterdam
Gina E. Slejko, University of Colorado – Boulder

The Logic of the Marketplace: How Consumers Use Metacognitive Skills to Process Brand Claims
Christina L. Brown, University of Michigan

Session 7.7 Transformative Consumer Culture Theory

Session Chair: Julie L. Ozanne, Virginia Tech

Susan Dobscha, Bentley College

Discussion Leaders: Eric J. Arnould, University of Arizona

Craig Thompson, University of Wisconsin

SPECIAL SESSION SUMMARY

<i>Transformative Consumer Culture Theory?</i>	520
Julie L. Ozanne, Virginia Tech Susan Dobscha, Bentley College	

We are What They Consume: The Neglect of the Non-consumers
June N.P. Francis, Simon Fraser University

Communities Beyond the Brand
Eileen Fischer, York University
Lisa Peñaloza, University of Colorado

Transformational Theory and Methodology
Jeff B. Murray, University of Arkansas
Julie L. Ozanne, Virginia Tech

Session 7.8 Retail Price Promotions and Consumers Gullibility

Session Chairs: Shailendra Pratap Jain, Indiana University
 Kyle Murray, University of Western Ontario

How Time Restrictions Work: The Roles of Urgency, Anticipated Regret, and Deal Evaluations 523
Scott D. Swain, Boston University
Richard Hanna, Boston College
Lisa J. Abendroth, Boston University

The Impact of Certain and Uncertain Store Promotions on the Decision-Making Process in Product Choices 526
Cathy Y. Chen, Singapore Management University
Shi Zhang, University of California-Los Angeles

Attitudes and Promotions: The Case of a Minimum Spending Restriction
Ayelet Gneezy, University of Chicago

Price Matching Guarantees as Signals of Value: The Role of Perceived Risk and Estimate of Lowest Market Price 527
Sujay Dutta, John Carroll University
Dipayan Biswas, Bentley College
Abhijit Biswas, Wayne State University
Chris P. Pullig, Baylor University

Session 7.9
FERBER AWARD SESSION

SESSION 8
Saturday Oct. 1
4:00 p.m. - 5:30 p.m.

Session 8.1 A Variety of Explanations for Variety-Seeking Behaviors: Physiological Needs, Memory Processes, and Primed Rules

Session Chair: Rebecca Ratner, University of North Carolina, Chapel Hill
Discussion Leader: Don Lehmann, Columbia University

SPECIAL SESSION SUMMARY
A Variety of Explanations for Variety-Seeking Behaviors: Physiological Needs, Memory Processes, and Primed Rules 529
Rebecca K. Ratner, University of North Carolina, Chapel Hill

High Satiety: The Effect of Sensory-Specific Satiety on Choice
 J. Jeffrey Inman, University of Pittsburgh
 Zata Vickers, University of Minnesota
 Andrea S. Maier, Institut National de la Recherche Agronomique

Retrospective Preference for Variety: An Ease of Retrieval Perspective
 Michelle Lee, Singapore Management University
 Barbara E. Kahn, University of Pennsylvania
 Susheela Varghese, Singapore Management University

Variety vs. Consistency Seeking: A Matter of the Primed Rule
 Rebecca K. Ratner, University of North Carolina, Chapel Hill
 Ying Zhang, University of Chicago
 Ayelet Fishbach, University of Chicago

Session 8.2 Motivational Influences in Consumer Behavior: The Role of Regulatory Focus

Session Chairs: Rongrong Zhou, Hong Kong University of Science and Technology
 Jaideep Sengupta, Hong Kong University of Science and Technology
 Discussion Leader: Robert Wyer, Hong Kong University of Science and Technology

SPECIAL SESSION SUMMARY

Motivational Influences in Consumer Behavior: The Role of Regulatory Focus 532
 Rongrong Zhou, Hong Kong University of Science and Technology
 Jaideep Sengupta, Hong Kong University of Science and Technology

Promotion and Prevention in Consumer Decision Making: A Propositional Inventory
 Michel Pham, Columbia University
 E. Tory Higgins, Columbia University

Understanding Impulsives' Unwise Eating Choices
 Jaideep Sengupta, Hong Kong University of Science and Technology
 Rongrong Zhou, Hong Kong University of Science and Technology

The Influence of Hedonic and Regulatory Focus Framing on Message Persuasion
 Prashant Malaviya, INSEAD
 C. Miguel Brendl, INSEAD

Session 8.3 Children and Adolescents: How (In)dependent Are They?

Session Chair: Sabrina Neeley, Miami University

Of Friends and Family: How Do Peers Affect the Development of Intergenerational Influences? 536
 Elizabeth S. Moore, University of Notre Dame
 Gale D. Bowman, University of Notre Dame

Dependence in Consumer Behavior Research: Exploring Measurement 543
 T. Bettina Cornwell, The University of Queensland
 Cameron Newton, Queensland University of Technology
 Robert Lawson, University of Otago

Brands and the Identification Process of Children 549
 Angelique Rodhain, University of Montpellier 2

Children's (Mis)understanding of Nutritional Information on Product Packages: Seeking Ways to Help Kids Make Healthier Food Choices 556
 Sabrina M. Neeley, Miami University
 Brianne Petricone, Miami University

Session 8.4 Do Products Smile?: When Fluency Confers Liking and Enhances Purchase Intent

Session Chair: Aparna A. Labroo, University of Chicago
Discussion Leader: Stijn van Osselaer, Erasmus University

SPECIAL SESSION SUMMARY

Do Products Smile? When Fluency Confers Liking and Enhances Purchase Intent 558
Aparna A. Labroo, University of Chicago

Of Smiling and Frowning Watches: Stimulus Specificity in Perceptual Fluency
Aparna A. Labroo, University of Chicago
Ravi Dhar, Yale University
Norbert Schwarz, University of Michigan

Is That Car Smiling at Me? Schema Congruity as a Basis for Evaluating Anthropomorphized Products
Pankaj Aggarwal, University of Toronto
Ann L. McGill, University of Chicago

Transfer Appropriate Processing, Response Fluency, and the Mere Measurement Effect
Elise Chandon, University of Florida
Chris Janiszewski, University of Florida

Session 8.5 Mental Accounts, Inferences and Miscalculations

Session Chair: Ashwani Monga, University of Texas, San Antonio

Joint Versus Separate Evaluations of Mental Accounts 562
Subimal Chatterjee, Binghamton University
Junhong Min, Binghamton University

The Effects of Mixed Bundling on Consumers' Inferences and Choices 564
Rebecca W. Hamilton, University of Maryland
Nevena T. Koukova, Lehigh University

On-line Versus Memory-based Information Credibility Inferences: Implications for Memory-based Product Judgments 565
Mario Pandelaere, Catholic University Leuven
Siegfried Dewitte, Catholic University Leuven

Looking for Lake Wobegon: Why Sometimes We Are All Below Average 569
Katherine Burson, University of Michigan
Joshua Klayman, University of Chicago

Session 8.6 Public Policy Prescriptions from Consumer Research

Session Chair: Nina Mazar, MIT Sloan School of Management
Discussion Leader: Joel Cohen, University of Florida

SPECIAL SESSION SUMMARY

Public Policy Prescriptions from Consumer Research 570
Nina Mazar, MIT Sloan School of Management

Almost Honest: Internal and External Motives for Honesty
Nina Mazar, MIT Sloan School of Management
On Amir, University of California, San Diego
Dan Ariely, MIT

A Repeated Decision-Making Framework for Understanding Decisions about Protective Measures: The “Magical Thinking” Model

Barbara E. Kahn, University of Pennsylvania
Mary Frances Luce, Duke University

Social Psychological Motivations in Nonprofit Marketing

Jen Shang, University of Pennsylvania
Rachel Croson, University of Pennsylvania

Session 8.7 Word-of-Mouth and Word-of-Web: Talking About Products, Talking About Me

Session Chair: Andrea C. Wojnicki, Harvard University
Discussion Leader: Robert V. Kozinets, York University

SPECIAL SESSION SUMMARY

Word-of-Mouth and Word-of-Web: Talking About Products, Talking About Me 573
Andrea C. Wojnicki, University of Toronto

Subjective Expertise and Word-of-Mouth
Andrea C. Wojnicki, University of Toronto

Word-of-Mouth in Virtual Communities: A Netnographic Analysis
Kristine de Valck, HEC School of Management

Discussion Leader: Janet L. Borgerson, University of Exeter

Participants: Jonathan Schroeder, University of Exeter
 Stephen Brown, University of Ulster
 Fuat Firat, University of Southern Denmark
 Sven Bergvall, Royal Institute of Technology
 Detlev Zwick, York University, Canada
 Marie-Agnes Parmentier, York University
 Jean-Sebastien Marcoux, HEC Montreal
 Jacob Östberg, Stockholm University, Sweden
 Susan Dobscha, Bentley College

ACR 2006 Program Committee Meeting
 Saturday Oct. 1
 4:30 p.m. - 6:00 p.m.

Dinner Event
Institute of Texan Cultures
 Saturday Oct. 1
 6:00 p.m. - 9:30 p.m.

Sponsored by

SUNDAY, OCTOBER 2, 2005

SESSION 9
 Sunday Oct. 2
 8:30 a.m.- 10:00 am

Session 9.1 Marketplace Motives and Consumer Skepticism

Session Chair: Barbara Bickart, Rutgers University – Camden
 Discussion Leader: Connie Pechmann, University of California-Irvine

SPECIAL SESSION SUMMARY
Marketplace Motives and Consumer Meta-Skepticism 593
 Barbara Bickart, Rutgers University-Camden

Truth and False in Marketing
 Dan Ariely, MIT
 Ayelet Gneezy, University of Chicago

Benefit of Doubt or Betrayal? The Effect of Priors and Reasons on Response to Price Increases
 Priya Raghubir, University of California at Berkeley
 Margaret C. Campbell, University of Colorado at Boulder

Does it Pay to Beat Around the Bush? Salesperson Motives and the Effects of Obfuscation versus Honesty in Communications
 Barbara Bickart, Rutgers University-Camden
 Maureen Morrin, Rutgers University-Camden
 S. Ratneshwar, University of Missouri

Session 9.2 Emerging Perspectives on Self-Control

Session Chair: Ran Kivetz, Columbia University
 Discussion Leader: Klaus Wertebroch, INSEAD

SPECIAL SESSION SUMMARY

Emerging Perspectives on Self-Control 594
 Ran Kivetz, Columbia University
 Yuhuang Zheng, Fordham University
 Nira Liberman, Tel-Aviv University

Construal Levels and Self-Control
 Kentaro Fujita, New York University
 Yaacov Trope, New York University

Determinants of Justification and Self-Control
 Ran Kivetz, Columbia University
 Yuhuang Zheng, Columbia University

The Conscious and Nonconscious Use of Self-Control for Emotion-Regulation
 Yael Zemack-Rugar, Duke University
 James R. Bettman, Duke University
 Gavan J. Fitzsimons, Duke University

Session 9.3 The Meanings of Food In Everyday Life

Session Chair: Susan Hogan, Emory University

How Single and Married Women Organize to Get the Food on the Table Every Day: Strategies, Orientations, Outcomes and the Role of Convenience Foods 599
 Louise Heslop, Carleton University
 Judith Madill, Carleton University
 Linda Duxbury, Carleton University
 Melissa Dowdles, Carleton, University

The Meanings of Family Dinners for Young, Affluent Families in Urban China 606
 Hongyan Yu, Jilin University
 Alvin C. Burns, Louisiana State University
 Ann Veeck, Western Michigan University

Foodsigns on the Highway of Life: The Semiotics of the Diner 607
 Elizabeth Hirschman, Rutgers University

Consuming, Studying, and Regulating Genetically Modified Foods: A Case for Transformative Consumer Research 613
 Ahmet Ekici, Bilkent University

Session 9.4 Culture and Cognition: The Case of Irrational Beliefs About Luck

Session Chair: Rashmi Adaval, Hong Kong University of Science and Technology
Discussion Leader: Robert S. Wyer, Hong Kong University of Science and Technology

SPECIAL SESSION SUMMARY

Culture and Cognition: The Case of Irrational Beliefs about Luck 623
Rashmi Adaval, Hong Kong University of Science & Technology

The Effects of Luck and Self Esteem: Cultural Differences in Risky Decision Making
Ana Valenzuela, Baruch College
Peter Darke, University of British Columbia
Donnel Briley, University of Sydney

Priming Lucky Numbers: Effects on Attributions and Performance
Yuwei Jiang, Hong Kong University of Science and Technology
Angela Cho, Hong Kong University of Science and Technology
Rashmi Adaval, Hong Kong University of Science and Technology

Retrospective Evaluations: Will Chance Versus Luck Oriented Individuals Select Different Moments of an Experience?
Elizabeth Cowley, University of Sydney
Colin Farrell, University of Sydney

Session 9.5 When How I Feel Affects How I Think

Session Chairs: Meryl Gardner, University of Delaware
Anu Sivaraman, University of Delaware

Affective Underpinnings of Decision Heuristics 628
Ritesh Saini, George Mason University

Does Nostalgia Depend on Valence of Past Experience? An Empirical Analysis of the Discontinuity Hypothesis 630
Mousumi Bose Godbole, Louisiana State University
Omar Shehryar, Montana State University
David M. Hunt, University of Wyoming

 Suri Weisfeld-Spolter, Baruch College

Session 9.9 *ROUNDTABLE*
The Journey Continues: Building on the Legacy of the Odyssey

- Discussion Leaders: Karen Fernandez, University of Auckland,
 Carolyn Curasi, Georgia State University
 Stacey Menzel Baker, University of Wyoming
- Participants: Russell Belk, University of Utah
 Melanie Wallendorf, University of Arizona
 John F. Sherry, Northwestern University
 Eric J. Arnould, University of Arizona
 John Lastovicka, Arizona State University
 Hope Schau, University of Arizona
 Robert V. Kozinets, York University
 Kent Grayson, Northwestern University
 Radan Martinec, The London Institute, School of Media
 Stacey Menzel Baker, University of Wyoming
 Ron Hampton, University of Nebraska-Lincoln

SESSION 10
 Sunday Oct. 2
 10:30 am - 12:00 p.m.

Session 10.1 An Examination of the Concept of Postmodern Home and the Role of Consumption in Home-making Practices

- Session Chair: Fleura Bardhi, Northeastern University
 Discussion Leader: Julie L. Ozanne, Virginia Polytechnic Institute and State University

SPECIAL SESSION SUMMARY

An Examination of the Concept of Postmodern Home and the Role of Consumption in Home-Making Practices 651
 Fleura Bardhi, Northeastern University
 Eric Arnould, University of Arizona

Making a Home on the Road: A Mobile Concept of Home among Transnational Mobile Professionals
 Fleura Bardhi, Northeastern University
 Eric J. Arnould, University of Arizona

From a Diner to a Home: Understanding How Customers Find Home in the Marketplace
 Mark S. Rosenbaum, University of Hawaii

Designing the Family Portal as Home Information System and Home Networking
 Alladi Venkatesh, University of California, Irvine

Session 10.2 Dynamics of Self-Regulation

Session Chair: Suresh Ramanathan, University of Chicago
Discussion Leader: Tanya Chartrand, Duke University

SPECIAL SESSION SUMMARY

Dynamics of Self-Regulation 655
Suresh Ramanathan, University of Chicago

Self-Regulatory Resource Depletion Makes People More Extreme in Their Emotions and Judgments: A Possible Mechanism for Ego-Depletion

Kathleen Vohs, University of Minnesota
Nicole Mead, Florida State University

PRESIDENTIAL ADDRESS

Meaning and Mattering Through Transformative Consumer Research

David Glen Mick, University of Virginia

The Association for Consumer Research was born in 1969 and is now approaching middle age. As with most of us personally, this stage of life often provokes introspection about our past and present, our values, and the extent to which our remaining words and actions can make any worthwhile difference in the world. Today I am asking you to pause with me and consider the meaning and mattering of ACR.¹

But before proceeding, we know as earnest scholars that it is imperative to define our central constructs. In the view of some notorious researchers, middle age is defined as when you no longer care about where you are particularly going, so long as you are back home by nine p.m.

Back to the meaning and mattering at hand, our founders undoubtedly had differing opinions about ACR's objectives and operations. Two of their statements, however, I will draw attention to. Bill Wells (1995, p. 562) has written that the "great hope" for ACR was that "Unlike the older other professional disciplines, *consumer research would solve real problems.*" [emphasis added] Jerry Kernan (1979, p. 1) proclaimed that the association's penultimate goal was to "orchestrate the natural talents of academia, government, and industry so as to *enhance consumer welfare.*" [emphasis added] Accordingly, the earliest ACR conferences often involved not only academics, but also administrators from consumer-oversight organizations, such as the Consumers Union and the U.S. Food and Drug Administration. Ideals and expectations were high, that ACR *could and should* solve legitimate problems and augment consumer welfare.

How do you feel about that vision? If you agree with it—even if only moderately—how would you grade ACR's related performance over the last 36 years? Where are we today?

One thing we all know for sure: in the arc of time, consumer behavior and the ideology of consumption have diffused across the world to every corner, to virtually every individual, to such an astonishing scale, that living and consuming are more complexly interdependent than at any other time in human history. Both the serious problems and the genuine opportunities of consumption, for billions of people and other living entities, have never needed ACR and our collective talents more than now.

There are many riddles, many stresses, and much suffering in our world. And so many of these conditions are instigated or aggravated by consumer behaviors, or could be alleviated by new and different consumer behaviors. The statistics are numbing, but let's consider a few to assist us in our middle age, self-analysis of ACR.²

In terms of one particular disease, 19 million people worldwide have died of AIDS, and about 35 million are currently infected. In terms of one particular handicap, internationally over 160 million people are visually impaired, of whom about 37 million are blind. What has our organization done about diseases and handicaps that consumer research could tend to?

On a seemingly more mundane topic—television—the average child in America will have watched 100,000 acts of televised violence, including 8,000 murders, by the time he or she finishes the sixth grade. By the age of 65, the average American will have spent nine years watching television. Television is now the most globalized form of entertainment, and yet how little we understand about the effects of TV. But it doesn't need to be this way.

And then there is food. Between 1962 and 2000, the percent of obese Americans rose from 13% to 31%, with childhood obesity tripling in the past two decades. The cost of overweight conditions in the U.S., through effects on health, has been estimated at \$117 billion annually. In the meantime, ACR has been mostly speechless about this tragedy of indulgence.

And, of course, there is tobacco. Diseases from smoking cause an estimated 430,000 deaths per year in the U.S. alone. And, as you all know, the incidence of smoking in developing economies has skyrocketed. Tobacco consumption has been a focus of some consumer researchers over the years, but we need more, following in the footsteps of Pechmann and Knight's (2002) award-winning *JCR* article on advertising, peer influences, and adolescent smoking.

And there are thousands of consumers harmed each year through product use and misuse. For example, in 2003 U. S. children were involved in over 200,000 toy-related injuries treated in hospital emergency rooms. Some of us study children, but rarely about their susceptibility to product injuries, and the related role and responsibility of their caregivers.

And lastly, but perhaps most alarming, there are the widespread environmental concerns. We know almost certainly that this planet cannot reasonably sustain the world population forecasted for mid to late 21st Century if current consumption activities keep mounting. Looking just at the U.S., the Environmental Protection Agency has recently estimated that 40% of U.S. waterways remain too polluted for fishing or swimming. Sadly, in several parts of the world, where consumption levels are rapidly rising, airway pollution and waterway pollution are already worse than in the U.S. But it doesn't need to be this way. These trends, epidemics, and pandemics—and so many more I have overlooked here—are not solely for politicians, engineers, and health specialists to address, to ease, or to remedy. Where is ACR?

It is important to be balanced, however. There is much contentment and joy, and many marvels and triumphs in our world. Consumer behaviors particularly have the capacity to support and enhance life. These include reading, exercise, many outdoor activities, hobbies of numerous kinds, festivals and celebrations, and an array of artistic endeavors such as music, painting, and sculpting. There are also caring for and maintaining possessions, gift giving, sharing, donating, and recycling. These and many other consumer behaviors, when conducted in sensible amounts, with conscientiousness or flow, can undeniably contribute to well-being, including physical health, authentic personal efficacy and human potential, social justice and social integration, community networks, family coherence and legacies, child nurturance and growth, ecological stability, and so on. On the whole, there are many affirmative consumer behaviors and related dimensions of life that consumer researchers could not only derive deeper understanding of, but also share the insights with the people who would most benefit from them.

¹I thank Jim Burroughs, Rich Lutz, Ed McQuarrie, Mary-Ann Twist, and Brian Wansink for commenting helpfully on a prior draft of this address.

²The statistics reported were gathered from a variety of governmental and non-governmental sources, mostly from associated websites.

So, am I intimating that our modestly-sized, non-profit association of loosely organized members, who serve mostly as volunteers, can positively impact millions of consumers? Absolutely. Of course, it won't be easy. As E. B. White once confessed, "I get up every morning determined both to change the world and to have one hell of a good time. Sometimes this makes planning the day difficult." This is the sort of difficulty that is good. It is good for the world, good for ACR, good for us and our children.

I feel sheepish, though, standing before you today. My own research has been as inconsequential to consumers' well-being as anyone else's in this field. Yet, when I received the honor of being elected president of ACR, I felt it was time for me and for ACR to revisit the meaning and mattering of our lives' work. As I thought more about the unrealized potential of ACR in the contexts of consumer suffering as well as consumer enrichment, I thought more about our association's great hope. And as I did, an exhortation from Eleanor Roosevelt kept haunting me. She said quite simply, "Do the thing you think you cannot do."

This means, of course, that we must do more than just think or converse about consumer welfare. As one Chinese proverb states matter-of-factly: "Talk doesn't cook rice." We need to take some actions. And another Chinese proverb reminds us, "A journey of a thousand miles begins with the first step."

A first step was actually taken a year ago when Debbie MacInnis and several others worked diligently to redesign the ACR website into a more contemporary, sophisticated, and multi-functional resource. This included planning a subsection titled "For Consumers." Today it includes consumer-friendly summaries of relevant research as well as numerous links to other organizations and publications that can aid consumers. We need more ACR members to assist the website editors in developing this subsection. Please contact the chief editor, Vanessa Patrick, or me if you wish to contribute.

Taking a second vital step, I asked four respected members of ACR—Connie Pechmann, Linda Price, Rick Netemeyer, and Lisa Penaloza—to organize this conference around a theme of consumer welfare. An immediate stumbling block was figuring out what to label this theme. So we generated and reviewed over 50 possibilities. For example, we considered calling it Positive Consumer Research. But that seemed too derivative from the movement of positive psychology (Seligman and Csikszentmihalyi 2000). Besides, positive contrasts with negative, and it wasn't negative consumer research we were up against, but rather that which was ineffectual for social and personal well being. We felt we needed something fresh and stirring.

Ultimately, we all agreed on *Transformative Consumer Research*. By transformative research we mean investigations that are framed by a fundamental problem or opportunity, and that strive to respect, uphold, and improve life in relation to the myriad conditions, demands, potentialities, and effects of consumption. Though transformative consumer research has an immediate practical orientation, it does not forsake scrupulous methodology or perceptive theory. In fact, it is mostly—if not only—through meticulous description and compelling explanation that the findings can lead to constructive, actionable implications. The word 'transformative' also carries the additional meaning of an inspired summon to researchers themselves, who might be newly considering this genre of work or who would like to recharge their long-time faith in applied consumer research via ACR.

The organizers of our conference and I have been gratified by the response of ACR members who submitted papers and session proposals around the theme of transformative consumer research. Hopefully, future ACR conferences, including those in Europe, the

Asia-Pacific area, and Latin America can build upon these initial efforts. I respectfully urge the program committees and the organizers of these conferences to not only include transformative consumer research as a content code in the submission page of research topics, but also to extend and mature this endeavor in their own ways through the conference plans they make.

Before announcing further steps, I want to stress and clarify two essential issues. First, we have by no means intended for transformative consumer research to become some overarching or predominant orientation for ACR. Our association is characterized by broadminded and mutually respectful members. ACR will continue to welcome all researchers who have keen interests in consumer behavior, regardless of their topic or research paradigm.

Secondly, transformative consumer research is not something new, nor has it been dormant. More than one past presidential address at ACR has pointed in this direction. Also, occasional articles in the *Journal of Consumer Research* have looked at transformative consumer research topics. The *Journal of Public Policy and Marketing*, the *Journal of Research for Consumers*, the *Journal of Macro Marketing*, and the *Journal of Consumer Affairs* have also published many related papers, and some special issues are now forthcoming at those journals that fit under the rubric of transformative consumer research as I have outlined it today.

This brings me to my precise point. I am not insinuating that few ACR members care about or have published research that deals with consumer welfare. That would be patently false, though as my remarks intend to advocate today, we categorically could do much, much more. Ten years ago at this conference, the honorable Bill Wells alleged that our field was rife with irrelevance. I agreed then, and I still mostly do. But over the last decade during which I have pondered Bill's indictment, I have come to believe that our irrelevance is ironically most situated in the association itself. ACR has made little systematic effort to draw together the resources and skills of members who wish to work on consumer welfare, little systematic effort to encourage and reward more of this sort of research, and little systematic effort to inform either the public, consumer advisors, or policy administrators who would most gain from learning of the research and its implications.

It is critical, therefore, that additional concrete steps be taken. Otherwise, transformative consumer research via ACR will risk being never more than just kindly thoughts and ambiguous aspirations. With the devoted input of several of you in the audience today, I have worked during this last year to move transformative consumer research beyond our three-day gathering in San Antonio.

As you have probably noted, there was included in your conference registration packet a short report on an ad hoc Task Force. With the support of ACR's Board of Directors, I recruited through email 46 individuals who have strong interests in consumer welfare, to brainstorm ideas on a small set of key issues that will be crucial to the viability and success of transformative consumer research.

I will not take much time or space here to convey the task force results, since you have already received the summary report. In brief, the task force members identified some of the most pressing research topics, including

- vulnerable consumer groups (such as the poor, children and adolescents, and the illiterate),
- tobacco, alcohol, and drug consumption,
- gambling,
- nutrition and obesity,
- violence in movies and computer games,
- financial and medical decision making,

- product safety,
- environmentally protective behaviors, and
- organ donations.

Among the most mentioned barriers were motivating and valuing transformative consumer research. Other challenges were the need for explicit funding and for increased publication opportunities, especially in the leading outlets. Advice for addressing these crucial issues included:

- enlisting ACR opinion leaders to be decidedly involved,
- obtaining earmarked research funds for ACR members,
- working with journal editors to find new or increased means to publishing related research,
- arranging for ACR to provide outgoing communications that are widely accessible and understandable, both to the public and policy administrators, and, finally,
- developing doctoral seminars that can encourage and train new scholars in conducting, publishing, and publicizing transformative consumer research.

Taking these insights as a springboard, immediately following my remarks today there will be a special session on the task force report that will feature a select panel of the task force members. A sizeable period of this session will be open discussion between the panel and audience members, as moderated by our conference co-chairs, Connie and Linda. I invite all of the task force members to attend, and I hope that several others of you, who have curiosity or interests in the promise of transformative consumer research, will participate vigorously as well.

I am additionally pleased to announce that the ACR Board of Directors has endorsed a proposal I made to form an ongoing Advisory Committee on Transformative Consumer Research. The committee will report to the Board, and it will work side-by-side as needed with the ACR president, executive director, website editors, and others to invigorate and carry on transformative consumer research. I have volunteered to chair this committee at the beginning, and its membership will rotate on a regular basis. Its first duty will be to review the task force report and underlying data, as well as the feedback during the special session following this luncheon, and to begin to prioritize and implement the best recommendations. I am delighted to name the charter members of this advisory committee. They are:

Steve Burgess, University of Cape Town, South Africa
Marv Goldberg, Penn State University
Ron Hill, University of South Florida at St. Petersburg
Eric Johnson, Columbia University
Punam Keller, Dartmouth College
Connie Pechmann, University of California, Irvine
Simone Pettigrew, University of Western Australia
Joe Plummer, Chief Research Officer, Advertising Research Foundation
Linda Price, University of Arizona
Brian Wansink, Cornell University
Rick Wilk, Indiana University

I am also very excited to reveal a new source of ACR research support. To my knowledge, it is the single largest monetary donation to our association in our history, for any purpose. With the assistance of Linda Price, ACR has received a \$30,000 fund of seed support from the Kellogg Foundation to provide for research expenses associated with transformative consumer research. This

support has been made most directly possible by Ms. Cynthia Milligan, who is the Dean of the University of Nebraska School of Business and the President of the Board of the Kellogg Foundation. We owe immense gratitude to Cynthia and the Kellogg Foundation for this generous and uplifting support.

The distribution of the Kellogg Foundation funds over the next two to three years will be managed by the ACR Advisory Committee on Transformative Consumer Research. The first call for research proposals will be made soon via the ACR website and the ACR listserv. Proposals will be reviewed by the committee and the recipients will be announced shortly thereafter. The committee will also seek additional funds to replenish and build upon the initial Kellogg Foundation monies.

Among the most emphasized concerns by the task force was the need for research on consumer welfare to be more welcomed at our top academic journals. To this end, I am pleased to acknowledge that John Deighton, the new editor of the *Journal of Consumer Research*, has offered to develop a special issue of *JCR* in the spirit of transformative consumer research. This effort will fit soundly with the philosophy John espoused in his first editorial (Deighton 2005), namely that consumer research should be “useful” by “illuminating a real-world consumption phenomenon” and harboring “implications for practice.” The call for submissions has just recently been posted on the *JCR* website, and will soon appear on the ACR listserv and elsewhere. I thank John and the *JCR* Policy Board for making a higher priority of pragmatic studies of consumer welfare. What is also prospectively satisfying about this special issue is that, over the last two years, *JCR* has had tremendous success in getting the news media to notice and incorporate more of its research into a variety of journalistic articles and stories on consumer behavior. Thus, there is opportunely an increased likelihood that the public at large will be exposed to the insights and implications of this special issue.

I hope these opening steps for developing transformative consumer research will usher in a renaissance of an original mission of ACR, namely, to conduct and impart outstanding research in the service of quality of life.

In closing, I want to go back to 1969. Not to ACR’s genesis, but to another event occurring independently, which surprisingly paralleled the founding dreams for ACR and the re-envisionment I have called for today. That event in 1969 was the presidential speech given before the American Psychological Association by the renowned psycholinguist, George Miller. Here are some of his sentences stitched together from across his address. As you hear the word “psychologist,” think “consumer researcher.” Miller (1969, p. 1063, p. 1074) said:

The most urgent problems of our world today are the problems we have made for ourselves....Our obligations as citizens are broader than our obligations as scientists....If we have something of practical value to contribute, we should make every effort to insure that it is implemented....I recognize that many of you will note these ambitions as little more than empty rhetoric. Psychologists will never be up to it, you will say....On the other hand, difficulty is no excuse for surrender. There is a sense in which the unattainable is the best goal to pursue. So let us continue our struggle to advance psychology as a means of promoting human welfare, each in our own way. For myself, however, I can imagine nothing we could do that would be more relevant to human welfare, and nothing that could pose a greater challenge to the next generation of psychologists, than to discover how best to give psychology away.

Several of our founders intended ACR to be a principal channel for giving consumer research away. Inviting, as I have today, a middle age, self-analysis of ACR, how do you feel about giving consumer research away? If you agree—even if only moderately—how would you grade ACR’s performance? Where are we today?

There will be plentiful doubts about transformative consumer research, and more than enough impediments. But we should all feel buoyed by someone who knows a lot about resilience and noble goals. “Our deepest fear,” Nelson Mandela said, “is not that we are inadequate. Our deepest fear is that we are powerful beyond measure. It is our light, not our darkness, that frightens us.”

How true of ACR as well! Let’s not be deterred. Together we can raise the meaning and mattering of our scholarship in this world. ACR can still become the brighter beacon it was conceived to be.

ACR 2005 North American Film Festival Overview

Russell Belk, University of Utah
Robert Kozinets, York University

SUMMARY

This year marked the fourth consecutive North American ACR Film Festival. This year's offerings continued the strong momentum established in prior years in terms of quality and representation of topics and nations. The ten films shown at the festival came from eight different countries: France, Turkey, Australia, Sweden, Japan, USA, Canada, and India.

The films ranged in tone from the light and humorous ("Burning Bock") to the heartbreaking ("Erasing Futures"). They offered a wide variety of topics, but some definite themes were apparent. First there were films that looked at particular regional consumption rituals, or at regional or national inflections of global consumption rituals or holidays. In this category were Scandinavian inflections of Christmas rituals ("What do Consumers Consume in Santa?"), the burning of a straw goat in a Swedish village ("Burning Bock"), the tradition of "money day" gatherings in Turkey ("Not Desperate Housewives"), and the no-holds-barred capitalism of charismatic churches in Ghana ("The Gospel of Prosperity").

Second were films that examined fan culture and subcultures. These ranged from films about of heavy metal fans ("Headbanging"), fans at a comic, horror, and science fiction convention ("There & Back, Again"), to a gathering of fans of the Indiana Jones films ("Gearhead Pilgrimage"). Finally, there were two films that examined consumption-related topics of social importance, one that revealed the plight faced of Cuban women who worked as prostitutes in order to escape oppression ("Las Cubanitas") and another that brought us into the world of homeless Indian children who survive by begging and sniffing intoxicants ("Erasing Futures"). These films, and the three categories we have grouped them into here, continue and contribute to important substantive traditions in the field of consumer research.

As always, the films inspired considerable discussion. The question and answer periods often had to be cut off short due to the lengthy and detailed discussions with the filmmakers that followed the premiere exhibition of each film.

Quality was high due to the strong rejection rate. This year's film festival had a 33 percent rejection rate—by far the highest historical benchmark. Not coincidentally, this was also the first year that we used a cadre of reviewers to assist us in reviewing and offering comments upon the Film Festival submissions. We owe each of them a debt of gratitude, and acknowledge them here.

SHORT ABSTRACTS

"The Paradox Between Only Looking and Possession"

Yu Chen, HEC, Paris

The "only looking at" or the "just seeing" is a quite frequent reaction of beholders vis à vis an aesthetic object, especially in visual artistic experience. According to the anthropologists as Maquet (1992) or Rothko (1970), it is "a mental deconditioning" and a state of "bare attention". Three specific traits of the "only looking" attitude- attention, nondiscursiveness, and disinterestedness- are found in the previous literature (Maquet 1986, Wagner 1999). These traits reflect a different logic from that of materialistic personality -jealousy, possessiveness and envy (Belk, 1988, 1996) and make us investigate the effect of this experience on human behaviours in general and consumer behaviours in special.

In this video essay, other than studying about the consumers, we would investigate how the artists- the 'producers' of artworks react to these two different attitudes and behaviours. The main question will be what the artists desire for actually, and for what reasons.

The video edition is organized as: firstly the openness of the scenario by a piece of installation works of the artist that we interview—the bubble machine. The camera then follows the bubbles and shows the enjoyment of people inside the parachute- the exhibition centre of this artist. Thirdly we show the "producer" of the works- artist Chris Coleman. His speech followed two main logics: his proud about his exhibition and his deception about the non purchase. His desire to show his artworks to the public—confused with that to sell his artworks to be able to continue the creation- is then shared by other three artists of contemporary art.

From their expressions, we could learn that the *desire* of artists is that people appreciate their art, while they have certain kind of *need* to be financially supported. The only manner of this support that they are expecting is the purchases of artworks, and in the video we could learn that they express their deception of consumers because of the lack of purchase. However, at the same time, they show their happiness that people love, look at and appreciate their works. We think that this paradox would continue if purchase were always the only way for artists to rely on for survival.

The understanding of the artists' desire for "high art" and need for "low money" and the gap between the number that they created and that they sold helped us investigate whether there would be another modality for consuming artworks. This video is thus a window for us to see an interior world of artists and to consider the necessity and the feasibility of another modality of art consumption experience- access to artworks without acquisition.

"Not Desperate Housewives: Turkish Housewives' Consumption Practices at 'Money Day' Gatherings"

Ebru Ulusoy, Istanbul University

This film is about Turkish housewives' consumption related practices in social gatherings with friends and relatives that are

generally named as “money day” gatherings in respect to money collecting tradition. In these systematically scheduled gatherings there are some practices that are related to consumption. In this work these are classified as spending for one’s self, time and food consumption and direct marketing of products that women make by themselves or of the companies they become distributors of.

“Money Day Gatherings” has been an important practice in Turkish housewives’ daily lives. These days refer to the very small friend or relative communities’ (approximately 5-10 housewives) social gatherings. Each gathering or shortly “day” mostly take place once a month in one of the community member’s house, but rarely out at a restaurant or cafe. A woman might be a member of different communities and attend different gatherings. There are two main characteristics of these community gatherings: systematical scheduling and money collecting.

In respect to systematic scheduling, every community decides when and where to gather every month at the beginning of the year which is mostly by September-October. And, at the last gathering of the year which happens mostly in the beginning of the summer, it is decided when and where to start the next year’s gatherings.

The most important aspect of these gatherings is that housewives in the community collect money (most accepted money currencies are Turkish Lira, Dollar, Euro or Gold) among themselves and give it to the host housewife in whose home the “Day” takes place. Or even if the day takes place outside, the collected money is given to the members of the community in a turn. Each community decides the amount of the money that will be collected and this amount differs from group to group. Due to this money collecting practice, these days are known as “Money Days”. But despite the ‘money’ aspect, these days are considered far from being materialistic among Turkish housewives. Being together is told to be the most important reason for these gatherings. The most important proof of this is that even sometimes there can be members who are not willing to pay money and welcomed in these gatherings and also welcomes guests once a year like all other community members. Being together, visiting friend’s home or receiving guests are very important for housewives in the community. Gift (for the house) –giving by the guests to the owner of the house, or serving to the guests throughout the day are some of the most important and common traditional behaviors in these days.

These gatherings have some aspects that are related to consumption. These can be generally classified as 1) enabling to spend for one’s self, 2) time and food consumption, 3) direct marketing.

Enabling to Spend For One’s Self. Generally, housewives who don’t have an income take money from their husbands mostly for the needs of the house, especially for the kitchen spendings, so mostly this money is for the spendings of the family. But these “days” enable them to label the money they get from these days “their own money”, and even though sometimes they spend it to make a contribution to home budget, most of them spend it for themselves. Clothes, jewelry and shoes are the things that this money is mostly spend for. Other than these, another place they spend this money for is “trips”.

Time and Food Consumption. Preparing for these gatherings happen like a ritual especially for the host housewife like most of the guest receivings in Turkey. The host housewife tries to get ready for receiving her guests in her best, so she puts a lot of time, money and effort into preparations. Preparations mostly begin a few days ago, the home is cleaned, the host decides which food to bake or cook and go for shopping. Mostly, food such as borek (kind of salty pastry made of thin sheet of dough mostly with meet, cheese or potatoes), corek (kind of bun), cake, desserts and other traditional dishes such as kisir (made of boiled and pounded wheat) are prepared (every housewife has her own recipe and way of doing them) one day ago

to be baked in the morning of the gathering to be served hot or fresh. These prepared food is mostly the most time consuming and talent expressing ones. And doing as much as one can is also a symbol of showing how much the host housewife cares for her friends.

Direct Marketing. Women sometimes sell their friends the things they make themselves such as bracelets, necklaces or the clothes they knit or sew. Other than selling the things they make, they sometimes become distributors of companies that prefer direct marketing and market their products to their friends. This is also an example of the micro economical aspects of these gathering for the housewives.

As a conclusion, these gatherings suggest how some communities negotiate consumption and production practices. But regardless of all these practices, the most cared aspect by housewives attending these gatherings is “being happy of being together” with friends.

“Headbanging: As Resistance or Refuge”

Marylouise Caldwell, University of Sydney

Paul Henry, University of Sydney

Heavy metal music (HMM) participants are often characterized by wider society as simply angry, aggressive, and aberrant, but is this the reality? Are they predominantly engaged in acts of social resistance in which they consciously reject mainstream social values, or are they primarily seeking a place of refuge amongst an accepting social group? This video explores formative experiences that have shaped their self identity, and how (successfully) they negotiate the dual worlds of HMM subculture and place in wider society.

The literature informing these research questions is drawn from work on the nature and functions of (apparent) consumer resistance (e.g. Firat and Venkatesh 1995; Holt 2002; Kozinets 2002; Ozanne and Murray 1995; Thompson 2003) and subcultures (e.g. Kozinets 2001; Schouten and Alexander 1995),

The HMM scene in Sydney, Australia was described by one industry figure as “hardly breathing.” The number of participants is small and the limited number of promotions at tiny venues reflects the interest. Our informants were certainly not conforming to the predominant youth trends in music or fashion. They had been long term adherents of HMM. One informant noted that “metal is generally rejected in Australia.” They suffer negative effects of being stereotyped as a pack of misfits. Adding to this disadvantage informants were from working class backgrounds with low incomes, barriers to good jobs, and limited economic resources.

In addition to the disempowering effects of socio-economic position (Henry 2005) and stigmatization as HMM adherents (Walser 1993), informants also report lack of fit with peer group norms especially in their teenage years. These memories reflected feelings of being different to others, experiencing rejection, and loneliness. Many informants were self-professed “geeks”, tending toward books, study and music. Working class attitudes to these types of interests typically range from ambivalence to derision (Bourdieu 1984). Informants also displayed a complete lack of interest in sports. In working class groups, since other forms of power are often denied, physicality and brute strength as exhibited in playing sport is highly valued (Bourdieu 1984). Furthermore, Australian culture is ‘sports-mad’ with sporting affiliations contributing to social acceptance.

These experiences of disempowerment have shaped informant’s sense of self, values, priorities and preferences. Recurring values articulated by informants revolved around the importance of open-mindedness and acceptance of different people, ideas, and music. This appeared to be a reaction to the closed-mindedness they have faced and the desire to distinguish them-

selves from the mainstream oppressors. Informants see themselves as individualists, free from mainstream social pressure. One cited as evidence their ability to discern good music independently: “you don’t go with the crowd. HMM makes us feel different and superior to the other people who are sheep and fed mainstream stuff . . . (and) we can have a laugh at the world coz we know better.”

In HMM informants had found an enclave of like-thinkers from which they derived (previously denied) social acceptance, a source of identification, and enhanced self-esteem. However, their broader aspirations throw continuing sense of disempowerment into sharp relief. When asked about the future, all informants expressed the desire to own their own homes, pay off debts, attain financial stability and bring up children in a secure manner. The statement “I’d like the whole wife, kids and white picket fence thing” is typical. Perceived difficulty in aspirational attainment was evident across informants as exemplified by the quote about financial advancement: “I’ve had a lot twists, turns and dead ends.”

Coping responses to the simultaneous desires to maintain their HMM identification as well as broader aspirations vary across informants. Some tended to be more adept at balancing participation in both HMM and mainstream worlds. Others withdrew almost exclusively into HMM subculture, often to detriment of their wider aspirations. They typically employed fantasy and escapist coping, with fascination in books like “The Lord of the Rings” or medieval themes depicting powerful archetypes. Those that more successfully balanced multiple worlds employed shielding techniques. For example, one described “work people are a whole different set of relationships, a different wardrobe, a different way of talking and acting. A different person walks out of here on Monday morning.” This shielding approach also had a cost in that these informants described a dissatisfying lack of fit with others in the workplace: “I just don’t feel I’ve found my niche in life.”

This surfaces the conundrum for all informants. They have all found refuge and strength in the HMM scene. Yet in order to obtain their wider aspirations successful engagement with the mainstream is required. This is where the economic and material resources lie. Oppositional actions and symbols stereotypical of HMM works against the social acceptance necessary for such engagement. So something has to give.

“Burning Bock”

Sven Bergvall, *Royal Institute of Technology*
Jacob Ostberg, *Stockholm University*

The straw goat (*bock* in Swedish) in the town of Gävle, a predecessor to Santa Claus with connotations ranging back to the pagan Viking traditions of Scandinavia, is the largest in the world. Its fame stems, however, from its almost annual burning. Standing as a symbol of both sacred and profane aspects of the Christmas celebration it has become the target of dark forces spreading fire and destruction. This videography explores the Gävleners relation to Christmas, the bock and its destruction.

“What Do Consumers Consume in Santa? A Comparative Study of Santa Claus in Scandinavia”

Junko Kimura, *Hosei University*

We investigate the reactions of consumers toward Santa Claus and the ways Santa satisfied them. Since Clement Moore wrote a storybook of Night Before Christmas in 1822, Santa lives in Arctic Circle. It is because wild reindeers can live only in the Arctic Circle. We see many motion films and children books of Santa living with elves and working for preparing Christmas in either polar or Arctic Circle. Not only in the imaginary stories, but also in the real world we can visit “real” Santa in Scandinavia. In Denmark, there is a Santa Claus meeting in every July, and over 100 official Santa from all over the world gather. In Tomteland in Mora, Sweden, 40,000 guests visit a year. 400,000 guests visit Santa Claus Village in Lapland, Finland. In Norway, there is Christmas House and Post Office and 80,000 guests visit a year.

For the present study, we choose Finnish and Norwegian Santa Villages. Santa has different meaning to consumers. In Finland, Santa is realization of people’s image. People come to see him in order to confirm that the constructed image is true. He need to be as same as the image people see in the motion films and books. Visitors are too eager to see him and do not mind waiting in line for two hours outside the building. For the memory of him, visitors do three things. First, they are taken in photo with Santa. Taking photo with their own camera is prohibited and they need to buy the photo which is taken by the cameraman there. Secondly, they write postcards to their friends and family from Santa Village Post Office. Each postcard and mail will be stamped with Santa postmark. Thirdly, visitors buy souvenirs at the shopping center. On the contrary, in Norway, Santa is media of Christmas spirit. He is a missionary who conveys people, especially children, the true meaning of Christmas: the importance of family bond.

These differences are created not only because Finnish Santa and Norwegian Santa are different in their figures, costumes, and stories but because marketers have different philosophy and strategy. In Finland, Santa Village insists that Finnish Santa is the genuine and original, even though the country adopted image of Santa from the US.

There used to be Tonto, a gift bringer, in Finnish folklore. Village downgraded Tonto to Santa’s helper. In order to distinguish Finnish Santa from other Santa, such as Coca Cola Santa and those

in motion films, Santa Village changed his costume. He used to wear red costume from his head to toe. About ten years ago, Village renewed his costume to the one with less red color because they did not prefer the fact that red costume reminds people of Coca Cola Santa. Other workers, such as Tonto and Country Elf, play their roles at any moments. Even though the researcher told them that they did not need to play their roles while talking to her, they kept acting the characters of Santa's story. These strategies make it possible to turn the imaginary world into the existing world, which attracts and satisfies visitors. On the contrary, in Norway, the director of Christmas House tries maintaining and reinforcing the original story of Norwegian folklore. It is why she insists calling a gift bringer Nisse instead of Santa Claus. When a Japanese marketer visited her for searching a business chance, the director scolded her explaining that Christmas is not a business chance but an opportunity people pile their family history. Some companies in Japan are moved by this Christmas spirit and invite Nisse as a missionary. We do not try deciding which Santa is superior. It is useless to compete to decide who is genuine because each has different meaning and different way to satisfy consumers.

“Gearhead Pilgrimage: The Queen Mary Summit of Indiana Jones”

Scott Smith, Central Missouri State University
S. Jason Cole, University of Kansas
Dan Fisher, University of Tulsa
Jeff B. Murray, University of Arkansas
Molly Rapert, University of Arkansas

A pilgrimage is one of the most widespread rituals found in religious, and now secular, culture. The term pilgrimage refers to the ritual of a journey to a specific place. It is based on the belief that certain places are more powerful than others, and that this power can be experienced, and even taken home, in the feeling of a spiritual renewal, the transformation of social status, or embodied in an artifact or relic from the journey (Dubisch 1995: 35). Although there is an emphasis on materiality in pilgrimage, as a ritual it is understood to be both a real journey and a symbolic or metaphorical one. Taking a pilgrimage is not about escaping reality, but about stepping into reality (Delahanty 1997).

The concept of the “symbolic pilgrimage,” or even “fan pilgrimage,” has been explored at various levels (Kozinets 2001; Kozinets 2002; Aden 1999; O’Guinn and Belk 1989; etc.), but it is often seen as nothing more than textual representation, devotion and status (Aden 1999). This film argues that, within fandom, the pilgrimage often holds a more illuminating sacredness than the traditional meanings attached to a place and journey. It is often a culmination of the affective experience of fans, actually mapped into the physical geography (Hills 2002). For the fan, a touristic pilgrimage does not merely represent a communal ritual with semiotic effects, but also a clarifying-experiential process that is inextricably linked to and helps to define actual material spaces as well as denote a capstone to years of fandom. A familiar rite of passage for a “religious” believer (Turner 1974), O’Guinn and Belk (1989) apply this concept in a consumer context in their examination of the religious theme park, Heritage Village, extending the application of a previously, strictly religious notion to consumption.

To investigate this conceptualization, fans of Indiana Jones and his costume, or “gear,” and their congregation at the RMS Queen Mary Transatlantic Ocean Liner Facility were explored. The Queen Mary, a former ocean liner, has been permanently docked in Long Beach, California and serves as a hotel, shopping center, and entertainment hub. These fans congregate at the Queen Mary due to

rumors its venue was used for a portion of Raiders of the Lost Ark, the first in the Indiana Jones trilogy, as well as for its historical background.

For the Indiana Jones fan, media reception is simply one point within an array of practices that enhance the original connection to the Indiana Jones trilogy. Participation in real and virtual communities, the obtaining of artifacts, or the creating of fan productions are just a few of the ways that Indy fans participate and are metaphorically linked to their passion. The traveling to symbolic locations is often seen in the same fashion and is reduced metaphorically, but similarly to creative fan productions, a symbolic pilgrimage goes beyond simple semiotic value, and helps to link iconic events to individual experience and creates a new way in which fans can engage and break through cultural structures

Within a religious context, the “journey” is traditionally a penance and involves sacrifice. Secularly, the pilgrimage is voluntary and based on individual choice. Yet for the Indiana Jones gear fans, known as “Indy Gearheads,” the trip is a direct link to the travels of their favorite adventurer, a suspected sight of filming for the first movie in the trilogy, a destination to a mode of transportation similar to one the fictitious adventurer might have used, and a first-hand moment connecting with history.

Within the common constructs of a pilgrimage, Indy Gearheads experience a state of “liminality” or “separation” as they prepare for the trip, preparing and packing their favorite gear. Additionally, the entire trip, a period of gear wearing, whip cracking and movie quoting can be considered “liminal” as they travel to a special location physically and transcendently. Participants of the Queen Mary Summit “become a privileged class” with abundant opportunity to learn and speculate about what the group and its members considers its “ultimate things” (Turner 1974: 259).

These sacred symbols operate culturally as mnemonics, or as ‘storage bins’ of information, not about pragmatic techniques, but about cosmologies, values and cultural axioms, whereby a society’s deep knowledge is transmitted from one generation to another (Turner 1974: 239). As Indy gear is the focus of thrust for these enthusiasts, the liminal stage of pilgrimage is obligated to continue to encompass the discussion of all aspects of movie costuming and props. Pilgrims leave behind the structures and obligations of home and the conventions and concerns associated with daily life. In the Company of others like themselves they become aware of their allegiance to a larger community beyond their local sphere (Turner 1974: 168), including favorite aspects of the movie’s main character and its artifacts.

What especially depicts this group is the concept of “communitas” and spirit of community. This quality of communitas in long established pilgrimages becomes articulated in some measure with the environing social structure (Turner 1974: 166). People from all levels of society and walks of life may form strong bonds, free from the structures that normally separate them. This potent and distinctive form of social community emerges in what Turner refers to as the liminal stages of pilgrimages and refers to, “jointly undergoing ritual transition” through which they experience an intense sense of intimacy and equality. All of the participants in the Queen Mary Summit are members of the online Indiana Jones gear forum Club Obi Wan, named after a dinner club that appears in the beginning of Indiana Jones and the Temple of Doom, the second movie in the trilogy.

For fans, the pilgrimage often holds a more illuminating sacredness than the traditional meanings attached to a trip. These pilgrimages allow fans to inhabit the world of the fan text in an affective, liminal and experiential way and to legitimate and ground textual geographies of fandom.

“There and Back Again: A Consumption Journey”

Robert Kozinets, York University

Consumption is a complex act: part pragmatic economization, part mystical conjuration. A consumption journey to a convention that unites comic book, anime, horror, and science fiction fans is the launch point for an exploration of consumers’ popular fascination with entertainment culture. Is entertainment culture harmful to society, as Frankfurt School theorists and other cultural critics assert? Drawing on ideas, concepts, and theories from Debord, Baudrillard, Postman, and others, this video seeks to embody consumption experiences such as celebrity-worship, mass media hyperbolization, collecting, and shopping, as practices shaped by the institutions of contemporary consumer society.

Or is it a playful expression of fun and *joie de vivre*, a source of community and creativity celebrated by cultural studies scholars such as John Fiske? This video attends to the combination of commercialization and sacralization that is the modern entertainment marketplace. The videography begins an exploration of comic book collecting, gaming, action figure collection, and other entertainment paraphernalia-related practices that brings into relief some of the key concerns

This film employs ethnographic and cultural studies frameworks to examine consumer cultures and communities. In the process, it will seek to educate about the characteristics of consumption-oriented communities and social formations. In terms of direct benefits, it seeks (1) to help de-stigmatize, where necessary, social groups that are often portrayed as “fringe,” “cult-like” or “fanatical,” (2) to study and explicate important relations of social power that corporations exercise through their control of consumer cultures and communities, (3) to point out the social benefits and risks of cultures and communities of consumption to their members, and to society, and (4) to provide new and useful ways of conceptualizing cultures and communities of consumption that are accessible to the public, to educators, and the members of the culture at large.

The central focus of the film is to enhance our understanding of market-oriented or consumer cultures and communities as they manifest in celebratory consumption gatherings such as the one studied here. This research provides an “inverted lens” look at commonplace consumer behaviors that seeks to defamiliarize and “re-strange-ify” the ordinary-yet-remarkable worlds of consumers.

The film uses linear narrative in part, but also draws upon a quick-cut, transformative, unsteady lens to portray the shifting psychedelic sense of the reality of modern consumer society. The film’s final section offers a new theorization of connectedness with entertainment consumption as driven by four essential factors. First are Dimensions, the extent to which there is complexity and depth to the created world(s) that consumer experience. Next is Desire, the extent to which the created world is one in which the consumers’ fantasy is engaged. This type of engagement takes the form of two elements: morality/heroism and admiration and personal power. The next factor is Division, a social capital related construct in which levels of hierarchies exist (such as those between producers and fans, between stars and producers, and between those who are knowledgeable and those who are not), which serve as strong motivation for going deeper into the community and the entertainment property. Finally, there are Doorways, such as occur at the convention. Doorways are the moments when a consumer gains entrance through breaches between the worlds, where immersion can be attained, where communities form, where a liminoidity pertains that allows trespass between the dimensions. The film theorizes that the greater the potential for Doorways, the greater the potential for consumer attractedness. Conventions such as this one

fulfill the popular and commercial need for Doorways to exist, which deepen entertainment experiences and provide financial and consumption opportunities.

“The Gospel of Prosperity: Charismatic Churches in Ghana”

Samuel K. Bonsu, York University

Russell W. Belk, University of Utah

Two quotations highlight the subject of our video. The first is by an anthropologist who has been studying Ghanaian religion for a number of years:

Nothing can better evoke what is at stake than the salience of the contrast between the familiar image of the African prophet from Zionist, Nazarite, or Aladura churches, dressed in white gowns, carrying crosses, and going to pray in the bush, and the flamboyant leaders of the new mega-churches, who dress in the latest (African) fashion, drive nothing less than a Mercedes Benz, participate in the global Pentecostal jetset, broadcast the message through flashy TV and radio programs, and preach the Prosperity Gospel to their deprived and hitherto-hopeless born-again followers at home and in the diaspora...the emergence of these figures [and their consumption lifestyles] suggests that the appropriation of Christianity in Africa has entered a new phase (Meyer 2004; p. 448).

The second quotation is by the founder of the church that is the primary site of our research. It is part of a sermon (later turned into a book), like many of those heard at Lighthouse Church International:

One facet of being successful is being prosperous. Poverty does not help anyone. The devil has made us believe that a spiritual person is a poor person. The fact that some priests take oaths of poverty only goes to emphasize the notion that there is some virtue in abject poverty. When I read the Bible, I do not see any such doctrine. Infact, the people God walked with often turned out to be rich. It is obvious that Satan has done a good job in making us all believe that poverty is more spiritual than prosperity... God wants to give you more money than you can use, but He wants you to love Him more than money. Money is not evil! It cannot be evil! It is when you love money more than God, that you are in danger of backsliding... God wants us to be successful. He wants His children to be rich and prosperous. God wants His people to build houses and to own cars. God’s will for you is to have an abundance of all things...what do you lose by believing this? Nothing! ...He wants you to be a millionaire, and even a billionaire... There will always be poor people amongst us, but it is our duty as preachers to speak the general truth of the Word of God. The general truth of God’s Word is explicitly and implicitly prosperity, riches, breakthrough, happiness, peace and success. Receive it because that is God’s desire for you...Decide today for prosperity and riches. Decide today that you will accomplish something in this life. God does not want you to borrow money; He wants you to be a giver. Don’t believe the lies of the devil...I am saying this because I want to help you. I am saying this because God has sent me into your life to help you climb out of darkness. God is telling me to tell you that prosperity is for you now! No matter who you are or where you live in this world, prosperity can be yours by faith. I see you having a breakthrough in your financial life. I see you living long and prospering. I see you without debt. I see you with

great riches...I see you owning many cars. That is God's plan for you! (Heward-Mills 2000a, p. 6-8; emphasis in original).

LCI is one of the leading charismatic churches in Ghana, which describes itself as a mega-church. The Church has at least 23 franchises in the USA alone, and more than 300 others in over 30 countries around the world (www.lighthousechapel.org). The materialistic focus of the sermon, along with Meyer's (2004) observation in the epigraph points to the pervasive nature of consumer culture and the inroads that it has made into contemporary African Christian doctrine and practice. The theology represented in the quotations challenges some of the core foundations of traditional Protestant Christianity such as denial of the flesh, inner asceticism, and the preferential option for the poor (Weber 1958). Clearly, the sermon was designed to disabuse audiences of the traditional beliefs that sustain the view that Christian religious piety and the aggressive pursuit of wealth cannot be bedfellows. Drawing on his interpretation of the Bible, Heward-Mills and his team of preachers offer hope that all children of God are guaranteed extreme wealth as long as they commit to God. This commitment and accompanying financial rewards, as he noted in the broader context of the excerpt above and in numerous other sermons elsewhere (e.g., Heward-Mills 2000b, 2002), derive in significant part from a conscientious giving of tithes and offerings to the Church. He guides his flock into compliance through teachings on loyalty and obedience to God and Church (e.g., Heward-Mills 2000c).

Based on a year of participant observation and depth interviews, this video explores both the positive and negative aspects of church-promoted materialism in a poor nation. On one hand, the Gospel of Prosperity offers hope and encourages entrepreneurship, investment, and generosity. On the other hand, for many this may be a false form of hope founded on greed, encouraged by displays of conspicuous consumption, and demanding donations that may make the church and its clergy wealthy at the expense of its credulous congregation. We show both sides of this movement and allow the audience to reach its own conclusions about whether the rapidly spreading Gospel of Prosperity is more of a blessing or a curse for Ghana.

"Las Cubanas: An Exploration of Life in Cuba"

Sindy Chapa, University of Texas-Pan American

The purpose of this work is to explore the life of "las Cubanas" (Cuban Ladies) in la Havana Cuba. First, in an attempt to explore the life of "las Cubanas," the author looks at the life in Cuba in general; its culture, history and government. Second, the video focuses on the life of the Cuban ladies who are involved in prostitution. Finally, the relationship between "las Cubanas" and the tourism is exposed. In conclusion, this video shows a general vision

of the life of "las Cubanas" by exploring how the necessity is what makes them to become prostitutes.

"Erasing Futures: Ethics of Marketing an Intoxicant to Homeless Children"

Ram Manohar, Vikas Indian Institute of Technology, Kanpur
Rohit Varman, Indian Institute of Technology, Kanpur

In the recent times, marketing has emerged as one of the most important of the business functions with marketers catering to the needs of customers. Good marketing managers identify problems of customers and fulfil them, which lead to higher levels of customer satisfaction. This, in turn, increases sales and profitability of firms, which results in greater benefits for employees and more dividends for stockholders. The other side of the argument, however, is that marketing is essentially profit oriented and is not concerned about consumer welfare. This conflict of interests between internal and external stakeholders leads to moral dilemmas for business. In this video we describe a case of consumption of correction fluid in India by homeless children. The correction fluid is being commonly used by these children as a drug. Our case study draws upon the classical works and addresses the issue of business ethics involved here.

The research was conducted at a railway station in the city of Kanpur in North India. The main actors of this study are homeless children who stay at a railway station. These boys in the age group of 5-15 have torn clothes, dishevelled hair and are looked upon as thieves and vagabonds by most of the passengers and the railway officials. There are around 150 kids on any given day at the station. These children make their living by begging, cleaning trains or by selling water. Most of the children told us that they earned more than two dollars a day which was higher than the minimum wages fixed by the Government. These children eat left over food which is given to them by passengers or coach attendants in lieu of cleaning train compartments.

The product consumed by these children is correcting fluid, which is used to erase typographical errors. Correcting fluid can be either water based or organic solvent based chemical. Latter is used by these children as an inhalant because it is highly intoxicating. Water based product is not available in India and is only meant for exports. This product is available in a glass bottle containing 20ml of liquid and is sold with a bottle of diluter. We talked to several typists about the consumption of correcting fluid and they informed us that on an average they consume one bottle in six months. In the recent times, with the advent of computer based typing, office usage has further declined. Many informants have also started using correcting fluid in pen form in place of the liquid version consumed by children. Erazex,¹ produced by Coral, is the most widely used brand in offices and at the railway station. Coral is a business group which prides itself as an Indian company with an International outlook. In 2004 it had sales turnover of 90 m USD and the profit after tax doubled to 10m USD from the previous year (Source-Capital Online).

Unit price of a pack varies from 40-50 cents at the retail stores near the station. Interestingly, this product is also available in small food stores near the railway station and is openly sold in the retail stores around the station. Despite awareness about the product abuse, retailers and the manufacturer have not taken any corrective steps to put a check on these sales. Correction fluid is being distributed through the outlets around the station to effectively target these children. The heavy usage by this consumer group offers a lucrative market, which is being exploited by the firm and

¹Names of the brand and the firm have been changed.

its retailers. These commercial establishments refused to speak to us about the product. Our interviews with these children indicated that easy availability contributed to their addiction.

In a capitalist system any compromise with the profit making agenda meets with resistance. Profit based system frequently thrives at the cost of vulnerable stakeholders like workers and consumers. The dilemma to continue marketing correcting fluid in the same form or to withdraw it from the market is a reflection of this problem. The firm does not find it wrong, although it has come to know that the bulk of product is (mis)used by homeless children. In the Consequentialist framework of Bentham and Mill, marketing managers can pursue their own interest of maximising sales. It can be argued that these managers are pursuing their own pleasure, which is central to this line of philosophy. Here, maximisation rule of Consequentialism, is also quite limiting because human lives are at stake. Even if the number of the children is lower than the number of the shareholders of the firm, profit cannot be made at the cost of the lives of these children. In pursuit of pleasure, Consequentialism as a system of ethics is, however, closed to this universalistic interpretation of human values. Virtue ethics which gives the manager his/her personal space, also gives him/her opportunity to be whimsical. Interpretation of the problem cannot be left at an individual level as it is evident in this case that the manager as an individual has failed to take corrective action. Aristotelian system of virtue ethics is open to acceptance of inequality and to differential treatment of less privileged population. Here, managers from more elite background can view these homeless kids as inferior beings, who do not require any special attention.

The above mentioned limitations with the framework of Consequentialism and Virtue Ethics lead us to the third classical approach proposed by Kant. Kantian ethics operates with a universal notion of fairness and justice. Here, Kant's categorical imperative, which emphasises certain actions as objectively necessary, without regard to any end, leads to a more just resolution of the problem. The drug abuse by children is clearly problematic and marketing managers have to put an end to it by restricting sales around the railway station. Their duty is to re-visit marketing strategy and make amends to discourage these users. This can happen by changing constituents of the product e.g. in the US, mustard oil is mixed in solvent based correcting fluid to discourage abusers. Kantian emphasis on the usage of correct means ensures that these children are not discriminated against. Further, Kant's stress on man being an absolute end strongly reinforces this solution. Here, children are used as means for the benefit of the retailers and the firm. Kant's emphasis on absolute end vehemently rejects this possibility. In summary, our research demonstrates that restrictions on unfair and unjust system of profit generation require a universal approach to ethical behaviour. Kantian emphases on duty, morality and obligations are essential to resolve the ethical dilemma presented in this case.

SPECIAL SESSION SUMMARY

In Harm's Way? The Turbulence of Adolescence

Julie L. Ozanne, Virginia Tech
Laurel Anderson, Arizona State University

SESSION SUMMARY

No longer children but not yet adults, teenagers have earned a reputation for inflicting pain on themselves and anyone within range. Adolescence is a period of experimentation and risk taking. Consumer research traditionally views adolescence as one stage in a series of progressive stages and has examined the socializing influences of family, peers, and media (Roedder John 1999). However, recent research in neuroscience raises questions about this framework. Massive changes are occurring in teen's synaptic reorganization, with millions of neuro-connections being erased and created, at a rate only matched during infancy. This recent research documents that a growth spurt occurs in teens' frontal lobes, the area of the brain that is responsible for planning, reasoning, and controlling inhibitions (Giedd, Blumenthal, Jeffreis et al. 1999; Strauch 2003). Rather than one stage in a series of progressive stages, adolescence is a period during which teens' brains quite literally get redesigned. Moreover, teens are managing this inner turbulence during a time of unprecedented social change, such as the increasing ambiguity of gender roles, the dizzying speed of technological innovations, media pervasiveness and interactivity, the global AIDS epidemic, and the spread of new designer drugs, to name a few. Teenagers are coming of age during an increasingly dynamic socio-historical context.

The objective of this special session is to take a multi-paradigmatic, multi-method approach to adolescence and focus attention on both the problems and opportunities facing contemporary adolescents. We seek to move beyond stage theories of development and research that only emphasizes the vulnerabilities of adolescents. We hope to begin building a more comprehensive understanding of teenagers that considers how they make decisions, assess risk, explore conflicting roles, play with gender expectations, assert their identity, and develop new norms and forms of communication within a socio-cultural-historical context.

Parker, Fischhoff, and Bruine de Bruin employ a behavioral decision-making approach to understanding teens' decision-making through the analysis of field data. They explore the problem of overconfidence in some of the most risky decisions made by teenagers. Scott approaches the challenges of adolescents using a socio-historical approach and bases her findings on in-depth analysis of video interviews. Her provocative thesis is that the seemingly shocking consumption behavior of contemporary young women is a continuation of decades of progressive social change. Anderson and Ozanne take a socio-cultural approach and utilize a range of data: metaphor, essays, collages, and web diaries. They examine the way that teens engage in identity play in cyberspace and explore the potential dangers and benefits of a plastic self during what was traditionally conceptualized as a period of identity solidification. These papers all focus on consumer research that is in the interest of consumers.

The likely audience for this session should include researchers interested in the substantive areas of adolescence and social issues. People who are interested in theories of risk, identity formation, and socialization will also find this session relevant. Marvin Goldberg has studied youths for decades and is one of the most well respected experts. He will be the discussant for this session. However, rather than playing the traditional discussant's role, he will offer advice on

the most fertile areas in which to do research for anyone considering work in this area.

"Who Thinks They Know More—But Actually Knows Less? Adolescent Confidence in their HIV/AIDS and General Knowledge"

Andrew M. Parker, Baruch Fischhoff, and Wändi Bruine de Bruin

Decisions regarding health-related behaviors are among the most important ones we make in our lives. Decisions about health checkups, sexual behavior, exercise, and diet affect our future health and well-being. In order to act effectively on their beliefs, individuals need to know how far to trust them. Undue confidence (i.e., thinking they know more than they do) can lead to capricious actions, failure to seek missing information, and inadequate sensitivity to signs that choices were wrong. Inadequate confidence (i.e., thinking that they know less than they do) can lead to unwarranted paralysis, needless worry, procrastination, and reliance on others. One group whose health-related decisions raise particular concern is adolescents, whose growing emancipation gives them the power to make choices that can dramatically affect their current and future well-being. The appropriateness of their confidence in their health-related beliefs is the subject of this paper. In it, we ask how much do teens know, and how aware are they of the extent of their knowledge? We contrast teens with high and low levels of self-reported risk behaviors, as well as parents of the low-risk teens.

One hundred and eleven teens (median age 16, 59% female) were recruited from community organizations in a large urban area, identified as having relatively high- or low-risk participants. Data were also collected from one parent for each of 38 of the low-risk teens (median age 42, 76% female). Teen respondents from the two populations differed markedly in their prevalence of self-reported risky behavior, for themselves and their peers, regarding sex, alcohol, smoking, and drugs. Respondents answered 100 true/false questions regarding HIV/AIDS and 30 questions regarding general knowledge. For each item, respondents then judged the probability that they had selected the correct answer (on a 50%-100% scale), as a reflection of confidence in their answer. Design of the HIV/AIDS knowledge test drew on mental-models research, designed to select questions in an ecologically valid way, focusing on key concepts, and formulated in terms recognizable to lay people (Fischhoff et al. 1998; Morgan et al. 2001). Demographics and reading comprehension (as measured by the Nelson-Denny Verbal Comprehension Test) were also measured.

Teen respondents were assigned individual risk-index scores, determined by their reported behavior, as well as peer social norms, as evident in the self-reports of the participants recruited through the same community organization. Specifically, the risk level of a community was determined by the self-reports of all respondents at that location. A median split across locations was used to label locations as high or low risk. By a variety of measures, the high-risk teens' performance was considerably poorer, even on a subset of HIV/AIDS items related to drug and sex risks, domains where they had much greater experience. In particular, the high-risk teens knew less, but were more confident than the low-risk teens. Additional analyses suggested that teens in both groups could reflect their

knowledge in their confidence judgments, giving higher probabilities with correct items. This meta-cognitive ability (to know what one knows) was equivalent to that of parents. However, the high-risk teens showed dramatically greater overconfidence (i.e., confidence judgments were high relative to percent correct).

Confidence showed signs of being socially influenced. Although parents-teen pairs' actual levels of knowledge were unrelated, their confidence judgments were highly correlated. Furthermore, the risk index, which reflects the reported risk behavior of teens and their peers, predicted the appropriateness of teens' confidence much more for the HIV/AIDS questions than for the general-knowledge questions. Regression analyses, predicting confidence and accuracy with risk status, literacy, and gender, showed that accuracy was most strongly predicted by literacy, whereas confidence was more strongly predicted by risk status, as was overconfidence (and calibration).

We found that teens from locations with higher amounts of sexual activity and drug use (tobacco, alcohol, marijuana, and cocaine) were much more overconfident than were teens from less risky environments—reporting higher confidence, even while exhibiting lower knowledge. To the extent that such overestimation of their knowledge affects information search, vigilance, and rash action, it could increase the chances of ill-considered behaviors. In addition, confidence is related to social influences, such as peer risky behavior and parental confidence, while accuracy (i.e., percent correct) is not. If confidence is socially constructed, as supported by the parent-teen correlations and differences across the social group-based risk index, then effective interventions may require group-based interventions, such as social skills training programs tailored to teens of different backgrounds (DiClemente 1990; Downs et al. 2004). Speculatively, one secret to the success of such programs is creating a shared sense of the limits to teens' knowledge of risks, even where they have direct experience.

“At Risk or Out Front? Understanding the Women of the Future”

Linda M. Scott

The starting point for this presentation emerges from Scott's recently-published history, *Fresh Lipstick: Redressing Fashion and Feminism*. This book documents a 150-year period in which dress, sex, recreation, and feminism have been contested among various subgroups of American women. One of the key points of struggle, consistently, is the generational conflict between the “mothers” and the “daughters” of an era about respectable dress and chaste behavior. Scott argues that this persistent conflict is not only a function of normal identity development, but is also directly attributable to a long-term trend in American history. With each successive generation, American women have shed more of the restrictions that attend gender. Since patriarchal order is built on identifiable “cornerstones,” such as sex, kinship, work, warfare, spirituality, and consumption, it's predictable that this trajectory in gender relations would periodically result in “shocking” behavior, especially in terms of sexuality, dress, and recreational consumption.

Interestingly, there also appears to be a pattern in which those generations who most shock the “establishment” in their youth are also those who make the most significant and lasting gender breakthroughs. One example is the New Girls of the Jazz Age, whose penchant for “necking,” alcohol, cigarettes, jazz, and the movies shocked their parents easily as much as today's girls drugs, rap, porn, Internet, and “friends with benefits” dismay current observers. In their teen years, the “flappers” were dismissed as shallow, sinful, and dissipated. Yet they became the young mothers

of the Depression and the home front workers of the war years—the cohort Tom Brokaw called “the Greatest Generation.” Clearly, the vagaries of their youth were no index to what their ultimate historical contribution would be.

Similarly, the “let it all hang out/if it feels good do it” generation of the 1960s challenged gender restrictions, not only by ushering in the “sexual revolution” but also by their theatrical and often “gender-bending” modes of dress. In the arena of consumption and recreation, too, we see the hallmarks of rebellion: from marijuana brownies to rock concerts, the Baby Boomer girls were just as outrageous as the flappers before them and the generation that now follows. And, though their parents despaired of their demise through the years of their youth, these women ultimately contributed more to the equal rights of women than any previous generation, chalking up a staggering number of “firsts” and pushing back boundaries on a range of fronts from work to kinship to church.

Today's young women are the daughters of that historic cohort. They are the first generation born after the “Second Wave” (the name usually given the women's movement of the 1970s). They are the first children generally raised by women who worked (though the majority of American women, contrary to popular belief, have always worked, what is significant about the shifts of recent years is the huge increase in the percentage of married women and, especially, mothers who work). They are also the first generation of teen-agers to be reared in the relatively more relaxed environment created by the very “sexual revolution” their own mothers instigated.

When we look today at those “cornerstones” that mark the gender structure, we can see the cracks wrought by thirty years of rapid change—and the many ambiguities of gender that have resulted. Marriage, motherhood, and the family are radically different than they were a generation ago. Women are in combat and become ministers. Females head corporations and smoke cigars. The bugaboo of the last generation—premarital sex—remains only for the young (in the form of the “abstinence” campaign). Given all this, we might expect the morals, norms, and dreams of the next generation to differ enough from their parents to shock the most liberal among them. And, indeed, that is exactly what we're seeing.

Scott's current research project picks up where *Fresh Lipstick* left off—with the current generation. She has interviewed, so far, 60+ young women between 8 and 23 about marriage, motherhood, sex, and careers, as well as media influences, consumption habits (especially pornography), and spirituality. Her findings are beginning to emerge in a picture very different from the hand-wringing consternation typical of pundits and parents. Instead, she argues that the behavior observable in today's young women is a continuation of two hundred years of history: they continue the efforts of their mothers and grandmothers, as well as generations before them, to break down the barriers of gender across a number of fronts—and they are shocking the socks off the older generation in the best tradition of American girlhood. Unlike so many who have berated the present generation of girls as slutty, shallow, and stupid, she finds them respectful, thoughtful, ambitious, and creative—an offer of hope for the future.

“The Cyborg Teen: Identity Play and Deception on the Internet”

Laurel Anderson and Julie L. Ozanne

Adolescence is widely recognized as an important period during which far ranging changes take place, such as the formation of identity and gender roles (Arnett 1995). Despite the significant changes that are occurring, adolescence is a time when the family's influence on socialization diminishes and the role of media in-

creases (Larson and Richards 1994). Among teenagers, the force of media is strong and growing. A recent study by the Kaiser Foundation (2005) found that by multi-tasking with different media children and teens cram 8 _ hours of media viewing into 6 _ hours each day. Among teens, Internet use was 18 hours per week, more than TV viewing time (Born to be Wired 2003). The relatively recent influence of the Internet is poorly understood and potentially more influential. In the case of the Internet, this media socialization often goes on behind the backs and over the heads of many parents who often have less expertise than their offspring and find the new "net lingo" unintelligible (e.g., PIMP—peeing in my pants). Teenagers have greater access and control over this media and are using it as an important source of self-socialization. Whether this self-socialization is good or bad is largely an empirical issue.

In this study, 150 thirteen and fourteen year olds articulated their relationship to the computer by developing metaphors and creating collages. These data were interpretively analyzed for themes (Thompson 1997). The findings support that the teens used their computer to create and explore multiple identities. For most of the teens, these different cyber identities spanning school, friends, and family cohered and were connected to their real lives away from the computer. The computer was an external "brain" that facilitated schoolwork; it was a "fraternity house" where they could engage old and new friends and stay current on gossip and fads; and it was a "carnival" full of bright lights, music, and fun. The computer was largely a positive influence, except within the family, where "WW III" raged and battles erupted over use and access.

These teens were too young to drive, but their computers were like their driver's license to go anywhere, with "no speed limits" posted, and no need to "borrow the keys!" For the most part, the teenagers perceived the computer to be a safe, non-evaluative setting in which no one "tells me its bad" and the computer "never complains." While they often traveled to inspiring destinations (e.g., the speech of Martin Luther King Jr. and the London Museum), dangers and opportunities existed.

The computer provided a unique social opportunity for teens to explore *publicly* private aspects of identity. Some teens complained about privacy within the family and longed for a computer in their own room where they would have their "friend and keeper of secrets." But for many of the teens the anonymity of the computer made it an ideal place to explore alternative identities and this exploration was liberating. As one youth said: "The Internet taught me that I can be anyone on the Internet not my old boring self."

The teens were generally unreflective about the ramifications of exploring cyber identities far removed from their real lives. A few teens stressed the potential dangers in this identity play. The teens used metaphors and images of "make up" and "masks" to capture the computer's potential complicity in more negative aspects of this identity play, such as cyber deception. In a few cases, teens lost their sense of time and space; they spent "hours staring at the computer as if it were a god." Cyber reality was a different reality: they likened it to a reality that was apart from normal life. "You can get swept up in the computer, just as if you got lost." The most ominous metaphors used by some of the teens involved the computer as an addictive drug. While on this drug, judgment may be poor and they travel to unsafe destination and engage in risky behavior.

The hazard of sexual predators on the Internet is well publicized. We ponder less about teens being the architect of new cyber identities and realities. What happens when teens explore an identity that cannot be integrated with their real identities? What occurs when a profound gap exists between their cyber and real identities (Turkle 1995)? These social fledglings are evolving new norms for

conduct. How do they develop and negotiate these norms and are cyber norms transferred back to real life? What traditionally private aspects of identity do we see presented in these anonymous but public forums? Do the cyber identities help them work out problem in real life and when do the cyber identities become problematic? To delve more deeply into these questions, we are currently analyzing data from a website of teenagers web blogs (cyber diaries) and will use these results to address these questions.

Emancipation Through Modernist Pursuits: The Discipline of Running

Tandy D. Chalmers, University of Arizona

"It's the art of taking more out of yourself than you've got"
(Roger Bannister).

In the early 1950s, English-born runner Roger Bannister set out to run a mile in under four minutes. This unprecedented feat was thought by many to be physiologically impossible. Nonetheless, on a windy day in 1954, Bannister crossed the line in 3:59.4. Two months later, Australian John Landy surpassed Bannister's record. At the time, commentators noted that in breaking the four-minute mark, Bannister not only broke a physical record but also burst through the psychological barrier surrounding the mystique of the four-minute mile. The interactions between the body and mind of distance runners (referred to solely as runners in this article) form the research site for this study. In particular, the manner in which runners utilize their bodies and the precision of the sport of running to achieve psychological emancipation is presented. This expands the current perceptions of emancipation as evidenced in marketing and consumer behavior literature.

The concept of emancipation is presented extensively in a myriad of academic areas. Each discipline removes the concept from its original theological or philosophical underpinnings and applies it to discipline-specific contexts. Consumer behavior and marketing researchers have examined emancipation from perspectives such as branding techniques (Holt 2002), postmodern ideals (Firat and Venkatash 1995), and consumer resistance (Geisler and Pohlmann 2003). This research typically presents emancipation as the disavowment of modernist tendencies. That is, emancipation is viewed as stemming from the removal of modernist constraints like competition, achievement, measurement, and progress that enslave individuals in their everyday lives. While this view is both enriching and informative, other manifestations of emancipation are also relevant to consumer research. This study focuses on the running subculture and presents a view of emancipation that, rather than opposing modernist elements, embraces them.

This paper outlines the key elements of the conceptualization of emancipation across academic literature, followed by a brief discussion of the methodology employed in the study and a discussion of findings related to a re-conceptualization of emancipation. It concludes with a discussion of how these findings expand upon and benefit marketing and consumer behavior researchers and proposes avenues for future research.

LITERATURE REVIEW

The following literature review briefly outlines the philosophical views of emancipation. This is followed by a discussion of how emancipation is presented in consumer behavior literature.

Perspectives on Emancipation:

Emancipation is defined as the process of being set free from constraints—deliverance from physical, intellectual, moral or spiritual fetters. Consistent with this definition, Alvesson and Willmott (1992), critical theorists, provide a conceptual synthesis of the theoretical underpinnings of emancipation: "Emancipation describes the process through which individuals and groups become freed from repressive social and ideological conditions, in particular those that place socially unnecessary restrictions upon the development and clarification of the meaning of human need and expansion of autonomy in personal and social life" (432). This definition states the premise of emancipation, however, the process through which emancipation occurs and the nature of the shackles from which one is to escape is hotly debated.

Implicit in the preceding definition of emancipation is freedom from constraints. Originally, emancipation referred to freedom from constraints of slavery and religious persecution. Marxist emancipation entails overcoming the capitalist ethos and is fully realized "with the suppression of the capitalist mode of production" and the removal of obstacles imposed by the conditions of wage labor (Lukes 1983; McGowan 1991). Since Marx, however, the focus has been on how modern society and consumer society constrain individual autonomy and freedom.

Critical theorists, represented by scholars such as Horkheimer, Habermas, and other representatives from the Frankfurt School, in an attempt to explain inadequacies in Marxist emancipation, express an alternate view of emancipation. They argue that emancipation lies in escaping the false consciousness imposed by society through self-knowledge and understanding of constraints inhibiting personal freedoms (Agger 1991; Fay 1987; Kilbourne 1987). One such constraint, consistent with the views of Marx, is wage labor enterprises, encompassing such practices as Fredrick Taylor's scientific management. Critical Theory tends to "dismiss modern management theory as an expression of technocratic thinking that seeks to manipulate human potential and desire in order to bolster a falsely naturalized status quo" (Alvesson and Willmott 1992, 436).

The arguments surrounding emancipation are complex and heterogeneous, but in simplified form, the focus of many of these arguments is that modernist pursuits focused on competition, achievement, measurement, and progress entrap and enslave individuals, resulting in a feeling of being 'slaves to the clock and performance.' Hence, these modernist pursuits are those from which individuals are thought to seek emancipation.

Emancipation in Consumer Theory and Research:

In the context of consumer research, emancipation has taken a particular focus on freedom from the totalizing constraints of the marketplace. Theory and research has taken to addressing three issues relating to consumer emancipation. The first question is whether and under what conditions consumers can be emancipated. In general, research suggests that consumers can only be emancipated by escaping the totalizing logic of the marketplace—a logic that is bound with the modernist pursuits described above. For example, Firat and Venkatesh (1995) note that even modernist views of emancipation serve to further ensnare individuals in an unemancipated existence. These theorists, building upon the work of Murray and Ozanne (1991), believe that emancipation occurs when consumers place themselves outside of the totalizing logic of the marketplace. Further, Firat and Dholakia (1998) advocate "theatres of consumption" as emancipatory spaces where consumers can escape the marketplace.

Contrary to the aforementioned orientation, some argue that an escape from the marketplace is illusory and impossible, and that even those attempting escape are caught up in the pursuit of brands. Holt (2002), utilizing an extended case method approach to examining the experiences of individual consumers, finds inconsistencies between his analysis and the ideas set forth by Murray and Ozanne (1991) and Firat and Venkatesh (1995). Specifically, he finds that even those individuals seeking to escape the totalizing logic of the marketplace end up making meanings with brands such that even these consumers further the traditional marketplace rather than being emancipated from it.

Still other researchers argue that escape from the marketplace is temporary and spatially constrained. Kozinets (2002) is an excellent example of research on consumer emancipation that

highlights the abandonment of modernist pursuits as a vehicle for experiencing temporary emancipation. In his ethnography of the Burning Man Festival, Kozinets describes a process in which consumers engage in a hyperreal temporally constrained event to achieve emancipation. He posits that by removing the totalizing elements of the marketplace and creating an environment that is free of modern constraints, consumers are able to free themselves from the totalizing logic of the marketplace. In this context, emancipation is set up as oppositional to daily life, the marketplace, and the rules of time, measurement, progress, and achievement.

In a similar vein as Kozinets (2002), Geisler and Pohlmann (2003) look at emancipation in terms of opposition in a dichotomous power relationship. They present the notion of a social form of emancipation. This social form of emancipation “is engaged in a permanent process of ensuring a social distinction between itself and its environment” (94). Central to their thesis is that consumers place themselves in direct opposition to mainstream corporate society and, through this, achieve emancipation from the marketplace.

The second inquiry, stemming from the presentations of emancipation described in the preceding section, asks whether other types and variants of consumer emancipation are possible. Specifically, researchers have questioned the underlying assumptions of some conceptualizations of consumer emancipation—resulting in the question, “if not this, what?” Murray and Ozanne (1991) provided a crucial impetus for debate related to consumer emancipation. For example, Hetrick and Lozada (1994) critique the work of Murray and Ozanne (1991) outlining discrepancies in the critical approach utilized in the original analysis. They argue that, in the Murray and Ozanne (1991) conceptualization, the purpose of critical analysis is not directed to the purpose of freeing individuals from a false consciousness to enable the emancipatory potential that flows from this.

Additional critique of conceptualizations of emancipation is presented in Thompson (2004). The author, making specific reference to Holt (2002), Kozinets (2002) and Firat and Venkatesh (1995) note that in their attempts to describe emancipation as freeing from modernist elements, they create a dichotomy between ‘within’ and ‘outside’ the marketplace: a dichotomy which is very ‘modern’ in orientation thereby negating elements of their ‘postmodern’ analysis of emancipation.

These critiques bring to light the third question entrusted to consumer researchers: whether or not consumers’ feelings of emancipation are always oppositional to daily life, the marketplace, and modernist pursuits. The purpose of this paper is to focus on a venue where modernist pursuits are valued in order to examine where and how opportunities for emancipation exist, thus exploring this third question.

In this paper, I take a critical approach to the notion of emancipation in an attempt to uncover new, previously underrepresented, processes through which emancipation can occur. While this does not fall into the category of a true ‘critical research project’ as I do not attempt to provide any form of emancipation for my audience (Handelman 1999), I do propose an expanded view of emancipation that is counter to traditional thinking. This view combines philosophical underpinnings and allows consumer narratives and experiences to drive the interpretative findings (Hirschman 1986).

METHODOLOGY

An existential-phenomenological analysis (Thompson, Locander, and Pollio 1989) of the distance running subculture is used to uncover the experiences and motivations of runners. Semi-structured depth interviews were conducted with twelve distance

runners with various levels of running involvement. Purposive sampling and snowballing techniques were used to recruit participants from the local running community, university running associations, and personal contacts. The sample was limited to those individuals who have competed in at least one race.

The final sample for this study consisted of five elite runners, four non-elite runners, two transitional runners, and one young elite runner. Elite runners, representing hard-core members of the subculture, are differentiated from other runners as running is the dominant aspect of their lifestyle. Three of the five elite runners were males (aged 23, 31, 40) and two were female (aged 22, 29). Non-elite runners are those who are actively involved with running, but consider it to be a non-dominant part of their lifestyle. Four non-elite runners were interviewed (two males aged 33 and 42 and two females aged 23 and 27). Transitional runners are those individuals who were formally elite runners but, for various reasons (usually injury related), are no longer as involved in running and now identify themselves as non-elite. Two male transitional runners (aged 22 and 24) were interviewed. Finally, one young elite runner (male aged 11) was interviewed. Runners were categorized into the aforementioned levels using self-report descriptions (Donnelly 1981) that were verified through screening questions asked during the interviews. The appendix provides a brief description of the interviewed participants.

The interviews were conducted over a period of three months (May-July 2004), with an average interview time of 1.5 hours for elite runners and one hour for non-elite runners. The difference in interview length for elite and non-elite runners is attributed to the dominant nature of running in the lifestyle of elite runners and the resulting multiplicity of meanings associated with running for these individuals. Naturally, more time was required to uncover the depth of these meanings. The interviews resulted in a total of 128 single spaced pages of interview data. Interview data was analyzed using a ‘back and forth’ reading process to uncover emerging themes and patterns both within subjects (idiographic analysis) and between subjects (nomothetic analysis). A draft of the analysis was given to participants to ensure that their interviews were appropriately interpreted. All of the participants were satisfied with the interpretations.

FINDINGS

The analysis of the interviews revealed several interesting aspects of the running subculture and the mentality of runners. Specifically, a powerful emergent theme relating to the core values of the running subculture is a seemingly paradoxical phenomena experienced by subculture members in that they achieve emancipation through the self-induced imposition of the modernist constraints of measured distance and time. Consider this quote from Bryan (Elite M 40):

“I approach it as sport and I think that has its own appeal. Even just chasing time and all that, subjecting yourself to the discipline of the clock and measuring the success in those terms. I think that has its own appeals and I think the whole faith and religion and spirituality aspect of [running] appeals more to people who do it as sort of a lifestyle kind of thing. And also, another one of the ways in which the running habit is dismissed is that it’s sort of like we’re addicted to it or something like that, or it’s a substitute for something or another. And I don’t like thinking of it as a substitute for something: either a substitute for religion or drugs or alcohol. I like to think it has its own appeals with the discipline of the watch, and distance, and intervals and just all those measurement elements of it that actually give it its appeal. And not in

a way that's sort of enslaving. The kind of the thing that you use to measure how well you're doing, how much better you're getting, for its own sake."

As Bryan describes the appeal of running, it becomes clear that runners achieve a kind of secular emancipation through the imposition of modernist elements that are traditionally thought to be enslaving. The two key elements of this process, modernist pursuits and emancipation, will be discussed separately and then in combination below.

Modernist Pursuits:

The preceding quote from Bryan describes the modernist aspect of the emancipation process and the running subculture. Runners derive a sense of fulfillment and pleasure from measurable success. The types of measures most frequently noted by runners as salient to them are time and distance. This creates an almost Frederick Taylor-like addiction to the 'discipline of the clock.' This 'addiction,' however, is not enslaving or negative as it contributes significantly to the emancipatory appeal of running.

The enjoyment of these modernist elements of running takes on several manifestations. First, the objectivity of time and distance is appealing to runners. Tyler (Elite M 31) states: "I like the preciseness of it. You have a set distance. I have a set time and go out and run another 1500 meters and if you run a couple of seconds more, you see that." The objectivity of these kinds of measurements is closely tied to the second manifestation of modernist characteristics: the desire to continuously improve, achieve, and progress. Both elite and non-elite runners express these sentiments. Lyndsay (Elite F 22) captured this when she said, "I think part of it is that it's just the challenge of it. Every time you run a certain time you want to go faster... 'Oh I ran that but I can go faster' so...and you keep training." All of the runners, when talking about their running goals, expressed a desire to perform better in some measurable way. For example, Jessica (Non-elite F 23) talks about how she would like to better her marathon time and qualify for the Boston Marathon and Aaron (Non-elite M 42) states, "My goal as far as pace goes is to do a sub five minute kilometer."

The third manifestation of the modernist focus on measurable performance is the ability to easily see and measure improvement, achievements, and progress. Runners find the objectivity and clarity of measured performance rewarding as it shows that the training efforts are worthwhile. Dylan (Elite M 23) says: "In running its clear how you're progressing. If you run everyday you know you're going to get better. It's without question. You're going to get better. It's just simple." Runners are propelled by the ability to clearly see improvement in themselves.

The ultimate appeal of the objectivity of running is that, in its purest form, it is free of ambiguity. With objective measurement of performance, it is impossible to question how well a person is doing. Furthermore, it allows an individual to receive recognition and credit for his or her performances. This is not something that is always accomplished in other sports, as some individuals may not feel comfortable talking about how well they performed. This clarity and lack of ambiguity is discussed by Dylan (Elite M 23):

"Success meant a lot and I started to realize how good I was. And then I started to realize how fast I could run. And going fast, and blazing, that's what I love. So realizing that I could do a 400m interval workout in 53 seconds. At the end of a workout, wow, that I loved. And the intensity of being on the track and the pressure. There's no hiding. There's nowhere to hide. That's what I love about track."

Thus, recognized (public and private) achievement, is an important element of running.

Emancipation:

The feeling of freedom and emancipation truly enriches those who run. Maxine (Elite F 29) articulates this freedom:

"I like it when you can just go out and run and your thoughts are free and you feel really good afterwards and at the time it's just time set apart for yourself—you're not going to do anything else for this hour. Everything else is so hectic and busy, once you fit it in and you're out there, you're relaxed and calm."

Maxine talks about the freedom that occurs when she is emancipated from a hectic, busy lifestyle. This is not uncommon among the participants in this study. Kyle (Elite M 11), the youngest member of this sample, best shows the intrinsic value of this to the running subculture as he (arguably) has the fewest demands made on his time. He says, "I usually run by myself. It's good: some time to be alone. To think about things." Sonya (Non Elite F 27) takes a somewhat different approach to the escape elements of running. She does not view it as a time to think, but more as a time to not think:

"When you're running that's the only thing you're thinking about. You're not thinking about your groceries or what you're going to do tomorrow or your work...you're just thinking about the next two strides. I think that's another reason why running appeals to me—it's like meditation because I find my mind going blank and I just have peace and I'm just running."

In addition to being able to free one's mind, Bryan (Elite M 40) discusses another element of the emancipation experienced by runners that relates to modernist measures. Bryan talks of how running is an element of life that can be controlled, whereas most elements cannot: "In a world where it's difficult to find a sense of control and mastery. In a world like that, it's a place to feel like there's at least one thing in your life that you can control and you can actually improve yourself." Thus, runners articulate a distinct feeling of emancipation from their everyday lives resulting from the running activity.

Emancipation Through Modernist Pursuits:

Through reliance on measurable performance and 'enslavement' to the clock, runners are able to achieve emancipation derived from self-actualization. The discipline of the clock is integral to emancipation for runners as it creates a concrete and objective measurement of performance. The constant measurement of distance and time against the performances of an individual's body results in a measurable mastery over oneself. This is accompanied by a sense of freedom (and control) from the constraints of everyday life.

The importance of the emancipatory feeling experienced by runners is captured in the manner in which runners describe the running emancipation. One way in which this is expressed is in comparisons to running versus other sports. Bryan (Elite M 40), in an attempt to explain why running is special when compared to other sports, states:

"It's partly physical, partly emotional, and partly psychological...it's all three of those things. People will stick at it to get back to that moment [where they feel a perfect sense

of self-mastery] just one more time in their life. I've seen it over and over again. People go through all kinds of injuries, break up with spouses, raising children. Everything. They will fight through all that stuff just to get back to that one moment."

It is "that moment" of ultimate emancipation that serves as the driving force behind runners. As Geoff (Transition M 22) states: "Its just sort of a high you get when you finish a really tough workout or when you've run a new [personal record]. It's just a good feeling it keeps you going back." The feelings that Geoff and Bryan refer to are those resulting from being emancipated through modernist pursuits, the importance of which is articulated by Dylan (Elite M 23):

"Runners will miss events. If people are partying, they go to a party late because they have to run. Or they'll do whatever they have to do to run on a day where they're supposed to run and if they've already done other exercise, it's not an excuse not to run. They're not like, 'oh I've already exercised today I don't have to run.' So when I was a runner, I could play two hockey games and still have to run. I could be playing ultimate frisbee, or doing two other events and I would still have to run, because nothing could replace it. That's exactly it, nothing can replace it."

An additional element of the runner emancipation is the evangelical tendencies of runners to help others achieve emancipation through modernist pursuits. Overall, what emerged from the interviews is a sense of cooperation and respect across all levels of the running subculture with elite members expressing a desire to share their knowledge and love of the sport with those who have not yet experienced emancipation through running. The emancipatory nature of running, therefore, includes an almost evangelical desire to help others achieve this kind of freedom.

Bryan (Elite M 40): "Because my own performances, I've trained so hard for so long, I realize that I'm just, my personal bests are so fast now that I'm going to have difficulty and I'm never actually going to beat some personal bests, but I can work with people who can achieve personal bests. So I enjoy that process. The process of preparing someone to run faster, do something that they've never done before. So it's a bit of a way of keeping in touch with that side of the sport. And also, I really get a kick out of watching people who don't think they ever had any ability or talent, and in some cases didn't think they had any athletic ability at all, actually discover running and do quite well and start winning...So I guess yeah, just passing on the torch to other people and prophesizing about the benefits [of running] and stuff like that [is what I want to continue doing with running in the future]."

To summarize the theme of emancipation through modernist pursuits, the core characteristic of the running subculture is that members seek emancipation and freedom from everyday life. This is achieved through a commitment to modernist concepts of objective measurement, time, distance, and achievement.

DISCUSSION

Emancipation through modernist pursuits is extremely interesting as it combines both modern and non-modern mentalities. The notion of embracing modernist elements to achieve emancipation contradicts traditional thoughts on emancipation. Emancipation is typically thought to be something that occurs when modernist principles of time and control are abandoned so that individuals can

take a more enlightened and liberated view of their world and their lives. In the case of runners, however, they abandon their 'work clock' for the 'running watch.' The running watch is a time keeper that they can control and turn off whenever they choose, but this choice is rarely made. The reason for the perpetual power of the running watch: emancipation. In the case of the running subculture, the mechanism through which emancipation occurs contradicts traditional thinking. Runners do not escape modernist elements; they choose to constrain themselves with specific modernist elements (competition, achievement, measurement, and progress) so that they can escape the constraints of everyday life. These individuals tradeoff different forms of modernity so that they can better control the constraints of their lives: it is empowering to enslave oneself but demoralizing to be enslaved by others. Runners are emancipated through their choice of enslavement, that they control, and that cannot be corrupted by outside forces. An enslavement that does not feel enslaving.

This research serves to enhance the current perceptions of how individuals can achieve emancipation. Generally speaking, consumer researchers are concerned with how consumers can emancipate themselves from the marketplace. While this is most certainly an important element of emancipation, the singular focus on one kind of emancipation has resulted in a view that is not holistic and does not fully appreciate the nuances of individuals and emancipation. Thus, an alternate view of emancipation is revealed through this examination of achieved emancipation that occurs within a less 'marketplace' (or anti-marketplace) sphere of consumption.

This alternative view presents an emancipation that is not temporally bound but instead takes place within the confines of everyday life. Furthermore, unlike many forms of consumer emancipation that are conceptualized as resistant to dominant entities, this emancipation does not rely on a dichotomized power relationship and bridges the tensions of modernist thinking contradicting emancipatory thought espoused by Thompson (2004). This form of emancipation depends upon individual autonomy in taking control of emancipation. This emancipatory control relies upon the imposition of modernist constraints to achieve liberation.

CONCLUSION

The purpose of this study is to present an alternative and complementary view of emancipation to enrich the discourses of consumer researchers. Motivated by the singular and somewhat contested views of emancipation in consumer literature, I undertook an existential-phenomenological analysis of the distance running subculture. In doing so, I discovered that these runners achieve emancipation through the imposition of modernist pursuits and an exploitation of these modernist elements to conform to the will of the runner.

The process through which runners achieve emancipation diverges from the mechanisms outlined in previous work in that it is not temporally constrained, it takes place within the confines of ordinary life, it is not opposed to a dominate power force, and, most interesting, it occurs through a systematic imposition (not removal) of constraints characteristic of the modern ethos: time, distance, and performance.

It is my hope that this research will stimulate interest in the various and abundant ways that individuals can achieve emancipation. Furthermore, I urge researchers to seek out this understanding in common areas of life as opposed to only exceptional life experiences. Researchers should also seek to uncover the complexities of how emancipatory activities fit into and interact with everyday life. The implications of this type of research are far reaching as it will bring to light fundamental functionalities and motivations of consumers functioning within society, hopefully

APPENDIX
PARTICIPANT SUMMARY

Tyler	Male, Aged 31; Elite; Running for 20 years. Tyler is a highly competitive runner. He started running and competing when he was in grade six. After high school he took two years off, but has since returned, running 40-80 miles ¹ per week.
Bryan	Male, Aged 40; Elite; Running for 29 years. Bryan competes at the masters level. He started running when he was 11 years old and competing year round at 16. He is one of the top runners in the country, competes nationally and internationally, and coaches highly competitive runners. He runs 70-95 miles per week.
Dylan	Male, Aged 23; Elite; Running for 12 years. Dylan was an elite level runner who experienced a career ending injury at age 20. He started running in grade two and competed nationally and internationally as one of the top junior runners in the country until the end of his first year in university, running 35-60 miles per week.
Lyndsay	Female, Aged 22; Elite; Running for 8 years. Lyndsay started running when she entered high school at the age of 14. She is one of the top university runners in the country and the world. She runs approximately 50-60 miles per week.
Maxine	Female, Aged 29; Elite; Running for 15 years. Maxine started running in elementary school and moved on to compete seriously in high school, university, and now independently. She currently competes in marathons and is one of the best marathon runners in the country. She runs 60-80 miles per week.
Geoff	Male, Aged 22; Transition; Running for 9 years. Geoff started running when he was in grade eight. He competed throughout high school and for three years at university, after which he suffered an injury that caused him to stop competing. He now competes as a non-elite. He runs 50 minutes a day, five days a week.
Wayne	Male, Aged 24; Transition; Running for 11 years. Wayne started running in grade three and competed seriously throughout high school and his first year of university when he suffered a serious injury. He has recently started running again, but only recreationally. He currently runs about 30 km a week.
Aaron	Male, Aged 42; Non-elite; Running for 20 years. Aaron started running in his early twenties. In recent years he has started taking it more seriously and regularly competes in local road races. He currently runs approximately 20 km per week.
Christopher	Male, Aged 33; Non-elite, Running for 1.5 years. Christopher started running 1.5 years ago with a group of people from work. He recently competed in his first race (10km) and is training for a half marathon. He runs 30-35 km per week.
Jessica	Female, Aged 23; Non-elite; Running for 4 years. Jessica used to compete in triathlons but found it to be logistically difficult so she switched to only running. She has competed in five marathons. She runs between 60-70 km per week.
Sonya	Female, 27; Non-Elite; Running for 1 year. Sonya has been running for 1 year. She started running with a group from work and has competed in one race (10km) and is training for a half-marathon. She runs between 15-21 km per week.
Kyle	Male, 11; Young Elite; Running for 4 years. Kyle started running when he was in grade three. He runs with his school and trains with an independent track club. He competes in both cross-country and track, and is currently the county champion in the 1500m. He runs for approximately 20-30 min everyday.

¹Participants differed in their use of miles versus kilometers. I present the units used by each participant.

leading to a more enriching experience for consumers and researchers alike.

Brand-Personal Values Fit and Brand Meanings: Exploring the Role Individual Values Play in Ongoing Brand Loyalty in Extreme Sports Subcultures

Pascale Quester, University of Adelaide
Michael Beverland, University of Melbourne
Francis Farrelly, Monash University

ABSTRACT

We examine whether value fit—the degree to which brands reflect core motivating values attracting individuals to join subcultures—is associated with brand loyalty. We also examine how the core value driving involvement in a sub-culture influences the way consumers respond to social pressures exerted on it namely increased commercialisation and mainstreaming. We identify freedom, belongingness, excellence and connection as core values driving involvement in a sub-culture. Results are based on 19-depth interviews of consumers in the surf, snowboarding and skate subcultures.

INTRODUCTION

The plethora of brands, brand communications and brand meanings that typify developed economies has resulted in a ‘culturally competent consumer’ (Holt 1997, 1998; Kates, 2002a). In contrast, there is mounting evidence that most brand strategies fall short when it comes to understanding consumer values or the broader cultural contexts that shape them. Academics and managers of some of the largest global brands (eg. IBM, Coca Cola) have called for a consumer-centric view of brand management, including a better understanding of consumer values and the socio-cultural contexts in which brands are consumed, and the application of this knowledge to brand building (Rust et al 2004, Kates 2004; Thompson 2004). However, despite explicit calls (eg. Thompson 2004) for a cross over from consumer research to brand management, this area has remained unexplored.

Studies have revealed a deep and at times unconscious connection that binds some buyers with the brands they favour or indeed may become fanatical about (Fournier 1998; Thompson 2004). Some consumers congregate around brands towards which they exhibit a socially motivated attachment, in what has been coined ‘brand communities’ (Brown, Kozinets and Sherry 2003; Muniz and O’Guinn, 2001; McAlexander, Schouten and Koenig, 2002), interpretive communities (Kates 2002a, 2002b), and/or consumption sub or micro-cultures (Celsi 1992; Schouten and McAlexander 1995; Sirsi, Ward and Reigen 1996; Kozinets 1997). While related, some of these constructs are subtly distinct. According to Shouten and Alexander (1995) for example, a subculture of consumption, such as their Harley Davidson study group, is a “distinctive subgroup of society that self-select on the basis of a shared commitment to a particular product class, brand or consumption activity” (p 43). Brand communities, on the other hand, comprise “a specialized, non-geographically bound community, based on a structured set of social relations among admirers of a brand” (Muniz and O’Guinn, 2001, p 412). More flexible and less codified than subcultures of consumption, brand communities are able to ‘negotiate’ the meaning of the brand(s) they admire as part of a process of social interaction. Furthermore, brand communities do not typically stand aside from (or against) society at large, as subcultures of consumption may do, but rather, evolve in its midst, allowing for more flexible boundaries between those members inside of it and those individuals outside.

Consumers in these groups or subcultures often respond to marketing communications about their loved/hated brands through

a ‘values lens’ (Holbrook 1999). For example, consumers of natural drug therapies became more attached to alternative therapies after scientific reports questioned their veracity, because of a value system that was both anti-science and anti-modernity (Thompson and Troester 2002).

However past research on brand communities has focused on shared community values and how they impact brand preference, and has tended to relegate differences in individual values to the background, despite the fact that these differences are likely to have a major impact on how members of the same subculture perceive the brands on offer (see for example, Schouten and McAlexander 1995; Kates 2002b).

The aim of the study is to tentatively explore a number of issues. First, that a core or predominant individual value can be identified that explains why consumers attach themselves to a subculture, and that this may be one of a number of different values held by individuals of the same subculture. Similar to Mick and Buhl’s (1992) life themes, or to what Fournier (1998) called central life theme, these core values are the fundamental motivators shaping individuals’ decisions in life, including which sports they may choose to engage in and which lifestyle they choose to lead. Second, we expect that consumers’ core values drive their brand choice, and influence their ongoing perceptions of the brand within the subculture. Third, we anticipate that the core value held by consumers, as well as their brand preference, will be impacted by two other key dynamics, namely whether they have close or loose ties to the subculture (i.e. whether they are at the core or the periphery of the subculture), and how they respond to pressures experienced by the subculture itself, such as increased commercialisation or ‘mainstreaming’.

METHODOLOGY

Given the exploratory and qualitative nature of our enquiry, interpretive interviews were judged to be the best way to capture the complexity of consumers’ personal values, embed these values within a sub-cultural context, and uncover the values behind consumption choices and reactions to brand-marketing communications (Kates 2002a, 2004; Strauss and Corbin 1998). We selected consumers involved in three sporting subcultures—surfing, skating and snowboarding. These sports have identifiable communities in Australia, and several Australian brands such as *Ripcurl* or *World* actively target these communities, and have expressed concerns about mainstreaming in recent years.

Consistent with theory building research and our discovery-driven purpose, our sampling technique sought to generalize to theory rather than be statistically representative. Therefore, a convenience sample was used with interviewees contacted through a market research agency. The agency was asked to provide interviewees from a diverse demographic background who stated they were actively involved in at least one of the aforementioned sporting activities. Importantly, these respondents represented varying levels of sub-cultural involvement, from periphery to core, as illustrated in Table 1. A total of 19 in depth individual interviews were conducted with consumers actively engaged in surfing and other extreme sports.

TABLE 1
Profile of Respondents

Name	Age	Gender	Occupation	Subculture	Status
Brandon	27	M	Public Servant	Skate	Core
Ryan	20	M	Student	Surf	Core
Mark	28	M	Customer Service & Artist	Skate; surf	Core
Marcio	27	M	Project Manager	Snow	Core
Sam	22	M	Snowboard Instructor	Skate; snow	Core
Anthony	24	M	Real Estate	Surf	Core
Christie	29	F	Account Executive	Surf	Core
Steve	21	M	Personal Trainer	Surf	Core
Joshua	20	M	Musician	Surf; snow	Core
Ashleigh	18	F	Student	Skate	Periphery
Jason	31	M	Police Officer	Surf	Periphery
Justin	22	M	Snowboard Instructor	Snow	Core
Wesley	14	M	Student	Snow	Periphery
Kieran	15	M	Student	Skate	Core
Kerry	26	F	Personal Assistant	Surf	Periphery
Hamish	28	M	Management	Surf	Core
Andrea	33	M	Personal Trainer	Surf	Periphery
James	19	M	Student	Surf	Periphery
Fiona	24	F	Student & Customer Service Agent	Surf	Periphery

The interviews were conducted by a trained assistant and supervised by two of the authors. To probe consumers' attachment to the sport and reasons for engaging in these activities, general questions were asked to allow respondents to tell their story in their own terms (McCracken 1988).

More direct questioning and floating prompts were also used to explore consumers' responses and issues of interest as they arose throughout the interview. Questions focused on specific activities of brands such as sponsoring events or high profile sportspeople within the sport, or on critical incidents relating to perceived breaches or reinforcement of the brand's values (cf: McCracken 1988). Paraphrasing was also used to clarify interviewees' responses, and to ensure the interviewers understood the consumer's response and allow for any follow up questions (Strauss and Corbin 1998). Interviews lasted one hour on average and were all audio-taped and then transcribed by an assistant.

Analysis occurred after each interview to allow the responses to influence subsequent interviews. After an initial careful reading of the transcripts, open coding took place whereby text from each interviewee was classified into emerging categories. This was followed by axial coding, whereby categories were related to sub-categories and categories were linked at the level of properties and dimensions, and then by selective coding for further integration and refinement of theory (Strauss and Corbin 1998). Dialectical tacking occurred throughout these two later stages whereby emerging concepts from the data were connected to, and enriched by, prior research (Spiggle 1994). As this analysis occurred independently, the authors met regularly to confirm interpretations and theory.

FINDINGS

We identified four focal values that attracted consumers to their sports, and then influenced their responses to brand activities and the commercialization of their respective sports (see Table 2). Our analysis revealed that, in most cases, consumers had one driving value in their choice of activity, even when they identified with other value motivators (that is, one typically took precedence over the other three).

Freedom was the most common value cited by all respondents and was discussed in ways similar to that identified by Arnould and Price (1993) in their investigation of white water rafting and by Schouten and McAlexander (1995) in their research on the Harley Davidson subculture. For our respondents, freedom related to being able to express one's creativity and individuality. There was also evidence of anti-establishment and getting free from the daily grind that is society, work, or school, and being a part of something not subject to the rules, processes (such as joining clubs) or structure of more mainstream and commercialised sports such as tennis.

Another value emerging recurrently from the data revolved around belongingness, and the sort of social bonding Turner (1977) labelled "Communitas" and which Celsi described as shared experiences or, as Belk, Wallendorf and Sherry (1989) put it, a "shared flow". The vast majority of respondents emphasised that while the practice of these activities were solitary pursuits, they were enjoyed most when enacted in the company of others, and that this resulted in desirable social outcomes, such as friendship, emulation, or simple story telling.

Despite the gregarious and social aspects of their sports, many of our respondents also appeared to relish the individual performance and challenge of their chosen activity, a value we have described as excellence, and which was also identified by Fournier (1998) as a key foundation for strong brand relationships.

The last major value related to a notion of connection and it captured feelings similar to what has been articulated in studies of topophilia (eg. Tuan, 1974). This included a strong sense of connection to a physical place (a geographic location, a beach, a particular resort, or mountain etc) and to others who were at one with place or had a long affiliation with it. It was also about the benefits of this connection, for example rejuvenation and self-renewal through communing with nature.

We identified differences in values depending on how involved in the sub-culture the consumers were. Consumers were classified as being core or peripheral members of a subculture: Core members were those actively engaged in an activity. In many cases these consumers often defined their identity around this activity and

TABLE 2
Values, definitions and text examples

Value	Definition	Text examples
Freedom	Not being bound by rules or procedures; escape from an ordered world	<p>“There is this kind of sense of freedom with surfing...” (Andrea WF33)</p> <p>“I don’t have to travel half way across the world just to go skateboarding” (Sam, WM22)</p> <p>“... free from the normal rushes of the world having time to think, having time out from your normal life...” (James WM19)</p>
Belongingness	Being part of a community; shared experiences; being part of something greater than oneself.	<p>“We’re all mates and we all do stuff together, so we all hand around together, wear the same clothes, are in the same sport... it’s good to fit in, just so you’re labelled as a surfer when you’re going out” (James WM19).</p> <p>“It’s good to be part of a tribe, part of a team... like most things in life, you’re better off doing them together aren’t you?” (Andrew)</p> <p>“It’s good to have 4 or 5 at least other people to go riding [snowboarding]... it builds up a god atmosphere within the group, so it makes it even more enjoyable” (Justin WM22)</p> <p>“We all get fall together, get up together, and encourage each other to keep going” (Joshua WM20).</p>
Excellence	The pursuit of continuous improvement in personal skill level and achievement	<p>“To be out there, trying new things, exploring the boundaries... to try a new surfing move or achieve some thing or just see yourself get better” (James WM19).</p> <p>“If you pull a trick, some of the tricks are really hard and it takes a lot of practice to actually work them... people get excited ... people cheer on someone who puts in a lot of efforts” (Mark WM28).</p>
Connection	An emotional, spiritual or experiential link with place, time, and / or nature.	<p>“Growing up at the beach and everyone did it, my brother surfed, all my family surfed so I got into it” (Hamish WM28)</p> <p>“You feel like you’re just part of a bigger pictures, being our in the ocean... it’s like your world stops and another starts” (Mark WM28).</p>

in the right season (summer for surf, winter for snowboarding) such activities took up 80 per cent of their time. These consumers usually identified more with freedom, excellence, or connection. Peripheral members fell into three groups: new members, previous members and image associates. New members often identified with belongingness because they were interested in becoming a recognised member of the sub-culture. As such, they stressed belonging to the tribe, or being part of something, as a core value (see Table 2) rather than more personal values. Previous members were those that had once partaken in the sport, but due to work or family commitments no longer engaged heavily (or at all) in the actual sporting activities. Again, these consumers stressed belongingness, but more out of a desire to retain some link to something positive in their past. Image associates were consumers that joined the sport largely because they liked the image associated with such activities. These consumers stressed belongingness, but this related more to an idealized image of what the sport stood for. These consumers rarely (if at all) engaged in the focal sporting activity.

Each type of sub-cultural member (core / periphery) also differed in their brand behaviour and attitude towards commercialisation and mainstreaming. This was driven by their focal value, and is explored in more detail in the next section.

Values and brands: how focal values drive brand choice and meaning

The values identified above also drove brand choice and reactions to commercial activity (including mainstreaming) per se

(see Table 3). Brand choice relates to preferred brands in relation to sub-cultural activities rather than brands per se (which were not examined).

Those who valued freedom used this value when selecting brands for sub-cultural activities. The key driver here was the rejection of brands that they saw as “selling out” to the commercial machine. For example:

“I think they’re a hype machine. I think they’ve done very good, making a lot of money. They do put on the contest and they make the Bell’s Beach and the Hawaiian thing, but those things are going to happen regardless of their major sponsorship. They’re just in there, plugging in their logo where they can. That’s the evolution of the sports world, though... I’m pretty sure Quiksilver is on the stock exchange, so we’re talking about people who don’t even surf now, investing in that company to make a profit. Everything changes-the company doesn’t become just about the community and working with the sport in terms of setting up the right environment for people to really grow out of that sport. It’s become more about how many people can we get sucked into, make it cool, make it fashionable.” (Mark WM28)

Mark’s position was representative of many surfers who engaged in the sport due to a desire for freedom. Those members who are openly sceptical of the establishment, including big business and mass marketing, view the recent mainstreaming of the

24 / Brand-Personal Values Fit and Brand Meanings

sport very negatively. For members like Mark, the change in ownership structure has led him to reconsider a brand that played a major role in developing surfing in Australia. Now, he questions the brand's motives, and even its commitment to surfing events through sponsorship, dismissed as largely irrelevant. Such brands have also lost value for Mark because the desire to make money has led the brand to target consumers who do not surf, and therefore quality has also been reduced. Mark questions the quality of the brand in two ways. First, by identifying real decreases in the quality of the prints. Second, by questioning the motive behind such changes, stating that these brands have become more interested in exploiting populist images of surfing and focusing on fashion instead of the values associated with surfing. For example:

"Some of the latest fashion I've seen lately has been funny, because people obviously just got a heap of paint on their hands and have just smudged it and have worn that out to nightclubs and stuff and why not? It looked a bit messy and stuff, but it's kind of cool. It looks like they've been in a fight with food or something. Now everyone is wearing it and they've never touched a surfboard. In that way they've lost their elite market, which is something they should definitely try and hang onto, really."

As a result of this perceived 'selling out', Mark has ceased buying surf brands altogether, preferring instead to buy customised clothes made by a surfer friend. For example:

"I kind of look at Rip Curl and Quiksilver now and cringe, to know that—I think Quiksilver started up in Torquay or somewhere. To think that it's just gone from being a small shop to a multi-million dollar, a billion dollar industry probably. I don't really go into surf shops any more for clothes. I've got a mate who pretty much looks after my board down the beach and he does them up, which is kind of nice."

In contrast to freedom-loving members, members valuing belongingness saw brands and marketing activity in a very different light (see Table 3). Belongingness was also a more complex value than freedom because the meaning of this value appears to split along core-periphery lines. For example, Fiona (WF24) who is a previous core member, now attempts to retain an association with that community by purchasing brands she believes will help her fit in and be identified as a member of the surf subculture. For example:

"Rip Curl, Billabong, and then there's also brands which I don't think are the main surfing brands, like Roxy. It's more of a mainstream version of what those other brands are, to try and appeal to a greater number of people, people that don't actually surf or people that live in the city... I suppose ultimately it's to feel as though I kind of fit into that niche. These are definitely things that you don't consider, but I'd say it's to fit into that little pocket of wherever I want to be, so if I wear those clothes, it's because I want to probably represent that part of me."

Wearing the brand Roxy enables Fiona to retain her past link with the surfing culture, even though she understands that the Roxy brand trades more off the fashion of surf rather than any real link (making surf boards, wetsuits and other equipment used directly in the activity) to surfing per se. Thus, her desire for belongingness drives a positive evaluation of the brands that best enable her to still fit into the surfing niche. In contrast to freedom-loving consumers like Mark, Fiona accepts mass, fashion-oriented surf brands be-

cause they allow her to feel like she remains in touch with the subculture. For Fiona, mainstreaming of surfing is fine because it places the sport on a more viable footing. Brand-related activity such as sponsorship is viewed positively because it contributes to the continuing health of the sport (in contrast to Mark's dismissal of such activity), as illustrated by the comment:

"I've never done any competitive surfing or anything, but it is important that they help keep it all alive and help people, anyone starting out, achieve things and stuff."

For new peripheral members of the subculture, brands act as a signal or ticket for group membership and they contributed much to the central value of belongingness. James (WM19) for example, wants to wear "what everyone else is wearing". As Kieran (WM15) puts it, "you don't want to be the daggy left out one". For such 'image associates', brands were chosen in a similar way to how Fiona chose the Roxy brand, in that brands that resembled a perceived surfing lifestyle were chosen regardless of their commitment to the sport. For these consumers, mainstreaming was never a concern, presumably because they were themselves active participants in the mainstreaming process.

The value of excellence drove consumers to value brands that performed to high standards, had a proven track record and made ongoing commitments to quality. For these sub-cultural members, the brand was only as good as any one of their products. For example:

"When you take surfing seriously, it's working best in good gear. The first thing you need apart from a surfboard is a really good wetsuit and every time I buy a wetsuit, I make sure I buy the top of the line because it's worth every cent given how much you use it, so I've bought a Rip Curl wetsuit and different brands are better for different types of gear. Even though a lot of the surf brands spread across just about every piece of surfing gear that you need in clothing and stuff, normally the best wetsuits you can get are the Rip Curl wetsuits because they're the first ones. Surfboards, there are just so many surfboards on offer. A lot of the time you want a custom made board, so I'm not too hooked on the brand, as long as I get a good shape, a good board. It's not only about the design, the looks and stuff, which attract a lot of people that don't actually surf, but it's about how practical it is." (Marcio, HM27)

Marcio's quotation uncovers a number of brand attributes valued by excellence-focused consumers, including an appreciation of quality-related details, a desire for the absolute best quality and functional performance and the denigration of fashion orientation in favour of practicality. Consumers like Marcio also had a preference for customised products because these would be made to fit their personal preferences, local conditions, and body shape and size. For these consumers, mainstreaming was not seen as a major problem.

"Burton still is a huge company, so I suppose you could call it—I don't know, it's probably got corporate ranks and stuff in its hierarchy and all that sort of stuff, but the guy that started it is still the owner of it and stuff like that, but it is a big company..."

...They're keeping it real, but they're still commercial, still growing and trying to increase their profit, obviously. You need to do that and I think half the reason they become successful is because they've had their product out there for so long and back in the 80's when it wasn't big, it was banned at

TABLE 3
Values, Brand Behaviour, and Attitudes to Mainstreaming

Value	Brand choice	Attitude to mainstreaming
Freedom	Anti-establishment brands, or brands are owned and run by members of the sub-culture	Either exit sport for less mainstreamed activities, or reduce that investment in the subculture by focusing more on personal interests. Brands per se start losing value.
Belongingness	Core: brands that are associated with sustaining the community. Periphery (new): brands recommended by expert others. Periphery (new, previous and image associates): brands that are perceived to be representative of sport's lifestyle	Core and periphery (previous) viewed mainstreaming as evidence of success: Therefore it will benefit community because it will sustain the sport. Periphery (new and image associates) did not recognize mainstreaming as an issue.
Excellence	Functionality, proven track record and ongoing commitments to quality.	Mainstreaming was viewed positively in general, unless it involves attracting image associates. Some concern that mainstreaming could lead to attracting of brands that take short cuts for commercial gain.
Connection	Brands that reflect local place, commitment to nature, commitment to sport, and are involved in actual activity.	Concerns about overtaxing resources, but generally accepted as it allows more people to connect with experience.

a lot of the ski resorts, snowboarding was, Burton and two other brands were pretty much the only boards you could buy and all the better riders were choosing Burton over the Gear, because obviously Jay Burton was the person that designed and started the company and he rides the same boards.” (Sam WM22)

Sam’s view of the Burton brand remains positive in the face of increased commercialisation because it still commits to quality improvements, and has a pedigree associated with top performance and pioneering technology. Even though Sam recognises that Burton is a large corporate company, he values their continued commitment and, like many other excellence-oriented consumers, believes that ongoing commercial success is due to continued functional performance. For these consumers, brands also offered value when developed by people actively engaged in the sport.

For these consumers, mainstreaming gave rise to a few problems. First, mainstreaming encouraged the entry of other brands into the market. For example, many snowboarders questioned how Rossignol (the main ski brand) could credibly make a good snowboard given their lack of previous development in the area. Rossignol also struggled for a time because they represented skiing, which was seen as the main ‘enemy’ of snowboarding. Second, mainstreaming could attract ‘image associates’ who did not engage in the focal activities but wanted to be connected with those who were. In contrast to freedom-loving members, excellence-loving members viewed these consumers negatively, rather than viewing the sport as having sold out. Finally, these members were often worried that brands would take short cuts to appeal to the mass market, and thus may reduce quality standards. As a result, they became more conscious of past track record, quality standards and product testing.

As noted, our respondents expressed the need for connection in many different forms (see Table 3) including country-of-origin,

heritage, or repeated involvement in important events. James (WM19), for example, described the recurrent presence of key surfing brands, and emphasized a sense of both time and space:

“I think it’s Billabong, I think their motto is ‘born at Bell’s’. Ripcurl first sponsored the Rip Curl Pro down at Bell’s Beach, just brands that are just true to surfing and have always been there, always sponsoring people, always sponsoring comps. They are really popular overseas and that’s really good because they’re an Australian brand and they’ve just expended so I think that’s good. I think they are good brands that are true to surfing.”

For James (WM19), the desire for connection drives him to choose local brands over larger, global brands. This is not driven by anti-commercial motives, but rather, a desire to have a product made by people with knowledge and experience of local conditions.

*“I think I have one of the first boards they ever brought out and it was made by a local down at Torquay, so he’s got general knowledge and everything and I think a lot of the big brands aren’t even made in Australia. A lot of their boards are made overseas, so I’d definitely go back to this board just because it’s thinner, it’s fast, it’s really fast, it’s easy to move because it’s so thin and I’m a little person, so it’s a lot easier to manoeuvre, so I think that’s good, because I’m that type of surfer that likes to do tricks and stuff.
(Probe)... So again it’s more to do with the actual product, rather than the brand?
Yes, the brand I think just put their name on it, where the product, it really depends on who’s made the product rather than the brand, who’s just given them the funding or whatever and just stuck their name on it, so I’d definitely go back to a Beach Crew board, just because—and they do advertise it as*

being locally made and stuff, like by a local hero on the bottom of it or something, so just general knowledge behind it."

In James' passage above, the value of connection drives his search for extremely localized products that enhance his experience of local conditions. Driven by a commitment to place, connection-prone consumers favour smaller brands that tailor their products to local conditions and support local surfers and events. For Anthony (WM24), commercialisation is problematic only if it attracts image associates, because they have no contact with the experience of surfing. For example:

"There's one thing that made me annoyed when I was a little kid, when I did go down surfing and the kids across the road who never knew anything about surfing, they never went to the beach, all wore the same clothes as me. I said why are you wearing them when I'm the one surfing? That made me annoyed, but now everyone does it. You probably see a kid walking around in a Quiksilver t-shirt who's never been to the beach before. It's just one of those brands, they just buy the brand."

This also leads to the rejection of brands that do not have a heritage of engaging in the focal activity, or brands that try and crossover from one sport to another. For example, asked which brand represents snowboarding for him, Sam (WM22) emphasizes the heritage of the brand, in this case it pioneering status among snowboarding brands:

"...Burton, obviously, I guess they're the leaders of technology in snowboarding and they put a lot of time, a lot of testing, a lot of people and a lot of money goes into what they build, so they're trying to create a product that is perfect for snowboarding and they have a lot of testing."

As can be seen in James and Sam's responses, 'connection' for these brands can stem from an early involvement in the sport. This is recognised by both core members like Sam and periphery members like James. For similar reasons, Sam rejected Solomon or Rossignol because they are 'ski companies' and would not want to 'cross over'. These brands, being new to the sport, cannot boast the same connection to it as Burton does and they suffer as a consequence. The connection is at times very personal: the connection with Burton, the brand, goes back to Burton, the man, who is known to have created the first snowboard and therefore is credited for spawning the entire snowboarding movement. This type of veneration for older brands is also apparent in the skateboard community where Vans is perceived as one of "*the bands that initiated everything*".

Connection with place also afforded some brands an edge with core members. Just as respondents recognised the value of the Australianness of some brands, others valued the association with specific locations, be it Torquay (a local Victorian Beach) or Bell's Beach. In other words, the sense of place which motivated so many of our respondents to take up their sport, resonated when the brands established a strong geographical presence or associated themselves with mythical places. For surfers, the beach brought on nostalgic feelings and some brands were able to embody similar emotions. For Hamish (WM) the connection goes back to childhood and the beach:

"Rip Curl would be the one that stands out the most. I think in Australia, it's one that—it's a Torquay company. There's a lot

of Rip Curl around in Victoria particularly and the majority of my stuff is Rip Curl as well...

...It probably comes back to brand favouritism as well, because my dad worked for Rip Curl for a while. He had this new Rip Curl towel and all this promotional stuff they gave him so I guess at a really young age, I just had Rip Curl imprinted in my brain.

...I guess when I look at the logo it reminds me of being a kid. (Probe): What else do you recall?

Wiping out a lot, just going to the beach, spending heaps of time at the beach."

CONCLUSION AND DIRECTIONS FOR FUTURE RESEARCH

Although exploratory in its intent, our study highlights the need for a more dynamic approach to subcultures. In particular, brand meanings and relevance appeared to shift in accordance with three main factors: whether consumers were closer to the core or periphery of the subculture, the primary value that linked them to the sub-culture, and pressures experienced by the subculture as a whole, such as mainstreaming. Despite the fact that we are limited in our ability to generalise these findings even to the small populations we examined (Australian surfers, snowboarders and skaters), we believe that evidence of such diversity within and between subcultures offers fertile grounds for future research. In particular, the degree of value fit between sub-cultures and brands deserves a closer look as different responses can clearly be seen within each sub-culture in response to the core values examined here. Furthermore, a longitudinal approach would seem warranted given our observation that consumers' evolving role within sub-culture seems to influence their response to brands.

Another possible explanation for our results, well worth investigating more formally in future research, could be that the 4 core values we identified in this exploratory work are really 4 expressions of a more fundamental search for authenticity, a concept increasingly described as crucial in the consumer/brand literature. For example, for freedom-motivated respondents, authenticity may be ascribed to brands that remain truly linked to the sport, whereas excellence-driven respondents define a brand as authentic if it performs best and the belongingness-seekers identify authentic by what their reference group uses or wears. Clearly, this hypothesis deserves to be examined with a larger sample of respondents for each of the three subcultures described here, as well as other subcultures beyond them.

Am I What I Wear? An Exploratory Study of Symbolic Meanings Associated with Secondhand Clothing

Dominique Roux, University Paris 12-IRG
Michaël Korchia, Bordeaux Ecole de Management

INTRODUCTION

Second-order or alternative marketing systems have received increased attention in recent years. Factors such as concern about the environment, reduction in household consumption costs and the attraction exerted by the experiential nature of exchange venues like swap meets, flea markets and garage sales combine to increase interest in used-product buying behaviors (Soiffer and Hermann, 1987; Belk, Sherry and Wallendorf 1988; Sherry, 1990a, 1990b; Rucker et al., 1995). Solomon and Rabolt (2004) have recently reported that “the number of used-merchandise retail establishments has grown at about ten times the rate of other stores”.

Among the wide range of goods for sale, clothing appears to be an important commodity in second-order marketing systems (O’Reilly et al., 1984). Such research as exists on this topic has revealed factors that can increase or decrease the willingness to acquire used clothing. Economic constraints have been pointed out as a critical factor in the purchase decision for secondhand goods (Yavas et al., 1982; O’Reilly et al., 1984). Conversely, concern about contamination has proven to impede the transfer of certain type of items, especially those worn next to the skin (O’Reilly et al., 1984; Belk, 1988). However, symbolic meanings associated with such consumption decisions have received less attention in comparison with demographic and behavioral variables related to products or purchase situations. Moreover, psychological approaches have especially and narrowly focused on contamination, disgust and negative meanings, while positive motives have received only scant attention. As suggested by Rucker et al. (1995), it is here proposed that a broader investigation of the various aspects of positive and negative meanings associated with the exchange and resale of secondhand clothing will offer insights into the relationships between ideological visions of the consumption world, values attached to possessions, and appropriation processes where contamination plays a significant role in shaping attitudes and perceptions.

This paper will conceptualize and explore the symbolic and psychological aspects of both acceptance and rejection toward used clothing. In-depth interviews and mini group discussions have been used to elicit qualitative data. The findings reveal, firstly, clear-cut attitudes of acceptance or rejection toward used clothing. Secondly, these attitudes seem basically deep-rooted in a system of symbolic meanings that is strongly dependent on the affectively charged power some consumers attribute to such possessions in providing a sense of self. In particular, when they view clothing as an intimate part of their self, they are unlikely to exchange, sell or buy it, especially from strangers. Conversely, when possessions are less a part of their extended self, they are able to perceive clothes as autonomous objects, free of any associations with their previous owner. Such consumers evaluate used items for their intrinsic properties and buy them according to their perceived value and appeal without reference to their past use. In such cases, we examine more specifically the different symbolic meanings and consumption patterns exhibited by those informants who feel concerned by such reappropriation processes.

LITERATURE REVIEW

Previous studies of second-hand clothing markets have mainly focused on factors affecting consumers’ willingness to purchase used items and their choice criteria. Winakor and Martin (1963) noted that the salability of clothing items was related to how worn

they were and to their fashionableness. O’Reilly et al. (1984) confirmed that low price alone was not sufficient to prompt purchases and that the sizes available, the newness and the quality of the merchandise affected their resale to a greater extent.

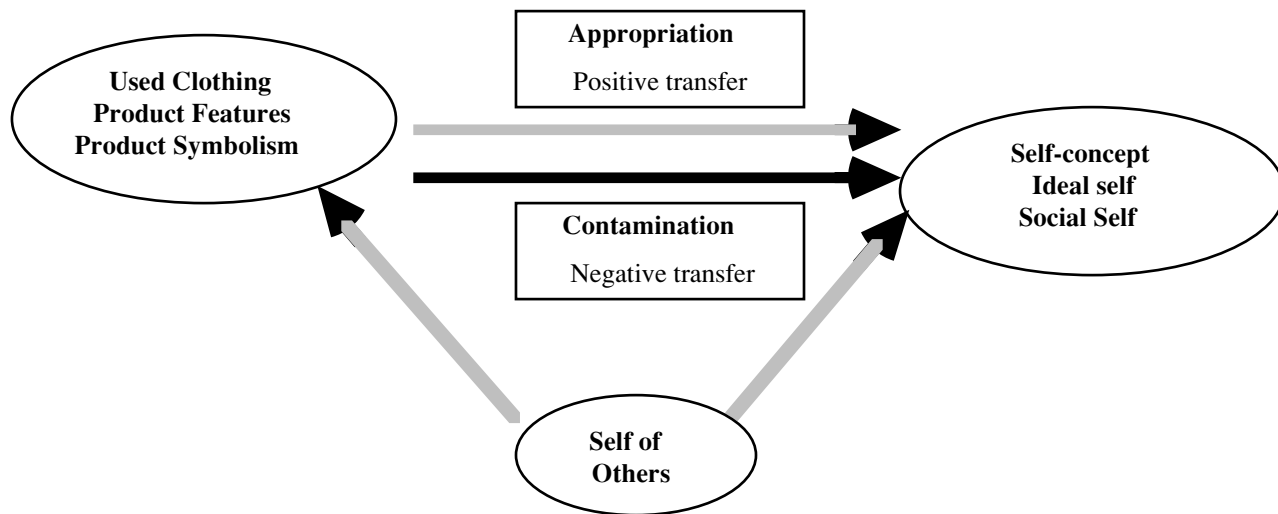

Furthermore, the rejection of certain types of clothing appeared to increase with the increase in proximity to the body, thus confirming concerns about contamination. Goffman (1971) describes contamination as a violation by others of one’s personal space through talking, glancing, touching, bodily contact and excreta. Real or imagined body markings on used clothes, such as perspiration stains or odor, can be felt as a territorial encroachment of the previous owner and therefore a taboo against their re-use. Perspectives on disgust stress the apparent offensive and contaminating nature of contact with other people’s possessions such as clothing and silverware (Rozin, Haidt and McCauley, 2000). While these authors report that aversion to strangeness persists despite laundering or sterilization, Ginsburg (1980) argues on the other hand that concerns toward contamination may have disappeared as a result of public health and cleanliness. Likewise, O’Reilly et al. (1984) and Ostergaard, Fitchett and Jantzen (1999) suggest that appropriation processes can depend on the type of clothes. For example, because of their closeness with the body, underwear are not likely to be transformed, even if washed or laundered, into reusable clothing. With reference to Sartre’s general model of appropriation (1943/1956), objects *are* a part of their owner. The same perspective is supported by the research on the extended self, defined as the self plus possessions (Belk, 1988; Sirgy, 1982; Kleine, Kleine and Kernan 1993). Clothes, perhaps more than any other goods, are supposed to be buried or destroyed when their owner dies, since they represent an intimate aspect of his or her existence. Moreover, destruction, divestment and grooming rituals are also depicted by McCracken (1986) as a means by which individuals void goods of previous symbolic meanings and take possession of the product.

Close relations between physical contamination and moral taint have been explored by Douglas (1966). She suggests that prescriptions concerning purity may derive from increased medical knowledge, but above all from the need to preserve socio-moral rules within the society. Appadurai (1981) found that interpersonal disgust serves the purpose of maintaining social distinctiveness and social hierarchies. Such an outlook is reflected by the literature on ‘aversive’ aspects of consumer choices described by Bourdieu (1984) as the ‘refusal of taste’, especially research conducted on the undesired self and the consumption anti-constellations (Ogilvie, 1987; Englis and Solomon, 1996, 1997; Hogg, 1998; Banister and Hogg, 2001).

However, contact with pre-owned clothing does not always trigger aversion (Belk, 1988). Positive contamination can occur when the clothes are acquired from relatives, parents, friends or loved ones (Lurie, 1981). The magical laws of contagion and similarity (Frazer, 1950/1922; Mauss, 1902/1972) that play a part in transferring negative meanings from strangers or undesirable persons exert symmetric positive influence when other people are part of the extended self (Belk, 1988). Whereas inherited clothes can be cherished as the continuation of loved ones, ancient or rare items of clothing can represent artifacts of a golden age (Baudrillard, 1975) or serve as social markers (Douglas and Isherwood, 1979).

Although accounting for the most commonly recognized psychological variable in purchasing or exchanging used clothing, contamination does not explain the whole significance of this

FIGURE 1
 CONCEPTUAL FRAMEWORK: NEGATIVE AND POSITIVE TRANSFERS BETWEEN USED CLOTHING AND CONSUMER SELF CONCEPT

consumption practice. Beyond the monetary or economic benefits that are commonly presented as key factors accounting for the growth of lateral cycling and re-use of secondhand clothing, other motives can be involved in this trend. Thompson and Haytko (1997) showed how consumers resist dominant fashion discourses and create personalized consumption meanings. They stress that some consumers exhibit creative clothing choices—sometimes including second-hand items—in order to stand out and feel unique. Dobscha (1998) has also explored the way some consumers rebel against the marketplace. Among other choices, purchasing secondhand allows them to avoid stimulating the overall demand for new products. Environmental concerns and love of the natural world fuel their motivation in undertaking resistance behaviors such as recycling. Similar anti-consumption attitudes as the result of ethical concerns have been reported by Zavestoski (2002) and Shaw and Newholm (2002). Wearing secondhand clothes *by choice* can thus be regarded as a sign of opposition to consumerism, associated with voluntary simplicity and various reducing behaviors. Murray (2002) has analyzed this recent trend as a response to the materialist culture that focuses on superficial meanings. Controversial elements of the consumerist way of life may lead to a form of detachment from symbolic aspects of the self (Goffman, 1971) and to an increase in re-using and recycling behaviors. Consumers involved in such resistance create new selves that appear to be more “socially conscious” than merely preoccupied with appearance.

CONCEPTUAL FRAMEWORK

In summary, the review of the literature on secondhand clothing has dealt principally, on the one hand, with functional values of used clothes—price, quality, condition, fashionability—and on the other, with the perceived effects of previous ownership and psychological issues relating to contamination. The conceptual framework presented in Figure 1 is based on Sartre’s (1943/1956) view on having and being. He posits that the fundamental intention of desire is to appropriate, in and through the possession of a certain product, some kind of being we lack. «The desire for a particular object is not the simple desire for this object; it is the desire to be united with the object in an internal relation, in the mode of

constituting with it the unity ‘possessor-possessed’ « (Sartre, 1943/1956). Products become significant not in themselves, but rather with respect to their place within the world of the consumer, or, more specifically, as a result of their role in enabling the consumer to appropriate the world of his or her desires. If “I am what I have” (Fromm, 1976, p. 76), to what extent then does the object of desire (here used clothes) contribute to the ideal of desire? Can it be reduced to the fanciful idea of being someone else, the one who preceded me? Or can it support, by its own features, the project of being me? If so, contamination turns out to be simply one of several potentialities carried by the object. But the appropriation of a previously worn item could express the desire to incorporate other symbolic meanings as well. As pointed out by Sartre (1943/1956), it constitutes a creative process shaping the sense of the exchange between the self and the object. Our intent is then to explore the different symbolic functions that such re-appropriation processes can serve for some consumers.

METHODOLOGY

As the overall aim of the research was to investigate the meanings associated with wearing or rejecting secondhand clothes, as well as the psychological and social perceptions embedded therein, a qualitative methodology was considered the most appropriate. In-depth interviews, each of which lasted from half an hour to two hours, were conducted with 43 informants—26 of them female and 17 male—over an 18-month period. A combination of purposive and convenience sampling was used, aimed at selecting informants who would maximally enrich or challenge the interpretations as they emerged and provide what Patton (1990) terms «information rich cases». A snowballing technique was used to identify second-hand clothing consumers *and* non-consumers, using the researcher’s professional and personal network. Variety and contrast were taken into account for recruitment, with respondents chosen sequentially and selectively according to issues and questions that arose as the research unfolded (Lincoln and Guba, 1985). The informants ranged in age from 22 to 62 with an average of 38. In order to reflect various symbolic meanings, informants were purposefully selected to represent a mix of different types of

occupation and/or levels of education. The specific nature of the topic led to an over-representation of female respondents, so reflecting their particular interest in fashion and their greater involvement in secondhand purchases, as has been pointed out by O'Reilly et al. (1984). Diversity in sampling also sought to maximize individual differences, taking into consideration familiarity or unfamiliarity with clothing exchange practices and general attitudes toward second-hand consumption. As well as the long interviews, a series of twelve mini-group discussions were held with several members of the same family—husband and wife, parents and children—which provided an opportunity to explore shared values and patterns of consumption.

In all cases, a phenomenological approach was adopted to uncover the lived experience of the respondents and their constructed reality of symbolic meanings. Interviews were conducted in a loosely-structured and non-directive manner around several topics including: 1) clothing choices in general; 2) negative and positive attitudes toward secondhand clothing; 3) type of clothing or situational influences that may affect perceptions; 4) meanings and imagery underlying acceptance and rejection patterns. Respondents were encouraged to recall personal memories, since these can throw light on affectively charged situations and enduring influences acquired during childhood (Sujan, Bettman and Baumgartner, 1993). All interview sessions were conducted at the informants' homes, audio-recorded and transcribed. The constant comparative method (Glaser and Strauss, 1967) and grounded theory techniques (Strauss and Corbin, 1990) guided data collection and analysis. Each successive interview was used to refine or put into question the information obtained from previous informants (Lincoln and Guba, 1985). The qualitative data were analyzed using an iterative process of searching for recurrent patterns and themes (Miles and Huberman, 1994). Every effort was made to ensure the reliability of the research, including a long-period observation, negative case analysis, debriefing by peers and member checks (Wallendorf and Belk, 1989)

FINDINGS AND DISCUSSION

Secondhand clothes purchasing habits

The categorization produced clear differential attitudes between respondents, ranging from those rejecting even the idea of wearing something previously used to those expressing attitudes of acceptance toward secondhand clothing. Some informants acknowledged that they buy used clothes rather frequently from swap meets, flea markets, personal sales or used-merchandise retail outlets. Interestingly, the latter category shows positive but heterogeneous behaviors toward second-hand clothing, as described in the following section. Some informants even admitted to re-using clothes that have been thrown away and put in the trash. Surprisingly, they also acknowledged that they are materially well-off and that such behavior is not dictated by necessity.

Between extreme positions, situational factors are also likely to influence perceptions about used items. For example, acquiring second hand evening dresses or suits for a special event or a fancy dress ball do not seem to elicit either strong feelings of appropriation or fears of contamination. Another perspective is offered by those informants who do not buy used clothes, but do not object to wearing clothes given to them by friends or acquaintances.

This key differentiation between acceptance or rejection related to secondhand consumption substantiates the theoretical model insofar as positive or negative emotions underlie symbolic meanings associated with consumers' choices. To clarify the presentation of the findings, we follow these two main schemata as they emerged from examination of the qualitative data.

Favorable attitudes and symbolic meanings: when reusing worn clothes extends positively the sense of self

Knowledge of the origin of worn clothes and their previous ownership by close friends or relatives transforms perceptions into a positive contagion (Lurie, 1981). These re-appropriations are likely to provoke an increased feeling of identity because they enhance the value or the confidence of the subject by identification with freely chosen, accepted or desired references. Certain respondents testify to this phenomenon through their attachment to special possessions that belonged to their relatives or through the exchange of clothes between friends during their adolescence.

“When I was younger, I sometimes wore clothes of certain friends that I found cute. So it operated itself as a sort of appropriation of their beauty” (Nadia, 30, Medical Secretary).

“I don't believe I've ever bought used clothes, but in the '70s, we'd meet up between girlfriends to exchange our clothes. I really loved this. It was enjoyable and fun. In general, it was the cute things that one would no longer want to wear. It was nice to wear a friend's clothes. It allowed us to change our style by thinking of one another” (Sylvia, 48, Commercial Manager).

On the other hand, the purchase of clothes from unknown individuals, and their recovery from a variety of questionable outlets, poses a more complex problem in conceptualizing the notion of evoked contamination both in the literature and when observed empirically. However, some respondents do not conform to the law of contagion which underlies a part of the sympathetic magic at work in contamination (Frazer, 1950/1922; Mauss, 1902/1972). To express this in another way, for these consumers, clothes can be dissociated from their previous owner and freed from his or her imprint. In contrast to what Rozin, Haidt and McCauley (2000) argue, cleaning does seem to be an effective and sufficient ritual of purification (though it may not always be necessary).

“Yes, I very often wear used clothes that I buy at flea markets and even those that I find in the trashcan. No, that doesn't bother me. Why would that bother me elsewhere? They have been washed. If the clothes please me, I take them, that's all! I do not think about the previous owner at all.” (John, 45, Telecom Engineer).

The lower the investment of self in the possession of clothing and the more the distinction between subject and object is verbalized by consumers, the more likely they are to invest the same types of relationships with worn clothes as with new clothes. In addition, certain characteristics of these clothes and/or of their state of use seem to create for some informants a particular desire for re-appropriation. Four types of motives characterized by distinctive symbolic representations and ideological arguments emerged from the interviews.

The desire for uniqueness

The worn clothing itself, sometimes unique or peculiar, acts as a vector of privileged expression of one's identity and of its wearer. It fulfils the need for uniqueness that certain consumers seek through choices of counter-conformist consumption—a creative expression or a refusal to be submerged in uniformity (Snyder and Fromkin, 1980; Tian and McKenzie, 2001; Tian, Bearden and Hunter, 2001). Worried about being dressed 'like everyone else' and losing their identity, certain respondents acquire worn clothing for the purpose of distinguishing themselves from the mass. De-

picted as risk-oriented consumers by Jensen and Ostergaard (1998), they emphasize differentiation, personal style and originality more than the pursuit of standards of 'good taste' and social norms.

Two young respondents perfectly expressed this need to be different in their clothing choices, to assert their personality and to create a distance between themselves and mass sartorial conventions.

"From my point of view, buying clothes at flea markets is far more original. I look for something unique, something that not everyone already has. And even if other people seek something similar, it will never be the same. It's also a way to feel different, a means to avoid following the rest of the world. What most people consume doesn't interest me" (Mary, 23, Medical Student).

"I buy used clothes about twice a year, always at the same shop. I love the clothes I see there and I hope that each time I will find something that will match my personality. In general, these clothes are very original and express my personal style" (Ellen, 24, Artist).

Smart shopping and social ruse

In contrast to the preceding profiles that incorporate the characteristics of used clothes to their ideal self in order to assert distinctiveness from others, some informants stress the role that branded used clothing can play within the social comparison process (Festinger, 1954). They express strong feelings of concern both about the image they project to others and about the price to pay to reflect a desirable standard of living. Insofar as they seem particularly sensitive to the impression they make on others through their appearance, second-hand purchases allow them to acquire luxurious and branded clothing, but without paying the full price. For bargain hunters and smart shoppers (Mano and Elliott, 1997), price savings may be a source of pride and accomplishment as much as their desire to escape their 'class habitus' and to acquire the appearance of certain upper social strata by what Bourdieu (1984) calls a strategy of distinction.

The overlap between the financial and psycho-social benefits of such shopping behaviors is attested by the repeated associations of satisfaction derived from pride in being able to buy items of high social value at a very low price.

"I wear used clothes that I generally buy in luxury secondhand shops, branded clothes—Chanel, Yves Saint-Laurent—often slightly worn, at a very reasonable price. What makes me really feel excited is finding nice clothes and accessories that I couldn't have afforded at their full price and that represent a very good deal under those conditions! And for my job, it's a real plus. I really look nice, and I'm all the more pleased in that everyone thinks I bought my stuff in an expensive shop" (Ann, 32, Directional Secretary).

The symbolic interactionist perspective (Solomon, 1983) has previously emphasized the importance of relevant product cues and reliance on material values in meeting role demands. The look created by having up-market clothing, even if second-hand and previously worn, enables consumers to manifest the signs of respectability that protect them against the risk of negative evaluation in public contexts. However, for some informants, this type of appropriation sometimes seems to betray a tension or conflict between an original identity and a borrowed appearance. Some try to keep at a distance the conspicuous display they apparently favor and despise at the same time, while deriving a certain cynical

pleasure in deceiving others. This paradoxical position appears to be what could be termed social ruse. One possible interpretation may be that their rationalization could be dictated by a high sensitivity toward appearances.

"I don't like branded fashion products in general. I find them expensive and not very original. Yet I have discovered that I can buy myself clothes in flea markets that I would have never bought new. Some of them are well-known brands. I laugh at women who have paid a fortune for items that I buy for two euros, and I think they're stupid to have spent so much money. But I am quite happy even so to advantage of it" (Valerie, 38, Medical Visitor).

