Advances in Consumer Research, Volume 34

(Duluth, MN: Association for Consumer Research, 2007)

Preface

The 34th Annual Conference of the Association for Consumer Research (ACR) was held at the Renaissance Orlando Resort at Seaworld in Orlando, Florida, from September 28-October 1, 2006. These proceedings include summaries of the presentations made at the conference in special sessions, competitive paper sessions, working paper sessions, roundtables, and the film festival.

The research presented at the conference this year was perhaps the most stimulating, high quality and diverse than at any previous ACR meeting. This year, records were set for the number of submissions in virtually every category, reflecting the growing interest in consumer research across a wide number of fields. As a result of this increased supply of research the quality of the work presented was exceptional. We were able to accept 30% of the 453 papers submitted for the competitive paper track, 43% of the 105 special session proposal submissions, as well as 112 working papers. In addition, the program included a film festival with 9 intriguing and engaging films as well as 8 roundtable sessions. A record high was also set in the number of people attending the conference (862) including over 200 from outside the U.S. and over 300 doctoral students. Over 140 students attended the doctoral symposium that preceded ACR.

We want to thank the generous donors who provided financial support for this year's conference including the College of Business at the University of Central Florida, the Warrington College of Business at the University of Florida, the Labovitz School of Business and Economics at University of Minnesota Duluth, Interpretive Software, the *Journal of Consumer Research*, Lawrence Erlbaum Associates, Survey Monkey, and the University of Chicago Press.

We also want to thank all the people who provided us with invaluable help with this conference. We especially want to thank the members of the ACR program committee, the working paper reviewers, film festival reviewers, and competitive paper reviewers. In addition, we owe a special thanks to all the student volunteers from Duke University and New York University who helped us tremendously. A number of folks played leadership roles in this year's conference and deserve special recognition. We thank Loraine Laugesk, University of California-Irvine, and Patti Williams, University of Pennsylvania, who co-chaired the roundtable sessions, Russell Belk, University of Utah, and Robert Kozinets, York University, who co-chaired the film festival, Sucharita Chandran, Boston University, and Andrea Morales, Arizona State University, who co-chaired the working papers poster session, Steve Nowlis, Arizona State University, and Rebecca Ratner, University of Maryland, who co-chaired the doctoral symposium, and Andrea Morales, Arizona State University, and Joe Nunes, University of Southern California, for helping us organize our Saturday night special event at Universal's Islands of Adventure. More than 400 ACR conference attendees attended the Saturday night event and gasped, laughed, and screamed on the rollercoaster with their ACR colleagues for the first time.

We also owe special thank you's to Alex Cherfas, University of Minnesota-Duluth, for his help with the ACR web system, Amber Turner, Duke University, for her help with academic aspects of the conference, Patty Salo Downs, ACR conference coordinator, for doing everything necessary to ensure the success of the conference and always doing so with patience and a smile, and Rajiv Vaidyanathan, ACR Executive Director, for all his support throughout the process. Finally, we want to thank Barbara Kahn, President of ACR, for trusting us with this conference and supporting us throughout its planning and execution.

Gavan J. Fitzsimons, Duke University
Vicki G. Morwitz, New York University
2006 ACR Conference Co-Chairs and Proceedings Editors

Conference Committees and Reviewers

PRESIDENT

Barbara Kahn, University of Pennsylvania

CONFERENCE CHAIRS

Gavan J. Fitzsimons, Duke University

Vicki G. Morwitz, New York University

PROGRAM COMMITTEE

Jennifer Aaker, Stanford	Tom Meyvis, NYU
Rohini Ahluwalia, Minnesota	Andrea Morales, Arizona State
Russ Belk, University of Utah	Page Moreau, Boulder
Barbara Bickart, Rutgers	Leif Nelson, NYU
Lauren Block, Baruch	Nathan Novemsky, Yale
Jim Burroughs, Virginia	Steve Nowlis, AZ State
Margaret Campbell, University of Colorado, Boulder	Joseph Nunes, USC
Kurt Carlson, Duke	Cele Otnes, Illinois
Amitav Chakravarti, NYU	Lisa Penaloza, University of Colorado
Pierre Chandon, INSEAD	Steve Posavac, Rochester
Sucharita Chandran, Boston University	Priya Raghurir, UC-Berkeley
Darren Dahl, UBC	Raj Raghunathan, UT-Austin
Utpal Dholakia, Rice	Suresh Ramanathan, Chicago
Kristin Diehl, University of Southern California	Rebecca Ratner, Maryland
Aimee Drolet, UCLA	Americus Reed, Wharton
Susan Fournier, Boston University	Cristel Russell, San Diego State
Andrew Gershoff, Michigan	Sankar Sen, Baruch
Kent Grayson, Kellogg	Jaideep Sengupta, HKUST
Eric Greenleaf, NYU	Baba Shiv, Stanford
Doug Holt, Oxford	Sanjay Sood, UCLA
Aaker Jennifer, Stanford	David Sprott, Washington State
Gita Johar, Columbia	Joydeep Srivastava, Maryland
Tina Kiesler, CSUN	Nader Tavassoli, London Business School
Ran Kivetz, Columbia	Craig Thompson, Wisconsin
Rob Kozinets, York University	Christian Wheeler, Stanford University
Justin Kruger, NYU	Tiffany White, Illinois
Loraine Lau-Gesk, UC-Irvine	Patti Williams, University of Pennsylvania
Angela Y Lee, Kellogg	Stacy Wood, South Carolina
Jonathan Levav, Columbia Business School	

ROUNDTABLES

Loraine Lau-Gesk, University of California-Irvine

Patti Williams, University of Pennsylvania

FILM FESTIVAL

Russell Belk, University of Utah

Robert V. Kozinets, York University

WORKING PAPERS

Sucharita Chandran, Boston University

Andrea Morales, Arizona State University

ACR DOCTORAL SYMPOSIUM

Steve Nowlis, Arizona State University

Rebecca Ratner, University of Maryland

SPECIAL EVENTS

Andrea Morales, Arizona State University
Joe Nunes, University of Southern California

SPECIAL THANKS TO

Aronte Bennett, New York University
Swati Bhargava, New York University
Cenk Bülbül, New York University
Lisa Cavanaugh, Duke University
Aleksy Cherfas, University of Minnesota-Duluth
Amy Dalton, Duke University
Patty Salo Downs, ACR conference coordinator
Jeff Galak, New York University
Ellie Kyung, New York University
Pragya Mathur, New York University
Sarah Moore, Duke University
Adriana Samper, Duke University
Dorothea Schaffner, New York University
Edith Shalev, New York University
Kathryn Sharpe, Duke University

FRIDAY
29 September 2006

SESSION 1
8:00am–9:30am

1.1. Competitive Paper : Brighter Side of Marketing

Chairs: Laurie Meamber, George Mason University, USA
Tim Heath, Miami University, USA

Mi Casa es Whose Casa? An Experimental Investigation of Consumers' Propensity to Participate in Multilateral Sharing Systems 14

Randall L. Rose, University of South Carolina, USA
Catherine Poynor, University of South Carolina, USA

The Muse Effect: When Romantic Motives Create Creativity 15

Vladas Griskevicius, Arizona State University, USA
Robert Cialdini, Arizona State University, USA
Douglas Kenrick, Arizona State University, USA

Gift-Giving Behaviors: Views from an Attachment Perspective 16

Hieu P. Nguyen, University of Texas at Arlington, USA
James M. Munch, University of Texas at Arlington, USA

Small Gains or Smaller Losses: Optimal Price Promotions and the Silver Lining Effect 18

Peter Jarnebrant, Columbia University, USA
Eric Johnson, Columbia University, USA
Olivier Toubia, Columbia University, USA

1.2. Roundtable Session: Researching Visual Consumption 19

Chair: Jonathan Schroeder, University of Exeter, UK

Participants:

Janet Borgerson, University of Exeter, UK
Kent Drummond, University of Wyoming, USA
Fuat Firat, University of Texas, Pan American, USA
Rika Houston, California State University, Los Angeles, USA
David Luna, Baruch College – CUNY, USA
Leighann Neilson, Queens University, Canada
Stefano Puntoni, Rotterdam School of Management, Netherlands
Linda Scott, University of Oxford, UK

1.3. Special Session: Workbench Issues in Transformative Consumer Research

Chair: Julie L. Ozanne, Virginia Tech, USA
Jonathan Deschenes, Concordia University, Canada
Discussion Leader: Connie Pechmann, University of California at Irvine, USA

SPECIAL SESSION SUMMARY

Workbench Issues in Transformative Consumer Research 20

Julie L. Ozanne, Virginia Tech, USA
Jonathan Deschenes, Concordia University, Canada

Behind Closed Doors: A Reflection on the Emotional Challenge of Doing Consumer Research on Painful Topics
Jonathan Deschenes, Concordia University, Canada

Consumer Research in the Shadow of the Towers
Jean-Sebastien Marcoux, HEC Montreal, Canada

Participatory Action Research as Engaged Practice: Implications for Transformative Consumer Research
Julie Ozanne, Virginia Tech, USA
Bige Saatcioglu, Virginia Tech, USA
Canan Corus, Virginia Tech, USA

1.4. Special Session: The Muscle Model of Self-Control Revisited: Does Exerting Self-Control Always Cause Depletion?

Chair: Sabrina Bruyneel, K.U.Leuven, Belgium / Carnegie Mellon University, USA
Discussion Leader: Klaus Wertenbroch, INSEAD, France

SPECIAL SESSION SUMMARY

The Muscle Model of Self-Control Revisited: Does Exerting Self-Control Always Cause Depletion? 23
Sabrina Bruyneel, K.U.Leuven, Belgium / Carnegie Mellon University, USA

The Influence of Positive Affect on Regulatory Depletion
Wen (Echo) Wan, Northwestern University, USA
Alice M. Isen, Cornell University, USA
Brian Sternthal, Northwestern University, USA

Inoculations of Self-Control: Switching vs. Reinforcement Effects of Recalling Past Behavior
Anirban Mukhopadhyay, HKUST, Hong Kong
Jaideep Sengupta, HKUST, Hong Kong
Suresh Ramanathan, University of Chicago, USA

Getting Into It. Exerting Self-Control Enhances Self-Control Performance on Similar Tasks
Kelly Geyskens, K.U.Leuven, Belgium
Sabrina Bruyneel, K.U.Leuven, Belgium / Carnegie Mellon University, USA
Siegfried Dewitte, K.U.Leuven, Belgium

1.5. Special Session: Measurement of Subjective Wellbeing

Chair: Jason Riis, New York University, USA
Joachim Vosgerau, Carnegie Mellon, USA

SPECIAL SESSION SUMMARY

Measurement of Subjective Wellbeing 27
Jason Riis, New York University, USA
Joachim Vosgerau, Carnegie Mellon University, USA

Measuring Cross-National Differences in Subjective Wellbeing
Jason Riis, New York University, USA
Daniel Kahneman, Princeton University, USA

A New Method for Comparing Subjective Wellbeing Across Countries and its Correlation with Suicide
Joachim Vosgerau, Carnegie Mellon, USA
Hubert Gatignon, INSEAD, France
Ed Diener, University of Illinois-Urbana Champagne, USA

Personality, Culture, and Subjective Wellbeing
Hans Baumgartner, Pennsylvania State University, USA
Jan-Benedict Steenkamp, UNC–Chapel Hill, USA

Critique of the Measurement of Happiness
Dan A. Ariely, MIT, USA
Uri Gneezy, University of San Diego, USA
Moshe Hoffman, University of Chicago, USA

1.6. Special Session: The Role of Metacognition in Consumers' Judgments

Chair: Manoj Thomas, Cornell University, USA
Discussion Leader: Chris Janiszewski, University of Florida, USA

SPECIAL SESSION SUMMARY

The Role of Metacognition in Consumers' Judgments 28
Manoj Thomas, Cornell University, USA

The Role of Ease in Consumers' Emotional Judgments
Derek D. Rucker, Northwestern University, USA
Pablo Briñol, Universidad Autonoma de Madrid, Spain
Richard E. Petty, Ohio State University, USA

The Role of Subjective Ease in Price Comparisons
Manoj Thomas, Cornell University, USA
Vicki G. Morwitz, New York University, USA

Perceptual Fluency, Attitudes and Choice
Andy Mitchell, University of Toronto, Canada
Seh-Woong Chung, Singapore Management University

1.7. Competitive Paper : What's Right is Right! Consumer Social Responsibility

Chair: Katherine White, University of Calgary, Canada

Intending To Be Ethical: An Examination of Consumer Choice in Sweatshop Avoidance 31
Deirdre Shaw, Glasgow Caledonian University, Scotland
Edward Shiu, Glasgow Caledonian University, Scotland
Louise Hassan, University of Stirling and the Open University, United Kingdom
Caroline Bekin, University of Birmingham, United Kingdom
Gillian Hogg, University of Strathclyde, Scotland

HOOLIGAN'S HOLIDAY: Rethinking Deviant Consumer Behavior and Marketing 39
Aubrey R. Fowler III, University of Nebraska, Lincoln, USA

Consumer Vigilantism 45
Olga Kravets, University of Sydney, Australia

A Room with a Viewpoint: Using Normative Appeals to Motivate Energy Conservation in a Hotel Setting 47
Noah J. Goldstein, Arizona State University, USA
Robert B. Cialdini, Arizona State University, USA
Vladas Griskevicius, Arizona State University, USA

1.8. *Competitive Paper* : Factors Influencing Brand Judgments

Chair: Alokparna Monga, University of Texas at San Antonio, USA

<i>“Uh-oh, Where is Our Brand Headed?” Exploring the Role of Risk in Brand Change</i>	49
Henrik Sjodin, Stockholm School of Economics, Sweden	
<i>The Moderating Effect of Brand Commitment on Consumer Response to Logo Shape Redesign</i>	54
Michael F. Walsh, West Virginia University, USA	
Vikas Mittal, University of Pittsburgh, USA	
Karen L. Page, University of Pittsburgh, USA	
<i>The Effects of Perceived Congruity Between Origin, Brand and Product on the Purchase Intention of a Branded Product of Origin</i>	55
Philippe Aurier, Montpellier University, France	
Fatiha Fort, ENSA Montpellier-MOISA Research Unit, France	
<i>Self-Brand Connections and Brand Resonance: The Role of Gender and Consumer Emotions</i>	64
David Moore, University of Michigan, USA	
Dayna Wurster, University of Michigan, USA	

1.9. *Competitive Paper* : Qualitative Approaches to Understanding Consumers

Chair: Therese Louie, San Jose State University, USA

<i>Gettysburg Co-Constructed: Producing and Consuming Narratives in an American Battlefield</i>	67
Athinodoros Chronis, California State University, USA	
<i>Representing Consumer Research: A Novel Approach</i>	70
Stephen Brown, University of Ulster, Northern Ireland	
<i>Authenticity in the Performing Arts: A Foolish Quest?</i>	75
Maud Derbaix, University of Namur, Belgium	
Alain Decrop, University of Namur, Belgium	
<i>Aesthetic Advertisements and Scientific Evaluations: Divergent Philosophies in Advertising Production</i>	81
Aidan Kelly, Dublin Institute of Technology, Ireland	
Katrina Lawlor, Dublin Institute of Technology, Ireland	
Stephanie O’Donohoe, University of Edinburgh, UK	

<p style="text-align: center;">FRIDAY 29 September 2006 KEITH HUNT NEWCOMERS’ BREAKFAST 9:30am-10:00am</p>
--

<p>FRIDAY 29 September 2006</p> <p>SESSION 2 10:00am-11:30am</p>
--

2.1. Roundtable Session: Disseminating Transformative Consumer Research: Getting Research Results Out of the Tower and Into Consumers' Lives 83

Chair: Stacey Menzel Baker, University of Wyoming, USA

Participants:
David Hunt, University of Wyoming, USA
David Mick, University of Virginia, USA
Julie Ozanne, Virginia Tech University, USA

2.2. Special Session: Low-Fat Foods and High-Fat People: The Role of Anticipated and Experienced Consumption Pleasure and Guilt

Chair: Pierre Chandon, INSEAD, France
Discussion Leader: Stella Volpe, University of Pennsylvania School of Nursing, USA

SPECIAL SESSION SUMMARY

Low-Fat Foods and High-Fat People: The Role of Anticipated and Experienced Consumption Pleasure and Guilt 84
Pierre Chandon, INSEAD, France
Brian Wansink, Cornell University, USA

The Unhealthy = Tasty Intuition and its Effects on Taste Inferences, Enjoyment, and Choice of Food Products
Rajagopal Raghunathan, The University of Texas at Austin, USA
Rebecca Naylor, University of South Carolina, USA
Wayne Hoyer, The University of Texas at Austin, USA

Nutrition Claims, Anticipated Guilt, and Consumption Quantity
Brian Wansink, Cornell University, USA
Pierre Chandon, INSEAD, France

Getting More out of Guilty Pleasures
Kelly Goldsmith, Yale University, USA
Eunice Kim, Yale University, USA
Ravi Dhar, Yale University, USA

2.3. Special Session: Thinking About the Future

Chair: Ying Zhang, University of Chicago, USA
Discussion Leader: Tanya L. Chartrand, Duke University, USA

SPECIAL SESSION SUMMARY

Thinking About the Future 85
Ying Zhang, University of Chicago, USA

To Be Optimistic or To Be Accurate: How Self-Control and Accuracy Motives Influence Predictions of Goal Pursuit
Ying Zhang, University of Chicago, USA
Ayelet Fishbach, University of Chicago, USA

Remedying Hyperopia: The Effects of Self-Control Regret on Consumer Behavior

Anat Keinan, Columbia University, USA

Ran Kivetz, Columbia University, USA

Planning For Which Future? Lay Theories of Self-Control and the Temporal Framing of Goal-Directed Behavior

Anirban Mukhopadhyay, HKUST, Hong Kong

Nidhi Agrawal, Northwestern University, USA

2.4. Special Session: Order Effects in Multiple Choices: Of Lost Love, Spent Willpower, and Relinquished Control

Chair: Simona Botti, Cornell University, USA

Discussion Leader: Barbara E. Kahn, University of Pennsylvania, USA

SPECIAL SESSION SUMMARY

Order Effects in Multiple Choices: of Lost love, Spent Willpower, and Relinquished Control 89
Simona Botti, Cornell University, USA

Setting the Stage or Making the Final Cut: The Timing of Control in the Choice Process

Simona Botti, Cornell University, USA

Tom Meyvis, New York University, USA

The Effect of Attribute Order and Variety on Choice Demotivation: A Field Experiment on German Car Buyers

Jonathan Levav, Columbia University, USA

Mark Heitmann, St. Gallen University, Switzerland

Andreas Herrmann, St. Gallen University, Switzerland

Sheena S. Iyengar, Columbia University, USA

The Bidirectional Relationship Between Making Choices and Self-Regulation

Kathleen D. Vohs, University of Minnesota, USA

Jungkeun Kim, University of Minnesota, USA

2.5. Special Session: When Who I Am Affects Who and How Much I Help: Social Influences on Giving

Chair: Karen Page, University of Pittsburgh, USA

Discussion Leader: Joan Nelson, Heart of Florida United Way, USA

SPECIAL SESSION SUMMARY

When Who I Am Affects Who and How Much I Help: Social Influences on Giving 93
Karen Page, University of Pittsburgh, USA

"I" Give, but "We" Give More: The Impact of Identity and the Mere Social Information Effect on Donation Behavior

Jen Shang, Indiana University, USA

Rachel Croson, University of Pennsylvania, USA

Americus Reed, University of Pennsylvania, USA

Tsunami or Katrina?: Effect of Conflicting Identities in Donation Behavior

Karen Page, University of Pittsburgh, USA

Vikas Mittal, University of Pittsburgh, USA

William Ross, Penn State University, USA

Giving and Sharing in Concentration Camps: The Impact of Third Party Influences

Tina Lowrey, University of Texas at San Antonio, USA

Jill Klein, INSEAD, France

2.6. *Competitive Paper: The Thoughts We Don't Have: The Unconscious Mind*

Chair: Michael Tsiros, University of Miami, USA and Athens Laboratory of Business Administration

<i>The Effect of Unintended Information Acquisition</i>	97
Lan Xia, Bentley College, USA	
Kent B. Monroe, University of Richmond and University of Illinois at Urbana-Champaign, USA	
<i>Sex-related Cues Instigate the Urge to Splurge. How An Incidental Visceral State Renders Subsequent Behavior, Judgment and Decision-Making More Impulsive</i>	100
Bram Van den Bergh, K.U. Leuven, Belgium	
Siegfried Dewitte, K.U. Leuven, Belgium	
Luk Warlop, K.U. Leuven, Belgium	
<i>Positive Implicit Memory Effects for Event Incongruent Sponsorship</i>	102
Olivier Trendel, Grenoble Ecole de Management / Institut du Capital Client, France	
Luk Warlop, K. U. Leuven, Belgium	
<i>Implicit and Explicit Influences on Spontaneous and Deliberate Food Choices</i>	104
Marie-Cecile Cervellon, International University of Monaco, Principality of Monaco	
Laurette Dube, McGill University, Canada	
Barbel Knauper, McGill Univeristy, Canada	

2.7. *Competitive Paper: Cross Cultural Constructs*

Chair: Rika Houston, California State University, USA
Michael Callow, Morgan State University, USA

<i>Investigating The Interactive Effects of Visual Imagery and Brand Familiarity on Brand Recall: A Cross-Cultural Study</i>	110
Andrei Mikhailitchenko, Cleveland State University, USA	
Galina Mikhailitchenko, Psychological Institute of Russian Education Academy, Russia	
<i>The Safety of Objects: An Examination of Materialism and Brand Connections</i>	112
Aric Rindfleisch, University of Wisconsin-Madison, USA	
James E. Burroughs, University of Virginia, USA	
Nancy Wong, Georgia Institute of Technology, USA	
<i>Cultural Differences in Brand Extension Judgments and Feedback Effects</i>	114
Kyeongheui Kim, University of Toronto, Canada	
Jongwon Park, Korea University, Korea	
Jungsang Yeo, Dong Guk University, Korea	
<i>Linguistic Differences between Chinese and English and Their Effects on Consumers' Ability to Generate Images</i>	116
Beichen Liang, University of Illinois at Chicago, USA	

2.8. *Competitive Paper: Rethinking Interactive and Online Marketing*

Chair: Charles McMellon, Hofstra University, USA

<i>Media Technologies: Mediated Families</i>	122
Shakeel Siddiqui, Dublin City University, Ireland	
Darach Turley, Dublin City University, Ireland	
<i>Live From Shopping Malls: Blogs and Chinese Consumer Desire</i>	131
Xin Zhao, University of Hawaii at Manoa, USA	
Russell W. Belk, University of Utah, USA	

Virtual Onscreen Assistants: A Viable Strategy to Support Online Customer Relationship Building? 138
 Kathy Keeling, University of Manchester, UK
 Peter McGoldrick, University of Manchester, UK
 Susan Beatty, University of Manchester, UK

Consuming Hyperplaces: Servicescape, Service-Escape, and the Production of the Servicespace 145
 Chris Houliez, University of Saskatchewan, Canada

2.9. Competitive Paper: MSI

**Friday
 29 September 2006**

ACR LUNCHEON AND PRESIDENTIAL ADDRESS
 11:30am-1:00pm

ACR FILM FESTIVAL
 1:00pm-6:15pm

**Friday
 29 September 2006**

SESSION 3
 1:00pm-2:30pm

3.1. Roundtable Session: Grant Funding Opportunities and Challenges for Transformative Consumer Research 146

Chairs: Cornelia Pechmann, University of California, Irvine USA
 Eric Johnson, Columbia University, USA

Participants:

Paul Bloom, Duke University, USA
 David Brinberg, Virginia Tech University, USA
 Dan Freeman, University of Delaware, USA
 Joseph Plummer, Advertising Research Federation, USA
 Ron Hill, University of South Florida, USA
 Punam Keller, Dartmouth College, USA
 Kathleen Kelly, Colorado State University, USA
 David Mick, University of Virginia, USA
 Robert O’Conner, National Science Foundation, USA

3.2. Special Session: Cultural Identity and Judgment–To Bias or not to Bias

Chair: Cristel Russell, Cristel Antonia Russell, San Diego State University, USA
 Ana Valenzuela, Baruch College, USA
 Discussion Leader: Angela Lee, Kellogg, Northwestern University, USA

SPECIAL SESSION SUMMARY

Cultural Identity and Judgment–To Bias or not to Bias 147
 Cristel Antonia Russell, San Diego State University, USA
 Ana Valenzuela, Baruch College, USA

Cultural Identity and the Antecedents of Risky Decision-Making: Am I Good or Lucky?

Ana Valenzuela, Baruch College, USA
Peter Darke, University of British Columbia, Canada
Donnel Briley, University of Sydney, Australia

When Does Culture Matter? Effects of Personal Knowledge on the Correction of Culture-based Judgments

Donnel A. Briley, University of Sydney, Australia
Jennifer Aaker, Stanford University, USA

Cultural Identity Salience as a Catalyst of Consumer Resistance

Dale W. Russell, INSEAD, France
Cristel Antonia Russell, San Diego State University, USA

3.3. Special Session: “New Thoughts and New Possibilities”: Frontiers in Consumers’ Interpretations of New Products

Chair: Reetika Gupta, Lehigh University, USA
Sankar Sen, Baruch College/CUNY, USA
Discussion Leader: S Ratneshwar, University of Missouri-Columbia, USA

SPECIAL SESSION SUMMARY

“New Thoughts and New Possibilities”: Frontiers in Consumers’ Interpretations of New Products 151
Reetika Gupta, Lehigh University, USA
Sankar Sen, Baruch College/CUNY, USA

From Combination Products to Brand Alliances: How Conceptual Combination Influences Consumers’ Preferences

Page Moreau, University of Colorado, Boulder, USA
Jen Dale, University of Colorado, Boulder, USA
Amna Kirmani, University of Maryland, College Park, USA

Conceptual Combination and Categorization of Ambiguous Products

Priyali Rajagopal, Southern Methodist University, USA
Robert Burnkrant, Ohio State University, USA

Learning and Liking through Comparison: The Influence of Multiple Analogies on New Product Interpretations and Preferences

Reetika Gupta, Lehigh University, USA
Sankar Sen, Baruch College/CUNY, USA

3.4. Special Session: From First to Second Generation: Moderated Nonconscious Behavior Effects

Chair: S. Christian Wheeler, Stanford University, USA
Discussion Leader: James Shah, Duke University, USA

SPECIAL SESSION SUMMARY

From First to Second Generation: Moderated Nonconscious Behavior Effects 155
S. Christian Wheeler, Stanford University, USA

Same Prime, Different Effects: Segmentation in Nonconscious Behavior Influence

S. Christian Wheeler, Stanford University, USA
Jonah Berger, Stanford University, USA

Nonconscious Relationship Reactance: When Significant Others Prime Opposing Goals

Amy Dalton, Duke University, USA
Tanya Chartrand, Duke University, USA

Nonconscious Effects on Economic Decisions: The Role of Perceptual Construals in Mediating Priming-to-Behavior Effects
 Dirk Smeesters, Tilburg University, Netherlands
 S. Christian Wheeler, Stanford University, USA
 Aaron Kay, University of Waterloo, Canada

3.5. Special Session: Variety, Expectations, and Choice

Chair: Alexander Chernev, Northwestern University, USA
 Discussion Leader: Barbara Kahn, University of Pennsylvania, USA

SPECIAL SESSION SUMMARY

Variety, Expectations and Choice 159
 Alexander Chernev, Northwestern University, USA
 Ryan Hamilton, Northwestern University, USA

Too Much of a Good Thing? Option Attractiveness and Assortment Choice
 Alexander Chernev, Northwestern University, USA
 Ryan Hamilton, Northwestern University, USA

Great Expectations?! Assortment Size, Expectations and Satisfaction
 Kristin Diehl, University of Southern California, USA
 Cait Poynor, University of South Carolina, USA

Do I Like It If You Choose For Me? The Influence of Relationship Norms on Consumer Satisfaction
 Pankaj Aggarwal, University of Toronto, Canada
 Simona Botti, Cornell University, USA

3.6. Competitive Paper: Framing Effects

Chair: Lisa Abendroth, Boston University, USA

To Add or Not To Add? The Effects of Add-ons on Product Evaluation 163
 Marco Bertini, London Business School, UK
 Elie Ofek, Harvard Business School, USA
 Dan Ariely, MIT, USA

Segmenting and Targeting American University Students to Promote Responsible Alcohol Use: A Case for Applying Social Marketing Principles 164
 Sameer Deshpande, University of Lethbridge, Canada

The Framing Effect of Price Format
 Marco Bertini, London Business School, UK
 Luc Wathieu, Harvard Business School, USA

Money: A Bias for the Whole 166
 Arul Mishra, University of Iowa, USA
 Himanshu Mishra, University of Iowa, USA
 Dhananjay Nayakankuppam, University of Iowa, USA

3.7. *Competitive Paper: Qualitative Analysis of Consumer Sub-cultures*

Chair: Anders Bengtsson, Suffolk University, USA

<i>Shedding the Cocoon: A “Mortal Embodiment” Perspective of Organ Donation in Supporting and Enhancing Life</i>	167
Ai-Ling Lai, University of Gloucestershire, UK	
Janine Dermody, University of Gloucestershire, UK	
Stuart Hanmer-Lloyd, University of Gloucestershire, UK	
<i>Consumer Culture Matters: Insights from Contemporary Representations of Cooking</i>	175
Paul Hewer, Strathclyde University, Scotland	
Douglas Brownlie, University of Stirling, Scotland	
<i>An Investigation of Household Decision Making Among Immigrants</i>	180
L. Wakiuru Wamwara-Mbugua, Wright State University, USA	
<i>We Love to Hate You: Discourse Between the Distance Running Subculture and Mainstream Media</i>	187
Tandy D. Chalmers, University of Arizona, USA	
Hope Jensen Schau, University of Arizona, USA	

3.8. *Competitive Paper: Moods, Emotions, and What They Do To Us*

Chair: Lisa Watson, University of Regina, Canada

<i>Mood Self Verification Explains the Selection and Intake Frequency of Comfort Foods</i>	189
Brian Wansink, Cornell University, USA	
Collin Payne, Cornell University, USA	
<i>Going Along Versus Going Alone: When Fear and Romance Alter the Influence of Reference Groups</i>	191
Vladas Griskevicius, Arizona State University, USA	
Noah Goldstein, Arizona State University, USA	
Chad Mortensen, Arizona State University, USA	
Robert Cialdini, Arizona State University, USA	
Douglas Kenrick, Arizona State University, USA	
<i>Side Effects From Fear: The Automatic Inhibition of Threat-Relevant Brand Advertising</i>	192
Jesper Nielsen, University of Arizona, USA	
Stewart Shapiro, University of Delaware, USA	
<i>“Hopelessly Devoted to You” -Towards an Extended Conceptualization of Consumer Devotion</i>	194
Elisabeth A. Pichler, University of Innsbruck, Austria	
Andrea Hemetsberger, University of Innsbruck, Austria	

3.9. *Competitive Paper: Consumer Targeted Advertising*

Chair: Sara Appleton-Knapp, SDSU College of Business, USA

<i>When More May Be Less: The Effects of Regulatory Focus on Responses to Maximal/Minimal Comparative Frames</i>	200
Shailendra Jain, Indiana University, USA	
Nidhi Agrawal, Northwestern University, USA	
Durairaj Maheswaran, New York University, USA	
<i>“Be All You Can Be”: The Influence of Advertising Slogans on Regulatory focus and Consumer Spending Behavior</i>	206
Marieke L. Fransen, University of Twente, The Netherlands	
Bob M. Fennis, University of Twente, The Netherlands	
Ad Th. H. Pruyn, University of Twente, The Netherlands	

Does Confirmation Trump Valence? Confirmation and the Effects of Negative and Positive Political Advertising 208
 Joan M. Phillips, University of Notre Dame, USA
 Joel E. Urbany, University of Notre Dame, USA
 Thomas J. Reynolds, University of Texas at Dallas (Emeritus) and SRDA, USA

Perceived Variability, Category Size, and the Relative Effectiveness of “Leading Brand” Versus “Best in Class” Comparative Advertising Claims 209
 Xiaojing Yang, University of Wisconsin, Milwaukee, USA
 Shailendra Jain, Indiana University Bloomington, USA
 Charles Lindsey, State University of New York, Buffalo, USA
 Frank Kardes, University of Cincinnati, USA

Friday
29 September 2006

SESSION 4
 3:00pm-4:30pm

4.1. Special Session: Regulatory Focus and the Use of Time in the Evaluation of Persuasive Messages

Chair: Anne Laure Sellier, New York University, USA
 Discussion Leader: Brian Sternthal, Northwestern University, USA

SPECIAL SESSION SUMMARY

Regulatory Focus and the Use of Time in the Evaluation of Persuasive Messages 210
 Anne-Laure Sellier, New York University, USA
 Brian Sternthal, Northwestern University, USA

The Pressing Preference for Prevention: The Impact of Temporal Construal on the Persuasiveness of Prevention versus Promotion Framed Product Information
 Ginger L. Pennington, University of Chicago, USA
 Jennifer L. Aaker, Stanford University, USA
 Cassie Mogilner, Stanford University, USA

Faster Is Not Always Better: Regulatory Focus and the Interpretation of Download Time
 Anne Laure Sellier, New York University, USA
 Amitava Chattopadhyay, INSEAD, Singapore

Regulatory Focus and Direct Comparative Ad Framing
 Shailendra Pratap Jain, Indiana University, USA
 Charles D. Lindsey, State University of New York at Buffalo, USA
 Nidhi Agrawal, Northwestern University, USA
 Durairaj Maheswaran, New York University, USA

4.2. Special Session: How Consumers Evaluate the Quality of Purchase Decisions

Chair: Justin Kruger, New York University, USA
 Discussion Leader: Mary Frances Luce, Duke University, USA

SPECIAL SESSION SUMMARY

How Consumers Evaluate the Quality of Purchase Decisions 214
 Justin Kruger, New York University, USA
 Gerald Häubl, University of Alberta, Canada

Do the Means Justify the End? The Effect of Choice on Evaluation of Hedonic versus Utilitarian Outcomes

Simona Botti, Cornell University, USA
Ann McGill, University of Chicago, USA

The Opposing Effects of Personalized Recommendations on Objective and Subjective Decision Outcomes

Gerald Häubl, University of Alberta, Canada
Benedict G.C. Dellaert, Erasmus University Rotterdam
Murat Usta, University of Alberta, Canada

Between a Rock and a Hard Place: Focalism in Evaluations of Consumer Choice

Justin Kruger, New York University, USA
Jeremy Burrus, Columbia University, USA

4.3. Special Session: The Role of Consumption in Re-establishing Cultural Stability: Case Studies of Disaster Recovery

Chair: Michelle F. Weinberger, University of Arizona, USA
Discussion Leader: John F. Sherry, University of Notre Dame, USA

SPECIAL SESSION SUMMARY

The Role of Consumption in Re-establishing Cultural Stability: Case Studies of Disaster Recovery 218
Michelle F. Weinberger, University of Arizona, USA

Meeting the Needs of Adolescent Disaster Survivors: Getting the Right Consumer Goods into the Right Hands

Jill G. Klein, INSEAD, France
Laura Huang, INSEAD, France

The Construction of Memory in the Aftermath of 9/11

Jean-Sebastien Marcoux, HEC Montreal, Canada

Tradition and Renewal: Reconstruction of Culture through Consumption

Michelle F. Weinberger, University of Arizona, USA
Melanie Wallendorf, University of Arizona, USA

4.4. Special Session: That's Not What I Wanted: Perspectives on Unwanted Choice Options and Outcomes

Chair: Merrie Brucks, University of Arizona, USA
Wendy Attaya Boland, University of Arizona, USA
Discussion Leader: Deborah J. MacInnis, University of Southern California, USA

SPECIAL SESSION SUMMARY

That's Not What I Wanted: Perspectives on Unwanted Choice Options and Outcomes 222
Merrie Brucks, University of Arizona, USA
Wendy Attaya Boland, University of Arizona, USA

Gone But Not Forgotten: The Role of Unacceptable Options in Decision Making

Katrien Wijnen, Ghent University, Belgium
James R. Bettman, Duke University, USA
Joel Huber, Duke University, USA

Constructive Preferences for Rejected Options: When You Can't Get What You Want

Wendy Attaya Boland, University of Arizona, USA
Merrie Brucks, University of Arizona, USA
Jesper H. Nielsen, University of Arizona, USA

What's Yours Is Mine: Self-construal and Reactance on Behalf of Others
Sarah Moore, Duke University, USA
Gavan J. Fitzsimons, Duke University, USA

4.5. Special Session: The Flavors of Emotions: Interplay of Affect and Decision Making

Chair: Monica Wadhwa, Stanford University, USA
Discussion Leader: Antoine Bechara, University of Southern California, USA

SPECIAL SESSION SUMMARY

The Flavors of Emotions: Interplay of Affect and Decision Making 225
Monica Wadhwa, Stanford University, USA

On the Consumption of Negative Feelings
Eduardo B. Andrade, University of California, Berkeley, USA
Joel B. Cohen, University of Florida, USA

In Search of Homo Economicus: Transitivity, Emotions, and Cognition
Leonard Lee, MIT, USA
Dan Ariely, MIT, USA
On Amir, University of California, San Diego, USA

Tantalizing Effects of Sampling: The Influence of Sampling on Motivational States
Steve Nowlis, Arizona State University, USA
Baba Shiv, Stanford University, USA
Monica Wadhwa, Stanford University, USA

4.6. Special Session: Catching Up with Consumer Visuals: Theory, Evidence, Upgrades, and Plug-Ins

Chair: Linda Scott, Oxford University, UK
Discussion Leader: David Mick, University of Virginia, USA

SPECIAL SESSION SUMMARY

Catching Up With Consumer Visuals: Theory, Evidence, Upgrades, and Plug-Ins 229
Linda Scott, University of Oxford, United Kingdom

Imagining Identity: Technology and the Body in Marketing Communications
Jonathan Schroeder, University of Exeter, UK
Peter Dobers, Mälardalen University, Sweden

Reason and Realism: Image as Argument
Linda Scott, Oxford University, UK
Patrick Vargas, University of Illinois, USA

Pictures, More Pictures, Nothing But Pictures: Image as Genre
Barbara J. Phillips, University of Saskatchewan, Canada
Edward F. McQuarrie, Santa Clara University, USA

4.7. *Competitive Paper: Product Perception*

Chair: Kalpesh Desai, The State University of New York at Binghamton, USA

<i>The Moderating Role of Need for Cognition and Counterfactual Thinking on Product Evaluation</i>	233
Kai-Yu Wang, University of Wisconsin-Milwaukee, USA	
Minli Liang, SUNY-Brockport, USA	
Laura Peracchio, University of Wisconsin-Milwaukee, USA	
<i>Visualization and New Product Evaluation: The Role of Memory- and Imagination-Focused Visualization</i>	235
Min Zhao, University of North Carolina, USA	
Steve Hoeffler, Vanderbilt University, USA	
Darren Dahl, University of British Columbia, Canada	
<i>Design and the Big Five: Linking Product Aesthetics to Product Personality</i>	238
Frédéric F. Brunel, Boston University, USA	
Rishtee Kumar, Boston University, USA	
<i>Product Design Perception and Brand Categorization</i>	240
Robert Kreuzbauer, University of Illinois at Urbana-Champaign, USA	
Alan J. Malter, University of Arizona, USA	

4.8. *Competitive Paper: Reactance, Trust, and Loyalty*

Chair: Meryl Gardner, University of Delaware, USA

<i>Playing Games Efficiently: Hedonic Learning and Loyalty</i>	247
Kyle B. Murray, University of Western Ontario, Canada	
Steve Bellman, Murdoch University, Australia	
<i>Using Public Commitment to Gain Customer Compliance</i>	249
Stephanie Dellande, Chapman University, USA	
Prashanth Nyer, Chapman University, USA	
<i>Consumer Experiences and Market Resistance: An Extension of Resistance Theories</i>	256
Angeline Grace Close, University of Nevada Las Vegas, USA	
George M. Zinkhan, University of Georgia, USA	
<i>Reducing Reactance Induced Backlash Responses to Recommendations</i>	263
Yael Zemack-Rugar, Duke University, USA	
Gavan J. Fitzsimons, Duke University, USA	
Donald R. Lehmann, Columbia University, USA	

<p style="text-align: center;">FRIDAY 29 September 2006</p> <p style="text-align: center;">ACR PROGRAM COMMITTEE MEETING 4:15pm-4:45pm</p> <p style="text-align: center;">JCR EDITORIAL REVIEW BOARD RECEPTION AND BUSINESS MEETING 4:30pm-6:15pm</p>

FRIDAY
29 September 2006

SESSION 5
4:45pm-6:15pm

5.1. Special Session: Advances in Understanding Consumers' Price Sensitivity

Chair: Joseph Simmons, Yale University, USA

SPECIAL SESSION SUMMARY

Advances in Understanding Consumers' Price Sensitivity 265

Joseph Simmons, Yale University

The Persuasive Power of Quality: Consumers' Misprediction of their Reactions to Price Promotions

Cenk Bulbul, New York University, USA

Tom Meyvis, New York University, USA

Intuitive Confidence: When Consumer Choices are Sensitive to Matching Prices

Joseph P. Simmons, Yale University, USA

Leif D. Nelson, New York University, USA

Lay Scientist: Ignorance of Value in Compensation Decisions

Claire Tsai, University of Chicago, USA

Christopher Hsee, University of Chicago, USA

The Effect of Opportunity Cost Salience on Purchase Decision

Shane Frederick, Massachusetts Institute of Technology, USA

Nathan Novemsky, Yale University, USA

Jang Wang, Yale University, USA

Ravi Dhar, Yale University, USA

Stephen M. Nowlis, Arizona State University, USA

5.2. Special Session: Belief Confidence and Consumer Reactions to Persuasive Messages:

Chair: Wes Hutchinson, Univeristy of Pennsylvania, USA

Discussion Leader: Americus Reed, Univeristy of Pennsylvania, USA

SPECIAL SESSION SUMMARY

Belief Confidence and Consumer Reactions to Persuasive Messages: Measures, Models, and Mechanisms 266

J. Wesley Hutchinson, University of Pennsylvania

Yanliu Huang, University of Pennsylvania

Believing that One is Strong as a Defensive Weakness: Using Defensive Confidence to Attract Reluctant Audiences

Dolores Albarracin, Univeristy of Florida, USA

Amy L. Mitchell, Univeristy of Florida, USA

Marta R. Durantini, Univeristy of Florida, USA

Allison Earl, Univeristy of Florida, USA

Justin Levitt, Univeristy of Florida, USA

Joanne Gunnoe, Alachua County Health Department, USA

Counting Every Thought: Indirect Measures of Cognitive Responses to Advertising

Yanliu Huang, Univeristy of Pennsylvania, USA

J. Wesley Hutchinson, Univeristy of Pennsylvania, USA

Sampling, Overconfidence, and Consumer Decisions
Jack B. Soll, Duke University, USA
Joshua Klayman, University of Chicago, USA

5.3. Special Session: Recent Research on Implicit Motivation

Chair: Andrew Mitchell, University of Toronto, Canada
Discussion Leader: Tanya Chartrand, Duke University, USA

SPECIAL SESSION SUMMARY

Recent Research on Implicit Motivation 270
Andrew Mitchell, University of Toronto, Canada

Unconscious Goals and Creativity: Activating Creativity Goals Breaks Established Associations and Leads to the Generation of Original Ideas
Gordon B. Moskowitz, Lehigh University, USA
Kai Sassenberg, University of Jena, Germany

The Automatic Evaluation of Goals
Melissa J. Ferguson, Cornell University, USA

Automatic Evaluations and Self-Control
Darlene Walsh, University of Toronto, Canada
Andrew Mitchell, University of Toronto, Canada

5.4. Special Session: It's All in How You Look at it—The Impact of Having an Incremental or Entity Theory on Consumer Behavior

Chair: Subbu Sivaramakrishnan, University of Manitoba, Canada
Discussion Leader: Harish Sujjan, Tulane University, USA

SPECIAL SESSION SUMMARY

It's All in How You Look at it—The Impact of Having an Incremental or Entity Theory on Consumer Behavior 274
Subbu Sivaramakrishnan, University of Manitoba, Canada

Implicit Theories: Implications for Consumer Behavior
Carol S. Dweck, Stanford University, USA

Revising Negative Initial Judgments of Salespeople: The Role of Implicit Theories in Overcoming the Perils of Active Listening
Subbu Sivaramakrishnan, University of Manitoba, Canada
Harish Sujjan, Tulane University, USA
Mita Sujjan, Tulane University, USA

The Role of Implicit Theories in Brand Extendibility
Eric Yorkston, Texas Christian University, USA
Joseph Nunes, University of Southern California, USA
Shashi Matta, Ohio State University, USA

5.5. *Competitive Paper: Consumer Demographic Differences*

Chair: Adriana M. Boveda-Lambie, University of Rhode Island, USA
Ann Veeck, Western Michigan University, USA

<i>Minority Consumers' Experiences of Marketplace Discrimination in Services: A Conceptual Model of Antecedents and Customer Outcomes</i>	278
Gianfranco Walsh, University of Koblenz-Landau, Germany	
Donna McGuire, University of Strathclyde Business School, Scotland	
<i>Brand in the Hand or Sand in the Hand? A Contextualized Account of Adolescents' Mobile Phone Consumption</i>	280
Ian Grant, University of Strathclyde, Scotland	
Stephanie O'Donohoe, University of Edinburgh, Scotland	
<i>A Multivariate Segmentation Model of the Older UK Consumer Market</i>	286
Lynn Sudbury, Liverpool John Moores University, UK	
Peter Simcock, Liverpool John Moores University, UK	
<i>Demographics in Sales Promotion Proneness: A Socio-Cultural Approach</i>	288
Kyoung-Nan Kwon, Michigan State University, USA	
Yoo Jin Kwon, Iowa State University, USA	

5.6. *Competitive Paper: Online Shopping and Marketing*

Chair: Igor Makienko, Loyola University New Orleans, USA

<i>Information Search and Consideration Set Formation in a Web-Based Environment</i>	295
Girish Punj, University of Connecticut, USA	
Robert Moore, Mississippi State University, USA	
<i>Selective Versus Comprehensive Processors: Gender Differences in Web Consumer Behavior</i>	303
Marie-Odile Richard, HEC-Montreal Business School, Canada	
Jean-Charles Chebat, HEC-Montreal Business School, Canada	
Zhiyong Yang, Concordia University, Canada	
Michel Laroche, Concordia University, Canada	
<i>Forced vs. Voluntary Exposure Web Ads: Immediate and Long-Term Impact of Ad Avoidance on Communication Outcomes</i>	304
Patrali Chatterjee, Montclair State University, USA	
<i>"Is it Really Complicated?" Motivational Differences in the Effects of Structural and Outcome Complexity on Consumers' Web site and Brand Evaluations</i>	305
Reetika Gupta, Lehigh University, USA	
Stephen J. Gould, Baruch College/CUNY, USA	

5.7. *Competitive Paper: The Dark Side of Marketing*

Chair: Ron Faber, University of Minnesota, USA
Tina Kiesler, California State University, Northridge, USA

<i>Mothers' Perceptions of their Control over their Children's Diets</i>	306
Simone Pettigrew, University of Western Australia, Australia	
Michele Roberts, University of Western Australia, Australia	

<i>Relationships Can Disappear in a Puff of Smoke: A Test of TMT and Risk Perceptions on Smoking Behavior</i>	312
Ingrid Martin, California State University-Long Beach, USA	
Michael Kamins, University of Southern California, USA	
<i>The Dark Side of Brand Community: Inter-Group Stereotyping, Trash Talk, and Schadenfreude</i>	314
Thomas Hickman, Loyola University, USA	
James Ward, Arizona State University, USA	

5.8. **Competitive Paper: Getting Through to the Consumer: Advertising and its Effects**

Chair: Sharmistha Law, University of Toronto, Canada

<i>A Meta-Analysis of Humor Effects in Advertising</i>	320
Martin Eisend, Freie Universität Berlin, Germany	
<i>The Role of Power in Consumer Persuasion</i>	324
Pablo Brinol, Universidad Autonoma de Madrid, Spain	
Derek Rucker, Kellogg School of Management, USA	
Richard Petty, Ohio State University, USA	
Carmen Valle, Universidad Autonoma de Madrid, Spain	
Alberto Becerra, Universidad Autonoma de Madrid, Spain	
<i>The Good, the Bad, and the Ugly: Firm Reputation, Advertising Correction, and Consumer Defensiveness</i>	326
Peter Darke, Florida State University, USA	
Laurence Ashworth, Queens University, Canada	
Robin Ritchie, University of Western Ontario, Canada	
<i>The Impact of Perceived Advertising Creativity on Ad Processing and Responses</i>	328
Xiaojing Yang, University of Wisconsin, Milwaukee, USA	
Robert Smith, Indiana University, USA	

<p>Friday 29 September 2006</p> <p>RECEPTION AND WORKING PAPER SESSION 6:15pm-8:00pm</p>

Working Paper: Working Paper Poster Session

<i>Endowment Effect as Inertia Equity in Brand Switching</i>	329
Gwei Ye, Towson University	
Curtis Haugtvedt, Ohio State University	
W. Fred Van Raaij, Tilburg University	
<i>Relationship Proneness—The Concept, Its Dimensions and Indicators</i>	329
Alberto Marcati, LUISS Guido Carli University, Italy	
Claudio Barbaranelli, University of Rome La Sapienza, Italy	
Michele Vecchione, University of Rome La Sapienza, Italy	
<i>U.S. Consumer's Cultural Choices: The Interplay of Ethnocentrism and Global Openness</i>	331
Dale Russell, INSEAD, France	
<i>Self-Monitoring and Status Motivation: An Implicit Cognition Perspective</i>	332
Sandor Czellar, HEC Paris, France	

<i>A Construal Level Theory Approach to Understanding Self-Control Strategies</i>	334
Kelly Haws, University of South Carolina	
<i>Collins's Interaction Ritual Theory: Using Interaction Rituals to Conceptualize How Objects Become Sacred Symbols</i>	335
Kyle A. Huggins, University of Arkansas - Fayetteville, USA	
Jeff B. Murray, University of Arkansas - Fayetteville, USA	
Jeremy Kees, University of Arkansas - Fayetteville, USA	
Elizabeth H. Creyer, University of Arkansas - Fayetteville, USA	
<i>Increasing Persuasion, Reducing Resistance: Maximizing the Efficacy of Persuasive Appeals for Esthetic Product Consumption</i>	337
Elyria Kemp, University of Arkansas, USA	
Elizabeth H. Creyer, University of Arkansas, USA	
<i>Are Good Intentions Enough? Encouraging Regular Savings Through Implementation Intentions</i>	338
Cäzilia Loibl, The Ohio State University, USA	
Robert Scharff, The Ohio State University, USA	
<i>Consumers' Appreciation of Product Personalization</i>	339
Ruth Mugge, Delft University of Technology, the Netherlands	
Jan P. L. Schoormans, Delft University of Technology, the Netherlands	
Addie de Lange, Delft University of Technology, the Netherlands	
<i>Consideration of Future Consequences as a Moderator of Temporal Framing and Regulatory Focus in a Risk Domain</i>	341

SATURDAY
30 September 2006

SCP EXECUTIVE COMMITTEE MEETING
7:30am-9:00am

ACR FILM FESTIVAL
8:00am-11:30am

SATURDAY
30 September 2006

SESSION 6
8:00am-9:30am

6.1. Special Session: Understanding Reactions to Assortments: A Process Perspective

Chair: Kristin Diehl, University of Southern California, USA
Discussion Leader: Brian Wansink, Cornell University, USA

SPECIAL SESSION SUMMARY

<i>Understanding Reactions To Assortments: A Process Perspective</i>	478
Kristin Diehl, University of Southern California, USA	
<i>The Psychology of Category Design: The Impact of Goal-Derived Structures on Consumer Information Processing and Choice</i>	
Cait Poynor, University of South Carolina, USA	
Kristin Diehl, University of Southern California, USA	
<i>The Company They Keep: The Influence of Reasons for Option Limitation on Assortment Judgments</i>	
Ann Schlosser, University of Washington, USA	
Tiffany White, University of Illinois, USA	
<i>Search Paradox: The Role of Feature Alignability in the Rise and Fall of Satisfaction</i>	
Jill Griffin, University of Evansville, USA	
Susan Broniarczyk, University of Texas at Austin, USA	

6.2. Roundtable Session: How To Do (Better) Web-Based Research 482

Chair: Dan Goldstein, London Business School, UK

Participants:

Donna Hoffman, Vanderbilt University, USA
Eric Johnson, Columbia University, USA
Gerald Haubl, University of Alberta, USA
Michael Schulte, Columbia University, USA
On Amir, UC-San Diego, USA
Tom Novak, Vanderbilt University, USA
Dan Goldstein, London Business School, UK

6.3. Special Session: Using or Losing Self Control: Antecedents of Regulatory Strength and Regulatory Depletion

Chair: Minjung Koo, University of Chicago, USA
Discussion Leader: Angela Y Lee, Northwestern University, USA

SPECIAL SESSION SUMMARY

Using or Losing Self Control: Antecedents of Regulatory Strength and Regulatory Depletion 483

Minjung Koo, University of Chicago
Angela Y. Lee, Northwestern University

Against the Odds: Prevention Focus Stands Firm in the Face of Temptations

Minjung Koo, University of Chicago, USA
Aparna A. Labroo, University of Chicago, USA
Angela Y Lee, Northwestern University, USA

Affect as a Cue for Goal Conflict Resolution

Tal Eyal, University of Chicago, USA
Ayelet Fishbach, University of Chicago, USA

Self-control, Depletion and Choice

Nathan Novemsky, Yale University, USA
Jing Wang, Yale University, USA
Ravi Dhar, Yale University, USA
Roy Baumesiter, Florida State University, USA

A Loss of Self-Regulatory Resources Makes People More Passive

Kathleen D. Vohs, University of Minnesota, USA
Matt Gailliot, Florida State University, USA

6.4. Special Session: Did You Know that Questioning Consumers Can Change Behavior?: New Research and Future Directions on the Question-Behavior Effect

Chair: Patti Williams, University of Pennsylvania, USA
Discussion Leader: David Sprott, Washington State University, USA

SPECIAL SESSION SUMMARY

Did You Know that Questioning Consumers Can Change Behavior?: New Research and Future Directions on the Question-Behavior Effect 487

Patti Williams, University of Pennsylvania, USA
David Sprott, Washington State University, USA

The Effects of Stating Expectations on Customer Satisfaction and Shopping Experience

Chezy Ofir, Hebrew University, Israel
Itamar Simonson, Stanford University, USA

Understanding Positivity Effects of Firm-Sponsored Satisfaction Surveys on Customer Behavior

Paul Dholakia, Rice University, USA
Robert Westbrook, Rice University, USA

Examining the Question-Behavior Effect Using the Implicit Association Test

Andrew Perkins, Rice University, USA
David Sprott, Washington State University, USA
Eric Spangenberg, Washington State University, USA
David Knuff, Oregon State University, USA
Ronn Smith, University of Arkansas, USA

6.5. Special Session: Reconsidering Dramatic Frameworks in Consumer Culture Research

Chair: Gulnur Tumbat, Oregon State University, USA
Markus Giesler, York University, Canada

Discussion Leader: Eric Arnould, University of Arizona, USA

SPECIAL SESSION SUMMARY

Rethinking Drama in Consumer Culture Research 488

Gülnur Tumbat, Oregon State University, USA
Markus Giesler, York University, Canada

The War on Downloading: A Music Marketplace Drama in Four Acts

Markus Giesler, York University, Canada
Marius Luedicke, York University, Canada

Four Ds of Risky Leisure: Drama, Divinity, Deservingness, and Deliverance

Gülnur Tumbat, Oregon State University, USA

“We Just Gripe’n Gripe...That’s All We Do!” : Performing the Griping Ritual in the Weight Watchers Brand Community

Risto Moisio, University of Arizona, USA
Mariam Beruchashvili, University of Arizona, USA

6.6. Competitive Paper: Searching for What’s Best: Information Search Processing

Chair: Elizabeth Creyer, University of Arkansas, USA

Currency of Search: Time versus Money 492

Ritesh Saini, George Mason University, USA
Ashwani Monga, University of Texas at San Antonio, USA

How Do Low-Price Guarantees Deter Consumer Price Search? The Effects of Branded Variants and Search Cost 494

Hillbun (Dixon) Ho, University of Arizona, USA

Giving an “E-Human Touch” to E-Tailing: The Moderating Roles of Static Information Quantity and Consumption Motive in the Effectiveness of a Virtual Salesperson 495

Fang Wan, University of Manitoba, Canada
Subramanian Sivaramakrishnan, University of Manitoba, Canada
Zaiyong Tang, Louisiana Tech University, USA

<i>The Benefits Leader Reversion Effect: How a Once Preferred Product Can Recapture Its Standing</i>	497
Kurt A. Carlson, Duke University, USA	
Margaret G. Meloy, Pennsylvania State University, USA	
Daniel S. Lieb, Duke University, USA	

6.7. Competitive Paper: Reaching Out: A Look at Brand Extensions

Chair: S. Adam Brasel, Boston College, USA

<i>The Brand Anchoring Effect: A Judgment Bias Resulting from Brand Awareness and Temporary Accessibility</i>	498
Franz-Rudolf Esch, Justus Liebig University Giessen, Germany	
Bernd H. Schmitt, Columbia Business School, USA	
Joern Redler, Madeleine Mode, Germany	
Tobias Langner, Justus Liebig University Giessen, Germany	
<i>Brands as Categories: Graded Structure and Its Determinants</i>	500
Christopher Joiner, George Mason University, USA	
<i>Which Fit Do Consumers Use in Composite Brand Extensions?</i>	507
Roger Pruppers, Maastricht University, The Netherlands	
Hans Ouwersloot, Maastricht University, The Netherlands	
Niraj Dawar, University of Western Ontario, Canada	
<i>Corporate and Product Message Effects on a Product Portfolio</i>	509
Daniel A. Sheinin, University of Rhode Island, USA	
Gabriel J. Biehal, University of Maryland, USA	

6.8. Competitive Paper: Behavioral Decision Theory and Choice

Chair: Kristine Ehrich, Washington State University, USA
Barney Pacheco, The University of the West Indies

<i>Me, Myself, and My Choices. The Influence of Self-Awareness on Preference-Behavior Consistency</i>	510
Caroline Goukens, K.U.Leuven, Belgium	
Siegfried Dewitte, K.U.Leuven, Belgium	
Luk Warlop, K.U.Leuven, Belgium	
<i>Who Chose the Forgone Alternative?: The Effects of Social Comparison on Regret</i>	511
Karen L. Page, University of Pittsburgh, USA	
Vikas Mittal, University of Pittsburgh, USA	
J. Jeffrey Inman, University of Pittsburgh, USA	
<i>To Hold Me Is To Love Me: The Role of Touch in the Endowment Effect</i>	513
Suzanne Shu, Southern Methodist University, USA	
Joann Peck, University of Wisconsin-Madison, USA	
<i>Scope Insensitivity in the Service of the Rational Self: The "Mere Token" Effect</i>	515
Oleg Urminsky, Columbia University, USA	
Ran Kivetz, Columbia University, USA	

6.9. *Competitive Paper: Word-of-Mouth, Agency, and Dynamics*

Chair: Qing Wang, Warwick Business School

<i>A Structural Look At Consumer Innovativeness and Self-Congruence In New Product Purchases</i>	517
Kelly O. Cowart, Florida State University, USA	
Gavin L. Fox, Florida State University, USA	
Andrew E. Wilson, Florida State University, USA	
<i>The Effect of Uniqueness on Word-Of-Mouth Agency: The Moderating Roles of Product Category and Availability</i>	519
Amar Cheema, Washington University in St. Louis, USA	
Andrew Kaikati, University of Minnesota, USA	
<i>Personality Characteristics of Market Mavens</i>	522
Vito Brancaleone, La Trobe University, Australia	
John Gountas, La Trobe University, Australia	
<i>Does Word-of-Mouth Change with the Passing of Time?</i>	528
Anat Toder-Alon, Boston University, USA	
Frédéric F. Brunel, Boston University, USA	

<p style="text-align: center;">SATURDAY 30 September 2006</p> <p style="text-align: center;">SESSION 7 10:00am-11:30am</p>
--

7.1. *Special Session: Health Marketing: How Consumers Cope*

Chair: Lisa E. Bolton, University of Pennsylvania, USA
Discussion Leader: Joel B. Cohen, University of Florida, USA; Editor JPPM, USA

SPECIAL SESSION SUMMARY

<i>Health Marketing: How Consumers Cope</i>	530
Lisa E. Bolton, University of Pennsylvania, USA	
<i>How Does Drug And Supplement Marketing Affect A Healthy Lifestyle?</i>	
Lisa E. Bolton, University of Pennsylvania, USA	
Americus Reed II, University of Pennsylvania, USA	
Kevin G. Volpp, Philadelphia Veterans Affairs Medical Center and University of Pennsylvania, USA	
Katrina Armstrong, University of Pennsylvania, USA	
<i>Getting Emotional About Health</i>	
Nidhi Agrawal, Northwestern University, USA	
Geeta Menon, New York University, USA	
Jennifer L. Aaker, Stanford University, USA	
<i>Fact, Fear, or Regret: Getting People to Cope Actively</i>	
Kirsten Grasshof, Salisbury University, USA	
Barbara Kahn, University of Pennsylvania, USA	
Mary Frances Luce, Duke University, USA	

7.2. Special Session: Negativity Biases in Consumer Preferences, Choices, and Outcome Perception

Chair: Carey K. Morewedge, Princeton University, USA
Discussion Leader: Dan Ariely, MIT, USA

SPECIAL SESSION SUMMARY

Negativity Biases in Consumer Preferences, Choice, and Outcome Perception 534

Carey K. Morewedge, Princeton University, USA

Do People Agree More On Who is Pretty or On Who is Ugly?

Christopher Hsee, The University of Chicago, USA

De gustibus non est disputandum? The Impact of the Nature of the Chosen Option in Positive and Negative Contexts

Thomas Kramer, City University of New York, USA

Michal Maimaran, Stanford University, USA

Itamar Simonson, Stanford University, USA

Negativity Bias in the Perception of External Agency

Carey K. Morewedge, Princeton University, USA

7.3. Special Session: Current Methodological Concerns for the Behavioral Researcher

Chair: Joachim Vosgerau, Carnegie Mellon, USA
Discussion Leader: Joel Huber, Duke University, USA

SPECIAL SESSION SUMMARY

Current Methodological Concerns for the Behavioral Researcher 536

Joachim Vosgerau, Carnegie Mellon, USA

A Meditation on Mediation

Dawn Iacobucci, Wharton, USA

Mean-Centering and the Interpretation of ANOVA and Moderated Regression

Joachim Vosgerau, Carnegie Mellon, USA

Hubert Gatignon, INSEAD, France

An Extended Paradigm for Measurement Analysis of Marketing Constructs Applicable to Panel Data

Hans Baumgartner, Penn State University, USA

Jan-Benedict E.M. Sreenkamp, University of Northern Carolina, USA

7.4. Roundtable Session: The Question-Behavior Effect: Current and Future Research 539

Chair: David Sprott, Washington State University, USA

Participants:

- Pierre Chandon, INSEAD, France (on leave at Wharton)
- Paul Dholakia, Rice University, USA
- Gavan J. Fitzsimons, Duke University, USA
- Chris Janiszewski, University of Florida, USA
- Jonathan Levav, Columbia University, USA
- Andrew Perkins, Rice University, USA
- Baba Shiv, Stanford University, USA
- Itamar Simonson, Stanford University, USA
- Ronn Smith, University of Arkansas, USA
- Eric Spangenberg, Washington State University, USA
- Chezy Ofir, Hebrew University, Israel
- Vicki G. Morwitz, New York University, USA

7.5. Special Session: Possessions and Identity: Shifting Identities, Shifting Relationships

Chair: Jonah Berger, Stanford University, USA

SPECIAL SESSION SUMMARY

Possessions and Identity: Shifting Identities, Shifting Relationships 541
Jonah Berger, Stanford University, USA

I Wasn't Myself When I Chose That: Identity-Salience Fluctuations and Post-Choice (Dis)Satisfaction
Robyn A. LeBoeuf, University of Florida, USA
Julia Belyavsky, University of Florida, USA

Attachment Style, Psychological Security, and Consumer Response to Special Possession Loss
Rosellina Ferraro, University of Maryland, USA
Jennifer Escalas, Vanderbilt University, USA
James R. Bettman, Duke University, USA

Identity Shifts and the Decision to Consume
Jane Machin, Virginia Tech, USA

Don't Confuse Me with Them: Identity-Signaling and Product Abandonment
Jonah Berger, Stanford University, USA
Chip Heath, Stanford University, USA

7.6. Special Session: Gazing into the Crystal Ball: How Thinking about the Future Impacts the Present and Relates to Faulty Memories of the Past

Chair: Rebecca K. Ratner, University of Maryland, USA

SPECIAL SESSION SUMMARY

Gazing into the Crystal Ball: How Thinking about the Future Impacts the Present and Relates to Faulty Memories of the Past 545
Rebecca K. Ratner, University of Maryland, USA

Contrasting Against the Future: The Unexpected Effects of Expectation
Tom Meyvis, New York University, USA
Leif Nelson, New York University, USA

Forecasting and Backcasting: Predicting the Impact of Events on the Future

Jane E. J. Ebert, University of Minnesota, USA

Daniel T. Gilbert, Harvard University, USA

Why We Don't Learn to Accurately Forecast Our Feelings: How the Misremembering of Our Predictions Blinds Us to Our Past Forecasting Errors

Rebecca K. Ratner, University of Maryland, USA

Tom Meyvis, New York University, USA

Jonathan Levav, Columbia University, USA

How Predictions Differ from Actual Adaptation to Durable Products

Jing Wang, Yale University, USA

Nathan Novemsky, Yale University, USA

Ravi Dhar, Yale University, USA

7.7. Competitive Paper: Belief Formation and Learning

Chair: Robin Coulter, University of Connecticut, USA

How Cue Congruity Affects Consumer Perceptions 549

Anne Roggeveen, Babson College, USA

Dhruv Grewal, Babson College, USA

Cue Competition, Attention Shifting, and the Highlighting Effect 551

Marcus Cunha, University of Washington, USA

Juliano Laran, University of Florida, USA

Do You or Someone You Know? When does Prior Experience Mitigate Unrealistic Optimism and Pessimism in Risk Perception 553

Ying-Ching Lin, National Dong Hwa University, Taiwan

Priya Raghubir, University of California at Berkeley, USA

The Moderating Effects of Past Experience on Behavioral Intentions 555

Blair Kidwell, University of Kentucky, USA

Robert D. Jewell, Kent State University, USA

7.8. Competitive Paper: Demographic Segmentation of Consumers

Chair: Lance-Michael Erickson, University of Arizona, USA

The Role of Fictionality on Gender Differences in Responses to Emotional Melodramatic Entertainment 557

Jennifer J. Argo, University of Alberta, Canada

Rui (Juliet) Zhu, University of British Columbia, Canada

Darren Dahl, University of British Columbia, Canada

Love and Consumption in Poor Families Headed by Lone Mothers 559

Kathy Hamilton, University of Strathclyde, Scotland

Miriam Catterall, Queen's University, Belfast

The Use of Seeker and Sentry Persuasion Management Strategies by Heterosexual Male Shoppers 565

Linda Tuncay, Loyola University Chicago, USA

Cele C. Otnes, University of Illinois at Urbana-Champaign, USA

Children's Conceptualizations of Sales 566

Wendy A. Boland, University of Arizona, USA

Lance-Michael Erickson, University of Arizona, USA

7.9. Competitive Paper: Goal-Directed Behavior: From Motivations to Negotiations

Chair: Margaret Hogg, Lancaster University Management School, UK

Individuality, Relatedness, or None of the Above? How Thinking Concretely Can Impair the Activation of Self-Relevant Goals 567
 Carlos Torelli, University of Illinois at Urbana-Champaign, USA

The Dilution Model: How Additional Goals Undermine the Perceived Effectiveness of a Common Means 569
 Ying Zhang, University of Chicago, USA
 Ayelet Fishbach, University of Chicago, USA
 Arie W. Kruglanski, University of Maryland, USA

Hungry for Money: The Desire for Caloric Resources Increases The Desire for Financial Resources and Vice Versa 571
 Barbara Briers, HEC Paris, France
 Mario Pandelaere, K.U.Leuven, Belgium
 Siegfried Dewitte, K.U.Leuven, Belgium
 Luk Warlop, K.U.Leuven, Belgium

Does Silence Matter? Effect of Time Taken to Respond on Bargaining Outcomes & Evaluations 573
 Shweta S. Oza, University of Maryland, USA
 Joydeep Srivastava, University of Maryland, USA

SATURDAY
30 September 2006

ACR LUNCHEON AND BUSINESS MEETING

ACR FILM FESTIVAL
 1:00pm-3:00pm

Saturday
30 September 2006

SESSION 8
 1:00pm-2:30pm

8.1. Special Session: Challenges and Extensions to Standard Beliefs in Branding Research

Chair: Kelly Goldsmith, Yale University, USA
 Tom Meyvis, New York University, USA

Discussion Leader: C.Whan Park, University of Southern California, USA

SPECIAL SESSION SUMMARY

Challenges and Extensions to Standard Beliefs in Branding Research 575
 Kelly Goldsmith, Yale University, USA
 Tom Meyvis, New York University, USA

Development of the Brand Experience Scale 580
 Lia Zarantonello, IULM University, Italy
 Bernd H. Schmitt, Columbia University, USA
 Josko J. Brakus, University of Rochester, USA

The Effects of Brand Name Structure and Product Experience on Brand Extension Evaluations and Parent Brand Dilution
Sanjay Sood, University of California, Los Angeles, USA
Kevin L. Keller, Dartmouth College, USA

Beyond Survival of the Fittest: The Influence of Mindsets on Consumers' Response to Brand Extensions
Tom Meyvis, New York University, USA
Kelly Goldsmith, Yale University, USA
Ravi Dhar, Yale University, USA

8.2. Special Session: Automatic Heart and Automatic Mind: Nonconscious Affective and Cognitive Influences on Consumer Behavior

Chair: Michal Maimaran, Stanford University, USA

SPECIAL SESSION SUMMARY

Automatic Heart and Automatic Mind: Nonconscious Affective and Cognitive Influences on Consumer Behavior 583

Michal Maimaran, Stanford University, USA
S. Christian Wheeler, Stanford University, USA

Effects of Specific, Nonconscious Emotion Primes on Behavior

Yael Zemack-Rugar, Virginia Tech, USA
James R. Bettman, Duke University, USA
Gavan J. Fitzsimons, Duke University, USA

Circles, Squares, and Choice: Graphical Priming Effects on Uniqueness and Variety Seeking

Michal Maimaran, Stanford University, USA
S. Christian Wheeler, Stanford University, USA

Be Better or Be Merry: How Mood Affects Self-Control

Ayelet Fishbach, University of Chicago, USA
Aparna A. Labroo, University of Chicago, USA

Individual Susceptibility to Priming Effects

Stacy L. Wood, University of South Carolina, USA
Catherine Poynor, University of South Carolina, USA
Tanya Chartrand, Duke University, USA

8.3. Roundtable Session: Exploring the Co-Evolution of Possession Constellations, Self, and Identity: Part Two—Mundane Consumption 588

Chair: Robert E. Kleine, III, Ohio Northern University, USA

Participants:

Eric Arnould, University of Arizona, USA
Linda Price, University of Arizona, USA
Margaret Hogg, Lancaster University, UK
Mike Solomon, St. Joseph's University, USA
Susan Kleine, Bowling Green State University, USA
Americus Reed, University of Pennsylvania, USA
Karen Fernandez, University of Auckland, New Zealand
Jean-Sebastien Marcoux, HEC-Montreal, Canada
Shakeel Siddiqui, Dublin City University, Ireland
Stacy Baker, University of Wyoming, USA
Terry Bristol, Arizona State University-West, USA
Barb Carroll, University of Georgia, USA
Tandy Chalmers, University of Arizona, USA
June Cotte, University of Western Ontario, Canada
Carolyn Curasi, Georgia State University, USA
Benet DeBerry-Spence, University of Illinois-Chicago, USA
Amber Epp, University of Georgia-Lincoln, USA
Gerri Henderson, University of Texas-Austin, USA
Radan Martinec, Ohio Northern University, USA
Catherine Roster, University of New Mexico, USA
Andrea Wojnicki, University of Toronto, Canada

8.4. Special Session: Space, The Final Frontier: Consumer Adaptation, Resistance and Redefinition of Spatial Limitations in the Marketspace

Chair: Teresa Pavia, University of Utah, USA
Discussion Leader: Lisa Penalosa, University of Colorado, USA

SPECIAL SESSION SUMMARY

Space, the Final Frontier: Consumer Adaptation, Resistance and Redefinition of Spatial Limitation in the Marketspace 590

Teresa Pavia, University of Utah, USA
Marlys Mason, Oklahoma State University, USA

Expanding Retail Spaces: Website Accessibility for Consumers with Visual Impairments

Carol Kaufman-Scarborough, Rutgers University, USA
Terry Childers, University of Kentucky, USA

The Homeless Renegotiating Marketspaces: Hey! Why is Your Store in Our Living Room?

Natalie Ross Adkins, Creighton University, USA
Susie Pryor, University of Nebraska, USA

Marketspace Power Struggles: Families Confronting Spatial Limitations

Marlys Mason, Oklahoma State University, USA
Teresa Pavia, University of Utah, USA

8.5. *Special Session: How Long Does it Seem? Advancing the Understanding of Past and Future Time Perception*

Chair: Robyn A. LeBoeuf, University of Florida, USA
Discussion Leader: Daniel Read, University of Durham, UK

SPECIAL SESSION SUMMARY

- How Long Does it Seem? Advancing the Understanding of Past and Future Time Perception* 594
Robyn A. LeBoeuf, University of Florida, USA
- How Long Did That Take? The Role of Causal Attribution in Estimating Elapsed Time*
David Faro, London Business School, UK
Ann McGill, University of Chicago, USA
Reid Hastie, University of Chicago, USA
- 1995 Feels so Close Yet so Far: The Effect of Event “Markers” on the Subjective Feeling of Elapsed Time*
Kristin Diehl, University of Southern California, USA
Jonathan Levav, Columbia University, USA
Gal Zauberman, University of Pennsylvania, USA
- Perceptions of the Length of Future Time Intervals: A Simulation Perspective*
Robyn A. LeBoeuf, University of Florida, USA
Joseph P. Simmons, Yale University, USA

8.6. *Special Session: The Effects of Mortality Salience on Consumption*

Chair: Michal Herzstein, University of Delaware, USA
Discussion Leader: Jamie Lynn Goldenberg, University of South Florida, USA

SPECIAL SESSION SUMMARY

- The Effects of Mortality Salience on Consumption* 598
Michal Herzstein, University of Delaware, USA
- Marketing under Frequent Terror Attacks*
Michal Herzstein, University of Delaware, USA
Sharon Horsky, IDC, Israel
- Mortality Salience, Control, and Choice*
Rosellina Ferraro, University of Maryland, USA
Nidhi Agrawal, Northwestern University, USA
- Shop ‘Til You Drop: The Effect of Mortality Salience on Consumption Quantity*
Naomi Mandel, Arizona State University, USA
Dirk Smeesters, Tilburg University, Netherlands

8.7. *Competitive Paper: Contemporary Perspectives on Market Places*

Chair: Laurel Anderson, Arizona State University, USA

- Ordinary Resistance as a Parasitic Form of Action: A Dialogical Analysis of Consumer/Firm Relations* 602
Dominique Roux, Paris 12 University-IRG, France
- Globalization and Rituals: Does Ramadan Turn into Christmas?* 610
Ozlem Sandikci, Bilkent University, Turkey
Sahver Omeraki, Bilkent University, Turkey

<i>Team-Sponsorship in the Formula One–Does it affect Brand Perception? An Empirical Assessment in the German Car Market</i>	616
David M. Woisetschlager, University of Muenster, Germany	
<i>The Commercial Appeal of Communism. Semiotic Tensions in the U.S. Stoli Advertising Campaign</i>	624
Natasha Tolstikova, University of Maine, USA	
Matthias Bode, University of Hannover, Germany	

8.8. Competitive Paper: Why Buy? Factors Affecting Purchase Decisions

Chair: Meera Venkatraman

<i>Attribute-Value Functions and the Importance of Attributes</i>	627
Koert Van Ittersum, Georgia Institute of Technology, USA.	
Joost M.E. Pennings, University of Illinois at Urbana-Champaign, USA	
<i>Why Not Buy the Leading Brand? A Preliminary Investigation of the Dynamics of Brand Choice</i>	628
WoonBong Na, KyungHee University, Korea	
YoungSeok Son, Hallym University, Korea	
Roger Marshall, Auckland University of Technology, New Zealand	
<i>Utility Blindness: Why Do We Fall For the Deal?</i>	630
Maggie Wenjing Liu, University of Toronto, Canada	
Dilip Soman, University of Toronto, Canada	
<i>The Effect of Mindsets on Consumer Decision Strategies</i>	631
Alison Jing Xu, Hong Kong University of Science and Technology	
Robert S. Wyer, Jr., Hong Kong University of Science and Technology	

8.9. Competitive Paper: Beliefs and Relationships of the Self: Alone and Between Trustees Across Generations

Chair: Fleura Bardhi, Northeastern University, USA

<i>“Confidentially Yours” : Restricting Information Flow Between Trustees Enhances Trust-Dependent Transactions</i>	632
Vincent Mak, The Hong Kong University of Science and Technology	
Rami Zwick, The Hong Kong University of Science and Technology	
<i>The Effect of Superstitious Beliefs on Consumer Judgments</i>	634
Thomas Kramer, Baruch College, CUNY, USA	
Lauren Block, Baruch College, CUNY, USA	
<i>Ambivalent Relationships and Projection onto Indexical Objects</i>	636
Deborah D. Heisley, California State University, Northridge, USA	
Deborah Cours, California State University, Northridge, USA	
<i>The Spyglass Self: A Model of Vicarious Self-perception</i>	642
Noah J. Goldstein, Arizona State University, USA	
Robert B. Cialdini, Arizona State University, USA	

SATURDAY
30 September 2006

SESSION 9
3:00pm-4:30pm

9.1. Special Session: Processes and Outcomes of Consumer Interactions within Brand Communities

Chair: Stefania Ordovas de Almeida, University of Sao Paulo, Brazil
Discussion Leader: James McAlexander, Oregon State University, USA

SPECIAL SESSION SUMMARY

Processes and Outcomes of Consumer Interactions within Brand Communities 644
Stefânia Ordovás de Almeida, University of São Paulo, Brazil
Utpal M. Dholakia, Rice University, USA

The Impact of Market Use of Consumer Generated Content on a Brand Community
Albert Muñoz, DePaul University, USA
Hope Jensen Schau, University of Arizona, USA

How to Get in With the in Crowd
Catja Prykop, Credit Suisse, Sweden
Nader T. Tavassoli, London Business School, UK
Andreas Herrmann, Universitat St. Gallen, Switzerland

Understanding Differences between Firm-Managed and Customer-Managed Brand Communities
Stefania Ordovas de Almeida, Unviersity of Sao Paulo, Brazil
Utpal M. Dholakia, Rice University, USA
Silvia Vianello, Universita Ca' Foscari di Venezia, Italy

9.10. Special Session: Ferber Award Session

9.2. Special Session: Fighting Obesity in Away-from Home Consumption: Healthier Food, Better Nutritional Labels, or Menu Assortment?

Chair: Pierre Chandon, INSEAD, France
Discussion Leader: Stella Volpe, University of Pennsylvania, USA

SPECIAL SESSION SUMMARY

Fighting Obesity in Away-from Home Consumption: Healthier Food, Better Nutritional Labels, or Menu Assortment? 647
Pierre Chandon, INSEAD, France
Brian Wansink, Cornell University, USA

How Health Claims Bias Portion Size Estimations and Lead to Obesity
Pierre Chandon, INSEAD, France
Brian Wansink, Cornell, USA

Why Improved Nutritional Labels May not Help Combat Obesity
Paul Bloom, Duke University, USA
Lisa Bolton, University of Pennsylvania, USA

Don't Quite Super Size Me: Demand for Portion Sizes and Bundles Based on Menu Format

Kathryn Sharpe, Duke University, USA

Richard Staelin, Duke University, USA

Joel Huber, Duke University, USA

9.3. Special Session: Do we Always Judge a Book by its Cover? The 'How' and 'When' of the Effect of Consumers' Stereotypes on Evaluations of Products and Services

Chair: Shashi Matta, Ohio State University, USA

Discussion Leader: Dawn Iacobucci, University of Pennsylvania, USA

SPECIAL SESSION SUMMARY

Do we Always Judge a Book by its Cover? The 'How' and 'When' of the Effect of Consumers' Stereotypes on Evaluations of Products and Services 648
Shashi Matta, Ohio State University, USA

When Women Lead, Do Consumers' Perceptions of Her Firm Follow?

Valerie Folkes, University of Southern California, USA

Shashi Matta, Ohio State University, USA

Racial Stereotypes in Consumer Judgment: The Effect of the Presence of Others

David Faro, London Business School, UK

Ann McGill, University of Chicago, USA

Beyond Demographics and Stereotypes: Effects of Urban Identification on Responses to Actor Race in Advertising

Marlene Morris, University of Georgetown, USA

Ladies and Gentlemen, Lend Me Your Attitudes...: Implicit Attitude Formation As a Result of Group Membership and Consumption Stereotypes

Andrew Perkins, Rice University, USA

Brad Pinter, Penn State Altoona, USA

Anthony G. Greenwald, University of Washington, USA

Mark Forehand, University of Washington, USA

9.4. Roundtable Session: Philosophy and Consumption 652

Chair: Janet Borgerson, University of Exeter, UK

Participants:

Shona Bettany, Bradford University, UK

Susan Dobscha, Bentley College, USA

Marcus Giesler, York University, Canada

Kent Grayson, Northwestern University, USA

Ashlee Humphreys, Northwestern University, USA

Krittinee Nuttavuthisit, Chulalongkorn University, Thailand

Rob Kleine, Ohio Northern University, USA

Jonathan Schroeder, University of Exeter, UK

Alladi Venkatesh, University of California-Irvine, USA

Clara Gustafsson, Stockholm University, Sweden

9.5. *Special Session: Time and Decision: New Perspectives on Present-Biased Preferences*

Chair: Selin Malkoc, University of Minnesota, USA
Discussion Leader: Drazen Prelec, Massachusetts Institute of Technology, USA

SPECIAL SESSION SUMMARY

Time and Decision: New Perspectives on Present-Biased Preferences 653
Selin A. Malkoc, University of Minnesota, USA

A New Method of Measuring Temporal Discounting: The Motivational Present Value of Future Rewards
Jane Ebert, University of Minnesota, USA
Drazen Prelec, Massachusetts Institute of Technology, USA

Impatience is In the Mindset: Carryover Effects of Processing Abstractness in Sequential Tasks
Selin Malkoc, University of Minnesota, USA
Gal Zauberger, University of Pennsylvania, USA
James Bettman, Duke University, USA

Longitudinal Time Inconsistency
Daniel Read, University of Durham, UK
Shane Frederick, Massachusetts Institute of Technology, USA

9.6. *Special Session: Changing Colors of My Thinking Hat: Influence of Situational and Task-Related Factors on Thinking Styles*

Chair: Monica Wadhwa, Stanford University, USA
Discussion Leader: Amitava Chattopadhyay, INSEAD, Singapore

SPECIAL SESSION SUMMARY

Changing Colors of My Thinking Hat: Influence of Situational and Task-Related Factors on Thinking Styles 657
Monica Wadhwa, Stanford University, USA

New Measures of Task-Specific Experiential and Rational Cognition
Thomas P. Novak, Vanderbilt University
Donna L. Hoffman, Vanderbilt University

Thinking Inside the Box: Why Consumers Enjoy Constrained Creative Experiences
Darren W. Dahl, University of British Columbia, Canada
C. Page Moreau, University of Colorado, US

The Eye's Mind and the Mind's Eye: Impact of Overt Visual Attention on Creative Thinking"
Baba Shiv, Stanford University, USA
Monica Wadhwa, Stanford University, USA

9.7. *Competitive Paper: Keep Them Coming Back: Customer Loyalty and Relationship Management*

Chair: Larry Compeau, Clarkson University, USA

The Process by Which Brand Committed Consumers Evaluate Competitive Brands: The Case for Similarity and Dissimilarity Testing 662
Sekar Raju, University at Buffalo, USA
H. Rao Unnava, Ohio State University, USA

Agent Gender and Sex-Typed Social Influenceability in Online Communication 664
Eun-Ju Lee, Chung-Ang University, Korea

<i>Let Your Workspace Speak for Itself: The Impact of Material Objects on Impression Formation and Service Quality Perception</i>	669
Joost W.M. Verhoeven, University of Twente, The Netherlands	
Thomas J.L. Van Rompay, University of Twente, The Netherlands	
Ad Th.H. Pruyn, University of Twente, The Netherlands	

<i>A Two-Step Model of Service Dissatisfaction: Theory and Evidence</i>	675
Lisa C. Wan, The Chinese University of Hong Kong	
Haksin Chan, The Chinese University of Hong Kong	

9.8. Competitive Paper: New Scale Development and Refinement

Chair: Dipayan Biswas, Bentley College, USA

<i>Consumers' Arrogance: Construct Conceptualization and Preliminary Validation Evidence</i>	677
Ayalla Ruvio, University of Haifa, Israel	
Aviv Shoham, University of Haifa, Israel	
Shlomo Hareli, University of Haifa, Israel	

<i>Sustained Consumer Fascination</i>	679
Canan Corus, Virginia Tech, USA	
Julie L. Ozanne, Virginia Tech, USA	

<i>The Brand Dislike Construct: Scale Development and Application to Actual Brands</i>	680
Daniele Dalli, Università di Pisa, Italy	
Silvia Grappi, Università di Modena e Reggio Emilia, Italy	
Simona Romani, Università di Sassari, Italy	
Giacomo Gistri, Università di Pisa, Italy	

<i>Toward a Theory on the Content and Structure of Money Attitudes</i>	682
Steven Michael Burgess, University of Cape Town, South Africa	

9.9. Competitive Paper: Media Effects on Brand Perceptions and Consumer Trust

Chair: Ashesh Mukherjee, McGill University, Canada

<i>Does a Medium Context Have a Priming or an Interference Effect? It Depends on How You Look At It</i>	684
Wim Janssens, University of Antwerp, Belgium	
Patrick De Pelsmacker, University of Antwerp, Belgium	
Maggie Geuens, Ghent University, Belgium	

<i>When Advertising Integration with Media Content Fails and Succeeds</i>	686
Jing Wang, University of Iowa, USA	
Bobby Calder, Northwestern University, USA	

<i>Convergence of Interests—Cultivating Consumer Trust through Corporate Social Initiatives</i>	687
Shuili Du, Boston University, USA	
C.B. Bhattacharya, Boston University, USA	
Sankar Sen, Baruch College, USA	

<i>The Effects of Different Category Context on Target Brand Evaluations</i>	688
Myungwoo Nam, INSEAD, Singapore	
Brian Sternthal, Northwestern University, USA	

SATURDAY
30 September 2006
JCP EDITORIAL BOARD MEETING
 4:30pm-6:00pm

SATURDAY
30 September 2006
SESSION 10
 4:45pm-6:15pm

10.1. Special Session: Casino Gambling: Meanings, Motives and Marketers

Chair: June Cotte, University of Western Ontario, Canada
 Discussion Leader: David Sprott, Washington State University, USA

SPECIAL SESSION SUMMARY

Casino Gambling: Meanings, Motives and Marketers 689
 June Cotte, University of Western Ontario, Canada

The Effect of Visual Stimuli in Casinos on Emotional Responses and Problem Gambling Behavior
 Karen Finlay, University of Guelph, Canada
 Vinay Kanetkar, University of Guelph, Canada
 Jane Londerville, University of Guelph, Canada
 Harvey H. C. Marmurek, University of Guelph, Canada

An Assessment of the Value of Slot Clubs as Drivers of Casino Loyalty
 Flavia Hendler, University of Nevada–Las Vegas, USA
 Kathryn A. Braun-LaTour, University of Nevada–Las Vegas, USA

Not Leaving Las Vegas: Identity Projects of Local Vegas Gamblers
 Kathryn A. Braun-LaTour, University of Nevada–Las Vegas, USA
 June Cotte, University of Western Ontario, Canada

10.2. Special Session: Instant Choices versus Slow-Developing Preferences: How Preferences Form and Shift over Time

Chair: Wendy Liu, University of California Los Angeles, USA

SPECIAL SESSION SUMMARY

Instant Choices versus Slow-Developing Preferences: How Preferences Form and Change over Time 692
 Wendy Liu, University of California Los Angeles, USA

Choice Construction versus Preference Construction: The Instability of Preferences Learned in Context
 On Amir, University of California San Diego, USA
 Jonathan Levav, Columbia University, USA

Preference Exploration and Learning: The Role of Intensiveness and Extensiveness of Experience
 Steve Hoeffler, University of North Carolina, USA
 Dan Ariely, MIT, USA
 Pat West, Ohio State University, USA
 Rod Duclos, University of North Carolina, USA

The Effect of Decision Interruption and Suspension on Preferences
Wendy Liu, University of California Los Angeles, USA

New Insights on the Benefits of Unconscious Thought
Ap Dijksterhuis, University of Amsterdam, The Netherlands

10.3. Special Session: Access versus Ownership in Consumer Research

Chair: Ashlee Humphreys, Northwestern University, USA
Discussion Leader: Russell Belk, University of Utah, USA

SPECIAL SESSION SUMMARY

Access versus Ownership in Consumer Research 696
Ashlee Humphreys, Northwestern University, USA
Markus Geisler, York University, Canada

Tensions between Access and Ownership in the Media Marketplace
Markus Giesler, York University, Canada
Ashlee Humphreys, Northwestern University, USA

Write and Wrong: Ownership, Access and Value In Consumer Co-Created Online Fan Fiction
Clinton D. Lanier, Jr, University of Nebraska-Lincoln, USA
Hope Jensen Schau, University of Arizona, USA
Albert M. Muñoz, Jr., DePaul University, USA

Guardianship and Ownership on Nebraska Century Farms
Eric Arnould, University of Arizona, USA
Carolyn Curasi, Georgia State University, USA
Linda Price, University of Arizona, USA

10.4. Special Session: “Fakin’ It”: Why Do Consumers Buy Counterfeit Goods?

Chair: Sankar Sen, Baruch College/CUNY, USA

SPECIAL SESSION SUMMARY

“Fakin’ It”: Why Do Consumers Buy Counterfeit Goods? 700
Sankar Sen, Baruch College/CUNY, USA

“When You Aren’t What You Are Wearing”: How Consumers of Counterfeits are Evaluated
Stephanie Geiger-Oneto, University of Houston, USA

Robin Hood is Alive: The Perceived Morality and Social Acceptance of Pirated Products and Counterfeits Usage
Hannah Chang, Columbia University, USA
Anat Keinan, Columbia University, USA
Donald Lehmann, Columbia University, USA

Exposing the Designer Paradox: Understanding How Consumers Rationalize Purchasing Counterfeit Designer Merchandise
Deborah Brown McCabe, Arizona State University, USA
Mark Rosenbaum, Northern Illinois University, USA

What’s In a Logo? Exploring Motivations to Purchase Counterfeit Brands
Keith Wilcox, Baruch College/CUNY Graduate Center, USA
Hyeong Min Kim, Baruch College/CUNY, USA
Sankar Sen, Baruch College/CUNY, USA

10.5. Competitive Paper: Understanding the Consumer as a Person: Studying the Consumer and His Values

Chair: Torsten Ringberg, University of Wisconsin-Milwaukee, USA

<i>Cueing Common Ecological Behaviors to Increase Environmental Attitudes and Behavior</i>	701
Gert Cornelissen, Catholic University Leuven, Belgium	
Mario Pandelaere, Catholic University Leuven, Belgium	
Luk Warlop, Catholic University Leuven, Belgium	
Siegfried, Dewitte, University Leuven, Belgium	
<i>Progressing a Taxonomy of Possible Reflexivities: Guidelines for Reflexive Practice in Consumer Research</i>	703
Shona Bettany, University of Bradford, UK	
Helen Woodruffe-Burton, University of Lancaster and University College of St.Martins UK	
<i>Auspiciousness: Coping with Kratophany</i>	704
Karen V. Fernandez, University of Auckland, New Zealand	
Ekant Veer, University of Auckland, New Zealand	
John L. Lastovicka, Arizona State University, USA	
<i>One or Many?: Examining Consumption Experiences from the Lens of Multiple Selves</i>	709
Shalini Bahl, University of Utah, USA	
George Milne, University of Massachusetts Amherst, USA	

10.6. Competitive Paper: To Indulge or Not to Indulge. That is the Question: A Look at Consumer Self-Control

Chair: Monika Kukar-Kinney, University of Richmond, USA

<i>Lines in the Sand: Using Category Widths to Define and Pursue Self-Control Goals</i>	711
Cait Poynor, University of South Carolina, USA	
Kelly Haws, University of South Carolina, USA	
<i>Stress and Eating: Disentangling the Effects of Psychological, Autonomic and Endocrine Components of Stress Response</i>	712
Zhenfeng Ma, University of Toronto Institute of Technology, Canada	
Aida Faber, McGill University, Canada	
Laurette Dubé, McGill University, Canada	
<i>Beating Back that Triple-Chocolate Cake: Mental Accounts as Instruments of Self-Regulation</i>	713
Parthasarathy Krishnamurthy, University of Houston, USA	
Sonja Prokopec, University of Houston, USA	
<i>Making Prudent vs. Impulsive Choices: The Role of Anticipated Shame and Guilt on Consumer Self-Control</i>	715
HaeEun Chun, University of Southern California, USA	
Vanessa M. Patrick, University of Georgia, USA	
Deborah J. MacInnis, University of Southern California, USA	

10.7. Competitive Paper: Customer Relationship Management

Chair: Daniel Laufer, Yeshiva University, USA

<i>Building Customer Relationships: A Comparison Across Multiple Service Encounters</i>	720
Hung-Chang Chiu, National Chung Hsing University, Taiwan	
Monle Lee, Indiana University South Bend, USA	
Yi-Ching Hsieh, National Central University, Taiwan	
Li-Ya Chen, Ming Chuan University, Taiwan	

<i>Switching Barriers in the Four-Stage Loyalty Model</i>	726
Markus Blut, University of Muenster	
Heiner Evanschitzky, University of Muenster	
Verena Vogel, University of Muenster	
Dieter Ahlert, University of Muenster	

<i>Why Companies Should Make Their Customers Happy: The Neural Correlates of Customer Loyalty</i>	735
Hilke Plassmann, California Institute of Technology, USA and University of Muenster, Germany	
Peter Kenning, University of Muenster, Germany	
Dieter Ahlert, University of Muenster, Germany	

<i>Optimizing Variety in Mass Customization: A Theoretical Perspective</i>	740
Sanjay Puligadda, Pennsylvania State University, USA	
Rajdeep Grewal, Pennsylvania State University, USA	
Arvind Rangaswamy, Pennsylvania State University, USA	
Frank R. Kardes, University of Cincinnati, USA	

10.8. Competitive Paper: Affect and Judgments

Chair: Hayden Noel, Baruch College, USA
 Lilia Ziamou, Baruch College, USA

<i>Temporal Sequence Effects: A Memory Framework</i>	743
Nicole Votolato Montgomery, Ohio State University, USA	
H. Rao Unnava, Ohio State University, USA	

<i>Mood and Comparative Judgment</i>	745
Cheng Qiu, National University of Singapore, Singapore	
Catherine W. M. Yeung, National University of Singapore, Singapore	

<i>Complexity Effects on Consumer Choice Consistency</i>	747
Benedict Dellaert, Erasmus University Rotterdam, The Netherlands	
Bas Donkers, Erasmus University Rotterdam, The Netherlands	
Bernard Conlon, TNS Australia, Sydney, Australia	
Arthur Van Soest, Tilburg University, The Netherlands	

<i>Recollections of Pleasure and Pain: When Losers are Motivated to Edit their Retrospective Evaluations</i>	749
Elizabeth Cowley, University of Sydney, Australia	
Colin Farrell, University of Sydney, Australia

PRESIDENTIAL ADDRESS

Moving the Needle: Can ACR Help Increase Our Research Productivity

Barbara E. Kahn, University of Pennsylvania, USA¹

Like all of the presidents before me, I checked out previous presidential addresses to see the issues discussed, and I discovered that *all* the good topics were taken. Previous presidents have discussed the definition of consumer research; many have addressed the quality of research, there have been calls for more theory, for different perspectives (anywhere from the international perspective to the perspective of children). And of course just last year, David Mick called for nothing less than transformative consumer research. So what was left? Although many of you might be happier if I stopped right now and acknowledged that indeed it has all been said, I did find one topic that no one seems to have addressed previously, and it does affect us all.