Nostalgia

Whereas for some consumers the previous history of their clothes is a matter of indifference, others precisely seek a trace of the past, a symbol of a style, epoch, culture or forgotten know-how. This process of historical and cultural identification is often underlined by the perpetuation of myths related to this particular period or that particular group, and for which the clothes constitute one of the visible narrators. Such clothing permits some individuals to perpetuate his or her memory and maintain some temporal continuity, and others to engage in vicarious nostalgia for periods outside of their living memory (Goulding, 2002):

"I often bought old embroidered sweaters and old garments at flea markets. I am also found of lace baptism dresses. They remind me of my childhood, when my grandmother was a laundry washer in the country... I get flashes of memory that come back to me when I see these clothes" (Esther, 54, Hair Stylist)

This nostalgic experience functions like a therapy in terms of memory against the uniformity and banality of mass production, and against a gradual depersonalization of the individual.

"Through objects, I appropriate fragments of history, moments of the past. Today, everything is focused on mass consumption, and the ideal is 'to buy buy buy'—but always something new, of course. Even so, certain products may have a soul or a spirit, because manufacturers reproduce what was made in the past. But it's not the same, because people clearly see it's new. It has no soul in fact. It lacks authenticity" (Alice, 22, Literature Student)

Rejection of squandering

Certain respondents express great concern about the proliferation of consumer goods. Faced with unequal distribution and scarcity of resources, they see the anarchistic depletion of such resources as part of the overall production of waste, and which is especially scandalous if dictated by mood or fashion. Closely aligned to the ethical concerns and attitudes of voluntary simplicity (Dobscha, 1998; Zavetoski, 2002; Shaw and Newholm, 2002), they reject inducements to consume, despise ads and mock all forms of conspicuous consumption. They frequently purchase worn clothing by choice, because it conforms to their logic of personal and collective economy and contributes to the conservation of resources.

"Very often I wear clothes that I buy in secondhand shops, but I also wear clothes I find thrown out in trashcans. And it doesn't bother me, actually! It's the fact that people throw out too many things that really bothers me. Most of the time, they are in good condition. These clothes are rejected and un-

wanted, but they're quite reusable. Why should I leave them?"
(Paul, 47, Primary School Teacher)

For such consumers, articles of clothing rejected as result of the arbitrary whim of fashion re-acquire some of their original desirability, in a process that resembles anthropomorphic attachment to abandoned objects.

"I feel no kind of repulsion toward clothes that have already been worn. Obviously, these clothes have a history that appeals me. They have been chosen by another woman, they had been loved, and now that they no longer please her, I give them a second chance" (Susan, 52, designer)

Attitudes of rejection: When wearing used clothes degrades the sense of self.

Unlike the previous informants for whom perceptions of waste are associated with an endless cycle of buying and disposal, other consumers perceive used clothing essentially as rubbish. They hold that an item of clothing can only be worn by a sole owner, in the same way that food can only be eaten by one mouth. According to Thompson's (1979) assumptions, usage of such products makes them change from the 'Transient' to the 'Rubbish-category'. Appropriation is perceived as a marking of the product, which becomes indissociable from its owner and thereby unfit for subsequent use. A used item of clothing cannot be seen other than as highly contaminating, because it is experienced as an extension of the body of another person. Grooming and purification rituals do not suffice to eradicate the fantasy of bodily impregnation.

"I will never buy secondhand clothes. This is due to the problem of hygiene. I can't stop myself from thinking that the previous owner could have been dirty and never have washed"
(Michael, 28, Export Executive)

These representations underline the existence of possible symbolic transfers between two identities, that of the other and that of the self, mediated by the object. For some respondents, fear of the unknown and of strangeness engenders a degraded image of the former wearer, which is projected onto the clothing. This then becomes a physical or symbolic vehicle of contamination by unwanted characteristics of others. Such intimate corporeal proximity can represent a kind of auto-violation of the territory of the self, according to Goffman (1971), or pollution, as proposed by Douglas (1966). Disease, death, and social misfortune are often associated in fantasy with used clothing:

"...I don't see myself ever buying these types of items, in any case. It is the idea of imagining the previous owner which puts me off. The idea of not knowing, I imagine it in a negative manner. Maybe the clothes carry diseases. The worst thing would be to imagine that I was wearing clothes of a dead person" (Laura, 24, Doctoral Student)

"Yes, I would be embarrassed to wear secondhand clothing. To me they seem tainted and associated with an image of failure. It would mean that I can't afford to buy new clothes and that I have gone down on the social scale." (Alex, 38, Lawyer)

Beside the fear of contamination, other interesting motives were revealed by the interviews. The intimate and unique link that some owners have with their clothes lead them to project this exclusive vision onto possessions in general. What is at stake here is less a concern about contamination with germs than the refusal of

a shared narrative with someone else through his or her possessions. Wearing something that belonged to others threatens the feeling of difference, unity and coherence which nurtures the sense of self (Allport, 1955; Erikson, 1968). As expressed by one of the young women participants:

"Clothes already have a history and a life before me. Purchasing them doesn't take away their previous life, and in some way they could never completely belong to me and be part of my intimacy." (Sandra, 22, Student).

Thus in certain cases, wearing used clothes is expressed figuratively as a feeling of dispossession. Individuals feel condemned to assume other people's identities and to leave their own behind. This point is particularly well illustrated by those informants who had to wear clothes passed down from their brothers or sisters who had outgrown them, and whose feeling of dispossession seems to derive from an involuntary encroachment of their older siblings' personalities on their identity, threatening their perception of their own value.

"When I was a little boy, I always wore used clothes. That is to say, clothes from my brother. I have never had anything of my own. Therefore I think that it comes from that, not wanting to buy secondhand clothes" (Joseph, 56, Professor).

All these aspects show the high degree of attachment some individuals invest in their clothing. Clothing plays a great part in reflecting their identity, and they cannot tolerate any kind of transfer or infringement from others. An exception can be made when others are incorporated in the individual's extended self.

GENERAL DISCUSSION

A review of the literature stressed the importance of contamination in appropriation processes concerning secondhand clothing. The findings confirmed that contamination is an important factor in rejection behaviors toward used clothes. In particular, our research showed that rejection is based on the specific fear of incorporating a degraded image of the previous owner. Death, disease or misfortune are often associated with the former wearer, and 'bad vibes' are imagined to transfer through his or her possessions to the new owner. But the findings suggested also that the concern with unwanted contamination is not as general as it is thought. Positive symbolic appropriation can be involved in exchanging clothing between friends or parents. Moreover, fear of contamination does not necessarily play any part in buying or wearing secondhand clothes, even when the previous owner is unknown.

What clearly differentiated acceptance from rejection behaviors was the ability of individuals to view clothing as mere objects rather than as part of their or someone else's extended self. When used clothes are not too closely associated with their former wearer, they can be appraised for their own values instead of being reduced to the incorporated intimacy of another person. In this case, other motives guide and explain purchasing and recycling behaviors in relation to used clothes. Four types of symbolic representations were extracted from the interviews. The first two refer to the social comparison process. The desire to be unique and smart shopping behaviors are two opposing facets of a way one presents oneself to others. This indicates that there is an integration of the imagined appraisals of oneself by others in the construction of one's ideal social self. While counterconformity expresses self-assertion, risk-taking and differentiation, social ruse orientations are grounded on conformity to and imitation of perceived social superiors.

Two other categories of representation are related to ideal self and self-esteem, namely nostalgia and responsibility. Because of their connection with the past, either of fashion or of a bygone age, used clothes may express a singularity, a difference or an authenticity for certain respondents. Possession allows them to differentiate themselves, express their personality, or maintain a tie with the past, history, and personal or collective memory. The refusal to squander combines an ethical dimension with the intense feelings of collective responsibility induced by acts of consumption. The ideal self does not express itself in clothing and appearance, but rather in the social implications of consuming less and reinvesting discarded objects with a value deriving from their function.

CONCLUSION

This examination of symbolic meanings associated with secondhand clothing stands in marked contrast to earlier studies which have generally focused on negative perceptions triggered only by a fear of contamination. The present study has sought to extend and challenge a traditional view of the appropriation processes by exploring other positive motives likely to promote the transfer and re-use of used clothing. It is hoped that the study, despite the small sample size, contributes to a deeper understanding of consumer-object relations and of the complex processes of incorporation of objects in constructing a sense of self. The illumination of such partially hidden consumption choices can illustrate how consumers exercise their freedom to create new meanings far from conventional consumption practices.

Based on the results of this exploratory research, the next step of this project could be to test on a larger sample the degree to which disgust sensitivity plays a part in differentiating attitudes toward used clothes. In addition, further research may test the propositions set forth in this paper concerning secondhand buyers' orientations such as the desire to be unique, the tendency to engage in nostalgic feelings, prestige sensitivity associated to smart shopping behaviors or anti-consumption attitudes.

Constructing 'Hortiporn': On the Aesthetics of Stylized Exteriors

Paul Hewer, University of Stirling
Douglas Brownlie, University of Stirling

INTRODUCTION

The commodification of contemporary gardening cultures is big entertainment business in the UK. It employs a panoply of celebrity gardening gods (e.g. Diarmuid Gavin, Alan Titchmarsh, Joe Swift) and goddesses (e.g. Rachel de Thame, Charlie Dimmock). Television and radio programs are regularly devoted to those 'green fingered' stars (*Gardener's World*, *The City Gardener*). They also author, or ghost-author, a wide variety of supporting texts which provide apparently avid consumers with instruction on *How to be a Gardener* (Titchmarsh, 2002), or how to bedeck one's *plant room* (Swift, 2001). Walk through many large bookstores to the section now known as 'lifestyles' and you will find crowded shelves of glossy gardening books competing to attract and hold your attention and spending power. Open some of those books and you will immediately be struck by their meritorious production values: glamorous photographic images of enchantingly aestheticized spaces not only decorate the text, they punctuate it, revealing the carefully deployed hands of designer calculation and the expensive grammar of fine art photography. In this sense such texts are purposefully landscaped, i.e. designed, moulded and assembled so as to provide a very particular vista, deeply enmeshed within dominant regimes of meaning. We understand this as one moment in the historical process of the 'aesthetic fetishising', the *hortipornography* of gardens and gardening.

While offering sophisticated compositions that play on discursive spaces around gardens and gardening, the paper argues that such texts employ dominant logics of representation that are socially and historically situated and which construct and reconstruct divisions within social formations. It considers the framing of meaning through competing strategic 'positionalities' generated by discourses that circulate around the garden and gardening, aligning viewers with social positions and employing various technologies of enchantment to imbue artifacts with aesthetic meaning. It provides a reading and interpretive analysis of one contemporary gardening text, understanding it as one heavily inscribed artifact, indicative of underlying cultural forces. We discuss the 'landscaping' of this artifact's materiality and how those landscapes are inscribed with aesthetic meaning. After Schroeder and McDonagh (2005, p.3), this text was selected because it "reveal[s] interesting aspects of [positioning]." Prior to this an assessment of the importance of the image to understanding contemporary culture is provided, alongside a discussion of methodological approaches available for understanding visual culture.

THE IMAGE AND CONTEMPORARY CONSUMER CULTURE

A host of contemporary theorists have sought to untangle the role of images in contemporary culture (Bauman, 2000; Maffesoli, 1996; Robins, 1996; Schroeder, 2002). The work of Maffesoli (1996) alerts us to the potential and power of images for an understanding of consumer culture. Maffesoli argues that the image must be understood as constitutive of urban memory: "the image *is* culture, the image *makes* culture" (1996, p.100, italics in original). The image from this account is thus expressive of our being-in-the-world, providing consumers with a 'linking' or 'communion' with others. The work of Bauman is also useful in advancing our understanding of the representational burden on images, as being

reflective and constitutive of positioning repertoires. In *Liquid Modernity* (2000), Bauman extends the meaning of shopping from its delimited retail context to that of:

"scanning the assortment of possibilities, examining, touching, feeling, handling the goods on display, comparing their costs with the contents of the wallet or the remaining credit limit of credit cards, putting some of them in the trolley and other back on the shelf—then we shop outside shops as much as inside; we shop in the street and at home, at work and at leisure, awake and in dreams... Shopping is not just about food, shoes, cars or furniture items. *The avid, never-ending search for new and improved examples and recipes for life is also a variety of shopping*" (2000, pp.73-74, italics added).

The notion of 'recipes for life' is a useful one and Bauman positions consumers as constantly seeking the skills and competences of consuming. Consumers are said to make use of discourses. In this regard, Bauman draws upon the work of Thrift, who considers discourses as "meta-languages that instruct people how to live as people" (Bauman, 2000, p.54). Our own argument builds upon this view by considering images as resources or scripts utilized by the consumer. Images in other words are considered as *recipes for life* that instruct people on the whys and wherefores of consuming, providing quick, easy and tailored solutions to time-strapped, harried consumers to resolve in an imaginary fashion the problems of contemporary life.

Parallels can be drawn with the work of Robins (1996) who, in drawing upon the work of Vattimo, conceives of images as devices for managing anxiety. Given the multiplication and proliferation of images in contemporary culture, he argues that this results in consumers becoming embroiled in images as a means to "take refuge from the shocking and exhausting reality of the modern world." (1996, p.121). The sphere of consumption is in this fashion said to provide consumers with "strategies of insulation and protection against the shocks of the real world" (p.126). Images by this token become akin to a resource for the consumer, functioning as technologies and sanctuaries of enchantment.

ANALYZING THE IMAGE

There are a variety of different ways in which visual culture can be understood, through the lenses of cultural theory, psychoanalysis, feminism, semiotics and post-structuralism (Fuery et al., 2003). Drawing upon the analytical distinction between structure and intention, Barnard (2001) describes two traditions by means of which to understand visual culture: the hermeneutic or phenomenological and the structural. And using the work of Ricoeur (1974), he goes on to state that those approaches depend on various ways upon each other, that each of them should be thought of as supplementing or complementing the other. This call to interdisciplinarity inspires the study reported here, which is informed by the seminal work of Barthes (1973; 1984), Williamson (1978), Scott (1994), Schroeder and Zwick (2004) and Zafar's (1999) later feminist work. All sought to generate understanding through cultural interpretation and detailed critique of a limited number of key texts. Rather than attempting the thinner but broader sweep of a larger sample, our approach seeks to employ the strengths of thick description and

interpretive analysis. Schroeder (2002) details how such an analysis moves through a series of stages, commencing with description and interpretation, prior to a shift to evaluation and theorization. More so, we draw specifically upon cultural analysis to investigate “*how meaning, pleasure and power are articulated through specific images*” (Lister and Wells, 2001, p.63). In this vein, we sought to develop readings of a carefully selected gardening text, to develop a line of argument which positions such texts as “*complexly coded cultural artefacts*” (Lister and Wells, 2001, p.89) embodying a host of representations, announcements and recipes for the consumer to enliven their lives. We argue for this cultural approach simply on the basis that it appears to replicate the way such cherished texts are consumed at an everyday level. Unlike the economy of exchange which marks out consumers’ interaction with formal advertising; readers (see Amazon, 2005) speak of the selected book as “*an engrossing read*” and a spur for the “*imagination*”: “*There’s so much going on in this book you’ll keep coming back for another little look. Whether it’s for a tip on keeping the maintenance down...or simply to gaze once again at some great pictures.*” Our method is therefore one of taking such ‘pictures’ or images seriously as data. And through interpretation, our own readings lead to the emergence of a number of key themes, namely: the reconfiguration of urban exterior spaces; seductive images of gardens as hortiporn; and finally the notion of consumer choice implicated in the instruction of a will to garden design.

IN SEARCH OF GARDEN REPRESENTATIONS

As a practice of consumption this paper is inspired by the lack of attention granted to such mundane, but spectacular and seductive activities as gardening. This perplexing lack of interest by consumer researchers is further questioned by the attention devoted to the practice from other disciplines. From the bible, to works of arts and literature the image of the garden can be read as what Morris terms a “*powerful collector of symbols*” (1996, p.62). Morris (1996) argues that the meanings of gardens are historically and culturally specific, always shifting, never fixed. In addition, she suggests “*The garden space, like identity, is fragmented, multiple, contradictory and provisional.*” (1996, p.76). She traces how the central motif of the novel, in this case *The Secret Garden*, is the representation of the garden as a retreat, but more specifically a feminine space for ‘self-determination and negotiated freedom’. Themes which echo throughout garden design history as we shall see when we turn to research which has examined gardening texts by garden designers of the Italian Renaissance to French formal gardens of the seventeenth and eighteenth centuries.

Mukerji (1990) in charting the history of French formal gardens analyses such spaces as ‘manifestations of materialism’ in early modern Europe suggesting:

“Gardens are forms of material culture inscribing affluence and power, legitimating social stations made problematic by economic change. They are places in which statues glorifying Europe’s classical heritage and rare imported plants, testifying to the economic reach of the international capitalist trading system, were used to buttress the social claims of their owners and designers. In addition, these gardens were designed. They were active means for communicating social location because they were carefully planned and executed, using the rich book culture that was being expanded through capitalist development in the book trade. With these tools, gardens were constituted as models of the exercise of power over nature, narratives for describing the virtues of discipline and of integrating divergent elements within an organized whole.” (1990, p.653).

From this we take a number of elements, the importance of garden spaces in previous societies, the use of gardens to express and communicate power, the importance of design and lastly, those sources through which such advice was exchanged. Mukerji thus demonstrates the importance of analysing representations of the garden, in her case through books on horticulture. In this way, she turns to the some of the first books on practical gardening, such as those of Alberti in Renaissance Italy for whom the garden “*was a place of retreat and fantasy, wish-fulfillment rather than practical activity. It was to be situated by the house so the garden could function as an outdoor living space.*” (1990, p.661). Gardens were therefore playful spaces for conspicuous display. Mukerji explains how the stylistic shift to French formal gardens involved a changing view of nature whereby the focus was placed upon the ‘geometry of its design’. This was most clearly articulated through the design of parterres and the work of Boyceau for whom the garden was conceived as a representation of the natural, a representation which contained two major characteristics, orderliness and diversity. As Mukerji explains, “*These were the aspects of nature that were revealed by scientific study. The diversity was made clear by empirical observation of particulars. The orderliness was revealed by the fact that natural laws could be written in the language of mathematics. The garden was a representation of the natural, so it too had to display the diversity and unity of nature.*” (1990, p.662).

Mukerji argues that the stylistic differences between Italian, French and English gardens during the seventeenth and eighteenth centuries can be read as “*systems for mapping social ambitions on nature.*” (1990, p.668). She suggests that the central motif of the English landscape garden was meant to mirror God’s creation, the earth. Gardens were therefore designed to be observed and admired: “*The English garden was a place of study and contemplation of a nature that was other, and perfect in its otherness. It was something beyond human control, and yet under control because people had come to understand and work within its autonomous movements.*” (1990, p.670). Through such representations the underlying message was of the control exerted over land, as expressed through the portraits of landowners in their gardens where the message was one of the land that was tamed and open to their gaze.

Watters (1988) explores the relationship between Victorian literature and garden design theory suggesting that no singular garden ideal existed rather an eclectic range of garden styles from the picturesque, to old-fashioned gardens. In detailing the aesthetics of Victorian garden theory Watters starts with the idea of the garden as “*a work of art rather than an attempt to copy the ‘natural’ landscape.*” (1988, p.9). In this way, much of Victorian literature articulated a disapproval of the eighteenth-century landscape garden ideal, as did the writings of perhaps the most famous garden designer of the time John Claudius Loudon. For Loudon, the appeal of nature was mistaken, rather “*the hand of man should be visible in gardens*” (Watters, 1988, p.9). And this hand is clearly evident through the appeal of the ‘trim’ garden as illustrated through the writings of Trollope and Disraeli. Trollope’s *Can You Forgive Her?* published in 1864-5 contains the following description of John Grey’s house and garden:

“...perhaps the gardens of Nethercoats constituted its greatest glory. They were spacious and excellently kept up, and had been originally laid out with that knowledge of gardening without which no garden, merely as a garden, can be effective. And such, of necessity, was the garden of Nethercoats. Fine single trees there were none there, nor was it possible that there should have been any such. Nor could there be a clear rippling stream with steep green banks, and broken rocks

lying about its bed. Such beauties are beauties of landscape, and do not of their nature belong to a garden. But the shrubs of Nethercoats were of the rarest kind, and had been long enough in their present places to have reached the period of their beauty." (Watters, 1988, pp.10-11).

This style needs to be contrasted to that of the cottage garden or old-fashioned garden, which flourished within Victorian literature, as expressed through the writings of Thomas Hardy to George Eliot. In *Scenes of Clerical Life*, published in 1858, Eliot describes Mr Jerome's garden along the following lines:

"The garden was one of those old-fashioned paradises which hardly exist any longer except as memories of our childhood: no finical separation between flower and kitchen-garden there; no monotony of enjoyment for one sense to the exclusion of another; but a charming paradisiacal mingling of all that was pleasant to the eye and good for food. The rich flower-border running along every walk, with its endless succession of spring flowers, anemones, auriculas, wall-flowers, sweet-williams, campanulas, snap-dragons, and tiger-lilies, had its taller beauties such as moss and Provence roses, varied with espalier apple-trees; the crimson of the neighbouring strawberry beds; you gathered a moss-rose one moment and a bunch of currants the next; you were in a delicious fluctuation between the scent of jasmine and the juice of gooseberries." (in Watters, 1988, p.50).

Watters (1988) argues that the qualities of such gardens included variety, simplicity, harmony, unforced abundance, but also that they mirrored those qualities which Victorians associated with pre-industrial England:

"Of all the old rural scenes the arts had to offer, that of the old-fashioned cottage garden afforded the most coherent, complete, and readily apprehensible symbolic version of the world it at once recalled, ratified, and rendered in miniature. It was also the most bounded and idyllic of these scenes, an image that bracketed off the complicating and discordant realities of agrarian capitalism and rural labour, with a potential for disguising material poverty as natural wealth." (1988, p.51).

From these accounts of contrasting styles we gather a sense of the garden as an empty vessel with which meaning is contained, a meaning which is inextricably linked to notions of society and our vision of ourselves, and our role in that society. This meaning thereby resists definition, is open to change, and borrows from previous eras continually.

The shift to American gardens of the twentieth century is considerable, but in making it we find similar preoccupations, although a democratization of the games being played appears to have taken place, for no longer are we solely concerned with the lives of elite groups. Virginia Scott Jenkins in her study entitled *The Lawn: A History of an American Obsession* (1994) asks the telling question: what do front lawns reveal about American culture? In answering this question she turns to representational forms such as lawn-care advertisements which promoted the ideal of upward mobility through their persuasive and carefully placed images. She suggests that two types of advertisements in early years of 20th century can be spotlighted. The first were straightforward and unsophisticated and simply stated what was available to the gardener; but the second were designed to create markets: "by convincing readers that they should do something new or in a different way." (1994, p.67). Scott Jenkins (1994) explains how lawns at this

time were still perceived as the province of the well-to-do and that therefore advertising appeals used English lawns as a standard of perfection. In this way, she charts the increasing emphasis placed upon public display in such a mobile society where "residents were judged on first impressions from the street." (1994, p.79). Gardens, but more specifically lawns, were marketed as important means by which the character and economic standing of their owners might be displayed. Garden design and advice was thereby democratized, and through magazines Scott Jenkins suggests that "Homeowners were taught that the house should be viewed from the road as a work of art." (1994, p.79). Crucial to this vision was the emphasis placed upon the image of the lawn as a veritable carpet. In this way, "Postwar lawns were marketed to the most white middle class as luxury items that reflected status." (1994, p.81). Embedded in this view of the front garden was the notion of nature as something to be controlled, not simply tamed, but something to be managed and transformed. Echoes of Mukerji's approach thus abound, but Scott Jenkins is able to show how this produced a whole horticultural industry of lawn-care products. As she explains "The standard held up for lawns that requires the grass to be of a single color, texture, and size was unrealistic even for the most devoted gardener; however, it enabled manufacturers to sell more weapons to homeowners in their battle against nature." (1994, p.158).

Scott Jenkins (1994) ends her account with the demise of the lawn aesthetic and the emergence of new trends, aspirations in the face of cultural change. One such being the search for cultural security, as she continues: "Privacy is becoming the new status symbol in a society that is increasingly crowded. As homeowners perceive a breakdown in the social order and must live closer to their neighbors, they are turning inward." (1994, p.187). This comment mirrors the view of Popcorn in her suggestion that gardens have become the buffer zone between 'our cocoons and the real world' (in Rice, 1995). She continues by distancing this search from the everyday practice of gardening itself: "This new wave of flower power seems rooted in a need to escape from a frenzied world rather than a desire to get dirt under the fingernails." (Rice, 1995, p19). Our own approach focuses upon another means of representing the garden, that of the design-inspired, photo-feature, coffee-table lifestyle gardening book.

RECONFIGURING URBAN EXTERIOR SPACES

In the commodified world of consumer culture, marketing books about gardening have become big business. It is no longer sufficient for such books to merely inform about horticultural issues, instead each must have its own USP, its unique take on lifestyle. For *the plant room* (2001), subtitled *a contemporary guide to urban gardening*, the proposition engages readers through a discussion of the changing meaning of gardens and gardening in the context of contemporary lifestyles. The book describes itself as 'mould-breaking' and heralding a 'new age of gardening'. Gardening by this account becomes 'garden-making'; the themed decoration of 'outer space'; the domestication of light, air, flora and space; the commodification of space as an essential component of a new form of identity kit: in other words, an escape from existential angst and alienation, an ontological practice for modern life. From this perspective the book can be read as a manual for time-strapped, design conscious consumers who are presented with quick (already) fixed solutions to some of the problems of contemporary living.

In *the plant room* (2001) representations of gardens are situated against the backdrop of contemporary urban living. The reader is presented with a playful stylistic mixing of codes such as dramatically juxtaposed notions of spatiality and de-centred subjects experimenting with fashion and the stylization of their lives,

in this case through shaping garden space. Images speak simultaneously of intimate and immense geometries making sense of each other; of centre and hierarchy giving way to periphery and horizontality; of the co-existence of agoraphobia and claustrophobia, of shelter and security and vulnerability and uncertainty; of cosy intimate metropolitan corners, secluded peaceful havens overlooking the River Thames (London), Sydney harbor, or Central Park (New York), located amidst the immense voids that punctuate skylines of imposing towers. In this way the garden is positioned as malleable imaginative space (Bachelard, 1994), as territory that is symbolic of the power and promise of modernity and its urge to shape, lift and separate. Rather than viewing the garden as a space that is 'other' to contemporary living, i.e. through a nostalgic return to some long-forgotten past (Hewer, 2003), in *the plant room* the reference point is to conceive of the garden as a mirror held to the rhythms of urban living: "In the cosmopolitan setting of a modern international city such as New York, London or Sydney there is an exciting shift taking place within the gardening world." (2001, p.7). The book employs a touristic quality of representing to the reader 'ideal' garden geometries exploring "contemporary city gardens from around the world, showing the wide range of garden designs that are at the forefront of this new look, and the issues that confront the modern gardener." (2001: 15). In this framing the targeted reader/viewer/consumer is that of the sophisticated aspirational metro-dweller. The book reads like a manifesto, or as the author prefers, 'guide' for the reconfiguring of garden space as outdoor interior. The spatial designs it offers not only anticipate forms of sociality, they transpose the idea of garden space into what Auge understands as a 'proper place', as a "principle of meaning for the people who live in it, and also a principle of intelligibility for the person who observes it" (1995, p.52). Auge asserts that as 'systems of possibilities' places have at least three characteristics in common: as sites of identity construction, of relations and of history. *The Plant Room* also anticipates the work of de Certeau (1984) when it portrays garden space as the place 'in whose terms elements are distributed in relations of coexistence', so that the patterns and rhythms of modern urban living are given expression in what is termed a 'versatile' space to be shaped and designed to 'suit your needs'. The garden is understood as an extension to our living space, an alfresco area for dining and recreation, an outdoor 'room' that flows seamlessly from your house's architecture and style. Not only is it "somewhere to relax, entertain, cook, eat, play and work." (2001, p.7), but somewhere to complement the classic interior of your home with an Italianate garden room featuring chalk white urns, striped fabrics and roman busts: a place for playing with geometries of space, for giving physical shape to the values that organize your life and for making one's lifestyle meaningful.

By this account, the text seeks to cast aside traditional conceptions of the garden as a "place to primarily grow plants" (2001, p.8) or to "imitate or recreate nature" (2001, p.9), to sex-up gardening for a younger generation through his tale of gardening as 'outdoor living'. In this way, we are told that the garden is "a place in which to spend leisure time" (2001, p.9), a space to reflect your personality and taste, an outdoor room in which to enact one's creativity and imagination, to show, find or reveal your selves to yourself. The central metaphor of garden space as a room is interesting in this respect as it heralds, not only the collapse of boundaries between the concepts of outdoor and indoor, but a reconfiguring of garden space whereby the ethos of design becomes paramount: "Some gardens are so closely designed and linked to the interior that the transition between the two has become seamless and the garden has become a real 'indoor-outdoor' room." (2001, p.11).

In a chapter entitled 'the versatile garden' the account of this space as produced through a deliberate and planned set of geom-

etries of design and decoration is outlined. Central to these is the idea of optimizing available space and its use by incorporating a 'large space for general outdoor living'. Within this space, Swift seeks to argue that it is the uses of such a space, the forms of sociality that it engenders that are paramount, rather than the traditional focus upon planting: "If you entertain outside on a regular basis, design a garden where people come first as the plants and features are easier to adapt to a layout than the other way round" (2001, pp.19-20). In this way, we can suggest that what the book outlines are the components of garden-making which are akin to a recipe for modern living, a recipe which has at its centre gardens as dwelling places: "It follows that with small garden you should try to keep a consistent paving level throughout. This will help keep the majority of the space usable...Dividing the garden into two main areas to create spaces for the children to play and the older folk to relax in can work really well." (2001, p.20). Such recipes include such items as the design of the layout, choices over the use of materials and surfaces, but also safety, especially in terms of child-friendliness:

"Safety is an important issue, especially where children are concerned. If the garden is a place to relax and unwind in, it has to also be a safe place where you don't have to be watching the children every minute of the day, and where you can be confident that the kids can't seriously injure themselves. Children are naturally inquisitive and will inevitably test a garden's safety to the max." (2001, p.24).

The importance of foregrounding children is interesting as it demonstrates a number of tensions within this aesthetic of modernism. First, the tension between the notions of the city as vibrant and energetic, with that of the city as a place of danger: "Unfortunately, the city has become a more dangerous place for children and the garden has become the principal place for them to play." (2001, p.12).

The second tension is that between having children in the garden and the effect of this inclusion on the design aesthetic, as we are told that "A child-friendly garden doesn't have to ruin the aesthetics of the design". To illustrate the point we are shown a garden with blue decking surrounding a square sandpit which is full of children's toys.

HORTIPORN: GARDENS AS HETEROTOPIC SPACES

As yet, we have attended to the design aesthetics which are central to *the plant room*. However the book also has fine art and design aesthetic which is equally conveyed through glamorous images of 'rooms' with decking, sparkling lights, glistening water pools, funky tables and chairs for conversation and relaxation and sociality, with verdant hyperreal plants acting as the backdrop to these scenes of contemporary living. All the images have one striking compositional feature in common-the absence of people, of actors. The reader is presented with scenes of outdoor living, whereby the gardens become stages for the drama of social communion, but without any actors being evident, emphasizing to us the agency of the images. One such image (2001, p.25) conveys a typical scene of outdoor living with the trademark large open space devoted to the rituals of everyday life, the text for the image reads as such:

"The cool colours and simple unfussy planting create a relaxing space for outdoor living. All the planting areas are mulched with cockleshells over a landscape fabric to minimize maintenance for the busy owners." (2001, p.24).

The images thus read as lifestyle enactments to provide solutions for the 'busy owners'. The absence of people as actors is interesting, as one might suggest that this facilitates the process of objectification by which viewers insert themselves within the network of traces, objects and imprints that define the images. The viewer is thus given furniture such as recliners and chairs to occupy, so that the garden space becomes a site of choice and critical moments of becoming, a room not for gardening as soil and toil, but a space for the shaping of power, desire and time as leisure-filled. The photographic image becomes a site of representational practice, a site of signifying activity; where photographs can themselves be seen as social agents doing the work of larger cultural forces, where images are required to be that which they are used to signify. In this sense signification can be seen as a constitutive feature of the context of the communication that is taking place around the discursive subject of gardens and gardening.

We refer to the images as 'hortiporn', after Smart's (1994) notion of 'gastroporn, where photography inscribes a 'look' into a subject position that demands submission, activated by mechanisms of fantasy and desire, fetishising goods such as food (Brownlie, Hewer and Horne, 2005; Hewer and Brownlie, 2005a), or in this case gardens, through, as Schroeder and McDonagh (2005, p.5) note, "eroticizing and reifying consumer products". That is to say, as hortiporn, the premeditated images in *the plant room* not only anticipate forms of arousal, they provide simulations of pleasure by means of employing pornography's photographic codes of representation. The pleasure is then derived from the act of gazing, whereby the images themselves act as substitutes for 'real' gardening. Paraphrasing Bywater (2001) we might suggest that hortiporn is to gardening, as gastroporn is to food, and what sexoporn is to sex: "Both are double-edged; they first create a simulacrum of a desire, then a simulacrum of satisfaction." (2001, p.1). For *the plant room* we might suggest that the images function in a number of similar ways. First, they convey images of gardens as desired lifestyles. Second, as forms of hortiporn the images function as *spectacles*, or as Debord suggests: "In societies where modern conditions of production prevail, all of life presents itself as an immense accumulation of *spectacles*. Everything that was directly lived has moved away into a representation." (1977, p.95)

For Debord the power of the image is conceived as a monopoly of appearance implying 'passive acceptance'. In *the plant room* the power and potency of the images appear to negate the view of gardening as a form of everyday practice. Instead garden making has become like tourism, a scopic regime, a spectator activity with its own prefigured rules or positions for the viewer (Crouch and Lubben, 2003). The space for any notion of gardening as a performance or practice (De Certeau, 1984) is thus delimited. Instead, the garden is read as a space for desire and consumption:

"As the sun sets, what you have created as your outdoor spaces takes on a completely different look. The ability to extend the hours of the day into the garden can constitute the perfect antidote to stressful city living while reflecting urban culture and all that comes with it." (2001, p.135)

As with a theatrical stage, Swift outlines how different lighting techniques, from spotlighting, to uplighting, to grazing, silhouetting, shadowing and downlighting can be employed to create a 'magical place'. The images of gardens as outdoor rooms can be read as simulated heterotopias. Foucault in the article 'Of Other Spaces' likens the garden space to a heterotopia, "...a space that is other, another real space, as perfect, as meticulous, as well arranged as ours is messy, ill constructed, and jumbled." (1986a, p.27). As other spaces we argue that the images function as representations of

spectacular artifice, as immaculate conceptions freed of labour and effort, conjured up by the magical hand of consumer culture. They thus function as heterotopic spaces, designed to shelter consumers from the anxiety and vicissitudes of everyday reality (Robins, 1996), but also to reenchant this sphere of everyday life (see Hewer and Brownlie, 2005b).

THE CHOOSING (CONSTRAINED) SELF AND THE WILL TO DESIGN

Within the book the gardener is positioned as above all a consumer, little space is provided for gardening as production, instead consumer choice is foregrounded, whether this be in the form of choices over plants, colours, water features etc. But the logic which unites this aesthetic is one of the will to design. Design has thus become the holy grail of gardening, offering a vocabulary for garden making for the anxious city dweller, as the book promises:

"It takes careful planning to foster plants which will look good in the urban setting. Joe Swift show you how to do this and to choose from the wide range of garden furniture and accessories available to complete the look...in each chapter, Joe looks at layout, planning, colour, landscaping, materials, lighting, irrigation, maintenance, furniture and accessories." (2001, Inside Cover).

From a Foucauldian perspective we might argue that consumer choice or freedom appears to deliver forms of power, the "inculcation of a self managing and choosing self" (Slater, 1997, p.61). Consumer culture is thus said to represent a form of governmentality, a preoccupation with the 'conduct of conduct', whereby the modern consumer conforms to the "norm of the autonomous, responsible subject, obliged to make its life meaningful through acts of choice" (Rose cited by Slater, 1997, p.61). A sphere in which liberation and freedom reveal themselves as ultimately constraining.

However, before the reader becomes too burdened in the face of such freedom, the text is quick to reassure, to offer a solution: "If you are confident about designing your space yourself then that's fine, but if you have a tricky site or find the building aspect complicated then you could consider employing a garden designer. Why not?" (2001, p.15). Such design consultants are thus suggested as providing solutions, able to wave their magical wands for inspiration, aesthetic stimulation and above all to deliver a space that 'functions well'.

However, the image of the panopticon is readily apparent within *the plant room*. The concept of the Loft or roof garden, is thus able to be represented as a form of freedom, an 'oasis in the city', a space where the vista of the city is opened up to the gaze of the loft dweller (see images on pages 54-55 and 59, 2001). As Swift advises:

"The roof garden can be a truly unique and exhilarating space from which the vibrancy of urban life can be viewed, taken part in—or escaped from...However small, the outdoor space can give a property an all-important feeling of freedom—creating an oasis in the city." (2001, p.43).

What appears paramount is the sense of freedom obtained from such an elevated position.

However, other images (see p.50 and 58, 2001) paint a very contrasting picture, here the garden is open to the gaze of the city, a site "to watch over others" (Foucault, 1986b, p.246), but also a space in which to be prone to the gaze of others. For Foucault,

“space is fundamental for the exercise of power” (1986b, p.252). From this perspective, devices such as plants, parasols and trellising are employed to screen the consumer from this objectifying gaze: “...if privacy from overlooking apartments is an issue, consider erecting strong visual boundaries.” (2001, p.45).

In these images the strategic uses of parasols and plants are important in that they function to shelter the consumer from the power of this gaze appears telling. However, dilemmas and guidance over their selection bring us back to the exercise of power as a form of surveillance.

CONCLUSION

In this exploratory paper we read-off aspects of contemporary gardening culture from the subject text, thinking of its images as windows through which to glimpse processes of culture-making at work. Moreover, we argue that those images do not simply reflect culture and that we need to understand those images as instances of culture in the making. Offering more than simply lifestyle recipes, in our view the subject text serves to represent, or position the shaping of space in terms of several discourses located in the magical realm of gardens and gardening, where acts of mundane consumption take on an extraordinary form and are represented as such by various technologies of enchantment. In doing so, we have sought to provide an analysis of representations of the contested space which is the garden, and the ways through which this space is represented to consumers as a locale in which issues of choice, design and surveillance are brought to bear.

SPECIAL SESSION SUMMARY

When Brands Join Hands: Examining the Reciprocal Effects of Brand Alliance Strategies on Partner Brand Equity

Vanitha Swaminathan, University of Pittsburgh

SESSION OVERVIEW

Consumer behavior researchers have long been interested in understanding factors that influence consumers' evaluations of brands and brand equity. Previous research has demonstrated that strategic actions such as brand extensions and co-branding influence consumers' perceptions of the parent brands. Such 'reciprocal effects' are often critical to enhancing or diluting brand equity. Brand alliances or co-branded strategies, where two brand names are jointly presented to the consumer are increasingly common. Co-branding can result in enhanced brand recognition, increased product differentiation and greater market share for the focal product. A successful co-branded product therefore, can improve perceptions of the partner brands and enhance their brand equity. However, negative information surrounding the co-branded product is also likely to backfire and dilute the brand equity of the partner brands. Aside from the early work on co-branded strategies (Park, Youl Jun and Shocker 1996, Simonin and Ruth 1998), there is little systematic examination of how consumers react to such co-branded strategies and how consumers use information regarding such co-branded products to modify their perceptions of the parent brands. The objective of this session is to examine the positive and negative reciprocal effects of brand alliance strategies. We present multiple theoretical perspectives on the phenomenon of co-branded strategies and their reciprocal effects on the parent brands. The proposed session builds on the early work by Park et al. (1996) and more recent research that has examined ingredient branded strategies (Desai and Keller 2003). Specifically, the papers in this session demonstrate that there are unexpected benefits and risks of brand alliance strategies that can impact brand equity of the partner brands. The first paper by Piyush Kumar demonstrates how a brand can mitigate the risk of brand counter-extensions by using a co-branded brand extension strategy. The second paper by Geylani, Hofstede and Inman how co-branded strategies may improve the expected values of the attributes of the partner brands, but also increase the uncertainty associated with the partner brands. The third paper by Swaminathan demonstrates how spillover effects may vary as a function of type of concept combination and attribute fit.

"The Reciprocal Effect of Co-Branding: A Counter-Extensions Perspective"

Piyush Kumar, University of Georgia

Brand extension activity between product categories is becoming increasingly bi-directional. As a result, a brand that successfully extends from its parent category into a new extension category often faces a *counter-extension* by a brand from the extension category back into its own parent category. However, while we increasingly see counter-extensions in many product-markets, there is little guidance available regarding how brand extension strategies need to be adjusted in order to mitigate the risk to the parent brand from counter-extensions. It is important to manage this risk to ensure that the gains to the brand from its own extension are not nullified by the losses it might suffer to future counter-extensions into its own parent category.

In this paper, we investigate whether co-branding an extension with a partner brand instead of launching it solo-branded has an

effect on customers' response towards a counter-extension into a brand's parent category. Drawing upon categorization theory, we argue that a successful launch of a solo-branded extension improves customer perceptions of the similarity between the parent and extension product categories. The improvement in similarity enhances perceptions of inter-category fit and, as a consequence, improves customer evaluation of a counter-extension. We further posit that, because a co-branded extension merely inherits select attributes from each partner brand, it leaves the perceptions of similarity between a parent category and the extension category relatively unchanged. Therefore, we hypothesize that a counter-extension will be evaluated less favorably if the previous extension by the focal brand was co-branded with a partner brand than if it was solo-branded.

We use a series of experimental investigations to examine the differential impact of co-branded versus solo-branded extensions on customer evaluation of brand counter-extensions. In each experiment we describe a scenario regarding the past extension activity of the focal brand and a set of unrelated brands. We then measure the subjects' response towards a future counter-extension. The results from the first study show that a counter-extension is evaluated more favorably if the previous extension by the focal brand was solo-branded than if it was co-branded. The evaluation of the counter-extension is especially weaker if the focal brand that launched the previous co-branded extension was a modifier brand than when it was the header brand. The results of the second study show that the differential impact of solo-versus co-branded extensions on the evaluation of the counter-extension persists even when we don't use real brand names in the construction of the stimuli. In both cases, we find that changes in perceptions of inter-category similarity mediate the impact of solo-branded versus co-branded extensions on the evaluation of a counter-extension.

The results of a third study suggest that co-branding results in a lower evaluation of a counter-extension relative to a successful solo-branded extension but not relative to a failed solo-branded extension. They show that a failed solo-branded extension does improve customer evaluation of a counter-extension because it is less likely to change perceptions of similarity between the parent and extension categories. Finally, a fourth study shows that a positioning and communication strategy that explicitly partitions the key attributes of a co-branded extension and relates them to the respective partner brands lowers the evaluation of a counter-extension. Further, under an attribute partitioning-based positioning strategy, the evaluation of the counter-extension does not depend on whether the focal brand serves as the header or the modifier brand in the previous co-branded extension.

Taken together, the results from the four studies show that customers evaluate a counter-extension *less favorably* if the preceding extension by the focal brand is co-branded than if it is solo-branded. The studies also show that the discrepancy between the evaluations of counter-extensions following the two alternative branding strategies results from the differences in the levels of post-extension perceptual similarity between a brand's parent and extension categories. Specifically, a successful solo-branded extension results in a greater improvement in the perceptions of inter-category similarity than does a co-branded extension. A brand in the exten-

sion category benefits from the relatively greater increase in the psychological proximity between the two categories following a solo-branded extension because its counter-extension is evaluated more favorably than what it would be if the previous extension was co-branded.

Overall, the paper provides a novel perspective on the defensive role of co-branding and suggests that launching an extension in partnership with a complementary brand may not only improve the attribute profile of a brand's own extension, it may also help protect the brand against counter-extensions. It also shows that the partner brands that launch a co-branded extension can further protect themselves against counter-extensions by using a positioning and communication strategy that explicitly outlines their respective contributions to the co-branded product. The findings suggest that the strategic choice between solo-branding versus co-branding an extension may influence the evaluation of not only a brand's own extension, but also of counter-extensions into its parent category. It provides some new directions regarding the criteria used to select partner brands as well as the configuration of a co-branded extension.

“Image Reinforcement or Impairment: The Effects of Co-Branding on Attribute Uncertainty”

Tansev Geylani, University of Pittsburgh

Frenkel ter Hofstede, University of Texas at Austin

Jeff Inman, University of Pittsburgh

Co-branding is a brand alliance strategy in which two or more brands are simultaneously presented to consumers. There is a wide range of brand alliance activities in the marketplace, ranging from advertising several brands in a single ad (e.g., Shell and Ferrari ads featuring both brands simultaneously, or ads showing the complementary consumption of McDonald's Fries and Coca-Cola) to jointly branded products (e.g., Lexus Coach Edition or Kellogg's Healthy Choice Cereal). In recent years, co-branding has become a strategic tool for many companies to attain higher market shares. There are a variety of reasons driving the surge in co-branding ranging from the desire to gain access to new markets to the attempt to signal unobservable quality. A key motivation for co-branding is image reinforcement, and this is the aspect on which we focus in this research. Previous research has also examined the effects of co-branding on brands' images. These studies investigated attribute or affect transferal that occurs as a result of co-branding. In our paper, we not only analyze attribute transferal but also how co-branding affects attribute uncertainty of the partner brands and that of the co-branded product.

This study addresses a number of issues important for managers considering co-branding as an image reinforcement strategy. More specifically, we study when a brand's image is reinforced or impaired as a result of co-branding, and which partner is right for a firm that considers co-branding for image reinforcement. We address these issues by investigating the effects of co-branding on attribute uncertainty of partner brands, when these brands are complementary in terms of their attribute performances and salencies. We conceptualize a specific attribute belief as a two-dimensional construct with location reflecting the average performance of the attribute and reliability reflecting the degree of certainty consumers have about the performance of the brand on the attribute. We argue that these parameters are updated after consumers are exposed to the co-branding activity. We incorporate theories of consumer behavior in a mathematical formulation for updating the location and degree of certainty in a multi-attribute co-branding model. Our model formalizes the formation of co-branded product beliefs using the notion that the greater the saliency of an associa-

tion, the greater its accessibility from memory. In our formulation, the updating of brand beliefs as a result of a co-branding activity relies on the occurrence of subtypes. Several propositions follow from our model, which we test in an experiment.

Our model predicts that partner brands attract each other through an alliance. That is, the difference between the locations of the brands decreases through an alliance. This was supported by the experiment which showed significant attraction of brands through co-branding. However, an important implication of our study is that it is not necessarily in a brand's interest to choose the best performing partner on the attribute of interest. Rather, it is optimal to collaborate with a brand that is perceived to be of only moderately higher performance. We find that inconsistent images of the partner brands may result in confusion about the co-branded product and cause high uncertainty about the joint venture. Moreover, when the brands are far apart, our analysis and experiment show that the co-branded product is regarded as an exception, and thus, does not substantially affect the formation of posterior partner beliefs. Considering that partner brands attract each other through an alliance, it is best to collaborate with a brand that is perceived to have a moderately higher performance. With a partner performing moderately higher, expected attribute belief of the brand will be enhanced with a less likelihood of subtyping and without an increase in uncertainty about this attribute.

Another important result of our study is that co-branding for image reinforcement may not be a viable strategy for reliable brands (brands for which consumers have low degree of uncertainty about their performance). This is because both our theory and experiment show that uncertainty associated with the reliable brand increases through co-branding. According to our results, although, location of a reliable brand improves when it co-brands with a better performing brand, no matter what partner the reliable brand chooses, its reliability always decreases (uncertainty associated with it increases). Thus, managers of reliable brands should carefully consider the trade-off between this risk of image impairment and advantages of collaboration.

Finally, according to our results, total location (total expected performance) of the partner brands improve as a result of co-branding suggesting brands reinforce their images. This is due to the pull of the highly performing brand. However, under certain conditions, uncertainty associated with the brands increases through co-branding. This is due to uncertainty transfer between the brands and to possible consumer confusion that can arise from a co-branded product that is inconsistent with the partner brand's prior image.

“Spillover Effects of Co-Branded Strategies: The Role of Attribute Fit and Type of Concept Combination”

Vanitha Swaminathan, University of Pittsburgh

This research focuses on spillover effects of co-branded strategies or the extent to which information regarding the co-branded product modifies perceptions of the constituent brand names. Specifically, this research examines the differential impact of attribute fit on spillover effects based on the type of concept combination. Previous research by Park et al. (1996) suggests that attribute-level complementarity will enhance the perception of the co-branded product leading to greater spillover effects when attribute complementarity is high and lower spillover effects when attribute complementarity is low. Indeed, Park et al. find evidence that attribute complementarity moderates the extent of spillover effects. We suggest that the impact of attribute-level fit between co-branded partners on parent brand attitudes is moderated by the type of concept combination.

Recent research on concept combinations has shown that people process noun-noun combinations in two different ways (property-based interpretation or relational interpretation). Property interpretations involved one of more properties of the modifier concept being applied to the head concept. Relational interpretations involve focusing on relationships among objects where each of the entities may play different functional roles. The type of concept combination (property-based or relational) may have an impact on the manner by which concepts are combined. For instance, in the case of Godiva cakemix by Slimfast, when property interpretations take place, consumers may map onto Godiva chocolate the properties of Slimfast (e.g., low calorie) and the tendency may be to think of this combination as a type of Godiva chocolate but with some health benefits.

In contrast, when thematic relationships are the focus, a combination of Godiva and Slimfast may evoke the possible ways in which these two may be consumed together, e.g., perhaps by people who are on a diet. These differences in concept combination may result in differential spillover effects on the constituent brand names.

In order to investigate the potential role of property-based and relational concept combinations on co-brand spillover effects, we prime a subject to process either relationally or in a property-based fashion first using the procedure suggested by Wisniewski and Love (1990). Following the administering of this prime, we examine reactions to co-branded partnerships that have either high or low levels of attribute complementarity. We expect that a high level of attribute complementarity will only matter when property priming takes place. A high level of attribute complementarity will not matter when relational priming takes place. Further, we suggest that this differential impact of attribute complementarity in the relational versus property conceptual combination will hold only under high levels of motivation. In addition, we suggest that the impact of attribute fit on co-brand spillover effects will vary across cultures, with East Asians exhibiting a thinking style that utilizes relational concept combinations and Westerners exhibiting a thinking style that utilizes property-based interpretations.

We test these ideas in a series of three studies. The first study examines the impact of relational versus property-based concept combinations by priming these conditions. The second study examines whether the level of motivation interacts with thinking style to impact co-brand evaluations and subsequently influences the host brand equity. The third study examines whether differences in dominant thinking style across cultures and the impact of such differences on spillover effects of co-branded strategies. Results of this research demonstrate that the impact of attribute fit varies based on the type of concept combination and level of motivation. In other words, a highly complementary combination such as Godiva cakemix by Slimfast resulted in significantly higher spillover effects than a less complementary combination such as Godiva cakemix by Haagen Dazs only when property-based interpretations took place. In the case of relational combinations, both types of co-branded products resulted in similar spillover effects. Further, these differences were only seen in the case of high motivation. Implications of these results for research on spillover effects are discussed.

Why Consumers Buy Lottery Tickets When the Sun Goes Down on Them. The Depleting Nature of Weather-Induced Bad Moods

Sabrina Bruyneel, Katholieke Universiteit Leuven
Siegfried Dewitte, Katholieke Universiteit Leuven
Philip Hans Franses, Erasmus University Rotterdam
Marnik G. Dekimpe, Tilburg University/Katholieke Universiteit Leuven

EXTENDED ABSTRACT

Lottery play is a phenomenon of all times that occurs around the world (Garrett 2001). In the present paper we investigate whether lottery play is linked to the amount of sunshine that consumers are exposed to. Earlier, it has been argued that certain consumer behaviors reflect adaptations to variations in the duration and intensity of sunlight (Parker and Tavassoli 2000). We conducted a longitudinal study in which we analyzed over eight years of semiweekly Belgian lottery-expenditure data. A seasonal time-series model showed that as the number of hours of sunshine decreased, the level of engagement in lottery play increased, even after controlling for other relevant drivers such as people's inertia, time-varying characteristics of the game, and deterministic seasonal components.

In subsequent laboratory studies, we investigated *why* this link between a reduction in sunlight and an increased engagement in lottery play takes place. We propose that a reduced exposure to sunshine leads to negative mood, which in turn leads to an increased engagement in lottery play. In a second study, we provide correlational evidence for the link between bad mood and lottery play. In addition, we test in a sequence of studies (2, 3, and 4) two alternative hypotheses as to why the link between bad mood and lottery play occurs. A first hypothesis (i.e., the mood repair hypothesis) states that negative moods prime a mood repair goal (Tice, Bratslavsky, and Baumeister 2001), which may be realized through lottery play (Pezza Leith and Baumeister 1996). In this model, lottery play serves as a means to repair one's bad mood. It predicts that lottery play will be related to people's mood *at the moment* they are given the opportunity to buy lottery tickets. A second hypothesis (i.e., the depletion hypothesis) builds on the theory of self-control depletion (Baumeister, Bratslavsky, Muraven, and Tice 1998; Muraven, Tice, and Baumeister 1998), which states that all acts of self-control draw on a common limited resource that is akin to energy or strength. Hence, exertion of self-control is followed by a period of diminished capacity to exert self-control (i.e., self-control depletion). One factor that weakens self-control is active mood regulation (Baumeister and Heatherton 1996; Vohs and Baumeister 2000). Attempts to regulate emotions deplete the same limited resource that is needed to resist temptations as lottery (Vohs and Baumeister 2000). In this model, lottery play reflects a reduced resistance to temptation after engagement in active mood regulation attempts. It predicts that lottery play will be related to people's mood some time *before* they are given the opportunity to buy lottery tickets. Indeed, people need a time lag of several minutes to engage in active mood regulation attempts (e.g., Baumeister et al. 1998).

Study 2 was a laboratory study that was correlational in nature. Participants filled out a PANAS (Watson, Clark, and Tellegen 1988), engaged in a creativity task during which they were given the opportunity to regulate their mood, and filled out another PANAS. Subsequently, they were given the opportunity to buy lottery tickets. Our dependent variable was each participant's amount of lottery expenditures. We found that the worse participants felt upon entering the laboratory, the higher their lottery expenditures were later. This provided support for the hypothesis that lottery play is related to negative mood. In addition, as lottery

expenditures were related to the extent to which people felt bad some time *before* they were given the opportunity to buy tickets, this finding was consistent with the depletion explanation. The depletion hypothesis was further supported by the finding that negative mood had decreased during the creativity task. In addition, we found that the bigger the reduction in negative mood was, the higher lottery expenditures were.

Study 3 aimed at experimentally manipulating mood and finding further evidence for the depletion hypothesis. Participants filled out the PANAS, were assigned to a bad or a good mood condition (i.e., by reading a description of a character walking around in cloudy or sunny weather conditions, respectively; Tice, Bratslavsky, and Baumeister 2001), filled out the PANAS again, were assigned to a depleting or a non-depleting condition (i.e., by engaging in a Stroop color-naming task in which colors and color names were mismatched or matched, respectively; Wallace and Baumeister 2002), and were given the opportunity to buy lottery tickets. The mood manipulation was crossed with the depletion manipulation, resulting in four experimental conditions. We found that lottery expenditures were higher for depleted than non-depleted participants, irrespective of their mood states. Although this finding seemed to rule out the mood repair explanation, one could argue that the mood repair explanation was not tested fairly, because of the lag between the mood induction and lottery play in our design. We conducted a follow-up experiment in which we removed the lag. We found that lottery expenditures were as high for participants in a good mood as for participants in a bad mood. Overall, the results of study 3 provided support for the depletion hypothesis for lottery play.

We conducted a fourth study in which we manipulated depletion due to engagement in active mood regulation attempts. A bad mood was induced for all participants in the same way as in study 3. Before and after the mood manipulation, participants were asked to fill out a PANAS. Subsequently, participants engaged in depleting mood regulation attempts or received a non-depleting good mood induction (i.e., by writing down their stream of consciousness or hand-copying a description of tranquility, respectively). Afterwards, participants were given the opportunity to buy lottery tickets. We found that lottery expenditures were significantly higher for participants who engaged in depleting attempts to regulate their bad moods than for participants whose mood was regulated by means of the mood induction procedure.

Overall, our studies showed that lottery play is linked to bad weather and weather-induced bad moods. Depleting mood regulation seems to be the underlying process for this link.

Meddling-in of Affect in Information Integration

Arul Mishra, University of Iowa

Himanshu Mishra, University of Iowa

Dhananjay Nayakankuppam (DJ), University of Iowa

EXTENDED ABSTRACT

Given the growing interest in the role of affect in consumer decision-making, in this article we examine the meddling-in role of stimulus-induced affect in the process of information integration. A large body of work on task-induced affect conceptualizes affect and cognition as two independent modules where the affective module works faster and gives an instant feedback compared to the cognitive module, which is slower and more deliberative. Therefore, the speed of affective reactions to the stimulus influences the decision making by preempting the slower response from the cognitive module.

We suggest that affect should not only influence cognitive processing, it should also have the capacity to meddle with information integration. Specifically, many decisions require the integration of information (given that information may be received at sporadic and infrequent intervals) to form accurate representation. We suggest that if one element of information elicits a strong affective reaction, this affect could then interfere with the information integration process by providing higher weight to the affectively charged element. Therefore, the appropriate stimulus should allow us to examine whether affective experiences cause biases in the information integration process. We discuss a series of studies that utilize different versions of the stimulus, relevant to everyday consumer decision-making, to test the prediction regarding the meddling-in of affect in information integration and how such meddling-in can be detected in altered mental representations. To test our predictions that affect meddles in with the process of information integration we constructed a stimulus wherein the failure to integrate information properly could result in a normatively indefensible choice. The stimulus was a choice set comprised of two alternatives, one being a dominant alternative. Information about each alternative was given on two related dimensions. An integration of both dimensions (since they were related) revealed the dominance relationship, with one alternative being better than the other. However, the stimuli were designed such that information on one dimension created an affective response in favor of the suboptimal option. Thus, the choice of the sub-optimal option allowed us to infer the meddling-in role of affect in information integration. In other words, if the information were integrated, the choice of the dominant option would become patently obvious. The inability to choose the dominant option would reflect problematic information integration.

These findings have important implications for consumer decision-making as many decisions require the consumer to make a choice after comparing and contrasting presented information. The decision could be a choice between banks, cell phone plans, product return options etc. If one of the options produces an affective reaction that hinders proper information integration of all the presented information then this would result in the consumer reaching a biased (probably sub-optimal) decision. In this article, we propose and find evidence that the affect generated from the provided stimulus does meddle-in with the process of information integration leading to the choice of a suboptimal option. The experiments use the setting discussed above of choice between banks, cell phone plans, ATMs and mail-in rebates to demonstrate the relevance of these findings for consumer decision-making.

Across four experiments, we document a tendency on the part of individuals to choose a sub-optimal option due to the meddling-in role of affect in the process of information integration. Experiment 1 uses a cell-phone minutes and penalty structure to show people's preference for the suboptimal option because the presented information gives an illusion of leniency to the suboptimal option, which results in this affect meddling-in with the process of information integration resulting in a non-normative choice. Experiment 2 uses a mail-in rebate scenario to show the robustness of this phenomenon in both the domain of gain as well as that of loss. Experiment 3 uses the misattribution paradigm to show the crucial role of affect. We followed this misattribution paradigm to test whether it is the affective reaction that is hindering information integration. In line with the findings of past research, we show that if participants were told that the background music could affect their subjective liking for an option, the positive affect experienced (due to the illusion of leniency given by the suboptimal option) is misattributed to the background music. Hence, the choice of suboptimal option is reduced when participants misattribute their affective signal to the music. In Experiment 4 we use an affective versus cognitive priming manipulation to show that affect is not merely being used as a cue but actually distorts the mental representations of the choice set, suggesting that the experienced affective reaction meddled, or interfered, with the process of information integration.

In sum, we hypothesize that the experience of an affective reaction meddles with ongoing information processing—by making us 'see what our affect wants us to see'—thereby resulting in systematic distortions of the resultant mental representation. In other words, affective reactions serve to facilitate and inhibit the formation of certain mental representations. Evidence for such interplay between the parallel, loosely interacting systems of affect and cognition, provide a more detailed picture of the apparatus underlying human choice and preference. We suggest that feelings are not just used as information but feelings also interfere with information integration.

Why Feelings Stray: Sources of Affective Misforecasting in Consumer Behavior

Vanessa M. Patrick, University of Georgia
Deborah J. MacInnis, University of Southern California

ABSTRACT

Affective misforecasting (AMF) is defined as the gap between predicted and experienced affect. Based on prior research that examines AMF, the current study uses qualitative and quantitative data to examine the sources of AMF (i.e., why it occurs) in the consumption domain. The authors find evidence supporting some sources of AMF identified in the psychology literature, develop a fuller understanding of others, and, find evidence for novel sources of AMF not previously explored. Importantly, they find considerable differences in the sources of AMF depending on whether feelings are worse than or better than forecast.

INTRODUCTION

Before purchase: *"I can't wait to use this all the time, it is going to be so much fun, I'm going to go out with my buddies and use it all the time. I am so happy."*

After purchase: *"It does not play a significant role in my life now, and I use it only on occasion."*

-Male (21)

Before purchase: *"This is going to be great. I am going to pay so much attention to my new dog. I will walk her everyday. I am so excited."*

After purchase: *"I am upset with myself for not thinking about the future. I was blinded by excitement at the time of purchase. I just am tired of it and don't want to spend time with it anymore."*

-Female (20)

Research in psychology suggests that when people think about their emotional futures, they are often wrong (Gilbert et al 1998; Loewenstein and Schkade 2000). In other words, they will exhibit Affective Misforecasting (hereafter AMF), experiencing a gap between predicted and experienced feelings. This paper is designed to determine whether the sources (or reasons) for AMF identified in the psychology literature is generalizable to consumer contexts. More importantly, we contribute to the AMF literature by determining whether *different* sources of AMF cause feelings to be better than forecasted vs. worse than forecasted. We also identify novel sources of AMF not previously revealed in the extant literature.

AFFECTIVE FORECASTING AND MISFORECASTING

A growing body of research indicates that decision-making is based on individuals' predictions or forecasts about how a given product will make them feel in the future (Bagozzi et al 1998; Mellers and McGraw 2001; Perugini and Bagozzi, 2001; Shiv and Huber 2000). A different body of research in psychology, however, also indicates that these *forecasts are often wrong*—as individuals feel quite differently about an outcome or decision than they predicted they would (e.g., Mellers et al. 1999; Gilbert et al. 1998; Loewenstein and Schkade 2000; Wilson et al. 2000). The fact that choices are based on predictions about how consumption will make the consumer feel, coupled with a tendency for inaccuracy in these forecasts suggests considerable potential for heightened satisfaction when consumers feel better than forecast, or dissatisfaction when they feel worse than forecast. Therefore, understanding the

drivers of AMF has considerable import for consumer behavior, particularly in the area of consumer satisfaction, brand loyalty and positive word-of-mouth.

Figure 1 depicts the process by which affective misforecasting occurs (for greater detail see MacInnis, Patrick and Park 2005). As Figure 1 suggests, affective forecasts are based on a representation of a future event and an assessment of the possible affective reactions to this event. AMF occurs when experienced affect deviates from the forecasted affect on one or more of the following dimensions: valence, intensity and duration.

Since forecasts can be made regarding the valence of the feelings, the specific emotions expected to be experienced, the intensity of feelings or the duration of a projected affective response, consequently affective misforecasting can occur along any of these dimensions. In this research we are particularly concerned with misforecasting along intensity and valence dimensions, such that feelings are either better than forecast (BTF) or worse than forecast (WTF).

SOURCES OF AFFECTIVE MISFORECASTING

A growing literature in psychology has examined the sources of affective misforecasting—or why predictions of future affect are often erroneous. As shown in Figure 2, in some cases, consumers feel different from forecasted because they initially *represented the future erroneously*, failed to consider critical details, were influenced by other influences at the time, or failed to consider other things that might make them happy. In other cases, consumers felt different from expected because they did not adequately or accurately *imagine their affective reaction* to the future outcome. In some cases consumers failed to *adjust their forecasts based on their current emotional state*. In other cases, the actual outcome was as expected, but simply did not produce the *intensity* of emotion imagined. Within these broad categories, several subcategories of AMF sources are identified and described briefly in Figure 2 (see MacInnis, Patrick and Park 2005 for more detailed discussion).

Research Objectives

While interesting, the framework in Figure 2 was based on studies that involved neither consumption nor satisfaction. As such, it is useful to consider (a) whether the sources of AMF identified in Figure 2 generalize to such contexts and (b) whether these contexts evoke novel sources of AMF unique to the consumption domain. Since satisfaction deals with outcomes that are not only different from expected but either better than or worse than expected (i.e., they are valenced judgments) it is also useful to consider (c) whether the sources of AMF differ depending on whether consumers feel better than forecast or worse than forecast. The study described below was designed to assess these three issues.

METHODOLOGY

Design

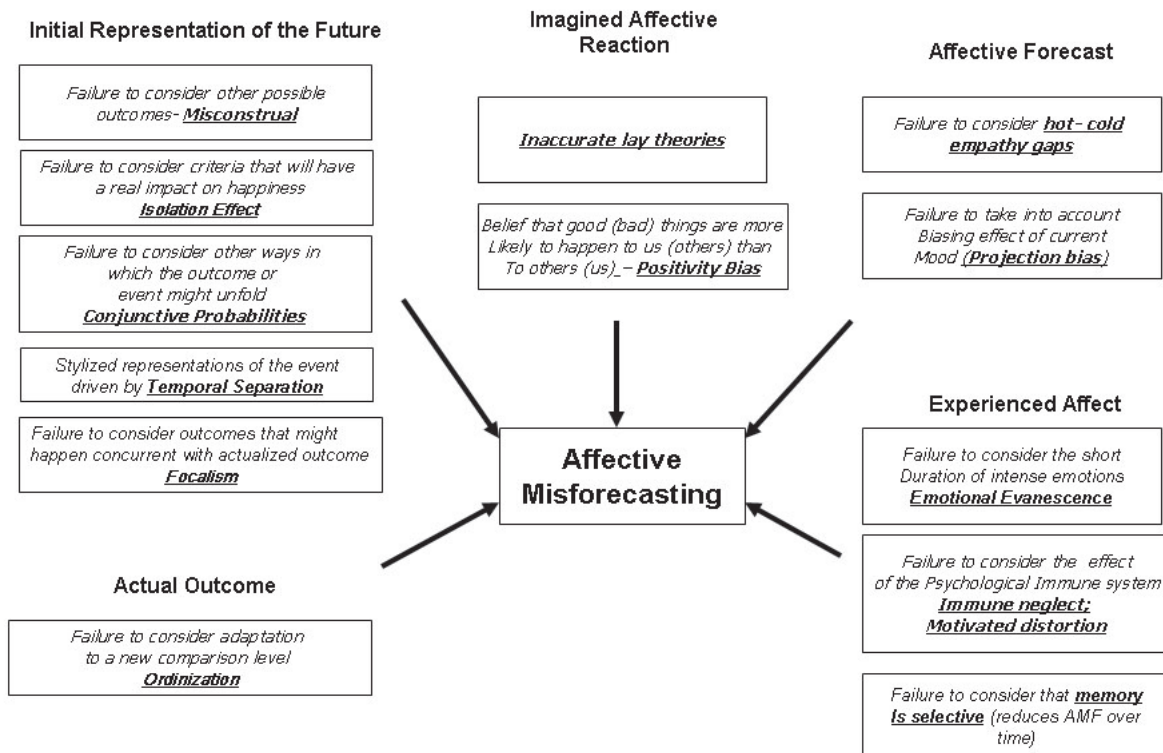

Given the exploratory nature of the study coupled with the notion that satisfaction is a process that evolves over time, we used a critical incident paradigm where (a) consumers could choose the purchase incident and (b) where the time frame in question (i.e., immediately following purchase, a short time or a longer time post-purchase) would vary across respondents. Respondents were divided into three groups: one group reported on a consumption

incident in which they felt better than forecasted (referred to as BTF, henceforth) (N=25); a second reported on a consumption incident in which they felt worse than forecasted (referred to as WTF, henceforth) (N=22); a control group (N=40) was asked to report on a situation in which they felt different from forecasted. The qualitative data from the respondents in this latter group would reveal whether consumption episodes that are better than forecasted are more or less salient in memory than those that are worse than forecasted.

Quantitative Measures

Respondents used a 9-point happiness scale to indicate how happy they felt when thinking about their purchase now (1=not at all, 9=extremely). As expected, happiness with the purchase in the “better than forecast” condition was significantly greater than happiness in the “worse than forecast” condition (8.03 vs. 3.51, $F(1,85)=145.41, p<.05$).

Respondents were also asked to report how frequently an incident like the one they reported occurred on a 7-point scale where 1=not at all often, and 7=very often. They also responded on 1-9 point agreement scales to a set of statements designed to represent some of the most frequently mentioned sources of AMF in past literature; namely, *misconstrual*, *focalism*, the *hot-cold empathy gap*, see Table 2 for items.

Qualitative Measures

A qualitative analysis of the data was then conducted, with responses placed within the categories represented in Figure 2 or placed in novel content categories. Inter-rater agreement among two coders knowledgeable about the categorization scheme provided by MacInnis, Patrick and Park 2004 (as shown in Figure 2) was .98.

RESULTS

Memory Salience

The results reveal that worse than forecasted experiences are more salient in memory than better than forecasted experiences. As evidence, 90% of control subjects (36 of 40) reported experiences that were worse than forecasted. Furthermore, subjects reported that feeling WTF occurred more frequently than feeling BTF ($M=5.47$ vs. $M=4.58, F(1,60)=3.72, p<.05$). The responses of control group subjects were subsequently combined with subjects in the BTF (if they reported a BTF experience) or WTF conditions (if they reported a WTF experience).

Sources of Affective Misforecasting

The results of the qualitative data, as summarized in Table 1 (a) replicate the sources of AMF identified from prior research, (b) identify novel sources of AMF, and (c) show differences in the sources found for BTF vs. WTF experiences. The results that correspond with the table and above noted conclusions are described below.

Sources Linked to the Initial Representation of the Future

Misconstruals. *Misconstrual* occurs when individuals consider one way in which an outcome might turn out and fail to consider others. Failing to take into consideration the temporal location of an event influences how we imagine it (Liberman and Trope 1998), how we appraise or evaluate it (Loewenstein and Elster 1992) how often we think about it (Fingerman and Perlmutter 1995) and how optimistic we are about it (e.g., Shepperd et al. 1996) are all dimensions of *misconstrual*. We found considerable evidence for *misconstrual* both when consumers felt WTF and BTF.

Moreover, we also found evidence of *misconstrual* of things besides outcomes (the focus of past research on AMF). We also found more variation in the types of *misconstruals* consumers used in the WTF compared to the BTF condition. These conclusions are illustrated below.

Consistent with past research on AMF, *misconstrual of outcomes* was observed:

In planning my trip I felt confused, overwhelmed, inexperienced, and unsure about lodging. I am extremely happy about my decision now because what I feared might turn out to be a mistake was actually the best vacation I have ever had. (BTF)

We also found evidence of *misconstrual* of other aspects of consumption not predicted by the expectancy-disconfirmation model, including *misconstrual of usage*:

I still am very happy and satisfied with the product. I still use it about every day, and I love music. (BTF)

Although I really liked the shoes at the time of purchase, I didn't think about how many times I would get to wear them and now it's been so long, I would rather buy a new pair of nice shoes that would make me happy. (WTF)

Interestingly, while these were the only types of *misconstrual* for consumers in the BTF condition, those in the WTF condition showed additional types, including *misconstrual of changes in the marketplace, changes in the economy, the need for the product in one's life, and social disapproval*. The following examples illustrate each type respectively:

Times change and so do trends. I was very excited about the purchase because it was new and “in” at the time. Although only a few months have passed, I already feel like it is out of style. (WTF)

I feel that I should have held off on the purchase because the prices of property came crashing down after an economic shakeout in Asia. If I were to try to sell it now, I would not be able to recover my cost, let alone think of making profit like I did when I made my first purchase. (WTF)

[I thought] This is going to be so fun. I'm going to go out with my buddies and use it all the time. The item does not play a significant role in my life now. (WTF)

Relatedly, some consumers anticipated feeling happy from product purchase because it would bring *social acknowledgement*. They felt worse than forecast at finding this social acknowledgement not forthcoming:

I thought the girls would notice my watch and perceive something good. Instead, I found that college age women don't really appreciate the prestige of an Omega watch. Even though I love the quality, beauty, reliability and workmanship of my Omega, it didn't help my status with women. (WTF)

Others failed to anticipate *post-consumption social comparisons* and their impact on future feelings. As one respondent noted:

After a year I saw all my friends driving nicer cars than mine and I was jealous. (WTF)

TABLE 1
Sources of AMF: Time of Occurrence and Characteristic Features

Time of Error	Nature of Error	Observed in BTF condition*	Observed in WTF condition*
Initial Representation (Painting a picture of the future)	Painting the wrong picture (Miscontrual)	X	X
	Painting the picture wrong (Framing/Isolation effect)	X	X
	Failing to account for the process (Conjunctive Probabilities)		X
	Painting an incomplete picture (Focalism, Focusing illusion)		X
The Forecast	Relying on the wrong theory (Inaccurate lay theories)	X	
	Being in the wrong state (Hot-cold empathy gaps)		X
	Situational influences (Projection Bias)		X
	Everything goes back to normal sometime (Ordinization)		X
The Experience	Seeing it the way I want to (Motivated Distortion)		X
	I made a thorough decision (Felt Security in the Thoughtfulness of Decision) **	X	
	Your liking influences my liking (Social Influence) **	X	
	You make me feel better (External Validation) **	X	
	I just didn't listen to my gut (Failure to heed decision rules) **		X
	I simply listened to my gut (Impulsive thoughtless decision making) **		X
	I want it therefore I need it (Escalation of anticipated consumption utility) **		X

* domain in which the source was observed, either BTF or WTF

** novel sources of AMF observed in the consumption domain

The Isolation Effect. The isolation effect occurs when individuals focus on some criterion in making their decisions but fail to realize that it is actually other criteria that will make them happy. We also found considerable evidence for the isolation effect, in both the BTF and WTF condition. For example, though one respondent in the BTF condition believed that happiness from his new car would be based on how cool it was, he later discovered that happiness was tied to its reliability:

After a month or so, I thought the car was not as cool as some other cars that had come out. But now that I have owned it for

two years with no major problems, I have found that it is a reliable automobile that I can depend on, transport my stuff and go on vacations with. (BTF)

Another respondent in the WTF condition believed that happiness with the apartment he rented would be predicated on the services offered by apartment complex; he failed to consider that happiness would really be a function of distance to campus.

I thought it would be great because of the services it provided and I was really excited about it, but then I realized that it

TABLE 2
Self-Reported Sources of AMF in the Better than Forecast vs. Worse than Forecast Conditions

Source of AMF	Item	BTF Means	WTF Means
<i>Misconstrual</i>	I did not consider how useful the product really was	4.46	4.83
<i>Focalism</i>	I had not taken into account all the other possessions I have when I made this purchase.	4.27	5.28*
<i>Inaccurate Lay Theories</i>	When I imagined how I would feel after the purchase, I did not imagine that I would be feeling this way	5.58	6.94*
	After I purchased and used it I knew I was just wrong about what I thought I would feel.	3.31	5.75*
<i>Hot-Cold Empathy Gaps</i>	Before purchase I was excited and charged up, but reality hit me after I purchased and used it.	4.19	4.19
<i>Projection Bias</i>	I bought the product when I was in a good mood	6.58	7.14
<i>Ordinization</i>	I did not take into consideration that I would get bored or fed-up with the product after a while	4.31	6.28*
<i>Emotional Evanescence</i>	I did not anticipate that the pleasure I would get from the product would fade so quickly.	3.69	6.33*

Means based on 9-point agreements scales (1= strongly disagree; 9= strongly agree)

* Differences significant at the $p < .05$ level

wasn't so great because it was too far from campus and I felt weighed down with having to drive in every day. (WTF)

Interestingly, while past research has identified the isolation effect in terms of using the wrong criteria, in the WTF condition we also found evidence of the isolation effect as a source for AMF due to reliance on others' vs. one's own when making a purchase decision. For example, one respondent noted:

The store made me feel that I really "needed the shirt when, if I thought about it, I really didn't. (WTF)

Conjunctive Probabilities. AMF tied to conjunctive probabilities reflects the fact that we often make a prediction about how happy a future event (e.g., going on vacation) will make us feel without adequately considering the number of discrete events that must occur in between the event's representation and its actualization (e.g., getting airline tickets, finding the right place to stay, having good weather, etc.). However, since any one of these contingent events may not occur as expected, AMF is possible. We found evidence (albeit limited) for this source of AMF but here only in the WTF condition:

The [computer] is still relatively new and I'm sure it will satisfy me in the future more but as of right now, I'm just waiting for it to work out. (WTF)

In this case, predicted happiness from buying a new computer was stymied because several events prior to its working went wrong (e.g. the operating system; installing a CD drive).

Focalism. With focalism AMF is tied to an individual's failure to consider what other outcomes (e.g., whiney and hungry kids; mosquitoes) might occur at the same time as that future event (e.g., a family swim before dinner). Wilson et al (2000) demonstrated that affective forecasts are erroneous when people focus only on the most salient event and fail to take into consideration other factors that might play a role. Similarly, Schkade and Kahneman (1998) illustrate this tendency to focus on the one factor that is salient at the time of judgment or decision-making and to downplay others, a phenomenon they termed the "focusing illusion". Although past research has focused a great deal on focalism, we found evidence for this source of AMF only in the WTF condition:

I purchased a pair of Oakley sunglasses last summer but due to my corrective glasses, that would require me to get sunglasses. I have been just too lazy and too stressed out to go get my eyes examined and get contacts. (WTF)

This consumer predicted that purchasing Oakley sunglasses would make her feel happy; however, she also failed to consider the other things that would happen along with the purchase of the sunglasses (exams, needs for relaxation) that would fail to produce the happiness she envisioned.

Sources Linked to the Imagined Affective Reaction to the Event

Inaccurate Lay Theories. We may mispredict how much pain/pleasure we are likely to feel because we hold *inaccurate theories* as to whether certain outcomes will indeed evoke specific affective reactions. If the theory is wrong, the affect we predict will arise in the future may also be wrong. Already evidence for AMF due to

inaccurate theories has been presented in the consumer behavior literature as several studies have shown that consumers hold theories about variety which cause them to overpredict how much variety will make them feel happy in the future (e.g., Ratner et al 1999). We also observed evidence for the use of inaccurate lay theories in this study, but here only in the BTF condition. For example, one consumer used her theory that “families that have had problems will be very difficult to be around” to predict that her vacation to her boyfriend’s family’s house would make her feel anxious. She found that in this case her theory was wrong.

I felt somewhat nervous and worried because of personal issues with my boyfriend’s family. Contrary to my worries, I found that his family was very open and accepting. They made me feel at ease, almost like I was an actual member of the family. (BTF)

Sources Linked to the Affective Forecast

After imagining a future outcome, consumers use the affect linked to this imagined outcome to predict how they will feel when the outcome does occur. Two potentially related sources of AMF have been linked to the affective forecast itself: The hot-cold empathy gap and the projection bias (see Figure 1).

Hot-Cold Empathy Gap. Research on the *hot-cold empathy gap* proposes that people have difficulty predicting future affect if their current affective state *differs* from the state they will ultimately be in when the experience actually happens. When in a “cold” (non-affect-laden) state people often have difficulty imagining how they would feel or what they might do if they were in a “hot” state—for example, angry, hungry, in pain or sexually excited. It may also be the case that, when in a “hot” state people frequently have difficulty imagining that they will inevitably eventually cool off (Loewenstein and Schkade 2000). We found some, though not extensive evidence for the hot-cold empathy gap, but only in the WTF condition. As one consumer wrote:

I am upset with myself for not thinking about the future. I was blinded by excitement at the time of the purchase. (WTF)

The Projection Bias. A related bias in the literature is called the projection bias, said to occur when individuals use their current feelings as a proxy for the feelings they will experience in the future (Loewenstein et al 2003). For example, consumers who are in a good mood at the time of purchase may misattribute their mood to the product and mistakenly believe that subsequent product use will make them feel the same way. We found some (although again, limited) evidence for this bias as well. For example, one consumer who reported feeling unhappy about a purchase of a leather coat wrote:

I was in a really good mood because the music in the store was music that I really enjoyed. I became more excited while looking around at the leather coats. I thought of how good I will look in [leather coats] and how long I have wanted one because they are so expensive. (WTF)

Sources Linked to the Actual Outcome

Ordinization. Affective misforecasting can sometimes be tied to a process called “*ordinization*”, or the failure to consider that novel experiences may become ordinary when they are repeated over and over (Wilson, Gilbert and Centerbar 2002). Because they become ordinary they may fail to have the same affective impact that they had when they first occurred. Some evidence was found

for ordinization, but again only in the WTF condition. As one consumer wrote:

Right now I feel the car is ordinary because I drive it every day (WTF).

The thrill that he imagined from driving a new car became ordinary, and his happiness declined.

Sources Linked to Experienced Affect

Emotional Evanescence. Ordinization is a special case of a broader category of sources—emotional evanescence. Wilson et al (2002) suggest that intense emotions are physiologically taxing and distract cognitive processing resources from the environment. As such, it may be adaptive to experience intense emotions for only a short time. Rapid recovery from intense emotions is also adaptive as it allows individuals to remain attuned to the immediate (and not always benign) environment. Because we do not consider how fleeting our emotions are, we over-predict how intensely and for how long we will feel good (bad) following positive (negative) outcomes. We observed evidence for emotional evanescence in the WTF conditions as illustrated by the following quote:

Before purchasing this stereo system I was enthralled with its appearance and the sound it provided. But in less than a year it went away and I am no longer extremely excited that I have this product. (WTF)

However, we also observed that in the BTF condition, consumers had positive emotions that *failed to dissipate* over time.

Within a week I was still elated to have [the speakers]. (BTF)

Motivated Distortion. Gilbert et al (1998) suggest that one reason why we may mispredict how *bad* we will feel after something negative occurs is that we don’t take into account the fact that our psychology works to minimize the psychological discomfort caused by negative events. People are skilled at re-construing what happens to them in a positive light and use a number of tactics to reframe negative outcomes as less negative than they might have been. We did observe evidence that motivation distortion did occur and perhaps minimized the AMF gap when the experience was WTF:

Maybe I should have gone with the convertible. But I am trying to love the SUV as it is now. (WTF)

If I really wanted to improve my status with women I should have bought a Tag Huer. But ...older people do take notice. (WTF)

Selective Memory. While experiences can sometimes be different from what was anticipated, with time, memories are distorted and so too are memories of the extent, nature and duration of feelings experienced in response to an outcome (Klaaren, Hodges and Wilson 1994). As such, while affective misforecasting may occur, over time selective memory distorts the experience and what one remembers becomes more and more congruent with what one had predicted. Selective memory reduces the gap between the affective forecast and the remembered experience. We found no evidence for selective memory in either the BTF or WTF condition, perhaps because this source operates largely outside of conscious awareness.

In addition to confirming some of the sources of AMF identified in past research outside of consumption and elaborating on others (e.g., misconstrual, the isolation effect) we also observed sources of AMF that have not yet been identified. Sources that occurred when outcomes were BTF and WTF are discussed sequentially below.

Novel Sources of AMF When Outcomes were BTF

Felt Security in Thoughtfulness of Decision. Some consumers reported feeling BTF because they realized that their conscientious efforts at information search and decision making brought them as much if not more happiness than they had anticipated by finding a product they really loved. For example:

I was content with my decision because I felt I made a rational choice. I am very happy that I made the choice I did. (BTF)

I feel that I have made a good choice and others agree with me (BTF)

External Validation. As exemplified in the quote above, some people had not anticipated social acknowledgement or social approval from their purchase but found that they felt BTF when their purchase was externally validated:

Hearing that other people liked the product helped to reinforce my own satisfaction with it. (BTF)

I get a lot of compliments on it so that made me feel even better. The good compliments I got had a big effect on how I feel about the dress now. (BTF)

These comments once again underscore the social aspects of the satisfaction process.

Novel Sources of AMF When Outcomes were WTF

Novel source of AMF were also identified when outcomes were WTF.

Failure to heed Gut Instincts/Internalized Decision Rules. One source that explained why consumers felt WTF occurred because occurred because consumers ignored internal gut instincts that the purchase might be good. Alternatively, they ignored tried and true decision rules. For example:

Before I bought the shoes I felt a feeling of uncertainty or rather discomfort because I believed that there were many opportunity costs that I would give up. That went on for two minutes and then I bought them. (WTF)

I bought a product that I thought was equal to the more expensive brands. I should have remembered—you get what you pay for. (WTF)

Failure to Discount Buying Impulses/Purchase with Limited Search. Relatedly, consumers who felt WTF attributed their AFM to the fact that they did not think through the decision process, acting impulsively and with limited thought.

It was a waste of money. I was acting impulsively. (WTF)

I feel like I should have asked more questions about it, because if I had then maybe I wouldn't have bought it. I realize that the purchase was not intelligent and should have been thought out more. (WTF)

I knew the moment I got there that I wanted to get it. I thought I might not wear it, but I wanted it anyway. I'm still trying to wear it but it just doesn't look right. I wish I had given it more thought. (WTF)

Differences in Sources by Condition

To further differentiate whether and the extent to which various sources were more likely to occur in the BTF vs. WTF conditions, t-tests were conducted on items designed to reflect many of the sources identified in Figure 1. Mean scores corresponding to these t-tests are reported in Table 1. As shown, there were differences in use of these sources between respondents in the BTF and WTF conditions, with respondents reporting greater agreement that differences in their forecasted affective experiences were attributable to focalism, inaccurate lay theories, ordinization, and emotional evanescence. Though subjects in the WTF condition also reported greater use of misconstrual and the projection bias, differences between the two groups were not significant.

CONCLUSION

This research finds evidence for many of the sources of AMF identified in non-consumption contexts. The most prevalent were sources tied to misconstruals and the isolation effect. Misconstrual was not, however simply failure to consider other possible outcomes or potential product failure, but also misconstrual of usage, social approval, social acknowledgement, of marketplace exchanges, of economic changes, of product needs, and of the product's larger role in one's future. The next most prevalent were ordinization and motivated distortion.

Patrick et al (2007, forthcoming) found that while affective misforecasting occurs in a variety of consumption domains, its impact is strongest when feelings are WTF. Perhaps for this reason, we observed a greater number of sources of AMF when feelings were WTF compared to BTF. Most of these were related to the initial representation of the future outcome or event and included failure to deeply consider the purchase, ignore gut instincts or consider the long-term viability of the product in relationship to longer term vs. shorter term goals. In general, the sources of AFM were more numerous and hence more complex when the outcome was WTF than when the outcome is BTF.

Limitations and Future Research. While use of a critical incident methodology enables the study of AMF across a variety of "real" consumption experiences, it affords little control over factors that might impact the frequency of sources, such as time since the consumption experience or the types of consumption experience. This limitation is not critical to the interpretation of the results of this study, since the main objective was to identify sources of affective misforecasting in the consumption domain. Moreover, the fact certain sources were not observed does not mean that they do not exist; perhaps they are simply not accessible (they are unconsciously used) or are not easily articulated.

Future research may link the various sources of affective misforecasting to consumer satisfaction, demonstrating the unique influence of these sources of misforecasting on satisfaction. Furthermore, the implications of these sources on the nature and quality of brand-consumer relationships, brand loyalty, etc. is worthy of study.

When Thinking Beats Doing: The Role of Optimistic Expectations on Goal-Based Choice

Ying Zhang, University of Chicago
Ayelet Fishbach, University of Chicago
Ravi Dhar, Yale University

EXTENDED ABSTRACT

With the presence of multiple conflicting goals, self-regulatory goal pursuit of one goal could be understood in terms of progress toward the goal or in terms of commitment to the goal (Carver & Scheier, 1998; Kruglanski et al., 2002). The progress framing of goal pursuit emphasizes how initial goal pursuit reduces the efforts needed for the final goal attainment, whereas commitment framing highlights how initial goal pursuit increases the value of the final goal attainment. Prior research demonstrated that framing goal pursuit as progress has a liberating effect and fosters goal disengagement, whereas framing it as commitment has a motivational effect and elicits more goal-consistent actions. For example, when workout is framed as progress toward the goal of being healthy, going to the gym elicits the perception of partial goal attainment and suggests that effort could be withdrawn to pursue alternative goals such as enjoying tasty but fatty food; when workout is framed as commitment to the goal of being healthy, going to the gym signals the commitment to the goal and thus suggests more consistent actions, such as refraining from tasty but fatty food, should be performed to ensure the goal attainment.

When deciding on subsequent choice of actions, people consider their achieved goal pursuit as well as anticipated future goal pursuit. Like achieved goal pursuit, future goal pursuit is also cognitively represented as means leading to the goal attainment. We therefore propose that anticipated goal pursuit can be similarly framed as commitment to the goal or as progress toward the goal before the actual performance and has similar motivational and liberating effects on choice of actions. Moreover, because of the optimism bias that characterizes the anticipation about future, people anticipated more goal pursuit in the future than in the past, and therefore infer either higher commitment in the future, or more progress will be made in the future. As a result, compared with framing past goal pursuit, framing future goal pursuit amplifies the motivational effect of commitment framing and the liberating effect of progress framing.

Three studies were conducted to test the hypothesis. In the Study 1, we first asked participants to describe either their workout in the past month or planned workout in the coming month. The subsequent mental framing manipulation was achieved by having participants rate the extent to which they agree with statements that either frame workout as commitment to the goal of being healthy (e.g., "Having worked out so much, I must really care about my health") or as progress toward the goal of being healthy (e.g., "Having worked out so much, I must really have improved my health."). We measured participants' intended duration of workout and (in a separate survey) their interest in healthy food as their motivation to pursue additional goal-consistent actions. The results showed participants planned to workout longer and were more interested in healthy food when they focus on future workout than on past workout under commitment framing, but planned to workout less and showed less interest in healthy food when they focus on future workout than on past workout under progress framing.

Our second experiment replicated Study 1 with actual gym users and offered participants a parting gift instead of indicating behavioral intentions. Participants were offered to choose between a can of sugared soda (unhealthy option) and a bottle of spring water

(healthy option). The percentage of participants who chose soda over water was analyzed to examine participants' likelihood to disengage from the health goal. The results showed that participants were more likely to choose soda when they focus on future workout than on past workout under progress framing, although the percentage of soda choosers was not significantly different between future and past condition under commitment framing due to floor effect.

Finally in a third experiment, we manipulated the magnitude of optimism bias about future through mental simulation of goal pursuit (Taylor et al. 1998). Participants either mentally simulated the process of future goal pursuit, which attenuates the optimism bias or the outcome of future goal pursuit, which accentuates the optimism bias, before estimating their planned workout for the future. Then participants completing the mental framing manipulation that was identical to the one used in the last 2 studies. The dependent measure was again their indicated interest in various healthy and unhealthy food items in a separate survey. As expected, when the optimism bias about future goal pursuit became more pronounced, the interest in healthy food as dinner increased under commitment framing, but decreased under progress framing.

Taken together, these studies illustrated that optimism bias amplifies the motivational effect of framing goal pursuit as commitment and the liberating effect of framing goal pursuit as progress. Our findings offered a new perspective in understanding the interaction between cognition and motivation and demonstrated that the optimism bias could be potentially beneficial in terms of enhancing one's self-regulation in making consistent choices to ensure the final goal attainment. This research also speaks to the broader interest in consistency vs. inconsistency in consumer choices. Adding to the finding that people plan ahead to ensure their current choice would be different from future choices (Read & Loewenstein, 1995; Simonson, 1990) for variety, our findings further suggest that, by inferring future choices as commitment, people also achieve forward-looking consistency by making choices in line with expected choices when consistency (e.g., loyalty) is desired.

SPECIAL SESSION SUMMARY

Consumer Researchers for Public Health: Insights from Three Government-Funded Programs

Cristel Antonia Russell, San Diego State University

SESSION SUMMARY

This session was organized around the conference's transformative consumer research theme and follows its call for research designed for and communicated to consumers. In the spirit of this mission, the session included three current government-funded research programs that address important public health issues. The first project, by Jerome Williams and colleagues, examines the relationship between obesity and other health indicators among minority consumers to environmental factors, such as billboard advertising, and purchasing behavior using scanner data. The second project, by Marty Fishbein and Amy Jordan, investigates the relationship between exposure to sex in the media and AIDS-related sexual behavior. The third project, by Cristel Russell and colleagues, documents the amount and nature of alcohol portrayals in television series to examine how they affect consumers' attitudes and beliefs about drinking.

As the existence of specialized journals and conferences focusing on public policy issues attests, consumer researchers have long considered the implications of their research for public policy. In addition to providing guidance to policy makers that way, consumer researchers are increasingly answering health organizations' requests for focused and applied research and developing research programs that center on the issues. Problems such as tobacco, drug, alcohol and excess food consumption, or the HIV-AIDS epidemic plague all societies and ultimately cost nations large sums of money resulting from lost productivity and increased healthcare expenditures. In the spirit of Kotler and Levy's (1969) original call for extending marketing research outside the traditional for-profit arena, it is crucial for consumer researchers to apply their knowledge of consumer behavior to directly tackle society's preventable health problems.

In the U.S., a multitude of health organizations strive to better understand these issues. Although each state has its own health research activities, the National Institute of Health (NIH) leads the U.S.'s health research efforts with a total budget exceeding \$28 billion, with over 80 percent of the budget going to 50,000+ research grants annually. The NIH's Office of Extramural Research (OER) has oversight of national behavior research. The OER has continued to see its annual research budget grow to nearly \$14 billion; and has increased its efforts to promote applied social science research, including consumer behavior. Presently, academic institutions (excluding medical schools) receive approximately \$3 billion of the OER's overall research budget. This amount continues to increase as the NIH strives to improve the knowledge surrounding influential sources and consumer behavior, in order to improve policies and educational tools for consumers in the hopes of improving public health.

All three research programs presented in this session are funded through government grants. All three document the themes and prevalence of damaging health-related information across a variety of media in order to understand how they affect consumers' beliefs and behaviors. We take a broad approach to the consumer environment by documenting the effects of both traditional advertising messages (Williams et al.) and those messages imbedded in the media content (Fishbein and Jordan), such as product placements (Russell et al.). All projects include a content analytic phase

and an effects-testing phase (with scanner data in the first project and survey data in the other two).

"Obesity and the Built Environment: A Tale of Five Cities"

Jerome D. Williams, University of Texas at Austin

Chiquita A. Collins, University of Texas at Austin

William J. McCarthy, University of California at Los Angeles

Antronette K. Yancey, University of California at Los Angeles

Obesity has reached pandemic proportions in the U.S. (Flegal et al. 2002; Koplan and Dietz 1999). Environmental intervention approaches are necessary to stem this epidemic, as the environment is becoming increasingly "obesogenic," particularly in communities of color, and individual-level change efforts have demonstrated little sustainability (Yancey et al. 2004; Fontaine et al. 2003; Sloane et al. 2003; French et al. 2002; Kersh and Morone 2002; Nestle and Jacobsen 2000; Swinburn et al. 1999; King et al. 1995). A similar shift in level of focus of intervention is credited with the dramatic declines in tobacco use and, recently, particularly in California as the leader in this arena, in tobacco-related disease burden, with important lessons for obesity control (Daynard 2004).

A critical but understudied element of the sociocultural environment influencing the food and beverage preferences and purchasing behaviors of Americans is commercial advertising, marketing and promotion (Nestle et al. 1998). The U.S. food industry spends approximately \$36 billion per year on advertising (Thomas 1998), making it the second largest advertiser in the American economy (Gallo, 2000). A growing literature endeavors to characterize the cultural variations in commercial advertisements in magazines, on billboards, and on television that may contribute to health risk behavior disparities (Wallack and Dorfman 1994; Mitchell and Greenberg 1995; Pratt and Pratt 1995; 1996; Byrd-Brenner and Grasso 2000; Lohmann and Kant 2000; Hackbarth et al. 2001; Story et al. 2000; Tirodkar and Jain 2003; Wakefield et al. 2003). A pattern of findings demonstrate significantly fewer ads for healthier food/beverage products, e.g., fruits, vegetables and dairy products, in magazines and television shows targeting African Americans compared with those targeting "general audiences," and a significantly greater number of ads for unhealthy products, e.g., sodas, candy and alcoholic beverages (Pratt and Pratt 1995; Tirodkar and Jain 2003). On billboards in predominantly African-American and Latino neighborhoods, alcohol products were advertised five times as frequently as in predominantly white areas (Hackbarth et al. 2001), and advertising themes included images of sex, youth and affluence to sell these products (Mitchell and Greenberg 1995).

The primary objective of this study is to conduct a content analysis of food, beverage, and physical activity products and services billboard advertisements to test the hypothesis that African Americans and Latinos are disproportionately targeted by advertising of high-energy, low nutrient density food and beverage products, and underexposed to advertising for nutritious food and beverage products and physical activity-related products and services. The study also will describe the attributes of billboard ads which may influence purchasing and consumption of unhealthy food and beverage products and examine weight-related body imagery in billboard ads. Finally, the study will examine the geographical positioning of billboards relative to schools, to exam-

ine whether the content of billboards near schools differs from the content of billboards far from schools.

To carry out the study, representative zip codes were selected in five cities. Two Los Angeles County health districts (HDs) with large proportions of African-Americans, 2 predominantly Latino HDs, and 2 predominantly white HDs were selected and analyzed using demographic and other data from the Los Angeles County Health Survey. A similar selection strategy was employed in Sacramento and Fresno, using California Health Interview Survey data. In Austin, Texas, zip codes were selected and analyzed using data from the Behavioral Risk Factor Surveillance Survey, Texas Hospital Patient Discharge Data, and STEPS to a Healthier Austin. Similar steps were taken to identify appropriate zip codes in Philadelphia. Each billboard was photographed with a digital camera, and the photographs were attached to a content analysis abstraction form, accompanied by a GIS map highlighting its location and its distance from nearby public schools. To complement the billboard data, arrangements have been made to obtain scanner purchasing data from the major food store chains in each neighborhood. This will allow analysis of not only differential media exposure but also differential food purchases in the same neighborhoods.

The implications of this work for policymaker and decision-maker education at the local and state levels are substantive. Examples of regulatory and legislative action that might be prompted or supported by the findings include: increased FCC oversight of Spanish-language media content; restrictions on food industry billboard placement modeled on those on tobacco; taxes on foods disproportionately advertised in poor neighborhoods to subsidize parks and recreational facilities or farmers' markets in those areas; and requirements for food establishment menu item nutrition labeling.

The research is in its first year. The neighborhood content analysis of billboards for all five cities were completed in 2005. The health data already is available, as well as the scanner data. Preliminary analysis of the billboard data in six zip codes has been conducted at the Austin site. Below are a few of the highlights of this preliminary analysis:

- Alcoholic beverages are the most advertised item in all zip codes.
- Fast food is the second most advertised item.
- The largest number of alcoholic beverage and fast food advertisements was found in the zip code with High Black and High Hispanic Low Income households.
- Only one water advertisement was found across all six zip codes.
- Milk was advertised in four of the six zip codes.
- None of the zip codes displayed advertisements for exercise.

“The Impact of Media on Adolescent Sexual Development”

Martin Fishbein, University of Pennsylvania

Amy Jordan, University of Pennsylvania

There can be little doubt that the amount of sexual content in the media has been steadily increasing. At the same time however, unwanted pregnancies and sexually transmitted diseases have been declining. Despite this apparent negative relationship, there is great deal of concern that sexual content in the media is increasing the likelihood that young adolescents will engage in sexual behaviors. This presentation described some of the formative research conducted in preparation for developing a longitudinal survey to assess the impact of six media (TV, Music, Magazines, Movies, Video

Games, and the Internet) on the sexual beliefs, attitudes, intentions and behaviors of adolescents.

More specifically, this presentation addressed some of the methodological issues involved in attempting to link exposure to sexual content in six different media to adolescent's sexual beliefs, attitudes, intentions and behaviors. For example, it focused on some of the problems involved in assessing the amount of time adolescents spend with different media and the extent to which the time spent with those media exposes them to sexual content. Among other things, data were presented showing that media use varies as a function of day of the week as well as by whether the media use estimates are obtained when school is in or out of session (e.g., Spring versus Summer). Moreover, media use estimates vary considerably as a function of the type of measurement instrument used (e.g., a daily diary versus a weekly log versus an open-ended survey) and the question format. In addition the relation between various measures of exposure varies with the medium being considered. The importance of taking multi-media use and multi-tasking into account in attempting to estimate the extent to which one is exposed to sexual content was discussed. Data were also presented showing that adolescents and adults have different perceptions of what is (or is not) sexual content. Thus it is necessary to obtain “objective” (content analytic) as well as “subjective” estimates of the extent to which one is exposed to sexual content.

While the above discussion focuses primarily on the independent variable (i.e., assessing exposure to sexual content), there are also a number of methodological issues concerning dependent variables. Since we wished to go beyond a dichotomous measure of whether an adolescent did or did not engage in sexual intercourse, we wanted to look at behavioral progression toward sexual intercourse. Thus we needed to develop a measure that included both non-coital and coital sexual behavior. This turned out to be a difficult task. For example, given the recent phenomenon of “hooking up,” and the apparent confusion among adolescents as to whether oral sex is, or is not “real sex”, the old notions of “bases” or of progressing from kissing to necking to petting to sex are no longer viable. Perhaps not surprisingly, what is an appropriate (or at least acceptable) progression of sexual activities varies as a function of the nature of the relationship (“hooking up”, forming a new relationship; or being in an “established” relationship) as well as the gender of the adolescent. Finally, the presentation showed that adolescents' intentions to engage in sexual intercourse can be very accurately predicted from a knowledge of their attitudes toward, perceived norms concerning, and self-efficacy with respect to their personally engaging in sexual intercourse. In addition, these attitudes, norms and judgments of self-efficacy are themselves accurately predicted from behavioral, normative, and control beliefs respectively. One implication of these latter findings is that it is important to explore the link between various measures of exposure to sexual content in the media and a wide range of psychosocial and behavioral outcomes.

“Documenting the Nature and Impact of Alcohol Portrayals in TV Programs”

Cristel Antonia Russell, San Diego State University

Dale Russell, University of Amsterdam

Joel Grube, Pacific Institute for Research and Evaluation

This project is funded by the NIH's National Institute on Alcohol Abuse and Alcoholism. It tackles the widespread concern over the potential effects of alcohol product placements and other media portrayals of drinking on alcohol consumption and drinking-related problems. Television, radio, film, and popular music are often identified as potential sources through which consumers learn

about alcohol and as potential influences on their drinking and drinking problems (e.g., Christensen, Henriksen, and Roberts 2000; Gerbner 1995; Stockdale 2001; Strasburger 1993; Villani 2001). In particular, public health advocates routinely call for stricter self- or governmental regulation of alcohol portrayals in television, film, and music and of alcohol advertising (e.g., Hacker and Stuart 1995; Hill and Casswell 2001; Mosher 1994; Strasburger 1993). The objective of this grant is to document how television programming contributes to the development of preferences and symbolic associations related to alcohol and to inform policymakers who are concerned about the effects of alcohol portrayals in television programming.

The research program includes two inter-related studies: a content analysis of a composite sample of regular TV series focusing on the themes, images, and other characteristics of alcohol portrayals in television programming; and a cross-sectional survey of viewers to investigate the effects of such alcohol portrayals on perceptions and beliefs regarding drinking. The aim is to document the frequencies and types of alcohol portrayals in current television programming and identify the processes through which such portrayals shape consumers' responses and behaviors. The results will provide a firmer basis for designing prevention strategies to counter the effects of TV-based alcohol portrayals on drinking beliefs and behaviors.

The theoretical model builds upon research on the effects of product placements (Russell 2002) that identified the conditions under which a product included in a program is remembered and whether attitudes toward it are positively affected. We apply the product placement typology to the context of alcohol products in television programming to investigate objectively both explicit and implicit themes, images and other characteristics of alcohol portrayals in TV programming. The model is rooted in cognitive social learning theory (e.g., Bandura 1986) and classic attitude theories (e.g., Ajzen 1989; Fazio 1989; Petty and Cacioppo 1983, 1986) and incorporates the mediating role of audience connectedness (Russell and Puto 1999) to specify different mechanisms by which programs contribute to consumers' schemas and beliefs related to alcohol. We propose that consumption portrayals in the television program context more strongly affect highly connected viewers' beliefs and behaviors because they view the TV characters displaying these consumptions as referent others (Newton and Buck 1985) and behavioral models (Nord and Peter 1980). Connectedness to TV characters is a key factor influencing viewers' recall of alcohol depictions, which in turn affects normative beliefs about drinking and alcohol expectancies and, ultimately shapes viewers' drinking intentions and drinking behavior. Further, the nature of alcohol portrayals in a series is expected to moderate the relationships between recall and drinking beliefs: recall of or connectedness to programs high in positive alcohol portrayals will have a greater effect, increasing drinking beliefs and behaviors, than will recall of or connectedness to programs with less alcohol portrayals.

SPECIAL SESSION SUMMARY
Exploring Masculine Ideologies
Gokcen Coskuner, University of Wisconsin, Madison

LONG ABSTRACTS

“Grooming Masculinities: A Poststructuralist Analysis of Masculinity Discourses in Films”

Gokcen Coskuner, University of Wisconsin, Madison

In this paper, I take a poststructuralist approach to present the masculinity discourses circulated in films. This approach allows me to analyze how masculinity is socially constructed in media images, to locate central tensions operating within masculine ideologies and to present the interconnectedness of gender, social class positions and ethnicity. In this analysis, I focus on the cinematic representations of men's grooming practices. Traditionally grooming like fashion is viewed as a feminine activity. It has been argued that men's increasing involvement in consumption especially fashion and grooming and the increased depiction of men in advertising inverted the male gaze onto itself (Mulvey 1975). Looking at the masculinity discourses in a consumption context that is traditionally viewed as incompatible with masculinity thus, provides potential to understand how masculinity is constructed through conventional feminine cultural practices. An analysis of men's grooming practices extends prior consumer research, which has primarily focused on the consumption of products/brands/activities that reinforce traditional masculinities (i.e. Belk and Costa 1998, Schouten and McAlexander 1995) and on research that presents how products are chosen/avoided because they are perceived as fit/unfit with masculinity (i.e. Barthes 1975, Bourdieu 1984).

The popular media offer a variety of characters and masculine ideologies. These ideologies function as how to be (or not to be) a man and they also represent the dominant tensions that exist with contemporary models of masculinity. Kimmel (1992) for example, asserts that if masculinity is socially constructed, one of the primary elements in that construction is the representations of manhood that we see daily in the mass media. Along similar lines in her book *The Male Body*, Bordo (1999) analyzes images of male bodies as represented in advertisements and films to understand the contemporary masculinity discourses. She asserts that advertising serves as the primary lexicon of gender images, responsible for the wide dissemination of currently relevant masculine and feminine imagery. I explore grooming of the male protagonists in films *About a Boy* (2002), *American Psycho* (2000), *Casino* (1995), *Saturday Night Fever* (1977), *Zoot Suit* (1981) and *Malcolm X* (1992) to understand the masculine ideologies that are represented through grooming practices. I map various masculinities in comparison to one another to understand the symbolic boundaries between masculinities that are expressed through distinctive grooming (see Holt 1997).

The analysis suggests that men's grooming not only carry gender instructions, but also represents/creates/reestablishes boundaries around social class and ethnicity. Men in upper class positions tend to gain power and status among his milieu through his extensive self care practices. A very good example of this phenomenon is depicted in *American Psycho* (2000), where the main character has a set of grooming rituals before he starts his day and spends extensive amount of time and energy on how he looks partly because this is a part of his competition in the business world. On the other hand, among working class the physical capital that is valued is associated with a more down to earth look where involve-

ment in extensive grooming would not be seen appropriate and men who do so are called “sissy” and/or even “gay”. In addition men from diverse ethnicities employ different grooming practices to construct their masculinities. Analysis of the masculine ideologies in films and comparison of characters in films such as *Casino* (1995), *Zoot Suit* (1981), *Malcolm X* (1992) and *About a Boy* (2002) provide an important tool to understand these differences.

Based on the analysis, I identify two dominant tensions (femininity versus masculinity and rebellion versus conformity) that are influential in the representation and/or construction of masculinities. I propose that men constantly borrow from and negotiate between these tensions to construct their masculinity and that exploring these tensions is imperative to understand men's identity projects. The first tension I present is between femininity and masculinity. The masculinities are constructed against other masculinities and sometimes femininities. In different forms of masculinities we see the balance between these tensions vary. Hugh Grant's character in *About a Boy* (2002) depicts a masculinity that borrows largely from feminine traits. The character and the story of the film transgress the modernist dichotomies connected with female and male that emerged from the modern era some of the eminent ones being home versus workplace, passive versus active, emotional versus rational, submissive versus assertive (Firat 1994). Grants' character (Will) is unemployed; he is submissive and passive; and depicted as developing an emotional relationship with a preadolescent. Another dominant tension I identify is rebellion versus conformity. Holt and Thompson (2004) point out how rebellion and conformity play an important role in formation of certain masculinities. Again by focusing on masculinities in films I discuss how men strategically employ grooming to rebel against the traditional masculinity roles (i.e. Hugh Grant in *About a Boy*) and to construct their identities against other masculinities. I also note that conformity and rebellion tensions are not always binary and that rebellious actions should be interpreted within new hegemonic power relations (Foucault 1984).

I present the implications of the poststructuralist analysis of masculinities in films to marketing. As Holt (1997) notes, under the conditions of postmodernism it becomes ever more difficult to capture the subtle differences among collectivities. The plethora of masculinities thus poses challenges especially for those who aim to segment the male consumer. The marketer that claims to be targeting to male consumers in a specific demographic, such as 18-25 year olds, will likely overlook important differences in product usage habits, advertising readership, consumption experiences, identity projects that exist within the statistical category (see Holt 1997). The poststructuralist analysis of masculinity discourses in the media, on the other hand, has the potential to map various masculinities that are represented across a variety of situational settings in comparison to one another, to locate main tensions around masculine ideologies and to understand the dominant masculinity ideologies and its relation to other constructs such as social class positions and ethnicity. Analyzing how masculinities are represented in other mainstream media and how these discourses are perceived/ negotiated/ reconstructed by men in different social positions and from diverse ethnicities will be important steps to undertake in the future studies.

“Men’s Responses to Depictions of Ideal Masculinity in Advertising”

Linda Tunca, *Loyola University Chicago*

Past researchers have noted the importance of examining the connections between advertising representation and identity construction (Schroeder and Zwick 2004; Bordo 1993). However, despite the increasing importance of male consumers in the marketplace, little consumer behavior research has investigated masculine gender identities, with few exceptions (Holt and Thompson 2004; Hirschman 2003; Belk and Costa 1998). While research outside of consumer behavior has investigated the ideals of masculinity, and created typologies to capture these ideals (Brannon 1976, Lindsey 1997), this research is outdated and offers insights only from the researcher’s perspective.

Moreover, men are bombarded with mediated messages of masculinity in advertisements, but little is known as to how these depictions influence their experiences of masculinity. Several researchers have discussed the confusing and often contradictory nature of depictions of masculinity in advertising and in society as a whole (Mangan 2003; Lindsey 1997; Firat 1994; Pleck 1981). Thus, it is clear that the meanings appropriated to masculinity are not only complex, but also dynamic in nature. It is important to examine these meanings to gain a better theoretical understanding, as well as to discover emergent themes in the experiences of masculinity.

The principal research questions for this study are (1) How do men respond to images of ideal masculinity in advertising? (2) What do men’s interpretations of ideal masculinity in advertising reveal about their own sense of masculinity? To investigate these issues, 20 in-depth interviews were conducted, using advertisements containing masculine images as projective aids (White 1984; McGrath, Sherry, and Levy 1993). The informants were asked “grand tour” questions (McCracken 1988) at the onset of the interviews, while subsequently moving toward a more semi-structured approach in order to compare responses to a set of 15 ads. Thus, the ads were used as projective techniques to gain a better understanding of how these men experienced ideal masculinity. The interviews yielded over 300 pages of text, which was analyzed through a process called “dialectical tacking” (Strauss and Corbin 1998).

Several findings emerged from the text. One of the aims of the research was to understand, how do men respond to images of ideal masculinity in advertising? Six “types” of responders emerged. These were the Skeptics, the Avoiders, the Indifferents, the Enhancers, the Strivers, and the Chasers. First, Skeptics attempted to avoid engaging in comparison to the male models depicted in the ads because they believed these depictions were unrealistic or unauthentic. They displayed negative emotional responses to the ads, sometimes even derogating the spokesperson. Next, Avoiders also avoided comparison to the models in the ads, but this was due to the fact that they felt threatened by the ideal standards set by the images. Individuals in this category sometimes shifted their own personal standards of masculinity as a coping mechanism. Indifferents claimed they were unaffected by ideal images of masculinity and did not believe advertising held any standards for them personally. Unlike the previous response styles, Enhancers often engaged in comparison, although their comparisons were relatively passive in nature. Moreover, the Enhancer felt motivated by ideal depictions and believed they were attainable through incremental improvements in the self. Strivers also felt motivated and believed the ideals depicted in advertising were attainable through hard work. These individuals often discussed “imagined selves” (Scott 1998). Finally, Chasers actively looked to advertis-

ing for standards of masculinity, although these standards often times were beyond reach. It is important to note that informants often displayed characteristics of several “types” of responders depending upon the focal point of the ad. This is due to the fact that different masculine themes interact with the consumers’ own personal histories and life projects (Mick and Buhl 1992). Moreover, informants expressed that as they progressed through their lives, their likely responses would have changed as well. Thus, these response styles are not only fluid in nature, but temporally situated.

The response styles to depictions of ideal masculinity in advertising were examined further in order to uncover what men’s reactions revealed about their own notions of masculinity. While these response styles emerged, it is important to note that the crux of the analysis was what these response styles meant about notions of masculinity rather than providing a typology of how these men read the ads. For example, to Skeptics masculinity meant *authenticity* while for Avoiders, masculinity was experienced as *vulnerability*. For Indifferents, masculinity meant *individuality* in thought while for Enhancers and Strivers masculinity was experienced as *achievement*. Finally, for the Chaser, masculinity was experienced as *elusiveness*.

Thus, the present research sheds light on how men respond to depictions of ideal masculinity in advertising. The findings reveal how images in advertising influence men’s conceptualizations of their own sense of masculinity, including creating feelings of vulnerability and elusiveness, among other outcomes. Future research could examine the ethical issues surrounding these findings. Finally, this research holds managerial implications for advertisers and retailers who target male consumers.

“The Challenge of the New Masculinity: Conservative Reactions to a New Consumption Ethos”

Jacob Ostberg, *Stockholm University School of Business*

It has been proposed that we today see a “*new hegemonic masculinity*” (Patterson and Elliott 2002), which includes a feminization of masculinity, and invites men from all social positions to partake in the carnival of consumption in ways previously reserved predominantly for female consumers (Schroeder and Zwick 2004). Due to this change in mainstream masculinity, the traditional elite—who have long been concerned with appearances and are expressing their masculine identities through a knowledge and practice of refined consumption—is challenged in their roles as tastemakers *par excellence* (Osgerby 2001). The advent of popular-culture outlets for new gender ideologies—such as the TV-show *Queer Eye for the Straight Guy*, self-help books such as *The Metrosexual Guide to Style*, not to mention the abundant availability of men’s lifestyle magazines—make the (sub)cultural capital previously reserved for the higher social classes available to the masses. Members of the traditional elite therefore need to find new ways to manifest their masculinity in unique ways. In this paper, I look at strategies utilized by the traditional elite to strengthen their sense of masculinity in light of this new, allegedly feminized, consumption ethos.

Previous research has looked at how changes in dominant masculinity ideologies force men to negotiate their identity projects (May and Strikwerda 1992). Focusing more on consumption practices, Holt and Thompson (2004) have looked at how men from the “*stuck-in-the-middle socioeconomic profile*” are afflicted by the crisis of masculinity and how they tackle this by adaptive consumption behaviors. What this research adds is a focus on how the changing gender ideologies in our consumer society ripple through the social classes and affect the groups that, according to their own

mythology, are not easily influenced by consumer fads and fashions.

Data was collected during a 12-month immersion in an enclave (cf. Firat and Dholakia 1998) of young, well-off consumers in Stockholm. The principle means of data collection was observational studies in three different online communities where the whereabouts of this enclave is documented and commented on. In addition, participant observation was conducted at venues where the members of the enclaves hang out. Through the analysis of the data—which consists of editorial material from the webpages, transcripts of chat-room conversations, and field notes—I detected various strategies used by the members of the enclave to construct masculine identities.

The first characteristic of the traditional elite's consumption is that they do not regard themselves as representing something new, or as following contemporary trends. Instead, they see themselves as defenders of stability and providing a timeless, classic (and classy) masculinity as an alternative to all available fast-moving consumer fads. They are characterized more by conservatism and a willingness to uphold—what they perceive to be—traditional values, than the more rebellious traits usually upheld by similar youth constellations (cf. Hebdige 1979). Instead of manifesting their identity by rebelling against the parent generation, they act in a rebellious fashion by trying to resurrect conservative values of an imagined past. They are thus escaping the temporality of contemporary, faddish consumption, of which they would regard the new feminized masculine consumption as a prime example, by attaching themselves to a timeless ethos of style. In the online communities, references are many times made to how they—the traditional elite—do things with style, whereas others—particularly the new elite—lack the ability, both economically and culturally, to be stylish. One principal way for them to distinguish their consumption from that of the new elite is to frame the latter's consumption behaviors as overly conscious or even girlish; if one *really* has style, one rarely has to show it in the explicit way utilized by the new elite.

Another common denominator for what is deemed stylish, and thus a suitable blueprint for the construction of masculinity, is that it should be connected to what other, imagined, groups of similar consumers around the world are engaging in. In this way, the traditional elite is trying to escape the spatial restrictions of their present consumption by attaching themselves to an imagined community of global cosmopolites. By viewing these global soul-mates as their points of reference rather than the upward-striving new elitists, they manage to downplay the similarities between their respective consumption behaviors. Another device utilized by members of the traditional elite in order to strengthen their sense of masculinity in light of the new masculine gender ideologies is to reframe women's roles. The underlying logic is that as consumption becomes feminized, having support from women to prove one's masculinity becomes even more important. In the online communities, there are explicit calls for women to accept a more stereotypically old-fashioned, passive role in the company of these men. In the enclaves under investigation, women appear content with playing only supportive roles in the males' identity game. This stands in stark contrast to contemporary nightscapes that have been characterized as "feminized", where young women are adopting "predatory" sexual attitudes and are thus playing a more active role (Chatterton and Hollands 2003, 155).

This study of the traditional elite's responses to the new hegemonic masculinity offers three major contributions. First, it extends research on the crisis in masculinities by looking at a group neither directly addressed by the marketers of the products and ideas behind the alleged new masculinity, nor studied by previous researchers. Despite not being the target group, the crisis of mascu-

linity reaches this group by altering the positions among the different subcultures of consumption on this particular market. Second, it taps into the rather undeveloped area of conspicuous non-consumption by looking at how the traditional elite can afford not to engage in potlatch-style consumption of branded goods in order to build their masculine identities, whereas the aspiring new elitists resort to this means of consumption. Finally, it addresses the issue of how men use women to manifest that they are still "real men" despite engaging in the allegedly feminized consumption patterns prescribed in contemporary consumer culture.

Cross-Gender Brand Extensions: Effects of Gender of the Brand, Gender of Consumer, and Product Type on Evaluation of Cross-Gender Extensions

Kwon Jung, KDI School of Public Policy & Management
Winston Lee, National University of Singapore

ABSTRACT

Many brands can possess strong gender identity: Marlboro for masculine images and Chanel for feminine images. Over the years, there has been a growing trend of cross-gender extensions among brands, partly due to the unisex trend in consumer goods. This study examines consumers' evaluations of cross-gender extensions in an attempt to identify conditions for successful cross-gender extensions. The results show that the gender of a brand, gender of consumers, and product type influence the evaluation of cross-gender extensions.

INTRODUCTION

There are many brands in the marketplace that possess gender identities (Allison, Golden, Mullet, and Coogan 1979; Alreck, Settle, Belch 1982; McCracken 1993). They can be stereotyped as either masculine or feminine. Some examples include Chanel, Hugo Boss, Marlboro, and Virginia Slims.

One advantage of these gendered brands is that they leverage on their masculine or feminine associations to attract the male or female consumers respectively. However, this strong association with a particular gender could be a hindrance for brands trying to extend beyond their traditional market segment. As a result, some companies choose to target the opposite gender segment by using different brand names. For example, Philip Morris uses the brand name 'Marlboro' for targeting men and 'Virginia Slims' to reach out to women (Alreck, Settle, and Belch 1982; McCracken 1993). Similarly, Estee Lauder uses its own brand of fragrance to target its female customers while a separate brand name, 'Aramis', is used to target male customers (*Fortune* 1998).

However, a major disadvantage of using this approach is cost. The cost of introducing a new brand in some consumer markets has been estimated to range from \$10 million to more than \$200 million (Kotler and Armstrong 2004). In order to deflect the high cost of launching new products, an extension strategy could be employed. In addition to the advantage of lower costs, using an extension strategy also allows the company to leverage on the current brand associations to build brand equity (Aaker 1991). In 1990, an estimated 81 percent of new products introduced were extensions (Keller 1998). This further testifies to the attractiveness of using an extension strategy of gendered brands.

Extending the same brand name to target the opposite sex (cross gender extension for short) is not a new phenomenon. There is a history of masculine brands launching an extension to reach out to women in the domain of traditional masculine products. Examples of cross-gender extensions by masculine brands include Levi's and Gillette in jeans and razors respectively. However, there is a recent trend of companies extending their feminine brands to target men. For example, Estee Lauder initially launched "Pleasures" for ladies as a perfume with a soft and feminine appeal with Elizabeth Hurley as the celebrity endorser. However, "Pleasures" was later extended into the men's segment directly under the Estee Lauder corporate brand (*Marketing Week* 1998). This represents a departure from the traditional branding strategies of Estee Lauder of using separate brand names to target the different gender segments. Another prominent example is the attempt by Triumph International to launch an extension into male swimwear from its

original offerings of female swimwear. What is seen here is a growing trend of companies using the same brand name to target the opposite sex segment. In recognition of the vast advantages of using the extension strategy, it is crucial for marketers to know under what conditions a cross gender extension can be successful. It is the objective of this study to find such conditions.

BACKGROUND

Gender Stereotyping of Brands

According to Wrightsman (1977), a stereotype is "a relatively rigid and oversimplified conception of a group of people in which all individuals in the group are labelled with the so-called group characteristics." Children in every society need to learn their roles and the behaviours that go with them. They need to learn what a child, a student, a brother/sister, son/daughter, man/woman should do. Thus, sex roles refer to the expectations of what a man and a woman should do by society. Combining the concept of stereotypes and the concept of gender roles, gender stereotypes refer to the rigidly held and oversimplified beliefs that men and women, by virtue of their gender, possess distinct psychological traits and characteristics. Such overgeneralizations tend to be widely shared by a particular society or culture. In the past, both men and women have had certain sex role requirements as well as prohibitions (Alreck 1994). For instance, a man had to be strong, tough minded, and decisive, while a woman was expected to be nurturing, lady-like, and put the family first.

Similar to cultural or country stereotypes, gender stereotypes should influence the perception and judgment of any object, including consumer products and brands (Alreck, Settle and Belch, 1982). Keller (1998) also argues that some brands in the marketplace possess certain gender-specific associations so that consumers associate the individual brand's user as specifically from either sex. A sample categorization of masculine and feminine brands in various product categories is provided in Table 1. The list is not exhaustive. However, it shows that gendered brands are not restricted to the traditional domain of fashion and beauty products. They are found in other product categories such as tobacco and toys

Perception of Fit in Cross-Gender Extensions

Past studies in brand extension areas have found that the success of an extension depends on the perception of fit between the parent brand and the extended product category (Aaker and Keller 1990; Boush and Loken 1991; Keller 1998). The greater the perception of fit between the two, the more easily the positive associations of the parent brand are transferred to the extension, thus increasing the chance of success in the extension. Greater fit perception will have a positive impact on consumers' evaluation of the extension (Aaker and Keller 1990) as well as on their attitude towards the parent brand (Loken and John 1993).

Although the perception of fit could be formed by various factors, past studies have identified two major bases for more successful fits: product feature similarity and brand image or concept consistency (Park, Milberg, and Lawson 1991; Bhat and Reddy 1998). Park, Milberg, and Lawson (1991) suggested that evaluations of brand extensions depend on the degree of overall

TABLE 1
Examples of Gendered Brands

Product Category	Masculine Brands	Feminine Brands
Fragrance	Aramis, Hugo Boss	Estee Lauder, Elizabeth Arden
Beauty care products	Clinique	L'oreal, Lancome
Tobacco	Marlboro	Virginia Slims
Fashion	Hugo Boss, Arrow	Chanel, Laura Ashley
Undergarments / Negligee	Byford	Victoria Secret, Triumph
Toys	Lego	Barbie

perceived fit between the extension product and the brand name. The degree of overall perceived fit is, then, a function of both product-feature similarity perceptions and brand-concept-consistency perceptions. Product feature similarity perceptions are derived by feature correlations or attribute matches from feature level comparisons. Brand concept consistency perceptions are formed by the image fit between the extension product and the brand (i.e., how well the brand concept accommodates the extension product).

In cross-gender extensions, the main concern for marketers would be brand image fit. This is because product feature similarity in cross-gender extension is not significantly important since the extension is in the same product category and shares the same features. The most critical aspect is a brand's perceived masculinity or femininity. For example, when Triumph extends into male swimwear, the key issue is whether men will accept the feminine image of Triumph on their swimwear. In essence, the focus of this study is on assessing brand image fit between cross-gender extensions.

Gender of Brand and Evaluation of Cross-Gender Extensions

According to studies in gender stereotyping, masculine traits tend to be regarded higher than traditional feminine traits (Broverman, Vogel, Broverman, Clarkson, and Rosenkrantz 1972; Ashmore, DelBoca, and Wohler 1986). Being strong, independent, and willing to take risks are seen more positively than being weak, gullible, and easily influenced. This difference in values may result in a greater desirability for masculine traits in society.

Since a brand is used as an expression of one's personality (Aaker 1996), the greater social desirability for masculine traits would be manifested in the choice of products as well as brands by consumers. This line of argument is consistent with the study by Alreck, Settle, and Belch (1982) which suggested that men will almost reject feminine brands while women will most likely accept masculine brands.

Stuteville (1971) also suggested that it is easier for a male-oriented product to attract females than the reverse situation. This is because society labels a boy who acts like a girl as a "sissy" boy while a girl who acts like a boy is called as a "tomboy". The latter is much easier for a girl to accept than the former is of a boy. Like products, a brand can also be an avenue to express one's masculinity/femininity (McCracken 1993). Given that it is more difficult for a female-oriented product to attract males, it follows that it is more difficult for a feminine brand to attract males than the reverse situation.

Based on the casual order of consumers' evaluations of brand extension as examined earlier, the following hypotheses are suggested to predict easier acceptance of an extension from a masculine

brand than an extension from a feminine brand:

H1: Compared to a cross-gender extension from a feminine brand, a cross-gender extension from a masculine brand will result in:

- (a) greater perception of brand image fit,
- (b) greater perception of overall fit,
- (c) more positive attitude towards the extension, and
- (d) more positive attitude towards the original brand.

Gender of Consumer and Evaluation of Cross-Gender Extensions

Gender stereotyping studies suggest that men and women perceive sex roles differently, with men holding a more unfavorable view towards femininity (Lii and Wong 1982; Smith and Midlarsky 1985; Werner and LaRussa 1985). Based on the concept that consumers use brands as an expression of their personalities, men and women are predicted to react differently when they encounter cross-gender extensions.

Alreck, Settle, and Belch (1982) found that men tend to exaggerate the differences in brands more markedly than women. Men are found to perceive a masculine brand to be more masculine and a feminine brand to be more feminine. They also suggested that compared to women, men tend to find their sexual identity in the material goods they buy and use. This implies that, compared to a woman, it would be more difficult for a man to accept an extension from a feminine brand if it contradicts to his masculine gender identity.

On the other hand, Lull, Hanson and Marx (1977) found that women were more sensitive and critical of sex-role stereotyping than men. Thus, women tend to be more responsive to gender crossing than men because they prefer to adhere less to the traditional sex role prescriptions. This is opposed to men who have a more rigid definition of their male sex roles. Therefore, the following hypotheses are suggested when predicting the possible differences between men and women towards cross-gender extensions:

H2: In evaluating cross-gender extensions, compared to men, women will have:

- (a) greater perception of brand image fit,
- (b) greater perception of overall fit,
- (c) more positive attitude towards the extension, and
- (d) more positive attitude towards the original brand.

Product Type and Evaluation of Cross-Gender Extensions

Product types may play an important role in consumers' evaluation of brand extensions. Since image fit is more important in cross-gender extensions, the acceptance of cross-gender

extensions would be influenced depending on whether the product type is image-oriented or function-oriented. Park, Jaworski, and MacInnis's (1986) conceptualization of functional and symbolic brand concept is useful in examining product type effect in cross-gender extensions. With symbolic products, the benefits sought are more extrinsic in nature and usually correspond to non-product related attributes, especially user imagery. Symbolic benefits relate to underlying needs for social approval or personal expression and outer-directed self-esteem (Solomon, 1983). Thus, getting the wrong symbolic product could result in high social and psychological risk.

In the case of functional products, the benefits sought are more intrinsic in nature and usually correspond to product-related attributes. Functional benefits are often linked to basic motivations such as physiological and safety needs, and often involve a desire to satisfy problem removal or avoidance (Fennell, 1978). Such products have a lower level of social and psychological risks when compared with symbolic products.

Since the main concern for cross-gender extensions is the image incongruence between masculinity and femininity, a symbolic product which offers emotional and self-expressive benefits is likely to experience more difficulties than functional products. To explore the differences between these two categories of products in cross-gender extensions, the third hypothesis is formed:

- H3: Compared to a symbolic product category, a cross-gender extension in a functional product category would result in:
- greater perception of brand image fit,
 - greater perception of overall fit,
 - more positive attitude towards the extension, and
 - more positive attitude towards the original brand.

METHOD

Experimental Design and Subjects

A 2 (product type: symbolic vs. functional) x 2 (direction of cross-gender extension: masculine to feminine vs. feminine to masculine) x 2 (gender of subject: male vs. female) factorial between subject design was used in this study to test the proposed hypotheses. A total of 233 undergraduate students participated in this study. Among them, 124 (53.2%) were male and 109 (46.8%) were female students.

Experimental Stimuli

Selection of Product Categories.

Two product categories, one represents the symbolic product category and the other represents the functional product category, were selected through the following procedure. First, a list of product categories where gender crossing of a brand is a relevant phenomenon was identified. Considering the technical feasibility of cross-gender extensions (the sanitary product category, for example, was not considered in this regard because men never use it) and actual existence of both masculine and feminine brand names in the product category, twelve product categories were identified. They were fragrance, shampoo, alcoholic beverages, tobacco, high-end fashion, undergarments, swimwear, magazines, shoes, sportswear, spectacles, and hair gel/spray.

Second, each product category was evaluated in terms of performance and social/psychological risks to select a functional and a symbolic product category (Friedman and Friedman 1979). A symbolic product is meant to satisfy the emotional and self-expressive benefits. A consumer buys a symbolic product to enhance one's self-image among others. For example, a consumer does not

buy an expensive dress just to satisfy the basic function of clothing. Rather, she buys it to keep or improve one's self image as perceived by others. Thus, a symbolic product has a high level of social and psychological risks and a low level of performance risk. On the other hand, getting a wrong functional product will not incur much social and psychological risk because it is meant to satisfy the basic utilitarian function of the product. The consumer would judge a functional product primarily in terms of how well it functions. For example, a consumer would be more worried that a vacuum cleaner does not work rather than whether it fits well with his/her image. Thus a functional product has a high level of performance risk and a low level of social and psychological risks based on the above classification of perceived risks.

Thirteen undergraduates took part in a pretest to evaluate the risks associated with the twelve product categories on a seven-point scale (e.g., 1="very unlikely" and 7="very likely"). For each product, ratings of the social and psychological risks were averaged out and the mean was compared with performance risk. Hair gel/spray was selected to represent a functional product type because of its highest level of performance risk (4.43) and relatively low level of social/psychological risk (3.26). High-end fashion was selected to represent a symbolic product type with its highest level of social/psychological risk (4.53) and relatively low level of performance risk (2.93).

Selection of Gendered Brands.

The pairs of masculine and feminine brands were chosen from the two product categories of high-end fashion and hair gel/spray based on the following criteria. First, the brands should be strongly identified with either of the gender images. Second, the chosen pair of brands for each product type should be equivalent in terms of subjects' familiarity with and attitudes towards the two brand names. This would allow a fair comparison of the cross-gender extendibility between the masculine and the feminine brand.

With the selection criteria in mind, a potential list of brands was identified first by the researcher. Thirty undergraduate students were then asked to rate each brand in terms of its gender image, attitude, and familiarity. Gender images of the brands were measured on a set of seven semantic scales with seven intervals between the two bipolar adjectives (e.g., large-small, harsh-gentle, masculine-feminine, strong-weak, rough-smooth, etc.) The scale was adapted from Alreck, Settle, and Belch (1982). Attitude and familiarity were measured by a seven-point scale (very unattractive-very attractive; very unfamiliar-very familiar).

Hugo Boss and Chanel were selected as a masculine brand and a feminine brand for high-end fashion product category. They were different in gender image (3.13 vs. 5.05, $t=12.28$, $p<.01$) but not significantly different in attitude (5.44 vs. 5.44, $t=0.00$, $p>.10$) and familiarity (5.41 vs. 5.52, $t=.42$, $p>.10$). Gatzby and Sifone were selected as a masculine brand and a feminine brand for hair gel/spray product category. They were also different in gender image (3.36 vs. 5.26, $t=6.38$, $p<.01$) but not significantly different in attitude (4.04 vs. 4.11, $t=0.21$, $p>.10$) and familiarity (5.30 vs. 5.41, $t=.32$, $p>.10$).

Manipulation of gender crossing extensions.

The gender crossing extensions of each brand were manipulated by providing a scenario that announced an extension to target the opposite gender group. For example, the scenario used for the high-end fashion product category is as follows:

"Hugo Boss (Chanel is now a leading men's (women's) fashion brand name in the high end fashion category. Delighted with the success of its men's (Women's) fashion line, the top management of Hugo Boss (Chanel) decides that it is time to take full advantage of this success. It decides to capitalize on

the strength of the *Hugo Boss (Chanel)* brand name in the high end fashion category by launching a new product line—*Hugo Boss Ladies (Chanel for men)* to target *female (male)* consumers. Examples of the new product line include *dress, jacket and blouse for women (shirts, pants and jackets for men)*.”

Dependent Measures

Four dependent variables were measured in this study: perception of overall fit, perception of brand image fit, attitude toward the extension, and attitude toward the original brand. Perception of overall fit was measured using four 7-point Likert scales adopted from Bhat and Reddy (1997). Degrees of agreement were measured with the following four statements: “The introduction of the extension makes sense,” “The extension seems logical,” “The extension would be a good example of the brand,” and “The extension would be typical of the brand”. The items showed a good reliability measure ($\alpha=.93$).

Seven items for perception of brand image fit were adopted from Bhat and Reddy (1997). The items include the scales measuring generic aspects of brand image fit (e.g., fit with subject’s idea and image, similar images, conveys same impressions), symbolic concept consistency (e.g., the user of the extension as stylish as user of brand, the extension makes same statements about users) and functional concept consistency (e.g., the extension as practical as parent brand) and produced a relatively good level of reliability ($\alpha=.89$).

Attitude toward the extension was measured using three 7-point Likert scales (e.g., good, likable, pleased) adopted from Park, Milberg and Lawson (1991). Attitude toward the original brand was measured using four 7-point semantic differential scales (e.g., good-bad, like-dislike, favorable-unfavorable, positive-negative) adopted from Holbrook and Batra (1987). Both items turned out to be reliable items ($\alpha=.94$ and $.96$ respectively).

RESULTS

Manipulation Check

Although product categories and brands were carefully selected based on pretest results, perceived risks associated with the product categories and the perception of gender image of the brands were measured to check manipulation using the same scales used in the pretests. First, the manipulation of product type turned out to be successful. It was found that hair gel/spray had a significantly higher level of performance risk than high-end fashion (4.87 vs. 3.44, $t=-2.358$, $p<0.05$). In terms of social/psychological risk, high-end fashion was rated significantly higher than hair gel/spray (4.90 vs. 3.50, $t=7.412$, $p<0.01$).

The choice of the gendered brands also turned out to be successful. There were significant differences between Hugo Boss and Chanel (3.40 vs. 5.06, $t=12.29$, $p<0.01$) as well as between Gatsby and Sifone (3.47 vs. 5.29, $t=9.63$, $p<0.01$) in the perception of gender image of the brands.

Initial attitudes towards the original brands were checked to evaluate possible confounding effects. It was found that respondents were equally favorable towards Hugo Boss and Chanel (5.15 vs. 4.94, $t=1.17$, $p>0.10$) as well as equally favorable towards Gatsby and Sifone (4.60 vs. 4.60, $t=0.02$, $p>0.10$). However, the initial attitude level of the symbolic product category (Hugo Boss and Chanel) was higher than that of the functional product category (Gatsby and Sifone). A t-test confirmed this difference ($t=2.30$, $p<0.05$). To remove the possible confounding effect from this difference in the initial attitude level between product categories,

the initial attitude level was used as a covariate in the following analyses.

Hypothesis Testing

To test the hypotheses, MANCOVA was first conducted using SPSS for Windows 11.0 with the initial attitude level as a covariate. The means for experimental conditions and the results of the multivariate are summarized in Table 2 and 3. MANCOVA results show significant main effects of product type and gender of consumers, and a significant 2-way interaction effect between product type and gender of consumers.

The effects are further investigated using univariate analyses. Table 4 summarizes the univariate ANCOVA results for all four dependent variables. First, although the main effect of gender-of-brand is not significant at the multivariate level, univariate analyses show a significant gender-of-brand main effect on the evaluation of cross-gender extensions. The image fit perception (3.81 vs. 3.44, $t_{1,231}=2.19$, $p<0.01$ by one-tail test), overall fit perception (4.03 vs. 3.69, $t_{1,231}=1.79$, $p<0.05$ by one-tail test) and attitude toward the extension (3.72 vs. 3.30, $t_{1,231}=2.10$, $p<0.05$ by one-tail test) are higher for the masculine brand condition than the feminine brand condition, thus providing supporting evidences for H1(a), H1(b) and H1(c). Even though it fails to reach the conventional level of significance, the mean of the attitude towards the original brand is higher when the extension is made from the masculine brand to target female consumers than the other way round (4.22 vs. 3.95, $t_{1,231}=1.58$, $p=.06$ by one-tail test), providing a directional support for H1(d).

Next, the main effect of gender-of-consumer is significant on all dependent variables as predicted. The acceptance of cross-gender extension is higher for female subjects than for male subjects (3.85 vs. 3.43, $t_{1,231}=2.78$, $p<0.01$ for perception of brand image fit by one-tail test; 4.09 vs. 3.65, $t_{1,231}=2.34$, $p<0.01$ for overall image fit by one-tail test; 3.78 vs. 3.28, $t_{1,231}=2.46$, $p<0.01$ for attitude toward extension by one-tail test; 4.41 vs. 3.80, $t_{1,231}=3.57$, $p<0.01$ for attitude toward original brand). Thus, H2(a), H2(b), H2(c) and H2(d) are supported at both multivariate and univariate levels.

The main effect of product type is significant on all dependent variables except for the attitude toward original brand. The acceptance of cross-gender extension is higher for the functional product category condition than for the symbolic product category condition (3.79 vs. 3.46, $t_{1,231}=2.19$, $p<0.05$ for perception of brand image fit by one-tail test; 4.14 vs. 3.58, $t_{1,231}=3.02$, $p<0.01$ for overall image fit by one-tail test; 3.86 vs. 3.16, $t_{1,231}=3.52$, $p<0.01$ for attitude toward extension by one-tail test; 4.19 vs. 3.98, $t_{1,231}=1.18$, $p=.12$ for attitude toward original brand by one-tail test). Thus, H3(a), H3(b), and H3(c) are supported, but not H3(d). However, a directional support is found on the attitude toward original brand H3(d).

In addition to the significant main effects, a significant 2-way interaction effect between gender of consumer and product type is found on the perception of brand image fit ($F_{1,224}=8.33$, $p<0.01$) and the attitude toward original brand ($F_{1,224}=4.56$, $p<0.01$). Therefore, the interpretation of significant main effects of both the gender-of-consumer and the product type factors has to be made within in the relationship depicted in the interaction effect. The relationship is presented in Figure 1 and 2, and the detailed relationship is explained in the discussion section.

DISCUSSION

This study examines consumers’ evaluations of cross-gender extensions in an attempt to identify conditions for successful cross

gender extensions. Gender of the brand, gender of consumers, and product type are considered key conditional factors that may influence the success of cross gender extensions. It is found that all three factors do influence the evaluation of cross gender extensions. Key findings are summarized as follows. First, although it is not significant at the multivariate level, a significant main effect of the gender of brand (more specifically the direction of gender crossing)

is observed on the three dependent variables related to the acceptance of cross-gender extension. As indicated by the results, the acceptance of a cross-gender extension is higher when an extension is made from a masculine brand to target female consumers than the other way round.

Second, significant main effects of the gender-of-consumer and the product type are also observed in the study. Women are

Note: \ddot{O} = $p < .10$, * = $p < .05$, ** = $p < .01$ (Initial attitude toward brand was used as a covariate)

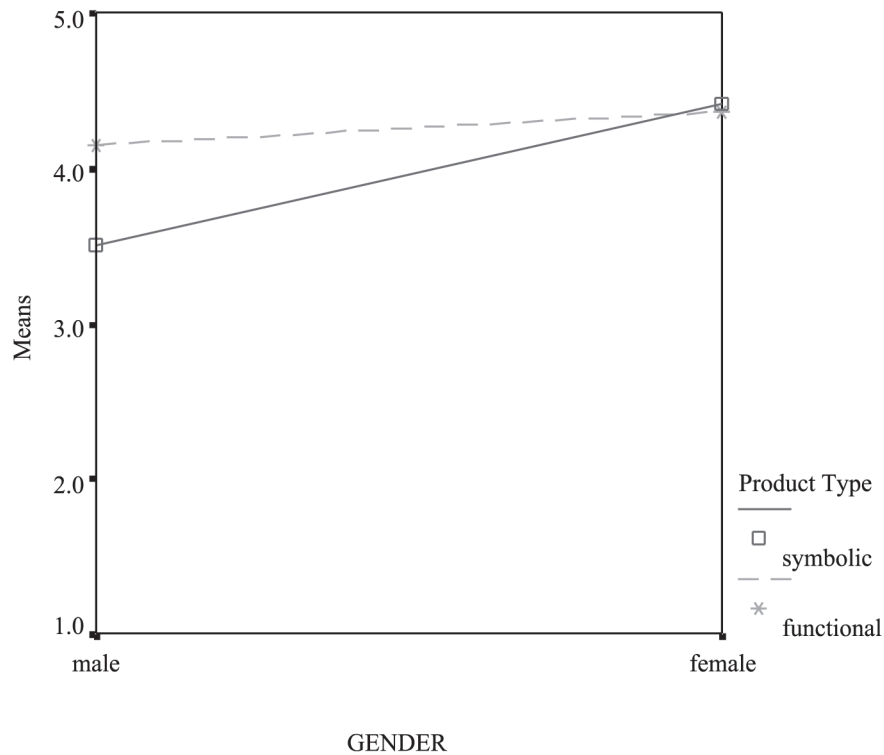

FIGURE 1
Interaction effect of product type and gender of consumer on the perception of brand image fit

found to be more receptive towards cross gender extensions than men. The acceptance of cross gender extensions is lower for the symbolic product category than for the functional product category. However, a significant 2-way interaction effect between the gender-of-consumer and the product type suggests a more complex picture on the relationships. It is observed that men’s perception of brand image fit of cross gender extensions is higher when the brand is

from the functional product category rather than from the symbolic product category. On the other hand, women’s perceptions are not different whether the brand is from the symbolic product category, or from the functional product category. This pattern is also evident on the attitude toward the brand after extension. Although it is not significant, a similar pattern is observed on other dependent variables as well. Overall, men’s acceptance of a cross-gender extension is

FIGURE 2
Interaction effect of product type and gender of consumer on the perception of brand image fit

found to be lower in the symbolic product category than in the functional product category compared to women. This finding is consistent with the past finding which suggests that men are more likely to find their sexual identity in the material goods they buy and use. Men are also more consistently defining their sexual identity in terms of external possessions. (Alreck, Settle and Belch 1982). In a symbolic product category, the gender image associated with a cross-gendered brand tends to become a salient attribute, thus, men would become more resistant than women to accept cross-gendered brands. On the other hand, the gender image associated with a brand tends to become a less salient attribute compared to other functional attributes in a functional product category. As a result, it may not become as influential as in a symbolic product category.

Third, the pattern of effects on the attitude towards the original brand after the extension mirrors that of the evaluation of the extension, although the effects are weaker. This may suggest that there is a positive correlation between evaluation of an extension and attitude towards the original brand. A possible explanation is that an incongruous extension not only affects the evaluation towards the extension, but it also affects consumers' attitudes towards the brand itself. This explanation is consistent with past research findings (Aaker 1991).

The results of this study provide some useful implications to marketers who are considering cross gender extensions. Faced with a cross gender extension from an established gendered brand, marketers may want to know the conditions that could increase a chance of success in the extension. The findings of this study suggest that it would be easier for a masculine brand to extend to target female customers than the other way round. The chance of success would be further increased if the product category is a

functional one. This explains why Gillette has successfully extended its shaving product lines to women customers.

However, the findings of this study should be interpreted with the following limitations in mind. Since university students were used in this study, it should be cautioned to generalize the result of this study to other populations. It has been suggested that demographic variables such as age also have an effect on an individual's sex role perceptions, which in turn affects an individual's perception of gender crossing. Another limitation of this study is that only one product category is used to represent each of the functional and the symbolic product categories. The results of this study should also be replicated in other product categories before generalizing the results in future studies.

The Effects of Line Extensions Up and Down in Quality on Initial Choice and Subsequent Switching Tendencies

Timothy Heath, Miami University
Michael S. McCarthy, Miami University
Subimal Chatterjee, Binghamton University

EXTENDED ABSTRACT

Line extensions have been popular for centuries, yet little is known about their effects on choice and switching, issues critical to global branding initiatives. For example, brands taken around the globe increasingly face pressures for lower-quality and higher-quality versions. In China, for example, *Colgate's* regular brand of toothpaste was too high in quality and price for many in this market to afford, leading *Colgate* to introduce a lower-quality toothpaste. The question, then, was whether to put the *Colgate* name on the lower-quality version (e.g., *Colgate Basic*) or adopt a new name altogether. Such decisions have far-reaching implications because they can (1) stimulate initial choice share, (2) influence subsequent switching rates to, and away, from our brand, (3) influence brand equity by way of associations with lower-quality or higher-quality products, and (4) influence brand equity through line-breadth effects, either positive effects resulting from perceived expertise and coverage, or negative effects from diluted image. To help begin answering such questions systematically, this study tests the effects of extending product/brand lines up or down in quality on initial brand choice and subsequent switching. In addition to their implications for practitioners, the results implicate theoretical mechanisms and methodological issues of relevance to decision researchers (e.g., switching rates offering a level test sensitivity beyond that of simple choice).

Design and Stimuli. In Experiment 1, respondents initially chose from two medium quality (MQ) brands (identical in price and quality) and one higher-quality (HQ) higher-priced brand, where all brands were listed by brand name, price, and quality level as rated by the retail chain's consumers. Experiment 2 respondents chose from the same two MQ brands plus one lower-quality (LQ) lower-priced brand. The cover story had U.S. college juniors and seniors imagine taking their first job in the UK, where they were faced with a given shopping decision. Fictitious (supposedly UK) brands were used for two product classes that were counter-balanced between-subjects (pasta sauce and portable CD players). In pasta sauce, the MQ names were *Giovanni's* and *Formaggio's*, where (1) the name of the single HQ brand in Experiment 1 was *Magnifico*, *Giovanni's Magnifico*, or *Formaggio's Magnifico* (varied between-subjects), and (2) the name of the single lower-quality brand in Experiment 2 was *Basiqué*, *Giovanni's Basiqué*, or *Formaggio's Basiqué* (varied between-subjects). Four-hundred-sixty-six respondents were randomly assigned across the various between-subjects conditions in Experiment 1, with the exception of self-selected conditions (e.g., choice at Time-1), and 586 were so assigned in Experiment 2. Experiments 3a and 3b began testing theoretical mechanisms but are discussed only briefly (later) due to inconclusive results.

Procedure. Respondents first chose one of the three brands and then, based on that choice, were directed to another page in their booklets where they chose again in the face of a price discount offered by a non-chosen brand from another quality tier. Key dependent measures were initial choice shares as well as various switching rates across lower and higher-quality brands: switching from a non-extended brand to another such brand (e.g., from *Formaggio's* to *Magnifico*), from an extended brand to a novel brand (e.g., from *Formaggio's Magnifico* to *Giovanni's*), from a

base brand to its extension (e.g., from *Formaggio's* to *Formaggio's Magnifico*), etc.

Initial Choice Results. Brand names had no effect on initial-tier shares in either choice experiment, and the split between the two brands at the MQ level was comparable when neither brand offered a line extension. However, when one MQ brand also offered an HQ extension (Experiment 1), it enjoyed a 2/1 share advantage over its MQ competitor (e.g., when HQ = *Magnifico*, *Formaggio's Regular* = *Giovanni's Regular*, but when HQ = *Formaggio's Magnifico*, *Formaggio's Regular* > *Giovanni's Regular*). No corresponding negative effects of LQ extensions emerged, however, in Experiment 2.

Switching Rates. Experiment 1's non-extension (control) conditions produced symmetric switching up and down in quality at roughly 46%. When HQ was a line extension, however, the standard asymmetry in price competition emerged, where line extensions helped HQ versions both attract new consumers and retain old ones. Discounted-HQ-extensions attracted 57% of LQ choosers but discounted-LQ-brands attracted only 34% of HQ-extension choosers.