This topic came to me at the AMA doctoral consortium this summer after overhearing some doctoral students discussing the difficulties of trying to set up a subject pool. As I was listening to them, I realized that in all the myriad presidential addresses, research productivity issues had never been discussed.

I decided that one way to attack this problem could parallel the process I used when I began working on my current research stream: understanding patient decision making. I started on that right after I got tenure (and right after my second parent had been diagnosed with cancer). Both of those events: the freedom (and obligation) of tenure and the pain of coping with the battles of cancer, motivated me to do research about “important,” “impactful” issues. But since this was a new stream for me, I had to start from scratch. The process I used then (see for example, Kahn and Luce 2003) and the process I used now is basically the same: first, I tried to learn about existing behavior. Second I looked to see where behaviors didn’t make sense and could be improved. Third, I identified the stresses or barriers that were hindering effective behavior. And finally I looked for a way to make a real contribution

Beginning, with the last point, since the contribution here would be through ACR, I wanted to ascertain a priori that there were ways that ACR could make a difference. I identified four potential areas: First ACR could help in sharing experiences. Second, ACR could initiate formalized mentoring programs. Third ACR could help through the power gained from being part of a group. Finally ACR could help by facilitating exchanges among various types of research resources.

To learn about the underlying problems, I conducted an online survey. I sent the link to the total population of fully paid non-student ACR members which at the time was about 1000. I ended up analyzing a sample of 376, which represented almost a 40% response rate. In the survey, I asked people to indicate the “degree of problem” they were experiencing for various research-related activities; I collected a few descriptive statistics and I had several open-ended questions. I kept the total survey time to about 5 minutes. In parallel I also emailed a smaller sample, sampling

broadly by gender, geography, rank, and methodology to get a richer appreciation of the issues.

The data I collected allowed me to test a few null hypotheses with respect to productivity issues. Specifically I was interested in whether there was gender equality or inequality, whether type of methodology mattered, and whether productivity issues varied by career stage.

First the gender issue. Gender equality? No, not quite. There is a significant “glass ceiling” in our field. We have 56% male, 44% female overall, but the percentage of females drops significantly in the more senior ranks (62% male, 38% female). This finding could be caused by several factors, but as I will illustrate later, I can show significant differences in perceived research productivity issues by gender and this may be a factor in this decline.

To test the effect of research methodology I listed the 36 methodologies that we use at ACR for reviewing and I similarly allowed people to indicate *up to four* that represented their expertise. Every *single one* of the 36 techniques listed had at least a few people represented. ACR is surprisingly diverse. Although we are diverse, it is also clear, that a majority (69%) of our members do some experimental work. For purposes of the subsequent analyses, I have simplified this data as follows: I classify members as “experimental” if they checked the experimental box; I classified members as “survey researchers” if they did not check the experimental box, but did check the survey research box. Finally if members did not check the experimental or survey research boxes but checked one of the multiple qualitative approaches listed, I classified them as a consumer culture theorist (CCT) (Arnould and Thompson 2005). There are a small number of ACR members who do not fit in any of these three classifications and I have deleted them from the analysis.

Using this coding I found that while there are more experimentalists at every rank (overall, 69% experimentalists, 19% CCT, and 13% survey) the differential is exceptionally great at the assistant level (82% experimental, 12% CCT and 7% survey, $p=.0002$). Further the number of experimentalists declines significantly with rank (assistant=105, associate=64, full=45 and chair=30) while the other methodologies are less affected by rank (for CCT, assistants=15, associates=24, full=15 and chair=15, and for survey, assistants=9, associates=14, full=20 and chair=6). Although I can think of several hypotheses as to why this might occur, I have not tested any of them, so I leave the issue to future research.

The last hypothesis I tested was whether people at different ranks perceived research barriers differently, and this is definitely true. I had 36% assistants, 28% associates, 22% fulls and 14% chairs. To get at perceived barriers to research productivity, I included an open-ended question that asked: “if you could have more resources for research what would you wish for?” I found a significant “wishes * rank” interaction ($p=.03$). For assistants and associates, the ranking was: more access to research participants (this included a host of issues such as: more participants, more lab space, non-student participants, establishing a research panel, setting up a behavioral lab etc.) The second factor was the need for more time, and the third factor was a need for research funding.

For full professors, the same factors were important but the relative ordering shifted. Time constraints rose to number 1, need for research participants was number 2 and research funding was number 3. At the chaired level, time constraints were again the most

¹Kim Corfman, Ravi Dhar, Jennifer Escalas, Susan Fournier, Donna Hoffman, Dawn Iacobucci, Punam Anand Keller, Mary Frances Luce, Robert Meyer and Lisa Peñaloza made many excellent comments on earlier versions of this address. I greatly appreciate their help. This is a slightly revised version of the address delivered at the 2006 Conference of the Association for Consumer Research held in Orlando, Florida.

important and research funding dropped out of the top three. A new wish emerged in the number two slot, a request for administrative support, and number three was need for research participants.

In addition to the top 3 “wishes,” there were also significant differences further down the list. The full and chair professors were more likely to mention a need for administrative support, access to good PhD students, relief from teaching, and resources to make an impact. Associate professors were more likely to mention equipment needs such as MRI or video equipment and access to data sets. Finally assistant professors were more likely to ask for help in finding co-authors or to request help with statistical analysis or software issues.

I also examined the three top barriers to research productivity in more detail. First, to understand the research resources that were available to our members, I asked respondents to indicate with a yes or no vote which of the following they had access to (the numbers in parentheses indicate the percentage of “yes” votes overall): a voluntary participant pool (50%), a required participant pool (34%), a behavioral lab (20%), an online panel (10%), school resources in paying for research participants (29%), or a shared participant pool across departments or schools (10%). I also asked several descriptive questions about the respondents’ schools, such as whether the school was public or private, had an undergraduate business program, had a PhD program and the size of the general undergraduate population. Several of these factors moderated the research resources that were available but the most interesting moderators were the public/private factor and whether or not there was a PhD program.

Overall, 68% of the respondents come from public and 32% from private universities. In my email correspondence, I learned that for members at public schools, especially large ones, getting undergraduate participants is not the issue, but as one professor at a public university wrote: “Our main “problem is *not* having a behavioral lab. Being a large, public institution, we have TONS of subjects, but can only run studies in classrooms so it limits what you can do research wise.” The data supported this observation. Public universities are over represented in the proportion of schools that have *required* participant pools (of the schools that have required participant pools, 79% are public) but they are under represented by the proportion of schools that have behavioral labs (of the schools that have behavioral labs, only 47% are public) or payment for research participants (of the schools that provide resources for research participants, only 52% are public).

The presence of a PhD program also significantly affects the availability of research resources. Overall 64% of respondents have PhD programs and that was correlated with a higher likelihood of having a required subject pool (of the schools that had a required pool, 73% had PhD programs) and a behavioral lab (of the schools that behavioral labs 92% had PhD programs).

I also asked whether access to *enough* research participants was a problem for respondents on a 1-7 scale where 1 indicated it was a real problem and 7 indicated it was not a real problem. 30% of the respondents checked the bottom two boxes indicating that this was a real problem. But the problem differed by type of methodology.

Experimentalists were more likely to feel like they had access to research participants, but just did not have *enough* whereas non experimentalists (both survey and qualitative researchers) didn’t even feel like they had easy access to research participants.

This result suggests that the analysis should be in two stages: For experimentalists, the issue is develop a useable participant pool on campus and then get enough participants. So we would want to know how many research participants are enough, and what is necessary for a good on-campus behavioral lab.

For non-experimentalists, on-campus participant pools are not as likely to solve the problem. For those there are three possible alternatives: (1) online panels (although there is some debate whether qualitative research is doable with online panels), (2) sharing data sets and/or creative solutions to data access, and (3) locating alternative funding sources that can help with the collection of hard-to-get data.

To answer the question “how many participants are enough?” I refer to an analysis done at Insead (Brendl & Vosgerau 2000, posted on the ACR website). They looked at several “A” journals from 1998-2000 and estimated on average how many research participants were needed to produce a paper for that journal. They found: at JCR, an average of 3.8 experiments were run, using an average of 453 participants (and this figure as well as the ones below should be augmented because they do not include subjects used for pilot studies, manipulation checks, etc.), at OBHDP, an average of 2 experiments were run with a total of 232 participants; at JPSP, an average of 3.4 experiments were run with a total of 322 participants. But since not all experimentation leads to A-level results, they assumed a 1 out 3 success ratio, leading to their conclusion that a faculty member needs 1800 experimental sessions to produce one “A” paper.

On my survey respondents indicated that on average they had access to 605 research participants a semester, or 1200 a year, short of the necessary 1800 sessions. The median at 200/semester or 400/year was significantly short of the requirement. The Insead estimate can obviously be scaled up to the school level and used in reports to deans or funding institutions to make the case for resource increases. For example, at Wharton, making a few assumptions (one of which is that we can run 2-3 experiments/participant hour), I calculated that we would need a lab that generated 9000 participant hours/year to keep our experimental faculty productive.

Looking across various lab programs, it’s clear that there are many different models but the more successful programs have:

- dedicated physical space preferably with networked computers and a focus group room. In addition, it is necessary to have centralized subject-management software.
- a faculty champion and several lab personnel to manage the lab
- Finally, unlike the psychology model, where individual faculty tend to have their own private labs, for consumer research, most of the successful labs tend to pool resources across a department and/or across the school, allowing greater opportunity for piggy backing and other positive synergies

For survey researchers (and probably others), another solution is the online panel. Although only 10% of the respondents currently have online panels, this is obviously a huge growth area for the future. Rather than go into details here about issues to consider in setting up an online panel, I suggest that interested members should read the document that I put up on the ACR website that Donna Hoffman created which discusses some of the issues one should consider in setting up an online panel.

ACR can also use its clout as a prestigious organization of consumer researchers to negotiate special arrangements with some online survey software vendors. For starters, Qualtrics (Survey Z), which is the software that I used to generate my online survey has agreed to provide a special arrangement JUST for ACR members. They will allow ACR members to create an account and to use their software to collect up to 2000 responses. Simply go to <http://acr.qualtrics.com>, then call 1 800 340 9194 to activate. Members are also eligible to receive an academic grant for their college with

an unlimited number of user accounts. For details, email stuartorgill@qualtrics.com or call the number above.

There are also other possible ways that ACR members can work together. We could establish “ACR” panels, or set up reciprocal arrangements where each institution with an online panel could notify their panelists about other opportunities. Or perhaps ACR can have “sign up portals” on the website where new panelists could fill out a single form and check off all the panels they would like to join. Similarly we could consider sharing access to large and/or unusual consumer databases or maybe set a participant pool exchange where researchers can trade available participant-hours. This could facilitate cross-cultural research as well as help with participant burn out.

The second barrier that many people mentioned was the time problem. To understand how people balanced demands on their time, I asked them to indicate how much of a problem they felt it was to balance research against teaching, administration and home life. For teaching, interestingly, the number of *preps* ($p=.01$) and NOT the number of overall courses taught (*ns*) influenced the perceived difficulty of balancing teaching demands against research productivity. Average course loads in the sample were equivalent to 3.68 semester courses per year (median=3.5, range=0 to 8). The average number of preps was 2.23/year (median =2 and range was 0 to 6).

Again, I asked respondents how much of a problem was it to balance research demands against teaching, administration and home life where 1 indicated a real problem and 7 indicated not a problem. There were three strong moderators.

The first moderator was *gender*. Women found it harder to balance all three against research demands. The means were as follows: with regard to teaching, $M(\text{women})=3.9$, $M(\text{men})= 4.4$ ($p<.05$), with regard to administration, $M(\text{women})= 3.8$, $M(\text{men})=4.4$, ($p<.05$), and with regard to home life, $M(\text{women})=3.7$, $M(\text{men})=4.3$, ($p<.03$)

This may provide some clue to the “glass ceiling” issue. For example, one woman wrote: “There are so very few women with small children who are pre-tenure at the top business schools. Why is being tenure track at a top school so incompatible with motherhood?” Another respondent wrote: I think that the biggest problem women face is summarized by the book “Women Don’t Ask” which includes research that shows that a big difference between men and women is that men assume that virtually everything is negotiable and women wait for someone to tell them that it is OK to negotiate.

The second moderator was *methodology*. There was a significant difference on these balance issues by methodology with the qualitative researchers expressing the biggest problems and the experimentalists expressing the least problems. Survey researchers were in the middle. These means were significantly different at the $p=.01$ level. For teaching, $M(\text{CCT}) =3.8$, $M(\text{survey})= 4.1$ and $M(\text{experimental})= 4.6$. For administration, $M(\text{CCT})= 3.7$, $M(\text{survey})=3.9$ and $M(\text{experimental})=4.4$. Finally, for home life, $M(\text{CCT})= 3.7$, $M(\text{survey})= 3.7$, and $M(\text{experimental}) =4.6$.

The last moderator was *rank*. Chaired professors had a harder time balancing administrative demands ($M(\text{chair})=3.2$) than any other rank ($M(\text{associates and full})=4.1$, $M(\text{assistants})= 4.6$, $p<.001$). Respondents mentioned “senior burnout.” One respondent noted that time becomes even more precious for successful people, because that “success” leads to many kinds of requests for help.

These problems are obviously not unique to ACR, but ironically, it is an area of consumer research. For example, research by Gal Zauberman & John Lynch (Zauberman and Lynch 2005) that got quite a bit of media attention tries to diagnose the problem. They found that “people were consistently surprised to be so busy today. But lacking knowledge of what tasks would compete for their time in the future; they act as if new demands would not inevitably arise

that are as pressing as those faced today.” So people over commit because they expect to have more time in the future. But then tomorrow becomes today and... yesterday’s “yes” becomes today’s “damn!”

This research diagnoses the problem but does not provide the answer. As an illustration of this, let me share the following. In the survey, many people mentioned journal or review process issues. Although this is not my focus here, ACR is a sponsor of JCR and we have a representative on the JCR policy board. It is my responsibility this year to appoint someone to this board and I wanted someone who had a great deal of journal and review process experience, and who would be responsive to member feedback so I asked John Lynch to be the next ACR representative, to which he said “yes.....”

And it was not until I was putting together this speech, that I noticed the irony in that!

This suggests that diagnosing the problem and solving the problem are two different things. To find a solution, I asked someone who is an excellent time manager, Punam Anand Keller. She said that using the goal literature she derived the following rules for herself.

1. *Prioritize your activities*. Make a matrix every year of goals and activities and eliminate those activities that are not associated with any goals. Some activities may seem necessary that are not linked with personal goals (e.g., attending a faculty meeting or graduation). Determine how much time you spend on those “non-goals” related activities and develop a strategy that will accommodate them more efficiently (for example, Punam attends two out of four faculty meetings and one out of three graduations).
2. *Learn When to Say No*. She suggests making a list of things you have said no to and sticking it in a place near your phone or computer. Most people don’t know when to say no because they feel bad or they think it’s unfair. A No-list makes you realize you will recover from feeling bad and it might be fair to say no because you have said no to other similar things.
3. *What is your perfect day?* Finally, she says to help motivate your efficient use of time ask yourself what is your perfect day. And then plan accordingly. Her bottom line is: happiness is a choice.

This idea of asking people who have solved problems for their secrets is the heart of the “mentoring” process and we can consider introducing formal mentoring sessions at ACR. Based on this survey, it might make sense to schedule mentoring sessions on time management, dealing with IRB boards, fundraising issues and various methodology workshops. Another related issue that was mentioned, particularly among more junior faculty, was the desire to meet new co-authors and to interact with ACR members more easily. Maybe we can set up a “speed dating” like session to test for research compatibility. If it works for finding marriage partners, it might work for joint research projects!

By the way we have tried to personalize our membership through a new feature we added to the website—and this feature came about because of an idea expressed in our “knowledge exchange.” We now have a new “get to know your fellow ACR members” feature. Every time you click on the website, a different ACR member’s bio and photo will be featured.

The last barrier mentioned was the funding problem. I asked “How much research support do you get per year in \$ from your school?” This question seemed to be interpreted differently by

different people. I believe some people may have factored in research ninths or salary but most did not. Anyway, the average was \$6976 (median: \$4000, range: 0-\$80,000).

Perhaps most interesting is that although people perceive a funding issue, they don't seem to be writing grants. I was surprised that overall 36% of the respondents had *never* tried to get a grant. The issue is particularly acute for younger researchers. 51% of assistants had never tried for grant money (For chaired professors, only 24% had never tried). "The didn't try" was a bigger percentage for all ranks than the "didn't get."

Survey respondents mentioned a whole host of sources where they received their funding, including: Robert Wood Johnson, David Packer, Aspen, MSI, NSF, NIH, ISBM, SSHRC, various state, federal and government grants, United Way, NASD Investor Education Foundation, CIBER and Fullbright. In addition, there is an excellent list of links to information and grant sources on the ACR website. Further David Mick and Ken Doyle have just recently put a new list of funding sources on the website as part of the TCR initiative. Asking for funding is typically done in other academic fields, but apparently is not a habit of ours.

MSI also remains a good source for small grant funding. Mike Hanssens, Executive Director, has committed MSI's support in helping out consumer researchers. He said MSI is very interested in: consumer advocacy type research, and will provide funding to enable access to "real-world" participants for strong research proposals that may otherwise have to be executed on college-students.

In summary, three research barriers seem to be universal: finding sufficient research participants; managing one's time effectively and finding funding sources. The research participant problem differs by types of schools and by research methodology. An initial solution is to share information. ACR may also help members by pooling resources, setting up exchanges or using ACR clout for better negotiation positions.

The time management issues continue to perplex people and is especially an issue for women, qualitative researchers and more senior faculty. Mentoring sessions at ACR may offer one helpful mechanism. Specialty conferences, such as this year's neuroscience conference, may also give us an opportunity to learn about new research paradigms more efficiently and perhaps can help prevent "burnout." Finally, we can also consider providing daycare resources at conferences. The funding problem is interesting, since many of our members are not in the practice of writing grants. It seems like funding sources are available if you ask for them and have strong research proposals.

Overall, this examination has convinced me that although many people think of ACR as JUST the NORTH AMERICAN conference, it can really be much more. The potential to increase our research productivity collectively is there.

Thank you for your attention.

ACR 2006 North American Film Festival

OVERVIEW

This year marked the fifth consecutive North American ACR Film Festival and it is perhaps this year's festival more than any other that required the prefix "North American." After showings in Gothenberg, Sydney, and Monterrey, with upcoming festivals already confirmed for Milan and Sao Paolo, there is little doubt that the film fest has gone global, thanks to the enthusiastic support of ACR Program Committees, Co-chairs, and Presidents.

This year's offerings begin to mark a real flowering of contributions. We introduced a theme for the film festival, "Having an Impact." Thanks to the generous support of the Center for Consumer Culture we also introduced a new, juried cash prize for the strongest contribution. Many of this year's film-makers were successful contributors from past years, and the learning curve and experience effects were in evidence. Even with global presence, the nine films shown at the festival this year came from six different countries: Denmark, Mexico, USA, Turkey, Australia, and Japan.

Given the theme this year, the tone of the festival was a bit more serious, with several of the films pulling no punches in terms of their critiques of consumer society, and others offering compelling stories or visually graphic and impactful images. Although it would not be our preferred demonstration, the impact of one film was most evident when an audience member fainted. There was a healthy variety in the topics of this year's films, ranging from global effects on local landscapes to the lack of local health care, and from consumption of counterfeits to consumption of coffee.

As always, the films inspired considerable discussion in the sessions. The question and answer periods were enlivened by the detailed discussions with the filmmakers that followed the premiere exhibition of each film. These interactive in-depth topical discussions were, as much as the films themselves, highlights of the sessions.

Continuing the positive trajectory established last year, film quality was very high due to the strong rejection rate. This year's film festival had a rejection rate of 50 percent (compared to last year's then-historic 33 percent rate). Our judgment criteria continue to develop, and we offered all reviewers a set of suggested criteria, and asked them to rate various aspects of the films. We continued the practice of using seasoned visual researchers as reviewers whose comments and ratings were decisive in making exhibition judgments. We owe each of them a great debt of gratitude for their continuing devotion to the film festival, and acknowledge them here.

COFFEE GROUNDS AND THE GLOBAL CUP: GLOCAL CONSUMER CULTURE IN SCANDINAVIA

Dannie Kjeldgaard, University of Southern Denmark
Jacob Ostberg, Stockholm University School of Business

This videography explores the glocalization of consumer culture by analyzing the consumptionscape of coffee culture in Scandinavia. The purpose of the videography is twofold: Firstly, to explore how the hegemonic brandscape may operate in a cultural context outside of North America by exploring coffee cultural discourses in the Scandinavian context. As a kind of commentary to, or re-inquiry of, Thompson and Arsel's (2004) study of the hegemonic influence that the Seattle-based company Starbucks exerts on the US coffee culture we explore how the logic of the hegemonic brandscape becomes glocalized in the Scandinavian context. While we generally agree with the analysis and take seriously the proposition that Starbucks exerts a global structure of common difference on local coffee cultures across the globe, we wish to explore and illustrate how different local market contexts implies different competitive and positioning roles for Starbucks and the like. Secondly, and more importantly, our purpose is also a more general one: namely to explore whether there is such a thing as a specific Scandinavian consumer culture that interact with global structures in the process of glocalization. Coffee culture seems an eminent site of exploration as Scandinavia constitutes the world's highest per capita consumption of coffee.

Our empirical investigations in Scandinavia, a cultural setting where Starbucks has yet not entered the market albeit gained significant cultural influence, show that there is a long-standing historically established coffee culture that exists in parallel to both a starbuckified coffee culture and a coffee connoisseurship culture. Our detailed analysis of this coffee consumptionscape illustrate that there is a plurality of cultural styles along which the different types of coffee establishments differ. At the same time, we show that there are tendencies toward the hegemonic influx of starbuckified dimensions suggested by Thompson and Arsel.

We identify three ideal typical overall coffee cultural styles: The first one we term Americana reflecting the recent global diffusion of the lactified coffee cultural consumption style most notably symbolized by Starbucks. The Americana coffee cultural style is heavily influenced by the coffee cultural ideals of Starbucks. As already mentioned, the dominant global player has yet to enter the Scandinavian market making room for plenty of simile brands that draw on the style originally laid out by Starbucks. According to an interview with the franchisee at an Espresso House in Lund, the owners of the Espresso House corporation travel to the US a couple of times a year just to visit Starbucks outlets and be inspired. They proudly announce that there is no difference whatsoever between Starbucks and the particular local variation of Espresso House. In addition to these simile brands a number of outlets such as restaurants, hot dog stands, and gas stations utilize the structure of common difference of the coffee shop menu.

The second we term Culinaria and is a more recent tendency obsessed with authenticity in the form of exoticism and high quality. The cultural style of Culinaria makes references to a number of different types of authenticity. One type is through what is perceived as an indexical authenticity through a reference to place of origin, most notably Italian cafés but also French brasseries. The Culinaria category also house a different type of connoisseur café equally obsessed with authenticity but more eclectic in their inspiration than the Italiana cafés described above. These places are a postmodern concoction of everything “authentic”, the menus are comprised of fascinating juxtapositions of elements from across the globe. Others emphasize authenticity by selling products of certain production methods such as organic and “politically correct” products. Rather than interpreting this refined culinary experience as an opposition to the influx of the starbuckified hegemonic consumptionscape we see it as part of a general gastronomic slow food movement not only opposing global standardized consumer culture but equally as much local consumer culture that has deteriorated gastronomic qualities.

The third we term Viennesia reflecting the traditional café culture originating in Vienna in the 17th century. These styles existed in pure forms in many establishments and creolized forms in others. Many of these cafés have a long history and were established at the end of the nineteenth century. Some of them are even explicitly called “Wienerkafé” to really spell out the link to their central European origins. Largely, the legitimacy of these classic cafés is grounded in their craftsmanship in confectionary and pastries. The traditional cafés therefore gain iconic authenticity by expressing that, just like in the Viennese counterparts, the goods for sale are made in-house. Even though the baked goods are at center stage, coffee is an integrated part of the serving and plays a key role. These classic cafés are hence culturally understood as a place where high quality coffee is served.

The historically constituted coffee culture comprises certain structural rules of brand competition in the coffee culture combined with what we interpret as a Scandinavian consumer cultural stance to competition based on an ideal of consensus rather than opposition. This hence constitutes a different hegemonic struggle in the Scandinavian cultural context than in the US context.

The inherently global origins of the existing coffee cultural consumptionscape problematize the notion of glocalization since the local part of the global-local dichotomy does not represent any kind of original authentic culture. Certain coffee cultural consumption styles may have been authenticated over time so that they have come to represent local culture. In the case of the coffee cultural consumptionscape, the symbols of the local (here represented by the classic cafés of the Viennesia type) and the global (Starbuckified coffee culture claiming ‘European’ heritage) all stem from the same socio-historical cultural origins of European coffee culture in the 17th century. Therefore, although Starbuckification exemplifies the hegemonizing force of a recent structure of common difference, it stands in relation to other structures of common difference which are locally ingrained, yet global—or foreign—in origin in an historical perspective.

SCENES FROM A STREET: VISUAL IMPACT OF GLOBALIZATION ON CONSUMPTIONSCAPES

[People’s Choice Award Winning Film]

Ebru Ulusoy, University of Texas-Pan American

“Globalization” process attracts more and more attention in order to understand the consumer culture which is globalizing by ethnoscapescapes, technoscapescapes, financescapescapes, mediascapescapes, ideoscapescapes (Appadurai 2001) and consumptionscapescapes (Ger and Belk 1996). One of the main reasons for this attention is that it captures something about the ways the world is changing and being restructured (Giddens 2000; Held 2000).

Globalization is many times approached as a visualized process both in terms of creating images and analysing such images. Mooij (2004) proposes that it is largely visualized as few ubiquitous global brands whose banners make its announcement (Ger and Belk 1996). But, even though it is illustrated as the spread of Western products and values, it is widely accepted that the process works the other way too even there is mostly asymmetry in flows. This work presents the visual impacts of globalization on a non-Western consumptionscape. It investigates and informs about the globalization, glocalization or creolization scenes on Istiklal Street in Istanbul, one of the world cities witnessing the interplay of the global and the local through the flows from both inside and outside Turkey.

One of the main points here is the interpenetration of the brands and products of transnational companies into the Turkish culture. Homogenization thesis proponents propose the colonization of mostly less affluent local cultures by transnational companies, which they call as Western imperialism. From McDonald’s to Starbucks, most of the inhabitants of our planet are available on Istiklal Street. Although in many aspects they are consumed, or more appropriately, attributed meaning in the same way as it is in the other places in the world, there are still some differences, such as consuming Burger King or McDonald’s as means of socializing, even incorporating these places into everyday lives as places to meet in front of rather than eating inside. Another example for the interpretation and consumption of such brands different than their imported country would be consumer preferences to drink Turkish coffee at a Starbucks coffee shop rather than taking away an American blend coffee and drinking it on the street. As consumption practices change, they also affect the change in values. New generation’s brand focused conversations which weren’t common short time ago (Görpe 2006) are influenced by the interpenetration of “brands” into the everyday life; or eating out on the street, in a culture where people generally refrain from eating or drinking outside (Ger and Belk 1996), is a consequence of growing fast food through global chains and fast foodized local food (e.g. “döner”). Besides the growth in the fast food industry, the global slow food movement (Firat 2005) of international and local cuisine, often in stylized and hyperreal manner (Belk 1996), is also a common scene on this globalized street.

While consumptionscapescapes are increasingly becoming the mixing grounds of dynamic local and global consumption icons, consumption activity is a means of living through necessary contradictions, changes, and uncertainties (Ger and Belk 1996). Another main

point of the film is to display the views of the “reproduced local” and its interplay with the global. Manti (Turkish ravioli with meat) houses, where women preparing the food are exhibited in the shop windows (mostly there is a coca-cola banner around); or Kahramanmaraş (a region in the East of Turkey famous for its ice-cream) ice-cream sellers in their traditional local clothes are of common examples of such reproduction. Most of such traditional scenes, products, and services were not available or that common on Istiklal Street until a few years ago. Münch (1999) explains this reproduction as brought by the “search for authenticity” in the wake of market success rather than to obliterate it in a process of homogenization (Held 2000). Beside local authenticity, the increasing availability of products and images of other non-Western contexts is also noticeable and important in order to understand the hybrid structure of the globalization.

The scenes in this film also props up that the global consumer culture is a jointly shaped culture that gives and takes from all possible sources. Thus, the global culture, produced by the help of transnational cultural forms, is mostly inflected by local conditions and practices. (Kellner 1999: 190). In general, scenes from Istiklal Street support the proposition that globalization as a process is fragmented, rather than being uniform, but it also provides a common language of homogenized fashions, entertainments, and foods (Firat and Venkatesh 1993).

As a conclusion, all these glocalization scenes from a street in a non-Western context reveals the visual transforms of consumptionscapes through the interplay of the global and the local “unique” to the context.

CULTURAL CO-CONSUMPTION: 21 CONVERSATIONS ABOUT THE PEOPLE WE CONSUME WITH

Gary F. Gebhardt, University of South Florida

Paul A. Swindle, University of South Florida

Across a range of consumption experiences, our enjoyment is dependent on others. Although some consumer research has investigated co-consumption without regard to culture (e.g., Raghunathan and Corfman 2006), the majority of research investigating the role of others in consumption recognizes culture’s primary role (e.g., Goffman 1959; Muniz and O’Guinn 2001; Schouten and McAlexander 1995). The importance of culture cannot be overstated, because it is “the ‘lens’ through which the individual views phenomena” and “the ‘blueprint of human activity, determining the co-ordinates of social action and productive activity” (McCracken 1986).

Culture is defined by shared assumptions, values, norms, symbols and meanings among a group of people; which are created, maintained and taught to new members through processes or interactions led by higher status members (Sherry 1986). Under the rubric of Consumer Culture Theory, researchers “have produced a flurry of research addressing the sociocultural, experiential, symbolic and ideological aspects of consumption” over the past twenty years (Arnould and Thompson 2005). Consistent with a cultural perspective, this stream of research focuses on shared cultural attributes among groups of people, how those shared attributes are maintained and new members are acculturated.

However, few studies have addressed the impact of co-consumption on an individual level when those consumers hold disparate assumptions, expectations and meanings of the same object or event. Although Holt (1997) has suggested that a given object “can be consumed in a variety of ways depending on the cultural frameworks that people apply when they interact with the object,” it is not clear how consumers observing each other consuming in such ways effect each other or how such interactions feed back into to update their existing “culture lenses” and “blueprints.”

For this project we videotaped twenty-four intercept interviews and twenty-four depth interviews soliciting informant perceptions of how the people they consume with affect their conceptualizations of brands and overall satisfaction with service encounters. The intercept interviews were done first, asking informants to explain their ideal and current automobiles and the kinds of people that drive each. For the depth interviews, we took a grounded theory development approach, first asking informants to compare and contrast good versus bad consumption experiences. We then asked whether they ever noticed other people who use the same brands or co-consume with them during activities such as shopping. Our analysis of these phenomenological interviews is revealing.

In situations where co-consumers are proximally situated, the degree to which assumptions, expectations and meanings were shared among consumers was positively correlated to the level of satisfaction or enjoyment of the experience. In cases where there were low levels

of shared cultural attributes, informants described others in classic “deviant” terms, but informants were unable to articulate what shared assumption, value or norm had actually been violated. In a number of cases, we found informants complaining about the deviant behaviors of earlier informants; while earlier informants described later informants as deviants. But, in fact, to be culturally deviant, there must be a shared culture defining such acts.

Thus, our research identifies a type of co-consumption in which there are no shared assumptions, values, norms, symbols and meanings—or processes to create and maintain them—among group members. Although individuals may view and interpret such situations through cultural lenses, no common cultural lens exists providing guidance as to shared assumptions, values, norms, symbols or meaning. Hence, without the shared attributes comprising a culture, these situations are inherently acultural. We label such situations acultural co-consumption encounters.

Juxtaposed against the existing Consumer Culture Theory research literature, acultural co-consumption may appear to be an oxymoron. Conversely, we note that while the existing literature focuses primarily on high involvement consumption experiences around which people create entire brand communities, acultural co-consumption is far more common in the everyday lives of consumers. Hence, insights into how to manage such consumer experiences would offer much more impact than additional studies of well-defined consumption communities.

Our work contributes to the consumer research literature by identifying acultural co-consumption experiences. These co-consumption situations differ from existing research ignoring culture or identifying common cultures, in that people are interacting based on what they perceived to be cultural norms—but conflict with other consumers because there is, in fact, no guiding culture in such situations.

Over the course of twenty-five minutes, we recreate our yearlong experience developing the notion of acultural co-consumption and its importance for consumer researchers. Combining representative informant interview excerpts and graphics illustrating our evolving conceptualizations, we document our journey from investigating how interactions among consumers impact brand meaning and consumption experiences to arrive at a notion of acultural co-consumption.

THE STONEWALL METAPHOR: MAKING AN IMPACT WITH TRANSFORMATIVE CONSUMER RESEARCH

*Eric D. DeRosia, Brigham Young University
Glenn L. Christensen, Brigham Young University*

Consumer behavior researchers generate and test theories for scholarly purposes. Many, if not all of those theories have implications for marketing managers. While some managers carefully learn and apply consumer behavior theories to their decision making, other managers do not. The result is an information asymmetry among competitors in terms of their understanding of customers.

Many consumer behavior researchers have worked to increase competitive information asymmetry. By teaching at university business schools, many consumer researchers train managers to comprehend consumer behavior jargon and expose managers to consumer behavior theories. The result is an elite set of managers who are able to leverage consumer behavior theories to their competitive advantage.

Consumer behavior researchers may want to reconsider the current state of affairs. Researchers may instead want to work to reduce the asymmetry of information among competitors. The elite managers currently being trained by business schools are not simply in competition with one another. In the broad marketplace, these elite managers are often in competition with entrepreneurs who are sometimes not as well trained. Importantly, these entrepreneurs are not lacking in intelligence or effort, but they often have not had the opportunity to enroll in a consumer behavior class at a university. Over the years, research has shown a high level of entrepreneurial activity among the economically disadvantaged. In emerging economies, entrepreneurs combine to be an important engine for economic growth. These enterprises may be very small, but if they are successful they can have a life-changing impact on that person’s income. Movements such as microfinance are aimed at helping these entrepreneurs succeed. Consumer behavior researchers may also be able to help. To help entrepreneurs compete against elite, well-trained managers who are working in large corporations, consumer behavior researchers can help reduce the information asymmetry in the marketplace. If there really is nothing so practical as a good theory, consumer behavior researchers can help entrepreneurs by helping them see the practical implications of consumer behavior theories.

The effort to reduce information asymmetry can be assisted by understanding more deeply the role information asymmetry plays in competitive environments. To that end, this research inquiry was guided by three questions: What types of information facilitate and inhibit competitive advantage? How does information asymmetry change over time in a competitive context? Lastly, what factors facilitate and inhibit the translation of information asymmetry into competitive advantage?

In an effort to address these questions, the research reported in this film uses historical metaphor as an inductive method for deriving new insights (Hunt and Menon 1995). Metaphors compare objects that are seemingly unrelated; new insights are generated when similarities between the objects are considered. Advertisers commonly employ metaphors in advertisements to entice viewers to generate new insights (e.g., DeRosia 2001). Qualitative researchers employ metaphors as research techniques for generating new insights about consumers' latent associations (e.g. Zaltman 1997). Because metaphors enable new insight, we employ an extended historic metaphor as a qualitative technique—a metaphor that compares events of the American Civil War with modern competitive business environments.

Modern firms compete for customers. In the Civil War, the Union and Confederate armies competed for the control of land. However, these generals had asymmetric insight into the land just as many managers enjoy differing levels of consumer understanding.

As part of this research, a number of primary and secondary historical sources were examined, including official records, private papers, and diaries of participants. The battle of Front Royal in Northern Virginia is closely examined as an example of competitive information asymmetry and the advantages it provided to Confederate generals.

This analysis provides insight into the first research question regarding types of knowledge and competitive advantage. First, deep and detailed information beyond mere measurement and layout was helpful in creating competitive advantage. Depth-knowledge of changes in road conditions in varied weather, the disposition of local residents, and the availability of forage are just a few examples of the textured information provided by confederate mapmakers giving General Stonewall Jackson a competitive advantage.

It should be noted that these deep and detailed insights required both quantitative and qualitative observations. Civil War mapmakers regularly performed quantitative measurements such as using aneroid barometers for measuring changes in altitude. They also wrote lengthy qualitative descriptions of the land in field notebooks and supplemented their maps with “map memoirs” offering qualitative descriptions of the land.

In sum, the metaphor of the Civil War suggests that firms are better able to gain a competitive advantage when their understanding of customers is deep and detailed, with both qualitative and quantitative information.

The second research question guiding this inquiry was, “How does information asymmetry change over time in a competitive context?”

The Civil War record suggests that the asymmetry of information enjoyed by the Confederacy eroded over time as Union generals identified the source of Southern competitive advantage and worked diligently embracing new methods of data collection (such as lighter-than-air hydrogen balloons) to create or capture maps and information that would level the field. Although the asymmetry of information completely dissipated by the end of the war, this research identifies types of information that were superior in terms of creating information asymmetry that was long-lasting.

The third question guiding this inquiry was, “What factors facilitate and inhibit the translation of information asymmetry into competitive advantage?”

The Civil War record suggests that competitive advantage was inhibited when there was poor information sharing and was enhanced when decision makers were assisted in comprehending it. The most important determinant of whether information lead to advantage was the extent to which a general sought to identify the strategic implications of the information he had. For example, in one battle Stonewall Jackson carefully expended resources to save strategic bridges from Union flames. Stonewall was not simply aware of the bridges. He understood their importance because he had studied his maps and wrung from them strategic implications.

In sum, the metaphor of the Civil War suggests that firms can translate an information advantage into competitive advantage when there is good information sharing, when managers are given information that is easily comprehended, when strategic implications are suggested to managers, and when managers strive to discover all the strategic implications of the information, even when those implications are not obvious.

This research has a number of implications for transformative research. Consumer behavior researchers can help economically disadvantaged entrepreneurs by explaining the best consumer behavior theories in widely read media, and doing so in an easily comprehended manner. Entrepreneurs will benefit from exposure to a wide variety of theories, not only the theories thought to be most universal or the theoretical areas most often researched. The most useful theories to entrepreneurs will be those that describe aspects of consumers that are relatively unchanging over time. In these explications of theory, researchers should not shy away from identifying managerial implications. They should suggest a wide variety of ways the theories could be applied. Researchers should motivate entrepreneurs to carefully consider each theory and wring from it all its competitive implications. Lastly, researchers must find a way to teach entrepreneurs the difficult skill of considering a general theory and identifying all the ways it applies to the entrepreneur's specific market.

Recently, the ACR Task Force on Transformative Consumer Research (Mick 2005) defined the mission of transformative consumer research as having a beneficial difference in the lives of consumers. Economically disadvantaged individuals and those in emerging economies were given particular emphasis. We suggest that one way to positively impact such individuals may be to communicate our best theories to struggling entrepreneurs, thus reducing the information asymmetries that advantage the well-trained few.

CONSUMPTION OF COUNTERFEIT LUXURY GOODS: HOW AND WHY?

María Eugenia Pérez, *Tecnológico de Monterrey*

Raquel Castaño, *Tecnológico de Monterrey*

Claudia Quintanilla, *Tecnológico de Monterrey*

Piracy of a wide range of products has been growing in countries like Mexico, where government control of the manufacturing and import of these goods is not pursued in a rigorous and efficient manner. The International Chamber of Commerce estimates 7% of world trade in counterfeit goods (Fact Sheet, 2005). The International Trade Commission estimates counterfeit sales worldwide grew from \$5.5 billion in 1982 to over \$350 billion in 2005 (Fact Sheet, 2005). According to the Mexican Association of Video and Audio Producers, 90 million pirate CDs were sold in the country in 2004 (El Norte, October 10th, 2005). Lack of adequate legislation limits the authorities' actions to the seizure of pirate goods. The study of this phenomenon is relevant considering that the price, quality, and the characteristics of their distribution points widely differ with the image that these copies intend to project.

This work intends to provide a framework for the study of the process associated with the purchase and consumption of counterfeit luxury goods. What leads consumers to buy them, how do they make the decision, how do they feel afterwards? In the context of consumer culture theory, the concept of extended self has been central in our intent of understanding how possessions become clues for self-definition "It seems an inescapable fact of modern life that we learn, define, and remind ourselves of who we are by our possessions" (Belk, 1988, p. 160). Previous research shows indications of the influence of luxury brands in the structuring of individual identity (see Vigneron and Johnson, 1999 for a review).

The following arguments constitute the core of this work: 1) copies are conspicuous goods that contribute to the formation and reflection of consumers' extended selves, 2) the relationships between needs, goals, actions and emotions have a crucial role in the purchase decision of counterfeit of luxury brands, and 3) the social reactions directed towards the consumers of copies are strongly related with the resulting emotions and coping behaviors developed by these.

Forty six short interviews and twelve in-depth interviews were conducted with consumers who have bought counterfeit luxury goods in ages between 21 and 65 years old. Each in-depth interview lasted between 45 and 90 minutes. All participants were women, as it has been shown by previous studies that women tend to develop stronger brand involvements (Sherrod, 1989). Also, it appears to exist a stronger relationship between women and fashion, than between men and fashion, "Historical currents have created a strong association between femininity and the pursuit of fashionability" (Sparke 1995, as cited by Thompson and Haytko, 1997 p.39). Women belonging to upper socioeconomic levels were chosen in order to assume the participant's economic possibilities to buy not only copies, but also originals.

Our findings highlight different points related to the processes associated with the purchase and consumption of counterfeit luxury goods. First, people buy this type of products to identify with certain social groups and project a desired image. Second, the basic patterns in decision-making are: buying counterfeits simply because the opportunity arises, without previous planning; and planning ahead, looking for information, and deciding beforehand. Third, adventure seeking and the social game of "feeling smart in deceiving others" are likely to be important goals in this process. The sense of risk, not necessarily danger, seems to make the experience memorable.

EMPOWERING THE CITIZEN-CONSUMER: STRIVING TO REDUCE MATERNAL DEATHS AND MORBIDITY IN PAKISTAN

[Center for Consumer Culture Award Winning Film]

Paul Henry, *University of Sydney*

Marylouise Caldwell, *University of Sydney*

This film highlights the complexities of empowering the citizen-consumer by implementing reform in the public obstetric and gynaecological health care sector of Pakistan. Every year approximately 35,000 women die from pregnancy related complications and a 375,000 suffer severe post-natal injuries. These figures place Pakistan's maternal death and morbidity rates as the highest in South Asia.

The film's narrative is largely conveyed and enacted by Dr Shershah Syed, Secretary General of the Pakistan Medical Association. Highly critical of the government, his determination to reduce pregnancy related deaths in Pakistan is earning him as many enemies as friends. Dr Shershah is former head obstetrician and gynaecologist at the only public health facility operating in Orangi town—a squalid sprawling ghetto on the outskirts of Karachi; reputedly one of the largest slums in Asia. Recently Dr Shershah was removed from this post in Orangi town, a move, attributed by many, to his public criticism of the government.

Four years ago in a joint initiative with international donors and the provincial government of Sindh, the first trial emergency obstetric care unit and school of midwifery was established in Qatar Hospital. The unit aimed to providing cheap and accessible health care for the women of Orangi town. Yet so far, little sign of change has occurred.

Pregnancy related deaths in poor communities like Orangi are abundant. Women are exposed to high levels of violence, malnutrition and disease. Massive illiteracy rates impede basic health care and gross gender disparity prevents women taking control in reproductive decision making. World Health Organisation figures estimate that 49% of all lactating women in urban areas like Orangi are malnourished and heavily anaemic.

DR SHERSHAH SYED: At the end of the day every thing boils down to the empowerment of women and her status in society. If a society does not consider women human beings and is not ready to give woman rights, then it is not ready to give her treatment also.

Traditionally considered a female profession, Dr Shershah never intended to be a gynaecologist. But after studying in the UK and witnessing the quality of health care in comparison to his own country, he returned to home to Karachi and against convention and his family's wishes, studied gynaecology.

DR SHERSHAHS MOTHER: He's just like his father. Whatever decision he makes he remains on that decision. I didn't want him to study the female medicine being a male but he did. I told him this work was not for boys, but he didn't listen; he became a gynaecologist.

Unlike the majority of his colleagues that left Pakistan to work in the lucrative western market, Dr Shershah took his experience and knowledge to impoverished communities desperate for professional care. Other younger gynaecologists, notably female, Nighat Shah and Frizana Iswan, support Dr Shershah's efforts by providing similar medical services.

For under-privileged women in Pakistan, accessing health care verges on the impossible. Distances to even basic health facilities are huge and too often vital drugs or surgeons are unavailable when patients arrive. Women are often forbidden to visit male physicians and strict religious practices such as Purdah prevent women from leaving the home even during an emergency. As a result, Pakistan now has the highest rate of home births in the world.

OLIVIER BRASSEUR, UNITED NATIONS POPULATION FUND: Islam is not against the control of maternal mortality. But our biggest problem is for people to avail the facilities provided by the government.

Most women rely on traditional birth attendants (known as daies) to supply antenatal and postnatal care. An old profession that has arisen out of necessity in poor communities, daies combine homespun superstition with unhygienic and often brutal delivery practices. Their inability to recognize obstetric emergencies and lack of an effective referral system play a significant role in the current standard of fatalities. Recently the government has funded a program in which young girls are trained as midwives. Training involves acquiring knowledge of standard medical procedures and skills required to assist women in giving birth and to provide post-natal care. Although progress is slow the aim is to replace the country's 80,000 daies with properly trained mid-wives. Significantly, figures from other countries suggest that the availability of properly trained mid-wives places a significant role in reducing maternal death and injury.

DR SHERSHAH SYED: The problem that we are facing is that the number of patients is growing geometrically. First I think we will have ten patients, instead we will have twenty patients. I expect we will have twenty patients instead we get forty or fifty patients. So you provide drugs you provide facilities and the people will come because the people have no money. It's really a problem, I don't know how to cope with it, it's really a problem...

Pakistan's exploding population rate is the fastest growing in the world and absorbing scarce government resources. In thirty years it will be the third most densely populated country in world, behind only that of China and India. The pressure placed on public sector funding is further compounded by expensive military commitments and servicing Pakistan's of massive foreign debt. With less than 0.22% of the domestic product going into health care, Islamabad's commitment to national reform shows little sign of improving.

President General Pervez Musharraf has made his population control program the centrepiece of his domestic policy. In an International Population Day speech earlier this year, Musharraf claimed the key to reducing maternal death rates was to curb family growth trends. However, his fertility control initiative has drawn criticism from hard-line Islamic parties opposed to liberalization of contraceptive and abortion practices. Illegal abortions currently contribute to 30% of maternal deaths.

Despite ongoing government promises and seventy-two women in the National Assembly, three pregnant women continue to die every hour and fifteen more are left with debilitating injuries. The question remains as to how to solve this problem; what are the barriers to consumer-citizen rights, why is progress so slow, who needs to take greater responsibility?

DIRTY LITTLE SECRET: HOME CHAOS AND PROFESSIONAL ORGANIZER

Russell Belk, University of Utah

Joon Yong Seo, University of Utah

Eric Li, University of Utah

Clutter is symbolic dirt or feces. The accumulation of possessions creates increasing problems of clutter as millions of Americans enjoy unprecedented affluence, growing home sizes, a decline in the real cost of clothing, furnishings, and many gadgets, and an onslaught of new electronic and other products. Professional organizing is a new industry in the United States that has emerged due to the increasing problem of disorganization in our homes and offices. A disorganized home is not only an issue of space utilization in the home, but is also strongly linked to the emotional life of the individual; a physically disorganized home means a disorganized life and a fragmented and chaotic sense of self. In this study we use video ethnography to examine the problem of home clutter. We collaborated with a professional organizer in Utah in order to explore the meanings of clutter and chaos to their clients and to examine how these professional organizers implement a three-stage system they call "See it, Map it, Do it" to help their clients gain a sense of control and manage their disorganized lives physically and spiritually. At the descriptive level, we study the interactions between the professional organizers and their clients.

We first sought to understand how the professional organizers help their clients tackle the problem of growing clutter and disorganization in their homes. At the interpretive level, we explore the meanings of clutter and chaos as well as the attachment to possessions embedded in clients' life stories. Among The role of the professional organizers is not simply a service provider, but in the best of circumstances they provide a gift to the client that releases them from the entanglement of too many possessions and prepares them for rebuilding a fresh life in the future.

The main reason for the creation of clutter is a long and gradual accretion and accumulation of possessions. With limited time, space, and skills in organizing their excessive possessions at home, cluttered consumers increasingly seek help from a professional organizers as well as self-help groups, books, videos, and television shows like "Clean Sweep" and others. The frustration and panic associated with the accumulation of things are magnified by the traumatic life events like birth, death, marriage, divorce, retirement, moving, and other dramatic changes. Most of us share the same ideology that more things mean a better life; thus we accumulate as much as we can. As a result, the tyranny of disorganized possessions controls us more than we control them. It is not just our things that are cluttered and disorganized. So is our time, our computer, and our lives. When they become desperate enough, the largely middle-age, middle-class, female clients studied seek help from professional organizer. A professional organizer is not only a service provider who brings skills and insights to bear in organizing the space of a home, but also a guide who helps clients redraw the lines of meaning and possessions. They help clients to not only rebuild their homes but to rebuild their lives and selves as well. Among the techniques employed are feng shui and meditation.

The clutter in our informants' homes were not composed of unwanted things or disposable waste. To the contrary, the clutter we studied was composed of the possessions which have deep meanings for the individual. Collections, photo albums, books, clothes, furniture, videos, paintings and other possessions were closely connected to the informants' memories, histories, and identities. Informants failed to give up these possessions and they accumulated in their closets, garage, and corners of their homes. Most of the possessions found in the clutter and chaos did not have any practical value for the individual except memories. The emotional attachment to these possessions and the fear of losing their memories and histories were the primary factors in the formation of clutter and chaos.

To get rid of the excess possessions and the chaos of disorder and rebuild a cleaner, less polluted, contaminated, and stigmatized, and more guilt-free environment, informants has to first realize that more is not better and that becoming organized offers an opportunity to create a fresh new life founded on a less extended sense of self. Those who can no longer manage their increasing piles of possessions experience frustration and even panic. They realize that they need somebody to help them to toss things and learn to live in greater simplicity. Thus, the increasing demand for professional organizers hired by perhaps one million Americans this year. We find that an organized life involves not only the changing possessive behaviors, but also adopting a new mind set or lifestyle. This is evident in that some of our informants agreed that their home is a visible manifestation of their mind or inner organization.

WHY DON'T CONSUMERS BEHAVE ETHICALLY? THE SOCIAL CONSTRUCTION OF CONSUMPTION

Giana Eckhardt, Suffolk University

Timothy Devinney, Austrian Graduate School of Management

Russell Belk, University of Utah

The fact that consumers believe an ethical issue is important does not imply that when faced with constrained choice options that they will act according to those beliefs. This leads to a conclusion that "all consumers care" but the extent of their "caring" is driven not by beliefs and intentions as much as it is by the constraints and circumstances in which purchasing occurs.

Consumer ethics should involve not only core values about social justice, morality, and just behavior, they should also be relatively easy to act upon given choices available in the marketplace that align with ethical stances. By either choosing products like soaps that contain no animal by-products and have not been tested on animals or by rejecting products like shoes and clothing made with sweatshop labor, consumers can use their expenditures to vote their conscience. Even consumers without strong ethical convictions would like to think of themselves as good people, so doing the "right" thing in their consumption choices should be appealing.

However, doing the right thing may mean paying more, expending more time and effort to find the "right" product, or doing without a popular brand. Therefore consumers may choose to remain ignorant of the labor conditions, environmental impacts, or intellectual property rights issues involved in the products they buy. They can invoke a series of accounts—justifications or excuses—in order to continue to think of themselves as good people, despite engaging in ostensibly unethical consumption behavior. A justification is an account that takes responsibility for the unethical act but attempts to make it seem ethical.

Given that the meaning of ethical consumerism has been under researched and is not well understood, and how important it is to gain this understanding of meaning to try and bridge the gap between ethical beliefs and behavior, we embarked on an interpretive study to understand consumer justifications. We presented our informants from eight countries—USA, Australia, Germany, Sweden, Turkey, China, India and Spain—with three scenarios, each focusing on a different ethical consumption scenario: purchasing Nike athletic shoes made in sweatshop labor conditions, purchasing soap which is non-biodegradable or tested on animals, and purchasing counterfeit Louis Vuitton handbags. Almost all of our informants either did not care about the issues presented to them, or professed to care, but when asked to describe their actual purchasing behavior, revealed a disconnect between their beliefs and behavior. In all cases, they offered justifications for the apparent inconsistency between their beliefs and behaviors. These varied across the countries in which the informants lived. From our informants' in depth discussions of these three consumption situations, in this film we present three varying rationales consumers use to explain their behaviors and/or beliefs: (1) economic rationalism, (2) governmental dependency, and (3) developmental realism.

The Economic Rationalist

In capitalist and individualist countries such as Australia and the US, many of the rationales and justifications used were of an economic rationalist nature. For example, an Australian informant, in discussing how factories operating under sweatshop conditions can be economically beneficial to the country in which it is located, said, "Part of this is a development issue. Years ago it was Japan, then Singapore and Malaysia. Now it is Vietnam and China. These countries need opportunities." Another Australian articulated this line of

thinking as: “Most Australians are concerned about price, not the labor issues. Morals stop at the pocket book. People might say something but if they were to make them [athletic shoes] in Australia at twice the price, people would buy the foreign cheaper brand. These blokes [factory workers in Southeast Asia] are lucky to have a job. If they weren’t making them there these people would not have work. You would not want to upset the labor conditions in these countries [by paying them more]. The advantages to these people outweigh the costs.”

The Governmental Dependents

In socialist democracies such as Germany and Sweden, the justifications that consumers offer for their ethical beliefs and behavior tend to focus around their lack of individual responsibility in addressing the issues. Rather, these consumers think it is the role of the government to address the issues.

In response to buying counterfeit goods, a Swedish informant said, “If it’s legal people should buy it, but if it is illegal, they shouldn’t.” If the government has decided that a particular product can be legally sold in the country, then the consumer does not have a responsibility to question that ruling.

The meaning that consumers in these countries attach to consumer ethical issues are filtered through a lens of holding other institutions responsible for addressing both ethical and consumer related issues. Thus, even if they think a particular practice is wrong, they do not see it as their responsibility to address the issue.

The Developmental Realists

Consumers in emerging markets tended to have quite different justifications for their beliefs and behavior. Even if our urban, middle class informants from China, India and Turkey perceived what was happening in the scenarios to be ethically wrong—and many of them did not—they saw breaching their own sense of morality as part of the price to pay for their country and individuals to develop and grow economically.

For example, in discussing the ethicality of buying soap that is non-biodegradable, our Turkish informants said, “In Turkey people are too poor to worry about such ethical issues.” A Chinese informant said, “To have exploitation of the workers is quite natural, this is the natural adoption of every business throughout the world.”

Some justifications surrounding why it is OK to buy counterfeit products centered on the ethicality of large corporations exploiting the people by charging high prices, especially in Turkey. “In the end they are giant companies. How much loss would Louis Vuitton suffer? I think nothing would happen to Louis Vuitton.”

In India, China and Turkey, consumers attach meanings to these ethical situations through the lens of their economic situation, political education, and intimate knowledge of the development and labor conditions in their countries.

WHAT’S GORGEOUS CONSUMPTION?

Hiroshi Tanaka, Hosei University

Junko Kimura, Hosei University

We investigate the values and functions of luxurious possessions. The term affluent becomes relevant in both Marketing and daily lives in the US and Japan. We find books with title of affluent at book store. We see gorgeous celebrities on TV program. There are TV quiz shows introducing the lives and consumption of affluent people. Marketing companies such as eMarketing are targeting affluent and successful in business performance. Its sales of 2002 were 2.5 million US dollars.

Not only real affluent people, as there are 760,000 households with 1 million US dollars monetary assets in Japan, but also ordinary also possess a several luxurious things. There are two research questions in this video. For ordinary, (1) What kind of values do luxurious possessions have? (2) What function do luxurious possessions have?

As Simmel (1919) argued using Trickle Down Theory, luxurious consumption of the ordinary are regarded as secularization or derivation from that of affluent. It is true that luxurious possessions are expensive and its function is conspicuousness and prestige, however, this video claims that there are other values and functions served by luxurious possessions in ordinary people, functions that Trickle Down Theory cannot explain.

Conducting interviews toward the US households and the Japanese college students, we found the cultural differences among the functions and meanings of luxurious things. For the US ordinary, luxurious things let them escape from daily hectic lives, are reward of their hard working, affordable (not necessarily expensive) and something they feel closeness to the possessions. For the Japanese ordinary, luxurious things are something they can feel belongingness to their family and construct self-identity and something for special occasions and showing off to others. In other words, luxuriousness is created not from state of goods but from the relationship between state of goods and state of person.

For future research, we need to continue cultural comparative research in order to find the differences between countries are caused by age differences or cultural differences.

Mi Casa es Whose Casa? An Experimental Investigation of Consumers' Propensity to Participate in Multilateral Sharing Systems

Randall L. Rose, University of South Carolina, USA
Catherine Poynor, University of South Carolina, USA

EXTENDED ABSTRACT

Sharing has been identified as a potentially underutilized economic engine, allowing for more efficient use of slack resources both within communities and across society in general. A rich literature has developed describing consumers' propensity to gift their property, thereby completely giving up control of the good (Lowrey, Otnes and Ruth 2004), or to unilaterally donate to charitable causes (Small, Loewenstein and Slovic 2005; Small and Loewenstein 2003). However, little is known about the kinds of goods likely to be shared or the motivations and conditions under which consumers are willing to participate in a more complex multilateral sharing system (Gintis 2004). Differing from unilateral donation programs, sharing systems allow the consumer to be both a donor, providing resources to the shared pool, and a beneficiary, drawing from shared resources when needed. In this research, we begin an exploration of consumers' willingness to participate in such arrangements by examining factors on both sides of this equation: those that increase initial motivation to donate to a sharing system as well as those that impact anticipated utility as a beneficiary of the shared resources. We examine these issues in three experiments using student participants.

In study 1 we demonstrate that individuals will be less likely to share goods that are "lumpy" in their consumption as well as in their provision, thereby extending prior theory from the economics literature. Lumpy goods are those that "provision functionality in discrete packages rather than a smooth flow" (Benkler 2004, p. 6); in economic terms, the utility they offer is indivisible within a discrete range. For example, when buying computers, consumers are offered central processing units with processing speeds and capacities that generally far exceed what is needed for mundane everyday tasks.

In study 2 we find that extrinsic (i.e., financial) incentives to participate in sharing systems are primarily effective only when resource slack is large. If individuals are willing to share in a low-slack setting (i.e., when they have little to contribute), it is unlikely that they are doing so expressly in order to gain financial benefit. With little to share, financial rewards that pay per unit shared may not amount to much financial gain, and thus, provide a relatively low amount of motivation. Moreover, seeing a relatively small, but concrete, financial figure assigned to a good to be shared may make the potential donor feel that their contribution is insignificant or unappreciated, further undermining their perception of the magnitude of the intrinsic, intangible rewards they might otherwise anticipate from such a donation. Thus, in conditions of small slack, we believe that the addition of an external incentive is likely to undermine the primary motivation to share, crowding out altruistic tendencies with a relatively small and non-compelling financial reward (Deci 1974; Deci and Ryan 1985). On the other hand, when a large, and therefore, more useful amount of slack is available, cumulative financial rewards may increase the attractiveness of the transaction to a point which exceeds internal motivation, providing a quantified, concrete, utilitarian reason for sharing.

Finally, in study 3 we find that perceived control and resource flow variability interact to predict consumers' propensity to participate in a multilateral sharing system, such that when individuals feel they lack control over usage of a highly variable resource,

sharing systems are more attractive. Furthermore, when consumers have the option of a sharing system and a sole ownership system containing equivalent objective utility, preliminary results also suggest that those facing high variability in resource flow will be willing to pay more for the sharing system than the sole ownership system.

The Muse Effect: When Romantic Motives Create Creativity

Vladas Griskevicius, Arizona State University, USA

Robert Cialdini, Arizona State University, USA

Douglas Kenrick, Arizona State University, USA

EXTENDED ABSTRACT

The topic of creativity has a rich history in psychology and has recently received renewed interest in consumer behavior (e.g., Burroughs and Mick 2004; Moreau and Dahl 2005). The current research explored a popular creativity phenomenon that has never been investigated, but one that has multiple theoretical and practical implications: The muse effect. That is, many creative juggernauts, such as Picasso, Dali, and Dante, attribute their creative bursts to muses—women who, like the nine daughters of Zeus in Greek mythology, inspired great creative output (Prose 2002). But does a romantic state actually lead people to be more creative? And if so, why are muses predominantly women who inspire men—and are there circumstances when male muses should serve to inspire women?

In three experiments, we examined how priming people with several types of romantic motivations influenced their creative displays and creative performance. Our research draws on consumer behavior and psychological research on motivational priming (e.g., Bargh 2002; Chartrand 2005), and on the evolutionary theories of sexual selection and parental investment (Darwin 1871; Trivers 1972). From this foundation, we tested (1) the basic question of whether romantic motives indeed inspire creativity, (2) boundary conditions regarding which specific romantic cues will inspire male versus female creativity, and (3) several possible mechanisms underlying these phenomena. Our purpose in this research is not only to investigate the muse effect, but also to foster new empirical research and theoretical development in consumer behavior regarding creativity, self-presentation, and the rich empirical possibilities stemming from considerations of evolutionary theory.

Some theorists (e.g., Miller 2000) have proposed that creativity may have in part evolved via sexual selection—an evolutionary process whereby the possession and display of a certain trait enhances an individual's ability to attract a mate. Human creativity shares many features with sexually selected traits in other species, like a peacock's tail, and the sexual selection view of creativity has received some empirical support (Haselton and Miller 2006). One distinct marker of a sexually selected trait across species is its conspicuous display in courtship (Andersson 1994). Given that cues related to mating can activate mating goals and its associated pattern of affect (Maner et al. 2005), people—particularly men (Cronin 1993)—should be more likely to display creativity when they are primed with cues related to courtship.

In Study 1, participants looked at photographs of attractive opposite-sex individuals or neutral images, and then wrote several short stories. Afterwards, the stories were rated by four judges blind to condition on various creative dimensions. Results indicated that men, but not women, wrote stories that were more creative after seeing photographs of opposite-sex individuals. Interestingly, men did not spend more time or use more words to write the more creative stories. Thus, it appears that romantic primes didn't just produce more displays of creativity; but that they produced qualitatively more creative displays.

Consistent with Study 1, sexually selected traits in mammals are displayed exclusively by males in 97% of species (Cronin 1993). However, parental investment theory posits that sex differences in sexually selected traits are linked to a species' expected

levels of maternal and paternal parental investment—the time and energy devoted to producing viable offspring (Trivers 1972). In those species in which courtship displays are performed by males, the males tend to invest the absolute minimum in offspring. But when expected parental investment for each sex is more equal, both males and females produce the displays (Buss 2005). Additionally, because women incur significantly higher reproductive costs if they are abandoned by a mate, women should be especially sensitive to the trustworthiness and commitment levels of the man before displaying desirable characteristics like creativity (Haselton and Buss 2000).

In Study 2, pre-tested romantic scenarios were used to induce romantic motivation. The scenarios differed on (1) the expected parental investment of the person, and on (2) the extent to which the potential romantic partner was trustworthy and committed. Afterwards, participants performed the Remote Associates Test (RAT), which is a standardized measure of creativity (Mednick 1962). The results of Study 2 conceptually replicated Study 1: For men, all romantic scenarios produced an increase in creativity; for women, however, neither imagining a brief encounter or a first date altered their level of creativity. However, as predicted, when women imagined desiring to take a budding romantic relationship to the next level—a relationship in which the man would be expected to contribute significant parental investment in the future—this kind of romantic motivation did indeed produce an increase in women's creativity. Additional data indicated that the creative boosts were not related to changes in mood or arousal.

Study 3 further extended the findings by showing that people in a romantic mindset were significantly more creative even when compared to individuals who had a monetary incentive to do well on the creative task.

In summary, this research is the first to examine how romantic motives influence creativity. We found that there is indeed a muse effect, and that this effect is elicited by specific theoretically relevant romantic motivations for men and women. Moreover, this effect does not appear to be related to mood or arousal, and is not caused by increased effort on the creative task. The current research has multiple theoretical implications for the influence of romantic motivation of behavior. For example, it is likely that romantic motives will influence a wide array of strategic consumer behaviors (e.g., conspicuous consumption, donations, etc.), and that other evolutionary relevant motives, such as a desire for status, may play a significant role in consumer behavior. Additionally, these findings have practical implications. For example, a work environment that activates romantic desires is likely to be a more creative environment—although primarily for men. Moreover, men and women are likely to be more creative consumers when specific romantic motivations are activated. We hope that these findings serve as a springboard in furthering consumer research on how specific motivations influence consumer creativity and self-presentation, as well as aid in the development of more stringent consumer theories that incorporate the promising perspective of evolutionary theory.

Gift-Giving Behaviors: Views from an Attachment Perspective

Hieu P. Nguyen, University of Texas at Arlington, USA

James M. Munch, University of Texas at Arlington, USA

EXTENDED ABSTRACT

A large body of research has investigated different aspects of the gift-giving experience including social, personal, and economic exchanges (Belk and Coon 1991; Mattson 1982), social roles and relationships (Joy 2001; Otnes et al. 1993; Ruth et al. 1999), symbolism (Belk and Coon 1993; Wolfinbarger 1990), anxiety (Wooten 2000) and the personal value of gifts (Larsen and Watson 2001; Ruffle 1999). Researchers have attempted to propose taxonomies of gift-giving motives, including Sherry's (1983) altruistic versus agnostic motives, the Goodwin et al.'s (1990) voluntary versus obligatory motives, and Wolfinbarger's (1990) groupings of motives (altruism, compliance with social norms, and self-interest). However, very few studies have attempted to explore the role of personal attachment in shaping gift giving behaviors among couples.

In an attempt to find the answer to this question, we based our research on findings from the interpersonal relationship literature, particularly Attachment Theory.

Attachment Theory (Bowlby, 1969, 1973) explains the propensity of people to form lasting affectional bonds with other people and to regulate inner distress, including anxiety, anger, depression, and emotional detachment. According to the theory, early experiences between a child and his or her primary caregiver lay the foundation for functioning in subsequent relationships. Early work (Ainsworth et al. 1978) identified three types of attachment: secure, avoidant, and anxious/ambivalent attachment. Bowlby (1973) found that securely attached people have a strong, secure base and believe that significant others are available in stressful circumstances. They tend to develop mental models of themselves as friendly, good-natured, and likeable whereas significant others are well intentioned, reliable, and trustworthy (Simpson 1990). Mikulincer and Orbach (1995) found that avoidant individuals tend to maintain distance from attachment figures, deny their insecurity and related negative affects. Meanwhile, Simpson (1990) found that anxious/ambivalent individuals tend to develop models of themselves as being misunderstood, unconfident, and underappreciated. In their eyes, significant others are typically unreliable, either unwilling or unable to commit themselves to a permanent relationship.

More recent work on attachment style has suggested that the attachment system could be more precisely conceptualized and measured dimensionally rather than categorically along two fundamental dimensions: attachment-related anxiety and attachment-related avoidance. People who score high on the anxiety dimension tend to worry whether their attachment figures would be available, responsive, and attentive. People who score low on this dimension are more secure with respect to the perceived responsiveness of their partners. People who score high on the avoidance dimension tend to retract from attachment figures and prefer not to rely on others. People who score low on this dimension are more comfortable being intimate with others and are more secure relying on and having others rely on them.

Based on these findings, ten hypotheses were developed and tested in this paper. We were interested in the effects of attachment style on people's gift giving motives (voluntary vs. obligatory), gift selection effort, gift giving anxiety, types of gifts chosen, and expectation of gratitude. A questionnaire was developed and handed

out to 134 undergraduate students, resulting in a usable sample size of 127 responses after data cleaning. Attachment style was measured with the ECR scale (Brennan et al. 1998) while dependent variables were measured with established scales. All scales showed significant reliability.

Multiple regression analysis was used as the analytical tool. Results indicated that nine out of ten hypotheses were supported. As predicted, anxiety attachment is positively related to obligatory rather than voluntary gift giving while avoidance attachment is negatively related to voluntary gift giving. Avoidance attachment was negatively related to gift selection efforts and surprisingly, anxiety attachment was not positively related to gift selection efforts as we had predicted. We also found that anxiety attachment was positively related to choice of gifts that are prestigious, functional, and fun, while it was not the case for avoidance attachment. We also found that anxiety attachment was positively related to gift giving anxiety while avoidant individuals seemed immune from it. Finally, results indicated that as expected, anxiety attachment was positively related to expectations of gratitude while avoidance attachment was not.

This study provides empirical support for the influence of individuals' attachment style on their gift giving behaviors in romantic relationships. The main contribution of this paper is that it provides a fresh perspective on the study of people's gift giving experiences. The personal attachment approach that we propose here is particularly relevant to the inquiry of gift giving behaviors in romantic relationships because it explores gift giving behaviors based on how people see themselves (actual role) versus others (their romantic partners) and consequently use gifts to strengthen that role and also express their aspiration to get closer to their ideal role in the relationship. This research direction is in line with Belk's (1979) contention that the giver's ideal self-concept may be more strongly related to gift choice than either the giver's actual self-concept or the perceptions of the gift by the recipient in both gift selection and symbolic encoding of gift by giver.

This study also provides valuable insights to marketers in their efforts to understand the "hot buttons" that cause consumers to choose certain products as gifts. Marketers could integrate findings from this study into their advertising messages for gifts that would appeal to different attachment patterns. For instance, knowing that anxious individuals experience a high level of anxiety when searching for gifts, marketers or gift consultants could present gift choices that not only take the burden off their shoulders but also communicate the message that they (the gift givers) are committed to the relationship and will therefore be rewarded with much gratitude and appreciation from their partners.

Future research should explore the effects of attachment style from the gift recipient's perspectives and answer these questions: what value do they appreciate the most (economic, functional, social, or expressive)? What gift attributes do they prefer? Do they feel comfortable letting their partners know of their feelings about the gift (for example, if a woman receives a gift that she does not like)? These questions, when answered, will provide valuable insights to marketers in designing marketing strategies and persuasive communications that speak to the heart of both the givers and recipients of the gifts.

Small Gains or Smaller Losses: Optimal Price Promotions and the Silver Lining Effect

Peter Jarnebrant, Columbia University, USA
Eric Johnson, Columbia University, USA
Olivier Toubia, Columbia University, USA

EXTENDED ABSTRACT

The representation of information as an integrated whole or as segregated components may have different effects on the decisions taken based on that information. This is the starting point for an analytical and empirical investigation of two phenomena: the silver lining effect (Thaler 1985), and the use of instant rebates in retailing (Lanctot 2002). We derive conditions for the appearance of the silver lining effect, based on prospect theory (Kahneman and Tversky 1979), and apply the results to a consumer setting, in which an instant rebate is used as the silver lining.

Rebates are common in modern retailing, especially consumer electronics, where they are the most common means of promotion (Lanctot 2002). The most commonly studied variant of rebates has been the mail-in rebate (e.g. Jolson, Weiner and Rosecky; Soman 1998), which has two characteristic elements: effort is required in order to receive the price reduction, and this effort occurs after the purchase, adding an intertemporal component to the purchase decision. We focus on the “instant rebate” in order to eliminate these two components and center on the effect of the representation of price as a base price and a separate reduction.

This form of promotion entails that the retailer, instead of simply presenting a new, lower, price, presents the old price accompanied by the amount that is “given back” to the customer upon purchase. We interpret this as a possible application of the silver lining effect (Thaler 1985), and next derive conditions for its implications for decision making.

In accord with the findings of Bateman et al. (2004), we assume that consumers treat purchases as losses, at least to some extent; thus, we can apply prospect theory (Kahneman and Tversky 1979) in our analysis. We take the value function $v(x)$ to be any concave function $g(x)$ for $x \geq 0$ (with $g(0)=0$), and $l(-x)=-\lambda g(-x)$ for $x < 0$; $g(x)$ is then the “gain function” and $l(-x)$ the “loss function.” This results in the characteristic curve kinked at $x=0$ due to the loss aversion parameter λ .

Thaler (1985) observed that when an outcome is composed of several parts, prescriptions can be issued for when it is optimal to combine (integrate) the parts, and when it is best to keep them separate in mind (segregate). We examine the case of a “mixed loss;” that is, where a loss, say $x < 0$, is combined with a smaller gain, say $y > 0$, making the overall outcome negative. The value from integrating the components is then $v(x + y) = l(x + y)$ and that from segregating them is $v(x) + v(y) = l(x) + g(y)$. In the first case, then, there is only a loss, whereas in the second there is a loss and a gain.

Our analysis shows that the optimality of segregation versus integration depends on the size of the gain, the size of the loss, the loss aversion parameter λ , and the degree of diminishing sensitivity (i.e., concavity) of the function $g(x)$. For any fixed loss L , there exists a threshold value of the loss aversion coefficient, λ^* , such that if λ is above this, it is optimal integrate for all $G \leq L$, and if λ is below this, it is optimal to segregate small gains (below a smallest gain G^*) from the loss.

From this analysis follow several predictions, of which two are tested empirically. We assume that participants treat information largely as it is presented to them (the concreteness principle, Slovic 1974). We first predict that for a small price reduction, a rebate (segregation) should be more optimal than a discount, and vice

versa for a large price reduction. Second, there should be a preference for segregation among participants with lower loss aversion, and for integration among those with higher loss aversion.

The hypotheses were tested in an online study using a hypothetical choice scenario, where participants chose to buy or not to buy a DVD player in one of four conditions (2(frame: rebate vs. discount) \times 2(size: small vs. large)). The results confirm the hypotheses. In the low reduction conditions, respondents preferred the product under the rebate ($M=.63$) versus under the discount ($M=.36$; Fisher’s exact $p=.03$), while in the high reduction conditions, respondents marginally preferred the product under the discount ($M=.70$) versus under the rebate ($M=.52$; Fisher’s exact $p=.11$); a logit analysis confirmed that the interaction was significant ($\chi^2=6.48, p=.01$).

For testing the second hypothesis, a measure of loss aversion was adapted from Götte, Huffman, and Fehr (2004); as predicted, there was a (marginally significant) interaction between the framing of the reduction and loss aversion ($\chi^2=3.47, p=.06$).

These results indicate that our analysis is valid, and have important implications for the optimal management of promotions; it also extends our understanding of the mental representation of information in decision making.

ROUNDTABLE
Researching Visual Consumption
Jonathan E. Schroeder, University of Exeter, UK

This roundtable discussed methodological and theoretical issues of aesthetics, images, and vision as it pertains to consumer behavior via interdisciplinary research examples and exemplars. We surveyed recent efforts in studying visual issues in consumer behavior, including Web browsing and design, advertising interpretation, digital photography and visual tools in research. This session presented research methods for studying visual consumption, with an emphasis on interpretation, representation, and interdisciplinary methods. We introduced key literature sources, and draw upon participant's own research to generate new insights into visual methods and topics in consumer research. One current concern is how visual strategy creates value.

Visual issues are being recognized as important issues in consumer behavior and consumer research (e.g., Pracejus, Olsen and O'Guinn, 2006; Phillips and McQuarrie 2004; Schroeder, 2002; Scott and Batra, 2003). Visual images constitute much corporate communication about products, economic performance, and social responsibility, and also inform governmental efforts to create positive attitudes for citizens, consumers, and organizations. Brand image, corporate image, advertising images, and images of identity all depend upon compelling visual imagery. Various referred to as the attention economy, the aesthetic economy, and the experience economy, this visual turn in marketing may call for new perspectives and research approaches. What does the production and consumption of images mean for marketing and society? How does the handling of images in the allied fields of visual studies, art history, film theory, design management, and corporate identity shed light on the relationships between visual processes and consumption? Visual consumer research cuts across methodological and topical boundary lines—the possibilities and problems of visual approaches encompass experimental and interpretive realms, and include such varied topics as information processing, image interpretation, and research techniques.

This roundtable's purpose was to survey recent efforts in studying visual issues in consumer behavior, including Web browsing and design, advertising interpretation, digital photography and visual tools in research. The session carries on from successful 'Researching Visual Consumption' roundtables in Atlanta in 2002 and Portland in 2004, and builds upon visual-related efforts such as the publication of the book *Persuasive Imagery: A Consumer Response Perspective* edited by Linda Scott and Rajiv Batra (2003), the growth of the ACR film festival, the University of Utah's workshops in visual methods, and a special issue in *Marketing Theory* on 'Aesthetics, Images and Vision' edited by the roundtable organizer (Schroeder, 2006). This session discussed research methods for studying visual consumption—with an emphasis on interpretation, representation, and interdisciplinary methods—as well as methodological and theoretical issues of aesthetics, images, and vision as it pertains to consumer behavior via interdisciplinary research examples and exemplars. We introduced key literature sources, and draw upon participant's own research to generate new insights into visual methods and topics in consumer research.

SPECIAL SESSION SUMMARY

Workbench Issues in Transformative Consumer Research

Julie L. Ozanne, Virginia Tech, USA

Jonathan Deschenes, Concordia University, Canada

SESSION SUMMARY

The 19th century roots of the social sciences in the United States arose from the twin desires to solve social problems and guide public policies. Thus, the romantic call for transformative consumer research (Mick 2005) is neither new nor revolutionary but is a return to our origins. While the early days of the social sciences had social reformers and academic analysts working side by side, reformers were quickly expelled from the academy as the academic social scientists consolidated their power in professional associations (Greenwood 2004; Krause 1996). For example, Ross (1991) documents a long and troubling history of the social sciences removing theorists who are social critics, which significantly predates the well-publicized McCarthy purges. Thus, a pressing issue facing would-be transformative consumer researchers is whether our academy can absorb the potentially destabilizing and critical nature of transformative consumer research. Unlike traditional positivistic research that claims an apolitical (despite the philosophical problem of a “neutral” vantage point), transformative consumer research explicitly affirms the goal of changing and improving society. Such an approach is likely to challenge our traditional notions of research product and process.

The purpose of this special session is to explore the practical and demanding workbench issues of doing research aimed at social change. Three papers are presented that explore challenges from the perspective of the researcher, the local community, and the broader academic community. First, Jonathan Deschenes examines the often invisible and rarely discussed problem of the emotional and personal demands of studying raw and poignant social problems such as AIDS, poverty, or domestic violence. In our hurried rush to meet the call for transformative research, Jonathan raises a caution flag suggesting that as researchers we will likely face personal transformations and he explores some practical approaches that we might take. Second, Jean-Sebastien Marcoux offers reflections from his fieldwork on the 9/11 attack and the construction of memory at Ground Zero. He explores the transformative consumer researcher as located at the nexus of competing and often contradictory interest groups within the local community and discusses the accompanying moral and ethical dilemmas faced. Finally, Julie Ozanne, Bige Saatcioglu, and Canan Corus suggest that the paradigm of participatory action research (PAR) offers valuable lessons that can be applied to research aimed at social change. However, PAR advocates a radical rethinking of the role of researcher, the research process, and the knowledge output that is generated.

This session is a multi-paradigmatic approach to issues facing researchers who seek to do research for social change. The domain of transformative research provides a context in which we can break down paradigmatic barriers and engage in constructive debate and the exchange of ideas unified by our shared interest in social problems. This session is relevant to researchers who are interested in transformative consumer research in general and those researchers who are struggling with the specific challenges of researching difficult social problems.

Connie Pechmann is an ideal discussant because her research exemplifies how consumer theory can be fused with social practice. In her work on adolescents and cigarette smoking, she engages in theoretically-driven programs of behavioral change. She is also active in disseminating her work to stakeholders who can benefit

from her research and can offer important reflections on the research issues arising in this session.

“Behind Closed Doors: Reflecting on the Emotional Challenges of Doing Consumer Research on Painful Topics”

Jonathan Deschenes

Consumer researchers are exploring highly sensitive population segments, such as AIDS victims (Kates 2001), breast cancer patients (Pavia and Mason 2004), juvenile delinquents (Ozanne, Hill and Wright 1998), drug addicts (Hirschman 1992; Hirschman and McGriff 1995), compulsive buyers (O’Guinn and Faber 1989), and homeless women (Hill 1991). Increasingly, consumer researchers are urged to develop “consumer research for consumers” (Bazerman 2001) and to create programs that will help communities in return for their generous contributions to science (Moorman 2002; Murray and Ozanne 1991). Recently, the *Association for Consumer Research* led by his President and by a special task force, coined the expression *Transformative Consumer Research* (TCR), which essentially insists on developing research programs to improve the quality of life of consumers (Mick 2005, Mick 2006).

However, this call for “consumer-centered” research, which mainly focuses on problems experienced by consumers individually or collectively, ignores the emotional impact *felt by researchers* when performing research on emotionally-demanding population segments. Interacting with despairing, distressed, seriously ill, traumatized, or abused consumers is likely to affect the researcher deeply. During research on rape victims, Campbell (2002) noted that research team members began to feel unsafe after dusk, resented being alone in unknown places, and locked themselves in at home. In a study with battered women, Dunn (1991) reported frequent insomnia, gastrointestinal problems and headaches. Similarly, investigators studying dying people reported experiencing strong emotional turmoil as they reflected on their own mortality (Owens and Payne 1999).

These powerful reactions often arise when the researcher deeply identifies with participants (Alder and Alder 1987; Kleinman and Copp 1993) or when the trauma is overwhelming, which can cause vicarious traumatization (Hesse 2002). Moreover, the use of interpretive methodologies likely exacerbates this effect. Indeed, by creating contextualized, intimate, humanized relationships, this approach collapses the distance between the researcher and the researched (Hirschman 1986; Hudson and Ozanne 1988). Methods that increase the empathetic and experiential understanding of another person’s vivid and painful reality are likely to be more emotionally demanding (Margulies 1989).

Notwithstanding their importance, these emotions and other responses are often neglected or even negated in the research process. Despite the postmodern turn in research, which allegedly reintroduced the subjective accounts of researcher into the research process, a strong socially constructed attraction towards “objectivity” still exists in doing and reporting research (Campbell 2002; Pratt 1986; Rothman 1986). Qualitative researchers often deliberately try to compartmentalize this information to avoid the inclusion of emotions in their analysis (Kleinman and Copp 1993). However, recent theories of emotions (e.g. Damasio 1994) and reflections on fieldwork (e.g. Kleinman and Copp 1993) suggest that this compartmentalization process is hardly possible if not illusory.

Following Kleinman and Copp (1993) and Campbell (2002), I argue that exploring and disclosing these emotions can improve the overall research process at three intermingled levels: the research, the researcher, and the researched. Exploring is the reflexive stance put forth by anthropologists such as Fabian (1983) and Marcus and Fischer (1999). Disclosing is the confessional stance (Van Maanen 1988). Being aware of one's emotions can help identifying the emotionally-induced prejudices or biases that affect data collection and analysis (Kleinman and Copp 1993; Agar 1982). This level of awareness can also help pinpoint self-induced constraints or negative consequences that should be managed during research (e.g., systematic avoidance of highly stressful situations). Discussing one's emotions with informants can sometimes lead to unexpected or novel information and better mutual understanding as in the case of "empathic disagreement" (Gordon 1987). Moreover, a transparent attitude is an important step in the development of "collaborative research", a subject-centered approach that is important in the context of research with children and at-risk population segments (Curtis, Bryce, and Treloar 1999; Eiser and Twamley 1999). Also, disclosing emotions in publications can potentially have cathartic properties for other researchers by offering benchmark examples concerning painful experiences and their remedies. Finally, the analysis of one's emotions can lead to significant contributions to science. For example, Campbell's (2002) investigation of researchers' emotions allowed her to reconsider the global effect of rape by documenting the ripple effect of this trauma on secondary victims.

"Consumer Research in the Shadow of the Towers"

Jean-Sebastien Marcoux

As individuals, we do not typically plan for medical emergencies, accidents, illnesses (Mason and Pavia 1998), disasters (Ikeuchi, Fujihara and Dohi 1999), or other potentially disruptive events that strike us or the members of our family (Turley 1999). We do not cease to be consumers when we face difficult, not to say tragic, situations. As such, in recent years, the scope of consumer research has broadened so as to include crisis situations. Consumer research now better accounts for the disruptive character of consumption, not to say the construction of consumption *via* disruption.

Despite these recent advances, consumer researchers' understanding of *sensitive* issues remains limited, however. More work is needed on the ethical dimensions of consumer research dealing with these issues. From a transformative research perspective (Ozanne 2005), additional research on the impact of consumer research *per se* is also needed. This presentation explores some of the questions that arise when dealing with socially important and emotionally challenging research. It is grounded in a reflexive account of an ethnographic analysis conducted since March 2003 in New York City, on the construction and the commodification of memory in the aftermath of the 9/11.

This presentation aims to reflect on some of the emotional struggles experienced in the field. It discusses the difficulties inherent to the study of an event such as the 9/11 attack that has deeply, sometimes tragically, affected the life of informants. As such, it explores the researcher's stance when dealing with people who had different relation with the tragedy such as the tourists visiting Ground Zero, the New Yorkers who experienced the attack, and the members of the victims' families associations who directly suffered the loss of loved ones and who are particularly concerned by the issue of remembrance.

In attempting to avoid the "diary disease" problem described by Bourdieu and Wacquant (1992), this presentation discusses some of the commitments of the researcher, as well as the moral and

ethical obligations that the researcher faces towards informants. It considers the positioning of the researcher in a field of multiple voices; a field where multiple voices are also competing ones. Indeed, the construction of memory in the aftermath of 9/11 is an ongoing process that is politically and ideologically charged. In the particular context of the construction of memory, a context where having a voice in the public sphere, asserting a presence in institutions such as the media and the museums may be determinant, consumer researchers like other social researchers become agents in the production of memory as far as they help giving legitimacy and a certain permanence to the view of people they work with. In contrast to other social researchers however, they are in a particular position. As far as they are associated with a marketplace that is at the same time (at least here) a primary resource and a part of the problem, consumer researchers face particular ethical questions. As such, this presentation will try to consider some of problems and contradictions of consumer research itself when it is conducted in a context such as post 9/11, where marketing, the commodification of the tragedy, and the aestheticization of consumption have been highly criticized.

This presentation can be situated along the line of a transformative research perspective as it was first sketched at ACR in San Antonio (Mick 2005; Ozanne 2005); a perspective that is concerned with the social implications of the research itself. It also draws on CCT research's interest in collective memory (Marcoux 2005). But it also attempts to repatriate some of the reflections of anthropologists and ethnographers who have been confronted with sensitive issues. A reflexive analysis of the struggle experienced on the field of Ground Zero does not only promise to fill in an important gap in consumer research, but may also help push transformative research in important directions.

"Participatory Action Research as Engaged Practice: Implications for Transformative Consumer Research"

Julie Ozanne, Bige Saatcioglu, and Canan Corus

Participatory action research (PAR) is a paradigm that evolved out of the experiences of social scientists working in developing countries in the 1970s. While engaged in field work, these researchers discovered that the positivistic methods that arose on university campuses of developed nations had little to do with the realities of working among the poor and disenfranchised (Hall 1997). What emerged independently yet concurrently was a form of engaged research practice in which the members of local communities became co-participants in doing research aimed at solving their social problems (Freire 1970, 1986).

PAR involves a diverse range of theories and methods. In this presentation, the original conceptualization of this approach is delineated (Gaventa and Horton 1981; Hall 1981; Tandon 1981). This approach arose in reaction to the class struggles in developing countries and involves studying research problems that arise in the local community and are identified by those people who are most disenfranchised. Like transformative consumer research, the goal of this research is to promote social change that will directly improve the lives of the people studied. The problems selected are often complex and thus are not as well structured as in conventional research (Small 1995). The researcher is conceived as a partner or facilitator who offers research help, but the research methods involve full participation by locals (Greenwood 2004). The local knowledge and folk theories of the participants are valued and believed to yield authentic and accurate social accounts. Moreover, it is assumed that when people are given ownership of the research they will be more invested in its use and implementation. Thus, the emancipatory potential of PAR arises in part from the ability of

participants to define their own social problems, to develop knowledge to address this problem (a process usually restricted to an elite few), and the subsequent raising of their consciousness and potential for agency (Greenwood, Whyte, and Harkavy 1993; Small 1995). The dichotomy between research and application is blurred when the research process itself becomes an empowering act.

The idealistic beginnings of PAR research met with the challenge of actually doing social change research, which spawned many new permutations. While different, these approaches still bear a family resemblance to the original formation. In this presentation, we will also delineate more contemporary versions of PAR research. For example, the desire for locals to have full participation in research projects met with the reality that people desire different levels of participation. This has led to the evolution of different models of the research relationship from a more researcher-led to a more collaboratively-managed model (Chisholm and Elden 1993). Similarly, different research models have emerged due to differences in the organizational settings examined and openness of the research process. Tightly organized settings often involve more shared values, clearer roles and goals, and formal procedures and a different research model emerges than the model that arises when studying more loosely organized groups that exhibit more diverse values, ambiguous roles and unclear goals, and fewer formal procedures. Feminist-informed PAR research has turned attention to social inequities based on gender that were unexplored in earlier versions (Macguire 1987, 2004).

The practical problems faced by PAR offer potential lessons to consumer researchers who seek to do transformative consumer research. For instance, a reoccurring theme in PAR research is the difficulty in managing the tensions between researcher roles as academic scholars and social activists (Cancian 1996; Crisp 2004). Consumer research that examines powerless groups and pressing social problems will undoubtedly unearth social injustices. Will we be content merely to document these inequities for other academicians to read? Will we erect ivory-tower barriers to engaging in action in a self-serving attempt to avoid these challenges as we cowardly reap the research wealth harvested from those people most in need of our help? If so, transformative research contexts will be reduced to fertile ground upon which academic researchers can build their publishing careers.

Or will we be brave enough to engage in social change and fight to defend a place in the academy for a scholar/activist as envisioned by PAR? This approach suggests some potential solutions. Such an approach offers a way to move beyond the tired dichotomies of basic research verses applied research and explore the potential of theoretically-informed programs that incorporate local knowledge. Moreover, the inclusion of the local participant helps to minimize the inherently exploitative relationship that exists among researchers and subjects whose human suffering may end up being commodified for the career profiteering of the academic (Brydon-Miller 2004). If we move beyond being only a ventriloquist for those we study, then new forms of knowledge might be envisioned to help the disenfranchised reclaim their own voice. If we embrace the assumption of PAR that the primary beneficiaries of our research should first and foremost be the people we research, then we are challenged to think beyond the traditional journal article to develop more democratic and accessible modes of knowledge dissemination and use.

SPECIAL SESSION SUMMARY

The Muscle Model of Self-Control Revisited: Does Exerting Self-Control Always Cause Depletion?

Sabrina Bruyneel, K.U.Leuven, Belgium / Carnegie Mellon University, USA

SESSION OVERVIEW

All too often, consumers find themselves making decisions that go against their own self-interest. The self-control strength model (Muraven and Baumeister 2000) for instance implies that sequences of product choices will induce a state of depletion and shift the balance between affective and cognitive product features in the advantage of the former (Baumeister 2002; Bruyneel, Dewitte, Vohs, and Warlop 2006; Vohs and Faber in press). From a transformational point of view, a depletion state appears threatening for consumer welfare because depletion yields poor decision making.

The purpose of this special session is to present ongoing research that challenges this grim view on the depletion state, and to provide new insights on the nature of the depletion effect. Beyond its theoretical impact, such research has direct relevance to consumer research because it provides insights that may help to dampen the negative impact of the depletion state. The present papers fit into this stream of research in that they all provide important boundary conditions for the depletion effect and even demonstrate reversals of the effect. Thereby, they simultaneously provide consumers with strategies that may help them to cope with the depletion state.

The three papers in this set demonstrate that exerting self-control sometimes helps consumers to exert self-control again. In the first paper, Wan, Isen, and Sternthal found that high levels of positive affect reversed typical depletion effects. They showed that positive affect reminds people of the high standard in prior depleting circumstances, which stimulates them to perform well again. In neutral affective circumstances, prior depleting circumstances put people's focus on the resource expenditures, which reduces their willingness to put in much effort again. In the second paper, Mukhopadhyay, Sengupta, and Ramanathan use a meta-cognitive perspective to show that trait impulsiveness moderates the influence of previous exertion of self-control on subsequent ability to resist temptation. Specifically, they showed that while high impulsives are subject to a depletion effect following an initial exercise of self-control, low impulsives follow the reverse pattern such that an initial exercise of self-control actually bolsters future resistance to temptation. Finally, Geyskens, Bruyneel, and Dewitte found that depletion effects were reversed when the two subsequent self-control tasks involved similar response conflicts. In three studies, they showed that when adapted to a demanding situation, people's self-control performance decreased in situations when the subsequent self-control task involved a different response conflict (replicating the typical depletion effects) but improved when the subsequent self-control task involved a similar response conflict. Taken together, the three papers in this session constitute a significant step in the study of the process underlying the ego depletion phenomenon and the prevention of self-control loss.