In Experiment 2, LQ extensions failed to influence choice shares or switching. At a practical level, marketers may have little to fear from extending brand names to lower-quality versions. In terms of theory, null lower-quality-extension effects may reflect two countervailing forces; a negative effect of the name being associated with lower-quality products, and a positive effect of the name being associated with broader product lines (perceived expertise, sensitivity to consumer needs, etc.). Experiments 3a and 3b began testing this possibility with measures of product perceptions (rated name respect, company knowledge, and overall quality). Although their results echo the patterns seen in the choice experiments, their results remain inconclusive with respect to the possible distinction between quality-breadth and quality-association effects.

Implications. First, line extensions can improve choice shares relative to novel names. Second, even if higher-quality extensions do not increase shares of the line-extended version, they can increase shares of lower-quality versions within their brand family. Third, extending a name to a higher-quality version can, relative to a novel name, improve that version's competitiveness by (1) increasing its ability to steal consumers from competitors, and (2) increasing its ability to retain consumers in the face of competitive attacks. Fourth, decision researchers can increase the sensitivity of their tests by assessing not only choice, but switching. Switching rates away from a target alternative reflect the same type of resistance-to-persuasion measures popular in attitude research, and switching rates to targeted alternatives reflect future persuasive power, in this case, an additional measure of brand equity. Such switching rates, moreover, mimic a marketplace dynamic of particular interest to practitioners (i.e., long-run (as opposed to initial) choice shares). Fifth, the failure of lower-quality extensions to produce corresponding negative effects suggests, at a practical level, that marketers may have little to fear from extending brand names to lower-quality versions within the product line, although work is still needed to understand such effects theoretically.

Existing Products and Brand Extension Judgments: Does Brand Category Context Matter?

Christopher Joiner, George Mason University

ABSTRACT

This research highlights how less accessible individual products and associations that are part of a brand category can influence consumers' brand-related judgments. Altering the brand category context in which a brand extension is introduced can increase the salience of these less accessible products and associations. In situations where this information is diagnostic, individuals base their extension judgments on a different set of dimensions than they would if the extension had been presented in the context of just the brand name. The data collected provided evidence that these brand context changes affected the temporary representations used to judge a new extension.

INTRODUCTION

Since the early 1980's, the idea of leveraging brand associations through a variety of strategies (e.g., brand and line extensions, licensing, etc.) has received a great deal of attention (see e.g., Broniarczyk and Alba 1994; Keller 1993). As many companies have pursued active brand leveraging strategies, it is increasingly common to observe a series of products that are on the market under a single brand name (Dacin and Smith 1994). This market phenomenon suggests that one of the ways that consumers' product information is likely to be organized is as *brand categories* (Boush 1993; Boush and Loken 1991; Dawar and Anderson 1994). There are clearly other possible organizations of consumer knowledge (e.g., by product categories, consideration sets, usage situations) however, brand categories are of growing importance. As a result, consumers are likely to consider the overall brand category when evaluating new products introduced with an existing brand.

Previous research in marketing has applied concepts from categorization to understand product categories (Loken and Ward 1990), brand categories (Boush and Loken 1991), and brand extensions (Dawar and Anderson 1994). *Mixed-representation* conceptualizations of categorical information include abstract, category level associations, as well as individual member, or exemplar, information (Sherman and Klein 1994). Although many brand category representations are influenced more by their most typical products, a wide range of exemplars and associations in the category may also influence consumers' information processing and judgments.

BRAND CATEGORY STRUCTURE AND BRAND EXTENSIONS

One area in which brand category structure is particularly relevant is consumers' evaluations and processing of brand extensions (Boush and Loken 1991; Dacin and Smith 1994). The relationship between an existing brand category and a new extension clearly influences perceptions and evaluations of the extension (e.g., Aaker and Keller 1990; Bottomley and Holden 2001; Boush and Loken 1991; Zhang and Sood 2004).

Recent research suggests that judgments of a brand extension may be influenced by whether different members of the brand category are made salient, or more accessible, during presentation of the extension. Changing individuals' temporary representations of the brand category, by increasing the accessibility of existing products in a brand category, may have an effect on subsequent brand-related judgments (Chakravarti, MacInnis and Nakamoto 1990; Lord et al. 2004).

Brand Extension Evaluation and "Fit"

A starting point for many conceptualizations of how consumers evaluate brand extensions is that brand affect and brand extension "fit" play important roles (Broniarczyk and Alba 1994; Dawar and Anderson 1994). In the brand extension literature there is a rather loose application of terms such as "similarity," "typicality (goodness-of-example)," "coherence," "relatedness," and "fit" (e.g., Aaker and Keller 1990; Boush and Loken 1991; Broniarczyk and Alba 1994; Dacin and Smith 1994; Dawar and Anderson 1994; Smith and Park 1992). A broader view, based on psychological research on similarity and categorization (e.g., Heit and Rubinstein 1994; Medin, Goldstone and Gentner 1993), suggests that fit is a more global measure that may be based on a variety of dimensions, and the specific context of the judgment may drive which of these are salient (Chakravarti, MacInnis and Nakamoto 1990).

Mixed-representation models of brand categories would suggest that it might be important to consider the role *individual exemplars* and the *breadth of the category* (Boush and Loken 1991; Meyvis and Janiszewski 2004) have on consumers' fit judgments and evaluations of brand extensions. If consumers consider the entire brand category, a different, broader, set of potential fit bases may be salient than would be otherwise, and these, in turn, are likely to influence consumers' judgments.

Flexible Category Representations

Category judgments are dependent upon the subset of relevant exemplars that happen to be momentarily salient or activated at the time a judgment is made (e.g., Bodenhausen et al. 1995; Lord et al. 2004; Sia et al. 1997; Smith and Zarate 1992). Because the subset of activated exemplars can change across time and situations, judgments of the same stimulus can change correspondingly (Bodenhausen et al. 1995; Lord et al. 2004; Sia et al. 1997). This suggests that different, specific individual products, as well as, or instead of, brand names, may play a role in brand extension judgment. Consistent with the notion of graded structure in a brand category, some exemplars and associations are likely to be more accessible than others when the brand is considered. When consumers make judgments about brand extensions, there are likely to be differences in the extent to which various products and associations are retrieved and used.

Typical Products, Context-Independence & Accessibility in Brand Category Representations

Previous category research suggests that many brand category representations are dominated by, and disproportionately reflect, the characteristics of the most typical product in the brand category (Rothbart and Lewis 1988; Smith and Zarate 1992). In many situations consumers give greater weight to prototypically good exemplars when making judgments about the brand category as a whole (Rothbart and Lewis 1988), and particularly, when judging or evaluating new instances of the category. Certain typical products in a brand category, as well as some of their stronger, more accessible associations, are relatively *context independent (CI)* when consumers consider the brand name. Other, less typical, products and associations may be more *context dependent*, only becoming salient in certain situations or contexts or when explicitly made salient

¹This conceptualization of context independence is closely related to the notion of *accessibility* in Feldman and Lynch's (1988) accessibility-diagnostics framework and to the work of a number of attitude researchers (e.g., Hodges and Wilson 1993).

(Barsalou 1982).¹ As a result, brand category representations may be less likely to represent the true breadth, or variability, that exists in the brand category in terms of both products and associations. Consumers may rely on a form of “*prototype heuristic*” (Cherniak 1984; Smith and Park 1992) in evaluating a new extension which may negatively impact those that are somewhat dissimilar from the typical exemplar(s). In many cases only a subset of the information available in a brand category’s knowledge base is used in a concept representation (Barsalou 1982; Sadler and Shoben 1993) for making related judgments. However, recent research on context effects suggests that in the case of multiple product brand categories temporarily salient exemplars and associations may influence consumers’ judgments (Boush 1993; Dawar and Anderson 1994).

Brand Breadth and Individual Product Accessibility

At issue are two types of information that may be made accessible by having consumers consider the entire brand category, each of which may influence brand extension judgments.

Brand Category Breadth. First, when all of the products in the brand category are considered, the true breadth of the brand category is made salient. If this information is seen as diagnostic, consumers should base their judgments on a broader conceptualization of the brand category. In general, wider categories allow for inclusion of a wider range of information than narrower categories (Meyvis and Janiszewski 2004; Park and Hastie 1987; Schwarz 1995). Including both typical and less typical products in the representation of the brand category should influence the standard against which the extension is judged. Recent brand extension research has found mixed evidence for the greater acceptability of brand extensions for broad brands versus narrow brands (Boush and Loken 1991; Dacin and Smith 1994; Meyvis and Janiszewski 2004; Sheinin and Schmitt 1994). However, the focus of this research is on examining judgments of the *same* extension from the *same* brand in different brand category context conditions.

Individual Product Salience. The second factor influencing perceptions of the extension is the relative salience of the brand’s less typical products. When the brand category is highlighted, less typical exemplars are available to play a more significant role in judgments of the new extension (Heit 1992; Whittlesea 1987). In most situations, the brand name or the prototypical products, and their associations are likely to be most salient and to influence brand extension judgments. In this case the first sufficiently diagnostic information retrieved is used for the judgment (Feldman and Lynch 1988). However, as an individual encounters the full range of products in the brand category, they are more likely to consider less context independent individual products and associations which are now more salient (e.g., Barsalou 1986; Lord et al. 2004).

Relevance/Diagnosticity of the Brand Category Context

The perceived *diagnosticity*, or *relevance*, of this new information must be considered as well (Broniarczyk and Alba 1994; Feldman and Lynch 1988). The brand category context should be seen as diagnostic for consumers’ judgments and processing when there is a *discernible link* between the extension and the brand category. In this context, it is the presence of some perceived similarity between the extension and an existing product in the brand category that is hypothesized to be the determining factor. Without this connection to the brand category, the extension should not benefit from the increased accessibility of either the category’s breadth or of its less typical products and associations.

We focus on moderately atypical, or poor fitting, extensions that are not similar to any of the brand’s typical products. In most situations, the typical products are the ones which influence brand-related thinking, and the extension would be viewed as a poor fit and

evaluated relatively poorly. Having consumers consider the entire brand category is expected to change these judgments.

Hypotheses. The previous sections suggest that an extension will be judged differently across different brand category contexts.

Fit. Consumers’ fit judgments of an extension with a link to the brand category are expected to be influenced by expanded brand category contexts, highlighting either a single atypical member of the brand category or the entire brand category. The extension should be rated higher with respect to fit in these contexts than in the context where just the brand name is present. Each of these contexts emphasizes one of the conceptual factors (brand breadth or individual product salience) to a greater extent than the other. When the entire brand category is highlighted (all-brand-products condition), the breadth of the brand category will likely be most salient, although the similarity between the extension and the similar atypical existing product in the brand category is likely to be salient as well. When just the atypical existing product is highlighted (atypical-product condition), the similarity between it and the extension is likely to be most salient, although this context may also increase perceptions of the breadth of the brand category. Although it is difficult to make predictions about which factor may be stronger, the effects on judgments are expected to be greater when the full brand category is presented.

- H1:(a) Fit judgments for a brand extension with a link to the brand category will be greater when the full brand category is made salient than when either a single atypical product or no brand category elements are highlighted. (b) Fit judgments for a brand extension with a link to the brand category will be greater when a similar atypical product is made salient than when no brand category elements are highlighted.

Fit ratings for an extension *without* this explicit link to the category should not be affected by any of these expanded information contexts, since with no link to the brand category, the more salient information should not be seen as diagnostic for fit judgments.

- H2: Fit judgments for a brand extension without a link to the brand category will be no different when the full brand category is made salient versus when a similar atypical product is made salient or when no brand category elements are highlighted.

Evaluation. Past research suggests that typical category members are linked more closely to the affect of the category (cf. Barsalou 1983; Loken and Ward 1990). As a result, extension evaluations should follow a pattern similar to the one described above for the fit measures.

- H3:(a) Evaluations of a brand extension with a link to the brand category will be greater when the full brand category is made salient than when either a similar atypical product or no brand category elements are highlighted. (b) Evaluations of a brand extension with a link to the brand category will be greater when a single atypical product is made salient than when no brand category elements are highlighted.
- H4: Evaluations of a brand extension without a link to the brand category will be no different when the full brand category is made salient versus when a similar atypical product is made salient or when no brand category elements are highlighted.

STUDY & EMPIRICAL RESULTS

Two brand categories (Haagen-Dazs and Levi's) were selected through a series of preliminary pretests. In order to test the hypotheses presented above, the study made use of a 2 X 3 X 2 factorial design. The first factor was the *type of extension*. Pretests were used to develop two extensions which differed in one critical respect. One extension was chosen to have a link, or connection, to the brand category by being similar to an atypical existing product in the brand category (linked extension). The second extension was not seen as being similar to any existing product in the brand category (non-linked extension). For the second factor, the brand extensions were presented (between-subjects) in one of three different *brand category information contexts*. In the brand-name-only condition, the brand extensions were presented with only the brand name mentioned. This context acts as a control condition against which the other conditions can be compared. In the all-brand-products condition, the extensions were described in the context of all of the existing products in the brand category. The extensions were also presented in an atypical-product condition which mentioned the brand name and a single atypical existing product. Finally, the last factor in the design was *brand category replicate presentation order*. The two brand categories were used as within-subjects replicates in this study.

Pretests. In order to develop the stimuli for this study, a series of three pretests were carried out.

Pretest 1 and 2. In the first pretest, 24 subjects generated a list of potential brand extensions for use in the remaining pretests. The purpose of the second pretest ($N=19$) was to find two extensions for each of the brand names. Eight extensions were tested for each brand. Subjects rated each extension's similarity to each of the existing products in the two brand categories on a scale from 0 (very dissimilar to) to 10 (very similar to). The Haagen-Dazs linked extension was *flavored coffee* (similar to Haagen-Dazs *liqueur*, $M=6.11$) and the non-linked extension was *hot chocolate mix*. The Levi's linked extension was *shoes* (similar to Levi's *socks*, $M=6.47$) and the non-linked extension was *cologne*. The two pairs of extensions were equally evaluated and were seen as equally poor fitting extensions. The Levi's brand was associated with a broader set of products (6.89 vs. 4.47, $t(18)=3.26, p<.005$) on an 11-point scale rating the perceived number of items available under the brand name (Brand X offers only one product-Brand X offers a wide variety of products; cf. Sheinin and Schmitt 1994).

Pretest 3. A final group ($N=41$) rated the perceived breadth of the brand categories after reading one of two descriptions of the brand: with all of the products mentioned or with the single, atypical, product mentioned. Although, the full brand category description lead to greater brand category breadth perceptions, this measure was included in the main study as a check on this in the context of the different brand extension announcements. Finally, subjects rated the stimuli to be used in the main study on four 7-point scales. The stimuli were rated as simple, easy to understand, believable, and clear for both brand categories ($M_s=5.76$ to 6.00).

Experimental Procedure. Undergraduate students ($N=193$) participated in the study during class time and were randomly assigned to the same experimental condition in both brand category replicates. The study used mock-ups of new product announcements from *The Wall Street Journal*, introducing the extension in one of the three contexts described above. Subjects were asked to "form an overall opinion of the new product, the brand and its existing products, and the announcement." Both the new product information and the brand category context were included in the new product announcements which focused on introducing the new product and presented a minimal amount of neutral product information.

Dependent Variables. Existing measures of similarity (overall), typicality, fit, and coherence were used to measure consumers'

judgments of the "fit" of the brand extensions. Evaluations of the extension were measured on three 0-10 semantic differential scales (unfavorable/favorable, very negative/very positive, poor/excellent). Respondents were asked a series of closed-end questions, ranging from 0 (disagree) to 10 (agree) regarding the process they used in evaluating the extensions, e.g., "In evaluating the new brand extension I compared it with Levi's jeans" (Wansink and Ray 1996). Perceptions of the breadth of the brand category were measured on the scales from Pretest 2. Finally, respondents also rated each new product announcement on the four scales described in Pretest 3. The non-summed, individual fit items were analyzed using a principal components factor analysis with a varimax rotation. For both brand categories, all six of the items loaded on a single factor (all loadings $>.632$). Correlations among the six revealed an extremely close relation between the items, and the coefficient alpha for a measure summing the six individual items was above .93 for both brands. As a result, analyses were conducted on this composite fit measure (FITCOMP).

Believability Screening. The new product announcements were seen as simple, easy to understand, and clear for the Levi's replicate ($M_s=5.73, 5.84, 5.69$) and for the Haagen-Dazs replicate ($M_s=5.83, 5.82, 5.70$). The product announcements were rated as believable in both brand categories (Levi's $M=5.66$; Haagen-Dazs $M=5.67$). However, in spite of the high overall means, there were individual respondents who did not find the announcements believable. For these respondents, the entire survey was likely to be suspect so this question was used as a screening device. There were no significant differences in the number of screened respondents across the 12 experimental conditions in the two brand replicates and cell sizes ranged from 21 to 27.

Order Effects. Order main effects and interactions were not significant in either brand category replicate and the data was collapsed across order conditions.

Category Breadth Ratings. Changes in category breadth perceptions were central in the conceptual development of the hypotheses, however, it was unclear whether presenting a brand extension in the context of the full brand category would have the same impact on brand breadth perceptions as presenting the extension in the context of a single, atypical, existing product. Both the brand category and atypical product contexts were expected to increase ratings versus the brand name only condition. For the linked extension Levi's brand breadth judgments were not significantly different in the all-brand-products ($M=7.14$) and atypical-product contexts ($M=7.29$; $t(44)<1$) though both were significantly greater than in the brand-name-only context ($M=5.50$; $t(42)=2.28, p=.026$ and $t(44)=2.55, p=.013$ respectively). For the non-linked extension the results were somewhat different. Once again breadth ratings in the all-brand-products ($M=6.86$) and atypical-product ($M=5.92$) contexts were not significantly different ($t(44)=1.29$), however, although the breadth ratings were higher in both these contexts than in the brand-name-only context ($M=5.71$), only the increase in the former approached significance ($t(41)=1.53, p=.133$).

Why were these breadth effects different for the two Levi's extensions? It seems as if the nature of the extension itself may have some influence on breadth perceptions. It is possible that the cologne extension was viewed as different (more so than the linked shoe extension) from the Levi's brand category. In this situation, since its

²Although in Pretest 2 both the shoes and cologne extension typicality ratings were moderate, and equivalent, in the main study brand-name-only (i.e., control) conditions, shoes were rated as a marginally better fit ($M=5.39$) than cologne ($M=4.25, t(41)=1.96, p=.057$).

introduction already represents a broadening of the category, it may have overwhelmed the presented brand category or atypical product context information.²

For the Haagen-Dazs linked extension, brand breadth judgments were significantly greater in the all-brand-products ($M=6.43$) than in the atypical-product context ($M=3.80$; $t(44)=3.13$, $p=.003$) and both were greater than in the brand-name-only context ($M=2.39$; $t(42)=5.21$, $p=.000$ and $t(46)=1.90$, $p=.062$). For the non-linked extension, although the breadth ratings were higher in the all-brand-products ($M=6.36$) and atypical-product contexts ($M=4.91$) than in the brand-name-only context ($M=4.88$), only the increase in the all-brand-products context was significant ($t(44)=2.05$, $p=.044$). In contrast to the Levi's condition, the all-brand-products context increased breadth perceptions even for the non-linked extension. Haagen-Dazs hot chocolate mix may not have been seen as different from the Haagen-Dazs brand as cologne was for the Levi's brand.³ As a result it may not have overwhelmed the additional product information to the same extent.

Hypotheses Testing. In order to test the hypotheses, a series of planned comparisons between the two expanded brand category context conditions and the brand-name-only context were conducted.

FITCOMP. In the Levi's brand replicate, although the results were directionally as expected, there was only partial support for H1(a): the linked extension's fit was significantly greater in the all-brand-products condition ($M=6.51$) than in the brand-name-only condition ($M=5.39$, $p=.043$), however, it was not significantly greater than in the atypical-product condition ($M=6.00$). The Haagen-Dazs data did not support H1(a): the linked extension's fit was not significantly greater in the all-brand-products condition ($M=5.04$) than in either the brand-name-only condition ($M=5.08$) or in the atypical-product condition ($M=5.51$). H1(b) was not supported in either brand replicate, since fit judgments in the atypical-product condition were not significantly greater than in the brand-name-only condition.

H2 predicts that there would be no differences in fit judgments of a non-linked extension across any information contexts. In support of H2, none of the mean fit judgments for the Levi's extension ($M_s=4.02$, 4.07, 4.25 for the all-brand-products, atypical-product, and brand-name-only conditions respectively) or the Haagen-Dazs extension ($M_s=5.61$, 6.52, 6.17 respectively) were significantly different.

Fit Measure Summary. There was a noticeable difference between the results for the two brand replicates. In spite of the fact that the Haagen-Dazs brand was perceived as being broader in the two expanded contexts there were no effects of these "expanded" contexts on the linked extension fit judgments. The closed-end processing responses were examined. Acknowledging that retrospective processing question have limitations, the data provide some interesting insights into the observed fit results. There were very few differences in the responses to any of these questions across the three brand extension information conditions for either the non-linked extension or for the linked extension. This was to be expected for the non-linked extension since the information about the products in the brand category was not expected to be diagnostic. Unexpectedly, there was only one significant and one marginally significant increase for the linked extension. Subjects reported comparing this extension marginally more often to "liqueur" in the all-brand-products context ($M=2.81$) than in the brand-name-only context ($M=1.26$; $t(42)=1.69$, $p<.10$). They also reported comparing the

extension to "all Haagen-Dazs products" more often ($M=4.52$ vs 2.44; $t(42)=2.09$, $p=.04$). These processing results while consistent with our conceptual perspective, show that the context had little impact on processing of the extension. One possible explanation for this focuses on the nature of the products in the Haagen-Dazs brand category. All of the products in this brand category, with the single exception of the atypical product, *liqueur*, are frozen desserts. It is possible that presenting the entire brand category simply reinforced the association consumers have between Haagen-Dazs and "frozen desserts". In the all-brand-products context, consumers may have acknowledged that Haagen-Dazs made more products than they usually thought, but since they were all frozen desserts, this information may not have "helped" judgments of the extension. This would suggest that the extension should have been seen as a better fit in the atypical-product context than in the all-brand-products context, since the "frozen dessert" associations may not have been as salient. In fact, the means were consistent with this line of reasoning, although not significantly so.

The Levi's results were much more consistent with the two fit judgment hypotheses. Again, the results of the closed-end processing questions provide some additional insight into these effects. As conceptualized, for the linked extension there was a significant increase in reported comparisons to "socks" (i.e., the atypical existing product), to "a different Levi's product (other than jeans or socks)," or to "all Levi's products" in both the all-brand-products and atypical-product conditions when compared to the brand-name-only condition. Despite the fact that additional information about existing products in the brand category was presented, the lack of a link between cologne and the brand category caused the information to be seen as less diagnostic. For the non-linked extension, no piece of information was used significantly more in either expanded condition. Fit judgments of the Levi's linked extension were greater when presented in the all-brand-products condition as compared to the brand-name-only condition. However, there was no significant difference between extension fit judgments in the all-brand-products and atypical-product conditions and breadth judgments in both conditions were virtually indistinguishable. This raises the question of whether there are any differences between the all-brand-products and atypical-product contexts. In spite of the equal breadth judgments, there is evidence that something may be changed when all the products are presented. According to the processing questions, subjects compared the linked extension to "a different Levi's product (other than jeans or socks)" and to "all Levi's products" to a greater extent in the all-brand-products condition than in the atypical-product condition. These data suggest that factors other than breadth may be influencing brand extension fit judgments. Broader categories tend to be more flexible, allowing less typical exemplars to be considered better members of the category than they would be in a narrower category (Honeck and Firment 1989). The all-brand-products context also provides explicit information about all the specific products that make up the brand category. This information about the entire distribution of products in the brand category may provide additional flexibility with respect to acceptance of a new extension above and beyond the information provided in the atypical-product context.

Brand Extension Evaluations. For both brand replicates, neither H3(a) nor 3(b) are supported. No differences in evaluations for the linked extension were observed across any of the information contexts (Levi's $M_s=6.83$, 6.46, 6.44 and Haagen-Dazs $M_s=5.97$, 6.18, 5.86 for the all-brand-products, atypical-product, and brand-name-only conditions). In both replicates, and consistent with H4, no differences in extension evaluations were found between any of the information contexts for the non-linked extension (Levi's $M_s=5.18$, 5.08, 5.29 and Haagen-Dazs's $M_s=6.65$, 7.15, 6.89).

³In the brand-name-only condition, Levi's cologne was seen as a poorer fit ($M=4.25$) than Haagen-Dazs hot chocolate mix ($M=6.17$; $t(43)=3.11$, $p<.05$).

Extension Evaluation Summary. The main evaluation effect was not supported in either brand replicate. It is possible that evaluation effects are more distal, occurring gradually after fit judgments have already been influenced. Over time, extension evaluations might reveal the same effects. It is also conceivable, however, that the magnitude of the fit judgment effects observed in this study were not large enough to produce changes in extension evaluations. A final possibility is that extension evaluation effects may be limited to situations where extensions are evaluated more poorly to begin with. In the Levi's replicate, both the non-linked extension ($M=5.29$) and the linked extension ($M=6.44$) were evaluated above the scale midpoint in the control conditions. It may be that if an extension is already evaluated somewhat positively improvements in fit perceptions do not carry over to extension evaluations. In these situations, other factors, like direct experience, may be required to change extension evaluations.

GENERAL DISCUSSION

Overall, the results of the study provide moderate support for the influence that different brand category contexts have on consumers' brand extension judgments. There are a few themes which emerge from the results.

Brand Category Replicates. As previously reported, there was a different pattern of results for the two brand category replicates. The results for the Levi's brand replicate were more consistent with the hypotheses. These differences suggest that other important brand category-specific factors may exist that can influence the extent to which different contexts influence brand-related judgments. Investigating these additional factors is an important future research topic.

Linked vs. Unlinked Extensions: Brand Category Relevance. The strongest results in the Levi's brand replicate were the differences in the effects the various brand category contexts had on judgments of the two types of extensions examined. Only the linked extension was affected by changes to the context in which the extension was introduced. The processing questions provided further evidence of this difference. These differences did not carry over to extension evaluations in contrast with the prediction made by H3.

All-Brand-Products vs. Atypical-Product Contexts. It was hypothesized that the effects of changing the brand category context would be greater in the all-brand-products context than in the context where a single atypical product was mentioned. The data addressing this distinction were somewhat unclear. Supplemental processing measures provided some evidence that the all-brand-products context had a greater impact on brand-related judgments, but the evidence is certainly not conclusive on this issue.

This research takes an important step in acknowledging the role of individual products, the relative salience and accessibility of these products, and individuals' temporary brand representations, in brand-related information processing, all of which have been previously under-examined aspects of brand research.

SPECIAL SESSION SUMMARY

Living Legacies: Exploring Influences on Family Consumption Behavior

Eric J. Arnould, University of Arizona

Amber M. Epp, University of Nebraska

SPECIAL SESSION OVERVIEW

Family legacy offers a unifying construct through which to view diverse areas of family consumer research. Family legacies are studied across disciplines including family therapy (Gold and Morris 2003; King and Wynne 2004;), psychology (Bennett, Wolin and McAvity 1988), family studies (Piercy and Chapman 2001), accounting (Swaim 2004), communication studies (Vangelisti, Crumley and Baker 1999), literature (Stone 1988) and family nursing (Plager 1999). With its origins entrenched in the psychology and family therapy literatures, researchers often focus on how to change or re-edit the family legacy, as a way of transforming negative and constraining themes. Few researchers have examined positive outcomes related to family legacies.

Plager (1999) defines legacy as “a living tradition, an aspect of the family’s life world reshaped over time in a family’s particular situation and influenced by family, culture, and society” (p. 52). Family legacies are built, preserved, enacted, and fluctuate. They are living traditions that both the tacit and explicit consumer behaviors of families continuously amend and rework. Finally, and most importantly for consumer researchers, the family myths, life themes, and group conceptions that form a significant part of legacies influence people’s lives as consumers and beyond (Bennett, Wolin and McAvity 1988; Papp and Imber-Black 1996). While intergenerational studies in consumer research reveal that consumption practices are transferred between generations (Moore-Shay and Lutz 1988; Moore, Wilkie and Lutz 2002), fewer studies could be classified as exploring the centrality of family legacies in this arena (Curasi, Price and Arnould 2004; Kozinets et al. 2005). Whether family members wholeheartedly embrace their family legacies or vehemently reject them, research suggests that family members are undeniably influenced by their family legacies (Stone 1988).

Exploring new theoretical and empirical views of family consumption behavior as it relates to families’ intergenerational legacies, the session addressed family legacies in the form of lasting themes or family myths that shape behavior and through an examination of both alienable and inalienable wealth that represent and constitute intergenerational family legacies. Collectively, the papers represent meso-level theorizing of family consumption behavior. The papers drew on a variety of disciplinary and methodological approaches that made the session dynamic and enlightening.

We began our exploration of family legacies with a presentation by Amber Epp, co-authored with Eric Arnould, underscoring how family legacies, conceptualized as lasting themes, influence consumption behavior. This presentation examined both the processes of influence and consumption-related outcomes. In other words, these researchers examined *how* family legacies influence consumption behavior in families. The first presentation extended on prior theoretical research that posited a model of family identity enactment (Epp and Price 2005) and described the results of a study based on projective techniques. The second presentation by Carolyn Curasi addressed the distinctive value of inalienable wealth in embodying and transmitting family legacies across generations of family. This paper, based on an ongoing study of inalienable wealth, examined dyadic depth interview and survey data. The third presentation by Tonya Williams explored alienable assets, in the form of money, as a resource for building and transferring family

legacies. Williams used in-depth interview data and investigated the role of inter vivos monetary gifts in transferring shared familial meanings. To summarize, the session examined legacies of beliefs, values, and family meanings that can be passed across generations of family and are central to a collective sense of identity.

Drawing on his knowledge and research on families, Suraj Commuri served as discussion leader in the session. Commuri’s thoughtful commentary sparked discussion on the career of commitment to a legacy, considering the formation, acquisition, adaptation and reformation of legacies over time. Specifically, audience members contemplated the process of legacy transformation, survival and failure in light of disruptions, such as when associated objects, possessions or alienable assets are destroyed.

“Enacting the Family Legacy: How Family Themes Influence Consumption Behavior”

Amber M. Epp, University of Nebraska-Lincoln

Eric J. Arnould, University of Arizona

Consumer researchers have demonstrated links between families’ consumption behavior and their collective identities (Belk 1988; Epp and Price 2005; McCracken 1989; Moisio, Price and Arnould 2004). Constituted within a family’s identity, overarching family themes or legacies have been recognized by scholars and clinical practitioners alike. Family themes can reflect shared values related to work, religion and family life (King and Wynne 2004). For instance, common legacies reported by the families in our sample included legacies of close/supportive, faith/service, health/athletics, hard work, and others. While family legacies are powerful drivers of behavior (Papp and Imber-Black 1996), we know little about their influences on consumption-related behavior in particular. As such, the research question guiding this paper is “how do family legacies/themes influence family consumption behavior?” Specifically, we examined the intersection of socialization processes, family legacy enactment and consumption outcomes.

This project draws on a model of family identity enactment, which posits that families enact their identities in various communication forms such as rituals, narratives, intergenerational transfers, and everyday interactions, and that consumer activities serve as symbols of family identity enactment (Epp and Price 2005). Our current paper extends this idea by examining family legacies as the embodiment of a family’s identity. It argues that consumption behaviors are one way in which families enact their legacies.

We employed a projective technique which is an appropriate method for “understanding consumers’ inner thoughts and feelings...[about] what consumers often cannot or will not verbalize in more direct, verbal measures such as interviews and surveys” (Chang 2001, p. 253). Following Belk, Ger and Askegaard (1997, 2003), we used projectives to elicit participants’ family themes. Forty participants constructed collages representing their families’ identities and wrote essays detailing their interpretations. The interpretations were filled with narratives about their families, and family legacies were prominently featured in the data. Analysis of written narratives is consistent with the dominant methods for studying family legacies (Androutsopoulou 2001; Vangelisti et al. 1999).

To outline our theoretical contributions, we review relevant literature across disciplines beginning with how family legacies are

passed between and within generations of family. The literature addressing this process mirrors socialization processes in consumer research that focus on family communication patterns (John 1999; Moschis 1985). For instance, a wide body of research connects the transmission of legacies to family storytelling (Fiese et al. 1995; King and Wynne 2004; Vangelisti et al. 1999). In addition, Bolea (2000) asserts that each generation influences the philosophies and themes of descendants through direct messages and replication of behavior. Similarly, Stone (1988) describes evidence of families using a family member as a model for the legacies or themes they wish to reproduce. Other forms of transmission include “kin keeping” practices like sharing family photos or passing on family recipes, music, or rituals. Finally, family legacies can be preserved, constructed and enacted in the transmission of families’ inalienable wealth (Curasi et al. 2004).

While our findings confirm the transmission of legacies through narratives, family interaction, modeling, and verbal instruction, we found that enacting and passing on legacies within the family is complex. Specifically, our data reveal the relationship between a family’s legacies and individual family members’ commitment to those legacies is dynamic. In some cases, individuals embraced and/or extended the legacies and in other cases, participants rejected the legacies. Thus, consumer socialization is challenged, contested and fueled by activities related to family legacies. In addition, scholars should pay attention to family legacies because they moderate the formation and development of both familial and individual identity projects.

A few important questions emerged from this data that we could not address in this study. First, how do differences in commitment to family legacies relate to consumption outcomes? We might speculate that when individuals embrace family legacies, we would see continuity in family identity, a continuance of intergenerational transfers and loyalty to products, brands, or activities that support that legacy. On the other hand, when family members reject legacies, we might observe tension between individual and family identity, adoption of alternative consumption behaviors, and dissipation of intergenerational transfers related to the legacy. Second, what might we learn by adopting a developmental perspective? Just as dominant narratives and ideologies are challenged, reshaped and sustained, examining family legacy enactment over time might suggest that family legacies that are inconsistent or rejected are, at that particular point in time, being challenged by individual family members. This would suggest that rejection/inconsistency is part of the process of reshaping legacies over time.

Researchers have also demonstrated direct links between family legacies and behavioral outcomes. For instance, as Papp and Imber-Black (1996) argue, central themes underpin individual and family decisions and behaviors. As such, our behaviors, and subsequent stories about our behaviors, reinforce the family legacy (Stone 1988). Further, themes “regulate interaction with the external world and can influence interpersonal involvement within the family” (Bennett, Wolin and McAvity 1988, p. 212). Emergent themes in our data offer indications of the diverse and evocative influences that family legacies have on consumption behavior, particularly related to collective identity. In particular, families in our study selected consumer activities based on their fit with the legacy: shaping the activities and services families elected to participate in, the products and brands they selected, their attitudes toward media and in a few cases, their decision-making processes. Interestingly, legacy types were differentially related to consumption outcomes. For instance, legacies of sophistication, frugality, and hard work were reflected in the attitudes family members had

toward consumption. Whereas, legacies of health, education, hard work, and closeness were related to the products these families purchased. This is surprising because it seems that if legacies provide a blueprint for action, each of the legacies should direct consumption behavior. The content of the legacy should not matter, but it does! More research is needed to delineate these differential relationships.

Papp and Imber-Black (1996) demonstrate that themes operate at many levels and trace the evolution of themes intergenerationally. The last pattern that emerged from the data was that in families with strong intergenerational influences, legacies were reflected in more categories of consumer behavior. For these participants, legacies that could be traced through their families to their grandparents or even great-grandparents seemed to be more pervasive with regard to consumption outcomes. The intergenerational literature reveals that families transfer brands, attitudes and behaviors across generations (Moore, Wilkie and Lutz 2002). However, consumer researchers have yet to delineate what differentiates families who engage in intergenerational transfers from those who do not. We speculate that family legacies offer one underlying process for explaining intergenerational consumption practices.

“Maybe it IS Your Father’s Oldsmobile: The Construction and Preservation of Family Identity through the Transfer of Possessions”

Carolyn F. Curasi, Georgia State University

In recent years there has been a growing body of literature providing insights about familial and individuals’ cherished possessions. These investigations, however, are typically qualitative projects with small purposive samples that could be influenced by self selection bias. This research project seeks to examine the pervasiveness of some of the most common themes emanating from these previous investigations. In exploring family possession transfers and the associated family identity that may also transfer, many literature streams inform this investigation including: cherished possessions; identity and values; intergenerationally transferred possessions; family communication; storytelling; and human memory.

Possessions play a profound role in the construction and preservation of personal identity (Csikszentmihalyi and Rochberg-Halton 1981; Mehta and Belk 1991; Belk 1988; Gentry, Baker, and Kraft 1995; Kleine, Kleine, and Allen 1995). We are able to extend ourselves and thus our identities through our possessions, our family members and the cultures within which we are embedded (Belk 1988). Some familial possessions serve as symbolic vehicles with the ability to extend the familial group forward in time. Through the achievements of our ancestors we are able to bask in the glories of their accomplishments (Curasi, Price and Arnould 2004; Weiner 1994).

Individual’s values are deeply patterned and personal, essential for understanding our personal identity. We become committed to those identities that best enable us to express values we feel most strongly about (Erickson 1995; Gecas 1986; Hitlin 2003). Although the role of possessions in constructing and preserving personal identity has received a great deal of attention, the role of possessions in the construction and definition of family identity has received relatively little research attention (Epp and Price 2005).

Possessions transferred intergenerationally are bundled with object stories, serving as a means to educate and socialize younger family members (Price, Arnould and Curasi 2000). The stories we hear in early childhood become important frames of reference or mental models that later influence our behavior, including our

consumption behavior (Connerton 1995; Schank 1996; Zaltman 2003). We remember by telling stories (Engel 1999; Schank and Abelson 1995) and thus, family stories attached to tangible objects such as family heirlooms can be a very effective way to communicate rich life lessons to younger family members.

This project took place in two phases. First, qualitative data were examined for overarching themes. In addition, family possession origin stories were examined for the lessons and values communicated by the ritual retelling of these stories. In the second phase of this project the pervasiveness of the main themes generated in the first phase of this project were examined with data from a random, national mailed sample collected in the spring of 2005. Two hundred and fifty three respondents between the ages of 18 and 93 responded, for approximately a nine percent response rate.

Possession stories commonly included lessons that served to teach and communicate with younger family members about strongly held family values. These possession stories were thick with messages about family values, and illustrated family values such as: the status and esteem of the family lineage and name, valuing of art and culture, the innate ability of the lineage to overcome hardship; the importance of carefully selecting a spouse; patriotism; and the importance of family and marriage; and the valuing of religion.

In addition, supporting previous investigations, many of our informants communicated their desire to know that their cherished family possessions would be passed forward through their lineage. Our informants discussed their hope that younger family members would understand and pass forward the possession stories as well as the favorite object. In depth interviews informants discuss their heirlooms as being their heritage, reflecting their personal identity.

The quantitative results suggest that many of the responses of informants in the qualitative research can be generalized to a far larger population. For example, to the statement, "My most cherished possessions reflect who I am," sixty-seven percent of our sample agreed. Almost as many, sixty-one percent, of our informants also agreed with the statement, "My family possessions communicate our family values." A very large percentage of respondents, eighty-six percent, agreed with the statement, "I hope my loved ones will care about my cherished possessions." Ninety-five percent of respondents also revealed they plan to pass on family possessions to family members. Responses to these statements as well as others in the survey provide preliminary evidence that the ideas and intentions of many informants in previous interpretive investigations can be found in the general population. Respondents also reveal a strong symbolic element to their most cherished possessions that gave these items a value that far exceeded their monetary value.

Consistent with a growing body of qualitative research, a majority of respondents: feel that their cherished possessions reflect who they are; hope that their loved ones will care about their cherished possessions; plan to pass on family possessions to family members; and feel their family possessions communicate their family values. The comments, attitudes and hopes reflected in qualitative research projects were found to be pervasive in the national, random mailed survey.

Values are communicated and transferred via the stories that are bundled with cherished possessions. These stories serve as an extremely effective format with which to teach and communicate family identity and family values (Connerton 1995; Zaltman 2003). Thus, this research suggests that consumers are socialized about those values that their older family members hold dear via the storytelling rituals associated with intergenerationally transferred possessions. Because the human mind functions not by processing letters and words but through processing images, and metaphors,

attaching storytelling to cherished family possessions increases the potential for future family members to be educated about the values viewed as important by the older members of the family (Connerton 1995). This research suggests that there is a pervasive desire to learn family stories and to pass those forward through the lineage.

This research stream could benefit from data that includes respondents that were under-represented in this sample, such as Hispanics and African-Americans as well as a larger percentage of younger informants.

"Money and Meaning: The Role of Social Bonds and Capital in Inter Vivos Gifting"

Tonya P. Williams, Northwestern University

...as I was graduating from college, I was about 22, and my Dad told me to invest at least \$100 each month... my Dad's instruction is partly responsible for me deciding that I wanted to become a millionaire by the age of 40. (African-American, Male, 30s)

I grew up in a family business—the family was a part of the business and the business was a part of the family.... (White Female, 40s)

My aunt owned this salon—she moved into the building when it was first built and I worked with her when I was younger...I came back...when she retired...I kept some of her clients too... (African-American Female, 50s)

...on my 8th birthday my grandfather anointed me the future leader of two large corporations... inheriting Coca-Cola stock developed [business] interests which are now managed by the 4th generation of our family... (White Male, 80s)

Consumer research includes several facets of the consumption experience, yet the literature is sparse on the role of assets in consumption. In the lives of these informants and extant literature we observe that assets encompass, imbue, and transfer meanings (Belk and Wallendorf 1990). I examine inter vivos asset gifting to construct a theory of how alienable assets transfer meaning in contemporary American families. My research considers the allocation of assets to mental and emotional budgets and the role of the respective budgets in meaning transfer.

Gifts are the most common type of assistance between generations (Cheal 1996). Gift giving is an embedded process of social exchange and communication (Mauss 1967; Sherry 1983) serving to establish, maintain, and alter social roles (Otnes et al. 1993). Further, gifts serve higher-order needs of love and self-actualization (Belk 1996). The propensity to provide an inter vivos asset gift is related to an individual's access to means, desire, and available transfer options. Wealth in America is equally distributed across three categories: business and real estate, home equity, and stocks and bonds, though there are differences in asset composition across class (Weicher 1997). Very wealthy Americans have income producing assets, such as businesses, real estate, equities, or trusts, typically involving enduring relationships. The majority of the population have assets resulting from specific transactions requiring minimal relationship persistence, such as the purchase of principal residences, automobiles, or life insurance (Kennickell et al. 1996). Though few inherit, many receive inter vivos asset gifts.

Americans' acquisition thirst has been studied broadly, however there is a dearth of research concerning assets individuals use to achieve goals. Money has a social component, though few

researchers have considered money beyond a vehicle of exchange (Zelizer 1989; Zhou and Pham 2004). Gifts of alienable assets have not been broadly studied, however relationships supporting gifting of heirlooms have been examined and contributed to theories of meaning transfer (Curasi et al. 2003; Price et al. 2000). Researchers have also shown that alienable assets are imbued with meaning and emotion (Belk and Wallendorf 1990), yet the literature is silent regarding gifts of alienable assets as vehicles for transferring meaning.

Family, consumption, and wealth accumulation have been primarily examined through the frame of the life cycle model, and non-income related influencers. Family and non-income related influencers have been included in the study of meaning creation and transfer in consumer behavior (Curasi et al. 2003; Otnes et al. 1993; Price et al. 2000). Consumer researchers have examined gift giving as transferring family legacy, or achieving symbolic immortality through tangible possessions. This literature has focused primarily on the transfer of inalienable possessions (Weiner 1992) and the implication for family relationships (Curasi et al. 2003). Though this literature speaks to meaning transfer processes, it does not address how meaning is maintained across generations when assets have salient alienable characteristics.

The role of money as a vehicle for meaning as well as a resource for consumption is a critical piece of the consumer behavior puzzle. Through understanding how individuals acquire and account for resources, I present a model of alienable assets as vehicles of meaning transfer. The model put forth describes how assets traverse market and family space as well as mental and emotional budgets in the creation and transfer of meaning across relationships.

Brand Dislike: Representing the Negative Side of Consumer Preferences

Daniele Dalli University of Pisa
Simona Romani, University of Sassari
Giacomo Gistri University of Pisa

ABSTRACT

There has been a recent increase in consumer research on the topic of brand dislike: it can be defined as the negative judgment expressed by the consumer and/or implied in the choice not to buy. The sparse literature in this field is fragmented into different streams of research that will be reviewed in this paper: a) consumer criticism and resistance b) dislike as a means of communicating and constructing self image, and c) consumer/brand relationship. After the literature review, the method and results from fieldwork will be presented. The data converge towards a unitary and consistent framework, in which various levels and factors can be interpreted in the light of the theoretical perspectives outlined above.

INTRODUCTION

Brand dislike can be considered as a “dark side” of consumer preferences because the literature has not dedicated the same effort to this topic as has been devoted to the analysis of positive attitudes and evaluations. The purpose of this paper is twofold: first of all, we will summarize extant, fragmented literature within a single framework. Secondly, relying upon qualitative data, we will give a descriptive picture of what brand dislike means, from the customers’ perspective.

FRAMEWORK AND LITERATURE

The research available on negative evaluations of products and brands is very limited, especially when compared to the research done on positive attitudes. This asymmetry is understandable, particularly in the marketing field: companies and institutions are very much interested in the practical consequences of positive forms of knowledge. They want to know what we want and are willing to buy (choose, vote, etc.).

On the contrary, this asymmetry is difficult to justify on a theoretical level considering that, in order to better understand and explain purchase and consumption behaviours, it is necessary to put both positive and negative aspects in the same framework. This statement will appear more relevant at the end of the literature review, reported below.

Actual research on negative attitudes towards brands and their related behaviours is fragmented in a number of perspectives, as emerges from the following examples.

Think about Disney from the point of view of the participants in the Burning Man event (Kozinets 2002, 25): they dislike this brand because of its overt commercialism; furthermore, activists dislike Nike because this company doesn’t respect some basic human rights: “the Nike campaign is about dignity and respect. And giving people enough money to live on” they specify (Kozinets and Handelman 2004, 695).

From another line of reasoning, Lara doesn’t like Kickers because it gives her the wrong image (Hogg and Banister 2001, 93).

A further different approach arises from Fournier’s research (1998, 363): Jean dislikes Bon Ami because she noticed that this brand started scratching the sink. After trying Comet, she discovered that this brand really is better.

These examples belong to different research traditions and perspectives and they will be reviewed in the following pages for the purpose of integrating them into a single frame.

Burning Man participants and activists can be observed from the perspective that Arnould and Thompson (2005) label consumption as a practice of ideological reproduction and resistance. Brand dislike appears if and when consumers opt for lifestyles that disregard dominant consumerist norms or directly challenge corporate power. Researchers have only recently started to pay attention to different strategies practiced by individuals or groups in response to marketplace ideology, perceived as a structure of domination.

These consumers explicitly reveal their skepticism toward the marketing system and they engage in resistance practices in order to distance themselves from structures and systems they consider oppressive and coercive. Several authors have tried to assess whether the results of resistance strategies are effective as emancipatory consumption practices (Firat and Dholakia 1998; Firat and Venkatesh 1995; Murray and Ozanne 1991; Ozanne and Murray 1995) or whether they reproduce the dominant ideology (Holt 2002; Kozinets 2002).

Following Thompson (2004), we can take a slightly different position: do these practices affect the power structure within the marketplace? Moving from modernity to postmodernity, marketers realized that consumers are less willing to behave according to company-generated patterns, passively accepting their authority. Consumers don’t want to receive directions on how they should live or why brands should be central in their life (Brown 2004). They want to experience consumption as a context of personal fulfilment and self-creation. As a consequence, the branding paradigm used by marketers had to shift, from modern to postmodern.

According to Holt (2002), the postmodern branding purpose is twofold: a) brands should not be presented as cultural blueprints, but as cultural resources, as useful components for creating and managing consumer self concept; b) branded cultural resources have to be perceived as authentic, “as invented and disseminated by parties without an instrumental economic agenda, by people who are intrinsically motivated by their inherent value”.

However, this postmodern branding paradigm is now running into trouble too, and the reason is not that brands don’t respect the search for personal sovereignty, as in the modern branding perspective, but because of a problematic interpretation of authenticity: “brands now cause trouble not because they dictate tastes, but because they allow companies to dodge civic obligations” (Holt 2002, 88). Activist organizations, but also mainstream consumers, even though with less commitment, call for a new idea of authenticity as a quality of the company and they especially ask for deeper integration between the values associated with the brand and the actions of the company. The focus of postmodern resistant consumers then is on the morals and ethics behind the brand and on the social and environmental implications of its use.

Turning back to Thompson (2004), the cultural struggle for authenticity is hard to fight for ordinary consumers given the complexity of a globalized and decentralized economy; only activists and their organizations are able to act effectively in this direction. They can play an active role in increasing consumers’ concern over contradictory marketing practices and inducing companies to cope with it. In Thompson’s view (2004), the most important aspect of this process is the redistribution of power within the market system. If activists are effective and mainstream con-

sumers receptive, companies can be forced towards the post postmodern branding paradigm: “brands will be trusted to serve as cultural source materials when their sponsors have demonstrated that they shoulder civic responsibilities as would a community pillar” (Holt 2002, 88).

Another perspective from which to look at consumer criticism towards brands is rooted in consumer identity projects, as identified by Arnould and Thompson (2005): consumers use brands and other marketing materials to create and manage a multifaceted and often fragmented sense of self. Dislike and distaste play a major role in this process (Wilk 1997). The creation of meanings and social relationships via consumption involves not only positive attitudes and choices but negative ones too. According to Bourdieu (1984, 56):

“In matters of taste, more than anywhere else, all determination is negation, and tastes are perhaps first and foremost distastes, disgust provoked by horror or visceral intolerance (‘sick-making’) of the tastes of others... Aesthetic intolerance can be terribly violent. Aversion to different life-styles is perhaps one of the strongest barriers between the classes.”

Consumers use positive and negative meanings attached to their consumption choices to create and maintain social and cultural identities (McCracken 1986); consumers also use these meanings to establish similarity and differentiation and, thus, to ask for inclusion in and exclusion from specific social settings. Wilk (1997), for example, showed that distaste and refusal are often more important than taste and choice because they are more effective as social indicators, even though likes are much easier to communicate than dislikes.

In this stream of research, it is also important to consider Hogg’s contribution (1998) on consumers’ negative choices within and across product categories: this author differentiates between *non choices*, which include products and services that are not bought simply because of availability, accessibility and affordability, and *anti choices*, which include products and services that are explicitly refused because they are not compatible with other choices. As such, they are not consistent with the consumer’s sense of self.

In Hogg’s research, consumers are able to identify typical associations between branded products and social roles (e.g. Ralph Lauren and trendy students). According to such associations, they dislike and refuse brands if they refer to a group from which they want to keep their distance. Furthermore, consumers clearly identify wrong associations, that is to say branded products that could never be related to a specific social role. More recently, Hogg (Banister and Hogg 2004; Hogg and Banister 2001) focused her attention on the role of the undesired self in the determination of anti choices: it is through the formation of distaste and the associated negative stereotypes that consumers are able to define themselves.

In short, the findings of this second stream of research support the importance of negative consumption experiences as a means to create and manage self concept and as a source for brand dislike.

Finally, the last stream of research that deals with brand dislike is rooted within the general framework of Consumption Culture Theory (Arnould and Thompson 2005), but does not specifically fit into one of its four main areas: in her seminal article, Fournier (1998) introduced relationship theory into consumer research and demonstrated its usefulness for understanding the role brands play in consumers’ lives. From this perspective, this approach has contributed to the renewal of an old topic in consumer research (brand loyalty) according to a more socially oriented perspective.

According to Fournier (1988), sometimes brands get personal qualifications and, therefore, they become active partners of the consumer. As a consequence, consumers’ choices and behaviors regarding brands are based on affective factors and bonds rather than on cognitive cues: on the shelves in the supermarket, consumers can meet friends, enemies and acquaintances, and not objects to be evaluated in a comparative manner. Fournier’s (1998, 363) conceptualization of brand relationship quality is a definitive important construct for understanding the contribution of brands in the creation of meanings in every day life.

Based on this perspective, the consumer-brand relationship can deteriorate and generate negative feelings for two reasons: entropy and stress. In the entropy model, the relationship terminates because of the failure of both partners to maintain and rejuvenate it; in the stress model, on the contrary, relationships break up due to environmental, partner or relational episodic factors. Similar indications are also presented by Fajer and Schouten (1995).

More recently, analyzing the evolution of consumer-brand relationships, Aaker et al. (2004) show different development patterns for sincere versus exciting brands and particularly opposite consequences in case of transgressions. Whereas relationships with sincere brands suffer and deteriorate despite subsequent reparation attempts, relationships with exciting brands surprisingly show improvements in the wake of transgression.

In conclusion, we can observe that in this stream of research, interpersonal relationship theories are used to approach the topic of terminating person-brand relationships, illustrating the interplay of instrumental/functional and value-expressive/symbolic meanings that could cause them and lead to brand dislike.

Several explanations of brand dislike can be drawn from the literature reviewed above, ranging from ideological commitment against unethical practices to product failure episodes. It is possible to integrate these perspectives within a single framework: consumer criticism and resistance can be seen as an extreme of a continuum of brand dislike factors, on the other side of which we find consumer/brand relationship perspective. The former is a typical *collectivistic* approach to brand dislike: consumers take care of values, rights and individual wealth that are not strictly related to their own personal interests. The latter is a more *individualistic* perspective: consumers do not interact with brands that prove to be inadequate partners. Social communication through disliked brands is somewhere in between because there are collectivistic as well as individualistic reasons for keeping one’s distance from a brand in order to fix one’s role within a social setting (Fig. 1).

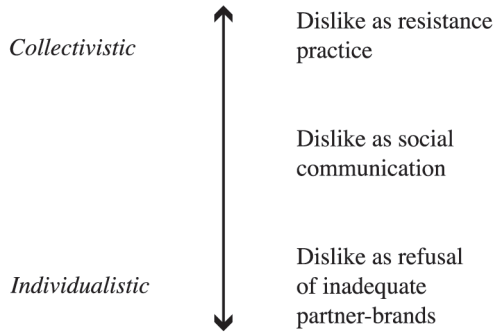

With this frame in mind, we have developed a research project to describe brand dislike from the consumer’s perspective.

EMPIRICAL ANALYSIS

What is still lacking in consumer research is a phenomenological account of brand dislike. In this study, after reviewing the literature within a unitary frame, the second purpose is to describe brand dislike from the consumer’s point of view in order to fill such a gap. Starting from different theoretical explanations pooled together into the collectivistic-individualistic frame, our research goal is to provide a description of brand dislike. The focus is on the thoughts, feelings, and activities evoked by consumers when asked to reflect on and visually represent disliked brands, both as lived experiences and general opinions.

We employed two qualitative methods in the present study: collages and introspective essays. The main goal is to elicit factors of brand dislike from consumers’ experience by means of methods with different capabilities: collages were made as a group project and employ images, while introspective essays are individual verbal tasks.

FIGURE 1
A UNITARY MODEL OF BRAND DISLIKE

Collages are based solely on images and they are absolutely free: there is no bias or filter between the conceptualization and the representation of the meaning (Belk et al. 1997; Havlena and Holak 1996). Similarly, introspective essays allowed us to evoke consumers' experiences and feelings without being specifically directed by an interviewer (Lupton 1996).

Projective techniques, then, helped us to better understand the nature of brand dislike; in this phase of our research, in fact, traditional methods, both qualitative and quantitative, may be limited. They are simply not well suited to eliciting consumer fantasies or revealing characterizations of consumer brand dislike (Belk et al. 1997). Hence, the projective measures sought to evoke fantasies, dreams and visual imagination in order to bypass the reluctance, defense mechanisms, rationalizations and social desirability that seemed to block the direct verbal accounts of some of those studied (Belk, Ger, and Askegaard 2003).

Data were collected in two undergraduate classrooms in economics and humanities schools. One hundred fifty one (151) students participated: equally distributed between males and females, between 20 and 25 years old. Each subject filled out the retrospective essay first and then, a few weeks later, took part in the collage project. We asked students to write down one liked and one disliked brand and then provide a description of the reason for their choice.

Collage making is a group task: we asked each group of around ten people to negotiate a common set of meanings of the concept of brand dislike, which had to be represented as a joint project. We gave each group the same Italian magazines and they had to cut out any material they wished to use to make the collage, expressing the concept of brand dislike. For this reason, some images are repeated in more than one collage. They were encouraged to let themselves go and express their feelings, intuitions, imaginings, fantasies and associations. Following the completion of their collage, they publicly explained their interpretation of it.

Both reports and collages were coded with Atlas.ti. The interpretation was conducted individually and then collectively by three researchers.

RESULTS: FACTORS AND LEVELS OF DISLIKE

Data from written reports and collages were grouped into three distinct levels, according to the object against which consumers addressed critical statements:

- *product brand*: subjects criticize brands that show an unfair price/quality ratio, whose products perform poorly, and that do not provide effective customer care services, etc.;
- *user brand*: subjects criticize brands that are associated with user stereotypes they do not like and they do not want to be linked with, and that do not let them be viewed by relevant others as they would like to be;
- *corporate brand*: subjects criticize brands that belong to companies that pursue behaviors and activities that they judge illegal, immoral, unethical, etc..

Factors of Dislike: Product Brand Level

At the product level, brands have been criticized for different reasons, ranging from their disproportionate price or unfair price/quality relationship to performance drawbacks.

Andrea (m, Sky). Recently prices increased. [...] with the same amount with which I was able to see movies, sports, soccer, specialized and cultural channels, now I see half of the programs. And I have to fill their wallet, because state-owned television is so dull.

Andrea complains due to the violation of price fairness: the *give* component in this exchange process is not adequate (Zeithaml 1988). However, even though the exchange is definitely disappointing, the relationship is still alive, given the absence of alternative brands. In Fournier terms (1998, 362), this is a case of enslavement: the consumer has negative feelings but persists in the relationship because of circumstances.

Davide (m, Trenitalia¹). Price/quality relationship is not good, because the price recently increased with virtually no benefits from the point of view of the service.

In this excerpt also, the focus is on the exchange side of the relationship, with attention devoted to both *get* and *give* components. However, in this case also, the relationship between the consumer and the brand is still in progress, mainly for the same reasons: Trenitalia is a monopolist and there no alternatives.

¹The national, state owned railways.

Both Andrea and Davide dislike their brands because of poor and declining value compared to the monetary sacrifice they are asked for: they are locked into the relationship and they feel frustrated.

Brand dislike is also related to performance problems derived either from the product per se (e.g. technical problems, unhealthiness, and hideousness) or from customer care services.

Alessandro (m, Sony). I don't like it because in my experience with hi-fi and tv Sony products I often underwent failures and technical drawbacks. Customer care service has proved to be slow and expensive and, in one case, they were not able to meet my expectations: in fact, the failure occurred once again. In the end, compared with the safety and reliability reputation of the company, my requirements have not been adequately satisfied by Sony products.

Alessandro (m, Aprilia). Because of these problems, I often had to bring the scooter to an Aprilia Center to have it fixed. But until now they have not been able to solve the problem and—as a result—most of the time the scooter is not usable and is subject to continuous technical adjustments. Regarding excessive oil consumption, I got in touch with the Aprilia headquarters, because local works were not able to fix the problem. Well, they refused to help because they claimed it was not their fault, but the fault of the local Aprilia staff which was not capable of solving the problem!

In both cases (Sony and Aprilia), dislike depends on a relationship deterioration generated by dyadic stress factors (Fournier 1998). Failure to keep a promise (Sony) or perception of scarce attention from the partner (Aprilia) generates strong negative feelings towards the brand.

In summary: a) exchange unfairness and b) relational troubles may generate brand dislike. In both cases, dislike refers to functional/instrumental aspects rather than cultural, value oriented or expressive ones. In all of these cases, dislike is not necessarily followed by the dissolution of the relationship, although Sky and Trenitalia are monopolist and consumers have virtually no alternative.

Factors of Dislike: User Brand Level

Agnese introduces us to the user dimension of brand dislike.

Agnese (Prada). Every young consumer started buying and wearing Prada and my hate has increased until becoming absolute intolerance. This brand is the symbol of a generation of boys and girls that can afford a pair of shoes that costs more than 200?!

This is a classic case of prototypical role-to-product association (Hogg 1998) and Agnese's strong refusal of Prada is rooted in the negative judgment she expresses about a specific group that she doesn't like and doesn't want to be a member of.

However, while Agnese refers to brand meanings in negative terms in order to establish distinction and (in this case) exclusion from a specific social group, Irene's dislike for Nike is related to her desire to create a sense of self via consumption.

Irene (f, Nike). I believe that these shoes and garments have become a means of homologation instead of something to express one's personality.

This informant criticizes Nike's attempt to impose preferences and styles in the market and tends to portray herself as a real postmodern consumer, able to creatively play with brands.

As illustrated by Thompson and Haytko (1997, 35), critiques of mindless conformity or perceived manipulative techniques by marketers "help each participant to see his or her self as an active creator of a personally unique style, rather than as a passive, trend-following consumer".

More in general, in this section brand dislike is represented as something strictly related to the creation and management of self concept and oriented towards social communication: Agnese and Irene complain that certain brands are associated with bad people and/or are not effective for self representation within the social context.

Factors of Dislike: Corporate Brand Level

At the corporate level, a number of factors emerge, all of which converge towards a general line of criticism that can be labeled as ideological (Murray and Ozanne 1995): subjects do not necessarily experience direct drawbacks or disadvantages, but they take care of the effects of unfair behaviors on a more general level.

Firstly, consumers dislike brands due to the fact that they believe the company has infringed written or ethical norms. In this perspective, abuses related to exploitations and transgressions are very important.

Alphonse (m, Nike). It is a huge multinational, but because of this they cannot be justified when they take advantage of their power in less developed countries and, even worse, against children.

As well illustrated by Alphonse, consumers recognize that global companies wield extraordinary influence, both positive and negative, on society's well-being. They expect firms to address social problems linked to what they sell and how they conduct business (Holt et al. 2004). People may turn a blind eye when local companies take advantage of employees, but they won't stand for transnational players like Nike adopting similar practices.

In effect, it's the largest, most visible companies in any category that are frequently classified by their informants as labor rights abusers, monopolistic threats to competition, and/or cultural imperialists (Kozinets and Handelman 2004).

Alessandra (f, Nestlé). One of their most successful strategies is that of distributing free samples of powdered milk in Third World hospitals, increasing the practice of bottle-feeding.

Federico (m, Ferrero). It is a multinational that allowed the production of some of its products in China without asking for controls on job conditions, which are dramatic according to some witnesses. The company buys cocoa through distributive channels that do not provide proper economic rewards to farmers.

Multinationals per se are often considered unreliable and, in addition, subjects declare that they do not trust them. This holds for companies in general and relates to a general form of unreliability and even to more practical aspects of fallibility.

Fabrizio (Nestlé): As soon I was aware of what Nestlé did in Africa, then they said that they had stopped, but I don't believe it, I stopped buying. Fabrizio does not believe that Nestlé had really stopped the unethical behavior he criticized.

FIGURE 2
THE FISH WITH THE LETHAL SPIT

FIGURE 3
A “LEGNANO” BICYCLE PRINT ADVERTISING

In addition, brand dislike can be generated by an unfair use of marketing practices, especially advertising. One of the groups used a picture of a fish that hunts another (smaller) fish by *spitting poison* to catch it: it is used as a metaphor for the company trying to hook the consumer (Fig.2).

Consumers criticize product claims, perceived as fallacious and misleading and, in general, advertising for its deceptive nature.

Agnese (f, Cepu²). They represent studying in a wrong way: they let the consumer perceive a degree or a diploma as an easy task, easy to get without sacrifices. And it's not like that. Their slogans do not sound realistic and feasible.

Davide (m, Trenitalia). Their advertising campaigns are a pure insult to consumers, because they do not represent the real situation, full of delays and technical troubles.

From one of the collages,³ the detail reported on the right (bicycle manufacturer ad) is used to emphasize the redundant use (and abuse) of female features to increase arousal and attention, but that do not fit the context and/or are not relevant in terms of product attributes (Fig. 3).

Sometimes consumers engage in acts of anti-brand equity (Dobscha 1997; Dobscha and Ritson 1998): the more money the manufacturer spends on advertising and brand building, the less I like that brand, as explained by Riccardo in regard to Vodafone.

Riccardo (m, Vodafone). Vodafone campaigns are obsessive. They broadcast even three ads in the same sequence.

Individuals also dislike brands because of the nature of company advertising that tries to exercise an authority over consumers' choices, proposing and often imposing an ideal lifestyle, a sort of "ought-to-be" realm.

²The company provides training and support services to students who do not pass university courses.

³The majority of pictures and concepts in the collages is related to product brand level factors: in this sense, the collective nature of this task (compared to the individual nature of introspective essays) may have exerted a significant role in knowledge elicitation: collages best represent factors that are related to the collectivistic pole of the continuum described in fig 1.

FIGURE 4
TELEVISION PASSIVE VIEWERS

Svetlana (f, Mulino Bianco). They have created an image of an “ideal household” which is not plausible. It is too sugary and grotesque to have any real relation with actual families.

Filippo (m, Nike). I do not agree with their effort aimed at convincing us that if we wear their products, we are different from those who don’t, and better.

In *modern time*, advertising was asked to present detailed instructions on how to live; such instructions were potentially important to consumers because they provided them with valuable information on desirable manners, styles, entertainment, and lifestyles.

Knowing what was new or popular might have been a means of gaining prestige and acceptance or might have facilitated social mobility. As reported by Holt (2002), in *postmodern time* consumers don’t like to accept corporate impositions and, when exposed to them, they might react with a negative feeling of dislike.

Such a stance is clearly implied in the representation that one of the groups gave of the typical family, made of plastic dummies entirely dominated by the TV. They explicitly urge us to make “better use of our heads” (Fig. 4).

Finally, consumers criticize brands because of the presence of counter values in the advertising used to build them.⁴

Federica (f, Armani). Armani ads represent the elit, as opposed to simplicity, freedom, comfort and moderateness.

Themes involving having or terminal materialism have also increased lately at the expense of doing or instrumental materialism. On the basis of these findings, it appears that ads did not show an escalating image of the good life as much as they increasingly employed pleasure, luxury, and terminal materialism to sell their products and services.

One of the groups represented such a theme with a sort of pyramid on top of which there is a *perfect woman*, who is considered as a sort of target for the young girl in the middle of the picture:

⁴From one of the collages, subjects list their preferred values as follows (no priority order): courage, friendship, family, love, nature, joy, culture.

advertisements show her products (luxury cars, watches, jewels) and models (top models, tv show stars) that portray the road to the top. Underneath there are obscure images of crowds of hardworking men and children and poor people (Fig. 5).

Factors that emerge from the data can thus be ordered according to three different levels that are strictly related to the framework that emerged from the literature review (Fig. 6).

In summary, looking at brand dislike from the consumers’ perspective produces a number of possible factors that can be positioned on the continuum between *collectivistic vs. individualistic* orientations. At this point, without any further and more in-depth analyses, it’s a matter of context and personal characteristics, which can explain the emergence of such factors. In the final section, some directions for future research will be proposed to obtain a more thorough understanding of these results.

CONCLUSIONS, IMPLICATIONS AND FUTURE RESEARCH DIRECTIONS

The main result that emerges from the analysis is a complex but coherent framework that is broken down into three levels. In this sense, the paper’s purpose of giving a descriptive picture of the consumers’ perspective on disliked brands has been achieved. Moreover, this picture is strictly integrated in the theoretical framework proposed above.

From a descriptive point of view, the first group of brand dislike factors fits in the product brand level: subjects are unsatisfied with some product or service characteristics and they end up disliking the brand. While some of these problems reveal a sort of mismatch between expectations and performance, others are more related to the monetary exchange that sometimes may produce a sort of skepticism towards the company and its brands.

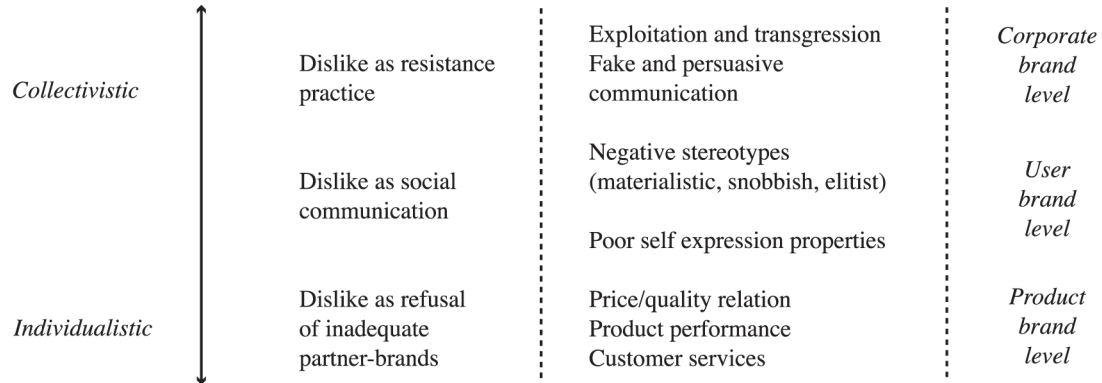

The second factor is related to the user brand level: subjects often associate the disliked brand with a sort of negative stereotype, someone who they do not want to be involved with. For instance, consumers criticize a brand because of its elitism: it is not targeted at them; it’s for someone else, someone more affluent. In other cases, the brand is criticized for its commonness: subjects are convinced that that particular brand is not capable of portraying them how they really want to be.

And, finally, the last dislike factor is related to the corporate brand level: no matter what the product characteristics are, consum-

FIGURE 5
 “PERFECT WOMAN” COLLAGE

FIGURE 6
 LEVELS AND FACTORS OF BRAND DISLIKE

ers criticize companies because of their supposedly unfair behaviors and abuses.

The main implication from a descriptive point of view is that consumers develop negative brand attitudes for a number of reasons, some of which are more individualistic (functional, egotistic) and others which have a more collectivistic and ideological nature (social, cultural, ethical). For instance, poor product performance belongs to the individualistic realm, while the exploitation of third world children belongs to the collectivistic one. Besides, consumers can also fall somewhere in between: sometimes they criticize brands because they are not able to express their personality (individualistic), while in other cases they are associated with

negative, materialistic and snobbish stereotypes they do not want to be associated with (collectivistic).

From the point of view of theoretical implications, this analysis of brand dislike both supports and integrates the evidence available in consumer research. We found that informants experience the different dislike factors illustrated in the literature review; nevertheless, the subjects' descriptions also integrate previous contributions in that—within the same analysis—we can find very different dislike factors at the same time, all of which can be rooted in different levels of ideological sensitivity (collectivistic vs. individualistic). This result seems interesting in the light of consumer resistance research. Until now it has been empirically analyzed with

the help of individuals and groups strongly involved in social and/or environmental issues (Dobscha and Ozanne 2000; Holt 2002; Kozinets and Handelman 2004); the fact that the results of this research study come from ordinary consumers gives new insights into the relevance of this trait in the mass market.

Another interesting implication that arises from this study, which needs to be better developed, is that in some cases consumers tend to separate product from brand relationship: they keep up the relationship with the brand despite negative evaluations of the product. Sometimes this occurs because of a lack of alternatives, but in general the relationship with the brand can be strong enough to consider product drawbacks insufficient reason to switch brands. Research on brand community (McAlexander et al. 2002; Muniz and O'Guinn 2000) strongly supports this line of thinking.

In the same perspective, the opposite case has to be carefully analyzed, even though we did not come across it directly in our data: sometimes consumers express very negative opinions about brands (even at the corporate level), but still buy and use the product.

This research presents some specificities and limitations, dependent on the nature of the (convenience) sample in terms of age (20-25), social role (students), and culture (Italy). Moreover, the study is essentially descriptive and needs to be developed further in three directions:

- a) after the qualitative research, quantitative methods are actually employed to measure brand dislike (in general and at the brand level) and to identify the weight of its three groups of factors. Only preliminary results are available at the moment;
- b) data will be collected on a larger and diversified scale (international comparisons and multiple stratified samples are going to be developed);
- c) further empirical analyses will address the relationship between dislike and behavior, with particular reference to the strength of this relationship, according to the different levels of the construct (corporate, product, user).

Schadenfreude as a Consumption-Related Emotion: Feeling Happiness about the Downfall of Another's Product

Jill M. Sundie, University of Houston
James Ward, Arizona State University
Wynne W. Chin, University of Houston
Stephanie Geiger-Oneto, University of Houston

EXTENDED ABSTRACT

Schadenfreude is the joy a person experiences when he or she observes another's downfall. Prior research on *schadenfreude* has focused largely on interpersonal judgments of an academically and socially successful target before and after a personal failure. We were interested in whether the emotion *schadenfreude* is generated spontaneously not only based on the downfall of an individual, but by the downfall of an individual's product. For example, if one is jealous of a neighbor's recent deluxe kitchen renovation, does news that the new appliances are malfunctioning bring one joy? And, if *schadenfreude* is experienced after witnessing a product failure, are the antecedents of this emotional response the same as they are for personal failure? This research extends the literature on *schadenfreude* by exploring its role as a consumption-related emotion, and by identifying specific emotional antecedents, such as resentment and jealousy, that drive the experience of joy after witnessing product failure.

Social comparison theory provides the conceptual framework for our research (e.g., Festinger 1954; Suls and Wheeler 2000). In the *schadenfreude* literature, the experience of this emotion was greater when the target was portrayed as being superior as opposed to average (e.g., Brigham et al. 1997). High status products are desired not only for their refinements, but for the positive image they help their owners project to others (Corrigan 1997; Belk 1988). When people consume and display status symbols, this may prompt observers to engage in upward social comparisons. Such upward comparisons can result in positive emotional responses such as admiration, but frequently prompt jealousy and other negative emotions such as anger and resentment. If a person then observes an envied status symbol fail, a disconcerting upward comparison may turn into a gratifying downward comparison, resulting in *schadenfreude*.

Literature in the area of services marketing has examined in depth the emotional reactions of consumers when they personally experience a product or service failure (e.g., Oliver and Westbrook 1991), the negative word-of-mouth a wronged consumer may spread after a failure (Richins 1983; Curren and Folkes 1987; Anderson 2003), and the implications of such failures for brand image (e.g., Folkes 1984). These product or service failures do not happen in social isolation, but are sometimes witnessed by others. As far as we know, there is no literature addressing how consumers respond to observing *others'* product or service failures, and how likely they are to spread malicious gossip about the product or brand after witnessing such events. (We employ the term malicious gossip to distinguish such behavior from negative word-of-mouth, which has traditionally been conceptualized as being prompted by a consumer's *own* product or service experiences). In the kitchen renovation example above, how likely would the jealous neighbor be to recount the story about the failure of the high-priced appliances to his or her friends, co-workers, or other like-minded neighbors? In this research we explore the role product-related *schadenfreude* plays in prompting malicious gossip, and suggest what kind of content this gossip is likely to contain. Our contribution to the literature on word-of-mouth is the exploration of how

observations of, rather than personal experiences of, and emotional reactions to others' product failures might also serve to prompt the spread of negative product-related information.

Status competition between individuals can take place on many dimensions, one of which is the purchase and display of status symbols. Multiple theories can be employed to predict sex differences in the modes of status competition, including but not limited to the evolutionary psychological perspective (e.g., Kenrick, Trost and Sundie 2004) and biosocial theory (e.g., Wood and Eagly 2002). Because men are more likely to compete with one another via displays of economic resources, they may experience more joy when another's status product fails—particularly if the owner is another man.

The objectives of the present study included:

- Exploring the extent to which observing the failure of a high (versus a low) status product evokes *schadenfreude*
- Assessing the extent to which the relationship between status symbol failure and *schadenfreude* is mediated by negative emotions induced by the target's product ownership
- Measuring the relationship between dispositional envy (a chronic tendency to be envious) and *schadenfreude* provoked by status symbol failure
- Assessing the extent to which *schadenfreude* provoked by failure of a status symbol prompts malicious gossip about the owner and his or her failed product
- Exploring sex differences in emotional reactions to the failure of others' status symbols

Participants in the study were 395 Southeastern university students (177 men, 218 women), randomly assigned to the conditions of a 2 (car type: high status (Mercedes CLK) vs. lower status (Ford Focus)) x 2 (sex of target: male vs. female) x 2 (sex of participant: male vs. female) between subjects design. Participants learned about a student similar to them that had recently acquired either a new Ford Focus or Mercedes CLK Coupe, and then subsequently experienced a public product failure when the car broke down at an upscale shopping mall. Emotional responses to both the student's car ownership, and the subsequent downfall, were collected. Participants rated their likelihood of spreading malicious gossip regarding such a product failure, and provided written responses indicating what specifically they might communicate to others regarding such an event. The data were analyzed using Partial Least Squares (PLS), a structural equation modeling technique (Chin 1998, Hulland 1999, Wold 1982).

Participants felt more *schadenfreude* after witnessing the failure of the high-status product, as opposed to the low-status product. This effect was mediated by negative initial feelings about the student's car ownership. The strongest predictors of

schadenfreude were the negative initial emotions jealousy and resentment. Participants pre-disposed to feel envy felt more schadenfreude, and this effect was partially mediated by the negative initial feelings. Men felt more schadenfreude than women, irrespective of the sex of the target. Experiencing schadenfreude after observing the product failure significantly predicted a willingness to spread malicious gossip about such an incident, and independent coding of the open-ended responses indicated that the gossip would frequently involve negative statements about the product/brand.

An Exploration of Consumer Forgiveness Following Marketer Transgressions

Emily Chung, Monash University

Michael Beverland, University of Melbourne

EXTENDED ABSTRACT

Do consumers forgive and forget marketer transgressions? Transgressions are defined as violations of relationship-relevant norms, and refer to the breaches of the implicit or explicit rules guiding relationship performance and evaluations (Aaker, Fournier, and Brasel 2004). Although existing research provides some evidence to support the service recovery paradox, i.e. a successful recovery can strengthen the consumer-brand relationship (Maxham and Netemeyer 2002), there is conflicting evidence that suggests service recovery efforts cannot compensate for poor service delivery, and that consumer perceptions of the brand and future repurchase intentions are lower than they would have been if the transgression had not occurred (Andreassen 2001). This suggests that the service recovery paradox occurs less frequently than thought, and that some consumers hold grudges against marketers following a transgression (Andreassen 2001; Aron 2001).

Research on the role of consumer-brand relationships within the context of marketer transgressions also remains inconclusive. It has been suggested that consumers in close relationships with marketers are more willing to forgive marketer transgressions (Mattila 2001). It is also believed that relationships provide a 'buffer effect' when failures occur, with prior positive experiences mitigating consumer evaluations of service recovery (Tax, Brown, and Chandrashekar 1998). However, a recent longitudinal study found that consumer-brand relationships suffered in the wake of transgressions (Aaker et al. 2004). This suggests that relationships can both buffer and magnify consumer responses to transgressions. Given that no service system is perfect, transgressions are possible within service encounters (Mattila 2001). Furthermore, as the frequency of interactions between the consumer and brand increases within the course of a long-term relationship, so does the likelihood of a transgression (Aaker et al. 2004). This leads to the question of whether and how consumers forgive firms for transgressions that befall their shared relationships.

The existing literature captures some aspects of consumer responses to marketer transgressions through studies on consumer complaint behaviour, service recovery and subsequent consumer evaluations of the marketer. However, none explicitly examine the phenomenon of whether and how consumers forgive brands that transgress relationship norms. A transactional focus, and an overemphasis on the concept of satisfaction and its behavioural outcomes related to service failure and recovery, has resulted in the neglect of the rich array of emotional experiences and emotional coping strategies that consumers may adopt in response to marketer transgressions (McCullough and Gwinner 1998; Westbrock and Oliver 1991).

To address the identified limitations and expand our understanding of how consumers respond to marketer transgressions, the present article explores the phenomenon of consumer forgiveness. The concept of forgiveness offers value to marketers because forgiveness is believed to occur within a relational context, and transgressions are proposed to affect the trajectory of the relationship (McCullough and Worthington 1999). Given that marketers are forming closer relationships with customers, and consumers form strong bonds with brands (Fournier 1998; Fournier and Mick 1999), forgiveness may better capture the range of cognitive and emotional reactions to a transgression, and provide the basis to restore the relationship to its original pre-transgression state, or minimise bad

feeling and harm. This notion of forgiveness will provide a relational focus to understanding consumer responses to marketer transgressions, providing new insights into consumer's cognitive, emotive and behavioural experiences, if, and when they come to forgive brands following a transgression. Insights into the concept of forgiveness could be utilised by scholars and marketers to improve consumer welfare and quality of life given the health and psychological benefits of forgiving documented in some medical and psychology literature (Pettitt 1987; Safer 1999; Witvliet, Ludwig, and Vander Laan 2001).

As the research aim is exploratory, data was collected via qualitative research methods. Previous research that sought to understand consumer emotions and coping strategies found qualitative in-depth interviews (as opposed to quantitative methods) provided the 'richest' data (e.g. Mick and Fournier 1998). Twenty semi-structured interviews were conducted with consumers who believed they had experienced marketer transgressions. Each interview was between thirty minutes to one hour in length and was audio taped and transcribed. Data analysis was conducted based on the seven qualitative manipulation operations described by Spiggle (1994).

The results provide evidence to suggest that the concept of forgiveness can be applied to the context of consumer-brand relationships, revealing themes that represented the triggers, processes and outcomes associated with the experience of marketer transgressions. The findings show that marketer transgressions extend beyond core service failures. For example, transgressions include various breaches of expressed and implied relationship norms. Following a transgression, consumers adopted various coping strategies and processes in re-evaluating the brand relationship. These were: service recovery, re-evaluations of the brand's trustworthiness, apportioning blame, and reinterpretations of the brand into stereotypes. Consumers' conceptualisations suggested forgiveness of a brand essentially involves the release of negative emotions associated with the transgression and becoming motivated to act constructively toward the relationship. A number of transgression-related outcomes were revealed, including strengthened relationship, renegotiated relationship, forced stay, exit, avoidance, revenge, and loss of faith. The results also provided evidence of various consumer benefits associated with the experience of forgiveness.

In identifying the triggers, processes and outcomes associated with consumer forgiveness, this exploratory study makes several significant contributions to theory. It is, to the authors' knowledge, the first empirical study conducted to observe the phenomenon of consumer forgiveness. In doing so, we respond to the limitations of existing marketing literature by extending the study of consumer reactions to marketer transgressions beyond product and service shortfalls. We also respond to the need to understand consumer emotions associated with marketer transgressions, including consumers who do not voice their complaints. The findings also offer a new, relationship approach to understanding consumer reactions to marketer transgressions that is lacking within most existing studies. The study of relational phenomena such as forgiveness extends existing knowledge to provide insights into consumer-brand relationships and the transformations that occurs following marketer transgressions. Furthermore, this study extends the Hirschman (1970) model, which is often utilised to explain

outcomes of marketer transgressions (and service recovery), beyond the three behavioural outcomes of exit, voice and loyalty. The study of forgiveness therefore contributes to an improved understanding of consumer responses to marketer transgressions and provides important foundations for future research. Marketers can benefit from assisting consumers to achieve forgiveness even though exit may occur. Such activities reduce harmful word-of-mouth and ongoing ill feeling towards the brand. We suggest that future investigations should extend these insights to benefit consumers in a move toward transformative consumer research.

Regulatory Focus, Feature Positive Effect, and Message Framing

Guangzhi Zhao, University of Kansas
Connie Pechmann, University of California, Irvine

EXTENDED ABSTRACT

Message framing effects have been widely documented in numerous research areas. Most extant work on message framing distinguishes message frames predominantly along the outcome valence dimension and has studied positive vs. negative frame. Positive messages highlight positive consequences (i.e., gains) of complying with the ad advocacy, for example, "Don't smoke. Quitting smoking reduces your chances of having a heart attack." In contrast, negative messages highlight negative consequences (i.e., losses) of not complying with the ad advocacy, for example, "Don't smoke. Smoking increases your chances of having a heart attack."

Unfortunately, empirical evidence regarding the relative effectiveness of positive vs. negative message frame is mixed. The research efforts seeking to define the boundary conditions for the relative persuasiveness of positive vs. negative messages have largely been unsuccessful so far as well. Given the robustness of message framing effects yet the mixed empirical evidence, we speculate that (1) the framework that distinguishes only between positive and negative messages might have been limited; and (2) message framing effects might be governed by fundamental factors that go beyond information processing motive factors such as issue involvement.

We note that a crucial qualitative difference between message frames has largely been ignored, specifically, behavior outcome type (benefit vs. cost). Message frames with the same valence are not necessarily being equal, but can call attention to quite different behavior outcome types. Research has shown that individuals have markedly different sensitivity to different behavior outcome types (benefits vs. costs). Surprisingly, behavior outcome type as a primary dimension for theorizing has mostly been neglected in message framing research.

In this research, we introduced this key parameter into message framing research and made refined distinction between message frames. Specifically, we distinguished message frames along the dimension of outcome type (benefits vs. costs) in addition to the dimension of outcome valence (positive vs. negative) and studied the relative persuasiveness of four distinct message frames, namely, (1) a benefit-positive frame, which emphasizes the attainment of benefits because of complying with the message advocacy, for example, "Don't smoke. Have a good time." (2) a benefit-negative frame, which emphasizes forgoing benefits because of failing to comply with the message advocacy, for example, "Don't smoke. Smoking spoils a good time." (3) a cost-positive frame, which emphasizes the avoidance of costs because of complying with the message advocacy, for example, "Don't smoke. Avoid being annoying." and (4) a cost-negative frame, which emphasizes the incurring of costs because of failing to comply with the message advocacy, for example, "Don't smoke. Smoking is annoying."

In search for fundamental factors that govern message framing effects, we examined the role of two factors. The first factor is Feature Positive Effect, that is, individuals find it easier to mentally represent a perceptual input when it is depicted as the presence of features rather than as the absence of features. This effect has been repeatedly demonstrated in numerous areas of research with animals and humans, but has never been studied in persuasion contexts before. A second factor is consumer regulatory focus. According to Regulatory Focus Theory, at any moment in time, an individual is guided primarily by one of two regulatory foci: a promotion focus

and a prevention focus. Regulatory focus is theorized to be a goal orientation and is at a relatively higher level in goal hierarchy than specific information processing motive factors such as issue involvement. Activation of a specific regulatory focus in individuals has been shown to significantly impact their affects, cognitions, and behavior.

We conducted two experimental studies with a total of 1,162 high school students in the context of antismoking TV ads targeted at youths. A total of 719 ninth graders from three local high schools participated in Study 1. The design was a 2 x 2 x 2 between-subjects randomized factorial. Control groups who watched ads of non-smoking-related public service announcements were included to serve as benchmarks. Subjects were primed to activate either a promotion focus or a prevention focus using a standard procedure from the literature. Results from this experiment supported the predicted Feature Positive Effect, that is, message frames emphasizing the presence of behavior outcomes (namely, a benefit-positive frame and a cost-negative frame) were more persuasive than message frames emphasizing the absence of behavior outcomes (namely, a benefit-negative frame and a cost-positive frame) and a control group.

In addition, consistent with Regulatory Focus Theory, it was found that, for promotion-focused youths, a benefit-positive antismoking message emphasizing the attainment of benefits because of refraining from smoking cigarettes was the most persuasive among the four frames and a control group; while for prevention-focused youths, a cost-negative antismoking message emphasizing the incurring of costs because of failing to refrain from smoking cigarettes was the most persuasive among the four frames and a control group. The increased persuasion was attributed to heightened perceived diagnosticity of information matching to youths' regulatory focus.

Study 2 sought to replicate and extend the findings from Study 1 using a different method. Rather than manipulating regulatory focus, subjects' chronic regulatory focus was measured using an established scale from the literature. Study 1's manipulation of regulatory focus represented a clean approach to study the impact of this variable. As suggested in Regulatory Focus Theory, regulatory focus tends to be a quite stable individual difference factor. Thus, in Study 2, regulatory focus was measured, in order to examine how such a dispositional trait might moderate the persuasiveness of differently framed antismoking TV ads. Subjects were 443 students from another two local high schools. Results from Study 2 were virtually identical to those in Study 1 and provided convergent evidence supporting our main propositions about message framing effects.

Does the Frame of a Comparative Ad Moderate the Effectiveness of Extrinsic Information Cues?

Anne Roggeveen, Babson College
Dhruv Grewal, Babson College
Jerry Gotlieb, Western Kentucky University

EXTENDED ABSTRACT

Comparative ads simultaneously communicate both positive information about the sponsor and negative information about the competition, and as a consequence could be framed in either a positive or negative fashion. When a comparative ad is negatively framed it focuses on the inferiority of the competitor and encourages consumers to think about potential losses they will incur as a result of using the competitor's brand (e.g., "MCI had over twice as many network outages as AT&T"). In contrast, when an ad is positively framed it focuses on the superiority of the sponsor and encourages consumers to think about their potential gains (e.g., "AT&T had less than half as many network outages as MCI"; Shiv, Edell, and Payne 1997). In both frames, the information content conveyed is the same; only the valence differs.

The valence difference caused by the message frame has a significant impact on consumer evaluations, preferences and choices. This has been demonstrated repeatedly in a variety of situations ranging from evaluations of ground beef to health related behaviors (see summary articles by Kuhberger 1998; Levin, Schneider and Gaeth 1998). Yet, despite the width and breath of this stream of research over the past 25 years, there is limited research into interactive effects of framing. The majority of the studies which do exist examine *how factors moderate* the effect of framing on outcomes (e.g., Maheswaran and Meyers-Levy 1990, Raghurir and Menon 2001, Shiv, Edell and Payne 1997). We only know of one study which has examined the moderation from the perspective of *how framing moderates* the effect of message cues (Grewal, Gotlieb, and Marmorstein 1994). That study suggests that the effectiveness of a new brand comparing itself to an established brand may be contingent upon the manner in which the message is framed.

The study found that when a comparative ad is framed positively (vs. negatively) people are less likely to use price in forming their evaluations of performance risk (Grewal, Gotlieb and Marmorstein 1994). Grewal, et al.'s explanation for the moderating effect of framing flowed from Prospect Theory (Kahneman and Tversky 1979). They argued that consumers who are risk averse (e.g., exposed to a positively framed message) conduct a more thorough analysis of the available information prior to making a decision in order to ensure a well-thought out evaluation that minimizes risk. They went on to hypothesize that a consequence of this more thorough analysis is that consumers are less likely to be affected by a single extrinsic cue, such as price.

The importance of their finding is significant. If their result holds, it means that framing can moderate the effectiveness of information cues on consumers' evaluations, preferences, and choices. As such, framing would be a critical contingency factor. Thus, understanding the moderating impact of frame is important from a theoretical perspective.

Although Grewal et al. provided initial evidence concerning the effects of message framing, the article tested only one extrinsic cue, and only alluded to the underlying process leading to the result. To have a more complete understanding of the moderating impact of framing, we extend Grewal et. al.'s paper in four critical ways—by (1) testing whether framing similarly affects the use of other extrinsic cues, (2) determining the effect when there are multiple

extrinsic cues, (3) determining the effect when extrinsic information is not explicitly provided, and (4) providing process evidence for the results.

Three experimental studies are conducted. Study 1, which used 240 subjects, is a $2 \times 2 \times 2$ between-subjects design which manipulates message framing (positive vs. negative), length of the product warranty in comparison with an industry standard (shorter vs. longer), and reputation of the retailer (strong vs. weak). Study 2 was $2 \times 2 \times 2$ between-subjects design ($n=186$) which manipulated message framing (positive vs. negative), reputation of the retailer (strong vs. weak) and price (discount versus no discount). Using the reputation and price we manipulated the consistency/inconsistency of the extrinsic cues. Finally, study 3 ($n=86$) used a 2×2 between-subjects design with message framing (positive vs. negative) and whether the individual prices of the warranty and product were bundled (individual prices not provided) or unbundled (individual prices explicitly available) as the factors. In all studies, performance risk was the key dependent measure. Studies 1-2 also collected process data.

Findings indicate that Grewal et al.'s result replicates for retailer's reputation, but consistent with our hypothesis, not warranty length. Findings also indicate that framing impacts whether consumers consider the consistency of the multiple extrinsic cues, as well as whether they consider if information is explicitly available or not. All results can be explained by the fact that positively framed messages engender more thorough analysis of message cues than negatively framed messages and impact how extrinsic cues are used. Process supports this conceptual underpinning.

Affect as Information: The Moderating Roles of Self-Regulatory System and Diagnosticity of Affective Valence

Thomas Kramer, Baruch College, CUNY
Song-Oh Yoon, Singapore Management University

EXTENDED ABSTRACT

While individuals often incorporate their affect into judgments (e.g., Schwarz and Clore 1983), and a variety of determinants of this effect have been put forth (e.g., Gorn, Goldberg, and Basu 1993, Pham 1998), the role that individuals' self-regulatory systems play in this relationship has received little attention. We hypothesize that reliance on affect as information differs according to individuals' self-regulatory systems and, more specifically, by differences in individuals' focus of attention and perceived diagnosticity of affective valence that are associated with these different systems.

In particular, motivational theorists have proposed that two distinct self-regulatory systems underlie individuals' motivation and behavior (e.g., Gray 1982, Carver and White 1994, Higgins 1997). For example, Gray (1982) shows that individuals' behavioral inhibition system (BIS) inhibits behavior to avoid negative or painful outcomes, and that individuals' behavioral activation system (BAS) activates behavior to approach positive or pleasurable outcomes. Related to this work, self-regulatory focus theory (e.g., Higgins 1997), which refers to the dominant process through which people approach pleasure and avoid pain, suggests two motivational strategies according to individuals' predominant promotion versus prevention self-regulatory focus. Prior research also suggests that self-regulatory systems (both BIS vs. BAS and prevention vs. promotion self-regulatory focus) influence individuals' internal versus external focus of attention.

Additionally, Pham and Avnet (2004) show that the type of goals consumers have may determine their reliance on affect, showing that promotion (vs. prevention) focused consumers increase their reliance on affect when evaluating ads, whereas prevention (vs. promotion) focused consumers increase their reliance on the substance of the message. Yet, self-regulatory systems may not only determine reliance on affect in general, but more specifically, individuals' reliance on affect of a positive versus negative valence. For example, Gray (1982) and Carver and White (1994) show that individuals with a predominant behavioral inhibition system (BIS) are generally more likely to feel emotions of a negative valence, while individuals with a predominant behavioral activation system (BAS) are generally more likely to feel emotions of a positive valence. We propose that individuals who more generally or consistently feel positive affect may become less likely to rely on it for informational value because it no longer offers diagnostic information. Conversely, individuals who in general have a greater tendency to experience negative affect may be expected to be less likely to use their negative affect as information.

Based on the above discussions on differences in focus of attention and trait affective valence we hypothesize that self-regulatory systems determine whether individuals use affect as information in judgments. In particular, individuals with a predominant BAS or promotion self-regulatory focus are relatively more likely to rely on their affect regardless of its valence because they focus on their internal states to a greater degree. On the other hand, externally focused individuals with a predominant BIS or prevention self-regulatory focus are likely to rely on their affect only when it is diagnostic and made salient by its mismatch to their trait affective valence. We tested these predictions in a series of

studies investigating the use of positive and negative affect in product satisfaction judgments.

Study 1 measures respondents' self-regulatory system using Carver and White's (1994) behavioral activation system / behavioral inhibition system scale. As expected, we find that product satisfaction of participants with a predominant behavioral activation system was influenced by their affect regardless of its valence. Apparently, since these individuals tend to be more internally focused, they were more likely to monitor their affect and use it as information. However, the satisfaction judgments of participants with a predominant behavioral inhibition system, who tend to be more externally focused, were influenced by affect only when its valence mismatched their trait affective valence.

Study 2 replicated and extended these by making participants' promotion versus prevention self-regulatory focus temporally accessible. Consistent with Study 1, the results show that with a temporarily accessible promotion-focus, participants became more internally focused and relied on both positive and negative emotions equally when evaluating their product satisfaction. However, following a prevention-focus prime, participants became more externally focused and relied on their emotions only when they were of a positive valence and hence were not compatible with the primed ought-self.

Lastly, in Study 3 we focus on the differential impact of negative affective priming on satisfaction judgment of individuals with a predominant behavioral activation (vs. inhibition) system. The study provides further support for our hypotheses, demonstrating that the tendency to incorporate temporary negative emotions into satisfaction judgment is reduced for individuals with a predominant behavioral inhibition system that is more externally focused and hence is associated with feeling more negative emotions in general.

Overall, in three studies we show that individuals with a chronic (studies 1 and 3) or temporarily induced (study 2) behavioral activation system / promotion self-regulatory focus are likely to rely on both positive and negative emotions for information. We hypothesize that this effect is obtained because these individuals are relatively more likely to monitor their internal states. On the other hand, the three studies show that individuals with a chronic or temporarily induced behavioral inhibition system / prevention self-regulatory focus only rely on positive (vs. negative) emotions for information. We hypothesize that this effect is obtained because these individuals are relatively more likely to focus on the external environment and may not find affect of a valence that they are generally more likely to experience salient and diagnostic. Instead, only affect that mismatches their trait affective valence is perceived to be diagnostic and will be incorporated into judgments.

Is a Picture Worth a Thousand Words?

Influence of Graphic Illustration on Framed Advertisements

Chun-Tuan Chang, National University of Kaohsiung

ABSTRACT

Statistical framing of product efficacy and graphic illustration were examined to explain the conditions under which messages would be more effective in a healthcare product advertisement. Using different health contexts (skin care and traveling) and statistical formats (percentage and frequency), two experiments investigate how consumers respond to positively and negatively framed messages with different forms but equivalent information about product efficacy. Framing effects were enhanced by graphic aids when statistics were presented in a percentage or a frequency with a small number size. The moderating role of graphic illustration on framing effectiveness was eliminated when statistics were presented in frequency with a large number size.

INTRODUCTION

Consumers in modern society are frequently required to make healthcare decisions that involve grave potential risk. Discussing risks and benefits of treatment or healthcare options has become an increasingly important part of healthcare communication. For a long time, consumer researchers and public health campaigners try to figure out if there are specific optimal ways for information presentation that can be adopted to maximize the effectiveness of message for well-informed communication and what kinds of manipulations of risk and benefit information may increase message persuasiveness because of people's subjective interpretation of information (Kahneman, Slovic and Tversky, 1982; Fischhoff, Bostrom and Quadrel, 1993; Naus et al., 2002; Lowe and Ferguson, 2003; Gurmankin, Baron and Armstrong, 2004).

An individual's judgments and decisions are influenced greatly by how information is presented or framed (for a review paper, see Levin, Schneider and Gaeth, 1998). A 50% chance of survival (positive frame) is logically equivalent to a 50% chance of mortality (negative frame). However, each statement influences differently on the attitudes formed, and decisions made by the message reader (Moxey et al., 2003). Positive labeling of probability leads to an encoding of the information that tends to evoke favorable associations in memory while negative framing of the same probability tends to cause unfavorable associations (Levin and Gaeth, 1988). This phenomenon has shown to extend on medical and healthcare scenarios (Edwards et al., 2001) and diversified consumer purchase contexts (e.g., Levin and Gaeth, 1988).

The objective of present study was to investigate moderators of information formats of product efficacy on framing effectiveness in *advertising* contexts. Using appropriate message frames could increase the persuasiveness of messages to consumers, thereby increasing sales (Martin and Marshall, 1999). Understanding of framing effects may provide direct applications in creative and effective execution of advertising copy and layout (Arora, 2000). This research tested the idea that consumer responses to a new product advertisement could be influenced by message framing and presentations of graphs and statistics, and determined whether different graphic illustrations and different statistical presentations described in a message modified framing effects. The question centered in this research was: "could different statistical formats about product efficacy and graphic displays influence consumers' evaluations and attitudes?"

A healthcare context is emphasized in this research because of the market value and the importance for public policy and

communication. The healthcare market has changed irrevocably in the last two decades with the emergence of 'healthcare consumers' who, rather than being passive, have taken a more active role in their own healthcare (Moorman and Matulich, 1993). Health expenditures have outpaced the growth of the economy in 2002 (Department of Health, 2003). Over-the-counter (OTC) pharmaceuticals and consumables had the highest growth rate in 2002 primarily because of new product introductions expanding the market. Consumers demand more information, more choices and more involvement in decision-making (Moorman and Matulich, 1993). An important marketing issue arising here is how to present information to best educate consumers about healthcare and convince them to purchase related healthcare products or services.

THEORETICAL BACKGROUND AND HYPOTHESES

Statistical Formats of Product Efficacy and Framing Effects

Across various contexts of consumer healthcare decisions, researchers suggest that attribute framing influences subjects' perceived willingness to accept a particular treatment (Levin et al., 1998). Levin et al. (1998) labeled it as attribute framing because only a single attribute within any given context is the subject of the framing manipulation and suggested that it represents the simplest case of framing, making it especially useful for gaining a basic understanding of how descriptive valence influences information processing. Positively framed messages stimulate more positive response than negatively framed ones to risk-avoidant options such as immunization (Donovan and Jalleh, 2000), condom usage (Linville, Fisher and Fischhoff, 1993), and adaptation of surgical procedures (McNeil et al., 1982; Wilson, Kaplan and Schneiderman, 1987; Marteau, 1989; Jacoby et al., 1993; Llewellyn-Thomas, McGreal and Thiel, 1995; O'Connor, Pennie and Dales, 1996; Krishnamurthy et al., 2001). Those risk-averse options may alleviate health problems and lead to longer life. A positively framed option generates positive associations and thus seems more attractive than a negatively framed option. People are more likely to approve of the choice when survival or success rates are emphasized than when the mortality or failure rates are emphasized.

Previous studies demonstrate that risk formats may influence consumers' attitudes and healthcare decisions (Stone, Yates and Parker, 1997; Feldman-Stewart et al., 2000; Evans et al., 2000). Halpern, Blackman and Salzman (1989) investigated the influences of various presentations of oral contraceptive risk information on perceived safety. They found that estimates of the probability of risky events were affected by multiple sources of error and interpretation of different forms but equivalent statistical information. A majority of previous framing studies manipulated attribute framing through percentage presentation (e.g., Levin and Gaeth, 1988; Jalleh, 1992; Linville et al., 1993; Donovan and Jalleh, 2000; Sanford et al., 2002). The persuasive effects from the use of the positive or negative framing remain unclear in different statistical formats (i.e., frequency).

Frequency is defined as the number of times a given case, value, or event occurs relevant to the whole sample (e.g., 7 in 10 or 700 out of 1,000). Frequency may also be stated as a ratio of numbers of individuals occurring in a specific class to a total sample under a survey. Siegrist (1997) showed that risk information via a

frequency format (e.g., 600 out of 1,000 people will die) leads to more risk-averse behavior than that via a percentage (incidence rate) form (e.g., 60% of people will die). Schapira, Nattinger and McHorney (2001) further indicated that frequency formats have several advantages over probability because of its attributes of ease of interpretation, simplicity and the ability to provide a human contextual quality in statistical information. Similarly, Gigerenzer (2002) and Hoffrage and Gigerenzer (1998) indicated that people find using information presented in frequency easier than using information in percentage format, and make less biased judgments of risk when using information in frequency format.

Frequency can be presented in different number sizes (i.e., with different denominators). People respond differently to equivalent forms of relative frequency information presented in superficially different ways. McFarland and Miller (1994) administered a test on social perceptiveness ability and found that the manipulation of group size changed participants' self-assessment of the ability to accurately interpret social situations. Participants were provided with fictitious feedback either that their performance was ranked in the 30th percentile or that they ranked 300th among 1,000 people. In interpreting information that represents relative frequencies, people tend to be more sensitive and responsive to frequencies in a large number size (e.g., 300 out of 1,000) than those in a small number size (e.g., 3 out of 10). These judgmental tendencies show that the number size of frequency serves as an anchoring point that determines subsequent decisions. The concept of "base-rate neglect" is often used to explain the cognitive judgmental tendency described above that people underutilize relative information about population statistics and instead overutilize other salient information such as the number size of frequency (Kahneman and Tversky, 1973). Yamagishi (1997) analyzed the rankings of 11 common causes of death given by undergraduates and suggested that a risk would be judged as more serious when the deaths are expressed by frequencies with large number sizes (e.g., 1,286 out of 10,000) than those with smaller ones (24.14 out of 100). Because of "base-rate neglect", individuals' judgments have been influenced by altering the anchoring points (i.e., the actual numbers of deaths, irrespective of the actual rates) (Elwyn, Edwards and Kinnersley, 1999). It implies that the higher magnitude of the denominator presented would be more influential on consumers' perceptions than the lower one.

It is expected that statistical formats would affect the way people interpret information and influence message persuasion. When a frequency format is presented in a positively framed message, frequency with a larger number size should arouse more attention and will be judged as more favorable than that with a smaller one, which leads to higher effectiveness. Alternatively, in a negatively framed message, frequency presented in a higher magnitude of number should make potential harmful consequences more serious which could lead to less favorable attitudes towards the promoted alternative and thus decrease the message effectiveness. The hypotheses are specifically presented as follows:

- H1: Different statistical formats would moderate the relationship between framing and message effectiveness.*
- H2a: Frequency framed positively with a larger number size would be more effective than that with a smaller number size.*
- H2b: Frequency framed negatively with a larger number size would be less effective than that with a smaller number size.*

The Moderator of Graphic Illustration on Framing Effectiveness

The other communication format factor investigated in the present study has widespread appeal among marketing practitioners and is related to vividness effects. Vividness effects occur when material is exhibited in the form of picture (Block and Keller, 1997). Researchers across disciplines agree that visual representation in appropriate graphs could contribute to information comprehension, problem solving, and effective communication (Pinker, 1982; Tufte, 1983; Kosslyn, 1989; Schapira et al., 2001; Edwards, Elwyn, and Mulley, 2002). There is an increasing trend in communicating health risks to employ a visual representation of risk, rather than just a bald statement of the relevant statistics (Edwards et al., 2002). After all, 'a picture is worth a thousand words.' Researchers proposed that the presentation of risk information in a graphic form could be an effective means of increasing risk-avoidant behavior (Keeney and von Winterfeldt, 1986). Stone et al. (1997) empirically demonstrated the efficacy of such recommendation by showing that graphic techniques of demonstrating risk information could be more effective than simply providing numerical information highlighting the risk reduction accorded by a safer product.

Some specific graphic types are suggested to assist consumer processing of quantitative information and increase the effectiveness of risk communication (Edwards et al., 2002; Schapira et al., 2001). Schapira et al. (2001) suggested that human figures add contextual implication to the numeric information presented and increase personal salience because of depiction of human beings in the graph. Frequency with human figures was easy to identify with, was understandable, and conveyed a meaningful message. Similarly, crowd figures (e.g., showing how many of 100 people are affected) were found useful in Edwards et al. (2002). In contrast, bar graphs are perceived as more analytical, more difficult to understand, and less influential. Feldman-Stewart et al. (2002) conducted a study to determine which formats for displaying quantities such as probabilities of treatment risks and benefits are perceived more accurately and easily by patients. The results showed that vertical bars, horizontal bars, numbers, and systematic ovals were equally well perceived for making a choice, whereas random ovals caused slower and less accurate performances. Stone et al. (2003) further adopted pie charts to demonstrate risk information, suggesting that it represents the percentage information accurately. Based on these findings, appropriate graphs and charts could enhance vividness effects and facilitate persuasion in comparison to the typical, exclusively verbal presentation of information. When a healthcare marketer communicates with a consumer about product efficacy, visual presentation of graphic display in the information would increase the effectiveness of message delivery.

H3: Graphic illustration would strengthen framing effects.

Interrelationship among Framing, Statistical Formats of Efficacy and Graphic Illustration

When both statistical formats of statistics and graphic aid are incorporated in a framed message, a three-way interaction effect is expected to occur since both information presentations could affect the people's evaluations. As discussed above, frequency with a large number size and an appropriate graph would boost framing effectiveness. Therefore, when both variables are considered, a synergy might occur and increase message persuasion. Nevertheless, earlier empirical results with a qualitative approach (i.e., focus group interviews) indicated that frequency in a graph with lower denominations have positive attributes of simplicity, directness, and ease of interpretation (Schapira et al., 2001). Graphs with large number sizes are perceived as depicting risk of lower magnitude.

Focusing on the denominator, participants noted that more figures presented with success (probability of successful rate) when the larger number size are used (i.e., 100 or 1000 compared to 10) (Schapira et al., 2001). People have a general intuition that larger samples lead to more accurate estimates of population means. It seems possible that when frequency is framed with a larger denominator in a graph, the larger denominator might dilute the salience of graphs on framing effectiveness. Therefore, the contradicting strengths of effects from graphic display and frequency with different denominators need to be further explored.

STUDY 1

Experiment 1 examined the moderating role of graphic illustration on framing effects by following the traditional manipulation of attribute framing which presents statistics in percentage. A 2 (message framing: positive vs. negative) X 2 (graphic display: without chart vs. with chart) factorial design was employed. Pie charts were chosen as the visual representation based on an earlier pilot study with a convenient sample. Skin care was selected as test product category and a new product named as *PerfectSlim* was selected with efficacy at 80%.

Prior to the experiment, the treatment booklets were randomized. Participants were assigned to one of the four experimental conditions above. The study was conducted at the ground floor of a large department store where cosmetics and accessories were sold. Female customers were selected as the sample. The sample consisted of 213 females; age ranged from 17–68 years with the mean age 35.8. Participants were approached and asked to participate in a survey for consumer research. Participants were instructed to follow the instructions on the booklet, read a scenario of a new skincare product, and respond to the questions that followed. Participants read a three-part booklet containing a survey on skincare routines and skincare product history (a pre-manipulation questionnaire), description of the new skincare product, and a survey on product evaluations (a post-manipulation questionnaire). When they finished, booklets were collected. The experiment lasted about 10 minutes.

Message Manipulations (Independent Variables)

The first paragraph was consistent across 4 experimental conditions and was stated as follows: “At night the body is relaxing and needs less energy, and sugars are more easily stored. An innovation PERFECTSLIM has been specially formulated for an evening application to stimulate the body’s natural drainage and reduce the appearance of cellulite, through the massage application technique. Body contours are refined and the stomach looks smoother. Scientific tests have proven the high effectiveness of the PERFECTSLIM formula.” Meeting the criterion that the framing involves an attribute of the framed object and avoid ceiling effect of extreme values (e.g., 90%) (Levin et al., 1998), the description of the new skincare treatment was presented in a positive (negative) frame with percentage was that “Reported reduction of the appearance cellulite: 80% agree” (“Reported reduction of the appearance cellulite: 20% disagree”) (Figure 1).

Pre-manipulation Measures

1. *Perceived health status and health consciousness.* Participants evaluated their skin health and weight control separately in two questions on a 4-point scale (poor, fair, good and excellent). The questions regarding health consciousness were adopted from the Health Consciousness Scale (Gould, 1990) and were modified into four questions targeting skincare measured on five-point scales (“does

not describe you at all” (0), “describes you a little” (1), “describes you about fifty-fifty” (2), “describes you fairly well” (3), and “describes you very well” (4)).

2. *Individual perceptions of skincare issues.* Participants were asked to identify skincare problems they were worried about and worrying degree of each acknowledged problem in 7-point semantic scales.
3. *Previous experience of skincare products.* Participants answered the questions whether they ever purchased or used ten skincare products (e.g., sun protection, softening toner, and anti-cellulite, anti-acne and oil control) and how much they usually spent on them every month to provide a basic understanding of purchase history and to represent one’s involvement.
4. *Background demographics.* Questions assessed participants’ age, occupation, income, and tendency towards new products.

Post-manipulation Measures

1. *Opinions of the information presentation.* Five specific questions assessed participants’ evaluation on the presented message. Respondents were asked “What do you think of the information above as a way of describing this new product?” to see whether the information made it easier to understand the product, whether the information was meaningful, confusing, informative, and whether it added nothing on 7-point scales. After reverse coding for some questions, a composite score was created by calculating the numerical average of the five scales.
2. *Manipulation check on framing.* One question assessed the difference of the information framing. Participants had to state whether the advertisement they had seen reported how test women felt about the new product (either agreed with product efficacy or not).
3. *Behavioral intention.* The likelihood of buying, using the advertised product and recommending it to family or friends were measured on a three-item 7-point semantic differential scale consisting of likely/unlikely. It was an indicator of message effectiveness.

Results

High Cronbach’s alphas (opinions of information presentation=0.88, and behavioral intention=0.93) indicated that the scales used in this study were reliable. The result of chi-square test for framing manipulation was significant ($p < .05$). Participants in the negatively framed conditions judged messages as emphasizing the chance satisfactory results of the product would fail to provide, whereas those in the positively framed conditions judged the messages as emphasizing the satisfactory results of the product would provide. The framing manipulation was successful.

An analysis of covariance (ANCOVA) controlling for purchase experience of skincare products was performed (please see Figure 2 for detailed results). The results are consistent with previous findings that positive framing is more effective than negative framing in presenting probability with $F(1, 212) = 33.78, p < .01$. Presenting information in a positive or negative way resulted in differences in the position of the anchoring point, and thus determined people code the alternative as entailing a loss or a gain, which led to different levels of behavioral intention. A significant interaction effect between framing and graphic illustration was found on participants’ behavioral intention with $F(1, 212) = 41.14, p < .01$. The results supported H3 that graphic display could enhance framing effects.

Negative frame in percentage presentation with graphic display (pie chart)

PERFECTSLIM may fail to provide satisfactory results for 20% of test women on reduction of the appearance cellulite:

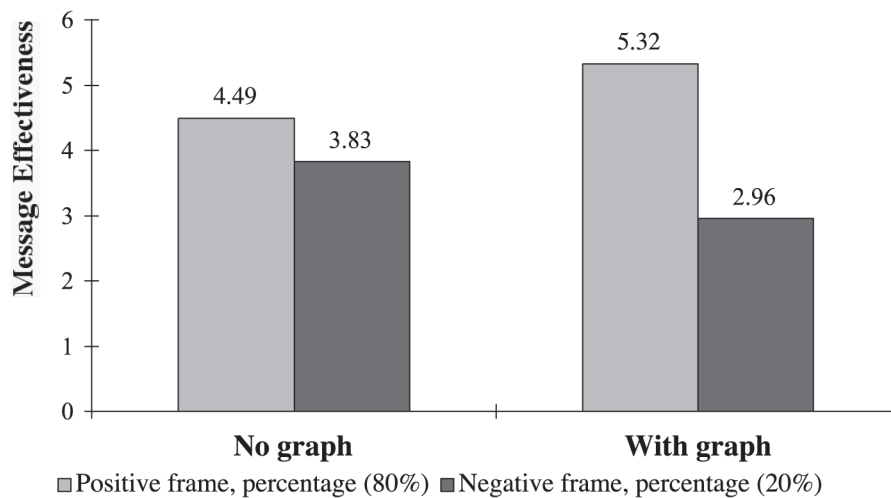

FIGURE 2

Influences of Graphic Display and Probability Format of Product Efficacy on Framed Ads

STUDY 2

Study 2 was designed with the objectives of considering multiple types of framed statistics to test the robustness of the moderating effect of graphic illustration in the relation between framing and persuasion found in Study 1. A traveling context was chosen to increase the external validity and generalizability of this research. The experiment tested the relative effectiveness of positively and negatively framed messages to promote a product in different statistical formats of efficacy probability in a 2 (message framing: positive vs. negative) X 3 (statistical format of medicine efficacy: percentage vs. frequency with a large denominator vs. frequency with a small denominator) X 2 (graphic display: without graph vs. with graph) between-subjects design. Each participant responded to one hypothetical medical alternative with a level of efficacy set at 75%.

Scenario of a New Medical Alternative

A new medicine for travel health was chosen. Health and well-being have been considered as one of the major risk factors in tourism and perceived risk in health was found to be the most important risk factor in travel experience (Lepp and Gibson, 2003). It is widely acknowledged that adverse health effects may significantly tarnish tourists' experience of a holiday and destination (Lawton and Page, 1997). Taking preventive preparations by purchasing related healthcare products become one effective risk-reduction strategy tourists may adopt. The context of traveling could facilitate an understanding of consumer attitudes towards healthcare decisions. Melatonin was selected to be tested product in this study. Replacing sleeping pills, melatonin is a new hormone replacement therapy for combating jet lag without serious hazards or side effects of drugs. Although it was approved by FDA in the

United States, it was not available in the Taiwanese market where the study was conducted. It avoided any possible confounding effects due to prior familiarity or attitudes of participants towards the sponsored product.

Participants consisted of 553 undergraduate students (219 males and 234 females) from business courses in a large university. The experiment was a between-subjects design. However, seven participants had to be removed from the analysis because of incomplete questionnaires. In the final sample of 446 respondents, age was ranged from 17–26 years with the mean age 22.1.

Message Manipulations

The first paragraph was consistent across 12 experimental conditions and was stated as follows: “Many people suffer from jet lag. It is caused when you travel through multiple time zones. Altitude and pressure changes at each landing and take-off also upset body systems. Anecdotal evidence indicates that jet lag makes travelers more susceptible to colds, flu and stomach upsets. Melatonin is a natural homeopathic remedy helping fight jet lag. It comes in the form of pleasant chewable tablets. It does not need to be taken prior to travel, and does not conflict with other medication. Scientific tests have proven the high effectiveness of the Melatonin.” The description of medicine was presented in a positive (negative) frame with percentage was that “Melatonin may provide satisfactory results for 75% of the people with your health condition” (“Melatonin may fail to provide satisfactory results for 25% of the people with your health condition”). When frequency was presented in a large denominator, description in a positive (negative) frame was that “Melatonin may provide satisfactory results for 225 out of 300 people with your condition.” (“Melatonin may fail to provide satisfactory results for 75 out of 300 people with your condition.”) On the contrary, when frequency was framed in a small denominator, medicine description in a positive (negative) frame was, “Melatonin may provide satisfactory results for 3 out of 4 people with your condition.” (“Melatonin may fail to provide satisfactory results for 1 out of 4 people with your condition.”)

Several graphic formats were pre-tested to determine their congruity with different statistical formats (i.e., percentage and frequency) and compare their effectiveness. Pie charts were found congruent with percentage format of probability, and the icons with human figures were compatible with a frequency format. These two charts were selected as appropriate graphs for probability of medicine efficacy (refer to Figure 3 for one example of message manipulations).

Administration Procedure

The researcher came along to courses that lecturers agreed for experiment at the beginning of the lectures. The experiment was conducted during the last week of the term in early June. The timing enhanced personal relevance and interests regarding the travel health scenario since summer was the high season of student traveling. Students were asked to voluntarily participate in the experiment. Participants were instructed to follow the instructions on the booklet, read a medical scenario, and respond to the questions that followed. Participants read a three-part booklet containing a survey on travel attitudes and experiences (a pre-manipulation questionnaire), description of melatonin (the new medical alternative), and a survey on product evaluations (a post-manipulation questionnaire). They were reminded, “Although it might be difficult to make a decision with this limited information, do your best. There are no right or wrong answers. It is important, however, that you be honest and take the task seriously in order for the data to be

meaningful.” When they finished, booklets were collected. The lectures continued. The experiment lasted about 20 minutes.

Pre-manipulation Measures

1. *Perceived health status and health consciousness.* Participants evaluated their general and travel health separately in two *questions* on a 4-point scale. Questions regarding health consciousness used in Study 1 were modified into four questions targeting travel care.
2. *Individual perceptions of health risk.* Derived from previous studies (Rosenstock et al., 1988; Slovic et al., 1989), six items assessed participants’ travel health attitudes by measuring perceived susceptibility, perceived severity and routine medicine-taking. Before further data analysis, some questions needed to be reversed-coded to ensure uniformity in coding.
3. *Previous experience of traveling healthcare products.* Participants answered the questions whether they ever purchased or used seven travel healthcare product categories (e.g., sun protection, travel sickness, and pain relief) to provide a basic understanding of purchase history.
4. *Background demographics and travel history.* A series of questions assessed participants’ age, gender, birthplace, number of trips during the past 12 months, number of international trips by plane, and number of regions they visited before.

Post-manipulation Measures

1. *Opinions of the information presentation.* The same questions adopted in Study 1 were used.
2. *Manipulation check on framing.* One question assessed the difference of the information framing. Participants had to state whether the leaflet they had read emphasized better results of melatonin would bring or not.
3. *Manipulation check on presentations of medicine efficacy.* Participants identified the statistical format of medical efficacy (with chart or not, with what kind of chart, frequency or percentage).
4. *Behavioral intention.* In addition to the three questions used in Study 1, the likelihood of discussing the alternative with physicians on a 7-point semantic differential scale consisting of likely/unlikely was incorporated into the intention scale.

Results

An initial set of analyses was conducted to determine whether any of the demographic or pre-manipulation variables moderated behavioral intentions. The variables of health consciousness and individual perceptions towards health risks were determined to be controlled variables in the further analyses. The reliability of the scales was also checked and the following Cronbach’s alphas were obtained: individual perceptions of health risk=0.75, opinions of information presentation=0.83, and behavioral intention=0.91. The result of chi-square test of framing manipulation was significant, confirming that participants in the negatively framed conditions judged the messages as emphasizing the chance the satisfactory results of the medicine would fail to provide, whereas those in the positively framed conditions judged the messages as emphasizing the satisfactory results of the medicine would provide. Similar procedures with significant chi-square tests were found to confirm the success of manipulations of statistical format presentations and graphic illustration.

FIGURE 3
Examples in Graphic Illustrations of Different Statistical Formats and Framing

Positive frame in a large denominator with graphic display (human figures)

Melatonin may provide satisfactory results for 225 out of 300 people with your health condition:

Provides satisfactory results for 225 out of 300 people with your health condition

Means of All Experimental Conditions

	Without graphic illustration	With graphic illustration
Positive frame, percentage (75%)	4.61	5.18 *
Negative frame, percentage (25%)	3.97	3.04 **
Positive frame, frequency in a small number size (3 out of 4)	4.01	4.52 *
Negative frame, frequency in a small number size (1 out of 4)	4.33	2.96 **
Positive frame, frequency in a large number size (225 out of 300)	5.21	5.30
Negative frame, frequency in a large number size (75 out of 300)	3.34	3.14

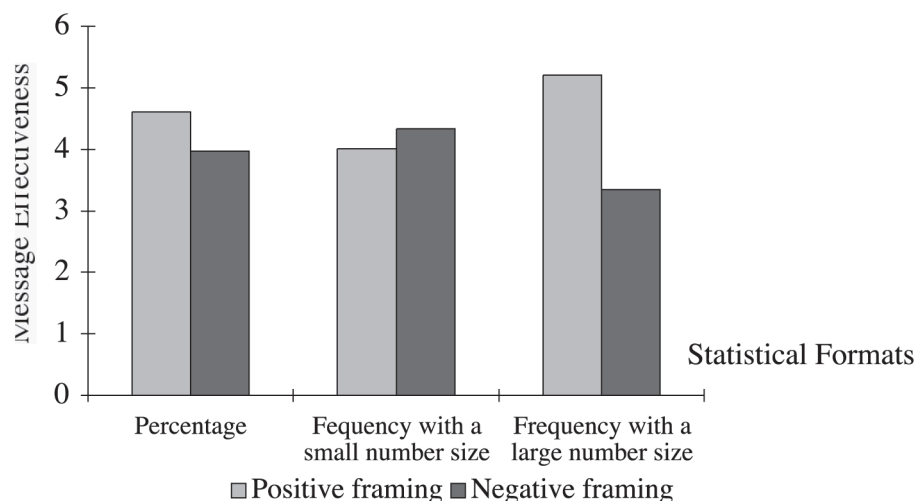

* $p < .05$; ** $p < .01$

An overall analysis of covariance (ANCOVA) controlling for health consciousness and individual perceptions towards health risks was performed. A significant three-way interaction of framing, statistical formats of medical efficacy, and graphic display was found on participants' behavioral intention with $F(2, 445)=31.49, p < .01$. Treatment means are summarized in Table 1.

Post-hoc tests with Bonferroni adjustment were conducted to test the rest of proposed hypotheses. When efficacy was presented in different statistical formats, a significant difference between

positive and negative framing was observed ($F(2, 445)=7.29, p < .05$). These results lend support for the main effect of statistical framing (H1) that information of medicine efficacy presented differently would influence framing effectiveness (Figure 4). Furthermore, a significant interaction effect between frequency and its number size was also found ($F(1, 445)=7.21, p < .05$). When statistical information of medical efficacy was presented in a larger number size, framing effects were enhanced (difference of framing effects in statistics with a larger number size= $5.21-3.34=1.87$ vs.

FIGURE 4
Influence of Statistical Formats on Framing Effectiveness

difference of framing effects in statistics with a smaller number size= $4.33-4.01=0.32$). Statistics framed positively and presented in a larger number size was more persuasive ($M=5.21$) than that with a smaller one ($M=4.01$). Conversely, statistics framed negatively and presented in a larger number size became less persuasive ($M=3.34$) than that with a smaller one ($M=4.33$). The results were consistent with predictions of H2a and H2b.

Graphic illustration was found to facilitate framing effects ($F(1, 445)=5.91, p<.05$), supporting H3. One interesting finding reveals that framing effects were enhanced by graphic display only when statistics were presented in percentage or in relative frequency with a small number size and no significant graphic effects were found with statistics presented in relative frequency with a large number size. The interaction between framing and graphic display became insignificant when the number size of the frequency was large (Figure 5). Participants appeared to focus on the increased number of figures in the larger denominator with larger numerator, regardless of graphs. Only main effect of framing was found significant. This finding is similar with prior work demonstrating a response range effect on subjective risk assessments (Yamagishi, 1997). Yamagishi reported that risk estimates were grater when ascertained on an X out of 100 scale compared to an X out of 10,000 scale. What it was found here was that the relative frequency information with a larger denominator dominated the message effectiveness and diluted the effect of visual representation of graphic aid. Without the graphic display, participants relied on not only the framing effects but also the statistical formats. Relative frequency with a large number size was more influential in decision making. With the aid of appropriate graphs, message effectiveness mainly depended on the way the statistics were framed (chance to provide satisfactory results vs. chance failed to provide satisfactory results). Visual representation of graphic aid could have more impacts on persuasion than the statistical formats (probability vs. frequency with different number sizes). Indeed, a picture could be worth a thousand words. The two studies above suggest potential biases in perceptions of a new product based on the way the efficacy

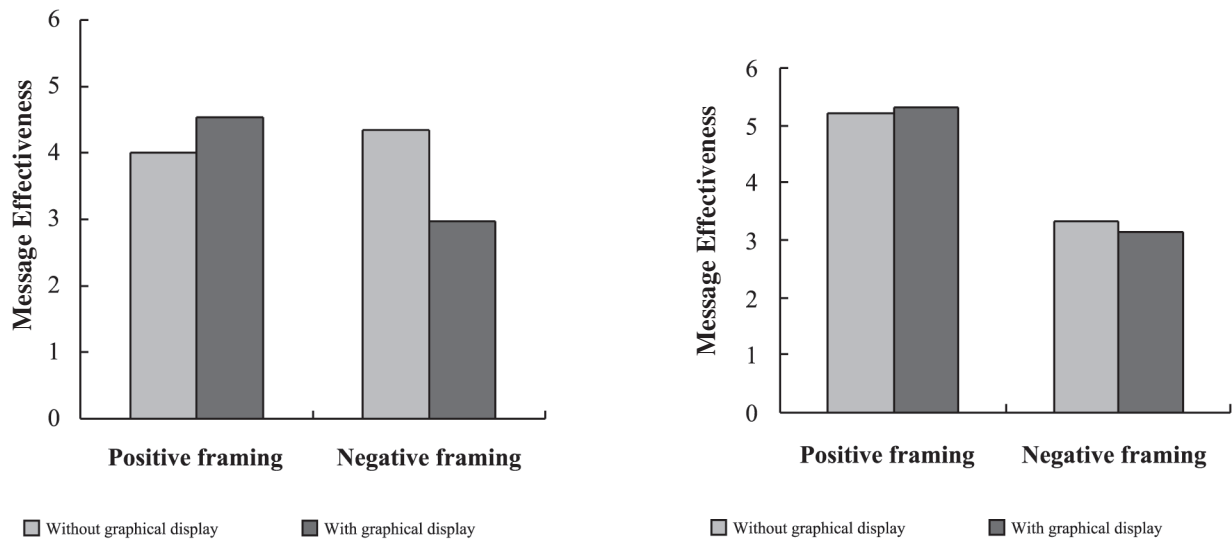

information is framed, the aid of graphic display (i.e., highlighted human figures and pie charts), the size of the number size the statistics presented in, and the interactions among these three communication format variables.

GENERAL DISCUSSION AND IMPLICATIONS

This paper examines the importance of the context in which a new product is presented to individuals. Partially replicating the results of previous research, the results showed that framing an alternative positively led to higher persuasion than framing it negatively. In addition, two moderators of this process were introduced, i.e., statistical formats of efficacy information (percentage vs. frequency) and the visual representation of graphic display. In line with earlier research, statistical formats may influence healthcare decisions (Stone et al., 1997; Feldman-Stewart et al., 2000; Schapira et al., 2001). In addition, relative frequency information may increase favorableness in the judgment making. Presenting frequency information with a larger number size was found to increase message persuasion. The provision of a chart representing the outcome rate further increased the persuasiveness of health communication in the case of positive framing but reduced that in the case of negative framing. Framing effects were enhanced by graphic aid only when statistics were presented in percentage or in relative frequency with a small number size. When statistics were presented in frequency with a large number size, only the main effect of framing remained significant. The increased number of figures might dilute the vividness effects of graphs.

Future research should test the generalizability of the three format factors with different level of product efficacy (less than 50% or very high efficacy such as 99.9%). Sheridan et al. (2003) suggest that framing affects could still be found when the balance of potential harms and benefits is a close call (50%). Additional studies on health communications should test the effectiveness of those factors in quasi-experiments or field tests across various products. The present study limited in the conditions of high congruence between statistical formats and graphic illustration

FIGURE 5
Moderating Role of Graphic Illustration on Framing Effectiveness

(i.e., probability presented in pie charts, and frequency presented in highlighted human figures). A full factorial design considering low congruence circumstances (i.e., using bar charts to present frequency or using crowd charts to illustrate percentage information) should be examined in future. Only one dimension of product efficacy (potential gain) was investigated. One proposal for future research is to incorporate risk information (potential loss of side effects) with these framing factors. It is important to understand under what conditions the messages would be effective and when and why statistical format and visual representation of graphic display are likely to facilitate or inhibit message framing and the effectiveness of the copy strategies. Researchers should also explore how those framing variables could influence consumers' understanding, belief, trust, or confidence in the information received (Gurmankin et al., 2004). Assessment of numeracy or prior exposure to risk concepts should be incorporated in future research as a possible moderator on framing effectiveness.

The meaningful communication of product efficacy information has an important role in the practice of marketing. This is especially so when a patient chooses to take an active role in a healthcare decision where risks and benefits must be considered (Schapira et al., 2001). First, information must be presented clearly. Care is required to avoid an overload of information. The visual presentation of graphic information has been explored. This study provides new insights into information formats when interpreting numeric efficacy information presented in different formats and graphic displays used in advertising communication. A picture could be worth a thousand words when appropriate statistical formats are chosen. In addition to the purpose of persuasion, statistical formats should be chosen to optimize consumer understanding and ability to use the information effectively. For general public, we would be able to look beyond the scene regarding advertising campaigner' framed messages. After all, it makes little mathematical difference how information is expressed. It does, however, make a psychological difference.

Two Wrongs Make a Right? Accidental Consensus in Predictions of Others' Preferences Under Uncertainty

David Faro, University of Chicago
Katherine Burson, University of Michigan
Yuval Rottenstreich, Duke University

EXTENDED ABSTRACT

To make effective decisions under uncertainty, marketers often must accurately predict other people's decisions under uncertainty. To illustrate, consider the managers at a pharmaceutical firm that is deciding whether to start developing a new allergy drug. These managers must of course assess their *own* risk tolerance, determining whether the chances and consequences of a successful development attempt outweigh the chances and consequences of an unsuccessful development attempt. Importantly, these managers must also predict the preferences of many *others*, including consumers and executives at competing firms. For example, how would executives at other firms respond to the development of a new drug? Would these competitors bear the risk of attempting to develop a next generation of rival drugs, thereby threatening the new drug's profitability? According to most descriptive models of decision under uncertainty (e.g. Tversky and Fox 1995), the managers have to perform two key judgments related to likelihood in order to accurately assess this possibility: 1) predict their rival's probability of success in developing a new treatment and 2) predict the impact (weight) of that probability on their rival's actual choices.

The present research examines people's predictions of others' preferences under uncertainty. We examine two distinct self-other discrepancies that can influence the accuracy of predictions under uncertainty, one occurring in the probability judgment stage and the other in the probability weighting stage. Importantly, we show that these self-other differences work in opposing directions. Hence, we examine the joint operation of these opposing forces and observe that they can result in "accidental consensus" in terms of own choices and predictions of other's choices under uncertainty.

The recent literature on perceptions of ability suggests that when judging their ability to perform on a given task, people egocentrically focus on their feelings of task difficulty and fail to adjust their self-assessments for the fact that the task or event in questions would be as difficult for others (e.g. Kruger 1999). In study 1 we confirm that we can expect a similar effect of difficulty using indirect methods, such as in the separate judgments of probability that we are interested in. As expected, we find that participants were more positive in their self-assessments than they thought others should be when the task was easier. Conversely, participants were more negative in their predictions than they thought others should be when the task was more difficult.

In study 2 we examine self-other differences in probability weighting. Drawing on the research on affective reactions and probability weighting (Rottenstreich and Hsee 2001) we suggest that deviations from impossibility and certainty will have greater impact for the self than they will be predicted to have on others. Even a tiny probability of obtaining some outcome might generate a great deal of risk-related affect that seems to go beyond what is justified by the mere numerical difference between a zero probability and a just slightly higher probability. Likewise, even a tiny probability of not obtaining some outcome might generate a great deal of risk-related affect that seems to go beyond the mere numerical difference between a probability of one and a just slightly lower probability. But research on empathy gaps (Loewenstein

1996; Van Boven, Dunning, and Loewenstein 2000) suggests that, although people's reactions to risk and uncertainty may in part reflect such affective reactions, they may not appreciate that other people have similar affective reactions. As a result, they may predict that others will respond to deviations from impossibility and certainty in relatively muted ways. Put differently, people may fail to predict that others will do what they themselves do—overweight small probabilities and underweight large probabilities. We confirm this prediction in a study that contrasts risky choices made for self with predictions for choices of others. We find that given a small probability of winning, choices were risk-seeking but predictions were less so. In contrast, given a large probability of winning choices were risk-averse but predictions were less so. This pattern of self-other differences in risky choices implies a self-other difference in weighting of probabilities: as predicted, people fail to predict that others will overweight small probabilities and underweight large probabilities just as they themselves do.

In Study 3, we combine the methodology of the first two studies to examine predictions of others' preferences under uncertainty, where both judgments of probability and weights of those probabilities need to be made. Participants were presented with word puzzles that varied in difficulty. We first asked them to judge the probability of success solving a word puzzle and then state a cash equivalent for a gamble based on that word puzzle. Participants made these two judgments for themselves and for a random-other. First, in terms of monetary decisions, we find no difference decisions for self versus predictions for random-other. This result, a sort of "accidental consensus" is explained by the replication of the two opposing self-other biases demonstrated in studies 1 and 2. Replicating study 1, we observe an interaction of target by puzzle difficulty. On harder word puzzles, participants thought their own probability of success was smaller than that of others. On easier word puzzles, participants thought that their own probability of success was greater than that of others. Replicating study 2, we also find an opposing self-other difference in weighting of these judged probabilities, offsetting the differences in probability judgment. Further, in line with the empathy gap account, we find that self-other differences in weighting of probabilities are attenuated when one is asked to make decisions for oneself before predicting the decisions of others.

We discuss the implications of these findings with respect to self-positivity, prediction, and behavior. Our findings suggest, for example that, while managers might predict that other managers are less likely to have a successful product launch than themselves, they might nonetheless predict that other managers would be equally likely to actually proceed with the launch.

When Losses Loom Even Larger: The Moderating Role of Relationship Norms

Pankaj Aggarwal, University of Toronto

Meng Zhang, University of Toronto

EXTENDED ABSTRACT

Prospect theory states that people interpret outcomes not as end-states but as gains and losses relative to a reference point. Removing a good from the endowment reflects a loss while adding the same good (to an endowment without it) reflects a gain. Furthermore, the value function for losses is steeper than the value function for gains, $v(x) < -v(-x)$, where v is the value of x . As such, losses loom larger than gains resulting in people generally being averse to losses (Kahneman and Tversky 1979). Thaler (1980) termed this increased value of a good when it becomes part of the individual's endowment the endowment effect. Recent research has identified factors that moderate the strength of the loss aversion and endowment effect, for example, source dependence (Loewenstein and Issacharoff 1994), transaction demand (Mandel 2002), and symbolic value of products (McGraw, Tetlock, and Kristel 2003). The present research extends proposes one other potential moderator of loss aversion: the type of relationship that consumers form with the product.

A growing body of literature in marketing has drawn upon social psychology to understand consumer-brand relationships, and has noted that people differ in how they relate to brands (Fournier, 1998; Muniz, Jr., & O'Guinn, 2001). In particular, Aggarwal (2004) finds that consumers use norms of relationship as a lens to evaluate a brand: consumers' evaluations differ depending on the type of their relationship with the brand. Two types of relationships are examined: *exchange* relationships in which people provide benefits to others to get something back from them; and *communal* relationships in which benefits are given to take care of others' needs and to demonstrate concern for their well being (Clark and Mills 1993).

In this research, we propose that the distinctive norms of exchange and communal relationships will also lead consumers to demonstrate different magnitudes of loss aversion. Norms of a communal relationship, relative to those of an exchange relationship, will result in a stronger loss aversion. Two reasons argue for this hypothesis. First, relationship norms lead consumers to treat gains and losses differently. Norms of exchange relationship suggest that people be attentive to the net balance of inputs and output in the relationship. This means that people are more likely to compute the *net* of gains and losses. Given that the value function of losses is steeper than that of gains, aggregating losses with gains is likely to result in the subsequent behavior being consistent with lower loss aversion levels. Second, different relationship norms may lead to the experience of loss being different for the two sets of consumers. When communal norms are salient the endowed option is akin to a friend or a family member and hence more likely to be incorporated into the consumer's extended self (Belk 1988). Due to self-enhancing bias that leads to enhanced evaluation of others with whom people have an association (Beggan 1992), an endowed product is likely to be enhanced in valuation more in a communal relationship. Furthermore, since people in a close relationship tend to devalue alternatives relative to their existing option (Johnson and Rusbult 1989), people are likely to demand larger dollar amount (due to devaluing of the alternative—the monetary value) to give up their current endowment.

Three studies test this overall thesis: norms of a communal relationship relative to those of an exchange relationship will make

consumers more loss averse. The first two studies use standard endowment effect experiments while the third study uses a more direct measure to assess participants' perceived loss aversion.

Study 1 uses students as participants and measures their relationship with the university. Participants are divided into communal and exchange groups based on a median split. Participants then go through the standard endowment effect experiment using a coffee mug with the university name and logo on it. Results show that both sets of participants show significant endowment effect. Further, even though there were no differences in their buying prices (\$4.08 vs. \$4.22), participants in the communal relationship stated a significantly larger selling price for the mug displaying stronger loss aversion than those in the exchange condition (\$9.12 vs. \$6.23).

Study 2 replicates the results of study 1 but instead of measuring the relationship norms study 2 manipulates them by using a scenario description of a social interaction. Endowment effect experiment using a plain mug conducted subsequent to this relationship manipulation shows that, as before, there were no differences in the stated buying prices of participants in the communal and exchange conditions (\$1.88 vs. \$2.04). However, loss aversion experienced by participants in the communal condition was significantly larger than that in the exchange condition, as revealed by their stated selling prices (\$5.32 vs. \$3.60).

Study 3 tests the overall hypothesis by more directly examining the participants' loss aversion coefficient. Adapting from prior research (Schmidt and Traub 2002), participants were administered two tasks that required them to provide dollar values that made two particular gambles worth playing. Greater loss aversion would suggest that participants should require greater dollar amounts to persuade them to gamble. Results show that participants in the communal condition indicated a significantly larger dollar amount (\$884) than those in the exchange condition (\$217) to play a gamble that had an equal likelihood to lose \$100. Similar results were observed for a gamble that had an equal likelihood of losing \$200 ($M_{com}=\890 vs. $M_{exch}=\$312$), further supporting the overall hypothesis. Furthermore, the three studies carefully ruled out alternative explanations like affect and perception of quality.

Our studies, to the best of our knowledge, are the first to demonstrate that mere salience of relationship norms makes consumers systematically more or less loss averse. Given that the salience of relationship norms can be influenced using different marketing tools, marketers can play a significant role in making consumers more loss averse towards their brand making them less likely to switch to competitive brands. This has huge implications on issues relating to brand loyalty—and opens up some exciting opportunities for future research.

He Wants, She Wants: Gender, Category, and Disagreement in Spouse's Joint Decisions

Cheryl B. Ward, Middle Tennessee State University

ABSTRACT

Family purchase decisions are examined in light of product category, differing individual preference intensities, past history, and couple preference intensity for jointly purchased products. Specifically, a 2x2x2 ANOVA with a covariate is used to explore spouses' predispositions in a series of joint purchase decisions. The results indicate that joint purchases are more likely to favor choices preferred by husbands than wives, especially when choices involve across product category selections. In situations where spouses differ in preference intensities for two products, the decisions also tend to favor males. This tendency is magnified when the joint decision involves across product category decisions.

INTRODUCTION

Consumers spend a whopping eight million dollars a minute in the United States (Wellner 2002). That figure encompasses nearly 110 million households, of which the majority are family household units. Recognizing the enormous economic impact of such expenditures, there has been a resurgence in research interest regarding family purchase-decision dynamics (Aribarg, Arora, and Bodur 2002; Arora and Allenby 1999; Seetharaman, Ainslie, and Chintagunta 1999; Su, Fern and Ye 2003). For instance, studies have shown that spouses may adjust influence strategies used in purchase decisions over time (Corfman and Lehmann 1987; Su et al. 2003). Marketers may gain insight into targeting communication messages (Arora and Allenby 1999; Petrevu 2001) and guiding personal selling activities (Aribarg et al. 2002) by better understanding the various effects of spousal influence.

In addition to spousal influence, marketers have also recently acknowledged the importance of differentiating product category in family purchase decisions (Aribarg et al. 2002; Seetharaman et al. 1999; Ward 2003). Aribarg et al. (2002) determined that product category may impact the effectiveness of salesperson strategies and Seetharaman et al. (1999) found that households display similar state dependence across product categories, with income and family size having little influence. Ward (2003) found that the perceived degree of conflict between spouses in purchase decisions is greater in across category choices than within category choices.

Purpose of Paper. This study extends the spousal family purchase-decision research by examining the impact of husbands and wives in joint decisions where decisions involve product choices both within and across product categories. In addition, previous research has indicated that how badly couples desire the product in question impacts the joint spousal purchase decision (Corfman and Lehmann 1987). However, Corfman and Lehmann did not investigate what happens when each couple individually differs in preference intensity for each product. Thus, this study looks at the impact differing individual preference intensity has on joint decisions, and how product category and differing preference intensity and product category interact in explaining joint product decisions. While this study focuses on the impact of the joint spousal decision process, the specific roles of husband and wives in the decision process will be investigated to further marketers understanding of the spousal communication process.

RESEARCH HYPOTHESES

Since husbands and wives are separate individuals facing joint purchase decisions, it is proposed that in a significant number of cases a spouse may have desires for products which are not

comparable to those desired by his/her spouse. Given that the vast majority of households have limited discretionary income, it stands to reason that the wants/desires of both spouses cannot always be met, resulting in the couple being faced with making a decision which is not optimal for either person individually. Hence, one spouse must either concede to the other or the two must work out a compromise acceptable to both parties, but with which neither party may be completely happy. As a result of the potential for conflict between spouses in this process, gender differences may be relevant.

Previous evidence has been found to indicate that males and females differ in their information processing, however, researchers have not addressed the specific issue of whether males and females differ in across versus within category decision processing (Corfman 1991; Kirchler 1993). Although researchers found some conflicting evidence, men are generally expected to use coercion, direct reward and informational power, whereas women are often thought to use helplessness, personal rewards and referent power. Specifically, Meyers-Levy (1988) found that males were more likely to adhere to self-relevant information, whereas females were affected not only by self-relevant information, but also by "other-sensitive" information.

Based on the gender research findings presented, one would expect across category decisions to be more important to men than within product category decisions. Accordingly, in choices involving two differing product categories, males would be expected to be less willing to compromise towards the product category favoring the female than the female would be towards the product category favoring the male. However, in within category choices, males may be more willing to compromise given that both products are from the same product category and males may be less likely to experience a sense of loss regardless of which product is chosen. In this instance, females may be likely to have more impact on the final product selection. Based on the aforementioned discussion, hypothesis one states:

H1: In joint decision responses, across category product decisions should be more likely to favor the male than the female; whereas, within category product decisions should be more likely to favor the female than the male.

In maintaining the stability of the relationship, Corfman and Lehmann (1987) found that relative couple preference intensity was the primary determining factor in a joint decision outcome; that is, how badly the couple wanted an item had the greatest impact on product selection by the couple. However, Corfman and Lehmann did not investigate what happens when each spouse differs individually in preference intensity (differing gender preference intensities) on the paired decision products in the couple's joint decision. Based on the gender effects discussed thus far, this paper expects that when spouses differ in how badly each wants a specific product (differ in individual preference intensity for products), the final product choice will most likely favor the males. Thus, hypothesis two states:

H2: In joint decision responses where spouses differ in preference intensities for the products, the joint product decision should be more likely to favor the male than the female.

If gender differences are impacting results, then one would also expect a significant interaction between product category and differing gender preference intensities in explaining joint product choice decisions. In their previous studies, Corfman and Lehmann (1987) presented their participants with across product category decisions only. They did not distinguish between across or within product category decisions. It would seem that the impact of differing individual preference intensity on the joint product choice would be magnified in across product category decisions. The relative importance of the decision to each spouse, reflected by his/her differing preference intensity for each product, would seem to be of greater importance in across product categories than within product categories because of the "win/loss" aspect of the decision.

If spouses have differing preference intensities for the products, then conflict is greater in situations involving across product decisions, and each spouse would be less willing to compromise in paired decision choices involving across product categories. Prior research suggests that men are more likely to be self-relevant, whereas women are more likely to consider others when making a decision. Women are more emotional in an interpersonal context and men are more emotional in an achievement context (Kelly and Hutson-Comeaux 1999). This finding would seem to indicate that a man would be more determined to "win" when he differs in preference intensity with his wife and when the decision involves across category choices than within category choices. Wives are thought to be more likely to compromise than are husbands. Thus, hypothesis three states the following expected interaction:

H3: In joint decision responses, the decision will favor the male more when spouses differ in preference intensities for across category joint product decisions than when spouses differ in preference intensities for within category joint product decisions.

METHODOLOGY

A total of 69 couples were recruited from various church, school, and community groups in the Nashville, Tennessee, area to participate in this study with 61 couples completing the entire task. This study involves both husbands and wives participating in joint product decisions. The couples resulted in a sample size of 480 joint product decisions or observations, an average of 7.8 observations per couple.

Each couple received \$10 for their participation and an opportunity to win a \$500 grand prize. Participating couples consisted of participants in a range of ages, incomes, education, number of hours worked, number of years married, and number of children.

Stimuli

The stimuli consisted of products and services within a wide price range (\$15 to \$4,000) that represented purchases that couples would likely make over the course of their marriage. The products were grouped into eight separate categories for within versus across category evaluations. A total of 54 different products were evaluated by participants and included choices in home entertainment, furniture, kitchen appliances, non-home entertainment, household chores, office/education, and environment/health.

Data Collection

First Data Collection Phase. This research project involved a considerable time investment on the part of the participants. Each spouse first completed an Individual Product Questionnaire in which he/she evaluated the likelihood of purchasing 54 products over the next two years (100 point scales) and what price level they would be willing to spend for the product (selecting one of three

options). The couples also provided various demographic information. After the researcher received the Individual Product Questionnaires from the couples, couples were contacted and scheduled to participate in a joint interview session and Post-Questionnaire requiring both spouses to be present.

Second Data Collection Phase. The responses on the first questionnaire were used to create product pairings for the second stage of data collection, the joint interview. Based on their ratings of the 54 products/services, couples were randomly placed in one of two primary categories: (1) couples presented with choices of products from within product categories (29 couples), or (2) couples presented with choices from across product categories (32 couples).

The spouses were shown a series of products/services, two at a time. The joint decisions created were chosen for their propensity to generate conflict between the two spouses. Specifically, of the two products paired together, the female had initially preferred one product in the initial questionnaire and the male had preferred the other.

In a controlled meeting with the researcher, the spouses individually rated the likelihood of purchasing the items within the next two years, dividing 100 points between the two items (100 point constant sum scales). These numbers were used to indicate preference intensity for the products. A fifty-fifty evaluation was not allowed in that it indicated no decision for one product over the other. After evaluating the products individually, the couples then repeated the process except that this time they were presented the product pairings and told they were free to discuss the products with their spouses. The goal for the couple was to come to a joint consensus on which of the two products would most likely be acquired and to divide 100 points between the two products indicating their joint decision. The couple completed this step for each of the product pairings in order to create a decision history for the spouses.

The final step of the data collection was a Post-Questionnaire following the interview which spouses did independently. The Post-Questionnaire consisted of reality and manipulation check questions (5-pt. Likert scales) and influence tactic questions (7-pt. Likert scales).

Development of Variables

Joint Decision Response (Dependent) Variable. The joint decision response variable (DECISION) is measured based on the 100 points allocated by each couple to the paired decision choices. Responses below 50 favor the male's preferred product, while responses above 50 favor the female's preferred product. In this context, the couples were forced to come to a joint decision between the products as to which product was most likely to be purchased by the couple and then, also as a couple, to divide 100 points between the two products. It is important to note that when the paired choices were presented, one product represented the product that the male had favored in the Individual Product Questionnaire and the other product represented the product that the female had originally favored. Thus, this variable is able to capture whether the couple's joint product decision favored the male's or the female's initial product preference.

Explanatory Variables. The explanatory variables used in this study to test the hypotheses consisted of variables measuring the following attributes: cumulative past decision history, couple preference intensity for products, product category, and difference in gender level of preference intensity.