"The Influence of Positive Affect on Regulatory Depletion"

(Echo) Wen Wan, Northwestern University

Alice M. Isen, Cornell University

Brian Sternthal, Northwestern University

Regulatory depletion refers to the fact that a preliminary act of self-control undermines persistence on a subsequent task (Baumeister, Bratslavsky, Muraven, and Tice 1998). This effect has been demonstrated in numerous studies (e.g., Baumeister et al. 1998; Muraven, Tice, and Baumeister 1998). Regulatory depletion theory explains this effect in terms of a self-control process that is akin to exercising a muscle: the self has a limited resource that is consumed in performing volitional regulatory activities; because all acts of self-regulation are thought to draw on the same resource pool, the use of a resource in performing one task undermines the immediate performance of a second task, even if the tasks are seemingly unrelated.

Recent research has extended this analysis of the regulatory depletion effects by identifying conditions under which depleted individuals activate the resources necessary to overcome the effects of regulatory depletion. Elimination of the depletion effect has been found when participants are offered the monetary incentive to perform better on the persistence task (Baumeister et al. 2005), informed that persistence would improve their performance on a target task, or believe that persistence is warranted because the issue requiring persistence is of substantial importance (Muraven and Slessareva 2003). The observation that people sometimes activate the resources necessary to overcome regulatory depletion and at other times fail to sustain their performance raises the question of when each of these outcomes is likely to occur.

One approach to addressing this question is to interpret the regulatory depletion effect in terms of a resource monitoring process (Baumeister 2000; Carver and Scheier 1998). This process entails keeping track of the resources allocated to various tasks, comparing this allocation to some standard, and adjusting the resource allocation to meet that standard. Resource monitoring interprets a regulatory depletion effect as a breakdown in the monitoring process. Rather than comparing the resource allocation to some standard, depleted individuals focus on their resource exertion, overestimate the exertion, and prematurely stop the activity (Vohs and Schmeichel 2003).

In the present research we examine the role of positive affect in moderating the regulatory depletion effect. Positive affect is a transitory favorable feeling that is thought to broaden the scope of inputs that individuals consider and enable integration of them in making a decision (Estrada, Isen, and Young 1997; Isen, Daubman, and Nowicki 1987). There is substantial evidence that positive affect, compared with a neutral control condition, increases the amount and variety of material that is brought to mind and brought

to bear on problems being solved (Isen and Daubman 1984; Kahn and Isen 1993; Lee and Sternthal 1999). It has been observed that positive affect prompts a consideration of a broader array of items in a choice set (Kahn and Isen 1993) and enhances individuals' ability to engage in comparison of objects from different categories (Roehm and Sternthal 2001).

Applied in the context of influencing the regulatory depletion effect, these findings suggest that individuals experiencing positive affect are likely to think broadly rather than confine their focus to the resources exerted on the persistence task. Moreover, this broad consideration of information is likely to involve comparison. If this occurs, those experiencing positive affect would monitor both the resources allocated to the persistence task and compare it with their standard for such performance even if the allocation and standard involved seemingly disparate categories. The effect of this monitoring process on persistence would depend on the standard that individuals activated to assess their resource allocation to the persistence task. A high standard will lead to greater persistence than a low standard.

Two studies were conducted to test the impact of positive affect on regulatory depletion. In both studies, we employed the two-task procedure typically used to investigate the regulatory depletion effect. Participants completed an initial regulatory task that was either depleting or not depleting. This was followed by a persistence task. The time participants spent on this latter task was the measure of persistence.

In Study 1, we tested the monitoring prediction by priming some participants with positive affect prior to performing the initial task and others with neutral affect. A depletion effect was observed among the neutral affect controls, which replicates the effect reported in the literature. This effect was not observed in the positive affect condition, an outcome that occurred because depleted participants in the positive affect condition persisted longer than did those in the control. We also found that when the initial self-regulatory task was non-depleting, those in the positive affect condition were less persistent than the controls. Consistent with our theorizing, positive affect prompted people to think broadly and activate the standard that was most accessible in determining their persistence. Thus, a depleting first task set a high standard and prompted greater persistence than in the control condition, whereas a non-depleting initial task set a low standard and resulted in less persistence for positive affect participants than in the control.

The purpose of Study 2 was to replicate the findings reported in Study 1, provide further evidence that positive affect would broaden the consideration to include a salient standard and examine whether respondents' perception of the time spent on the persistence task mediated the depletion effect. Study 2 replicated the previous findings. In addition, it showed that when positive affect participants in the non-depletion condition were provided with a standard that suggested they had spent substantial resources on the initial task, they didn't reduce their persistence in relation to controls. Moreover, support was found for the notion that participants' estimates of the time they had spent on the persistence task mediated the effect of the initial task on the persistence in performing the second task.

These findings suggest that the depletion effect involves a monitoring breakdown in which people overestimate the time spent on the persistence task undermining their persistence. Positive affect serves to enhance monitoring by broadening the consideration of cues to include a standard to guide their persistence. When the accessible cue sets a high standard, persistence is greater than when a lower standard is accessible.

"Inoculations of Self-Control: Switching vs. Reinforcement Effects of Recalling Past Behavior"

Anirban Mukhopadhyay, HKUST

Jaideep Sengupta, HKUST

Suresh Ramanathan, University of Chicago

While much of consumer research has focused on stand-alone decisions and point-in-time behaviors, consumers go through life being exposed to strings of stimuli and making sequences of decisions. This research explores how consumers respond to a given temptation, specifically a tasty but unhealthy food item, contingent on having been faced with a similar temptation in the recent past.

When faced with temptation, knowledge of one's own past behavior may influence current behavior by either increasing or decreasing the likelihood of consistency. This research integrates three relevant areas: a) self-control and impulsivity; b) effects of past behavior; and c) the influence of unfulfilled goals, to propose

that the direction of this influence is moderated by the content of the cognitions that become accessible when past behavior is salient. Further, these cognitions are likely to differ depending on the extent to which conflicting forces (temptation vs. restraint) are salient in the original self-control situation. We propose and show that for certain individuals (impulsives), who may experience ambivalence in self-control situations, making a past behavior salient causes a switching effect (i.e., the consciousness of past resistance causes future succumbing), whereas other individuals (non-impulsives), who experience less conflict in such situations, exhibit behavioral consistency when past behavior is made salient.

Study 1 manipulated Time 1 cognitions (cold vs. hot) and delay between T1 and T2, with impulsivity as a measured variable. At T1, participants were exposed to a plate of tempting snacks and asked to write down all the thoughts they had regarding these snacks. Half the respondents were asked to write hot cognitions (e.g., relating to taste) while the other half wrote cold cognitions (e.g., uses for the snacks as non-food objects). All respondents were under strict instructions to not eat any of the snacks. Under these circumstances, hot cognitions, which enhance “temptingness”, should require participants to resist more actively as compared to cold cognitions, which render the snacks less appetitive. Accordingly, participants in the hot cognitions conditions should later have a greater sense of having resisted a past temptation.

After the T1 task, respondents were escorted to a different room and seated at separate tables, each with a covered box. In the no-delay condition, the experimenter lifted the box and revealed a bowl full of (50 identical) cheeseballs, and asked participants to help themselves while they waited. Exactly two minutes afterwards, the bowls were removed and a 30-minute long unrelated filler task administered. Research assistants counted the number of cheeseballs consumed by each participant. Following the filler, participants responded to a battery of personality measures. In contrast, respondents in the delay condition received the filler task as soon as they entered the second room, and only saw the bowls with cheeseballs afterwards.

Analysis of the number of cheeseballs eaten by condition revealed a significant three-way interaction, with no effects of impulsivity or cognitions in the no-delay condition—respondents ate few cheeseballs across conditions. This was expected, since the T1 instructions to resist would have remained salient across the short delay. More interestingly, in the long delay conditions, when given hot cognitions at T1, impulsives ate twice as many cheeseballs as non-impulsives; no differences were obtained in the cold cognitions conditions. Over a delay, therefore, the consciousness of having actively resisted a temptation in the past seems to undermine future resistance for impulsives, but bolsters it for non-impulsives.

Experiment 1 thus provides initial evidence that increased salience of past behavior has different effects for impulsives and non-impulsives. However, our conceptualization further argues that these effects are driven not because of having performed the past behavior per se, but because of the consciousness of that past behavior and the nature of cognitions that acquire increased salience as a result.

Experiment 2 therefore manipulated recall of past behavior, rather than the behavior itself. Participants were asked to recall a recent situation where they had been exposed to a tempting food item and had either succumbed to the temptation or resisted it. Then, as before, they were led into a different room and after a delay given the opportunity to eat cheeseballs. Results showed that impulsives were more likely to “switch”, i.e., eat more cheeseballs if they had recalled resisting (vs. succumbing to) the temptation, while non-impulsives were more likely to display consistency, and resist if

they recalled resisting, and succumb if they recalled succumbing. These patterns cannot easily be explained by other existing theories of self-control such as ego depletion (Muraven and Baumeister 2000) or the shopping momentum effect (Dhar, Huber, and Khan 2005). Rather, they suggest that a key difference between impulsives and non-impulsives is in the content of cognitions associated with recall of a past behavior. When recalling a past behavior, non-impulsives may spontaneously generate positive cognitions associated with that behavior, thus reinforcing the chances of performing the same behavior at a later point in time. Such a reinforcing process has much support in the literature on the effects of past behavior (cf. Albarracín and Wyer 2001). For impulsives, however, we propose that the presence of conflicting goals (temptation vs. restraint) yields somewhat different cognitions when a past behavior is recalled. In particular, drawing on the Zeigarnik effect (Zeigarnik 1967) which suggests that non-fulfilled goals tend to take on greater salience than fulfilled ones, we hypothesize that recalling a certain type of behavior (e.g., resisting in the past) actually increases the relative salience of counter-cognitions (e.g., the positive consequences of succumbing to temptation), thus causing them to switch.

Study 3 replicated study 2 findings, and, based on the conceptualization above, identified a boundary condition for the impulsives’ switching behavior. If the switching effect is driven by increased salience of counter-cognitions, this effect should be dampened if impulsives are explicitly required to recall behavior-congruent cognitions. On the other hand, such forced recall should not have any effect for non-impulsives, since this group spontaneously recalls behavior-congruent cognitions. Initial results provide good support for these predictions. As in study 2, when simply asked to recall either resisting or succumbing to a food-related temptation, non-impulsives subsequently displayed a reinforcement effect, while impulsives switched. However, when explicitly asked to recall behavior-congruent cognitions along with the behavior itself, a reinforcement effect obtained for both impulsives and non-impulsives. These results again support our conceptualization. Further data investigating these processes are being collected at the time of writing.

“Getting Into It. Exerting Self-Control Enhances Self-Control Performance on Similar Tasks”

Kelly Geyskens, K.U.Leuven

Sabrina Bruyneel, K.U.Leuven / Carnegie Mellon University

Siegfried Dewitte, K.U.Leuven

The self-control strength model (Muraven and Baumeister 2000) states that exerting self-control taxes a limited resource that is akin to energy or strength, and thus brings people in a state of resource depletion. This state reduces people’s capacity to exert self-control in the next phase. Although the basic finding is undisputed, the nature of the scarce mental resource remains elusive.

Several moderators (e.g., the activation of beliefs (Martijn, Tenbult, Merckelbach, Dreezens, and de Vries 2002), motivation (Muraven and Slessareva 2003), implementation intentions (Webb and Sheeran 2003)) and mediators (e.g., subjective time perception (Vohs and Schmeichel 2003)) have been proposed that shed some light on the nature of the scarce mental resource. In this paper, we claim that depletion is a consequence of an adaptive strategy that helps people to cope with a demanding task.

We propose that depletion effects result from an individual's attempts to cope with a situation that triggers a response conflict. Cognitive control theory (e.g., Botvinick, Braver, Barch, Carter, and Cohen 2001; Miller and Cohen 2001) claims that people have a system that monitors for response conflicts. This system induces control processes to become actively involved in potentially challenging situations. According to the theory, the actual attempt to perform a difficult task leads to the recruitment of cognitive resources through the detection of conflict. Conflict indicates that current levels of control are insufficient to meet task demands, and thus signals a demand for greater control. Increased control helps people to successfully solve the response conflict at hand but reduces their flexibility in dealing with a new response conflict. Reduced flexibility may explain the depletion effect. The increased adaptation to the response conflict at hand allows us to predict that the typical depletion effect should reverse if the response conflict in both phases is similar. The contribution of this paper is twofold. The empirical contribution of this paper is showing that the depletion effect critically depends on the dissimilarity of the response conflict in phase 1 and phase 2. We predict that depletion effects will occur only in case response conflicts are dissimilar in the two consecutive phases, and will reverse in case response conflicts are similar in the two consecutive phases. The theoretical contribution consists of providing insight in the nature of depletion.

In the first study, we investigated whether continuing to exert self-control in the same domain either gradually reduces performance (consistent with the self-control strength model, Baumeister 2002) or enhances performance (consistent with the cognitive control model). To give both models a fair test, we used procedures that have been successfully used as depletion inductions (i.e., thought suppression and a Stroop task), and measured the evolution of performance within that task. We found that, as people engage longer in a given self-control task, they become increasingly better at fulfilling the task requirements of thought inhibition and response accuracy.

In the second study, we mimicked the two phase paradigm of the depletion literature, and tested the importance of the dissimilarity of the response conflict in the two tasks. We investigated whether the similarity between the two subsequent tasks moderates the direction of the depletion effect. We applied a response reversal task (e.g. Paus, Petrides, Evans, and Meyer 1993) in the second phase. In the first phase, participants engaged in a control task, a similar response reversal task (high similarity condition), or a thought suppression task (low similarity condition). The results show that, compared to the control condition, engagement in a typically depleting thought suppression task decreased self-control performance in a subsequent response reversal task (i.e., low similarity), replicating the typical self-control depletion effect. However, in the high similarity condition, engagement in a typically depleting response reversal task *enhanced* performance in a subsequent similar response reversal task (i.e., reversing the typical self-control depletion effect), compared to the control condition.

In the third study, we attempted to rule out a learning explanation and generalize to other self-control tasks. We asked half of the female participants to restrict their urge to consume sweets in a first

phase, which is assumed to be depleting (Baumeister et al. 1998, Study 1), and afterwards invited them to partake in a taste test (similar response conflict, condition 1) or a word anagram (dissimilar response mode, condition 2). People who inhibited their eating behavior in phase one performed worse on the anagram task (i.e., replicating the typical self-control depletion effect), but performed better on the taste test (i.e., reversing the typical self-control depletion effect).

Our data provide strong support for the cognitive control model. This suggests that the depletion effects are typical for dissimilar self-control tasks because the exertion of self-control in the first phase adjusts the control system to that particular response conflict. This adjustment hinders adjustment to subsequent dissimilar response conflicts and leads to worsened self-control performance in the second (dissimilar) self-control task. However, if the self-control tasks in both phases are similar, the adjustment to the response conflict of the self-control task in the first phase enhances self-control performance in the second self-control task. The exertion of self-control on a first task thus enhances self-control for subsequent similar tasks but hinders self-control for subsequent dissimilar tasks.

SPECIAL SESSION SUMMARY
Measurement of Subjective Wellbeing

Jason Riis, New York University, USA
Joachim Vosgerau, Carnegie Mellon University, USA

“Measuring Cross-National Differences in Subjective Wellbeing”

Jason Riis, New York University
Daniel Kahneman, Princeton University

In light of studies showing that differences in life circumstances contribute relatively little to subjective well-being, large cross-national differences in life satisfaction are quite surprising. As evidence that these differences are not based on real differences in moment-to-moment experience, we appeal to the large discrepancy between subjective and objective national indicators of health. Analyses of these health data strongly suggest that national differences in life satisfaction (at least between wealthy, developed countries) are due to response style artifacts. We discuss a new, time-based measure of well-being that is less prone to response style artifacts.

“A New Method for Comparing Subjective Wellbeing Across Countries and its Correlation with Suicide”

Joachim Vosgerau, Carnegie Mellon
Hubert Gatignon, INSEAD
Ed Diener, University of Illinois–Urbana Champagne

Cross-national comparisons of subjective well-being (SWB) suffer from individual and national response biases (e.g. self-enhancement, positivity, or social desirability). Many researchers argue that meaningful comparisons across countries are therefore impossible. We demonstrate with simulated data that a new method, the differenced confirmatory factor analysis (dCFA), eliminates response biases as opposed to extant methods such as simple means or traditional CFA. Using two independent SWB datasets of 26 and 30 countries, we show that dCFA yields dramatically different country rankings, and that suicide rates correlate with SWB means.

“Personality, Culture, and Subjective Wellbeing”

Hans Baumgartner, Pennsylvania State University
Jan-Benedict E.M. Steenkamp, UNC–Chapel Hill

Although the study of subjective well-being (SWB) has produced many interesting findings about the personality and cultural correlates of SWB (e.g., Diener et al., 2003), certain weaknesses can be identified in previous research. First, SWB has often been assessed in a limited way using simplistic measures. Second, comparability of measures across cultures is often assumed rather than tested. Third, the multi-level structure of the data is usually ignored. We address these issues in the current paper and use primary data collected from over 13,000 respondents in 28 countries around the world to provide new insights into the personality and cultural determinants of SWB.

“A Critique of the Measurement of Happiness”

Dan Ariely, MIT
Uri Gneezy, University of San Diego
Moshe Hoffman, University of Chicago

Measuring happiness has become not only a topic of interest for psychologists, but a popular tool in public policy. After all, if policy is about maximizing happiness, what could be better than asking people about it directly? In this work we add some caution-

ary notes to this issue, suggesting that the interpretation of such happiness ratings might be premature, and sometimes misleading. To illustrate our point we conducted two types of studies: one addressing the question of using happiness scales, and the other addressing the construct of happiness more generally.

SPECIAL SESSION SUMMARY

The Role of Metacognition in Consumers' Judgments

Manoj Thomas, Cornell University, USA

SESSION OVERVIEW

Metacognition refers to people's cognitions about their own thought processes. Over the past two decades psychologists have shown that our judgments and decisions are influenced not only by the available information, but also by the subjective ease or difficulty with which the information is processed. In this special session, we bring together three research papers that present hitherto unexplored aspects metacognition in consumers' judgments. The three papers in this session share two common features:

All the three papers demonstrate novel effects of metacognitive experiences that have *not* been shown in the extant literature. By demonstrating that metacognitive experiences influence consumers' emotional judgments, price evaluations and brand choice, the three papers, together, argue for a more pivotal role for metacognition research in consumer psychology.

All three papers present a series of experiments to uncover the underlying psychological mechanisms and thus offer new theoretical insights about metacognitive processes.

The first paper, by Rucker, Briñol and Petty, examines the effect of metacognitive experiences on emotional judgments. Rucker et al. suggest that subjective ease has the power to moderate consumers' emotional responses. Specifically, their experiments demonstrate that emotions are felt more strongly, and have a greater effect on consumer behavior, when it is easy to construe the emotion-inducing events. This paper, thus, not only uncovers a novel effect of subjective ease, but also offers new insights into the interplay of affect and cognition in consumer behavior.

The second paper by Thomas and Morwitz examines the effects of metacognition in judgments of numerical differences. Judgments of numerical differences are ubiquitous. For example, while comparing two products, people have to judge whether the price difference is small or large. While deciding whether to purchase a product on discount, people have to judge whether the difference between the regular price and sale price is small or large. This paper presents convincing empirical evidence for a counterintuitive hypothesis: People *perceive* the numerical difference to be larger when the difference is easier to compute than when it is difficult to compute, even when the arithmetic difference is not larger. A series of experiments reveal that this effect is on account of nonconscious attribution of the metacognitive experience induced by computational fluency to the analog distance between the numerical stimuli.

The domain of choice has always been a challenge for metacognition researchers. Little is known about the effects of processing fluency on brand choice. Huber (2004, p. 359) eloquently summarized the challenge: "The elegance of naïve theories (used for metacognitive inferences) seems to break down in the domain of choices..." The third paper by Chung and Mitchell takes on this challenge to identify conditions when perceptual fluency will influence choice from a limited set of brands. Their results indicate that perceptual fluency affects brand choice only under low motivation and opportunity conditions. Interestingly, fluency affects choice even when the evaluation of the brand is negative. Their results also suggest that attitudes formed toward the alternatives may not influence choice when the choice is based on metacognitive experiences.

The similarity of the theoretical constructs across the three papers will facilitate a coherent session. Yet, each paper addresses

a different substantive problem and thus makes unique contributions to advance our knowledge of metacognition.

"The Role of Ease in Consumers' Emotional Judgments"

Derek D. Rucker, Northwestern University

Pablo Briñol, Universidad Autonoma de Madrid

Richard E. Petty, Ohio State University

Human emotion has a long history in the study of consumer behavior. For example, earlier research focused on how emotional states influenced the amount of persuasion through various mechanisms (e.g., Petty et al. 1993). Petty et al. found that, when elaboration was low, placing consumers in a positive emotional state enhanced persuasion by serving as a simple cue; however, when elaboration was high, placing consumers in a positive mood facilitated persuasion by leading consumers to generate more positive thoughts. Given the profound role emotions play in the persuasion process, an important question that arises is what factors determine the degree to which consumers experience emotions?

The present research submits that one previously unexamined factor that may influence emotional judgments is the subjective sense of ease accompanying emotion provoking events. We argue that subjective ease has the power to moderate consumers' emotional reaction. Specifically, when it is easy to generate emotion provoking events, we hypothesize that emotions will be more strongly felt, and exert a greater influence, than when it is difficult to generate or process emotion provoking events. These predictions are borne out in several experiments.

Past Research

A growing body of research has documented that not only do consumers rely upon the content of the thoughts they generate, but they also rely upon the metacognitive experience of ease accompanying the generation of their thoughts. To illustrate, in one representative study, Wänke, Bohner and Jurkowsch (1997) instructed participants to imagine either 1 or 10 reasons to drive a BMW. While instructing participants to consider 10 reasons in favor of driving a BMW provided more positive information about the BMW, participants held more positive attitudes when they had only thought of a single reason to drive a BMW. Thus, this finding could not be explained by participants relying upon the content of their thoughts. Rather, this finding could be explained by the fact that imagining a single reason was presumably easier than imaging ten, and the perceived ease led to the perception there must be even more reasons to drive it. That is, consumers could reason, "if I can think of one reason, there must be many more," as opposed to, "if I have trouble thinking of ten, there must not be many more."

Current Research

Ease has been studied in a number of diverse domains including, but not limited to, persuasion, risk assessment, likelihood estimates, attitude strength, interpersonal closeness, stereotypes, and implicit attitudes (for reviews see Rolf, Schwarz, and Winkielman 2004; Schwarz 2004). Surprisingly, no prior research has examined how the experience of ease influences judgments of one's emotions. The present research examines whether subjective ease can influence consumers' emotional judgments. In experiment 1, we induced emotions by instructing participants to list emotional events. Specifically, all participants were asked to recall happy

events in their life. However, participants were asked to generate either few (2) or many (10) of those happy events. After the event recall, participants were asked how happy they felt. Finally, because past research has found people rely on ease under high degrees of elaboration (see Tormala et al. 2002) we assessed participants' need for cognition (Cacioppo and Petty 1982). As expected, high need for cognition participants reported feeling happier after generating few rather than many episodes of happiness, whereas low need for cognition participants reported feeling happier after generating many as opposed to few events. In short, Experiment 1 supported the proposition that consumers' emotional judgments were significantly influenced by the subjective sense of ease accompanying the generation of the emotional events. Consistent with prior research, this held for individuals who were high, as opposed to low, in need for cognition.

Experiment 2 replicated the findings of experiment 1, and sought to establish the effect of ease was not limited simply to the self-report of emotions, but could have consequences on outcomes previously found to be influenced by emotion. To enhance generalizability, experiment 2 also used a different manipulation of ease. Specifically, participants were asked to write about 4 times they felt either sad or happy. However, to induce a feeling of ease or difficulty, participants were instructed to write the events with either their dominant or non-dominant hands, respectively. This task has been shown to successfully manipulate subjective ease (e.g., Briñol and Petty 2003; Petrova and Cialdini, 2005). Finally, after completing the emotion induction task participants were asked to estimate the likelihood a number of events would happen to them (e.g., finding a good job after college). Prior research has clearly documented that participants' emotional states can influence the perceived likelihood of similarly valenced events (e.g., Desteno et al. 2000). Results of experiment 2 revealed that participants predicted that events related to happiness were more likely to occur when the emotion inducing task was easy compared to difficult. That is, emotions exerted a stronger influence on emotional outcomes when the emotion inducing events were physically easier to write.

Taken together, these findings suggest the experienced ease in generating affective information can increase the impact of that mental content on subsequent emotional judgments. That is, the easier it felt to generate thoughts about happy events (because few were requested), the greater participants' emotional reactions (provided participants' natural proclivity to think was high). The metacognitive experience not only affected self-reported emotions, but its effect extended to emotional consequences. In subsequent studies, we examined the implications of confidence and emotion for specific aspects of consumer behavior (e.g., consumers' receptivity to advertisements).

Contributions and Conclusions

The present experiments present a new perspective on how consumers reach emotional judgments and provide a new role for subjective ease in consumer behavior. Across different paradigms in which the ease of generating emotional thoughts was manipulated, we find the impact of emotional thoughts on affective judgments is greater when people have an easy, as opposed to difficult, time generating those emotional experiences. These studies provide new insights into the interplay of affect and cognition in consumer thinking, and new perspectives on understanding how consumers come to know their emotions.

“The Role of Subjective Ease in Price Comparisons”

Manoj Thomas, Cornell University

Vicki Morwitz, New York University

Numerical judgments often entail mental computations. These mental computations are not always easy. One factor that affects the ease of mental computation is the complexity of the multi-digit numbers. Mental computations are easier when the problem entails simple single-digit computations (e.g., 5.00–4.00) instead of complex multi-digit computations (e.g., 4.99–3.98). Will this computational complexity in anyway affect our numerical judgments? In the context of the given example, will the difference between 4.99 and 3.98 be perceived to be smaller than, larger than, or the same as, that between 5.00 and 4.00? More generally, how does the subjective ease or difficulty of mental computations affect our numerical judgments?

Although ease of processing has been shown to affect judgments of the probability of an event occurring (Tversky and Kahneman 1973), fame (Jacoby et al. 1989), judgments of familiarity (Whittlesea 1993), the implication of these psychological phenomena for numerical comparisons is not clear. This research started by investigating whether the subjective experience of ease of computation has any effect on judgments of numerical difference between two numbers. Our experiments unearthed an intriguing phenomenon: Computationally easier differences are perceived to be larger than computationally difficult differences, even when the arithmetic difference is not larger. With the aim of delineating the underlying psychological mechanisms, we then focused our attention of two research questions: (i) Why are computationally easier differences perceived to be larger? (ii) To what extent are people aware of the role of subjective experiences in their judgments?

The Association Between Distance And Fluency

Research in numerical cognition has revealed a strong association between analog distance and the ease of processing. This association, labeled as the distance effect (Dehaene 1997; Moyer and Landauer 1967), suggests that people take more time to process two numbers when the analog distance between the two numbers is small, irrespective of the absolute magnitudes of the numbers. For example, it has been observed that the response time to discriminate between 4 and 5 is larger than that to discriminate between 2 and 5 (Dehaene 1997). The distance effect is said to occur because mental representations of numerical stimuli become difficult when the numbers are close to each other. The distance effect has been shown to be an extremely robust phenomenon. “After experimenting on number comparison for more than ten years, I still have to find a single subject who compares 5 and 6 as quickly as he or she compares 2 and 9, without showing a distance effect,” articulated Dehaene (1997, p.74). The ubiquity of the distance effect suggests *an implicit association between numerical distance and fluency: fluent processing is associated with stimuli that are distant from each other*. If the processing is difficult, then this associative rule suggests that the stimuli are possibly close to each other and therefore not easily discriminable.

Misattribution of Fluency Induced by Computational Complexity

Past research has shown that although the human mind is very adept at detecting small changes in processing fluency, it is not so adept at identifying the actual source of fluency. Instead, it misattributes the experienced fluency to the factor made most salient by the judgment task. For example, fluency induced by repetition is attributed to fame (Jacoby et al. 1989), and fluency

created through an incidental noise mask is attributed to familiarity (Whittlesea, Jacoby and Girard 1990).

In this research, we suggest that the fluency induced by computational complexity is misattributed to the analog distance between numbers. Results from four experiments were found to support this hypothesis. In experiment 1, fluency and numerical distance was manipulated in a within-subjects design. Participants were shown 24 pairs of prices; each pair comprised of a regular price and a sale price. Participants were asked to evaluate the magnitude of the discount on a small-large semantic differential scale by computing the difference between the regular price and the sale price. The price stimuli differed from each other in the magnitude of the discount (small vs. large) as well as in the number complexity (difficult vs. easy). Consistent with our hypothesis and contrary to the rules of arithmetic, participants in our experiments perceived the discount magnitude to be larger when the difference was easier to compute (e.g., 5.00-4.00; difference 1.00) than when it was difficult to compute (e.g., 4.99-3.98; difference 1.01). This effect manifested across all levels of discounts as well as prices. Experiment 2 shows this effect is robust and manifests with judgments of price difference as well as judgments of weight difference. However, this effect manifests only when the judgment requires mental computations. When the participants did not have to do the mental computations to make the judgment, processing fluency had no effect on judgments (Experiment 3). Finally, the observed effect seems to be on account of non-conscious misattribution of the metacognitive experience. When the participants were explicitly warned that the computation is either easy or difficult, processing fluency had no effect on judgments (Experiment 4).

“Perceptual Fluency, Attitudes and Choice”

Andy Mitchell, University of Toronto

Seh-Woong Chung, Singapore Management University

In a series of studies we examine the relationship between perceptual fluency, attitudes and their accessibility and choice from a limited set of brands. We hypothesize that under these conditions, brand choice is a two-stage process. The first stage is a recognition stage where certain brands will “stand out” in the environment. The second stage is a choice stage, where consumers use information about the brands, which is stored in memory to make a choice.

Previous research indicates that objects with highly accessible attitudes “stand out” in the environment (Roskos-Ewoldsen and Fazio 1992) and that perceptual fluency will also cause this to happen (Jacoby, Kelley and Dywan 1989). Consequently, attitude accessibility and perceptual fluency are expected to influence the first stage. Previous research also indicates that beliefs, attitudes and their accessibility will influence the second stage (e.g., Fazio and Towles-Schwen 1999).

These conjectures are tested in a series of experiments. In all the experiments, the participants are provided with information about four hypothetical brands of personal music players that vary on five attributes so that there is a clear rank order of the brands on the attributes. One brand is evaluated as very positive, the second as slightly positive, the third slightly negative and the fourth very negative. Both the attribute information and the attitudes provide the same rank order. During the experiment, the participants form an attitude toward each brand.

In the first experiment, the perceptual fluency, attitude accessibility of the second best personal music player are manipulated and the participants are asked to select which brand they would purchase if they all had the same price under either high or low motivation and opportunity conditions. Under high motivation and opportunity conditions the participants are given as much time as

they want to make a decision and are told that if they select the best brand they are eligible to enter a drawing to win \$25. Under low motivation and opportunity conditions the participants were told to make a decision as quickly as possible.

Under high motivation and opportunity conditions only attitude accessibility had an influence on choice while under low motivation and opportunity conditions, both attitude accessibility and perceptual fluency were found to have independent influences on choice. The response times of the choice process were not measured in this experiment, so it is possible that the low motivation and opportunity condition included both the recognition stage and part of the choice stage in the choice process. In other words, the choice of the brand with the highly accessible attitude may be due to effects at both the recognition and choice stage.

To examine this possibility we conducted a second experiment, which is similar to the first, only the perceptual fluency and attitude accessibility of the third best brand, which has a negative attitude, are manipulated. In addition, the response times in the choice task were measured. As expected, neither attitude accessibility nor perceptual fluency affected choice under high motivation and opportunity conditions. However, under low motivation and opportunity conditions, perceptual fluency has a significant effect on choice while attitude accessibility has a marginally significant effect. A closer examination of the data indicates that with a median split on the response times used when reaching a decision, all the participants who selected the third best brand, which had a negative attitude made the decision quickly. In fact, all the participants who choose the third best brand did so within 1.1 seconds.

In a third experiment, we replicated the low motivation and opportunity conditions of the first experiment, however, we forced the participants to make a choice within 1.1 seconds. The results indicate a significant interaction between the effects of perceptual fluency and attitude accessibility on choice. Both high perceptual fluency and high attitude accessibility had significant effects on choice. However, these effects were not additive.

In summary, the results of our experiments indicate that the recognition stage lasts for approximately 1.1 secs and perceptual fluency and attitude accessibility affect this stage. If choices are based on this stage, perceptual fluency and attitude accessibility will affect choice regardless of the valence of the attitude. Attitudes, attitude accessibility and attribute information will influence the second stage. In our studies attitudes and attribute information provided the same rank order information of the brands, so only attitude accessibility had an effect on choice when the attitude was positive. These results indicate that even when attitudes are formed toward the alternatives, they do not influence choice when it is based on metacognitive processes.

Intending To Be Ethical: An Examination of Consumer Choice in Sweatshop Avoidance

INTRODUCTION

The Theory of Reasoned Action (TRA) is a theory of attitude-behavior relationships which links attitudes, subjective norms, behavioral intentions and behavior in a fixed causal sequence (Ajzen and Fishbein 1980). The TRA has been criticized on the basis that it applies only to behaviors that are totally under volitional control. To address this concern Ajzen (1985) introduced the TPB that added a measure of perceived behavioral control to the existing TRA structure. This extended model has been widely applied in many behavioral domains often with a significantly improved predictive ability (Dabholkar 1994; Penz and Stottinger 2005). In their meta-analytic review of the TPB, Armitage and Conner (2001) found empirical evidence based on a database of 185 published studies that the TPB accounted for 39% of the variance in intention but only 27% in behavior. They further proposed that desire might act as an intermediary construct mediating the relationships between the TPB antecedents (attitude, subjective norm and perceived behavioral control) and intention. Gollwizer (1990) proposed that beyond the motivational stage a second stage comprising planning be utilized to capture implementation intention that helps to progress desires and intention toward action.

In this study the Theory of Planned Behavior (TPB) is used as a framework to examine consumers' intention to avoid purchasing sweatshop produced apparel. The research develops and tests a conceptual model that explains the motivational and implementation aspects of intention that convert attitudes, subjective norms and behavioural control into behaviour. We draw on existing research (Bagozzi 1992; Perugini and Conner 2000) that has identified volitional constructs but which in the main neglected to examine and establish their separate and distinct roles both as a precursor to intention and in converting intention toward behavior. Specifically, we aim to develop a conceptual model that examines the roles of desire, intention and plan to avoid sweatshop apparel within a TPB framework using a sample of 794 UK consumers to test its explanatory power.

SWEATSHOP APPAREL AND CONSUMER CHOICE

Research across many Western nations has confirmed the existence and continued growth of a group of consumers for whom ethical issues drive consumption behavior. US sales of fair trade products increased by 44% between 2001 and 2002 and UK consumers spent \$44.9 billion in line with their ethical values in 2004, an increase of 15% from 2003 (Williams, Taylor, and Howard 2005). While much of this development has been in the food sector research reveals that other product sectors, notably apparel, are exerting pressure for similar action with 30% increase in sales of ethical apparel in the UK from \$57 million in 2003 to \$75 million in 2004 (Williams et al. 2005). Although many companies have responded to consumer concerns through the introduction of codes of conduct on production practices, many campaigners and consumers see these as mere public relations exercises and unreliable as a guide to ethical decision-making (Shaw and Duff 2002). As yet consumer decision-making cues such as labeling are not

readily available in this sector. Consumers are further restrained by a lack of availability and choice, and even when ethical alternatives are available they have often been considered unfashionable and expensive (Shaw and Duff 2002). Thus, concerned consumers find themselves confronted by uncertainty in terms of information available to aid decision-making and significant compromises in making an ethical stance. It is hardly surprising that an intention-behavior gap has been reported in terms of a weak relationship between what consumers say, and what they do (Newholm 2005). Research exploring ethical issues in apparel choice is limited (Dickson 2001; Shaw and Duff 2002). Tomolillo and Shaw (2004) revealed that sweatshop labor is the most important ethical concern among consumers in apparel choice. Although generally neglected in ethical contexts, the TPB has been found to be pertinent in the ethical context of purchasing fair trade products where barriers to behavior such as availability have been found to be significant (Shaw, Shiu, and Clarke 2000; Shaw and Shiu 2003).

THEORY OF PLANNED BEHAVIOR AND MODIFICATIONS

The TPB has been widely applied and favorably received in the literature over the last two decades. However Bagozzi (1993) argued strongly that research is needed to understand the intervening processes linking attitudes and behavior and proposed a theory of volitional processes as the central mediators. Intention is undoubtedly an important precursor to action but its meaning and role need to be clarified. Nuttin (1987) argues that the meaning of intention relates to motivational functioning and volition. Events are intended in so far as an individual's will impacts their occurrence, and volition refers to motivational and cognitive processes that follow an overall plan to pursue an action (i.e., the processes that succeed intention). Nuttin's arguments have clearly been accepted and developed within a volitional framework for goal-directed behaviors (Bagozzi 1992; 1993). Indeed, it has been argued that the broader construct of volition rather than intention should be used in the prediction and understanding of behavior; intention as used within the TPB framework is viewed not to concede enough importance to what having an intention actually means (Perugini and Conner 2000), and as too narrow to encompass both an action plan and the channeling of motivation to act (Bagozzi 1992; 1993; Perugini and Conner 2000). Although these latter studies have used a goal-directed approach, the current research is eschewing a goal orientation for the following reasons. First, the definition of goals is inextricably complex and involves the identification of intermediate and terminal or higher-order goals (Bagozzi and Warshaw 1990; Perugini and Conner 2000). This may be operationally feasible in contexts where goals are initiated, successfully or unsuccessfully attempted and terminated. In the context of ethical consumption, however, an attempt to define intermediate and higher order goals (and the level of abstraction of these higher order goals) would be problematic at best. Previous research has shown that concerns with ethical issues in the context of consumption are inextricably interrelated (Shaw and Clarke 1999) and while ethical consumers may strive to achieve a particular goal through

the performance of several behaviors, they may also aim to achieve several goals through the performance of a single behavior. For example, by purchasing fair trade coffee one may aim to help developing world producers to get a better deal for their produce. Alternatively, one may aim to support more equitable trading initiatives, or both. Finally, the newer models of goal-directed behavior (MGB) have been subject to limited empirical testing while the TPB has been the subject of research application for several decades. We recognize the contribution of new frameworks as helping to improve both our understanding of the links between the model's theoretical constructs and the explanatory ability of the models, and as highlighting the TPB's lack of attention to the processes that take place between the formation of an intention to act and actual behavior. As such, we seek to deepen the theoretical framework of the TPB through a modified framework that will improve understanding of how intentions are translated into behaviors.

While previous research has highlighted the existence of different aspects of volition as distinct from intention, research examining the role of these volitional stages in decision-making is limited. Perugini and Conner (2000) measure volitional stages but present them as one construct of volition. In order to understand the motivational stages underlying decisions to avoid sweatshop apparel, the previously identified constructs of desire and plan (Perugini and Conner 2000), are postulated as conceptually distinct and pertinent to our understanding of the motivation and action aspects of intention. Previous research has argued that desire is distinct from intention within the MGB (Bagozzi 1992) and plan has been found to play a separate role from intention within the TPB (Jones et al. 2001; Sniehotta, Scholze, and Schwarzer 2005). Such research suggests the pertinence of these motivation and volition stages in addressing the intention-behavior gap often found in ethical consumption contexts. Thus, we hypothesize:

- H1a:* The constructs of desire, intention and plan are conceptually distinct.
- H1b:* The TPB constructs of attitude, subjective norm, perceived behavior control, intention and the additional constructs of desire and plan are conceptually distinct.

The TPB has been successfully utilized in similar behavioral contexts, thus it is expected that the components of the model will operate according to the theory within this study. These relationships are specified in the following three hypotheses:

- H2a:* The more positive the consumer attitude toward avoiding the purchase of sweatshop apparel, the stronger the intention to avoid the purchase of sweatshop apparel.
- H2b:* The more the consumer perceives a normative pressure from important others with regard to the decision to avoid purchasing sweatshop apparel, the stronger the intention to avoid purchasing sweatshop apparel.
- H2c:* The more control over avoiding purchasing sweatshop apparel the consumer perceives, the stronger the intention to avoid purchasing sweatshop apparel.

Desire

In the MGB, Perugini and Bagozzi (2001, 80) state that "desires provide the direct impetus for intentions and transform the motivational content to act." Desire has been conceptualized by Perugini and Bagozzi (2004, 71) as "a state of mind whereby an agent has a personal motivation to perform an action or to achieve a goal." Although a goal-directed approach is not adopted here, we

adopt measures of desire and hypothesize that desire will partially mediate the effects of attitude, subjective norm and perceived behavioral control on intention. We hypothesize these effects as partial, as the antecedents to intention specified within the TPB are well established. As such, we support the role of desire as an addition to the TPB relationships outlined in hypotheses 2a, 2b and 2c but further the following hypotheses H3a to H3e.

- H3a:* The stronger the attitude of the consumer to avoid purchasing sweatshop apparel, the stronger the desire to avoid purchasing sweatshop apparel.
- H3b:* The more consumers perceive a normative pressure from important others with regard to the decision to avoid purchasing sweatshop apparel, the stronger the desire will be to actually avoid purchasing sweatshop apparel.
- H3c:* The stronger the level of perceived behavioral control towards avoiding purchasing sweatshop apparel the stronger the desire to avoid purchasing sweatshop apparel.
- H3d:* The stronger the consumer has a desire to avoid purchasing sweatshop apparel, the stronger their intention to avoid purchasing sweatshop apparel.
- H3e:* The effect of attitude, subjective norm and perceived behavioral control on intention is reduced when the mediating role of desire is included in the model.

Plan

Research has argued that in addition to an individual's direct statement of his/her intention, which refers to the directive function of volition, there are also action orientated aspects of volition following the formation of an intention that are important motivators to behavior (Perugini and Conner 2000; Jones et al. 2001; Sniehotta et al. 2005). This volitional stage following intention is plan. The above authors conceptualize plan as cognitive effort and argue that intentions are more likely to convert into behaviors when they are operationalized through a plan to act. This is to be differentiated from intention to act, as plan is reflective of actual effort/steps expended to undertake the behavior. Thus, once an intention is formed to avoid the purchase of sweatshop apparel the next volitional stage for an individual is the performance of steps (plans) orientated towards the behavior. At the plan stage of volition we argue that attitude is already formed and, thus, a commitment with respect to the behavior has been produced. Further, the influence of others is reduced as one's motivation towards the behavior moves closer to action, and all reasoning with regards to perceived barriers has taken place and been resolved. We, therefore, hypothesize that attitude, subjective norm and perceived behavioral control will not directly impact plan, but together with desire, their relationships with plan are fully mediated through intention.

- H4:* The effect of attitude, subjective norm, perceived behavioral control and desire on plan is fully mediated through intention.

METHODOLOGY

To satisfy the aim of this research, subscribers to the UK Ethical Consumer magazine were purposively selected as the target population for our study. The main questionnaire was developed to measure the components of the TPB and motivation and volitional stages using 7-point Likert-scales. Direct measures of the TPB components (attitude, subjective norm and perceived behavioral

control) were captured in accordance to Ajzen (1985). Measures of desire are similar to Perugini and Bagozzi (2001). Measures of plan were based on Perugini and Conner (2000) and Sniehotta et al. (2005) reflecting actual moves taken to enact the behavior. Questionnaire measures are detailed in table 1. Questionnaires detailing the purpose of the study with a prepaid envelope were inserted into the April/ May 2003 issue of the Ethical Consumer magazine and mailed to 4,500 UK subscribers. In total 794 useable questionnaires were returned within the specified four week period, representing a response rate of 20%. In the sample, 33% of respondents were male and 67% female; the average age was 43 years; and 84% were educated to degree level or higher. SPSS was used to generate descriptive statistics and to conduct reliability analyses of measurement scales via Cronbach's alpha. Examinations of hypotheses and models were undertaken via structural equation modeling (SEM) using AMOS 6.0.

RESULTS

Scale Reliability and Validity. In order to assess the reliability and validity of the volitional constructs (desire, intention, and plan), a measurement model was assessed via confirmatory factor analysis. This model revealed an excellent fit ($\chi^2(6)=17.24, p<.01$, goodness of fit index or GFI=.99, Adjusted GFI or AGFI=.98, CFI=1.00, TLI=.99, IFI=1.00, RMSEA=.049 and AIC=47.244) according to the usual conventions (Hair et al. 1998; Hu and Bentler 1999). All standardized regression paths are above .7 (range .75-.96) and are significant at $p<.001$. Given the general absence of cross-loadings, convergent validity is supported. In terms of construct reliability, the average variance extracted (AVE) for each of the constructs is above the recommended level of .5 with construct reliability above .7. Discriminant validity was assessed following Fornell and Larcker's (1981) procedure by determining if the squared correlation between each pair of constructs was less than the average of the AVE for each of the constructs. This is true for all pairs of constructs in the model. These results fully support hypothesis 1a.

To address hypothesis 1b, a measurement model comprising the TPB and the additional motivational and volitional constructs (desire and plan) was assessed via confirmatory factor analysis. This model also provided an excellent fit ($\chi^2(161)=414.735, p<.001$, GFI=.95, AGFI=.93, CFI=.98, TLI=.97, IFI=.98, RMSEA=.045 and AIC=554.735). Standardized regression paths are all above .7 (with the exception of one subjective norm item with .613) and are all significant at $p<.001$. Given the absence of cross-loadings, convergent validity is supported. In terms of construct reliability, the AVE for each of the constructs (except subjective norm) is above .5 with construct reliability above .7 (see Table 1). The subjective norm construct yielded an AVE of .28 and construct reliability of .44. Discriminant validity is fully supported for all pairs of constructs in the model. Thus, hypothesis 1b is fully supported.

TPB Hypothesis Tests via SEM. To assess the TPB model, a SEM analysis was conducted. Table 2 outlines the path loadings and p -values. All paths are significant ($p<.001$). The model possesses good fit with $\chi^2(38)=129.634, p<.001$, GFI=.97, AGFI=.95, CFI=.98, TLI=.98, IFI=.98, RMSEA=.055 and AIC=185.634. The explanatory power (R^2) of the TPB in this behavioral context is adequate ($R^2=.331$). These results fully support hypotheses 2a, 2b and 2c, thus, we can conclude that although the TPB is acceptable in this behavioral context the explanatory power is limited.

The Mediating Role of Desire. To determine mediating relationships within the model Baron and Kenny (1986) and Holmbeck (1997) outline that four conditions must hold. Thus, to establish if

the construct desire mediates the relationship between the TPB antecedents (attitude, subjective norm and perceived behavioral control) and intention the following must be satisfied: 1) the predictor variables (attitude, subjective norm and perceived behavioral control) significantly impact the mediator (desire) in the expected direction; 2) the mediator (desire) significantly impacts the dependent construct (intention) in the expected direction; 3) the predictor variables (attitude, subjective norm and perceived behavioral control) significantly impact the dependent construct (intention) in the expected direction; and 4) after controlling for the effects of the mediator (desire), the impact of the predictor variables (attitude, subjective norm and perceived behavioral control) on the dependent construct (intention) is not significantly different from zero (for full mediation) or significantly reduced (for partial mediation). This is examine via three models (see table 3).

An examination of the fully mediated model (see Table 3 model 1) shows that attitude, subjective norm and perceived behavioral control significantly impact desire, and that desire significantly impacts intention. Furthermore, the regression weights for these three antecedents are all significantly positive as expected, thus, conditions 1 and 2 are satisfied and hypotheses 3a, 3b, 3c and 3d are supported. The amount of variance in intention captured is 28%. The fit of this model is adequate.

Condition 3 is examined via model 2. Table 3 shows that this condition is also satisfied with regression weights in the expected direction, and 33% of the variance in intention captured. Regarding condition 4, results of model 3 show that the effects of attitude on intention are fully mediated by the variable desire. However, desire partially mediates the effects of subjective norm on intention and no mediation effect is observed between perceived behavioral control and intention. Given these results, hypothesis 3e is generally supported.

Examining the Mediating Role of Intention. To consider the mediating effect of intention on the relationships between attitude, subjective norm, perceived behavioral control, desire and plan three models are examined. Model 1 (Table 4) represents the model fully mediated by intention. Given that in model 3 (Table 3), the resultant model from previous analysis is valid, and that intention significantly impacts plan in the expected direction, conditions 1 and 2 of the procedure are satisfied.

The results of model 2 (Table 4) show that, without the mediator (intention), only the TPB antecedent perceived behavioral control significantly impacts plan, and that desire significantly impacts plan in the expected direction. Hence, condition 3 is satisfied.

Examining the model (model 3 table 4) where intention is assumed to have no mediation role, Table 4 shows that model 3 when compared to model 1 did not yield significant chi-square difference test, and that the regression path from desire to plan is no longer significant at $p<.05$; further the R^2 for plan remains unchanged. It can, therefore, be concluded that intention fully mediates the effects of its antecedents (attitude, subjective norm, perceived behavioral control and desire) on plan. Therefore, model 1 in Table 4 is the final and most parsimonious model for this study. Thus, hypothesis 4 is fully supported. The final model for this behavioral context can be represented in Figure 1 and a summary of results is outlined in Table 5.

DISCUSSION

Previous research has criticized the TPB for the lack of attention given to understanding the motivational aspects of intention. While contributions have been made in highlighting the volitional aspects of intention (Perugini and Conner 2000), this

research has failed to explore these volitional constructs as distinct motivational stages. The theoretical contribution of the current research is novel in empirically testing the links between the constructs desire, intention and plan, with results revealing significant findings enriching the TPB framework.

Desire was found to be distinct from intention and pertinent in fully mediating the effect of attitude and partially mediating the

effect of subjective norm on intention. This suggests that attitude does not directly impact intention but rather required the motivational stage of desire; reflective of a personal motivation to act. In the context of avoiding sweatshop apparel this personal motivation is important and can be energized by emotive feelings surrounding the issue, resulting in a strong desire to act. Thus, a desire to avoid sweatshop apparel informed by an attitude that sweatshop apparel

is negatively valued is necessary before forming into an intention. Perugini and Bagozzi (2004) through the concept of temporal framing suggest that desire resides at a mental level where practical consideration of behavioral enactment has not yet been considered. Therefore, the positive attitudinal aspects of avoiding sweatshop apparel must be desired before they move to an intention to act. This highlights a time oriented distinction between desire and intention. Similarly, the role of important others can serve to impact personal motivation to act in terms of desire by positively supporting personal motivation or through negatively influencing desire to avoid sweatshop apparel. In terms of perceived behavioral control, which is not mediated through desire, we argue that consideration of perceived difficulties occur closer to the temporal framing of the behavior at the point of intention. The explanatory ability of this enriched framework increases greatly from $R^2 = .33$ to $R^2 = .48$ with the addition of the mediating construct of desire.

The existence of a gap between attitude and behavior has been the subject of academic debate both within the TPB literature and elsewhere (Armitage and Conner 2001; Newholm 2005). The current research findings highlight the significance of plan as a volitional stage toward behavior, with results revealing the impact of attitude, subjective norm, perceived behavioral control, and desire on plan as fully mediated through intention. Previous research has highlighted the requirement for some level of effort to be expended to achieve a behavior (Bagozzi 1993; Heider 1958). In the context of the current research where there are difficulties in avoiding the purchase of sweatshop apparel the need to take steps towards enacting the behavior beyond the formation of an intention is reasonable. For example, outlets and brands may need to be

researched and their accessibility assessed. This further enrichment of the TPB framework through the addition of plan resulted in $R^2 = .49$ for intention, a large improvement on the traditional TPB model, and $R^2 = .53$ for plan.

The significant contribution of this enriched framework is particularly apparent in contexts where there may be barriers to behavior, such as found in addictive behaviors (e.g., smoking) and in behaviors where conflict may exist, either with self or significant others (e.g., lifestyle changes, sustainable behaviors). We would recommend that future research test the applicability of the derived model in different behavioral contexts. Further, the findings of the current research highlight a significant deepening of the TPB framework. Further research is required to fully assess the impact of desire and plan as explanatory motivational and volitional constructs to behavior. It is suggested that such research should include actual behavior so the links between these constructs and actual behavior can be fully assessed.

TABLE 5
Summary of Hypotheses and Conclusions

Hypothesis	Decision	Conclusion
1a	Fully supported	Reliability and discriminant validity of volitional components desire, intention and plan fully supported.
1b	Fully supported	Reliability and discriminant validity of TPB antecedents and volitional components desire, intention and plan fully supported.
2a, b, c	Fully supported	TPB antecedents all significantly impact intention in the expected direction. Thus, the TPB is potentially valid in this behavioral context.
3a, b, c	Fully Supported	TPB antecedents all significantly impact desire in the expected direction.
3d	Fully supported	Desire significantly impacts intention in the expected direction.
3e	Only Partially supported	Desire fully mediates the effects of attitude on intention, partially mediates the effects of subjective norm on intention, with no evidence of mediating effect on the relationship between perceived behavioral control and intention.
4	Fully supported	Intention fully mediates the effects of attitude, subjective norm, perceived behavioral control and desire on plan.

HOOLIGAN'S HOLIDAY: Rethinking Deviant Consumer Behavior and Marketing

Aubrey R. Fowler III, University of Nebraska, Lincoln, USA

INTRODUCTION

Consumers navigate a variety of behaviors every day that range from what might be considered normal (i.e., purchasing a new dress from a retail outlet), to questionable or possibly inappropriate (i.e., purchasing a new dress, wearing it once with its tags still attached, and then returning it to the retail outlet), to downright illegal (i.e., stuffing the dress into a bag and walking out of the retail outlet without paying for it). The examples used here are acquisition-based, and much of the literature on deviant consumer behavior deals with deviant forms of acquisition, but deviant behaviors are as multifaceted and complex as otherwise “normal” consumer behaviors which range from acquisition to consumption to disposal. Some of these behaviors are perfectly legal but frowned upon by the society at large such as adorning one’s body with a tattoo or smoking a cigarette. Some are illegal but considered somewhat acceptable by the social body at large as anyone who has ever said “if you’re within ten miles of the speed limit, the cops won’t stop you” can bear witness to. Given that most definitions of deviant consumer behavior consider it to involve those behaviors that violate certain accepted norms and given that those accepted norms may be rather fluid depending upon a variety of elements and circumstances, what then is deviant consumer behavior?

The purpose of this paper is to attempt to answer this question through an exploration of a typology of consumer behavior that accounts for a variety of behavior types—normal, deviant, or otherwise—that consumers engage in on a daily basis. By developing such a typology, I hope to provide marketers with a tool by which to study and understand many of these behaviors that are considered deviant as well as other behaviors not considered to be deviant. The more we understand these behaviors, the better prepared we are to de-market certain behaviors that we find untenable and unacceptable. Furthermore, the more we understand why and how consumers behave in certain deviant situations the more we may be able to explain how consumers behave in less than deviant environments. But first, I turn my attention to the question at hand.

WHAT IS DEVIANT CONSUMER BEHAVIOR?

Before tackling the question offered in the above heading, it is first prudent to develop an understanding of what constitutes a general definition of deviant behavior. Erickson (1962) describes deviant behavior as “an alien element in society” and a “vagrant form of human activity, moving outside the more orderly currents of social life” (307), and Sarason (1972) refers to it as personal maladaptations. Heckert and Heckert (2002) report that “others have restricted [the notion of] deviance to violations of social norms that are important enough to elicit a strong reaction” (451). Merton (1949) regards deviance as “a symptom of dissociation between culturally prescribed aspirations and socially structured avenues for realizing those aspirations” (128). The common theme between these and the many other conceptualizations of deviance that dot the landscape of the sociology and psychology literature is that deviant behavior is that which is considered to be different from “normal” behavior by the society at large.

Deviance and Consumer Behavior

In keeping with this thematic approach to deviance, Mills and Bonoma (1979) define deviant consumer behavior as “behavior in a retail store that society considers inappropriate or in conflict with

a previously accepted societal norm” (347). Labeling such behaviors as aberrant consumer behavior, Fullerton and Punj (1993) assert that these behaviors are generally held in disrepute by both marketers and consumers. Fullerton and Punj (1997) further explore the phenomenon—labeling it as consumer misbehavior—suggesting that it disrupts the expected order of consumption situations.

Deviant consumer behavior manifests itself in one or more of three major categories which include the destruction of property, the victimization of other consumers and/or marketers, and material loss (Fullerton and Punj 1993); although, some deviant behaviors may also fall into a category of non-material loss or change such as a consumer-driven alteration of brand identity or the purchase and subsequent return of an article of clothing after wearing it once. Activities that fall within the former categories include illegal market transactions, misuse of product, compulsive buying habits, credit misuse, shoplifting, and a host of others (Budden and Griffen 1996). Though such activities appear to have received little attention from consumer researchers (Babin and Griffen 1995), a number of studies in recent years have explored several facets of deviant consumer behavior, most of it dealing with shoplifting.

But even with all this work, these and other researchers do not fully answer the question at hand: what is deviant consumer behavior? A behavior such as shoplifting is considered deviant because it violates societal norms of product acquisition (Cox, Cox, and Moschis 1990; Kraut 1976; Tonglet 2001); but is it truly deviant in the sense that it is an abnormal means of acquisition? In 1993, retail outlets lost nearly \$30 billion in revenues as a result of shoplifting (Fullerton and Punj 1993), enough to be classified “as one of the developed world’s leading industries” (Babin and Griffen 1995, 668). Furthermore, the sheer number of people engaging in such behavior exceeds what we might reasonably think. Klemke (1982) suggests that as much as 60 percent of the population has engaged in shoplifting at one time or another, and Baumer and Rosenbaum (1984) indicate that more than 200 million individual shoplifting incidents occur on an annual basis, a number that is certain to have increased in the two-plus decades since their particular study. Numbers aside, the truly extraordinary aspect of shoplifting is that it is typically enacted by amateurs who steal for consumption rather than for profit and that these amateurs are mostly ordinary people with no criminal record (Cox, et al. 1990) who are motivated to steal for much the same reasons that people perform normal shopping activities... “the acquisition of goods at minimum cost” (Kraut 1976, 365). I ask again, with so many people engaging in it, is shoplifting a truly deviant consumer behavior as we have traditionally defined deviant consumer behavior or is it simply an alternative means of acquisition?

What we are exploring with shoplifting and other illicit examples of consumer acquisition is actually criminal behavior, and current definitions of deviance in consumer behavior do not account for this distinction, making it too vague and too confining at the same time. Deviance does not simply describe criminal behaviors. Granted, criminal behaviors do violate the accepted norms of the social entity, but as suggested earlier, there are consumer behaviors that violate the societal norms or expectations without breaking any laws such as the individual who wears outrageously mismatched and out-of-fashion clothing to anything other than a costume party or even the individual that steps outside to smoke a

cigarette during his or her lunch break. These are the behaviors that Erickson (1962) refers to when he defines deviancy as the alien element in a society.

Some marketing examples of non-criminal consumer behavior that may not be considered “normal” by the general populace include participation in the mountain man retreat (Belk and Costa 1998), the formation and development of certain brand communities (Muniz and O’Guinn 2001; Muniz and Schau 2005) and consumption subcultures (Schouten and McAlexander 1995), the hedonic consumption of skydiving (Celsi, Rose, and Leigh 1993), and even public nudity (Shrum and Kilburn 1996) or strip-club attendance (Frank 2002). The possible range of consumer behaviors of interest to marketers is limitless. Hence, the range of potential deviant consumer behaviors is also limitless; yet, with the vague and confining definitions that have come before, we are, perhaps, limiting our own ability to understand consumer behavior and the notion of deviance.

Shifting the Paradigm

The current paradigm in the study of consumer behavior contains four basic questions that may limit our ability to understand and counteract such behaviors. First of all, the notion of what is or is not a deviant behavior is vague and begs the following question: *what are the generally accepted norms of conduct in consumption situations, how are they defined, and who defines them?* In conjunction with this vague notion of deviance, the existing definitions of deviant consumer behavior also provide a rather limiting viewpoint on what constitutes deviance by focusing on criminal or destructive activities in consumption environments. With that in mind, the following question arises: *is it only criminal behavior that we find deviant in marketing or are there other non-criminal behaviors that fall within that deviant range?* There is also an apparently moralistic assumption that deviant behaviors are wrong, bad, or otherwise undesirable; and therefore, many social scientists seek to explore such behaviors through ethical decision-making processes as they relate to the individual consumer’s notion of what is right and what is wrong. *But what if the consideration of what is right and wrong do not even enter the consumer’s thought processes during the perpetration of acts that are considered deviant by the dominant culture, or what if morality is not part of the equation at all?* Finally, Durkheim (1893, 1897) has pointed out that crime and deviance are not only normal aspects of human behavior but also reasonably healthy and, in fact, necessary for the continued innovation found in social entities. He claims that crime itself serves as a protective function of society by which the collective conscious is recognized, reaffirmed, and celebrated and that deviance promotes innovation and progress. With that in mind, *do we automatically wish to eradicate behavior considered to be deviant or do we seek to study, learn, and innovate from it?*

It seems, then, that with these questions surrounding the current paradigm, it may be time to shift the paradigm to something that accounts for all consumer behaviors and not just deviant consumer behaviors. In other words, I suggest that we discard the question contained within the opening heading of this section. Instead of asking *what is deviant consumer behavior?*, we should be asking *what are the types of consumer behaviors that exist in the marketplace?* To that end, I propose that marketing discard the notion of aberrant, undesirable, unethical, or otherwise deviant behavior and all that the notion entails and, instead, seek a definition of such behaviors that explores whether or not the behaviors are in agreement or disagreement with the institutionalized and cultural norms of a particular society. In the next section, I propose a new typology of consumer behavior that is predicated upon these two dimensions.

A TYPOLOGY OF CONSUMER BEHAVIOR

Within any given social entity—be it on a national scale, a neighborhood scale, or a familial scale—there are a set of cultural norms and expectations to which the entity’s members are expected to adhere. Furthermore, there are also sets of institutionalized norms (i.e., laws, covenants, rules, etc.) that work to maintain civilization or, at least, some semblance of civilization within the social body. The framework that follows has as its two dimensions the cultural norms and the institutionalized norms of a given social entity.

Institutional and Cultural Norms

According to Durkheim (1897), “no living being can be happy or even exist unless his needs are sufficiently proportioned to his means” (246). In order to achieve this state of happiness, this equilibrium of means and needs, the living being must have regulations or restraints placed on the unlimited desires that may plague him or her, tempering the insatiability that may haunt them. An unlimited desire by definition is insatiable and an “inextinguishable thirst is constantly renewed torture” (247). It is Durkheim’s contention that this regulation of desire is provided by a society which alone has the authority—granted to it by the individual—and the “power necessary to stipulate law and to set the point beyond which the passions must not go” (249). When this regulation of the individual is disrupted for economic, cultural, or individual reasons, the individual or the culture may find itself in a state of anomie.

Merton (1949) also interprets this state of social instability as anomie but refers to it as a sense of normlessness. He begins under the premise that there are two elements of social and cultural structures that are paramount to the understanding of how deviant behavior develops within a society. First of all, there is the set of cultural goals, purposes, and interests “held out as legitimate objectives for all or for diversely located members of society” (126). In short, the culture defines the “what” that is to be achieved and is acceptable for the stability and continuation of that particular culture or social entity. Second, the methods for achieving those goals are also defined by the culture as “every social group invariably couples its cultural objectives with regulations, rooted in the mores or institutions, of allowable procedures for moving toward these objectives” (126). In other words, the institution—or authority to use Durkheim’s term—is responsible for formalizing certain rules and regulations that govern acceptable behavior by its constituents.

It is when these two elements of the social entity are at odds with one another that conditions of anomie exist. If we divest, for a moment, the first of these two elements, we are left then with the dimension of institutionalized norms which I have defined here as *the formal rules and regulations intended to protect the institution as well as the individual from certain behaviors and to protect the institutional and individual right to engage in certain behaviors.* These are behaviors that have been codified in some way, be it by the state or by the group, in a formalized and normative manner in order to define what is and what is not acceptable for the stability of the individual social unit. To that end, an isolated behavior either meets or violates the rules and regulations set up and enforced by the dominant institution be it at the level of national, state, or local government or at the level of the individual marketing institution such as a retail store or other servicescape.

For instance, the institutionalized norms within many national economies define monetary exchange, trade, barter, and gift-giving as acceptable means of acquiring goods and these norms are intended to protect the institution and the individual’s right to expect these forms of acquisition in exchange situations. Acquisi-

FIGURE 1

Meets Institutional Norms	Abiding	Carnavalesque
Violates Institutional Norms	Anomic	Aberrant

tion behaviors that violate these norms include such behaviors as shoplifting, fraud, illegal downloading, bribery and others. These institutionalized norms also govern the “how” of consumption and disposal of consumed items as well as what is consumed. An individual’s behavior either acts in accordance with these institutionalized norms or they violate them.

With the institutional dimension, we divested ourselves of the cultural aspect of the typology. However, institutions do not exist in a vacuum and many of the regulations they carry are driven by cultural expectations of what is “normal” or “deviant” or “unacceptable” behavior. As Merton (1949) contends, the dominant culture drives the goals, purposes, and interests that are considered to be legitimate within the cultural domain. The dominant culture defines what is acceptable or “official” (Bakhtin 1936) in regards to the motivations or end results of behavior. To that end, the cultural norms are defined here as *the informal expectations a culture places upon the individual and the institution as to what are or are not viewed as officially acceptable motivating elements (goals, purposes, and other interests) for behavior.*

As an example, the cultural norms of decency require that the acquisition of explicit sexual activity through monetary means is unacceptable. We shouldn’t reduce sex and sexual activity to an economic commodity. Throughout the United States, behavior that involves the exchange of sexual favors for money violates institutionalized norms, but in some locations and in some situations, this exchange is not in violation of the institutionalized norm for that particular social entity (i.e., institutionalized prostitution in Pahrump, Nevada or the X-rated film industry in California). However, these behaviors may still carry with them a cultural snubbing as do such behaviors as purchasing an item and returning it after one use, having multiple visible tattoos and body piercings, dying one’s hair a vibrant green, or some other culturally frowned upon though not necessarily illegal behavior.

The Framework

What these two dimensions provide marketers is a framework in which to view behaviors from a non-moralistic viewpoint, one that sets aside ethical and/or legal concerns and simply attempts to place the behavior within its institutional and cultural context. In each case, the particular behavior either violates or abides by the established cultural or institutional norms under the auspices of a particular social entity. In the case of the institutional norms, the behavior either violates or does not violate in a fairly clear-cut manner. An individual steals or does not steal; speeds or does not speed; wears a shirt and shoes into the convenience store or does not; so on and so forth. But in the case of the cultural norms, the particular dimension may be more of a spectrum where we have some behaviors that are not quite unacceptable but aren’t exactly

acceptable either. Other behaviors, depending upon the situation or contextual elements surrounding them, may float along the spectrum. Regardless, as shown in Figure 1, the dimensions provide a set of four particular types of behaviors which can be assessed by marketers and other institutions.

First, the framework identifies an *Abiding Behavior* which includes all those behaviors that do not violate any institutional rules nor do they violate any cultural norms either. An example of abiding behavior, in American culture, is the purchase of a popular CD from a music store where the purchase fits with the institutional rules of acquisition and the CD is a culturally acceptable product to acquire. When a behavior violates the institutional norms but does not violate cultural norms, I identify this as an *Anomic Behavior*. An example of an anomic behavior is the theft of the popular CD from the music store. Again, the CD is a culturally acceptable product for acquisition and consumption; however, the institutional rules governing that acquisition have been broken.

Carnavalesque Behavior occurs when the institutional rules have not been violated, but the cultural norms of what is acceptable have been circumnavigated in some manner. An example of a carnivalesque behavior is the purchase of a CD preaching racial intolerance and bigotry from a website. The purchase, again, does not violate the institutionalized norms of acquisition; however, that which has been purchased may not fall within the realm of the culturally acceptable. Finally, we have *Aberrant Behavior*, those behaviors that violate both institutional and cultural norms. For instance, aberrant behavior may include the illicit download of a graphically hard-core pornographic CD from the internet where both the acquisition and the product violate institutional and cultural norms. These behavior types will be explored in further detail in following discussion.

DISCUSSION OF BEHAVIOR TYPES

In this section, I discuss in a bit more detail the various categories developed within the framework. Since much of what has been discussed in terms of consumer behavior in the marketing literature is, within this framework, abiding behavior, the discussion here will be limited to the remaining three categories. To begin with, I will start with anomic behavior.

Anomic Behavior

Anomic behavior includes many of the behaviors marketers have considered aberrant, deviant, or otherwise unacceptable. Shoplifting is an anomic behavior because it clearly defies institutional norms; however, it does not necessarily violate cultural norms of what to acquire and consume. For instance, an adolescent boy finds a new CD by his girlfriend’s favorite artist and, wanting to impress her with a bit of a gift, slips the CD into his coat pocket and leaves

FIGURE 2

Research questions based upon consideration of norms and the participation in the behavior

CONSIDERATION OF NORMS		
ANOMIC BEHAVIOR	Agrees with Norms	Disagrees with Norms
Engages in Behavior	What drives the individual to perform the anomic behavior when he or she supports the institutional or cultural norms?	What can marketers do to either change the behavior of the individual or their consideration of the norm in question?
Does Not Engage in Behavior	What can marketers learn from individuals such as these in order to prevent the behaviors in individuals who do not share this philosophy?	What keeps the individual from engaging in the anomic behavior when he or she does not support the institutional or cultural norms?

the record store without paying for it. He is definitely stealing, but he is still acquiring a culturally acceptable product to enjoy in a culturally acceptable manner. The means have been violated, but the ends have not necessarily seen any violation.

As marketers, parents, and members of “civilized” culture, we can look at such an example and cry ethical-decision making processes from the mountaintops, pulling the Multidimensional Ethics Scale (MES) developed by Reidenbach and Robin (1991) out of our collective back pockets in order to better understand how the adolescent in question set aside culturally defined morality and ethical considerations in order to walk out of the record store with the CD hidden in his pocket. But it may be that the individual did not even consider the ethical ramifications in this case. He simply wanted to impress his girlfriend with a gift of her favorite musical artist and may not have had the money to purchase the CD. In retrospect, we can judge such behaviors on the moral equity, relativism, and contractualism dimensions put forth by Reidenbach and Robin (1991); and, the individual may judge the behavior along such dimensions after the fact as well. But while engaging in the act, it is possible that the teenage boy thought more about the *thanks* from a grateful girlfriend that he would receive after the gift had been given.

Within this and other quadrants of this particular typology, we can further implant individual perception into the institutional/cultural context of these behaviors. Instead of simply having a two dimensional construct, we can actually imbed an additional two-dimensional construct within each quadrant of the typology that may lead us to the truly interesting research questions available to us. For instance, as marketers, we may wish to investigate why individuals engage in many of the behaviors we consider anomic. An appropriate set of considerations may include whether or not the individual agrees with the norms established by the institution and whether or not the individual engages in the particular behavior. Figure 2 provides a cross section of possible questions that come out of such a typology from the perspective of the consumer.

Given the questions found in Figure 2, ethical decision making processes on the part of the consumer may indeed be at play, but we may also find other processes within the consideration of such questions which override or push aside the notion of consumer ethics. Perhaps it is simply fear of punishment that keeps the individual who disagrees with the norms from engaging in the behavior, and perhaps the individual who agrees with the norms but engages in the anomic behavior anyway is guided by motivations of defiance or, possibly, ritualistic behavior in association with some group.

The inclusion of the framework of the individual entity within the context of a particular behavior is possible in each of the identified categories in the overall framework, providing us, ultimately, with a four by four framework. However, for parsimony’s sake, we may wish to simply work with one internally constructed framework within each behavioral category. In addition, we may want to develop a host of individual-centric frameworks that can then be utilized in our examination of anomic or other behaviors. This individual-centric framework need not be relegated to the individual consumer either. It may be centered upon a particular product, service, marketer, community, subculture, and so forth.

Carnavalesque Behavior

I named this category carnival because it involves behavior that does not violate institutionally sanctioned rules and regulations but does involve behavior that steps outside of “official” culture. Bakhtin (1936) first proposed his theory of the carnival in his examination of popular humor and folk culture in the novels of Francois Rabelais, a theory that accounted for the differences between the life endorsed by social order and a life full of the repressed pleasures of those individuals subordinate to the social order. The carnival is characterized by laughter, excessiveness, bad taste, offensiveness, degradation, and a host of other traits that sit just outside of the orderly life of polite culture. It is an arena that offers “a completely different, nonofficial, extraecclesiastical and extrapolitical aspect of the world, of man, and of human relations” where the folk build “a second world and a life outside officialdom” (6).

As such, we can use the Bakhtinian notion of carnival to explore a variety of behaviors that fall outside the bounds of official or culturally acceptable notions of behavior. For instance, Bakhtin (1936) identifies three distinct forms of folk culture that are involved in the carnival. First of all, there are the ritual spectacles—carnival pageants, comic shows of the marketplace, and other such activities—that may be considered “temporary liberation from the prevailing truth and from the established order” where individuals can suspend “all hierarchical rank, privileges, norms, and prohibitions” (10). The brand communities established with the Burning Man festival (Kozinets 2002) or the Harley Davidson gatherings (Schouten and McAlexander 1995) may be examples of carnival culture, as are, possibly, attendance at strip clubs, vacations in Las Vegas, or going to a Mötley Crüe concert.

Carnival, according to Bakhtin (1936), also involves comic verbal compositions or those parodies of the established social order that found their way into the folk tales. A great deal of today’s

popular culture may involve the comic verbal composition involved in this parody, and may in fact be a driving motivation for individuals' desire to view or otherwise participate in such activities. A look at modern television gives us a veritable cascade of parodic and comic spectacles that seem to defy explanation such as many programs found on MTV, reality programming, and a host of others. Finally, we also find the various curses, oaths, and popular blazons of the carnivalesque, what Bakhtin (1936) identifies as the third form of folk culture inherent within the carnival, those various genres of billingsgate that exist as part of informal or popular culture. Marketers tap into the carnival desires inherent within individuals a great deal in the advertising that is developed to sell a variety of products. Just about any beer commercial provides an excellent glimpse into the carnivalesque and the festive spectacle, as do certain shampoo commercials that unpack carnivalesque orgasms for women and an "edge in the dating game" (AXE) for men. A good bit of advertising also utilizes and disseminates popular forms of language in terms of slang phrases and other blazons or slogans such as "What happens in Vegas, stays in Vegas."

Marketing has repeatedly tapped into the carnivalesque desires of consumers in order to sell products and services, but consumers often engage in carnivalesque behaviors on their own, driving forward their own "unofficial" agendas in an attempt to live outside of the official world, even for a short time. As we did with the Anomic Behavior quadrant, we can create a second two-by-two matrix where the individual either agrees or disagrees with the cultural norms and either engages or does not engage in the behavior. From this, we can pull a variety of research questions such as what prompts individuals who typically agree with the cultural norms to occasionally step outside of them to engage in a particular behavior? Is it social pressure, age, lifestyle, or something completely different that motivates such behaviors? Another question of interest may involve how an individual who does not engage in the behavior yet disagrees with the social norms actually keeps from engaging in the behavior. Additionally, how does the social animal deal with and tolerate individuals who disagree with the cultural norms and engage in the carnivalesque behavior? These and many other questions can provide fodder for future research on a variety of different topics in a host of different contexts.

Aberrant Behavior

Behaviors that violate both cultural and institutional norms are defined here as aberrant and include a whole host of behaviors that affect marketers and consumers alike, and marketing has done little to actually examine aberrant consumer behavior under the definition proposed here. An example of an aberrant consumer behavior is the purchase and consumption of illicit drugs such as marijuana, cocaine, methamphetamine, and ecstasy. We might better understand the difficulties in de-marketing such activities if we better understand the motivating factors for participating in drug use. In some cases, it may simply be a ritualistic activity associated with the particular subculture to which the individual belongs; or it may be indicative of something more stringent within the individual.

Another example is the solicitation of prostitution. In this case, as in the case of the drug use, we may want to, as marketers, explore exactly why it is that the behavior is aberrant. Why does the culture consider the activity to be illegal and culturally unacceptable? If we understand better the "why" from the cultural perspective, we may be able to better understand the "why" of the individual perspective or, at least, how we might start to ease the tension between the two.

In this case, we need to explore both anomic and carnivalesque theories to help us understand aberrant consumer behavior. In so doing, we may be able to gain insight into aberrant behaviors, but

also into non-aberrant behaviors. An individual who engages in marijuana usage may not be all that different from an individual who engages in alcohol usage. In fact, given that moderate alcohol use is a culturally acceptable (and even culturally expected) behavior and not necessarily institutionally inappropriate, questions arise in terms of why it is exactly that marijuana is institutionally sanctioned given its similarity to alcohol. Marketing may be able to help explain this difference or, possibly, help to change or confirm public policy on the matter.

CONCLUSION

The main purpose of this paper was to provide a framework for the categorization and study of the variety of consumer behaviors considered deviant or otherwise undesirable, removing the ethical and moral considerations from that categorization. The paper accomplishes this goal by looking at behavior under two dimensions. On the one hand, behavior either conforms to the institutionalized norms established by a society to maintain notions of civilization and order. On the other hand, behavior exists somewhere along the spectrum of cultural acceptability, meaning that it either conforms to what is considered culturally acceptable or it exists in an unofficial world of some measure of violation of that acceptability. Together, the two dimensions provide us with the categories of abiding, anomic, carnivalesque, and aberrant behaviors.

A secondary purpose of this paper was to open up marketer's eyes to the untapped plethora of research possibilities inherent within consumer behavior. What possesses individuals to choose shoplifting over actual purchase? What are all the legitimate payment methods acceptable within a given culture? What drives an individual to engage in behaviors that are not necessarily culturally acceptable but do not violate institutional norms? How can we as marketers understand, foresee, and adapt to the changing cultural and institutional norms that envelope behavior on so many different levels? As marketers, we can't close ourselves off to the variety of possibilities for research into and understanding of consumer behaviors because of a moral or ethical stance against certain behaviors. As social scientists, as hard as it may be to accomplish, we have to set aside our moral perceptions of activities and behaviors that consumers engage in so that we may have a richer understanding of our consumers and of marketing within the context of consumer culture.

Consumer Vigilantism

Olga Kravets, University of Sydney, Australia

EXTENDED ABSTRACT

Consumer communal activities in the marketplace have received considerable research attention (e.g., Kates 2002; Kozinets and Handelman 2004; Muniz and Schau 2003). As a generalization, this research focused on issues of consumer resistance and emancipatory potentialities of such activities. What remains unexplored is the possibility that some consumer communal activities are concerned with maintaining and defending the prevalent symbolic order, rather than challenging and subverting it. The paper engages the concept of vigilantism to explore this possibility. Toward this end, it examines some activities, carried out by the Louis Vuitton brand community. The paper suggests that these activities are aimed at preventing the crime of counterfeiting but also at policing and reinforcing certain social symbolic boundaries.

The socio-historical studies on vigilantism define this social phenomenon as voluntary activities by private individuals, undertaken without explicit sanction of authorities and motivated by desire to defend an existing social order 'from some form of attack or subversion' (Sederberg 1978). Vigilantism is said to occur when there is a (perceived) lack or weakness in the ability of the officialdom to respond to an activity, which vigilantes see as a serious problem (Johnston 1996). More generally, social situations in which there exists some threat to important values appear particularly conducive to the emergence of vigilante activity (Brown 1975).

The notion of consumer vigilantism emerged during a netnographic study into activities of brand communities. The case presented here is a part of the study conducted in the internet-based community devoted to the Louis Vuitton brand in the period from November 2003-May 2005. This research follows the guidelines of Kozinets' (2002) netnography, but is less participatory. A number of data sources were accessed and generated during the study period, including magazine articles, government reports, press releases, court reports and field notes. Given that social activities are dialectically inseparable doings and sayings (Schatzki 2002), the data collection and analysis focused on practical as well as discursive aspects of communal activities. The data was analyzed iteratively, allowing persistent themes to emerge, then moving back and forth between these themes and the literature to develop an understanding of the themes and to propose a possible interpretation of the observed phenomenon.

To explain the core issue of the vigilantism in the community, it is essential to consider, first, what the Louis Vuitton brand is, and, second, the relation between the notions of *counterfeit* and *fake*. The Louis Vuitton brand (LV hereafter) is an iconic brand (Holt 2004). It is a symbol of status, affluence and glamour (Twitchell 2002), in Holt's (2004) terminology, LV embodies a cultural myth, an aspirational story of life of luxury and leisure, associated with the brand's famous patrons, many among them past and present royals and celebrities. As with any iconic brand, LV is a matter of high emotional and financial investment for many LV community participants. Being the symbol that it is, LV is among the most counterfeited brands (*Business Week* 2005). Even so, *fakes* rather than *counterfeits* are the issue for the community. To present the issue of fakes as it appears in the community, the paper draws on Baudrillard's (1993) orders of simulacra to outline three orders of fakes: counterfeit (direct copy of original), production (imitation of a look) and simulation ('a real without reality'—the Louis Vuitton brand as a representative symbol of luxury). These orders are

explicated to suggest that the first two orders contribute to an enactment and maintenance of the original, and all orders are problematic to some extent for the community.

The LV community takes the issue of fakes seriously, because they feel fakes "ruin" their LV experience and make them vulnerable to criticism about paying high prices for purses. Against these feelings, the community believe that "LV corporate" does not do enough to fight fakes, and worse, inadvertently promote faking, in particular by advertising LV as 'must-have' fashion item, targeting youth and increasing prices. Still, when it comes to the activities directed at others, the community adopts the discourse of the social threat of terrorism, one of the normative anti-counterfeiting arguments. This discourse mobilizes the community, and it makes protecting the brand, their own status, and community at large a moral imperative.

Four sets of vigilante-type of activities emerged from the data: educating, patrolling, responding and self-policing. *Educating* mainly involves distributing information about "what is real what is not," as well as edifying the public about counterfeits. The latter is directed at relatives, friends and colleagues, and occasionally strangers. *Patrolling* refers to observation of vendors and other consumers, both celebrities and average people. It also involves monitoring and reporting incidents of "fake attacks" in certain places and in media. *Responding* is taking actions against vendors of fakes. This includes reporting to authorities, approaching potential buyers with warning, and publicly exposing vendors. *Self-policing* is monitoring own community, which includes self-censorship in order to prevent any unwitting assistance to counterfeiters or promotion of fakes. Significantly, self-policing also involves unmasking fakes among "the LV lovers and supporters" themselves to assure that all participants are fitting or proper LV owners.

In summary, vigilantism as revealed in the context of the LV community, includes acting as if with a law enforcement agency and encompasses the notion of surveillance. Vigilante activity appear to arise from the perception that the participants and the brand are threatened by fakes, while authorities fail to deal with the threat.

Conceived as polemic, the paper concludes by pointing out three issues that arise from framing some activities of the LV brand community as consumer vigilantism. The first has to do with the perception of inadequate institutional protection of products' aesthetic features against the background of increasing value of aesthetics in the marketplace (Postrel 2003). The second concerns the issue of anxiety about social status and cultural boundaries, associated with *fakes*. The case evidences that one response to a (perceived) threat of symbolic instability is to defend boundaries through acts of vigilantism (cf. Holt 1998). The third is the question about the nature of consumer collective power. Specifically, whereas previous research has conceived it largely as positive, affording emancipatory potentialities, here it is at least ambivalent.

A Room with a Viewpoint: Using Normative Appeals to Motivate Energy Conservation in a Hotel Setting

Noah J. Goldstein, Arizona State University, USA
Robert B. Cialdini, Arizona State University, USA
Vladas Griskevicius, Arizona State University, USA

EXTENDED ABSTRACT

Recently, many consumer researchers have noted that very little research has been conducted on the factors that influence consumers' prosocial behaviors, and even less on pro-environmental behaviors. This paper seeks to fill this gap in the literature while also making theoretical contributions to consumer behavior by examining the extent to which a variety of different types of consumer identities might differentially motivate adherence to the implicit social roles or explicit descriptive norms associated with such identities. In these studies, we manipulated the message hotel guests see in signs in their rooms asking them to participate in the hotel's environmental conservation program by reusing their towels.

We conducted study 1 with two major purposes in mind. The first was to test the effectiveness of one of the more commonly used towel reuse messages—a cause-related marketing message that promised a donation to an environmental protection organization on the condition that guests chose to participate in the program—versus a similar message that better utilized the norm of reciprocity by informing the guests that the hotel had already donated to such an organization on their behalf. We suggested that rather than making a beneficial action contingent on the guests' behavior, a more psychologically effective strategy utilizing the norm of reciprocity would be to have the hotel provide the beneficial action first on behalf of its guests and then ask the guests to return the favor by participating in the towel reuse program. This hypothesis was supported by the finding that the reciprocation message yielded higher towel reuse rates than the cooperation-based cause-related marketing message. In addition to demonstrating the sequence of actions that most effectively utilizes the norm of reciprocity, these findings add to the research literature on when incentives fail to motivate the intended target behavior.

The second purpose of study 1 was to attempt to disentangle a potential confound in previous research investigating social identity and norm adherence. Specifically, when researchers have found that individuals adhere to the norms of important reference groups that are relevant to their self-concept, there are two potential mechanisms for this effect. On the one hand, learning the descriptive norms of an important social group could activate the social identity associated with that group and cause individuals to follow the explicit descriptive norm of that group. Yet, it is also possible that simply activating a given important social identity inclines individuals to behave in line with the social roles that are commonly and implicitly associated with such a social category. We hypothesized and found that the messages that activated either of the two important social identities but that contained no explicit descriptive normative information would motivate towel reuse to a lesser extent that would a message conveying an explicit descriptive norm of an unimportant (but situationally relevant) social identity. The results of study 1 suggested that in order to optimize social identity effects, it is necessary to ensure that an important social identity is not only salient but that the norms associated with the identity are known and also salient. In addition, study 1 revealed that descriptive normative information, even if not associated with an impor-

tant social identity but rather is associated with those who have been in the same situation as the target individual, is a powerful social influence on that individual's behavior.

The primary purpose of study 2 was to investigate the extent to which the descriptive norms of different types of reference groups might differentially encourage guests to participate in the towel recycling program. We argue that, although the meaningfulness of a given reference group identity is certainly an important factor in determining the degree to which a consumer will follow that group's norms, both the perceived uniqueness and the perceived diagnosticity of that reference group identity are other important factors. Consistent with predictions, but contrary to previous conceptualizations, we found that the appeal conveying the descriptive norm of that particular room's previous occupants yielded a higher compliance rate than the other three descriptive norm appeals, even though individuals considered this group to be comparatively much less meaningful to their personal identities than the other groups. Finally, all of the descriptive norm appeals as a group did better than the traditional environmental appeal, which makes salient guests' identities as environmentalists but does not communicate an explicit descriptive norm. Both theoretical and pragmatic implications are discussed.

“Uh-oh, Where Is Our Brand Headed?” Exploring the Role of Risk in Brand Change

Henrik Sjödin, Stockholm School of Economics, Sweden

INTRODUCTION

Imagine your reactions to the news that one of your favorite singers is recording a new album in a style that is very different from the kind of music you usually enjoy. Perhaps you would feel uncertain and concerned that the record would flop or that the artist would lose its appeal to you? Like artists, certain brands have the power to engage consumers, who rely on them for reassurance and their symbolic meanings. When such a brand seems to be changing, for example upon introducing a product that challenges established brand meanings, how do consumers respond? Uncertainty, concern, and expectations of loss might figure in this situation as well. These reactions are all related to perceptions of risk. This perspective on risk is somewhat different from the one traditionally embraced in consumer research, where risk is typically studied as an input to purchase decisions. The interpretive study presented in this paper offers observations on consumer responses to brand change that acknowledge the relevance of risk beyond the immediate setting of a purchase decision. Leveraging the risk concept in a new context, drawing on a broader literature, is shown to unlock new insights and implications for brand change and our understanding of consumers with high interest in a brand (“brand enthusiasts”). It aligns with current work to explore complications to emotional-branding strategies designed to forge strong consumer ties to a brand (Aaker, Fournier, and Brasel 2004; Thompson, Rindfleisch, and Arsel 2006). The purpose of the paper is thus twofold: (1) to show how perceptions of risk can imbue consumer responses to brand change, and (2) to outline some implications of recognizing such risk perceptions for the theory and practice of brand meaning management. The intent is not to argue that risk should obliterate or supersede other important constructs in this area. Rather, the essential point is that the concept of risk can provide an additional lens through which we can view consumer responses to brand change and discover things we might miss without it.

BACKGROUND

Brands certainly differ in their importance to people. However, some brands become very important to their followers. They can evoke commitment, attachment, and strong feelings from consumers individually (e.g., Fournier 1998) and within groups or communities (e.g., McAlexander, Schouten and Koenig 2002; Muñiz and O’Guinn 2001). Contemporary accounts of consumer culture have firmly established the role of commercial objects in creating and communicating a sense of self (Arnould and Thompson 2005; Belk 1988). Brands are tools for social identification and identity construction, partly because they provide consistency in a turbulent world (Elliott & Wattanasuwan 1998). What happens when cherished brands take actions that challenge this consistency?

The impetus for this paper comes from an ongoing study of consumer responses to brand extensions. Examining naturally occurring comments from brand enthusiasts, I noticed how many of them expressed uncertainty, danger, and feelings of impending loss (cf. Sjödin 2006). These reactions are characteristic for perceptions of risk, which has been defined as “subjective expectations of loss” (Peter and Ryan 1976; Stone and Grønhaug 1993). From previous research, we do know that brand owners and enthusiasts may react negatively when entrenched brand meanings become challenged (e.g., Brown, Kozinets, and Sherry 2003; Muñiz and O’Guinn 2001). However, risk has not been considered in such investiga-

tions. Moreover, research on brand extensions show that consumers often are skeptical towards new products if they lack a fit with the brand (Aaker and Keller 1990; Kirmani, Bridges, and Sood 2001) and that a risky purchase situation increases preference for the norm (Campbell and Goodstein 2001). However, this line of research has not explored risk beyond its role in purchase decisions (see also DelVecchio and Smith 2005). This is unfortunate, as the risk literature can offer original insights relevant to our understanding of brand enthusiasts, long-term brand loyalty, and brand management. These insights are applicable to predict and promote (or hold back) consumer acceptance of brand change. They should also supplement recent reports on the ramifications of emotional branding and close consumer-brand bonds (e.g., Aaker et al. 2004; Thompson et al. 2006).

RISK AND BRAND CHANGE

Consumer and marketing research holds a massive, ever-growing, literature on risk and its influence on decisions and choices by consumers. As noted in comprehensive reviews by Conchar et al. (2004) and Mitchell (1999) definitions of perceived risk are manifold and varied. Still, most consumer behavior applications seem to converge on a handful of key tenets. First, consumers perceive risk when they cannot be sure of a desired outcome. In other words, risk involves two components: uncertainty and unfavorable consequences. Second, existing research links risk very closely to decisions or choices, typically regarding a product purchase. Third, different types of loss contribute to overall perceived risk. Jacoby and Kaplan (1972) mention financial, performance, physical, psychological, and social loss. Roselius (1971) mentions time loss. Fourth, consumers normally strive to reduce risk. Research has identified brand loyalty as one important strategy to reduce perceived risk in a purchase (Roselius 1971). Fifth, risk is considered a cognitive construct, studied from an information-processing view.

Within marketing, the agreement on these tenets has been surprisingly stable over the decades (cf. Mitchell 1999). In contrast, the social sciences more broadly provide alternative viewpoints. Many accounts situate risk within the conditions of contemporary society, with “an intensifying sense of uncertainty, complexity, ambivalence and disorder, a growing distrust of social institutions and traditional authorities and an increasing awareness of the threats inherent in everyday life” (Lupton 1999, 12). In these views, risk has emerged as a key concept to understand and deal with many different aspects of existence in this turbulence. Moreover, socio-cultural views highlight the cultural aspects of risk: risk is a label assigned to phenomena by people, in a social context. This implies that risk has more uses than as an input to a decision. For instance, people can invoke the concept to define appropriate behavior or to assign blame (Douglas 1966; Lupton 1999). Correspondingly, consumer cultural theory emphasizes that consumers are social actors and that purchase decisions are but one class of relevant behaviors to consider in consumer research (Arnould and Thompson 2005). Altogether, these perspectives suggest that the concept of risk could be fruitfully employed to further the understanding of brand change. The present study investigates how risk imbues consumer responses to a brand extension perceived to challenge traditional brand meanings.

RESEARCH APPROACH

The starting point for my investigation was to consider consumer responses to a controversial brand initiative. Specifically, I studied opinions towards a brand extension, as expressed in an internet discussion forum (cf. Brown, Kozinets, and Sherry 2003; Kozinets (2002). These opinions were collected in a public newsgroup for discussions among internet users interested in Porsche. They all concern the introduction of the first sports utility vehicle (SUV) in the company's portfolio: Porsche Cayenne. For many people, this model constituted a significant departure from history and expectations. This case was chosen to allow enough consumer involvement for opinions towards the initiative to be articulated. Messages were consciously selected to give a novel understanding rather than to generalize across populations, akin to purposeful sampling (Kozinets 2002). I searched the newsgroup for comments on the Cayenne, made between June 1998, when the company first announced its plans, and December 2002, when the car reached the public. Messages expressing notions of risk were retrieved. In this assessment, I employed the aforementioned operationalization of risk as subjective expectations of loss (Peter and Ryan 1976; Stone and Grønhaug 1993), as this was broad enough to suit the purposes of the research. Drawing on standard qualitative procedures (Spiggle 1994), I explored emerging themes through multiple iterations and comparison with literature. Through repeated readings of the messages, I examined the expressions of risk in consumer opinions towards brand change.

FINDINGS

The following sections detail the various expressions of risk that appear in the consumer comments. All comments are presented with idiosyncratic spelling and punctuation retained.

Risk is present beyond single transactions

The comments on Porsche Cayenne show that risk should be a relevant concept even outside the setting of an imminent purchase. The informants discuss Porsche and the new car independently of any concrete purchase decision. Still, notions of risk (again, as subjective expectations of loss), figure in the posts:

Porsche recently had a marketing theme that said, "Porsche, not something to everyone, but everything to someone." That is why they are great. If they lose the ability to separate their cars from all the other cars on the market, they essentially lose "Porsche". I love Porsche and don't ever want to see that happen. Without Porsche, I may not be the autoenthusiast that I am. And I cannot imagine life like that. (posted by "Barry," alt.autos.porsche, July 2001)

This expressive quote talks about the risk of "Porsche" getting lost. It also connects concerns over the future of the brand with the risk of a less enjoyable life for the poster. Risk for the company is intertwined with risk for the enthusiast. This link exists because the brand is a part of the poster's life, regardless of whether he is about to purchase a new car or not. Rather, it is a relationship to the cars and brand of Porsche that is the basis for anxiety, beyond any single transaction with the company. Risk is relevant throughout the whole consumption process instead of merely at the purchase itself (Brunel and Pichon 2004); possibly even independent of any one purchase at all. Subsequent sections offer further details on this expanded view of risk.