Corfman and Lehmann looked at past decision history numerous ways in their study. They concluded that a cumulative history variable resulted in the strongest results. The variable is measured by identifying cumulatively which spouse has won in their prior

joint decisions. For the first decision, and in cases when each has won the same number of decisions, this variable is coded 0. All models in this study were rerun using the other past history measures used by Corfman and Lehmann. Like Corfman and Lehmann, the cumulative history variable always produced the strongest results.

Corfman and Lehmann found that a couple's preference intensity for a product was one of the strongest variables in explaining product choices. Thus, this study includes preference intensity (PRE) as a continuous covariate variable to control for the perceived relative importance of each product to the couple.

Product category and gender preference intensity are the two variables of interest in this study. Product category (CATEGORY) is a dichotomous measure of the across versus within decision effects. All product choice decisions involved couples selecting between two products. These paired products were either from the same product category or from different product categories.

Gender preference intensity (GENDINTENSE) is a dichotomous measure of the gender effect of each spouse having different individual preference intensities for the joint products used in the joint product decision. When viewing the paired product choices and evaluating them individually, if both the male and female either rated product a (both assigned preference intensities greater than 50 points) or product b (both assigned preference intensities less than 50 points) as the preferred product, then both spouses are said to prefer the same product in the joint decision process. The spouses prefer the same product, thus their preference intensities should make the joint decision easier. However, if the male rated product a with more than 50 points and the female rated product b with more than 50 points (or vice versa), the spouses have differing gender preference intensities. He wants one product, she wants the other; therefore, a successful joint decision on the part of the couple will require more effort.

Research Design

A 2 (cumulative past history: female did not win vs female won) X 2 (product category: within vs across) X 2 (gender preference intensity: agree vs differ) between subjects design with one continuous covariate (couple preference intensity) is used in testing the hypotheses in this study. A second model examined the impact of separating the couple's preference intensity measure into its male and female components.

Since the 2 X 2 X 2 with covariate design contains three dichotomous variables and one continuous variable, it is an Analysis of Covariance (ANCOVA) model. The ANCOVA model was developed by regressing PAST, PRE, CATEGORY, and GENDINTENSE on DECISION. Because of prior expectations and hypotheses, all two-way interactions among the three dichotomous variables were generated.

RESULTS

Main Effects. The ANCOVA model was run using 480 joint decisions (observations). Table one reports the Type II Sums of Squares, F statistic, and P-Value for each variable and interaction term, along with the overall model statistics.

Table two contains the means assigned to the joint product choice (CATEGORY) for each level of the dichotomous explanatory variables (main effects). Remember, a mean greater than 50 means that the joint decision favored the female, while a mean less than 50 means that the joint decision favored the male.

Results for the control variables are as expected and consistent with Corfman and Lehmann (1987). Couple past history (PAST) and couple preference intensity (PRE) are both significant in

explaining the couples' joint decisions. The Type III SS shows that couple preference intensity is the strongest variable in explaining the joint decision. The means reported in table two show that in cases where the female had cumulatively won in prior decisions, the current joint decision favored the male ($M=48.421$), while in cases where the female had not cumulatively won in prior decisions, the current joint decision favored the female ($M=51.424$).

The main effect for product category (CATEGORY) was significant, $F(1, 473)=20.52$, $p<.001$. Means revealed that the male's preferred product was significantly more likely to be chosen in across category product decisions ($M=49.389$) and that the female's preferred product was significantly more likely to be chosen in within category product decisions ($M=51.844$). Thus, hypothesis one is accepted.

The main effect for gender preference intensity (GENDINTENSE) is significant, $F(1, 473)=6.73$, $p<.01$. When both spouses have strong preference intensities for different products, males are more likely than females to have the final product decision favor their preferred products ($M: Agree=53.89$, $Disagree=22.94$). Thus, hypothesis two is accepted.

Interaction Effects. Interaction between product category and differing preference intensity appear to provide information in joint product decisions above that explained by their main effects alone. The interaction term CATEGORY x GENDINTENSE is significant, $F(1, 473)=17.89$, $p<.001$.

Table three contains the means for product choice across the four cells for each of the two-way interactions. Decomposition of the interaction for CATEGORY and GENDINTENSE suggests that the effect of differing individual preference intensities between spouses on joint decisions is magnified in across product decisions (see figure 1).

Although, joint decisions still favor the male when spouses have differing preference intensity for within product decisions ($M: Agree=54.169$, $Disagree=31.807$), this effect is even stronger in situations involving across category decisions ($M: Agree=53.589$, $Disagree=13.33$). When the couples have major differences in preference intensity for the products, the joint product decision is more likely to favor the males in both across and within category product choices, but significantly more so for those joint decisions involving across product category choices. Therefore, hypothesis three is accepted.

Although the prior research and theory did not indicate that additional interactions should exist in explaining joint product decisions, we ran the models with all two-way interactions. The two-way interaction between product category and past history was not significant, $F(1, 473)=.44$, $p<.51$. However, the two-way interaction between gender preference intensity and past history is significant in explaining joint product decisions, $F(1, 473)=10.55$, $p<.01$. Investigation of the decision means across the four cells of the interaction suggest that relationship between past history and joint product decision may not hold true in situations where the couples have differing preference intensities.

Model Rerun With Separate Male and Female Preference Intensity Variables. Based on Corfman and Lehmann (1987), we included couple preference intensity as a control variable in this study. However, results could differ if one separates this measure into its male and female components. The author reran the model using separate male and female preference intensity variables. These results are reported in table four.

The results were the same for the variables of interest in this study, although the model was somewhat stronger (R-square of .747 versus .734 before). However, breaking down the preference intensity into its male and female parts did produce some interesting results for that measure. Although both variables are significant, the

Type II SS suggests that the male preference intensity for a product (MALEPRE) impacts the joint decision more than the female preference intensity for a product (FEPRE). This result would suggest that researchers using preference intensity as a variable should consider breaking down the variable into its male and female components in future research. Failure to do so could impact results.

CONCLUSIONS

Similar to prior research, this study finds that past history and couple preference intensity are significant in explaining joint product decisions. However, this study also finds that gender preference

intensity (differing preference intensity) and product category are significant factors affecting the joint decisions made by couples.

An intriguing finding from this study's results involved gender effects and the joint decisions that couples ultimately reached. Specifically, joint product choices were most likely to favor the male's preferred product in across category decisions and when the spouses had major differences in preference intensities for the products. Apparently, in those decisions when the products were from different product categories, males "won" more often than females, in that their preferred products were chosen more often than were the females. This finding lends support to earlier research

*FEPRE measures the female's preference intensity for the paired product choice. MALEPRE measures the male's preference intensity for the paired product choice.

which suggests that men and women may follow alternative sex roles with males following goals having immediate personal consequences and females focusing on harmonious relationships with other parties (Meyers-Levy 1988). When faced with a win/loss product decision, the male may have been most concerned with achieving the product of his choice, whereas the female was more likely to focus on preserving the relationship.

In decisions where the spouses disagree in preference intensity for the paired product choices, preference intensity was a significant factor in determining which product was selected by the couple in the final joint decision. This finding is true in both within and across category decisions, but the effect is stronger for across category choices than for within category choices (interaction effect). Apparently, when men and women express strong preference intensities for product choices that differ from each other, men are more likely to ultimately gain the product choice they preferred in the joint decision than are women.

The strength of this finding was further exhibited by the significant interaction between gender preference intensity and product category. When spouses exhibited clear preference intensities for differing products, the decision response was significantly affected for both types of product categories—across and within. Both across and within product category choices were more likely to favor the male's preferred product than the female's preferred product. However, additional contrast results indicated that the effects were more pronounced in across category product decisions than for within category product decisions. Thus, even though across and within category decisions were more likely to favor the male when gender preference intensities varied, the result for across product category decisions was strong enough to be significantly different from within product category decisions.

Contributions

Some support was found for the notion that spouses, particularly males, are more concerned with the outcome of across category decisions than within category decisions. Another contribution of this research is to extend the research of Corfman and Lehmann (1987). This study extends Corfman and Lehmann by examining the impact product category has on decision choices and how individual spouses differing in preference intensity impact joint decisions.

This study found strong support for gender effects in spouses' joint decisions. Final joint product decisions were more likely to favor males than females when decisions involved across category product choices and when decisions involved strong differences in preference intensities between the spouses. Apparently, when the spouses do not feel as strongly about the product choice to be made, they are more likely to be influenced by their spouse or to compromise due to their lack of commitment and to preserve harmony in their relationship. It seems that although women have come a long way in both the workforce and the household, results showed that there is still a tendency for decisions to favor men over women in situations involving greater conflict.

Finally, researchers in the past have frequently not been able to conduct studies involving participation by both spouses. This study is one of relatively few that employed active involvement by both spouses (Corfman and Lehmann 1987; Kirchler 1993; Spiro 1983). With spouses reporting increasing levels of time poverty and lifestyles being busier than ever, it is increasingly difficult to gain cooperation by couples in completing this type of study. As a result, this study is more realistic in examining what happens when you bring a husband and wife together in a joint decision making process.

Limitations

Some limitations to this study should be noted. First, the results found here may have limited generalizability. This study was conducted in the Southeast where husbands and wives may have more traditional role expectations than in many other parts of the country. It would be interesting to determine whether the results found in this study hold constant in other geographic regions. Cultural and ethnic differences may also produce different results. Most of the participants in this study were from a white European, predominantly Christian background. There is some evidence that African-American and Hispanic couples may use different decision-making dynamics than do white couples (Cohen and Kaufman 1991; Webster 1994). Thus, participants from different racial or religious backgrounds may produce different results.

Although participants reported that they found the task realistic, the process was artificial and did not require actual expenditures on the part of the couple. Had actual monies been at stake, the results may have differed. However, by providing each couple with \$10 for

their participation and a chance to win a \$500 grand prize, the researcher attempted to ensure that the participants took the decision task seriously.

Participants were limited in this study by the researcher's choice of products on the initial questionnaire. Also, participants were presented with only two products at a time (similar to Corfman and Lehmann 1987). In reality, participants may be faced with many more than two purchase options at a given time. Accordingly, products that may have been much more relevant to individual couples may not have been included. Though an effort was made to include a wide variety of products that are commonly purchased by married couples, each couple differs in their product and service preferences. Thus, some couples may not have enough products of sufficient interest to purchase, thereby limiting the relevance of this decision making process for them.

Future research. The findings in this study suggest several avenues for future decision-making research. Although not significant in all instances in this study, there is strong evidence to suggest that across versus within product category choices should be explored further. In certain conditions category choices do make a difference to the decision making process between couples. These findings could be explored more with different product categories than those used in this study, or perhaps with a larger, more varied sample than that included in this paper.

Corfman (1991) noted that researchers are beginning to acknowledge the importance of across product category choices, but that the choice processes underlying the decision process are understudied. The current review was unable to discover research studies that compared across category product choices with within category product choices. Realistically, individuals are typically presented with choices involving several different options from two or more different product categories. In addition, gender effects appear to still play an important role in spousal decision processes.

These hypotheses tested the implications for across product category choices on a primary decision unit in society—the family. Gaining an improved understanding of spousal decision making in differing product categories with differing product preference intensities will not only contribute to our understanding of joint decision making, but may also have implications for people who market to couples.

Conceptualizing and Exploring Couple Dyads in the World of Collecting

Nia Hughes, Keele University
Margaret K. Hogg, Lancaster University

ABSTRACT

Despite a growing body of literature on collecting, collections and collectors, we still know very little about collecting in the context of families and coupledom. This study offers a conceptualization to examine the social world of collecting couples, suggesting that their experiences may be understood by reference to three sets of forces which focus on aspects of the collector's social world, their need for legitimization and for material culture. Data from dyadic ethnographic interviews is discussed in the context of these forces and used to generate insights into the collaborative and co-operative behaviors of couples who collect.

INTRODUCTION

This study addresses a significant gap in the literature on collecting as a form of consumption behavior, namely the lack of research into dyadic behaviors within the world of collecting. We therefore focus on the consumption attitudes and behaviors of couples who collect, and begin by conceptualizing the social world and the shared meanings which couples ascribe to their collecting activity, and how coupledom influences the individual in this context. The study is informed by prolonged insider participant observation in the collecting world, absorbing the 'tales of the field' (Van Maanen 1988). In line with Penaloza's (1994) approach to ethnography, we take an *a priori* view of this world, that play, love and gender are salient themes/factors that underpin the attitudes and behaviors of couples interacting in their social worlds.

We begin by briefly describing the growing interest of consumer researchers in collectors, collections and collecting, before providing a literature review focusing on social identity, love, play, gender and social processes. After this, the theoretical orientations of the study are briefly set out, including a description of the methods of data collection and analysis. The findings from long-term participant observation, combined with data from ethnographic interviews with eight couples in an European setting are then presented, interpreted and discussed. The study of dyadic couples allows us to identify important under-theorized dimensions of collecting behavior, notably the dynamics of collaborative and co-operative behaviors amongst collectors, and the influence of the social world, in many guises, on the individual collector.

DEFINITIONS: COLLECTORS AND COLLECTING

Collecting has been defined (Arnould, Zinkhan and Price 2004:146) as the "selective, active and longitudinal acquisition, possession, and disposition of an interrelated set of differentiated objects (material things, ideas, beings, or experiences) that contribute to and derive extraordinary meaning for the set itself". Purposive collecting occurs when there is a strong element of aesthetic discrimination involved (Herrman, 1972:8) and when the owner has acquired sufficient objects of a kind and enough connoisseurship to impress the professionals active in the same field (Herrmann, 1972). This latter definition explicitly acknowledges the importance of social influences upon collectors. Public interest in collecting has grown exponentially in recent years, spanning themes from low culture to high culture. Pearce (1998) estimates that one in three members of the UK and North American population is, or has at some time been, a collector. Gender and socio-economic analysis suggests that collectors mirror national demographic trends with

few defining social or class characteristics and this seems to be the case in both the UK (Pearce 1998) and in the US (Baker and Martin, 2000, Slater, 2000).

With regard to the nature of collecting, there is much information about individual collectors, but our knowledge of couples as consumer-collectors is almost non-existent. Johnston and Beddows' short study (1986) of two couples-one male/female couple, one male/male couple-is a rare exception. To remedy this knowledge gap, we now set out a literature review that explicitly focuses on collecting as viewed in the wider context of family, groups and the social world.

LITERATURE REVIEW

Our discussion of the literature starts by focusing on aspects of collecting at the primary conceptual level: subjects, objects and group influences. We then move from the primary level to the secondary conceptual level, where the primary themes interact by means of three mediating forces: the social world, a need for legitimization, and subject-object relationships within a material culture setting. Bringing together these forces has allowed us to generate new insights into the meaning of possessions and collecting relationships.

COLLECTORS IN THEIR SOCIAL WORLDS

Collectors and collections are found within a social consumption framework that operates in private family settings; in semi-public spaces such as collectors' clubs; in public spaces such as auctions; and in informal spaces such as fairs and car boot sales. The behaviors of individual collectors, and the consumption spaces in which these behaviors occur, have been explored by consumer researchers, yet we know very little about collecting in the context of families and coupledom. Most studies of collectors have remained focused on the individual, largely to the exclusion of the wider context of couples, family and group membership. Studies that do focus on shared experiences have addressed aspects of the sense of shared selves (Lastovicka and Fernandez, 2005), also wider aspects of collective behavior (Hogg and Abrams, 1998).

Linking up the literature to our conceptual approach, we examine the forces that mediate the collecting behaviour of dyads below, in order to show how collectors' experiences as dyads differ from that which might be expected from individual collectors. We seek to represent the full lived experiences of collectors, rather than narrower aspects of collecting.

1. The social world

The first set of relationships concerns the interactions between the individual or couple collector(s) of a particular category of object and other collectors of the same items. These social relationships between individuals, couple collector(s) and other collectors represent the influence of group pressure on the consumption experiences and behaviors of individual collectors.

The self-concept is derived from both social identity and personal identity (Turner, 1982), and the two components may be integrated, congruent self-identifications, or they may be distinct and contradictory (Hogg and Abrams, 1985). Therefore to examine personal aspects of identity affected by collecting without consideration of the social-identity function is unlikely to yield a full understanding of collectors and collecting. However, what we do

know is that material possessions and collections are part of the self-identity of UK and US collectors (Hirschman, 1980; Belk, 1988; Dittmar, 1992) and that self-identity through possessions changes over the course of an individual's life (Gentry, Baker and Kraft, 1995).

For some, collecting is significantly influenced by aspects of the social world: it may be a source of social prestige (Herrmann, 1972) and an opportunity to socialize with other collectors in ways that may yield satisfaction well beyond the economic aspects of their collections (Belk, 2001). Some collectors become active participants in collectors' clubs or interest groups, meeting on a regular basis with other collectors (Dannefer 1980; Baker and Martin, 2000; Slater, 2000; Kozinets, 2001). Collecting may also be viewed as a form of adult competition and play (Glancy, 1988, Olmstead, 1991, Pearce, 1998) and play may occur at the aesthetic or at the intellectual level (Pearce, 1998) and in a variety of social settings. Social aspects of play may occur as a result of the collector's decision to share access to their sacred things (Belk et al, 1989) or to attend the play-world setting of the auction (Glancy, 1988).

Many collectors live in households alongside other family members who also collect, and collecting has been noted as a potentially bonding activity for couple-collectors (Belk and Wallendorf, 1997). Collecting couples could be expected to demonstrate shared selves (Lastovicka and Fernandez, 2005) in respect of their collecting, and to derive common identities both from their coupledom, and from common membership of groups outside the family (Prentice, Miller and Lightdale, 1994). Such couples may collect the same or very similar themes and items, and they could be forecast to represent a special case of collecting behavior worth studying for the light that they potentially throw on collecting in particular, and consumption in general.

2. The legitimizing function

A second set of relationships concerns the role of group authentication, validation and approval of certain objects as being collectable. In the context of collecting, the "group" may consist of participants in a collecting society or club; the network of dealers who source and supply the collectables; the experts seen in various media; the "other half" of the husband/wife unit; the family; or indeed any combination of these. Objects may be categorized as sacred when they become collectable (Holt, 1995) and hence the legitimizing function may act, for some people, as the sacralizer. For some, collecting is an aspirational activity focused on the acquisition of cultural capital and the demonstration of good taste (Bourdieu, 1986). Objects have to become worthy of being collected, and this may be a function of expert opinion or a function of society's judgement on our taste in "things" (Rook, 1991). This implicit need for approval echoes McCracken's (1981: 582) analysis of the transfer of meaning from the "culturally constituted world" to the individual consumer, with fashion and taste serving to create a legitimacy climate mediated through "the trade" i.e. the companies and dealers in antiques and collectables. The trade makes objects and makes them available to meet collectors' demand, for the purposes of collecting. Collectors may also need to negotiate permission to collect from partners, as adding to the collection may incur significant expenditure, and also may impact upon the home environment, where individuals construct personal meaning through environmental schematization (Holahan, 1978) and the appropriation of space (Ingold, 1986) and place.

What is important to note is that the "group" performing the legitimizing function may be a couple, or a family, or a social set, or an expert set. All may have some degree of legitimizing power

stemming from personal or social relationships, or from expert knowledge.

3. Material culture and subject-object relationships

Material culture approaches to the consumption phenomenon focus on the relationship of individual collectors to their (usually) man-made objects (e.g. Lovatt, 1997, Pearce, 1998). This sphere of subject-to-object relationships is well-documented in the UK and the US: collecting is a culturally acceptable device for gaining an expanded sense of self (Belk 1988; Rigby and Rigby 1944); for improving self-esteem through a sense of mastery (Danet and Katriel, 1986); and as an act of love (Belk and Coon, 1993; Baudrillard, 1994; Slater 2000). The unifying theme for all collectors is the intrinsic need to re-stabilise the ego in order to regain self composure and equilibrium by means of acquiring possessions (Muensterberger, 1994) and they may be passionate, cool or even obsessive (Olmstead, 1991) about their collections.

Unlike ordinary objects of consumption, collections tend to take on an importance and character comparable in some respects to that of family members (Belk et al, 1991). The importance of 'love' attached to collections can be seen in the heartache associated with the disposition of treasured possessions by elderly consumers (Price, Arnould and Curasi, 2000).

Even children as collectors seem to be influenced by social factors (Baker and Gentry, 1996) and feel it is important to have their own possessions for developing their sense of self (Dittmar, 1992). However the detailed process of organizing and codifying a collection is usually a more solitary activity. Belk and Wallendorf (1997:251) have noted that collecting permits "experimentation with androgyny as an individual participates in the masculine hunt for additions to the collection as well as the feminine nurturance in curating the collection".

Table 1 captures the different effects and satisfactions generated by the three categories outlined above. Having conceptualized the social, legitimizing and material world of the collector into these three categories, we now go on to examine a neglected aspect of consumption—that of couples and the differing context that a dyadic relationship creates for a collector.

THEORETICAL ORIENTATION OF THIS STUDY

The research is ideographic rather than nomothetic (Alvesson and Skoldberg, 2000) in that it is an intensive study of relatively few cases followed by abduction, or identification of patterns (Hanson, 1958). In the tradition of ethnographic research, multiple data collection methods such as observational data, audio recordings, handwritten notes, and non-directive and directive ethnographic interview techniques (Holt 1997; Elliott, 1999) have been used. For analysis, we have tacked back and forth between the part and the whole, identifying emerging categories, and also examining existing categories derived from the literature review and our conceptual ideas, following the style of earlier researchers (e.g. Fournier and Mick 1999). The data has been iteratively analysed until it has reached the point of saturation, where new insights cease to emerge.

RESEARCH DESIGN AND METHODOLOGY

Participants: Couples were recruited through contacts established by means of one author's participation in the collecting world, and an overview of the couple dyads can be seen in Table 2. The sampling plan was purposeful (Thompson and Troester, 2002) in its aim of seeking couples at various stages of immersion in collecting and coupledom, rather than seeking a statistically representative sample. The couples were interviewed with the aim of exploring the nature of coupledom and its effects upon individual

TABLE 1
Effects & satisfactions

CATEGORY	EFFECTS & SATISFACTIONS
Social Relationships	Mutual satisfactions of common identity and common membership of the collecting world, within and outside the family.
Legitimizing Function	Satisfactions gained directly and indirectly through the transfer of meaning from the wider world to the individual collector; the need for approval and permission.
Material Culture	The satisfaction and security gained by the collector from “having things” and sharing living space with them.

TABLE 2
Overview of lifestage, occupation and collecting themes of each couple/dyad

Age profile of dyads	Male	Female
Dyad 1: mid-late 30s;	Carl: caretaker. Collects scout badges & scouting memorabilia	Dawn: main child carer; and part-time retail worker. Collects: juvenile character merchandise
Dyad 2: early 50s	Alec: self-employed draughtsman. Collects WW2 German militaria	Jane: an office manager. Collects: decorative chinaware
Dyad 3: late 50s	Barry: self-employed gardener. Collects: old picture postcards; lantern slides; Staffordshire figures	Lesley: part-time catering worker. Collects small decorative objects; pictures; textiles; Staffordshire figures
Dyad 4: mid 60s	Tom: retired schoolteacher. Collects: stamps; postmarks; postal history; minerals	Jill: retired schoolteacher. Collects chinaware; toy lorries; Russian enamels; minerals
Dyad 5: early 60s	Dave: accountant. Collects: postcards; local history; Viewmasters and slides; items connected to Venice and Cologne	Janet: schoolteacher. Collects: decorative items eg cats, ducks, penguins; Venice; Cologne; paperweights; picture postcards.
Dyad 6: late 50s, early 60s	Gerald: retired engineer. Collects pictures, prints and decorative items representing horses; military vehicles	Teresa: author Collects items connected to the 1940s eg clothing, menus, paperwork
Dyad 7: mid 40s	Richard: office manager. Collects football and cricket memorabilia	Jennifer: business manager. Collects vintage dolls
Dyad 8: late 50s, early 60s	Jack: ancillary service worker. Collects decorative ware and picture postcards	Sandra: schoolteacher. Collects decorative ware; and picture postcards

collectors as consumers. Their responses have been examined in relation to our conceptual ideas in order to provide further insights into the relationship between subjects, objects, and groups.

Interviews: The interviews lasted, on average, around two hours, and were conducted in dyads' homes. Pre-prepared or set questions were avoided in order to preserve the style of the ethnographic interviewing approach (Holt, 1997). However, some specific areas of interest were woven into the interviews, focusing discussion onto joint decisions about purchase, storage and display; the shared and separate meanings which surrounded their collection(s); and the expense represented by collecting. Direct and indirect but unscripted questions were used to probe these issues.

Couples were interviewed as dyads, and at intervals, as individuals, in their homes. Informal member checks (Wallendorf and Belk, 1989) were incorporated verbally during interviews, and return visits were made where appropriate.

FINDINGS

The meaning of collected possessions and collecting relationships for the dyads

Generating insights gained by focusing our study on the social world, on the need for legitimization and on material culture, we combine all of these to offer a deeper view of how collecting creates

meaningful life experiences for collectors. We also examine the social and personal collecting relationships that mediate the collecting urge.

Meanings aligned to social forces

Carl uses his collection to maintain the link with his former social world as a scout and scoutmaster, before family life created more demands on his time and his income. Collecting scouting memorabilia maintains his sense of belonging to the social world of the scout movement, despite no longer being active within it. Carl is very keen to show off his collection to anyone who takes an interest, but he feels despondent that few show any interest in it. Dawn, his wife has, for now, stopped collecting, but is still active in encouraging Carl to buy the objects that he is clearly desperate to buy. Indeed, she goes further by rationalizing the purchasing decision for him, as a sign of encouragement; otherwise, Carl is "worried sick" about spending money that he needs for the family. Stress caused by leisure activity can be high (Orthner And Mancini, 1990): Carl constantly battles with his collecting instincts, as they drive him to negotiate a path between caution in parting with money, and delight when faced with the chance to spend money on an object he desires. He thoroughly enjoys going to antique fairs, where he is likely to find something to add to his collection. But he will often actively decide to stay away from this social world in order to minimize the chance of seeing something to spend his money on: "You know, you're ripping yourself apart inside thinking 'I really like it but I can't really afford it', so if you don't go, you don't see".

Alec, as a collector of controversial militaria, is anxious to position himself as a serious connoisseur of historically accurate and rare items. He is aware of the tension between his interest in the German memorabilia and his display of that material in the family home. Alec gets pleasure from constructing "proper" and "tasteful" displays of historically accurate uniforms and weaponry, believing that this accuracy is vital to the integrity and credibility of his collections in the eyes of those who might see it. On the other hand, Jane, his wife, values most the items given to her by family, friends and ex-colleagues. To her, the sentimental value of objects—that represent past and present relationships—far outweighs any other aspect of her china collection. Whilst Alec can focus on quality of workmanship and the style aesthetic of the objects in his collection, Jane sees mainly the negative connotations that overwhelm any considerations of workmanship. Yet, Alec is also interested in the symbolism of the memorabilia of the objects, and its accurate curating, in the feminine style (Belk and Wallendorf, 1997). It seems that to co-exist with these things in the house, they have to be selective in the meanings that they ascribe to these items and the sacralizing (Belk et al, 1989) and demarcation of space in the home has to be negotiated (Joy et al, 1995). Jane says:

"There's no way I'd have a flag, open, with the swastika in the middle, in the house...no I wouldn't like that...I'm not...That's the only thing I don't like about it, I know the stuff's really nice and it's really well made, they were very industrious people and perfectionists...but that symbol to me means something horrible, whereas he can just bypass that and think of what the industrial side of it, the industrious side of it, and the attractiveness of it. But I can't get past that. I have trouble with it."

Barry's leisure activity is as a local history expert for the area where he was born and bred. He is invited to give talks to local societies, and expands his collection with a view to adding items that can be used for his talks. His purchasing is therefore driven, to some extent by his position in his social world, and the contribution

that collecting makes to his social capital. Lesley, his wife, actively supports Barry by accompanying him to his talks, and clearly gets pleasure from doing so. Barry worries for days if he thinks he has overspent on collectables, and Lesley has to encourage him to buy things for his collection: "I remember having to convince you about those lantern slides. I said to Barry 'Look there's about £200 left'. I said: 'Have that money'. He had all this sorting out to do and I was ill and everything. He would have regretted not having this." Lesley recalls another occasion: "We had a spell about 3 years ago. He was very quiet for about 4 days...He had spent some money and felt really bad"

A major worry for Tom is the prospect of losing the valuable postal history that he collects. He believes his collection to be historically important, and is worried at the possibility of it going up in flames, never to be recreated. This fear drives his social behavior. He prefers to think that his (or their) collection is of use to someone, so he and Jill have loaned it to a local museum so that it is actively used. Meanwhile, both Tom and Jill use their collections to give talks at the local collecting club, and get pleasure from this. As a couple with high cultural capital, they seek out diverse educational and informative experiences that allow them to achieve competence, acquire knowledge and express themselves creatively (Holt, 1998) through collectors' club memberships, but they have been disappointed by the competitive atmosphere of other clubs they have joined in the past.

A recurring theme for dyads such as Teresa and Gerald, Dave and Janet, and Barry and Lesley, is the encroaching tide of "things" taking over the household space and the pressing need to organize or dispose of hitherto treasured possessions that express shared and self-identity. Janet admits that the church-like atmosphere of parts of the house, created by the display of religious artifacts, was not to the liking of Dave or her daughters, and some items had to be packed away to make the house more homely.

Meanings aligned to the need for legitimization

The second set of interactions concern the role of group authentication, validation and approval of certain objects as being collectable i.e. those influences upon collectors that indicate that objects are worthy of collecting, and that he or she has permission to buy. Happy to trust his own judgement as an experienced collector, Carl is not worried about spending money buying something that is intrinsically poor: "it's only a thin, tinny-type rubbish really, in the sense of what it's made of, but it's lovely". He knows that even an item like this is well valued in the scouting collector circles. He sometimes wears one of his scout badges in the spirit of "Look at me!".

For Alec, the items he collects must be historically accurate; they must make up a "proper" display, as disparate bits and pieces do not add up, in his view, to a credible whole. He conducts historical research, using acknowledged sources, and targets expensive items from international auction houses. Tom and Jill have an agreement that they must have mutual permission before spending a significant amount of money on any object. This is perceived by Tom—who is the one most likely to spend large amounts—as a "regulator". He is quite prepared not to buy if Jill does not approve, and she makes her dislike of his stamp collection quite clear:

"He can't add to his stamps very much and I can't stand stamps. Remember he was paying £300 for a little stamp! Good God! It's only a bit of paper. It's not even pretty!"

But Jill is generally relaxed about Tom spending large sums of money on his postal history collection. She, on the other hand, delights in picking up unrecognized, cheap pieces of china on a

hunch. Tom is probably the collector who seems most concerned about investment, and he uses this to encourage Jill to spend, although she finds it difficult to spend a lot of money on collectables—it does not come easily to her.

Jill regularly seeks the approval of her expert friends—china dealers and collectors—who affirm and confirm her judgement in identifying obscure items. Whilst Tom asserts vehemently that he is not interested in the accolade of best collection in his field—*“it’s my own private collection and that’s it!”*, he does want his completed collections to be used and to be useful. He also likes his/their expertise to be recognized as such by experts, such as the university professors with whom he negotiated to secure a home for his and Jill’s collection of rocks or minerals, a collection now on permanent loan.

Carl seeks Dawn’s agreement to dropping in to visit antique fairs when they have a day out. On these occasions, Dawn often strongly urges Carl to buy an item if he sees something he likes, and she rationalizes the decision for him: he will never see it again; he will not be able to afford it if it comes up again; he can have it as a gift:

“She’d say ‘You’ve got to have it! You’ve got to have it’ and I’m saying ‘Hang on, hang on, we don’t know how much it is yet’ and you may go into this shop or pick it up off the stall, and it might have a price on. Then Dawn’ll say ‘Well you can have that for your birthday present this year and Christmas present next year, or.....’ and encourage me to try and have it, because she knows that I won’t spend money on.....£40 or £50 or £90 or £100, if I think my girls need a pair of socks, pair of shoes, a new coat, we’re going to take them out to the theatre, whatever. There’s a line got to be drawn and I have to draw it myself.”

Jennifer does not seek permission from Richard for any of her doll purchases, but she was nevertheless reluctant to say out loud the exact cost of her most expensive doll, and compromised by writing down the sum for the interviewer. Richard, meanwhile, spends only small sums that are too modest to require mutual consideration and which would be unlikely to harm family finances. A recurring theme between most of the couples, then, is the need to legitimize the expenditure incurred through collecting, either directly, through verbal agreement, or indirectly, through avoidance behavior of one sort or another.

Meanings aligned to material culture

This aspect concerns the relationship of individual collectors to their (usually man-made) objects—i.e. individual subject-to-object relationships. Carl gets “the buzz” from collecting objects and is “ripped apart” by the prospect of not being able to buy something he has seen. He tries not to leave a venue without buying something; he is scared of missing things if he does not go around an antique fair systematically, but acknowledges he would need to be a millionaire to buy it all. Commitment to family life heavily constrains Carl in terms of how much he may spend and how much time he can devote to collecting. He is constantly trading off his delight in the objects he wants to buy, the “buzz” he gets from them, and the dissonance he feels when tempted to spend beyond his means:

“It’s been wrapped up in a bag, and I’ve thought, ‘I haven’t got this badge and I’m over the moon’...someone else might say ‘How much? You must be mental!’ . But I’m happy, and I think ‘That’s my badge’ and you’re like proud to put it in your collection, one more off a list of million badges to buy.”

Whilst he has many prints and pictures on the wall, and badges in display cases, he has long sought a particular item: a metal bust of Baden Powell, founder of the Scout movement. This is an item to hold, as opposed to something he simply looks at. Dawn, whilst still deriving pleasure from her collections, has sold some objects to create space in their house.

Alec, like Tom, positions himself as a guardian of history; an expert collector who has to use premier auctions to source new items for his collection. Lesley and Barry, like Tom and Jill, already have some completed collections—for instance their collection of Staffordshire figures, which they recently completed when they found one particularly rare item, in good condition. Lesley now looks for small objects that will fit into their tiny cottage, or that can be hung on the wall. Barry’s slides pack up easily into boxes—he does not need to be able to see these, as display is achieved through his talks.

Tom’s worry about losing his collection through accident or misfortune is underpinned by his belief that these items are representational of history and of interest to the wider world. Although he likes to have the originals, he does not hesitate to allow his material to be photocopied—unlike many other collectors. Like Barry, Tom uses objects to recreate and to understand history, and this is a recurring theme in his conversations, as is the issue of how much he has paid for something, and its current market value. In fact, he uses the argument that as collectors, he and Jill are saving history whilst at the same time making an investment. Jill is not so relaxed about spending money on collecting, but happily supports Tom if convinced that he is buying good quality items for investment purposes, which implicitly minimises the downside risk.

DISCUSSION AND CONCLUSION

Possessions, collecting relationships & conflict: interfaces

For most of the eight couples interviewed, the dominant mood is one of co-operation in creating joint, shared meanings from collecting. However, in situations where the concerns of two people appear to be incompatible (eg Tom and Jill, Alec and Jane), the final outcome may be a combination of each person’s assertiveness and co-operativeness and their conflict handling modes, which might range from competing, collaborating, compromising, and avoiding through to accommodating modes (Thomas, 1976).

Couples negotiate the issue of displaying controversial items by implicitly accepting the premise that consumption objects can be polysemic symbolic resources with multiple meanings (Holt 1997) that allow for significant variation in consumer interpretation and use. Normally, in gendered situations where family conflict must be resolved, it seems that the husband has the final say (Gentry et al, 2003) but in Alec and Jane’s case, Jane is exercising her power of veto regarding the display of Alec’s collection, due to the strength of feeling on her part. Tom and Jill also have very different notions of what is worth collecting and what is not, but they have collaborated to find integrative solutions on the matter of financial outlay as have Jane and Alec. Equally, Barry and Lesley seem to cope with their limited budget and shortage of house space by negotiating on a purchase-by-purchase basis, and there is a great sense of mutually accommodating behavior to resolve these problems.

Other couples use avoiding behavior: for instance Jennifer avoids discussing the cost of her purchases with Richard, and given their relative affluence, neither is willing to give or receive full information that might potentially spark off unnecessary conflict. Furthermore, many of the couples have reached agreement that shared consumption patterns need not involve consuming the same consumption objects, and that social meaning can be found in consumption/collecting *practices*, not necessarily in the consump-

tion/collection of *objects*. Carl uses avoiding behavior not in relation to his wife, Dawn, but in relationship to the objects that he desires, and he avoids seeing them in order to avoid being tempted to buy them. Dawn in turn simply accommodates Carl's collecting, despite having effectively stopped collecting herself, due to time and money pressures.

Few couples seem to be actively competing, although where there were common collecting themes shared within the dyad, there was a tendency for some husbands (eg Tom and Jack) to appropriate ownership of their wives' objects as part of their own collection. These transgressions were swiftly corrected by Jill and Sandra, their respective wives, with pointed comments such as "Whose collection?", an attempt on their part to reclaim their own cherished objects (Price, Arnold and Curasi, 2000), to establish limits to shared selves (Lastovicka and Fernandez, 2005) and perhaps also to discourage any possibility of their self-identity being appropriated, despite the verbal appropriation of the object by the husband. These mis-appropriations did not seem to happen when women talked about collecting, and in the cases above, occurred despite the fact that both Tom and Jack talked mainly of "our" collection. There seemed a greater tendency with some husbands for "ours" to become "mine".

In summary, our research supports the premise of Burch (1969) that leisure behavior is the product of both interactionist (relationship-based) and structural (social circles within communities) forces. These categories resonate with the social forces and the legitimization function expressed in our conceptualization and are clearly underpinned by the third element, material culture, and the subject-object relationships of collectors with their collections. Other frameworks also seem to fit our conceptualization of dyad consumption, as categorized below by Holt (1995)

- Consumption as play: using consumption objects as resources to interact with fellow consumers. This aligns with aspects of both material culture (objects collected for play) and the social world (the social interactions of collectors).
- Consumption as integration: integrating consumption objects into one's identity such that they become self-extensions. This aligns with subject-object relationships within material culture; also the social world whereby consumers employ product symbolism to define social reality and to ensure that behaviors appropriate to that reality will ensue (Solomon, 1983).
- Consumption as experience: objects are embedded in the social world, which imparts to consumers a shared definition of reality by structuring perceptions of "the way things are in that world". This aligns with our view of a legitimizing function that operates via the macro-level shared meanings that occur within the culturally constituted world (McCracken, 1981).
- Consumption as classification: engaging in actions that enhance one's sense of affiliation eg (Holt, 1995). This aligns with our findings on how the dyads engage with their social worlds and their engagement with , for instance, collecting clubs and societies, auctions, social events and public talks.

So, our conceptualization can be aligned to the literature in a way that enhances, in an original way, our understanding of collecting and collectors. We have used this approach to explore three different forces that influence the social world of collectors, their judgments about their collecting practice, and their role in shaping and filtering the rituals of purchasing and possession, as well as the various effects and satisfactions created. We have been intent upon

capturing and encompassing the whole "collecting experience", and examining the impact of the family and social influences upon the collector, and the impact of the collector on the dyad. The next stage of our search for knowledge and understanding of collectors will focus more closely on attitudes to conflict and the way it might be handled and the further consideration of how behaviors are deployed by collectors, within dyads and in social settings. These lines of enquiry are consistent with growing wider interest in how the family contextualizes and shapes consumption behaviors.

SPECIAL SESSION SUMMARY

New Perspectives on Compulsive Buying: Its Roots, Measurement and Physiology

Nancy M. Ridgway, University of Richmond
Monika Kukar-Kinney, University of Richmond
Kent B. Monroe, University of Richmond

SESSION OVERVIEW

Compulsive buying and other dysfunctional consumption behaviors have attracted substantial attention of consumer and other researchers in recent years. However, most research to date remains descriptive, and many theoretical, substantive and methodological issues remain unresolved.

The first paper provides a theoretical framework, specifically escape theory, to explain why people engage in a self-destructive behavior, such as compulsive buying. Escape theory maintains that for some people, self-awareness can be very painful. Usually, these people have self-expectations that are so high they are unable to fulfill them. To block-out the painful self-awareness, these people become totally absorbed in a task, such as buying, without considering long-range consequences. The paper suggests that compulsive buying can be explained as a manifestation of escape theory.

Using the theoretical foundations of compulsive buying, obsessive-compulsive disorder and impulse-control disorder, the second paper addresses a development of a scale that is geared toward measuring excessive buying of those consumers who overspend, but are not pathologically ill. Excessive buyers are defined as those who are preoccupied with buying, but who are, at times, able to resist the urge to do so. Pathological buyers, on the other hand are completely unable to control their urges to buy. Using two studies, the authors show the scale is both reliable and valid. Moreover, by developing a scale to measure excessive buying as a construct containing elements of both obsessive-compulsive and impulse-control disorders, an important methodological contribution is made to the literature.

The final paper takes a broader look at dysfunctional/destructive consumption behaviors in general, of which compulsive buying is one example. The author provides a biogenetics perspective to explain why consumers engage in compulsive/addictive/impulsive and novelty seeking behaviors. Specific portions of human brain, and ultimately the human genetic endowment appear to be responsible for the tendency towards such behaviors. The paper further discusses implications for public policy and treatment programs.

While the first two papers provide new theoretical and methodological perspectives on compulsive and excessive buying behavior specifically, the third paper places compulsive buying in a larger setting of other destructive consumption behaviors and provides a biogenetics explanation for why such behaviors occur. As a set, the three papers importantly advance knowledge on what compulsive buying is, what its causal roots are, and how to measure it. While compulsive buying and other dysfunctional consumption behaviors are important consumer behaviors, they have been investigated predominantly in the psychological and psychiatric journals, and only sporadically in the consumer research literature.

Dr. April Lane Benson (author of the widely acclaimed book *I Shop, Therefore I am: Compulsive Buying and the Search for Self*; in clinical practice for 25 years and developer of a program called Stopping Overshopping) served as a discussant of the session and offered the perspective of a clinician who has worked extensively with patients whose lives are negatively affected by compulsive buying disorder.

EXTENDED ABSTRACTS

“A Theoretical Account for Compulsive Buying: An Application of Escape Theory”

Ronald J. Faber

The past 20 years has witnessed a huge growth in research on compulsive buying. However, most of this research has remained at a descriptive stage identifying variables that are related to compulsive buying, patterns of behavior, and related disorders. Factors linked to compulsive buying have included: 1) psychological factors such as low self esteem, depression, anxiety, and perfectionism; 2) biological ones reflected in the impact of drug therapies and neurotransmission, linkages to arousal, and personal and family histories of compulsive buying and related disorders; and 3) cultural ones such as gender roles, early childhood experiences and changing social norms and feeling of alienation.

One explanation for compulsive buying is that it serves as a form of mood manipulation for people who experience negative feelings (Faber and Christenson 1996). Research in psychology, communication and consumer behavior has found that people will engage in specific behaviors as a means to change undesirable mood states or to prolong more desirable ones. Studies of compulsive buyers have found that they are particularly prone to engage in this behavior when they are in negative mood states and their description of episodes of compulsive buying suggests that they experience these episodes in positive and arousing terms. Additionally, the compulsive buyers were far more likely to report that their mood states moved in a positive direction as a result of shopping than did the matched general consumers. Thus, compulsive buyers may engage in buying as a way to manage their mood states.

Jacobs (1989) proposed that there are two important components that make people susceptible to addictive or excessive behaviors. One is their ability to alter negative affective states and the second is their ability to change physiological arousal levels. He suggests that some people have a physiological resting state that they find aversive. To overcome this, they seek behaviors that can heighten or reduce their arousal level and they run the risk of becoming addicted to such activities or substances.

While both of these accounts for compulsive buying suggest what benefits the behavior may provide, they don't fully address the fact that compulsive buying, by definition, leads to extreme negative consequences. For example, compulsive buying has been referred to as causing “excessive and inappropriate impairment in one or more life domains” (Black 2000), and marked distress that “interferes with social or occupational functioning” (Goldsmith and McElroy 2000). However, the literature on self-defeating behaviors has suggested that people are not prone to harming themselves (Baumeister and Scher 1988). Instead, such behaviors result from poor strategy choices that don't work as intended, or from a conscious decision to engage in a negative behavior to avoid even more painful losses. This latter explanation has led to escape theory, which has been used to explain behaviors such as eating disorders and suicide. It is proposed here that escape theory may also provide the best theoretical account for why compulsive buyers engage in this destructive behavior.

Escape theory maintains that for some people, self-awareness can be very painful. Typically, these people have exceptionally high standards or expectations that they are unable to meet, leading to a sense of failure, low self-esteem, anxiety and depression. When these feelings become too extreme, they seek ways to block out this painful self-awareness, at least for a little while. The way people accomplish this is by becoming completely absorbed in an immediate, concrete, low-level task. By focusing on this activity and the sights, sounds and other sensations within this limited environment, they are able to block out the painful sense of self. Two additional consequences of the cognitive narrowing is that during this period: 1) consideration of long range consequences of an action are not considered; and 2) the implausibility of fanciful thoughts is not recognized, giving way to non-critical and irrational beliefs and magical thinking.

This paper shows how each of these characteristics of escape theory is present in accounts of compulsive buying. It shows that: 1) compulsive buyers experience negative and painful self-awareness; 2) compulsive buyers tend to be perfectionist and hold themselves to impossibly high standards; 3) perceived failure and negative self feelings trigger compulsive buying episodes; 4) a high level of absorption and cognitive narrowing characterize these episodes; 5) during these episodes, compulsive buyers engage in fanciful and magical thinking; and 6) compulsive buyers block out long range consequences when engaged in compulsive buying. Thus, it is suggested that compulsive buying can best be explained as a manifestation of escape theory.

“The Development and Validation of a Scale to Measure Excessive Buying”

Nancy M. Ridgway, Monika Kukar-Kinney, Kent B. Monroe

In recent years, hundreds of popular press articles, books, and websites have been devoted to the problems experienced by compulsive buyers (e.g., Adams 2003; Benson 2000; Chaker 2003; Ethridge 2002, etc.). Researchers traditionally have used the term “compulsive buying” to describe the dysfunctional, maladaptive, or abnormal consumptive behaviors exhibited by a small number of pathologically ill consumers who are unable to control the overpowering impulse or urge to buy.

While a relatively small percentage of the general population may qualify as pathological compulsive buyers, in that they cannot resist the urge to buy and that their buying behavior results in unmanageable financial debt, it is our belief that more consumers are affected by what we term “excessive buying”. In comparison with pathological compulsive buyers, excessive buyers may not continuously experience an uncontrollable urge to buy. However, they may occasionally or often exhibit tendencies for buying too much and too frequently. A second key difference between excessive and compulsive buying is that it is not necessary that excessive spending results in harm (particularly financial) to the consumer (Faber and O’Guinn 1992; Hassay and Smith 1996). In many respects, excessive buying is similar to compulsive buying; however, it covers a broader set of consumers. Indeed, the popular press articles alluded to above seem to be more about excessive buying than the pathology of compulsive buying (Chaker 2003; Hoffman 2000; Kelly 1999).

Using the theoretical foundations of compulsive buying, obsessive-compulsive disorder, impulse-control disorder and obsessive-compulsive spectrum disorder, we developed a scale to measure excessive buying. To develop and validate the scale, two studies were conducted. The first study, using 352 undergraduate students as a sample, was used to narrow down the potential set of scale items to the final twelve by conducting first exploratory, followed by confirmatory factor analysis. The final scale consists of

four dimensions/factors (obsessive-compulsive preoccupation with buying; impulse-control buying; positive feelings associated with buying; negative feelings leading to buying). Each dimension is measured with three items.

The second study, in which a sample of 555 university staff members participated, was conducted to validate the scale. This sample was more heterogeneous in terms of age and education, and less heterogeneous in terms of gender (93 percent women); and, hence, more relevant to the study of excessive and compulsive buying behavior, which has previously been found to plague women more than men (e.g., Black 2001; d’Astous 1990).

Confirmatory factor analysis results show that the four factor model with underlying second-order factor fits the data well (the best in comparison with other alternative models). The scale is also reliable ($\alpha = .91$ and $.90$ in studies 1 and 2, respectively). Discriminant and nomological validity were evaluated by correlating the excessive buying scale with other constructs, for example obsessive-compulsive disorder (to evaluate discriminant validity), materialism, self-esteem, stress, frequency of returning items and hiding behavior. The scale correlates with all these constructs in the theoretically-predicted manner, thus displaying nomological validity. Moreover, non-response and response biases were also evaluated. Finally, directions for future research on excessive buying were discussed.

“Biogenetics, Addiction and Novelty Seeking: A Review of Recent Research”

Elizabeth C. Hirschman

Both addictive/compulsive behaviors and novelty/stimulation-seeking behaviors have been subjected to scrutiny by consumer researchers over the past three decades (Faber, Christensen, de Zwaan and Mitchell 1995, Hirschman 1981, 1992, O’Guinn and Faber 1989, Raju 1980, Rook 1987, Rook and Fisher 1995). A review of the biogenetics literature from the 1990’s found significant linkages between neurological features, such as genetic mutations and dopaminergic signaling and these two consumption behaviors. Indeed the empirical findings suggest that addictive/compulsive tendencies and novelty seeking are closely related at the biogenetic level (Hirschman and Stern 2001).

The present paper extends this line of inquiry by reviewing the biogenetics literature pertaining to addiction and novelty seeking over the past five years (i.e., 2000-2005). Previous work showed that two genetic mutations in the dopamine receptor alleles DRD4 and DRD2 were identified. These mutations caused fewer than normal receptor sites to be present in the brain. To compensate, the consumer possessing these mutations may engage in novelty seeking, self-medication, be more likely to suffer from ADHD, have eating disorders and heightened impulsivity. Several new and highly significant findings have emerged which describe in detail the neuronal reward pathways characterizing both addictive and novelty seeking tendencies. Perhaps most profoundly, these have now been traced back to at least one evolutionary genetic mutation which was likely central to several positive expressions of human innovativeness, for example the development of agriculture and migratory/exploratory tendencies leading to the discovery of new continents and the spread of the human species.

As a result of more advanced brain imaging technologies and more detailed genetic coding studies, several significant advances have been made. Comings and Blum (2000) note that the two critical areas for understanding both addictive and stimulation seeking behaviors lie in the dopaminergic and opiodergic pathways of the brain “both of which are critical for {human} survival, since they provide the pleasure drives for eating, love, and reproduction” (“Reward Deficiency Syndrome”). In their view, the genetic muta-

tions which lead to above average levels of reward-seeking (the reward deficiency syndrome), constitute behavioral disorders due to their linkage to self-destructive consumption activities, such as gambling, compulsive purchasing and alcoholism.

By 2002, research had implicated a specific polymorphism within the mu-opioid receptor gene (the G variant of the +118A allele) as a precursor to generalized substance abuse (Schinka et al. 2002). In fact, 95% of the study's participants who were multiple substance abusers carried this genetic mutation. Experientially, persons carrying this version of the gene will have enhanced feelings of pleasure, stimulation and euphoria when consuming substances, such as alcohol, nicotine, heroin and cocaine, which are the result of higher blood levels of beta endorphin and higher stimulation of neural dopamine receptors. This creates a learned response of reinforcement and motivation to seek out additional stimulation.

This stimulation seeking behavior appears linked, as well, to genetic preferences for sweet tastes and novelty seeking, as measured by Cloninger's TPQ Novelty Seeking scale, according to Kompov-Polevoy et al. (2004). Research (Johanssen and Hansen 2001) also demonstrated that Cloninger's TPQ trait of lower-than-average Harm Avoidance, often found to characterize persons engaging in extreme sports, was also linked to Type 2 alcoholism.

Schultz (2001) offers an alternative paradigm for viewing these same characteristics: "{dopamine} systems appear to be crucially involved in the use of reward information for learning and maintaining approach and consummatory behavior (p. 293)...." Rewards are events or objects that make subjects "come back for more" and have three basic functions—they elicit approach and consummatory behavior and serve as goals of voluntary behavior, they have positive reinforcing effects, and they induce subjective feelings of pleasure (hedonia) and positive emotional states (p. 293)".

In other words, persons with higher than average reward-seeking behavior, which may lead to dysfunctional consequences, such as addiction, compulsive purchasing, and inattention in school (ADHD) due to genetic characteristics, represent an 'extreme' or 'enhanced' version of normal, human behavior. They are not radically different than most people, they just want more than most people—more stimulation, more excitement, more novelty, more pleasure, more activity and so forth. Sometimes their quest for more will bring positive results to themselves and others; sometimes the results will be negative.

Ding et al. (2001) brings us back to the DRD4 dopamine receptor 7-repeat allele, one of the first mutations linked to compulsive shopping and other impulse-control disorders. Using advanced SNP DNA haplotype testing, these researchers learned that this receptor is an ancient mutation and speaks to the idea that having humans from those with and without this mutation make for a more balanced society. These theories were tied to the DRD4-7-repeat mutation and both the positive and negative impacts it has on human existence.

SPECIAL SESSION SUMMARY

Consumption in Soap Operas from Brazil, New Zealand, and the U.S.: Production, Products, and Process

Cristel Antonia Russell, San Diego State University

Barbara Stern, Rutgers University

SESSION OVERVIEW

This session examined the influence on consumers of consumption imagery and cultural reality depicted in soap operas from Brazil, New Zealand, and the United States. The papers presented studies of products placed in television soaps in selected countries where the vehicle and/or the audience have not been sufficiently well studied. The rationale is that knowledge of the entertainment-education value of soaps in context contributes both to better understanding of consumers as well as to ways that placed products impact their lives (Kennedy et al. 2004; Singhal and Rogers 1999). Insofar as soaps produced and consumed in each culture have important but not fully researched differences, the session provided insight into consumption scenarios and consumer interpretations.

The importance of soaps lies in their ubiquity across the globe: soaps are not only produced in or exported to most countries in the world, but also are the media vehicles of choice of a majority of viewing audiences wherever they are aired (Allen 1995). However, despite the omnipresence and popularity of soaps as a vehicle for spreading consumption ideology, the genre is not uniform from country to country. Rather, each country's soap negotiates reality through the lens of the particular culture where it is produced and consumed, for the vehicle is shaped to conform to the local context with messages crafted to appeal to a local audience. That is, soaps are responsive to a wide variety of local institutions and social requirements (Allen 1995).

But notwithstanding the particularized social context, soaps do have one common feature—product placements in consumption scenarios. Placements reflect the economic realities of production, the society in which characters and consumers live, and the nature of the products shown. Depictions of consumption influence audience reception via the characters, who serve as aspirational figures, role models, and agents of socialization, revealing themselves by means of the products they use, the usage context, and the usage outcomes.

General Orientation

The three papers in this session all focused on soap operas and placed products, but relied on different methodologies and studied different cultures. Pervan and Martin's paper documents the consumption messages and ideology in soaps in a U.S.-New Zealand content analysis; La Pastina's paper relies on ethnographic data to discuss issues of reception and interpretation of a telenovela in rural Brazil; and the Russell and Stern paper uses a cross-sectional survey to test a model of the influence of soaps on U.S. viewers.

Simon Pervan and Brett Martin's "Soap Operas in New Zealand and the U.S.: Product Placement Strategy and Consumption Imagery" is a comparison of products found in the New Zealand soap *Shortland Street* (SS) and in the U.S. soap *The Young and the Restless* (YR). Each country's vehicle displays the relationship between the country-of-origin identity and culture, including the production factors that influence differences in the serial dramas. The study provides insight into the consumption habits of viewing audiences in both countries, for despite a high level of product placements, differences in the types of products and emotional outcomes of product use between the two countries were found.

Antonio La Pastina's "Product Placement in Brazilian Telenovelas: Selling Soaps and Social Causes" is a study of audience reception of telenovelas in Brazil, and uses ethnographic participant-observation to analyze soap opera consumption in a rural area. The telenovela production industry is financed in part by revenues from product placements, and even though the interweaving of cultural and economic issues is pervasive, interpretation in rural communities differs from that in a city. The reason is that rural communities such as the one in this study are not only distant from urban production centers, but are also poor agricultural areas with dormant economies. Factors that influence interpretation are multi-generational group viewing, daily discussions in the village square, and low exposure to sources of outside news. The focus is on the "limits and appropriations" of interpretation, and the study presents findings about the reception of placed products that highlight issues of interpretation and appropriation of the consumption ideology as springboards for viewers' discussion of political and gendered life in their communities.

Cristel Russell and Barbara Stern's "Aspirational Consumption in U.S. Soap Operas: The Process of Parasocial Attachment to Soap Characters" is a study of the influence of television soap characters on viewers' aspirational consumption and behavioral modeling. It uses real-time survey data to analyze U.S. viewers' parasocial attachment to soap characters. Unlike soap operas in Brazil or New Zealand, U.S. soaps go on for decades and allow viewers to form extended relationships with characters who become familiar over a long period of time. The characters are depicted in realistic consumption scenarios, surrounded by familiar consumer products such as homes, clothing, food, beverages, and cars. The paper proposes a model in which viewers' parasocial attachment to the characters shape attitudes towards the characters that ultimately influence their own consumption desires. The study presents findings about the direct and mediated effects of parasocial attachment on viewers' consumption behavior in five product categories.

The discussion was orchestrated by Marilyn Lavin, whose research has traced the history of the soap opera genre since its emergence on the radio in the 1930's (Lavin 1995). She tied her own academic and personal experience of soaps to the three presentations and engaged the audience in further consideration of the issue of the relationship of consumption ideology and culture in global soap operas.

Important Substantive Issue in Consumer Research

Perhaps the main contribution of the session was heightened awareness of the world-wide scope and significance of soaps—like advertisements, they both reflect and affect cultural precepts, but unlike advertisements, they do so more subtly via product placements. Attention to between-country differences in what is only ostensibly the same genre opens up consideration of issues of production, viewing modes, materialism, and social responsibility.

In addition, understanding the consumption imagery in general enables a better assessment of both the relevance of product placement and the consumption habits of the viewing audiences, and an important substantive issue is the nature and valence of soaps' influence on consumers. Equally important is the issue of the

industry's responsibility to consumers beyond mere entertainment. In the U.S., the industry is untrammelled by the need for government funding, and thus not obligated to engage with social welfare issues, unlike the industries in Brazil and New Zealand, which depend on such funding. The result is an exclusion of these issues—soaps ignore the outer world—and a celebration of materialism in the characters' world that represents the neglect of an opportunity for positive influence that has.

“Soap Operas in New Zealand and the U.S.: Product Placement Strategy and Consumption Imagery”

Simon J. Pervan and Brett A. S. Martin

The imagery of consumption, as represented on a daily basis in a range of media channels, plays an important role in the way consumers develop and apply meaning to their consumption habits (Hirschman 1988; Englis et al. 1993). In broadcast media, the development of the soap opera has been regarded as a major contributor to the rise of mass consumption (Lavin 1995; Miller 1995) as well as one of the most successful advertising vehicles ever used (Allen 1995).

Given the impact of soap operas on our economy and our society, it is somewhat surprising that there has been relatively little attention paid to them in the marketing literature. Much of the research is in the form of sociological critiques (see for example Harrington and Bielby 1995; Riegel 1996; Barker 1998) or magazine and newspaper articles. In marketing, Hirschman (1988) has conducted an analysis of the ideology of consumption, and Lavin (1995) provided an historical review of the success of the early radio soap operas. However, questions remain about the importance of this television genre to marketers and consumers such as: What types of products are being consumed? How are they being consumed? In what light does the consumption episode portray the product?

This study examines the types of products as well as the context and emotional outcomes of consumption imagery in soap operas in two countries, the U.S. and New Zealand. The importance of the U.S. industry is self evident. Over \$500 million per year is earned from international sales by each of the transnational giants Warner Brother, Paramount, and Universal, making the U.S. soap opera industry alone a billion dollar entity (Ortiz de Urbina and Lopez 1999). Our decision to study soaps in New Zealand follows the remarkable success of a locally produced soap opera (Shortland Street). Based on life around a private medical clinic, the show attracts around 25% of the three million population every day, and has been syndicated around the world, including the UK, South Africa, Ireland, and Australia (Television New Zealand, 2000). Our research interests centered on both the cross cultural differences of consumption imagery and a test of the assumption, noted in the sociology literature that the influence of soaps is limited to the effects of “Americanization” on local culture (Miller 1995).

Content analysis was used to provide evidence of product categories and brands, product use, and the emotional outcome of product use. The highest rated soap operas were chosen from each country: The Young and the Restless (Y&R) in the U.S. and Shortland Street (SS) in New Zealand. Y&R has been the top rated daytime television show in the U.S. for over 11 years (Schlosser, 1999), and Shortland Street, now in its eighth year in New Zealand, has consistently outrated all other drama programs, soap opera or otherwise, on television (Television New Zealand 2000). Both shows have daytime schedules, with Shortland Street aired twice due to its popularity, plus an additional early evening schedule. Furthermore, both shows are typical of the soap genre, with serial narratives (Allen 1995) and a primary focus on issues relating to sex

and social life within a family (Cantor and Pingree 1983). Finally, each attracts a similar target group, key amongst which are 18-49 year old females.

Findings indicated that American soap operas tended to display more consumption imagery in relation to leisure and appearance-related items, whereas New Zealand soap operas included products for transport or food. There were also differences in the emotional outcomes of product consumption, with the New Zealand soap opera yielding more positive emotional consequences, particularly for products such as alcohol and cars, and the U.S. more negative consequences for products such as phones. The analyses also found support for soaps as a rich context of brand placements, with almost half of all episodes (46%) containing actual brand references, with higher levels in New Zealand (70%) than in the U.S. (26%). These findings provide a basis for discussing the processes of reception and interpretation described in the La Pastina presentation and the process of referential influence driven by the soap characters addressed in the Russell and Stern presentation.

“Product Placement in Brazilian Telenovelas: Selling Soaps and Social Causes”

Antonio C. La Pastina

Telenovelas are melodramatic narratives with roots in the early U.S. soaps, the Cuban radio and TV melodramas, and the French feuilleton. Since the late 1960s they have evolved into a more socially tuned narrative with contemporary themes, becoming on occasion a commentary on political debates in the nation. Unlike the U.S. counterpart, they are aired on prime time, traditionally attracting the highest audiences in the country among men and women. Globo network, the largest in the nation and the fourth worldwide, has dominated the market in the last twenty years.

Production in Brazil is partially subsidized by government funding, but product placement is the main source of funding, providing an extra source of income as well as a means of circumventing the government-imposed limit of 15 minutes of commercials per hour (La Pastina 2001). However, government funding has encouraged telenovela producers to go beyond commercial product placements and develop social merchandising strategies that include social and educational messages. In the mid-1990s, the strategy began to receive attention by Globo, writers, producers, non-governmental groups, and the news media as a viable means of promoting social change (Apolinario 1996; Guerini 1996; Firme 1994). Unlike commercial product placements, early social issue insertions were generally based on the writers' personal agenda.

Both commercial and social messages in Latin American telenovelas reach a more diverse audience than soaps do in the U.S., for in Brazil they are broadcast on prime-time television and are designed to attract a wide viewing audience of men, women, and children (Lopez 1991 p. 600). Further, plots are finite in that the programs “have very definitive endings that permit narrative closure” after 180 to 200 episodes, unlike U.S. soaps, which can go on for generations. Plots center on class conflict and the promotion of social mobility (Mazziotti 1992), with a few central characters engaged not only in relationships with each other but also in activities relevant to political, cultural, and economic issues.

This presentation reported findings from a year-long ethnographic study of soap viewers in a small rural community in the backlands of northeast Brazil. The community of roughly 2,000 inhabitants is in one of Brazil's smallest and poorest states, an area where the unpredictability of rainfall and soil exhaustion have created a culture of migration and religious devotion. Leisure options are few, and television and its main entertainment programs, the telenovelas, maintain a hold on community members'

attention. The presentation discussed the way that rural viewers appropriate telenovelas in their daily lives and assign meanings to the texts according to their own values and beliefs about gender roles, relationships, and sexuality. The geographical isolation and the local patriarchal culture mediate the process of reception, interpretation, and appropriation of telenovelas. The isolation of the community in relation to the urban characters and settings in the telenovela narratives intensify the perceived gap between the local patriarchal culture and the urban reality constructed in the telenovela text.

Findings suggest that product placements within telenovelas are not necessarily read as direct product promotion or advertising, but instead are perceived as an inherent element of the genre: the glamour of upper-class urbanites. Evidence also exists that the relationship between viewers and product placement is dynamic in that different viewers not only address the same text with different subjectivities, but also within contextual structures that enable or constrain that text-reader relationship. The role of telenovelas in promoting a vicarious participation in the modern world (Leal, 1986) cannot be overlooked: the desire to learn about fashion, lifestyle trends, and behavior is intrinsically associated with telenovelas, fueling knowledge of consumer goods and lifestyles. Nevertheless, local isolation and limited de facto access to consumer goods and purchasing power remain a hindrance to more complete participation in a global consumer culture. Technological changes may bring greater access and awareness of global consumer culture, but, as this study demonstrates, the cultural capital available to viewers remains a central element in the process of media interpretation.

“Aspirational Consumption in U.S. Soap Operas: The Process of Parasocial Attachment to Television Soap Characters”

Cristel Antonia Russell and Barbara Stern

This paper focuses on U.S. soap operas and consumers to test a model of the influence of soap characters on viewers' consumption attitudes and behaviors. As the first presentations indicated, soap operas convey information about product symbolism, the way that people live, and the representation of consumption practices and ideologies (Larson 1996; Hirschman 1988; Hirschman and Thompson 1997). This presentation proposed that soap opera characters to whom consumers feel parasocially attached trigger a behavioral modeling process channeled through viewers' consumption attitudes and behaviors. The model draws from literary theory to explain the romance attributes of soaps that foster emotional attachment and from social learning and persuasion theory to shed light on parasocial-referential responses. In this way, the model reflects the link between characteristic U.S. stimulus attributes (soap genre) and psychological and behavioral influence through parasocial interaction.

Unlike its Latin American counterpart, U.S. soap structure is completely open: first, the series can go on indefinitely, for it has neither a beginning nor an end, consisting only of an evolving middle; and second, each episode replicates the series structure, also having neither a beginning nor an end, but characterized by a suspenseful stopping point. The lack of closure sustains serial longevity, which ensures viewers' long-term daily participation in the soap characters' lives. The regularity and suspenseful nature of soaps contribute to viewers' perception that characters exceed their textual existence and live in real-time, just as viewers do (Fiske 1987), thereby promoting the development and maintenance of viewers' relationships with characters. Both structural longevity and long-term viewing require sustained viewer interest in the

intense and complex lives typical of the large cast of characters.

The focus of U.S. soaps is on complicated sexual relationships. The relationship orientation is considered the locus of soaps' appeal to women, long the target audience, for whom the fictions serve as fantasies about rich emotional and sexual lives in which men (as well as women) are always eager to talk about their feelings (Herzog 1941, Lavin 1995). As viewers become actively vested in the characters whose lives they closely follow and care about, they become parasocial attached to them as if they were real people (Levy 1962). Parasocial attachment affects the degree to which soap characters serve as meaningful referent others, socialization agents, and sources of influence (Russell, Norman and Heckler 2004). They become behavioral models who can influence viewers' attitudes and behaviors (Churchill and Moschis 1979).

Even though soap characters' emotional lives may seem the stuff of fantasy to most viewers, their consumption surroundings include familiar items that are likely to stimulate a more attainable mechanism of modeling. As Pervan and Martin pointed out, content analyses of U.S. soap operas have shown that they are ridden with cues about the characters' consumption. We propose that parasocial relationships that viewers develop with soap characters over years of viewing help shape their attitudes toward consumption and, in turn, their own consumption behavior. This model of influence keeps with a long tradition of social learning and behavioral modeling theories that explain the processes of real-life influence received from highly-valued reinforcing agents (Bandura 1971, 1976; Fishbein and Ajzen 1975).

Our model was tested in a cross-sectional survey of female viewers of four of the longest lasting U.S. soap operas (Young and Restless, General Hospital, All My Children and Days of Our Lives). On average, respondents had watched the soaps for over 20 years, and had watched over 5,000 episodes. The research instrument addressed the respondent's history with and attitude towards the program in general; it then measured attitude toward and levels of parasocial attachment to two characters of the respondent's choice, one male and one female; finally, respondents were asked to comment and rate different aspects of each character's consumption, with measures of attitude toward and the consumer's own behavior across five product categories. Survey data were analyzed using structural equations modeling to test the hypothesized relationships about the direct and mediated effects of parasocial attachment on viewers' attitudes and behavior.

We find that the level of parasocial attachment to both male and female soap characters affects viewers' own consumption behaviors. Consistent with theories of social learning and behavioral modeling, the process of influence through parasocial attachment on viewers' behaviors is both direct and indirect, via its effects on viewers' attitudes such that fictional characters have the power to influence real-life attitudes and subsequent behavioral modeling.

Discount Rates for Time Versus Dates: The Sensitivity of Discounting to Time-Interval Description

Robyn A. LeBoeuf, University of Florida

EXTENDED ABSTRACT

Consumers must often consider tradeoffs between future and present dollars, as when they decide to forego immediate consumption to save for a long-term goal, such as college tuition or retirement. A long research tradition has examined such intertemporal choices, with much attention focusing on the phenomenon of positive *temporal discounting*: people perceive money available in the future as worth somewhat less than an equivalent amount in the present. Over the years, research on consumer discounting has played a vital role in attempts to model and predict intertemporal decisions (see Loewenstein, Read, and Baumeister 2003, for review).

This paper identifies a new consideration that substantially affects temporal discounting. The current experiments examine how discounting is impacted by whether time intervals are described in terms of temporal extent (e.g., number of months) or in terms of boundaries (e.g., dates). Specifically, future *dates* may seem like relatively abstract points in time; interval length may not loom large when dates are considered. In contrast, when extents are considered, the amount of time in an interval is, by definition, highlighted, and attention is called explicitly to interval length. Such attention to the sheer length of intervals may in turn make those intervals seem longer. Thus, consumers may find future dollars to appear exceptionally distant (and thus to deserve more discounting) when extent-based descriptors are used, compared to when date-based descriptors are used.

In experiment 1, participants ($N=356$) were asked to imagine choosing between a prize of specified value now and a prize of unspecified greater value after a given time interval had passed. Participants were asked to state the future prize value that would render waiting the time interval (and foregoing the immediate prize) worthwhile. The time intervals were either described by extent (e.g., "in eight months") or date (e.g., "on October 15th," a date exactly eight months in the future). Across four such scenarios, reliably greater future prizes were requested with extent than with date descriptions. In other words, participants demanded more compensation to endure a delay (i.e., they discounted future dollars to a greater degree) when the delay was described by the amount of time to be waited than when it was described by the wait's endpoint.

Experiment 2's task had a similar structure, but in experiment 2, the dollar amounts of the immediate and future prizes were fixed, and participants ($N=253$) were required to specify (either with extent or date) the time interval that would make them indifferent between receiving the smaller prize immediately and the larger prize after the interval passed. Across three such scenarios, those specifying extents were not willing to wait as long as those specifying dates. This supports the idea that discount rates are higher (i.e., impatience increases) when future intervals are thought of in terms of lengths instead of boundaries.

Experiment 3 investigated whether these effects are strong enough to even affect choices between pre-defined alternatives. Participants ($N=133$) considered six investments that each had two options: a smaller, shorter-term payoff, and a larger, longer-term payoff. The times until the payoffs were either described by dates or by extents of time, and for each investment, participants were asked to select the payoff they preferred. For each investment, participants were reliably less likely to select the long-term payoff when time was described by extent than when it was described by

date. Participants thus again behaved reliably more impatiently when extent, instead of date, descriptors were used, indicating that increased discounting under extent descriptors manifests even when participants are asked to choose between discrete options.

Experiment 4 examined whether similar effects arise when consumers consider future losses. Participants ($N=81$) each read three scenarios that gave them an opportunity to defer a debt (e.g., a tax bill) for a fixed interval. The interval was either described by an extent of time or by the date on which the deferral would end. Participants indicated the total amount they would be willing to pay post-deferral to avoid paying anything immediately. Across the three scenarios, those in the extent condition were willing to pay reliably more to defer their debts than were their date-condition counterparts. As in the previous studies, participants seem to have discounted future dollars (here, future *debts*) to a greater degree when time was described by extent.

Experiment 5 investigated a potential reason for this finding: although objective interval length does not change when interval description is manipulated, *perceptions* of interval length may be affected by such manipulations. By explicitly mentioning an amount of time, an extent description might render more vivid the upcoming delay, making the interval itself seem rather long. Thus, in experiment 5, participants ($N=132$) each considered three time intervals, described either by extent or date. Participants were asked to rate the perceived length of each interval on a seven-point scale ranging from "seems very short" to "seems very long." Indeed, participants facing extent-based intervals reported that the intervals seemed reliably longer than did those facing equivalent date-based intervals.

Discount rates are apparently sensitive enough to fluctuate with slight changes in time-interval description. Across multiple domains and despite disparate elicitation procedures, consumers consistently exhibited more discounting when time intervals were described with extents instead of dates, perhaps because under the former description, the distance to future transactions actually seems longer. The current results have obvious implications for consumer decisions involving intertemporal tradeoffs (such as investment decisions), and these results join years of research showing consumer discount rates to be more unstable, and intertemporal choice to be relatively less orderly, than early normative models posited (e.g., Samuelson 1937). Notably, the current work highlights the fact that even when all conceivable objective factors in the decision situation are fixed, discount rates remain quite malleable and sensitive to ostensibly irrelevant nuances generated by descriptions.

Balancing Giving-Up Vs. Taking-In: Does the Pattern of Payments and Benefits Matter to Customers in a Financing Decision Context?

Seiyoung Auh, Yonsei University,
Chuan-Fong Shih, Wake Forest University

ABSTRACT

Despite the relevance of mental accounting as a framework in addressing consumer behavior decision making, very little has been documented about the applicability of mental accounting to financial marketing and behavioral financing. This paper attempts to build and extend the literature on financial decision making by drawing on mental accounting and prospect theory. Specifically, we take the current literature one step further by testing the alignment hypothesis which states that consumers prefer financing schemes that not only match the length of benefits with payments but also the corresponding patterns as well. Through three studies, our paper finds general support for the alignment hypothesis. Implications for financial decision making along with retailing strategies are discussed.

INTRODUCTION

As consumers increasingly use debt and installment payments to finance durable goods, understanding of how financing decisions are made can allow marketers to better design financing schemes that will stimulate purchases. Prior researches have examined consumer financing decisions using mental accounting principles which enable a better understanding of how gains and losses from transactions are processed (Henderson and Peterson 1992; Okada 2001; Thaler 1985). Gains and losses can occur not only at a specific point in time as when purchases are made and consumptions takes place but can also extend over a longer period of time. Such is the case when consumers finance a durable good.

In a typical financing scenario, the consumer makes payments for an agreed upon time period and in exchange uses the product and reaps the benefits that are derived from consumption. The financing period can be either longer or shorter than the useful life of the product depending on the financing term. Research has shown that consumers prefer to match the cost stream associated with the financing payments with the benefit streams that accrue from using the product (Hirst, Joyce, and Schaedewald 1994; Prelec and Loewenstein 1998). When unbalance between the two types of stream occur, people are less likely to choose financing as a method of payment. This has been one of the primary reasons for people's hesitance for financing services such as vacations since the benefits terminate once the trip is over but the payments used for financing the trip continue (Hirst, Joyce, and Schaedewald 1994).

Our paper tries to add theoretical and practical knowledge into this important area by addressing inconsistencies in the literature and is distinct in several ways. First, we attempt to capture how consumers prefer to match the length of benefit streams with the length of cost streams (experiment 1). We specifically address this in the context of a widely used and accepted promotion, payment deferrals. Put differently, our research explores how flexibility to make repayments (e.g., when I can start to make repayments) can affect the misalignment between benefit and cost streams created by a special financing promotion, payment deferral programs.

Second, whereas prior research has found a linear pattern for mental depreciation of durable goods, we contest this and suggest a non-linear mental depreciation pattern for high-tech products (experiment 2).

Third, past research has been solely focused on the temporal contiguity of costs and benefits thereby suggesting that as long as the benefit stream coincides and overlaps with the cost stream, consumers will be favorable towards financing (Hirst, Joyce, and Schaedewald 1994). We build and extend this argument by asserting that it is not only the *length* of cost and benefit streams that are relevant but also the *pattern* of costs and benefits that is of utmost importance in determining consumer's preference for financing (experiment 3). That is, when benefits display a constant pattern throughout the useful life of the product, consumers should prefer payments that correspond to a constant pattern. However, when the benefit stream is not constant but decreases over time, consumers should prefer decreasing payments. We refer to this, the similarity in pattern of benefit and cost streams, as the *alignment hypothesis* throughout the paper. We test our above three contributions in three different experiments.

Our paper is organized in the following order. We first discuss the relevant literature in this under developed area of financial marketing by building and extending on mental accounting as our primary analytical framework in developing our argument for the alignment hypothesis. We then report the results of three experiments that test the robustness and validity of our alignment hypothesis.

CONCEPTUAL BACKGROUND AND HYPOTHESES

Compatibility between Length of Gains and Losses over Time

Our previous arguments have underscored the central thesis that consumers prefer to engage in financing when the benefits from using the product are in temporal alignment with the payments. In recent years, payment deferral programs (PDP) have been popular promotional tools among retailers to boost sales. This type of promotion can be conceived as a decoupling strategy as consumptions occur before payments are made (Prelec and Loewenstein 1998). Strictly speaking, a PDP is a special type of financing whereby the retailer gives the consumer a "make up" time to make the payments. This no payment and interest free period typically ranges from 12 to 36 months depending on the details of the promotion. During this interval, the consumer is literally using the product for free. The consumer is not responsible for any payments or interests during this period. This is an attractive promotional tool for consumers who want the product today but don't have the money to make the payments now.

However, payment deferral programs create considerable misalignment or non-overlap between the benefit stream and the payment stream. In other words, if the PDP is for 24 months and assuming that the consumer is planning to take full advantage of this PDP by not making any payments till the very end, for the first 24 months, only the benefits are accumulated without any payment streams to be matched. A crucial pitfall of PDP can occur when the product's useful life is often shorter than the no payment and interest free interval such as is the case for high technology products. This implies that the consumer will have to make payments when the benefits are starting to decline or have already

declined. This would be an extremely painful experience on the part of consumers as it would be perceived of as paying for something that returns very little in exchange.

Thus, in contrast to the intended objective of PDP, such a promotion can actually hamper sales especially for products that have a shorter useful life than the payment deferral period itself. Therefore, given our argument for people's preferences to desire temporal alignment between benefits and costs, when PDPs have a longer payment deferral period than the product's useful life, people will act purposefully to achieve alignment between benefits and costs as much as possible, given the opportunity. On the other hand, when the product's useful life is longer than the payment deferral interval, people should be relatively insensitive to act upon the opportunity to make temporal alignments between benefits and payments.

The objective of hypothesis 1 is to test our basic contention of consumer's preferences for temporal alignment between benefits and costs by giving the subjects the opportunity to do so and examine if they will readily accept such opportunities. If we consider the worst scenario in which the consumer decides to take full advantage of the payment deferral period and make no payments, we believe this situation will have a different effect than would be the case if a consumer were in a position to make payments before the expiration of the deferral period. In the first case where no payments are expected to be made before expiration of the deferral period (i.e., deferred payment option), a PDP whose no payment period's length is longer than the useful life of a product would not be very attractive. This is because when the time comes to make your first payment, the financed product will have been essentially obsolete and useless.

In contrast, when the option is given to consumers to make payments anytime before the expiration of the deferral period (i.e., flexible payment option), this sense of being in control should nullify the relationship between the length of the deferral period and the useful life of the financed product. Only when the length of the financing term is greater than the useful life of the financed product will there be an effect of payment option (flexible vs. deferred) on the likelihood of using and attitude towards a PDP. Taken collectively, the above arguments lead us to the following hypotheses:

H_{1a} : When the length of the payment deferral period is greater than the useful life of the financed product, the likelihood of using and attitude towards a PDP will be greater under a flexible payment option than a deferred payment option.

H_{1b} : When the length of the payment deferral period is equal to or less than the useful life of the financed product, there will be no difference in the likelihood of using and attitude towards a PDP between a flexible payment option and a deferred payment option.

Mental Depreciation

The notion of mental depreciation (Heath and Fennema 1996) and mental cost allocation (Gourville and Soman 1998) commonly refer to the activity of consumers spreading out the costs involved with a purchase over an extended period of time in order to align the expected benefits with the upfront incurred payment. The tendency to engage in such behaviors stem from the fact that quite often the benefits that accrue with a purchase are obtained over a certain time period, usually over the useful life of the product, while the payments occur at the time of purchase. As an example, when a consumer purchases a notebook computer for \$2000, rather than opening up a notebook account and posting the entire \$2000 to the

account at the time of purchase, consumers may allocate certain sub-amounts to this account as they use the notebook or have gotten their money's worth from using the notebook over time.

Prior researches have examined the pattern of mental depreciation. Heath and Fennema (1996) report a linear relationship between mental depreciation and different time periods in a product's useful life. In their study, they used indirect measures to measure mental depreciation. They specifically used a) how much people would sell their products at different time points in the product's useful life, b) how disappointed they would be if they lost their products at different points in time, and c) the extent to which they were willing to make a replacement decision for a new product. Their results generally supported a linear trend with the exception of disappointment, which followed a quadratic pattern.

We took a more direct approach and asked the subjects how much they got their money's worth (GMW hereafter) at different time points in the product's useful life. Greater GMW would be indicative of more mental depreciation because in order to realize a significant amount of GMW, a considerable amount of depreciation has to have occurred. Using the above measure, we posit that consumer's mental depreciation can take on one of three possible patterns as illustrated in Figure 1.

In Figure 1, line A indicates a constant mental depreciation of products over time. In other words, consumers are getting roughly an equal amount of money every time they use the product. For example, a consumer purchases a brand new sofa that lasts about 10 years. Every year, the consumer uses roughly 1/10 of the value of the sofa. Since the utility consumers get from sitting on the sofa does not change from year to year, he/she mentally depreciates equal amounts of value from the initial purchase price until the sofa is worthless at the end of the 10th year.

On the contrary, line B indicates a mental depreciation pattern in which there is little loss in value initially in the life cycle of the product. After a period of time, there is an increase in loss in value and the line races towards the horizontal axis. This indicates that consumers are more likely to get most of their money's worth towards the later half of the product's useful life than the first half. Products, which require a prolonged period of consumer adjustment before full benefits can be enjoyed, may be indicative of this pattern.

Finally, line C illustrates a mental depreciation pattern in which the majority of the value is consumed in the early part of the product's life than the later part. That is, consumers get most of their money's worth early on in the product's useful life. Products with a high "newness" premium typically fall into this category. Having the latest and the newest product often is a source of pride for consumers, and thus having something that's new in it of itself is often enough to justify a premium price. Much of today's computing hardware also falls under this pattern of mental depreciation. Initially, new computers are able to process information and perform tasks at a relatively high speed. However, as more and larger softwares are installed, the computer's hardware resources are taxed and its processing speed starts to decline after some point. Thus, from the perspective of computer users, most of the value of the computer is in the early part of its useful life where hardware technology is ahead of the software as opposed to the later half where hardware struggles to keep up with software updates.

Based on our argument about mental depreciation, we posit that for a high-tech product such as a notebook computer, the mental depreciation curve will follow a pattern consistent with graph C. This implies that consumers will obtain more GMW in the early stages of the product's useful life compared to later stages. This leads us to the following hypothesis:

FIGURE 1
Mental Depreciation over Time

FIGURE 2
Alignment of Benefits and Payments

Benefit	+	+	+	+	0
Payment 1	-	-	-	-	-
Payment 2	-	-	-	-	0
Net Gain 1	+2	+1	0	-1	-2
Net Gain 2	0	0	0	0	0

Time →

H2a: GMW and cost used up will be greater during the first half of the product’s useful life than in the second half for high-tech products

H2b: GMW and cost used up will be equal between the first half and the second half of the product’s useful life for durable non-high-tech products.

Compatibility between Patterns of Gains and Losses over Time

If we conceptualize utility from product usage as gains (i.e., GMW) and payments as losses, the problem can be framed using prospect theory (Kahneman and Tversky 1979). Two principles in prospect theory warrant further attention, mixed gains and mixed losses. Mixed gains (losses) are defined as outcomes that entail gains (losses) that are larger in absolute size than losses (gains). The notion of financing includes both multiple gains and losses over time. Financing a product corresponds to a mixed gain in that in order for a customer to use such a promotional tool, the multiple gains (i.e., benefits from using the product over its useful life) should equal or outweigh the multiple losses (i.e., costs from paying over the financial term). Over the useful life of a product, the stream of gains and losses can be graphically depicted as in Figure 2.

In Figure 2, benefits from product use is depicted by “+” while payments are represented by “-“. For illustrative purposes, we show the declining benefit stream for a hypothetical technological innovation and two possible payment streams, constant and declining. When the patterns of the benefit stream and the payment stream are matched, each period has a net gain/loss of 0. That is, the financing payments consumers make are just enough to be offset by the benefits consumers reap each time they use the product.

When constant payments are made, however, consumers perceive positive net gain early on in the life of the product because they derive more utility than they are actually paying for while in later periods they are making more payments than what they actually derive from product usage. Thus, consumers experience net gain early on but net loss later on. Despite the different configuration of net gains and losses, when aggregated over the life of the product, both the decreasing and constant financing payments will result in a zero balance.

We argue that such future streams of gains and losses derived from usage benefits and financing payments, respectively are evaluated by consumers at the time of purchase. This implies that consumers are forward looking in their evaluations of benefits and

payments downstream. When a mismatch occurs between the patterns of benefits and payments such that the benefits are received non-linearly but payments occur in a linear pattern over the life of the product, this creates a pattern of misalignment. Under such a case, consumers are expected to perceive an advantage during the early part of a product's useful life but a disadvantage during the later stages. Prospect theory suggests that in a mixed gain/loss context, losses loom larger than gains and therefore losses towards the end of the financing period should have a greater impact than the gains realized early in the financing period, thus adversely affecting the evaluation of financing decisions and purchase intent.¹

Prelec and Loewenstein (1998) provide additional support for making greater payments early on than later in the product's useful life. They argued that all else equal, people prefer to pay in advance so that when they actually consume the product downstream, it is perceived as if it is free. This is consistent with the idea of eliminating a loss or dread as soon as possible (Loewenstein and Prelec 1993). As a result, consumers are able to savor the good for later and appreciate delayed gratification. Furthermore, preference for improvement over time may be a natural instinct and desire for humans in that we like to make incremental improvements rather than deteriorations over time. Also, the notion of preference for a happy ending is in line with a decreasing payment financing structure (Ross and Simonson 1991).

Hirst, Joyce, and Schaedwald (1994) have used the mixed gains argument to show that temporal contiguity matters in a financing context. They posit that since $V(\text{gains}) > -V(\text{loss})$ is satisfied in a mixed gains context, due to our third feature of prospect theory (value function is steeper for losses than for gains), it is better to combine and integrate the gains with the losses before evaluation than it is to evaluate them separately followed by combination ($V(\text{gains} + \text{losses}) > V(\text{gains}) + V(\text{losses})$). This suggests that temporal contiguity is important in that value is greater when the multiple benefits from using the product overlap with the costs associated with the payments as opposed to if they occur in a sequential manner whereby one occurs after the other.

Alternatively, rational economic theory would argue in favor of payment deferral as much as possible as \$1 worth today is more than \$1 worth tomorrow. In other words, rational economic behavior would suggest postponing payments now by better utilizing the current balance to obtain a higher rate of return elsewhere. Therefore, a rival explanation can be advanced whereby a decreasing payment stream should not be preferred regardless of the pattern of the benefit stream. Taken collectively based on the arguments set forth above, we offer the following alignment hypothesis:

H₃: The evaluation of a financing program will be more positive when a decreasing (constant) benefit stream is matched with a similar decreasing (constant) payment stream than a constant (decreasing) payment stream.

¹Support for preference for congruity between the patterns of benefits and costs can be found in the effect of perceived pain or consumption experience patterns over time of an evaluation (Ariely 1998; Loewenstein and Prelec 1993; Ross and Simonson 1991; Varey and Kahneman 1992). The common theme that ties the above research together is the fact that the sequencing, intensity, and pattern of experience or episodes matter in determining one's overall evaluation of an experience.

STUDY 1

Method

Design and Procedure

H_{1a} and H_{1b} were tested in a 3 (financing term: payment deferral length > product life vs. payment deferral length < product life vs. payment deferral length = product life) x 2 (repayment option: deferred vs. flexible) between subjects ANCOVA with knowledge in financing as a covariate. Participants were recruited in a local shopping mall. A compensation of \$10 was given for their participation. After having agreed to participate, the subjects were led to individual tables and chairs where they completed the instruments at their own pace. A booklet that contained the instruments was given to the subjects and the average time for completion was about 7 minutes.

Subjects

A total of one hundred and seventy four subjects ($n=174$) with diverse job backgrounds participated in the study (e.g., consumer goods, retail, financial services, high-tech, etc.). We used the mall intercept as a vehicle for data collection.

Materials

The booklet contained scenarios about financing a notebook computer. Subjects were told that they were on the market to purchase a notebook computer but since they were short on cash they had to use a payment deferral promotion to make the purchase. The definition of a payment deferral promotion was provided in the scenario to accommodate those who were unfamiliar with the concept. They were also informed that after the typical life span of a notebook it significantly loses performance because its processor and memory can no longer keep up with the latest softwares and have minimal resale value.

The financing term variable was manipulated by varying the length of the promotion vs. the typical life span of a notebook. The typical life span of a notebook was held constant at 2 years and the length of the promotion was varied at 3, 1, and 2 years, respectively, to capture the three levels under the financing term variable. The repayment option was manipulated by providing future financial situational information. In the deferred payment condition, it was explained to the subjects that because you are short on cash and you do not foresee your situation to change in the near future, you intend to take full advantage of the deferred payment program and not make any payments prior to the end of the promotional period. Conversely, in the flexible payment condition, the subjects were told that although you are short on cash right now, your situation may change in the future and you may choose to prepay parts of or the entire loan without penalty.

Dependent Variable

Three dependent variables (agreement with the fact that this is a very good payment deferral program; agreement with the fact that this is a payment deferral program that makes sense; agreement with the fact that if such a promotion were available, I would be likely to use such a promotion) were used in this study. The very good and makes sense variables were averaged to create an attitude index ($\alpha=.75$). In conclusion, we used an index that measured subject's attitudes towards the financing promotion and the likelihood of using such a promotion if available.

Results

Initial Analysis

Beyond further proceeding, we examined to see if any differences existed in our attitude index and likelihood of use across the three conditions of the financing term variable. Upon close examination, the mean values for both dependent variables were very

similar when product life span=length of the payment deferral program and when product life span>length of the payment deferral program (for attitude index, $M's=4.18$ vs. 4.34 , $t(117)=-.702$, $p>.40$ and for likelihood of use, $M's=4.80$ vs. 4.48 , $t(117)=1.16$, $p>.20$). Therefore these two conditions were collapsed for all subsequent analyses.

Hypothesis Testing

As a result of collapsing the financing term variable, the attitude index and likelihood of use were subjected to a 2 (financing term: product life span<length of payment deferral vs. product life span \geq length of payment deferral) \times 2 (repayment option: deferred vs. flexible) between subjects ANCOVA with knowledge in financing as a covariate. We report the results of likelihood of use followed by the attitude index.

When likelihood of use was the dependent variable, significant main effects were supported for both the financing term ($M's=4.64$ vs. 3.88 , $F(1,169)=9.71$, $p<.005$) and repayment options ($M's=4.81$ vs. 3.71 , $F(1,169)=19.74$, $p<.001$). But more importantly, a significant interaction between the financing term and repayment option was supported ($F(1,169)=10.41$, $p<.005$).

Further analyses revealed that under the deferred repayment option, likelihood of using such a promotion was significantly greater when the product lifespan was \geq length of deferred payment vs. when the product lifespan was <length of deferred payment ($M's=4.49$ vs. 2.93 , simple $F=19.54$, $p<.001$). However when the repayment option was flexible, no significant difference was observed in the likelihood of using such a promotion between the two financing terms ($M's=4.79$ vs. 4.82 , simple $F=.008$, $p>.30$).

However, when attitude index was the dependent variable, the interaction between financing term and repayment option did not approach significance ($F(1,169)=2.12$, $p<.15$). Albeit not significant, the difference in the attitude index between the two levels of financing term was greater in the deferred repayment option than in the flexible repayment option, which is consistent with our hypothesis. Thus, this provides strong support for H_{1a} and H_{1b} when likelihood of use is the dependent variable.

STUDY 2

Method

Design and Procedure

This study used a 2 (GMW vs. cost used up) \times 2 (notebook vs. dining table) mixed factorial design. The first factor was between subjects while the second was within subjects. Respondents were randomly assigned to either a GMW cell or a cost used-up (CUP) cell. Within each of these cells respondents rated two product categories, notebooks and dining tables.

Ninety-six MBA students from a private business school in the Southeast were used as respondents. Participation was voluntary and the average time for completion was about 10 minutes. The average age of the respondents was 26.53 years old with females comprising 41% and males 59%.

Two key questions were used to measure mental depreciation. The first focused on obtaining one's money's worth out of a product. We described a situation where the respondents purchased a notebook (dining table). Then it was explained to the respondents that they would get their money's worth out of the notebook (dining table) as they used it. Subjects chose from three options that they felt best described the pattern of depreciation in their minds. The first option was getting more GMW from the first half than from the second half of the product's useful life. The second option was receiving more GMW from the second half than from the first half. The third option was obtaining equal GMW between the first and second halves.

The second measure of mental depreciation concerned their feelings as they used up the cost of a notebook (dining table) over the useful life of the product. To this end, we asked whether they used up more of the cost of a notebook (dining table) during (a) the first half of the notebook's (dining table's) useful life, (b) the second half of the notebook's (dining table's) useful life or (c) equal amounts between the first and second halves.

Results

We first tested to see whether GMW and CUP were valid indicators of mental depreciation. We accomplished this by testing to see if any difference existed between GMW and CUP for both notebooks and dining tables. Our results strongly suggested that respondents interpreted GMW and CUP similarly. For notebooks, more respondents agreed with obtaining greater GMW in the first half over the second half than receiving equal GMW between the two halves. The same pattern was observed for CUP in that respondents felt they used up more value during the first half than the second half compared to using up equal amounts between the two halves. The pattern of distribution between GMW and CUP were not statistically different, lending support for the validity of the measures of mental depreciation ($\chi^2=.08$, $p>.78$). This similarity in distribution pattern was also supported for dining tables ($\chi^2=.009$, $p>.92$). Therefore, based on the above tests, we obtained greater confidence of GMW and CUP as valid measures of mental depreciation.

Next, we report the results of our hypothesis testing. For notebooks, as hypothesized, respondents felt that they got more of their money's worth during the first half of the notebook's useful life than in the second half ($n=36$), and this was significantly greater than those who thought that they received equal amounts of money's worth between the two halves ($n=8$, $\chi^2=17.82$, $p<.001$). Also, respondents felt that they used up more of the cost of the notebook during the first half than the second half ($n=37$), and this number was significantly greater than those who agreed with using up equal amounts between the two halves ($n=7$, $\chi^2=20.46$, $p<.001$). Therefore, H_{2a} was strongly supported.

On the other hand, for dining tables, we expected a linear mental depreciation curve in that the GMW and CUP would be equal between the first and second halves of the dining table's useful life. Our results were consistent with our predictions. As hypothesized, significantly more respondents felt that they received equal GMW between the two halves ($n=37$) than receiving more in the first half compared to the second half ($n=7$, $\chi^2=20.46$, $p<.001$). Moreover, the results for CUP were also consistent with GMW. A significantly greater number of respondents agreed that they had used up equal amounts between the first and second halves ($n=35$) compared to using up more in the first half than in the second half ($n=7$, $\chi^2=18.67$, $p<.001$). Therefore, we find strong support for H_{2b} .

STUDY 3

Design and Procedure

H_3 was tested using a 2 (performance pattern: constant vs. decreasing) \times 2 (repayment pattern: constant vs. decreasing) between subjects ANCOVA with knowledge in financing as a covariate. The nature of the subjects, procedure of the study, and data collection method for study 3 were identical to that of study 1. A total of one hundred and fourteen ($n=114$) subjects participated in this study.

Materials

A booklet contained scenarios about financing either a notebook computer or furniture. Subjects were told that they were on the market to purchase either a notebook or furniture and that since they

were short on cash, they had to partially finance their purchase. For subjects in the notebook condition, they were told that notebook computers, in general, lose performance and provide decreasing benefits as they get older and become obsolete. On the other hand, subjects in the furniture condition were told that furniture, in general, provides the same level of performance through their useful life. Thus, for notebooks, the performance was manipulated to be a decreasing pattern over time while for furniture it was manipulated to follow a constant pattern over time.

Furthermore, they were made aware of the fact that currently two types of financing options were available on the market. The first type of financing followed a fixed payment plan in which they were responsible for paying the same amount every month over the duration of the loan (3 years / 36 months). The second plan was a decreasing payment plan in which they would start out by paying a higher amount each month but gradually decrease over the 3 year duration of the loan. In either case, they were informed that the total amount paid in principal and interest was the same between the two plans. The repayment pattern manipulation was followed by stating that the only bank from which they were qualified to borrow \$3,000 was only offering the decreasing (constant) payment plan, in which they would be making decreasing (constant) payments every month. In all four conditions, the length of the loan was held constant at 3 years.

Dependent Variables

Three questions (agreement about their bank's plan as a very good repayment plan; agreement with the bank's plan as making sense; agreement about their bank's plan as preferable to the other plan that was not available) that tapped into the attitude of the financing plan offered by the subject's bank were used as the dependent variables. All three were rated on a 1 (strongly disagree) to 7 (strongly agree) scale. Since all three items were highly correlated ($\alpha=.78$), an index as the mean of all three items was used as the dependent variable in subsequent analysis.

Results

Attitude towards the financing plan was subjected to a 2 (performance pattern: constant vs. decreasing) x 2 (repayment pattern: constant vs. decreasing) between subjects ANCOVA with knowledge in financing as a covariate. Results revealed a main effect for performance pattern with subjects in the decreasing performance pattern condition rating attitude towards the financing plan higher than those in the constant performance pattern condition ($M's=4.25$ vs. 3.85 , $F(1,113)=4.42$, $p<.05$) but not for repayment pattern ($M's=4.14$ vs. 3.96 , $F(1,113)=.90$, $p>.30$). More importantly though, this was qualified by a significant interaction between performance and repayment pattern ($F(1,113)=27.21$, $p<.001$). Further analyses revealed that the constant repayment plan was rated higher than the decreasing repayment plan under constant performance ($M's=4.26$ vs. 3.43 , simple $F=10.45$, $p<.05$). Also, the attitude towards decreasing repayment plan was greater than the constant repayment plan under decreasing performance ($M's=4.85$ vs. 3.65 , simple $F=17.06$, $p<.001$).

We conducted further analyses to confirm our strong interaction effect between repayment pattern and performance pattern on the evaluation of financing plans. We compared the compatible condition (constant performance and constant repayment or decreasing performance and decreasing repayment) to the incompatible condition (constant performance and decreasing repayment or decreasing performance and constant repayment) on the evaluation of financing plans. The results strongly confirmed our previous interaction effect. The financing plan in the compatible condition was rated as better ($M's=4.30$ vs. 3.46 , $F(1,112)=13.31$, $p<.001$), as making more sense ($M's=4.67$ vs. 3.63 , $F(1,112)=21.12$, $p<.001$),

and as being preferred over the other unselected plan ($M's=4.77$ vs. 3.54 , $F(1,112)=19.09$, $p<.001$) than the financing plan in the incompatible condition.

IMPLICATIONS

Our first implication is that firms should consider utilizing more payment deferral program as a mean to stimulate purchase, particularly for consumer durables. Recently, firms have increasingly adopted discounting strategies such as manufacturer's discount of low financing rates to stimulate durable purchases. However, a low interest rate financing scheme may end up costing the firm much more because such incentives may hurt margins while at the same time frequent manufacturer discounts may permanently lower price expectations for products.

For example, when sales for the automaker GM fell in the US, GM announced zero percent financing up to 60 months or up to \$4,000 rebate on all its models. However, analyst warned that while such tactics may help GM gain short term market share, such pricing deals may end up costing GM \$3,100 per vehicle (Welch 2002). Our findings suggest that instead of low interests or rebate offers, a possible alternative is payment deferral programs. Study 1 showed that when given the option in a payment deferral program, consumers often choose to make payments earlier than called for because they prefer to match their benefit stream with their payment stream. This way, they avoid having to make payments later when the payments outweigh the benefits and end up feeling they are not getting their money's worth. Consequently, firms are not committed to price discounts, and early payments that consumers make become windfalls for the firm.

A second implication is the possibility of designing an alternative financing scheme for consumers where payments decrease over time. Unlike most financing terms where payments typically remain the same over the duration of the loan, decreasing payments are better aligned with durables that exhibit a decreasing benefit pattern. Since the majority of the payments are made up front decreasing payments may provide creditors a lower default risk toward the end of the financing term.

Adding Exchange to Charity: a Reference Price Explanation

Barbara Briers, K.U. Leuven
Mario Pandelaere, K.U. Leuven
Luk Warlop, K.U. Leuven

EXTENDED ABSTRACT

Charities often request donations while offering a near-worthless token, like a key chain or a pencil, in exchange. Little research has examined whether such 'exchange' requests are met with higher compliance rates than simply asking people to donate.

According to Holmes, Miller, and Lerner (2002), construing the donation as a commercial exchange will allow people to show their genuine compassion, while avoiding the negative feelings associated with violating the norm of self-interest. They argue that the assumption of self-interest has become a collectively shared cultural ideology: people think that other people are mainly driven by self-interest. As a consequence, people prefer self-interested behavior to avoid being exploited by self-interested others, or to avoid social disapproval for being 'irrational' (Miller & Ratner, 1998; Miller, 1999). Framing the donation as a commercial exchange may therefore provide potential donors a 'psychological cover' that enables them to act altruistically.

In three studies we examine whether and why consumers react positively to donation requests that are framed as the sale of a product. We think that one of the reasons why a priced exchange may increase compliance is that it signals an anchor or a reference price to which potential donors can compare candidate contributions. Just like consumers may have difficulties in estimating the price of a service due to a lack of a salient cost of goods sold (Bolton, Warlop, & Alba, 2003), in a simple donation setting potential donors may also experience difficulties determining what would be an appropriate donation amount. For economic reasons they may want to avoid too large a contribution, while too small a contribution may be perceived as inappropriate. Therefore, the option to 'buy something' instead of just donating may make it easier for potential donors to assess the minimally socially acceptable donation amount (cf. Fraser, Hite, & Sauer, 1988).

Clearly, if the token that is offered signals too high a donation amount, people will not donate, not even in exchange for a token. In particular, donation requests coupled with 'overpriced' exchanges may not help or may even decrease compliance rates compared to simple donation settings. On the other hand, low priced tokens may signal a donation amount that people consider being 'fair'. First, a low priced token may signal a donation price that is lower than the perceived donation price in simple donation settings. Moreover, low priced exchanges may legitimize small contributions and, therefore, render most excuses for noncompliance (e.g. "We can't afford to help.") inappropriate. Finally, if the presence of an anchor or reference price is an important factor in triggering donations, the association of simple donations and fixed prices should cause similar effects as the bundling of donation requests and priced tokens.

In the first (scenario) study, participants were asked to donate to a charity without a product being offered (mere donation) or to donate in exchange of staples (exchange condition). To explore our prediction that an exchange might signal an anchor or reference price that may induce people to donate, we asked participants to estimate the value of the offered product either before or after the donation decision. We found that people in the exchange conditions donated more easily when their attention was drawn to the 'low' estimated product value. In the mere donation setting, however, people lacked a 'fair' reference price; they apparently overestimated the cost of 'giving' and hence decided not to donate.

In study 2 we tested directly whether the 'exchange' effect is moderated by the token's value. This time, participants had to make a real donation decision. They were invited to just donate, to donate in exchange of paperclips without a shop value mentioned, to donate in exchange of paperclips with a mentioned shop value of €3, or to donate in exchange of paperclips with a mentioned shop value of €0.50. In line with study 1, the €0.50-token presented a comfortable reference price, a socially acceptable anchor that urged people to donate. On the other hand, €3 was perceived as a too large amount, a too large anchor that did not induce and even inhibited people to donate. In other words, we found evidence for the moderating role of priced tokens to increase compliance rates.

As the value of an exchange can 'help or hurt' depending on its price, we hypothesized in study 3 that the bundling of mere donations and fixed prices would generate similar results as the bundling of donation requests and priced tokens. In a scenario study we found data to support this prediction: the presence of a small (€0.50) or large (€3) reference price in a mere donation setting fulfilled the same, or an even better, 'anchoring' function as a small (€0.50) or large (€3) priced exchange. We interpret these findings in the context of the 'donation deal transparency': in a mere donation setting the net donation value is explicitly present, whereas the product cost in an exchange context not always is.

In sum, our studies suggest that in simple donation settings people may have difficulties in estimating a socially acceptable donation amount and therefore prefer opportunities that provide them with an anchor price. The value of a material good in a donation setting can play this anchoring role and signal a reference price. To the extent that the suggested reference price is low enough, exchange requests lead to more compliance than simple donation requests. A 'high' socially unacceptable or too large an anchor, on the contrary, may inhibit people from donating. It should be noted that our studies were not designed to rule out the exchange fiction theory of Holmes et al. (2002). In fact, our first two studies are still in line with the theory of the norm of self-interest (Miller, 1999). Still, our anchoring explanation gives an additional account for why people react positively to the sale of tokens in a donation request. Moreover, study 3 shows that, as expected by our anchoring explanation, a donation request that explicitly asks for a low amount generates more compliance than a simple donation request.

When You Can't Count On the Numbers: Corporate Fraud, Generalized Suspicion and Investment Behavior

Peter R. Darke, University of British Columbia and Florida State University
Jennifer J. Argo, University of Alberta

EXTENDED ABSTRACT

Recent frauds by Enron, Worldcom, and Tyco have had a devastating effect on the stock prices of the firms directly involved. More interesting is that these frauds seemed to have much broader effects on the stocks of companies not directly involved in the scandals. For instance, news of Tyco's fraud met with a broad sell off in the domestic stock markets (McKay 2002), and Worldcom's troubles precipitated a 4% drop in stock in international markets (Economist 2002). We examined generalized suspicion as a possible mechanism for the negative impact of fraud on stock investment. The information processing induced by such suspicions was also investigated.

Dual process theory (Chaiken and Trope 1999) proposes that judgment occurs through two qualitatively different types of information processing: 1) heuristic processing, a relatively automatic form of judgment relying on simple heuristic cues, and 2) systematic processing, which involves careful thought and integration of information when making judgments. Information processing can be motivated by a number of different goals, including accuracy and defense concerns (Chen and Chaiken 1999). Accuracy goals motivate individuals to make valid, correct, or objective judgments, whereas defense goals lead to judgments aimed at maintaining self-esteem or protecting material interests.

Prior research in the trust literature (Rotter 1971) makes a distinction between *specific trust/distrust* based on past experiences with the same information source (e.g., distrust of Enron following revelation of the fraud this firm committed), and *generalized trust/distrust* based on experiences with other, similar sources of information (e.g., distrust of other firms on the basis of Enron's misdeeds). Previous research (Petty et al. 1983) shows that specific trust can act as a simple agreement heuristic (e.g., "I should agree with the financial statements of firms that I already know and trust"), whereas specific distrust tends to increase the amount of systematic information processing that occurs, thereby improving the accuracy of judgment (Priester and Petty 1995). In contrast, generalized trust/suspicion tends to be schema-based or stereotyped, where judgments occur automatically in response to associations between the information source and trusted/distrusted groups or organizations (Kramer 1999). Consistent with this mechanism, prior research examining consumer reactions to false advertising shows that deception by one firm can automatically evoke the negative stereotype that no firms can be trusted, resulting in more negative attitudes towards unrelated second-party firms (Darke and Ritchie 2003).

Two experiments examined the prediction that fraudulent statements made by one firm would produce more negative investment decisions towards a second, unrelated firm due to generalized suspicion. The basic strategy was to expose participants to false financial statements from one firm (deception manipulation), and then examine the implications for information processing, suspicion and investment decisions towards a second, unrelated firm. The findings of both studies supported our predictions by showing that corporate deception lowered investor confidence as well as the amount of money invested in the second firm. Process analyses indicated that these effects occurred because the initial fraud induced greater distrust of the second firm. Moreover, these effects occurred automatically, in that they were not mediated by con-

scious thoughts about the second firm. Other evidence argued against negative affect as an alternative explanation for the effects of fraud on investment.

In addition, both experiments also manipulated the level of the specific trust concerning the prior reputation of the second-party firm, in order to examine whether specific trust would be effective in buffering firms from the negative effects of generalized suspicion. Accuracy-based views of trust/suspicion suggest it is reasonable to generalize suspicion from one source to another only when more diagnostic information about the trustworthiness of the second source is not available (Rotter 1971). However, other evidence suggests that individuals are not always perfectly rational when it comes to distrust (Kramer 1998). Suspicions can be exaggerated, and may be maintained despite specific information suggesting a particular source is trustworthy. Consistent with the bias view, the results of both experiments showed that specific trust did little to buffer the second-party firm from the effects of generalized suspicion. These findings fit the view that suspicion evoked a defensive bias in judgment, where investors who have been fooled once become wary of additional financial claims in order to avoid being fooled again.

Our research is consistent with the idea that corporate fraud undermines investor trust in a general sense. Generalized suspicions also proved capable of undermining reputable second-party firms, not just lesser known firms. These findings underscore the need for publically traded firms to be concerned about investment fraud, and the need to better regulate the accounting and finance industries to reduce the likelihood of similar events in the future. As suggested by Robert Shiller (2003), trust may be "[t]he market's most valuable stock."

ROUNDTABLE

Anthropomorphism and Consumer Behavior

Tina Kiesler, California State University, Northridge

Anthropomorphism is the tendency of people to make attributions of humanlike characteristics to animals and nonhuman entities. Research on humans' perceptions of pets (e.g., Hirschman 1994; Holbrook et al. 2001; Sanders 1990, 1993) and possessions (Kiesler and Kiesler 2005; Wallendorf, Belk and Heisley 1988) indicates that humans easily attribute humanlike qualities and attributions to nonhuman entities. Yet, consumer researchers have scant knowledge of the antecedents and consequences of consumers' attributions of humanlike qualities to nonhuman entities such as pets, possessions, advertised brands and brand-related characters.

Anthropomorphic creations abound in the marketplace. Engineers and product designers often mimic the human form in products such as the Koziol Pot Scrubber, the friendly face of the front of a Volkswagen Bug, and the Honda Asimo Robot. Advertisers and brand consultants often mimic the human form in their logos, such as TiVo and the Mac startup icon, as well as their nonhuman endorsers such as the Pillsbury Dough Boy and the Michelin Man. Assumptions about the effects of anthropomorphism influence strategic decision making by organizations. Consider for instance that until 2004, the Pittsburgh Zoo did not publicly name its animals, fearing the public would think of wild animals as pets or people (Fahy, 2004). The Pittsburgh Zoo assumed negative effects of anthropomorphism. However, an alternative positive effect could be an increase in potential visitors' perceived attachment to the animals and thus to the zoo and its educational mission. Clearly, a greater understanding of anthropomorphism and consumer behavior can provide insight for a wide range of applications while also contributing to our general understanding of consumer cognition.

An animated roundtable discussion among consumer researchers resulted in the following research questions ripe for further inquiry.

- *Why do people anthropomorphize?* Whether conscious or subconscious, consumers' motives may influence the likelihood of anthropomorphism, the conditions (antecedents) under which anthropomorphism is more or less likely to occur and the type and degree of the consequences of anthropomorphism.
- *What are the antecedents of anthropomorphism in a consumer context?*

- *What are the consequences of anthropomorphism in a consumer context?* Our discussion noted that consequences may be positive (such as increased attachment to an anthropomorphized entity) or negative (as might occur if one feels negative affect towards an anthropomorphized entity due to a perceived negative humanlike characteristic).

Figure 1 graphically represents the relationships among the research questions posed in the roundtable discussion and it serves as a framework for future research on anthropomorphism in a consumer context.

SPECIAL SESSION SUMMARY

Understanding Our Behavior as We Age: Effects of Memory and Time Horizons on Beliefs, Preferences, and Choices

Ian Skurnik, University of Toronto
Carolyn Yoon, University of Michigan

SESSION OVERVIEW

One of the few inevitabilities in life is that we will all grow older. Because of rising standards of living and the size of the “Baby Boom” generation, by 2040 one in four Americans will be over age sixty-five. People over 65 are already the biggest consumers of medical products and services, and the US Census Bureau estimates that as the Baby Boomers advance through retirement, they will form the wealthiest cohort in US history. It is difficult to exaggerate the importance of understanding how older adults think and make judgments as consumers.

Perhaps the single most important fact about mental function and aging is that the performance of older adults varies widely across different situations and tasks. This complex variation in performance is not well understood, but investigating it is crucial to our comprehension of older consumers’ cognition and behavior. The purpose of this special session will be to advance our knowledge of older consumers beyond the simple demonstration of cognitive deficits, and show how the mental processes and perspectives that older adults employ lead them to make judgments and preferences that are systematically different from those of their younger counterparts. This purpose highlights the conference’s general theme, “transformative consumer research,” in its focus on improving outcomes for both consumers and managers. The session includes experimental research grounded in social cognition and cognitive psychology, and also formal empirical modeling of product choice. The session should interest a diverse range of ACR attendees.

The papers in this session focus on extending our knowledge of older and younger consumers’ cognition by examining both memory and time perspective differences, including: (1) some unexpected consequences of a standard memory deficit, (2) a demonstration of the role of age-dependent time horizons on preferences for sequences, and (3) an explanation of product choice and brand loyalty across the lifespan. In the first paper, Ian Skurnik, Carolyn Yoon, and Norbert Schwarz show some unexpected “downstream” consequences of informing consumers about health issues. Older consumers show an increased “illusion of truth effect” (relative to younger adults) because they have trouble remembering the context in which they acquired information, but can still recognize the information itself with high accuracy. In this experiment, older adults read a flyer from the Centers for Disease Control (CDC) that warns people about some “myths” about the flu vaccine. The flyer is published for public education as a free service of the CDC. Shortly after reading the flyer, older adults tended to misremember flu “myths” as flu “facts.” The undesired consequence of this memory bias is that older adults who read the CDC flyer ultimately reported reduced intentions to get the flu vaccine, and felt that the flu was less dangerous, compared to older adults who read an “all-fact” version of the flyer and a third group who read no information about the flu at all.

The second paper, by Sanjay Sood, Loraine Lau-Gesk, and Aimee Drolet, focuses on the consequences of older adults’ focus on the present moment, as opposed to younger adults’ concern with the future. In their first two experiments, they show that some of the ‘gestalt’ features of sequences identified by psychologists, such as

giving extra weight to the sequence’s peak and end, may have differing influence on the judgments of older and younger people. Younger adults preferred to save the best for last when choosing a sequence of rides at Disneyland (Experiment 1) or ordering the courses of a meal (Experiment 2). In contrast, older adults consistently choose to experience the best elements of a sequence first. This age difference can be explained by socioemotional selectivity theory (Carstensen 1992), according to which older people have a more limited time horizon perspective. In other words, older people feel that their time is limited, and they choose not to postpone pleasurable or positive experiences. A third experiment expands on these results and finds that older adults are less apt to seek variety across sequential choices.

The third paper, by Raphaëlle Lambert-Pandraud and Gilles Laurent, examines perfume purchases across the lifespan. Using a large dataset of perfume purchasers in France, the authors consider the genesis of long-term brand loyalty and other patterns of preference. Perfume is a high-involvement product and is normally sold in circumstances of relatively constraint-free choice. The authors investigate two different explanations for perfume preference: (1) a nostalgia explanation, where consumers would form preferences at some critical period in life and maintain those preferences into the future, and (2) a socioemotional explanation in which a person’s relationship to a brand is built continuously over the lifespan. These explanations are formalized qualitatively through analytical models and compared to conditional logit model results to determine which explanation provides the ‘best’ fit. The results point to specific time periods in consumers’ lives reflecting the greatest sensitivity in terms of preference formation. The authors highlight the marketing implications of their findings.

EXTENDED ABSTRACTS

“Educating Older Adults About the Flu Can Reduce Their Intentions to Get a Vaccination”

Ian Skurnik, University of Toronto
Carolyn Yoon, University of Michigan
Norbert Schwarz, University of Michigan

The flu infects more than 300 million people each year, making it one of the world’s most widespread contagious diseases. In the United States alone between 20,000 and 36,000 annual deaths are attributed to influenza, with over 80% of those deaths occurring in the over-65 age category (MMWR 2003). Vaccination is the most effective measure to prevent infection and transmittal of the flu. Although vaccination programs are effective enough to reduce flu incidence by 70%-90% in healthy adults (Bridges et al., 2000), the CDC reports that at least 60% of US residents do not get vaccinated.

An important cause of these low immunization rates is incorrect beliefs about the vaccine itself. Sources of misinformation range from anti-vaccination web sites to uninformed health care workers. The near-universal response from professional medical sources is a call for educational measures that correct misconceptions about the vaccine (e.g., Nicholson et al., 2003). Following these recommendations, the US Centers for Disease Control and

prevention (CDC) published a flier about flu vaccine. The flier describes “facts and myths” about the vaccine with a short paragraph of additional information about each fact and myth. This approach rests on the reasonable assumption that warning people about false information will keep them from thinking that it is true.

However, research on component processes of memory suggests that attempts to warn people about false information can backfire and unintentionally increase people’s belief. Specifically, sometimes people can remember the basic content of a message without remembering the details of its presentation (e.g., Jacoby, 1999). When faced with this sort of incomplete memory for information, people show a marked tendency to think of the information as true (e.g., Skurnik, Yoon, Park, & Schwarz, 2005). In other words, mentioning misinformation in order to discredit it risks enhancing its perceived truth. Moreover, this effect is stronger in older adults than in younger adults because of a particular pattern of memory decline with age. Relative to younger adults, older adults show a systematic decline in memory for contextual details, but intact feelings of familiarity for information they have seen before. Hence older adults are especially likely to remember false information without remembering that it has been discredited.

We had older and younger adults read the CDC “Flu Facts and Myths” flier, and then, either immediately or after _ an hour, we tested their memory for the flier’s information and asked about their personal beliefs and intentions toward the disease and the vaccine. For comparison, other participants read an altered version of the flier that included the same information but restated the “myths” in factual form, so that no false information was presented. A third group of participants answered the questions about flu knowledge and intentions to get the vaccine without having read any flier. The experiment hence had a 2(age) X 3(flyer version) between-subjects design.

Immediately after reading the CDC Facts & Myths flyer, participants showed no truth bias in their memory of the flyer claims. However, after _ an hour, older adults tended to misremember the flyer’s myths as facts. That is, they misidentified more than 20% of the myths as facts, but misidentified only 5% of the facts as myths. Younger adults showed a similar trend in their memory for the flyer’s claims after _ an hour, but it was much less pronounced than that of the older adults.

Memory for the false claims also had implications for participants’ intentions to get flu vaccines in the upcoming flu season. Since the flu “myths” generally allege some drawback of the vaccine, belief in them should make getting a vaccine less attractive (an example is “The side effects of the vaccine are worse than the flu”). Immediately after reading either version of the flyer, people reported increased intentions to get a flu vaccine for the upcoming flu season, compared to people who didn’t read any flyer. For people who read the Facts-Only flyer, intentions were still increased after _ an hour. However, after _ an hour people who read the Facts and Myths flyer had reduced intentions to get a vaccine, and did not differ from people who had not read a flyer at all. In addition, after half an hour, people who read the Facts and Myths flyer reported the lowest perceived personal risk for catching the flu than any other group in the study, including those who read no flyer at all.

Extensions of this study are under way using information about Alzheimer’s disease and healthy diet. To summarize our findings, damaging misinformation was inadvertently supplied/reinforced by the very attempt to refute it. After a delay, the CDC flyer left older adults less likely to get a vaccine than anyone else—they were worse off than if they had not read anything about the flu. Results for the Facts-Only flier show that emphasizing what’s true,

rather than what’s false, has a much better chance of enhancing people’s correct knowledge about flu vaccine.

“Age Differences in Consumer Decision Making”

Sanjay Sood, UCLA

Loraine Lau-Gesk, UC Irvine

Aimee Drolet, UCLA

Are older consumers wiser consumers? Do consumers make better decisions as they age? Much research shows that the judgments and decisions of older consumers differ from those of younger adults. Some of these differences can be attributed to declining cognitive abilities (e.g., Hasher and Zacks 1992; John and Cole 1986), which can lead to either diminished or enhanced performance relative to younger adults (Drolet & Luce, 2003). Other age differences may be driven by older adults’ more limited time horizon perspective: younger adults tend to be more focused on the future, while older adults tend to be more present focused (Carstensen, 1992).

Taken together, the above research strongly indicates that the underlying decision processes of older adults can differ significantly from those of younger adults. Our research investigates the impact of aging on decision-making. In particular, we focus on the impact of age on consumers’ preferences for sequences of hedonic events.

Research on how people make retrospective hedonic judgments suggests that people tend to neglect the duration of an overall experience (e.g., Redelmeir and Kahneman 1996). Instead, they follow a “peak and end” rule (Fredrickson and Kahneman 1993). In making retrospective judgments, people tend to overweight the most intense hedonic moment (the “peak”) and the last hedonic moment (the “end”). Accordingly, people generally prefer sequences of events with improving trends. Put differently, people like to “save the best for last.”

Accordingly, we could expect differences in older versus younger consumers’ preferences. On one hand, older consumers may lack the mental resources needed to depart from habitual ways of making judgments, and may weight the peak and end of experiences more than, or more consistently than, younger adults do. If so, then older adults would more strongly prefer sequences with improving trends compared to younger consumers. On the other hand, older consumers may evaluate sequences of hedonic events differently because of their limited time horizon perspective. According to socioemotional selectivity theory (Carstensen 1992), older people have a more limited time horizon perspective; put informally, older people recognize that their time in this world is limited. Consequently, they are more present-focused, living more for the moment compared to younger individuals, who are more focused on the future. Older consumers might prefer not to wait and have the most preferred experience first.

We conducted three experiments. In experiment 1 ($n=200$), young (18-25) and older (65 plus) adult participants were asked to imagine they were visiting Disneyland and only had time left for three rides. They were told that the three available rides varied in terms of how much participants could expect to enjoy them: 1) It’s a Small World (“least enjoyable”); 2) Haunted Mansion (“most enjoyable”); and 3) Trolley Ride (“somewhere in the middle”). Participants were asked to order the rides so they maximized their (potential) overall pleasure. Experiment 1 finds preferences for improving sequences among younger but not older consumers. Specifically, 58% of younger consumers prefer to experience the most enjoyable ride last compared to 36% for older consumers.

Experiment 2 uses a different context to test for age-related differences in preferences for sequences. Experiment 1 used an

actual environment (Disneyland). The amount of familiarity with Disneyland may have differed among older versus younger participants. In experiment 2, older and younger participants ($n=193$) were asked to imagine they were eating at a tapas restaurant (a restaurant that serves small appetizer-like dishes). They were told they will have three dishes: an “excellent dish”, “so-so dish”, and a “not very good dish.” As in experiment 1, results shows that younger consumers are more likely to order the best option last. In addition, experiment 2 finds an effect of temporal proximity. Older consumers strongly prefer having the neutral option (“so-so dish”) come between the positive and negative options (92% vs. 75%). The older consumers prefer that the positive and negative affective events happen farther apart in time.

Results of experiments 1 and 2 imply that some of the ‘gestalt’ features of sequences identified by psychologists may have differing influence on the judgments of older people. Experiment 3 tests whether there are age-related differences in adherence to another rule that governs preferences for sequences of events. Past research shows that consumers seek variety in how they make sequential choices (Drolet 2002). Having relied on a particular heuristic to make a choice (e.g., “Buy brand name”), consumers tend to rely on that particular heuristic less in later choice. Experiment 3 tests for differences in inherent rule variability due to age.

In experiment 3, older and younger participants ($n=400$) were randomly assigned to one of four groups. Two groups were asked to make a choice in a background set that favored choice of the lower price option, either fax machine (Hewlett Packard \$249 or Lexmark \$149) or pine cleaner (Pine Sol \$4.59 or private label \$3.69). Two other groups were asked to make a choice in a background set that favored choice of the higher quality option, either TV (Sony \$389 or Sharp \$299) or cereal (Kellogg’s \$5.49 or private label \$3.89). All four groups made their second choice in the same (target) set, Mexican restaurant (4 stars \$27 or 2.5 stars \$16). Results show that younger consumers were more likely to vary rule use across choices. In the lower price sets, there were no differences in choice of the lower price option by age group (young=75%; old=78%). However, in the second set, younger consumers were much more likely to choose the expensive Mexican restaurant (young=65%; old=39%). In the higher quality sets, there was no significant difference in choice of the higher price option by age group (young=42%; old=36%). Again, younger consumers showed a greater tendency to vary rule use across the sequence of choices. They preferred the cheaper restaurant more (57%) compared to the older consumers (46%).

“Modeling Long-Term Determinants of Brand Choice by Older Consumers”

*Raphaëlle Lambert-Pandraud, Négocia
Gilles Laurent, HEC School of Management*

Previous studies have shown that older consumers tend to prefer long-known items: older movie stars, older car styles, older music forms, and also long-established brands. Several theoretical perspectives have been proposed to explain this phenomenon, such as nostalgia, socioemotional selectivity, and declining innovativeness of older consumers. While these perspectives all predict that older persons should have a higher probability of choosing long-known items, they predict different patterns of preference change across ages. For example, a nostalgia explanation would argue that preferences are acquired during a sensitive period (late adolescence, early adulthood) and remain present in later life. In contrast, socioemotional selectivity theory suggests that the affective relationship of a person to a product or brand is built continuously over all the years of that person’s life, rather than

only on the basis of an early sensitive period. In this research, we test these theoretical perspectives by comparing their predictions to actual patterns of preferences by consumers of different ages for products introduced at different dates.

Our empirical application concerns perfume choice for several reasons. First, perfume is a high involvement product. Second, it is a product for which each store typically carries a very complete selection, thus allowing consumers a constraint-free choice (in contrast to a product like cars, for which each dealer typically carries only a few brands, often a single one). Further, it is one of the very few categories in which products remain in their exact initial form as long as they are sold: same name, same formula, same bottle (in contrast to cars, for which brand names remain, but models change regularly). Some of today’s successful perfumes were introduced, in the same form, more than eighty years ago. Our empirical work is based on a large mail survey, performed in 2002 in France, describing the perfume choices of 148,537 female users of perfume, aged 19 to 103.

Comparative analysis of the theoretical perspectives comprised two steps: qualitative and quantitative. In the qualitative step, we built simple analytical models of consumer preference based on each theoretical perspective. For example, the analytical model based on the nostalgia explanation assumes that the attractiveness of a perfume, for a person of a given age, depends on whether the perfume appeared when the person was in the sensitive period described above. Thus, attractiveness would be at a maximum if the perfume appeared when the consumer was between 15 and 25, and at a minimum if not (with some smooth transition between the two levels). In contrast, the analytical model based on the socioemotional selectivity perspective assumes that the attractiveness of a perfume, for a person of a given age, depends on the number of years during which the person has known the perfume (i.e., number of years during which the perfume was available in the market since the person turned 15). Thus, a perfume introduced 60 years ago has been known for 60 years by a 80-year old consumer, but for only 0 years by a 25-year old consumer, and its attractiveness is assumed to be six times higher for the first person. In contrast, a perfume introduced 10 years ago should have the same attractiveness for both consumers, since both have known it for 10 years. In our analytical models, the predicted share of choices, for a given perfume, or for a group of perfumes, is simply equal to its attractiveness, divided by the summed attractiveness of all the competing perfumes. Following the tradition of analytical models, we perform our tests on a simplified, aggregate data set, in which perfumes are clustered according to their launch date: before 1962, 1962 to 1991, and after 1991. We analyze how the relative shares of these three groups change as a function of consumer age, for each of the analytical models. We then compare the *qualitative* patterns of these changes to those observed in empirical data. For example, are there smooth changes in perfume choices over age, or are the changes occurring mostly on certain age periods? In the latter case, what are the key ages? What are the orders of magnitude of the predicted changes? What are the predicted shares for typical groups of consumers defined by their age—e.g., 80 or 25 years? On the basis of these qualitative pattern comparisons, we assess the different theoretical approaches by testing whether the analytical model based on nostalgia fits better than the one based on a socioemotional selectivity explanation.

The quantitative step of the assessment uses a conditional logit model. In this statistical model, the choice probability of a given perfume (or group of perfumes) is computed in the same manner as in the qualitative approach— its attractiveness divided by the summed attractiveness of the competitors. The differences com-

pared to the previous step are that we use a more detailed data set (perfumes are aggregated in more groups, each group being defined by a narrower set of introduction dates), and that we rely on formal maximum likelihood tests to compare the predictive power of the different theoretical approaches. Also, we analyze the results of combining several theoretical approaches in the same statistical estimation: Is it worthwhile to include both a socioemotional selectivity component and a nostalgia component in the same model?

The implications of our results are important from a theoretical point of view. The large scale of our dataset, and the specific characteristics of the perfume market described above, allow us to make differentiated predictions for the different theoretical approaches, and to assess their relative predictive power. Managerial implications are equally important, as we assess whether the preference for a perfume is mostly acquired during an early sensitive period, or whether this preferences is accumulated over all the years of a consumer's lifetime, and therefore can be acquired or reinforced subsequent to one's sensitive period.

A Bite to Whet the Reward Appetite: Influence of Sampling on Appetitive Behaviors

Monica Wadhwa, Stanford University

Baba Shiv, Stanford University

Stephen Nowlis, Arizona State University

EXTENDED ABSTRACT

Sampling programs are an important element of the promotion mix, particularly in the food and beverages categories. Sampling has many benefits including the ability to change a product's image or introducing a new product in the market. However, a dilemma retailers commonly face is that though sampling is an effective marketing tool, sampling food and beverage items at retail outlets can also make the consumer less hungry or thirsty, which could potentially reduce sale of items in these categories and, thereby, shrink the size of the market basket. This research argues that sampling a food item or a drink, rather than satiating the consumer can actually work as a reward cue and potentiate appetite for more drink or food as effectively as an increase in a physiological need of hunger or thirst. In other words, one bite of food or a quaff of drink can lead to intensification of hunger or thirst in an individual who moments ago was not thinking of dinner or consuming a drink. As the French expression puts it, "l'appétite vient en mangeant" loosely translated as appetite comes with eating. If this is true then consumers ought to buy more food and/or beverage items after sampling a food item or a drink in the store environment.

The above thesis is in line with research conducted on drive states and reward cues. For example Cornell et al (1989) in their study find that human subjects who were fed to satiety, if asked to take a bite of either pizza or ice cream subsequently chose to eat more of the foods they had just eaten. Their study, therefore, proposes that eating a food item can increase the subsequent consumption of the same food item. Further, in Winkielman and Berridge's research presenting individuals with smiling faces led to an increase in consumption of lemon-lime beverage. In other words, smiling faces acted as a reward cue, thereby, activating a general reward system leading to an increase in subsequent consumption of the drink. Moreover, a body of research in alcohol addiction demonstrates presenting an individual with a conditioned reward cue can lead to the activation of a general reward system causing individuals to seek anything rewarding. For example, Kambouropoulos and Staiger (2001) in their study show that presenting individuals with a reward cue such as a Beer can and a beer glass activated a general reward system making them more engaged in appetitive behaviors such as making money in a subsequent task.

Drawing upon research on reward cues and drive states, we propose that sampling a morsel of food or a quaff of a drink high in affective quality is likely to trigger a general reward system that will not only increase consumption of a drink in the subsequent task but will make individuals seek anything rewarding. Moreover, we predict that this effect should be stronger for individuals high on reward seeking behavior. In other words, individuals overactive on the Behavioral Activation Scale (BAS) should be more sensitive to the reward cues than those low on the BAS.

To test the above mentioned hypotheses, we randomly assigned subjects to either a reward cue condition or a control condition. In the reward cue condition participants sampled Hawaiian punch (presented to participants in the guise of a new sports drink), while those in the control condition consumed nothing. Subsequent to sampling the drink, participants moved to an adjoining room where they evaluated several rewarding and non

rewarding items in both food and non food categories. Participants then viewed a documentary purportedly part of a main study conducted for TiVo. They were served Pepsi while they watched the video. To disguise the purpose of the study, subjects were told that TiVo had given free Pepsi to be served to them.

Consistent with our expectations experiment 1 results indicate that a brief taste of Hawaiian Punch not only enhanced subsequent consumption of Pepsi but also prompted the activation of a general reward system. To elaborate, subjects who had tasted Hawaiian Punch consumed significantly more amount of Pepsi than those in the control condition. Further, subjects in the reward cue condition evaluated the rewarding items such as an exquisite spa, vacation in Bora Bora, \$5 off on batteries etc significantly higher in the subsequent task of product evaluations than those in the control condition. These effects were moderated by the personality variable, Behavioral Activation System, such that individuals high on BAS were more sensitive to external incentive stimulus (Hawaiian Punch) than those low on the BAS.

Our proposition thus far is that presenting a reward cue high in affective quality can lead to activation of a general reward system making individuals seek anything rewarding. If this is true, then satiating the reward drive prior to the consumption of Pepsi ought to attenuate the effects found in experiment 1. This proposition was supported in experiment 2. Consistent with our proposition, participants in the high affective quality cue (milk chocolate) condition consumed significantly more amount of Pepsi than those in the low affective quality cue (soy chocolate) condition who were not different from control condition in the pattern of drinking. This effect was moderated by reward satiation. In other words, subjects in the high affective quality-non reward satiation condition consumed significantly more amount of Pepsi than those in the high affective quality-reward satiation condition. Thus, presenting a dollar bill after the sampling task but before the subsequent consumption task, satiated the reward drive thereby reducing the drive to seek anything rewarding in the subsequent task.

In sum, our findings suggest that affective quality of an external cue such as a quaff of Hawaiian Punch or a bite of milk chocolate can trigger a general reward system, the appetitive potentiation effects of which can carry over to the subsequent task leading individuals to seek anything rewarding. Our findings have important implications for the marketers. These results suggest that sampling a food item or drink in a grocery store is not only likely to increase the purchase of food and beverage items but also other rewarding items such as items on sale.

“You’re A Wizard, Harry!”

Consumer Response to the Harry Potter Phenomenon

Stephen Brown, University of Ulster
Anthony Patterson, University of Liverpool

ABSTRACT

Harry Potter is one of the most overwhelming consumer tsunamis of recent years. Less than a decade ago, the boy wizard’s creator was an anonymous single mom on welfare. Today, J.K. Rowling presides over a \$4 billion marketing empire and is one of the most famous faces on the planet. This paper examines consumer responses to the fashion for all things Potter. It argues that far from being trivial, as some suppose, fads are typical of today’s Entertainment Economy. If transformative consumer research is our aim, Harry Potteresque phenomena need to be better understood.

FAN OF TEEN FABLES

An indigent author writes a compelling story about an eleven-year-old orphan with wayward hair and distinctive features, who is transported to another place, finds it difficult to fit in and, after getting into all sorts of intriguing scrapes, eventually learns to do the right thing. The indigent author’s manuscript, however, is rejected by numerous publishing houses, which see no market for the quirky tale. She is on the point of giving up and returning to her hardscrabble job as a schoolteacher, but on a whim, decides to try one last publisher. The manuscript is accepted, published in a limited edition and, miraculously, becomes an enormous hit. The indigent author follows up with sequel after sequel after sequel and a storybook franchise is born.

Familiar as it is, this rags-to-riches tale of literary good fortune is not the heart-warming story of J.K. Rowling and the Harry Potter phenomenon. It is the tale of L.M. Montgomery, an impecunious inhabitant of Prince Edward Island whose classic children’s story, *Anne of Green Gables*, was published in 1908 to huge popularity, instant acclaim and not a little criticism (Barrett 1997). It is a story that spawned six successful sequels, all of which have been filmed, televised, merchandised and variously recycled in the century since *Anne of Green Gables* was written (Gammel 2002).

Montgomery’s story, nevertheless, is almost identical to that of Joanne Rowling’s (even down to the six sequels), who published her first Harry Potter novel in 1997 and saw her creation grow, like Topsy, as the episodes rolled off the Rowling production line (Smith 2001). More pertinently perhaps, Montgomery’s story reminds us that Anne/Harry-style fads are—and long have been—an important aspect of consumer culture (Berger 2000). From the bicycle craze of the late-nineteenth century, through the crossword puzzle mania of the 1920s, to the Pet Rock phenomenon of the 1970s, consumer fads are always with us (Thorne 1992). Individually, they may be here today and gone tomorrow, but collectively fads are as dependable as Old Faithful. They are the geysers of western capitalism. Another is certain to erupt before long and evaporate equally quickly.

Despite their ubiquity in domains as diverse as medicine, politics, fashion, sport, music, pastimes and academia (Hoffman and Bailey 1992), fads are unloved by mainstream marketing and consumer researchers. They are regarded as unpredictable, uncontrollable and infuriatingly short-lived (Kotler 2000; Solomon 2002). There is, admittedly, a definitional difficulty with fads: What exactly is a fad? What are its distinguishing features? What, if anything, are the differences between fads and fashions, let alone crazes and manias? How long does a fad have to last before it

becomes a trend or indeed a classic? Be that as it may, there is no doubt that the word “fad” carries pejorative connotations, particularly when it’s combined with the word “management.” Management fads like *kaizen*, re-engineering and TQM are universally disdained, though that doesn’t prevent their proliferation (Furnham 2004).

In fairness, not everyone regards fads as regressive. The ample fan community literature reveals the strength of consumer bonds that congeal around crazes like *Star Trek*, Beanie Babies, Blackberries, iPods et al (Hills 2002). Brand communities, most studies agree, are knowledgeable, proprietorial, opinionated, disputatious, committed and, actively encouraged by far-sighted corporate executives, increasingly involved in the co-creation of brand meaning (e.g. Fournier 1998; Holt 2002; Kozinets 2001; McAlexander et al 2002; Muniz and O’Guinn 2001). Set against this, of course, they are somewhat atypical. By their very nature, brand fans are unusually dedicated to the object of their veneration, be it Elvis or ET. They are the keepers of the fad flame. They continue to tend it long after the craze has died down and the next big thing’s all the rage. It follows that the picture presented by the burgeoning brandfan literature is incomplete. It also follows that, if we are to better understand the nature of fads, the feelings of less committed fans and, moreover, non-fans must be investigated.

The present paper attempts to increase our understanding of “fadology.” It does so by means of a qualitative study of the Harry Potter phenomenon, a staggeringly successful consumer craze that erupted at the turn of the millennium and is still going strong. The paper begins with a brief outline of Harry Potter mania, continues with an overview of our research program, turns to a summary of the findings, and concludes with some thoughts on the nature of fads.

BRANDACADABRA

Harry Potter is one of the most astonishing marketing tsunamis of recent years (Blake 2002). So much so, that surely there can’t be a single person anywhere who hasn’t heard of Harry Potter and the best selling books that bear his name. A scarred and orphaned schoolboy, who is maltreated by his stepparents, bullied by his stepbrother and discovers on his eleventh birthday that he possesses magical powers, Harry Potter is whisked off to Hogwarts School of Witchcraft and Wizardry, where he studies the magical curriculum, learns that an enchanted world co-exists alongside the everyday world of non-magical Muggles, makes friends with fellow pupils Hermione Granger and Ron Weasley, spends many a happy hour playing Quidditch, a kind of airborne basketball, and, not least, battles against the evil Lord Voldemort, who killed his parents, tried and failed to kill Harry too, and is determined to take over the wizarding world by hook, crook, curse, hex and analogous nefarious means (Rowling 1997, 1998, 1999, 2000, 2003).

To date, six books in the seven-book series have been published and approximately 300 million copies have been sold worldwide (Brown 2002). This places Potter third in the all-time bestsellers list, after *The Bible* (2.5 billion copies sold) and *The Thoughts of Chairman Mao* (800 million). In addition to the books themselves, the first three HP adventures have been made into live-action movies by Warner Bros, earning some \$1.6 billion at the global box office and a further \$750 million in DVD, video and television

licensing sales. More than 400 items of tie-in merchandise are also available, everything from candy and key rings to computer games and glow-in-the-dark glasses (Beahm 2004). It is estimated that the brand is worth \$1 billion per annum and that J.K. Rowling is a (dollar) billionaire. She is 6th on *Forbes'* roll-call of female business leaders, 5th on *Entertainment Weekly's* inventory of movers and shakers, and was runner-up to George W. Bush as *Time's* "Person of the Year, 2000." Not bad for someone who was a poverty-stricken single mom, living on welfare in an unheated Edinburgh apartment, less than a decade ago (Gupta 2003).

Staggering as the sales figures are, the Harry Potter phenomenon goes way, way beyond the bottom line. The entire children's book sector has been invigorated by the teenage mage, as countless identikit novels attest. Innumerable parings, parodies and pastiches of Harry Potter have also been published, including two pseudonymous books by J.K. Rowling herself. Boarding schools report significant increases in applications, both in Britain and France; EFL teachers claim that the HP texts are ideal workbooks for those wishing to improve their grasp of the mother tongue, as do parents of children with learning difficulties; owls are proving increasingly popular as household pets, much to the dismay of Animal Rights activists who have triggered a to-whit to-do about consumers' inability to care for the often-irascible creatures; the locations used in the movies are proving popular with tourists, though some sites have been chastised by Warner Brothers' legal department for advertising the connection; and signed first editions are fetching \$50,000 plus on the rare books market. As celebrity booksout Rick Gekoski (2004, p. 223) notes with dismay, "For that price, for God's sake, you could buy a pretty good collection of W.B. Yeats, or Conrad, or D.H. Lawrence."

Pottermania, in short, is escaping the economic base and colonizing the cultural superstructure. Consumer culture especially. Cyberspace, for instance, is chock-a-block with tribute websites such as mugglenet.com, hpana.com and hp-lexicon.org. Dedicated chatrooms, newsgroups and weblogs dissect every tidbit of Pottertrivia, including the latest scuttlebutt from the movie sets and interminable speculation about narrative twists and turns to come. No less than 64,000 fan fictions—that is, *entire* HP "novels" written by aficionados using Rowling's characters, settings, etc—are currently posted on the foremost clearing house for this so-called "fanon." At least three fan fayres have been organized thus far (in Orlando, Salem and Reading), academic interest is increasing exponentially (the principal HP database lists more than 500 scholarly publications) and the Potter lexicon of "muggles," "quidditch," "slytherin," et al has not only been inducted into dictionaries but is part and parcel of popular parlance.

HOCUS POCUS GROUPS

Needless to say, the latter-day Potterquake has attracted the attention of numerous marketing and consumer researchers. The book tracking consultants, NDP Group, regularly publish opinion polls on the phenomenon. A 2001 questionnaire survey of 1,511 respondents, for example, revealed that 60% of American teenagers are favorably disposed toward Harry Potter, with 25% of adults feeling the same way (see Gupta 2003). In Britain, there is a much-cited statistic to the effect that 50% of UK households own at least one Harry Potter novel (Blake 2002). The rest of the world is equally besotted, according to the *Guardian* newspaper, which compiled a "Potter Potty Index" of the boy wizard's global impact. Apparently, Australia, Germany, Japan and China are most entranced by Harry's adventures, with Mexico, India and Indonesia not far behind (*Guardian* 2002).

In addition to the quantitative facts and figures, the qualitative side of the Harry Potter fad has also been explored. Rebecca Borah

(2002) has surfed the highways and byways of the world wide web, conversing with Potterphiles, Weasleymanes and Graingerphagites. From her analysis of message board postings, she calculates that two-thirds of Potter posters are under the age of 18, with most falling between 12 and 16. Of the 12-16 subgroup, approximately two-thirds are female, though male participation is much greater in movie-related message boards. Borah followed up with email interviews of twenty teenage consumers and found that most had been introduced to Harry by a friend or relative, many had participated in school activities pertaining to Potter, around half had made objects inspired by the books, such as wands, artwork or costumes, and the majority are keen to acquire official Warner Brothers merchandise. However, her interviewees are by no means Pottermonogamous, since Pokemon cards, favorite TV characters, and pop band fandom also figured prominently in the discussions. Far from being brand loyal, teenage consumers are quite profligate with their preferences. Harry Potter may be the crack cocaine of kiddy culture—to put it crudely—but the boy wizard is only one among many brand-name intoxicants.

Above and beyond her analyses of adolescents, Borah (2002) interviewed ten adult Potterites. Although most are unashamed of their enthusiasm for products targeted primarily at teenagers, their fanaticism is more subdued. They only attend fan activities—theme parties, Potter bees, collector fayres, book launch events, etc.—when accompanied by a child or several. They wouldn't dream of wearing a Harry Potter T-shirt, which is too uncool for words, and worry about Warner's meretricious merchandising of Rowling's well-told tales. That said, they love chatting to fellow adult initiates of the Harry Potter "club."

Fascinating though her findings are, Borah's research predates the deluge of movie tie-in merchandise, as well as the three-year hiatus between books four and five. It fails to give a complete picture, furthermore. The problem with studies of Harry Potter fan communities, or any self-selected enthusiasts, is that they are somewhat atypical. As only the most obsessive Potterites are prepared to write *entire novels* about his ongoing adventures, let alone build and maintain dedicated websites, their views hardly reflect those of the average consumer.

In order, therefore, to deepen our understanding of the HP phenomenon—and consumer fads in general—a three-stage program of qualitative research is being undertaken by the authors. These stages comprise analyses of adults', schoolchildren's and college students' feelings about brand Harry Potter, the first phase of which is considered herein. Twenty-one adults—seven male, fourteen female, some fans, some phobes, ranging in age from 20 to 45—were asked to write individual "introspective essays" on the Harry Potter phenomenon. No restrictions were placed on essay length or what was considered an acceptable or unacceptable response. They were simply required to reflect on and write about their feelings (positive, negative or otherwise) concerning the Harry Potter brand in all its manifold manifestations (books, movies, merchandise, websites, whatever). Although introspective approaches, broadly defined, have been debated at length in the consumer research literature (e.g. Mick 2005), the evidence suggests that, once their initial apprehensions are overcome, informants find the introspective essay writing experience quite enjoyable. Revelatory even. The results, certainly, seem to bear this out, inasmuch as the individual introspective essays ranged from 2,500 to 6,000 words, which compares well with analogous consumer research techniques. While no one would claim that introspection is better than established qualitative procedures, such as focus groups, depth interviews, ethnography and so forth, it is a methodology that is well suited to story-based brands like Harry Potter (Haig 2004).

RIDDLE ME RESULTS

As might be expected, just about every one of our essayists has heard of Harry Potter and has some familiarity with the Harry Potter phenomenon. Let's be honest, the boy wizard's impossible to avoid, though that hasn't stopped people from trying. The idolization of Harry Potter, interestingly enough, is very off-putting for many consumers. His popularity with some makes him unpopular with others. They are determined to resist his bewitching blandishments at all costs. They pride themselves on not being taken in:

The crazy over-the-top media frenzy surrounding the whole phenomenon acts as a barrier preventing me from taking the bold step of reading a Harry Potter book or watching any of the films... Even if I was to sit down and watch one of the movies any enjoyment would be tarnished by the continual feeling that this is a box-office hit, adored by millions and a regular feature in *The Sun* newspaper... I think I have this attitude simply because I'm generally a person who doesn't like to conform with popular opinion. It's more fun to be different.

(David B.)

They also hate Harry Potter devotees, with their knowing smiles, secret language and embarrassing enthusiasm:

It's just gone Halloween and the number of fake Harry Potters and Hermiones I saw on a night out was crazy. Big fat women trying to fool themselves that they look good dressed as Hermione when all they look like is a man in drag, bad drag at that! I don't know who they are trying to kid but the only guys that seemed to be attracted to them were Harry Potter wannabes. Where did all these people come from? All these people who think dressing up as school kids is a turn-on! Surely this is verging on perversion.

(Kim P.)

These perceived barriers to entry, furthermore, are reinforced by incessant peer pressure. Everyone knows someone who suffers from Pottermania—a parent, a cousin, a friend—and the evangelist is determined to spread the good word, which further alienates the agnostics. While one hesitates to call this bullying, it's a lot closer to Dudley Dursley than J.K. Rowling and Co might imagine:

I like to think that I have managed to remain neutral about Harry Potter, but because I am not a devout fan this can be very testing. It's a bit like Christianity. Harry Potter lovers feel that they must spread the message of the 'good book'. They automatically make a dash for non-believers with the aim of saving them from their non-Harry Potter ways.

(Gemma A.)

That said, peer pressure works both ways. Individuals who are intrigued by the Harry Potter phenomenon and would quite like to check it out, if only to satisfy their curiosity, sometimes find themselves stymied by anti-Potter types, such as knuckle-dragging boyfriends or mega-macho companions, who refuse to embarrass themselves by association:

I had reckoned without my beloved partner. Even though we have gone to see shows like *Monsters Inc* and *Toy Story*, and even though he actually owns copies of both *Lion King* movies, he point blank refused to go and see Harry Potter. I personally considered this very unfair, since I had sacrificed many a Friday night watching horror films (which I hate) and war films (which I pretend to hate, but usually quite enjoy).

But no, there was no budging him, and sad as I was, I had no intentions of going to see it on my own. So, it was a long wait for the film to come out on video.

(Eleanor Mc)

Embarrassment, in truth, is an emotion that figures prominently in the stories told by adult consumers. As often as not, it's the embarrassment of buying, or borrowing, or being seen reading a children's book. Or, alternatively, being caught attending a kid's movie that has none of the multi-level appeal of, say, *Shrek* or *Toy Story* or *Shark Tale*, with their jokes-just-for-adults dimension. However, it's also the adolescent antics of adult Harry Potter fans that many non-devotees find bizarre at best and bananas at worst:

One of the most fascinating aspects of Harry Potter mania is that many of the fans appear to be adults. From someone who hasn't read any of the books, watched an entire film or bought any merchandise, maybe I'm not the best person to pass judgment. However, Harry Potter strikes me as something that's written for kids—as evidenced by the various merchandise available aimed at young people. Despite this, I've found that a number of people my own age are big fans of the movies and to a slightly lesser extent the books. Only the other day, I saw a young woman, in her early twenties, wearing a Harry Potter T-shirt. What is wrong with these people?

(David B.)

At the same time, people are occasionally embarrassed into Potter participation, as in the following anecdote:

Let me set the scene: it was the summer of 2003, a long hot summer where I was bored out of my head. [My boyfriend's] sister had just bought the fifth book and we were all talking about it over dinner one Sunday. I tried to keep out of the conversation as much as possible as I didn't know a thing about the books and these people were obviously avid fans, to the point of arguing about it over Christmas. No matter how much I tried to keep quiet I was uncovered as a Harry Potter virgin when I was asked who my favorite character was. The only character I knew was Harry Potter and I think they were looking for some more in-depth answer than that. So I had to confess that I had not read even one page out of the Harry Potter books, never mind have a favorite character!! Oh the look of shame!

(Kim P.)

Mortification notwithstanding, and regardless of how individuals get press-ganged into Potterphilia, the fact remains that when people *do* fall for Harry Potter they fall big. They have the zeal of the newly converted. They refuse to let minor inconveniences, like being on honeymoon, get in the way of their obsession:

In April this year, my girlfriend had just become my wife and we were about to set off on honeymoon. We had an hour or two to kill in Gatwick and I did some last minute panic buying for some holiday reading... I decided to buy the first two Harry Potter books, the *Philosopher's Stone* and the *Chamber of Secrets*. I have got to say I was something of a Harry Potter virgin, that is to say I had never read anything by JK Rowling, hadn't seen the films or knowingly bought any affiliated wands or broomsticks. I was however only too aware of the publicity surrounding the books and who the author was, as well as some of the characters... When I got down to reading, I felt the books were brilliant. I could really see how the books

appealed to adults and children alike. Needless to say that my new page turning obsession did not go down too well with my new life partner. When on our first night in the Maldives and expecting some form of conjugal rites found herself in second place to a fictional 11-year-old trainee wizard and something called the Sorting Hat.

(Keith T.)

Even those who hate Harry Potter with a vengeance find that their temper is tempered when they are required to read the books or watch the movies. They may not like the boy wizard—and like his admirers even less—but at least they understand why the fans feel the way they do:

Watching the film provided me with a glimpse of why so many older people worship Harry Potter. On one hand it may be the idea that takes them back to their childhood days. I can relate to this theory. On the other hand it may be that it takes them away from the mundane reality of their own lives. As you get older it gets increasingly harder to have fun. Worries about the mortgage, worries about the kids, worries about the kids having kids, and so on. So for those few brief moments I realized that perhaps it wasn't just a stupid childish fad, it had a real offering for the older generation too.

(Richard H.)

Now, this doesn't mean that once consumers take a hit of Hogwarts they are hopelessly addicted and thereafter hang on Rowling's every word. On the contrary, most consumers are self-conscious about their fixation—especially those who have been Pottermanes from day one—and are actually quite relieved to discover that there are people much more obsessed than them. I'm sad, as it were, but not *that* sad!

Although I would be loath to admit it in polite company, I am a Harry Potter fan, and probably always will be. I'm not sure what it is about the books, but I have a feeling that I will eventually get round to collecting all the hardbacks, like I had originally planned. By the time the last book came out, maybe I had gotten wise to the marketing ploys of the publishers. Even though the hype was at fever pitch, it didn't really get through to me at all. I did buy it, and I have read and enjoyed it as much as the others, but I certainly didn't queue outside Eason's from 12 midnight.

(Eleanor Mc)

Other enthusiasts adopt a kind of wry detachment from the whole thing. Yes, they love the books. Yes, they rush out and see the movies. Yes, they buy the DVDs and some other bits and pieces. But let's not get carried away. It's only a bit of fun, after all:

I've become a Harry Potter junkie. I need my fixes to keep me spellbound. Aaarrggghhh!!! There are a few things that annoy me though—the names of the characters, a lot of them end in 'ius' or similar, such as Cornelius, Albus, Lucius, Sirius (seriously now, come on), Severus (cut me some slack), Bartimus (Simpsonus) and so on... There's another thing that annoys me, the not naming of people and things, it's like *The Village*, the 'you-know-what' and 'those-we-don't-speak-of' and 'the-place-we-don't-go'. Crap, crap, crap. Name them—Voldemort—it is a bit hard to say and I admit it took ME several times to get it right. But now I'm a wizard at it.

(Daria C.)

Some customers, similarly, appropriate the product and take it to places that Warner Brothers didn't anticipate:

All the Harry Potter novels have provided many a laugh for me but some have spilled over into my social life. After a crowd of my mates and I went to watch the first movie it is not uncommon for the following phrase to be shouted out randomly on a night out. 'You're a wizard, Harry!' may seem a bit strange to onlookers but believe me it is bound to have us in stitches. And of course it is a lot funnier when you are drunk!

(Kim P.)

Many consumers, in short, are quite proprietorial about Harry Potter. They feel a very strong sense of ownership. Personal friendship, near enough. As such, they are contemptuously dismissive about certain parts of the movie adaptations:

The saying goes that the books are much better than the films and in my view this is certainly true. I can't believe [*Chamber of Secrets*] left out the hilarious picture of the Weasleys degnoming their garden. The film does not match the vivid and detailed descriptions that I have conjured up when reading the book. I imagine Gilderoy Lockheart (sic) with long blonde flowing locks that he is constantly flicking back. As orange as Dale Winton and just as camp. The book leads me to think he is much more pompous and exaggerated than in the film. The film was a great let down of the character I had built up.

(Gemma A.)

The books aren't immune, either. Quite a few feel that the fifth volume wasn't up to scratch (a view, incidentally, shared by lots in the fanfiction community, who aren't reluctant to excise *Phoenix* from "the canon") and worry whether Rowling will continue to do justice to her creation now that the series is reaching its climax and the whole world is wild about Harry:

The build up to the fifth book was immense, it was the longest book but in my opinion very disappointing... How could this woman who has written four such wonderful books ruin it all with her latest release? I was looking forward to continuing the Harry Potter 'experience' but for me the fifth book ruined it... I just hope that the sixth book proves me wrong. Could Rowling really start to go downhill? Did she reach her peak? I hope not.

(Susan Mc.)

Ex-enthusiasts, furthermore, feel that the phenomenon is rapidly running out of steam, that it has become too popular for its own good, that it is being milked dry and merchandised to death. Thus, when Rowling announces that another character's about to die—yawn—the news is interpreted not as an intriguing HP come-on but as a sign that the series is on the skids. Sensationalist sales tactics are a cry for help, don't you know:

When I was driving into town the other week the news came on and hey guess what? Yes, that's right, one of the articles of news was about how J.K. Rowling had stated that she was going to kill off a character in her new book. This got me thinking. My initial reaction was not one of excitement or who will it be, but a very negative 'this is just a publicity stunt'. I thought 'Is Harry slowly dying and was this just a clever PR stunt to help revive Harry Potter?' I think so. I suppose if I was a true Harry Potter fan (which I can assure you I never will be) I would be ecstatic. But I think this is because I have watched

as the media and companies drown Harry Potter out and have made me sick to the back teeth of Harry Potter...I simply do not give a gryffindor about Harry Potter in my everyday life. My life is too busy to care about Harry Potter and what J.K. Rowling wants to do next. I simply have no interest.

(Laura O'K.)

Harry isn't history yet. But he's heading that way...

I CAN'T BELIEVE IT'S NOT POTTER

Obviously, too much shouldn't be inferred from a single case study, even a case study as impactful as Harry Potter. However, if the Harry Potter phenomenon is emblematic of the ever-burgeoning Entertainment Economy (Wolf 1999), then extracting a few concluding lessons may be helpful, if only as an indicator of future research possibilities. The first of these concerns the dialectical character of consumer crazes. That is to say, crazes call forth consumer resistance, they repel as well as attract. For every curious consumer who wonders what all the fuss is about, many more seem determined to stand aloof by refusing to get dragged in. The bigger the fad, we suspect, the more virulent the resistance and the more virulent the resistance the more convinced true believers become. Certainly, the copious attacks on Harry Potter from concerned parents, Christian fundamentalists and condescending literary critics have helped further the phenomenon (Weiner 2003). Fads, as Gladwell (2000) notes, need fans, enthusiasts who are willing to spread the word, but our HP evidence suggests fads need phobes as well.

Another intriguing issue pertains to the fan acquisition process. The idea that consumers follow a preordained HP progression—what economists term path dependency—which starts with the books, continues with the movies and culminates with the merchandise is completely at odds with reality. Some are drawn in by the movies, others by watching the videos, others by catching a trailer, others by encounters with the tie-ins (being asked to buy a present for someone), others by a family connection (reading bedtime stories to a nephew), others by gifts or prizes or sales promotions (free tickets to a premiere courtesy of Coca-Cola), others by the phenomenon itself (what's all the fuss about?) and yet others by default (there's nothing else to read). Harry Potter is a brand smorgasbord. People pick and mix. Some pile their plates high, others are content to nibble. Many suck it and see. Brand fans are not an undifferentiated mass of wide-eyed enthusiasts.

A third, if somewhat mundane, issue is the definitional and research problematics that studying Harry Potter entails. What exactly is a fad? How does it differ from a craze, if at all? Is Potter a fad or a craze or something else entirely? Where do marketers, PR types and the media generally fit into the picture? Do they control or channel fads or simply hang on to their consumer-driven coattails? To what extent is contemporary consumer fandom an artifact of the Internet and how does this form of communication shape the trajectory—indeed longevity—of fads? Will, for example, the Harry Potter books be remembered 100 years from now, thanks to their eternal interment in a cyber sarcophagus, or will Rowling's fame fade like that of her equally successful predecessor, L.M. Montgomery?

The fourth lesson relates to the final phase of the fad life cycle. Conventional wisdom maintains that popularity kills a fad (Gladwell 2000). Once everyone is into it—sporting the hairstyle, singing the song, using the catchphrase, reading the book—the early adopters move on to something newer, cooler, obscurer, whatever. The 64,000 Galleon question, however, is how do we know when the point of departure is reached? Our Harry Potter study suggests that *marketing itself* is the signal. When brand enthusiasts start com-

plaining about too much marketing, excessive exploitation, undue commercialization and so on, the writing is on the wall for the fad concerned. Crazes come wrapped in an authentic, grass-roots, word-of-mouth accrued aura and once this aura is damaged through marketer reproduction—Walter Benjamin (1973) style—commodification can't be far away, collapse is imminent, the end is nigh.

What Do They Say About “Friends”?

Jyh-Shen Chiou, National Chengchi University
Jasi Lee, Proctor & Gamble

EXTENDED ABSTRACT

The virtual community is a cyberspace supported by computer-based information technology, which centers on the communication and interaction of participants to generate member-driven content, resulting in the establishment of relationships (Hagel and Armstrong 1997; Lee et al. 2003). These days, people surf the Internet on a scale far greater than could have been imagined before, converging on chat rooms, message boards and discussion forums, which have become assembly points for personal communication (Fion et al. 2003). Because the virtual community can enhance participants' sense of belonging and loyalty toward a brand or corporation, more and more marketers are actively participating in the establishment of chat rooms, message boards and discussion forums to promote their brand or corporation (Chiou 2003; Wellman, 1999). However, little research has been done on the summarization of electronic communications (Radev et al. 2001; Zinkhan et al. 2003).

The primary goal of this exploratory research is to analyze the impact of the highly popular US TV program *Friends* on Internet communication in the US, Japan, and Taiwan. It intends to establish whether exposure to foreign TV could lead to similar communication content in the context of the virtual community between exporting and importing societies. If the content of communication is different among societies, what is the process that causes this difference? In this study, we view discussion forums or message boards as online tools that allow for interactive consumer communication. Our research concentrates on the ways consumers express their reactions and feelings toward a foreign (or domestic) TV program on the message boards or discussion forums.

Content analysis was used in this cross-cultural study, with the aim of understanding the ways in which dialogues posted on various discussion forums differed among the United States, Japan, and Taiwan. The TV sitcom *Friends* was chosen as the medium for conducting the research, due to the fact that it is a popular global sitcom that has been broadcast in several countries, particularly the three societies used in this research: the United States, Japan, and Taiwan. A second Japanese sitcom, *Beauty or Beast*, broadcast in Taiwan was included in the study, mainly to examine the effect of cultural proximity. Similar to *Friends*, it is a foreign sitcom aired in Taiwan, but differs from *Friends* in that it comes from a country that shares an Eastern culture similar to that of Taiwan. The third sitcom included in the study is *Love of Rose*, made in Taiwan. The reason for including it was to examine the effect of viewers' profiles, as it targeted younger generations of viewers than those of *Friends* and *Beauty or Beast*. Finally, both *Beauty or Beast* and *Love of Rose* were chosen because of their light-hearted nature, which is similar to that of *Friends*; they were also aired close to the time when *Friends*, Season 9, was aired in Taiwan. There were two types of data for the content analysis. The first one comprised topics that had been initiated by viewers visiting the website. Another set of data was the messages themselves, which included all the replies posted under each topic.

The results show that Japanese viewers of *Friends* exhibited a pattern more similar to the US than Taiwanese viewers did. Taiwanese viewers tended to initiate more *Information-seeking* topics and discuss less *Plot-related* messages and *Emotion-related* messages than Japanese and US viewers did. In addition, the results

of the Japanese *Beauty or Beast* sitcom aired in Taiwan may provide support for the proposition that cultural proximity may affect viewers' abilities in interpreting and retaining the message of a foreign TV program. Taiwanese viewers of *Beauty or Beast* related very well to the program. They discussed significantly more *Emotion-related* and *Plot-related* topics and messages than *Friends*. Finally, the results of *Love of Rose* also provide evidence for this claim among younger generations.

Overall, the results of the study showed that the communication style in discussion forums is very similar among the three cultures studied, if the cultural proximity factor is controlled. Although viewers used discussion forums to search for related information more than any other purposes, they were willing to share their views regarding the plot and even express their personal feelings on the web in all three societies, as long as the TV show touched the audiences. This assertion was also sustained when analyzing the data from the discussion forums for the TV program targeting the younger generation. The results of this exploratory study support the notion that the process of cultural value influence is more complex than Cultural Imperialism advocates propose. Audiences respond actively rather than passively to foreign TV programs. Prior information structure of the audience is affecting the interpretation of subsequent information. Therefore, the assertion that global cultural invasion will happen in a rapid and dominant way may be too optimistic. Globalization is more likely to pluralize the world, by recognizing the value of cultural niches and local ability (Water 1995).

Pretty Woman or Erin Brockovich? Unconscious and Conscious Reactions to Commercials and Movies Shaped by Fairy Tale Archetypes—Results from Two Experimental Studies

Andrea Gröppel-Klein, European University Viadrina
Anja Domke, European University Viadrina
Benedikt Bartmann, European University Viadrina

ABSTRACT

This paper describes the principles and assumptions of Jung's archetypal psychology, and analyzes the question of whether the use of archetypes influences the conscious assessment of commercials, brands, movies and unconscious approach reactions. Furthermore, the question is discussed as to whether different personality types vary in the degree to which they are attracted by advertising and movies which use typical archetypes. Two laboratory experiments were conducted to test our hypotheses. In order to gain insight into the unconscious reactions of test persons and to assess the activating function of archetypes, we also measured electrodermal reactions to explore arousal evoked by archetypal commercials and movies.

INTRODUCTION AND GENERAL QUESTION

Are books like "Lord of the Rings", "Harry Potter", or "Ancestors of Avalon" and movies presenting Arnold Schwarzenegger as the "Terminator" or internet games like "Everquest" so successful, because all these products use archetypes that activate more or less unconscious, but innate human desires? Are advertising campaigns shaped by archetypal myths also appealing to consumers (Walle 1986)? A content analysis of advertisements in magazines and newspapers reveals that many brands (even credit institutes or sophisticated newspapers) use archetypal images like brave heroes, innocent maidens like the "Sleeping Beauty", or pictures associated with such fairy tales as "Cinderella", "The Frog Prince", or animal archetypes like the "faithful horse" or the "lion".

In the consumer behavior literature, there are several articles inquiring into archetypes from a qualitative research perspective (e.g., Hirschman 2000; Veen 1994; Walle 1986). However, there appear to be no *empirical* studies investigating the effect of archetypes on approach behavior and on affective responses. In this paper, we analyze the topic from a positivistic research perspective: 1) whether archetypes influence, on the one hand, the conscious assessment of commercials, brands, and movies and, on the other hand, unconscious approach reactions and 2) whether all people behave similarly to the same exposure or whether different personality types vary in the degree to which they are attracted by archetypal topics. To acquire insights into the unconscious reactions of test persons and to assess the biological, activating function of archetypes, we also measured arousal evoked by archetypal commercials and movies.

An Introduction to Jung's Archetypes

Because Carl G. Jung (1875-1961) was influenced by his mentor Sigmund Freud, he was called Freud's "crown prince of psychoanalysis". However, "Jung had never been entirely sold on Freud's theory" (Boeree 1997). Briefly, Freud's (1933) therapy objective was to render the personal unconscious conscious. According to Freud, repressed personal experiences are fueled by primitive, pleasure-seeking and destructive emotions that must be controlled (Enns 1994). Furthermore, Freud was convinced that one day, his theory about the relevance of unconscious instincts would be confirmed by modern neurological techniques of brain imaging (Behrens and Neumaier 2004).

Jung's theory (1954/1959a, b) can be divided into three parts. Part one is the conscious mind termed the "ego". Closely related to the ego is the personal unconscious that includes anything not presently conscious. The personal unconscious includes both memories that can easily be brought to mind and those that have been suppressed for some reason. Jung's third part of the psyche is called the "collective unconscious", and this element makes his theory stand out from others (Boeree 1997, 2). The collective unconscious can be characterized as a "psychic inheritance" or the kind of knowledge with which all human beings are born. The individual is never directly aware of this collective reservoir of experience, but it can indirectly influence personal feelings and behavior. Effects that illustrate the functioning of the collective unconscious are experiences of first love, of déjà vu and the immediate recognition and understanding of certain myths. In contrast to Freud (1933), Jung (1961) viewed the unconscious as a meaningful source of renewal.

The content of the collective unconscious is characterized by so-called "archetypes" that represent inborn and universal ways of perceiving and comprehending the world and provide individuals with "wisdom" about the past and predispose people to experience the world as their ancestors did. Thus, archetypes have an instinctive or biological function (Veen 1994, 332) and act as regulators and stimulators. In other words, "archetypes activate behavior" (= "systems of readiness for action" (Stevens 1982, 62)). As inherent experiences of the human species, they are stable across time and societies, but can be culturally coded in typical iconic representations.

The variety of archetypal images is substantial. In general, archetypes are mythological or primordial images and are regarded as useful in the analysis of myths, fairy tales and general literature. Jung (1954/1959a, b) devoted special attention to those archetypes he considered as highly important in shaping behavior. It would go beyond the scope of this article to discuss them all, but three types are of major relevance for this article and are presented in more detail: the anima in men and the animus in woman, the hero, and the maiden (Jung 1982, 165)

Bolen (1984) argued that although archetypes are universal, people reveal a wide diversity of personality styles that influence the decision to allow the psyche to bring the collective unconscious into the conscious. Furthermore, personality factors like self-esteem and clarity of self-concept (Campbell et al. 1996) may also influence individual (unconscious) preferences for romantic archetypes (Boeree 1997; Holbrook and Olney 1995).

Archetypes and Consumer Behavior

Some authors (e.g., Walle 1986) suggest the general use of heroes or archetypes in advertising campaigns. Walle (1986, 22) describes archetypes as "constitute valuable tools for practitioners such as strategic planners of promotional campaigns", because archetypal advertising originates from innate human universals and focuses on innate needs. Veen (1984) argues that archetypes like the hero in particular, are helpful in explaining buying behavior (e.g. of cars) and that myths in general give products a ritualistic image. Ritualistic consumption satisfies the search for spiritual satisfac-

TABLE 1
IMPORTANT ARCHETYPES

(1) Anima and Animus	(2) Hero	(3) Innocent Maiden
<p>The "anima" depicts the unconscious female side of the male psyche, and the "animus" expresses the unconscious masculine side of the female. The anima may be personified as a young girl, a fairy godmother or the earth mother. The animus may be personified as a wise old man, or a rational male character. According to Jung, both anima and animus are present within one character. However, due to societal rules, women are still expected to be less aggressive and more understanding than men, whereas the latter are expected to be stronger and to ignore the emotional side of life more than females.</p>	<p>The "hero" can be characterized as the man of "self-generated-submission" who will eradicate the difficulties of the world. The hero is the defeater of the dragon (Aziz 1990, 29) who "undertakes the battle and ultimately, because of his sincerity, is given the strength to overcome the dragon" (Veen 1994, 332). In other words, the hero can master all challenges in life. Moreover, the typical male hero is able to rescue an unhappy or threatened woman and sweep her into an idyllic existence.</p>	<p>In fairy tales, the female role is often that of the innocent maiden like Cinderella or Sleeping Beauty (Boeree 1997). The young and beautiful woman, who lives in distress or misery or is maltreated by her stepmother or the evil fairy is rescued by a gallant prince who protects her forever and promises her a wonderful life free of worry and care. The story of the 350 year-old fairy tale "Cinderella" has survived, because it has given the "underdogs of society a source of hope", because the tale has "flourished as a paradigm of happily-ever-after, wish-fulfilling romantic fantasy" (Waters 2003). Women are assumed to like this fairy tale, because it offers an optimistic or sentimental escape from a complicated and difficult reality, whereas men are supposed to identify with the heroic prince.</p>

tion and self-actualization (Belk 1988; Belk, Wallendorf, and Sherry 1989; Rook and Levy 1983; Solomon 1983). According to Hirschman (2000), movies portraying particularly meaningful archetypal figures create living icons that are used by consumers as important personal anchors. This could be the reason for the popularity of many archetype-oriented movies.

Feminism and the Innocent Maiden Archetype

In converse, the feminist movement opposes the reduction of archetypes to stereotypes like Cinderella or Sleeping Beauty. Feminists complain about a misinterpretation of Jung's theory (e.g., Enns 1994, 73; Lauter and Rupprecht 1985). They point out that his notion that an unconscious man exists within the woman (animus) and that an unconscious woman exists within the man (anima) implies that masculine and feminine characteristics can be united in a balanced relationship and that mentally healthy people have both a well-developed anima and animus. However, Jung (1954/1959b, 82) also wrote that femininity is associated with "feelings of inferiority". Since his work has predominantly been interpreted by men who are mostly against abolishing patriarchal structures, these concepts have helped men enhance patriarchal myths and undervalue the merits of women as well as their experience and power (Enns 1994). Furthermore, archetypes (though principally stable over time) are nevertheless embedded in socialization processes. On the one hand, feminists (e.g., Lauter and Rupprecht 1985) believe that the more fairy tales that prevail about heroic men and needy women, the more difficult it will be for women to change such stereotyped role expectations as "Men are brave and clever, they hunt and solve problems, whereas women stay home, look after children, create a pleasant home life—and obey." On the other hand, currently, more and more students are female; they often achieve better examination results than their male colleagues and more and more women gain high career positions. Thus, a maiden

archetype like Cinderella is called into question or even eroded. The book "The Cinderella Complex" (Dowling 1981) questions the abdication of women's power to males and asks why, in the old fairy tales, we never hear what happens to the young Cinderella after she marries the prince. Will she really be happy and satisfied with a spouse role or will there be a tendency to break out of the repressive castle existence? To summarize, we could question whether a modern young woman still believes that she needs to do no more with her life than find a gallant prince who will look after her. In other words, do typical maiden archetypes like "Cinderella" or "Sleeping Beauty" really reflect women's ideals and can they therefore be used successfully in advertising strategies?

However, we can analyze this topic from a male perspective as well. Women's emancipation might also have changed men's expectations and philosophies of life. Analogously, we could question whether men are still attracted by the hero-scheme. Does a man always feel capable of mastering all obstacles and is he really keen to assume responsibility for his wife and family or does the hero-claim rather lead to a feeling of being burdened?

In our study, we wish to investigate whether archetypal stories like Cinderella or Sleeping Beauty cause positive unconscious and/or conscious responses. This general research question will be specified in the following sections.

Self-Concept, Personality and Archetypes

According to Jung (1954/1959a, b), archetypes refer to deep structures of the human mind and act as "organizing principles". This would suggest that a message which is compatible with innate desires or desired behavior will be more effective (with regard to approach behavior towards this special message) than one that is less focused on these innate drives (Celsi and Olson 1988; MacInnis, Moorman, and Jaworski 1991). Thus, we can assume that advertising messages shaped by desirable archetypes will evoke positive

responses. Furthermore, as mentioned before, a relationship between personality variables and preferred archetypes can be assumed. Holbrook and Olney (1995) found that people vary in the degree to which they are attracted either by romanticism (measured by items like: "I think that life is an awesome mystery" or "it is okay to daydream a lot") or by classicism (measured by items like "I have a scientific outlook on most problems") and that women in general are more attracted by romanticism. These findings could lead to assumptions that on the one hand, females are more attracted by romantic archetypes than male persons and, on the other hand, that individual levels of romanticism or classicism, or in a broader sense personality factors, also influence the perceived appeal of different archetypes.

In this context, self-concept clarity and self-esteem may also play an important role. Self-concept clarity can be defined as the "extent to which self-beliefs are clearly and confidently defined, internally consistent, and stable" (Campbell et al. 1996, 141). Self-concept clarity demonstrates whether or not an individual has a clear "conception of his or her life". Self-esteem characterizes the extent to which individuals have well-articulated positive or negative beliefs about themselves. People with either high or low self-esteem differ in their appreciation of their own individual achievements in life (Campbell et al. 1996). We propose that self-concept clarity and self-esteem also impact on the evaluation of typical archetypes and we assume that individuals who have not yet dealt with questions like "who or what am I?" or "how do I feel about myself?" and thus have unclear self-concepts, will be more attracted by maiden archetypal figures, because these fairy tales give a source of hope, or an anchor as to how life could improve, either as the hero (male perspective) or the rescued maiden (female perspective). In contrast to self-concept clarity, the relevance of self-esteem is not that clear. We hypothesize that, on the one hand, females with high self-esteem will be less attracted by Cinderella or Sleeping Beauty stereotypes and more attracted by powerful female heroes, because self-confident women regard themselves as successful. Thus, there is no need to wait for gallant princes who will rescue them and master all problems (this is a more feminist argument, as mentioned above). On the other hand, females who are fascinated by Cinderella-stories presumably also have at least a minimum level of self-esteem, because they would otherwise never believe they could attract a prince one day. Consequently, without self-esteem, identification with a maiden archetype would go beyond their wildest dreams. Men also need a minimum of self-esteem, because they would otherwise not be able to identify with the hero. To summarize, we hypothesize that, in general, all individuals are attracted by archetypes, but that different degrees of attraction are associated with different personality types.

Research Perspective

In consumer behavior, there are already some qualitative approaches to understanding the meaning of archetypes in advertising (e.g., Hirschman 2000; Veen 1994; Walle 1986). Furthermore, we found many articles analyzing the role of male or female stereotypes in advertising (Artz and Venkatesh 1991; DeYoung and Crane 1992; Fenell 1984; Johar, Moreau, and Schwarz 2003; Orth and Holancova 2004). However, there seem to be no experimental or positivistic studies exploring the effect and efficiency of archetypes used in commercials and movies. One probable reason for this lack of research is that Jung—in contrast to Freud, whose theory was linked to the natural sciences and who tended to believe that things work through cause and effect—believed in a "synchronicity" of events that cannot be explained by a mechanistic perspective or typical experiments. Synchronicity is the (unexpected) occurrence

of two events that are meaningfully related. For instance, people sometimes pick up the phone to call a friend, only to find the friend already on the line. Jung (1953) believed that the collective unconscious is responsible for these two synchronous events. Moreover, as mentioned before, Freud was fascinated by the notion that his theory could one day be validated by neurological research, whereas Jung was not at all interested in a biological foundation for his theory and declared instead: "Anyone who wants to know the human psyche will learn next to nothing from experimental psychology. He would better be advised to abandon exact science" (quoted in Boeree 1997, 1).

Even though Jung clearly does not recommend experimental research (and would perhaps turn in his grave if he could read our study), we wish to investigate the role of archetypes in advertising and movies by an experiment measuring test persons' responses to archetypal presentations. We deliberately asked male and mainly female students in all faculties at our university to participate in our experiment so as to guarantee that test persons with different outlooks on life (e.g., focus on career or on family) are involved. However, since many students probably know about the functioning of Cinderella-stereotypes as well as feminist resistance to these myths, we must be aware of the problem of *social desirability response bias*. In particular, female students might be attracted by maiden fairy tales, but not dare to admit this (because they are afraid to violate an unwritten "feminist student philosophy"). Therefore, test persons' attitudes were measured not only by verbal scales, but also by phasic arousal reactions to detect their unconscious responses towards the media. Furthermore, arousal can be used as an indicator of the biological and activating function of archetypes.

Psychophysiological Perspective and the Relevance of Arousal in Advertising

From a psychophysiological perspective, arousal is a fundamental feature of behavior. It can be defined as the basic neurophysiological process underlying all processes in the human organism. Thus, arousal is the basis of emotions, motivation, information processing, and behavioral reactions (Bagozzi, Gopinath, and Nyer 1999; Öhman et al. 1993). Arousal can vary from deep sleep through moderate increases to panic. Basically, a distinction can be made between tonic and phasic arousal. Tonic arousal refers to a relatively long-term state of consciousness that changes slowly due to long-lasting or extremely intensive stimuli. Phasic arousal arises in response to specific stimuli, resulting in short-term variations in the arousal level. It indicates a ready state of the body for reaction and is closely related to attention, that is, enhanced sensitivity of the organism to relevant stimuli and stimuli processing, while irrelevant stimuli are filtered and not processed. Both internal (thought/metabolic processes) and external stimuli can cause arousal (Boucsein 1997).

Empirical studies emphasize the relevance of phasic arousal in marketing communication. Kroeber-Riel (1979) investigated the impact of weak, medium, and high arousal potential of advertisements on recall and attitudes towards the ad and brand. He found support for the hypothesis that highly arousing stimuli exert a positive impact on advertising efficiency. Empirical studies at the point-of-sale established that perceived arousal leads to more shopping enjoyment, more time spent for browsing and exploring, as well as to a higher probability of returning to the store and/or to the tendency to spend more money (Donovan and Rossiter 1982; Groeppel-Klein 1997; Groeppel-Klein and Baun 2001; Tai and Fung 1997; Van Kenhove and Desrumaux 1997). Thus, *arousal* is an important factor in *predicting approach behavior*. Furthermore, since consumers cannot willingly influence their arousal reactions,

it is either a valid indicator of *unconscious reactions* or a detection mechanism for social desirability articulation biases (Behrens and Neumaier 2004).

Hypotheses. To summarize, we investigate the following hypotheses in our studies:

- H1:* If a TV-commercial uses a typical fairy tale archetype, it will evoke higher phasic arousal reactions than commercials without this archetype.
- H2a:* Movies presenting typical maiden archetypes as characters will, in general, evoke higher phasic arousal and be evaluated more positively than films presenting brave, aggressive (in the sense of not merely accepting one's fate passively) and selfish female characters.
- H2b:* However, females with high ratings on self-clarity and low ratings on romanticism will be less attracted by maiden archetypes than females with the converse personality traits.

Measurement of Arousal

Various verbal methods have been used to measure perceived arousal. However, the results derived from these scales are controversial and the discriminant validity has been criticized (Van Kenhove and Desrumaux 1997; Vitouch 1997). Basically, there are three reasons for these criticisms: (1) selection of inappropriate items to represent perceived arousal, (2) verbal reports require some form of cognitive evaluation of perceived arousal by the individual, who might (in a non-measurement condition) not even be aware of the arousal (thus, verbal scales can only measure conscious reactions), (3) the fact that verbal measures are made some time later than the actual experience of the situation (Groepel-Klein and Baun 2001). In contrast to these methods, psychophysiological measures such as heart rate, electroencephalogram (EEG) and Electrodermal Activity (EDA) are the most valid indicators, since *deliberately influencing* the test results obtained from these methods is almost impossible. In addition, EDA is generally "regarded as a sensitive and valid indicator for the lower arousal range" (Boucsein 1992, 263). Electrodermal Reaction¹ (EDR shows phasic arousal) is recommended as an indicator for measuring arousal that is manifest in the third system of the 3-dimensional arousal model of Boucsein (1997). This so-called "preparatory activation" system basically encompasses motivational aspects of arousal. Expectations are transformed into a ready state for reaction. This part of the system interacts especially with motor and pre-motor activation of behavior, and with positive emotions (Groepel-Klein and Baun 2001). It is assumed to be responsible for (conscious and unconscious) approach behavior (Boucsein 1997).² Contrary to the heart rate, EDR indicates even the very smallest psychological change (Boucsein 1992). It is thus considered the most sensitive indicator of arousal that could be relevant to behavior and can be recorded *simultaneously* with the perception of a stimulus. Due to these advantages, we employed EDR as indicator.³ Two EDR parameters are of particular relevance: 1) The amplitude describes the strength of each phasic arousal reaction (Boucsein 1992; Cacioppo, Marshall-Goodell, and Gormezano 1983).⁴ According to Steiger (1988), the intensity of perceived arousal over a certain *period of time* can be received by summing all single amplitudes so as to obtain the *total amplitude* which is the most important phasic arousal parameter in experiments. 2) The second important parameter is the so-called "frequency" of responses, which sums all individual reactions. Each skin-conductance response demonstrates the particular attention of the individual towards an object in its environment (Steiger 1988).

EXPERIMENTAL DESIGN

Study 1

The first study was conducted in October and November 2004 in a lecture room at our university. First, students were chosen randomly and asked if they were interested in participating in an advertising experiment. Then, the participants (arranged in groups of two to four) completed a general questionnaire about their personal attitudes towards career, family and typical male/female stereotypes. Furthermore, items of the Romanticism-Classicism Index (Holbrook and Olney 1995) and statements measuring self-concept clarity and self-esteem (Campbell et al. 1996) were valued on 5-point-rating scales. Before presenting six different TV-commercials and the movies, one member of the group was attached to the EDR-electrodes and asked to relax and to watch the film just as in a cinema or at home. In contrast to all other commercials, only the third used an archetypal myth- the story takes place in a typical enchanted "fairy tale castle". The prince wants to rescue and wake up Sleeping Beauty, but all kissing attempts fail. Only the flavor of a cookie (named "Prinzenrolle") works, so that Sleeping Beauty is finally enraptured by her rescuer. During EDR registration, markers were set on the registered data whenever a new commercial started and another when the scene from the movie began. Thus, the arousal reaction of each commercial and of the movie could be registered. After presenting the TV-commercials, half the sample (randomly chosen) was presented with the last scene of "Pretty Woman" whereas the other half watched a sequence from "Gone With The Wind". Students were told that we wanted to arrange a typical advertising situation, in which films are normally interrupted by TV-commercials. Actually, we chose these two films, because the Cinderella-"archetype has shaped movies such as Pretty Woman" (Waters 2003), and Scarlett O'Hara (as we established through an internet search) is characterized as a "woman, who fought with her sweat and blood to keep her family's plantation, a woman who overcame every war and obstacle" (unknown reviewer, www.target.com) and "her incredible tenacity makes her a contender" (Isaacs 2004, 4). Thus, viewing the movie was also

¹Former expression: Galvanic skin response

²Phasic electrodermal amplitude, as measured here, can serve as an indicator of the third dimension. The second dimension, the "affect-arousal"-system, comprises primarily emotional components of arousal. The physiological outcome results in phasic cardiovascular (heart rate) and / or tonic electrodermal variations. When it comes to behavior and perception, processes within this second dimension lead to defense and negative emotions (Boucsein 1997, Groepel-Klein and Baun 2001).

³For registration purposes, we chose an exosomatic approach applying DC (0.4 V) and measuring skin conductance. The technical equipment runs with a 12-bit analog-to-digital (A / D) converter. We used two Ag / AgCl electrodes filled with a 0.5% NaCl electrode cream. Electrodes were attached to the left palm of right-handers and vice versa.

⁴In order to calculate amplitudes, for all studies, we chose a minimum amplitude criterion of 0.01µS, so as to exclude recording artifacts from the signal-to-noise ratio (Boucsein 1992; Venables and Christie 1980). While registering EDR, overlapping amplitudes may occur, that is, a second amplitude follows a first one, although the original baseline has not yet been reached. For our data analysis, overlapping amplitudes were evaluated, each by means of its own baseline, regardless of the recovery time of the preceding amplitude (Boucsein 1992).

part of the experiment, although participants were not aware of it and were already attached to electrodes. Afterwards, EDR-test persons were detached from the electrodes, and together with the rest of the group, completed the second part of the questionnaire, including items measuring attitude towards the ad, the brand, and the movie (reduced version of the statement-list of Edell and Burke 1987) as well as socio-demographic variables. Since attitude measurement relating to all commercials would have taken too much time and we were interested mainly in assessments of the third commercial that used a typical fairy tale archetype, we decided only to measure the ratings for this particular spot. To conceal our special interest, we arranged a kind of lottery and told the participants that by drawing lots, we wanted to randomly select which commercial had to be evaluated. However, we manipulated the lottery in such a way that the lot always drew our archetypal commercial. 59 male and 126 female test persons participated in our experiment.

Study 2

The second study was conducted in February 2005, with an improved experimental design and questionnaire similar to those of Study 1, in order to control additional influences (famous brand name, product category, actress popularity, order effects). This time, however, only *female* students were interviewed.⁵ In contrast to our first study, half the sample (randomly chosen) was exposed to the archetypal TV-commercial “Sleeping Beauty” (“Prinzenrolle”, see Study 1), whereas the other half was exposed to a more informational TV-commercial of “Prinzenrolle”, that shows a group of cooks (called the “cookie-experts”) with white coats and long chef’s hats preparing hot chocolate sauce for their delicious cookies. This experimental design was chosen in order to find out whether the archetypal TV-commercial of “Prinzenrolle” was really more effective than a more informational spot for the same brand. Furthermore, the water softener commercial (see Table 2) was replaced by a spot also advertising cookies (with the brand name “Hanuta”). This clip shows a female fencer fighting with one of the famous Three Musketeers. She wins and gets the “Hanuta”. This commercial was chosen for two reasons, firstly to present a tough and fearless *female* actor and, secondly to show an additional “sweets”-spot to examine whether arousal reactions were evoked only by this special *product category*. As in the first study, during EDR registration, a “marker” was set on the registered data again whenever a new commercial started and when the movie scene began. After presenting the TV-commercials, half the sample

(randomly chosen) was presented with the last scene of “Pretty Woman”, whereas the other half watched a (typical) sequence from “Erin Brockovich”. In our first study, we chose the movie “Gone With the Wind”, because Scarlett O’Hara is probably one of the most prominent examples of a fearless female character. However, “Gone With The Wind” was shot before World War II and is set in the American Civil War, whereas “Pretty Woman” was produced in 1990 and features a modern “zeitgeist”. Furthermore, Julia Roberts is one of the most popular actresses in Hollywood and the arousal reaction to “Pretty Woman” might simply be due to her still-fresh charisma. Therefore, in the second study, we wanted to control a potential “Julia Roberts-artifact”, and compared “Pretty Woman” to another movie starring Julia Roberts, this time not in a “Cinderella”-role, but as “Erin Brockovich” who is characterized as “an inspirational reminder of the power of the human spirit. Her passion, tenacity and steadfast desire to fight for the rights of the underdog defied the odds” (www.erinbrockovich.com). In addition to Study 1, we used statements from the sympathy/empathy scale of Escalas and Stern (2003) to establish whether the movies evoke weaker or stronger reactions due to test persons’ different levels of identification with the characters.

After excluding the artifacts (e.g., pressure on the electrodes—for details, see Boucsein 1992), we obtained 92 valid EDR data sets and 91 additional questionnaires for Study 1 and 62 valid EDR data sets and questionnaires for Study 2. There are no significant differences between the “Pretty Woman” and “Gone With The Wind” or “Erin Brockovich” samples with regard to socio-demographic variables (age, personal disposable income, study programs). However, it should be emphasized that we only presented a nine-minute key-scene from each movie in both studies. Therefore, we also controlled whether arousal reactions differ between participants who had already seen the movies and those who did not know them. There were no significant differences, neither in the experimental nor in the control groups, between the numbers of participants who had already seen the entire film (Study 1: *Gone With The Wind*: $n=16$, *Pretty Woman*: $n=37$, Study 2: *Erin Brockovich*: $n=17$, *Pretty Woman*: $n=28$) and those who only watched the sequence for the first time. The TV-commercials were all familiar to the audience.

EMPIRICAL RESULTS

In both studies, we first applied exploratory factor analyses to the statements measuring attitudes towards career, family, romanticism, self-concept clarity and self-esteem, as well as to the items measuring attitude towards the ad, brand, and movie. The statements load clearly on the postulated dimensions.

Results for Hypothesis 1

Hypothesis 1 analyzes whether a TV-commercial using a typical fairytale archetype evokes higher phasic arousal reactions than commercials without such an archetype. Therefore, in both studies, six commercials were presented to the respondents, with the intention of simulating a typical commercial-break. The first commercial served solely as an “ice-breaking-spot” to ensure that test persons had become used to and familiar with the EDR-electrodes, and was therefore excluded from further analysis. As mentioned before, only the third spot used a typical archetype (“Sleeping Beauty”, see Table 2).

Study 1. To investigate Hypothesis 1, we conducted a non-parametric Friedman-test (due to the small sample sizes) comparing frequency and total amplitude evoked by each of the five TV-commercials. Table 3 shows the highest ranks for the archetypal spot with regard to both frequency and total amplitude. Furthermore, we used a nonparametric Wilcoxon-test for connected samples

⁵In Study 1, we analyzed whether there were gender differences with respect to attitudes towards career, family, romanticism, self-concept clarity and self esteem. Referring to 4 (of 20) statements, our study revealed that there are significant differences ($p<.05$) between male and female students, demonstrating that typical male / female stereotypes can be found even today (Facts are more important than feelings: $M_{\text{male}}=+.287$, $M_{\text{female}}=-.119$ / I think that even today, it is more important for a man to have positive career prospects than for a woman: $M_{\text{male}}=+.330$, $M_{\text{female}}=-.157$ / I believe in love at first sight: $M_{\text{male}}=-.207$, $M_{\text{female}}=+.104$ / My beliefs about myself seem to change very frequently: $M_{\text{male}}=-.225$, $M_{\text{female}}=+.109$). In a second step, we analyzed whether there were also significant differences between male and female viewers with respect to their phasic arousal reactions towards the archetypal commercial and the movie. Here, we found no significant differences, which might indicate that either men are attracted by the hero-image of the male character and women by the Cinderella-image of the female character or they are not. In Study 2, we only investigated female arousal reactions.

TABLE 2
 CONTENT OF THE INVESTIGATED TV-COMMERCIALS IN BOTH STUDIES

Study 1	Study 2
1 "ice-breaking"-spot	
2 Calgon (water softener) Story: A woman has problems with her washing machine because of calcification. The technician explains and recommends a certain water softener.	Jever (beer) Story: A man stands alone at the coastline, enjoys the landscape and sky and thinks about drinking a beer.
3 Prinzenrolle (cookie): Archetypal spot Story: A prince tries to wake up Sleeping Beauty, all kissing attempts fail, only the aroma of a cookie works. Sleeping Beauty is rescued and enraptured by the gallant prince.	Prinzenrolle (cookie) Archetypal spot: Sleeping Beauty (50 %) Story: see Study 1 Informational spot: Cookie experts (50 %) Story: Some cooks (called "cookie experts") with white coats and chef's hats are preparing hot chocolate sauce for delicious cookies.
4 Lycos (internet search engine) Story: Some dogs, dressed up as members of a jury at an ice skating competition, make fun of different web pages.	
5 Jever (beer) Story: A man stands alone at the coastline, enjoys the landscape and sky and thinks about drinking a beer.	Hanuta (cookie): Tough, fighting woman Story: A female fencer fights one of the Three Musketeers. She wins and gets the cookie.
6 D2 (mobile phone) Story: In an office, two women spread a rumour and wait to see how long it takes before this message is published as "official information" via mail and phone.	

to establish whether there is a significant difference between the archetypal and second ranked commercial. Again, we found a significant difference between the two spots with respect to frequency ($p=.011$). The difference between the total amplitudes of the two best ranked spots was not significant ($p=.081$) at a .05 level, only at a .10 level. However, our results point in the postulated direction, and we found support for Hypothesis 1, at least for the frequency.

The results of our first study confirm the high arousal potential of the archetypal spot. To emphasize the relevance of arousal, we first standardized and then recoded our metric variable "total amplitude evoked by the archetypal commercial" in a nominal-scaled variable to ensure highly-aroused (HA=above average) and minimally-aroused (LA=low level of arousal, below average) test persons. Consumers who were highly aroused by the archetypal commercial were significantly ($p<.05$) more attracted by the spot than those who had a low level of arousal with respect to attitude towards the ad: entertaining spot ($M_{HA}=+.527, M_{LA}=-.287$), attitude towards the ad: valuable spot ($M_{HA}=+.475, M_{LA}=-.133$), intention to buy the product ($M_{HA}=+.643, M_{LA}=-.381$), and intention to recommend the product ($M_{HA}=+.413, M_{LA}=-.312$).

Study 2. In our second study, we controlled whether the brand name or the product category might be responsible for the arousal reactions. Table 4 (results of the "robust" Welch-test used because of non-homogeneous variances) shows that the archetypal spot of "Prinzenrolle" evokes a significantly higher total amplitude than the informational spot of the same brand. Furthermore, the archetypal cookie spot leads to higher arousal reaction than the competi-

tive "Hanuta" cookie spot, at least for the comparison of total amplitudes (Table 5).

Results for Hypothesis 2a

Hypothesis 2a assumes different arousal responses and attitudes towards the movies "Pretty Woman", showing typical Cinderella archetypes as characters and "Gone With The Wind" or "Erin Brockovich", which present brave, aggressive and selfish female characters. ANOVA supports our hypothesis, at least for the comparison of total amplitudes (Table 6).

We used ANOVA to compare attitudes towards the movie. The results (Table 7) support Hypothesis 2a with respect to the question of whether the movie has touched personal desires. In Study 2, we used the sympathy/empathy scale of Escalas and Stern (2003) in order to control whether "Pretty Woman" or "Erin Brockovich" evoke high arousal because test persons identify more or less with the character. There were no significant differences between the two movies, neither for *sympathy* nor for *empathy*. Thus, the results indicate that "Pretty Woman" seems to touch on innate (unconscious?) desires.

Results for Hypothesis 2b

Hypothesis 2b investigates the relationship between personality types and responses towards the movie and proposes that female test persons with high ratings on self-clarity and low ratings on romanticism will be less attracted by maiden archetypes than females with the converse personality traits. This hypothesis will be investigated mainly for Study 1. In order to identify different female

personality types (and derive our independent variable), a two-stage clustering-approach was conducted. The Elbow-Criterion (Timm 2002) of a prior Ward's hierarchical cluster method with squared Euclidean distances indicates a three cluster-solution. The final cluster solution was conducted with Quick Cluster. The final cluster centroids are shown in Table 8.

According to the results of our cluster analysis, female test participants can be segmented into three groups. Women in the first

segment are characterized by romanticism (they enjoy daydreaming and believe in love at first sight). They want to be protected by their future husband and yearn for a life without worries. Although they are quite self-confident, they still have an unclear self-concept. This segment will be referred to as "optimistic daydreamers". The second group considers it important to believe in facts rather than dreams, and always to keep a cool head. They have a clear self-concept and high self-esteem. Thus, they will be described as "cool

TABLE 8

TABLE 9
AROUSAL DIFFERENCES BETWEEN PERSONALITY TYPES: COMMERCIAL

EDR Parameters	Personality types	n	Mean (for illustra- tion)	Kruskal-Wallis-H-tests					
				Mean Rank	Chi- Square	Sign.	Sign. 1-2	Sign. 1-3	Sign. 2-3
Frequency: archetypal commercial	1) optimistic daydreamers	17	54.53	41.85	7.635	.022	.005	.079	.372
	2) cool self-made women	24	29.33	25.92					
	3) students with low self- confidence	22	41.36	31.02					
Total Amplitude (in η-Siemens): archetypal commercial	1) optimistic daydreamer	17	2480.07	42.53	8.176	.017	.003	.058	.582
	2) cool self-made women	24	1368.24	26.29					
	3) students with low self- confidence	22	1930.62	30.09					

self-made women”. The third cluster has an extreme negative score on “high self-esteem”. These women perceive themselves as failures and have no self-confidence at all. They are neither energetic nor career-oriented, nor do they have any optimistic daydreams as to how they could change their lives. However, they too, want to be protected in life. This cluster will be called “students with low self-confidence”. With respect to Hypothesis 2b, we are mainly interested in comparing the first and second clusters, because they can be differentiated by opposing values on self-clarity and romanticism.

Due to the small sample sizes (< 30) within the subgroups, we used a nonparametric Kruskal-Wallis-test. With respect to the archetypal commercial both, total amplitude and frequency differ significantly between the groups (Table 9). However, the results of the arousal responses with respect to “Pretty Woman” yielded *no significant differences* between the three clusters. Unfortunately, there were too few test persons to compare the arousal effects of “Gone With The Wind” between the three clusters.

Thus, we found only partial support for Hypothesis 2b that female characters with high ratings on self-clarity and low ratings

TABLE 11
DIFFERENCES IN A_{MOVIE} BETWEEN PERSONALITY GROUPS

Factors	Personality types	n	Mean (for illustration)	Kruskal-Wallis-H-tests					
				Mean Rank	Chi-Square	Sign. (all groups)	Sign. 1-2	Sign. 1-3	Sign. 2-3
Attitude towards the movie (archetypal, <i>Pretty Woman</i>)	1) optimistic daydreamer	21	.757	39.43	9.241	.010	.072	.003	.159
	2) cool self-made women	24	.209	29.83					
	3) students with low self-confidence	16	-.109	21.69					
Attitude towards the movie (non-archetypal, <i>GWTW</i>)	1) optimistic daydreamer	19	-.188	30.45	3.086	.214	.448	.286	.090
	2) cool self-made women	21	.103	34.31					
	3) students with low self-confidence	19	-.622	24.79					

on romanticism (self-made women) are less activated by maiden archetypes than females with opposite personality traits (daydreamers). Does this mean that even “cool-headed women” cannot avoid being unconsciously affected by the “*Pretty Woman*” story? Or do these students have both a well-developed anima and animus?

We also measured “conscious” responses to test Hypothesis 2b. ANOVA revealed significant differences between the groups with respect to assessing the commercial’s perceived relevance and the relevance of the brand. Post-hoc-tests revealed that these results are caused mainly by differences between the optimistic daydreamers and the cool self-made women. No significant differences could be found for other attitude dimensions. Thus, we again found partial support for Hypothesis 2b with respect to the *archetypal commercial* (Table 10).

To test the influence of cluster membership on the *attitude towards the movie*, we used a nonparametric Kruskal-Wallis-test.

The results (see Table 11) show that optimistic daydreamers have a significantly more positive attitude towards the movie than members of the other two groups ($p=.010$). Here, we also found support for Hypothesis 2b. Among those subjects who watched the “*Gone With The Wind*” sequence (which, in contrast to the Cinderella archetype, shows an independent woman), the cool self-made women sympathized more with the movie than members of the other two groups. However, this difference is not significant ($p=.214$).

Due to the small sample size for Study 2, we did not conduct a segmentation analysis. However, we found a moderate, but still significant positive correlation (Pearson coefficient) between high ratings on romanticism and a positive evaluation of the archetypal commercial of “*Prinzenrolle*” ($p=.038$, $r=.362$, $n=32$). Furthermore, we found a positive correlation between self-esteem and liking “*Pretty Woman*” ($p=.008$, $r=.461$, $n=32$).

Consistency of the Results

To investigate the consistency of our results, we analyzed the correlation (Pearson coefficient) between frequency and total amplitude of the archetypal commercial and the arousal parameters of the archetypal movie "Pretty Woman". Due to the small sample size of Study 2, this is only relevant for Study 1. The correlations are high and significant ($p < .000$, $n = 35$, $r_{\text{frequency}} = .761$, $r_{\text{total amplitude}} = .735$). Furthermore, the average figures for total amplitude and frequency evoked by the movie "Pretty Woman" are nearly identical in both studies, which further indicates the validity of the used measurement procedure. Reliability was tested by controlling a possible influence of the date and the different interviewers. There was no significant influence on the dependent variables (arousal, attitudes).

SUMMARY AND DISCUSSION

Summarizing the essence of our empirical studies, it is evident that fairy tale archetypes, as investigated here, have a positive impact on consumer arousal reactions and conscious evaluations of commercials and movies. EDR-measurement cannot be influenced deliberately. Study 2 shows that the archetypal commercial ("Sleeping Beauty") produced a higher total amplitude than the informational spot of the same brand. Furthermore, the commercial that presents a story about a tough and successful female fighter evoked lower arousal reactions than the "Sleeping Beauty" commercial. Thus, arousal is not only evoked simply by a strong brand name or an appealing product category. The results also show that even cool-headed, emancipated women (Study 1) or female test persons with high-self esteem (Study 2) could be attracted by romance and cannot avoid the appeal of Cinderella-stories like "Pretty Woman". However, mainly women with high scores on romanticism and low scores on self-clarity are fascinated by archetypes in TV-commercials.

In Study 1, we found no gender differences with respect to the effects of the commercials and the movies. This might indicate that men can identify with the hero, and women with the rescued maiden. However, since our sample was quite small, more research is needed on this topic.

Some limitations should be mentioned here with reference to our empirical results. Firstly, our findings are based on relatively small sample sizes. This is due mainly to the intricate EDA measurement process. Each recorded curve needs to be screened manually for measurement artifacts. Furthermore, our study was conducted only with students. Thus, it should be replicated with men and women from all age and income groups. Furthermore, we did not measure familiarity with the brand. Instead, we can assume that brand familiarity is stronger for German students than for participants from other countries who also participated in the study. Since there are no significant differences between German and foreign students with regard to the arousal parameters and attitude towards the ad, we can assume that brand familiarity does not influence arousal and attitude towards the ad. Unfortunately, in these studies we were not able to control for a "Richard Gere" artifact in our "Pretty Woman" sample. It might be that some of our female students were attracted to the movie because of the male actor.

A further interesting and significant question for further studies could be to compare an archetypal commercial with an emotional, but not archetypal one for the same brand to measure differences in arousal. Last but not least, it would also be useful to investigate our archetypes from a qualitative research perspective and to combine and compare the qualitative and quantitative results.

Support *Your* Local Team: Resistance, Subculture, and the Desire for Distinction

Brendan Richardson, University College Cork
Darach Turley, Dublin City University

Consumer resistance is frequently conceptualised as consumption ‘on the edge’ (Ritson and Dobscha 1999), or resistance of the subordinate consumer to the dominant market (Holt 2002, Penalzoza and Price 1993). An alternative conceptualisation of resistance is the desire of some minority groups to have their identities properly *represented* in the marketplace, rather than a desire for emancipation *from* the market (Penalzoza and Price 1993). Yet another conceptualisation of resistance defines it as aversion to the tastes of others. Hogg and Savolainen (1998) cite Bourdieu (1984) to argue that a particular ‘taste’ is primarily a distaste, or aversion, to the identity associated with another set of tastes.

These perspectives help to construct a “resistance continuum”, moving from “avoidance behaviour” at one end, to acts of active rebellion against the market at the other (Fournier 1998). At the weaker end of the continuum, consumer resistance can result from the desire for distinction, rather than an ideological opposition to the market *per se*. The purpose of aversion for alternative tastes is to demonstrate to oneself what one is not (Bourdieu 1984, Hogg and Savolainen 1998).

RESEARCH QUESTION

This paper seeks to address several related questions. Firstly, it asks whether the definition of resistance as aversion is helpful in understanding the consumption of soccer fans. Secondly it explores how resistance as aversion is structured. Whose tastes are denigrated, why are they denigrated, and how are they denigrated? Is the ingroup’s system of subcultural capital (Bourdieu 1984, Jancovich 2002) important in determining these issues? Finally, it also considers the question of how such aversion might impact upon the consumption behaviors of the ingroup.

RESISTANCE AND SUBCULTURAL CAPITAL

The conceptualisation of resistance as distaste for the consumption preferences of others is supported by the work of a number of researchers. Thornton (1995:93) argues that the punk rock movement had more to do with an aversion to disco music—*within the cultural sphere of popular musical tastes among youth*—than resistance to normal, bourgeois society as a whole, as originally suggested by Hebdige (1979). The ‘mainstream’ is often nothing more than something invoked by members of a subculture when they wish to make distinctions between their group and some easily derogated ‘other’ (Jancovich 2002, Thornton 1997, 1995). Members of the rave scene in the U.K., for example, make distinctions between themselves and the mainstream Tracys and Sharons, the ordinary working class girls dancing round their handbags at the local disco (Thornton 1997). The subcultural capital of the rave scene is expressed through knowing which CDs to have in your collection, what to wear to a rave, knowing which DJ’s are considered the ‘hippest’, knowing which forms of dance style are considered appropriate and which are not, which venues are ‘in’ and which are not, and so on (Thornton, *ibid*). Canadian rave participants articulate a resistance to the ‘mainstream’ of drunkenness and disco bars, not bourgeois society in general (Wilson 2002), and while cult movie fans mock the shortcomings of ‘mainstream’ cinema, the construction of ‘mainstream’ proffered by the various strands of thought within the cult movie subculture is incoherent, contradictory, and inconsistent (Jancovich 2002). What matters to subcultural participants, however, is that these distinctions “provide a

sense of subcultural authenticity (Jancovich, *ibid*)”. Goods or services associated with the outgroup are seen as indicators of a lack of cultural capital, and so are stigmatised by a collective distaste. Consumer resistance, in this light, can be a manifestation of the desire for distinction, rather than a desire to resist the market itself.

BOURDIEU AND CULTURAL CAPITAL

How consistent is the above with Bourdieu’s original conceptualisation of cultural capital? Cultural capital was originally understood as knowledge of how to consume, how to appreciate, to understand what should be considered tasteful and what should not, with particular reference to high (or “legitimate”) culture (Bourdieu 1984, Holt 1998). Central to this thesis was the argument that this specialist knowledge, these ways of consuming, allowed members of the upper classes to maintain social and economic distinctions between themselves and members of other social classes. Cultural capital was therefore conceptualised as nothing less than a weapon that was being deployed to great effect in the perpetuation of class inequalities. In rejecting this thesis, Bourdieu’s critics have tended to take the view that members of the dominant social class in North America, for example, tend not to limit their expressed tastes to “legitimate” culture, and that an ability to aesthetically appreciate the arts is not a key to social or economic advancement (Erickson 1996, Gartman 1991, Halle 1993). It is beyond the scope of this paper to examine the question of whether cultural capital, as depicted by Bourdieu, is in fact deployed as a means of perpetuating class inequalities. There is some evidence, as noted above, to suggest that whether it is used in that way or not seems at the very least to depend on which country is being considered, France or North America, for example. What must be considered, however, is whether cultural capital has something important to say about consumer behaviour, beyond any putative use as a weapon in inter-class strife. This paper is concerned with the manner in which group-specific systems of cultural capital structure consumption *outside* the dichotomous framework of class conflict. Members of brand communities, for example, have their own systems of cultural capital, which they deploy to assert the superiority of the tastes—and ultimately the identity—of their particular group:

Appreciation of the history of the brand often differentiates the true believers from the more opportunistic. Knowing these things is a form of cultural capital (Bourdieu 1984, Holt 1998) within the brand community (Muniz and O’Guinn 2001)

Systems of cultural capital within brand communities therefore have fundamentally important functions with regard to the behaviours, attitudes, and experiences of members of these communities. “Insider” status can be attained through the acquisition of higher *community-specific* levels of cultural capital. This motivates members to immerse themselves more deeply in the culture of the brand. Thus we have cultural capital operating not to prevent members of one social class from gaining access to membership of the class above them, but rather to allow contemporary consumers experience a strong sense of community with each other. This takes place partly through the mutual development of robust ties to particular brands, but also through a mutual aversion towards other tastes and other brands. This resistance to the tastes of others is

grounded in the collective, community-specific system of cultural capital, and helps to give these consumers their sense of distinction (Muniz and O'Guinn 2001).

DEVELOPING A COMMUNITY-SPECIFIC SYSTEM OF CULTURAL CAPITAL: THE CASE OF SPORTS FANS

Cultural capital has always been primarily dependent upon how, rather than what, one consumes (Bourdieu 1984, Holt 1998, 1995, Muniz and O'Guinn 2001). Some basis for asserting distinction will be found, even where all concerned are consuming the same consumption object. Just as the bourgeois consumer might assert distinction through an ability to critically analyse a play or movie in a way that a lower class consumer can not (Holt 1998), baseball fans achieve distinction through the practice of classifying (Holt 1995). This occurs at the level of both objects and actions (practices). At the level of object, for example, distinction from baseball fans who support other teams is readily attained through the consumption of clothing that bears one's own team's insignia. At the level of actions, practices such as the "throw back" are used by Cubs fans to maintain distinction between themselves and other less knowledgeable fans. Normally when a baseball fan manages to catch a baseball that has been hit for a home run, it is kept as a treasured souvenir. If it is an opposing batter who has hit the home run, however, Cubs fans pride themselves on throwing the ball back as a gesture of defiance. Failure to throw it back identifies the spectator as a neophyte fan poorly versed in the fan culture. A different group of fans, the "lads" of Manchester United assert *their* distinctiveness through the practice of terrace-style fandom, drinking copious amounts of beer prior to the game, and singing and chanting during the game itself (King 1997). Aversion is expressed through an antipathy towards the more sedate style of fandom practiced by the 'new consumer' fan. The official merchandise, including team shirts, the *de rigueur* outfit of the 'new consumer' fan on matchday, is boycotted by the "lads". This paper will now examine the practices of another group of football fans who practice resistance through aversion *without* resorting to a boycott of their own team's merchandise.

THE CURRENT STUDY: THE FANS OF CORK CITY F.C.

In seeking a site for this study, we were influenced not only by the relative neglect of soccer fandom in the literature on consumer behavior, but also by Lofland and Lofland's (1995) principle of "starting where you are". One of the researchers being based in the city of Cork in southern Ireland meant that regular, in-depth access to the fans of Cork City Football (soccer) Club was possible. A period of prolonged immersion (Stewart 1998) in the local fan culture was carried out, involving participant observation during football matches in the club's home stadium over an eighteen month time period, and participant observation on several web-based fan discussion forums, including 'Foot.ie' and 'CityNet', over a somewhat longer timeframe. These discussion forums were chosen for participation partly on the basis of criteria for 'netnography' proffered by Kozinets (2002). While Kozinets recommends observation of online forums with high research-question relevance, the highest levels of traffic, high numbers of discrete posters, and so on, the low number of forums available to Cork City fans made the task of forum selection very straightforward. Citynet and Foot.ie met Kozinets' criteria more so than the small number of alternative options available to Cork City fans at the time. It should also be noted that while no record was kept of the total number of posts downloaded from these web forums, 'Citynet' was visited several

times a day, most weekdays, over a timeframe of several years so that any fresh posts could be read. When it closed down, the focus of attention switched to Foot.ie, a website for fans of Irish soccer clubs where each club has its own individual discussion forum. Themes identified from these web forums were subsequently introduced as discussion topics during interviews with fans. Respondents for these in-depth naturalistic interviews were initially selected using Lofland and Lofland's (1995) 'casting about' approach but purposive sampling (Stewart 1998) was subsequently used to select respondents who matched criteria identified through participant observation fieldwork. It became highly apparent during the participant observation process that the most active and vocal supporters at Cork City's home stadium were to be found in or near The Shed, the terrace (standing area) at the Turner's Cross end of the ground. This was observed, for example, throughout most of Cork City's home games for the duration of the 2004 football season. Usually, the most vocal of any soccer team's supporters tend to congregate at one end in this way, effectively making it the "home end" of the ground (Marsh *et al* 1997). This suggested that interviewing fans who frequented the Shed could generate rich, meaningful data. Having noted the predominance of males under thirty in the crowd of colourful noisy fans in the middle of the Shed, a number of these fans were interviewed, to explore their fandom through naturalistic dialogue. 'Richard', an accountant in his twenties, was interviewed over coffee in the student centre of the local university. 'Pablo' was interviewed in a pub prior to the match between Cork City and a French football team, Nantes AFC, in the Inter Toto Cup, in 2004. 'David', again of similar age, was interviewed one evening in a quiet pub, before going to play in his regular Tuesday night soccer match. 'Gerry', an older fan who prefers the seated Main Stand to the Shed, was also interviewed at around this time. By contrast, 'Greg' was interviewed later on in the study, after the pattern of antipathy towards fans of English football had been identified in data from the earlier interviews and web based discussion threads. His profile provided a match to the criteria used in the first round of purposive sampling, but with the additional characteristic of a distaste for televised English football. Finally, 'Eddie', a slightly older fan in his late thirties, was also selected for interview on this basis. The interview with Eddie was conducted in the living room of his home one evening after work. This facilitated the desired naturalistic approach to the interview. For example, Eddie could easily locate photographs and other memorabilia to show to the interviewer, as related topics arose in the course of the dialogue.

FAN PRACTICES, PERCEIVED AUTHENTICITY, AND FELT AVERSION

The literature on subculture and resistance consistently asserts that readily *accessible* cultural materials and practices are used to affirm distinction (Fiske 1989, Thornton 1995). In order to better understand the basis for distinction (as an aversion to the tastes of others) it is useful to consider what the data tell us about the practices and tastes the fans have. It is these practices and these tastes that provide a basis for comparison with the practices and tastes of others, to allow for the assertion of distinction (Holt 1995, Thornton 1995).

What can easily be observed on the Shed Terrace at any Cork City home fixture are the carnivalesque practices of ritualised group singing and chanting. Generally speaking, the intensity of the atmosphere tends to depend on the identity of the opposing team. If, for example, City are playing a European cup tie, this adds glamour and excitement to the occasion, while at the other end of the spectrum, a domestic league fixture against weaker opposition will

FIGURE 1
Hierarchy of Perceived Fan Authenticity

not be characterised by the same level of intensity. In addition to the practices of vocal support for their team, Cork City supporters usually create a ‘Sea of Green’ effect on the Shed by wearing replica team shirts and displaying giant flags and banners in team colours. The flags are usually unfurled and waved prior to kick-off and again at half-time, and this visual display, along with the pre-match singing and chanting, helps to establish a dramatic atmosphere inside the ground.

The fans’ participation in these rituals gives them a deeply felt sense of self as *participatory* Cork City supporters (Belk 1988, McCracken 1988:87). For these fans, being a Cork City supporter is something that you proactively *do*. They therefore make strong distinctions between themselves and other categories of soccer fan, who fail to practice fandom in the culturally appropriate way. In fact there are high levels of aversion for the practices of some of the other fans. The degree of aversion varies with the location of these other fans in the perceived hierarchy of fan authenticity (Figure 1):

The ‘lads’, in other words fans like ‘Pablo’ and ‘David’, see it as their duty to contribute to the atmosphere in the stadium. The ‘call to order’ (Bourdieu 1984:380) extends not only to attending matches but to being as vocal as possible, in order to play one’s part in supporting the team:

I think everything we do is basically to try and create an atmosphere in there, to support the team... It’s from the first whistle now to the end ...whether we win or lose, basically—that’s the way it should be, you know? (‘Pablo’)

As shown in Figure One, aversion is expressed for two other categories of fan, namely fans who attend games in the stadium, but who fail to join in the participatory style of support, and ‘barstool’ fans, who watch English soccer teams on television, instead of supporting their local team. The basis for aversion in the case of the former group is failure to practice participatory fandom:

I know it’s a big bone of contention for some people ... that people in the other parts of the ground don’t make an effort but what do you do, like? There’s no point in getting upset about it either ...you know? They’re not gonna change just cos you’re urging them on...at least they’re there anyway, they’re better than the people sitting at home watching ... Sky (i.e. English football) on the telly like so—I think any criticism should be qualified you know, for what it is (‘Richard’)

Commenting on a recent trip to Estonia to see an international match between the local team and the Republic of Ireland, ‘Eddie’ says:

What’s happened in the last couple of years is there’s so many just, trippers going to the match, and they kinda turn up like they’re going to the theatre or the cinema, and they just want to be entertained...you could see people around you—you can’t resent them, because they’re entitled to be there—but they just weren’t up for it, they just wanted to be entertained.

'Real' support is not always about being entertained, it is about duty, obligation, blood, sweat and tears. Even if the football on show is horrendous or the weather conditions are miserable, the 'real' fan gets on with the job of supporting the team:

I mean we've all been to horrible games like we'll say the (Bohemians) game just after the Malmo game ...we lost 1-0 and it was like-poor crowd, terrible weather, average game, you know?... (I)t's like those kind of games where people will go 'Ah...I'd much prefer being at home now, warm, watching the Simpsons or something' (laughter) (David)

Aversion for the 'barstool' fans is grounded in a number of factors, including their practice of mediated fandom, as well as their support for non-local clubs:

Well, I like to watch Man United and Arsenal ...but eh...that's for entertainment purposes-I wouldn't be one of those fellas standing there or sitting there on a barstool screaming at the TV screen! ('Gerry')

The seemingly throwaway remark "that's (only) for entertainment purposes" confirms that it is acceptable to watch football on television, as long as it is understood that such viewing is only for "entertainment purposes". Thus the mediated fandom of the 'barstool' fan is deemed far less authentic than the participatory fandom culturally understood to make a difference to the outcome of a game. The "barstool" fans are also denigrated for their practice of supporting English teams (rather than the more authentic practice of supporting one's local team):

I've an affinity to the team...being from Cork, you know? ...I never understood sitting in a pub watching football, just it doesn't appeal to me and it's kind of amusing to me, people saying 'we' talking about English teams...I can genuinely say 'we' going to Turner's Cross, it's not the biggest, but they're our own at the end of the day you know? ('Pablo')

'Pablo' being from Cork means that he is supporting his local team. For the 'lads', his is a more authentic form of support than that of the Irish soccer fan who supports an English team such as Manchester United. 'Pablo' places himself in the same category as native Mancunians who support their local club:

Your average football fan from Moss Side's going to be a Manchester City supporter (rather than a Man United fan)...he's following that football team because that's where he's from, not because they're winning trophies every year ... they (Manchester City)... were still getting 30,000 people in the Second Division ... you'd respect them as supporters for that.

Therefore, Irish fans of Manchester United are derogated not just because of failure to support their local team, not only because of their failure to practice participatory fandom, but also because of their perceived fickle preference for the winning of trophies, over the long-term unconditional loyalty expected of 'real' fans. Being a 'real' fan, for members of the Cork City subculture, prohibits anything other than single-minded monogamous devotion to one team:

A meanderer is a fella ...who goes to a live game and says 'I miss the replays' or 'I'd love a pint now' ...he meanders from (watching) Celtic V Rangers and Celtic are this great team...

then just after that Liverpool are playing Man United and then he's all into Liverpool...and then just after that they'll watch something else and they've always got this, they're a life long Liverpool and Celtic fan-they're not! They meander between 'em ('David')

The 'meanderer' is regarded as lacking in that crucial characteristic of the 'authentic' fan – a single-minded devotion to one team only. The meanderer *affects* fandom but seldom, if ever, actually *practices* fandom in the subculturally appropriate way. The demonstrated fickleness, the lack of committed passion for one team only, forms part of the basis for distinction between real fans and 'barstoolers'. Being a fan has to *matter* (Grossberg 1992). Full membership of the community of 'real' fans is reserved for the faithful who adhere to the code of unconditional loyalty, irrespective of the team's level of success, and who passionately practice participatory fandom. These practices will always be privileged over the lukewarm alternative demonstrated by any other group.

THE WINNING OF 'SPACE' AND THE EMBRACING OF THE MARKET

A key component in the Birmingham School's conceptualisation of subculture is resistance through the winning, or appropriation, of space. The working class "*have won space for their own forms of life. The values of this ...culture are registered everywhere, in material and social forms, in the shapes and uses of things, in patterns of recreation and leisure... (t)hese spaces are both physical ...and social (Clarke et al 1975:43)*".

In critiquing this view, Thornton (1995:25) asserts that space is 'won' by the actions of the *market*, in catering for a particular demographic. Yet in the context of Cork City FC's home ground of Turner's Cross, the tradition of the 'Shed' as the space that in a sense belongs to the 'real' fans, is a product of football fan culture and tradition, rather than a deliberate creation of the market. The market has informally facilitated this in the past through differential pricing between the (seated) Stand and the (standing) terrace patronised by younger low-income fans, but it is the *practices* of the fans on the Shed that have given it its meaning as hallowed ground reserved for those partisans who give their all to defend the honour of the team. It is highly illuminative to see how official Cork City merchandise is used in an unproblematic way to help create this space, through the group norm of buying and wearing official replica shirts to the match, creating the 'sea of green' effect discussed earlier. While this acts as a symbol to rally both fans and players, it is also a form of semiotic resistance to the 'barstool' fan practice of wearing the shirts of non-local clubs:

City are pretty good in that way, in that they usually (have the same shirt)...for two years-...other clubs (such as)...Manchester United-they'll probably have three shirts and they'll change them twice a year, you know? So it's not that expensive in that respect...the merchandise is pretty good quality as well ('Pablo')

'Pablo' clearly enjoys buying and using merchandise that facilitates the expression of self-as-local-fan. He regards the merchandise as being of "pretty good quality", hardly the thoughts of someone with an oppositional stance to the market. He also enjoys the expression of opposition to 'barstool' fandom that it allows him to practice. Pablo's resistance to the market is therefore bound up in his aversion for oppositional tastes. His aversion for excessive consumption of merchandise must be placed in the context of his cultural understanding of 'real' fandom. 'Real' fandom is something that cannot be bought, but rather is produced through a

combination of participatory behaviour and *appropriate*, rather than excessive, levels of merchandise consumption.

DISCUSSION

A key theme in the research of the Birmingham School was the expression of working class solidarity (Clarke 1975, Clarke *et al* 1975, Jefferson 1975). An 'us' versus 'them' attitude was expressed in every arena of working class life, particularly in the field of leisure. With the local football team being a particularly potent symbol of 'us' versus 'them', nothing less than absolute solidarity was acceptable. Contemporary football fan culture has inherited this sense of solidarity, this spirit of 'us' versus 'them' (Giulianotti 1999). In the case of fans of Cork City Football Club, the internal system of subcultural capital is systematically used to make distinctions between members of the subculture and other fans, particularly the 'barstool' fans. 'Other' is carefully constructed in ways that privilege 'ingroup' practice (Jancovich 2002, Thornton 1997, 1995, Wilson 2002). Cork City fans draw on the cultural belief that supporting one's *local* team is a *hallmark* of authentic football fandom (Giulianotti 1999:34-35). Thus while there is a degree of aversion for the practice of attending matches but not participating actively in supporter rituals, there is an acknowledgement that such non-participatory fans have at least made some effort to support their local team. 'Barstool' fans, however, being relatively restricted in their opportunities to practice participatory fandom, due for example to the cost of travelling from Cork to attend matches in England, are far more easily denigrated. They are usually confined to watching their heroes on television, unlike the Cork City fans who can easily travel the short distance to Turner's Cross. This allows the 'lads' to assert that theirs is the more authentic fandom. Furthermore, 'barstool' fans are described as glory hunters or meanderers, who transfer their affections with ease from one team to the next. This is a particularly barbed and highly subjective distinction, given the cultural significance of loyalty for football fans. The norm for Irish fans of English clubs is to practice lifelong loyalty to their teams (Richardson and O'Dwyer 2003), in keeping with the 'call to order' (Bourdieu 1984) of diehard loyalty that prevails across the wider culture of football fandom (Giulianotti 1999).

What all of this confirms is that the construction of 'other' does not have to be accurate, but must have sufficient perceived credibility for the affirmation of distinction. Resistance in this case can therefore be understood as the assertion of an oppositional stance to alternative tastes, or as Hogg and Savolainen (1998) describe it, aversion. Its purpose is the affirmation of the distinctiveness of the fans' own identity, and not the expression of ideological opposition to the market. It is therefore at the 'weak' end of the resistance continuum outlined by Fournier (1998). Market offerings that facilitate the group's identity are readily embraced, while alternative market offerings are rejected -not because they are market offerings, but because they are indicative of the oppositional taste of 'other'. There is resistance to the oppositional tastes represented by the behaviours and practices of the barstoolers, trippers, and meanderers, because these practices imply that fandom is something that can simply be 'bought' and that purchases alone can make the purchaser a real fan. For the 'lads' of Cork City, being a supporter is something that you *do*. Anything less than this, any suggestion that fandom can be achieved through simply buying a shirt, a scarf, or even a match ticket, is fiercely resisted because it represents a threat to the distinctive identity of the group. The lads' resistance, therefore, is not directly to the market, but rather to oppositional tastes, chosen for derogation on the basis of proximity in socio-cultural space, and the relative ease with which the distinctiveness of ingroup practices can be asserted.

Finally, the identity of this group is not primarily asserted through their aversion to the tastes of 'other', but through the felt sense of *communitas* (Belk *et al* 1989, Maffesoli 1996) derived from their communal style of fandom, including of course their mass displays of tribal colours (Derbaix *et al* 2002). This contrasts somewhat with the suggestion that "we are (first and foremost) what we reject (Fournier 1998)" but the concept of taste as distaste nevertheless plays a fundamentally important role in clarifying the lads' sense of self. It can certainly be speculated that these consumers would have found it very difficult to develop a clear, sustainable sense of group identity, were it not for the fundamentally important role played by aversion.

SPECIAL SESSION SUMMARY

Consumer Response to Price Presentation Formats: Implications for Partitioned Pricing and Transaction Bundling

Rebecca Hamilton, University of Maryland

SESSION OVERVIEW

Consider the following scenarios:

An online auto parts retailer is choosing its pricing strategy. Is it better to charge \$89.95 for a specific part plus \$32.50 for shipping or \$69.95 plus \$52.50 for shipping?

A catalog company is setting prices. Is it better to charge \$39 for a jacket and \$12 for shipping or charge \$51 including shipping? Will preferences change if the price of the jacket is \$149?

An auto dealer is making an offer to a consumer purchasing a new car and trading in an old car. Is it better to provide a good deal on the new car and a bad deal on the trade-in, a bad deal on the new car and a good deal on the trade-in, or a moderately good deal on both?

These three scenarios highlight transactions in which prices are partitioned among multiple, separable components that are naturally related (e.g., price of product and price of shipping) or occur together in time (e.g., buying a new car and trading in an old one). Although the idea that differences in price presentation affect consumer evaluations and purchase intentions is well entrenched in the marketing literature, it is only recently that research has begun to examine how consumers process partitioned prices (Morwitz et al. 1998; Xia and Monroe 2004).

Earlier work suggests that consumers may process partitioned and non-partitioned prices differently. Consumers may use simplifying strategies to process partitioned prices, such as ignoring relatively small surcharges or anchoring on one component of the partitioned price, making partitioned prices seem lower than non-partitioned prices (Morwitz et al. 1998). There is also evidence that prices partitioning can make certain components more salient than when the same components are presented under a single price tag (Chakravarti et al. 2002).

Building on this earlier work, the three papers in this session provide evidence that heuristic processing and salience cannot fully explain differences in consumers' reactions to partitioned prices when the same total price is partitioned in different ways. In the first paper, Hamilton and Srivastava show that consumers systematically prefer that more of the total price be allocated to components that are high in perceived value rather than low in perceived value, suggesting that consumer price sensitivity can vary across components of a partitioned offer. In the second paper, Roggeveen, Xia, and Monroe show that consumer skepticism moderates the beneficial effect of partitioned relative to non-partitioned prices. Using attribution theory as the underlying framework, they show that preferences for partitioned prices are influenced by both beliefs that a company makes a profit from shipping charges and the price of the product. Finally, Srivastava and Chakravarti demonstrate that variations in price presentation format affect consumers' valuations for both the overall transaction and each component transaction. Overall transaction evaluations are influenced by quite malleable component transaction prices.

Together, these papers show that consumer perceptions are influenced in a systematic and predictable way by price partition-

ing. Eric Greenleaf, the session discussant, highlighted both the theoretical and practical contributions of this work.

EXTENDED ABSTRACTS

“Consumer Reactions to Partitioned Prices: Variations in Price Sensitivity Across Components”

Rebecca Hamilton, University of Maryland
Joydeep Srivastava, University of Maryland

Prices are often partitioned into two or more components that the consumer must purchase together, such as an auto part and the labor to install it, or a book purchased online plus shipping and handling. When both components are mandatory, sellers can choose to allocate more or less of the total price to each component. Controlling for the total price, we show that consumers have systematic preferences for offers based on the relative sizes of price components.

This research links consumers' preferences for certain price partitions to their price sensitivity for various components of the total price. We propose that differences in price sensitivity across the components of a partitioned price are linked to consumers' perceptions of value. The perceived value of a product is positively influenced by product benefits and negatively influenced by price (Dodds, Monroe and Grewal 1991; Zeithaml 1988). If partitioning promotes component-level evaluation, we propose that consumers should be less sensitive to prices of components that are perceived to provide greater consumption benefit.

To test this proposition, participants in our first study were asked to choose between two suppliers of a new front bumper for their car, supplier A and supplier B. The auto part, a good, was combined with two different service components. For half of the participants, the offer was described as being from an auto parts supplier, and was partitioned into separate charges for the front bumper and shipping. For the other half of the participants, the offer was described as being from an auto service shop, and was partitioned into separate charges for the front bumper and installation. Holding the total price constant, supplier A charged 27% of the total price for the service (shipping or labor), while supplier B charged 43% of the total price for the service. To minimize the effect of differential processing across components, we also provided the total price. Participants ($N=74$) systematically preferred to pay a lower percentage of the total price for the service component (which provides less consumption benefit), regardless of whether the service was shipping or installation.

In study 2, to further rule out a processing explanation, we varied whether the good or the service was the larger of the two components. For half of the participants, the service component, installation, was 76% of the total price, and the good, new headlamps, was 24% of the total price. For the other half of the participants, installation was 27% of the total price, and the good, a new front bumper, was 73% of the total price. Again, participants ($N=85$) preferred to pay less for the service component, and there was no difference across conditions.

In study 3, we used a conjoint task to measure price sensitivity more directly. In contrast to the within-subjects designs of studies 1 and 2, we used a between-subjects design, and we partitioned the price of two goods. Participants were tasked with selecting a new

refrigerator (as in Chakravarti et al. 2002) that had both an icemaker and a sound silencing system. We chose these two features because we expected them to vary in their perceived consumption benefits. A pretest ($N=76$) indicated that our college student participants perceived more consumption benefit in the icemaker than in the sound silencing system. After study participants read the scenario, they ranked their preferences for nine different refrigerators. For half of the participants, the price of the icemaker and the base price of the refrigerator were varied across alternatives, and the sound silencing system was simply indicated to be present. For the other half of the participants, the price of the sound silencing system and the base price of the refrigerator were varied, and the icemaker was simply indicated to be present.

We regressed participants' preference rankings on the component price levels to measure participants' sensitivity to changes in the base price of the refrigerator and to changes in the price of the icemaker or sound silencing system components. We performed separate regressions for each of the 81 participants, and then we compared the beta weights across conditions. As expected, we found that sensitivity to component prices (as measured by the unstandardized beta weights) was significantly higher for those in the sound silencing system condition than for those in the icemaker condition. These results indicate that participants were more sensitive to changes in the price of the low-benefit component, the sound silencing system, than to changes in the price of the high-benefit component, the icemaker. In contrast, participants were equally sensitive to changes in the base price of the refrigerator across conditions. Thus, even when price information is presented in exactly the same way, the nature of the components makes a difference.

In summary, controlling for processing differences and salience of price components, consumers are more sensitive to changes in the prices of some components than other components, whether these components are goods and services (studies 1 and 2) or pure goods (study 3). Specifically, in study 3, price sensitivity was demonstrated to be higher for a component perceived to have low consumption benefit than for a component perceived to have high consumption benefit. Because price partitioning encourages component-level processing, sellers should consider the perceived consumption benefits of components when allocating the total price among components.

“How Attributions and the Product's Price Impact the Effectiveness of Price Partitioning”

Anne L. Roggeveen, Babson University

Lan Xia, Bentley College

Kent B. Monroe, Richmond University

As on-line shopping becomes more popular, marketers face the decision of how to present shipping and handling charges to their customers. Some companies charge one price for the product and advertise free shipping and handling (i.e., bundled price). Other companies charge one price for the product and a separate price for the shipping and handling (i.e., partitioned price). Information from the Direct Marketing Association indicates charging a bundled price and advertising “free shipping and handling” is the most effective purchase incentive (DMA 2000, p. 63). Yet, there is evidence that partitioned pricing may be advantageous to direct marketers. Partitioning shipping charges may lead to lower total recalled costs, which is expected to lead to increased demand (Morwitz, Greenleaf, and Johnson 1998). Research shows however that these results are qualified by how appropriate the consumer views the shipping charge to be, which is influenced by the amount, type, and presentation of surcharge (Xia and Monroe 2004).

This research extends the price partitioning research in two ways. First, we examine a potential boundary of the positive effect of price partitioning by looking at the interaction of attributions about the profit companies make from the shipping charge and product price. Previous research has shown that consumer skepticism about shipping charges moderates how the price format influences consumer reactions. Specifically, Schindler, Morrin, and Bechwati (2004) found that when customers are skeptical, bundling is more effective than partitioning. We expect that knowing a company makes a profit from the shipping charges will cause consumers to be skeptical such that bundling will be more effective than partitioning when the company makes a profit but we expect this to hold only when the total cost is fairly inexpensive. The rationale is that when the product is inexpensive and shipping is bundled, the overall cost seems reasonable and shipping is not salient. However, when shipping is partitioned from an inexpensive product's price, the shipping charge appears high in relation to the product cost and hence becomes salient. In contrast, for expensive products, when shipping is bundled and the total price seems high, consumers prefer to know how much the shipping charge is with expensive products. Therefore, when the product is inexpensive, bundled price is more effective than partitioned price but when the product is expensive, partitioned price is more effective.

In a $2 \times 2 \times 2$ between-subjects design ($n=243$), the base product's price (\$39 or \$149 jacket), whether the shipping charge is partitioned (partitioned vs. bundled), and the attribution for the shipping charge (company does not make a profit from the shipping vs. company does make a profit from the shipping) were manipulated. A shipping and handling charge of \$12 was applied to all conditions. We find the hypothesized three-way interaction.

Second, while previous research on price partitioning research has focused on the influence of price format on pre-purchase processes, we examine whether partitioned pricing influences consumers' product return after purchase. After measuring purchase intentions, a follow-up scenario was provided suggesting that after the jacket was purchased, the color of the jacket did not look as you thought it would. Then, participants are told the shipping price is non-refundable and asked whether they would return the jacket. We find that partitioned price leads to lower return intentions compared with the bundled price, but only for the inexpensive product. When the product is expensive, return intention is high regardless of the price format. Analysis revealed that when shipping costs are bundled and the jacket is inexpensive, participants believe they will be refunded more money hence the higher likelihood to return. In addition, we find that knowing a company does not make a profit from the shipping charges makes consumers think they will get more money back when the shipping is bundled (versus partitioned) with the product's price.

Study 2, replicating the results in a different context, examines how a product's weight influences consumer reactions to partitioning of prices. It is expected that when the weight is light (heavy), consumers will react similarly to the condition in which they knew the company was making a profit (not making a profit) from the shipping charge. Using a 2 (partitioned versus bundled) $\times 2$ (light product versus heavy product) $\times 2$ (inexpensive vs. expensive product) between-subjects design, we examined both pre- and post-purchase reactions.

Overall, this research suggests that managing consumers' price perceptions using different price structures is crucial. For a relatively low priced product, a high shipping and handling charge would scare consumers away even if the charge is honestly just to cover the cost. Therefore, shifting all or part of this cost to the base price of the product may be a good tactic. On the other hand,

charging the same amount of shipping for a higher priced product could be well accepted by consumers and create perceptions that benefit the retailers.

“Transaction Bundling: Effect of Price Presentation on Consumer Perceptions”

Joydeep Srivastava, *University of Maryland*
Dipankar Chakravarti, *University of Colorado*

Consumers are often confronted with transactions that are naturally related or occur together in time. For example, new car purchases are often made in conjunction with the trade-in of an older car and a vacation involves the purchase of air-ticket and lodging. In such situations, marketers have various options in how to price and present the overall transaction. For example, a car dealer has the option to treat the purchase of a new car and the trading-in of the old car as separate transactions with different price tags or as a bundled (consolidated) transaction where the overall transaction is presented under a single price tag. The manner in which the overall transaction is priced can significantly alter consumer perceptions (Chakravarti et al. 2002).

Even when the transaction is presented under separate price tags, a car dealer may create different gain (loss) scenarios from the same net transaction. To the extent that reference prices are available for both transactions, the manner in which the component transactions are priced could lead to different representations of the separate transactions and hence the overall exchange episode (Purohit 1995). For example, a car dealer can choose to provide a good deal on the new car but a poor deal on the trade-in. Alternatively, the dealer can provide a good deal on the trade-in and a poor deal on the new car, or the dealer could provide moderately good deals on both the new car and the trade-in, while maintaining the same net dollar amount for the overall transaction. Although marketers can implement these different price presentations relatively easily, there is little systematic research on the effects of such price presentation on consumers.

This research examines how variations in the price presentation of transaction bundles affect consumer perceptions. While economic theory would predict no differences in consumer preferences across the different price presentations, the mental accounting principle of segregate the gains (Thaler 1985) would suggest that consumers are likely to prefer the overall transaction where the dealer provides moderately good deals on both the new car and the trade-in. Alternatively, consumers may be more sensitive to the price of the new car as that is the focal transaction or consumers may be more sensitive to the price of the trade-in because of the general inclination to demand more for giving up something they own (endowment).

This paper reports the results of two studies that examine consumer preferences for transaction bundles as a function of price presentation. Using a scenario involving the purchase of a new car along with the trade-in of an old car, study 1 had six conditions, all with a separate price for the new car and a separate price for the trade-in. In all conditions, reference prices were provided for the new car and the trade-in such that the overall transaction would always result in a gain. The six conditions varied how the net total price was split across the new car and the trade-in. For example, in the conditions where there was a gain on one component and loss on the other, the price of the new car was \$15,000 and the trade-in value was \$4,000 whereas in the related condition, the new car price was \$18,000 and the trade-in value was \$7,000. The results of study 1 (n=158) show the different price presentations systematically affected consumer perceptions. Specifically, in contrast to the principle of segregating the gains, consumers were more sensitive

to the price of the new car. The overall transactions in which the price of the new car was relatively low were preferred to the transactions in which the price of the trade-in value was relatively high. These results suggest that consumer preferences for overall transactions are affected by how the component transactions are priced.

Study 2 then adds a consolidated condition where the overall transaction is presented under a single price tag to the six conditions used in study 1 and also examines how consumer attachment (involvement) with the trade-in affects preferences for the different transactions. The results (n=296) replicate the findings of study 1 in the low attachment condition. However, when consumers are trading-in a car that they were attached to, they prefer the overall transactions where the price of the trade-in is relatively high. In addition, the consolidated price presentation is uniformly preferred to the segregated price presentation in the high attachment condition but not in the low attachment condition. Together the findings of studies 1 and 2 show that consumers are differentially price sensitive to the component transactions and that this price sensitivity is malleable. The findings have both theoretical and managerial implications.

Scale Development for Consumer Confusion

Markus Schweizer, University of St. Gallen

Alexander J. Kotouc, University of St. Gallen

Tillmann Wagner, Texas Tech University

INTRODUCTION

Consumers experienced an unrivalled expansion of options with reference to entertainment, lifestyle, and working life within the last decades. Just consider of the countless TV stations, the ever increasing choice of sodas or the numerous working models. This rising freedom is often associated with a higher standard of living. Consumers are gaining power—this popular development is called consumer democracy (cf., Bosshart 2004). Not retailers determine what consumers buy, but consumers themselves. But as Caldwell recently pointed out (2004), most people are terrible choosers. As freedom of choice is accompanied with abandoning traditions and habits, one is required to get involved with the single offers in an increasing assortment pool. Years ago, for example, buying a Coke was not a challenge. Today, one has to choose between 15 or more varieties (among brands: e. g., Coca Cola, Pepsi, Virgin Cola but also within product lines: e. g., Coca Cola Vanilla, Crystal or Diet). Thereby, most consumers are driven to make the right choices. This “tyranny of choice”—as Barry Schwartz (2004) named the phenomenon of increasing choices and consumer suffering—can cause Consumer Confusion. Consumers are not able to choose efficiently anymore. Which of the 200 TV-channels complies with my needs tonight? What is the difference between the two most common types of coffee (Robustica and Arabica)? Which components are essential for a home computer? These mainly rudimentary examples indicate, that the explosion of choice plays an important role in confusing consumers. Malhotra (1984) demonstrated that product variety in retail environments leads to a higher decision density for consumers which can “result in a variety of dysfunctional consequences such as *confusion*, panic, perplexity, frustration and withdrawal” (Malhotra 1984, 14).

Not only the increasing options but all stimuli generated by marketing instruments are potential causes for Consumer Confusion. Missing quality references, frequent price changes or complex indications of product compositions are store environment stimuli that may cause confusion. Of course, consumers are able to adapt to any environment but retailers are thereby confronted with negative consequences. Due to reduction strategies (simplification of purchase decisions), consumers often abandon their purchase intention or make their decision by means of just a few criterions (e. g., price).

There is clearly need for research on this issue: “While the design of pleasant retail environments is certainly a pertinent marketing goal, it might be also useful to study the darker side of the shopping experience and try to identify the environmental elements that create negative consumer feelings during shopping” (D’Astous 2000, 149). Our study intends to follow this direction for future research. Based on qualitative and quantitative studies, a scale measuring Consumer Confusion is developed. On one side, the measurement instrument provides a basis for future research, investigating interrelationships between different groups of consumers or different industries, and on the other, it offers retailers a tool that can be employed to observe current triggers of confusion. By identifying these key elements, retailers are given a guidance for their strategy development and consequently, for profiling their stores.

The paper is divided into three major sections. First, we discuss previous research that has been conducted concerning

consumer confusion. In this first section, we identify factors which conceptionally lead to Consumer Confusion. Secondly, we present our qualitative findings on confusion triggers and subsequently, we depict the quantitative study that allowed us to develop the scale for Consumer Confusion. Finally, we discuss the general implications of our findings and point out directions for future research.

LITERATURE REVIEW

Consumer Confusion as a phenomenon of its own is not yet considered in well-established consumer behavior scholar books (e. g., Assael 1997; Blackwell, Miniard, and Engel 2001). Nevertheless, confusion triggers have been mentioned in the marketing literature for quite a long time, but either in other respect or in a very isolated manner.

Trade-mark infringements enforced research efforts concerning the physical similarity of original brand and me-too products (c.f., Miaoulis and D’Amato 1978; Loken, Ross and Hinkle 1986; Foxman, Muehling and Berger 1990; Kapferer 1995). Because consumers transfer attributes (e. g., quality, functionality) from the original brand to imitational products if similarity is given, manufacturers of original products had-and still have-a strong interest to restrain copycats. The research process enabled the judges to settle objectively disputes of manufacturers in courtrooms. Still prominent is the action “Tic Tac vs. Mighty Mints” which was taken place in the seventies. This biased perception is called *Brand Confusion* (Mitchell and Papavassiliou 1999, 320). While research on Brand Confusion exclusively focuses on the physical similarity of products, research on Consumer Confusion extends this research interest by capturing the store environments multi-dimensionality. While Brand Confusion predominantly concerns (legal) issues between manufacturers, Consumer Confusion originates at the store and involves retailers’ as well as consumers’ behavior.

Having recognized, that a store *environment* does have a substantial influence on shopping (and in particular choice) behavior, environment psychologists urged to focus on confusion triggers other than just product appearance (c.f., Berlyne 1960). Subsequently in retail management, researchers dealt amongst other variables with the effect of music (c.f., Yalch and Spangenberg 1990), colors (c.f., Bellizzi, Crowley, and Hasty 1983), light (c.f., Areni and Kim 1994) and scent (c.f., Mitchell, Kahn, and Knasko 1995). Although this research stream has isolated the effects of particular environmental stimuli to date, there is not much understanding of which elements in the retail atmosphere are most salient to consumers when forming an approach-avoidance evaluation (Turley and Milliman 2000). However, to create successful marketing measures, it is crucial to understand what (combination of) variables contribute to an orienting/confusing environment which subsequently leads to approach/avoidance behavior. Furthermore, consumers don’t perceive an environment element (e. g. scent) in an isolated manner when entering a store. The perception is affected by versatile interacting components. In order to evaluate a store’s potential to confuse consumers, the focus has to be on the environment (including perceivable signals of all marketing instruments).

Mitchell and Papavassiliou (1997 and 1999) first initiated a holistic consideration of Consumer Confusion. They widened the research interest from the rather tight perspective of trade-mark infringement to a more holistic discussion including additional

triggers of confusion in a store environment. They speak of product, price and promotional confusion. Even though, their research broadened the perspective on a relevant phenomenon that has not received sufficient attention in the past, proximate research mostly neglected the conceptual work of Mitchell and Papavassiliou—with the exception of Walsh (2002). However, the latter still focuses on product performance. The factors stimuli similarity, stimuli overload and stimuli ambiguity emphasize merely the emergence of confusion due to characteristics of the perceived assortment in a store (e. g. similarity or variety of products).

So from our point of a *conceptual and empirical analysis of all potential confusion triggers* in a store environment has not yet been conducted. This step seems in particular crucial because the rising degree of competition has led many retailers to intensify their marketing efforts without understanding its (*potentially negative*) impact on consumers (e.g. due to inconsistency or untrustworthiness of the efforts, c.f. Bitner 1992). For instance, many European retailers tried to meet the emerging customer need for environment friendly products. To give consumers orientation, retailers introduced new product labels. Indeed, labelling products enhances mental convenience but since each retailer initiated many equivalent labels for different product ranges using even different assessment standards, the marketing effort lost credibility and entailed confusion. By introducing the Consumer Confusion phenomenon, we want to sensitize retail industry to select marketing measures wisely and in line with their strategy. To do so, retailers need a scale to measure Consumer Confusion in order to assess the impact of (newly introduced) marketing activities.

In order to develop a relevant scale for Consumer Confusion we define the phenomenon as *a result of a temporary exceedance of an individual capacity threshold for absorbing and processing environment stimuli. Consumer Confusion is an emotional state that makes it difficult for consumers to select and interpret stimuli.* The failure of proper information selection leads to lower decision quality or efficiency respectively. Referring to the optimal stimulation level theory (cf., Raju 1981), consumers lose steadily orientation as soon as an individual critical threshold (by means of stimuli intensity) is exceeded. As this threshold is individual and relatively stable, consumers get confused at different levels of stimuli intensity. Up to this optimal stimulation level, consumers are indeed in search of surprising or dynamic stimuli (e.g., promotions or new products). But exceeding the critical threshold, consumers get confused gradually. By specifying stimuli that trigger this exceedance, we provide an instrument to regulate the stimuli intensity in a retail environment. This measure is crucial considering that consumers perceive confusion as a negative emotional state. Nonetheless, through specific behavior patterns (e.g., selective perception), consumers are able to regain an optimal stimulation level. However, this entails a creeping consumer reticence (due to an increasing loss of motivation to approach unknown stimuli), which reflects in stagnating/declining sales. In other words, stimulation is positive up to a certain threshold. Beyond that point, the perceived stimulation intensity turns successively into Consumer Confusion and symptoms of consumption fatigue.

CONCEPTUALIZATION

For conceptualization, we have to identify factors accounting for stimuli intensity within an environment, and thus mapping the assumed structure of the hypothetical construct of Consumer Confusion. The assumption is, the higher the stimuli intensity of an environment, the higher the potential for Consumer Confusion. The intention is that the items, generated by the qualitative study, may be assigned to exactly one of these subsequent conceptually identified factors.

Mitchell and Papavassiliou (1997, 1999) and Walsh (2002) first dealt with marketing related triggers of Consumer Confusion. The authors tie in with the research findings of cognitive psychologists, referring to the information-overload studies of Jacoby (1977) and Malhotra, Jain and Lagakos (1982). Confusion is seen to originate from product overchoice and the information carried on products, hence triggers of confusion turned out to be “stimulus overload”, “stimulus similarity” and “ambivalent, misleading or inadequate information”. Since the determination of these factors took place with a strong focus on products and furthermore originates primarily in the discipline of cognitive psychology, we recognized the need to expand this perspective. Thereby, we came across environmental psychology, which comprises cognitive and emotional consumer responses and entails all elements perceived by consumers in a retail store. We targeted all factors that are capable of increasing the *information rate*.

As essential factors for the information rate, Wohlwill identified mainly “variation”, “novelty”, “complexity”, “incongruence”, “intensity” and “surprise” in his first article (1966). In his second contribution (1974), he condensed the factors to three variables: “intensity”, “variation” and “patterning”. Even before, Berlyne (1960) has documented-exploring stimulus patterns which affect stimulus selection-very similar variables: “novelty”, “uncertainty”, “conflict” and “complexity”. “Uncertainty” can be seen as equivalent to Wohlwill’s “variety” (see FIGURE 1), because Berlyne defines “uncertainty” by the “range of alternative options” (Berlyne 1960). Mehrabian and Russell (1974) continued with the variables identified by the psychologists Wohlwill and Berlyne respectively and developed a unidimensional explanation of the complex stimuli constellation in a retail environment. The concept of information rate integrates all single stimuli within a specified environment and allows a classification by means of the stimuli’s effect on consumers. Mehrabian and Russell (1974) characterized the information rate by the factors “novelty” (unusual and surprising stimuli) and “complexity” (number and changes of stimuli). The information rate is, generally speaking, defined as the sum of information per time unit contained in the environment (see also Raju 1981; Steenkamp, Baumgartner, and Van der Wulp 1996). In other words, the more unfamiliar and the more complex an environment is perceived by consumers, the higher their individual perceived information rate.

Figure 1 summarizes all relevant factors identified by the most important researchers in the discipline of environmental psychology and Consumer Confusion. Interestingly, the Consumer Confusion research approach regards “overload” and “similarity” as isolated dimensions. However, empirical evidence shows that the more items in a product line (even though they objectively differ from each other), the more alike consumers perceive them (Bijmolt et al. 1998). This finding indicates not to address “stimuli overload” and “stimuli similarity” in an isolated way. Furthermore, the factor “surprising” can be expressed by “novelty”, and “intensity” describes the intenseness of the information rate as a whole. We finally identified four constitutive factors for characterizing the information rate, which are widely recognized in environment psychology literature: “stimuli variety”, “stimuli novelty”, “stimuli complexity” and “stimuli conflict”.

Stimuli variety refers to the number of alternative options within an environment. Thereby the options can also be non-decisional like ceiling danglers or technological applications. Stimuli variety arouses uncertainty about matching the options with the own needs. Consumers do not have any cognitive patterns for unknown stimuli yet. These situational effects are subsumed in the factor *stimuli novelty*. Diffuse and unclear perceptions of objects cause for *stimuli complexity*. Thereby not the amount but the quality

FIGURE 1
Conceptualising the Information Rate

EP	Berlyne 1960	Uncertainty	Novelty	Complexity	Conflict

 CC = Consumer Confusion

of the subjectively perceived stimuli raise complexity. There is a need for more cognitive effort to comprehend the immediate environment or parts of it. *Stimuli conflict* at last is characterized by two or more similar distincted stimuli. There is more than one appropriate stimulus to solve decision problems.

RESEARCH APPROACH AND METHODOLOGY

Although research has been done in operationalizing Consumer Confusion, it has never comprised all environment stimuli. Dominantly, the focus was set on products (e. g., similarity and overchoice) or information on products (e. g., similarity and overload). Confusion triggers emerging from other marketing instruments (e. g., store personnel, price strategy) are often not considered. We strive to identify precise triggers of Consumer Confusion within a retail environment. Thereby we specify factors based on the above mentioned research, but determine their indicators by means of qualitative research and with a specific focus on shopping behavior.

The scale development process (see FIGURE 2) thereby relies on widely accepted paradigms provided by Churchill (1979) and applied or reviewed by Peter (1981), Anderson and Gerbing (1982), Gerbing and Anderson (1988), as well as Baumgartner and Homberg (1996).

To describe the complexity of the Consumer Confusion phenomenon, we accomplished a conceptual analysis. On the basis of the conceptual conclusions, we conducted four focus groups to operationalize the identified theoretical factors. This procedure ensures the generation of an initial pool of items. Subsequently, we purified the Consumer Confusion scale by exploratory and confirmatory factor analysis. The qualitative and quantitative analyses are discussed in detail in the following sections.

QUALITATIVE ANALYSIS

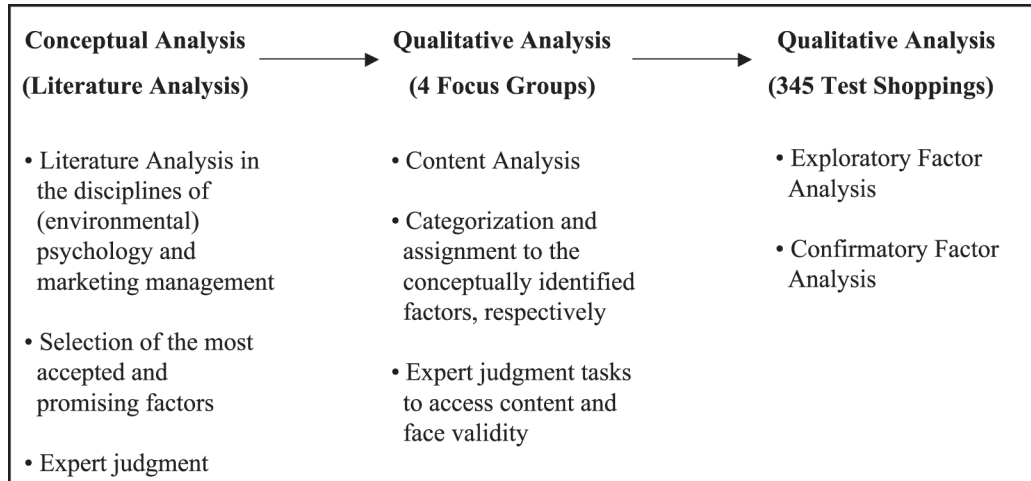

Vaughn, Schumm, and Sinagub (1996) have characterized focus groups as a valid method for learning about participants'

conceptualisations of particular phenomena. Through participant interaction, it's possible to gain insights into individual experiences (Steward and Shaqmdasani 1990). These anecdotes-related to confusion triggers during grocery shopping-account for the generation of relevant items. Content analysis of the focus group discussions form a systemized procedure to identify these items which subsequently can be used to develop a questionnaire for the quantitative study (cf., Greenbaum 1988; Wolff, Knodel and Sittitrai 1993; Nassar-McMillan and Borders 2002). This procedure assures that conscious and unconscious facets of the research interest are gathered in the questionnaire: "The presence of others leads individuals to focus attention on themselves and increases self-awareness and thought about one's own attitudes and feelings" (Bristol and Fern 1993, 445).

To allow for a high content validity, we conducted a pilot test conducting a focus group with four consumers. Consequently we had to slightly interchange some questions in order to guarantee an efficient discussion. Ensuring a representative sample of shoppers, respondents were recruited with regard to customer demographics (obtained by analysing the loyalty card data base of a dominant Swiss grocery store- over 80% of the sales volume is generated by loyalty cards) of the grocery store concerning gender, age and, size of household. The final sample included 14 women and seven men, ranging from 20 to 63 years of age. 11 consumers stemmed from family households, six from single households and the rest from apartment-sharing communities.

The moderator of the focus groups was given a semi-structured discussion guideline. First, the respondents were provided with a brief introduction to the research content and goals. To open the discussion, participants spontaneously had to think of sources of confusion in a retail environment (cf., Fern 2001). Respondents were subsequently asked to recall appendant shopping situations. The interviewers were instructed to ask follow-up questions to ensure that the potential confusion triggers are identified non-ambiguously. All four focus groups were recorded and transcribed.

FIGURE 2
Scale Development Process

Following the process of Mayring's (2003) qualitative content analysis, the transcribed focus group discussions were reduced to relevant indicators, which consequently were assigned to the four factors gained by the conceptual analysis earlier on. Four faculty members familiar with the research project conducted this process independently. A closing discussion led to a minimization of the disagreements. The initial item-generation process produced 26 items: three items for stimuli variety, eight items for stimuli novelty, three items for stimuli complexity and three items for stimuli conflict. A pool of nine items was not assignable to the four initial and conceptually identified factors representing the information rate. Because three, respectively six, non-classified items could easily be subsumed as component elements to a subordinate factor, two new factors called "stimuli comfort" and "stimuli reliability" were created. The initial pool of 26 potential scale items was submitted to a multi-sample scale purification process, which is described next.

QUANTITATIVE ANALYSIS

Scale purification is accomplished with detailed item analyses, exploratory factor analyses, confirmatory factor analyses, and an initial assessment of scale reliability and unidimensionality. We thereby follow the suggestions of Churchill (1979) and Gerbing and Anderson (1988) to item reduction and to assess factor structure. The quantitative study is based on the findings of the qualitative analysis. Thereby, environmental psychologists usually accomplish their empirical considerations by observing individuals in their *behavioural context* (e. g., Donovan et al. 1994; Ittelson et al. 1977; Turley and Milliman 2000).

In order to confront consumers with real shopping situations, we conducted a "buying test" (c.f., Titus and Everett 1996). We provided consumers with a predetermined shopping list, asking them to look for specific groceries within the store. In that way, test persons were immediately confronted with the store environment (e.g., product offering, advertising message) and subsequently with potential confusion triggers. The shopping list is thereby considered relevant, because "if shoppers are familiar with the store, they may experience preconditioned emotional approach or avoidance responses that would override or even hinder the emotions induced by the store atmosphere. Therefore, the validity of the study may be affected" (Tai and Fung 1997, 335). Shopping routines are often expressions of (unconscious) avoidance behavior. Consumers learn

to act in a certain way in order to shelter themselves from too many stimuli and subsequently keep this behavior routine for a (long) period of time—thus there is hardly any cognitive effort in deciding for a product. However, these "reduction strategies" do not constantly prevent consumers from confusion: through marketing measures like product relaunches or changes in product packaging, just to name two, consumers' reduction strategies can become obsolete. This is why we used a shopping list. The list breaches the consumers' routines and confronts them with all environmental stimuli—they now have to newly evaluate the product offer. However, we only considered everyday products for the list (mustard, jam, sweets, grapes, tea filter, salmon). For content validity, three experts judged the questionnaire and the buying test and we conducted a pilot test on 105 consumers in a grocery store. Subsequently five questions had to be rewritten, due to misunderstanding.

The shopping test was carried out in 15 grocery stores of the same retail chain. Again, we recruited consumers regarding age, gender and size of household. To avoid a high rejection rate (because the shopping test takes 25 to 35 minutes), consumers were recruited face-to-face one week earlier at the check out of the respective stores. First, respondents were given the shopping list. After the shopping tour, they were provided with a paper copy of the self-administered questionnaire. This questionnaire contained the 26 confusion trigger items (seven-point Likert-type agree-disagree response format) we identified conducting the focus groups, as well as questions on age, income, gender and size of household. A total of 350 questionnaires were returned. Five of them were judged unusable. Therefore, we ultimately had 345 valid questionnaires in hand.

For *item analysis* we examined the corrected item-total subscale correlation for each set of items representing an assumed factor of Consumer Confusion in advance. Items that do not meet a corrected item-total correlation above .50 are candidates for deletion (Zaichowsky 1985). Non of the Items were below this threshold. Furthermore, the correlations for items with their hypothesized dimensions were compared with their correlations with the remaining dimensions (cf., Bearden, Netemeyer and Teel 1989). Items, that did not show statistically higher correlations with the dimensions to which they were hypothesized to belong to, are subject to deletion. The procedure resulted in no deletion of items.

The remaining pool of 26 items was subject to *exploratory factor analysis* with principal component factoring and oblique

TABLE 1
Exploratory Factor Analysis

Exploratory factor analysis results							
Item No.	Items	Stimuli Variety	Stimuli Novelty	Stimuli Complexity	Stimuli Conflict	Stimuli Comfort	Stimuli Reliability
1	To me, there are too many products to choose from	.76	.30	.15	.28	.05	.09
2	It is not easy, to choose between similar products	.81	.10	.23	.22	.07	-.04
3	Products often seem similar but are not	.67	.22	.08	.08	.15	.31
4	Products in favour are often replaced too frequently	.25	.69	.20	.04	.06	.13
6	Products I'm looking for are often missing in store shelves	.16	.65	.18	.05	.06	.35
7	I frequently have to get used on new labels/promotion programs	.16	.68	.37	.25	.03	.17
8	Shelves and/or products are replaced very often	.12	.67	.00	.01	.11	.30
9	Product packaging of products are often replaced	.20	.77	.20	.19	.13	.19
10	Prices for products are subject of frequent changes	.10	.62	.17	.27	.05	.46
11	Services are often subject of chance	.20	.63	.07	.31	.13	.21
12	I have a hard time to understand product descriptions	.18	.15	.73	.19	.21	.03
13	I'm not sure, what the numerous Labels are standing for	.22	.18	.77	.13	.03	.19
14	Often I'm uneasy if a more expensive product is really better than a cheaper one	.05	.20	.62	.07	.07	.34
15	Some times I'm not sure, if the store wants me to manipulate with the loyalty card program	.13	.15	.20	.79	.23	.34
16	It's critical, that my personal data is available for the store by means of the loyalty card	.21	.15	.16	.75	.27	.18
17	I believe, that the store urges me sometimes to buy something	.25	.19	.08	.74	.19	.14
18	I'm already irritated, if I'm confronted with a long waiting line at the check out, entering the store	-.04	-.01	.02	.04	.70	.30
19	Customers shopping in this store, are sometimes annoying	.17	.18	.21	.28	.78	-.02
20	Crowding in this store often disables an agreeable shopping	.18	.18	.10	.37	.81	.18
21	Some times it's difficult to judge the quality of a product	.31	.31	.32	.14	.24	.64
22	I often get only vague information	.11	.26	.23	.26	.22	.68
23	Some times I'm not sure, if I can rely on the ads messages	.20	.35	.47	.35	.12	.54
24	The product's picture on the package some times doesn't correspond with the real product	.17	.30	.06	.40	.21	.64
25	Sales often are only slightly cheaper than the regular price	.18	.42	.33	.33	.15	.58
26	I believe, that the store frequently increases prices without informing consumers	.08	.48	.31	.25	.13	.61

Extraction Method: Principal Component Analysis. Rotation Method: Oblimin with Kaiser Normalization.

rotation using SPSS 12.01 software. Items exhibiting low factor loadings ($< .50$) and high cross-loadings ($> .50$) were candidates for elimination (cf., Hair et al. 1998). After inspection, one item was deleted. The remaining 25 items were subject to further exploratory factor analysis. A final six-factor model was estimated. Applying the same empirical considerations, no further items had to be eliminated. The deletion of any item would have weakened the scale's reliability. The key data of the item pool purification process is shown in table 1. Furthermore, the factor solution accounted for 55% of the total variance and exhibited a KMO measure of sampling adequacy of .853. All communalities ranged from .45 to .70.

Next step for scale purification is a *confirmatory factor analysis* (cf. Gerbing and Anderson 1988). A 25-item, six-dimension confirmatory factor model was estimated using LISREL 12.1 (Jöreskog and Sörbom 1996) and maximum likelihood method. Inspection of model fit revealed indices that were all above acceptable thresholds (Hair et al. 1998; Bentler and Bonett 1980): Chi-Square (260, $N=345$)=413.70, $p=.000$; Chi-Square/df=1.59; GFI=.92; AGFI=.90; CFI=.97; NNFI=.97; standardized RMR=.051; RMSEA=.039. We are aware, that using confirmatory factor analysis on an already purified item battery for the same sample will result in a certain tendency to obtain inflated fit indices. Nevertheless, these results show evidence of a six-factor scale (which has to be validated through replicating the confirmatory factor structure on an independent sample).

The results indicate that measures are unidimensional, with each item reflecting one and only one underlying construct (Gerbing and Anderson 1988). The proposed model fits the data adequately. Factor correlations for the confirmatory factor analysis are ranging from a low of .24 (stimuli complexity and comfort) to a high of .69 (stimuli novelty and reliability)-all on a significant level. Further-

more all constructs demonstrated discriminant validity using the Fornell and Larcker's (1981) procedure ($AVE > r^2$). For example, the shared variance between stimuli variety and novelty was .314, whereas the average variance extracted for the two constructs was .61 each. Convergent validity is obtained from the measurement model by determining whether each indicator's estimated maximum likelihood loading on the underlying construct is significant (Bagozzi and Phillips 1982). All confirmatory factor loadings exceed .50 (indicator reliability exceeding .40) and all are significant with t values ranging from a low of 7.32 to a high of 14.06. Therefore, we have evidence of convergent validity.

DISCUSSION

The main contribution of our study was the inquiry of confusion triggers and the following scale development for consumer confusion in shopping environments. We therefore pursued a "two-step approach" by forming four focus groups in order to identify potential confusion triggers. Applying content analysis, this qualitative analysis generated 26 items. For the proximate scale purification, we employed exploratory factor analysis, confirmatory factor analysis, and an initial assessment of scale reliability and unidimensionality. Our results indicate a 25-item and six-factor model exhibiting respectable fit.

Further research is needed for the final scale validation. This activity intends to demonstrate the replication and the stability of the model across independent samples. Having successfully done the scale validation, the next step is to implement the scale into retail management. We expect four steps to effectively use the measurement. First, stores need to analyse the current confusion potential. Having done this situation analysis, manager have to create orientation measures to challenge the confusion triggers. After implementation, there is another need for analysing the confusion poten-

TABLE 2
Confirmatory Factor Analysis

Factor	Items	Construct Reliability	t-value	AVE	Indicator Reliability

SPECIAL SESSION SUMMARY

Coming Home: The Role of Consumption in the (Re)Construction of Heritage among African Americans

Laura R. Oswald, ESSEC Business School

SESSION OVERVIEW

African-Americans currently enjoy the fastest socio-economic growth of any ethnic group in the United States (MarketResearch.com, 1999), recasting “the problem of the color line” dividing black and white America (Dubois, 1996) within a problematic of the culture lines drawn within African American culture itself. The growth of the African American middle class has reshaped the meaning of “mainstream America” in the more fluid and dynamic terms associated with wealth, education, and social status (Wilson, 1980) in addition to race and ethnicity. It has also contributed new urgency to the question of African-American identity in relation to American as well as African culture, since the growth in personal wealth has enabled African Americans to expand the possibilities for cultural definition through consumption rituals such as collecting, travel, and even relocation to Africa (Ball, 1998, Bonsu & Belk, 2003).

Such “heritage rituals” contribute to the construction/reconstruction of personal and cultural identity in the absence of a clear lineage to ancestors in Africa or the Americas. The slash joining/separating cultural construction and reconstruction symbolizes the problematic relation of African Americans to their native culture, since historical links to their African ancestors were disrupted if not destroyed by slavery (Herskovits, 1956), which generated a massive diaspora of Africans throughout the Americas beginning in the 17th century (Bennett, 2003).

The objective of this session is to stimulate dialogue, discussion, and more comprehensive theorizing about transformative consumption theory and practice in relation to cross-cultural consumption rituals among middle class African Americans in search of cultural “roots.” To this end, the session is targeted to the consumer researcher interested in cross-cultural consumer behavior, ethnicity, Africana, or post-modern critical inquiry. The heritage quest is a form of symbolic consumption derived from the internalization of meanings associated with cultural rituals, folklore, artifacts and artisan crafts rather than genealogy per se. It is (trans)formative inasmuch as the heritage ritual anchors the individual in a shared cultural past and social solidarity. The African American heritage quest can be theorized in the framework of the post-modern cultural critique, inasmuch as it posits meaning, being, and identity as provisional, rather than transcendent essences. Following writers such as Bourdieu (1979/1984), Baudrillard (1970/1998), and Derrida (1972/1983), meaning, being, and identity are functions of sign production and consumption, always and already divided between memory and anticipation, between meaning and its other (eg. Baudrillard 1970/1998, Derrida 1972/1983, Lacan 1966/2004).

Session participants examine pilgrimage consumption rituals in a variety of ethnographic research settings. The first study entitled “Constructing Pasts, Serving Today: Appropriating Collective Memory for Identity (Re)Presentation,” journeys through sacred pilgrimages and self-identity formations in the context of American expatriate experiences in South Africa. The second study, “Wearing Identity: The Symbolic Uses of Native African Clothing by African Americans,” examines theories of consumer comfort via the comforting practices of African Americans donned in African dress. The final study entitled, “How African Americans Use Relationships with Kenyan Immigrants in the Heritage Quest,”

explores how interactions between Africans and African Americans facilitate cultural reconnection and maintenance. Data collection and analysis is complete for each of these studies and all have journal papers in preparation.

EXTENDED ABSTRACTS

“Constructing Pasts, Serving Today: Appropriating Collective Memory for Identity (Re)Presentation”

Tonya P. Williams. Northwestern University

John F. Sherry, Jr., University of Notre Dame

Globalization, as a form of movement, may be described as a set of changes in structure, environment, and norms shaping the remembrance of the past while providing a direction for the future. These changes provide the wherewithal for individual and collective identity negotiation and representation (Zukin & Maguire, 2004). Globalization is not new yet the range of people participating is (Appadurai., 1996; Harvey, 2000). The globe once provided a stage for the privileged few and is now a pavilion for many, each seeking to ameliorate their lives.

I don't care however tenuous our connection was, it could be 8, 9, 10, 12 generations ago, to see that [African Americans] come from someplace that is beautiful, that is vast, that is magnificent, it is glorious... Africa ... I went there to have an experience and see try to see something different and try to see if I could frame myself in a different way. (170/176)

Through our informants' experiences, we describe how social capital and collective memory enables the maintenance and representation of identity.

Consumer behaviour literature on possessions and cross cultural movement has focused on consumers negotiating their identity and environment through possessions across home and host environments (Mehta & Belk, 1991; Oswald, 1999; Penaloza, 1994; Thompson & Tambyah, 1999). Individuals employ possessions as symbols of self (Belk, 1988) which may be contested during times of transition (Mehta & Belk, 1991; Oswald, 1999; Penaloza, 1994; Thompson & Tambyah, 1999). Possessions for transitional people has been considered for identity reconstruction reflected in material alterations of the body as well as the recasting of personal history at death (Bonsu & Belk, 2003; Schouten, 1991). That scholarship describes the selection and synthesis of existing and possible aspects of the self that will comprise the (re)presented self. The focus of those scholars is the use of cultural capital, as tastes, individuals engage to navigate society and (re)present identity.

What is lacking in prior research is the consideration of an alternate mechanism enabling possessions across the home and host environments to contribute identity (re)presentation. In our research, we describe the role of collective memory, the shared remembrances of a community (Halbwachs, 1992 [1952, 1941]), on identity (re)presentation in cross cultural movements. Consumer behavior researchers have considered the role of nostalgia and the desires of a mythical yesteryear (Brown, 2003). Collective memory, unlike nostalgia, is the remembrance of the past for the purpose of shaping the present and future (Sherry, 2003; Zerubavel, 1996). Previous research has considered cultural capital as the mechanism for possessing objects in the (re)presentation of self while superficially addressing the role of interpersonal relationships across the home and host environment.

Interpersonal relationships support the desire to maintain or alter identity (re)presentation. In our research, we describe the relationship between movements, appropriation of collective memory, and identity (re)presentation evidenced in consumer behavior through possessions. Identity (re)presentation draws upon notions of liminality (MacCannell, 1976), and negotiating between host and home identity (Mehta & Belk, 1991; Oswald, 1999; Penaloza, 1994; Thompson & Tambyah, 1999). From our data, we derive a framework for the appropriation of collective memory and identity (re)presentation.

Appropriation of collective memory is the result of investing resources to navigate social space (Bourdieu 1984), emphasizing relationships with the self, and their mnemonic communities. The resource enabling African Americans to construct an alternate (re)presentation is social capital, accumulated as entelechy. Entelechy is the vital force fueling the individual pursuit of self fulfillment. Pursuit of self fulfillment requires modification and or construction of the self, including a relevant past, enabled by appropriating collective memory. We describe how African Americans expatriate in South Africa construct and (re)present identity focusing on the appropriation of home and host collective memories. The contribution of this research is the understanding of the role of collective memory in identity construction and representation for people in transition.

In addition to contributing to the consumer behavior literature, this research will inform the collective memory literature. Researchers of collective memory focus primarily on the creation of collective memories in mnemonic communities, periodic commemoration, and the influence on collective identity. The present research illustrates how collective memory is deployed in daily

living and is evidenced in consumer behaviors related to identity (re)presentations.

"Wearing Identity: The Symbolic Uses of Native African Clothing by African Americans"

Benét DeBerry-Spence, University of Illinois at Chicago
Elif Izberk-Bilgin, University of Illinois at Chicago

This research explores the construct of consumer comfort through an examination of African Americans' narratives of African clothing consumption. For many African Americans, wearing African clothing is a pilgrimage, as it enables them to (re)connect with Africa and African peoples, both past and present. Their comfort in this dress attire reflects perceived extensions of African traditions and their ability to use this clothing as a vehicle for expressing social disaffection. Consumers recall the political significance of African clothing in the United States during the 1960s, employing both cultural and historical references as a means of creating personalized comfort.

Comfort is an important construct given that consumers frequently use this term to describe their own thoughts and feelings

about consumption experiences. Yet, its abstractness can make it difficult to study as a theoretical concept and may account for the lack of scholarly research focused solely on the concept of comfort. Existing consumer behavior research conceptualizes comfort as a multidimensional construct with physical, physiological, and psychological aspects (Scitovsky 1992) and situates comfort as an endpoint of consumer activity that yields a stable (Cabanac 2000) and balanced state (Simmons 2001). Studies on consumer convenience address personal comfort as it relates to the value placed on products and services that provide personal comfort and/or save time in performing various activities (Brown 1990). Comfort has also been operationalized as a psychological state that promotes risk avoidance in the context of service encounters (Spake et al. 2003). While the research on comfort has examined the construct as a stable end goal for consumers, little attention has been given to comfort as a means to an end except Shove (2003), which conceptualized comfort as a creative and dynamic process. We extend current theorizing by empirically examining comfort as ongoing practices.

Because consumer comfort is contextual, a multi-site ethnography of African Americans wearing African clothing across multiple consumption settings was conducted. The study comprises depth studies of 8 informants per context, wherein each of the informants was observed wearing African clothing in at least three different consumption settings. In addition to the core consumers, over 70 single informant interviews were conducted. The final research product included a compilation of single interviews with different informants, a series of depth interviews with the same informant and extensive observational data.

Our study findings indicate comfort is both an end-goal consumers desire (i.e., to be comfortable), and a practice in which consumers actively engage (i.e. comforting). African Americans seek comfort from African clothing in four ways: 1) an Authenticating practice—sifting through socially constructed images and personalized ideals of African and African American culture; 2) a Resistance practice—using African clothing to symbolize solidarity with current and historical struggles of African Americans in the United States (Field, 1990); 3) a Homecoming practice—using African clothing to connect with an idealized traditional world or “Motherland” that never existed (Rabine 2002), something that Diasporic Africans have sought since their forcible transportation to the Americas (Boateng, 2004); and 4) a Legacy Transmission practice—using clothing to inhabit a “walking history lesson” for self, family, and others.

The comforting practices employed by African Americans in this study highlight the duality of consumer comfort, specifically illustrating both the static and continual nature of this construct. We believe this has important implications for our understanding of consumer behavior. Just as comfort has been shown to be a key element of consumer goals, like customer satisfaction and convenience, understanding comfort as a consumer practice may enable more comprehensive theorizing about other ongoing consumer behavior, such as identity construction, product meaning development, and acculturation, where comforting is most likely an underlying component.

“How African Americans Use Relationships with Kenyan Immigrants in the Heritage Quest”

L. Wakiuru Wamwara-Mbugua, Wright State University

Although extant research explores issues of racism, discrimination and identity formulation among African Americans, no research has examined the role that African immigrants play in the maintenance and reconnection to African culture by African Americans. In recent times, the attempts to reconnect with Africa can be seen through the adoption of the term African American which was intended to stress the cultural aspects of African ancestry and to move away from the distinction between ethnic groups and racial groups (Waters 1991).

This research examines the role of Kenyan immigrants in the maintenance of African culture among African Americans. Interviews were conducted with twenty-four African Americans (12 men and 12 women) who were the friends, spouses or significant others of Kenyan immigrants in a Southern city. Proper interviewing techniques (Wallendorf and Belk 1989) were utilized in order to ensure that trustworthy data was obtained. The data was analyzed by means of coding patterns and themes with the use of the constant comparative method (Glazer and Strauss 1967). The findings demonstrate that the respondents interact with Kenyans as a way to remain connected to the “Motherland.” These interactions were comprised of such things as: a) attending Kenyan parties; b) attending fund raising events; c) becoming members of the Kenya Association in the city. Five of the respondents had been to Kenya with their friends and six of the respondents were either dating or were married to Kenyans. Twelve of the respondents indicated that they had attended church services with their Kenyan friends. The above examples show varying degrees of interaction but clearly show an active attempt to become a part of the Kenyan community.

Respondents described many ways that they attempted to integrate aspects of the Kenyan culture into their lives, including the placement of African artifacts from Kenya and other countries in their homes, eating and cooking Kenyan recipes, and surrounding themselves with reminders of their imagined “home” in Africa. The respondents also described eating goat and subsequently buying goat meat from the international grocery stores. Our findings are consistent with McCracken (1986) who suggests that cultural

meaning is usually drawn from a culturally constituted world and transferred to a consumer good. As such the consumption of “goat” and other Kenyan recipes enables the respondents to metaphorically reconnect with their African heritage through the act of consumption.

Interestingly, the respondents exhibited some degree of situational ethnicity (Stayman and Deshpande 1989) with regards to their identity. Some of the respondents described themselves as African (from a Pan Africanist perspective), while others said that they identify as African American, because the African is first in this descriptor. One of the respondents indicated that when he was around Kenyans that he identified himself as a Kenyan who was born here. He argued that since his ancestors were from Africa that picking a country was just an extension of this recognition of his ancestry. This was also done to ensure that he was fully accepted when he was at a Kenyan party.

Respondents described the mutual benefits that could be derived from positive relationships between the two groups. To this end, some of the respondents described the influence of hairstyles from Africa among African Americans and in turn the influence of African American hairstyles on Africans. Other examples of this dual influence include such things as clothing, music and dance styles. A recent New York Times article suggested that over fifty thousand legal African immigrants enter the United States every year (Roberts 2005). The article further suggests that more African immigrants have migrated from Africa since 1990 than had migrated in the entire preceding two centuries. If these migration patterns continue then opportunities for mutual benefits as well as dual influences will abound. Since going back to Africa is certainly not feasible for many African Americans, then the next best opportunity for them to reconnect with their African heritage will be through interaction with their African brothers and sisters. Given the evolving identity of African Americans in the United States, the future may result in a redefinition of African American identity. A possibility might be that the term “African” might describe all black people and this will add another dimension to the problem of identity in relation to African Americans in the United States.

Situation Variation in Consumers' Media Channel Consideration

Sonja Wendel, Maastricht University
Benedict G.C. Dellaert, Maastricht University

EXTENDED ABSTRACT

Recent advances in communication technology such as the Internet have changed managers' and consumers' ideas about how firms and customers should interact (e.g., Watson et al. 2000); increasingly, consumers are viewed as active participants in supply chain value-creation processes (e.g., Wind and Rangaswamy 2001). An important consequence of this new perspective is that it has become more important for firms to provide their consumers with information about their offerings. For example, in the case of online customization (e.g., Dell), consumers must be able to understand the details of many product variants to judge which variant is most suitable for them and provide their made-to-measure specifications (Huffman and Kahn 1998). In the case of food products, consumers need to understand how they can use the manufacturer's product enjoyably and safely.

In turn, manufacturers are faced with new questions about how to communicate with their consumers. First, in the context of specific media channels, how should product information be designed to communicate effectively with consumers? For example, recent research highlights the interactive nature of new media channels such as the Internet, as well as the requirements this places on communication design (Stewart and Pavlou 2002). Second, which media channels should be used to communicate with consumers? Even if product communications are well designed, they may be ineffective if the messages are sent through media channels that consumers do not consider.

We address this second question in the current study. In particular, we analyze consumers' consideration of media channels by investigating which channels they find acceptable for use. Furthermore, we propose that the concept of a consideration set can be extended to the field of media channels and investigate how consumers' media channel consideration is related to the communication benefits (e.g., trustworthy, detailed) they perceive these various media channels to possess. In our analysis, we also investigate the notion that consumers' consideration of media channels depends on the specific usage situation (e.g., Seybold 2001). This phenomenon has been well supported by previous work on the effect of situational variations on consumer preferences for products and services (Srivastava, Leone, and Shocker 1981). We hypothesize that situational differences in consumer preferences exist in consumers' media channel consideration and argue that the usage situation influences which benefits consumers require from a media channel. Specifically, it is expected that consumers' media channel consideration will shift according to the usage situation and that this shift is due to differences in the requirements they have for the media channels.

We formulate a random coefficient binary logit model to test the proposed relationships of respondents' perceptions of various media channel benefits, usage situation-specific requirements, and media channel considerations in their search for product information. We use survey data from 453 consumers who had the responsibility for food purchases in their household.

The survey was constructed on the basis of the Association Pattern Technique (APT) (ter Hofstede et al. 1998; ter Hofstede, Steenkamp, and Wedel 1999) to investigate the different relationships between media channels, media channel benefits, and situations. The APT was originally developed to study the relationships consumers perceive between different products, product benefits

(e.g., low in calories), and their personal objectives (e.g., to be healthy). Unlike qualitative approaches to collecting data, the APT approach allows us to quantify the relationships between the media channels and their perceived benefits, as well as between the situations and benefits in which we are interested in.

Based on three focus groups and discussions with industry experts, we identified 14 relevant channels and 8 media channel benefits that were most relevant in the context of food product information. Of the 14 media channels in the survey, 3 were Internet-based channels: the manufacturer's website, a third-party website about cooking, and a food information website created by an independent agency. We also included 11 more traditional media channels, including television advertising, television programs, radio advertising, radio programs, magazine advertising, magazine articles, newspaper advertising, newspaper articles, in-store magazines, product labels, and educational brochures. The 8 media channel benefits included in the study were whether a media channel was trustworthy ("trustworthy"), provided detailed information ("detailed"), took little time to use ("time saving"), was easy to use ("easy"), was tailored to the individual user ("personal"), was exciting and arousing ("stimulating"), was informative ("informative"), and was relaxing to use ("relaxing"). The following three hypothetical usage situations were identified: (1) a food scare in which an ingredient in one of the manufacturer's food products was contaminated, (2) a new product introduction in which the consumer is interested, and (3) a search for a recipe so the consumer can prepare a meal that includes one of the manufacturer's food products.

Our model provides strong support for the fact that most media channel benefits have a significant effect on media channel consideration. We find significant positive results at the 0.05 level for all media channel benefits except "trustworthy" and "informative." Furthermore, we investigated the role of usage situation as a driver of media channel benefits that consumers require. The results reveal that consumers' required media channel benefits differ significantly across the three usage situations (food scare, new product introduction, and recipe search). In case of a food scare, we observe significant differences from the average at the 0.05 level for almost all required benefits except "easy" and "stimulating," whereas in case of a new product introduction, we find significant effects for the benefits "trustworthy," "detailed," and "informative." Our results also provide support for the hypothesized interaction of consumers' required and perceived media channel benefits on media channel consideration. We find significant positive results at the 0.05 level for the media channel benefits "trustworthy," "easy," "stimulating," and "informative." Furthermore, the results of the random coefficient estimates indicate significant coefficient heterogeneity across consumers' evaluations of the perceived media channel benefits, as well as across the media channel intercepts.

Perceived Risk and Deliberation in Retailer Choice: Consumer Behavior towards Online Pharmacies

Oliver B. Büttner, Georg-August-Universität Göttingen
Sebastian Schulz, Georg-August-Universität Göttingen
Günter Silberer, Georg-August-Universität Göttingen

With the rise of electronic commerce, traditional ways of distributing pharmaceuticals have been supplemented by online pharmacies. However, as the online environment offers further opportunities for fraudulent suppliers, there are also dangers associated with the purchase of drugs online (Arruñada 2004). For example, a consumer's health might be jeopardized by counterfeit medications bought online, or sensitive health-related information may be passed on illegally, resulting in adverse social or financial consequences to the individual. A recent report from the UN highlights the significance of the topic: The online distribution of pharmaceuticals is deemed to facilitate the circulation of dangerous drugs by undermining established control mechanisms (International Narcotics Control Board 2005). Threats to consumers are not restricted to dubious suppliers; even genuine online pharmacies suffer from severe deficiencies in, for example, the quality of the medical advice (Stiftung Warentest 2005).

Research on consumer behavior towards online pharmacies is scarce. Büttner and Göritz (2005) found that perceived trustworthiness of an online pharmacy is a crucial factor effecting consumers' intention to buy as well as their actual risk-taking, and that perceived trustworthiness is related to the risk associated with buying medication online. However, a better understanding of how consumers handle these risks when interacting with online pharmacies would be valuable to both retailers and public policy makers. Studying consumer behavior towards online pharmacies can also contribute to research on e-commerce in general: As online pharmacies were legalized in Germany in January 2004 — only a few months prior to the study — the effects of various factors encountered in more mature markets, such as coexistence of new retailers and established brands or different levels of consumer experience, could be discounted. This enabled an in-depth investigation of the basic processes that underlie consumer choice of online retailers. For this, we drew on the risk-taking framework established by Bauer (1960).

THEORETICAL BACKGROUND AND DEVELOPMENT OF HYPOTHESES

The notion of consumer behavior as risk-taking focuses on the understanding that consumer decisions can have adverse consequences, which may or may not occur (Bauer 1960; for an overview, see Mitchell 1999). The central concept is perceived risk — assumed to consist of a probability and a magnitude component. The probability component refers to the likelihood that a certain action (e.g., buying a product) will have negative consequences for the consumer, whereas the magnitude refers to the severity of those consequences (Dowling and Staelin 1994; Mitchell 1999). If a purchase is perceived as risky, consumers will employ strategies to reduce the perceived risk until it is below their level of acceptable risk or, if they are unable to do so, withdraw from the purchase (Dowling and Staelin 1994). Within this context, Bettman (1973) distinguishes between inherent and handled risk. The former refers to the risk *before* and the latter to the risk *after* the consumer has applied risk-reduction strategies. Thus, inherent risk is a determinant of risk-reduction, whereas handled risk is the result thereof.

Most research on perceived risk has focused on the choice of the product. Here, the product class has been found to contribute to

the risk inherent in the purchase decision (e.g., Dowling and Staelin 1994). Therefore, Dowling and Staelin (1994) distinguish between product class risk (“the riskiness of buying ‘an average product’”, p. 119) and specific product risk (determined by the particular product under consideration and other factors such as the purchase situation). There are also a smaller number of studies explicitly addressing perceived risk and the selection of retailers. Cox and Rich (1964) report that consumers perceive telephone shopping as risky and mainly tend to purchase low risk products by telephone. Dash, Schiffman, and Berenson (1976) observe differences in the level of perceived risk between specialty store and department store shoppers, while Mattson (1982) shows that the selection of a store type varies with social and financial risk inherent in the purchase situation. In the literature on electronic commerce, the risk associated with online shopping in general (Garbarino and Strahilevitz 2004) and with a specific retailer (Jarvenpaa, Tractinsky, and Vitale 2000) has been found to be adversely related to intention to buy. Biswas and Biswas (2004) demonstrate that signals such as reputation matter more in e-commerce because of higher risks associated with buying online.

What conclusions can be drawn from these studies on retailer selection? First, the level of perceived risk varies with the type of retailer. Hence, and in an analogous manner to product class risk, we will consider the risk linked to buying from an “average” retailer from within a particular class (e.g., online pharmacies) as “retailer class risk”. Both product class risk and retailer class risk have been identified as important factors, but the exact way in which these two factors together contribute to the risk inherent in a purchase decision has not been experimentally investigated. While product class risk has been manipulated in studies on product choice (Gürhan-Canli and Batra 2004), retailer class risk has been neglected in experimental research. Moreover, previous research has focused on the final choice of retailer, rather than on the preceding deliberations. We have therefore experimentally investigated the impact of product class risk and retailer class risk on consumer deliberation when choosing between providers. We focused on a larger part of the decision process than previous studies by examining the influence of both risk types on the risk perceived as inherent in the decision, on consumers' information processing while on the website, and on final outcomes of the deliberation process.

Inherent Risk

Within the two-component model, the relationship of product class risk and retailer class risk to the risk inherent in a purchase decision that includes retailer selection can be elaborated further. We assume that the magnitude component of inherent risk perceived in a purchase decision is linked to product class risk, and the probability component predominantly related to retailer class risk. Due to the information asymmetry between customer and retailer, consumers do not know in advance whether a retailer can perform well or intends to cheat the customer (performance and relational risk; Das and Teng 2004 p. 101). With regard to these possibilities, a consumer's assessment of a retailer can be described in terms of their judgment of the likelihood that something will go wrong during the transaction (Kee and Knox 1970), and therefore it is linked to the probability component of perceived risk (cf. Das and

Teng 2004). The magnitude of the consequences, however, can be assumed to be independent of retailer class risk. For instance, the consequences of receiving the wrong medication do not differ whether it is purchased using a 'virtual' online pharmacy or in a 'real' pharmacy.

We further suggest that the magnitude component of inherent risk is determined by the product class. For instance, in the pharmaceutical domain, the magnitude of negative consequences differs substantially depending on the class of medication: A fake headache remedy is less critical than an ineffective counterfeit drug for coronary heart disease. In general, the probability of a negative outcome can be assumed to be independent of the product class. For instance, the likelihood that a hacker gets access to the details of a customer's order or the condition of their health during an online transaction is not linked to the particular class of medication being purchased. Hence, we propose the following hypotheses:

- H1* Product class risk influences the magnitude component but not the probability component of inherent risk in a purchase decision. When product class risk is high (low), consumers judge the seriousness of negative outcomes as high (low).
- H2* Retailer class risk influences the probability component but not the magnitude component of inherent risk in a purchase decision.¹ When retailer class risk is high (low), consumers judge the probability of a negative outcome as high (low).

Information Processing

If a purchase is perceived as risky, the consumer will employ strategies to reduce the perceived risk until it is below his or her level of acceptable risk (Cox and Rich 1964; Dowling and Staelin 1994). One strategy for risk-reduction is to consult information provided by the retailer (Dowling and Staelin 1994; Mitchell and McGoldrick 1996). Hence, we propose that product class risk as well as retailer class risk will influence consumers' information search on the website of an online retailer:

- H3a* When product class risk is high (low), consumers search for more (less) information while visiting the website.
- H3b* When retailer class risk is high (low), consumers search for more (less) information while visiting the website.

Whether customers are persuaded by a website that a purchase is safe depends on how consumers process the information provided. Consumers' level of involvement moderates how such persuasive messages are processed: If involvement is high, consumers focus on the arguments of a message, whereas they process more peripheral cues such as pictures if involvement is low (Petty and Cacioppo 1986). On a website, arguments are provided by the content, while the interface (design, navigation etc.) gives peripheral cues. As the risk associated with a decision has been found to increase involvement (Laurent and Kapferer 1985), we assume that

¹There might be exceptions regarding certain facets of product class risk. For instance, a higher price involves higher financial risk (magnitude component) to the customer but also provides a higher incentive for the provider to cheat, thereby making fraud more probable (probability component). This does not invalidate our assumptions because financial risk is only one facet of product class risk. Moreover, although such links might exist at the level of objective risk, these links might not be obvious enough to the consumers in order to enter their assessment of perceived risk.

the perceived risk influences which elements of a website consumers tend to focus on:

- H4a* When product class risk is high (low), consumers process more (less) content-related aspects of a website while visiting the online shop.
- H4b* When retailer class risk is high (low), consumers process more (less) content-related aspects of a website while visiting the online shop.

Outcomes of Deliberation

The success of retailers in communicating their trustworthiness is reflected by consumers' perception of this quality. Perceived trustworthiness entails judgments regarding a retailer's competence, benevolence, and integrity as well as the predictability of the retailer's behavior (McKnight, Choudhury, and Kacmar 2002). Perceived trustworthiness has been claimed to be the "mirror image" of perceived risk (Das and Teng 2004) and has been found to be inversely related to handled risk (Jarvenpaa et al. 2000). Therefore in an analogous manner to handled risk (cf. Bettman 1973), perceived trustworthiness may be assumed to be influenced by inherent risk both in a direct and an indirect way, the latter mediated by information processing related to risk-reduction. Indeed, perceived trustworthiness of online shops has been found to be related to evaluations of the website (Koufaris and Hampton-Sosa 2004) as well as to the risk inherent in a purchase decision (Büttner and Göritz 2005). Hence, we propose the following hypothesis:

- H5* Perceived trustworthiness of an online shop will be determined negatively by product class risk, negatively by retailer class risk, and negatively (positively) by consumers' negative (positive) thoughts formed during their visit to the website.

If perceived trustworthiness is adversely related to handled risk, then high trustworthiness should encourage consumers to take risks with a retailer (McKnight et al. 2002). Indeed, research on electronic commerce has found that trust fosters the intention to buy from an online retailer (Jarvenpaa et al. 2000; McKnight et al. 2002). Hence, we propose the following hypotheses:

- H6a* The more trustworthy an online shop is perceived to be, the higher the consumer's intention to buy from the online shop.
- H6b* Differences in perceived trustworthiness determine a consumer's choice of online shop. Consumers prefer the option that is judged as more trustworthy.

METHOD

Sample and Procedure

Ninety-four participants, mainly from the local university, volunteered to participate in the study. Sixty-nine percent were students and another 19% were employed. The mean age was 27.17 years, SD=6.58, and 49% were female. Eighty-six percent had purchased at least one product online but only 7% had ever visited an online pharmacy. As an incentive, participants were allowed to choose between a box of cookies and a bottle of wine.

The study was conducted in a laboratory. We applied a 2 (product class risk: low vs. high) x 2 (retailer class risk: low vs. high) design. Product class risk (PCR) was manipulated by variations in the task. In the low PCR condition, participants were told that they had run out of headache remedies and were attempting to order an

over-the-counter (OTC) replacement from an online pharmacy. Participants in the high PCR condition were told that they were to order a particular drug for high blood pressure that was only available on prescription. They were told that an older relative with a corresponding prescription had asked them to order the product on their behalf.² Retailer class risk (RCR) was manipulated by a short newspaper report that all participants were required to read. The report provided neutral information about internet pharmacies and their price policy. In the high RCR condition, the report also cited critical comments from consumer protection associations that highlighted the problems of inadequate advice and counterfeit drugs; these comments were missing in the low RCR condition. Participants were randomly assigned to one of the four experimental groups.

Participants read the short newspaper report and received instructions to visit the sites of two given online pharmacies and to search for either the OTC medication (PCR low) or the prescription drug (PCR high). They were asked to evaluate both pharmacies and were permitted to move around the websites as well as to switch freely between the two providers. The online pharmacy to start with was counterbalanced across the experimental groups. During the experiment, screen content was recorded in a video using screen capture software. After 15 min surfing, participants' thoughts from the shopping episode were assessed using video-cued thought protocols (Silberer 2005): The captured video was presented and participants were asked to concurrently verbalize the thoughts they remembered from the surfing episode. In order to avoid annoying the interviewee, the interview was stopped after the participant had commented on the first 5 min of the original surfing episode.

Measures

Inherent risk was assessed after participants had visited the websites because asking for perceived risk beforehand may have produced artifacts by sensitizing participants to potential risks. Nevertheless, it can be assumed that inherent risk was captured by the questionnaire, as the items referred to an assessment of buying medication online in general rather than from a particular retailer. For measuring the probability component of inherent perceived risk, six of the seven items from Büttner and Göritz (2005) were used (see table 1). For the magnitude component, the severity of each of the six consequences was estimated on a 7-point rating scale. Perceived trustworthiness was assessed for each online pharmacy using the 12-item scale from Büttner and Göritz (2005), both α s=.90. The intention to buy was assessed for each pharmacy using a single 7-point rating item where participants could indicate the likelihood of purchasing at the respective pharmacy (1=not at all; 7=yes, definitely). Moreover, participants were asked to indicate from which online pharmacy they would have purchased in a forced choice set (A, B, none of the two).

Information search and information processing were coded from the commented videos. Two raters analyzed the transcripts of a number of protocols and discussed the coding of the verbalizations until consensus was established. Then, the remaining proto-

cols were coded verbatim by one rater. Each discrete verbalization that matched one of the established categories was counted for each participant. Information search refers to all verbalizations where participants stated that they had actively sought information concerning the products or the provider (example: "Here, I wanted to know more about this"; participant clicks on shipping expenses). For information processing, we distinguished whether the verbalization referred to content ("By comparing the prices, I noticed that this pharmacy was less expensive") or interface characteristics of the website ("I liked the fact that there were pictures"). Furthermore, all information processing verbalizations were rated as either being positive, negative, or neutral.

RESULTS

Inherent Risk

All statistical tests in this and the following sections have been conducted two-tailed at an α -level of .05. As the treatments for product class risk and retailer class risk cannot be expected to influence all risk items, perceived risk was analyzed at an item-level instead of forming a scale (Garbarino and Strahilevitz 2004). A 2 x 2 MANOVA on the probability ratings for perceived risk showed a significant main effect for RCR, $F(6, 82)=3.65$, $\eta^2=.21$, $p<.01$. Further univariate analyses showed that the probability of receiving counterfeit drugs was rated higher when RCR was high (see table 1). The main effect for PCR is also significant, $F(6, 82)=2.81$, $\eta^2=.17$, $p<.05$. Univariate analyses showed that the risk of late delivery of medication is judged as more likely in the high PCR group, whereas the probability of receiving counterfeit drugs is higher in the low PCR condition (see table 1). The MANOVA yielded no significant interaction effect, $F(6, 82)=1.09$, $p>.37$.

With regard to the magnitude ratings of perceived risk, a 2 x 2 MANOVA yielded no significant main effect for RCR, $F(6, 82)=0.64$, $p>.70$, and no significant interaction effect, $F(6, 82)=0.46$, $p>.83$. The main effect for PCR slightly misses the α -level of .05, $F(6, 82)=2.14$, $\eta^2=.14$, $p<.06$. Further univariate analysis showed significant differences for the risk "loss of medical privacy", $F(1, 87)=4.53$, $\eta^2=.05$, $p<.05$, and for late delivery of medication, $F(1, 87)=7.50$, $\eta^2=.08$, $p<.01$. The consequences of these risks are rated higher when PCR is high (see table 1). In summary, product class risk influences both the magnitude and the probability component. Thus, hypothesis 1 is only partially supported. Hypothesis 2 is clearly supported: Retailer class risk influences the probability component of inherent risk but not the magnitude component.