Consumers worry about their brands: Brand risk

The data shows how consumers are concerned about risk pertaining to the company they depend on. Under the broad heading

of *Brand risk*, three types of risk can be discerned, each affecting the Porsche company. Firstly, some posters draw attention to potential economic problems that they associate with the brand extension, such as insufficient demand, poor profitability, or financial instability. Such comments might be said to express an *Initiative risk*:

I honestly don't see where they got the idea that the world needed another SUV and wanted it from Stuttgart. This project has just sucked away resources from the areas the company is already strong in, to an area where there's nothing but risk for the company. (posted by "D.J.," alt.autos.porsche, January 2002)

It's an abomination. I predict the biggest flop in automotive history. (posted by "DMD," alt.autos.porsche, April 2002)

Other messages cover perceived threats to the public reputation and image of the company brand. The data contain numerous comments on the risk that other people's perceptions of the brand will change. These express *Image risk*:

I just think in a few years time everyone, will be saying "Ahhhh the Cayenne, what a mistake, why did they build that? It's not a real Porsche, etc, etc". Porsche have a heritage and an important image to think of. Something like this could ruin it. (posted by "Jim O," alt.autos.porsche, December 2002)

Years down the track, when you think of buying a new sports car, the Porsche name might not be as "illustrious" as it once was due to cashing in on the SUV craze... (posted by "Dan," alt.autos.porsche, August 2001)

Finally, *Integrity risk* captures fears that the extension violates a company essence or identity. The concern over the company "selling out" or disgracing the name does not depend on what other people will think about this (as in *Image risk*), but is more about principles and values:

Even my 81-one year old grand father could drive one, is that a positive thing????? Porsche shouldn't sell their soul, but it is happening in every new model they come up with..... (posted by "Adam Larsen," alt.autos.porsche, January 2002)

This isn't a Porsche vs. VW question, it's a VW vs. dressed up VW question. It's also a disgrace to the Porsche family name and an insult to me as a Porsche owner. (posted by "D.P.," alt.autos.porsche, October 1998)

Consumers worry about their future with the brand: Relationship risk

In the previous section, consumers were shown to care about the risks facing a brand. The data examined also expresses risks that pertain more directly to the consumers themselves and their relationships with the brand. Mainstream literature on perceived risk recognizes the "performance risk" of a product not working properly or delivering functionally (e.g., Jacoby and Kaplan 1972). The present study suggests a need for a broader conceptualization such as *Relationship risk*, as new brand initiatives can make consumers wonder if the brand will be able to satisfy relevant needs in the future. These needs could be functional, as well as intangible, aesthetic, or hedonic:

Right now Porsche has pulled engineers from doing what they do best at Porsche (race and build those cars for their custom-

ers) to working on this truck so they can serve “the masses”. I don’t need another car built by a company to serve the masses. (posted by “Barry,” alt.autos.porsche, July 2001)

[It] seems that it is a more of a Volvo Turbo Wagon on steroids; with a spiritless morphing of some select Porsche ‘accents’ or ‘styling cues’ just to gussy it up for the consumerati. (posted by “noid,” alt.autos.porsche, March 2002)

The messages also express fears that the Image risk facing the brand will spill over and affect the consumer’s relationship with the brand, as their social needs will be less well served:

Man I hope they don’t produce those. I kinda like the idea of people knowing that when I say Porsche I own a sportscar! Porsche= Sportscar (posted by “JKL,” alt.autos.porsche, July 2001)

Consumers invest mental and material resources in relationships with brands, partly because they expect certain benefits. The comments illustrate how doubts about a brand’s ability to keep delivering these benefits introduce risk into the relationship. Such risk can also come from the threat of the brand taking on characteristics that are in conflict with the beliefs, values, or self-image of the consumer. Consumers who perceive the risk of subjective loss as too great may need to reframe their relationship to the brand. The following quote illustrates how substantial redefinitions can be triggered:

In my opinion, it’s disgusting that porsche would consider producing a truck. God, I hate those dam SUV’s enough already. How humiliating... .. If I’m ever in the market for a new performance car, Porsche will be automatically removed from consideration because of a stupid move like this. (posted by “Ultraforce,” alt.autos.porsche, February 2002)

These meaning-based risks bear some resemblance to the classic outline of social and psychological risks that Jacoby and Kaplan (1972) have put forward. The crucial distinction is that they consider only the purchase decision, explicitly discussing unfamiliar brands. In contrast, the notions that emerge in my study reflect the role of well-known brands in market relationships, identity work, and symbolic consumption (Arnould and Thompson 2005).

Using risk to make sense of brand disorder

What is the function of risk in consumer reasoning? The findings on Brand risk and Relationship risk indicate that consumers put the concept to further uses than only to inform purchase decisions. Consider also these quotes from posters in the Porsche newsgroup:

I (happy 996 owner) would not be CAUGHT DEAD in a Porsche SUV. That is even more pretentious and stupid than the Mercedes SUV. How many North Shore moms can get them and how fast?? (posted by “DanKing,” alt.autos.porsche, October 1998)

I still hold out a shred of hope that Porsche will have second thoughts and at least not market a version as a Porsche. What a gaffe! What a blunder! (posted by “S T Jones,” alt.autos.porsche, November 1998)

Here, risk seems to be invoked mainly to vent annoyance. Complaining can serve an intrapsychic function of catharsis, ex-

pressing frustration and reducing negative emotions (Kowalski 1996). When a new initiative threatens to upset the existing brand order, people are troubled and risk could provide a tool for getting things off one’s chest. This suggests that risk can be helpful in making sense of the unfamiliar. Risk is a label often assigned to phenomena that violate norms or expectations (Douglas 1966) and it has been described as “the cultural response to transgression: the outcome of breaking a taboo, crossing a boundary, committing a sin” (Lupton 1999, 45). Consumers may also use risk discourses for self-exploration: to try out perspectives, prepare for the future, and dampen potential realization of loss. Social comparison is a related function, as complaints prompt information about what other people think and feel (Kowalski 1996). By using risk to discuss and give meaning to threatening events, people may regain a sense of control and deal with negative feelings (Lupton 1999).

Using risk as a rhetorical resource

Another emergent use of risk is as a key argument in consumer-to-consumer recommendations and viewpoints. It provides a rationalized vocabulary, which can impress and persuade. Consider the quote below, leveraging risk to argue in favor of the Cayenne:

I don’t disagree with you, but Porsche is getting more and more obscure in the upper echelons of racing. MB and BMW are fielding very serious cars (as is Audi) because they have the capital to play in that arena. If BMW irons out its “8 problems” it might very well give Porsche everything it can handle in its own back yard. Porsche needs more cashflow to sustain its racing heritage. If the Beemers begin beating Porsche with consistency, it will hurt Porsche sales in the long run, making it more and more difficult to stay at the top. (posted by “Mike,” alt.autos.porsche, July 2001)

This kind of risk-fuelled word of mouth may be driven by conviction, when consumers feel obliged to persuade others that their view of the brand future is right. The quote also illustrates how some commentators, although a minority, draw attention to risks that the company might weaken without new initiatives. Regardless of viewpoint, risk can provide an opportunity for self-presentation, conveying impressions of desired attributes on an audience (Kowalski 1996). By discussing risks, consumers can appear faithful to “original” brand values, or just display expertise:

“SUV’s” are the single most profitable vehicle on the market today... or were. The day of the SUV is starting to drift into oblivion... cross-wagons are the new suburban rage. Therefore, Porsche/VW better get their SUV versions to market soon and they better be something extra special, because everybody and their brother already has one. The tide is beginning to shift. (posted by “Mike,” alt.autos.porsche, July 2001)

DISCUSSION

This study is exploratory in nature, with the aim to stimulate interest and provoke thought, primarily on brand change and secondarily on the role of risk in consumer research. A specific limitation to acknowledge is that the data originates from a brand that has a more devoted following than the average brand. It should also be noted that the study deals with a brand initiative that is planned and pre-announced, so that consumer comments are based on anticipation rather than actual outcomes. Nonetheless, the study demonstrates the value in expanding the traditional view of risk in consumer research to inform our understanding of brands.

In sum, the consumer data presented makes risk a visible element in responses to brand change. A basic belief in consumer culture theory (Arnould and Thompson 2005), is that research should cover more behaviors than choice and purchases. To this end, the present study adds to current initiatives to broaden consumer research on risk (Thompson 2005). The study also calls for recognition that risk can take on shapes different from the ones prevalent in existing research. Such new shapes were discussed under two major headings: Brand risk (with sub-headings of Initiative risk, Image risk, and Integrity risk) and Relationship risk. The traditional view holds that consumers often attempt to reduce perceived risk in a purchase by being loyal to a brand (Roselius 1971). The present study suggests that such loyalty, while reducing some risks, may in fact bring on new facets of risk. Finally, the findings reflect the role of risk as an organizing construct in sensemaking and debate. Overall, the study contributes to an emerging body of knowledge on the complications of strong consumer-brand linkages (e.g., Aaker et al. 2004; Thompson et al. 2006), by examining how such bonds can create resistance to brand change and by positioning risk as a pivotal concern to brand enthusiasts.

Taking a step back, one might ask whether comments can express risk even in cases when their explicit content primarily deals with negative consequences for the brand rather than direct effects for the commentators. The question is justified as most consumer research on risk is focused on consumers who experience risk because they themselves face unfavorable consequences. On the other hand, some previous research implies that consumers can indeed experience risk also when the unfavorable consequences pertain to other people and entities, such as the environment (Ekström and Askegaard 2000), a member of the family (Stone and Grønhaug 1993), or other people who are important to the person (Frewer, Scholderer, and Bredahl 2003). Like empathy responses, such vicarious experiences indicate that enthusiasts actually could take on expectations of loss for a brand as their own (cf., Escalas and Stern 2003). Risks pertaining to brands may be relevant to enthusiasts in a similar way that risks pertaining to sports teams are relevant to dedicated fans, or even how risks pertaining to children are relevant to their parents, to extend the metaphor of a brand as a relationship partner (Fournier 1998). The more consumers identify with a brand, the more they might be expected to experience risks in a personal manner. Conversely, low personal stakes could facilitate meaningful distinctions between risks facing consumers themselves and risks facing the brands. Such distinctions are difficult to make within the scope of the present study, with the data it draws on, but could perhaps be explored in future research.

Recognizing how risk perceptions can imbue consumer responses to controversial brand initiatives has practical and theoretical implications relating to brand meaning management. For instance, the risk perspective highlights why brand change so easily meets with protests: People judge risks of action worse than risks of non-action, due to an "omission bias" (Baron 2004). Even if consumers judge the fit between a brand and a new initiative as acceptable, other factors could contribute to feelings of risk. Such factors could be the scale of the new initiative (e.g., the size of investment relative to the current business), decision irreversibility, salience of similar initiatives that have failed, or alignment with moral values. The outcome of a change initiative is thus dependent on how perceptions of Brand risk and Relationship risk are managed, primarily through communication.

One might argue that general consumer audiences have other things on their minds than risk factors and that marketers may be wise not to draw attention to them. However, marketers are not in

full control of risk perceptions. The study findings clearly show how brand enthusiasts themselves generate and circulate risk-imbued accounts of brand change. The significance of risk is problematic for managers who are looking to secure support and advocacy from a loyal core of consumers. Brand enthusiasts might easily identify risks as the ones discussed in this paper, whereas they see direct benefits accrue to others, such as shareholders and new consumer segments. Researchers have repeatedly shown that marketers do not have a monopoly on the making of the symbolic meanings of brands. Consumers are highly involved in the exploration and co-creation of brand meanings (e.g., Arnould and Thompson 2005; Brown et al. 2003). The opinions about Porsche Cayenne illustrate how consumers can use highly rationalized arguments, cast in a language often associated with business management, in the construction of a brand story. Thus, it becomes even clearer how consumers can take on roles as "unofficial officials", as they assume not only a task (in terms of creating brand meaning), but also a rhetoric (in terms of a risk vocabulary), traditionally assigned to company managers. The findings thus contribute to the literature on brand meaning management by showing how risk is mobilized as a resource in an argument over values (cf. Thompson 2005). Designating the Cayenne as a risk allows "genuine" Porsche ideals and idealists to be valorized. Heritage is respected and celebrated by assigning blame to an allegedly unwise or greedy management. If engaged consumers feel disfranchised in relation to corporate power in general and the particular company management in particular, they may at least restore some pride by challenging current practices. Disputing the wisdom of a decision may then be a more potent approach than only invoking feelings about what the brand is about. Where personal beliefs appear subjective, irrational, and unconvincing, risk appears objective, rational, and compelling.

The practical influence of vocal consumers can be considerable, as word of mouth diffuses to a wider audience. Managers would be wise to consider the arousing property of risk and to seek out and diagnose brand enthusiast beliefs in internet discussions or other community fora. If risky initiatives stir brand enthusiasts to widespread expressions of their concerns, this might set off a downward spiral for the brand. Even if "pessimists" are few, their influence might be considerable if risk-imbued opinions are transmitted through the media and internet to more mainstream consumers (cf. Thompson et al. 2006). However, addressing risk perceptions head on is probably tricky. Refutations of unfavorable consumer claims have been found to easily backfire and increase the salience of the claims (e.g., Skurnik et al. 2005). Ignoring risk perceptions might be an effective strategy for broad marketing communications, but are there better options when dealing with brand enthusiasts? Inviting citizens to participate in dialog before decisions has been a strategy widely discussed in the risk literature (cf., Arvai 2003; Tuler 2000). Can risk be neutralized or even presented as a strength rather than a weakness, perhaps by exploiting the potential for pleasure and progress in risk-taking (cf. Arnould and Price 1993; Celsi et al 1993; Lupton 1999)? Future investigations should examine the consequences of different communication strategies for risk perceptions relating to brands.

Risk is a perennial construct in the social sciences. Accordingly, it is multifaceted and definitions are manifold (cf. Conchar et al. 2004; Lupton 1999; Mitchell 1999). This study used a broad definition, which admittedly leaves open the possibility of overlaps between risk and other constructs in consumer research. Efforts to systematically juxtapose them and probe the boundaries might generate additional insight into the significance of risk for an expanded range of consumer behaviors.

The Moderating Effect of Brand Commitment on Consumer Response to Logo Shape Redesign

Michael F. Walsh, West Virginia University, USA
Vikas Mittal, University of Pittsburgh, USA
Karen L. Page, University of Pittsburgh, USA

EXTENDED ABSTRACT

In a given year, one in 50 companies will change its name and logo for a variety of reasons (Speath 1990). Logos may need to be changed due to changes in the company name, adoption of new strategies, reorganizations or novelty. Not all logo changes are embraced by a brand's customers. In 2003, Apple Computer announced a change to their logo from a monochromatically red color to a brushed silver hue. Within hours of Apple's announcement, there were over 200 signatures on an online petition demanding a return to the old logo treatment (Kahney 2003). On the other hand, Pepsi's 1991 logo change was accepted by consumers with little resistance. These examples of logo change beg the obvious question, why are some logo changes met with consumer resistance and others are not?

Our research explores this issue, specifically consumer response to one aspect of logo redesign: shape. Past logo research has developed a typology of logo elements and examined how some of these elements (such as color) affect underlying brand attitudes. However, consumer brand attitude in response to logo redesign has not been addressed by researchers (Henderson and Cote 1998, Gorn, Chattopadhyay, Yi and Dahl 1997 and Tavassoli 2001).

Brand commitment has been shown to play a critical role in determining resistance to various actions such as brand transgressions and outside attacks on the brand. The more committed an individual is toward a brand, the more likely they will resist information that attacks that brand (Ahluwalia, Unnava, and Burnkrant 2000). When faced with negative information regarding a brand, consumers committed to the brand counter-argued negative information about the brand (Ahluwalia, Unnava, and Burnkrant 2000). Consumers who counterargue negative information are defense motivated (Ratneshwar and Chaiken 1991), defined as the use of heuristics to protect vested interests, attitudinal commitments, or other preferences (Koslow 2002). Thus a strongly committed consumer of a brand, because of defense motivation, is more likely to resist information that attacks or undermines the meaning of the brand. This counter argumentation occurs to protect one's brand, which defines their self-image. What occurs when committed consumers are faced with a change to a core element of their self-defining brand's meaning—brand logo (Bennett 1995)? Changes to a logo have the potential of changing the meaning of the brand to a consumer, which may impact the consumer's self-image.

We posit that reaction to change in logo shape is a function of the degree of change (from incremental to considerable) and the level of commitment (from strong to weak) a consumer has towards the underlying brand. Two experimental studies featured modified brand logos and measured consumer response to the redesign and consumer commitment to the underlying brand. Study one used athletic shoes as stimuli and study two featured brands of bottled water. The second study was designed to extend generalizability by replicating the effects in study one for brands from another product category. Study two also considered a number of potential covariates and tested a mediation hypothesis (defined and discussed as part of study two).

In these studies, we find that consumers who are strongly committed to a brand have a more negative attitude toward the brand (as logo redesign increases) whereas consumers less committed to a brand will have a more positive attitude toward the brand.

Additionally, in Study 2 we find that logo evaluation mediates the moderating effect of brand commitment on brand attitude.

We believe this research makes several contributions to brand commitment and brand management literature as well as to the practices of brand managers. First, brand commitment has been found to have several positive benefits to brands, such as counter arguing negative information (Ahluwalia, Unnava, and Burnkrant 2000) or minimizing brand dilution (Ahluwalia, Unnava, and Burnkrant 2001). However, this research indicates that changes to logo design can result in a more negative brand attitude for strongly committed consumers than for weakly committed consumers. Second, this research indicates that logo redesign can significantly impact brand attitude even when there are only incremental changes to logo shape. Therefore, brand management research should give more attention to the effects of changes in brand logos on brand attitude and evaluation and those factors that influence the reaction to these brand dimensions. Third, these findings have substantial implications for brand managers. Specifically, brand managers should recognize that their loyal customers may have the strongest reaction to changes in brand logo redesign, and it is not a positive response. To avoid alienating committed customers brand managers should consider the response of their customers, both strongly and weakly committed, prior to making such changes.

The Effects of Perceived Congruity Between Origin, Brand and Product on the Purchase Intention of a Branded Product of Origin

Philippe Aurier, Montpellier University, France
Fatiha Fort, ENSA Montpellier-MOISA Research Unit, France

ABSTRACT

Attitude toward geographical origin is considered an influential factor of individual evaluations in the COO literature. However, a model controlling for the effects of attitude toward the product category, the brand, the geographical origin and the corresponding perceived congruity factors (product category x origin, brand x origin, product category x brand), demonstrates no effect of origin attitude on the purchase intention of a branded product of origin. In the case of congruity between brand, origin and the product category, a dominant effect of brand attitude is observed. This effect decreases in the case of incongruity, and perceived congruity factors are then included in the evaluation, alongside brand attitude. Our empirical application is replicated over two food product categories.

INTRODUCTION

Because of competition between international firms on the global market, many firms seek to reduce cost production by a relocation of their manufactures in less developed countries and by an enlargement of their procurement sources. However, in sectors like food, geographical origin is becoming a key factor in consumer purchase because of many crises shook, reinforced by regulation of Geographical Indication and TRIPS Agreement.¹ Academic research on Country of Origin (COO) effects on consumers' evaluation and behavior has increased steadily over the last two decades and, at the same time, reference to geographical origin has been used as a factor of differentiation and added value by a growing number of food manufacturers (national and regional brands) and retailers (private brands). Marketing literature has shown that geographical origin (GO) effects² can rival the effects of price, brand equity and product attributes because it enhances attribute perception, perceived quality and it is supposed to transfer the image of and attitude toward the region to the promoted branded products (Han 1989; Maheswaran 1994; Gürhan-Canli and Maheswaran 2000).

An interesting result emerging from this area of research concerns the role of the perceived congruity between the branded product and its geographical origin (Maheswaran 1994; Gürhan-Canli and Maheswaran 2000; Häubl and Elrod 1999). Perceived congruity has been demonstrated to have a positive impact on consumer evaluation, and the extent of this effect might be greater than the effects of brand or origin. The element of prime importance in GO management could, then, be the perceived congruity between branded product x origin rather than the GO itself. For instance, a positive attitude toward a Swiss raclette cheese could be due less to the attitude toward the raclette cheese or toward its Swiss origin than to an interaction between Switzerland and raclette cheese, expressed through perceived congruity.

However, theoretical and methodological variations make any comparison of these effects difficult. Firstly, the concept of product (or brand) x origin congruity has been diversely considered, thereby making comparisons difficult. Sometimes it is implicitly considered, through a simple statistical interaction term between a product (or brand) indicator and an origin indicator (Han and Terpstra 1988; Cordell 1992), with the limitation that the theoretical content of this interaction term remains unclear, specifically in the perspective of information processing by consumers. In other research, this interaction is explicitly considered in terms of congruity, but diversely conceptualized and measured. For instance, in Häubl and Elrod (1999), brand x origin congruity is an objective binary indicator corresponding to the fact that the product was manufactured (or not) in the country of the brand. Secondly, experimental designs are implemented using, alternatively, products (Roth and Romeo 1992), brands (Jo, Nakamoto, and Nelson 2003) or branded products (Ettenson 1993; Cordell 1992; Häubl and Elrod 1999) as the unit of evaluation by individuals. We might then suspect that, depending on the design of the research, confounds effects may exist between what is due to the brand, to the product, to the origin and to the corresponding congruity terms. For instance, in a model explaining the purchase intention for Swiss Valdor raclette cheese, it is possible, without an effective control for the brand effect, to attribute (at least partially) to the attitude toward Switzerland what is actually due to the Valdor brand or to the perceived congruity between Switzerland and Valdor. It is also possible, without an effective control for the product category, to attribute to the Valdor brand what is actually due to the "raclette cheese" product category, or to a perceived congruity between "raclette cheese" and Valdor. Thirdly, most research on geographical origin uses statistical methods (Anova, Multiple regression, Conjoint analysis, Logit; Johansson, Douglas, and Nonaka 1985; Han and Terpstra 1988; Maheswaran 1994; Okechuku 1994; Häubl and Elrod 1999; Gürhan-Canli and Maheswaran 2000), which do not allow to control for measurement error and its negative impacts on the estimation of coefficients and hypothesis testing, as underlined by Steenkamp and Baumgartner (2000).

In this perspective, we propose to analyze and compare the effects of attitude toward the product category, the brand, the geographical origin and the corresponding perceived congruity factors (product category x origin, brand x origin, product category x brand) on the evaluation (intention to purchase) of a branded product of origin, *i.e.* an alternative defined using three pieces of information: the product category, the brand and the geographical origin. Measurement error will be taken into account by means of a multi-item measurement process and structural equation modeling. Our empirical application involves two experiments in the domain of food consumption in France, identically replicated in the Tomme cheese and the Cassoulet canned meat product categories. Varying the origin, we manipulated both the perceived congruity between origin and product category (logical/illogical) and the perceived congruity between brand and product category (logical/illogical). Due to practical constraints, brand x origin perceived congruity was not manipulated (once origin x product and brand x product congruity is manipulated, there is no degree of freedom to manipulate brand x origin perceived congruity), but only controlled for.

¹Trade-Related Aspects of Intellectual Property Rights: a specific section of the WTO Agreement of 1994, addressing intellectual property.

²This general term covers "country", but also "region", or even more specialized areas of production, like the French concept of "terroir".

THEORETICAL BACKGROUNDS

Several meta-analyses have attempted to synthesize the COO findings (Bilkey and Nes 1982; Peterson and Jolibert 1995; Samiee 1994; Verlegh and Steenkamp 1999) and show that, despite considerable research in the field, the origin effect is still not very well understood. There are divergences relating to the magnitude of this effect (Verlegh and Steenkamp 1999); the nature of its influence (Chao 1993; Hong and Wyer 1998; Obermiller and Spangenberg 1989); the strength of the origin effect on brand, price and other extrinsic and intrinsic attributes (Ahmed and d'Astou 1993; Johansson et al. 1985, Okechuku 1994); and the dependant variables affected by origin (perceived quality, attitude and intention to purchase).

The COO literature is also characterized by results contingent to the product category (Ahmed and d'Astou 1993; Han 1989; Kaynak and Cavusgil 1983; Roth and Romeo 1992) and to the consumers, due to ethnocentrism and stereotype effects (Agrawal and Kamakura 1999; Cordell 1992; Erickson, Johansson, and Chao 1984; Maheswaran 1994; Samiee 1994).

With the rise of global manufacturing strategies, the COO literature has focused on the effects of the brand name x origin interactions, and various effects have been characterized including the "conjoint effect" (Ahmed and d'Astou 1993; Cordell 1992; Han and Terpstra 1988; Kaynak and Cavusgil 1983; Okechuku 1994), the "shielding effect" (Jo et al. 2003; Johansson and Nebenzahl 1986; Nebenzahl and Jaffe 1996) and the "congruity effect" (Häubl and Elrod 1999). The concept of perceived congruity is based on the cognitive consistency theory that suggests a link between consumers' attitudes and the consistency between objects, persons, brands and individual beliefs (Sirgy 1982). Cognitive psychology considers that information about objects is stored in cognitive categories and that consumers' evaluations depend on the effect associated with the category to which the object belongs (Medin and Smith 1984; Mervis and Rosh 1981). This assimilation process depends on the product category schema congruity (Sujan and Bettman 1989). Roth and Romeo (1992) showed that the perceived match between the product and the geographical origin plays an important role in purchasing behavior. If brands and product categories are conceptualized as cognitive categories in the consumer's memory (Broniarczyk and Alba 1994), the perceived similarity or congruity (also called "perceived fit") facilitates both the categorization process and the transfer of attitudes from these cognitive categories to the branded product. The role of the perceived fit in the success of brand extension has been underlined in a number of studies (Aaker and Keller 1990; Broniarczyk and Alba 1994).

RESEARCH HYPOTHESES

Combining findings from COO and brand extension literature, we can propose that the evaluation of a branded product of origin is influenced by product category, geographical origin and brand attitudes, as well as by the perceived congruity terms between product category, origin and brand.

Effects of Attitude Toward Product, Brand and Origin

Figure 1 shows that brand, product and origin attitudes have positive effects on the evaluation of a branded product of origin. Purchase intention was chosen in this research as a good synthesis of individuals' evaluations and also because it represents a good proxy for consumer behavior (Chandon, Morwitz, and Reinartz 2005). As such, it is frequently used in COO and brand research (Roth and Romeo 1992; Czellar 2003). We propose, then, the three following hypotheses (Figure 1):

H1a: Attitude toward the product has a direct positive influence on the purchase intention for the branded product of origin.

H1b: Attitude toward the brand has a direct positive influence on the purchase intention for the branded product of origin.

H1c: Attitude toward the origin has a direct positive influence on the purchase intention for the branded product of origin.

Effects of Perceived Congruity Between Product, Brand and Origin

Figure 1 shows that three congruity factors can influence the evaluation of a branded product of origin. The first, perceived congruity of origin x product category (H2a hypothesis), has traditionally been examined in the COO literature where authors have studied the impact of origin in conjunction with product categories, but without controlling for the brand. For instance, Han (1989) has studied the impact of Korea and USA national images in the car and TV categories. Maheswaran (1994), controlling for consumer expertise, has studied the impact of COO in the micro-computer (Germany vs. Thailand) and stereo system (Japan vs. South Korea) categories. We propose then:

H2a: The perceived congruity between origin and product category has a direct positive impact on the purchase intention for the branded product of origin.

The second, perceived congruity of origin x brand (H2b hypothesis) has also been examined in the COO literature, but without controlling for the product category (Keller 1993; Leclerc, Schmitt and Dubé 1994; Häubl and Elrod 1999). For instance, Häubl and Elrod studied the impact of the congruity between the brand name (4 brands) and the country of production (France, Germany, Slovenia) in the alpine skiing category. We propose then:

H2b: The perceived congruity between origin and brand has a direct positive impact on the purchase intention for the branded product of origin.

The third, perceived congruity of product category x brand (H2c hypothesis) has been extensively studied in the brand extension literature, but has not been included in the COO literature, at least as a controlled factor. This form of congruity, the so-called "perceived fit" between the original brand and the extension category, has proved to be a central factor in explaining the success of brand extensions (Aaker and Keller 1990; Czellar 2003). We propose then:

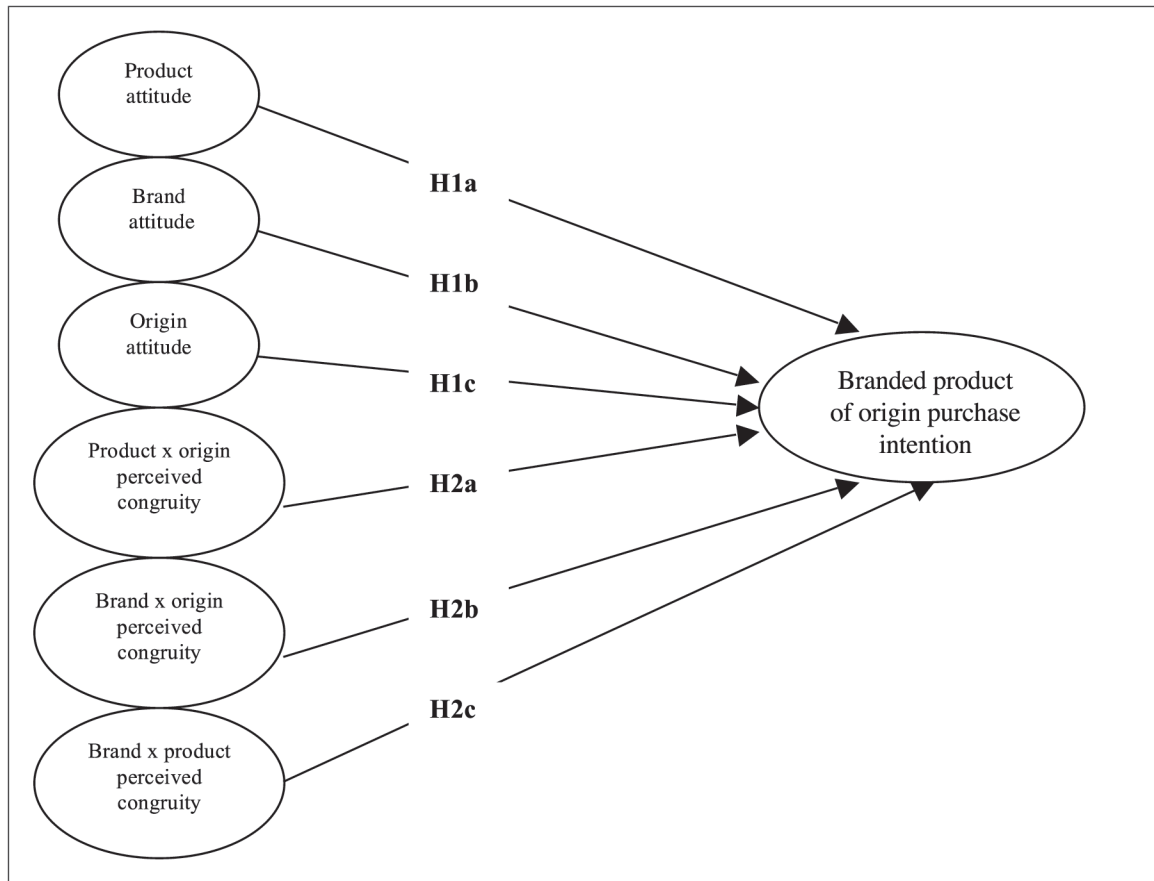

H2c: The perceived congruity between brand and product category has a direct positive impact on the purchase intention for the branded product of origin.

METHODOLOGY

Our experiment is applied to food consumption, a domain where product categories, brands and geographical origins play important roles in the strategy of firms. Consequently, individuals are used to evaluate alternatives representing combinations of these three components, thereby conferring a reasonable degree of realism on the task of the participants.

Because we studied French food products in France, geographical origin was studied at the regional level, as suggested by

FIGURE 1
Conceptual Model and Research Hypothesis

Van Ittersum, Candel and Meulenberg (2003). Although origin is generally understood at the national level in the COO literature (Japan, United States, ...), the cognitive category used by consumers to deal with origin can sometimes be more specific: a region or even a smaller area of "terroir", depending on the product category being evaluated (Askegaard and Ger, 1998). This is typically the case in the food and beverage sectors, where the evaluation can be enhanced or discounted as a function of the region of origin. Although the French region of Savoie (eastern-France) has a positive impact on the evaluation of "Gruyere" or "Tomme" cheese categories, it can also demonstrate a null or even a negative impact on the category of "rosé" wines. Moreover, in a number of product categories, there are sometimes greater differences between regions in the same country than between regions in different countries. In the "Tomme" cheese category, there is a greater degree of similarity between Romandie (western Switzerland) and Savoie (eastern France) than between Savoie and the Pyrennées (south-west France), even though these three mountainous regions all manufacture "Tomme cheese".

Construct Measurement

The variable used to explain the purchase intention of a branded product of origin was measured on a five-point Likert scale as the likelihood of purchasing the branded product of origin on the next shopping trip (Punj and Hillyer 2004; "If I need xxx, I will probably buy xxx"; "The next time I will need xxx, I will certainly buy xxx").

To make measurement scale effects as constant as possible when testing hypotheses H1a, H1b, H1c and to make comparisons

easier, attitudes toward brand, product category and geographical origin were all measured using the same Broniarczyk and Alba (1994) 3-item scale ("I like", "I appreciate", "I'm favorable", on a 5-point Likert scale). For the same reasons, when testing hypotheses H2a, H2b, H2c hypotheses, perceived congruity (product x origin, brand x origin, product x brand) was measured using the same Aaker and Keller (1990) 3-item scale ("logical \leftrightarrow illogical", "natural \leftrightarrow not natural", "coherent \leftrightarrow not coherent", on a 5-point differential semantic). Involvement and subjective expertise were also measured, to be used as controlled factors (Zachkowsky, 1985).

The form started with judgment toward the category (involvement, expertise), then we successively measured product, geographical origin and brand attitudes, then perceived congruities and finally purchase intentions.

Selection of Product Categories, Origins and Brands

We implemented the same experiment across two food sectors, cheese and canned meat, which were selected as moderate vs. low involvement food categories on the basis of a pilot study carried out on a convenient sample of 193 French consumers. To make the evaluation more specific and concrete, we selected the product variety "Tomme"³ in the cheese sector and the product variety "Cassoulet"⁴ in the canned meat sector.

³Tomme is a variety of cheese manufactured in mountainous areas.

⁴Cassoulet is a typical meal composed of a meat and bean stew, sausage, duck cutlets and conserve of duck, produced in the region of Toulouse (south-west France).

TABLE 1
Psychometric properties (CFA*)

	Composite reliability	Shared variance	Root shared variance
Intention to purchase	0.91	0.84	0.92
Attitude toward the product	0.94	0.84	0.92
Attitude toward the brand	0.93	0.81	0.90
Attitude toward the origin	0.93	0.81	0.90
Origin x product category perceived congruity	0.94	0.84	0.92
Brand x origin perceived congruity	0.96	0.89	0.94
Brand x product category perceived congruity	0.96	0.88	0.94
Product category involvement	0.92	0.79	0.89
Product category subjective expertise	0.90	0.75	0.86

* Indicators are those obtained in the worst estimation condition (experimental cell), with a RMSEA of 0.049

To manipulate the perceived congruity of geographical origin x product category (logical vs. illogical), two geographical origins were selected in each product category: “Savoie” (logical) and “Alsace” (illogical) for the Tomme cheese category; “Toulouse” (logical) and “Auvergne” (illogical) for the Cassoulet canned meat category.

In order to manipulate the brand x product category perceived congruity (logical vs. illogical), we had to select well-known, familiar and realistic choice alternatives. For each product category, a list of 20 national brands was presented to three agro-food experts who had to class them as congruent or not congruent with the category, or possibly “unknown”. On this basis, we selected the brands “Riches Monts” and “Bridel” in the Tomme product category and the brands “William Saurin” and “Fleury Michon” in the Cassoulet product category as logical vs. illogical respectively. As these national brands are not specifically associated with one of the selected origins, we maintain the independence of the origin and the brand factors, and this is also the reason why it was not possible to manipulate the brand x origin perceived congruity.

Experimental Design and Sample

Our experimental design, in each product category, is a 2 x 2 intra-subject full orthogonal design, where each participant had to evaluate 4 branded products of origin (one per experimental condition), for instance a Tomme cheese manufactured in Savoie (logical origin) by the brand Riches Monts (logical brand). This design was identically replicated over the two product categories, on similar samples comprising 360 individuals each. Working on two product categories was also a means of controlling, a posteriori, the average level of involvement, which is higher in France for cheese than for canned meat. To diversify the two samples (Tomme/Cassoulet), the forms were managed identically across three geographically-contrasting areas in France (North, Paris, South) because food and origin perception could vary as a function of this factor. For each

stratum (a product category x geographic area of interview), the same quotas were imposed on age and gender. Forms were managed face to face using the data collector methodology (Bitner, Booms, and Tetreault 1990; Gwinner, Bremler, and Bitner 1998).

Construct Validity

For simplicity, measurement quality is presented after having pooled the two product categories ($n=720$) successively for each of the 8 experimental conditions. All scales demonstrate satisfying reliability: all Cronbach coefficients are greater than 0.8 and no item had to be deleted. Trait validity was established on the basis of EFA and then CFA, for each construct taken in isolation, then two by two, three by three and finally for all constructs taken together (Anderson, Gerbing, and Hunter 1987). CFA estimations were performed under Lisrel, using the maximum likelihood procedure because of its robustness for large sample sizes. The goodness-of-fit indices are satisfactory: RMSEA vary between 0.038 and 0.049 (associated π values are all greater than 0.76), AGFI vary between 0.91 and 0.93, SRMR between 0.025 and 0.028, NFI between 0.96 and 0.97 and CFI between 0.98 and 0.99.

All constructs exhibit a good degree of convergent validity: standardized factor loadings are highly significant, reliability coefficients range between 0.90 and 0.96, mean variance indicators (Fornell & Larker, 1981) are greater than 0.75, which can be considered as a satisfying result (Table 1). Finally, root mean variance indicators are all greater than their corresponding inter-construct correlations, demonstrating a satisfying degree of discriminant validity.

Manipulation Checks

Table 2 shows that involvement is greater for Tomme cheese than for Cassoulet canned meat ($p<0.0001$): on average Tomme appears to be a category with moderate involvement (3.3/5), and Cassoulet a category demonstrating low involvement (2.2/5). In

TABLE 2

Product x origin perceived congruity	4.6	2.5	4.4	2.4
Experimental condition \mathbb{L}	Logical brand “ Riches Monts”	Illogical brand “ Bridel”	Logical brand “ William Saurin”	Illogical brand “ Fleury Michon”
Brand x product perceived congruity	3.9	3.3	4.2	3.5

* Construct scores equal the means (/5) of their items

both categories, the average perceived congruity between origin and product category decreases in the product x origin illogical condition ($p < 0.0001$). Similarly, perceived congruity between brand and product category decreases in the brand x product illogical condition ($p < 0.0001$). We can conclude, then, that our manipulations were effective. Moreover, in the two product categories, the two brands (logical/illogical), but also the two origins (logical/illogical) obtained similar levels of attitudes (no statistical differences).

RESULTS AND DISCUSSION

Structural Model Estimation and Hypotheses Testing

In order to validate our hypotheses, we tested the structural model representing the whole set of hypotheses developed in the theoretical section (Figure 1). This model explains the purchase intention of the branded product of origin, as a function of product category, brand and origin attitudes as well as the three perceived congruity factors (product x origin, brand x origin, product x brand). Age, gender, subjective expertise and involvement were also initially included in the model to control for their effects on purchase intention, but were later abandoned because they were not statistically significant. The model was successively estimated in the 2 x 4=8 experimental conditions (1 to 4 in the Tomme cheese category and 1' to 4' in the Cassoulet-Canned meat category; Table 3), using here the bootstrap estimation procedure (200 replications; $n=360$). On the basis of indicators of fit, the hypothesized model fits the data reasonably well, in all conditions (Appendix 1). Research hypotheses were then tested on the basis of the standardized direct coefficients (Table 3).

Attitude toward the product and attitude toward the origin have no significant direct effect on the purchase intention of a branded product of origin, in any of the 8 experimental conditions: H1a and H1c hypotheses must, then, be rejected.

Conversely, there is a significant (moderate to strong) effect of attitude toward the brand in all experimental conditions, meaning that H1b is strongly validated. In both product categories, this effect is greater when the brand is logical vs. illogical and/or when the origin is logical vs. illogical. Then, it is in the case of complete congruity (conditions 1 and 1') that attitude toward the brand has its strongest effect. In these two conditions, it is the sole factor influencing purchase intention of the branded product of origin and

the corresponding R^2 for purchase intention is at its maximum. Moreover, for every experimental condition, the impact of brand attitude is higher in the low involvement category (Cassoulet canned meat) than in the moderate involvement category (Tomme cheese), a result coherent with the literature on involvement (Petty, Unnava, and Strathman 1991).

In both categories, the effect of origin x product category perceived congruity is significant only in the origin x product category illogical conditions. H2a hypothesis is only validated in the 3, 4 and 3', 4' conditions: when individuals have doubts about the origin x product congruity, they include this factor in their global evaluation.

In the moderate involvement category (Tomme cheese), brand x origin perceived congruity has a significant impact only when the origin is not logical with respect to the product category (conditions 3 and 4), where H2b is validated. In the low involvement category (Cassoulet canned meat), this effect is significant only when the brand is not logical with respect to the product category (conditions 2 and 4) where H2b is validated.

In the moderate involvement category, the effect of brand x product perceived congruity (the so-called “fit” in the brand extension literature) is significant only in the case of the illogical brand x product condition (conditions 2 and 4), where H2c is validated. This result conforms to the brand extension literature where, typically, a brand is extended to a new product category and individuals, having doubts about brand x product congruity, include the perceived brand x product congruity (the perceived fit) in their global evaluation. The same result is observed in the low involvement category, but limited to the logical origin (condition 2'), where H2c is validated.

Discussion

Over the 8 experimental conditions, brand attitude demonstrates an important and systematic effect on purchase intention. This impact increases in the low involvement category and when the experimental conditions are “logical”, and we can conclude that brand attitude plays a “default” role. When the brand and origin are perceived as congruent with the product category (conditions 1, 1'), brand attitude is the unique factor influencing the purchase intention in our model. In the case of low involvement, the explained variance reaches 64 %, which is the maximum over all experimental conditions.

R ² (purchase int. , %)	33	31	21	24	43	33	32	24
Only significant coefficients are presented (at the 1% risk level).								

At the same time, attitudes toward the product or toward the origin have no impact at all. This result contradicts the COO marketing literature, which observes significant effects (Erickson, Jacobson, and Johansson 1992; Ettenson 1993; Tse and Gorn 1993). It can, however, be explained by the fact that, contrary to previous research, we controlled for brand, product and origin attitudes and also for the three perceived congruity factors with, as a consequence, limited possibilities to confound the effect of attitude toward the origin with those due to product or brand attitude, or to the origin x brand or the origin x product perceived congruity. The “direct” effect of origin attitude is then mechanically discounted. Peterson and Jolibert (1995), in their meta-analysis have also underlined the weakness of COO effects, at least partially attributed to method effects. This result is also coherent with Han and Terpstra (1988) who suggest that strong brands are less sensitive to COO effects.

As suggested by Thakor and Kohli (1996), we can also demonstrate that geographic origin has a greater potential impact through its perceived congruity with the brand or product category, than directly as a potential source of positive attitude, as proposed in earlier research on COO effects. However, these effects seem to work only in cases where individuals have doubts about the brand x origin or the product category x origin perceived congruity. The

more the object under evaluation is a combination of congruent pieces of information concerning the product, brand and origin, the simpler the evaluation process (conditions 1, 1’), centered solely on the attitude toward brand. These results are coherent with Lee (1995), Chakravarti and Janiszewski (2003) who observed that, confronted by a new and dissonant alternative, individuals focus on the most salient attribute, the perceived congruity in our experiment. Moreover, we observe that the impact of perceived congruity increases in the case of a moderate involvement product category compared to a low involvement category. For the low involvement condition, the evaluation process is always dominated by brand attitude, whereas for the moderate involvement condition, this role can become minor compared to perceived congruity, in the case of illogical conditions (typically the # 3 and 4 conditions).

CONCLUSION

Although the brand literature has concentrated on the brand x product fit, we must conclude after this empirical study that a new line of research could focus more deeply on the perceived congruity between brand (or product category) and Geographic Origin.

However, our empirical investigation is limited to the food product area, and new systematic comparisons should be implemented in other sectors such as fashion, sport items, cars, electron-

ics. Moreover, product category x GO congruity was a manipulated factor and it is possible that participants perceived the main intentions of the experiment, stimulating and overestimating the impact of product category x GO congruity.

Our empirical results help us to refine the use of GO in the management of a branded product with, of course, the limitations of the food product category. First of all, although GO represents a great potential in branded product evaluation, this is through its potential interactions with the brand (and product category) rather than in its own right. Then, referring to the attitude toward a well-evaluated GO is not sufficient to increase the branded product evaluation. It is the brand x origin perceived congruity that makes the effect positive in the evaluation and this congruity effect can be more important than the effect of the brand attitude itself. This result can still be reinforced by the moderating role of product x origin perceived congruity in the evaluation process. When it is low, the effect of attitude toward the brand decreases and brand x origin plays a genuinely dominant role in the evaluation of the branded product.

Therefore, our results open the door for strategies specifically designed for small or medium-sized firms, which do not have the financial means to develop a strong positive brand attitude. If geographical origin involves collective image and attitude strategies, our results show that these firms have interest to manage carefully their own brand x origin perceived congruity. We can also underline that strong international brands can bear on their attitude as a main factor of evaluation, but at the same time must pay attention to be perceived as congruent as possible with the product category and its associate geographical origin, if any. The lack of congruity can involve a risk that consumers use perceived congruity as a factor of evaluation, at the benefit of a local brand having a greater brand x origin perceived congruity.

Self-Brand Connections and Brand Resonance: The Role of Gender and Consumer Emotions

David Moore, University of Michigan, USA
Dayna Wurster, University of Michigan, USA

EXTENDED ABSTRACT

The fundamental premise of the Self-Brand Connections (SBC) construct is that when brand associations are used to construct one's self or to communicate one's self to others, a strong connection is formed between the brand and the consumer's self identity (Escalas, 2004). In a similar manner, brand resonance suggests a profound consumer brand relationship that is based on loyalty, attachment, and an enduring sense of communal kinship or affiliation. This relationship is so strong that members of that brand community are willing to make investments of their personal resources to remain connected to the brand (Keller 2001).

First, it is predicted that brand resonance should be significantly related to Self-Brand Connections and that respondents should respond in a similar manner to both constructs. Second, as a test of the SBC construct, it is expected that consumer fans who identify with a specific in-group organization (the home team) will report significantly higher SBCs and stronger brand resonance scores than those who support the out-group or rival team. Third, no gender differences are expected to occur in response to a gender neutral brand like college football. More specifically, females will resonate and connect with a brand only when that brand is perceived as gender relevant. Fourth, brand resonance and self-brand connections are especially capable of building deep attachments and evoking strong emotions (Keller 2003; Escalas 1996). Emotions are known to influence consumer attitudes (Edell and Burke 1987). Accordingly, it is hypothesized that the effects that self-brand connections and brand resonance may have on attitudes will be mediated by the emotions that consumers express.