Information Processing. For testing the influence of PCR and RCR on information search activities, a 2 x 2 ANOVA was conducted. The main effect of PCR was significant, $F(1, 84)=10.70$, $\eta^2=.11$, $p<.01$, and as predicted, $M_{PCR-}=2.81$ vs. $M_{PCR+}=3.89$, thus supporting hypothesis 3a. The main effect of RCR was not significant, $F(1, 84)=1.13$, $p>.28$, whereas the interaction effect was significant, $F(1, 84)=4.92$, $\eta^2=.05$, $p<.05$. Simple effects tests show that when PCR is high, information search is higher in the high RCR group, $M_{RCR+}=4.39$, than in the low RCR group, $M_{RCR-}=3.33$, $F(1, 88)=5.20$, $\eta^2=.06$, $p<.05$. No significant difference between low and high RCR was found in the low PCR condition, $F(1, 88)=0.72$, $p>.40$. This finding partially supports hypothesis 3b.

As an indicator of information processing, we used the proportion of content-related verbalizations to all verbalizations. A 2 x 2 ANOVA showed a significant main effect for PCR, $F(1, 88)=47.59$, $\eta^2=.35$, $p<.001$. The main effect for RCR was significant at an α -level of .10, $F(1, 88)=3.35$, $\eta^2=.04$. No significant interaction was found, $F(1, 88)=1.06$, $p>.30$. All differences are as predicted, $M_{PCR-}=.44$ vs. $M_{PCR+}=.68$, $M_{RCR-}=.52$ vs. $M_{RCR+}=.59$. Hence, hypothesis 4a is supported by the data. With regard to RCR, the

²The older relative was introduced to render the scenario more realistic and is not supposed to alter other characteristics of the decision (e.g., its significance) beyond the manipulated product class risk. This assumption is supported by preliminary results from an experiment in which we used the same scenarios but independently manipulated product class risk and target of purchase: Purchase decision involvement was influenced by product class risk but not by whether participants purchased for themselves or for an older relative (Schulz, Mau, Büttner, and Silberer 2006).

TABLE 1
Mean Differences of Perceived Risk Items (for Main Effects)

		Overall	Product Class Risk		Retailer Class Risk	
			Low (N=48)	High (N=46)	Low (N=47)	High (N=47)
Loss of privacy	<i>Prob</i> ^a	3.89 (1.57)	3.70 (1.49)	4.09 (1.64)	4.02 (1.57)	3.77 (1.56)
(medical data)	<i>Magn</i> ^b	4.68 (1.89)	4.28 (1.94)	5.11 (1.75)*	4.43 (1.93)	4.91 (1.84)
Inadequate Advice	<i>Prob</i>	4.91 (1.51)	4.83 (1.37)	5.00 (1.66)	4.93 (1.52)	4.89 (1.52)
	<i>Magn</i>	5.81 (1.44)	5.55 (1.52)	6.09 (1.32) [†]	5.75 (1.41)	5.87 (1.48)
Counterfeit Drugs	<i>Prob</i>	3.13 (1.35)	3.40 (1.30)	2.86 (1.37)*	2.70 (1.37)	3.55 (1.21)**
	<i>Magn</i>	6.71 (0.69)	6.64 (0.85)	6.80 (0.46)	6.73 (0.50)	6.70 (0.83)
Credit Card Misuse	<i>Prob</i>	2.70 (1.32)	2.60 (1.15)	2.82 (1.48)	2.81 (1.32)	2.60 (1.33)
	<i>Magn</i>	6.40 (1.21)	6.23 (1.27)	6.57 (1.13)	6.39 (1.37)	6.40 (1.21)
Loss of Privacy	<i>Prob</i>	4.65 (1.58)	4.60 (1.48)	4.70 (1.69)	4.89 (1.32)	4.43 (1.78)
(nonmedical)	<i>Magn</i>	5.00 (1.49)	5.06 (1.31)	4.93 (1.68)	5.20 (1.34)	4.81 (1.61)
Late Delivery	<i>Prob</i>	3.66 (1.45)	3.32 (1.34)	4.02 (1.49)*	3.77 (1.43)	3.55 (1.47)
	<i>Magn</i>	5.70 (1.12)	5.40 (0.99)	6.02 (1.12)*	5.77 (1.10)	5.64 (1.15)

Note: SD in parentheses; ^aprobability component (1=not at all, 7=definitely); ^bmagnitude component (1=not serious, 7=very serious); [†] $p < .10$, * $p < .05$, ** $p < .01$ (main effects)

result could be interpreted as favoring hypothesis 4b because the nature of the hypothesis would allow for one-tailed testing. Effect sizes, however, indicate that its impact is negligible compared to those of PCR.

Outcomes of Deliberation

As we assume that perceived trustworthiness is influenced both by information processing and by the two risk types, we regressed intention to buy on four information processing variables (negative and positive content-related, negative and positive interface-related verbalizations; respective proportions on all verbalizations including neutral ones), on product class risk, and on retailer class risk. Due to the video-cued thought protocols being only 5 min in length, we decided to analyze only thoughts referring to the first pharmacy each participant started with and the perceived trustworthiness of this pharmacy. The respective pharmacy was included as a dichotomous control variable in the regression. The regression equation was significant, $F(7, 80)=5.57$, $R^2=.22$, $p < .01$. However, only the proportions of negative content related thoughts, $\beta = -.33$, $p < .01$, and of negative interface related thoughts, $\beta = -.29$, $p < .05$, are significant predictors of perceived trustworthiness (all other $ps > .35$). This only partially supports hypothesis 5. The finding might be attributed to the fact that the treatments PCR and RCR only influence certain aspects of inherent risk and that using an aggregated measure of inherent risk might be more accurate. To further

investigate this issue, we regressed perceived trustworthiness on the significant predictors from the first regression (i.e., proportion of negative content and interface related thoughts) and on the average of the probability, $\alpha = .66$, as well as the magnitude, $\alpha = .56$, measures of perceived risk (internal consistency is no useful criterion as the measures are rather formative than a scale; Mitchell 1999). The regression was significant, $F(4, 80)=8.64$, $p < .001$. Negative content-related thoughts, $\beta = -.26$, negative interface-related thoughts, $\beta = -.31$, and the probability component, $\beta = -.31$, contribute significantly to the equation (all $ps < .01$), whereas the magnitude component is not a significant predictor, $p > .14$.

With regard to the relationship between perceived trustworthiness and intended risk-taking, we found substantial correlations between perceived trustworthiness and intention to buy from the respective pharmacy, $r_A = .62$, $r_B = .60$, $ps < .001$. This supports hypothesis 6a. For testing hypothesis 6b, we used the difference between each pharmacy's perceived trustworthiness. Testing mean differences showed that those who opted for pharmacy A, judged A as more trustworthy than B, $M_{B-A} = -0.60$, and that those who opted for B, judged B to be more trustworthy than A, $M_{B-A} = 0.34$, $t(59) = -4.40$, $p < .001$, supporting hypothesis 6b.

DISCUSSION

In the experiment presented here, we systematically investigated the impact of product class risk and retailer class risk on

consumers' deliberations regarding retailer choice in an online purchase decision. By manipulating these risk types, we found evidence for differentiated influences on the components of inherent risk. When the retailer class risk is higher, the likelihood of a negative outcome is judged to be higher. In contrast, product class risk influences judgments on the magnitude of negative outcomes. However, we also found an influence of product class risk on two facets of the probability component. This might be an artifact of the PCR factor's link with requirement for prescription. Having to send the prescription to the pharmacy before receiving medication makes late delivery more probable. Moreover, prescription drugs are paid for directly by the social insurance. This might be perceived as a control mechanism, thereby lowering the probability of counterfeit in the high PCR condition.

The two risk types also have different impacts on consumers' use of risk-reduction strategies. Product class risk fosters information search on the website, whereas retailer class risk only becomes important if product class risk is high. This is consistent with the view of consumers as adaptive decision makers (Payne, Bettman, and Johnson 1993). If little is at stake, consumers might not feel the need to reduce perceived risk. If the possible losses are high, however, consumers consider further information, such as the likelihood of a negative outcome, when allocating resources to the decision (cf. Laurent and Kapferer 1985). A similar interaction effect between retailer class risk and product class risk is reflected in the findings of Cox and Rich (1964) with a more straightforward risk reduction strategy: When product class risk is high, do not buy from high risk retailers.

Another aspect of consumers' adaptations to the riskiness of the purchase decision has been found for the process of evaluating the website. In accordance with our hypotheses derived from research on persuasion (Petty and Cacioppo 1986), participants process more content-related features of the website when product class risk is high and, to a lesser extent, when retailer class risk is high, thus indicating a more in-depth evaluation of the retailer's website. Perceived trustworthiness, the result of the website evaluation, was found to depend on the information processing as well as on the probability component of perceived risk but not on the magnitude component. The finding indicates that the probability component contributes to the evaluation of a particular retailer as a "general component" – or a baseline –, which is then modified by specific, retailer-related judgments. This is related to Dowling and Staelin's (1994) additive model on product class risk and specific risk as constituents of overall perceived risk.

The results stress the importance of considering both retailer class risk and product class risk in research on online shopping. From the findings presented above, we conclude that product class risk is a determinant of how consumers adapt their strategies when evaluating an online retailer. Retailer class risk adds a little extra to this process, but its main impact can be assumed to be a "base line" to the evaluation of a specific retailer. Whether a particular retailer is judged as trustworthy also depends on the evaluation of the particular retailer. Consistent with findings from research on electronic commerce addressing other product classes (Jarvenpaa et al. 2000; McKnight et al. 2002), perceived trustworthiness has been found to be crucial for a consumer's intention to buy from a provider and in making the choice between competing online shops.

The results from the study also contribute to the ongoing debate on whether the probability and magnitude components of perceived risk are truly independent from each other (Mitchell 1999). The findings that these two components can be separately influenced and play different roles when evaluating a retailer, provide further evidence supporting the assumption that the two are independent.

This study, however, has certain limitations. In real life settings, a wide variety of risk reduction strategies are available to the consumer (Mitchell and McGoldrick 1996). The strategies in our study were limited by both the laboratory setting (e.g., participants could not consult a friend) and the relative immaturity of the market under investigation (e.g., too young to establish brand loyalty). This, however, allowed us to attribute information search to perceived risk; a link that has not always been successfully established (Gemünden 1985). Furthermore, the high proportion of students in the sample may limit the readiness with which the results can be generalized. Nevertheless, the results pertaining to the relationships between the probability components of perceived risk, perceived trustworthiness, and intention to buy have also been demonstrated in a correlational study on online pharmacies that draws on a more heterogeneous sample (Büttner and Göritz 2005). Restricting the study to pharmacies may also have limited the extent to which the conclusions can be generalized. We argue, however, that the results can be applied to online shopping in general because we focused on the basic processes underlying consumer choice when developing our hypotheses. This conclusion is supported by the observation that results from our study are consistent with studies on online shops other than pharmacies (see above).

Keeping these limitations in mind, we are able to make a number of recommendations for the management of online shops. Consumers exhibit different behaviors towards online shops depending on the class risk of the product they wish to purchase. High risk customers will search for more information and evaluate it more critically: They will not be satisfied with nice pictures of the products. Nevertheless, both content and interface have to be considered in the design of the online shop. The finding that negative but not positive evaluations contribute to perceived trustworthiness highlights that customers' requirements have to be considered carefully. If customers' requirements are not met, trustworthiness will decline and, consequently, consumers' willingness to use the online shop.

With regard to online pharmacies, what are the implications for public policy makers? At first sight, the results suggest that consumers do well in handling the situation as they adapt their strategies according to the amount at stake. Shall we therefore claim to leave it all up to the market instead of searching for new ways to protect consumers — even in the high risk domain of medication? Our results do not support such a conclusion. The study examines how consumers evaluate online shops — not how effectively they detect fraud. Indeed, results from Grazioli and Wang (2001) show that consumers often fail to do so. The pitfalls consumers encounter during the evaluation of online retailers should be thoroughly investigated by further research. Providing recommendations that would help consumers to make successful decisions in situations where their health might be at stake would undoubtedly make consumer research more relevant to consumers themselves.

The Moderating Effect of Online Purchase Experience on the Evaluation of Online Store Attributes and the Subsequent Impact on Market Response Outcomes

Byoung-ho Jin, Oklahoma State University

Jin Yong Park, Dong-Eui University

ABSTRACT

The purpose of this study was to propose and test an integrative theoretical model that allows one to determine the relative importance of online store attributes on market response outcomes (i.e., trust, satisfaction, and loyalty), and to examine the moderating effect of online purchase experience on the impact of online store attributes on trust and satisfaction. The empirical results showed that merchandising was the most important attribute to enhancing both trust and satisfaction, followed by security/privacy and order fulfillment. The findings also revealed that the source of consumer trust changes as consumer purchase experience increases, whereas the source of consumer satisfaction remains the same regardless of consumer purchase experience.

INTRODUCTION

One of the critical aims of retailers is to increase consumers' market response outcomes, such as trust, satisfaction, and loyalty. In the online retailing setting, several online store aspects (i.e., website design, security, website quality, etc.) are individually studied as important antecedents of market response outcomes. Although prior studies pertaining to market response outcomes and their antecedents have contributed to understanding consumers' online shopping behavior, some critical gaps remain. First, individual links of market response outcomes with online store aspects are well established. Examples are trust-loyalty (e.g., Harris and Goode 2004), satisfaction-loyalty (e.g., Shankar, Smith, and Rangaswamy 2003; Wallace, Giese, and Johnson 2004), trust-satisfaction (e.g., Singh and Sirdeshmukh 2000), website design-satisfaction (e.g., Montoya-Weiss, Voss, and Grewal 2003), and privacy-trust and satisfaction (e.g., Wagner and Rydstrom 2001). However, integrative attempts of outcomes with online store aspects are lacking. In order to understand consumers' online purchases, it is important to integrate these disparate discoveries so the relative importance of each factor can be judged and appropriately implemented by retailers.

Second, prior studies implicitly assume that consumers' evaluation of online store attributes and the impact on market response outcomes is identical across customers. Several pieces of evidence suggest this assumption might be too simplistic. According to Hoffman, Novak, and Peralta (1999), consumers' evaluation of an online retailer is likely to be different by customers' Internet usage patterns. Online trust varies by a consumer's buying experience (Liu, Dixon, and Murphy 2002) and is moderated by the consumer's degree of trust propensity (Lee and Turban 2001) and duration of relationship (Gounaris and Venetis 2002). Extending these notions, this study posits that consumer evaluation of online store attributes and the impact on consumer trust and satisfaction vary by the degree of consumer online purchase experience. For example, inexperienced e-shoppers might consider the security and order fulfillment aspects of e-tailers more important than other online attributes in building trust, which in turn may lead to customer loyalty. This study attempts to fill such gaps in the literature. Therefore, the purpose of this study is to propose and test an integrative theoretical model that identify the relative importance of each online store attribute on market response outcomes (i.e., trust, satisfaction, and loyalty), and to examine the moderating effect of online purchase experience on the impact of each online attribute on trust and satisfaction.

RESEARCH MODEL AND HYPOTHESES

Online Store Attributes and Trust

In the literature, a significant number of studies focus on a discrete aspect of online store attributes in examining its impact on market response outcomes (e.g., Loiacono, Watson, and Goodhue 2002; Montoya-Weiss et al. 2003; Wagner and Rydstrom 2001; Wolfenbarger and Gilly 2003; Yoo and Donthu 2001). Because a single online store aspect does not determine consumers' reaction to e-tailers, this study considers a comprehensive set of online store attributes, rather than a single aspect. Lindquist (1974-75) synthesized store attributes into nine categories: merchandising, service, clientele, physical facilities, convenience, promotion, store atmosphere, institutional factors, and past transactions. Considering this classification and incorporating online specific characteristics from intensive literature review, this study considers six aspects of online store attributes: website design, order fulfillment, communication, merchandise, security/privacy, and promotion.

In this study, trust is defined as a belief or expectation that the word or promise by the merchant can be relied upon (i.e., credibility) and that the seller will not take advantage of the consumer's vulnerability (i.e., benevolence) (Geyskens et al. 1996). While few studies have attempted to find out the relative influence of each of the online store attributes in building consumers' trust toward the online store, literature provides evidence of individual attributes doing so. For example, Lohse and Spiller (1999) claimed that information content and website design played an important role in building customer trust as these attributes replace the salesperson and physical surroundings of a traditional retail store. Security/privacy, order fulfillment, and communication dimensions are conceptually suggested as important consumer trust builders (i.e., Hoffman et al. 1999; Urban et al. 2000), but empirical support has not been provided. Neither is empirical evidence available with respect to merchandise. It is expected, though, that providing merchandise that satisfies customers' needs will be positively related to customer trust toward e-tailers. One of the most important factors that attracts consumers online is saving money (Abbott et al. 2000). Accordingly, providing monetary incentives may create the impression that the e-tailer is benevolent (i.e., trustworthy). In line with previous literature and reasoning, the following hypotheses are developed.

- H1: The following online store attributes have a positive influence on consumer trust toward e-tailer.
- H1a. Website design,
 - H1b. Order fulfillment,
 - H1c. Communication,
 - H1d. Merchandising,
 - H1e. Security/Privacy, and
 - H1f. Promotion

Online Store Attributes and Satisfaction

Satisfaction is defined as the perception of pleasurable fulfillment and occurs when retailer performance matches or is higher than consumers' expectations (Oliver 1997). Overall, prior studies indicate that satisfaction toward an e-tailer depends primarily on customers' evaluation of performance on various online store attributes. Specifically, the relationship of website design to satis-

faction has received moderate attention. In two service contexts (i.e., a financial service institution and a university), Montoya-Weiss et al. (2003) found that three website design factors (information content, navigation structure, and graphic style) influenced customers' use of an online channel and overall satisfaction. Of the three website design factors, information content perceptions exerted stronger effects on overall satisfaction than navigation structure or graphic style. Site design and convenience were found to have a more prominent role in consumer e-satisfaction than greater breadth of offerings (Szymanski and Hise 2000). Communication with customers by providing information has been found to be important in enhancing customer satisfaction toward e-tailers, too. Shankar et al. (2003) found that ease of obtaining information and depth of information at the website increased overall satisfaction. Information quality also affected satisfaction levels (Park and Kim 2003). Wagner and Rydstrom (2001) provided additional support that customer satisfaction is a positive function of communication, user-friendliness, and privacy. The security and privacy aspect is a significant contributor to customer satisfaction (Park and Kim 2003; Szymanski and Hise 2000; Wagner and Rydstrom 2001). While the influence of the merchandise aspect on customer satisfaction remained unexplored, this study deems that retailers' successful merchandising has a strong impact on consumers' satisfaction levels as consumers seek merchandise that will satisfy their needs through e-tailers. The promotion aspect may lead marginally to customer satisfaction as expectation of savings may be better met by placing online orders than by purchasing offline. This view is supported by Jin and Sternquist (2004), who found that price savings create higher levels of satisfaction. Taken together, we put forth the following hypotheses.

- H2: The following online store attributes have a positive influence on consumer satisfaction toward e-tailier.
- H2a. Website design,
 - H2b. Order fulfillment,
 - H2c. Communication,
 - H2d. Merchandising,
 - H2e. Security/Privacy, and
 - H2f. Promotion

Trust and Satisfaction

While the notion that satisfaction precedes trust is well established in the marketing channel (e.g., Garbarino and Johnson 1999; Geyskens, Steenkamp, and Kumar 1998), we posit that trust leads to satisfaction in the e-tailing context, where trust serves a pivotal role in attracting customers to shop (Hoffman et al 1999; Reichheld and Schefter 2000; Urban, Sultan, and Qualls 2000). Unlike offline retail stores, the inability to interact with a salesperson and merchandise, as well as electronic payment methods, increases consumers' perceived risk of online purchasing. Consequently, trust may provide a stimulus to purchase over the Internet. Singh and Sirdeshmukh (2000) proposed a circular trust model. That is, trust before a specific exchange episode enhances consumers' postpurchase satisfaction, which in turn increases postpurchase trust. As such, this study suggests that customer satisfaction can be achieved only when customers feel comfortable about placing orders over the Internet. Recent empirical findings by Harris and Goode (2004) support a positive direct trust-satisfaction link. Therefore, we expect customer satisfaction to be reflective of customer trust toward the e-tailier.

- H3: Consumer trust positively influences consumer satisfaction with e-tailier.

Trust and Loyalty

Considerable studies have confirmed that trust is a significant driver of customer loyalty (e.g., Chaudhuri and Holbrook 2001; Reichheld and Schefter 2000). According to Reichheld and Schefter (2000, 107), retailers must first gain trust, asserting "to gain the loyalty of customers, you must first gain their trust. That's always been the case but on the web...it's truer than ever." Harris and Goode (2004) concluded that trust might be more important in establishing loyalty in online retailing than in offline purchasing. And, Lynch, Kent, and Srinivasan (2001) found that trust is consistently associated with online loyalty in a number of contrasting national contexts.

- H4: Consumer trust positively influences consumer loyalty with e-tailier.

Satisfaction and Loyalty

Overall, a significant positive relationship between satisfaction and loyalty has been sufficiently documented (Cronin, Brady and Hult 2000; Shemwell, Yavas, and Bilgin 1998; Wallace et al. 2004). Oliver (1999, 42) viewed satisfaction as the "seed" out of which loyalty develops. In a multichannel context, Wallace et al. (2004) found that satisfaction is a significant predictor of loyalty for multiple channel customers, while it is not for single channel customers. The relationship between satisfaction-loyalty is found to be higher online than offline (Shankar et al. 2003). Therefore, our next hypothesis is given:

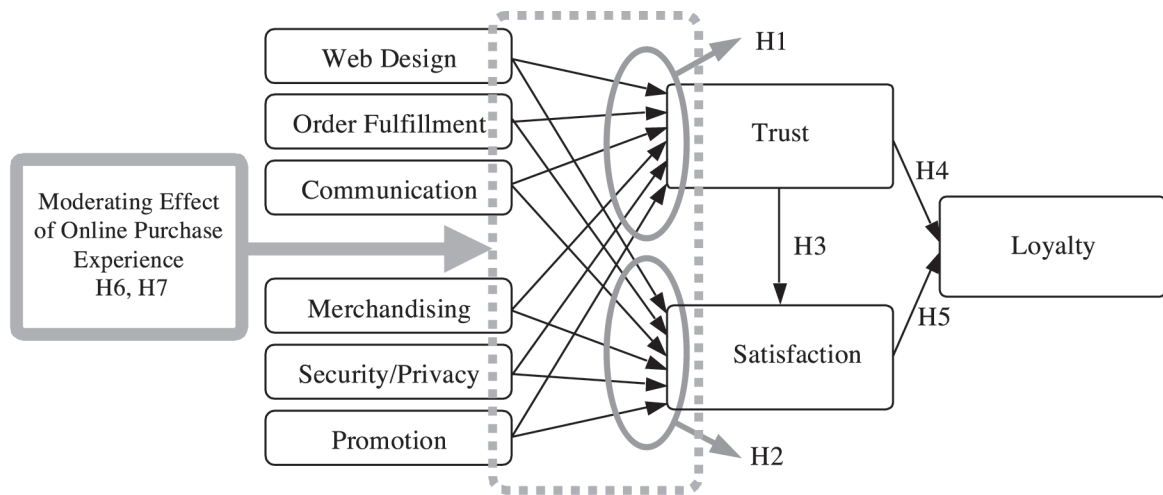

- H5: Consumer satisfaction positively influences consumer loyalty toward e-tailier.

The Moderating Effect of Online Purchase Experience

When deciding whether and how much to trust, consumers look for cues (e.g., trustworthiness attributes). Gounaris and Venetis (2002) found in the industrial service context that the impact of trust antecedents is moderated by the duration of the relationship and that the source of trust changes as the relationship progresses. For example, as the relationship matures, higher levels of the quality dimension (i.e., immediate outcome quality, actual performance of the provider in delivering the service) were found to be more important, whereas potential quality (i.e., cues) was more important at the early phase of the relationship. Following this notion, our study speculates that trust building cues, such as security/privacy, order fulfillment, website design, and promotion become less critical as e-shoppers' experiences increase. Website design serves as the store atmosphere (Abbott et al. 2000; Lohse and Spiller 1999) and, accordingly, is a trustworthiness cue, especially at the beginning of transactions with an e-tailier. E-shoppers are particularly fearful of disclosing personal information related to security, privacy and order fulfillment aspects (e.g., Andrade, Kaltcheva, and Weitz 2002; Hoffman et al. 1999). This concern may be lessened as their purchase experience increases. Consumers are more likely, too, to trust an e-tailier that continuously offers lower prices than competitors. Inexperienced shoppers may be more reactive to this aspect as saving money draws shoppers online (Abbott et al. 2000). Merchandising is an actual performance of the e-tailier. Accordingly, the merchandising aspect is thought to be more critical as an e-shopper's experience with an e-tailier increases. Taken together, the following hypothesis is derived.

- H6: Online attributes-trust link is moderated by the customers' online purchase experience.

FIGURE 1
The Proposed Research Model and Hypotheses

As with the online attributes-trust link, we expect that the online attributes-satisfaction link is also moderated by consumers' online purchase experience. Important attributes that affect the satisfaction level are likely to differ by consumer decision process stages. Chen-Yu and Kincade (2001) discovered that product image was important in the alternative evaluation stage, while product performance and product image affected satisfaction in a post-purchase stage. Abbott et al. (2000) viewed satisfaction as either latent satisfaction (i.e., initial evaluation before purchase) or manifest satisfaction (i.e., after purchase through explicit comparison between consumer expectation and performance). As such, they proposed different impacts of online store attributes on latent and manifest satisfaction. For example, they proposed that the effect of perceived security is higher for latent satisfaction than for manifest satisfaction. Similarly, atmospherics (i.e., website design) and price (i.e., promotion) are critical in latent satisfaction, but their importance is diminished in manifest satisfaction. However, the importance of product assortment and information availability is proposed equally high across the two satisfaction stages. In line with the above study, this study posits that website design, order fulfillment, security, and promotion aspects are more important to consumer satisfaction for consumers with less purchase experience than for their counterparts. In contrast, merchandise and communication aspects are more important for experienced online shoppers.

H7: Online attributes-satisfaction link is moderated by the customers' online purchase experience.

METHOD

Data was collected using two different formats, a mall intercept method and an online survey. This mixed mode approach mitigates coverage errors or other biases resulting from data collection methods. Males and females over 18 who reside in South Korea and who have online purchase experience were chosen as respondents. For the mall intercept method, shoppers at two major department stores and one major discount store in Seoul, Korea, were asked by trained interviewers to complete a questionnaire. An online survey was conducted in cooperation with a major online retailer. The survey was posted on the retailer's website and visitors were invited by means of a pop-up window to fill out the survey.

After checking equivalence of the two covariance matrices using LISREL 8.50 ($\chi^2=56.93, df=45, p=.11$), two data sets (226 from the mall intercept and 227 from the online survey) were combined as a total for further analysis.

Survey Instrument Development

The questionnaire in this study was developed through three phases. In the first phase, 58 items that measure six proposed aspects of online store attributes (i.e., website design, order fulfillment, communication, merchandising, security/privacy, and promotion) were adopted from Loiacono et al. (2002); Mathwick, Malhotra, and Rigdon (2001); Wolfenbarger and Gilly (2003); Yoo and Donthu (2001). Twenty-two items for measuring three market response outcomes (i.e., trust, satisfaction, and loyalty) were compiled from prior studies (Doney and Cannon 1997; Garbarino and Johnson 1999; Srinivasan, Anderson, and Ponnayolu 2002) and translated into Korean by one of the researchers who is fluent in both English and Korean. In the second phase, based on a focus group interview and person-to-person interview results, seven Korean-specific website attributes (e.g., no interest up to 18 months installment) were incorporated into the questionnaire. Lastly, a pretest was conducted with 53 respondents. Based on results of the pretest, the final 35 items for online store attributes and 16 items for assessing the market response outcomes were developed. All items were measured by the seven-point Likert scale (1=strongly disagree, 7=strongly agree), except the extent of online shopping and demographic variables. Respondents were asked to write the name of the e-retailer from which they most frequently shopped and to answer questions with the store in mind.

Respondents

Regarding the respondents, 67% were female, 71% were between the ages of 25 and 39, 84.8% had earned a bachelor's degree or higher, 51.2% were single, and 67.9% had average monthly incomes of \$2,500 or above. This sample could be considered representative of e-shoppers as it was previously reported that frequent e-shoppers are female with high income and education and who are relatively young (Korea Information Strategy Development Institute 2004, June 28).

Measurement Validation

To provide an assessment of the overall validity of the measures, a confirmatory factor analysis (CFA) of online store attributes and market response outcomes was undertaken. The CFA result for online store attributes indicated an acceptable fit ($\chi^2(174)=890.15, p=.00$; GFI=.85; CFI=.83; NFI=.80; RMR=.07). Factor loadings were generally in the .61-.85 range and statistically

significant at $p<.01$, suggesting construct validity. Internal consistency was also proved (table 1). The CFA result of market response outcomes showed an acceptable fit ($\chi^2(51)=289.28, p=.00$; GFI=.91; CFI=.94; NFI=.92; RMR=.04) and factor loadings were in the .63-.89 range, providing construct validity for the measures (trust, satisfaction, and loyalty). Internal consistency was also verified through construct reliability (ranging .81-.89) and Cronbach's

alpha (ranging .80-.88) (table 2). Items in one factor were averaged for further analysis.

RESULTS

The hypotheses of the research model were tested with three structural equation path models. The first model involved testing H1-H5 with the full sample (n=453). The other two models tested H6 and H7 (i.e., the moderating effect of online purchase experience). To test the moderating effect, the total sample was divided into two groups based on the respondent’s number of online purchases in the past year. To ensure high versus low online purchase groups, the top one-third (approximately 33%) was classified as the high online purchase experience group (High, n=150) and the low one-third was classified as the low online purchase experience group (Low, n=154). High group purchased 18 times or more in a year, while Low purchased 6 or fewer times in a year.

Testing the Proposed Model

Results pertaining to the proposed model (H1-H5) are shown in table 3. The overall fit statistics ($\chi^2(6)=18.49, p=.01$; GFI=.99; CFI=.99; RMSEA=.07; RMR=.03) indicated an acceptable level of fit. In testing the effect of online store attributes evaluation on trust, four out of six paths were statistically significant. That is, four online attributes, Order Fulfillment (.14), Merchandising (.36), Security/Privacy (.23), and Promotion (.12), played an important role in improving consumers’ trust toward e-tailers. These results are consistent with Hoffman et al (1999) and Urban et al. (2000). However, the other two paths, Website Design-trust (.00) and

Communication-trust (.04), were insignificant. This finding contradicts Lohse and Spiller (1999) who found that website design increases the customer trust level. Therefore, H1b, H1d, H1e, and H1f were accepted; H1a and H1c were rejected.

In testing the effects of online store attributes evaluation to satisfaction, Order Fulfillment (.20), Merchandising (.27), and Security/Privacy (.20) had significant positive effects on consumer satisfaction toward e-tailers. These results are parallel to previous studies (Park and Kim 2003; Wagner and Rydstrom 2001). However, Website Design (.02), Communication (.05), and Promotion (.03) did not increase consumers’ level of satisfaction. This finding is inconsistent with Montoya-Weiss et al. (2003), Shankar et al. (2003), and Szymanski and Hise (2000) who found that website design and information were important to satisfaction. Therefore, H2b, H2d, and H2e were accepted and the other three hypotheses were rejected.

Hypotheses testing relationships among the three market response outcomes (i.e., paths from trust → satisfaction (.24), trust → loyalty (.36), and satisfaction → loyalty (.38)), were all proved to be significant in our path model. This finding corresponds to prior studies (Harris and Goode 2004; Reichheld and Scheffer 2000; Wallace et al. 2004). Therefore, H3, H4, and H5 were accepted.

Testing the Moderating Effect of Online Purchase Experience

To test the moderating effect of online purchase experience, three steps of multiple group analysis method in LISREL were taken. First, all path coefficients across the two groups (high versus low) were set to free (free model). The chi square value of the free

	<u>Trust, Satisfaction, and Loyalty</u>		
Hypothesis 3	Trust → Satisfaction	.24(6.34) ^a	Supported
Hypothesis 4	Trust → Loyalty	.36(8.08) ^a	Supported
Hypothesis 5	Satisfaction → Loyalty	.38(8.53) ^a	Supported

$\chi^2=18.49$ ($df=6$), p -value=.01, GFI=.99, CFI=.99, RMSEA=.07, RMR=.03

a. $p < .01$

model ($\chi^2=18.13$, $df=12$, $p=.11$) was then used as a base model for comparison of the two groups. In the second step, all path coefficients across the two groups were constrained to be equal (constrained model, $\chi^2=53.88$, $df=24$, $p=.00$). The chi-square difference test (change in $\chi^2=35.8$, $df=12$, $p < .01$) indicated that, as a group, the constrained model was significantly poorer than the free model, allowing us to test individual paths. Therefore, in the third step, the individual path coefficient, taken one at a time, was compared between the two groups (see Sauer and Dick 1993). The chi-square of the free model ($\chi^2=18.13$, $df=12$, $p=.11$) was also used as a base. The twelve constrained models (six online store attributes → trust and six online store attributes → satisfaction) were examined (i.e., each time, just one path was set to equal between groups and the rest were set to free). As table 4 shows, five paths out of twelve were significantly different between groups. That is, the effects of Website Design, Order Fulfillment, Merchandising, and Promotion on trust are significantly different between the groups. In the paths to satisfaction, group difference was found in the Communication-satisfaction path. However, this path was not significant in both groups. This finding indirectly opposes the proposition of Abbott et

al. (2000) that online store attributes had differing influences on latent and manifest satisfaction. Therefore, taken together, H6 was partially accepted and H7 was rejected.

CONCLUSION

The purpose of this study was two-fold. First, the study proposed and tested an integrative model for examining the relative influence of diverse online store attributes on market response outcomes. The findings revealed that Merchandising was the most important attribute in enhancing both trust and satisfaction, followed by Security/Privacy and Order Fulfillment. Promotion exerted the smallest contribution, increasing only consumer trust, not satisfaction. Second, this study examined the moderating effect of online purchase experience on the impact of each online attribute on consumer trust and satisfaction. Specifically, Order Fulfillment, Promotion, and Website Design were the most critical in enhancing consumer trust for low online purchasers, while Merchandising was the most critical in cultivating trust for high online purchasers. Security/Privacy was found to be important in increasing trust for both groups.

An important theoretical contribution of this study stems from discovering the relative importance of diverse online store attributes in enhancing consumer trust and satisfaction. By integrating the online store attributes and market response outcomes, this study enables us to find merchandising to be foremost in enhancing trust and satisfaction. In addition, the merchandising aspect is proved to be more critical in cultivating heavy purchasers. Surprisingly, despite the importance of merchandising, this aspect has not received attention in previous e-tailing study. This study provides multiple reasons why merchandising needs to be taken into account in future studies. A more important contribution of this study comes from examining the differing moderating role of online purchase experience on trust and satisfaction. That is, the source of trust changes as consumer purchase experience increases, whereas source of satisfaction remains the same regardless of consumer experience. Previous studies tended to assume that trust is developed as time passes. This study suggests that consumer trust toward e-tailer may be developed through different sources as experience with e-tailers evolves. This result further adds to the literature that different aspects of online store attributes need to be strategically managed,

keeping in mind consumer online purchase frequency, in order to continue to build trust.

Our findings also generate relevant insights that are more directly applicable to marketing management. A key empirical finding in our study is the relative importance of merchandising in building trust and satisfaction. This parallels Lindquist (1974-75) that merchandise related considerations (e.g., assortment) appeared to be the most critical dimension. This finding, thirty years ago in the offline setting, is still highly relevant in the online context. Therefore, e-tailers are required to maintain a competitive merchandising strategy. Contrary to prior studies, website design and communication aspects did not contribute to enhancing consumer trust or satisfaction. This may be due to the lack of differentiation found among e-tailers and inadequate approaches. For example, most e-tailers use the same communication approach toward every customer, regardless of the customer's experiences. One possible solution would be to tailor communication messages based on the consumer's purchase experience. Such a solution would be possible using data mining. Unlike offline retailing, data mining technology allows e-tailers to easily discern heavy purchasers versus light

purchasers. As order fulfillment was an important aspect to gain trust for low purchasers, e-tailers need to ensure flawless delivery and to communicate this fact to low purchasers. For heavy purchasers, the more diverse aspect of merchandising needs to be communicated because merchandising was proved to be a critical trust cultivator for heavy purchasers. Lastly, this study found that trust precedes satisfaction. Therefore, e-tailers need to build consumer trust first via the identified sources of trust so it can be transferred to satisfaction and eventually to loyalty. In building trust, e-tailers need to remember that the same strategies may not work for every customer.

A couple of limitations of this study suggest potential research opportunities. The proposed model is empirically tested only in one country (i.e., Korea). Comparison of the model with other countries would increase generalizability. Surprisingly, no comprehensive and detailed measurement of online store attributes exists. As antecedents of consumer trust, satisfaction, and loyalty, online store attributes are critical elements that e-tailers can control. Therefore, developing a comprehensive and detailed set of online store attributes could trigger fruitful research in the future.

Consumers' Privacy Concerns and Willingness to Provide Marketing-Related Personal Information Online¹

Chan Ik Park, Information and Communications University

INTRODUCTION

The Internet has triggered revolutionary changes in our lives. People consider it to be a reliable source of information on products and services (Gervy and Lin, 2000). However, the use of the Internet for consumer purchasing has not been growing as fast as its other uses as an information source. One explanation for this disparity in growth rates may be consumers' reluctance to provide personal information on the Internet. For example, Ernst and Young's survey (1999) indicated that the most important reason why consumers do not make purchases on the Internet is their concern about sending out credit card information. A survey showed that only 24.9% of consumers felt comfortable using their credit card for purchasing on the Internet (Graeff and Harmon 2002). Media scrutiny of Internet fraud, hacking, and identity theft has heightened people's awareness of the risks of conducting transactions on the Internet.

While Internet marketing is perceived as either a threat or a nuisance by many consumers, it is a valuable tool for both online and offline businesses. Rapid advances in information technology and the increase of Internet use enable companies to gather, store, and exchange consumer data that can be used for developing more accurately targeted marketing. A typical Internet marketing strategy focuses on a long-term relationship and a series of business transactions with a customer. This strategy becomes possible through the collection of data on customers' buying patterns, preferences, and/or personal information. These databases, however, require consumers to share their personal information, whether voluntarily or involuntarily. In most cases, the nature of e-commerce requires consumers to disclose a certain amount of personal information (e.g., their name, address, and telephone number) and payment information (e.g., their credit card number). The problem is that consumers have generally shown increasing concerns over privacy due to an increase in questionable and illegal activities in the Internet, such as the precipitous rise of junk mail, identity theft, and fraud. Thus, issues of privacy and security in e-commerce have been receiving more attention by researchers in different fields (e.g., Caudill and Murphy 2000; Culnan and Armstrong 1999). Consumers' growing concern over their privacy is a significant problem for the potential growth of e-businesses. According to a survey of Internet marketers, 92% believe that greater consumer confidence of online privacy would lead to an increase in online purchasing (Javis 2000).

A crucial question is what makes consumers voluntarily share their personal information with businesses. The present paper proposes and empirically tests a model of how individuals' willingness to share personal information is determined. More specifically, this paper examines relationships between three factors related to consumers' privacy concerns and one dependent variable: consumers' willingness to disclose personal information.

LITERATURE REVIEW AND RESEARCH MODEL

Privacy concerns in the Internet era

Privacy is often understood as the right to be left alone (Cheskin Research and Studio Archetype/Sapient 1999). The invasion of privacy on the Internet is commonly regarded as the unauthorized collection, disclosure, or other use of personal information (Wang, Lee, and Wang 1998). Even before the Internet era, consumers' personal information was often collected, analyzed, and exchanged for various marketing purposes such as direct marketing and telemarketing. However, pre-electronic consumer transactions provided a natural protection of consumer privacy, particularly where transactions were made in cash and consumers refused to release personal information. Since then, Internet commerce has eroded the benefits of such anonymity (Caudill and Murphy 2000). In fact, Internet has facilitated collection, process, and exchange of personal data in both speed and scope. Now, some commentators argue that it is almost impossible for consumers to transact businesses on the Internet without revealing information about themselves (Rust, Kannan, and Peng 2002). This also caused increased attention to the issue of consumer privacy showing dramatic increase in mass media coverage of the topic in all media formats between 1990 and 2001 (Roznowski 2003). It identified retailers as the most prevalent problem source.

Due to the nature of Internet-based business transactions, one of the major research trends in online marketing or e-commerce has been consumers' concern about their privacy. In a telephone survey, only 24.9 percent responded that they were comfortable using their credit card to make purchases on the Internet (Graeff and Harmon 2002). According to an October 2001 report by Forrester Research, about 60 percent of online users are wary of giving out personal information online, inhibiting roughly \$15 billion of potential e-commerce revenue in 2001 (Kelley, Denton, and Broadbent 2001).

Privacy concerns regarding Internet marketing are not limited to the better known cases of junk-mailing and illicit cookie distribution, but to the selling of consumer databases for direct marketing purposes. Thus, Rust et al. (2002) even argued that the Internet will inevitably cause individual privacy to disappear, and that a specialized market for privacy will emerge. In other words, consumers may have to pay for a certain degree of comparative privacy in the future, but the underlying degree of privacy will continue to be eroded.

In the light of the perceived and actual erosion of consumer privacy, one comprehensive study examined four groups of input factors: types of personal information, the amount of control that consumers were given over how the information is used, the potential consequences for and benefits to consumers, and the consumer characteristics associated with overall privacy concerns, and found that 45 percent of people were very concerned about the way in which their personal information is used by companies, and most respondents wanted more control over the gathering and use of their personal information (Phelps, Nowak, and Ferrel 2000). Another study focused on procedural justice and found that fair procedures to protect consumers' privacy can alleviate their concerns by building trust (Culnan and Armstrong 1999). In a study that was

¹This research was supported by the MIC (Ministry of Information and Communication), Korea, under the ITRC (Information Technology Research Center) support program supervised by the IITA (Institute of Information Technology Assessment).

not specific to the Internet, Phelps, D'Souza, and Nowak (2001) conducted a national mail survey to test a model of consumer privacy concerns about direct marketing, and found that consumers' attitudes towards direct marketing and their desire for control over the use of their personal information were associated with privacy concerns.

A number of studies have surveyed consumers' attitudes towards various marketing tactics, including the gathering and use of personal data, both online and offline. For example, Graeff and Harmon (2002) studied consumers' awareness and concerns regarding the general collection and use of personal data. One of their findings was that a majority of consumers believe it is easier to obtain their personal information through the Internet than through other means. Even though there has been increasing awareness of the erosion of privacy, consumers are aware of the benefits of using the Internet, and some—24.9 percent of the respondents—do feel comfortable making credit card purchases on the Internet (Graeff and Harmon 2002). In particular, younger Internet users tend to have positive views on information collection for marketing purposes (Gervey and Lin 2000), while older consumers tend to feel less comfortable making credit-purchases on the Internet (Graeff and Harmon 2002). In comparison with female consumers, male consumers show fewer privacy concerns, and feel more comfortable making purchases on the Internet (Graeff and Harmon 2002). Another study examined the role of e-consumers' personality trait on their shopping, surfing, and information seeking behaviors on the web, and suggested that e-consumers with low interpersonal trust tend to have high security concerns which in turn lead to lower intent to purchase on the Web (Das, Echambadi, McCardle, and Luckett 2003).

According to consumers, two of the most important attributes of commercial Websites are ease of use (e.g., simplicity, speed, convenience) and security (e.g., privacy, trustworthiness, transaction security) (Gervey and Lin 2000). Bush, Bush, and Harris (1998) found that security and privacy issues are major barriers to using the Internet as a marketing tool. Hershel and Andrews (1997) also reported that many users are reluctant to purchase products because of uncertainty regarding the privacy and security of information transactions. Thus, it is of great importance that e-businesses to find a way to reduce consumer privacy concerns.

Antecedents of privacy concerns

Reducing privacy concerns and, in turn, increasing consumers' willingness to disclose personal information, is one of vital keys to the success of e-commerce. Research in this field identifies antecedents that lead to a decrease in privacy concerns, namely (1) consumer trust in the e-vendor, and (2) the value provided by the Website. Trust is widely considered to be vital in allaying the privacy concerns of consumers. Considering that consumers in the Internet market are likely to interact with unfamiliar vendors, trust is an even more important construct in e-commerce than in traditional business transactions. In her review of consumers' trust in online shopping, Grabner-Kraeuter (2002) claimed that trust arises in two environmental conditions, the uncertain and the risky, and further categorized the uncertainties as system-dependent and transaction-specific. Trust plays an important role in consumers' overcoming their perceptions of risk and insecurity in online business transactions (McKnight, Choudhury, and Kacmar 2002). Based on the theory of reasoned action (Fishbein and Ajzen 1975), Liu, Marchewka, and Ku (2004) also proposed a privacy-trust-behavioral intention model to explain consumer's behavioral intention for online transaction. Their laboratory experiment showed that four dimensions of privacy strongly influenced the level of trust, which in turn influenced a

customer's behavioral intentions to purchase from or visit a Website. A joint research project by Cheskin Research and Studio Archetype/Sapient (1999) on consumer trust in e-commerce concluded that trustworthiness is a result of a consumer's experience of a website over time. According to the report, it is the brand image, navigation, consequent consumer fulfillment, presentation, up-to-date technology, and the logos of security-guaranteeing companies that constitute the essential characteristics of a website that communicate trustworthiness to a visitor. In the same way as for offline transactions, the trusting process in online transactions begins when an individual perceives that a company may be worthy of trust. Such a perception can be strengthened over time, and is eventually transformed into personifications of character, such as dependability, reliability and honesty. Using structural equation modeling, it has been found that trust is one of the most important determinants of a customer's attitude towards using Internet banking (Suh and Han 2002).

Building consumers' trust, a core component of social exchange theory and relationship marketing can be one of the solutions for enhancing e-retailing. Campbell (1997) viewed trust as an effective way of managing consumer privacy concerns, and noted that if consumers know that the personal information collected has the potential to build a relationship in which they could participate in the transfer of goods or services, their privacy concerns might be diminished or superseded by their desire to participate. Phelps and his colleagues (2001) found that a consumer's attitudes towards direct marketing and desire for information control as antecedents to privacy concerns are related to subsequent purchase behavior.

The second category of antecedents concerns how value provided by an e-vendor can reduce privacy concerns and increase the use of e-shopping. Exchange theory and a cost-benefit perspective suggest that consumers might be willing to provide information if they receive more than a certain level of value in exchange for their privacy disclosures.

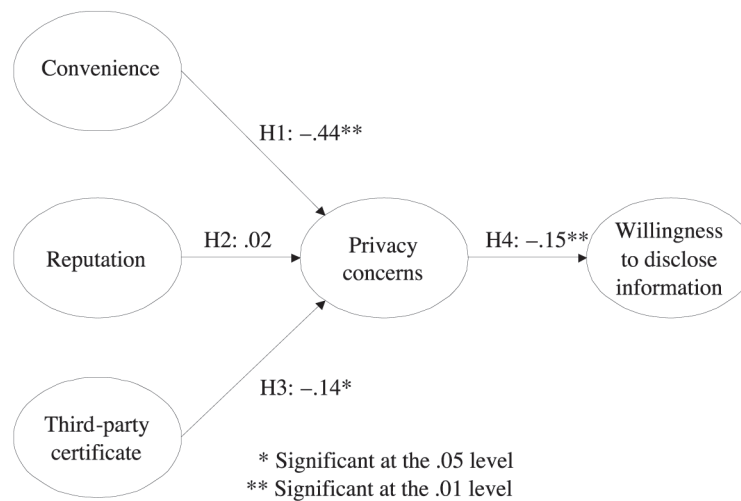

In the field of Web research, the most important values perceived by consumers who accept the technology-based retailing of a product are two beliefs, both related to the utility and ease of using e-retailing (Gefen, Karahanna, and Straub 2003; Phelps et al. 2000). In addition, Chen and Dubinsky (2003) posit that values such as e-retailer reputation and the perceived quality and price of a product influence privacy concerns, which represent one type of perceived risk. Empirical evidence by Phelps and associates (2000) shows that privacy concerns will be reduced if consumers experience shopping benefits such as time saving and wider selection. Another study suggests that 'having a mutually beneficial relationship with an online entity will have an influence on privacy concern' (Sarathy and Robertson 2003).

Research model and hypotheses

Information gathered during e-business transactions are considered to be both a blessing and a curse to both businesses and consumers. Consumers are greatly concerned about the erosion of their privacy and are reluctant to share their information or to conduct business transactions in the Internet environment. Information collected using the Internet has enabled effective and efficient marketing strategies to benefit both businesses and consumers.

Research has shown that value and trust are separate but interrelated and complementary constructs. A study of Internet banking examined the effect of trust on customers' attitude and behavior, and showed the effect on trust of perceived ease of use and perceived utility and the effect of trust on attitudes towards Internet usage and purchasing intentions (Suh and Han 2002). Each of these aspects has different types of sub-constructs and some are included

FIGURE 1
Research model with standardized coefficients

in both 'trust' and 'value' antecedents (Chen and Dubinsky 2003; Gefen et al. 2003). We investigated the three most prominent constructs of trust and/or value in the model—convenience of a website, a website's reputation, and a third-party certificate—to identify their effects on consumers' privacy concerns and willingness to disclose personal information. The research model is depicted in Figure 1.

Nowadays, a growing proportion of consumers are aware that their personal information can be collected, shared, and sometimes even stolen by unknown numbers of businesses, organizations, or criminals for financial gain. For example, "phishing" (a newest scam leading to identity theft) is estimated to cost victims more than \$1.2 billion between April 2003 and April 2004 (Lepofsky 2004). Thus, consumers are starting to protect their privacy by refusing to disclose personal information or, where possible, providing deceptive information. Meanwhile, for the collected information to be useful, it must be accurate and up to date. To maximize usefulness of the collected information, Internet websites need to reassure users that their privacy is well protected. Milne and Boza (1999) showed that building trust was a key element in reducing the privacy concerns of consumers and improving relationships between consumers and businesses. Trust is developed through the effective communication of privacy safeguards, market signals that effectively convey high reputation and credibility, and previous favorable consumer experiences of perceived value. The development of trust between direct marketers and consumers reduces consumers' perceived risk, which then improves consumers' willingness to share their personal information with marketers.

The characteristics of an Internet website may impact on users' privacy concerns. According to the Technology Acceptance Model (TAM), perceived ease of use and utility are major values provided by a website (Zeithaml, Parasuraman, and Malhotra 2002) and are key determinants of users' technology acceptance (Gefen et al. 2003). Even though Salisbury and his colleagues (2001) showed that ease of navigation and usefulness were not significantly related to purchasing intention, a meta-analysis showed a weighted average correlation between ease of use and intention to use of .51 (Saeed, Hwang, and Yi 2003). Meanwhile, web security was related with

purchase intention (Salisbury et al., 2001), and this suggests that users' perception of web security is related to their perception of security.

Similarly, in his discussion of the nature of and conditions for online trust, Koehn (2003) recommended several guidelines for Internet retailers. For example, to maximize knowledge-based trust, Koehn (2003) recommends that Internet retailers should avoid poor spelling, grammar, and syntax that may cause doubts about their identity. For respect-based trust, purchasing processes should be user-friendly and customer-oriented.

Online consumers are also influenced by user interfaces (Chen and Dubinsky 2003), and are likely to shop at well-designed Websites (Liang and Lai 2002). A meta-analysis also indicated that system quality, including interface, navigation, and aesthetics, influences consumers' behavior by changing their perceptions of ease of use, usefulness, trust, and shopping enjoyment (Saeed et al. 2003). Based on reviews of existing literature on this subject, we developed a hypothesis about the relationship between users' perceived convenience of a website and their privacy concerns.

Hypothesis 1: The perceived convenience of a website is negatively related to users' privacy concerns.

Another determinant that may influence Internet users' sense of trust and privacy concern is a website's reputation. Consumers develop a perception of the reputation of a retail outlet based on the service quality they experience, the nature of the store's advertising, and the opinions of friends and relatives (Assael 1998). As the reputation of a store is equivalent to the total perception based on a consumer's experience, knowledge, and belief in relation to that store, it has a strong effect on the consumer's perception of the value offered by the store. This perception helps consumers to evaluate the differences between stores and choose between them. According to Sheehan and Hoy (2000), online users are less concerned about their privacy when they are interacting with companies with whom they are familiar. Consumers may feel familiar with a company when they have heard a positive evaluation of the company. Chen and Dubinsky (2003) also proposed that there is a positive relationship

between an e-retailer's reputation and perceived risk that includes financial, performance, and privacy matters, but did not find a significant relationship. Chen and Dubinsky (2003) tried to explain this non-significant relationship by proposing that product price is a moderator. Specifically, the relationship between an e-retailer's reputation and perceived risk might be stronger when the product being purchased is expensive. A study showed that an e-retailer with a good reputation tends to be more trusted and perceived as more credible than those with a poor reputation (Hendrix 1999). A meta-analysis by Saeed et al. (2003) showed that vendor characteristics such as size and reputation have an impact on online consumer behavior through vendor trust and the perceived usefulness of the vendor. Based on the present literature review, a relationship between a website's reputation and users' privacy concerns has been encapsulated in the following hypothesis.

Hypothesis 2: The perception of a website's reputation is negatively related to users' perceived privacy concern.

Meanwhile, Zucker (1986) proposed that the trust placed in an institution depends either on company-specific attributes (e.g., certification as an accountant) or on an intermediary mechanism (e.g., the use of escrow accounts). Such trust has a formal marketable structure similar to that of institutions and third-party guarantors that sell certificates guaranteeing integrity, ability, and intention. Such certifications are deliberately designed and used to build trust in the bearer's ability and behavior, through external guarantors such as universities and state regulators.

For example, the Korean government issues an e-privacy certificate to Internet sites as supporting evidence of a vendor's respect for personal privacy. In the United States, online seal programs, such as TRUSTe, the Online Privacy Alliance, and the Council of Better Business Bureaus, Inc. (BBBOnline), are designed to build consumers' trust and confidence in the Internet. The certificates are typically conferred on the Internet sites by the government, institutions or the mass media. The conferred Internet sites display the certificate so that visitors will recognize that their privacy protection is dependable. Miyazaki and Krishnamurthy's (2002) study indicated that participation in seal programs reduces consumers' privacy concerns, although it has no influence on the actual online privacy practices of companies. The presence of seal logos was found to increase personal information disclosure among online shopping consumers who are highly risk-averse with respect to privacy security, but no effect was found for those who are less risk-averse. Kimery and McCord (2002) found that third-party assurance seals had no influence on consumers' trust of a specific e-retailer, with the exception of the use of one particular seal, TRUSTe. Accordingly, a relationship between third-party approval of a Web site and users' perceived privacy concern was hypothesized as follows.

Hypothesis 3: The perception of third-party certificates in a Web site is negatively related to users' perception of privacy concern.

Consumers' willingness to disclose their personal information and their attitudes towards marketers' use of that information are affected by various factors, such as their awareness of the risks of the misuse of personal information and the potential advantages of disclosure. Culnan (1993) showed that consumers with positive attitudes towards the use of personal information are less concerned about privacy (defined as control over personal information). For the purposes of the present study, Internet users' privacy concerns

are determined to be the sole factor affecting their willingness to disclose personal information.

Hypothesis 4: There is a negative relation between users' privacy concerns about a Website and the intention to disclose personal information on the website.

RESEARCH METHODS

To test the proposed model, an online survey was conducted. A Website was created for the Web survey and five thousands of e-mails requesting participation were sent to Internet users in Korea. E-mailing list was purchased from a research company. There were 395 online participants over a two-week period. After eliminating responses with insincere answers and excessive amounts of missing data, 323 responses were analyzed to test the proposed model. Sixty-eight percent of the respondents were male, almost all in their 20s or 30s.

Measurements

The respondents were first asked to identify a Website they had recently visited. They were then asked to answer a series of questions about that Website. Questionnaire items were developed based on the literature review. Most of the items related to the three antecedents (i.e., perceived ease of using the Website, perceived reputation of the Web site, and third-party certificates in the Website) were conceptually based on Cheskin Research and Studio Archetype/Sapient (1999) and Luo (2002). The perceived convenience of using the Website was defined as the development of a trust based on convenience, usefulness, familiarity, and cultural similarity. The perceived reputation of the Website was based on brand name and experience. The perception of third party certificates was measured in relation to certificates, marks, and symbols authenticated by a third-party guarantor. Items for measuring privacy concerns and willingness to disclose personal information were adapted from Culnan (1993) and Cranor, Reagle, and Ackerman (1999) to fit the Internet context. Privacy concerns were measured in relation to uneasiness about unauthorized (internal and external) secondary use of personal information and improper access by third parties to the data. Willingness to disclose personal information was measured by asking respondents about the extent to which they were willing to disclose their personal information to the website.

The data were examined to assess the validity and reliability of the scales. First, exploratory factor analysis was conducted with a Varimax rotation to examine whether all items fell into the five conceptual categories, as expected. The five categories were extracted as expected, and no item failed to fall into these categories. The factor loadings were greater than .60, which is considered to be sufficient (Bagozzi and Yi 1988). As a measure of reliability, the internal consistencies of the variables were calculated. Internal consistency is an expression of the stability of individual measurement items across replication from the same source of information (Straub 1989). The Cronbach alphas of the constructs ranged from 0.83 to 0.95, which is considered to be an acceptable level of reliability (Hair, Anderson, and Tatham 1998; Straub 1989). The correlation matrix of the entire data set indicates that each item showed a higher correlation with items reflecting the same construct than with items reflecting other constructs, in accordance with the MTMM (Multitraits-Multimethod) principle (Bagozzi 1991).

Finally, a confirmatory factor analysis (CFA) was run using LISREL 8. The CFA indicated that several items had shared residual variance, which means that they needed to be dropped to achieve unidimensionality and good fit indexes in LISREL. The

resulting CFA showed that all remaining items loaded significantly and highly on their assigned constructs and that LISREL reliability coefficients and extracted variances of constructs were acceptable. The CFA also showed that the overall models' fit indices were good, except for χ^2 , which is typical for a large sample: RMSR=.05, GFI=.93, AGFI=.90, NFI=.93 and $\chi^2_{109}=213.23$ ($p=.00$) (Kelloway 1998).

Hypothesis testing

The hypotheses were analyzed using LISREL 8; the results are presented in Figure 1. There was good model fit $\{\chi^2_{112}=227.35$ ($p=.00$), GFI=.92, AGFI=.90, NFI=.93, RMSR=.062}, except for χ^2 , which is typical for a large sample. In addition to the overall fit of the model, four relationships were proposed. In Hypothesis 1, a negative relationship was proposed between consumers' perceived convenience of using a Website and their privacy concerns about the Web site. The data showed a significant negative relationship ($\gamma = -.44$, $p < .01$) as proposed. However, Hypothesis 2 was not supported ($\gamma = .02$, $p > .10$). In other words, the relationship between the perceived brand reputation of a Website and an individual's privacy concerns about that Website was not significant. Hypothesis 3 proposed a negative relation between third-party certificates and privacy concerns, and was supported ($\gamma = -.14$, $p < .05$). The data supported Hypothesis 4, which proposed a negative relation between users' privacy concerns and their willingness to disclose personal information ($\beta = -.15$, $p < .01$).

DISCUSSION

This research makes two primary contributions to the field of Internet marketing. Most previous studies incorporated constructs of value and trust separately and used sub-dimensions such as ease of navigation, usefulness, web security, brand, technology, and clarity of interface interchangeably to determine whether these are related to the willingness to disclose personal information. However, the present study tried to reclassify three categories of antecedent simultaneously in relation to benefits and trust. The present study proposed a model incorporating antecedents, privacy concern, and intent to disclose personal information. This study is one of the first attempts to examine empirically a model that embraces antecedents that are associated with Internet users' privacy concerns and their willingness to cooperate Internet sites for direct marketing. Most studies incorporated those factors separately as determinants of trust in or perceived value of the Internet, or attitudes towards direct marketing, or examined causal relationships between trustworthiness and attitude towards disclosure. Thus, the present study embodies a more comprehensive approach.

All proposed path relationships were significant, with one exception: between perceived brand reputation of a Website and privacy concerns about the Website. This implies that Internet users tend to feel more secure and safe at Websites that they perceive as more comfortable, convenient, and easy to use, and where they can recognize reliable third-party certificates or logos. Accordingly, a business may be wise to maximize the user-friendliness of its Website by making it more consistent with potential visitors' value and preferences. The business may consider acquiring authentic third-party certification by establishing concrete privacy-related policies and practices. By doing so, the business could gather high-quality data regarding current and potential consumers, which may increase its profitability.

However, the reputation of a Website will not directly allay the privacy concerns of consumers. This may be because the experience of most online shoppers has not yet accumulated to the extent that it supports a good reputation for Websites. Meanwhile, consumers who are less concerned about their privacy at a Website are more

willing to share their personal information for marketing purposes. Considering that marketers need quality data for individualized marketing strategies, individuals who are willing to share their personal information are a valuable source of quality data. Consumers who are willing to provide accurate and current data in comparison with those who are forced to or deceived into disclosing their personal information may provide more reliable data. According to our findings, Websites that collect, store, and exchange consumer data are likely to improve their data quality and quantity if they establish the trust of their Website visitors by developing visitor-friendly Websites and obtain and display privacy-related certificates and logos conferred by credible third-party organizations.

Our proposed model and its empirical testing could provide valuable information to policy makers who intend to boost e-commerce. The model suggests that governments should consider establishing comprehensive and clear-cut policies regarding consumer privacy issues in e-businesses and direct marketing. Under such policies, a certificate could be conferred to compliant e-businesses. In this way, consumers would become less reluctant to make business transactions on the Internet, thereby assisting the expansion of e-business.

Like other studies, this study has a number of limitations. First, most of the respondents were regular Internet users. Thus, the findings may not be applicable to those who are unfamiliar with it. However, this may not be a significant concern because Internet businesses are also mostly interested in understanding the attitudes and behaviors of consumers who already are regular Internet users. The second limitation is also related to the sample. Most of the respondents were students or office workers. Considering a growing number of housewives are active Internet users, a portion of the population could be considered as under-represented, and the findings may not be generalizable to other populations.

The present study raises other questions that call for future research. Future studies should measure actual disclosure rather than merely stated willingness to disclose personal data. Considering the variety of Websites, privacy concerns and behaviors could be compared among various categories of Websites with different characteristics. For example, the Website of a non-profit organization may not be perceived to be as much of a threat to privacy as a commercial website.

SPECIAL SESSION SUMMARY
Understanding Consumer Enjoyment and Happiness

Tonya P. Williams, Northwestern University
Angela Y. Lee, Northwestern University

SESSION OVERVIEW

A recent focus in consumer research is on improving consumer welfare and the quality of life. Consistent with this focus, this session aims to make the important first steps toward understanding how consumer welfare may be improved by adopting a systematic approach to examine what contributes to consumer subjective well-being (SWB; i.e., what makes consumers happy), and how to measure it. The three papers seek to take a closer look at what happiness means to different people, what type of TV viewing behavior would make people happier, and how happiness should be measured and compared.

The first paper by Williams and Lee examines the relationship between wealth and SWB. The authors define transaction wealth as assets associated with material possessions and exchange value, and relationship wealth as assets associated with security from close relationships. They argue that those with an independent self-construal derive more happiness from transaction than relationship wealth, and the reverse is true for those with an interdependent self-construal. The authors present the results of four studies in support of their hypothesis. Across these studies, self-construal is operationalized as a personal disposition, a cultural orientation, and as a situational prime. Their results also demonstrate the implications of the two distinct self-construals on helping behavior: Independents are more likely to donate money to a charity than interdependents, whereas interdependents are more likely to contribute by volunteering to the charity than independents.

Whereas the first paper approaches happiness from an overall life satisfaction perspective, the second paper by Mandel and Nowlis examines happiness from a more focused, situation-based angle. More specifically, they propose to understand some of the factors underlying consumers' enjoyment of popular game shows on TV (e.g., *The Weakest Link*, *Fear Factor*). The prevalence of office pools and online betting websites suggest that predicting the outcome of the game or competition enhances a viewer's enjoyment while watching these hugely popular TV shows that involve audience participation with uncertain outcomes. However, the authors find that participants who made outcome predictions enjoyed the show less than those who simply watched the show, especially when they were made accountable for their predictions. These effects were observed despite participants' expectations to the contrary.

In the third paper, Hsee discusses how happiness should be measured to capture the true construct of life satisfaction and happiness that researchers are interested in. More specifically, this research highlights the problem with traditional Likert scales used to measure feelings of happiness in that the scales are susceptible to scale-renorming (i.e., respondents are prone to interpret the scales differently in different contexts). As a result, researchers may confuse spurious difference in people's responses to life satisfaction and happiness scales with real differences in their subjective well-being. Hsee proposes a modulus-based approach to measure happiness to enhance construct validity in happiness-related research.

The theme of the session is in line with the mission of the conference to make a positive difference in the lives of consumers. Together, the three papers address an important gap in consumer research by focusing on consumer welfare. The papers contribute to

the literature methodologically as well as theoretically, and the results have implications for both researchers and practitioners. This research represents critical first steps toward understanding and improving consumers' quality of life and subjective well-being. Dipankar Chakravarti as discussant raised interesting issues regarding how consumer psychologists can more actively enable a better understanding of subjective well-being, and how it can be enhanced.

“Benjamin My Friend or My Money: Wealth and Subjective Well-Being”

Tonya P. Williams, Northwestern University
Angela Y. Lee, Northwestern University

The relationship between Subjective Well-Being (SWB) and wealth has been examined extensively in an attempt to expose causality. Although there is a general belief that wealth leads to SWB, unambiguous evidence of a causal relationship is still lacking (Burroughs and Rindfleisch 2002; Csikszentmihalyi 1999; Easterlin 2004; King and Napa 1998; Myers 2000; Ormel et al. 1999). In fact, recent research shows that wealth, as defined and operationalized in economic terms (e.g., GNP), does not further increase SWB beyond attaining biological needs of food and housing (Diener et al. 1995; Diener and Fujita 1995; Diener and Oishi 2000; Tatzel 2003). More specifically, Diener et al. (1995) examined the relationship between wealth and SWB across 20 different nations representing different cultures, and found that GNP and SWB are positively correlated ($r=.55$), as are individualism and SWB ($r=.77$). However, in a more recent study, Diener (2002) found that the correlation between income and SWB within each nation is tenuous (ranges from $-.06$ in Germany to $.45$ in poor areas in Calcutta). If wealth does not imply SWB or happiness, then what does? The objective of the current research is to understand what makes people happy, and to further examine the relationship between wealth and SWB.

According to the Merriam-Webster Dictionary, wealth is defined as “all property that has a money value or an exchange value” or “abundance of valuable possessions or resources.” While the concept of wealth as money and worldly possessions is familiar to most people, it is interesting to note that resource is defined in the same dictionary as “a means of spending leisure time.” Our own experience tells us that spending leisure time does not always involve money; being with friends and family, for instance, is often a very enjoyable way to spend leisure time. And Mother Theresa once said “the most terrible poverty is loneliness and the feeling of being unloved.” Thus, to understand what affects SWB, we may need to start with a broader conceptualization of wealth that also includes close relationships.

Although most people would agree that material possessions as well as family and friends all contribute to wealth and in turn happiness, our view is that those with an independent self-construal are more likely to emphasize personal desires and possessions (termed transaction wealth), whereas those with an interdependent self-construal are more likely to focus on communal desires and relationships (termed relationship wealth). Across four studies, we provide convergent evidence in support of this hypothesis.

In Study 1, participants were presented with pictures of smiling people (individuals as well as groups), and were asked to indicate how happy they thought these people were, and the extent

to which these people had transaction or relationship wealth. Participants' chronic self-construal was measured using the Independence-Interdependence Scale (Singelis 1994). The results showed that the more independent participants were, the more likely they thought happiness comes from transaction wealth, and the more interdependent they were, the more likely they thought happiness comes from relationship wealth.

In Study 2, we used a 2 (country: Chinese, US) x (self-construal: independent, interdependent) x 2 (wealth: transaction, relationship) between-participant design, and self-construal was manipulated by country status as well as by priming. Participants were presented with an "ideal life" situation that either emphasized transaction wealth (e.g., I/We live in a comfortable home) or relationship wealth (e.g., I am/We are surrounded by friends who care about me/us), and were asked to indicate how happy they would be if they were in that situation. The results showed that among our U.S. participants, independents were happier with transaction wealth than relationship wealth, whereas the reverse was true of the interdependents. However, among our Chinese participants, both independents and interdependents derived more happiness from relationship than from transaction wealth.

We also examined the behavioral implications of these results on happiness by investigating whether independents versus interdependents might be more willing to contribute money or volunteer time to a charity (Study 3). We first primed participants with either an independent or an interdependent self-construal and then presented them with an ad for the Make-A-Wish Foundation. Our results showed that independents were more likely to donate money as compared to the interdependents, whereas the interdependents were more likely to volunteer their time than the independents. We present further evidence showing that independents valued a monetary contribution to community projects higher than interdependents, whereas the reverse was true for volunteering.

Our results across four studies provide convergent support for our hypothesis that for those with an independent self-construal, financial possessions bring about greater SWB, whereas for those with an interdependent self-construal, relationship harmony and belongingness bring about greater SWB. These findings enrich our understanding of what makes people happy, and offers one explanation to account for the tenuous relationship between SWB and wealth documented in the literature.

"The Effect of Prediction on the Enjoyment of a Consumption Experience"

Naomi Mandel, Arizona State University

Stephen M. Nowlis, Arizona State University

Does predicting the outcome of a television show enhance a consumer's enjoyment while watching the show? For example, if a consumer is watching a game show like *Survivor*, she might explicitly predict the winner of this show by participating in an office pool, message board, or through online betting. Alternatively, this consumer might just watch *Survivor* without making any explicit predictions about who the ultimate winner will be.

One line of research suggests that people enjoy the feeling of suspense, and that predictions can increase the involvement with a task and heighten suspense (Caplin and Leahy 2001). This research would predict that consumers will end up liking a hedonic experience *more* if they make a prediction in advance.

Another line of research suggests that consumers attempt to minimize the uncertainty they experience toward events (McGregor and Marigold 2003; Wu 1999) and that uncertainty can lead to anxiety (Arai 1997). When consumers make explicit predictions about the outcome of an uncertain hedonic event, this can increase

feelings of anxiety and *lower* the enjoyment of a hedonic experience.

Our results support the second of these predictions, that making predictions lowers the enjoyment of a hedonic event. Across a series of four experiments, we found that participants who made outcome predictions enjoyed the show significantly less than those who did not make predictions, despite participants' expectations to the contrary.

In study 1, participants watched a video clip from the game show *The Weakest Link* and then answered questions about it. Participants who predicted which contestant would win the current round of the game demonstrated a significantly lower level of enjoyment than those who did not make predictions ($M=0.81$ vs. 2.69 on a 7-point scale; $F(1, 144)=9.25, p<.005$). In fact, participants who were told in advance who would win the round demonstrated the highest level of enjoyment ($M=3.00$).

In study 2, we wanted to see whether participants' expectations about their enjoyment in these conditions would match their actual enjoyment, and we found that they didn't. While participants believed, in hypothetical scenarios, that they would be happiest watching *The Wheel of Fortune* after predicting the outcome, and least happy when the outcome was revealed before watching, in fact the opposite was true. Replicating our findings in study 1, we found that participants were least happy when they had to write down their predictions before watching the show.

In our third study, we explored the moderating effects of accuracy and certainty on our results, and found that the combination of both accuracy and certainty is required for prediction to enhance viewing enjoyment. Participants who were both highly certain of their predictions and correct were significantly more likely to enjoy the clip ($M=4.29$) than were those who were certain but incorrect ($M=2.00$), uncertain but correct ($M=2.43$), or uncertain and incorrect ($M=1.92$; $F(1, 63)=4.07, p<.05$).

In study 4, we found that these effects became even more pronounced when individuals were made accountable for their predictions. We manipulated three levels of accountability: High (where participants were told they would have to explain their predictions to a group), Low (where participants were told that their answers were unimportant), and Control (where no instructions were given). Consistent with our findings in prior studies, participants who made predictions enjoyed a Fear Factor clip less ($M=1.98$ vs. 3.24 ; $F(1, 244)=10.38, p<.001$) and were less likely to want to keep watching the show ($M=2.13$ vs. 3.73 ; $F(1, 244)=16.55, p<.0001$) than were those who did not make predictions. A series of planned comparisons revealed that participants who made predictions under high accountability enjoyed the clip significantly less ($F(1, 250)=6.80, p<.01$) and expressed less desire to keep watching the clip ($F(1, 250)=12.71, p<.0005$) than participants in the other conditions.

Furthermore, we confirmed the moderating role of certainty on our findings. Participants who felt certain about the outcome did not mind predicting; in fact, they were equally likely, in both the prediction and no-prediction conditions, to enjoy ($M=2.19$ vs. 2.52 ; $F(1, 135)=0.21, p>.50$) and want to keep watching ($M=2.58$ vs. 3.27 ; $F(1, 135)=1.52, p>.20$) the video clip. In contrast, participants who were uncertain about the outcome were unhappy about predicting. They were significantly less likely to enjoy ($M=1.58$ vs. 3.84 ; $F(1, 114)=20.92, p<.0001$) and want to keep watching the show ($M=1.24$ vs. 4.10 ; $F(1, 114)=26.72, p<.0001$) than those who were not required to make predictions.

In conclusion, our research found that participants did not enjoy television shows as much when they made predictions as to the outcome of these shows. If we generalize beyond television shows, our results suggest that consumers will not enjoy hedonic

experiences where there is an element of risk involved as much when they predict the outcome of those experiences in advance. This could apply to all sorts of situations, such as going to an amusement park, where the prediction could be how much a new ride is enjoyed, to visiting a museum, where the prediction could be whether or not one's favorite paintings will be carried in a new exhibit. Thus, our research offers insights into factors that affect consumer happiness. Managerially, our findings suggest that the current practice of encouraging consumers to participate in interactive, online games and internet discussions about a consumption experience can actually backfire, in that consumers' resulting consumption enjoyment may be lowered.

"A Sunny-Day Measurement of Happiness"

Christopher Hsee, University of Chicago

The topic of happiness (broadly defined) is popular in both basic disciplines (e.g., psychology and economics) and applied fields (e.g., marketing, and HR management). Research on this topic has produced provocative findings. For example, paraplegics are nearly as happy as lottery winners (Brickman and Janoff-Bulman 1978; Ubel et al. 2004). Across generations when GDP and consumption increase in developed nations, happiness hardly increases (Blanchflower and Oswald 2004; Diener and Oishi 2000).

Most happiness research uses bounded labeled scales, such as a 7-point scale ranging from "very unhappy" to "very happy." These scales are susceptible to a serious bias: scale renorming. This bias casts doubt on the accuracy of many findings from the happiness literature. Consider two individuals, one earning \$15,000 a year and living in a country where most others earn only \$10,000 a year, and the other earning \$25,000 a year and living in a country where most others earn \$30,000 a year. When asked to report their happiness with their income on the 7-point scale described above, the \$15,000 earner reports greater happiness than the \$25,000 earner. We refer to this phenomenon as an income-happiness reversal.

What causes this reversal? We submit two explanations. One is genuine relativism. According to this explanation, the \$15,000 earner indeed feels happier than the \$25,000 earner. This may occur if the two individuals compare their income with their compatriots'. The \$15,000 earner finds his income higher than his compatriots' and feels happy, and the \$25,000 earner finds his income lower than his compatriots' and feels unhappy. The other explanation is scale-renorming or specious relativism. According to this explanation, the \$15,000 earner is actually less happy than the \$25,000 earner, but somehow he gives a higher happiness rating. This may occur if the two individuals norm (interpret) the rating scale differently. Each person may interpret the scale as descriptions of relative happiness between themselves and their compatriots. Because the \$15,000 earner earns more than his compatriots and the \$25,000 earner earns less than his compatriots, the \$15,000 earner gives a higher rating than the \$25,000 earner, even though in reality the \$15,000 earner is still less happy than the \$25,000 earner. This reversal is analogous to rating of bald eagle as bigger than a compact car (Kahneman et al. 1999), and rating of the number 9 as greater than the number 221 (Birnbaum 1999).

To recapitulate, genuine relativism is relativism in real feelings and is induced by psychological processes such as social comparison. Specious relativism is relativism in the interpretation of the scale and is an artifact due to scale-renorming. Traditionally-used Likert scales cannot discriminate the two types of relativisms.

To reduce specious relativism yet retain genuine relativism, we propose a modulus-based measurement—the sunny-day method. It is a combination of two psychophysical methods: magnitude estimation (Stevens 1975) and cross-modality matching (Stevens

and Marks 1980; Stevens and Greenbaum 1966), and yet is simpler than either method and can be practically used in large surveys. Specifically, we first ask respondents to consider their degree of happiness with a particular event (the modulus) as 10, and then rate their happiness with the events we are interested in studying (the targets) relative to their happiness with the modulus on an unbounded ratio scale, where 0 indicates no feeling. Because this procedure uses the modulus as a common yardstick and does not allow respondents to make arbitrary interpretations, we expect it to solve the scale-renorming problem.

In three studies, we found that the sunny-day scale is less susceptible to specious relativism than a traditional 7-point semantic differential scale. In one study, for example, respondents were first asked to predict, using either a traditional 7-point scale anchored by "very unhappy" and "very happy" or the sunny-day scale, the happiness of four individuals, each having found some money on the street. The four individuals were described in two separate scenarios:

Scenario 1 (consisting of the following two persons)
Person A found \$5 Person B found \$20

Scenario 2 (consisting of the following two persons)
Person C found \$30 Person D found \$500

The study was of a 2 (traditional scale vs. sunny-day scale) x 2 (with or without social-comparison) between-subject design. In the without-social-comparison condition, respondents were told that in both scenarios, the two money finders (A and B, and C and D) did not know each other and could not compare each other's windfall. Thus, objectively, Person B (who found \$20) could not possibly be happier than Person C (who found \$30). In the with-social-comparison condition, respondents were told that the two money-finders in each scenario knew how much the other found (but they did not know anything about the individuals in the other scenario). Thus, through social comparison, Person B (who found more than Person A and knew it) would naturally be happier than Person C (who found less than Person D and knew it).

In the traditional scale condition, Person B was rated as happier than Person C in both the with- and the without-social comparison conditions. The fact that Person B was rated happier than Person C in the without-social-comparison condition was a manifestation of scale renorming, or specious relativism.

In the sunny-day scale condition, Person B was rated as happier than Person C only in the social-comparison condition, and not in the without-social comparison condition. The findings suggest that the sunny-scale can avoid specious relativism (due to scale renorming), yet retain real relativism (due to social comparison).

What is the implication of this research for existing research that uses traditional semantic differential or Likert scales? On the one hand, readers, including researchers, media and policymakers, should interpret the findings with caution and not rush to conclusions. On the other hand, findings such as disabled people are nearly as happy as healthy people, and Americans today are not happier than Americans decades ago, may well reflect genuine feelings (Diener and Oishi 2000; Frederick and Loewenstein 1999; Kahneman 1999; Ubel et al. 2004; Wilson et al. 2000). However, in order to insure that these findings reflect real feelings, future researchers should consider using a modulus-based measure as a supplement to conventionally-used scales.

The Transformative Potential of Feminist Critique in Consumer Research

Miriam Catterall, The Queen's University of Belfast

Pauline Maclaran, De Montfort University

Lorna Stevens, University of Ulster

ABSTRACT

Given the importance of gender in consumer research, one might expect feminist perspectives to be at the forefront of critical engagement with consumer behavior theory. However, in recent years, critical, feminist voices have been barely audible. This paper explores the value of, and insights offered by, feminist theories and feminist activism, and how feminist theory and practice has altered our understanding of gendered consumption. It then argues that postmodern and postfeminist perspectives have diluted feminism's transformative potential, leading to a critical impasse in marketing and consumer research. In conclusion, we suggest that feminist perspectives, notably materialist feminism, may open up fresh new possibilities for critique, and interesting and worthwhile areas for transformative research in consumer behavior.

INTRODUCTION

The value of critical perspectives on theory is uncontested in disciplines across the academy, as such perspectives challenge assumptions, stimulate debate, and bring about changes in current ways of thinking. Given the importance of gender in marketing and consumer research discourse, one might expect feminist perspectives to be at or near the forefront of critical engagement with consumer behavior theory. An upsurge of critical feminist voices during the 1990s, however, has been followed by a lull in recent times. This paper offers some explanation as to why this has happened. The paper begins with a brief review of how insights from feminist theories and feminist activism began to alter our understanding of gendered consumption. It then discusses how postmodern and postfeminist perspectives have diluted feminism as a potentially transformative critique, leading to what we consider is a critical impasse. Finally, we suggest ways in which to move beyond this impasse, and how feminist perspectives, specifically materialist feminism, may open up new possibilities for critique, together with new avenues for transformative research in consumer behavior.

FEMINIST PERSPECTIVES IN CONSUMER RESEARCH

Modern marketing has relied on gender to help conceptualize, understand and explain consumers and their behavior. Indeed the gender discourse of the marketplace is well-documented in our discipline. For decades marketers took it for granted that consumers were female (Frederick 1929). However, in spite of its omnipresence in marketing theory, research and practice, the concept of gender is not always well-understood or conceptualized in marketing and consumer behavior.

Consumer research on gender in the 1970s focused primarily on two gender-related topics, namely gender portrayals in advertising, and how gender identity could be used to conceptualize, understand and predict consumer behavior. Most of the advertising studies examined how women were portrayed and whether or not these portrayals altered in line with the changing role of women in society. Kacen and Nelson, however, in their 2002 study of gender portrayals in advertising, found little change in the ways that women have been represented over the decades. Similarly, the other main area of research, gender identity, or the extent to which a person identifies with masculine or feminine personality traits, has

also proved disappointing, with inconclusive results across a wide range of product studies (see Palan 2001).

Some researchers, however, took a more critical view, arguing that such approaches consistently failed to address the complexity of the relationship between gender and consumer behavior. Artz and Venkatesh (1991, p.619), for example, observed that studies of gender issues in marketing and advertising generated 'superficial and self-evident inferences', were devoid of theory, and were preoccupied with the single issue of sex stereotyping. A paradigm shift in the 1980s led to a shift in emphasis, and new theoretical and methodological perspectives began to emerge in consumer research, as anthropologists, sociologists and literary critics joined marketing departments (Belk 1995). These fresh perspectives explored wider consumption issues such as the meanings that consumers attached to products, how products were consumed, and how products were used to create and sustain identity and self-concept. This 'new' consumer research has recently been termed Consumer Culture Theory by Arnould and Thompson (2005). Whilst the term gender has no single and universally agreed meaning, most consumer researchers in the Consumer Culture Theory tradition accept that gender is a socio-cultural category which refers to the ways that men and women are socialized into male and female roles. As such, Consumer Culture Theory problematizes the category of gender, and challenges traditional, ontological tendencies to essentialize men and women.

The paradigm shift in consumer behavior research in the 1980s brought to the fore new perspectives, some of which mirrored the development of feminist theories on gender and research methodologies in other disciplines. Feminist methodologies stress parity between researcher and informant, and researcher involvement in the research process to minimize 'otherness' (Madriz 2000). They also privilege consumers (readers) rather than producers and products (authors and texts), and emphasize the importance of context and the 'lived experience' of informants, rather than 'expert' interpretations of consumer experience (Rinehart 1998; Andrews and Talbot 2000). Above all, feminist research addresses social change and political equality. The concepts of transformation and praxis: 'the struggle to unite theory and practice in action and reflection upon the world in order to transform it for women' (Humm 1995, p. 218), is central to its aims. We now turn to the application of feminist theory in consumer research.

The first papers in the consumer research literature to draw on feminist perspectives were by Stern (1992), Bristor and Fischer (1993), Hirschman (1993), Fischer and Bristor (1994), Joy and Venkatesh (1994) and Peñaloza, (1994). These authors showed how theory and knowledge in marketing and consumer research was gendered in taken-for-granted, unarticulated, unrecognized, and, above all, profound ways. Stern (1992), for example, applied feminist literary theory to the interpretation of advertisements. Fischer and Bristor (1994) deconstructed the rhetoric of marketing relationships. These authors argued that the discourse associated with the marketer/consumer relationship revealed parallels to that between male and female. Specifically, they argued that notions of seduction and patriarchy were woven into that relationship. In a similar vein, Hirschman (1993) examined the ideology expressed in articles published in the 1980 and 1990 volumes of the *Journal of Consumer Research*. She concluded that the dominant ideology

was masculinist, and that a key theme in both volumes was the use of the machine metaphor to characterize human behavior. Joy and Venkatesh (1994) applied a postmodern, feminist perspective to deconstruct the machine metaphor in consumer research, a pervasive metaphor that privileged the mind and cognitive activity (assumed male) over the body and emotions (assumed female). Drawing on feminist epistemology and research approaches, Peñaloza (1994) recommended the use of participatory and dialogic research methods, in order to achieve a greater understanding of consumers, and thus move away from traditional, machine-like, information-processing models. Numerous other studies have also contributed to our knowledge of the gendered nature of marketing and consumer behavior (Venkatesh 1993; Ozanne and Stern 1993; Dobscha 1993; Costa 1994; Woodruffe 1996; Catterall, Maclaran and Stevens 2000).

Despite a proliferation of feminist perspectives on consumer research during the 1990s, there has been little work of this nature in recent times, both in terms of journal publications and conference proceedings, apart from a few exceptions (Stevens, Maclaran and Brown 2003; Stern and Russell 2004; Houston 2004). Furthermore, although Friend and Thompson (2000) demonstrated how one method, feminist memory work, could result in transforming the ways that women viewed and understood their experiences and attitudes in a shopping context, few studies have had an explicit transformatory agenda which is at the heart of feminist research. In the section that follows we explore some of the reasons why we think this may be the case.

THE DEMISE OF CRITIQUE

As part of its critique of elitist assumptions and traditional hierarchical orders, postmodern thinking argued that gender is also one of those universalizing and unhelpful dichotomies that typify modern Western thought (Scott 1992). What is meant by masculinity and femininity are now so indistinct that dividing people on the basis of gender identity is simply unproductive and only serves to reify sex differences (Firat 1994). In a postmodern world of endless possibilities and multiple personas, gender becomes another ludic element and an aspect of identity that can be altered at will.

The terms postmodern feminism and postfeminism are often conflated. Although postfeminism has been influenced by postmodern feminism, the two terms are not synonymous, nor does postfeminism mean the end of feminism. It does, however, represent a significant shift from the activist feminist movements of the 1970s (often referred to as second-wave feminism) to what has sometimes been described as ludic or celebratory feminism. In this respect it contrasts sharply with feminist critiques of consumption during the 1960s and 1970s, which focused on how marketers manipulated the female consumer through advertising images that stereotyped women and contributed to unequal power relationships. Typified by Wolf's (1991) critique of the beauty myth in consumer culture, this critical approach to the marketplace persisted into the 1990s. At this time feminist activists were essentially anti-marketing and anti-consumerism, promoting a natural, authentic self that could be realized through various styles that were both anti-fashion and anti-capitalist (Cole and Hriber 2000). The ethos of Anita Roddick's *The Body Shop*, founded in 1976, with its natural, herbal-based products and ethical policies, was very much in keeping with these feminist perspectives.

The reconciliation of feminism and consumption characterizes the postfeminist imaginary, with the remaking of feminism into desires and identities that can be realized through consumption. This postfeminist celebratory position is epitomized by the Nike culture that began to target women in the late 1980s. Nike's campaigns to women appealed to a more authentic self that could

be realized through exercise. As such they were accorded with upholding feminist values and playing a pivotal role in encouraging women to become more physically active (Scott 1993). Representing sports as empowering to women, Nike constructed the female athlete as resolute, determined and committed (Goldman and Pappson 1998). Yet, this view is received somewhat skeptically by many feminists, because its focus on individual satisfaction stifles collective action (McDonald 2000).

In a similar vein, the issue of gender in social and political processes is diluted by postmodernism, with its emphasis on lifestyles and 'hybrid consumption' for consumers generally, rather than suggesting that any one variable has priority over other variables in an individual's make-up. Hollows (2000) argues that the lifestyle project may be experienced as a complex and troubling one for women; indeed the concept of consumer liberation through multiple choices in the marketplace may merely be experienced as another form of disenfranchisement and confusion (Miller 1995).

Although they acknowledge the postmodern critique of universalizing categories such as male and female, and the postfeminist reconciliation with, and celebration of, consumer culture, many feminists argue that gender is still an important category. But whilst distinctions between male and female gender categories may now be more blurred, the male/female binary remains an important organizing category in our society. Feminists have always campaigned for the proper representation of women, an agenda that postmodernists challenge in their questioning of the very identity of womanhood itself (Lee 2001). Thus, there are many points of agreement between postmodernists, postfeminists and the more traditional, and usually older, feminists, but they disagree on the significance and relevance of maleness versus femaleness in people's everyday lives. To illustrate, when it comes to various quality of life indicators such as health, education and income, women are still disadvantaged in comparison to their male counterparts (Hill and Kanwalroop 1999). Similarly, most jobs are segregated on the basis of gender, with female-dominated occupations still attracting less status and money than those of males (Jarman et al. 1999). This is particularly relevant to marketers, given the increasing 'feminization' of the marketing profession (Maclaran and Catterall 2000).

The decline in political engagement among feminists has occurred right across the academy and not simply in marketing and consumer research. Thus, Segal (2000) argues that the literary paradigms that dominate current feminist thinking have produced rich models for subjectivity and identity, but there also needs to be engagement between feminist theory and feminist activism.

TOWARDS A TRANSFORMATIVE AGENDA

In this respect, one of the most interesting theoretical perspectives to attract attention in recent times is materialist feminism (Jackson 2001). Materialist feminists argue that the so-called 'cultural turn' embraced by postmodernists shifted feminism's emphasis from social structures and inequalities, to issues of culture, language, representation and subjectivity (Jackson 2001). Gender is more than just a cultural distinction between men and women, however; it is sustained through hierarchical social structures that include divisions in labor.

Although this perspective is not new, there has been a resurgence of interest in some of its basic tenets. Materialist feminists refused to abandon the goals of early second wave feminism, and persisted in problematizing the category 'woman' in terms of class, race, sexuality, culture, and so forth (Landry and Maclean 1993). Historical materialism is a key method for analyzing relations between men and women, since it emphasizes the 'social' rather than 'natural'. A key influence here was Delphy's (1975) work *For a Materialist Feminism*, in which she argued that feminism was

above all a social movement, one which underlined that the situation of women was cause for revolt and was not a 'natural' state of affairs, but one which should be challenged and changed, given the 'social' origins of women's disadvantaged situation. From this perspective, patriarchal gendered structures are every bit as material as the capitalist ones, with which Marxist historical materialism is usually associated. Indeed, in sharp contrast to Marxism, patriarchy rather than capitalism is an object of analysis, and the former does not necessarily derive from the latter.

Of particular interest is Jackson's (2001) work on materialist feminism, which foregrounds the social, i.e. social structures, relations and practices. She argues that adopting a materialist stance does not preclude an awareness of differences amongst women. On the contrary, it requires a focus on everyday social inequalities and everyday social practices. Nor does materialism ignore issues of language, cultural representation, and subjectivity, but it does entail locating them in their social and historical contexts. In 1981 Delphy wrote that materialist feminism goes beyond the oppression of women: 'It will not leave untouched any aspect of reality, any domain of knowledge, any aspect of the world' (Landry and Maclean 1993, p. xii). In this vein, then, materialist feminism explores 'other axes of difference' (Landry and Maclean, *op cit*, p. 150) and does not reduce women's oppression to a single cause. Thus, it eschews attempts at totalizing grand theory, and trans-historical universalistic claims.

The situation of low income consumers will be used to illustrate the research potential for materialist feminist analyses in consumer research. Consumers on low incomes are far from a minority group in society; 32.3 million people in the US are classified as officially poor (Hill 2002). It has also been long acknowledged that poor people pay more than their more prosperous counterparts to access even the most basic goods and services they need (Alwitt and Donley 1996). For example, supermarket prices are often higher in poor areas than in more prosperous ones. Poor consumers are also less able to switch to alternative suppliers because of existing debt burdens, and they are unable to take advantage of any savings from direct debit (Curtis 2000). As Bauman (1998) pointed out, the poor, who are limited in their ability to respond to market temptations, have been marginalized from mainstream society, and described as 'unwanted', 'abnormal', non-consumers', and flawed consumers.

Consuming on a low income is a rich topic for consumer research in its own right, but especially now, given the current neo-conservative economic and social policies in the US, Britain and elsewhere. The Personal Responsibility and Work Opportunity Reconciliation Act (1996) in the US is similar to welfare-to-work initiatives elsewhere. These initiatives are based on an assumption that taking people from dependency on welfare or state benefits would augment their financial well-being and, by implication, their social inclusion and ability to participate more fully in the consumer society. As Myers and Lee (2003) point out many who leave the welfare system simply shift from the category of welfare poor to working poor. As in Britain, families may find themselves in even worse material circumstances after they leave the welfare rolls. The huge rise in service industries has provided job opportunities, and whilst there are highly paid, high-skilled service jobs, there are many low-skilled ones that may not provide a living wage (Barrington 2000). A key point here is that when we examine consuming on a low income, we need to contextualize this, and connect such studies to wider social structures, systems and practices. Studies on the poor in consumer research have tended to focus on those in extreme poverty. Clearly, there is a need to broaden our definition of what counts as poor in comparatively affluent service economies. More

emphasis on relative rather than absolute measures of poverty would go some way to achieving this.

As consumer researchers we focus on the relationship between gender and consumption but in our efforts to understand this relationship in culture, we too often ignore important interrelationships with production and reproduction. To illustrate, Hill and Kanwalroop (1999) have drawn our attention to a lack of research on the gendered aspects of consumer disadvantage. Lone parents, mainly mothers, account for a significant percentage of the poverty population, and lone parenthood is the main cause of family poverty (Field 1996). Welfare to work policies and initiatives effectively mean that reproductive work (child bearing, childrearing and childcare) is no longer a valid basis for making welfare claims (Boyer 2003). The underpinning assumption is that reproductive work is not of value, and certainly not within certain forms of 'family' structure. The stigmatization of lone mothers is well-documented; one of the reasons for such stigmatization is the tendency to prioritize paid work. Thus, in addition to coping with the practicalities of working within a restricted family budget, lone mothers have to cope with the negative attitudes and reactions of other members of society. The impact on consumer identities, especially in relation to stigmatization, has yet to be investigated fully, together with the impact on family dynamics. For example, families on low incomes, through various consumption strategies, can mask or disguise their poverty from outsiders, and parents will attempt to hide their restricted finances within the family.

Feminist economists have long argued against the devaluation of reproductive work, given that it sustains, or even makes possible, productive work outside the home. Sivard (1995), for example, suggests that at least a quarter of the value of the world's gross domestic product can be attributed to women's work inside the home. At the same time, there is an increasing overlap between the productive and reproductive economies, the formal and informal economies. The separation of private and public spheres for example, becomes less distinct with home working. The productive economy has become increasingly informalized and more like the reproductive economy. The huge rise in service industries referred to above has been accompanied by increasing casualization of the service workforce. Economic activity outside of regulation, such as proceeds from illegal activity, and unrecorded income, were estimated at a quarter of the world's gross domestic product in 1998 (Peterson 2002). Thus, Peterson (2002, p. 13) argues that such informalization connects the different economies and exposes 'the inappropriateness of drawing rigid distinctions between economic and non-economic activities'. Whilst there are research opportunities to investigate the impact of this increasing informalization on consumption more generally, the blurring of boundaries between production and reproduction also opens up to scrutiny the divide between work, including consumption work, performed in public and in private spaces.

CONCLUSION

Critique from a variety of critical perspectives is important for academics and practitioners alike, in that it offers a space wherein the basic assumptions, theories and practices in marketing and consumer research can be challenged. It can also lead to a rethinking of key issues, and a reframing of the debates in which theory and practice development takes place. During the 1990s feminist perspectives on consumer behavior, especially in the arena of gender, performed an important critical role. However, as postmodernist writers challenged the modernist assumptions in feminist theories, and postfeminists disengaged with feminist activism, critical feminist perspectives seemed to wane. Whilst we do not propose a return

to the early 1970s feminist, anti-marketing and anti-consumerism critique, feminist critique still has much to offer us. This is especially so in relation to marketers' assumptions regarding marginalized consumers. In this paper we have argued that feminist critique can enable us to challenge the current focus on consumption as a liberatory identity project, which, we suggest, neglects important structural interrelationships with production and reproduction in our market economy.

Steps Towards Transformative Consumer Research Practice: A Taxonomy of Possible Reflexivities

Shona Bettany, University of Bradford
Helen Woodruffe Burton, University of Lancaster

ABSTRACT

The aim of ACR 2005 has been articulated by the organisers as the promotion and dissemination of consumer research 'for' consumers. This call asks for *transformative* consumer research raising the issue that '*Historically, the organization's research has been impelled by the theoretical and substantive interests of academics*'. It is on this point that this paper acts to transform arguing that a transformative ethic should be enacted though consumer research praxis. To achieve this it presents worked examples of the practice of reflexivity in consumer research developing a taxonomy of 'possible reflexivities', and discusses their possibilities for transformation of the consumer research process

INTRODUCTION

Reflexivity has been identified in the Social Sciences (e.g. Wasserfall, 1993, Kleinsasser, 2000, Mauthner and Doucet, 2003) as a way to address power and control in the research encounter (amongst other issues). Researchers are encouraged to understand themselves through 'thinking about their own thinking' in order to scrutinise pre-understandings and their influence on research and its results (Johnson and Duberley, 2003) and to give analytical attention to the researcher/researched relationship (Fischer and Bristol 1993, Hirschman 1993). In 1993, Wallendorf and Brucks called for consumer researchers to engage more with reflexivity particularly about the researchers' roles during the research. It would seem fair to suggest that these considerations would help to further benefit the aims of 'emancipatory' consumer research (Oleson, 2000, Hirschman, 1993). It is perhaps surprising therefore, that researcher reflexivity *per se* has not received more attention within the consumer research literature to date. One reason for this may be as Mauthner and Doucet (2003) point out, '*While the importance of being reflexive is acknowledged within social science research, the difficulties, practicalities and methods of doing it are rarely addressed. Thus, the implications of current theoretical and philosophical discussions about reflexivity (in) research practice remain under-developed*' (p. 413)

As well as having the potential for assisting the development of consumer research which is more emancipatory in nature, there is another strong argument for paying greater attention to researcher reflexivity within consumer research—the growth of interpretive approaches to consumer research. The notion of researcher reflexivity, of presenting honest and self-searching accounts of the research process, is increasingly being seen as an important and integral part of qualitative research (e.g. Sherry and Schouten, 2002, Kleinsasser, 2000). According to Gergen and Gergen (2000), reflexive researchers seek ways of demonstrating to their audiences their historical situatedness, their personal investments in the research, acknowledging various biases they may bring, revealing "*their surprises and 'undoings' in the process of the research endeavour.*" (p.1027) As Mauthner and Doucet (1998) describe the role of reflexivity in data analysis "*the best we can do then is to trace and document our data analysis processes, and the decisions we make, so that other researchers and interested parties can see for themselves some of what has been lost and what has been gained. ... we need to document these reflexive processes, not just in general terms but in a more concrete ... way in terms of where, how and why*

particular decisions are made at particular stages." (p.138)

As qualitative research has become so much more prominent in consumer research over the last couple of decades, the notion of reflexivity—aligned so closely as it is with qualitative research interests—indicates a clear need to develop the discourses already apparent in consumer research in terms of reflexivity and formalise the conceptualisation and operation of this research approach. Currently, there appears to be a lack of structured debate about what reflexivity is, the research processes around reflexive research are not articulated clearly; as Mauthner and Doucet (2003) point out: "*in practice few researchers give reflexive accounts of data analysis or discuss how reflexivity can be operationalised*" (p.416) Additionally, a plethora of different approaches are evident—in short, as Johnson and Duberley (2003, p.1280) note, the result of this complexity can be "*terminal ambiguity*". The aim, therefore, of this paper is to stimulate essential new discourse around the praxis of transformative consumer research, and move the discussion towards one which examines the many different reflexivities which might be enacted within consumer research. To accomplish this it provides a discussion of 'possible reflexivities' to structure the debate of this element of transformative consumer research practice and to guide the transformative consumer researcher. This discussion is illustrated using worked examples from the writers own research endeavours to demonstrate how these different reflexivities have worked in practice.

REFLEXIVITY IN CONSUMER RESEARCH

Researcher reflexivity has been conceptualised in consumer research discourse as a sub type of introspection (Wallendorf and Brucks 1993). These authors argue that there is much to recommend reflexivity as a research practice as it will '*improve our understanding of the actual research process*' and act as such to develop consumer research theory (Ibid.355). In social sciences this has been characterised by some writers as akin to exposing the '*critical incidents*' in a research project (Fish *et al* 1991) and discussing these openly and honestly as a way for the reader to examine and appraise the decisions that were made during the research journey. However, in addition to these concerns for reflexivity as a route to better knowledge making, reflexivity has also been identified as a way to address the power issues and specifically the instrumentality of the researcher/respondent relationship. Hirschman (1993:551) advocates a more reflexive approach to research, and argues against the use of detached and 'objective' methods in consumer research. She exhorts consumer researchers to '*choose to abandon any method or practice that is premised on power inequalities between researcher and subject*' she argues that research should be designed which recognises respondents as '*equal sentient beings*'. Fischer and Bristol (1993) suggest that engaging in ongoing self reflection in consumer research can be used to develop a more collaborative, open and sensitive approach to research and act as a foil to the authority of the consumer researcher in the research encounter.

It was while conducting our own research and immersing ourselves in the possibilities of reflexivity that we began to recognise that reflexivity was not a simple or straightforward endeavour, but one which emerged even in our own research projects as different entities. A close reading of the literature around reflexivity, and

reflection on our own research led us to think about reflexivity in terms of 'ontology' and 'power'. In terms of ontology, we reflected upon reflexivity as it has been seen as a route to better knowledge and enhanced theory building through reflection on the process of research. This to us suggested questions and challenges arising pertaining to the 'reality' of the research process, not just in terms of what 'really' happened but the model of reality implied in different reflexive approaches. In terms of power, this pertains to reflexivity as a route to addressing the power imbalances inherent in any research encounter, whether that be conceptualised in terms of an overt remit for an emancipatory research politics, or as a way to direct the researcher encounter towards one with less of a dominating and instrumental dynamic. Here we reflected upon the shifts in the researcher/respondent power dynamic which occurred at different parts of our own research. It was these twin bulwarks of reflexivity, *ontology* and *power* that became the cornerstones of our discussion. To illustrate the discussion, two research stories are given as worked examples.

TALES FROM A TRANSFORMATIVE FIELD 1: *****S STORY

My research can be termed '*feminist*' from my self-identification as a feminist and from the inclusion (but not exclusivity) of methods drawn from feminist scholarship. It embodies feminism as a *perspective* (Reinharz, 1992) rather than a political stance and embraces many of the issues raised by a number of writers (e.g. Bristor and Fischer, 1993) concerning consumer research in terms of acknowledging individual differences, for example, and opting for research which is not explicitly aligned to marketer interests (e.g. Olander, 1993). However, the literature does not offer a particular framework to show what feminist research should be like (Maynard, 1994), rather feminist researchers (e.g. Fonow and Cook, 1991, Skeggs, 1994) examine the research process from a viewpoint of the different elements feminist scholarship has to offer. A great deal is written, however, on the nature of the interview in feminist research (e.g. Reinharz, 1992), largely stemming from Oakley's seminal 1981 paper "*Interviewing women; a contradiction in terms*" in which she challenges the traditional conventions of interviewing and the role of the interviewer, especially the characteristics of "*proper*" (p.38) interviews, such as objectivity, detachment, hierarchy and science and where she asserts that personal involvement is "*the condition under which people come to know each other and to admit others into their lives.*" (p.58)

I was influenced by the notion of the researcher as "*bricoleur*" (Denzin and Lincoln, 1998), incorporating the idea that research is a process shaped by the individual history of the researcher and the individual characteristics of all the people in the research setting. The qualitative researcher "*refuses to be limited*" (Janesick, 2000, p.381), rather, the '*researcher-as-bricoleur*' uses the tools of his or her methodological trade to provide solutions to problems (Denzin and Lincoln, 1998); "*the choice of which tools to use, which research practices to employ, is not set in advance.*" (p.3). According to Denzin and Lincoln, the '*bricoleur*' develops diverse skills from interviewing to observing and interpreting, engages in intensive self-reflection and also explores the many interpretive paradigms that can be brought to any particular problem. As Denzin and Lincoln (1998, p.8) note: "*Qualitative researchers stress the socially constructed nature of reality, the intimate relationship between the researcher and what is studied and the situational constraints that shape inquiry.*" In my research, I draw from a number of areas to develop a methodological approach which can best capture the individual's point of view and secure rich descriptions. Additionally, individual factors such as the researcher's (*my*)

personality (Punch, 1998), (*my*) personal history (Denzin and Lincoln, 1998), (*my*) personal interest (Morse, 1998) and (*my*) personal desire to examine consumption independently of marketing management implications (Holbrook, 1987) from the consumer's perspective (Hirschman, 1991), were of primary concern to me in my endeavours; hence they represent my first steps on the way to becoming a reflexive researcher. At the outset, I planned to adhere to the best tenets of interpretive research (Lincoln and Guba, 1985) adopting the existential phenomenological interview as the main tool for engaging with lived experience (Thomson et al., 1989). However, from a personal experience perspective, I soon found myself confronting certain challenges arising from the interview process. Instead of ignoring these difficulties or '*brushing them under the carpet*' in the writing up process, I undertook self-reflexive reporting of the interview process (Reinharz, 1992) to present a critical assessment, from my perspective, of the design decisions and changes which took place.

One of these challenges was the sense of difficulty in the "*bracketing*" which Thompson et al (1989) hold is necessary for attaining an understanding of respondents' lived experiences (p.140). Hudson and Ozanne (1988) recognise this difficulty as a criticism of interpretivist approaches; "*it is questionable whether researchers can really bracket their biases and socio-cultural backgrounds*". (p.516) Thompson, Locander and Pollio do make the assertion, however, that bracketing is not intended to imply a neutral view as researchers must always see and interpret the world from some perspective. Hirschman (1992) did not feel that the issue of bracketing was a problem in her study of drug addicts, even though she admitted at the time to being a recovering drug addict (p.161). However, her description of what bracketing consists of is perhaps slightly more straightforward: "*phenomenology brackets the external world to include only those aspects that are present in the consumers' consciousness*" (p.161). Certainly, within her description of the research methodology, Hirschman made no secret of her personal status; she identified herself as a recovering addict as well as researcher and noted that she believed some of the participants' "*willingness to serve as informants was based largely on their knowledge of my own addictive history*". (p.161) However, I sensed a real problem in this regard which stemmed from direct experience of, and involvement with, the subject of the study, unlike, for example, Eccles (2000) who notes that during her study of addicted shoppers, "*the fact that the researcher had experience as a woman and as a researcher, but none as an addicted consumer prevented the imposition of preconceived notions*". (p.143, emphasis added) While Sue Eccles is not, by her own admission, addicted to shopping, I have a feeling that there is no-one in the world better qualified than me to undertake research into the particular area of consumer behaviour which has been the subject of my research for many years now—frankly, what I don't know about it *from personal history and experience* isn't worth knowing.

It would be hard to state for certain, therefore, that bracketing was successful, especially when Arnould and Fischer's (1994) definition of the sort of knowledge which would be classed as "*[pre-]understanding or pre-judgement*" (and thus which should be bracketed) is considered: "*The [pre-]understanding of consumer researchers is found in two inter-related traditions—experience as a consumer and experience as a researcher*". (p.57) However, from the perspective of philosophical hermeneutics, according to Arnould and Fischer's discussion (1994), researchers should not try to put aside [pre-]understanding, rather researchers should capitalise on it; "*Philosophical hermeneutics stresses that [pre-]understanding enables rather than constrains the interpreter*". (p.57) This viewpoint, when taken into account vis-à-vis the explication of existential phenom-

enology as put forward by Thompson et al (1989) perhaps illustrates the two oppositional dimensions of the researchers' role in the interview and the interpretive process. Some writers have criticised the lack of reflexivity in interpreting unstructured interviews: "*common platitudes proclaim that the data speak for themselves, that the researcher is neutral, unbiased, invisible*" (Fontana and Frey, 2000, p.661) and this view negates the value of the researcher and the "*strong arguments for strongly reflexive accounts*" (Oleson, 2000, p.229) about the researcher's own part in the research. Indeed, as Fontana and Frey (2000) note, while traditional interview techniques have determinedly aimed to maintain neutrality and achieve objectivity, feminists are rebelling against this stance and seeking to use the interview in a more participatory way. Hirschman and Holbrook (1986) suggest that in humanistic enquiry researcher understanding arises from direct personal experience and the researcher serves as measuring instrument; there is no possibility of objective truth; "*the researcher must place faith instead in his or her own sensitivity and empathic insightfulness when exposed to the thoughts, beliefs, values and realities constructed by others*" (p.242)

For me, the interview experience raised issues which led to further reflection and critical review, especially concerning the role of the researcher (i.e. my own role) in the research process and issues such as self-disclosure (Reinharz, 1992). At this stage, these questions can probably be best described as reflecting conflict between, on the one hand, my desire to maintain rigour by adhering to a prescribed methodological protocol (i.e. existential phenomenology at this point) yet simultaneously, on the other hand, to start to be more critical; to engage in critical analysis of alternative approaches and to examine issues relating to my role in the research, particularly as a woman and as a feminist. This reflected my growing awareness of, and engagement with, the critical debate surrounding marketing and consumer research discussed previously as well as an increasing sense of the role of self as a researcher, as a woman and as a feminist. It is a dilemma recognised and questioned by feminist researchers who identify problems with "*how we shift across the edges of our own personal lived experiences, our research explorations of others' private lives and our transformation of these into the format of public knowledge.*" (Edwards and Ribbens, 1998, p.203)

As stated, it was principally the notion of '*bracketing*' which started to give rise to doubts in my mind as to the use of the existential phenomenological interview approach. As Schwandt (1998) states: "*Whereas the individual-as-citizen legitimately has a practical (in a classic sense), pragmatic, interested attitude, the individual-turned-social-scientist brackets out that attitude and adopts the posture of objective, disinterested, empirical theorist.*" (p.248) Because of this distancing of oneself as inquirer, Schwandt argues that interpretivists cannot engage in critical evaluation of the social reality they want to portray. Contrast this with feminist scholarship which emphasises identification, trust and empathy, which brings out a relationship between researcher and researched based on cooperation and collaboration (Punch, 1998). This describes much more aptly the situation I found was arising in the interviews and which, I felt, made a positive contribution to the successful outcome of those interviews in terms of generating rich, deeply personal accounts of the consumption experience. Acknowledging this was probably the starting point for my engagement with feminist research praxis. Oakley advocated a new model of feminist interviewing that strove for intimacy and included self disclosure. Other key aspects of feminist interviewing relate to the issue of hierarchy and equality between the researcher and the researched (Oakley, 1981, Oleson, 2000); the notion of the interviewee being actively involved in constructing data about their lives, rather than passively manipulated (Graham, 1983); interviewee-guided interviews (Sandelowski and Pollock, 1986) where

the interview becomes an *interviewee*-guided investigation of a lived experience that asks almost no prepared questions; self disclosure where interviews are modelled on a '*true dialogue*' rather than an '*interrogation*', where participants become '*co-researchers*' (Bristow and Esper, 1988). Another important issue in feminist scholarship is that of '*voice*'; of allowing the different and multiple voices within the research (including the researcher's) to be heard and displayed equally, rather than subordinated or manipulated by the '*scientific*' researcher, of trying to understand and interpret the participants' stories without imposing meanings (DeVault, 1990). Thus, interviews were conducted in ways which embraced the above issues wherever appropriate. This does not mean, however, that the existential phenomenological approach was rejected completely; the thinking behind this approach remained influential throughout, particularly at the hermeneutic level within the iterative interpretation process to identify the interpretive themes (Thompson et al, 1990). I no longer tried to be as invisible as possible (Fontana and Frey, 2000) and made no attempt to retain a quasi-objective role through detachment, bracketing or any alternative techniques; instead emphasis was placed in the interview on exploring the participant's experience of the specific aspect of consumer behaviour under study through the medium of shared knowledge; a dialogue which acknowledged my own personal experience of the phenomenon and which attempted, as far as possible, to build empathy and trust between the researcher and the researched.

In a sense, this illustration represents my own '*autobiography*' of the interview stage of the research process which provides a "*practical tool to bring the process of constructing research to the surface.*" (Birch, 1998, p.174) This also responds to Mauthner and Doucet's (1998) call for acknowledgement of the three '*voices*' within research; the researcher's '*voice*', the '*voices*' of the individuals interviewed and the '*voices*' represented in existing theories or frameworks, which should be incorporated into the structure of the research.

TALES FROM A TRANSFORMATIVE FIELD 2:

*****S STORY

I too self identify as a feminist researcher, while understanding that there is no definitive guide to the nature of feminist research (Fonow and Cook 1991). Feminist research, rather than being a prescriptive guide to the researcher, presents a series of challenges to the researcher. Indeed, for me, feminist research is much more about a series of question marks that 'hang over' the research process which must be addressed by the researcher and the choices made and dilemmas struggled over clearly articulated within the research text (Griffiths 1995, Ramazanoglu and Holland 2000). One of the most enduring challenges and dilemmas for feminist researchers has been the concern to be reflexive in the research encounter, that is, to reflect on the process of research and to engage with the issues of power, control and instrumentality in the researcher/respondent relationship. It seems sensible to assume that the form of reflexivity that emerges from any specific research encounter is configured through the nature of that encounter both ontologically and in terms of the aims and objectives (the politics) of the project. Thus discussion of researcher reflexivity in terms of '*possible reflexivities*' seems more realistic. This story therefore outlines the forms of reflexivity which emerged in my own recent research project, described as a consequence of the nature of the research both ontologically and politically.

My research project concerns anthropological study of a professional context, focusing on organisational and identity work with what might be called an '*elite*' respondent group (Moyser and Wagstaffe 1987). The theoretical approach used was Actor Network Theory (ANT). ANT is an interdisciplinary approach to the social

sciences and technology studies that evolved from the work of Michel Callon (1991) and Bruno Latour (1992) at the Ecole des Mines in Paris. ANT has not gained significant purchase in consumer or marketing research as an approach as yet, but has achieved much credibility as a research approach in organisational studies (Cooper 1992, Cooper and Law 1995, Law 1994), health studies (Callon and Rabeharisoa 1998, 1999, Cussins 1998, Singleton 2000), the arts (Hennion 1989, 1996, Gomant and Hennion 1999), medical technology (Mol 1998, Dugdale 1999, Prout 1996) and engineering (Suchman 2000) to name but a few. ANT is rooted in semiotics and poststructuralist thought and can broadly be characterised as a research approach based on a post humanist ontology (Jones 1996). This foundational ontology is predicated upon a rejection of both natural realism and constructivism (or relativism), which the key protagonists call instead 'social realism'. Latour (1992), argues that both social realism and natural realism actually reinforce modernist categories like subject/object, micro/macro and agency/structure, thus replaying the arguments about these dualisms which have dogged sociology for centuries. As a result, the power of these analyses was becoming lost in endless epistemological debate. As a researcher I had found the contemporary renderings of these debates in marketing an insufficient basis for addressing these dualisms, which are also of concern to feminist theorists, and as such saw ANT as a possible way to do research which got past these stultifying debates and allowed me to engage with, particularly, the subject/object dualism. As Jones (1996:291) argues, this radical post humanist approach attempts to move beyond these debates through a 'deliberate rejection of scientific realism (the belief that nature alone determines the ways in which scientific representations are developed and refined) and social realism (the idea that questions of scientific fact are never answered definitively by nature, but are decided instead by human interactions)'. In 'We have never been modern', Latour (1993) justifies this rejection by arguing that social constructionism and the scientific realist approaches they purport to critique follow the same basic ontological logic. This is because they rest on the assumption of an ontological 'gap' between the 'real world' and 'the social'. To illustrate this he argues that, scientific realists when asked the question of whether you can close the gap between the social and the natural, say that the gap can be closed through good scientific methodology. On the other hand, social constructionist approaches would argue that the gap cannot be closed because science is just another language game. Latour argues that in effect they are both realist positions, the social constructionist is arguing for social realism, the 'real' is determined by the social. The ontological position of ANT proceeds from the answer that there is no gap, what is deemed to be 'the social' or 'the real' are co emergent effects of heterogeneous relations. This means that 'because society is one of the categories that actor network analyses render transparent, societal explanations-interests, norms, class position-are no longer useful answers, but instead become part of the question' (Frickel 1996:29). This reconfigures the type of questions that might be asked, in that they are framed in terms of 'how things are as they are', how they are 'held in place' as effects. As Law argues, 'Far from being a theory of the social or even worse an explanation of what makes society exert pressure on actors, it always was, and this from its inception, a crude method to learn from the actors without imposing on them an a priori definition of their world-building capacities.' (Law et al 1999: 20). In understanding what to study in this ontological approach, the metaphor of the 'actor-network' was developed (Callon 1986, Latour 1988) as one which is intentionally oxymoronic and in tension (Law 1999). That is, it does not simply map onto the dualisms 'agency' and 'structure' but attempts to guide the researcher in theorising a de centred, post social and post humanist account. In this formula-

tion, the object of research becomes 'heterogeneous networks' (Law 1987), 'empirically identifiable configurations of human and non human forces seen in relation to one another' (Frickel 1996:31) that is, networks of entities, human, non human, conceptual and material that are defined in terms of each other in a 'material relationality' (Law 1999). The process of 'heterogeneous engineering' constructs those entities in terms that their 'stability and form' is seen as 'the function of heterogeneous (social, technical and natural) elements as they are shaped and assimilated into a network' (Law 1987:113). Therefore, these entities, both human and non human are seen as effects of the actor network(s), and the human, or any other actor was not to be privileged or considered 'essential' or prior.

Crucial to this discussion of researcher reflexivity is that ANT is based on no stable theory of the actor; in other words, it assumes the radical indeterminacy of the actor. For example, neither the actor's size nor its psychological make-up nor the motivations behind its actions are predetermined. This means that 'agency' is found, not in terms of the prior goals and plans of the 'independent thinking subject' but in terms of the relational networks within which they are embedded. As Fuller (1994: 746) argues, ANT, 'instead of treating agency as an ontological primitive out of which societies are constructed (it) treats agency as a theoretical construct carved out of an already transpiring social order'. The 'ontological primitive' view sees the agent as already formed and essentially prior, moving according to its own volition unless constrained by other forces. ANT on the other hand sees agency as not beginning with this kind of 'agent' but with a social space through which 'agents' emerge. Agency is therefore seen as the property of associations rather than emanating from the 'choices' of bodies seen as 'ontologically primitive'. Action, and thus responsibility, becomes distributed among a series of relations. As Callon and Law (1995: 485) put it, 'it's the relations . . . that are important. Relations which perform. Perform agency' This ontological foundation poses very specific problems for the would be reflexive researcher. Reflexivity is a problematic issue for any project which has at heart a post humanist ontology because the idea of reflexivity, at base, is grounded in the assumption that the reflections on the process by a thinking, independent subject can give a better account of the research (Haraway 1997). In terms of this research, this would inevitably lead to critiques that it reproduces a dominating logic that I can stand outside this process and comment on it, a logic that I am not 'allowing' my respondents from within this ontological approach (i.e. I am a sentient subject everyone else is an effect). Moreover, it assumes a stable and coherent 'project-ness' (Law 1994) that I can capture as a whole, reflect upon and represent. This significantly refigures what reflexivity can mean within a post humanist approach because ways must be found to operate research to subvert the simplistic logic of the researcher using reflexivity in a technical sense, to reflect upon their interaction with object of study such that the subject-object binary is reproduced.

The best way I found to deal with this issue was to step back and to think about it in terms of what or who am 'I' during the research process. Using the narrative given above I can describe this in comparison to the 'I' that is emerging as an effect in that research story. In the previous story, the research has a politics of emancipation, which has a specific configuring effect on the researchers

¹There are many realisms. Jones (1996) posits that realism generally denotes belief in the existence of a 'real world' beyond human language and cognition. Common forms of scientific of correspondence realism further stipulate that logically ordered statements about the real world can more or less accurately represent the external realities to which they refer

subjectivity. Here no such politics can be claimed for my work because as just another effect of the research process, the politics of my position as researcher becomes one which feminist theorist Judith Butler calls 'a reiterative or rearticulatory practice, immanent to power, and not a relation of external opposition to power' (Butler 1993:35). ANT diffuses 'responsibility' among a network, thus subverting the 'us and them' logic of research as such describing the research dynamic in terms of a researcher/respondent relationship becomes meaningless. This is because ANT analysis is based on engagement with a set of negotiations which describes the progressive constitution of a network in which both human and non-human actors assume shifting and multiple identities according to prevailing strategies of interaction. This way of doing research has interesting effects on my relationship *vis a vis* the others who have taken part in the research, because taken as an 'effect', I am articulated within the research as implicated, produced and co-emergent. I am not performing a location for myself that resist the norms of the 'field' as performed by this research, or is located as outside those norms. As Butler argues (1993:15) that the subject 'who would resist such norms, is itself enabled, if not produced by such norms'. This position means that my relationship with the others that participated in the research is flattened, that I am a performative effect within the same conditions of possibility as the respondents.

In terms of what might be called reflexivity, 'I am being produced by the research as a story that constructs me within the conditions of possibility and project specific exigencies, as what I am allowed to become, not a 'reflexive subject'. For me ANT emerged as an idealist approach, which in practice grated against the genre of scientific research we all have to work within. This proved tricky to work around in cases where reflexivity might be most evident. For example, at moments in the research where I felt the pressure to make a 'methodological choice' which I would then be expected to 'reflect upon' this was obviously done overtly. For example I had to make 'decisions' in my methodology about sample size and sample frame. However, instead of articulating this in terms of 'choice' my narrative resembled one where I reflected on the 'researcher-as-effect' and 'respondent-as-effect' that was emerging through the research at that time in terms of the field of possibilities enacted by the multiple networks of the specific research project within which I was operating.

Of course, it could be argued that would be disingenuous of me to make such a claim, I am writing the thesis, I have 'captured' the words of the respondents in my tapes and field notes and, despite the admission that I am inevitably folded into the same conditions as my respondents I retain some kind of power to produce this work, and myself, in certain ways rather than other ways. I would argue that this type of approach because it explicitly places me as an effect emerging with and through the research, although it may never 'equalise' the power relationship within the research it gives me a well articulated analytical position within the research from which to at least interrogate that position and destabilise my own authority as within the research.

Illustrating how ANT has addressed this concern for reflexivity, Latour (2003:36) has reminded researchers using this approach in a recent paper that, 'the network is not 'a thing in the world' but a path traced by the researcher'. This is where a more specific form of 'reflexivity' comes in, where to be reflexive 'does not signal an increase in mastery and consciousness, but only a heightened awareness that mastery is impossible and control over actions is now seen as a complete modernist fiction'. (Latour 2003:36). During my research, and especially the writing up stages, I presented 'my self' as an uncertain and emergent effect, multiple and shifting. The 'researcher-as-effect' in the research as a result of the

multiple and complex actor networks that are inevitably implied in any funded research project became an explicit and major part of the research. In these confrontations I have articulated the possible ways of coming to matter as an 'author' that 'I' could have emerged as, as an effect of the research. This means that 'I' and the other effects in the research, emerge in the thesis as 'becoming subject' to it, fragile, processual achieved effects performed as different and multiple and that 'could have been otherwise'. In this research approach, the idea of different voices of participants is not valid, the focus and topic of the research is the emergence, through negotiations and confrontations, of the various non human and human effects that emerge *as a consequence of the research process*, with no prior essence implied, and which are seen in this context in terms of their material semiotic fragility, multiplicity and tenuousness.

DISCUSSION: CONCEPTUALISING REFLEXIVITY WITHIN A TRANSFORMATIVE AGENDA

As has already been explained, during our discussions of reflexivity in the research process, it became clear to us that different forms of reflexivity were in fact being deployed. In fact, the overweening issues for both of us was the shifting nature of reflexivity itself during both of our research processes. As has already been addressed there was an emerging dynamic in our reflections between power, ontology and reflexivity. Different kinds of reflexivity were implied by the different ways reality emerged in our research, and different kinds of power relationship were being enacted at specific points through our own reflexive approaches.

This rendered the theorising of reflexivity in our own projects highly problematic. Analysing and close reading of our own work suggested a taxonomy of four possible reflexivities, based on the two dimensions of power and ontology, Objectivist, Perspectival, Experiential, and Multiplex (Figure 1).

These should not be seen as mutually exclusive, both of our worked examples contained elements of each, and this is the point we are making. There is no claim in this paper that any one of these reflexivities are superior to the others, only that they are appropriate to the different contexts that large qualitative research projects inevitably throw up, and as such they denote shifts in the ontological/political nature of the researcher/respondent relationship at different times in any one research project. There is also no suggestion that this framework is exhaustive or prescriptive, it is merely presented as a starting point for the stimulation of necessary dialogue.

Objectivist reflexivity refers to the practice of commenting upon the technical choices that were made on the research journey in terms of, for example, method choice, decisions over analytical categories etc. This form of reflexivity is deemed objectivist because it is aimed primarily at giving better accounts of the research process to produce better knowledge. In objectivist reflexivity there is an assumption of both a fairly stable and ontologically singular research project and researcher who reflects on this project and the choices and possibilities open to them. Despite our political commitments against objectivism, this form of reflexivity was evident in both of our research projects. At stages throughout the research, particularly the methodology, we gave commentaries upon our choices based on objectivist measures of research. Both of us feel that this is inevitable given the genre within which we are working, where metanarratives of truth and objectivism are dominant and the researcher has to show a degree of rigour in terms of the choices made and how they relate to the idea of better science. As can be seen in our examples, objectivist reflexivity has problems for the researcher who is trying to deal with issues of power in the

FIGURE 1
 Framework of possible reflexivities

		Nature of the research encounter

Ontology	Singular reality	Objectivist Reflexivity	Experiential Reflexivity
	Multiple reality	Perspectival Reflexivity	Multiplex Reflexivity

research context. Whatever the ontological approach, reflecting on methodological choices, however this is done, reinforces the authority of the researcher and reiterates their status as thinking sentient subjects. In both of our examples it can be seen that the shifting nature of the researcher/respondent power dynamic is something that we both have had to struggle with and manage as best we could through employing different kinds of reflexivity as necessary and facing the implications and consequences of that as an important part of the research process.

Experiential reflexivity concerns complex research situations where researcher and respondent are engaged in sharing of experiences. This type of reflexivity is evident in the first worked example. Emphasis is on co-creation of meaning through intimate research in which experiences are shared and no attempt is made to 'bracket' the researchers own lived experience. The researcher reflects upon their own experiences and those of their respondents to build a picture of, and to understand, the phenomenon under study. The issue raised here concerns how to ensure that the experience of those being researched does not become subsumed within the researchers own frameworks and lived experience. Experiential reflexivity therefore becomes a task of interrogating the researchers own research practice to ensure that this does not happen.

Perspectival reflexivity is so named because it demonstrates an appreciation of the different perspectives of the different subjects involved in a specific research encounter, and/or recognises that different groups are likely to view different topics through very different lenses, and sensitivity to this is reflected in the research design. The researcher reflects on these different perspectives or views them as different 'lenses' through which the researcher might view the research 'object'. This can be evident in interpretive research where researcher gives various perspectives on the research object as different stories from different perspectives, or as in the worked example given first, as a sensitivity to the different voices that make up the research encounter. Perspectival reflexivity rests upon the ontological assumption that there is a fairly stable research object which can be viewed differently depending upon the perspective of the viewer. This can emerge as different 'voices' or indeed the different 'stories' of reflexivity that are being presented here. Reflexivity in this case emerged as a requirement to ensure that the researcher reflected upon the likely implicit boundary work being done in terms of this research object.

Multiplex reflexivity is evident only in the second worked example. Multiplex reflexivity differs from Perspectival in that the

object of research is not taken as essential, with different perspectives or lenses deployed to view it differently. This type of reflexivity focuses on how the researcher and the researched are constructed as such through the research process as multiple, shifting and tenuous entities specific to that project. Unlike experiential reflexivity no prior or shared experience is sought, reflection in on how the entities that emerge take shape and this is seen only in terms of the multiple actor networks of the research itself. This type of reflexivity is evident in story two.

CONCLUSION

We would have liked to have analysed in much more depth the four categories of reflexivity, and to provide further examples for our struggles with this issue. Indeed, this is another of the problems of reflexive consumer research: restrictive word count. However, we have presented this thus far as a starting point. We begin and end our paper with the specific call for papers from the ACR 2005 organisers, as it is one we identify with strongly as transformative consumer researchers. In the call, the mission of this conference is stated as one which focuses upon making a 'positive difference in the lives of consumers, both present and future generations, through the chosen focus and conduct of specific research'. The organisers emphasise their hopes of stimulating a 'fresh dialogue on the opportunities, challenges, and future of Transformative Consumer Research, and to showcase promising and path-creating examples of TCR as well'. Following the ethos of this call, this paper is designed not as a definitive statement on reflexivity in consumer research or a desiccated or normative framework which prescribes approaches that the consumer behaviour researcher should follow, but instead as a starting point for fresh dialogue around these issues. The politics of this paper are transformative but true transformation requires collaborative discussion and a sense of moving forwards together. We sincerely hope that this paper is therefore taken in the spirit with which it was written, as a dialogue opening starting point for these very prescient discussions of transformation in the process and praxis of consumer research.

Remembering Prices: Numeric Cognition, Language, and Price Recall

David Luna, Baruch College
Hyeong Min Kim, Baruch College

EXTENDED ABSTRACT

This paper examines the role of language on price recall. Three experiments show that the linguistic coding of prices can influence the accuracy of individuals' mental calculations and subsequent price recall. We trace the root of this effect to the length (i.e., the number of syllables) of the number names to be processed. Based on prior research, we theorize that when several prices are presented together, individuals encode them phonologically. They rehearse subvocally the number names of the individual prices as they read them and perform calculations. This process is constrained by the capacity of working memory. Thus, when individuals encode the numbers in a language that requires fewer syllables to rehearse them, total price recall will be more accurate than if they encode the numbers in a language that requires more syllables. Similarly, if we consider a single language, when individuals process numbers with shorter names, their subsequent recall will be more accurate than when they process numbers with longer names.

To date, research studying language differences in information processing has explored issues like presentation modality (Tavassoli and Han 2001; 2002), language-specific markers (Schmitt and Zhang 1998), or differences in information load across the languages known by bilinguals (Luna and Peracchio 2001). This paper investigates a new area in which language impacts information processing: number cognition. This is an exceedingly important area of consumer behavior since consumers engage in number processing any time they make a purchase. In particular, we study how number processing influences memory for multi-dimensional prices, which are prices that consist of more than one number (e.g., "\$729 dish washer, plus \$45 installation fee"), or prices of multiple items (e.g., \$20 beer and \$13 potato chips in one shopping trip). Both multi-dimensional prices and prices of multiple items will be referred to as "multi-prices." We focus on multi-prices in this research because consumers are frequently exposed to them and because their processing involves the calculation of a total price, so the linguistic and numeric effects we investigate are particularly applicable to them. Thus, number names with more syllables (e.g., "seven" vs. "six") are likely to overtax working memory, which can make the calculation of total prices more difficult. This, in turn, may lead to lower price recall accuracy.

Two major contributions emerge from this research. First, we highlight the important role of numeric cognition in research on price perception. Previous pricing research suggests that price recall is influenced by various factors such as required effort to accurately process price information, consumers' choice of a processing strategy, and price knowledge (Estelami and Lehmann 2001; Estelami 2003; Monroe and Lee 1999; Morwitz, Greenleaf, and Johnson 1998). However, as Monroe and Lee (1999) point out, little research on price recall has been conducted based on numeric cognition. Our approach is based on current theories of linguistic processing and mental arithmetic, so we provide new insights to pricing research. Second, and more generally, we extend the notion of linguistic influences on cognition to number processing. Although recent research has examined how language influences other areas of cognitive processing (e.g., Schmitt and Zhang 1998), the influence of language on number cognition is still unexplored in spite of the importance of number processing for pricing and promotion. We investigate how language affects the accuracy of

mental calculations and provide evidence that the effects we find take place during encoding of prices, not retrieval.

The paper begins with a brief review of the literature on mental arithmetic and language. Study 1 shows that there are differences in the recall accuracy of the total price of two multi-prices, depending on the language in which the prices are processed. When respondents process the prices in a "short" language (a language that requires fewer syllables to encode a number phonologically) versus in a "long" language, they display higher accuracy. Studies 1 and 2 attribute this result to encoding effects. In other words, number-length is shown to influence price recall accuracy when the numbers are initially read. Study 3 validates the effect of number name length on price recall in a single-language setting and finds the effect regardless of the magnitude of the prices.

The Principle Matters: Antecedents and Consequences of Procedural Justice in the Context of Pricing

Laurence Ashworth, Queen's University
Peter R. Darke, University of British Columbia

EXTENDED ABSTRACT

Fairness seems to matter to consumers a great deal. It is an important source of satisfaction with purchases (e.g. Darke and Dahl 2003; Oliver and Swan 1989) and consumers seem to react quite negatively to perceived unfairness (Kahneman, Knetsch and Thaler 1986). Within marketing, much of the research on fairness has focused on prices. Thaler (1985) first asserted that consumers derive utility from the fairness of a price (transaction utility) and argued this is judged by a comparison of the actual price to some reference price. Such reference prices appear to be influenced by a variety of factors including past prices, prices in comparable stores, perceptions of the cost of the product to the seller, etc. (e.g. Bolton, Warlop and Alba 2003). Recent work has broadened the perspective on price fairness to include judgments based on social comparisons between different customers' inputs and outcomes (Darke and Dahl 2003; Xia, Monroe, and Cox 2004), consistent with equity theory (Adams 1965). Overall, the existing research on price fairness fits into the broad framework of *distributive justice* (Deutsch 1985), which assumes that judgments of fairness are based on the allocation of material outcomes.

The current investigation builds on this framework by examining the role of *procedural justice* in a pricing context. We propose and test a model that includes both procedural justice and existing theories of distributive justice as unique predictors of fairness. Across two experiments, we demonstrate that judgments of procedural justice are distinct from distributive justice by showing that they have different antecedents and independently predict overall judgments of fairness and satisfaction. It is shown that perceptions of procedural justice stem from the violation of implicit prescriptive norms that dictate socially appropriate ways in which marketers should treat consumers. In particular, we identify two different procedural norms, norms of consistency and openness, and show that violation of these norms leads to perceptions of procedural injustice, which lowers perceptions of general fairness.

Experiment 1 showed that procedural and distributive forms of justice were distinct sources of fairness in pricing, and that both were important predictors of purchase satisfaction. This was demonstrated by independently manipulating elements of a purchase situation that were predicted to affect procedural and distributive justice. Procedural justice was shown to stem from the violation of a norm of consistency. In contrast, distributive justice was manipulated by varying the perceived relevance of the inputs used to determine consumers' outcomes, consistent with predictions from equity theory. As expected, both procedural and distributive justice contributed to general perceptions of fairness and satisfaction with the purchase.

In the experiment participants read a scenario that explained they bought a stereo for \$199. However, they later discovered that another customer had purchased the same stereo for \$159 because they qualified for a discount based on the stores' pricing policy. Violation of the consistency norm was manipulated by having the salesperson ask whether the participant actually qualified for the discount in one case and not ask in another case. Importantly, participants never qualified for the discount anyway, meaning the violation was independent of their outcome. This was crossed with a second manipulation designed to influence perceptions of distributive justice according to equity theory. Two different pricing

policies were used that specified different inputs that would entitle customers to the discount. The first policy entitled loyal customers to a discount. This input was chosen because it was predicted to be relevant to the outcome price (Darke and Dahl 2003; Huppertz, Arenson, and Evans 1978). The second pricing policy was designed to be considered less relevant, by granting a discount only to students of a particular university. As predicted, both the norm violation and relevance of the input had a significant impact on general perceptions of fairness and satisfaction. However, the effect of the norm violation was mediated by perceptions of procedural justice, whereas the effect of the pricing policy was mediated by perceptions of distributive justice.

Experiment 2 provided a conceptual replication of the first experiment using a different prescriptive norm. It was hypothesized that a norm of openness also exists in marketing interactions, which dictates sellers should provide consumers with the information that is relevant to their purchase. This norm was examined in the context of an upcoming sale, where the norm would dictate that sellers should inform customers that prices will shortly be reduced. In order to examine the influence of the violation of the norm independent of material outcomes we constructed a scenario where, in one instance, customers were unable to wait for the upcoming sale. This meant they could not obtain the sale price whether or not they were told about it. In this case, it was shown that violation of the openness norm reduced general perceptions of fairness and satisfaction because the violation lowered perceptions of procedural justice. In the other instance, customers were able to wait for the sale, which meant that violation of the openness norm also impacted their price outcome. In these circumstances, the violation reduced perceptions of fairness and satisfaction, but this was caused by reductions in both perceptions of distributive and procedural justice. Importantly, participants found out about the sale price whether or not the openness norm was violated, which meant that the reference price did not vary and therefore these differences could not be explained by differences in transaction utility.

Overall, these studies expand on our knowledge of the factors that contribute to perceptions of fairness and satisfaction in a pricing context. Consumers care about the principles that govern marketing interactions and not just the material aspects of the interaction. This suggests that marketers should observe certain prescriptive norms in their interactions with consumers, even when no material consequences are involved.

The Presence of Reference Price: How Value Can Appear Convergent to Buyers and Sellers

Chaang-Yung Kung, Chao-yang University of Technology

ABSTRACT

This paper argues that the endowment effect—the tendency of minimum selling price to exceed maximum buying price for a particular object—might be minimized when a reference price appears. The findings from 418 participants in two experiments support our hypothesis: the endowment effect would be smaller when the reference price is available. The importance of reference price is thus highlighted.

INTRODUCTION

Economists are often concerned about the estimated “value” or welfare measures on various goods or services, and attempt to derive empirical estimation of objective measures. The assessment of objective values refers to “people are required to estimate the least price they are willing to accept (WTA) to sell and the ceiling price they are willing to pay (WTP).” Most economists argue that the gap between WTA and WTP should converge for most commodities. However, experimental research showed that the values of WTA and WTP might be remarkably different even for the same object. Specifically, research on the valuation of objects by laboratory experiments indicated that people desire a higher WTA for an owned object than WTP for a not-owned-yet object (Kahneman, Knetsch, and Thaler 1990; Knetsch and Sinden 1984; Thaler 1980). The gap between the buying price and the selling price for an object is perfectly rooted in the status of ownership and is termed as “the endowment effect” (Thaler 1980; Kahneman et al. 1990).

The concept of the term “endowment effect,” first mentioned by Kahneman et al. (1990), has proven robust in studies employing laboratory experiments (Kahneman, et al. 1990), economics style market experiments (Franciosi, Kujal, Michelitsch, Smith, and Deng 1996), and field studies (e.g., Johnson, Hershey, Meszaros, and Kunreuther 1993). These studies have shown that people tend to demand a higher selling price for commodity that they own than they would be willing to pay in order to acquire as a buyer.

Explanations of the endowment effect generally rely on psychophysical notions of reference dependence and loss aversion, as postulated in prospect theory (Kahneman and Tversky 1979; Tversky and Kahneman 1974) and subsequent research on mental accounting (Thaler 1980). According to prospect theory, states below the reference point are negatively coded as losses and states above the reference point are positively coded as gains. The loss aversion postulate further states that losses loom larger than the corresponding gains: $-V(x) > V(x)$. In other words, the pain of giving up an endowment will exceed the pleasure of acquiring it. This should be observed as a disparity in selling and buying price for the same good, with the former exceeding the latter (Mandel 2002). Similarly, loss aversion may account for why people are reluctant to exchange lottery tickets, even when a small bonus is offered for doing so (Bar-Hillel and Neter 1996). Explanations of support loss aversion have shown that endowment effects are more likely to be observed when prospective gains and losses are difficult to integrate, either because of high uncertainty about future exchange prices (van Dijk and van Knippenberg 1998) or reduced comparability of consumer goods (Chapman 1998). Strahilevitz and Loewenstein (1998) also used loss aversion to explain the ways

in which perception of subjective valuation depends on time of possession for the object. An individual’s selling price for a current possession will increase as a function of how long the person has owned the object.

The endowment effect also appears to be moderated by regulatory focus: participants were reluctant to exchange an endowed object when they focused on prevention goals rather than they focused on promotion goals (Lieberman, Idson, Camacho, and Higgins 1999). Mandel (2002) found that the endowment effect was observed when participants imagined another individual wanting to buy from or sell to them rather than they imagined wanting to buy from or sell to another individual. Additionally, some works emphasized the importance of affective response (i.e. positive and negative feeling evaluations). Loewenstein and Issacharoff (1994) found that the manner in which people obtained an object affected their valuation of the objects. Specifically, individuals who received goods based on exemplary performance valued the goods more than they received the goods by chance or based on poor performance. These findings suggested that an affective role based on associating positive affect with the item was responsible. Forgas and Ciarrochi (2001) found that people with positive emotions enhanced and those with negative emotions decreased subjective cognitive value regardless of both owner and non-owner for general consumer’s commodity.

This research focused on the relationship of reference price to the impact of endowment effects. The magnitude of the endowment effect might be influenced by reference price. Previous research on perceptual valuation has shown that perception of valuation is likely to be influenced by both cues relating to the subjective value of the item and the relevant reference price (e.g., the market price for the product) (Monroe 2003; Green, Jacobowitz, and Kahneman 1998). It is reasonable that both seller and buyer’s perceptions of value are influenced by reference price and indirectly moderate endowment effects.

MODEL OF REFERENCE PRICE AND ANCHORING EFFECT

The role of reference price in consumer price perception and evaluation has been underscored by numerous studies (Heath, Chatterjee, and France 1995; Herr 1989; Mayhew and Winer 1992; Urbany and Dickson 1991). Reference price can be defined as “an internal price to which consumers compare observed prices” (Winer 1989). In other words, consumers possess a reference price, which is based either on their previous experiences (Winer 1986; Lattin and Bucklin 1989), on an external cue such as the advertised price (Biswas and Bliar 1991), or contextual effects (Rajendran and Tellis 1994; Hardie, Johnson, and Fader 1993). Empirical findings in the literature support the notion that consumers behave as if they had a reference price that factors into their decision process (Kalyanarm and Winer 1995). These findings indicate an increase in the predictive power of choice models that incorporate reference price rather than to price-only models (Winer 1989; Lattin and Bucklin 1989; Kalwani, Yim, Rinne, and Sugita 1990; Mayhew and Winer 1992). Although there is a general consensus in the consumer literature that reference price has a significant impact on product evaluation and purchase decision, there has been less studies

regarding to the manner in which consumers decide on the lowest price they are willing to accept for an item (Carmon and Ariely 2000; Kahneman et al. 1990).

The anchoring effect is often used to explain the effect of reference price on product evaluation. Tversky and Kahneman (1974) described anchoring as a process in which “people make estimates by starting from an initial value that is adjusted to yield a final answer...” In a typical demonstration, participants were asked to estimate a certain value. They were given an arbitrary value (20% or 80%) and are then asked to provide their best estimate. The usual finding is that these estimates are significantly influenced by the anchor (Green et al. 1998; Jacowitz and Kahneman 1995). Consistent with this idea of anchoring, Jacowitz and Kahneman (1995) also suggest that judges who are first asked if a target value is higher or lower than a given anchor adjust their estimates in the appropriate direction until reaching an acceptable value. We used the concept of anchor to explain reference price effect on consumer’s WTP and WTA (or endowment effect).

Theoretically, perception of valuation is influenced both by cues relating to the subjective value of the item and the relevant reference price (e.g., the market price for the product). However, that most products come in several varieties with different features are associated with numerous brands and counties of origin. They also are sold at a variety of stores. Once consumers decide to purchase a product, they still need to decide on a specific item and, correspondingly, the price they are willing to pay. Consumers must determine what combination of item characteristics and price offers the best solution for their values. This can be a challenging task, because preference and values are often ambiguous and unstable (Bettman, Luce, and Payne 1998; Simonson 1993). Thus, the buyer’s valuation of an item is expected to be particularly susceptible to reference price.

In contrast, sellers who have already decided to trade can base their asking price on the estimated market price. Suppose that a consumer has an unwanted item (e.g. a second CD player received as a gift) deciding to sell. In this situation, the personal value of the item to the seller becomes less relevant and the selling price is expected to be determined primarily by an external cue such as reference price. When reference price is provided by the retailer or the advertiser, a person who wants to sell a product will anchor and will be inclined to accept the price.

The magnitude of the endowment effect might be influenced by reference price. Specifically, when market reference price appears, owners may be more anchored into reference price to sell and potential buyers may be more anchored and inclined to buy. To see how inferred reference price might influence the endowment effect, one considers the “wine problem” that Frisch (1993) (see also Thaler 1980) used to test the endowment effect:

1. *Back in the 1950s you purchased a case of good wine for \$5 a bottle. Today, a wine merchant offers to purchase it from you. How much would you be willing to sell it for?*
2. *You have just heard that a wine merchant has a case of good wine dated from the 1950s. He purchased the wine for \$5 a bottle. He now wants to sell it. How much would you be willing to pay per bottle?*

Consistent with the endowment effect prediction, Frisch (1993) found that the mean price was significantly greater for participants when they imagined themselves as sellers (scenario 1) than as buyers (scenario 2). However, if the information of “market price is \$12 for same commodity now” is added to both scenarios 1 and 2, seller and buyer will anchor and adjust subjective perceptible value to the price. Jacowitz and Kahneman (1995) described

anchoring as a process in which “people make estimates by starting from an initial value that is adjusted to yield a final answer...”. When both seller and buyer anchor the reference market price, their subjective value will be adjusted to approach the price and the endowment effect—the discrepancy in buying and selling price for the same commodity— will be decreased. Thus, we predict that

H1: The endowment effect will be small when reference price is available.

STUDY 1

In order to examine our hypothesis that ownership and the presence of preference price interact to influence subjective valuation, an experiment was conducted in which two additional experimental conditions were added to a tiny modified version of the wine problem. Scenarios A and B correspond to scenarios 1 and 2, respectively:

- A. *A decade ago, you purchased a case of good wine for \$ 5 per bottle. Today, you are interested in selling the case to a wine merchant. How much would you be willing to sell each bottle?*
- B. *A decade ago, a wine merchant purchased a case of good wine for \$ 5 per bottle. You are interested in buying the case. How much would you be willing to pay for each bottle?*

In contrast to scenarios A and B in which reference price was explicitly present in market information in the following two scenarios:

- C. *A decade ago, you purchased a case of good wine for \$ 5 per bottle. Today, a wine merchant offers to purchase it from you. You got information from the Internet that there is a market price with \$ 12 for same commodity. How much would you be willing to sell each bottle for?*
- D. *A decade ago, a wine merchant purchased a case of good wine for \$5 per bottle. He is now interested in selling the case. You got information from Internet that there is a market price of \$ 12 for the same commodity. How much would you be willing to pay per bottle?*

As in scenario A, the case of wine is endowed to the participant in scenario C. However, unlike that in scenario A, the presence of market reference price is showed by the participant C. Similarly, presence of market reference price is inverse between scenarios B and D

Method

The experiment was conducted by a 2 (ownership: owner vs. non-owner) x 2 (reference price: presence vs. absence) between-subjects design. One hundred and sixty undergraduate students (88 females and 72 males), who participated in this experiment as part of the course requirement in marketing management class, were randomly and equally assigned to one of four different experimental conditions.

Procedure

Participants were given a 1-page questionnaire in which they were asked to consider a case of wine problem. The case varied in terms of who was described.

After reading the scenario, participants were asked to indicate the amounts for which they thought the owner was willing to sell the bottle of wine and the non-owner was willing to buy the bottle of

wine. For example, in the owner conditions, participants were asked to indicate the minimum amount for which they would be willing to sell the bottle of wine and they were asked to indicate the maximum amount they thought the wine merchant would be willing to pay to buy the bottle of wine from them.

Results and discussion

A two-way factorial ANOVA was employed to test the effect of reference price on the perceived value for the case of wine. The statistics $F(1, 156)=88.49, p<0.01$ showed significant main effects of ownership: people who own the case of wine have a significantly higher price (\$ 10.01) than the non-owners do (\$ 7.96). This finding is consistent with prior evidence for the endowment effect (Thaler, 1980). More importantly, as we expected, a significant interaction was found between the endowment effect and reference price, $F(1, 156)=16.12, p<0.01$. A significantly higher price for the case of wine was perceived by the owners (\$8.97) than by the non-owners (NT\$6.95) in the absence of reference price, $t(78)=6.15, p<0.0001$. However, statistics also proved to be an irrelevant factor between “those who owned the case of wine but wanted to sell it” (\$ 10.15) and “those who did not own the case of wine but wanted to buy one” (\$9.87) in the condition of presence of reference price, $t(78)=0.96, p>0.1$, these analysis supports our H1.

These statistics strongly support our assumption that the endowment effect occurs only in the absence of reference price rather than in the presence of reference price.

Experiment 1 supported our hypothesis that the reference price as a moderator decreased one’s perceived value of an owned object and the endowment effect did not occur in the presence of reference price. However, although the results of Experiment 1 supported our hypothesis, we found the above value effects on choice even we used a bisecting task to control for the impact of reference price. Thus, a stronger test of our hypothesis would require simultaneously manipulating the degree to which prospective buyers and seller value a target commodity about market reference price is provided. Experiment 2 was designed to allow a direct comparison of range versus value effects.

STUDY 2

The objectives of Experiment 2 were dual: Firstly, Experiment 2 was designed to simultaneously manipulate various market reference prices on the part of prospective buyer and seller, thus permitting more rigorous tests of our hypothesis. Secondly, the problem was changed in an attempt to test the robustness of predicted effects.

Method

Design. Two hundred and fifty eight participants (142 females and 116 males) were involved in Experiment 2 as part of the course requirement. They were randomly and equally assigned to one of six grids of a 2 (ownership: owner vs. non-owner) x 3 (Reference price: low, high, no information) between-subjects design. The factor of reference price was designed into three levels: low, high, and no information. No information is the control condition in which neither the owner nor the non-owner knew the reference price. High or low reference price implies that the transaction price in the market is relatively higher or lower than the initial purchase price.

Procedure

Participants were given a 1-page questionnaire in which they were asked to consider a hypothetical CD purchase. The case varied in terms of who was described as the recent purchaser of the CD

(either the participant or a person named Lee). For example, in the low-price-owner condition, participants read one of the following:

A year ago, you bought a classical musical CD for \$ 10. After listening to it, you really liked this CD. Lee, who hasn't bought the CD yet, also listens to and likes it. Now, he wants to purchase it from you. You got information from Internet that there is a market price of \$8 for same commodity (in the high-price was conducted in \$12) for same commodity. How much would you be willing to sell the CD for?

Others read the baseline version (no information condition):

A year ago, you bought a classical musical CD for \$ 10. After listening to it, you really liked this CD. Lee, who hasn't bought the CD yet, also listens to and likes it. Now, he wants to purchase it from you. How much would you be willing to sell the CD for?

Conversely, the non-owner condition describes Lee as having recently purchased the CD and the participant as having listened to it.

After reading the scenario, participants were asked to indicate the amounts for which they thought the owner was willing to sell the CD and that the non-owner was willing to buy the CD. For example, in the owner conditions, participants were asked to indicate the minimum amount for which they would be willing to sell the CD to Lee and they were asked to indicate the maximum amount they thought Lee would be willing to pay to buy the CD from them. Last, in order to understand whether participants were induced by the different reference price situation, participants were asked to respond to the question: “do you agree that market transaction price is higher than initial purchased price by you for the CD?” The scales were described with end point 1= “extremely disagreement” to 7= “extremely agreement.”

RESULT AND DISCUSSION

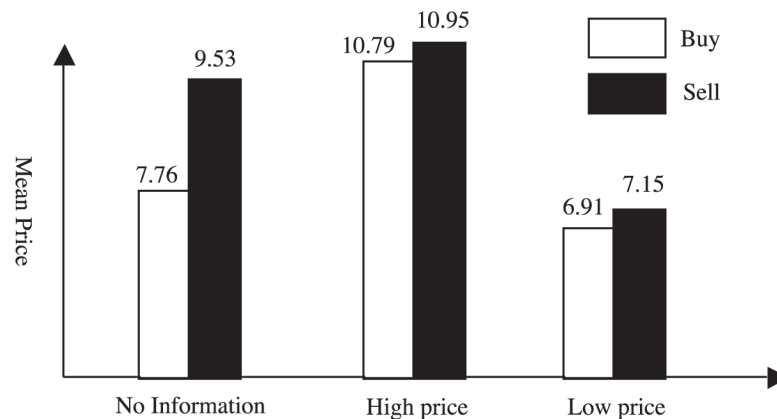

Manipulation checks

In this experiment, the manipulation of market reference price was operationalized by varying the description of scenarios. To assess the validity of this operational definition, we examined whether participants’ mean ratings of perceptive market price varied as a direct function of the reference price manipulations. As expected, mean perceptive market price for the CD differed significantly as a function of varying reference price, $F(2, 255)=619.2, p<0.0001$. In Scheefe test, the high price condition (6.05) was a significantly higher perceptive market price than low price condition (2.06) and no information condition (3.94). On information condition, it was also a significantly higher perceptive market price than low price condition. These results indicate a significant variation in the perceptive reference price of market transaction under the three experimental conditions, showing that the manipulation was effective.

Effect of reference price

A two-way ANOVA was administered to evaluate the impacts of reference price (low, high, no information) and ownership status (owners vs. non-owners) on the perceived value for hypothetical CD. It found that the ownership status ($F(1, 252)=21.8, p<0.001$) had a significant main effect on the estimated value of the CD, indicating that people perceived a significantly higher value on an owned the CD (\$9.21) than on a not-owned-yet one (\$8.48). This

FIGURE 1
Mean price as a function of reference price and owner in Experiment 2

result conceptually replicated previous evidence for the endowment effect (Bar-Hillel and Netter 1996; Thaler 1980) and was consistent with Experiment 1.

Moreover, as we predicted, a significant interaction was identified between ownership status and reference price states, $F(2,252)=20.12$, $p<0.001$. The mean selling and buying prices are indicated in Figure 1. As the figure shows, endowment effects were observed only when the reference price disappears. In that condition, mean selling price (\$9.53) significantly exceeded mean selling price (\$7.76), paired $t(84)=6.34$, $SE=0.29$, $p<0.001$. However, there is no significant difference between selling price (\$10.95) and buying price (\$10.79) when reference price was condition, $t(84)=0.73$, $SE=0.22$, $p>0.5$. There was also no significant difference between selling price (\$7.15) and buying price (\$6.91) when reference price was low condition, $t(84)=0.99$, $SE=0.186$, $p>0.5$. We examined a two-way(Owner \rightarrow reference price states[absence vs. high]) ANOVA, showing that there is a significant interaction effect between owner states and reference price, $F(1,168)=20.27$, $p<.05$. We also examined a two-way(Owner \rightarrow reference price states[absence vs. low]) ANOVA, showing that there is a significant interaction effect between owner states and reference price, $F(1,168)=33.91$, $p<0.0001$. Only when we tested the relationship of owner and reference price (low vs. high), there was no interaction effect found, $F(1,168)=1.44$, $p>0.1$. These results also indicated that the impact of reference price on endowment effect was stable, seemingly because the effect of reference price will be accompanied by differences in reference price (high or low).

CONCLUSION

All other things being equal, sellers tend to pursue a higher selling price for an owned object than they would be willing to pay as buyers (e.g. Kahneman, Knetsch, and Thaler 1990). However, as demonstrated in this article, the presence of reference price can affect the magnitude of the endowment effect. The endowment effect only occurs when reference price is absent, and is absent when reference price is present. Hence, the presence of reference price can be classified as a moderator in the endowment effect.

Alternative explanation

In this study, the anchoring effect is often used to explain the influence of reference price upon product evaluation and percep-

tion of value and its effects on endowment effect. However, the anchoring effect is not the only explanation of the effect of reference price. Signaling theory is usually applied in explaining various marketing programs, which are based on information economics and the premise that two parties to a transaction frequently possess asymmetrical information (Kirmani and Rao, 2000; Spence, 1974). Selling firms often possess important information that consumer does not, such as product quality and the dispersion of actual market price. When lacking important information, consumers must gather additional information or make inferences regarding the nature of the unknown or missing information. Reference price serves as important signal information to help consumers overcome this information asymmetry. Thus, the presence of reference price as signal helps consumers to understand a product's perceptive value. A seller who wants to sell a product for more than its market price will not find a willing buyer in this situation. Thus, the seller is constrained to accept the reference price (market price). In contrast, for the buyer, appearance of reference price implies that the value of the product approaches the price and other buyers with maximum willingness to pay money also approximately are the price in the market. Thus, the presence of signal of reference price convinces buyers that the value of product is worth this one.

Future research

This research has explored reference price effect on endowment effect in a laboratory setting. However, it is not clear how many reference price categories consumers use in evaluating product value and endowment effects (Kalyanarm and Winer, 1995). Winer (1989) has argued that there may be as many as eight types of reference prices. Consumers may use multiple reference prices in a single judgment. Providing an understanding of the effects of various reference price types is an interesting avenue for future research.

Price Skimming Paradoxes

Gary F. Gebhardt, University of South Florida

EXTENDED ABSTRACT

A common pricing strategy employed by managers in new and growing markets is price skimming—setting prices high at introduction and dropping them over time. As product life cycles become shorter and the number of new products and services increase every year, managerial use of price skimming appears to be increasing. Likewise, as prices drop at ever increasing rates for a range of products and services, consumer awareness of price skimming also appears to be increasing.

The managerial attractiveness of price skimming is straightforward: by sequentially lowering price over time, capturing incremental customers with every price drop, price skimming allows a firm to charge each customer their reservation price (e.g., Besanko and Winston 1990). A central assumption of price skimming is because each consumer pays a price at or below his or her reservation price, each consumer is satisfied with his or her purchase.

However, beyond the purchase decision, there is scant research on consumers' responses to price skimming. Instead, investigations concern firm profit maximization and variables impacting profit maximization, such as diffusion rates, competition and production learning curves (e.g., Robinson and Lakhani 1975; Irwin and Klenow 1994). Thus, although price skimming is widely used by managers and investigated in the economics and strategy literatures, it has received little attention in consumer research.

This research investigates the relationship between price skimming and post-purchase consumer attitudes and behavioral intentions. Prior research has found pricing information, even when revealed *after purchase and consumption*, affects customer satisfaction levels (Voss, Parasuraman, and Grewal 1998; Varki and Colgate 2001; Fornell et al. 1996). Additionally, empirical studies suggest customers' perceptions of pricing fairness are a significant predictor of customer satisfaction levels (Xia, Monroe, and Cox 2004), which are positively related to positive word-of-mouth, repurchase intent and customer life-time-value (Szymanski and Henard 2001; Anderson, Fornell, and Mazvancheryl 2004). In this research I explore whether and under what conditions consumers perceive price skimming as fair and how those perceptions affect post-purchase attitudes, behavioral intentions and customer life-time-value.

Consumer behavior research relies primarily on equity theory to explain differences in fairness perceptions (e.g., Xia, Monroe, and Cox 2004). According to equity theory, people compare their inputs and outputs to referent others in similar exchange situations to determine whether an exchange is fair (e.g., Huppertz, Arenson, and Evans 1978). In contrast to the consumer behavior literature, organizational behavior conceptualizations of social justice delineate between distributive and procedural justice (Tyler 1997). Distributive justice ascertains fairness based on inputs and outputs of comparative others, consistent with equity theory. Procedural justice focuses on the *process* mediating inputs and outputs to ascertain fairness. Although related, empirical studies support distributive and procedural justice as distinct constructs (Cohen-Charash and Spector 2001). These distinctions suggest consumers ascertain fairness based on whether prices and pricing policies differ among customers for the same product or service.

I conduct four experimental studies investigating under what conditions consumers perceive price skimming as fair or unfair and how pricing policies for existing customers may moderate or

reverse fairness perceptions. The first study investigates the relationship between price-skimming strategies and consumer attitudes, given new customers are paying lower prices than existing customers. I find price skimming for relational services is associated with significantly lower perceptions of fairness, satisfaction and behavioral intentions, than products and discrete services with similar price points and changes over identical time periods. Analysis of free form responses suggests price skimming for relational services is perceived as distributively unfair.

Study two investigates the moderating effect of four existing customer pricing policies for relational services: (1) no adjustment (same as study one); (2) lower price if the customer extends agreement; (3) lower price at customer's request; and (4) most-favored customer pricing, where all existing customers automatically receive the same lower price offered new customers (e.g., Besanko and Lyon 1993). I find policies with identical inputs and outputs are associated with similar satisfaction levels, but significantly different perceptions of fairness, likelihood to repurchase and positive word-of-mouth intentions. These results support the notion that consumers react differently to distributively and procedurally just pricing policies.

Study three compares price skimming by a service provider versus the provider's competitor. Significant differences in participant attitudes suggest social justice concerns differ between intrafirm and interfirm price skimming.

Although social justice concerns explain the moderating effects of existing customer policies, moderating effects can also be explained by simple mental accounting: consumers receiving a lower price realize a gain, leading to more positive attitudes and behavioral intentions (e.g., Thaler 1985). Study four explores these competing explanations by investigating the moderating impact of most-favored customer policies on price skimming for products, discrete services and relational services. If perceptions of social justice are responsible for differences, most-favored customer policies should only affect consumer attitudes when price skimming is perceived as socially unjust. The results of study four show a significant reversal for relational services, but not for products or discrete services, supporting a social justice explanation.

Finally, using wireless telephony industry metrics, I illustrate how some firms may be realizing suboptimal revenues and profits by employing price-skimming strategies, paradoxically, thought to maximize revenues and profits. This *managerial paradox of price skimming* is only apparent when considering consumer perceptions of fairness, satisfaction, likelihood to repurchase and positive word-of-mouth intent. Furthermore, I suggest a *consumer welfare paradox of price skimming*: most-favored customer pricing policies may be jointly optimal for consumers and firms in markets where consumers perceive price skimming as distributively or procedurally unfair.

Overvaluation Bias in the Valuation and Utilization of Novel Technological Attributes

Shenghui Zhao, University of Miami
Robert J. Meyer, University of Pennsylvania
Jin Han, Singapore Management University

EXTENDED ABSTRACT

This research examines the relationship between consumers' valuation of new product attributes and their subsequent utilization of those attributes. Although the literature on consumer response to product innovations is large, this issue has not been investigated empirically. We report the results from three laboratory experiments that provide strong evidence for an overvaluation bias: consumers often reveal a high willingness-to-pay for new product attributes that far exceeds the incremental benefit they can reasonably expect or actual obtain because consumers are averse to incurring substantial learning cost to take full advantage of the new attributes once they have them in their possession. In this research we examine the situation where the functionalities of the new and old attributes are independent of each and no combined usage is allowed.

Background

Two theories of dynamic inconsistency suggest that consumers may exhibit this overvaluation bias. The affective forecasting research has documented the impact bias in a variety of contexts. It says that actual affective reaction to an event is typically less intense and of shorter duration than people expect in prospect. Since acquiring a new gadget is often a positive experience, people in prospect are likely to exaggerate the level of excitement they will experience as an owner, which results in a higher level of valuation of the new product than what their subsequent experience can justify. This overly optimistic expectation, once disconfirmed by actual experience, is likely lead to low usage.

The reference point shift theory provides a different explanation. It argues that valuation and usage decisions have different reference points because usage decisions receive immediate and unambiguous feedbacks, which induces greater myopia and risk aversion. This subtle effect of reference point change is hard to anticipate, leading to inconsistency between valuation and utilization behaviors.

Empirical Investigation

Three experiments were conducted where participants played a novel computer game. A total of nearly three hundred undergraduate business students participated in the studies and received monetary reward based on their performance in the last fifteen games (money rounds).

In study 1, participants first trained on one type of controls (basic version) for fifteen games (training rounds) and then were offered the opportunity to buy a new game (combo version) that had new set of controls whose performance was unknown, in addition to the existing controls. Participants' WTP for the new game were measured via BDM procedure. Depending on their WTP, they continued to play the new game or the existing one for another fifteen games (money rounds). Study 1 manipulated the availability of the new game to test whether WTPs for the new game were excessive in light of their subsequent usage and performance. Study 2 followed the same procedure and collected explicit forecasts prior to WTP measurement to test the two competing explanations. Study 3 examined the effect of direct experience with the new attribute on overvaluation bias. It reversed sequence of games that participants

played (combo version followed by basic version) and elicited WTA for trading away the controls they used less frequently.

Results

Across the three studies, the results provide converging evidence for the hypothesized overvaluation bias. Specifically, participants indicated a high level of WTP ($M=384$ for study 1 and $M=349$ for study 2), but their subsequent usage of the new control was rather low, compared to what might be implied by their WTP. Though their subsequent performance improved, their improvement fell short of the level that was achieved by those participants who did not have the opportunity for acquiring the new game (difference in improvement: $M=-100$ for study 1 and $M=-458$ for study 2). Thus, it appears that their WTP far exceeded the incremental value of the new attribute (i.e., difference in improvement).

The forecasts results from study 2 did not find support for the impact bias explanation. Specifically, forecasts of future performance with the existing and new games were not overly optimistic, nor were forecasts of future utilization of the new controls in an initial set of games. This is contrary to the predictions of the impact bias explanation, and may indicate some indirect support for the reference point shift explanation.

Study 3 found that participants demanded excessive compensation for trading down to a simplified set of controls ($M=455$), even when they had never used the controls to be traded away in fifteen games. A variation replicated the procedure of study 2 but allowed two free trials with the new game before WTP measurement. The results showed a similar level of WTP, but even lower level of usage rate of the new controls after they were acquired.

Precommitment Bias in the Evaluation of a Single Option: The Importance of Evaluative Disposition

Samuel D. Bond, Duke University
Kurt A. Carlson, Duke University
Margaret G. Meloy, Penn State University
J. Edward Russo, Cornell University
Robin J. Tanner, Duke University

EXTENDED ABSTRACT

A growing body of evidence has raised challenges to normative models of preferential choice. An important example is the phenomenon of precommitment bias, whereby information is selectively interpreted to favor options that are tentatively preferred, even in the absence of prior beliefs or preferences regarding the options (e.g., Russo, Medvec, and Meloy 1996). Even for knowledgeable consumers (Carlson and Pearo 2004), the systematic distortion of product information can have a powerful influence on final decisions. Therefore, increased understanding of the phenomenon is an important step towards the improvement of consumer decision making.

Explanations of precommitment bias have emphasized its role in the separation of alternatives (Svenson 1992; Montgomery 1994), and empirical demonstrations have been mostly restricted to settings involving multiple options. However, consumer decisions commonly involve the evaluation of a single option, and there has been growing academic interest in this type of decision (Hsee and Leclerc 1998; Posavac et al. 2004). Investigators have uncovered a range of cognitive and motivational factors that are unique to singular evaluation, and it is not obvious that the precommitment bias observed in prior research will extend to a single-option setting. In fact, theoretical accounts relying on a separation goal are largely inapplicable to situations of singular evaluation.

We suggest that even in contexts with a single focal option, information will be systematically distorted as it is acquired, leading to corresponding effects on judgment and choice. In doing so, we draw from cognitive consistency theories and contemporary arguments for the importance of coherence in predecisional processing (Heider 1946; Holyoak and Simon 1999). We propose that a tentative assessment of the option's attractiveness, an *evaluative disposition*, becomes a crucial element in the pursuit of cognitive coherence. Even among individuals planning to reserve judgment, early information will lead to an initial evaluative disposition, which will in turn influence the interpretation of subsequent information. Specifically, in order to maintain coherence, new information will be distorted to be compatible with the initial disposition. The search for coherence will thereby cause systematic bias in both 1) evaluations of the attributes themselves and 2) the final outcome of the decision.

In three empirical studies of preference formation, we investigated the role of an initial evaluative disposition in biasing the interpretation of information. The studies employed diverse stimuli and procedures but shared a common design. Participants evaluated single options in the context of either a binary choice (e.g., 'buy/don't buy') or of a judgment (e.g., willingness-to-pay). Information about the option was presented one piece at a time, and attribute ratings were assessed as an indicator of information distortion.

In Study 1, participants were provided with attribute information about a consumer product. In order to create an initial disposition, the order of information was varied so that either a positive or negative attribute came first in the sequence. As expected, partici-

pants whose first attribute was positive rated subsequent attributes more positively than participants whose first attribute was negative. A similar order effect was obtained on a binary measure of purchase intention. Study 2 utilized an impression formation task and incorporated both choice and judgment conditions. As part of a role-playing scenario, participants evaluated candidates for a scholarship application. Unlike Study 1, attribute order was not manipulated. The predicted effect of disposition was again observed, as participants distorted their attribute-level evaluations towards the direction of their initial leaning. The magnitude of the bias did not differ across the choice and judgment groups. Study 3 examined a purely judgmental task that would be difficult to reframe in binary terms. After evaluating probability and value information, participants provided their willingness-to-pay for a lottery ticket. Results showed the expected effect of information order on willingness-to-pay, and attribute ratings revealed a tendency for value information (but not probability information) to be distorted.

Together, these studies provide initial evidence that precommitment bias will occur even in the evaluation of a single option. They supplement existing anchoring-and-adjustment models of judgment (e.g., Hogarth and Einhorn 1992) by illustrating how adjustment can operate via the encoding of new information. The results support our contention that the primary culprit is the development of an evaluative disposition early in the choice process. Citing recent research, we propose that distortion may be reduced among individuals who enter the process expecting either: 1) a particular judgment or choice to be obvious, or 2) high attribute correlation. The unwitting pursuit of coherence presents a powerful obstacle to consumer decision making, and by exploring these issues, researchers might improve even the most consequential decisions.

The Illusory Truth Effect: Exploring Implicit and Explicit Memory Influences on Consumer Judgments

Maria L. Cronley, Miami University
Frank R. Kardes, University of Cincinnati
Scott A. Hawkins, University of Toronto

EXTENDED ABSTRACT

Consumers are continually inundated with marketing information. Much of this information is processed at low involvement levels, with incidental-type learning. There is also emerging evidence that unconscious processing exerts influences on motivations, judgments, and behaviors (e.g., Cooper and Cooper 2002; Dijksterhuis 2004; Strahan, Spencer, and Zanna, 2002).

The goal of this research was to further our understanding of how consumers form judgments, both explicitly and implicitly, regarding the truth of marketing claims, given the illusory truth effect. The illusory truth effect is a repetition-based memory effect, where people consistently rate repeated statements as more true than non-repeated statements, primarily because of perceived familiarity of the statements (Hawkins and Hoch 1992). Two experiments examined the influence of repeated marketing claims, the combined influences of processing capacity and exclusion instructions (i.e., telling people that a statement being judged is actually false) as potential moderators (experiment 1), and unconscious influences on judged validity (experiment 2), which to our knowledge has not been examined previously. It was hypothesized that when repetition of claims increased from 0 to 1 to 3 exposures (experiment 1), and from 0 to 4 subliminal exposures (experiment 2), the judged truth of the statements would significantly increase.

Beyond the focal hypothesis, for experiment 1, it was hypothesized that divided attention (vs. full attention) would result in higher ratings of judged truth of claims as repetition increased. It was also hypothesized that an exclusion instruction would result in higher truth ratings of product claims as repetition of the claims decreased.

A 3 (product claim repetition of 0, vs. 1 vs. 3 exposures) X 2 (divided attention vs. full attention) X 2 (exclusion instruction vs. no exclusion instruction) mixed design was employed. The study was administered via computer and truth ratings and response latencies were collected. Analysis of variance of mean truth ratings showed significant main effects and a repetition x exclusion interaction, indicating that the illusory truth effect extends to a marketing message environment and that the exclusion instructions moderated the effect, resulting in higher truth ratings as repetition of claims decreased from 3 to 1 to 0. Analysis of variance of response latencies revealed main effects, 2-way, and 3-way interactions for all three variables of interest. Although there were no specific hypothesized effects for response times, results were surprising. As the ability to judge validity was made easier because of familiarity due to repetition or exclusion instructions, response times became faster which logically supports the truth effect explanation. But under distraction, response times also became faster. One explanation may be that subjects became more involved, or simply concentrated on the distraction task to the exclusion of the truth task, resulting in faster response times and attenuating repetition effects.

Experiment 2 examined potential repetition effects of product claims, resulting from unconscious processing of stimuli. It was hypothesized that subliminal (vs. supraliminal) exposure to product information would result in an enhancement of the illusory truth effect. A 2 (product claim repetition of 0 vs. 4) X 2 (subliminal vs. supraliminal exposure) mixed design was used. The subliminal manipulation was administered via a lexical decision task, adapted from Strahan et al. (2002).

Analysis of mean truth ratings as a function of repetition and exposure showed main effects and a significant repetition x exposure interaction. Under supraliminal conditions, mean truth ratings were significantly higher for 4 (vs. 0) repetitions, as expected, which replicated the results from experiment 1. Surprisingly, a reverse effect emerged in subliminal conditions, with mean truth ratings significantly lower for 4 (vs. 0) repetitions. The unexpected results found in the subliminal conditions suggest that other mechanisms may be at work when information is processed implicitly. We suggest that a form of "implicit correction" may be occurring, whereby the unconscious is able to recognize that familiarity via repetition does not equal truth.

The results of both experiments show that the robustness of the illusory truth effect replicates to an explicit marketing message environment and that as repetition increases, the judged validity of product claims increases. Further, it appears that providing exclusion information moderates the effect. While results of the subliminal conditions ran contrary to predictions, we propose that there is some support for the notion that the unconscious mind operates differently from the conscious mind, and what may be occurring is a type of "implicit correction." Extant research surrounding unconscious processing suggests that the unconscious mind is extremely adept at taking care of a person (e.g., Dijksterhuis 2004; Fernandez-Duque and Thornton 2002; Strahan et al. 2002), painting a picture of a highly efficient and powerful unconscious, and our findings support this conclusion. Of course, we recognize that an implicit correction explanation is speculation, and that alternate possibilities exist. Additional work is needed before any conclusions can be drawn.

In general, this research has important practical implications for marketers who use the commonly employed techniques of repetition of product claims to build brand recognition. Further, the results of experiment 2 may have important implications for the practical and ethical use of subliminal marketing messages and for messages where the goal is "incidental" or mere exposure.

SPECIAL SESSION SUMMARY
Affect and Its Effects on Compensatory Consumption

Nitika Garg, University of Mississippi

LONG ABSTRACTS

“The Effect of Moods on Comfort Food Consumption”

Junyong Kim, University of Central Florida

Brian Wansink, University of Illinois at Urbana-Champaign

Meryl P. Gardner, University of Delaware

Se-Bum Park, Northwestern University

Collin Payne, Cornell University

What are comfort foods? The popular press depicts comfort foods as various forms of junk food, with very little nutritive value. However, this may not always be the case. Taste related studies show that most taste preferences are developed throughout the life cycle. Developmental studies also show conditioned responses to comfort foods through early exposure, prenatal exposure, and genetic differences that may result in unconventional preferences for comfort foods. Using a national survey and two lab experiments, a framework is developed for examining the phenomenon of comfort foods. The graphic description of influential factors on comfort foods depicts physiological and psychological links to taste and preference development, the antecedents of comfort foods. Examination of how these tastes and preferences translate into comfort food choices due to mood states has not yet been extensively explored. The need for the consumption of food can be attributed to physiological functions and psychological reasons. Physiological factors of food needs consist of the body's natural response to derive pleasure from certain foods. Psychological factors, consisting of social contexts, conditioned responses, and mood specific responses, affect the consumption of food. The stimulation to eat results from a combination of the brain's arousal of hunger to satiate the body's energy and nutritive imbalance and of sensory stimulation (Le Magnen 1986) to satiate cravings.

A national survey of 1005 participants were used in determining mood effects on the consumption tendency towards comfort foods. The findings indicate that comfort foods are made up of both nutritive and less-nutritive foods. The scenario-based recall study suggested that positive mood states encouraged the consumption of healthful comfort foods while negative mood states encourage less-nutritive comfort food consumption. In two follow-up studies in the lab, positive or negative moods were induced through scenario development, and participants were presented with advertisements for products that were relatively healthy or relatively unhealthy. This included cookies (vs. rice cakes), candy bars (vs. apples), and so forth. Measures of attitude and consumption intentions were consistent with the basic notion that those in negative moods were more likely to generate favorable attitudes and consumption intentions for the unhealthy foods than the healthier ones. This study makes three contributions to the discussion of mood and food. First, contrary to common wisdom, it shows that people use both nutritive as well as less nutritive foods to provide themselves comfort. Second, contrary to clinical research, it shows that people may be more prone to consume comfort foods both when in bad moods and in good moods. Third, consistent with hedonic contingency theory, it shows that preferences for foods vary with one's mood. Those in positive moods prefer more nutritive foods, and those in negative moods prefer less nutritive foods.

Although it was beyond the scope of this research to specifically examine the underlying mechanism by which people come to prefer certain comfort foods more than others in different moods,

the results of two experiments offer an explanation as to why such differences occur. While this research provides some interesting and important theoretical and practical implications, there are numerous issues yet to be explored in understanding the taxonomy of comfort foods and the preference structures related to them. These studies add three important findings to the growing literature that investigates the importance and impact of how eating habits develop. These findings can hopefully serve as a springboard for future investigations of how physiological and psychological factors influence comfort food preferences and how these preferences then impact subsequent dieting and food consumption habits.

“Emotion Effects on Compensatory Consumption”

Nitika Garg, University of Mississippi

Jennifer S. Lerner, Carnegie Mellon University

For some time now, researchers have been paying closer attention to the influence of affect on consumption and have hinted at a possible relationship between the two. For example, Woodruffe (1997) examines ‘compensatory consumption’ in women’s shopping behavior. Her findings suggest that shopping offers a means of compensation (reward) for some women when they are in a negative affective state. Her study makes two important points. First, she suggests that compensatory consumption is a regular activity and is not restricted to clinically ill or under-privileged groups of consumers. Second, she suggests that this might be a way for people to ‘repair’ negative emotional states.

More recently, research has shown that when individuals experience sadness, one of the ways they try to repair their affective state is by consuming tasty, fatty food products that are hedonically rewarding to the individual (Garg, Wansink and Inman 2005). Research has also established that sad individuals tend to pay more to obtain a new object (e.g., water bottle) than do individuals in a neutral state (Lerner et al. 2004). Also, they choose to take the object over money to a greater extent than do neutral individuals (choice price). However, this process is not completely conscious for most individuals. Thus, the objective of this study is to take an in-depth look at compensatory consumption and examine how people use it to cope with their affective state. Specifically, this research examines the influence of two discrete emotions, sadness, and neutral, on two outcome measures—amount of food consumed and choice price for an object—and whether the influence of sadness on choice price is moderated when participants have the opportunity of consuming food product earlier on (Study 1) and whether the influence of sadness is consumption domain specific such as across eating food vs. acquiring a new object (Study 2).

Study 1 examines the role of sadness and neutral emotions on two variables in the consumption domain. One, is the amount of food consumed (e.g., Garg et al. 2005) and the second, is the choice price for an object (e.g., Lerner et al. 2004). Garg et al. (2005) found that sad (vs. happy) individuals consume more butter popcorn (a hedonic product) and they suggest that this is done in order to repair their mood. Study 1 predicts that when participants are given an opportunity to consume a hedonic product before they provide their choice price for a product (say, water bottle), this will influence their choice price. A 2 (popcorn: present, absent) x 2 (emotion: sad, neutral) between-subjects design was implemented to test the hypotheses of the study. Interestingly, the results indicate that whereas neutral individual’s choice price goes down after consum-

ing a hedonic product, sad individual's choice price actually goes up. This suggests that whereas neutral individuals are insensitive to activity differences in compensatory consumption (eating vs. buying a product), sad individuals' need to compensate for that feeling of loss (Lazarus 1991) becomes more salient in the other domain (acquiring a new product) after they have an opportunity to satisfy it in the first domain (eating in this case).

Study 2 thus, examines the mechanism driving the influence of sadness on compensatory consumption. Specifically, it tries to ascertain whether the results obtained in study 1 are due to sadness being domain specific or whether it is due to sad individuals just having a higher threshold for compensatory consumption. To test this hypothesis, a 3 (sad with emotion repair task, sad with emotion amplification task, neutral) cell design was implemented. Everyone was also offered popcorn and diet soda/ water to consume. The prediction is that if the results are being driven by sad individuals' higher threshold for compensation, then subjects in the 'sad with emotion repair' condition should show a drop in their choice prices as they are offered two opportunities to compensate—food consumption and emotion repair task—before their choice price is elicited. However, if sadness is domain specific then we should see similar choice prices across the two sadness conditions and these choice prices should be higher than those in the neutral condition, replicating the results from Study 1.

Overall, these studies will provide valuable insights about consumption behavior and the influence of affect on the same. Given the rising concern with obesity and other consumption related problems (e.g., compulsive shopping), the implications of this research should be of interest to academics, policy regulators, managers as well as consumers. Further, this research would shed some light on the underlying mechanism by comparing and contrasting different theoretical frameworks to suggest the one that can better explain the results.

“Feeling Ashamed or Guilty? The Emotions and Consequences of Violating Consumption Norms”

Vanessa M. Patrick, University of Georgia

Deborah J. Mcinnis, University of Southern California

Shashi Matta, University of Southern California

Shame and guilt are negative self-conscious emotions that have remained relatively unexplored in consumer research. Understanding shame and guilt has practical significance as their evocation may motivate, de-motivate, or serve as responses to consumption. For instance, shame and guilt may be evoked in response to consumption practices viewed as normatively inappropriate (e.g., compulsive shopping, consumption of pornography, over-eating) as well as from the failure to consume products and services viewed as normatively appropriate (e.g. exercise, low calorie foods, gift giving, failure to tip or buy a product from a doting salesperson). In sum, these emotions arise as a result of the violation of a consumption norm. Further, from a motivational standpoint, some products and services (e.g., therapy, exercise, cosmetic surgery, and gifts) are consumed so as to reduce shame or guilt. Others are avoided (e.g., visits to doctors) because they induce shame or guilt. The study of shame and guilt also has theoretical significance. While prior research has largely focused on contrasting affective states of different valence (Arkes, Herren, and Isen 1988; Wright and Bower 1992), studying the potential differential effects of emotions of the same valence is particularly relevant for emotions such as shame and guilt, which are often referred to inconsistently or used interchangeably.

The objectives of this research are three-fold. The authors first introduce and conceptually distinguish the two self-conscious emotions of shame and guilt in the consumption domain. Second,

they examine the differential impact of shame and guilt on consumers' behavioral motivations and demonstrate the moderating role of an individual difference variable—consumers' implicit theories about the fixedness / malleability of personality (study 1). Finally, they demonstrate that the priming of shame and guilt impacts consumers' encoding and retrieval of new information regarding the violation of a consumption norm, their expectations of the behavioral response to this violation, and the perceived likelihood of repeating the violation of the consumption norm in the future (study 2).

Defining Shame and Guilt. Shame and guilt are often confused and used interchangeably (Tangney and Dearing 2002), perhaps because they are both self-conscious and moral emotions of self-condemnation. Though similar, some research in psychology suggests that shame and guilt are distinct. Shame involves a focus on and evaluation of one's self, whereas guilt concerns a focus on and evaluation of one's behavior (Lindsay-Hartz 1984; Tangney 1992; Tangney et al. 1996). Notably, while shame and guilt differ in perceived causal locus, they may be precipitated by the same causes. For instance, the same behavior (eating chocolate mousse/ forgetting a birthday gift) may evoke shame in one consumer (I am selfish/a glutton) and guilt in another (I shouldn't have broken my diet/let my busy schedule get the better of me). What matters is not the initiating cause but rather consumers' interpretation (i.e., appraisal) of it. Based on their differing appraisals, the authors define shame and guilt as follows: Shame is an emotion evoked from a perceived transgression of the self in evaluating a consumption episode involving oneself. Guilt is an emotion evoked from a perceived transgression of behavior in evaluating a consumption episode involving oneself.

Study 1. The study (N=199) used a 2 x 2 x 2 between-subjects design manipulating the evoked emotion (shame vs. guilt), the context in which the incident occurred (consumption vs. non-consumption), and measuring consumers' implicit theories about the malleability of personality (fixed vs. malleable). Measures included ratings of the intensity of various emotions and different motivations arising from the emotion-evoking incident. Results showed that (1) shame and guilt are recent and frequent emotions in consumption contexts; (2) shame inspires the motivation to distance oneself from the shame-inducing situation whereas (3) guilt inspires the motivation to repair the situation that gave rise to the feelings of guilt; and (4) consumers' implicit theories about the fixedness / malleability of personality moderate the effect of experienced shame or guilt on consumers' behavioral motivations.

Study 2. Respondents (N=60) provided a detailed written account of a personal shame (or guilt) experience, listed a set of counterfactuals about how the situation might have been different. They then read a narrative in which an undergraduate senior describes two episodes in which an individual engaged in a violation of a consumption norm. Following a two-minute distractor task, participants were asked to write down as much of the narrative as they could recall. Other measures included respondents' expectations of behavioral responses of the characters in the narratives, and the perceived likelihood of these characters repeating similar consumption behaviors in the future. Results showed that (1) priming shame made consumers process and recall new information about a violation of a consumption norm with an emphasis on traits or personality whereas (2) priming guilt shifted the emphasis to behaviors; and (3) consumers primed with shame report a greater expectation of the likelihood of repeating the consumption behavior than those primed with guilt. The authors discuss the theoretical contributions of this research, and the practical implications to consumer behavior, self-regulation, and advertising.

The Price of 'Free'-dom: Consumer Sensitivity to Promotions with Negative Contextual Influences

Sucharita Chandran, Boston University
Vicki G. Morwitz, New York University

EXTENDED ABSTRACT

Free offers are a frequent form of promotion used across a wide range of products (e.g., free lipstick with the purchase of cosmetics), a bundled offering (e.g., buy a computer and get a free printer) or free delivery/shipping. Despite the prevalence of such offers, little research has examined how consumers react to free promotions. Prospect theory (Kahneman and Tversky 1979) suggests that decisions are typically framed with respect to a reference point and inconsistencies in decision-making result from changes to such frames. Therefore, consumers may not react in the same way to a free promotional offer as they do to another monetarily equivalent promotion. Research has shown that monetary promotions like discounts are more readily processed with price as the focus and tend to be integrated with price, while free promotions are more likely to be processed independent of price because their monetary value is often not explicit or is non-focal even when available (Thaler 1985, Nunes and Park 2003). In this paper, we examine some strategic benefits that free promotions may offer over other types of promotions on account of such differential processing. We suggest that this differential processing makes the free promotion salient, which in turn affects consumers' reactions to a promotion in the face of negative quality information.

Through a series of three experiments we first establish the basic effect that while purchase intentions of consumers who see a monetary discount are sensitive to negative information on quality, purchase intentions of consumers who see free promotions are not. We next show that this invariance of free promotions to negative quality information appears to be on account of the salience of the free promotion and that it can be reversed by making other decision factors more salient.

Our first study establishes the basic effect that free price offers are relatively invariant to negative quality information compared to equivalent price discounts. Participants in this study read a scenario about a senior in their university who is preparing to take the GMAT exam and comes across a used GMAT textbook that he is looking to buy for extra practice. Participants are either told that the quality of used books at that bookstore is usually good (positive quality information) or is variable and he is uncertain about the quality of the book (negative quality information). Participants either saw a book costing \$23 with a discount of 2.99 (shipping and handling costs \$2.99) or a book costing \$25 where shipping is free. We find that while those who saw a discount had significantly lower purchase intentions when the quality of the book was uncertain than when quality of the book was good, those who saw a free shipping offer did not have significantly different purchase intentions across the two quality conditions. Hence, we find support for the basic free effect that we hypothesize.

In the next study we test the process that we hypothesize by using a similar purchase scenario as in study 1. We expect that the free promotion is more salient than the discount because it is likely processed independent of price. If this is so, we should be able to impair its salience when participants consider other aspects of the decision. We do this by manipulating the order of measurement of purchase intentions and reasons to buy the book. When we measure purchase intent first and reasons to buy next we replicate the basic free effect from study 1. However when we measure reasons to buy

first and purchase intent next we find that much like for discounts, purchase intentions of those in the free shipping condition drop significantly in the negative quality condition (vs. the positive quality condition). Thus, by having participants focus on different aspects of the decision, we are able to reduce the salience of the free promotion thereby mitigating its invariance to negative quality information.

Finally in study 3, we replicate our results in a different product context and use a different method to blunt the salience of the free promotion. Here participants read a scenario where they are considering the purchase of a wireless mouse. They are told about a CNN program featuring the company that makes the wireless mouse. The company is said to be either outsourcing their manufacturing to countries like India and China and therefore their product quality is variable and uncertain (low quality) or that the company is resisting such cost cutting moves, manufacturing locally and therefore their quality is excellent (high quality). Participants either saw a mouse costing \$33.99 with a discount of \$5.99 (shipping=\$5.99) or saw a price of \$39.99 with free shipping. Finally we had them list either two reasons to buy the product or 6 reasons to buy the product. We expected those who did the easy task of listing two reasons infer that they really needed this product. Conversely those who did the difficult task of listing six reasons were expected to infer that they didn't really need the product and question the purchase thereby impairing the salience of the free offer. As expected in the two reasons condition, the free offer was again invariant to negative quality information, however in the six reasons condition intentions dropped in the low quality condition.

In summary we find support for our thesis that differential processing of free promotions and monetary discounts results in differences in consumers' reactions to negative contextual influences. We conclude by discussing some theoretical and practical implications of our research.

Influence of Price of Coupons on Redemption Rates

Vishal Lala, University of Wisconsin

ABSTRACT

This paper investigates the effect of having consumers pay for a coupon booklet on its subsequent usage. The literature on sunk costs predicts that consumers who pay for a coupon booklet and thereby incur a sunk cost will be more likely to invest the effort to redeem the coupon(s). In a series of four studies, it was found that putting a price on a coupon booklet increased the extent of coupon usage and this effect was driven by self-justification concerns of the consumer.

The Role of Consumer Inferences About Price Discounts in Influencing Switching Behavior

Beomjoon Choi, University of Kansas
Rohini Ahluwalia, University of Minnesota

EXTENDED ABSTRACT

Past research in the area of price discounts oriented sales promotions has generated a rich, but diverse and mixed body of literature. Furthermore, recent research suggests that consumers are likely to generate a variety of inferences in response to promotional offers, ranging from economic to hedonic and informational (Chandon, Wansink and Laurent 2000; Raghurir, Inman and Grande 2004). Persuasion outcomes (or switching) occur as a result of the consumer inferences generated.

Our research provides a new perspective for classifying and understanding the impact of these inferences on switching behavior. Specifically, based on past research in the area of persuasion knowledge model (Friestad and Wright 1994) and consumer inferring (e.g., Ahluwalia, Burnkrant and Unnava 2000; Schwarz 2004) we focus on two types of consumer inferences: those that focus on the benefits/costs to the consumer; and those that deal with persuasion strategies, tactics and motivation of the marketer. We propose that the former type of inferences (consumer focused) are easier to generate and more likely to spontaneously occur when elaboration likelihood is relatively low. The latter types of inferences are metacognitive in nature, which are more effortful to generate, and thereby, expected to dominate when the consumer's elaboration likelihood is relatively high. Further, we argue that compatibility between type of inference generated and other informational inputs (e.g., consumer's goal) will determine the likelihood of switching. We present empirical evidence from one experiment that supports our central thesis.

The experiment used a 2 (strength of preference: high, low) X 2 (perceived risk in the product category: high, low) X 2 (size of inducement: high, low) between subject design. Four control groups (one for each combination of preference strength and perceived risk) in which subjects were not offered any economic inducement were also run. Two hundred fifty-two undergraduate students participated in the study.

Our results provide very interesting insights regarding how consumers' response to competitor inducements varies depending upon their preference strength for the incumbent brand and perceived risk in the product category. Our data suggest that depending upon these factors, consumers might make positive or negative inferences relating to the same sized discount. Our research adds to the emerging stream of research in consumer behavior which suggests that consumers inferences may be more important than pure economic benefits, in determining the effectiveness of discounts (e.g., Raghurir, Inman and Grande 2004).

The findings demonstrate that any discount in a high-risk product category is likely to be ineffective in wooing consumers who have formed strong preferences. In contrast, large discounts tend to be extremely effective for the low preference strength consumers or "switchers" in the high risk categories. It is important to note that even the "strong" preference groups in our study represented relatively "weak" preferences compared to the marketplace where consumers are likely to have past experience as well as more information and interaction with their preferred brands. Therefore, our results suggest that in high risk product categories, discounts are only likely to motivate "switchers". And that too, only large discounts, since our data demonstrated the ineffectiveness of the small discounts in this condition.

With regards to the low risk conditions, it appears that discounts (only large ones) are likely to be effective in inducing some of the consumers who prefer a competitive brand to switch. More importantly, even when consumers don't switch in response to the discount, the process of being exposed to it in itself is likely to reduce the strength of their preference for their chosen brand. In essence, large discounts are likely to leave these consumers more vulnerable to switching in response to future inducements. Price discounts, however, don't seem to be as effective for the "switcher" segment in the low risk condition (as compared to the "high risk" condition). Importantly, the low preference strength consumers who are able to resist these discounts are not rendered any more likely to switch in the future.

How Small is Zero Price? The True Value of Free Products

Kristina Shampan'er, MIT
Dan Ariely, MIT

EXTENDED ABSTRACT

The main finding of the paper is that people “overreact” to free products, in a sense that in order to get a free product, people are eager to forgo an option that they “should” find preferable. We create two choice situations for our participants; in one they reveal their preferences about two products, in the other one of the products becomes free, and participants (as it turns out) act inconsistently with their preferences revealed in the first situations, overreacting to the free product. In particular, in a typical zero price experiment subjects in one condition are offered a choice between a piece of more attractive candy for a reasonable positive price (e.g. a Lindt truffle for 14¢) and a piece of less attractive candy for a price close to zero (e.g. a Hershey kiss for 1¢); subjects also have an option of choosing neither. In the other condition both prices are reduced by a constant such that the smaller price becomes zero (Lindt now costs 13¢, and Hershey is free).

The standard theoretical model where the option with the highest benefit cost difference is chosen, argues as follows. The difference between the net benefits of the two product options has not changed (because prices went down by the same amount), thus consumers should not switch from one product to the other; and because prices went down some consumers may switch from buying nothing to buying something. Thus the standard model predicts that the proportions of the subjects choosing *each* of the two chocolates should weakly increase when prices are equally reduced. In contrast, our experiments show that whereas the proportion of participants choosing the cheaper chocolate increases, the proportion of participants choosing the more attractive chocolate *decreases*. We call the combination of the increase in the demand for the low-value good and the decrease in demand for the high-value good “the zero price effect.” The effect tells us that becoming free makes a product not only cost less, but consumers act as if being free also adds intrinsic value to the product, thus making them switch from the high-value to the low-value good.

In a series of experiments we tried to find out an explanation for the effect. We started by checking some economic explanations, such as “the transaction cost explanation” (people are lazy to search for change and this adds value to the free option), and semi-economic explanations (“people do not subtract costs from benefits, but divide benefits by costs and thus a free option has an infinite value”). Experiment 1 rejected these explanations and we turned our attention to possible psychological explanations.

The first psychological explanation was that the effect might be due to the difficulty of mapping consumption utility into money (Ariely et al., 2003; Hsee et al., 2003; Nunes & Park, 2003). If people do not know exactly how much they value each of the chocolates they might be attracted to a free chocolate because it guarantees a positive net benefit to them. We tested this idea by using commensurate goods and currency (e.g. trading chocolate for chocolate), and thus reducing the mapping difficulty. Experiment 2 showed that eliminating mapping difficulty did not eliminate the zero price effect, and thus mapping difficulty was not an explanation for it.

We next tested the possibility that the zero price effect was due to a change in norms when dealing with transactions not involving money. Gneezy & Rustichini (2000) and Heyman & Ariely (2004) suggest that people treat free options as having additional social meaning, and we hypothesized that that this additional meaning

could be increasing the value of the free option. We tested this prediction by comparing consumers’ reaction to zero and negative price. The idea is that the negative price does not have a downside just like zero price, but unlike zero price, negative price mentions money, and thus has no social aspect. Experiment 3 showed that negative prices enjoyed the same “overreaction” as zero price, and thus the social aspect of the zero price could not be the explanation for the phenomenon.

Our last set of experiments was motivated by the findings of Diederich (2003), Houston & Doan (1996), Iyengar & Lepper (2000), Luce (1998), and Tversky & Shafir (1992). These findings suggest that people are averse to trade-offs, and we hypothesized that because of the fact that free options involved fewer trade-offs (consumer does not have to trade-off price versus value), might be bolstering their value for consumers.

In Experiment 4 we showed that a free Hershey induced a much higher positive affect than a Hershey for 1¢, a Lindt truffle for 13¢, or a Lindt truffle for 14¢. Although this might not be surprising, the fact that the latter three options did not differ in the induced affect suggested that no cost-benefit calculations translated into affect, but rather, the “trade-off free” option was the most positively affective.

In Experiments 5 and 6 we crossed our cost/free conditions with a different manipulation. In experiment 5 for some of the participants we bundled the chocolates with fruit (apple of pear) costing \$1-\$1.5. This manipulation was aimed at making the “free option” not “trade-off free”. In the conditions with bundles the zero price effect disappeared suggesting that people jump at “trade-off free” options, and not the merely free ones. Finally in Experiment 6 we forced some of the participants to work through all the trade-offs needed to do the choice. For these participants we found no zero price effect. Thus, once all trade-offs become sunk cost, consumers are not attracted to the easy option any more, and choose according to their “true” or “rational” preferences.

We conclude that cost benefit decisions might be more complex than simply subtracting costs from benefits. People are averse to trade-offs, and may value an option more if it implies fewer trade-offs than other options with the same benefit-cost difference. We attribute the zero price effect to the trade-off aversion mechanism.

ROUNDTABLE

Exploring the Co-Evolution of Possession Constellations, Self, and Identity

Robert E. Kleine, III, Ohio Northern University

The intersection of possession constellations (Solomon and Assael 1987), self, and identity provides a common thread linking seemingly diverse topics in consumer research. Representative topics include: self-extension (Belk 1988), possession attachment (Ball and Tasaki 1992; Kleine, Kleine, and Allen 1995; Wallendorf and Arnould 1988), possession value (Richins 1994), authenticity (Grayson and Martinec 2004); identity salience effects (Reed 2004), identity schemas (Kleine, Kleine, and Kernan 1993), Diderot effects (McCracken 1988), possession collections (Baker and Martin 2000); brand communities (McAlexander, Schouten, and Koenig 2002; Muniz and O'Guinn 2001), disposition (Lastovicka and Fernandez 2004; McAlexander 1991; Price, Arnould, and Curasi 2000), involuntary possession loss (Sayre 1994), and anti-constellations (Hogg and Mitchell 1997). At a macro level, this intersection provides the organizing construct through which everyday consumption can be understood. Assembling scholars interested in different facets of the possession constellation-self-identity link can stimulate further research on the topic.

The roundtable session's objective was to bring together scholars spanning disciplinary and methodological boundaries to stimulate interest in research at the intersection of possessions and self-identity. Twenty-eight scholars, representing the full spectrum of theoretical perspectives and disciplinary backgrounds participated.

The roundtable's agenda was to explore: (1) persisting mysteries and gaps in knowledge about how possession constellations, self, and identity co-evolve; (2) obstacles to research progress in this area including conceptual, methodological, and substantive issues; and (3) opportunities and potential new directions for research.

Topics discussed included:

- the malleability of self
- differing conceptions of identity
- possessions as indicators of, or assisting to alleviate identity conflict
- how possessions simultaneously determine and reflect identity
- how an item one no longer possesses may continue to affect and be part of an identity
- methodological considerations related to priming identities in experimental settings
- product anti-constellations
- role of possessions in navigating family identities
- cultural differences in opportunities for self-expression
- faith as a possession
- the dangers of confounding the proliferation or inventory of possessions with the importance of possessions to individuals or society
- whether the identity-related role of possessions varies cross-culturally
- the importance of mundane or "invisible" possessions; how objects of low involvement are essential for identity cultivation and enactment
- effects of possession loss on identity
- that little is known about how intentionally removing a possession impacts routine or identity

Negative Mood and Risk Taking Tendency: The Effect of Attachment Style

Hieu P. Nguyen, The University of Texas at Arlington

Eyad M. Youssef, Old Dominion University

Introduction

While the effects of mood and affect on consumer decision making has received much attention among consumer researchers, the effects of mood on social evaluative judgments in general, and risk taking tendency in particular, remain understudied in marketing. Findings from research in social psychology have indicated mixed results. Most research seems to support the prediction that positive mood leads to increased risk taking tendency while negative mood gives rise to increased risk aversion (Isen and Geva 1987, Isen and Patrick 1983, Mittal and Ross 1998, Nygren, Isen, Taylor, and Dulin 1996). Nevertheless, other studies (Arkes, Herren, and Isen 1988, Isen, Nygren, and Ashby 1988, Johnson and Tversky 1983) also found that people in positive mood also tend to be more conservative and self-protective in choice tasks where there is a focus on loss or where there is a reasonable possibility that a real and meaningful loss may occur.

In this study we look at mood regulation strategies as an influential factor of risk taking tendency. A key factor in mood regulation is people's *attachment style*—the systematic pattern of relational expectations, emotions, and behaviors resulting from the internalization of a particular history of attachment experiences (Fraley and Shaver, 2000).

Attachment Theory (Bowlby, 1969, 1973, 1980) explains the propensity of people to form lasting affectional bonds with other people and to regulate inner distress. Early experiences between a child and his or her primary caregiver lay the foundation for functioning in subsequent relationships. Early work on attachment style in infancy (Ainsworth et al. 1978) identified three types of attachment styles: secure, avoidant, and anxious/ambivalent attachment. However, more recent studies have revealed that attachment styles are more appropriately conceptualized as regions in a two-dimension space: *avoidance* (the extent to which a person distrusts relationship partners' goodwill and strives to maintain autonomy and emotional distance from partners), and *anxiety* (the extent to which a person worries that a partner will not be available in times of need) (Mikulincer, Dolev, and Shaver, 2004). Previous research has shown that these two dimensions are orthogonal. High scores on avoidance indicates a person's reliance on deactivating strategies in dealing with stress (inhibition of proximity seeking, attempting to handle stressors by themselves). High scores on the anxiety dimension reflects hyperacting strategies (energetic attempts to attain greater proximity, support, and love combined with a lack of confidence that it will be provided). People scoring low on both dimensions hold internalized representations of comforting attachment figures which leads to continuing sense of attachment security, positive self-regard (Mikulincer, Dolev, and Shaver, 2004).

In this study, we predicted that low avoidance people's risk taking tendency would not be influenced by negative mood due to their sense of attachment security and positive self-regard. We also predicted that highly avoidant people's tendency to detract from emotional figures and engage in self-protective activities will cause them to be more risk taking to correct their negative mood state without having to reach out for help. Meanwhile, people with high anxiety scores are already overwhelmed with constant worries and fears of separation and therefore the negative mood state would not result in a significant change in their risk taking tendency.

Methodology

123 undergraduate students participated in a 2x2x2 between-subject experiment to investigate how mood state (negative, neutral) and attachment style (avoidance: high, low; anxiety: high, low) influences subjects' risk taking tendency. Negative mood was induced by asking subjects to recall and describe in details their saddest day, while in the neutral mood condition subjects were asked to describe their television viewing habits. Subjects were then asked to indicate their choice of a risky decision presented in both gain and loss frames.

Major findings

Findings supported our hypotheses. There was a significant interaction effect between mood and avoidance attachment. In both gain and loss frames, subjects scoring high on the avoidance dimension showed a significant increase in risk taking tendency under negative mood. For low avoidance subjects, negative mood did not result in a significant change in their risk taking tendency in the gain frame, but a significant decrease in the loss frame. One possible explanation for the stronger effect in the loss frame was that people tend to be more risk seeking when the choice is presented in a loss frame and more risk averse in a gain frame (the well-known Asian Disease dilemma, Tversky and Kahneman 1981). High anxiety people did not show any significant changes in their risky behaviors under negative mood in either frame.

General Discussion

These findings contribute to existing theory in several ways. To our knowledge, this research is the first in the marketing literature that investigates the effects of negative mood and attachment style on consumers' risk taking tendency. It sheds some light on the current mixed results in the literature. Whether negative mood encourages risk taking (the *mood maintenance* hypothesis) or risk aversion (the *affect-as-information* hypothesis) seems to be influenced by subjects' attachment style. For low avoidance subjects, the large network of emotional figures and the positive mental model of self tend to dampen the effect of negative mood. For anxious subjects, their constant worries and fears of attachment separation seems to diminish the effect of negative mood on their risk taking tendency. Meanwhile high avoidant subjects tend to engage in self-protective activities and by choosing more risky options, they hope to escape from the current negative mood state without having to reach out for help.

One limitation of this study is the use of convenience samples of American undergraduate students who are normally not overly affluent. Does this factor affect their choice of the risky or safe option in a risky situation involving money? In this study we investigated individuals' risk taking tendency in a financial risky choice context. In order to maximize the external validity of the findings, future research should examine risk taking tendency under negative mood in other risky consumption situations that involve social, physical, performance, and psychological risks.

In this study, we investigated the effect of mood, which by definition, refers to transient feeling states particular to specific times and situations and are subjectively perceived by individuals (Gardner 1985). Future research should investigate the moderating effects of attachment styles under strong affective states such as disgust, fear, depression.

"When the Going Gets Tough, the Tough Go Shopping": An Examination of Self-Gifting Behavior

A. Selin Atalay, Penn State University
Margaret G. Meloy, Penn State University

What motivates the purchase of treats and small indulgences for the self? Do we buy self-gifts when we have something to celebrate or, alternatively, when the "going" is getting tough? Much of the published work has focused on the celebratory side of self-gifts (Mick 1991; Mick and DeMoss 1990a, 1990b). Achievements that are internally attributed are celebrated with indulgent consumption (Mick and Faure 1998), particularly those requiring higher effort (Kivetz and Simonson 2002a; Stevens, Maclaran and Brown 2003). The literature also suggests that self-gifts are premeditated (Mick and DeMoss 1990a). However, the classic saying above suggests that self-gifting may be impulsive and motivated by something darker.

The current work focuses on the use of self-gifts as a mechanism not only for celebration, but also for mood management. Consider the colloquial examples of "comfort-food" and "pick-me-up" bouquets of flowers. In particular, we examine the impact of individual differences in self-esteem, mood, loneliness, and regulatory orientation as moderators of self-gifting behavior, and explore the underlying motivations and needs that are satisfied by self-gifts in both celebratory and mood-repair roles.

Two studies were conducted to explore the different motivations of individuals who buy self-gifts for celebration versus consolation and to explore the impulsive nature of self-gifts. Individual differences in self-esteem (Study 1), loneliness (Study 2), regulatory orientation (Study 2) and mood (Studies 1 and 2) were also measured.

Study 1

Study 1 was conducted with 46 undergraduate students. Participants were asked to think back to their most recent self-gift experience and to explain the motivations and the meanings attached to it. In particular, we asked participants to indicate what gift they had purchased and the occasion that had motivated it. Self-esteem measures were taken.

Results. Both celebration and mood-repair were reported as reasons for past purchases (98%). The last purchase was approximately evenly divided between mood-repair (46%) and celebratory motives (54%). As such, both motivations for self-gifting are prevalent.

What items were purchased? First, we note that the items purchased for mood-repair and celebration did not differ ($\chi(5)=5.22, p>.30$). As such, any difference in motivation was not reflected in the type of product purchased but rather in the meanings participants attached to them. In their last self-gifting experience, participants in both conditions reported having bought clothing (48%), food/beverages (26%), entertainment products (e.g., DVD/CDs) (9%), items for personal enjoyment (e.g., plants) (7%), and hobby products (7%).

The meanings that were assigned to these purchases differed based on motivation for the purchase. Namely, self-gifts purchased for mood-repair were described as less functional ($F(1,44)=4.624, p<.05$) and less durable ($F(1,44)=5.256, p<.05$). For celebration, the gifts reflected self-purpose ($F(1,44)=5.078, p<.05$), individual uniqueness ($F(1,44)=5.087, p<.05$), and one's heritage ($F(1,44)=4.396, p<.05$). Contrary to our expectations, consumers who were higher (lower) in self-esteem did not differ in either their motivations ($F(1,44)=-.385, p>0.50$) or the meanings attached to the self-gift (all $p>.10$). Mood, however, did. In general, an elevated mood led to an exaggeration of the average meaning attached to the self-gift, regardless of motivation.

Study 2

In order to increase the validity of our findings and examine the impulsivity of self-gifting behavior, we conducted a field study with 195 individuals at a shopping mall. They were surveyed both as they entered the mall and right before they left. Prior to shopping, they made a list of planned purchases. We collected measures of mood, loneliness, and regulatory orientation at that time. At the end of the visit, they provided a list of what they had bought.

Results. Of the 195 participants, 89 (46%) purchased an item as a self-gift, with mood repair twice as prevalent (69%) as celebration (31%) ($z=3.08, p<.01$). These results reveal that self-gifting is more frequently motivated by mood-repair than self-celebration when the measure is collected at the point of purchase rather than through a retrospective report of the last self-gift purchased. Contrary to the pre-meditated nature of self-gifts described by Mick and DeMoss (1990a), we found that among impulse purchases, 72% were self-treats. Impulsive self-gifting was prevalent.

As expected, the moods of individuals who purchased treats for mood-repair (celebration) were worse (better) ($F(1,62)=4.88, p<.05$). Loneliness was unrelated to motivation ($F(1,62)=0.61, p>.40$). Finally, individuals who purchased treats for mood-repair were lower in promotion focus than those who bought treats for celebration ($F(1,62)=4.43, p<.05$).

The meanings attached to the items were consistent with the findings in Study 1. Self-treats for mood repair were considered less durable ($F(1,60)=7.60, p<.01$) and less indulgent ($F(1,60)=2.70, p<.10$). We examined the impacts of mood and motivation on the meanings and found few differences. A promotion focus, however, led to treats that represented an ideal self ($F(1,60)=3.40, p<.07$).

Discussion

The findings of the two studies suggest that self-gifting behavior is not solely driven by celebratory motives. The mood repair motivation accounted for one-half to two-thirds of all self-gifts. We also found evidence of substantial impulsivity in self-gifting behavior. If the majority of self-treats are purchased for mood repair and purchased impulsively, this may lead individuals to spend beyond their means, deepening their emotional angst, and creating negative impacts on well-being. Future research is currently underway to examine the links between self-gifting, impulsive purchases, and post-purchase regret. What will you be doing when the going gets tough ...?

Coping with Individual-Group Incongruity

Shuoyang Zhang, Indiana University

Adam Duhachek, Indiana University

Shanker Krishnan, Indiana University

Introduction

It has long been recognized in social psychology and consumer research that decisions are context dependent and that groups have influence on the judgment and behavior of individuals. Most of the previous studies have focused on the influence of reference groups on product and brand decisions (Bearden and Etzel 1982; Childer and Rao 1992), and consumer susceptibility to interpersonal influence (Netemeyer, Bearden and Teel 1992). More recent findings have suggested that mere anticipation of an approaching group discussion causes people to tailor their responses in a strategic manner and influence their product attitudes (Schlosser and Shavitt 1999, 2002). In such situations, consumers may experience stress due to anticipated group influence. While consumer research has implicitly explored a subset of coping behaviors, for example, revision and concession (Aribarg, Arora, and Bodur 2002), previous investigations have not systematically considered coping as a set of stress responses involved in consumer decision process under group influence.

Coping is defined as the process of managing internal or external demands that are appraised as taxing or exceeding the resources of a person (Lazarus and Folkman 1984). Previous research has shown that cognitive and emotional appraisals interrelate to predict consumers' choice of specific coping strategies. Additionally, Tetlock, Skitka, and Boettger (1989) argue that attitude change in anticipation of social interaction often result from cognitive process rather than being an automatic heuristic shift. Additionally, there is a high possibility that individuals have to cope with negative emotions generated by exposure to group feedback with is different from their own evaluations. Thus, it seems likely that both cognitions and emotions operate together to drive coping responses to social influence. This is especially likely to occur when consumers face controversial issues (e.g. products with favorable functional attributes but unfavorable norms or vice versa), which is common but understudied in the domain of consumer research.

In summary, the purpose of this study is to identify conditions under which individuals change their attitude toward a product and engage in coping strategies upon exposure to group feedback. Tetlock et al. (1989) proposed a social contingency model of judgment and choice. The model assumes that when people know the view of the audience to whom they are accountable and unconstrained by past commitments, they tend to respond to the pressures by shifting their public positions toward the audience and adopt the salient, socially acceptable position. This argument leads to our prediction of a main effect for subjects to report more positive evaluation upon positive group feedback and to report more negative evaluation upon negative group feedback. We argue that when there is an incongruity between individual response and group feedback, consumers experience stress and anxiety and therefore engage in coping strategies.

Method

We employed a 2 (positive vs. negative individual response) x 2 (positive vs. negative group feedback) between subjects design and manipulated the incongruity between initial individual evaluation and group feedback. The experiment was conducted in a behavioral technology lab on the computer-based interface of MediaLab software. A total of 161 undergraduate business students (87 males and 74 females) participated in the study to partially fulfill a course requirement. Each participant completed the procedures individually in his or her own cubicle individually.

On arrival, participants completed a consent form and were randomly assigned to the four conditions. First, they received a review about a fictitious study guide for business students with positive and negative information. The study guide was chosen as the product material because it is highly relevant to students. Questions were then asked about their attitudes about the study guide. To reduce the likelihood that participants would perceive a connection between the initial evaluation and later questions, a filler task was provided during which participants were told to answer some unrelated questions. Afterwards, either positive or negative group feedback was provided according to the four conditions. Participants were again asked about their evaluation of the study guide. Participants were told that there would be a group discussion during which they could share their thoughts and opinion with other students. They could choose either to participate or not to participate the group discussion. They were asked questions measuring stress, coping, susceptibility, need for cognition, memory of their evaluation and confidence.

Preliminary Findings and Discussion

Data were analyzed using ANOVA with participants overall shift, stress and coping as the dependent variables. The shift measure was calculated by subtracting the initial evaluation from the later evaluation after exposure to group feedback. As predicted, when there is a high degree of individual-group incongruity, participants shift from their initial evaluation toward group feedback. Accordingly, they experience anxiety and engage in coping strategies.

Consumer coping behavior under group influence is an important issue and has profound implications in producing consumer well being. Our research examined how coping strategies may help individuals respond to individual-group evaluation incongruity. Further research involves identifying factors that may mediate and moderate this effect.

Alleviating Mommy's Guilt: Emotional Expression and Guilt Appeals in Advertising

Sooyeon Nikki Lee-Wingate, Rutgers University

Extended Abstract

Guilt results from "essentially private recognition that one has violated a personal standard" (Kugler and Jones 1992); Its anticipation influences people's behaviors (Baumeister, Stillwell, and Heatherton 1994). Guilt appeals have been studied in marketing (Ghingold, 1980; Pinto & Priest, 1991; Ruth & Faber, 1988a, 1988b). Though not as their main focus, numerous studies implicitly assume the influence of guilt behind impulsive buying (Rook 1987), overspending (Pirisi 1995), pre-commitment to reward programs (Kivetz and Simonson 2002), compulsive consumption behavior (O'Guinn and Faber 1989), and donating to charities (Strahilevitz and Myers 1998). More specifically, some examined advertising campaigns that attempt to arouse guilt (Wheatley & Oshikawa, 1970; Huhmann and Brotherton, 1997); others investigated consumer reactions to advertisements containing guilt appeals (Ghingold, 1980).

Guilt is intrapersonal, mainly arising from transgressions of personal values or societal norms (e.g., McGraw 1987), but also interpersonal, arising from inequities in social comparisons (e.g., Baumeister et al., 1994; Walster, Berscheid, and Walster 1976). Consistent with this main distinction, self-reported guilt in consumption contexts is categorized into guilt arising from either actions or inactions related to a) others in close and distant relationships, b) societal standards, and c) oneself (Dahl, Honea, and Manchanda 2003).

One group of those who are affected by the experience of such guilt is mothers. Their guilt involves all three categories of the consumption guilt, not just one. It entails the children who are in an extremely close relationship to themselves. The society idealizes the Madonna, the symbol of the perfect mother as the perfect standard which every mother should strive to equal. Every mother, moreover, has her own goals and ideas of being a mother, which influences her own self-esteem. Divorced mother (Boney 2002), working mothers (Elvin-Nowak 1999), and mothers of handicapped children (Natale and Barron 1994) all suffer from the inherent maternal guilt they experience.

Especially, working mothers are influenced by guilt appeals in advertising. Coupled with this inherent "it goes with the territory" kind of maternal guilt, there is the potentially manipulative survival tendency of the babies, not to mention their helplessness and dependency. Even infants under a year of age possess ability to use the mere information about an adult's direction of gaze and emotional expression to predict action (Phillips, Wellman, and Spelke 2002). Given this, it becomes more difficult for the working mothers to manage their negative emotions. Since the baby must spend most of the daytime with caretakers, it may only be natural for these mothers to feel compelled to compensate for their absence in other ways. One particular kind of ways is shopping for their children (e.g., to buy the very best for the children). The advertising effects of guilt appeals on working mothers have been studied (Coulter and Pinto 1995), using print stimuli of every day products (bread and dental floss, but not with products directly related to the baby); their results indicated that moderate guilt appeals elicited most felt guilt in the working mothers. However, there have not been any moderators that may alleviate the guilt in them.

The purpose of this research is to introduce one such moderator, drawn from the emotional disclosure literature in clinical psychology. Since early 1990's there has been much research on why talking or writing about emotional events can influence mental and physical health (e.g., Pennebaker 1990; 1995; Pennebaker and Seagal 1999). Expressing one's emotions regarding traumatic or stressful events in life leads to both psychologically and physically healthier state. Specifically, writing about emotional experiences produces improvements in immune function, drops in physician visits for illness, and better performance at school and work (e.g., Esterling, Antoni, Fletcher, Margulies, and Schneiderman 1994; Pennebaker 1993; Spera, Buhrfeind, and Pennebaker 1994). Consistent with this stream of research, I hypothesize that writing about their maternal guilt related to their career choice for the working mothers can strengthen their ability to resist the guilt appeals in advertising.

Proposed studies involve a sample of employed mothers of infants under a year of age, and a stimuli set of baby products that are used by infants, in addition to everyday products. Planned design for the first study is 2 (writing about maternal guilt vs. control group of not writing) X 3 (level of guilt appeals: low, medium, and high) X (baby products vs. everyday products). I hypothesize that for the controls for everyday products, the previous research results will be replicated, such that moderate guilt level is most effective in inducing purchase; but for those who write about their maternal guilt, the effect will show a different pattern. Their guilt will be more resolved and will not be as influenced by the guilt appeals in advertising. This effect will appear across different domains, but in different magnitude, such that it will be significantly greater for the baby products but not for the non-baby products, since the maternal guilt is specifically targeted to the baby-related domain.

Subsequent studies will examine various practical ways that may serve a similar role to that shown by emotional expression. The second study will examine whether showing a sponsor or a spokesperson who expresses her maternal guilt in advertising will show equivalent effects to emotional expression, though vicariously; and whether this effect will show a similar pattern in baby-related domain

(e.g., to invest in the best educational video for your baby) versus non-baby-related domains (e.g., recycling to save the planet Earth). Third study will examine whether specific advertising appeals that solicit such written emotional expression of maternal guilt will change the initial effect; whether the entity of solicitation matters; and whether these effects carry over to non-baby related domains.

Considering that mothers constitute a major proportion of consumers that make purchases especially in baby-related domains, these studies will provide the marketers with managerial implications to utilize the guilt appeals specifically targeting them.

Positive versus Negative Affect Asymmetry and Comfort Food Consumption

Jordan LeBel, Concordia University

Ji Lu, McGill University

Laurette Dube, McGill University

In the present study, we examine the effect on comfort food consumption of variables previously linked to the asymmetry between positive and negative affect. Specifically, we consider consumers' gender, age, and cultural background as well as features of food product categories (e.g., sugar and fat contents) as moderators of emotional antecedents and consequences of comfort food consumption.

Men and women vary considerably in terms of how they experience, express and regulate emotions. Women tend to rely more on negative emotions in decision-making and behaviours; men tend to distract themselves from negative emotional experiences. We propose that men's comfort-seeking consumption is more likely to be triggered by and then lead to enhanced positive affects, whereas women's comfort-seeking consumption is expected to be driven by negative affects. With age, one learns to better regulate one's emotions, developing both the ability and the tendency to constrain emotional experiences with a focus on heightening positive affect. In addition, research has also shown that as age increases so does the relative dominance of positive affect in decision-making. Thus, it is expected that for older adults positive emotions should be a more prevalent antecedent of comfort-seeking consumption than negative emotions.

Culture may also be related to affect asymmetry. For instance, the French cultural stereotype includes a longstanding association to hedonism as a general philosophy of life guiding individual decisions and behaviors. In contrast, the Anglo-Saxon philosophy of life includes stronger dispositions and associations to functionality and restraint. Therefore, we expect that comfort food consumption in

French-cultured individuals will be motivated by the maintenance/enhancement of positive emotions, and for English participants, comfort food consumption is more likely to be related to the alleviation of negative emotions. Finally, the type of food eaten to provide emotional comfort is another factor likely to be tied to affect asymmetry. For instance, sweet and high-fat foods (SHF), like ice cream, cookies or chocolate, have been linked to the experience of negative affect. Thus, we expect that the consumption of SHF foods is more likely to be triggered by negative affects than is the case for non-sweet high-fat foods (NSHF) or for foods of low energy density (LED) regardless of their dominant nutrient.

A survey was administered via the World Wide Web and was promoted in electronic and mass media in the city of Montreal, a multicultural Canadian city with a predominance of French- and English-cultured citizens. In total, 277 participants (196 women; 81 men) completed the survey. The age distribution was as follows: 117 young adults (age 18-24), 136 adults (25-54) and 21 older adults (55 and more). The language primarily spoken at home was taken as a proxy for cultural background: 121 participants primarily spoke French, 129 primarily spoke English at home, and the remaining 27 primarily spoke another language. Participants did not receive any incentive for this study. Participants first provided background information (age, height, weight, etc.), identified their favorite comfort food and were then asked to think back to instances when they ate their favorite comfort food, taking time to form a vivid and complete recollection. Next, using 7-point scales ("not at all" to "very intensely") participants indicated the degree to which they typically felt a set of positive (happy, joyful, calm and relaxed, $\alpha=.81$) and negative affects (depressed, anxious, sad, nostalgic, upset, and lonely, $\alpha=.88$) prior to eating their favorite comfort food. Finally, to explore the effects of the proposed factors on the emotional consequences of comfort food consumption, we also asked participants to indicate the degree to which they typically experience the same positive and negative affects after eating their favorite comfort food. The difference between the pre- and post-consumption reports was used to assess change in affect. Guilt was added to the post-consumption list since it is distinct from general negative affects and was shown to arise from comfort food consumption.

Favorite comfort foods cited by participants were assigned to one of three categories: 1) sweet high fat (SHF) foods, which totalled 101 mentions (36.5%) and included primarily chocolate, ice cream and baked goods; 2) non-sweet high-fat (NSHF) foods with 69 mentions (24.9 %) including meats and meat products, pizza and salted snacks; 3) lower energy density foods (LED) with 93 mentions (33.6%) including soups, pasta dishes, fruits and vegetables. Fourteen favorite comfort foods could not be coded into these categories or were incomprehensible (e.g., foreign language vernacular or abbreviation).

Consistent with expectations, results indicate that men's comfort food consumption was preceded by more intense positive emotions than women (Men=4.18, Women=3.69, $p<.001$). On the other hand, women's consumption tended to be triggered by more intense negative affect (Women= 3.03, Men= 2.9) but this difference did not reach significance. Consumption of comfort foods alleviated women's negative emotions but also produced more intense feelings of guilt than men (Men=2.00, Women=2.69, $p<.05$). Positive affect was a particularly powerful trigger of comfort food consumption for older participants (younger= 3.65, older=4.36, $p<.05$) and for French-cultured participants (French=4.06, English=3.66, $p<.05$). Younger participants and English-culture participants reported more intense negative emotions prior to consuming comfort foods. Foods high in sugar and fat content were more efficient in alleviating negative affects whereas low- to medium energy density foods were more efficient in increasing positive emotions.

Anger in Ultimatum Bargaining: Emotional Outcomes Lead to Irrational Decisions

Francine Espinoza, University of Maryland

Alexander Fedorikhin, Indiana University

Joydeep Srivastava, University of Maryland

Consumers evaluate most retail prices in terms of utility/value of the good, but they may also infer fairness from these offers. When buying a car, for instance, consumers may judge the price as fair or unfair, and accept the offer (purchase) or not (do not purchase). This mechanism is similar to ultimatum bargaining, where perceptions of fairness influence offer evaluation. It is argued that emotions such as anger are a consequence of the fairness appraisal and it is possible to influence bargaining behavior by altering the perceived source of the emotion, holding fairness perceptions constant.

In ultimatum bargaining, a proposer controls an amount of money (say \$10) and must offer some fraction (say \$3) to the responder. Both players know the amount being divided and the rules of the game. If the responder accepts the offer, s/he receives \$3, and the proposer receives \$7. If the responder rejects the offer, both people receive nothing (Camerer and Thaler 1995).

Rationally, the respondent should never reject an offer, since even \$.01 has more utility than zero. However, previous research has shown that ultimatum offers are sometimes rejected (Straub and Murnighan 1995), and variables such as fairness (Kahneman, Knetsch, and Thaler, 1986) and anger (Güth 1995) play a critical role. Pillutla and Murnighan (1996) proposed that respondents react to small offers by perceiving them as unfair and attributing responsibility to offerers. Accordingly, people are willing to sacrifice their own outcome to punish a player who had offered an unequal division to another player (Kahneman et al. 1986).

Anger has been found to correspond to appraisal of a negative event caused by another person and involving *unfairness* (Frijda, Kuipers, and ter Schure 1989). One behavioral consequence of anger is that the angry individual will probably try to hurt the agent as a punitive revenge or as retribution (Darley and Pittman 2003). Nevertheless, the punitive behavior will be directed towards the cause of the feeling (e.g. Younger and Doob 1978).

Transferring this to ultimatum bargaining, as people perceive an offer as unfair, they feel anger towards the agent and tend to reject the offer; however, when people misattribute the cause of anger, the rate of rejection tends to decrease. We tested these ideas in two experiments.

In study 1 we manipulated size of offer to test if a low offer leads to higher levels of anger and to what extent the anger felt decreases the probability of acceptance of an offer. Subjects read the description of ultimatum games and learned that participants in their session were randomly selected as respondents. We randomly assigned \$2 and \$4 offers-out of a total amount of \$10-to 155 students from a major west coast university. After they marked their response to the “proposer’s offer” they answered questions about the offer. Then, respondents proceeded to the “next study dealing with scale development”, which included emotion scales, individual difference variable of anger proneness, and background questions.

Participants showed higher levels of felt anger when they were offered \$2 than when they were offered \$4 ($M_2=2.22$; $M_4=1.74$; $F(1,145)=8.63$; $p<.01$). Anger proneness also showed significant effect ($F(1,145)=8.57$; $p<.01$). A logistic regression showed the \$2 offer was more likely to get rejected as a function of anger. Mediation analysis showed rejection was mediated by anger: in the first model, offer had a significant impact on rejection ($p<.01$); when anger is added to this model, anger is significant ($p<.01$), but offer no longer is ($p>.05$). Anger proneness was not significant in the regression ($p>.1$), showing that the individual difference variable does not influence offer rejection.

The goal of study 2 was to examine outcomes when people misattribute the cause of anger. It was a 2 (control, misattribution of anger) x 3 (offer: \$1, \$3, \$5) between-subjects experiment ($n=120$ students). Misattribution of anger was manipulated through an “independent” task called “life event inventory study” that consisted in asking participants to describe three/four “ordinary and mundane” events of their lives which they do not give much thought to nor have strong feelings about. In the control condition, participants started the “game” study right after this task. In the misattribution condition, they were told “in a similar study participants reported experiencing varying degrees of anger because of this assignment.” Fairness was manipulated through the “proposer-responder game”. The procedure was similar to experiment 1, and participants were asked to accept or reject the offer randomly assigned to them: \$1, \$3, or \$5 out of \$10. Finally, they responded to questions about their feelings and opinions.

In the control condition, 25% of the participants accepted the \$1 offer, 36.36% accepted the \$3 offer, and 100% accepted the \$5 offer. A chi-square test ($p<.01$) revealed that significantly higher proportions of participants accepted the “unfair” offers in the misattribution condition: 50% of the participants accepted the \$1 offer and 63.16% accepted the \$3 offer. The \$5 offer was accepted by 95.24% of the participants. A logistic regression showed that the effect of misattribution was significant ($p<.05$) and the effect of offer was significant ($p<.01$). When anger was included (“to what extent were you angry with the offer?”) as a covariate, the effect of misattribution was not significant ($p>.05$), offer was significant ($p<.01$), and anger was significant ($p<.01$).

Experiment 1 shows anger resulting from the perception of (un)fairness of the offer and increasing the rejection of the offer. Experiment 2 suggests that when people misattribute the cause of anger they tend to “discount” its effect, decreasing the rejection rate of the “unfair” offer. The results have implications for the management of cooperative and competitive behavior in conflict situations such as bargaining.

I Want It Even Though I Do Not Like It: Preference for Familiar but Less Liked Music

Morgan K. Ward, The University of Texas at Austin
 Joseph K. Goodman, The University of Texas at Austin
 Julie R. Irwin, The University of Texas at Austin

Many radio stations play the same songs over and over again, with little willingness to add new songs to the playlist, despite voiced criticism. Station managers argue that they are simply giving the listeners what they want to hear. We investigate this radio paradigm to understand what is driving this discrepancy between voiced preference and actual choice.

Presenting 24 songs from 12 artists (one familiar and one unfamiliar), and 22 famous actors to participants, we show that people do indeed choose to listen to songs, and see actors in movies, based on two factors: their preference (or “liking”) and their familiarity with the song or actor. Interestingly, we find that the effect of familiarity on choice remains significant when we control for the effects of preference on choice. That is, participants sometimes chose a song they liked less than the other option, just because the chosen song was familiar.

In a second study we control for liking across songs based on pretests and show that participants choose playlists of songs that they are familiar with despite lower preferences for these songs. Our last study tested whether the results could be explained by anticipated regret and/or social perceptions (or “coolness,” which may drive people to indicate they do not like familiar songs even though they do actually like them). Using personal computers where participants actually listened to their choices on individual headphones, participants made choices first and then indicated familiarity and liking, as well as how much they may regret their choice and how “cool” they thought each song was. Though regret did affect choice, indicating the presence of some uncertainty about the options, we find that familiarity significantly predicts choice when controlling for the effects of liking, regret, and coolness.

When do Moods Influence Consumer Preferences?: Moderators of Mood Congruency

Katherine White, University of Calgary
 Cathy McFarland, Simon Fraser University

The mood congruency effect refers to the tendency for those in positive moods to make more favorable judgments than those in negative moods. Although mood congruency has been documented in the domain of consumer judgment, past research is equivocal regarding the conditions under which such mood congruency effects emerge. While some authors have documented mood congruency effects in consumer judgments (Curren and Harich 1994; Isen, Shalke, Clark, and Karp 1978), other researchers have not (Adaval 2001). In addition, several moderators of the mood congruency effect have been proposed, such as relevance of the product (Curren and Harich, 1994), consumer motivation (Pham 1998), ability to attribute the source of one’s moods accurately (Gorn, Goldberg, and Basu 1993; Pham 1998), and desirability of the brand (Barone and Miniard 2002).

One such moderator is the ability to focus on one’s mood states. Although some research suggests that those who focus on their moods are better able to avoid or correct for mood congruency (e.g., McFarland, White, and Newth 2003), other research suggests that those who focus on their moods are more likely to demonstrate mood congruency (e.g., Forgas and Ciarrochi 2001). We suspect that the different judgment tasks used in these two studies may be responsible for the discrepant results. The evaluation task used by Forgas and Ciarrochi (2001) involved evaluations of actual and potential possessions, whereas the evaluation task used by McFarland and colleagues involved making evaluations of another person. It seems plausible that people may consider it more appropriate to allow their moods to influence consumer judgments than interpersonal evaluations.

We attempt to resolve this discrepancy and suggest that the influence of mood-focus on the mood congruency effect will be moderated by *perceived appropriateness* of using moods to guide judgments. For example, Gasper & Clore (2000) found that the future predictions of participants high in mood attention were more affected by their current mood than those of participants low in mood attention. Importantly, the mood congruency bias revealed among persons high in mood attention was eliminated only when they were actively encouraged to view their moods as irrelevant to the judgment task. Thus, our key prediction is that mood congruency in consumer judgment will be most pronounced when individuals both acknowledge their moods and consider it appropriate to allow moods to influence their judgments.

In study 1, we utilized a 2(Mood: positive vs. negative) X 2(Focus: focused vs. not focused) X 2 (Appropriateness: moods appropriate vs. cognitions appropriate) between subjects design. We manipulated mood by having participants recall either a negative or positive event (e.g., McFarland et al., 2002)¹. Participants were either focused on their moods (i.e., they rated their moods before making consumer judgments) or distracted from their moods (i.e., they completed a distraction task before making judgments). Perceived appropriateness was manipulated by having participants read either that using moods to inform consumer judgments is a good strategy or that using cognitions to inform consumer judgments is a good strategy. The consumer judgment task involved rating two products that pretested as being equally perceived as “think” and “feel” products: a camera and a backpack. Participants viewed photographs of both products and rated them in on 9-point likert scales ranging from dislike very much to like very much, unfavorable to favorable, negative to positive, and bad to good. A product evaluation index was created by averaging across these measures ($\alpha=.86$). The interaction between mood, focus, and perceived appropriateness was statistically significant $F(1, 186)=6.77, p < .02$. In particular, participants demonstrated mood congruency only when they were focused on their moods and perceived moods to be appropriate ($M_{\text{positive}}=6.07$ and $M_{\text{negative}}=5.19, t(186)=2.54, p < .02$).

¹manipulation checks in study 1 and 2 were successful.

Study 2 utilized product type to manipulate perceived appropriateness. In study 2 mood and focus were manipulated as in study 1. To manipulate perceived appropriateness, we selected products that differed in terms of whether people believed that moods or cognitions were most useful for evaluating them. In a pretest we asked participants a) whether it was more appropriate to use “emotions” or “thoughts” to evaluate each product and b) whether their own evaluation of the product was more based on “feelings” or more “logical/objective” information. We identified two “think” products (a pen and *Newsweek* magazine) and two “feel” products (a chocolate bar and *People* magazine). The pen and chocolate bar, as well as the two magazines were matched on stated price in order to control for the effects of differential price perceptions. Participants were presented with photos of each product (with think and feel products counterbalanced) and then asked to complete the same evaluations as in study 1. The 3-way interaction between mood, focus, and product type (as a repeated measure) was significant, $F(1, 90)=10.13, p<.005$. Once again, mood congruency only emerged when participants were focused on their mood states and when using moods to inform judgments was appropriate (i.e., when evaluating feel products; $M_{\text{positive}}=6.49$ and $M_{\text{negative}}=5.68, t(90)=2.09, p<.05$). Significant mood congruency effects were not exhibited in any other conditions.

The preceding studies reveal an important nuance regarding the influence of moods on consumer judgment. When it is considered appropriate to allow moods to influence judgments, those focused on their moods are more likely than those not focused on their moods to rely on their feelings when making judgments. We also provide evidence that, for certain products, it may be perceived as appropriate to use moods to inform judgments, whereas for other products it may be deemed inappropriate to use moods to inform judgments. In addition, advertisers may want to encourage consumers to perceive it to be appropriate to use positive moods when evaluating their own products, or to perceive it to be appropriate to use negative moods when evaluating a competitor’s product.

How Affect Influences Choice: An Investigation of the Comparison Processes

Catherine Yeung, National University of Singapore

Cheng Qiu, National University of Singapore

Extended Abstract

Research has shown that consumers’ affective experience can influence their evaluations of products (e.g., Adaval 2001; Pham 1998). While we know that affect can influence consumers’ absolute judgments of products, we are less clear about how it can influence consumers’ comparisons and choices among products. Consider a consumer who is choosing among a number of options, and assume that s/he receives information on each of these options one by one. Would affect influence evaluations of all these options in a similar way and to a similar extent, and hence have no *net* effect on choice? Alternatively, would affect influence evaluations of only one of the options, and lead to changes of his/her choice? If this is the case, which particular one will be influenced? Our research suggests that this would depend on the point of time (during the comparative judgment process) at which consumers start evaluating the options in the choice set.

In one case, consumers may begin their evaluations on receiving information on the first option. In this instance, affect is likely to influence evaluations of this first option, but not the ones that are encountered subsequently. This is due to two reasons. First, consumers are likely to form an initial impression of a product spontaneously based on their affect when they encounter the product (Pham, Cohen, Pracejus, and Hughes 2001; Yeung and Wyer 2004). Consequently, affect can influence their impressions of this option. Second, according to previous findings on affect attribution (see Pham 2004 for a review), once individuals have attributed their affect to one source (the first option), they are less likely to attribute this affect to other sources (the second and the third options). Based on these arguments, we propose that consumers’ affect is likely to have a positive impact on their liking of the first option that they encounter, and hence a positive impact on the choice share of this option.

In a second case, consumers may not start evaluating the options until after they have received information on all the options in a choice set. In this instance, their affect will be attributed to the last option instead of the preceding ones. As such, it will have a positive impact on their liking and choices of the last option.

We further suggest that the point of time at which consumers start evaluating the options would change as a function of choice set characteristics. In choosing among options that do not have any differentiating features but only differ in global aesthetic aspects, consumers tend to form a spontaneous impression of each option upon receiving information on the options, and hence the first option being evaluated would be the first option that they encounter (Yeung and Wyer 2004). However, in choosing among options that have certain differentiating feature(s), consumers may feel a need to delay their judgments until they have seen information on all the options, and hence the first option being evaluated would be the last option that they encounter (Houston, Sherman, and Baker 1989; Mantel and Kardes 1999). In either case, we predict that affect will have a positive impact on their liking of the first option being evaluated, and hence a positive impact on the choice share of this option. More specifically, consumers in a happy mood would be more likely to choose this option than those in an unhappy mood. Three experiments were conducted to test these predictions.

Experiment 1. We examined the influence of affect on choices between two options which did not have any differentiating features but only differed in global aesthetic aspects. We induced participants’ mood by asking them to write a piece of happy or unhappy personal experience. Then they moved on to the second (ostensibly unrelated) task where they saw pictures of two mango-flavored desserts sequentially. After that, participants indicated their choices between the options and also their absolute judgments of the options. Consistent with our predictions, the choice share of the first option was higher when participants were in a positive mood than when they were in a negative mood (68.97% vs. 38.46%; $p<.05$). The data on absolute judgments of the two options confirmed that participants had a higher evaluation of the first option when they were happy than when they were unhappy ($p<.05$); whereas the two groups did not differ in their evaluations of the second option ($p>.50$).

However, one might argue that, as dessert tends to elicit positive affective reactions, participants’ negative extraneous affect might not be perceived as a genuine affective response to the dessert and hence should not have an effect on choices of desserts. Instead, the low

choice share of the first option under the negative mood condition could be due to the high choice share of the second option, which, in turn, was driven by a recency effect. This alternative explanation is addressed in experiment 2.

Experiment 2. We investigated a three-option choice context in order to disentangle between the mood effect explanation and the recency effect explanation. If the change of choice share was due to an effect of mood, this change would be reflected in the choice share of the first option. However, if the change of choice share was due to a recency effect, it would be reflected in the choice share of the third (i.e., last) option. The results lend support to the mood effect explanation. That is, participants in a positive mood were more likely to choose the first option than those in a negative mood. Choices of the last option did not differ across the two mood conditions. Moreover, the absolute judgments data show that the two groups differed in their evaluations of the first option, but not in their evaluations of the ones that they encountered subsequently.

Experiment 3. In experiments 1 and 2, the first option that participants encountered was presumably the starting point of comparative judgments. To further investigate the mechanism through which affect influences choice, we manipulated the time at which participants started to evaluate the options in experiment 3. The procedure of experiment 3 was essentially the same as experiment 2. However, we delayed the starting point of comparative judgments by asking participants to choose among desserts that differ in flavor (which is presumably a differentiating feature for desserts). We predict that affect would influence choices of this last option in much the same way as it influenced choices of the first option in experiments 1 and 2. We found a marginally significant relationship between mood and choice ($p=.067$). Consistent with our predictions, participants in a positive mood evaluated the last option significantly higher than those in a negative mood and were more likely to choose the last option (46.3% vs. 26.9%; $p<.05$).

In combination, experiments 1-3 suggest that, the point at which consumers' affect is incorporated into a comparison process depends on the starting point of the process. In any case, affect is incorporated into the first evaluation people make, regardless of whether this evaluation is made with reference to the first option or the last option from a choice set.

How Do Consumer Targets Perceive and Respond to Brand Agents in Persuasion Attempts?

Mei-Ling Wei, York University

Many advances of the persuasion knowledge model have focused upon people in selling functions as agents in a persuasion episode. A major facet that remains under researched is our understanding of brands as agents. This paper addresses this gap by examining consumer beliefs about brands as agents of persuasion. Depth interview data show how target perceptions of agents can be more complex and their responses less resistant than previous conceptualizations. Consumer targets can perceive brand agents as representing, offering, reaching out, getting the word, and making do; and they can respond by defending, congratulating, choosing, and getting suckered.

How do consumer targets perceive and respond to brand agents in persuasion attempts?

In their seminal article, Friestad and Wright (1994) began to explore the nature of consumers' taken for granted understandings of how persuasion agents attempt to influence them in the marketplace. Although they recognized that agents were not necessarily people in selling functions, many advances since have been situated in such settings [e.g., a salesclerk making a sale (Campbell and Kirmani 2000), a retailer convincing customers "to spend more money very soon" (Brown and Krishna 2004, 532)]. Recently, Kirmani and Campbell (2004) consolidated and extended our understanding consumers' understandings of salespeople as persuasion agents. A major facet of persuasion knowledge that remains under researched, however, is our understanding of brands as persuasion agents.

This paper begins to address this gap by examining consumers' perceptions of how brands attempt to persuade and how they themselves respond to these attempts. This is important because unless we do so, we risk overlooking differences in consumers' beliefs about how brands as compared with salespeople attempt to persuade. As well, this paper contributes larger conversations about how persuasion knowledge is an invariable resource (Friestad and Wright 1994; Kirmani and Campbell 2004) and how consumer responses to brand actions vary as a function of their relationship with the brand (Aaker, Fournier, and Brasel 2004; Aggarwal 2004).

Method

Depth interviews on the general topic of brands were conducted with five participants (Jack, Jill, Joe, Jon, and Jay), and transcribed verbatim. Transcripts were first coded individually, and after grouping observations and identifying themes, the process of comparison and refinements was repeated until a coherent account of the data was achieved (Charmaz 2000; Strauss and Corbin 1998).

Findings

Brands as agents

Five dimensions emerge in participants' perceptions of brands as agents: 1) agents represent, 2) agents offer, 3) agents reach out, 4) agents get the word, and 5) agents make do. It is worth noting that not all brands are discussed along these dimensions. For example, brands described as "imitators" and "least luxurious" are rarely talked about along these dimensions.

In seeing agents as representing, participants drop names and reference stereotypes. For example, on Diesel, Joe exclaims "GINO, you know, Italian, STM [local catholic school], '98 civic lowered with rims and beads, spiky hair perfect to the twist!" As well, participants see agents as offering them symbolic connotations that might otherwise be inaccessible. For example, Jill notes how Club Monaco helps portray her as having class and cosmopolitanism, and how without it, she would risk looking like a "little hoochie" or "country". Participants talk about agents as "reaching out" for them, and they express belief that agents get the word and teach them about styles and about "what gets hot". For example, Joe talks excitedly about how Tommy Hilfiger "180 degrees reversed their marketing" to reach him as a youth, and Jill explains how Club Monaco "looks at all the runway shows, everything and whatever's hip at the time" and then gets this out to "the younger generation". Lastly, participants see agents as making do with what already exists in "the system, the way society works", and speak easily of branded placements in movies and video games. Jay remarks how "they do that all the time...if you watch your favorite sitcom, again the guy wears certain clothes, sits on certain furniture, whatever, like all that's been placed there."

Consumers as targets

Four dimensions are identified in participants' perceptions of themselves as targets: 1) targets defend, 2) targets congratulate, 3) targets choose, and 4) targets get suckered. Again, it is worth noting that not all brands are discussed along these dimensions, instead these are often brands that participants like.

Although participants often talk about brand agents as "sneaky", they are quick to defend when asked to elaborate. For example, on criticisms and Hugo Boss, Jack concludes "problem is that's the nature of the game...they're in the market where everybody else is doing it, so if they don't do it, they'll get left in the dust", and adds "you shouldn't need to have certain clothing to have more confidence, but the reality of the situation is...it gives you that nice, warm feeling inside." Sometimes, agents are congratulated for being "sly" in persuasion attempts. In talking about Rocawear in music videos, Jay commends "a music video's more subversive right...it's clever right, an effective way to reach your target." As well, participants often stress *their* choice by emphasizing product specifics and contrasting with others. For example, Joe repeatedly contrasts himself from others who are "into" his music: "I would say that 98% of people who like hip hop don't like Guess", and even when he retraces Guess back to a hip hop song, he is very adamant: "Honestly to tell you the truth why I bought Guess, because I heard it on a [Nas] song...[So might others?] No, not really, Guess is not very popular in that sense, where

like Puff Daddy wears that or like, this guy wears that.” Lastly, participants talk about themselves as being taken in by agent attempts at persuasion, terms such as “sucker” and “slave” come up repeatedly in interviews. For example, on Ecco, Jon notes how he “hopped on the bandwagon” and later, in talking about the prevalence of branded placements, he remarks “Oh clearly I’m a slave. [What do you mean?] Just cuz’ I am, know what I mean, you see a poster, a commercial, a radio show, you say ‘I want to buy that’. I don’t know why.”

Closing

This paper shows how consumer target perceptions of brands as agents can be more complex and their responses less resistant than previous conceptualizations. Targets can perceive agents as representing, offering, reaching out, getting the word, and making do; and they can respond by defending, congratulating, choosing, and getting suckered. A sensible next step is to probe conditions that cultivate such beliefs.

Attributional Processes in the Case of Product Failures—The Role of the Corporate Brand as Buffer

Sabine Einwiller, University of St. Gallen
 Michaela Waenke, University of Basel
 Andreas Herrmann, University of St. Gallen
 Jakub Samochowiec, University of Basel

A coherent brand architecture is to enhance impact, clarity, synergy, and leverage among a firm’s brands (Aaker & Joachimsthaler, 2000). Within this context, the organizing structure between the corporate brand and the product brands is of considerable interest for marketing and corporate management alike. Extending the ideas of what good brand architecture should do, we argue that a superordinate corporate brand can serve a buffer function by protecting its subordinate brands in case of a negative occurrence.

Attributional theorists argue that individuals attempt to develop a realistic understanding of the causes of events, such as why a product has failed (Folkes, 1984). Accordingly, people are inclined to find reasons why something negative has happened and who is responsible for the damage. We suggest that the brand architecture influences consumers’ judgment of responsibility (Weiner, 1995) by indicating the level of influence one brand has over another. The closer the endorsement by the corporate brand for the product brand, the closer the perceived influence of the former over the latter. A strong endorsement also indicates that the company guides the decisions and actions of the endorsed product brand, making the former partly responsible for the latter’s actions if things go wrong. Consequently, the corporate brand takes some of the blame for mishaps and thereby attenuates the negative effects for the product brand.

H1: A strong (weak) endorsement of the product brand by the corporate brand leads to less (more) perceived responsibility of the product brand in case of a failure.

The deferred responsibility to the endorsing corporate entity prevents damage to the attitude toward the product brand. Judgment of responsibility serves as the mediating variable for the effect of brand endorsement on brand attitudes.

H2: A strong (weak) endorsement of the product brand by the corporate brand results in a less (more) negative attitude towards the product brand in case of a failure.

H3: The effect of brand endorsement on product brand attitude is mediated by a consumer’s judgment of responsibility. .

We conducted two experiments to test our hypotheses. In study 1 we manipulated the endorsement of a product brand (strong vs weak endorsement) by a superordinate corporate brand to find support for hypothesis 1. In study 2 we tested hypotheses 2 and 3 by means of a 2 (brand endorsement: strong vs weak) x 2 (information valence: neutral vs negative) factorial design.

Results

The results of our first study which was conducted among 39 student subjects indicated that the strength of the corporate brand endorsement moderated the perceived responsibility in case of a product failure. Responsibility was judged on a scale from -5 (product brand completely responsible) to 5 (corporation completely responsible). The responsibility of the corporation for a failure by the product brand was judged significantly greater when the corporate endorser was prominently displayed in an advertisement than when it was hidden in the corner of the ad ($\text{mean}_{\text{endostrong}}=0.25$, $\text{mean}_{\text{endoweak}}=-1.88$; $F=4.1$, $p<.05$). Further support came from the manipulation of the brand name similarity. The corporation was perceived more responsible when the corporate brand and product brand names were similar than when the brand names were different ($\text{mean}_{\text{endostrong}}=-1.37$, $\text{mean}_{\text{endoweak}}=-3.59$; $F=6.3$, $p<.02$).

In study 2 we presented 77 student subjects with an advertisement of a product brand for sporting goods and a fictitious news article. The advertisement served as the main manipulation of brand endorsement by either prominently displaying the corporate brand endorser or by hiding it in the corner of the ad. The news article reported either on flaws in products (broken zippers and faulty shock absorbers) or on a neutral event (brand presents its new collection) thereby manipulating the valence of the information. In the strong endorsement condition the corporate name was reinforced in the news article but not in the weak endorsement condition.

In support of hypothesis 2, we found a significant 2-way interaction of information valence and endorsement strength on the attitude toward the product brand ($F=14.8$, $p<.001$). The attitude toward the product brand was negatively affected by the failure story when the corporate brand endorsement was weak ($\text{mean}_{\text{negative}}=2.8$, $\text{mean}_{\text{neutral}}=4.07$). In the strong endorsement condition the corporate brand seemed to have worked as a buffer by taking on the responsibility for the failure ($\text{mean}_{\text{negative}}=4.18$, $\text{mean}_{\text{neutral}}=4.10$). Also, the product brand was perceived less responsible for the failure when the corporate endorsement was strong than when it was weak thereby replicating the findings from study 1 ($\text{mean}_{\text{endostrong}}=0.22$, $\text{mean}_{\text{endoweak}}=-3.32$; $F=31.0$, $p<.001$).

Mediational analyses (Baron & Kenny, 1986) suggest that judgment of responsibility served as a mediator of attitude towards the product brand. Brand endorsement was a significant predictor of brand attitude ($p<.001$) and brand endorsement predicted judgment of responsibility ($p<.001$). Regressing both, the potential mediator and the independent variable, on attitude, the impact of brand endorsement was attenuated (from $p<.001$ to $p<.10$).

Our findings extend the previous research on the role of superordinate brands. They raise new questions on how to incorporate the buffer role into the theoretical models of the effects of brand architecture and provide practical implications. Strengthening the corporate brand as is currently en vogue in marketing may provide an unforeseen benefit when it comes to coping with product failure.

Protection Motivation Theory—An Additive or a Multiplicative Model?

Magdalena Cismaru, University of Regina

Protection Motivation Theory (PMT) Variables

According to PMT, four factors influence the persuasiveness of health communications: vulnerability, severity, efficacy (response and self), and costs. Vulnerability refers to one's subjective perception of the risk of contracting a condition or leaving a condition untreated. Severity refers to feelings concerning the seriousness of the condition. Response efficacy refers to the person's belief that the recommended behaviors are effective in reducing or eliminating the danger. Self-efficacy refers to the person's belief that he or she has the ability to perform the recommended behaviors. Finally, costs represent the sum of all barriers to engaging in the recommended behavior.

Variables' Importance

All PMT variables were found to have an impact on persuasion, though not equally so. Indeed, the results of a meta-analytic review (Milne, Sheeran, and Orbell, 2000) show that costs and self-efficacy have the highest impact on persuasion measures.

Interactions Effects

Literature shows significant two-way interaction effects suggesting that costs influence the effect of self and response efficacy on persuasion measures, whereas self-efficacy and response-efficacy influence the effect of perceived vulnerability. Further, vulnerability was found to modify the effect of severity, whereas severity was shown to influence the effect of response efficacy.

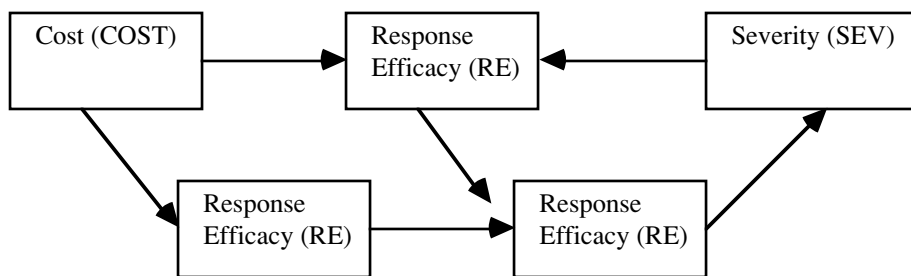

Additive versus Multiplicative

There is disagreement among researchers as to whether the combined effect of PMT variables on persuasion follows a multiplicative model or an additive one. A multiplicative model assumes that no protection motivation would be aroused if the value of any of the components would be zero and expects a significant interaction effect among all variables. An additive relationship assumes that even when one of the predictor variables is 0, the persuasion could be different than zero and the combination of high levels of the variables produces the highest persuasion scores.

TABLE 1
Individual Associations of PMT Variables with Persuasion Measures (Milne, Sheeran, and Orbell, 2000).

Variable	Intention	Concurrent Behavior	Subsequent Behavior
Vulnerability	.16	.13	.12
Severity	.10	.10	ns
Response Efficacy	.29	.17	ns
Self-efficacy	.33	.36	.22
Costs	-.34	-.32	-.25

FIGURE 1
Proposed Relationships Between PMT Variables

Proposed Combinatorial Rules and Empirical Evidence

Rogers (1975) predicted that perceived vulnerability, severity, and response efficacy combine multiplicatively to influence intentions. He expected significant main effects for each variable, and two-way and three-way interaction effects among these three variables. Few studies provided support for this model (Eagly & Chaiken, 1993).

A second model proposed by Rogers (1983) posited an additive relationship within each appraisal process and second-order interaction effects between the threat and coping variables. This model has also failed to find empirical support (Eagly & Chaiken, 1993).

Weinstein (1993) proposed a weighted additive model, implying that the PMT variables are not equal in importance. Although this model has not been empirically tested, it makes a valid attempt to mathematically describe the relationships among the PMT variables. However, this model does not account for the numerous interactions among PMT variables that have been recently reported in the literature and described in the present review.

Proposed Model

We propose a new model in which the decision-maker does not equally and simultaneously considers all the PMT variables, but rather subjectively ranks the variables based on his or her own perception of their importance and sets minimum cut-offs for each. The person then starts by evaluating the most important variable, and decides not to follow the recommendations if the level of that variable does not meet the minimum cut-off point. If the variable meets the minimum cut-off point, then the next most important variable is evaluated and the overall effect will follow a weighted additive rule.

Costs were found to have the highest impact on persuasion (together with self-efficacy). In addition, costs are certain and represent a loss to the person. Consequently, it is likely that cost information would be considered as the most important among the PMT variables. When decision makers evaluate costs, they will set a maximum level above which they will not consider performing the behaviour (regardless of the other variables' levels). If the costs are considered reasonable (below the cut-off level), thus self-efficacy is reasonable high, we expect people to evaluate the other PMT variables' levels. Again, if the level of any of the variables is under a particular minimal level, the person decides not to follow the recommendations, following an initial elimination-by-aspects rule. In the situation in which all the PMT variables pass the cut-off levels, the general decision rule followed would be a weighted additive one.

Our model is based on the assumption that people are exposed to numerous health messages advocating changes in behavior. They choose not to adopt many of these behaviors, but may consider adopting a few. When exposed to fear-arousing health information advocating changes in behavior, people look for reasons to avoid adopting the recommended behavior. This proposed model thus, posits a combination of strategies frequently observed in the decision-making literature (Bettman, Luce, and Payne, 1998) with an initial use of the elimination by aspects rule to reduce the number of health messages considered for adoption, followed by a compensatory strategy such as the weighted additive rule to select from those remaining.

We believe our proposed model helps explain the inconsistent findings in the literature regarding the presence or the absence of one variable's impact on persuasion and will also provide insight into the decision making process involved when deciding whether or not to follow a particular recommended health behavior.

The Devil You Know: Effects of Suspicion of an Information Source's Identity

Jodie L. Ferguson, Georgia State University

Pam Scholder Ellen, Georgia State University

The sheer number of information sources available for search and choice comparisons has exploded with technology. With the growth of "buzz marketing" and organized "word-of-mouth" tactics such as "alpha pups" and "leaners," marketers are intentionally using strategies to influence consumers that mask their true identity. As a result, the lines between marketer and non-marketer controlled are increasingly blurred. Without knowing the identity of the source, consumers may have problems assessing self-interest, and in turn, may discount credibility and recommendations. Rather than "gaining" the credibility often attributed to true word-of-mouth sources, Fein (1996) suggests that, when suspicion is raised, the "individual actively entertains multiple plausible rival hypotheses about the motives and genuineness of a person's behavior" (p. 1165).

Sources explicitly identified as marketers may allow confident attributions of intent, and consumers can then factor such self-interest into their decision-making. Information provided by sources with expected self-interests in certain outcomes may naturally evoke coping mechanisms based on their persuasion knowledge (Friestad and Wright 1994). In personal sales contexts, perceived self interest has been shown to moderate the effectiveness of argument strength and perceived expertise (Wiener, LaForge, and Goolsby 1990).

Sources appearing in identified "consumer" web forums would be expected to be judged synonymously with other forms of non-marketer controlled sources. If a posting in a web forum, is suspected to be authored by a marketer, instead of being viewed like other identified marketing sources, the suspicion of deception may result in even more negative thoughts than self-interested sources because of uncertainty.

The purpose of this study was to examine the willingness to rely on persuasive sources which vary on identified self-interests across traditional and web-based forums. Specifically, we examine the effects of suspicion of self-interested motives on perceived credibility of the sources and likelihood of relying on them for advice.

Method

An online survey presented a purchase scenario. Respondents were asked to imagine they planned to buy a digital camera as a gift. Though they had identified four models of camera in their price range, they were told that they could not discriminate between them so they sought additional input. Four sources of information were described (abbreviated descriptions below):

A salesperson at a large electronics store has gone through extensive training on digital cameras in addition to 15 years experience in the business.

A website's Buying Guide has ads for electronics companies and direct links to various retailers. Its Buying Guide lets you identify up to five products and it provides a "best in class" recommendation.

A customer in the store who overhears your conversation and offers personal testimony about his recent camera purchase since he'd looked at the same four models.

A person in a chatroom who says he has 15 years of business experience with all types of cameras and experience with the four specific cameras in question.

The respondent was told that each source recommends a different camera so they will have to make a decision based solely on the sources since they must buy the gift immediately.

Each source was then rated on their expertise, believability, trustworthiness and interest in helping them make the best choice on a nine-point scale. They were then asked which recommendation they would be most likely and least likely to take. For the latter, they were asked why they would be least likely to follow this recommendation.

Results

Respondents were 140 undergraduate students. The sample was 54.1% female and 90.1% spent four or more hours per week on the internet.

In terms of interest in helping the customer to make the best decision, the chatroom advisor was rated statistically significantly lower (mean=5.09) than all three other sources (Customer=6.63, Web Guide=6.01, Salesperson=6.04), confirming expectations that suspicion led to lower ratings than those with admitted self-interest. While the salesperson and chatroom advisor were described as having equivalent expertise experience, the chatroom advisor was rated statistically lower (mean=5.48) on expertise than the salesperson (mean=6.81), and was even statistically lower than the store customer (mean=5.90) or the Buying Guide (mean=6.47).

When asked whose recommendation they would most likely take, 31.4% said the website buying guide and 30.0% said the customer, while 25.7% said the electronics' salesperson. In terms of the recommendation they would be least likely to take, 51.4% said the chatroom advisor. The verbatims for those respondents showed that 68% of the responses doubted the chatroom advisor's credibility, some expressing the need to see advisors face-to-face to be able to judge their credibility. Another 11% suggested that the person probably worked for the manufacturer. Interestingly 12% saw the recommendation as part of a possible joke, prank or fraud.

This provides some limited support to Fein's arguments about the effects of suspicion. Consumers seem to be suspicious of sources who may be concealing their true identity and therefore their self-interest, rating them lower than self-interested sources.

This study suggests that marketers should proceed with caution in using online forums. Consumers are becoming more sophisticated in these forums where identity is less verifiable, leading to suspicion. The very "hint" of deceit may be sufficient to elicit significant consumer backlash. The heyday of marketers being able to "masquerade" as consumers to gain greater influence and avoid coping strategies may be past. The suspicion in this study seemed to be limited to the online forums.

Product Placement: Developing Concepts, Constructs and Measures

Jane Scott, University of New South Wales

Margaret Craig-Lees, Auckland University of Technology

Product placement practice has grown in scope and volume, and expenditure now exceeds one billion dollars per annum. Publicity and public concern is also increasing. Placement research however has not kept pace with these trends. Effects-based research is minimal and findings across studies diverge. Most researchers have adopted traditional advertising effect measures, however placement is qualitatively different to interruptive advertising. Whilst theoretical discussion is ensuing, it remains minimal. Before viable research can emerge, sound concepts and constructs must be developed. This paper presents a discussion and resolution of conceptual issues.

The Effect of Perceived Brand Name-Logo Coherence on Brand Attitudes

Bruno Kocher, University of Lausanne

Sandor Czellar, HEC School of Management, Paris

Jean-Claude Usunier, University of Lausanne

Extended Abstract

This research investigates how the perceived coherence between brand name and logo affects brand attitudes and how this relationship is influenced by consumer-level and marketer-controlled variables (Keller, 1993, 1998). The topic is an important one since brand names and logos are common means to communicate brand identity to consumers (Aaker 1996; Henderson and Cote 1998). However, if these brand elements are incoherent, incongruity may occur at the brand association level (Keller 1993). Therefore, the coherence between brand name and logo is crucial to the development of a strong brand identity. Even though the coherence between brand names and their logos has been recognized as an important research topic, little systematic research has investigated it yet (Henderson and Cote 1998; Henderson, Giese, and Cote 2003; Klink 2003).

The purpose of this research is to study a main effect (the impact of brand name-logo coherence on brand attitudes), its potential moderators and its boundary conditions. To do so, the primary theoretical frameworks we rely on are Keller's (1993) consumer-based

brand equity model, research on self-brand connections (Edson Escalas and Bettman 2003; Edson Escalas 2004) and preference for consistency (Cialdini, Trost, and Newsom 1995). The main rationale is that consumers will favor brand logos that are coherent with the brand's current image and that this preference is affected by several consumer-level and marketer-controlled variables.

The constructs whose relationships are investigated in a first study are perceptions of coherent brand logo actions, self-brand connections (SBC) and preference for consistency (PFC). Specifically, the following hypotheses are tested:

- H1: Attitudes toward a brand action that increases coherence between brand name and logo will be more positive than attitudes toward a brand action that decreases coherence between brand name and logo.
- H2: Consumers with a high PFC will have more positive attitudes toward a brand action that increases coherence between brand name and logo than consumers with a low PFC.
- H3: Consumers with a strong SBC will have more positive attitudes toward a brand action that increases coherence between brand name and logo than consumers with a weak SBC.
- H4: Consumers with a strong SBC and a high PFC will have more positive attitudes toward a brand action that increases coherence between brand name and logo than consumers with a strong SBC and a low PFC.

An experiment was conducted to test these initial hypotheses. A multinational cell phone brand was chosen as the stimulus brand for two reasons. First, most students know the brand and own a cell phone. Second, cell phone brands usually have a distinct positioning and the brand to be investigated possesses distinctive characteristics in terms of brand name and brand marks. Stimuli and instructions were pre-tested with 15 students. Eighty-nine undergraduate students aged between 19 and 23 participated in the main study, which comprised two separate parts presented to participants as ostensibly unrelated surveys. In the first part, personal characteristics were collected including the seven-item SBC and the 18-item PFC scales (Cialdini et al. 1995; Edson Escalas 2004). In the second part, a 2 x 2 x 2 between-participants experiment was conducted (incoherent/coherent logo with brand; weak/strong self-brand connection; low/high preference for consistency). Participants were presented the current brand logo and were asked to imagine a new logo that would be (in)coherent with the name and current positioning of the brand. After time for reflection, they were asked to write down the characteristics of such a logo and why these characteristics could improve cohesiveness with the brand compared to the current logo. Participants also had the possibility to draw a new logo if they wished to do so. Finally, they were asked to rate their attitudes toward a brand action (three items) that would actually introduce a new logo in the market based on participants' recommendations.

A 2 X 2 X 2 ANOVA was conducted with attitude toward brand action as the dependent variable and logo coherence, SBC and PFC as between-participant factors. Low/high groups on the SBC and PFC scales were constituted using a conventional median split. The main effect of logo coherence was significant ($F(1, 81)=47.78, p<.01$), whereby participants rated a brand action introducing a coherent logo with the brand more favorably ($M=4.67$) than an incoherent logo ($M=2.79$). This result supports hypothesis 1 and suggest that brand name–logo coherence matters to consumers. The three-way interaction between logo coherence, SBC and PFC was also significant ($F(1, 81)=4.08, p<.05$). A planned contrast revealed that participants with a strong self-brand connection and a high preference for consistency had more positive attitudes toward a brand action that increased coherence between brand name and logo ($M=5.04$) than participants with a strong self-brand connection and a low preference for consistency ($M=3.85, F(1, 81)=4.23, p<.05$). These results support hypothesis 4 and suggest that the effect of the two psychological difference measures on brand attitudes is strongly intertwined.

As a next step, a series of experiments are projected aiming at testing the effect of additional moderators on the basic relationship of hypothesis 1. These include other consumer-level factors such as brand ownership and but also marketer-controlled factors such as perceived initial congruence between brand and logo, stability of the logo over time and the social visibility of the brand. Specifically, we expect consumers actually owning a product of the brand to judge coherent brand logos more favorably than consumers who do not own any product from the brand. We also expect that brand name–logo congruence will be important for brands that frequently (vs. rarely) change logos over time; and for brands that are highly (vs. weakly) visible in social interactions.

In a broad perspective for future research, our conceptual framework may also extend to brand elements other than logo (slogans, sponsoring, public relations etc.) It would also be interesting to relate our framework to brand extensions research (e.g. Aaker and Keller 1990; Sanjay and Sood 2002). Whether the same factors influence the effect of other brand elements on attitudes as those hypothesized in this research is certainly an interesting question for future inquiry.

Explaining the Negative Spillover Effect in Target Marketing: Automatic Social Comparisons that Threaten Collective Self-Esteem

Claudiu V. Dimofte, Georgetown University
Ronald C. Goodstein, Georgetown University

The present research proposes that previously inconsistent findings on the NSE in consumer behavior work can be explained by accounting for the unconscious impact of activated negative stereotypes among non-targeted consumers. More importantly, it appears that (for those consumers highly identified with a particular group membership) this activation occurs even when prompted by cues that are largely irrelevant to the particular stereotype in question. While this finding is troubling, a particular way to mitigate the risk of NSE by advertisers refers to their use of specific regulatory focus manipulations, such as execution variables that put consumers in a state of promotion (strategic eagerness).

Effective Counter Persuasion: Creating Lasting Resistance to a Stronger Opponent

Petia K. Petrova, Arizona State University
Robert B. Cialdini, Arizona State University
Daniel W. Barrett, Western Connecticut State University
Noah Goldstein, Arizona State University
Jon Maner, Florida State University

Two studies investigated a counterpersuasive strategy that can be effective for a communicator facing a rival who can deliver his or her message many more times than the communicator. This strategy incorporated: 1) strong counterarguments against the claims of the target message and 2) a mnemonic link between the target message and these counterarguments. Results demonstrated that the combination of counterarguments and mnemonic links not only produced greater resistance to the target ad than a counterad that lacked mnemonic links, but it also undermined the target ad more strongly as the number of exposures to the target ad increased.

The Role of Mindfulness in Consumer Behavior

Weiming Dong, Boston University
Frédéric F. Brunel, Boston University

Since its initial publication by Langer and her colleagues (Langer 1977; Langer, Blank and Chanowitz 1978), the psychological construct of mindfulness has gained increased influence in the field of social psychology (e.g., Martin 1997; Brown and Ryan 2003). In this research, we provide (1) a general review and description of the mindfulness construct, (2) a discussion of how mindfulness can be used in consumer research, (3) results from an advertising persuasion study where mindfulness is shown to moderate persuasion routes, and (4) an overall discussion of our on-going research program as well as further research areas for this construct.

Mindfulness refers to "a state of conscious awareness characterized by active distinction drawing that leaves the individual open to novelty and sensitive to both context and perspective" (Langer 1992). There are four main features to mindfulness: greater sensitivity to one's context or environment, more openness to new information, greater aptitude at cognitive categorization, and enhanced awareness of multiple perspectives in problem solving (Langer 1989). As such, mindfulness is distinct from other important psychological constructs which tend to solely apply to issues that are central or salient to an individual. In contrast, mindfulness speaks more about one's general aptitude to notice and deal with what is new. Studies between mindfulness and other cognition, personality and social psychology constructs have shown that mindfulness should be seen more as a cognitive style than just a specific cognitive ability or a personality trait (Sternberg, 2000), and therefore it should be seen as existing at the boundary of personality and cognition, and can be used both as a state or trait variable.

This very brief description should be enough to outline the potential relevance of the mindfulness construct in a vast array of consumer behavior issues, such as consumer decision making, marketing communication, persuasion, and so on. However, a review of articles published in the leading consumer research journals reveals that this construct has been largely overlooked by consumer research scholars.

This lacuna is unfortunate as we believe that mindfulness can provide valuable insights into the study of consumption. First, when used as an individual difference measure (trait variable), mindfulness can be a valuable tool to segment consumers into groups, and can be used in theory testing and development. Second, when used as a state variable, it can provide insights on how contexts, marketing interventions, education and message elements might influence one’s level of mindfulness and therefore consumption behavior. Third, we believe that mindfulness can provide new insights into consumer cognition, judgment and decision making, and especially help us better understand issues such as heuristic processing, selective perception, routine behavior etc. Fourth, because it has been shown that mindfulness can be increased through training or other interventions, it seems that there is a direct consumer welfare implication as well, as increased mindfulness should help consumers make better decisions and achieve improved wellbeing.

To illustrate the potential role of mindfulness, we present a study on how mindfulness might affect persuasion efforts. In particular, we are interested in the role of mindfulness in the well established dual process models of attitude formation and change (e.g., Elaboration Likelihood Model, Petty and Caccioppo 1986; Heuristic-Systematic Model, Chaiken 1987). In this context, we also wish to contrast mindfulness with need for cognition (NFC), as NFC has also been shown to moderate the routes to persuasion, and on the surface, the two construct might appear quite related. However, we also believe that there are fundamental differences between the two. For instance, mindfulness is characterized by high level of conscious awareness, sensitivity to context change, openness to new information, ability to create new categories in cognition, and awareness of multiple perspectives in problem solving (characteristics not necessarily shared by high NFC individuals). In persuasion contexts, where both motivation (e.g., NFC, mindfulness) and ability (e.g., expertise) to process a claim have been shown to determine persuasion routes and outcomes, we propose that NFC and mindfulness operate differently. Figure 1 shows how the two processes can differ. One key difference is that we believe that high mindful individual will attempt to process a claim, even if the information is outside of their typical expertise.

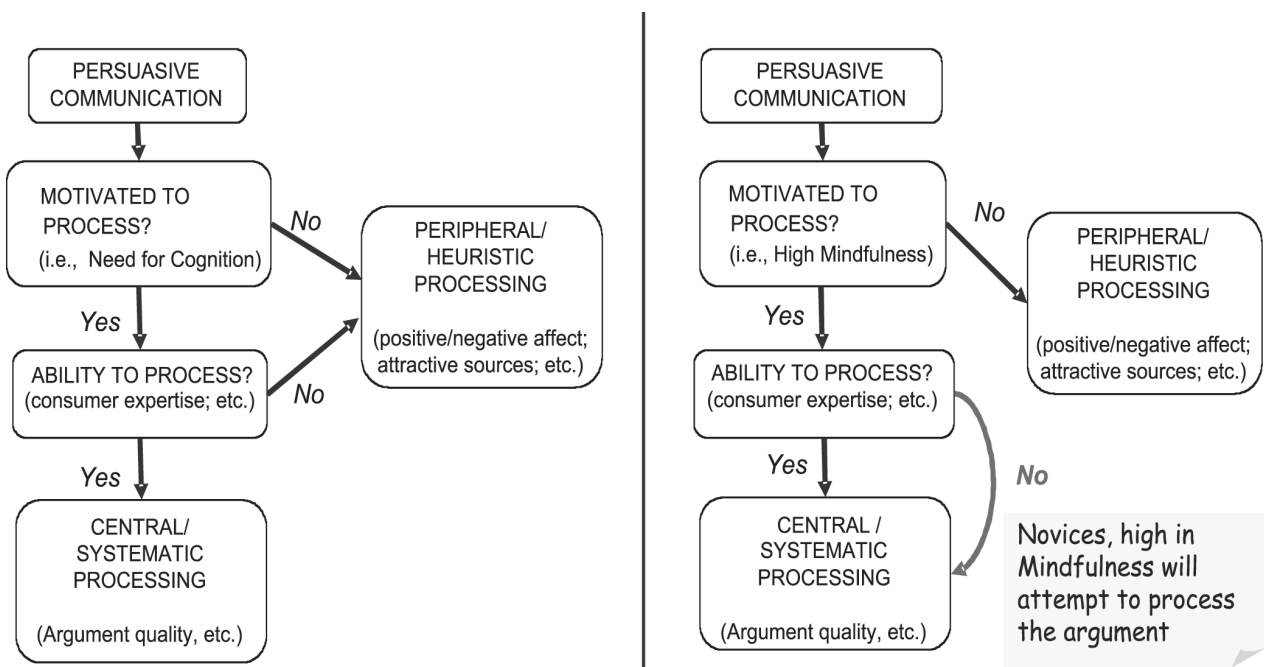

More specifically, we hypothesize:

- H1: Low mindful consumers and low NFC consumers both tend to employ peripheral/heuristics routes in processing persuasive messages (regardless of expertise).
- H2: Experts who are high in mindfulness or/and high in NFC will tend to employ central/systematic routes in processing persuasive messages.
- H3: Novices high in NFC will tend to employ peripheral/heuristics routes in processing persuasive messages, whereas novices high in mindfulness will tend to employ central/systematic routes in processing persuasive messages.

A 2 (NFC/Mindfulness: high vs. low) X 2 (Argument Quality: strong vs. weak) X 2 (Expertise: high vs. low) experiment was designed. 228 undergraduates participated in this study. Participants were shown a series of print ads, in which a target ad for a digital camera (adapted from previous advertising studies) had been imbedded. We varied the product messages (strong/weak arguments, a between-subject manipulation) in the target ad, and took individual difference measures of mindfulness, NFC, and expertise (within-subject measures). Groups (based on median splits) were created for each of the individual difference measures.

Even though our results confirmed that mindfulness and NFC are significantly correlated ($r=0.49, p<.001$), these results also establish that these two constructs are distinct (only 25% common variance). Further, we were able to confirm that the two constructs do not serve

FIGURE 1
The Contrasting Roles of Need-For-Cognition and Mindfulness in Persuasion

the same function in persuasion. Analyses of variance for product evaluation (attitude toward the product) and cognitive responses confirmed our theoretical predictions and allowed us to support hypotheses H1, H2 and H3.

In conclusion, we were able to show in this study that individual differences in NFC and mindfulness lead to significant differences in how consumers respond to persuasive messages. Especially, it is important to note that the introduction of the Mindfulness construct expands our understanding of the routes that lead to persuasion, and outlines routes that were previously deemed unlikely (central processing of a message under low expertise). Future research, however, should investigate further the nature of the processing styles that high mindful novice engage in (e.g., item specific, relational etc.). Also, it would also be important to consider the role of mindfulness in situations where consumers are repeatedly exposed to a message. In these situations, do high mindful consumers notice small change in information more than other consumers do, and are they more likely to update (keep constructing) their attitudes over time (as opposed to retrieving already formed attitudes)? Thus, the next step in our on-going program of research targets longitudinal studies designed to explore how consumers (characterized by mindfulness and NFC respectively) respond differently to multi-exposed messages. These questions can be investigated by exposing respondents to multiple instances of a similar message, with a slight alteration to the message content at a later exposure (for example a change in price), and then showing that this later change gets incorporated in the judgments of the high mindful respondents, but not for high NFC respondents. Also, we believe that this line of research has potential in providing some insights on the constructive vs. retrieval-based perspectives on attitude formation.

Identifying the Black Sheep From the Ordinary: Social Categorization and Within Group Deviation in Print Advertisements

Tracy R. Harmon, University of South Florida

From a social influence perspective, Grier and Deshpande (2001) suggest that academics and practitioners seek to better understand how social context and individual characteristics influence consumer response to marketing communications. By addressing the perceived likeability of spokespersons presented in marketing communications, the factors of social identity will emerge allowing for a better understanding of how social identity strongly impacts consumer receipt of marketing communications. The biggest implication for this research is that marketers will be able to construct their strategy in a manner that not only has homogenous appeal for targeted groups but it appeals to the overall heterogeneous market. The lack of empirical data that addresses the deviant norms expressed by a spokesperson of the ingroup, and how it impacts the recipient's evaluation is the motivation for our research question: What happens when consumers reject an ad because the spokesperson undermines the ingroup norms? It is suspected that the consumer will garner an unfavorable attitude of the advertisement and the spokesperson based on the salient ingroup norms, and ingroup derogation for the unlikable target will occur.

Social identity theory (SIT) offers a social-psychological perspective of group formations and inter/intragroup relationships. According to SIT, individuals tend to classify themselves and others into various categories, such as religious affiliation, gender, ethnicity, and organizational affiliations. Social identity theory attributes the general form of intergroup behavior such as ethnocentrism, stereotypic intergroup attitudes, and intergroup differentiation to social categorization and self-esteem processes. Where the categories are defined by the prototypical characteristics derived from the group members (Turner 1985). Social categorization serves two functions 1) it cognitively segments and orders the social environment, allowing individuals to define others around them, and 2) it enables the individual to define himself within the social environment. When members of a particular group differentiate ingroup members from the outgroup, and simultaneously differentiate between specific likable and unlikable ingroup members, the "black sheep effect" occurs. Ingroup members who conform to the ingroup prototype or consistently maintain group norms validate their social identity, and therefore attract favorable reactions. However, in contrast members of the ingroup who do not conform to ingroup norms, exercise deviant (norm undermining) behavior. *Participants*. One hundred and twenty-three undergraduate students from a major Southeastern University participated as a part of a class requirement.

Participants were exposed to all levels of treatment, and the stimuli were counterbalanced to prevent learning effects. Participants were presented with a booklet of print advertisements for a fictitious brand of digital cameras. After viewing each ad, participants responded to a questionnaire that contained all of the dependent measures. The print stimuli were a series of eight advertisements for a digital camera. All advertisements were identical with the exception of the socially categorized model. The models in the advertisements were chosen from stock photos of non-celebrity models. The order of advertisements was counterbalanced according to the various treatment conditions.

As hypothesized members of the respective socially categorized ethnic group classified themselves more favorably than other groups as a whole. This is consistent with the phenomenon of ingroup favoritism. In addition, the black sheep hypothesis held across all treatments for the respondents in the Caucasian and Asian categories. For Hispanic respondents the black sheep effect was supported except for the evaluation of the Caucasian target. Respondents in the African American category did not exhibit the black sheep effect. They evaluated the deviate ingroup member more favorably than outgroup deviates, which is not in support of the black sheep hypothesis. Additionally, ingroup favoritism was only shown among Asian respondents, thus H1 is supported for that group only. The other three groups evaluated themselves less favorably than members of the outgroup.

Consumer Conflict Management Strategies in Everyday Service Encounters

Gerrard Macintosh, North Dakota State University

Charles Stevens, North Dakota State University

The nature of services creates a context in which disagreements between consumers and service providers are likely to occur. A growing body of research has been devoted to complaint behavior in services (e.g., Fornell and Wernerfelt 1987; Goodwin and Ross 1989; Tax, Brown, and Chandrashekar 1998), but relatively little research focuses on a broader range of conflicts in services. We draw on an established literature of conflict management, to examine conflict behavior in everyday consumer service interactions.

Conflict, defined as an “interactive process manifested in incompatibility, disagreement, or dissonance within or between social entities” (Rahim 2002); has been studied extensively in the contexts of organizational life (e.g., labor relations) and economic exchange (e.g., channel conflict and buyer/ seller negotiations). Rahim (2002) identifies six conditions which are likely to produce conflict: (1) Activity that is incongruent with needs and interests, (2) Incompatibility of behavior, (3) Differences in attitudes and values, (4) Exclusive preferences in joint activities, (5) Contention for limited resources, and (6) Interdependence in the performance of activities. Relating these conditions to the unique characteristics of services, such as intangibility, heterogeneity, and co-production, suggests that many services are likely to generate conflict between provider and customer. However, it is not clear how service providers and consumers manage such conflict.

In general, conflict management strategies refer to the specific behavior patterns one applies in conflict situations (e.g., Pruitt and Rubin 1986; Rahim 1983). Conflict management strategies/styles can be categorized into five types based on one’s level of concern for self and concern for others (e.g., Rahim and Bonoma 1979). These five styles are integrative/problem solving (high concern for self/ high concern for other), obliging/ accommodating (low self/high other), dominating/ contending (high self/low other), avoiding (low self/ low other), and compromise (moderate self/ moderate other).

Research question 1: What conflict management styles do consumers use in everyday service interactions?

A number of authors have suggested the role of multiple motives in conflict resolution (e.g., Carnevale and Pruitt 1992). Recently, Ohbuchi and his co-authors proposed multiple goal theory (Fukushima and Ohbuchi 1996; Ohbuchi and Tedeschi 1997), which considers social motives, as well as resource (economic) motives, in interpersonal conflicts. Economic exchanges in services involve resource issues (money, time), but also are likely to involve social motives. Ohbuchi and Tedeschi’s (1997) research suggests that in everyday interpersonal conflicts (non-business), social motives are often activated in addition to resource (economic) motives.

Research question 2: In everyday minor conflicts with services providers, are social motives important and are they as important as economic motives?

Fukushima and Ohbuchi (1996) also suggest a relationship between motives and conflict management strategies.

Research question 3: In the resolution of minor conflicts with service providers, are consumers’ resolution tactics related to their motives?

If both social and economic motives are activated in service conflict situations, the choice of resolution strategy is likely to be influenced by the mix (combination) of motives expressed by each customer. Therefore, it would be expected that the level of activation of various motives (profiles) would vary between the different categories of conflict strategies employed.

Research question 4: Does the mix of motives (mean levels of activation) vary across alternative conflict resolution strategies employed?

A study was conducted to exam these research questions. The participants were 70 undergraduate students enrolled in business related courses at a large Midwestern university. Students were given a scenario in which they had been confronted by a video rental store about

a lost rented DVD. They were then asked to respond to a motives questionnaire, followed by an open-ended question about how they would deal with the conflict situation. The student responses to the open-ended question were coded by two independent coders for the presence or absence of four conflict strategies: integrating, obliging, compromising, and dominating. The level of agreement between the coders for each strategy was assessed using Cohen's Kappa statistic ($\text{all} > .70$). Motives were measured with six-point likert-style scales based on Fukushima and Ohbuchi (1996).

The results suggest that respondents used a number of different conflict management strategies in their attempt to resolve the conflict over the lost DVD. Compromise was the most frequently used strategy ($N=26$), followed closely by integration ($N=24$), and obliging ($N=23$). Relatively few respondents used a dominating strategy ($N=6$). The results also indicate that social motives were at least as (two were actually more) important than economic motives. Looking at the means across the motive categories, justice was the most important motive (9.97), followed by relational (8.20), economic (7.80), and identity (7.75), respectively. The relationship between motives and strategies employed was assessed using binary logistic regression. Significant predictors were found for each of the strategies except the integrative strategy. The results suggest that the higher the economic motive the lower the probability of an obliging strategy being used. Similarly, the higher the justice motive, the lower the probability of a dominating strategy and the higher the relationship motive, the lower the probability of a compromise strategy.

Based on the premise of mixed motives, we examined profiles of the means for the four motives by strategy. For the obliging strategy, the justice motive was the strongest, followed by relationship and identity, with economic being the weakest motive. For the aggressive strategy, the economic motive was highest and the relational motive was lowest. For the compromise strategy, the justice motive was highest, followed by economic and identity, with relational being the lowest. For integrative, justice was very high, followed by relational, identity, and economic.

Obviously, the study is preliminary in nature, however, it does provide some insights. The study suggests that even in a fairly insignificant service conflict situation, consumer behavior can be fairly complex. Therefore, service employees cannot rely on predetermined, "one-best-way," strategies for handling consumer conflicts. Frontline employees must be able to identify alternative strategies and be capable of adapting their style of responding to conflict with customers. Alternative strategies were activated based on mixed motives. Maintaining a working relationship with the retailer and justice were rated to be more important motives to customers than the most favorable economic outcome. This finding is consistent with previous studies that have emphasized the importance of justice in complaint resolution (Goodwin and Ross 1989; Tax, Brown, and Chandrashekar 1998). These results are also consistent with Fukushima and Ohbuchi's (1996) research, which indicated that an integrative strategy was related to relational motives, an obliging strategy was positively related to relationship motives and negatively related to economic motives, and an aggressive style was related to high economic and identity motives.

Relationships Among Individual, Institutional, and System Level Public Trust: A Case for Consumer Evaluations of Food Safety

Ahmet Ekici, Bilkent University

Extended Abstract

Many of the most challenging public policy issues of our century hang on the problem of public trust. Despite the central importance of public trust to consumer behavior and public policy research, relatively little is known about the origins and relationships between various types/levels of public trust. For example, it is not clear why consumers trust their own grocery stores and yet distrust grocery stores in general in providing safe food. Further, it is not clear why as consumers distrust food retailers, regulatory agencies, law-makers, food

manufacturers, scientists, they still trust the food system to supply them safe food. Our paper provides a unique perspective for understanding the origins of public trust and relationships between various levels of public trust.

Public trust has been studied largely at the institutional level where the focus has been to understand the citizens' trust in specific social institutions (e.g. Lazarus 1991; Mc Garity 1986; Rampton and Stauber 2001). So far, the focus in understanding public attitudes toward GMF has also been limited at the institutional level-which we find shortsighted. In order to understand public trust in food safety and in the safety of GMF, one should investigate citizen's views of various individual establishments (e.g. family farms) and institutions (e.g. farmers in general) through a holistic approach. Approaching public trust through systems perspective (Patton 1990) is likely to inform us about the relationships between various levels of public trust.

As we noted, the relationships between various levels of public trust are paradoxically conflicting. Various polls conducted over the past a few decades suggest that the public has generally positive perceptions of individual politicians (such as congressional representatives) and quite negative perceptions of political institutions (such as the Congress). These perceptions are not limited to politics. For example, people's overall assessments of their own doctors are systematically more positive than their assessments of doctors in general (Jacobs and Shapiro 1994). Despite negative evaluations by the public at the institutional level, the polls over the same period of time suggest that collectively, across institutions, public trust is still very high. The great majority of people find United States the best place to live; and have confidence in the political system, the health system, the food safety system, etc (e.g. Nye 1997; Cooper 1999; Muntz and Fleeming 1999).

Although social scientists (mostly in the area of political science) have attempted to explain the paradoxical conflict between individual and institutional levels of public trust (e.g. Asher and Barr 1994; Cook 1979; Fenno 1975; Ripley et al. 1992), there has been no attempt to explain the relationship between individual, institutional, and system levels of public trust. In other words, we do not know how citizens' evaluations at the local level affect their evaluations of systems. In addition, we do not know how negative evaluations at the institutional level can collect into positive evaluations at the system level. The purpose of this article is to understand the origins and the relationships between institutional and system level public trust in the context of food safety and consumer evaluations of genetically modified foods. Our research design involved a two-stage iterative data collection process. The first stage involved eighteen depth-interviews and the second stage involved seventeen depth interviews with consumers in a Midwestern state. Based on our findings, we introduce the idea that consumer use "balancing strategies" in that their trust in one institution can offset their lack of trust in other institutions, and as a result, they feel safe about the food they consume. In addition, public trust in the food safety system may depend on the perceived capabilities of the most powerful institution of the system, and/or perceived negative and positive interactions between component social institutions that form the food safety system. We also explore the possibilities that institutional and/or system levels of public trust do not matter in consumers' beliefs about food safety.

We believe that our paper complements to this year's conference theme, Transformative Consumer Research (TCR), as TCR aims to "make a positive difference in the lives of consumers, both present and future generations, through the chosen focus and conduct of specific research, and in the communicating of its implications and usefulness" (ACR 2005). In addition, TCR aims a heightened relevance and value related to consumer research to business executives and public policy administrators. In this paper, we first set out to conceptualize public trust at three different levels, individual, institutional, and system levels. Then we review the prior research related to public trust. After a brief overview of research on public (institutional) trust, we specifically focus on the research that deals with the paradoxical disparity between various levels of public trust. We then provide an overview of our research context and activities that took place between 1999-2003 in the Midwest. After reporting our findings, we conclude with a general discussion of contributions and implications for consumer, for academicians, for practitioners (e.g. the food industry) and for public policy makers.

Smoke Gets in Your Eyes: The Stigmatization of Smokers

Norlaine Thomas, University of Manitoba
Sridhar Samu, University of Manitoba
Namita Bhatnagar, University of Manitoba

This exploratory research looks at how anti-smoking messages, legislation and environmental changes have affected non-smokers and their attitudes towards, and treatment of smokers. Preliminary research suggests that a negative smoker stereotype has been created with various possible effects on the smokers themselves. Ex-smokers also appear to enjoy a particularly positive perception. The data collected allows the construction of composite images of each of these stereotypes. Finally, this research seeks to shed light on the possible implications of these attitudinal changes for the efficacy of the anti-smoking campaign.

When I Go Out to Eat I Want to Enjoy Myself: An Investigation into Consumers' Use of Nutrition Information

Courtney Droms, University of South Carolina

Extended Abstract

Over the past several decades, the populations of the world have become more and more overweight. As we have seen from the recent round of legal claims filed in the United States against many of the fast food companies and several best-selling books (i.e. Nestle 2002, Schlosser 2002), many people and organizations are firmly convinced that the fast food companies and their marketing representatives are to blame for this public health epidemic. As a result, many have sought legislative action in the form of new laws and regulations from the USDA to control what aspects of food products are marketed and to which age brackets certain products can be targeted (Nestle 2002). For example, The Center for Science in the Public Interest (CSPI) released a report in early 2005, urging that nutrition information be included on fast food and chain restaurant menus. They found that when nutrition information is provided, consumers have the ability to make healthier food choices off of restaurant menus. They also noted in their report that in a study of nutritionists, nutrition information was grossly underestimated for restaurant menu items (CSPI 2005). Also, within the past year the HeLP America Act of 2005 (S1074) has been introduced in the United States Congress to require restaurants to list the standard nutrition information on their menus for their regular offerings. While this legislation may not pass, this issue is not going away and will play a major role in the way restaurants and other food service establishments develop their marketing strategies for the future. Despite the increased government and public interest group efforts to include nutrition information on restaurant menus because they feel it is in the consumers best interest, the key question from a consumer research perspective is: whether consumers will in fact use the nutrition information if it is presented on a menu to make healthier food choices?

The current consumer literature on nutrition information began with the public policy research surrounding the Nutrition Labeling and Education Act (NLEA) of 1990, which regulated the nutritional labeling of packaged foods. This literature covers a wide variety of topics ranging from how consumers use nutrition information from a food package (Balasubramanian and Cole, 2002) to how nutritional labeling has effected the way in which food products are advertised (Pappalardo and Ringold, 2000). However, the consumption of food at home and the consumption of food in a restaurant seem to be different activities in that one meal can take place in a private setting (e.g. at home), while the other takes place in a more public location (e.g. at a restaurant). As Ratner and Kahn (2002) find, consumers make different decisions in public and private contexts and so we should reasonably expect that they also use different information to make decisions in public and private contexts (e.g. at home or in a restaurant). In an effort to study consumers' choices from a restaurant menu, recent research has shown that evaluations of a restaurant are affected by the presence of health claims and nutrition information on the menus (Kozup, Creyer, and Burton 2003). Also, consumers have been shown to be willing to pay more for healthier food options at a restaurant (Burton et al. 2004). However, the consumers' decision process is not thoroughly explored in the above studies and as a result, this paper will attempt to shed some light on the decision making process for consumers' choices at a chain restaurant.

One model frequently used in the public health literature may help to explain why consumers have differing reactions to the addition of nutrition information to restaurant menus, and may use or not use the information presented. The Stages of Change Model (Prochaska and DiClemente 1992) posits that there are five stages consumers pass through when they are changing their behaviors (from precontemplation to maintenance) and at each stage, the consumers use different strategies to make decisions. This model was previously used to examine consumption-control processes in a self-chosen problem behavior area (Lawson 2001). As a result, in this context, consumers should have different reactions to the nutrition information (i.e. whether the information is used, and what types of affect are generated by the presence of nutrition information) based on the stage in which their current behaviors fall.

In an effort to study this issue, Study 1 involved an experiment with 121 subjects in three different settings, a community barbecue on the Mid-Atlantic and a weight loss center and student subject pool in the Southeast of the United States. The study consisted of a menu of selected items from a nationally-recognized chain restaurant, questions to determine the subject's stage of change, food choices, and evaluation of the menu. The quantitative results from this study indicate that there are no effects of stage of change on the use of nutrition information or on the decisions made by consumers. Also, the presence of nutrition information on the menu in this study has no effect on the evaluation of the menu ($p=0.13$). As a result, the responses to the open-ended questions on the survey were analyzed and some interesting patterns were noted. These results show that a majority of the consumers made their food choices based on the description of the menu option and their food preferences. For example, as one respondent noted, "When I eat out I get what I like, regardless of money or health." These results provide some preliminary insights into why consumers' make certain (usually unhealthy) decisions when they eat out at restaurants. They also contribute to the literature on the Stages of Change model, which contains a debate about the appropriateness of the Stages of Change model for complex decisions like food choices (Jeffrey et al. 1999).

Since the results of Study 1 did not support the predicted hypotheses, Study 2 was developed to try to further uncover some factors that could explain an individual's reactions to nutrition information on a restaurant menu. The purpose of this study was to examine the function of dietary restraint in food choices and whether there was a moderating effect of the presence or absence of nutrition information on this relationship. The secondary purpose of this study was to examine the role of health knowledge in food choice decisions. Study 2 involved an experiment with 124 subjects that again used the menu items from a national chain restaurant and the manipulation of either nutrition information being present or absent on the menu. In this study, the measured variables included dietary restraint (Herman and Polivy 1980), self-esteem (Heatherton and Polivy 1991), self-objectification (Fredrickson et al. 1998), and health knowledge (Moorman 1990; Moorman and Matulich 1993). The results support the hypotheses that self-esteem ($F(1,103)=19.017, p<0.001$) and self-objectification ($F(1,103)=3.481, p=0.06$) are predictors of dietary restraint. The results also indicate that health knowledge has a significant effect on food choices ($F(1,119)=4.755, p<0.05$). The results of the moderation of nutrition information on the relationship between dietary restraint and food choices are in the predicted direction, such that when an individual is a restrained eater, if nutrition information is presented on the menu, they order meals with fewer calories than unrestrained eaters. However, the moderation was not significant.

In conclusion, when examining the two studies together, we may be able to gain some interesting insights into how adults chose foods from restaurant menus. From the results of the qualitative data in each study, we can see that the main reason people state for choosing foods are that they like the way to food tastes or that these are the foods they prefer. Results so far are mixed in answering the question of whether or not individuals make healthier decisions when nutrition information is on the menu. Future research in this area could continue to investigate the role of health knowledge as well as dietary restraint in food choices. The framework developed in Study 2 may also be tested in restaurants that serve different types of food since the restaurant in this study offered mainly American food. Overall, the results of this series of studies may have some implications for the current legislation as well as further public policy efforts to regulate the provision of nutrition information at restaurants.

Field Experiments in Nonprofit Marketing: Social Identity and Status Influence Contributions

Yue Shang, University of Pennsylvania
Tara Thomas, University of Michigan
Shirli Kopelman, University of Michigan

This project examines whether the level of contribution to a public good is influenced by the relational affiliation, relative status of donors, and motivational framing of the transaction as consumption versus a charitable exchange. We use a field experiment in alumni giving to study such effects. Pilot field research has shown that social factors do influence contributions, and that donors do categorize their motivational framing of the transaction differently. In this abstract, we will focus on the hypothesis and the design of the actual research.

I Gave at the Office (And I Hated It): Changes in Preference for Ethical Behavior Following an Unrelated Ethical Act

Jennifer Young, University of Texas, Austin
Julie Irwin, University of Texas, Austin

Two studies examine propensity to give to a charity following another, unrelated charitable act. We find that giving is affected both by 1) assimilation of affect from the first charitable act to the second and 2) a newly-identified phenomenon we call “gave at the office”: respondents sometimes feel that they have done their fair share of charitable giving and lose a sense of obligation to donate to subsequent activities. Manipulations of difficulty and morality of the first charitable activity determine whether people are likely to experience assimilation or “gave at the office” effects and thus influence people’s likelihood to donate to a second unrelated ethical cause.

Can a Rational Consumer Be a Good Citizen? Conflicting Goals in Today’s Society

Crina Tarasi, Arizona State University
Maura Scott, Arizona State University

According to public opinion polls, when “all other things are equal” consumers prefer “green” products (Ginsberg and Bloom 2004). However, other things are almost never equal. Price, characteristics and functionality are often poorer for environmentally friendly products, and people compromise. Our preliminary research suggests the existence of a goal hierarchy formed by consumers. The highest level of conflict is perceived between self related goals and environmental goals, while least perceived conflict is between self related goals and family and friends related goals. To explain the phenomenon we draw from the literature on social dilemmas, as well as motivation theory.

Free Bumper Stickers for a Better Future: The Long Term Effect of the Labeling Technique

Gert Cornelissen, Catholic University Leuven
Siegfried Dewitte, Catholic University Leuven
Luk Warlop, Catholic University Leuven
Arnaud Liégeois, Catholic University of Louvain
Vincent Yzerbyt, Catholic University of Louvain
Olivier Corneille, Catholic University of Louvain

Abstract

We compared the labeling technique with a traditional social marketing campaign, providing thought-provoking arguments, regarding their long term effect on ecological behavior. In this study ($n=241$), we provided participants either with an ecological, self-descriptive label, an information-based campaign promoting ecological behavior or no information at all, and compared behavior in a repeated social dilemma situation, framed as an ecological task. We found that labeling outperforms classical campaigns on the longer term. We did not observe the expected interaction with mental load.

Paper Summary

Campaigns promoting different kinds of sustainable consumer behavior (e.g. buying ethical or ecological products) have often shown limited success, especially in the long term. Classical social marketing efforts, communicating arguments in favor of the sustainable alternatives, may cause consumers to think about the pros but also the cons of these purchases. Ethical and ecological products often are more expensive, require more effort to find, and their quality is trusted less. Even if these campaigns achieve short term success, people

often regress to their original purchase habits because the original drawbacks of sustainable products re-gain salience over time. We propose that 'labeling' the consumer might lead to better results. The labeling technique (Kraut, 1973; Miller, Brickman, & Bolen, 1975) exists of providing people with a self-defining label after an external stimulant has provoked a certain behavior. We will focus on ecological behavior. Consumers might, for example, be tempted into buying an ecological product by offering a price promotion. After this externally motivated purchase, a message is communicated which labels the consumer as an ecologically responsible person. When people accept this label as self-descriptive, their future ecological behavior might be internally motivated and hence be more robust to regression to the original purchase habits. We expect that imposing a mental load while receiving this label will result in increased acceptance of the label, and increased compliance.

Experiment

Two hundred forty-four students participated in the study for course credit. In a first phase, we provoked an ecological purchase decision. In order to do this, we provided the participants with a list of seven identically priced TV-sets, which were rated on several dimensions (Image quality, image quality in sunlight, sound quality, remote control, ecological aspects, ease of programming and quality of the manual). One of the TV-sets was superior on both image and sound quality, pretested as the most important features in the choice for a TV-set, and most participants (92.6 %) therefore chose this option. The others were discarded from the analysis. Importantly, the chosen TV set was also rated highest on 'ecological aspects'.

Following this initial choice, participants were assigned to one of three conditions in the second phase of the experiment. Those in the 'labeling' group received feedback on the personality traits of the typical customer choosing this TV-set. The subjects who chose the superior TV-set learned that the people making this choice were typically 'very concerned with the environment, and ecologically conscious'. A second group got to read an explicit plea in favor of ecologically conscious consumer behavior. These two groups read this information either when imposed to a cognitive load manipulation or not. A third, control group merely received the mental load manipulation, but did not get any information.

In the third stage of the experiment, the participants made three consecutive decisions in a social dilemma, framed as an ecological task. They were asked to imagine that they needed to buy 10 bags of potato chips for a party. The available potato chip alternatives were either packed in conventional or in bio-degradable bags. The bio-degradable bags were more expensive because they were bought less often. If enough people would buy the bio-degradable bag, its associated price could go down. After making a first decision, all participants received bogus feedback, saying that among the eight people present in the lab not enough bio-degradable bags had been bought to achieve a price decrease. They then proceeded to identical second and third rounds.

We also measured participant's social value orientation, and asked on a seven point scale to which degree they took ecological aspects into account when making a purchase decision. Answers to the latter question demonstrated that the manipulation was successful.

Labeling had an effect on how many biodegradable bags were chosen. We assessed the effect both within and between subjects.

Within subjects, we compared behavior on choice 1 and choice 3. The choice position by communication (labeling vs explicit vs control) interaction was significant ($F(2,213)=6.27, p<.01$). In the explicit plea group the number of ecological choices increased, on average, from $M=5.30$ ($SD=.38$) to $M=7.80$ ($SD=.38$), in the control group it increased from $M=5.31$ ($SD=.56$) to $M=7.57$ ($SD=.57$). In the labeling group we observed the sharpest increase from $M=5.07$ ($SD=.40$) to $M=8.59$ ($SD=.41$).

The means for the three groups differed significantly in round 3 ($F(2,213)=4.63$); $p<.01$

To examine the differential impact of the persuasion tools we tested how choice order interacted with the contrasts among the communication conditions. The contrasts between the labeling and the control condition and between the labeling and the explicit plea condition interacted with choice order ($F(1,142)=8.15$; $p<.01$ and $F(1,138)=12.17$; $p<.01$, respectively). The interaction of choice order with the contrast between the control and the explicit plea conditions, on the other hand was not significant ($F<1, NS$).

The effects of neither mental load nor social value orientation were significant.

The results suggest that providing people with a self-descriptive label is an effective means to achieve an internally motivated increase in sustainable consumer behavior, particularly in the longer term. Future research will deal with the generalizability of these findings to more involving situations, requiring actual personal sacrifices.

We will also investigate why mental load did not have the expected effect.

Do "Possessors" Really have a Stronger Desire to Possess than "Non Possessors"? Study of Consumer Desires of Visitors and Collectors of Contemporary Art Vis-à-vis Two Modes of Consumption-Access and Possession

Chen Yu, HEC School of Management

Extended Abstract

Consumer behaviour studies seem to be separated into two different approaches: the "possession" behaviours-the classical modality of purchase- considered as "the most basic and powerful fact of consumer behaviour" (Belk, 1988, 1992; Mehta and Belk, 1991; O'Guinn and Belk, 1989; Richins, 1994 etc.); the "access" behaviours- the experience within a service which permits the temporal or long-term

utilisation without purchase, initially linked to the “experiential products” in the field of consumer studies (Holbrook, 1980; Evrard et al., 2001; Pine II and Gilmore, 1999 etc.).

However, few studies have been done regarding on the situation where both “possession” and “access” -as two possible available means to “consume” the wanted goods- can occur depending on the consumers’ desires and choices.

From the literature, we find that 1) there is a lack of research that takes into account the two kinds of consumption behaviours concerning the same products and makes a comparison between them; 2) previous work puts emphasis on the objective of the consumption experience, but rarely focused on “what consumers desire” vis à vis these two consumption modes. This paper will contribute to the comparison of consumer desires between two modes of consumption -access and possession- by developing scales measuring consumer desires.

In our study, we are interested in two questions:

- 1) Are consumer desires for “access” different for “possessors” and “non possessors”?
- 2) Are consumer desires for “possession” different for “possessors” and “non possessors”?

Proposed Methodology:

Field chosen:

The field of contemporary art has been chosen due to the pre-existing consumption modes -notably art museum visits and the purchases- as well as due to the continual new creation of artworks. Therefore, the access and possession situations in this study refer to visits and purchases; possessors correspond to the collectors and non possessors correspond to the visitors.

The qualitative part:

The part of qualitative study, based on more than 30 depth interviews, shows that the desires of visitors to contemporary art exhibitions include discovery; curiosity; emotion; pleasure; passion; understanding; cultural broadening; inspiration; the enjoyment of beauty; escape; meeting friends; pastime; social representation; stimulus; social obligation; extended-self; and freedom of imagination. The desires of collectors of contemporary art are found to be emotional; aesthetic; intellectual; social; utilitarian (decorative); symbolic; philanthropic; ostentatious, and financial.

The quantitative part:

A questionnaire containing 273 items, developed on the basis of the results of the qualitative study, was sent to 1000 people on the occasion of the FIAC (International Fair of Contemporary Art) and GMAC (Grand Marché d’Art Contemporain) in Paris. One hundred and ninety six complete responses (98 from collectors and 98 from visitors) were received and allowed us to obtain preliminary empirical results. The responses to the items were subjected to a principal components analysis. The items were divided into 7 different factors (consumer desires in access experience, those in possession experience, etc.) and the analyses are effected respectively by these categories. The empirical results of the final study will be presented in this paper.

Analysis of data:

Analysis of principal components (APC) and Structural equation modelling (AMOS) were used in this study.

We have followed logical steps to analyse the data:

1. Item purification (APC)
2. Scale validation (AMOS)
3. The test for invariant factorial structure (AMOS)-the application involving multiple samples. The central concern is whether or not components of the measurement model and/or the structural model are invariant across the multiple groups.

In our study, we use this method to first confirm the stability of the measurement model and then learn about the similarities or differences of the desires for “access” and for “possession” of visitors and collectors.

Empirical Results:

Results in this study show that consumers have some contradictory desires vis à vis their behaviours: regarding the desire for possession, collectors have a weaker possessive desire; desire for accomplishment; desire for keeping family traditions. and desire for intellectual enrichment than visitors, while having a stronger philanthropic desire and desire for sociality. Regarding the desire for access, visitors have a stronger desire for sociality and desire for freedom, and a weaker desire for a simple visit than collectors.

The Act of Giving: Involvement, Habitual Giving, and Motives of Volunteerism

Gary Gregory, University of New South Wales

Charitable organizations are under constant pressure to increase both financial and non-financial contributions. The question of how and why people give is crucial in helping non-profit organizations attract and retain donors and volunteers. Although the literature is rich in studies on helping behavior (*c.f.* Bendapudi, Singh and Bendapudi, 1996), research in consumer behavior provides little guidance in helping us understand motives of volunteerism (Fisher and Ackerman, 1998). Given that the number of voluntary organizations has increased in recent years, marketing techniques are playing an ever more important role in helping organizations recruit and retain volunteers (Bussell and Forbes, 2002). Understanding the psychological and behavioral aspects of volunteerism helps charities to identify characteristics of those most likely to volunteer, as well as target volunteer recruiting campaigns more effectively.

The purpose of this study is to explore relations between various psychological and behavioral aspects and volunteerism. Specifically, *reasoned influences* (e.g., attitudes, values, involvement and motives), *unreasoned influences* (e.g., habitual giving), and *situational influences* (e.g., income, education, etc.) are used to predict volunteer behavior. Extending existing theory in social psychology, Ronis et al.'s (1989) repeated behavior model is adapted to the study of volunteer behavior. The adapted model allows for measuring the effects of reasoned processes, unreasoned processes, and situational factors on volunteer behavior. Ouellette and Wood (1998) were able to demonstrate that repetitive past-behavior (habits) directly affects future behavior, independently of cognitions (attitudes, subjective norms, intentions, and perceived control). Although recent research has shown the influence of social norms on volunteerism (Fisher and Ackerman, 1998), there is evidence to indicate that there may be additional functions (or motives) served by volunteering (Clary et al., 1998).

Survey data were collected from members belonging to The Cancer Council Australia (TCCA), Australia's national non-government cancer control organization. Surveys were mailed to 1000 randomly selected members in the TCCA database, with 418 completed surveys returned (42% response rate). TCCA members include those that have contributed either time through volunteering and/or made financial contributions to the organization in the past. The first step was to determine if existing scales measuring attitudes towards helping others (AHO) and attitudes towards charitable organizations (ACO) (Webb, Green and Brashear, 2000), and volunteer motives (Clary et al., 1998) could be replicated in Australia. Consistent with Webb et al., (2000), the four items measuring AHO and the five items measuring ACO loaded on two factors, respectively. Similarly, the factor analysis on the 30 items in the Volunteer Functions Inventory (VFI) was consistent with prior scale development by Clary et al. (1998). The results produced six factors representing various functions served by volunteering (protective, values, career, social, understanding and enhancement). Based on the ability of these scales to capture the dimensions intended, composite measures were developed for each of the two attitude scales (AHO and ACO), as well as for each of the six volunteer functions (protective, values, career, social, understanding and enhancement). In order to test the adapted repeated behavior model, additional independent measures were gathered: *involvement* (number of activities supported, degree of support to other non-profits); *habits* (length of time supporting specific events, degree of habitual support of charity days, volitional/automatic support of charities in general); *values* (Schwartz's (1992) 27 universal values: altruism, equality, etc.); and, *situational/enabling* factors (employer involvement with TCCA (2 items), age, income, education).

To identify significant predictors of volunteer behavior, stepwise multiple discriminant analysis (SMDA) was performed using a model consisting of 46 variables: attitude (2), volunteer motives (6), involvement (3), habitual giving behavior (3), values (27), and situational variables (5). Two groups were created, based on whether members volunteered for the organization or gave monetary donations or other financial contributions (e.g., purchased merchandise). The SMDA resulted in an 11-step model. Based on minimum Mahalanobis D^2 and Wilks' Lambda values, the 11 variables included in the final discriminant model, based on their loading order, were: Total number of activities involved in with TCCA (*involvement*), Employer involvement with charity (*situational/enabler*), Length of time supported special charity event (*habit*), Support provided to other non-profits (*involvement*), Employer matches donation (*situational/enabler*), Values (*motive to volunteer*), Social (*motive to volunteer*), Routine involvement in special charity events (*habit*), Enhancement (*motive to volunteer*), Age (*situational*), and INCOME (*situational*). Together, these 11 variables made up a discriminant function that was able to correctly classify just over 74% of TCCA members.

A summary of the findings suggests that attitudes (AHO, ACO) were poor predictors in discriminating between volunteers and non-volunteers. Similarly, personal values (e.g., altruism, helping, etc) were not able to explain variation between volunteers and non-volunteers. One of the best predictors of volunteerism was involvement. Those that consistently showed prior support to TCCA through greater number of activities (breadth of support) were volunteers. Interestingly, those that showed greater involvement in other non-profit organizations were non-volunteers, suggesting volunteers were loyal to TCCA. Habits were also a significant predictor of volunteerism. The amount of prior time supporting TCCA's special charity events significantly predicted tendency towards volunteering. Similarly, routinely supporting the special charity event was also a significant predictor of volunteerism. Consistent with past research (Clary et al., 1998), three of the six volunteer motives (values, social, and enhancement functions) were able to significantly predict volunteer tendencies. Although personal values (Schwartz's values) were not able to directly predict tendencies towards volunteering, they appear to manifest themselves in one's specific motives to volunteer. Factors that were able to predict non-volunteers are also meaningful. Non-volunteers were significantly influenced by their employer's involvement with TCCA, suggesting that situational enablers help facilitate and encourage donation behavior. Furthermore, donors tended to be younger and have a higher income, perhaps influencing their decision to donate money versus time. And as expected, donors tended to make greater financial contributions to other non-profit organizations than did volunteers. These findings suggest that there may be a trade-off in how members of non-profit organizations decide on what they are going to give. Involvement, habitual giving tendencies, and motives to volunteer appear to serve as important predictors of why members tend to volunteer versus donate. Future research investigating such trade-offs in a repeated behavior framework are encouraged.

An Examination of a Strategic Household Purchase: Consumer Home Buying Behavior

Mateja Kos Koklic, University of Ljubljana

Irena Vida, University of Ljubljana

In the past few years, a criticism has been directed towards publication in the consumer behavior field, claiming that it is biased toward a marketing perspective and that it neglects consumer well-being and difficulties consumers face when making buying decisions for a strategic product. Existing literature lacks empirical studies of consumer decision making for "big" or "strategic decisions" (Bazerman, 2001; Gronhaug, Kleppe, and Haukedal 1987). According to Wells (1993), investigating purchasing decisions that can change lives of consumers, such as a car or a house purchase, can make an essential contribution to consumer behavior knowledge.

In view of the dearth of literature exploring consumer decision making when purchasing high-involvement and emotionally charged products, the purpose of this research was twofold: a) to develop a conceptual model of consumer decision-making process for a prefabricated house purchase; and b) to gain knowledge of factors impacting this process from the empirical standpoint. The product selected in this study was a custom-made prefabricated house. House is the most important durable good in the household and it requires high involvement as well as complex decision making. The strongest parallel can be made with a car purchase, and many studies of consumer decision making indicate there are similarities in the buying processes of different durable goods (Punj, 1987). Hence, the empirical literature in this area and the real estate literature provided a basis for conceptual and empirical work.

After a thorough review of the existing empirical work, a conceptual model of a consumer buying process in case of a home purchase was developed. This model consists of three main groups of variables: the buying process, the external and the internal factors. It suggests that an individual's lifestyle and the meaning a person wants to derive from owning a house influence his/her needs and desires concerning the house. We posit that a house will reflect its owners' individuality and personal style. For a complex product such as a house, the information stemming solely from a buyer's memory is generally inadequate (Gibler and Nelson 2003). Therefore, consumers continuously gather new information and adapt their desires and goals accordingly. The buyer usually does not get to know all the alternatives simultaneously. Rather, new alternatives are gradually added.

The second stage of this research involved empirical testing of the presented conceptual model. A number of factors prompted us to utilize qualitative research methods, i.e., in-depth personal interviews with consumers: a deeper understanding of consumer behavior, a complicated nature of the buying process, and potential useful directions for further quantitative research. In this research, six semi-structured in-depth interviews were carried out; three with recent owners of the prefabricated house, and another three with potential buyers of the same product. Due to a very limited population, the sample was selected on a non-random basis. Interviews were carried out in participants' households. At least one decision maker in the household participated in the interview which lasted from 45 to 90 minutes and it was audio-taped. Topics of discussion followed the established interviewing protocol.

In the analytic stage of our research, we followed the procedure for analyzing qualitative data by Miles and Huberman (1984). These guidelines enable investigators to produce compelling analytic conclusions and enhance the internal validity of the study. The analyses involved three types of activities: data reduction, data display and conclusion drawing. Audio tapes with interviews were transcribed and reviewed several times by the researchers. The conclusion drawing was based on the cross-case comparisons, reference to previously reviewed empirical studies and to the theoretical framework. Noting patterns, themes and regularities supported final conclusions.

One of the major contributions of this study was an extensive review of the literature dealing with consumer decision making processes and behavior in relation to strategic purchases. Using qualitative research design, we empirically examined the conceptual model and carefully compared the theoretical and empirical findings. Similar to Erasmus, Boshoff, and Rousseau (2001) and Loewenstein (2001) our results suggest that cognitive and rational factors alone do not offer a sufficient explanation of consumer behavior in the case of high-involvement products such as a prefabricated house. In addition to the idiosyncratic characteristics of the customer, his/her personal situation and environmental factors, the role of feelings, experience, subconscious factors, needs and goals should be taken into account. Along with the emotionally charged internal factors, other factors identified in our qualitative analysis include consumer's experience with and prior knowledge of a house buying process. Significant external factors in this qualitative study included recommendations from people buyers trust, the seller/company's behavior and marketing communication activities in the housing market.

As households may have serious problems in making wise strategic purchase decisions (Gronhaug, Kleppe, and Haukedal 1987), we offer several implications for consumers. Since house buying is a decision with long-term consequences, we recommend to consumers that they first explicitly define their needs and objectives concerning the purchase. Next, we propose consumers gain information about available alternatives and specific criteria relevant to them. Clearly, external information search is a way to increase knowledge, and reduce perceptions of risk and uncertainty (Dowling and Staelin 1994). Respondents in our study seem to have had limited knowledge about houses and the buying process itself. We emphasize that gaining additional knowledge about this topic is of critical importance. We recommend to the home buyers that they make attempts to experience the house independently of its producer. The findings of this study indicate that an individual's experience with company's representatives plays an important role in the consideration set formation and

decision making regarding the house purchase. Decision should be made based on direct comparison of evaluated alternatives consistent with a person's goals and needs. Taking into consideration the specifics of the selected product, it is hoped that this study contributes to a better understanding of the strategic buying process and provides some useful guidelines for consumers.

Community and Connectivity: Examining the Motives Underlying the Adoption of a Lifestyle of Voluntary Simplicity

Suzanne Miller, University of Delaware
Jennifer Gregan-Paxton, University of Delaware

Duane Elgin's book *Voluntary Simplicity* resonated with those seeking an alternative to America's "commodity culture," a culture in which people are "primed to want and desire commodities even though they cannot afford to have them" (Elgin, 1981, O'Sullivan, 2003). While "voluntary simplicity" is not a new concept, recently there has been a growing ripple of individuals adding steam to this longstanding "anti-consumerism" movement (Etzioni, 1988). In the popular culture, many books, such as *Circle of Simplicity* and *Choosing Simplicity*, and organizations, such as Adbusters and Seeds of Simplicity, have emerged to give validity to this lifestyle and provide a forum for exploring ideas and gaining support (Andrews, 1997; Pierce, 1999).

Prior to this past decade, there was little academic interest in the voluntary simplicity movement. However, as the movement gains momentum in the popular culture, researchers are beginning to focus on understanding the attitudes, values and motivations of voluntary simplifiers, as well as those engaged in other anti-consumerism lifestyles (Cherrier and Murray, 2002; Zavestoski, 2002). This limited body of research suggests that voluntary simplicity can be viewed as a lifestyle choice since it pervades all aspects of behavior and is not necessarily correlated with what may otherwise appear to be highly related personality traits, such as frugality (Lastovicka 1999, Todd 2002). In fact, many who currently practice voluntary simplicity experienced a transformative learning process that led them to simplify their lives. In *Choosing Simplicity*, a book that explores the different ways in which individuals have chosen to implement the principles of voluntary simplicity, several adherents stated that they were not content just going along with the "norm" and sought something more meaningful in their lives (Pierce, 1999). Interestingly, though implementing the voluntary simplicity lifestyle in quite divergent ways, those interviewed for the book shared the conviction that the "good life" is not based upon material possession or image.

Because research on this topic is still in its infancy, we currently lack answers to even the most basic questions about the voluntary simplicity lifestyle, such as what a lifestyle of voluntary simplicity entails, what factors prompt an individual to simplify their life and how voluntary simplifiers participate in the traditional marketplace. One of the earliest accounts of voluntary simplicity states that:

"Voluntary simplicity involves both inner and outer condition. It means singleness of purpose, sincerity and honesty within, as well as avoidance of exterior clutter, of many possessions irrelevant to the chief purpose of life. It means an ordering and guiding of our energy and our desires, a partial restraint in some directions in order to secure greater abundance of life in other directions. It involves a deliberate organization of life for a purpose" (Gregg 1936).

In another work, Elgin and Mitchell categorize simplicity according to five basic values: material simplicity, self-determination, ecological awareness, human scale, and personal growth. However, based on a review of the definitions appearing in the popular press and selective articles in the marketing field, Johnston and Burton (2002) reports that Elgin and Mitchell's taxonomy of values fails to provide a complete account of the values and motivations underlying an individual's decision to adopt this lifestyle. Johnston and Burton's review represents a step forward, in that it attempts to provide a more clearly articulated conceptualization for future academic research on the topic.

Other attempts to bring coherence to the definition and motivations underlying this lifestyle have focused on clarifying what voluntary simplicity is *not*. This work shows that, contrary to the common misconception, voluntary simplicity does not advocate giving up all material possessions, but instead promotes the notion of mindful consumption.

In this working paper we attempt to bring greater clarity to our understanding of voluntary simplicity by examining the values, attitudes and marketplace behaviors of those adopting the lifestyle. Unstructured, in-depth interviews were administered with self-proclaimed voluntary simplifiers. Initial results provide insight into many dimensions of voluntary simplicity. In particular, the data reveal an interesting pattern among participants with regards to motivations for choosing this lifestyle. The stated motivations varied from individual to individual and included environmental concern, desire for financial independence and time freedom. However, the concept of community, both local and global, entwined many of their reflections. The local community aspect dealt with the face-to-face interactions with family, friends, and community members, whereas the global community referred to all living things on the planet, including plants, animals, and humans. Along with the discussion of community arose the desire to feel “connected” with nature, people and their inner self. This indicates that perhaps the most basic underlying motivation for choosing voluntary simplicity is the desire to feel connected to one’s inner, external and global community.

The need for connectivity is universal. The means by which voluntary simplifiers satisfy this need suggests that past consumer behavior research, which draws a direct link between identity and material items (Belk 1988), may need to be refined. The findings also suggest that marketers seeking to increase consumer well-being must decrease their focus on material possessions and emphasize experiences that facilitate connectivity.

Sacred and Profane Consumption Revisited: The Case of Fair Trade Consumers

Nick Gould, University of Glamorgan

Conceptualisation

Two main responses to globalisation prevail. Protagonists committed to programmes of industrial and economic modernisation emphasise the role of world trade in attaining universal peace, prosperity and well-being. Antagonistic to the consumer culture driven by marketing and neo-liberalist activity, a ‘rainbow coalition’ points to a long list of the ills of globalisation ranging from habitat destruction through ‘air miles’ issues to child labour.

‘Third Way’ approaches to globalisation attempt a measured response based on the reality of the current propensity to consume. Accepting the dominance of consumption, strategic solutions to the ‘dark side’ of globalisation are understood in terms of responsible and ethical practices by producers and consumers alike. The Fair Trade movement represents a case in point.

Whilst recording the positive effects of Fair Trade on producers in developing countries, this paper proposes to concentrate on its benefits to consumers. A definition of Fair Trade is given:

“Fair Trade is a trading partnership, based on dialogue, transparency and respect, that seeks greater equity in international trade. It contributes to sustainable development by offering better trading conditions to, and securing the rights of, marginalized producers and workers—especially in the South. Fair Trade organisations (backed by consumers) are engaged actively in supporting producers, awareness raising and in campaigning for changes in the rules and practice of conventional international trade.” (European Fair Trade Association 2002)

This generates a discussion of the relational dynamics between consumers and Fair Trade producers. Given the Christian or humanist foundations of some Fair Trade companies, this discussion leads canonically to issues of the sacred and profane.

Russell Belk and his colleagues assert that anything may become sacred (or profane) as a result of a process of the investment of meaning by an individual or group. 'Sacred' consumption refers to that which is "more significant, powerful and extraordinary than the self". The 'profane' is "ordinary and lacks the ability to induce ecstatic, self-transcending, extraordinary experience." (all quotes, Belk et al 1989, p.13). Experiences of Fair Trade suggest that this notion of profanity needs adjustment. It is precisely in the mundane, everyday world of making coffee, washing clothes and dusting ornaments that we find the magical reality of our humanity. When the objects of our domestic actions are already 'pre-sacralised' through being fairly traded, then those actions serve to intensify that sacredness.

Design and Method

The central aim of the research is an inquiry:

"To what extent is Belk et al's conceptualisation of the 'sacred and profane in consumer behavior' consistent with the experiences and understandings of Fair Trade consumers?"

There are methodological challenges in addressing the sacred and profane. The terms are complex. For example, Belk et al list twelve 'properties of sacredness'. They are also open to considerable personal interpretation. Further, initial informal discussion between the researcher and informants suggested a degree of perplexity in relating the sacred and profane to consumption. The researcher was also aware of the twin pitfalls of reification and the 'double hermeneutic' (Giddens 1976)—the phenomenon of respondents adopting the researcher's terminology in formulating their responses.

With these challenges in mind, the researcher drafted a semi-structured interview schedule that would progressively create a framework for the discussion of the sacred and profane. The schedule has four sections:

- I) Details of respondent's Fair Trade purchase and use.
- II) An exploration of interviewees':
 - Length of involvement and reason for involvement in Fair Trade;
 - Fair Trade meanings;
 - Personal beliefs and values;
 - Understanding of the relevance of these beliefs and values to Fair Trade involvement;
 - Opinions of personal and other changes connected to the development of Fair Trade.
- III) Using a set of consumer artefacts (e.g. Fair Trade coffee) and written prompts (e.g. quotes), the researcher and research participant engaged in discussions on:
 - Reactions to Fair Trade and non-Fair Trade products;
 - Intentional action and the Fair Trade consumer;
 - Comparative and contrasting views of the consumer culture, elicited using written prompts:
 - i) "... Render therefore unto Caesar ... " (Matthew, xxii, 22);
 - ii) "The consumer society exists today ... " (Miller 1995);
 - iii) Five summary critiques of the consumer culture derived from Droege et al (1993);
 - iv) The 'definitions' of sacred and profane used by Belk et al (1989);
 - v) A description of Fair Trade Christmas composed using four of the twelve properties of sacredness.
- IV) Personal details: age / occupation / education / religion.

The schedule is a mix of conversational prompts typical of traditional qualitative research and the use of media that have a market research character.

Due to the origins of Fair Trade and the focus on sacred/profane, respondents were purposively sampled as Christian and 'no formal religious affiliation' (NFRA). Additionally, 'greater than ten years as a Fair Trade consumer' was used as a selection criterion.

Initial Findings

Currently, data from 10 interviews have been processed. Interviewee breakdown is: 4 female/Christian; 3 male/Christian; 2 female/NFRA; and 1 male/NFRA. Experience as a Fair Trade consumer ranged from 10 to 40 years. (Interviewing of other respondents continues; more NFRA's need to be recruited.)

Initial findings indicate:

- Considerable use of Fair Trade products in daily life;
- A belief in making social justice a reality, common to all interviewees;
- Clear articulation of Fair Trade as a means of substantiating those beliefs;
- Christian respondents expressed the view that their faith needed to be lived out as direct connection with the Poor and Fair Trade was one means for doing this;
- Respondents least favoured the Puritan critique of the consumer culture and most favoured the Quaker;
- Before considering the sacred/profane issue, many interviewees referred to certain products as evil. Connections were made to ecological degradation and particularly the promotion of formula milk in developing countries. Respondents used these opinions to inform their complex reflections on the sacred and profane. For Fair Trade products, there was partial agreement with the

definition of sacred but the facet of 'ordinariness' provoked rich and varied responses, difficult to reconcile with the definition of the profane.

Effects of Interior Color on Healthcare Consumers: A 360 degree Photo Simulation Experiment

Joost W.M. Verhoeven, University of Twente
 Marcel E. Pieterse, University of Twente
 Ad Th. H. Pruyn, University of Twente

The effects of the 'servicescape' (Bitner, 1992) on consumer behavior have long been recognized. Especially in high-stress services, such as medical care, the physical environment can strongly influence customer evaluation. This experiment investigates the effect of interior color on patients' emotional and cognitive appraisal and perceived service quality. Subjects were exposed to QuickTime 360° panorama photos of a first aid examination room and a private ward room. Blue walls (as compared to white walls) reduce anxiety and increase cognitive and affective appraisal and even perceived service quality.

Introduction

Hospitalization can have a great psychological impact. A patient's health is at stake, and (s)he is temporarily separated from family and friends. Under such conditions, patients display a strong need for information concerning their health and treatment (Engström, 1984). However, reliable information about the quality of healthcare is rather difficult or even impossible to obtain, as patients lack insight into the procedure and effects of the treatment. To reduce this uncertainty, patients will be inclined to infer their judgment of service quality from other indicators, such as the tangible environment. Therefore, physical aspects of the service environment play an important role in customers' evaluation of healthcare services (Arneill & Devlin, 2002).

A considerable amount of empirical evidence is available about the effects of environmental factors on a wide variety of consumer responses (Turley & Milliman, 2000). Historically, the atmosphere in clinical environments has been cold and sterile due to color, lighting and furniture. The current trend in hospital interior design is to create an attractive, relaxing atmosphere in order to relieve patients' stress and anxiety, improve their emotions and hence encourage the healing process (Devlin & Arneill, 2003). Color can be used effectively for this purpose (Calkins, 2002; Marberry & Zagon, 1995). Blue has been found to be the most preferred color throughout color literature (e.g. Bellizzi, Crowley & Hasty, 1983; Guilford & Smith, 1959), and stress-reducing effects of short wavelength colors (blue, green) are well-documented (e.g., Birren, 1979; Valdez & Mehrabian, 1994). Yet, solid empirical evidence for anxiety-reducing and affect-enhancing effects of interior color in healthcare settings is largely lacking.

In this study we investigated the effects of wall color on anxiety, pleasure, evaluation of the room and perceived service quality in a simulation of a general hospital. We expected subjects exposed to a hospital room with blue walls to experience more positive emotions, and lower anxiety, to evaluate the room more positively, and to appraise the quality of the service higher than subjects exposed to a white hospital room.

Method

Procedure

A total of 90 students participated in a uni-factorial between-subjects design (blue vs. white wall color), using desktop computers in a social science laboratory.

First, participants were asked to imagine being hospitalized with a leg fracture, after a fall from a ladder. The vignette described how the patient, upon arrival in the hospital, was admitted to a first aid examination room. After the doctor made X-ray pictures, he performed surgery on the patient.

Next, for 70 seconds, subjects were exposed to a QuickTime 360° panorama of an examination room. Photos were taken at a local hospital. In a 360° panorama, the direction and rotation speed of the representation can be controlled by moving the mouse in the desired direction. Wall color was manipulated using Adobe Photoshop. Subjects were randomly assigned to either the white (Hue 336°, Saturation 3%, Brightness 93%) or the blue condition (Hue 226°, Saturation 27%, Brightness 80%). They filled out a questionnaire measuring anxiety, pleasure, cognitive appraisal and perceived service quality. Subsequently, the vignette described the patient being transferred to a private ward room for a 10-day recovery. A 360° panorama of the ward room was shown. Again, subjects were randomly assigned to the color conditions. The same colors were used as in the examination room, and again, the cognitive appraisal, pleasure and anxiety-scales were administered.

Measures

Anxiety and emotion were measured using the 6-item translated 'Profile of mood states' anxiety subscale (Wald & Mellenbergh, 1990; $\alpha=.92$) and the 6-item Mehrabian & Russell pleasure subscale (Mehrabian & Russell, 1974; $\alpha=.84$), respectively. Cognitive appraisal was assessed using the 10-item environmental appraisal scale (Bitner, 1992; $\alpha=.81$), and perceived service quality was measured, using a 13-item adjusted SERVQUAL-questionnaire (Parasuraman, Zeithaml & Berry, 1988; Parasuraman, Berry & Zeithaml, 1991; $\alpha=.87$).

Results

Not surprisingly, respondents felt far more anxious receiving treatment in the examination room ($M_{\text{examination room}}=3.05$), than they did recovering in the ward room ($M_{\text{ward room}}=2.18$; $t=9.32$, $p<.001$).

Analyses of variance showed that in both rooms, blue walls significantly decreased anxiety compared to white walls (examination room: $F(1,88)=4.77$, $p<.04$, $\eta^2=.05$; ward room: $F(1,88)=5.77$, $p<.02$, $\eta^2=.06$), and also improved the subject's pleasure (examination room: $F(1,88)=5.81$, $p<.02$, $\eta^2=.06$; ward room: $F(1,88)=5.36$, $p<.03$, $\eta^2=.06$) and cognitive appraisal (examination room: $F(1,88)=12.30$, $p<.002$, $\eta^2=.12$; ward room: $F(1,88)=8.54$, $p<.005$, $\eta^2=.09$). Even more interestingly, participants in the blue examination room condition perceived a higher service quality ($M_{\text{blue}}=3.53$), than participants in the white examination room ($M_{\text{white}}=3.24$; $F(1,88)=9.56$, $p<.004$, $\eta^2=.10$), even if the items referring to tangible aspects of the service, were omitted from the scale ($F(1,88)=7.33$, $p<.01$, $\eta^2=.08$).

A mediation analysis (Baron & Kenny, 1986) revealed that the relationship between color and perceived service quality ($\beta=.28$, $p<.004$) was partially mediated by both pleasure ($Z=1.83$, $p<.07$) and cognitive appraisal ($Z=2.56$, $p<.02$).

Discussion

The results provide consistent empirical evidence regarding the effects of interior color on patient responses. The hypothesis that blue walls in healthcare settings alleviate anxiety and improve emotion, the evaluation of the physical environment, and perceived service quality, was confirmed.

Mediation analyses confirm that affective as well as cognitive processes underlie the relationship between interior color and consumer evaluation. Color can enhance service evaluation by improving customers' affective state and by increasing their evaluation of the physical environment. This may be the result of a halo effect (Thorndike, 1920): because the physical environment is positively evaluated, customers assume that other aspects of the service, such as the diagnosis and the treatment, are of the same, high quality.

When entering an emergency room, patients experience elevated levels of distress as a result of an acute health threat and the anticipation of a medical treatment. The aforementioned positive effects of blue walls are found in a high-anxiety, short-stay emergency room and in the relatively low-anxiety ward room, in which a patient is to spend considerable time recovering. First, this suggests that the beneficial effects of a blue wall color are not restricted to high-stress encounters, but may also occur under moderately stressful conditions. Secondly, the effect seems to be independent of exposure length.

Some care needs to be taken in interpreting these outcomes, since the data were collected among healthy subjects who were asked to imagine being hospitalized. These results should be replicated under realistic circumstances.

A Taxonomy of Spiritual Motivations for Consumption

Heather Skousgaard, University of Sydney

Consumer researchers have acknowledged that spirituality is an important factor in motivating consumption (eg. Baumgartner 2002; Curasi, Price and Arnould 2004; Gould and Stinerock 1992; Hirschman 1985; Holbrook 1999, 2001; Kozinets, 1997, 2001; Murray 2002; Thompson 2004; Twitchell 2004). Considered to be the 'life force' by which we act (Golberg 1998), the spirit is a major driver for human behaviour (Dyson, Cobb and Forman 1997; Golberg 1998; Stoll 1989), including consumption. Yet despite this, consumer researchers still lack a clear understanding of what spirituality is and how it affects consumer choices. This study set out to develop a taxonomy by which researchers may understand this previously ill-defined and misunderstood motivation for consumption and presents propositions through which it may be studied.

A review of consumer research reveals a paucity of studies that explicitly focus on spiritual motivations for consumption. This seems surprising given the host of studies that reflect facets of a search for spiritual fulfilment, including river rafting (Arnould and Price 1993), skydiving (Celsi, Rose and Leigh 1993), collecting (Belk 1995; Belk et al. 1988), sporting spectatorship (Holt 1995; Kozinets et al. 2004), ownership of automobiles (Belk 2004) or pets (Hirschman 1994), and engagement in consumption communities (Belk and Costa 1998; McAlexander, Schouten and Koenig 2002; Schouten and McAlexander 1995; Thompson and Troester 2002) or anticonsumption activities (Huneke, 2005; Kozinets 2002;). Furthermore, the few studies that have directly examined spiritually-motivated consumption (SMC) have predominantly focussed on its religious expression (eg. O'Guinn and Belk 1989; Ozanne 1992; Wright and Larsen 1992), thus excluding the substantial portion of SMC that is not within a religious context (see Durgee 1999, for one exception).

Much needs yet to be learnt about spiritual motivations for consumption. Central to this is the acknowledgment that spirituality is a complex, multifaceted phenomena (Emmons and Paloutzian 2003) that cannot be characterised by a single behaviour or experience. Rather, spirituality represents a series of interrelated constructs that work together to form a cohesive yet intricate whole. Accordingly, this study offers a theoretical framework through which the many facets of spirituality may be understood and further examined.

Method

An extensive multi-disciplinary review of literature from psychology, religion, anthropology, personality, consumption and health care was undertaken. Content analysis revealed eleven potential descriptors of spirituality or spiritual experience which were synthesised into three main categories. The first two (meaning and connection) reflect the cognitive component of spirituality, while the third (emotional transcendence) reflects its affective component (Seidlitz et al. 2002). Testable propositions were then developed to enable future study.

Results

Meaning. Whether sought through literature, art, food, music, ideology, or relationships (Burkhart 2001; Dyson et al. 1997; Golberg 1998), meaning was identified as a primary focus of spirituality (Apikos 1992; Zinnbauer et al. 1997), and thus a sense of meaning in life was seen to be central to spiritual wellbeing (Stoll 1989). Closely related to meaning were the concepts of purpose, hope and personhood (Dyson et al. 1997; Golberg 1998; Stoll 1989), each giving a sense of 'what or who one ought to live for' (Stoll 1989, 6).

Seen from a consumption standpoint, meaning may be proposed to shape an individual's SMC choices as follows:

- P1: Individuals who feel their lives lack meaning are more likely to choose SMC experiences that offer an explicit meaning narrative within a structured context such as a church (eg. O'Guinn and Belk 1989) or a social activist group (eg. Kozinets and Handelman 2004).
- P2: Individuals who feel their lives already have inherent meaning are more likely to choose SMC experiences that enable them to create their own meaning narrative via self-driven behaviours (eg. the personal fashion discourse of 'Delores' in Murray 2002)

Connection. Caring connections with both external 'others' (other people, nature or a Higher Power) and with one's internal selves were frequently cited as key expressions and experiences of spirituality (eg. Burkhart 2001; Dyson et al. 1997; Hirschman 1985; Holbrook 1999; Moore 1996; Rose 2001; Thompson and Troester 2002; Walton 2002; Zinnbauer et al. 1997). A sense of connection to the past, present or future (Badone 1991; Golberg 1998) or to a greater plan (Emmons and Paloutzian 2003) were considered important influences on spirituality. Hope, love, compassion, trust and forgiveness were identified as vital foundations for one's relationships, thus influencing one's sense of connection (Dyson et al. 1997; Golberg 1998; Rose 2001; Stoll 1989).

A desire for connection may be proposed to influence SMC choices in the following ways:

- P3: Individuals seeking outer-directed spiritual connection are more likely to seek SMC experiences that are other-focussed or externally-driven such as antimarket festivals (eg. Kozinets 2002).
- P4: Individuals seeking inner-centred spiritual connection are more likely to seek SMC experiences that are internally-focussed and self-generated such as sky diving (eg. Celsi et al. 1993).

Emotional Transcendence. The final key characteristic of spirituality concerned the 'feeling level' (Stoll 1989) of spiritual experience. Desirable affective states ranged from tranquil emotions such as peace, inner harmony, comfort, or a sense of security (Golberg 1998; Moore 1996; Stoll 1989), to more vibrant emotions such as joy (Zinnbauer et al. 1997), ecstasy, exaltation or rapture (Holbrook 1999).

The nature of emotional transcendence that is desired may be proposed to influence SMC choices as follows:

- P5: Individuals who seek tranquil spiritual experiences are more likely to engage in SMC activities that are of a quiet, gentle nature such as collecting (eg. Belk 1995; Belk et al. 1988) or meditative ritual (eg. Badone 1991).

P6: Individuals who seek vibrant spiritual experiences are more likely to engage in SMC activities that are of a vigorous, exciting nature such as river rafting (eg. Arnould and Price 1993) or shamanistic dance (eg. Gould 1991).

Future Directions

This study set out to advance understanding of a dynamic consumer value that has vital implications for consumer motivation. Future research may explore SMC using the taxonomy and propositions presented. Further analysis of extant literature may also be required so as to integrate additional facets of spirituality such as healing (Golberg 1998) into this taxonomy.

Childhood Socialization Effects on Adult Ability to Control Impulse

Seamus Decker, McGill University
 Zhenfeng Ma, McGill University
 Aida Faber, McGill University
 Li-Lu, McGill University
 Laurette Dube, McGill University

Extended Abstract

Conceptualization: There has been widespread recognition of the inability of purely cognitive decision models to fully account for important aspects of consumer behavior (Bargh 2002; Luce, Jia et al. 2003). Consequently there has been increasing interest in including "visceral" factors such as impulsive drives in consumer decision-making paradigms (Alba 2000; Loewenstein 1996). The merging of these conceptual models offers great promise for transformative consumer research by improving understanding of how and why consumers often act against their own self-interest, despite their having exquisite knowledge of the negative implications of their behavior. Consumer domains in which this line of inquiry shows great promise include, drug abuse, addictions, impulsive and compulsive buying, and overeating (Hirschman 1992; O'Guinn and Faber 1989). To date, many consumer researchers interested in visceral factors have focused on immediate external circumstances, such as "high pressure" sales tactics, or aversive states such as hunger, or fear (Aaker, Stayman et al. 1996; Cools, Schotte et al. 1992; Keller and Block 1996; Kroeber-Riel 1979; Lang, Greenwald et al. 1993; Pham 1996; Raju 1980; Sanbonmatsu and Kardes 1988; Sternthal and Craig 1974). However, there is an extensive developmental psychology literature that details how experiences during child development can have longlasting influences on a person's capacities, sensitivities, and predispositions (Berntson and Cacioppo 2000; Goldhaber 2000). For example, unloving and overprotective parenting is known to increase risk for emotional disorders, school dropout and impulsive behaviors such as drug use, initiation of sexual behavior, and conduct disorder (Chisholm 1993; Chisholm 1999; Chisholm 1999; DuHamel, Manne et al. 2004; Hall, Peden et al. 2004; Hill, Young et al. 1994; Hojat 1998; Karen, Byron et al. 2005; Mason, Cauce et al. 1994; Meyer and Gillings 2004; Wells and Rankin 1991; Zimmerman, Salem et al. 1995). Long-term effects of childhood socialization may occur via several different varieties of "carry-forward" effects: (1) neural growth effects such as those known from studies of visual deprivation in infancy; (2) neuroendocrine organizational effects; (3) cognitive features such as self-esteem, self-efficacy, and cognitive models of relationships; or (4) predisposition of one social adversity to others (Decker 2000; Flinn, Quinlan et al. 1996; Rutter 1994; Worthman 1999). In the case of the first three varieties, emotionally-valenced experiences during childhood, including those resulting from parental care, may alter long-term psychological characters via molecular reorganization of neurobiological networks involved in the integration of impulsive and reflective psychological states (Bechara 2002; Bechara, Damasio et al. 1997; Damasio 2001; Posner, Rothbart et al. 2001).

Method: We examined the influence of parenting on consumer impulse-control with a go-no-go task, and retrospective ratings of maternal care among 140 healthy women ages to 18 to 83 years. Vulnerability to consumer impulsiveness was examined through performance on an experimental affective-shifting task that requires participants to rapidly distinguish neutral from emotional stimuli (in this case positive or negative valence words), and to either respond by pressing a key or withholding response as directed. Impulsiveness was operationalized as response time to negative and positive targets, numbers of omissions and errors, as well as aggregated disinhibition and discrimination scores. Maternal care was measured using the "Parental Bonding Instrument" (PBI) (Parker, Tupling et al. 1979), which includes two scales, "caringness" and "controllingness." The PBI has been widely found to have good long-term reliability, and sound validity.

Expectations: Several studies have revealed PBI “caringness” to be associated with adaptive adult outcomes, whereas “controllingness” often has been linked to maladaptive outcomes, such as emotional disorders. Go-no-go tasks have revealed differences in executive function among persons suffering psychiatric and/or substance abuse disorders. Go-no-go tasks have revealed that manic patients have impaired ability to inhibit behavioural responses and focus attention. Depressed patients are impaired in their ability to shift attentional focus, and also exhibit negative attentional bias (Murphy, Sahakian et al. 1999). Recovering alcoholics show generally slower response times than non-alcoholics, and poor discrimination between targets and distractors, but better executive functioning for alcohol words, indicating cognitive biases toward alcohol (Xavier, Van Der Linden et al. In Press). Based on past findings about parental bonding and impulse control, we expected that maternal caring would be associated with better executive function, whereas maternal controlling would be associated with deficits in executive function, including more omissions, more errors, and slower responses.

Major Findings: We did not find maternal caring to be strongly associated with measures of impulse control. Response latency was not found to vary as a function of childhood socialization. With age controlled ($Y = \text{CONTROL} + \text{AGE} + \text{CARE}$) women who reported their mothers as more controlling had less flexibility in shifting stimulus reward associations. This was manifest as both: greater response disinhibition $F(1, 136) = 1.86, p = .064$ ($\beta_1 = 0.17$), and lower accuracy when shifting away from positive targets $F(1, 136) = 2.22, p = .028$ ($\beta_1 = -0.2$). Although this trend was also true for performance on all shift-blocks aggregated $F(1, 136) = 1.74, p = .065$ ($\beta_1 = 0.17$), a similar effect was not observed for the “shift-to-positive” condition, indicating that the impairment in adult executive function associated with maternal controlling during childhood is specific to flexibility in turning attention away from positive targets. Similarly, an association between childhood maternal control and errors in distinguishing positive from neutral stimuli during all shift blocks $F(1, 134) = 2.15, p = .033$ ($\beta_1 = -0.2$), was accounted for entirely by the shift-FROM-positive condition $F(1, 134) = 2.22, p = .028$ ($\beta_1 = -0.168$). Despite the fact that there was a non-significant difference in disinhibition during shift compared to non-shift blocks in general, maternal controlling associated with increased disinhibition in shift- compared to non-shift blocks $F(1, 136) = 2.72, p = .008$ ($\beta_1 = 0.25$). Results suggest that the childhood experience of having a controlling mother may influence impulsive, “out of control” consumer behavior. These findings indicate that controlling maternal behavior specifically decreases flexibility in turning attention away from positive stimuli. Such an effect could influence many of the maladaptive behavioral outcomes that have been associated with maternal “overprotectiveness,” as well as “out of control” consumer behavior.

Contributions to Transformative Consumer Research: The impulse control dimension examined in this study may be integral to a wide range of consumer behaviors ranging from overeating, to drug addictions, gambling, and impulsive buying. However, this study represents merely the first steps in one example of how transformative consumer research may be strengthened through an interlocation of traditional decision-theory and concepts and methods from developmental psychobiology for addressing “visceral” factors. This study provides a foundation for myriad trajectories through which future studies may extend the consumer-centric values of the present findings. Future work should seek to relate the parental bonding, and impulse-control variables examined here to actual patterns of consumer behavior, such as food buying habits. Representative community samples are needed to establish the degree to which parental behavior is correlated with, or confounded by other childhood socialization influences, such as schools, neighborhoods, poverty, illness or trauma. Studies of these issues in current parent-child social interactions will be needed to reveal the relative and/or interactive influence of the various carry-forward effects described above.

Biases in Mental Extrapolation

Shenghui Zhao, University of Miami

Robert J. Meyer, University of Pennsylvania

Extended Abstract

Consumption choices often involve forecasting one's future preferences with a product based on limited information. The current investigation examines the biases and cognitive processes in a particular class of such preferential forecasting, namely, mental extrapolation tasks. By mental extrapolation we mean the process of envisioning the appearance of whole product on the basis of exposure to product fragments. For example, home owners often have to choose paint colors based on small swatches of various colors, so they have to imagine how their home would look like with each particular color since the complete product (i.e., their home in various colors) is not available. Likewise, movie goers often select movies based on trailers, essentially fragments of a movie, they have seen on TV. Although this problem is extremely common, there has been little academic research on this topic. The current research aims to fill the research void and to contribute to our understanding of preferential forecasting.

Background

Two lines of research are relevant. First, the affective forecasting literature (for a review, see Wilson and Gilbert 2003) examines people's ability to accurately predict their affective reactions to a future event. This literature has shown a pervasive tendency to overpredict the intensity and duration of their future affective experience (i.e., the impact bias). In other words, the feelings people actually experience are often weaker than what people predict. A major source of this bias is anchoring; that is, predictions are excessively influenced by people's current affective reaction to the target event and not tempered by considerations of future circumstances that may attenuate this reaction. In the context of mental extrapolation, we should also expect anchoring to influence forecasts more than actual experience since evaluations of the fragments per se are more salient in the forecast context than in the consumption context. This also leads to more extreme forecasts.

The second line of research, that on memory processes, helps to shed more light on the detailed cognitive processes for such judgments. The accessibility of prior experience affects preferential forecasts by strengthening the anchoring effect. Several authors have discussed the anchoring phenomenon in the framework of priming (e.g., Chapman and Johnson 2002), which highlights the role of accessibility in anchoring effect. In addition, more accessible information (e.g., memories of prior experience with a product fragment) is likely to be activated earlier than other information and bias the subsequent retrieval process (Roediger 1978). As a result memories that are consistent with the initial information are more likely to be retrieved than inconsistent memories. Both processes are likely to be present in mental extrapolation tasks, and both will result in more extreme forecasts and hence greater inconsistency between predicted preferences and actual experience.

Empirical Studies

These predictions were tested in two laboratory experiments. Both experiments recruited undergraduate students at an east coast university as participants for partial course credit. In both experiments, participants were told to evaluate some new shirt designs from a catalog company that was considering to expand business to target college students in the region where the school is located. All materials were presented on computer screens and all measures were collected by the computer. Each experiment consisted of two sessions separated by a short filler task. In the first session (forecast session), participants were first shown a series of patterns and were told that each pattern would be arranged in a particular array on a shirt. They were asked to indicate how much they would like a shirt with each pattern on a 100-point scale (i.e., a scroll bar). In the second session (experience session), participants were shown shirts with the patterns they saw in the forecast session and asked to evaluate each shirt on the same 100-point scale. The order of presentation for the stimuli was randomized.

The shirt patterns were manipulated on two dimensions: typicality for the product class, and familiarity. Both manipulations were confirmed by ratings of a pretest group. A third factor, predicted liking, was created based on each participant's response in the forecast session in the following way: for each participant shirt patterns that ranked in the top third in predicted liking were coded as high in predicted liking, and patterns that ranked in the bottom third in predicted liking were coded as low. The middle third was dropped, but this did not affect the pattern or direction of results reported below.

In all respects, the two experiments were very similar except that in experiment 1 manipulations of typicality and familiarity were based on ratings of the pretest group whereas in experiment 2 they were manipulated based on each participant's own ratings. Therefore, participants in experiment 2 first evaluated each pattern on typicality, familiarity, and attractiveness, and then proceeded to the forecast session after a short filler task.

The key dependent measures are forecast errors (= predicted liking [response in forecast session]–actual evaluation of shirt [response in experience session]) and response time for each prediction measured in seconds.

Results

Across the two experiments, several stylized findings emerge. First, in support of H1, forecast errors were positive when people expected to like the final product but negative when they expected to dislike it.

Second, consistent with H2, predicted likings in the forecast session had a significantly stronger correlation with evaluations of the shirt patterns per se than did actual evaluations of the whole shirts in the experience session. This indicates that preference forecasts were anchored on evaluations of the product fragment. Moreover, about 70% of participants across the two studies exhibited this anchoring effect, that is, pattern evaluations were more correlated with forecasted liking than with actual experience.

Third, familiarity with the product fragment tended to increase the magnitude of these errors, especially when the fragments were also atypical. This suggests that memory processes may have played a significant role in such judgments.

Discussion

The current research provides some initial investigation into a class of common consumption judgments (i.e., mental extrapolation) and extends the existing research on affective forecasting by introducing the role of memory processes and richer stimuli. The results also have implications for some retail practice.

Toward Developing Conceptual Foundations of Internet Brand Community

Juran Kim, University of Tennessee

Extended Abstract

The concept of brand community has been studied by a number of marketing scholars. Recently, Internet brand communities are attracting attention from marketers. Internet brand communities are growing taking various forms include extensions of a brand community built by corporations and Internet-centric brand communities built by consumers. Despite the widely acknowledged significance of Internet brand community, consumer behaviors within such a context have rarely been studied in the marketing literature, particularly when considering critical characteristics of the Internet environment. This paper seeks to address this distinctive absence.

In this paper, concepts that lie within the Structuration theory (Giddens 1984) will be used as a framework for integrating literature and conceptualizing Internet brand community. This paper's objectives are as follows: One purpose of this study is to offer conceptual foundations of Internet brand community by developing an integrated overview of the current research. Concepts from the Structuration theory are used for synthesizing the consumer behavior literature. Among the basic concepts of Structuration theory, structure, social integration, time and space, and routines are employed for comparing the concepts of brand community and Internet brand community in the literature synthesis. Brand community and Internet brand community are compared based on the concepts in the Structuration theory.

A second purpose of this study is to find and fill the gaps between brand community and Internet brand community in the literature. Internet brand community is a new concept in academic literature. Comparing brand community and Internet brand community by using the basic concepts of Structuration theory, structure, social/ social system integration, time and space, and routines, gaps between brand community and Internet brand community were found. To fill the gaps in the literature, potential research questions are suggested.

First, while the literature offer insights into defining the structure of brand community by discussing hierarchy and formalization, the structure of Internet brand community has only been discussed in terms of the super membership (Schau and Muniz 2003). Further, super membership in an Internet brand community is discussed not in an Internet-centric context but as an extension of offline brand community. It is imperative that the gaps between brand community and Internet brand community studies be filled, in order to clarify the Internet brand community structure. Thus, the following questions may be drawn upon in future research endeavors to fill the gaps: How can the structure of Internet brand community be conceptualized? What are the differences and similarities in structure between brand community and Internet brand community? What are the differences and similarities in structure between Internet brand community as an extension of offline brand community and Internet-centric brand community?

Second, while the literature conceptualized integration of brand community as Customer-Brand Relationship, Customer-Customer-Brand Relationship and Customer-Centric Relationship (Muniz and O'Guinn 2001; McAlexander, Schouten and Koenig 2002), the integration of Internet brand community has not been conceptualized. Further, loyalty and satisfaction related to the Internet brand community have not been discussed. It is imperative to fill the gaps between brand community and Internet brand community studies, in order to clarify the Internet brand community integration. Thus, the following questions can be drawn upon during future research efforts: How can Internet brand community integration be conceptualized? What are the differences and similarities in integration between brand community and Internet brand community? How can loyalty and satisfaction be conceptualized and measured in Internet brand community integration?

Third, Internet brand community studies clearly propose time-space compression in the Internet environment. By considering time and space, the following questions can be drawn upon for the future research efforts which will consider the Internet environment: How does time-space compression affect the structure of Internet brand community? How does time-space compression affect the integration of Internet brand community?

Fourth, Brand communities as subcultures of consumption are characterized by sets of shared beliefs and values, rituals, symbolic expression, shared consumption patterns and ideologies of consumption. But discussions of routines, shared consumption patterns, or shared values in the Internet brand community were hardly found in the literature. The following questions can be drawn upon in future research efforts considering Internet brand community: What are shared beliefs and values, rituals, consumption patterns and ideologies of consumption in the Internet brand community as subculture? How do Internet brand community members present symbolic expression in the Internet environment?

Finally, the future research directions for conceptualizing Internet brand communities are discussed by considering basic concepts in the theory of Structuration and critical characteristics of the Internet environment. Critical characteristics of the Internet environment will be discussed. Then, by considering those characteristics, the future research direction for the Internet brand community will be suggested to fill gaps in the literature.

A conceptual model of Internet brand community will be suggested by providing theoretical underpinnings of Structuration theory in the Internet environment. The Structuration theory offers insights into the relationship between structure and interactivity, by providing the concept of the duality of structure. In fact, interactivity is a central issue in the Internet environment. However, few articles in the literature offered partial information toward interaction in the Internet brand community in order to build a conceptual framework for Internet brand community in the Internet environment, the relationships between structure and interactivity would need to be thoroughly captured into the model.

Consumers' Internet and Internet Consumers: Exploring Internet-based Electronic Decision Aids

Michael Merz, University of Hawaii-Manoa
Qimei Chen, University of Hawaii-Manoa

Extended Abstract

As early as 1955, Simon introduced the notion of bounded rationality. Since then, it has become clear that the traditional approach in explaining consumers' decision-making, which is based on rational choice theory, is incomplete and flawed (Bettman, Luce, and Payne 1998). According to Simon (1955), bounded rationality takes into account that consumers have cognitive limitations in respect to processing information, and that it is the interaction between task environment and human information-processing system that ultimately determines the behavior of consumers (Bettman et al. 1998; Simon 1990; Todd 1999).

Technological advances, shorter product lifecycles, and the globalization of market transactions have led to a new environment that is not characterized any more by its lack of products and information but by its abundance. In particular the development and fast dissemination of the Internet constitutes such a new task or information-search environment that makes available an enormous amount of information on alternatives (Alba et al. 1997; Urban and Hauser 2004).

It becomes clear that in such information- or choice-overloaded situations, in which the decision task becomes more complex, it is often not possible for consumers to make rational decisions. Customers simply do not have the time (Weenig and Maarleveld 2002) and/or the cognitive capacity to process all of the information available to them in a given time (Iyengar and Lepper 2000; Malhotra 1982, 1984). Because of limitations of consumers' cognitive system—such limitations include limited online memory and computational capabilities (Bettman et al. 1998)—research has demonstrated that customers simplify their decision-making processes in information rich environments or under time constraints by relying on simple heuristics (Payne 1982; Timmermans 1993).

While the amount of information available on the Internet keeps expanding, the human processing capacity remains limited. This has created the need for sophisticated decision support tools that are available to consumers in the Internet environment to reduce their cognitive stress by helping them make their choices and providing them with information that is appropriate and relevant for their specific needs (Ariely 2000). Internet's own technological development accommodates this need. Dickson (2000, 117) therefore calls the Internet a super-diffusion innovation, i.e. one that stands above other technological innovations in that it increases effectiveness, efficiency, and speed of "the transmission of new ideas and technologies between individuals and cultures" (see also Diamond 1998).

The focus of consumer research to date on Internet's technological advancement has been to investigate how Internet tools influence consumers' online search behavior. Little attention has been given to examine how the Internet helps improve consumers' decision-making (Kohli, Devaraj, and Mahmood 2004; Zeng and Reinartz 2003) despite the increasing needs of more research that benefits consumers in general and that helps "individuals make wise consumption decisions" in particular (Bazerman 2001, 500). In a different vein, Bechwati and Xia (2003) note that traditional models of decision-making need to be revisited in the new Internet context. Others go even so far as to suggest that the Internet has changed at least some part of traditional theories of marketing, economics, and other fields of business management (see Biswas 2004; Gatarski and Lundkvist 1998; Hawkins Mansell, and Steinmuller 1999). Diamond (1998) therefore calls on scholars to examine how the available Internet services change consumers' decision processes. In response to these calls, the present study developed a conceptual framework to demonstrate that Internet's technological advancement could be used to (1) reduce consumers' perceived information overload; (2) replace or supplement consumers' choice heuristics; (3) redefine consumers' optimal choice; and (4) reduce consumers' post choice cognitive dissonance.

Specifically, we argue that the Internet not only provides customers with electronic decision aids (e.g. recommendation agents, side-by-side comparisons, ordering and ranking) but also with multi-sensory stimuli (e.g. pictures, short films, or sound) that ultimately help customers in their decision-making process through mental imagery or mood-creation. While research has widely acknowledged the former form of decision aids, it has not sufficiently considered the latter one. We propose that both electronic decision aids and multi-sensory stimuli are being used by online consumers as choice strategies in addition to or instead of commonly discussed heuristics to reduce their perceived information overload and/or to deal with the huge information load provided by the Internet.

In addition, we bring forward that the electronic decision aids and multi-sensory stimuli on the Internet help consumers make more rational decisions. We borrow Bazerman's (2001) definition of rationality, according to which a decision is considered rational when it maximizes the consumer's expected welfare. As such, we propose that the most rational decision in the Internet environment does not necessarily have to be the most optimal choice according to the expected utility theory (Tversky and Kahneman 1981) or weighted adding strategy (Bettman et al. 1998). Rather, we propose that consumers judge their choice outcome or the "quality of the decision" according to a reference (e.g. recommendation, average customer rating) that does not necessarily constitute the theoretically optimal choice. This argumentation is in accordance with the information theory that implies to maximize consumers' benefits (welfare) and minimize their costs (cognitive [over]load through information [over]load). Hence, the Internet environment requires a redefinition of "optimal choice" or "optimal decision performance."

Finally, we argue that the Internet also changes post choice behavior. The foregoing discussion implies that a redefinition of "optimal choice" will also lead to more satisfied customers and ultimately alleviated consumers' post-choice cognitive dissonance.

Delivering Differentiated Experiential Branding in Web Environments

Jordan LeBel, Concordia University
 Yanan Yang, McGill University
 Demetrios Vakratsas, McGill University
 Ashesh Mukherjee, McGill University
 Laurette Dube, McGill University

Recent empirical evidence revealed that, beyond the hedonic/utilitarian distinction, a more differentiated representation of pleasure or positive affects or attitudes provides additional marketing insights (Dubé, Cervellon and Jingyuan 2003; Dubé and LeBel 2003). For instances, Dubé and LeBel showed that laypeople's conception of pleasure is best captured by four differentiated pleasures: sensory/physical, emotional/aesthetic, social, and intellectual/accomplishment. Brand positioning strategies anchored in the delivery of differentiated pleasurable experiences have become ubiquitous and web communications are privileged vehicles to convey such positioning.

The present study focuses on consumers' on-line experiences with products and/or services websites positioned along Dubé and LeBel's four pleasure types. The objectives are: 1) to examine to what extent the intensity of the four types of pleasures is predictive of consumer responses at the individual level, as measured by website satisfaction and revisit intent, and 2) to examine to what extent the success of a website in inducing each of the four types of pleasures is predictive of market response at the brand level, as measured by patronage patterns reported by Media Metrix. We expect that the experiential positioning of the brand moderates the pleasure-intensity and consumer (vs. market) response relationship.

At the individual level, 100 web-sites with differentiated experiential branding strategy (sensorial, emotional, social and intellectual) were each observed on 24 visits by a panel of 200 participants. Websites were pretested so that each experiential branding strategy (sensory, social, emotional/aesthetic, intellectual) was represented. Each participant browsed a different website for 12 days and after browsing each website visit reported on the intensity of their experience of differentiated pleasures (twelve items, 7-point scale), website functionality (5 items, $\alpha=.87$), satisfaction (4 items, $\alpha=.81$) and revisit intent (a single likelihood item). Confirmatory factor analysis (CFA) performed on the 12 differentiated pleasure items revealed that a three-factor structure best represented the differentiated pleasures experience during the browsing episodes: sensory/emotional, social, intellectual. These results imply that sensory and emotional pleasures might have even fuzzier boundaries than expected, which may be due in part to the fact that Internet browsing is dominated by the more abstract senses of sight and sound (Howes, 1991). The correlations over the three types of online experiential pleasures are: -0.68 (for sensory/emotional-social), 0.49 (for sensory/emotional-intellectual) and -0.57 (for social-intellectual).

Structural analyses conducted at the visit level revealed a distinct contribution of the different pleasures to satisfaction and revisit intent, with a moderating effect for the website's experiential branding strategies. Specifically, the results revealed that sensory/emotional pleasure accounts for the largest main effect on satisfaction (standard coefficient equals to 0.589, with p-value <0.01) over the four types of website. Further, the results demonstrated that website functionality contributes to browsing satisfaction (standard coefficient equals to 0.421, with p-value <0.01) and website browsing satisfaction in turn has a positive and strong impact on revisit intentions (standard coefficient equals to 0.862, with p-value <0.01).

Results revealed that social pleasure has overall a negative impact on website satisfaction, and the effect is further moderated by the type of experiential positioning espoused by a website. Specifically, social pleasure experience while browsing has a significant negative effect on website browsing satisfaction, except for website with a sensory pleasure positioning strategy (standard coefficients of -0.321 for social websites, -0.228 for emotional websites and -0.308 for intellectual websites). Further, intellectual pleasure has a mild positive impact on website satisfaction and the effect is further moderated by branding positioning as well. Specifically, intellectual pleasure had

no significant influence on website satisfaction when visitors were browsing websites with sensory and emotional pleasure branding strategy, while significant effects were detected for websites with social and intellectual pleasure branding strategy, with standard coefficients equal to 0.296 and 0.211 respectively.

At the website level, we tested websites' effectiveness in conveying the brand's experiential positioning. To this end, Media Metrix data on traffic and information search patterns were obtained for the period extending from March to August 2003. The number of unique visitors served as a proxy for site traffic performance at the aggregate market response level. Further, based on Moe and Fader (2004) we also used indicators of visit depth and breadth such as average pages per usage day, average minutes per page, average usage days per visitor and average minutes per visitors.

Due to the censored nature of Media Metrix data, the standard Tobit Maximum likelihood estimation was adopted to explore the relationship between experiential pleasures aggregated as website level and website effectiveness. TOBIT analyses performed at the site level highlighted the central role of intellectual pleasure, more so that the site functionality, in accounting for traffic and search pattern. Sensory/emotional pleasure and social pleasure didn't demonstrate any significant predictive power on website-level response indicators, yet the coefficients are negative and large. Further tests revealed that intellectual pleasure has the highest predictive power on website effectiveness for sensory website, and second for social website.

In this study, we attempted to trace and document the linkages between the differentiated pleasures that a brand may be attempting to convey, consumers' responses when visiting websites for these brands, and aggregate market level responses. Overall, our research provides exploratory insights to better understand and estimate these linkages. It is clear that when using differentiated experiential branding strategies in the web environment, different types of pleasures have different influences on consumers' responses. This suggests that brand managers and web designers should use extra care in planning their positioning and communication strategies.

Watchdogs on the Internet—Protecting Consumers against Online Fraud

L. Simpson, University of Otago

Counterfeiting is one of the biggest growth industries in the world and factors such as increased profit margins, tax free incomes and low overheads, when combined with the relative 'safety' from prosecution that the internet provides, has contributed to the explosion of 'fake' good that consumers are offered through mediums such as E-Bay and other on-line auction sites (Alcock, Chen, Ch'ng, Hodson et al 2003). In the past it was generally accepted that consumers knowingly purchased these items as counterfeit, and were prepared to trade off inferior quality goods for the satisfaction of owning a luxury product they might not have been otherwise able to afford. The rise of the 'super counterfeit' however, has meant that consumers are often paying large amounts of money for products they believe are genuine (Nia and Zaichkowsky 2000). The sale of branded goods identical in nature to legitimate articles is contrived to purposely deceive naive consumers (Ang, Cheng, Lim and Tambyah 2001) as well as capture a segment of the consumer market who are willing collaborators in the trade (Tom, Garibaldi, Zeng and Pilcher 1998).

A number of studies in recent years have examined the ability of consumers to differentiate between 'fake' and genuine luxury products (e.g. Ang, Cheng, Lim and Tambyah 2001), consumer demand for such products (e.g. Prendergast, Chuen and Phau 2002; Tom, Garibaldi, Zeng and Pilcher 1998), the value of these goods and consumer purchase intentions towards them (e.g. Cordell, Kieschnick and Wongtada 1996; Nia and Zaichkowsky 2000) as well as means of preventing counterfeiting at the manufacturing end (e.g. Alcock; Chen, Ch'ng, Hodson et al 2003). However, studies of this type do little to actually aid those consumers who are not willing participants in the trade of counterfeit goods—those who genuinely believe they are purchasing legitimate luxury goods.

Counterfeit products on the internet are somewhat of a hidden menace (Field 2005), particularly when they are positioned as genuine, and often sold through a team of sellers to avoid detection of large scale operations. Organisations such as the Anti-Counterfeiting Group (ACG) are useful in identifying and prosecuting large-scale offenders, however, this does not always help the individual consumer looking to buy a designer good at slightly less than retail. Firms such as Tiffany's have launched legal action against E-Bay as a response to the high numbers of counterfeit products sold through this medium, however Rolex's failure to successfully sue E-Bay's German site raises questions regarding the success of any such lawsuit (Passariello 2004). Individual countries' (such as France's) tightening on the import of Asian-made replica products and the like has spurred the growth of sales of this type on the internet, as it becomes the most "easy way for a counterfeiter to get the product out to an end customer" (David Margolis, cited in Passariello 2004). Most luxury goods companies employ individuals to monitor representation of their products on the net, but these companies are more concerned with large scale fraud than the individual seller with one or two items on offer. In addition, programs such as VeRO (E-Bay's Verified Rights Owner program), which shift the burden of monitoring sales to the brand holder in return for an agreement to remove all infringing items at the brand's request, have not been successful, as the debate as to whose job it is to prevent sales of these items remains unresolved and most luxury goods brand (including Tiffany's and LVMH) have refused to join the program.

Given that the law is still somewhat behind in effectively policing trade of this type on the internet, some consumers, frustrated by stories of friends and acquaintances bad experiences of purchasing faux luxury goods, have set themselves up as self-styled 'consumer

watchdogs', campaigning about this type of fraud by educating their more naïve counterparts. This research is concerned with two key issues—firstly the question of what motivates certain consumers to set themselves up in this way and give their time (and often money) to aid in the education of consumers about purchasing on the internet, and secondly to assess how consumers in general react to such 'watchdogs' and to what extent they utilize these services.

The research is exploratory in nature, and is designed to be conducted in two distinct phases. A number of organizations (including 'watchdog' sites, online auction sites and regulatory bodies) have been identified to form the basis of the initial development of this research, with depth interviews to be conducted with individuals representing these organizations. The second phase of the research involves qualitative analysis of consumer responses to a number of watchdog sites and online auction chat forums. Responses will be content analysed to determine overall themes and a guidelines for the development of watchdog sites that disseminate brand specific anti-counterfeiting related information to consumers. It is hoped that in the future such sites may be adopted by large scale trading sites such as E-bay as a consumer information resource, allowing greater protection of consumer interests than is currently provided.

Technology-Based Communication Patterns of Youth

Nivein Behairy, University of California, Irvine
 Sayantani Mukherjee, University of California, Irvine
 Burcak Ertimur, University of California, Irvine
 Alladi Venkatesh, University of California, Irvine

Extended Abstract

This paper explores the consumption practices of young consumers in relation to their use of technology. We seek to understand the use of communication technologies, the underlying motivations for these uses and how young consumers select these communication technologies.

Consumer researchers have studied consumer practices and experiences centered on technological products. Specifically, scholars have considered various aspects of technology consumption such as use-diffusion of technology (Shih and Venkatesh 2004), consumer self-presentation through websites (Schau and Gilly 2004), disappointment in consumer technology (Thompson 1994), paradoxes of technology (Mick and Fournier 1998), and intimate self-disclosure via computers (Moon 2000). Whereas the focus of most of these studies has been on adults, our study focuses on young consumers.

There are two main reasons for our focus on young consumers. First, technology occupies a central position in the lives of these consumers. They have grown up with technology such as television, video, arcade games and CD players (Sefton-Green 1998). These technologies form a ubiquitous part of their cultural environment (Hutchby and Moran-Ellis 2001, Pearce and Mallan 2003). Second, young consumers form one of the most viable segments for targeting technological products. For instance, online spending by American 18-24 year olds was four times greater than among older age groups (Pastore 2000 in Osgerby 2004).

The research reported here is part of an ongoing study. We used qualitative research methods and collected data from eight informants in Southern California. This sample size is deemed adequate for generating themes and cultural categories (McCracken 1988). The informants were all undergraduate students and their ages ranged from 18-25 years. Data were collected through semi-structured in-depth interviews which lasted from 90 to 120 minutes. We followed the general procedures of grounded theory (Strauss and Corbin 1998) in our data analysis. First, we identified conceptual categories and themes. Then we established relations among the emerging patterns. NVivo, data management software (QSR1999) was employed in the analysis.

The results indicate that there are evolving communication patterns among young consumers. They use various types of technological products for communication purposes. These communicative mediums include phones, cell phones, instant messaging, email, chat rooms, blogs and websites. Our analysis reveals that the underlying motivations for use of these mediums are guided mostly by young consumers' need for connectedness, and to a lesser degree, by their need for self-expression and instrumental purposes. Self-expression as an underlying motivation is specifically evident in case of blogs. Blogs constitute a medium to reflect and express one's self to others in the

virtual world. Our participants argue that blogs can be personalized in various ways to reflect the blogger's identity and can constitute a medium through which individuals carry their real-life self to the virtual world. The instrumental reasons, on the other hand, are reflected in instances such as the use of instant messenger to discuss schoolwork with classmates and the use of blogs to organize and maintain a record of daily activities.

Consumers' *need for connectedness* emerged as the central theme which motivates the use of different communication mediums. Our findings suggest that participants use different technologies to connect with their existing friends, family members, new people and communities of interest. In doing so, they cultivate their existing relations, bond with friends, meet new people and become members of broader communities.

The data also reveals that there are two main factors guiding consumers' selection of specific communication technologies. These are *structural properties* of a particular technology and the *level of intimacy* in social relationships. Informants describe their choice of a particular medium in terms of its convenience in communicating and maintaining contact with others. Convenience of different forms of communication technologies stems from their inherent properties. For instance, participants view instant messaging as suitable for maintaining contact with friends. The structural properties of instant messaging allows participants to create a 'buddy list' composed of their community of friends and to engage in different levels of participation ranging from active conversations to merely observing others. Consumer discourses also reveal that participants act quite intuitively in their selection of different modes of on/off line communication technologies available to them based on *intimacy in relationships*, *intimacy of content* as well as the *interplay between intimacy and structural properties*.

Both the nature and the intimacy of relationship determine the appropriateness of the medium. Participants easily delineate among "family", "friends", and "acquaintances". They use different communicative mediums depending on whom they want to communicate with. For instance, some young consumers communicate with email and instant messenger at the start of a relationship, then as the relationship progresses they use communication mediums such as phone. The subject matter of conversation is also found to affect the selection of a particular communication medium. For example, participants use online chat for impersonal conversations, while they prefer using the phone for more personal conversations. Finally, there is interplay between intimacy and structural properties which provides a sense of control and empowerment to participants. For example, they maintain several email accounts not only to channel different kinds of information, but also to differentially communicate with other individuals depending on the level of intimacy in the relationship.

We contribute to the existing literature by illustrating the ways in which intimacy in social relationships influence and guide young consumers' use of communication technologies. Overall as consumers' relations with social actors in their lives move along the continuums of impersonal to personal and distant to intimate, the use of particular technological products also changes. Consumer narratives reveal the role of technology in mediating social and personal relationships. These accounts highlight how technology usage shapes and structures, and in turn is shaped and structured by consumers' relationships. This study has implications for consumer research. Due to changing communication patterns, marketers should consider the role of communication technologies in enabling different patterns of information exchange. These exchanges have implications for diffusion of product information. Given that this is an ongoing study, further work is anticipated to extend the findings.

A Blind Mind's Eye: Perceptual Defense Mechanisms and Aschematic Visual Information

S. Adam Brasel, Boston College
Philip Zimbardo, Stanford University
George Slavich, University of Oregon

This research reports on an eyetracker experiment exploring aschematic perception in visual processing. While eighty percent of those exposed to an urban image containing a woman committing suicide fixated on the woman, only thirty-five percent reported seeing her. Another thirty-five percent reported schema consistent items in her place and were three times as likely to insert other false schematic items into image recall. Schematic responders were also partially protected from the negative affect the image created. These findings suggest that people ignore aschematic stimuli due to top-down cognitive frameworks that transform images between sight and memory, rather than changing the visual search pattern itself.

'Do I Know You?': Constraints on the Recognition of the Celebrity Endorser

Geraldine R Henderson, The University of Texas, Austin
Jerome D. Williams, The University of Texas, Austin
Carol M. Motley, Howard University

We explore a celebrity recognition framework in which the ability to recognize other-race faces is based upon not only the race of the viewer relative to the celebrity, but also the amount of exposure/familiarity the viewer has had with others who are of the same race as the celebrity. The other-race-effect is pertinent for marketing researchers to understand because it has significant implications for not only multicultural celebrity facial recognition in advertising, but also for other marketing-related issues, including customer service, direct marketing, and personal selling.

The Role of Self in Evaluation of Advertisements with Highly Attractive Models

Rajani Ganesh Pillai, University of Central Florida

Yun-Oh Whang, University of Central Florida

Judy Harris, University of Central Florida

Media, whether it is print, television or even the Internet, is flooded with advertisements for products and services endorsed by sources that are highly attractive. Marketers targeting their products towards women often use highly attractive sources in their advertisements in an effort to increase the ad's effectiveness (Bower 2001). Marketing literature provides evidence of the positive effects of using highly attractive sources on consumers' evaluations of both the product and the ad (Baker and Churchill 1977; Kahle and Homer 1985; Kamins 1990; Solomon, Ashmore and Longo 1992). However, researchers have been divided in their support for the effectiveness of the use of highly attractive sources in advertisements. For example Bower (2001), Cabellero and Solomon (1984), and Cabellero, Lumpkin, and Madden (1989) have documented the negative effect of using highly attractive sources in advertisements. These studies suggest that such negative effects are due to social comparison, feelings of inadequacy and/or jealousy (Bower 2001, Richins 1991). The research presented here furthers existing literature in this area by investigating the cognitive process underlying the formation of negative attitudes toward advertisements using highly attractive sources.

CONCEPTUAL FRAMEWORK: It has been suggested that the use of attractive sources in advertisements may result in more favorable attitudes toward the product advertised—either by serving as peripheral cues when elaboration likelihood is low or by providing information central to the merits of the argument when elaboration likelihood is high (Kahle and Homer 1985, Puckett, Petty, Cacioppo, and Fisher 1983; see also Petty, Unnava and Strathman 1991 for a review). Here, we examine how the use of attractive sources in advertisements may result in more negative attitudes by influencing the extent of elaboration itself. Specifically, we draw upon theories of self-concept (e.g., Grub and Grathwohl 1967), comparison and dissatisfaction (e.g., Richins 1991), dual process models of processing (e.g., Chaiken 1980; Petty and Cacioppo 1986), and preference-inconsistent information processing (e.g., Jain and Maheswaran 2000) to suggest that the relative gap between consumers' perceptions of their own attractiveness and that of the source influences the extent of processing, and thus whether consumers will process the message claims in the advertisements or use attractiveness of the source as peripheral cue in forming attitudes. We suggest that it is not just the absolute level of attractiveness of the source that determines whether consumers form positive or negative attitude towards the advertisement, but also the gap between the perceived self-attractiveness and attractiveness of the source.

Based on this conceptualization, we propose the following hypotheses. First, the use of highly attractive sources in ads will result in a greater gap between self-attractiveness and attractiveness of the source (H_1). Further, the greater the gap between the self-attractiveness and the attractiveness of the source, the greater the processing of ad claims (H_2). Finally, in the case of a weak message, higher gaps will lead to: lower credibility of ad claims (H_{3a}), more negative evaluations of the ad (H_{3b}), and negative evaluations of the brand (H_{3c}).

METHOD: A 2 x 2 x 2 between subjects experiment was conducted with source attractiveness (high/low), message strength (strong/weak), and gender (male/female) as independent variables. The stimulus was an advertisement for a bank. Male participants viewed an advertisement with a male model and female participants viewed an advertisement with a female model. Message strength was manipulated by the text in the ad. Gap was measured as the difference between the perceived self-attractiveness of the participants and that of the source (model featured in the advertisement). The experiment yielded 213 usable responses (113 males and 100 females).

RESULTS: As hypothesized, we found that the use of highly attractive sources in the advertisements resulted in significantly greater gaps as compared to the ads using less attractive sources across male and female participants (H_1 supported). Second, we found that greater gaps between the perceived attractiveness of the self and that of the source leads to more processing of the ad claims for both males and females, as measured by a greater number of thoughts (H_2 supported). Third, we found significant effects of gap and message strength on the credibility of the ad for males but not for females (H_{3a} partially supported). The attitude toward the ad was found to be less favorable when the gap was high for males, while females were only influenced by message strength (H_{3b} partially supported). Finally, the attitude toward the brand was negatively affected by the magnitude of the gap for both males and females (H_{3c} supported).

DISCUSSION: The results of this study indicate that the use of highly attractive sources in advertisements can lead to a gap between perceived image of the self and that of the source, and higher levels of gap motivate consumers to scrutinize and process the ad claims more closely. This study also found significant effects of gap and message strength on advertisement effectiveness measures, showing that it is not the absolute level of attractiveness of the source that may determine the effectiveness of ad but the gap between the perceived attractiveness of the self and that of the source. Unlike previous research that views negative attitude toward advertisements with highly attractive sources as an affective response, this study explains the cognitive process involved in the negative attitude formation.

The Generation Gap: A Baby Boomer vs. Gen Y Comparison of Religiosity, Consumer Values, and Advertising Appeal Effectiveness

Peggy Sue Loroz, Gonzaga University

Marketing academics have increasingly shown an interest in consumer values over the past decade, with materialism garnering most of the research attention (see e.g., Burroughs and Rindfleisch 2002; Richins 1994). Relatively little consumer researcher has been done on religious values, despite the fact that religion is an influential and important aspect of American and many other cultures, impacting consumer attitudes (e.g., towards divorce, music, political issues), values (e.g., altruism, sexual morality, work ethic), and behaviors (e.g., food and alcohol consumption, holiday celebrations, dress) at both the individual and societal levels. (For notable exceptions, see Hirschman 1983; LaBarbera and Gurhan 1997; Wilkes, Burnett, and Howell 1986.) This research attempts to fill some of the gaps in extant knowledge about how religion and other values may influence consumer behavior by examining the relationship between religiosity and materialism, as well as two related sub-values: concern for consumption ethics and value expression through brands. These values are compared across two generations of consumers of high interest to marketers today: Gen Y and Baby Boomers. In addition, this study tests the influence of generation and consumer values on the effectiveness of several types of advertising appeals. With respect to values, members of Generation Y were expected to be more materialistic, more likely to use brands as communication devices, and more concerned about the ethics of consumption as compared to Baby Boomers. Little is known at this point about Generation Y's level of religiosity, so this was an open research question. With respect to appeal types, members of Generation Y were expected to respond more positively to advertising in general, and in particular to image, indulgence, eco, and sex appeals.

The sample for this study consisted of 264 Baby Boomers and 213 members of Generation Y. The method was a pencil and paper experiment in which each participant evaluated four advertisements drawn from the following set: image vs. functional appeals, value vs. indulgence appeals, waste vs. eco appeals, and high sex vs. low sex appeals. In the first three categories, the ads were for either a car (a public, durable product) or for a shampoo (a private, nondurable product). Both sex appeals were for cologne. In all cases, fictitious brand/organization names were used and ad presentation order was rotated and counter-balanced across subjects. Participants' attitudes toward each of the four ads and intention to purchase the advertised product were assessed on ten Likert-type items, all on seven-point scales. Participants also completed multi-item scales to assess individual differences in religiosity, materialism, brand value expressiveness, and consumption ethics, and were asked to report their religious affiliation (if any), gender, age, education, income, and marital status. All multi-item scales were subjected to factor analysis, and composite variables were created for use in further analysis.

The results of the data analysis support the majority of the initial hypotheses. As expected, members of Generation Y were more materialistic and more likely to use brands as communication devices than members of the Baby Boom generation. They were also less significantly less religious on every measure, providing a preliminary answer to this research question. However, there was no significant difference between the two generations in concern regarding the ethics of their consumption practices. With respect to responsiveness to appeal types, Gen Y'ers responded more positively to image, indulge, and sex appeals, as expected. However, they also responded more positively to function appeals, which was not specifically hypothesized, and no difference was found in response to eco, value, or waste appeals between the two generations. In addition, regression analyses were run separately for each of the four consumer values to test the interactions among generation, value, and appeal type factors. Several complex, higher-order interactions were found, but due to space constraints, cannot be discussed here.

This research potentially makes a couple of contributions to the study of consumer values and advertising effectiveness. First, the study examines religiosity and several other consumption-related values in two important generational cohorts to construct a more complete picture of religious consumers as a group. Although materialism and, to a lesser extent, religiosity have both been examined in the literature, the relationship between the two has not yet been fully explored. Furthermore, consumption ethics, its ties to religiosity, and the connection between brand value expressiveness and religiosity are also new to the literature. By explicating these relationships, a clearer picture of how these values relate to consumption may be obtained. Furthermore, the cross-generational nature of this study yields additional insights into these value constellations. Second, this research explores how generation and consumer values impact advertising appeal effectiveness. Studies on appeal effectiveness for different personality types and subcultures have been limited in general, so more

work is needed in this area. In addition, despite the apparently strong influence of religion and religiosity on a wide variety of consumer attitudes, values, and behaviors, this area has received much less attention than some other similar areas of influence (e.g., race or ethnicity). Although the results of the present research are limited in scope, it appears likely that religion and religiosity may have important implications for segmentation, targeting, and advertising strategy development and may serve as the basis for an important area of transformative consumer research.

Bilingual Processing of Advertising from a Psycholinguistic Perspective: The Link Between Attributes Remembered and Attributes Preferred

Jaime Luynes Noriega, University of Houston

When marketers first studied cross cultural communications the focal audience was African-Americans and the usual issue was the ethnic match between perceiver and spokesperson(s) (For a review see Whittler, 1991).

As immigration from the south increased, researchers set their sights on the Hispanic market. In order to study this group, language necessarily became an operant variable. However, researchers seemed to be accepting the theoretical implication of an invalidated premise—the Whorfian hypothesis of linguistic relativity (Whorf 1956)—by treating language and culture as if though they were completely dependent on each other. As a result, most studies looked at cross cultural communication from a strictly cultural/social perspective and demoted language to the status of a corollary variable.

Seemingly justified by this type of research, Madison Avenue came up with a most disingenuous solution to the issue of how to communicate with ethnic target populations: simply translate the message to their dominant language. However, very little theory-based research exists to validate such an approach (Luna & Peracchio 2002).

The psycholinguistics literature suggests there are universal aspects of language learning and production, including characteristics of second language acquisition, encoding, and recall regardless of what language(s) we consider. Working from this knowledge, Luna & Peracchio have begun to study cross cultural marketing communications from a psycholinguistic perspective (Luna & Peracchio 1999, 2001, 2002).

Although Luna & Peracchio have looked at the quantity of recall by bilinguals when processing a second language message, and have concluded that the extra cognitive effort results in less recall for bilinguals than monolinguals, they have not considered the possibility that the information bilinguals do recall may be more valuable from a cognitive and/or affective standpoint than the information monolinguals are able to recall.

Contrary to what Kroll & Stewart's Revised Hierarchical Model and the Conceptual Mediation Model have suggested, Silverberg and Samuel (2004) found that bilinguals who had learned their second language past the age of seven, did not exhibit any cross language semantic priming regardless of their second language proficiency. The cut off age of seven was based on research which found that during the planning of second language words, bilinguals who learned their second language after the age of seven, showed significantly different brain activation patterns than bilinguals who had learned their second language before the age of seven (Kim et al, 1997). This information leads us to believe that bilinguals who learn their second language after the age of seven (highly representative of U.S. adult immigrants), are likely to engage in more lexical activity than many theories would suggest.

For bilinguals, second language lexical to first language lexical activation results in a form of elaborative rehearsal as information is linked between short term and long term memory and both a lexical link and a conceptual link are activated. Elaborative rehearsal has been shown to improve episodic memory (Kellog 2003). It is believed that the extra elaboration undertaken by bilinguals, will result in a generation effect: better memory for target items that are generated (Slamecka & Graf 1978). Research has shown the occurrence of a bilingual generation effect (O'Neill, Roy, & Tremblay, 1993).

We intended to show that presenting a second language selling message to a bilingual may actually result in better recall of personally relevant attributes for any given product category, than would be the case for monolinguals.

It has been said that "recognition of the impact of attribute importance on information search is so widespread... that information acquisition behavior is accepted as a direct measure of attribute importance" (Mackenzie 1986, p.174). It therefore stands to reason that in an advertising context, a developing bilingual will begin to learn, recognize, and pay special attention to words representing the attributes he/she feels are most important in the focal product category. Because second language word recognition is not as automatic as first language recognition, a bilingual is better able to focus on the "important" words and essentially ignore the rest.

Our research began with a pilot study; a nested 2 x (2 x 2) between-subjects design: Hi/Lo-Motivation, Monolingual/Bilingual-Language, Forced/Unforced-translation (for bilinguals only). Subjects were randomly assigned to each of the controllable conditions.

Low-motivation subjects were only told they would be asked to judge an advertisement; additionally, hi-motivation subjects were told they would have to explain the ad to another subject at a later time. Within the bilingual group, half the subjects were asked to make a conscious effort to think of the words in the ad in a language other than English.

Subjects were then exposed to an advertisement for a backpack which featured seven distinct attributes. Immediately after the exposure, subjects were asked to complete a standard attitude toward the ad scale, they were then asked to list all of the product information they could recall from the ad. This was followed by language usage, demographics, and product involvement questions and a measure of lexical activity.

One week later, subjects were asked to complete a conjoint task meant to assess their revealed preferences for a subset of the different product attributes presented in the stimulus advertisement.

It was hypothesized that bilingual subjects' revealed preferences for certain product attributes would be more highly correlated with the attributes they recalled after exposure to the stimulus ad during week one, indicating that bilingual subjects had better recall for the attributes they preferred in the focal product category than monolinguals.

Through a series of binary logistic regressions, we regressed the relative importance of all attributes on the likelihood that a given attribute was recalled. We expected to find more and higher significant betas corresponding to our dependent attribute for bilinguals than monolinguals.

Examination of the data revealed sampling problems related to self-reported language proficiencies by American bilingual subjects; however, tests on a small sub-sample of international bilinguals yielded strong directional support for the hypothesized effects.

Future studies will be conducted with subjects whose language proficiency can be objectively assessed; specifically, individuals enrolled in English as a Second Language programs.

Advertising Claims About Search and Experiential Attributes and Their Effect on Post-Trial Evaluations of Functional versus Hedonic Products

Camelia Micu, Fairfield University

Introduction

Advertising and product trial are often used by companies to encourage consumers to buy their products. One focus of ad-trial research has been on type of attribute information provided by advertising versus trial. A key finding is that product trial provides maximum information relative to experiential attributes (e.g., taste, speed, softness); whereas advertising provides maximum information for search attributes (e.g., price, ingredients, calorie content) (Wright and Lynch 1995).

Several researchers have speculated that other factors are important in the ad-trial experience. In particular, Devi and Ang (2001) argue that advertising can more effectively communicate products' hedonic dimensions, and product trial can more effectively communicate the utilitarian dimensions. Additionally, research indicates that message claims affect advertising's degree of effectiveness (see Darley and Smith 1993; Edell and Staelin 1983; Ford, Smith, and Swasy 1990; Holbrook 1978), and in the context of trial, the extent to which a claim provides more objective versus more subjective information may be important.

To-date, no ad-trial research has examined the effect of advertising claims on post-trial evaluations. Specifically, the objective of this study is to investigate whether objective versus subjective pre-trial advertising claims about experiential versus search product attributes differentially affect consumers' post-trial perceptions of a functional versus a hedonic product.

Background Literature

The Integrated Information Response Model

The Integrated Information Response Model (Smith and Swinyard 1982) provides an insightful framework in understanding the processing of advertising and trial experience. IIRM states that an advertisement because it is provided by a source with a vested interest will be met with resistance by consumers, generating weak beliefs about the advertised brand. These weak beliefs coupled with weak affect lack sufficient expected value to create brand preferences; only upon trial can these weaker beliefs be transformed to stronger beliefs and affect, and result in commitment to the brand.

Although advertising may be less effective in generating stronger belief strength and belief confidence, it may still play a significant role in product evaluation. In his two-stage model of advertising effect, Deighton (1984) argued that advertising arouses expectations. Therefore, even though consumers may indicate that they do not believe in the ad claims, they store the message and (subconsciously) form a tentative hypothesis regarding the product, which is then assessed during product trial.

In the context of advertisement and product trial effects for highly diagnostic products, I argue that the processing related to the IIRM is dependent upon product type (hedonic vs. functional), type of attribute information (experiential vs. search) and claim objectivity (objective vs. subjective).

Hypotheses Development

Functional products are those that fulfill utilitarian needs (Babin, Darden, and Griffin 1994; Engel, Blackwell, and Miniard 1993), and the utilitarian value of a product is decided objectively. Using the expectancy value model, several studies investigating functional products have demonstrated that objective claims, as opposed to subjective claims, generate more positive expected values, are more credible (Ford, Smith, and Swasy 1990; Holbrook 1978), and generate higher purchase intentions (Darley and Smith 1993). Further, Ford et al. (1990), by cross-classifying claim objectivity (objective/subjective) with attribute type (search/experiential attributes), indicate that in the context of functional products: (1) consumers are least skeptical of advertising claims about search attributes expressed in objective terms (e.g., "Buy this product for only \$4.99"); (2) consumers become more skeptical of subjective claims about search attributes ("Buy this product at an extremely low price"), which are relatively ambiguous; (3) consumers are even more skeptical of objective claims about experiential attributes (e.g., "[...] carpeting will not mildew or rot for at least three years"); (4) consumers are most skeptical of subjective claims about experiential attributes (e.g., "this auto service treats you fairly time after time"). Further, because belief confidence is a function of the amount of information the individual has available to form a judgment of relevant attributes (Peterson and Pitz 1988), search attribute claims have the potential to generate more confidently held trial-based brand beliefs than trial alone.

The hedonic value of a product is decided based upon the ability to provide feelings or hedonic pleasure. Hirschman (1980) defines hedonic consumption as consumer behavior that is related to sensual, fantastic, and sensitive experience with a product. As argued by Hopkinson and Pujari (1999, 273), "the unrestricted imagination is controlled ultimately by the participant, hedonism creates the opportunity for the individual dream" and experiential attributes, as opposed to search attributes, may facilitate imagination. For instance, when shopping for perfumes, trial by giving away scented cards does not effectively communicate the fantasy and imagination attributes associated with a perfume. Perfumes do not just sell the fragrance. They also sell beauty, image, dreams, and fantasy, which are more effectively communicated through advertising's experiential attribute claims than through trial (Dewi and Ang 2001).

With regard to claim objectivity for the experiential attribute information, the subjective claims should generate more positive consumers' responses than objective claims in the context of hedonic products. In fact, research indicates that subjective claims may be more effective than objective claims for value-expressive products (Park and Young 1986) or other hedonic products like perfume or stylish clothes. However, for the search attribute advertisement, I do not expect a significant difference between the objective and the subjective ads in the post-trial responses they generate, because the search attributes, by definition, are pragmatic and do not allow the customer to imagine experiencing the product. Finally, trial alone should generate the least positive post-trial responses because it neither "prepares" the customer for the experience that is about to occur, nor does it provide additional information (i.e., search attribute information) to increase consumers' beliefs in their evaluations.

Conclusions

This paper develops the theoretical foundation and hypotheses related to the effect of pre-trial advertising messages (i.e., objective versus subjective claims about search or experiential attributes) on subsequent trial experience. This study provides practical insights for advertisers in formulating specific advertising claims for functional versus hedonic products, when advertising precedes a sampling campaign.

Brand Stereotypes and Consumer Judgments: The Automatic Shifting of Standards in Brand Evaluations

Claudiu V. Dimofte, Georgetown University

Johny K. Johansson, Georgetown University

Applying the social psychology precepts of the Shifting Standards Model (Biernat, Manis, and Nelson 1991) it is shown that—depending on a marketer's particular choice of eliciting consumer feedback—a brand that fares objectively better than another on a specific attribute can in fact be perceived as equal or even relatively worse than the same brand on that very attribute. Such anomalous explicit response originates in consumers' use of different stereotypical standards for the competing brands. Unless brands are directly juxtaposed (objective judgment), evaluative standards are implicitly more relaxed for the inferior brand, allowing it to match or even surpass its competitor in subjective judgments.

Empirical Support for an Item and Relational Conceptualization of Sponsorship

Clinton S. Weeks, University of Queensland

T. Bettina Cornwell, University of Queensland

Michael S. Humphreys, University of Queensland

Many marketers rely on commercial sponsorship as a means of promoting brand awareness or enhancing brand image, and many events rely on sponsorship as a source of funding and would potentially cease to exist without it (Gardner and Shuman 1988, Lardinoit and Derbaix 2001). Despite a growing body of research aimed at investigating various aspects of sponsorship, such as potential outcomes and measures of effectiveness (see Cornwell, Weeks, and Roy 2005 for a discussion), few researchers have proposed fully developed psychologically-based conceptual models of how commercial sponsorship might function to affect its audiences. Without such models, predictions about sponsorship success can be difficult to make, and firms that might otherwise invest in worthwhile events may be reluctant to do so (Lardinoit and Derbaix 2001). This paper uses theory from the item and relational information memory literature (e.g., Einstein and Hunt 1980, Hunt and Einstein 1981) to explain how commercial sponsorship can be conceptualized. Further, it reports empirical data in support of this conceptual model, and illustrates that the model can be used to predict memory for various types of sponsorship information. This theoretical framework has been presented in Weeks, Cornwell, and Humphreys (forthcoming) and the empirical support from the current study demonstrates its validity.

Item information is that which is encoded to represent specific events or objects in memory, while relational information is that which is encoded to represent the relationships between events and objects. If both brands and events (the two key components of a sponsorship) can be considered forms of item information, and the relationship a brand holds with an event (a sponsorship) can be considered relational information, then an item and relational information framework should be a valid way to conceptualize commercial sponsorship. Item and relational theory suggests that item information is encoded in such a way that item-specific features are stored which make the item distinctive from other information represented in memory (Einstein and Hunt 1980). Relational information, on the other hand, is encoded such that features shared across items are stored, thereby enabling the representation of relationships among items in memory (Einstein and Hunt 1980). Memory for the relationship that a brand holds with an event (a sponsorship), is therefore dependent upon the encoding and storage of both sponsor-specific item information (which distinguishes the brand as a sponsor) and sponsor-event relational information (which ties the brand to the event). Congruent sponsorships (e.g., where a sporting goods manufacturer sponsors a sporting event) may be at an advantage to incongruent sponsorships (e.g., where a mineral water brand sponsors an electronics fair) in that relational information is more readily available given that a relationship is more obvious. Market competitors can also be conceptualized in this model, as sources of information (also encoded as item or relational information) that can potentially interfere with the storage of the target (sponsor) information.

The current study used an experimental design to test the predictive value of this model. Since sponsorship information is likely to be processed as peripheral information (Petty, Cacioppo, and Schumann 1983, Pham and Vanhuele, 1997), participants were exposed to

a series of radio-like press announcements detailing upcoming event sponsorships, which were embedded among distracter announcements outlining horoscope predictions and weather forecasts. Participants were asked to rate the announcers in terms of effectiveness and suitability to be radio presenters rather than focus on content, and at the end of the session they were given an unexpected recall task. In total, 196 student volunteers took part in the study and received course credit for doing so.

The study used a 4 (competitor information type) x 3 (sponsor information type) x 2 (sponsor-event congruence type) mixed factorial design. Participants heard twelve announcements, each containing a description of a fictitious upcoming event, one of four levels of competitor information (no competitor, competitor mention, competitor-specific item information, competitor-event relational information) in order to assess the effects of competitor information interference, and one of three levels of sponsor information (sponsor mention, sponsor-specific item information, sponsor-event relational information). Each level of competitor information was presented between groups, while the three levels of sponsor information were presented within groups. Half of the announcements that participants heard detailed congruent sponsors and competitors, and half detailed incongruent sponsors and competitors. All conditions were counterbalanced to avoid possible order effects. Memory for the sponsorship information was assessed using cued recall where the event name served as the recall cue.

Results lend support to conceptualizing sponsorship within an item and relational information framework. In general, the provision of sponsor-specific item information produced superior memory performance to simply having a sponsor mention, and providing sponsor-event relational information was generally superior to providing sponsor-specific item information. As predicted, sponsor-specific item information facilitated recall for the already-related congruent sponsors, but did little to improve recall for the unrelated incongruent sponsors. Sponsor-event relational information enhanced recall for incongruent sponsors, and improved recall for congruent sponsors to a similar extent as sponsor-specific item information. Although it was expected that higher levels of competitor information would result in greater interference and hence reduced memory for sponsors, marginal means tended to suggest relatively stable levels of overall recall across the four competitor information conditions.

The data provided here, although preliminary, lend considerable support to an item and relational information conceptualization of commercial sponsorship. The model is able to predict, based upon the type of sponsorship information a consumer receives and the congruence between an event and sponsor, just how well the consumer will remember that information. If these results can be replicated in future studies, this model will prove valuable to both marketing researchers and practitioners alike. Although memory for sponsorship information is an important outcome of sponsorships, whether the model is able to predict affective and behavioral outcomes must also be considered in future work.

Elaboration, Imagination and the Misinformation Effect

Arun Lakshmanan, Indiana University

Shanker Krishnan, Indiana University

Consumers' recollection of their consumption experience has been shown to be open to suggestion and susceptible to external influence. For instance, recollections about product quality as well as product type have been shown to be open to misleading suggestions from print advertisements (Braun, 1999; Cowley & Janus, 2004). While these initial studies have demonstrated the presence of the misinformation effect in the consumer behavior context and some boundary conditions for the same, they have also raised important questions regarding the nature of the effect, the level to which it extends to and processing strategies that might enhance or mitigate the effect. For instance, one important question that is raised is whether consumers' false recollections are limited to the actual misinforming stimulus or do they extend to confabulations that go beyond the misinforming intrusion. The objective of this study is to investigate this possibility.

Previous studies in the decision making literature have shown that extended processing of information may not always lead to accurate judgments and might, in some cases, reduce judgment accuracy. In addition to this, evidence from the eyewitness testimony and cognitive psychology literature suggests that when individuals are placed in situations that elicit extended recollection, they are prone to greater

memory errors. The interesting aspect of this is that in certain situations these errors of recollection could go beyond the misinforming stimulus. Recent qualitative studies on the role of imagination in the consumption of products (Martin, 2004) have also provided us with an explanation of how imagination, by way of enhancing vivid imagery and inducing embellishment, could actually lead to greater errors in recall of the consumption experience.

The above two threads of rationale lead us to expect that some forms consumption, specifically, consumption experiences that encourage extended processing of information (through elaboration), might actually lead to *greater* errors in memory as compared to experiences with no such extended processing. Studies on autobiographical memories find that in situations when participants were encouraged repeatedly (along with misinformation stimuli) to provide detailed accounts for their childhood experiences, misinformation effects were particularly strong and confidence in their recall were also high. Accordingly, we expect that when consumers are in an immersive experience and are naturally placed in a situation conducive to imagination, their consumption memory is not only susceptible to misinformation but can also be led to *confabulate*. That is, via the misinforming stimulus and imagination, they can be expected to not only recall their experience to be more consistent with the misinforming stimulus but also go beyond the stimulus itself and ‘hyper-recall’ aspects or features of the experience that were actually not presented. We expect these reconstructions to be specific features or aspects that are extensions of the (main) misinforming stimulus. In a way, contrary to previous misinformation effect studies, we expect misinformation at the more ‘general’ thematic level to lead to greater ‘specific’ feature-level false alarms.

Based on a survey and pretest examining product relevance and involvement, we chose computer games as the test setting. In a 2 X 2 computer-based experiment, the misinformation stimulus manipulated a) the basic theme of the game and b) the primary evaluative dimension related to the game via misleading questions presented after the participants had read a description and had actually played the game for 4 minutes. Imagination was manipulated by a story which placed them in an imaginary problem situation and asked them to imagine and write down their account of the way in which they tackled the problem. In addition to free recall measures, we also collected recognition measures on a variety of words that were semantically related (as well as unrelated) to the key misinformation stimulus. Preliminary analyses show that the main effect of misinformation on both theme-related and evaluation-related words was significant at the $p < 0.001$ level. That is, when exposed to the incorrect theme (in the misinformation condition), participants’ recognition of the misinformation-consistent theme and evaluation words was significantly more than the no-misinformation condition. The main effect of imagination was not significant on both. However, imagination had a significant effect on unrelated words, i.e. words that were neither part of the description nor part of the misinformation stimulus. Further, this effect was found to be inhibitory. That is, in the imagination condition, participants were *less* likely to falsely recognize unrelated words. The misinformation X imagination interaction was also not significant.

The pattern of results suggests that consumers’ susceptibility to misinformation is robust. However, increased thought put in on the game after initial consumption (by way of the ‘imagine’ instruction) seemed to do two things. Firstly, it led participants along a different path which made them falsely recognize words that were actually consistent with the imagination story (and thus inconsistent with both the game and the misinformation). Secondly, the increased thought induced by the imagination condition probably enhanced the involvement of these participants and led them to reduced false alarms with respect to both misinformation-related and completely unrelated words. The lack of an interaction between misinformation and imagination leads us to believe that further study is necessary to untangle the effects of involvement and imagination upon consumers’ susceptibility confabulate and embellish their memories.

Innovating and Lagging as Signals of General Intelligence

Kobe Millet, KULeuven
Siegfried Dewitte, KULeuven

We approach innovativeness from a costly signaling perspective. We suggest that both innovative and lagging consumer behaviors signal general intelligence. Only highly intelligent consumers can afford not to follow the majority, possibly because they can justify their choices. Innovators and laggards do not follow the majority by definition. In three studies, we find evidence that (1) more intelligent people are expected to innovate or lag, (2) people who do not follow the majority, either by lagging or innovating, are actually more intelligent and (3) are perceived by others as more intelligent than those who follow the majority.

The Impact of Mathematics Anxiety on the Evaluation of Price and Price Presentation Formats

Rajneesh Suri, Drexel University
Kent B. Monroe, University of Illinois at Urbana-Champaign

Price, a numeric aspect of product information, at time requires simple calculations and comparisons with either prices of competing offers or a price in memory to determine the savings or evaluating an offer. But for some consumers these computations could become a source of anxiety. This research develops a conceptualization that predicts the effects of mathematics anxiety and motivation to process information on the processing of price information and price presentation formats. The results from two studies show that mathematics anxiety influences the evaluation of prices and price presentation formats.

Intuition in Consumer Decision Making

Wilson O Readinger, Klein Associates Inc.

Almost 30 years ago, Mace (1977) published a paper on his interpretation of the theories of perception espoused by psychologist James J. Gibson. The subtitle of that paper should serve as a constant reminder of a very common mistake in consumer research, as well as a roadmap to significantly greater understanding of consumers and consumer decision making from an academic and an applied perspective: "ask not what's inside your head but what your head's inside of." Qualitative research into naturalistic decision making (e.g., Zsombok & Klein, 1997), including consumer decision making (e.g., Readinger, 2004), has repeatedly shown the importance of recognizing environmental cues in making split-second decisions. Currently, the most convincing model explaining this phenomenon is Klein's (1989) Recognition-Primed Decision (RPD) model. It shifts the emphasis of decision making away from selecting among a set of options, and towards assessing a situation and mentally simulating courses of action. Essentially, it places a premium on the ability of the decision maker to perceive and interpret the environment. In this framework, recognizing relevant aspects of past experience in the current situation is the fundamental step in making many rapid decisions. Therefore, understanding "what the head's inside of" is the key to understanding consumers' intuitions in many naturalistic situations.

Domain experts recognize in an instant the presence of certain contextual factors that tell them nearly everything they need to know about a situation. For example, critical care nurses in a neonatal intensive care unit (NICU) know (without explicitly knowing that they know) the factors that indicate sepsis (Crandall & Calderwood, 1989). They may have memorized a list of symptoms "by heart," but they recognize the physical manifestations of those symptoms "by intuition." In many cases, all such experts need is an appropriate frame in which to situate their cognition; they need to recognize features of the environment that are familiar, and then proceed to build expectations about what will happen next and what cues and factors they should pay attention to. Consider another example. When professional hockey players are on the ice in a game situation, they recognize a defense and take actions to exploit its weaknesses well before they can verbalize where their opponents are located and what they're doing (Readinger, Ross, & Phillips, in preparation). The action (or reaction) seems to precede the explicit decision. The players call it intuition or instinct, and it is very similar to what the NICU nurses mentioned above. Intuition, though, is a keen perception of the environment, now and in the past. It is the conjunction of what an expert has thought and done before, when the environmental context was relevantly similar.

In this sense, buying a product is not significantly different from recognizing sepsis or playing professional hockey. The critical contingency in the comparison is the "expertise" of the consumer. Is he or she an expert, in the way that the NHL hockey players or the nurses are? There are differences, but the similarities are more striking. The ability to "size up" a situation in a moment's glance often comes with practice, and it is present when a shopper purchases household goods at a supermarket, just as it is when nurses diagnose sepsis. Behavior often becomes routinized and difficult to verbalize, when consumers are questioned. In the extreme, the experts do not even recognize that they are making any decisions at all. Certainly not all consumer behavior will be at the expert level; purchases made infrequently, for example, are often considerably more analytical (involving the explicit comparison of options) in nature. In these cases, there has been no opportunity for intuition to develop, no environmental and contextual factors that can be grouped across experiences. In some cases, though, consumer intuition can be studied and demystified in the same way that tacit, expert knowledge has been researched in other domains.

Research techniques exist, such as the Critical Decision Method (e.g., Hoffman, Crandall, & Shadbolt, 1998), that focus attention on the aspects of the environment that are critical in making rapid decisions. These have been used on a somewhat limited basis for purposes of consumer research, but will be critical in further exploring the role of intuition in consumer decision making, as well as identifying the cases where analytical decision making predominates. Consumer needs and wants can ultimately be better met when research professionals have the appropriate tools and theoretical stance to uncover the primary environmental cues and factors behind split-second, intuitive behaviors, and relate these to cognition and behavior.

Consumer Preference Between Price and Feature Changes

Maura Scott, Arizona State University
 Stephen Nowlis, Arizona State University
 Naomi Mandel, Arizona State University

Over time, a firm may be required to either cut features or raise price in order to maintain profitability. Conversely, a firm may decide to deliver additional value to customers and will have to choose between increasing features and reducing the price. In this paper, we explore these trade-offs across multiple product categories to better understand consumer preferences. We expect to find that consumers prefer feature changes to price changes due to loss aversion. We also expect to find that consumers prefer non-alignable gains and alignable losses. We are currently conducting experiments to test our predictions.

Today It's New! Great! And Tomorrow? Perceived Product Newness and Product Liking with a Time Perspective

Anne Michaut-Denizeau, HEC School of Management
 Stan Knoops, IFF

With today's companies innovating at the speed of light, it's no wonder that consumers' response to new products has aroused a great deal of interest in the past years. But are consumers as fast? Most prior research has addressed the issue of product newness or innovativeness from a firm perspective (e.g. Garcia and Calantone, 2002) but the psychological approach of newness from a consumer point of view has received little attention in the marketing and consumer behavior literature. In this research, we propose that, from the consumer's perspective, newness can be seen as lying along two dimensions with distinct effects on product liking: (1) mere perception (perceptual newness) and (2) an epistemic dimension linked to the difficulty of understanding a new product. Besides, if a large number of studies focused on exposure effects on new stimuli evaluation (e.g. Bornstein, 1989), product newness perception over time has been relatively poorly addressed. This paper examines the effect of time and exposure on product newness evaluation and product liking separately, as well as on the relationship between these two variables; it also examines the effect of product trial on perceived product newness.

Building on Berlyne's (1960) theory of 'collative' variables (i.e. variables of comparison), we conceptualize newness as a two-dimensional construct, but how do we expect these two dimensions to evolve over time? As newness involves a comparison in time between a previous and a current status, we expect newness perception to decrease over time. Yet, previous research suggests that repeated exposure results in perceptual fluency when encoding is based on perceptual information, but also conceptual fluency with meaning-based representation (Shapiro, 1999; Janiszewski and Meyvis, 2001). Consequently, we argue reaching a better understanding of the new product (conceptual fluency) with repeated exposure, actually leads to a temporary increase in perceptual newness.

With respect to liking, Mandler's theory (1982) and empirical findings in the consumer behavior context (e.g. Meyers-Levy and Tybout, 1989; Moreau et al., 2001), suggest liking increases with newness as long as newness remains cognitively manageable; otherwise the effect is reversed. As a result, the type of newness considered should greatly influence product liking. More precisely, product liking is expected to increase with perceptual newness, whereas it is expected to drop when epistemic newness increases (i.e. makes the problem-solving task more difficult for consumers). Over time and with repeated exposure there is reason to believe that although the differential effect of perceptual and epistemic newness on product liking will remain, consumers should also develop new criteria to form their judgment over the new product (e.g. resulting from their experience). Hence the explanatory power of newness for liking is expected to decrease over time and with exposure.

In the first study, we examine the evolution of newness perception and its relationship with product liking in product usage conditions. With the collaboration of a market research agency, 420 Dutch consumers were randomly assigned one of five new products (in the fabric care category) and data were collected throughout the 2.5 months of the experiment at t_0 (start of the experiment), t_1 (after 3 weeks), t_2 (after 6 weeks) and t_3 (after 9 weeks). After confirming the two dimensions of product newness in a consumer's perspective, we find opposite effects of these two dimensions of product liking. Namely, a positive effect of mere perception versus a negative effect of the epistemic dimension. We also find that the mere perception of product newness increases in the short run (3 weeks), as consumers simultaneously become more able to make sense of the product. Finally, we find that, in the longer run (12 weeks), newness remains persistent despite daily product usage and exposure, yet, its explanatory power for product liking decreases.

In a second study, we examine the particular impact of product trial on the evolution pattern of perceived product newness and liking. In a test-retest context, we ask 160 consumers to rate perceived product newness and liking before and after trial for three new food products. Similar to the first study, we find that mere newness perception is higher after product trial compared to before trial. We also find that consumers become more able to make sense of the product after product trial.

Overall, these findings suggest that getting consumers exposed to the product fosters understanding and simultaneously facilitates perceiving change, thus potentially product advantage. This may be emphasized in this study where consumers were in a context of daily product usage and exposure. Interestingly, consumers acknowledge the fact that the product is new on both dimensions, hence both perceptually and cognitively, however it seems that the benefits/disadvantages of being new vanish. Consequently, it seems that although product newness is critical to determine innovation trial rates, it may not be an appropriate determinant for long-term success.

Brand Equity and Shadow Diffusion in the Music Industry: Implications of Familiar and Popular

Ruskin M. Morgan, Huron Consulting Group
Joel C. Watson, Rockhurst University
William L. Moore, University of Utah

Extended Abstract

Explicitly or implicitly, it is generally accepted that brand equity plays a role in the sales of entertainment products. For example, new novels by established authors such as John Irving or J.K. Rowling generally sell better than a first novel by an unknown author. In this research we recognize that consumers are subject to a number of influences when consuming entertainment. Two broad forces, one's own prior consumption (personal consumption capital) and other consumers' consumption (social consumption capital) constitute the brand equity effect that we consider. Of particular interest and note relative to prior diffusion models, we focus on how the sales of a current offering are complementary to the sales of prior offerings.

Record executives, book publishers, and film studios have increasingly focused on selling the products of established artists. While new bands, authors, and movies are breakouts on occasion, it is perceived that there is less risk to offering the known or familiar. Movie sequels and new books or albums by established names are generally believed to perform better in the market. The charts of top selling offerings (e.g., Billboard 200, New York Times Bestsellers) are primarily populated with established artists, providing ample support for this perception.

In many cases, preference is a function of one's own past consumption and experience as well as the consumption of others (e.g., Becker 1996; Zajonc and Markus 1982). One area where this may hold is in entertainment goods. For example, Backstreet Boys albums are phenomenally successful with teenagers, but these consumers were not born with the inherent desire to buy Backstreet Boys albums. Instead, it is the consumption of these albums by their peers and their own consumption of prior Backstreet Boys album(s) that contributes heavily to their current preference and the album's sales.

We contribute to the existing knowledge in this area by constructing an estimation model that explicitly captures the effect of consumption of a previous generation entertainment product, as well as the effect of peer consumption of the current generation. This model allows us to investigate differences in consumer purchase patterns for new and established artists. By estimating diffusion parameters for several generations of albums by numerous music groups, we are able to provide insight into the diffusion pattern for music purchases. This decomposition of sales provides knowledge that allows managers to more proactively manage new product introductions and better manage multiple generations of offerings.

The estimation model is a modified diffusion model (e.g., Bass 1969). While this model has generally been applied to product categories, it also fits many entertainment markets quite well. With many entertainment products there is a distinct consumption cycle for each product generation. Within a cycle, a population of potential consumers may buy based on an innovative influence or buy because of social influence, but few consumers will buy the product more than once.

While Norton and Bass (1987; 1992) investigated the situation where a latter generation cannibalizes, we investigate the converse, incorporating complementarity by expanding the basic diffusion model to include an across generation imitation influence in addition to the traditional within generation effects of innovation and imitation. This framework is consistent with Becker's (1996) conception that prior consumption and social consumption (consumption by others) will affect an individual's current consumption.

Our model allows us to empirically explore two areas of interest. First, we provide hypotheses about the across generation pattern of the coefficients of innovation and within- and across-generation imitation. This focuses on the patterns, systematic variation due to brand equity–personal influence, social influence, and innovation. Second, we use information a past generation’s success to forecast the success of a new generation.

To specify the model we use the Billboard 200 data. Limiting the set to the Billboard 200 allowed us to focus on albums that received greater than marginal attention but was not too restrictive. Sales volume outside the top 200 was fairly inconsequential; usually well below 5,000 units per week nationally. Sales of the top three albums were around 200,000 with sales for the top album occasionally substantially above that figure.

Our findings show that an album’s sales over time are influenced by an innovative (or external to the social system) influence as well as both within- and across-generation imitative (or internal) influences. The first two influences, innovative and within-generation imitative are part of a traditional diffusion model. The last influence, across-generation imitative, is new and explicitly connects the diffusion pattern of the current generation with brand equity established prior to the launch of the current generation.

Turning attention to predicting future success for an album we focused on whether a follow-up album makes the charts and if it does, how success in the prior generation is related to success for the current generation offering. Our data show that if a prior album makes the charts, less than 30% of follow-up albums fail to make the charts. The data shows that this occurs when a prior album experiences relatively minimal success in the top 200. Another observation is that the contribution of brand capital may not grow with each successive offering. We did not observe growth in the importance of brand equity across latter generations of offerings and in fact observed a non-significant decline in the importance from 48% to 39%. We did observe a U shaped effect from the 2nd to third and fourth and beyond albums for albums subsequent releases not to even make the charts.

Clearly, brand equity and sales due to across generation effects are important. Our results and the fact that knowing a group’s prior album made the charts significantly elevates its chance of making the charts with its next album seems to justify the industry executive’s focus on the established and familiar.

Our approach has been to decompose the sales pattern and derive a separate estimate for sales due to across generation effects. This provided a better understanding of differences across generations of offerings and implications for a group’s next offering.

If I Don't Understand It, It Must Be New: Processing Fluency and Perceived Product Innovativeness

Hyejeung Cho, University of Michigan
Norbert Schwarz, University of Michigan

Extended Abstract

The meta-cognitive experience of the ease or difficulty with which new information is processed, referred to as 'processing fluency', has been shown to influence a wide range of human judgments including judgments of truth and preference (e.g., Lee and Labroo 2005; Reber and Schwarz 1999; Skurnik et al. 2005; Winkielman et al. 2003). In relation to preference, high fluency has typically been found to increase subjective liking of the judgment target due to the positive feelings elicited by the fluency experience (see Winkielman et al. 2003). However, what people conclude from their meta-cognitive experiences of processing fluency should be influenced by which naïve theory of information processing they bring to bear on their fluency experience (see Schwarz 2004). The present study addresses this possibility.

Study objectives and hypotheses

High processing fluency is hedonically marked and experienced as positive, which can be captured with psychophysiological measures (Winkielman and Cacioppo 2001). This positive affective response, in turn, results in more positive preference judgments. Suppose, however, that the initial judgment pertains to a specific product attribute (e.g., innovativeness). In this case, fluency may serve as input into a more specific judgment, provided that the task brings an applicable naïve theory of information processing to mind that can serve as an inference rule. We test one such naïve theory, namely the (usually correct) assumption that 'new information is more difficult to process than familiar information'. This assumption may influence judgments of the novelty and innovativeness of a described product. Specifically, we predict that a given product is judged as more innovative when consumers have difficulty processing the product information. Once that judgment is made, it may feed into a later judgment of product preference, reversing the typically observed pattern of the fluency-liking link.

Whether consumers rely on their subjective experience of processing fluency in making specific attribute judgments, however, may depend on their willingness to engage in effortful cognitive processing (referred to as Need for Cognition; Cacioppo and Petty 1982). If a judgment of product innovativeness is seen as pertaining to an objective product characteristic, consumers high in NFC may draw on the details of the product description, whereas consumers low in NFC may rely on their processing experience. Hence, the expected influence of fluency on innovativeness judgments may be limited to low NFC consumers.

Finally, judgments of preference always pertain to one's own subjective response to the product. Accordingly, high as well as low NFC consumers may, in principle, draw on their fluency experience in making preference judgments. But they may be more likely to do so if they have not already attributed this experience to a specific product characteristic. The reported experiment explores these possibilities.

Method

Following a 2 (Fluency: High vs. Low) x 2 (NFC: High vs. Low) between-subjects design, 95 undergraduates read a product review printed in either an easy-to-read font (10 point, black Arial font) or a difficult-to-read font (10 point, dark gray Agency font). Pretests confirmed that the text was differentially easy to read. The product was a multi-functional digital handset which can function as a phone, mp3 player, camera, video recorder, and e-mailer. After reading the product review, participants were asked to indicate how innovative the product was and how much they liked it, each on a 7-point scale. At the end, participants were shown the same product review article (printed in Times New Roman font) where twenty-five key product attributes were underlined, and asked to circle those they thought were false, based on their memory of what they read before. This measure serves to capture participants' substantive processing of the text. NFC was measured using an 18-item NFC scale (Cacioppo, Petty, and Kao 1984); a median split on this variable is used for data analysis.

Findings

Innovativeness. A 2 (Fluency) x 2 (NFC) ANOVA revealed the predicted fluency x NFC interaction on the product innovativeness judgment ($F(1, 91)=4.264, p=.042$). Contrasts confirmed that low NFC participants perceived the product as more innovative when the product information was printed in a difficult-to-read font rather than an easy-to-read font. This provides the first evidence that processing fluency can serve as an experiential basis of judgments of innovativeness. The innovativeness judgments of high NFC participants, in contrast, were not influenced by the fluency manipulation.

Preference. A significant fluency x NFC interaction was also obtained for participants' preference judgments ($F(1, 91)=6.454, p=.013$). As predicted, low NFC participants, who just inferred from low processing fluency that the product is highly innovative, drew on this preceding judgment and tended to like the product *more* when its description was *difficult* to process. That is, we obtained a reversal of the commonly observed fluency-liking link. In contrast, high NFC participants liked the product more when its description was easy to process, replicating the standard finding in this area.

Memory. It is conceivable that our fluency manipulation affected participants' attention to the presented product information. To address this possibility, we assessed their memory of what they had read. A 2 (Fluency) x 2 (NFC) ANOVA of the product attribute verification judgments measure revealed no difference in participants' memory of the product attributes across the four conditions, putting this concern to rest.

Conclusions

This study extends our understanding of the role of processing fluency in consumer judgment as follows. First, it provides the first evidence that fluency can serve as a basis for judging the innovativeness of a product. Because familiar information is easier to process

than novel information, consumers may infer from difficulty of processing that the information is novel, resulting in favorable assessments of the product's innovativeness. Second, once low fluency is attributed to innovativeness, it no longer leads to a negative response to the product. Instead, we observed a reversed pattern of the usual high fluency–high liking link. Third, our findings highlight the role of NFC in the use of fluency as a source of information for making specific attribute judgments. In our study, only low NFC participants relied on their fluency experience as a heuristic cue when asked to judge an objective product characteristic, innovativeness. In contrast, high NFC participants' judgments of innovativeness were not affected by fluency, presumably because they relied on the substantive description of the product. Finally, high NFC participants used their fluency experience in making liking judgments, replicating the usual fluency-liking link. This reflects that liking judgments are subjective, rendering one's fluency-related affective response (Winkielman and Cacioppo 2001) highly relevant.

The Impact of Regulatory Focus on Brand Choice and Category-Brand Associations

Arnd Florack, University of Basel
Martin Scarabis, University of Muenster

Consumer decisions vary with the specific wishes and requirements of consumers. For one consumer, a product has to be very reliable whereas, for another consumer, it has to be well designed. Recent research demonstrated that such decision criteria are affected by basic orientations and motivations which are related to hedonic goals of avoiding an undesired state and approaching a desired state. A very sophisticated framework to study the impact of these motivations is provided by Higgins (1997). In his regulatory focus theory, he posits two different self-regulatory strategies: The regulation of behavior according to ideals, hopes, and aspirations, termed promotion focus, and the regulation of behavior according to responsibilities, duties, and security, termed prevention focus. The promotion focus emphasizes the pursuit of positive outcomes. The prevention focus is related to the avoidance of negative outcomes. A basic assumption of regulatory focus theory is that individuals are more concerned with information relevant for the regulatory focus and that attributes compatible to this focus are given more weight in choice (Chernev, 2004; Florack, Scarabis, & Gosejohann, in press).

The main objective of the present paper is to complement this research by showing that the regulatory focus of consumers has an influence on product preferences as well as on the strength of the association of a brand with the product category. In particular, we assumed that category-brand associations vary over different contexts and that products of a category which are compatible to consumers' regulatory focus are more likely to be associated with the category than products that are less compatible with the consumers' regulatory focus. Product preferences and category-brand preferences are two important factors influencing choice. Whereas brand preferences determine the choice between available alternatives of a consideration set, category-brand associations have an influence on whether brands are recalled from memory (Posavac, Sanbonmatsu, Cronley, & Kardes, 2001). The latter is of particular importance when brands are not displayed and when they have to be recalled from memory (Negandgi, 1990).

To examine our hypotheses, we conducted two experiments. The goal of Experiment 1 (N=415) was to show that the regulatory focus of consumers has an impact on the preferences of sun lotions with different claims. We asked participants to evaluate two different brands of sun lotions (cf. Aaker & Lee, 2004) and to indicate which one they would purchase for their summer holidays at the sea. The two sun lotions were presented by two pictures with an advertising claim for each. For one brand, we used a claim that was concerned with the avoidance of sunburn ("Give sunburn no chance. Brand X provides safe protection.") while for the other brand we used a claim that stressed enjoyment of the sun ("Enjoy the warm rays of the sun. Brand X for a healthy tan."). Before participants evaluated the brands, we induced either a promotion or prevention focus with a few questions. In the promotion focus condition, we provided participants with a list of positive things that could happen during their holidays (e.g., meeting nice people) and asked them to indicate which of these things they would actively pursue. In the prevention focus condition, we provided participants with a list of negative things that could occur during holidays and asked them to indicate those they would actively try to avoid (e.g., risk of terror attacks). As predicted, prevention-focused participants preferred the sun lotion with the claim that stressed protection more than promotion-focused participants. This pattern of

preferences was reversed as regards the advertisement for a sun lotion with a claim related to enjoyment. Thus, our results are congruent to those of Chernev (2004) who showed that the regulatory focus of consumers may have a direct effect on product preferences.

In Experiment 2 (N=110), we tested the question whether the manipulation of the regulatory focus of consumers also changes the association between a brand and a product category. In the first part of this experiment, participants saw advertising claims for various products and for the target sun lotion. In one condition, a promotion-focused claim and, in the other condition, a prevention-focused claim was used for the target brand. To guarantee that participants elaborated the claims, they were also asked to recall the presented claims.

In the second part of the experiment, we applied a procedure of Pham and Avnet (2004) to induce either a promotion or a prevention focus. In the promotion focus condition, participants were asked to list present and past hopes and ideals. In the prevention focus condition, they were asked to list present and past responsibilities and duties. Then, we measured the brand category associations with a procedure of Fazio, Herr, and Powell (1992). On a computer screen, we presented the name of a brand category (e.g., electronics) followed by the name of a brand. We presented a total of 60 category-brand pairs. The target brand was presented five times in the correct category-brand pair. The task of participants was to decide as fast as possible whether the presented brand belonged to the preceding product category. The response latency of the trials in which the correct pair was presented was used as a measure of category-brand associations. The results provided support for our hypotheses. Participants showed stronger category-brand associations for the target brand when the claim of the target brand was related to the primed regulatory focus of participants.

Since preferences and category-brand associations are important determinants of product choice, our findings suggest that advertising strategies are more effective when they consider the regulatory focus of the consumer at the point of purchase which may differ within the specific context of choice (e.g., buying a sun lotion in a pharmacy or in a shop for beach equipment).

Does Ingredient Branding Improve Choice of Host and Ingredient Brands? A Test of Brand Equity-Choice Behavior Consistency

Kalpesh Desai, State University of New York, Buffalo

Vishal Singh, Carnegie Mellon University

Dinesh Gauri, State University of New York, Buffalo

S Ratneshwar, University of Missouri – Columbia

We extend prior research in ingredient branding in two important ways. First, we use real data about consumer's *choice vs. judgment* measures employed by prior research to find out if ingredient branding improves choice (and not just brand attitudes) of host and ingredient brands. Second, *with attitudinal survey data*, we attempt to find out to what extent consumers' equity perceptions about the ingredient product and the ingredient and host brands explain their choice behaviors towards these products. This investigation of the consistency between consumers' brand equity perceptions and their choice behaviors is rare and thus adds to the brand equity literature. Our analytical approach involves running a Random Coefficient Logit Model of consumers' actual choices of four ingredient products from a rich scanner data set

Mortality Salience and Regional Consumer Behavior Effects of Mortality Salience on Ethnocentric Consumer Behavior at a Regional Level

Thomas Marchlewski, University of Cologne
Detlef Fetchenhauer, University of Cologne

Effects of Mortality Salience on Ethnocentric Consumer Behavior at a Regional Level

How do we react as consumers to information that reminds us of the inevitability of our own death (e.g., news of terrorist attacks, natural disasters, wars, murders, accidents)? Terror management theory suggests that one possible reaction to mortality salience is consumer ethnocentrism. But what are the cultural boundaries that define in- and out-groups in such comparisons? And are these ethnocentrism effects only responsible for consumer attitude change or do they also have an influence on less cognitive concepts, e.g., gustatory preferences for a local drink?

Consumer Ethnocentrism is an individual's tendency to view the in-group's objects of consumption as superior to those of the out-group. As Shimp and Sharma (1987) stated, this tendency increases when people experience an economic threat from foreign competition.

Economic threat may be an important source of out-group derogation but another existential threat that also seems to influence ethnocentric tendencies can be derived from *terror management theory* (for an overview see Greenberg, Solomon, and Pyszczynski 1997). According to this theory, affiliation to an in-group and belief in its worldviews serve as a mechanism to buffer our death-related anxieties. The bolstering of a shared cultural worldview against views of the out-group could lead people to ethnocentrism (e.g. Nelson et al. 1997).

Consequently, priming thoughts of people's own mortality (mortality salience) should also lead to stronger *ethnocentric consumer preferences*. Indeed, an ethnocentric bias related to mortality salience is not only an in-group-out-group phenomenon, but it can also be found towards objects of consumption (consumer ethnocentrism): e.g., preferences for national cultural items (cars, food, sports, etc.) under mortality salient conditions (Jonas, Fritsche, and Greenberg 2005). As information that reminds us of the inevitability of our own demise is frequently presented in the media, the influence of our existential concerns on ethnocentric consumption behavior should be investigated thoroughly.

Since many consumer brands and products (e.g., foods and beverages) are mainly or exclusively marketed and consumed within a local region, we were interested in whether ethnocentrism effects only occur on a national level or if they can be found among regions as well. In accordance with social identity theory (Tajfel and Turner 1979), worldviews in a regional context should have at least the same strong influence on individuals' cognitive structure as national views because regions are less inclusive than nations and so they should provide the individual with an even more homogeneous worldview.

We analyzed the *local beer preferences* of the inhabitants of two German cities under mortality salient versus control conditions. We chose the cities of Cologne and Düsseldorf because they are situated close to each other and, objectively, have an almost identical cultural background. Nevertheless, from the inhabitants' perspective, a *cultural competition* can be observed that is manifest in different traditions, lifestyles, and consumption patterns. Hence, the residents of each city were assumed to perceive at least an unconscious threat to their regional worldviews if asked to evaluate a cultural symbol (we chose beer sorts) from the other city.

We were also interested in whether the predicted ethnocentrism effects would take place if a less cognitively controlled concept like taste was the dependent measure. Thus, *gustatory preferences* between two German beers that either came from either the participants' own or the competing region (within the same nation) were examined.

- H 1: A regional ethnocentrism effect—i.e., a main effect of beer sort—will occur across all experimental conditions: the beer sort of participants' own city will taste better than that of the other city.
H 2: This main effect will be qualified by an interaction effect between priming and beer sort. Mortality salience will additionally increase this ethnocentrism effect.

In our experiment, we used a 2 (city) x 2 (mortality salience vs. control condition) x 2 (own beer vs. foreign beer) between-subject design with condition and beer sort randomly manipulated and two fixed city samples (Düsseldorf and Cologne). The dependent measure was evaluation of beer's taste compared to an idealized one. 192 people (72 females and 120 males)—96 from each city—agreed to participate in our study (participants were between 19 and 88 years old; $M=43.8$).

Results show that both hypotheses could be confirmed. Participants in both cities and both conditions rated their own beer as tasting significantly better than the beer of the other city ($F[1, 184]=25.46, p<.001$). This main effect was qualified by a significant interaction effect between sort and priming: the taste difference was greater in the mortality salience condition than in the control condition ($F[1, 184]=7.85, p<.01$) mainly due to a devaluation of the foreign region's beer sort.

To summarize, we would argue that our research adds to the emerging line of research that relates terror management theory to consumer behavior. Our research showed that individuals that have previously thought about their own death have a tendency towards regional consumer ethnocentrism. According to terror management and social identity theories, we found that regional identity serves as an anxiety buffer when mortality is salient, and consumption objects that challenge our regional worldviews—like a foreign region's beer sort—are devaluated more strongly under that condition.

"Is This Product Really New?" A Study on the Effect of Category Information and Certainty on Newness Evaluations for New-to-Market Products

Miranda Selinger, University of British Columbia

Darren W. Dahl, University of British Columbia

C. Page Moreau, University of Colorado-Boulder

Both academic and industry research shows that consumers desire and value new and original products (Battel.org/news; Dahl & Moreau, 2002; Lee & O'Connor, 2003). Individuals strive to obtain new products for both functional benefits that can provide utility as well as psychological benefits inherent with being the first to recognize an innovation. Research has shown that the perceived product newness can have a major impact on the product's diffusion and adoption (Gatignon & Robertson, 1991; Rogers, 1976). A new product can also instigate demand and may even redefine major aspects of consumption in a particular product category. Finally, new products can motivate consumers to seek more information, stimulate word of mouth and can enhance consumers' receptivity to marketing activities surrounding the innovation. Given the ascribed benefits of newness it is not surprising that organizations spend millions of dollars in developing new products and convincing consumers of their newness. Yet, very little research has been conducted to determine how consumers recognize and define newness in new-to-market products. What constitutes newness in the mind of a consumer?

Research suggests that people naturally rely on categorization and perceived prototypicality to form inferences about newly encountered objects (Cohen & Basu, 1987; Gelman & Markman, 1987; Veryzer & Hutchinson, 1998). Categorization is necessary to incite learning and the formation of product evaluations and preferences (Gregan-Paxton & John, 1997). Aesthetic response to product prototypicality is also influential in the development of preferences in consumers. Research on prototypicality indicates that people respond more favorably to objects that are stronger category exemplars than to objects that are less prototypical (Veryzer & Hutchinson, 1998). To date, new product learning has been studied in a context that provides consumers with obvious categories and detailed attribute information (Hoeffler, 2003; Moreau et al., 2001A; Moreau et al., 2001B). However many consumer product encounters occur under information limited and ambiguous circumstances where a category label is not immediately available (e.g., limited visual exposure, teaser ad campaigns). This context provides a rich opportunity to explore the direct effect of categorization and certainty on newness perceptions. The following studies are the first of a series that are designed to illuminate the interplay between categorization, certainty and perceptions of newness. Thus far, we find evidence to support that newness perceptions, first rely on the ability of the consumer to identify a product's category and, second, depend on the accuracy of this categorization.

Study 1 provided a direct test of the effect of categorization on newness perceptions for new-to-market products. Participants were randomly assigned to receive either a 30 second visual product exposure only or a product exposure and product category. The product stimulus was the Roomba Vacuum Cleaner, a new-to-market product. Following the manipulation, participants completed a survey containing measures relating to perceived product newness. There was a significant difference in perceived newness between individuals who received the product category [$M = 5.33$], and individuals who did not receive the category [$M = 4.24$] ($t(50) = -3.31$, $p < 0.05$). This finding demonstrates that categorization plays an important role in facilitating perceptions of newness during new-to-market product encounters. Having a category label enhanced newness ratings, and not having a category label reduced newness ratings.

Study 2 examined the effect of natural categorization processes on perceived newness for new-to-market products. The design was a 2 information level (no demo/demo) x 2 product prototypicality (prototypical/non-prototypical) between-subjects design. The Roomba differed substantially from typical category exemplars and was used in the non-prototypical condition. The Dyson Cyclone vacuum was selected as a new but representative exemplar for the prototypical condition. After the manipulation, participants described the product as though talking to a friend. This description was coded for the use and accuracy of a category label. Participants then completed a survey with the key dependent variable, perceived newness and relevant manipulation checks.

A significant interaction between information level and product prototypicality on perceived product newness was found [$F(1,76) = 4.66$, $p < 0.05$]. Perceived newness was significantly higher for the high [$M = 4.83$] versus low [$M = 3.76$] information conditions for the non-prototypical product [$t(39) = -3.06$, $p < 0.01$]. Perceived newness in both the low and high information conditions for the prototypical product were significantly lower than perceived newness in the non-prototypical, high information condition [both p 's < 0.05]. Perceived newness did not differ significantly among the prototypical and non-prototypical products at the low information level and the prototypical product and the high information level [all t 's < 1 , $p > 0.05$].

A significant interaction between information level and product prototypicality on categorization accuracy was found [$F(1,76) = 37.06$, $p < 0.05$]. Accurate categorization for the prototypical product in the low and high information conditions and the non-prototypical product in the high information condition were all significantly higher than in the non-prototypical, low information condition [all p 's < 0.05]. Prototypicality also had a significant effect on categorization, such that accurate categorization always occurred for the prototypical product in comparison to the non-prototypical products [$F(1,76) = 75.17$, $p < 0.01$]. There was also a significant main effect of information level on correct categorization [$F(1,76) = 37.06$, $p < 0.01$]. High information enhanced categorization accuracy in comparison to low information.

Accurate categorization mediated the relationship between information level, product prototypicality and perceptions of product newness (as per Baron & Kenny, 1986). The first two mediation criteria were realized above. When categorization accuracy was added into the analysis, the interaction between information level and prototypicality on perceived product newness was significantly diminished [$F(1,75)=0.64, p>0.05$], while the effect of categorization accuracy remained moderately significant [$F(1,75)=3.02, p<0.1$].

These findings provide evidence that 1) participants naturally engage in categorization processes upon encountering new products, and 2) the identification of a correct category label is needed to facilitate accurate newness perceptions for new-to-market products. Our findings suggest that people are not willing to perceive new-to-market products as new until they can identify with some level of certainty an appropriate category anchor.

The Impact of Information Characteristics on Negative Spillover Effects in Brand Portfolios

Jing Lei, University of Maastricht
 Niraj Dawar, University of Western Ontario
 Jos Lemmink, University of Maastricht

This study investigates the moderating effect of the information characteristics, namely crisis severity and attribution, on the spillover effect of negative information in a brand portfolio context. Three experiments provided validation of hypotheses related to spillover effects. We found that both factors moderate the pattern of spillover effects, although attribution information has a more dominant role in consumers' interpretation process of negative information. This study sets the boundary conditions for the impact of negative information, and provides marketers with knowledge of situations in which the negative spillover is likely to be strengthened, attenuated, or even diminished.

Research background

Product-harm crises are product-related incidents of negative publicity in the marketplace due to the malfunction, misuse and sabotage of products (Ahluwalia, Burnkrant, and Unnava 2000; Dawar and Pillutla 2000). Beyond the direct impact on the harmed brand, a product-harm crisis may also affect other affiliated brands. For example, a sudden acceleration problem with the Audi 4000 automobile also negatively influenced the demand for Audi Quattro (Sullivan 1990). This spillover phenomenon can be conceptualized as the impact of external information (e.g. a product-harm crisis) on associated objects (e.g. brands) that are not directly involved (Balachander and Ghose 2003).

Despite the potential impact of such spillover between brands, knowledge about its effect is limited. Many studies on this issue focus on market-level analyses (e.g. Sullivan 1990). Among those that do focus on consumer-related issues (e.g. brand evaluations), few investigate the impact of inter-brand structure or relationships (e.g. strength of association between two brands, brand typicality in a product category) on spillover (e.g. Lei, Dawar and Lemmink 2005; Roehm and Tybout 2004). Essentially, a spillover effect is a network effect, and thus the network structure describing inter-brand relationships plays an important role in predicting the pattern of spillover effects.

Research questions

One underlying assumption in previous studies is that all negative information is alike in nature and induces similar patterns of spillover effects. Departing from prior research, we argue that the characteristics of the information itself moderate the processing of negative information and the spillover effect between brands. One important attribute of negative information is its severity (Herr, Kardes,

and Kim 1991). Extremely negative information draws more attention and a greater level of cognitive elaboration on the information, which facilitates spillover onto related brands (Petty et al. 1997). Next, consumers' attribution of the crisis incident may also potentially influence the pattern of spillover effects. Attribution theory views people as rational information processors whose reactions are influenced by their causal inference (Folkes 1984). Previous research has shown that crises perceived to be avoidable cause more anger and stronger emotional reactions to the harmed brand than crises perceived to be unavoidable (Folkes 1984; Weiner 2000). These induced negative emotions could be generalized to related products/brands (Smith et al. 1999) and strengthen the spillover effect.

Hence, this research investigates the impact of crisis severity, consumers' attribution of the crisis, and their interaction with the inter-brand structure on the pattern of spillover effects. We intend to set boundary conditions for the impact of negative information on brand evaluations, and therefore provide marketers with the knowledge of situations in which the negative spillover is likely to be strengthened, attenuated, or even diminished (Ahluwalia 2000). Furthermore, despite the prevalence of portfolio brands in the marketplace, little empirical research has been conducted in the brand portfolio context. In the current research, we lay the foundation for a theoretical framework of negative information spillover by focusing on the pattern of spillover in brand portfolios.

Experimental design

Three experiments provided tests of hypotheses related to spillover effects. Experiment 1 utilized a 2*2 factorial design, in which two levels of crisis severity (high/low) and strength of association between brands (strong/weak) were manipulated in one brand portfolio. Experiment 2 utilized a 2*3 factorial design, in which three levels of crisis attribution (internal controllable/internal uncontrollable/external uncontrollable) and two levels of strength of association were manipulated in a different brand portfolio. Experiment 3 utilized a 2*2*2 factorial design, in which two levels of crisis severity, attribution (internal controllable/external uncontrollable), and strength of association were manipulated to test the three-way interaction. A series of pretests were conducted to develop appropriate crisis scenarios and select suitable brand portfolios where brands are associated with each other in different levels of association strength.

Experiment 1 and 2

Experiment 1 and 2 investigate the moderating effect of crisis severity and attribution on the spillover effect respectively. We hypothesize that severe crises and crises perceived to be internal controllable can induce a higher level of cognitive activation at the origin brand (where the crisis is exposed), and therefore facilitate a stronger spillover effect conveyed via associative linkages between brands. Results of experiment 1 support our hypotheses that a severe crisis at an origin brand has a greater spillover effect on the strongly associated target brand as compared with the weakly associated target brand, whereas no such differences are found for the non-severe crisis. Results of experiment 2 support our hypotheses that both internal controllable and internal uncontrollable crises have a greater spillover effect on the strongly associated target brand as compared with the weakly associated target brand, whereas no such differences are found for the external uncontrollable crisis. These results indicate that the network structure, namely the strength of association, influences the magnitude of spillover effect only if the crisis is perceived to be severe or it is attributed as internal causes.

Experiment 3

Attribution theory suggests that the attribution process dominates consumers' interpretation process of negative information (Folkes 1984). Therefore, we expect that when severity information and attribution information are both present, attribution information might overshadow the impact of severity on the spillover effect contingent on strength of associations. Specifically, when a crisis is due to internal and controllable causes, consumers may already have very negative attitudes towards the brand. This may create a ceiling effect so that the impact of severity on spillover will be weakened or diminished. However, when a crisis is due to external and uncontrollable causes, a severe crisis would lead to a greater spillover than a non-severe crisis. We test this three-way interaction in experiment 3. The results confirm our hypotheses, yet reveal a different pattern than in experiment 1 and 2.

The results of this study suggest that the impact of negative information on brand portfolios is not homogenous. Rather, it depends on several information characteristics, such as crisis severity and attribution. This study also shows that, when dominant crisis information such as attribution is present, the impact of other crisis information will be weakened or even diminished. Furthermore, this study corroborates previous evidence that attribution information forms the basis for the updating of central consumer judgments such as brand evaluations (Folkes 1988; Klein and Dawar 2004). From a managerial viewpoint, the results of this study help managers to predict the pattern of spillover effects in brand portfolios by looking at not only the inter-brand relationships, but also the characteristics of negative information itself.

The Film Preference Scale: The Effect of Preference and Cultural Capital on Film Going Behavior

Joel C. Watson, Rockhurst University

Extended Abstract

Independent film and the independent film audience are neglected areas of research. Using the film preferences scale film audiences are split into four preference groups (independent, crossover, mainstream and no film) and these four groups are compared on a number of quantitative measures (Cultural Capital, Sensation Seeking and Communication behavior (Watson 2004)). This is the first attempt to categorize film audience's types via a scale that can be given to the general public.

The measure of cultural capital is used to elaborate on the notion that there is a class system in film that mirrors the dichotomy found in the traditional art world of high art and popular art. In the case of film, independent film functions as high art compared to mainstream films functioning as popular art. This dichotomy in film will help to explain to a certain extent the perceived inaccessibility of independent film.

Most of what we know about filmgoers falls in the category of demographic information. Little has been done to explore who these people are in a more behavioral way. There is extensive research on audiences for the traditional arts such as symphony, opera, fine arts, ballet, and theatre. Film audiences have been a neglected area of research. Research for the art film audience has received even less attention (Corbett 1999; Meers 2001). Only a small amount of literature has attempted to separate film audiences into distinct groups based on film preferences. These studies have centered on fringe audiences such as those for cult films (Austin 1981), X-rated films (Nawy 1970; Webster 1998), and drive-ins (Austin 1985). For the purposes of this paper, the art film audience is closest to the independent film audience, although it historically encompasses a slightly broader group of types of films. The definition of art films most often used in research comes from Twomey (1956, p. 240), "(art films are) films from other countries, reissues of old-time Hollywood 'classics', documentaries, and independently made films on off-beat themes-in short films that lie outside of the mainstream Hollywood product." Independent films, on the other hand, do not include old-time Hollywood classics or for the most part foreign films.

Research on art film audiences has shown that they tend to have more education, are of higher socioeconomic status, are older, hold more prestigious occupations, and are heavier consumers of cultural activities (Adler 1959; National Research Center for the Arts 1975; Smythe, Lusk, and Lewis 1953)

There is an inherently social aspect to the arts in general and film in particular. Although much of the direct interaction with the art object is one on one, the interaction with others plays varying roles in the experience. The conceptual model in this paper delineates the importance of the passing of information, the socialization that occurs in the process.

Traditionally, most film has not been considered a form of high art. This label has been reserved for symphony, opera, and fine art. It is argued here that the film world operates like many of the art worlds (Becker 1982). There are certain works that are more popular and others that are more alternative. These works appeal to different audiences. The independent film world, in this case, is considered to be high art, whereas the Hollywood film world is considered popular art. This will help explain the differing level of popularity between the two types of films. Given this designation of film groups it follows that the independent film group should have higher cultural capital than either the crossover film preference group or the mainstream film preference group.

The measure of cultural capital used in this study captures the three primary sites of acculturation, which is where, according to Bourdieu, cultural capital is attained. These are: cultural upbringing, formal education and occupational culture, all three being equally weighted (Bourdieu 1984; DiMaggio 1982; Holt 1997). In other studies, measures of cultural capital have included father's occupation and education level only (Holt 1998). They have looked at the relationship of cultural capital to the father's education and occupation only (DiMaggio and Mohr 1985). For this study, the mother's education and occupation is included as well, to take into account the changing influence of word-of-mouth in the workforce, mother's influences on their children, and the cases of mothers as single heads of household.

In order to test if the film scale predicts actual filmgoing behavior, respondents were presented with two lists of films, the 30 top grossing Hollywood films of 2002 and 30 top independent films from 2000-2002.

For this study a 174-item questionnaire composed of Likert style items, categorical questions, open-ended questions, and demographic information was administered to a group of 350 students of a large northwestern U.S. University. Out of the group a total of 301 usable questionnaires were generated. The 49 unusable surveys were incomplete due to unpredictable time constraints.

The results showed that the means for number of films seen in each category (independent and Hollywood) by the independent, crossover, and mainstream film preference groups were significantly different, and the number of films from each category conformed to what was predicted. The independent group saw the most independent films followed by the crossover group and finally the mainstream group. With respect to Hollywood films, the mainstream group saw the most, followed by the crossover and independent groups respectfully.

The study showed that there was a significant correlation between Independent film preferences and both general sensation seeking and the experience seeking construct and that the level of both was significantly higher for this group.

The study showed that there was a difference between the groups with respect to their level of Cultural Capital with the independent group having higher cultural capital than each of the other groups in the study. This fact may begin to account for the differing viewing habits for the three groups when looking at the relationship of independent film to Hollywood film as that of High Art to Popular Art.