Method

Subjects and Procedure

Subjects were 183 University of Michigan undergraduates (male=104; female=79) who were asked to give their opinions about the upcoming biggest rivalry football game against Ohio State. In one condition (In-Group Perspective, U-M), subjects read an enticing narrative relating the highlights of his/her experience as a home team fan while attending the famous Michigan vs. Ohio State football game. The second version (OSU fan) maintained the identical structure, relating the game experience from the Buckeye perspective. Subjects were first asked to identify themselves as either a U-M or an OSU fan. Subjects then responded to questions about their emotional reactions to the upcoming football game. This was followed by a series of questions about loyalty and attachment to the respective teams (U-M and OSU). These 16 measures were, in fact, measures of self-brand connections (Escalas and Bettman 2003) and brand resonance (Keller 2003). A pre-test confirmed that college football is a gender neutral brand, and the WNBA represents a female gendered brand.

Measures

Self-brand Connections measures were taken from Escalas and Bettman (2003) and *brand resonance* measures were selected from Keller (2003). *Emotional Responses* were measured by 1-9 point semantic differential scales (Cronbach's $\alpha=.96$): negative/positive, not exciting/exciting; not thrilling/thrilling; not confident of victory/confident of victory. Attitudes ($\alpha=.96$) to the upcoming

game were measured using 1-9 semantic differential scales: unfavorable/favorable, negative/positive, dislike/like, very bad/very good. Behavioral intentions measures were: very unlikely/likely to attend, unwilling/willing to attend, no desire/strong desire ($\alpha=.86$).

Results and Discussion

These results provided several new insights into the Self-brand Connections construct. First, it was confirmed that gender had no significant effect on SBC when the target brand is equally popular between male and female respondents. This was a necessary test to provide more validity to the notion that females will exhibit stronger self-brand connections towards products that 'match' their own gender. Thus, women, compared to their male counterparts, should report higher levels of self-brand connections as well as stronger brand resonance when the brand is perceived as a female-gendered brand such as the WNBA. However, when the target brand was football, with a non-female gendered identity, women no longer demonstrated stronger self-brand connections. This finding suggests that the WNBA may have a leading role to play in connecting with the aspirations of young women today. In order for the WNBA to continue to build a strong brand community among its target audience, special care should always be exercised when selecting the most appropriate female role models who could effectively resonate with the values and ideals of its gendered audience (Kahle & Homer, 1985; Kamins, 1990).

Second, this study showed for the first time in the extant literature the close relationship between SBC and brand resonance. This is particularly interesting given the crucial role that brand resonance plays in customer relationship management and the development of sustainable brand equity between customers and the brand (Keller, 2001). A principal components factor analysis with varimax rotation revealed that all the measures of SBC and Brand Resonance loaded on a single factor with eigenvalue=12.63, accounting for 84% of the total variance (Cronbach $\alpha=.98$). The items comprising SBC and brand resonance were used to create two distinct variables, respectively. To understand the fit between these two constructs, Confirmatory Factor Analysis using Amos (Arbuckle, 1997) was conducted with all the items of SBC and brand resonance representing one single factor. The chi-square for this model was significant (indicating a poor fit): χ^2 (104, N=180)=620, $p<.000$; NFI=.89, Bollen's (1989) Incremental Fit Index (IFI)=.91, CFI=.91, RMSEA=.160.

Third, emotions played a spectacular role in mediating the influence of SBC (and brand resonance) on consumer attitude. This intriguing relationship to emotions has never been explored before. Given the dominant role that emotions and passion play in the consumption and experience of sports, this insightful revelation of the link between emotions, brand resonance and self-brand connection offers exciting opportunities for future research. Moreover, since females have been shown to score significantly higher than men in the expression of emotions (Diener, Sandvik & Larsen, 1985), the appropriate role of gender should be included in future studies on affect, brand resonance, and self-connections in human behavior and particularly in our efforts to enhance the consumers' experience of sport, entertainment, or any other delivered service.

Gettysburg Co-Constructed: Producing and Consuming Narratives in an American Battlefield

Athinodoros Chronis, California State University, USA

EXTENDED ABSTRACT

During the American Civil War, more than 600,000 people were killed while the country was divided by blood and hatred. Today, after 140 year from its ending, the Civil War is still present in the American memory as one of its most defining moments. What is more, vestiges of the big fratricide are located among a plethora of cultural expressions including more than 50,000 publications, hundreds of round tables, courses and seminars, movies, television series and documentaries, museum exhibitions, and battle reenactments. Through what process certain events of the past become meaningful cultural narratives feeding the collective imagination and the associated consumption practices? While established marketing knowledge sets the consumption experience apart from production, it is argued that the creation and development of experiential products are an outcome of a co-constructive process between marketers and consumers. The purpose of this paper is to shed light into the co-constructive nature of experiential products. Viewing cultural narratives as mutually constructed outcomes between producers and consumers who interact in the marketplace offers a new theoretical insight into experiential consumption and contributes to the evolving body of Consumer Culture Theory.

Theoretical insight into the production of cultural narratives is offered by narrative theory whose major premise is that life comes to us in the form of stories. The theoretical framework used in this study adopts a constructivist perspective according to which narratives are not natural phenomena, but human inventions. Narratives are constructed through the interaction of two parties: the storyteller and the listener. On the one hand, the storyteller or the narrator relates the story to his or her audience in a particular medium. On the other hand, listeners of a story play an active role into the construction of the experiential product by actively following the narrative. The final narrative outcome and the quality of the consumption experience will be determined by examining the contributions of both producers and consumers. The American Civil War can be seen as a narrative text where this theory can be further developed.

Ethnographic research was conducted at Gettysburg, a small town in south-central Pennsylvania, where one the most bloody battles of the American Civil War took place from July 1st to July 3rd of 1863. Fieldwork was carried out during the summer of 2002 and data collection methods included personal semi-structured personal interviews, photo-elicitation, and observation. Overall, fieldwork resulted in a total of 76 interviews where the voices of 125 informants was recorded, 238 photographs, and hundreds of hours of observation. Transcribed interviews offered 430 pages of verbal data.

The findings provide theoretical insight into the co-constructed nature of the Gettysburg narrative. On the production side, service providers are responsible for staging the servicescape in both substantive and communicative ways. The Gettysburg storyscape is substantively staged through its landscape and through a large number of monuments, museums, buildings, and "authentic" artifacts. Communicative staging is being achieved through the interpretation of the stupendous battle by numerous agents. Private businesses offer their own versions of the story. Nothing provides a more detailed and colorful story though than a battlefield tour. Tour guides invent and offer a plethora of narrative constructions

based on the material they have read and investigated in the national archives. One of the major concerns of the guides is their contact with diverse audience and the subsequent need to adapt their presentation to the visitors' background. Thus, during a battlefield tour, guides' presentation becomes a balancing act that struggles to consider the multiple audiences and adjust accordingly.

On the consumption side, visitors' active participation is subsumed under their effort to follow the narrative. In doing so, consumers at Gettysburg use their prior familiarity with history and they struggle to fill narrative gaps. In order to achieve a deeper understanding, they re-contextualize their new experiences and they use their narrative imagination in order to come closer to what it feels like to live in the story.

The present paper contributes to Consumer Culture Theory by illustrating a theoretical account for understanding dynamic relationships between consumer actions, the marketplace, and cultural meanings. In contrast to established knowledge that keeps production separate from consumption, an alternative approach looks at consumption experiences and cultural meanings as products of interaction between producers and consumers. This research supplements and advances the ongoing discussion on consumer agency and the co-construction of experiences by using narrative theory to illustrate the way in which national stories are collectively shaped through the interaction of multiple parties. The narrative of the American Civil War is used as an experiential product and the Gettysburg storyscape is used as the context where interactions between service providers and consumers are studied. According to this account, marketers are responsible for staging the storyscape in both substantive and communicative ways. On their side, consumers use their prior familiarity with the story, they fill narrative gaps, they re-contextualize their narrative experience, and they use their imagination in order to come closer to what it feels like to live in the story.

This paper provides theoretical insight into the market-mediated consumer imagination. As an increasing consumer research attention is paid on imagery elicitation in experiential settings, a co-constructive approach emphasizes the role of stories in sparking consumer imagination. Rooted within the mental imagery theory is the notion that decontextualized static images mirroring the external reality are passively formed in consumer's mind and are subsequently used in information processing to improve decision-making and enhance purchase outcomes. In contrast, it is theorized in the current work that consumer imagination is an experience with a narrative structure including actors, events, and plots with beginning, middle, and end. It is shown that consumer imagination is a multi-sensory, holistic, and dynamic experience within which consumers actively produce narrative understandings. It is also suggested that imagination as an experience is located at the intersection of the service providers' effort to stage the servicescape in a narrative way and consumers' active participation in completing, re-shaping, and (re)living the narrative.

Representing Consumer Research: A Novel Approach

Stephen Brown, University of Ulster, Northern Ireland

ABSTRACT

Twenty years ago, Belk contended that marketing and consumer research can learn more from a reasonably good novel than a garden variety piece of contemporary social science. In the decades since this declaration, copious scholars have derived many significant insights from the literary canon. Consumer researchers' pursuit of matters literary, however, has not extended to the next logical step—the novelization of their findings. Despite the advent of “experimental” modes of representation, such as poetry, performance and painting, the preeminent cultural form of the century just past remains beyond the professorial pale. This paper considers our reluctance to write the Great CB Novel and posits four possible reasons for researchers' apparent reticence. It examines some of the problems encountered by would-be novelists, argues that the pleasures of novel writing far exceed the pains, which are indubitably acute, and maintains that marketing and consumer researchers must not only cull novels for academic insights but compose novels with academic insights.

INTRODUCTION

In recent years, consumer research has been enlivened by the rise of heterodox representational practices. The traditional academic article is being supplemented by videography (Belk 1998), poetry (Sherry and Schouten 2002), performance art (Thompson 1999), stereoscopy (Holbrook 1997) and more besides (Stern 1998). The ACR Film Festival, to cite perhaps the most celebrated example, is now a firm fixture on the conference calendar and, although it may be some time before moving images replace the written word in the great scholarly scheme of things, the Association's consecration of the event bears witness to the broadening of our field's representational repertoire. The weird, as Russell Belk (1984) famously anticipated, have not only turned professional, they are auteurs to boot.

Admirable though the advent of Sherry's (2003) “sixth moment” undoubtedly is (see also Denzin 1997), there remains one representational form that has yet to be wholeheartedly embraced. And that is the novel. There are, of course, many fine examples of creative writing in marketing and consumer research. Schau (2000), Sherry (1998), Holbrook (1998), Aherne (2003) and several others have published “novelistic” pieces. Jack Trout (2003), of “positioning” fame, has penned a novella on best marketing practice. John Schouten is known to be working on a full-length work of fiction and if, as legend has it, everyone has a novel in them, then many unpublished manuscripts are presumably gathering dust in academics' drawers and filing cabinets. Yet all things considered, it is disappointing that there are so few published novels by marketing and consumer researchers.

The causes of this scholarly lacuna are doubtless many and varied. However, four factors undeniably loom large. The first of these is payback. Few professional rewards accrue to novel writers. Novels do not secure tenure, or promotion, and if anything may inhibit the pursuit of professional preferment in a supposedly “scientific” discipline. The same, to be sure, is true of movie making, composing poems and stand-up comedy, but the sheer amount of time that novel writing requires invariably invites questions about the best use of B-school employees' temporal resources and intellectual energies.¹

¹Three years appears to be the norm for first-time novelists (see Doughy 2006).

The second issue is technical. Comparatively few marketing and consumer researchers are trained in creative writing and very few doctoral programs include courses on writing skills (even though, as Mick (2005) rightly notes, writing is a core academic competency).² Experienced writers, what is more, are inadvertently hampered by their professional prowess, insofar as the skills necessary for fiction—plot, character, dialogue, drama—are very different from those demanded by conventional academic articles. Every consumer researcher may well have a novel in them, but unless it's written in a different register, the novel within is likely to be an abortion.

Competition is the third factor. The world is not short of novelists—quite the opposite, in fact (Zaid 2003)—nor is it short of novelists who write about marketing matters and consumer society generally. As Brown (2005) observes, one of the most striking latter-day literary trends is the rise of “mart-lit.” That is, novels written about branding, marketing and consumerist issues. Recent examples include Sophie Kinsella's (2004, 2005) mega-selling *Shopaholic* series, William Gibson's (2004) extravagant excursus on guerrilla marketing, and Don DeLillo's (2004) proctological ruminations on the anti-globalization movement. Our discipline's would-be novelists, in other words, are up against full-time professionals and are liable to suffer by comparison.

The fourth and in certain respects most important factor is good old-fashioned business. The book trade, by and large, is chary of novelized scholarship.³ Such works are difficult to categorize, as a rule, and appropriate in-store placement isn't easily determined (fiction section? non-fiction shelves? business and management boondocks?). Given the avalanche of incoming titles and inevitably limited display space, chain bookstore buyers tend to be skeptical and, unless substantial promotional support is forthcoming from the publisher, it's difficult to get decent distribution. Granted, aspiring authors can embrace the self-publishing option—low-cost websites like Xlibris, Lulu et al make this an attractive alternative—but this invites institutional opprobrium, as per point one above.

Institutional opprobrium, however, hasn't stopped economists (Brunger 1993), psychoanalysts (Kristeva 2006), cultural theorists (Berger 1997), computer scientists (Papadimitriou 2003) and consciousness researchers (Lloyd 2004) writing novels about their specialty. The management literature too is studded with fairy tales (Denning 2004), leadership fables (Rovira and Trias de Bes 2004), corporate satires (Barry 2006) and organizational parables (Goldratt 2004). Precedents exist, in short, and perhaps it is time for marketing and consumer researchers to step up to the literary plate. The present author has done so and, in an attempt to encourage others to do likewise, the remainder of this article will consist of the first chapter of *The Marketing Code*, followed by a brief discussion of some salient scholarly issues.

THE MARKETING CODE

The room buzzed with anticipation as the speaker strode toward the imposing podium. Conservatively dressed and carefully coiffed, she looked much like any other middle-aged marketing professor. Only the smart Paul Costello suit betrayed her country of origin, as did a tiny twist of emerald ribbon on her Irish linen lapel.

²If, as John Fowles (1990) avers, “creative writing” is a euphemism for “imitative writing,” then most marketing and consumer researchers are indeed trained in creative writing.

³I speak from personal experience, sadly.

To all intents and purposes, she was indistinguishable from the three previous presenters, Professor Bland, Professor Boring, Professor Blowhard.

Professor Emer Aherne was different in one important respect. Unlike the earlier presenters, she had rehearsed and polished and buffed up her speech. She didn't believe in inarticulacy, considering it a sign of professional weakness. She was an educator, someone who earned her living from standing and delivering. She regarded ums, ahs, ers, and analogous stuttering utterances as an affront, an indicator of the presenter's scholarly laxity, of their failure to appreciate that conference papers are professors' moments of truth, the instant when the intellectual sale is made.

Nor did Emer Aherne believe in beginning with banal bromides of the nice-to-be-here, thank-you-for-coming, you're-a-winnerful-winnerful-audience variety. She subscribed to the showbiz notion of starting with a bang and building things up from there. This was true of all her presentations, but it was especially true of the one she had rehearsed so assiduously. Not only did it deal with an important aspect of the Entertainment Economy, but it was being delivered in the quintessence of showbusiness, Las Vegas.

She stood silently behind the podium, waited for the room to settle and, fixing the audience with an imperious stare, proceeded to give them rhetorical hell.

"Tahiti. The beach. A lone figure strolls disconsolately along the shoreline. It is Dan Brown, a jobbing musician whose career is going nowhere. Several years in and he's sold next to nothing, apart from a theme song for the Atlanta Olympics. It's time to try something new, possibly related to his passion for art history. Turning back to his hotel, he stumbles over a tattered blockbuster novel, devoured and discarded by a departed holidaymaker. It's *The Doomsday Conspiracy* by Sidney Sheldon. Brown starts reading. Engrossed, he can't put it down. He swallows it whole and, in a moment of inspiration, Dan decides, 'I can do that'. And do that he does.

"His first conspiracy-propelled thriller, *Digital Fortress*, is published in 1998. No one notices. His second and third novels, *Angels & Demons* and *Deception Point*, follow *Digital Fortress* to paperback Palukaville. The music business pattern is starting to repeat itself.

"Dan moves to Doubleday. He writes *The Da Vinci Code*. Expectations are low, since its irreligious stance is deemed inappropriate in the post-9/11 climate. But his editor, Jason Kaufman, can't put Brown's manuscript down. Nor can Kaufman's editorial colleagues. Nor can Barnes & Noble's chief fiction buyer, Sessalee Hensley. Collectively, they take a chance on the risky property, even though the market signals are discouraging. A record number of Advance Reader Copies is produced in order to build some much-needed buzz. Barnes & Noble, facing fierce price competition from supermarket chains, especially on brand name blockbusters by Grisham and King, backs the no-name author to the hilt. *The Da Vinci Code* is released on 18th March 2003 and, thanks to the pre-publication marketing campaign, shoots straight to the top of the *New York Times* bestseller list.

"Beginning as it means to go on, the book barnstorms bestseller lists worldwide. Brown's back catalogue follows suit. Special editions are issued. Books about the book sell like hot cakes, even the *Da Vinci Diet Book*. Grail trails around the locations mentioned in the bestseller are promptly pulled together and prove extremely popular, much to the clergy's dismay. A big-budget, Ron Howard-helmed movie, starring Tom Hanks as Professor Robert Langdon, is put into production. Meanwhile, Dan the Man has gone into hiding, writing his next thrilling novel, a sequel to *The Da Vinci Code* called *The Solomon Key*. The world awaits. Agog."

In the bowels of the auditorium, a member of the hitherto somnolent audience sat up, intrigued by what he was hearing. Barton Brady II glanced at his associate, Yasmin Buonarroti, and raised an inquiring eyebrow. Yasmin replied with a slight frown. It was difficult to make out what the presenter was saying, due to her impenetrable Irish accent and quickfire delivery. But the slick slides more than compensated.

Images of Dan Brown, interspersed with video clips of his TV appearances scrolled impressively across the screen. And just when the sight of Dan's doe-like stare was becoming unbearable, the slide show segued into shots of Leonardo's *Mona Lisa*, the Louvre's glass pyramid, Saint Sulpice Church, Chateau Vilette, Westminster Abbey, and Rosslyn Chapel, the key locations in Brown's better than best-selling thriller. These were followed by video inserts of Dan's fans taking the tie-in tours of Paris, vox-pop interviews with exasperated church officials, who daily deal with hordes of loud-mouthed, Coke-chugging, plaid-clad Langdon-lovers, whose enthusiasm is surpassed only by their ignorance.

PowerPoint this wasn't.

It was a shame there were so few people in the audience. A lot of time and effort had obviously gone into Professor Aherne's presentation. But it was the final day of the American Marketing Association conference and the majority of delegates were making their weary way to McCarran. Having delivered their own words of wisdom and paid sycophantic obeisance to those in power—principally Professor Kate Phillips, the guru of gurus, who had deigned to attend the bacchanal—most conference-goers didn't feel the need to listen to yet another yawn-inducing speech. Only Barton Brady, Yasmin Buonarroti and a smattering of die-hard delegates, all with later planes to catch, were in the Bordeaux Room of the Paris Hotel & Casino for the turbo-charged presentation. You'd have thought a title like "The Marketing Code: How Brown's Bestseller Holds the Key to Business Success" would have packed them in. However, the dead zone scheduling, plus the raging hangovers of hard-partying marketing professors, militated against it. The Las Vegas Strip has a lot to answer for, as indeed the delegates would, once they got home to their unforgiving partners.

Brady glanced again at his associate, who sat across the aisle of the unspeakably ostentatious conference room, where vast paintings of Versailles Palace and the Tuileries Gardens dominated the side walls and where the chandelier was bigger—and brighter—than most of the audience. He raised both eyebrows querulously. Yasmin responded with a 'not sure' shake of the head.

"So, what are the secrets of Dan Brown's staggering marketing success?" Professor Aherne went on. "Are there lessons for others and, if so, what are they?"

The audience, such as it was, looked up expectantly.

"Well, it seems to me that there are four crucial factors. The first of these is entertainment. Entertainment is the key ingredient here. For all its alleged literary faults, *The Da Vinci Code* is a rattling good read, a veritable roller coaster-ride. It is a wonderful, unforgettable, page-turning, thrills-and-spills filled story. It epitomizes today's Entertainment Economy, our fast-moving, hit-driven, fad-fuelled world of show-stopping, knock-em-dead, next big things.

"This very venue," she went on, opening her arms to embrace the thinly populated auditorium, "is testament to entertainment's central place in the contemporary marketing cosmos. The thrill we get staring up at the Paris Hotel's imitation Louvre façade, or scaled down Arc de Triomphe, or its half-size replica of the Eiffel Tower, is similar to the thrill we get reading about Robert Langdon's adventures in the 'real' Louvre Museum, the real Arc de Triomphe, the real Eiffel Tower, all of which feature in Brown's book."

At this precise point, a shiny-suited slick of self-importance, the conference session chairperson, leapt to his feet and, with more than a hint of East Coast condescension, announced that the presenter had five minutes remaining.

Aherne ignored the interruption.

"The second factor is Determination. Dan didn't give up, even though his first three books were failures, near enough. He kept plugging away, as did his support team at Doubleday. Business history shows that it's those who persevere despite repeated failure, abject failure, heart-wrenching failure are those who win through in the end. Thomas Edison, Henry Ford, Walt Disney, Ted Turner, Steve Jobs, James Dyson, Oprah Winfrey, Martha Stewart, Mary K. Ash and so on exemplify this never-say-die attitude. Dan Brown, indeed, is an embodiment of the personal philosophy of Samuel Beckett, the Nobel-Prize winning Irish playwright, who urges us to 'fail better'. That is, to accept failure, to learn from failure and, eventually, to overcome failure. Brown failed better!"

Yasmin Buonarroti nodded enthusiastically. Brady was too preoccupied with the creases in his Armani pants to notice his associate's change in attitude.

"The third factor is Obscurity. People like puzzles, mysteries, enigmas, secrets, the more head-scratchingly cryptic the better. And *The Da Vinci Code*, with its arcane amalgam of esoteric symbology and cranky conspiracy theory, attractively wrapped up in a thrill-a-minute detective story, pressed all the right buttons. Better yet was Brown's post-publication withdrawal from public life. His refusal to give interviews, except in exceptional circumstances, and his strictly-no-comment stance only served to ramp up interest in the increasingly intriguing author. As J.D. Salinger, Thomas Pynchon and Don DeLillo remind us, there's nothing more newsworthy than a newswary celebrity."

The slick insect stood up with a one-minute warning.

"Fourthly and finally," the presenter said forcefully, "Controversy proved vital. There's nothing like a little controversy to attract attention, especially in today's world of superabundant similitude. There are so many brands out there, all functionally indistinguishable, all ably marketed, all vying for consumers' attention, that it's very difficult to stand out from the crowd. The commercial clamor is deafening these days and controversy helps cut through the cacophony. The Vatican's official disapproval was the best thing that ever happened to Brown. The wrath of Opus Dei, the harrumphing of hidebound historians, and the legal action brought by outraged authors, who claimed that Dan had stolen their ideas, also helped move the merchandise. Madonna's been doing it for years. Eminem's no slouch either."

Glaring at the session chair, with a don't-dare-interrupt expression, Emer Aherne continued, "In conclusion, Brown's success is down to Controversy, Obscurity, Determination and Entertainment. Or CODE for short. CODE is the key to the *Code*!"

As the audience chuckled appreciatively, the presenter pressed home her advantage, "However, a code without a well-trained operator is useless and Dan Brown is a very well-trained, very astute operator. He is what I call an 'authorpreneur', a writer with an exceptionally strong sense of what the market wants. Charles Dickens, Mark Twain, L. Frank Baum, Edgar Rice Burroughs, Norman Mailer and, of late, J.K. Rowling all qualify as authorpreneurs. Dan Brown is an authorpreneur and a half. He has discovered, dare I say it, the Holy Grail of modern marketing. He..."

Slick had had enough, even if the audience hadn't. "Thank you, Professor Aherne, thank you very much. Perfect timing! Are there any questions?" he went on quickly, hoping that his disapproving tone would discourage the curious and he'd be on his way as expeditiously as possible. Inevitably, this attitude had the oppo-

site effect. An arm shot up to slick's obvious annoyance. It was an eager doctoral student, attending her first academic conference and determined to savor every moment. "Is Brown's CODE applicable outside the bookselling business?"

"Oh very much so. As I said in my presentation, we live in an Entertainment Economy, where there's no business *without* show business—even the business-to-business business—and CODE applies there too. Marketers often treat the cultural industries as if they are a benighted backwater, where the principles of modern marketing have yet to penetrate. I believe that the opposite holds true. The entertainment industry is the toughest, most competitive business around, and while their marketing ideas are incompatible with mainstream Kate Phillips-style marketing, it seems to me that the 4Ps brigade have much to learn from Brown's marketing code."

"But it's not very scientific, is it?" interjected slick, assuming that the ultimate academic put-down would close the discussion.

"No, it's not," conceded Professor Aherne. "But then, I don't believe marketing is a science. Never has been, never will be."

"If it's not a science, what is it?"

"It's a belief system, just like religion, or magic, or indeed science for that matter. If you believe in marketing, it works. And if you don't believe, no amount of fancy analysis or hypothesis testing or marketing metric measurement will help you."

Slick rolled his eyes. Another hand flew up, an older hand this time, the hand of an ageing tenured professor, with ponytail. "Aren't we talking about two different marketing approaches here," he inquired, "the left brain and the right brain, the artistic and the scientific, the feminine and the masculine? Brown's basic approach is feminine, is it not? Doesn't he talk about the 'eternal feminine' in *The Da Vinci Code*? Isn't his marketing premised on this, too?"

"That's an interesting one," Aherne answered, choosing her words carefully. "Brown has been criticized by many feminists. The 'eternal feminine' stuff is regarded as a veneer, a thin cover for what some regard as antediluvian sexism. His books, especially *Angels & Demons*, the prequel to *Da Vinci*, are full of references to rape, sado-masochism, and the brutal degradation of women generally. The comedic books Brown wrote before he tried his hand at thrillers are equally misogynistic. One of the songs on his debut album was a ballad about the dubious pleasures of telephone sex. Even his hero, Robert Langdon, is a love-em-and-leave-em kinda guy, an unreconstructed chauvinist. So, I think the jury is out on the feminine angle."

"What you're really saying, Professor Aherne, is that the acronym CODE is inappropriate. The keywords surely are Chauvinist, Reactionary, Androcentric and Patriarchal. Or CRAP for short!"

"An awful lot of people have swallowed it, though," the quick-witted presenter retorted.

Slick seized the day. His moment of glory had arrived. "If anyone wants to continue talking CRAP, Professor Aherne will be around after the session. Unfortunately, we've run out of time. Thank you all for attending. Have a safe journey home."

Barton Brady II stood up. He straightened his Hermes tie, shot the cuffs of his Brooks Brothers button-down, checked the time on his Vintage Rolex Oyster and sauntered across the aisle. He leaned over his Prada-clad colleague, who was busy pulling a Moleskine notebook and Mont Blanc pen from her Miu Miu purse. "Get her," he whispered. "Take Aherne out! Make her an offer she can't refuse."

DISCUSSION

As is evident from the above excerpt, *The Marketing Code* is predicated on Dan Brown's megaselling blockbuster, *The Da Vinci Code*. It is simultaneously an analysis of the DVC phenomenon,

which is fascinating from a marketing/consumer research perspective, and an attempt to communicate the findings in an imitation of Dan Brown's distinctive style. *TMC*, in fact, is a deliberate and systematic inversion of *DVC*. Where *DVC* is set in the world of high culture (art, aesthetics), *TMC* is set in the world of base commerce (marketing, consumption); where *DVC* unfolds in delightfully picturesque cities (Rome, Paris, London), *TMC* transpires in purportedly dangerous places (Las Vegas, Belfast, Chicago); where *DVC* is based on a Cathar/Opus Dei/Priory of Sion conspiracy, *TMC* relies on a Freemasons/Knights Templar/P2 admixture; where *DVC* is Roman Catholic and makes much of the "sacred feminine," *TMC* is inherently Protestant and gets in touch with the "sacred masculine"; where *DVC* is a thriller with a pedagogic subtext, *TMC* is pure pedagogy with thrills on top; and, last but not least, where *DVC* was humorless at heart, *TMC* is humorous at bottom.

The Marketing Code is an admittedly derivative thriller. It contends that there is a marketing cabal at the heart of contemporary consumer society, a conspiratorial organization which seeks to exploit innocent consumers for its unconscionably nasty ends. Publicly, its affiliates adhere to the clichéd catalogue of customer-first, customer-focused, customer-facing corporate strategies. But privately, they cleave to a primal marketing code, a mysterious way of doing business, which keeps them on top and consumers in hock.

The cabal, however, is under threat. Its secret is rumbled by Barton Brady II, the main chance-minded CEO of Serendipity Associates, a Las Vegas-based branding consultancy. Something must be done to protect the cabal's ancient code of marketing practice. The word goes out. Stop Brady. Get Buonarroti.

Living happily ever after isn't an option...

To be sure, there's more to *The Marketing Code* than the usual mix of thrills, spills, destruction and death—"Sometimes You Have to Kill to Make a Killing," as the book's byline puts it—inasmuch as it is a novel about marketing and consumer research. It is not an out-and-out thriller but a novelization of academic issues. Thus the challenge for the author, or any author of scholarly fiction, is to ensure that the academic issues are introduced without impeding the action and, conversely, to make sure that the academic message is communicated in sufficient detail. This is a very difficult balance to maintain, especially in thrillers, which demand a page-turning momentum.⁴ Many novels, it is true, contain "messages," be they political (*Uncle Tom's Cabin*), philosophical (*Atlas Shrugged*), sociological (*Lord of the Flies*) satiric (*Animal Farm*), or whatever. Indeed, Dan Brown's (2006) literary high concept, believe it or not, is "thriller as academic lecture." Nevertheless, there's no doubt that authors whose intent is predominantly pedagogic are prone to fail when facing the foremost challenge for would-be writers of page-turning fiction—namely, keeping readers reading and wondering what happens next. Failure to do so means failure to communicate, means failure to inform and, as often as not, means failure to sell.

Regardless of its success or failure in the marketplace, *The Marketing Code* contains lessons for consumer researchers considering "alternative" (Sherry 1991) modes of representation. The actual writing process is undeniably challenging—as is making a movie, performing a play, composing a poem, etc.—but these fiction-forging challenges bring their own rewards. Being forced to think about plot, dialogue, character, pacing and so forth, the bread and butter of professional writers, is a very useful training exercise. Writing, after all, is a craft and being required to write outside the

comfort zone of the standard academic article helps enhance the skills that our craft calls for (Booth, Colomb and Williams 1995). We can all improve as writers and the field as a whole can only benefit thereby.

The downside of fictionalizing one's research is that it is very difficult to revert to more familiar forms of expression. Just as Belk and Costa (1998) discovered in their study of modern mountain men, it isn't easy to return to "real life" after immersion in the rites of rendezvous (see also Kozinets 2002). Analogously, the fiction writer's god-like ability to create living breathing characters—and controlling their ultimate fate—is dangerously intoxicating for researchers more used to testing hypotheses, mining data sets and writing articles in a conventional scholarly manner. The lesson, then, is that those who pursue unorthodox modes of representation must be prepared for a the post-partum sense of scholarly estrangement.⁵

Despite this caveat, the pleasures of writing academic fiction greatly exceed the accompanying pains and it is hoped that just as videography has been embraced by marketing and consumer researchers, so too novelizations of our research will become the norm. Perhaps, in due course, creative writing workshops will run alongside the ACR Film Festival. Screenwriting workshops as well. Time will no doubt tell.

CONCLUSION

Twenty years ago, Russell Belk (1986, p.24) contended that "one can learn more from a reasonably good novel than from a 'solid' piece of social science research." It is equally arguable that one can learn more from writing a novel than publishing yet another solid piece of social science research. The novel, according to its innumerable boosters (e.g. Bradbury 1990), is the pre-eminent form of cultural expression in the western world. Poets, painters, musicians, movie-makers, television-producers, video-games developers may beg to differ, but there's no doubt that novels are blessed with considerable cultural cachet. Although it is unlikely that marketing and consumer researchers will turn to writing novels en masse—highly unlikely—the recent rise of heterodox forms of representation demands that we make an attempt. As a cultural form and representational practice, the novel is just too important to ignore. Call me Phishmael.

⁴In *TMC*'s case, this is circumvented to some extent by the academic setting, which affords numerous opportunities for incorporating instructional material in the guise of lectures, seminars, conversations between colleagues and, as the excerpt indicates, descriptions of conference presentations.

⁵Would-be CB novelists must also be prepared for the ultimate professional question: "Why bother?" In a world teeming with wannabe novelists writing books on contemporary consumerism and equally replete with consumer researchers wedded to established modes of representation, why bother bringing both together? The principal reason, as Belk (2002) rightly points out, is that conventional modes of representation are becoming less and less effective. Managers and policy makers increasingly look elsewhere for inspiration. The preeminent commentators on consumer issues are journalists, not academicians. If no one is reading our stuff, perhaps consumer researchers should reconsider how they communicate their findings.

Authenticity in the Performing Arts: A Foolish Quest?

Maud Derbaix, University of Namur, Belgium

Alain Decrop, University of Namur, Belgium

Although philosophers (Benjamin [1936] 1973), anthropologists and sociologists (MacCannell 1973) have examined the concept of authenticity decades ago, it has been neglected by consumer researchers for a long time. Only recently did authenticity draw the attention of a few scholars (Arnould and Price 2000, Camus 2001, 2004; Cova and Cova 2004; Grayson 2002; Grayson and Martinec 2004; Grayson and Shulman 2000; Rose and Wood 2005). According to Grayson and Martinec (2004), consumer quest for authenticity has existed for hundreds of years and still persists today as reflected by a substantial number of purchase situations and a wide variety of market offerings. For Camus (2001), an actual culture of authenticity only emerged in the seventies. This emergence may be explained by three major factors: nostalgia of the past and of elsewhere, the quest for references, meanings and truth (Benjamin [1936] 1973) and the need for singularity.

Much in contrast with the idea of authenticity as emerging cultural framework, postmodern writers have argued that technology's innovations and globalization have undermined consumers' ability to assess the difference between the real and the fake, between the authentic and the contrived. Benjamin ([1936] 1973) was among the first authors to point at the depreciation of authenticity in the arts. In his "*Work of Art in the Age of Mechanical Reproduction*", he observes a shift in the status of traditional art, in a period where technical means of art reproduction such as photography and film increasingly dominate the imagination of mass public. Similarly, for Baudrillard (1983), authenticity has been replaced by copy and nothing is real though those engaged in the illusion are incapable of seeing it. For others, as Belk (1996), consumers now prefer the easily accessible replica to the more inaccessible original. Moreover, as far as museums and historic sites are concerned, Belk (1996) underlines that *consumers are no longer interested in history, art and culture as such but in fantasy and spectacle. In the same way, Benjamin quotes Duhamel* "the masses seek distraction whereas art demands concentration from the spectator" (232). In summary, in a *cultural* world of hyperreality where the distinctions between real and unreal are blurred, the search for *distraction and entertainment appears to prevail over the quest for authenticity*.

This paper is about authenticity in arts and more precisely in the performing arts. Our research was *guided by an attempt to answer the following questions: are consumers looking for authenticity in their artistic/cultural experiences? Are they looking for "artertainment" rather than authenticity? Which type of authenticity is relevant when considering different types of cultural domains?* Departing from the hyperreal condition of the postmodern view (Baudrillard 1983; Belk 1996; Firat and Venkatesh 1995), we argue that some performing arts' spectators look for and experience a kind of "authenticity" when attending such shows. The paper is articulated in three major parts. Firstly, we briefly examine the concept of authenticity according to relevant streams of research. Secondly, we propose an extended review of the concept of authenticity and of definitions/dimensions according to different theoretical perspectives. Finally, we consider the extent to which those definitions/dimensions can be applied to different forms of art focusing on "high" and "pop" performing arts.

PARADIGMATICAL SHIFTS

MacCannell (1973) is the first to suggest that an object's authenticity can be assessed according to certain standards. In

tourism, products such as souvenirs or works of art are usually described as authentic or inauthentic depending on whether they are made or performed by locals according to local traditions (Reisinger and Steiner 2006). Hence, in the tourism literature, modernists usually refer to authenticity as something which is perceived and judged independently by experts and not by the tourists themselves. Tourists sometimes have the illusion they have encountered authentic things but tourist spaces are often constructed backstage in a contrived manner. This is the origin of MacCannell's popular concept of "staged authenticity." The modernist view of authenticity as something that can be determined objectively reflects a way of thinking that is radically opposed by postmodernists.

Postmodern researchers argue that "there is no sense in asking what is the original and what is the copy" (Venkatesh 1999, 157). For them, inauthenticity is even not a problem arguing that people live in hyperreality (Eco 1986). Whereas modern art is characterized by realism and representation (Firat and Venkatesh 1995), postmodernism is characterized by the blurring of art and everyday life, high and pop culture, pastiche, irony, etc. (Featherstone 1991). For some postmodern writers like Firat and Venkatesh, postmodernity should lead to the liberation and emancipation of consumers as opposed to the highly pessimistic view of other postmodernists. For Baudrillard (1995) and Featherstone (1991), life is becoming more aesthetic, more like the arts: ephemeral, experiential, image- and style-based. Postmodern performance theorists such as Kaye (1994) show that postmodernist—or more accurately anti-modernist—projects seek to disrupt any foundationalism or essentialism and question the very concepts of authenticity, wholeness, meaning and originality. He isolates three unifying elements in many of the postmodern works he approaches, i.e. (1) the deflation of the art object as an autonomous whole in favor of an emphasis on the spectator's construction of that object as an image in the mind; (2) the shift from art as object to art as receptive event; and (3) the upsetting of the hierarchies and assumptions that define and stabilize the formal and thematic parameters of the performance work (on that point, see also Auslander (1992) and his analysis of the Wooster Group's work).

Recent studies in consumer research, supporting the perspective that the distinction between the authentic and the inauthentic can be personally or socially constructed, pinpoint common cues that consumers use to evaluate different kinds of authenticity (Grayson 2002; Grayson and Martinec 2004; Grayson and Shulman 2000). In their consumption study about reality television, Rose and Wood (2005) even argue that the consumption of reality shows represents a sophisticated quest for authenticity within the traditionally fiction-oriented entertainment paradigm. These "constructivist" approaches of authenticity contrast postmodern views of hyperreality and even accept as authentic the fantasy that consumers co-produce during recreative experiences.

DECLINATIONS OF AUTHENTICITY

The term "authenticity" derives from the Greek "authentikos" in which "autos" means self and "entea" refers to tools or instruments. Nowadays, "authentic" is generally defined in two different ways: it means either "of the authorship or origin claimed, real, genuine" (something which has genuine authority) or "worthy of acceptance, true" as opposed to that which is false, fictitious and counterfeit (Costa and Bamossy 1995; Kennick 1985; Phillips 1997). In other words, genuineness and true value are the two

broadly accepted meanings of authenticity and, as we will see, they often are taken into account in the different approaches exploring the concept.

Following a semiotic approach, Barrère and Santagata (1999) define a work of art according to three criteria, i.e., originality, artistic labour, and aesthetic need (or lack of utility). In the quest of authenticity in the art, the two first criteria appear to be more relevant. Indeed art aesthetics cannot be generalized as some goods may be considered art in one society and not in another (Barrère and Santagata 1999; Gell 1996). Originality may be connected with the “genuineness” definition of authenticity mentioned above. Every creative act, if original, is also unique and, in this sense, is to be opposed to the multiple productions of standardized goods. This characteristic means that art can be copied but not perfectly reproduced (Barrère and Santagata 1999). According to Benjamin ([1936] 1973), the presence of the original is central to the concept of authenticity, and the existence of the original is enhanced by its survival through time. According to him, authenticity includes “everything that is to be transmitted, from its origin, its material duration as well as its historical testimony” (214) and is depreciated by any mechanical reproduction. Of course, mechanical reproduction enables to reproduce all transmitted works of art but even the most perfect reproduction is lacking an essential feature: its *hic and nunc*, its unique existence or history. The *hic and nunc* of the original forms the essence of the notion of authenticity. With mechanical reproduction, the *hic and nunc* is depreciated. The subsequent proliferations of a traditional artwork bear only an imagistic similitude to the original, lacking the *aura* and therefore any relation to the actual historical dimension thereof. The *aura* refers to the artwork’s “presence in time where it happens to be” (Benjamin [1936] 1973, 214) and is an indicator of its authenticity and authority. According to Benjamin, in the age of mechanical reproduction, the *aura* is declining because exhibition value (emerging from reproductibility) gets the prevalence over cult value (arising from the devotion to a work of art or an artist). Originality is not the only condition for authentic artworks for Barrère and Santagata (1999). A second criterion is artistic labour, or the fact that the creation is achieved through a specific work. Because of its own specificity, the output of artistic labour is extremely heterogeneous. What is important here is the quality and personality of artistic labour, as well as the talent and the creativity incorporated in it. This criterion involves a broader definition of authenticity than “originality” because its emphasis is more on the artist’s performance than on the history of the work of art. This criterion includes the author’s inspiration and intention to create the object, which makes it authentic (Camus, 2001). In the same way, Cova and Cova (2002) argue that authentic refers to which is “built” without any strategic intention in it. The “producer” is to be authentic in his/her actions focusing on his/her current production/work and not on the future of it. This “short-term” disinterested view is, for us, the landmark of authentic artistic work as opposed to a mid-term perspective guided by returns or yields. On the one hand, spontaneity, emotionality, and simultaneity prevail, whereas, on the other hand, mechanical reproduction, calculation, and simulation contribute to inauthenticity. Those dimensions are in accordance with the “truth” definition already mentioned in the sense that a work of art will be considered as authentic because each performance is unique in itself.

Perhaps the earliest account of authenticity still popular today is Socrates’ admonition that the “unexamined” life is not worth living. In the 20th century, discussions of authenticity often refer to the key writers associated with existentialist philosophy (e.g., Kierkegaard, Heidegger, Sartre). Heidegger (1977) associates authenticity with non-technological modes of existence, seeing

technology as distorting a more “authentic” relationship with the natural world. With the new technologies, people observe spectacles, via control screens instead of living real experiences. Instead of the real, we have simulations and simulacra (Baudrillard 1983). So, from a philosophical point of view, the drift towards authenticity may be seen as a reaction to threats of inauthenticity inherent in postmodernism (Firat and Venkatesh 1995). Authenticity is contrasted with “falsity” or “fakery” in ordinary discourse, but, falsity does not imply fraud at every stage of the production of a fake, as argued by Dutton in his essay “*Authenticity in Art*” (2003). The latter author identifies two broad categories that help making a distinction between the authentic and inauthentic in aesthetics, which parallel the originality and performance criteria described above. First, works of art may possess “nominal authenticity”, simply defined as the correct identification of the origins, authorship, or provenance of an object, ensuring that an object of aesthetic experience is properly named (our originality criterion). However, the concept of authenticity often connotes something else, having to do with an object’s character as a true expression of an individual (our “artistic labour” or “performance” criterion). This second dimension of authenticity is called “expressive authenticity”. According to Dutton, many works of art that are called “inauthentic” are merely misidentified. There is nothing fraudulent about wrongly guessing the origins of an apparently eighteenth-century Italian painting. Fraudulence is approached only when what is only an optimistic guess is presented as well-established knowledge, or when the person making the guess uses his/her position or authority to give it a weight exceeding what it deserves (Dutton 2003).

In consumer research, many studies on authenticity have observed that commercialization can undermine authenticity and that the assessment of authenticity involves complex perceptual processes (Belk and Costa 1998; Kozinets 2002; Peñaloza 2001). But few of them clearly define and consider it as a key component that consumers take into account in their assessment of the arts. According to Rose and Wood (2005), consumers increasingly value authenticity in a world characterized by the mass production of artifacts. Recent works by Grayson (2002) and Grayson and Martinec (2004) on tourist attractions specified and identified two types of authenticity based on a semiotic perspective: indexical authenticity and iconic authenticity, both being associated with genuineness or true but in different ways. On the one hand, indexicality helps to distinguish “the real thing” from its copies. To perceive something as an index, the consumer must believe that it actually has the factual and spatio-temporal link that is claimed (Grayson and Shulman 2000). On the other hand, iconicity refers to the object being perceived to look like what was expected. In other words, iconic authenticity describes an entity whose physical manifestation resembles something that is indexically authentic of it (writers sometimes use phrases such as “authentic reproduction” or “authentic recreation”). The authors also mention that these two kinds of authenticity are not mutually exclusive. Moreover, all market offerings have both properties but not all will be judged as authentic by a particular consumer. Finally, perceptions of indexicality and iconicity are graded: consumers may perceive market offerings as being more or less iconic or indexical. These studies contrast postmodern views of hyperreality by suggesting that consumers can readily distinguish between the authentic and the contrived. Rose and Wood (2005) challenge the notion of indexical authenticity adopted by Grayson and Shulman (2000) considering that authenticity necessarily depends on a judgment of genuineness. In the context of reality shows, indexical authenticity is found to be an important condition for commitment but not sufficient to ensure a judgment of “satisfying” authenticity (a function of the conjunction of the objectively real and the desirable). The authors argue that

consumers mix fantastic elements of programming with indexical elements connected with their personal reality. In other words, viewers value “hyperauthenticity”, a label used by Rose and Wood after Baudrillard’s (1983) notion of hyperreality: “whereas hyperreality denotes the nonreflexive substitutions of signs of the real for the real itself, hyperauthenticity denotes viewer’s reflexive consumption of an individualized blend of fantasy with the real” (294). In fact they propose a third way between the modern quest for authenticity and the postmodern view of hyperreality; they accept as authentic the fantasy that is coproduced in entertainment experiences.

Looking at authenticity from different perspectives reveals the multidimensionality of that concept and hence, the complexity of its assessment. Consumers will rely on different cues to assess different kinds of authenticity (Grayson and Martinec 2004). In the arts, the way the authentic/inauthentic distinction sorts out is thus importantly context-dependent. In the next section, we describe the particular characteristics of performing arts and investigate how these characteristics can influence the complex process involved in the perception and assessment of authenticity.

AUTHENTICITY IN THE PERFORMING ARTS

There is a need to analyze the nature of authenticity in arts, like dance and music, even though they are being created, *hic et nunc*. Seminal works of Holbrook and Hirschman (1982) have frequently been mentioned as the first attempt to understand consumer behavior in the cultural field. For these authors, consumption has to be seen as involving a steady flow of fantasies, feelings and fun encompassed by an “experiential view.” According to them, cultural and artistic activities are particular services whose consumption mainly aims at satisfying the consumer’s hedonic and aesthetic needs. What the consumer really looks for is living a rewarding experience rather than solving a utilitarian problem. It should be stressed that “live” cultural activities involve more experiential and spectacular aspects of the consumption than cultural goods. The artwork remains the same in time and is unaffected by the presence of a different audience; this is not such the case for the cultural activity/experience. In this paper, the focus is on cultural activities involving “a performer” (e.g. a singer, an actor, an orchestra, a ballet dancer, etc). Performing arts not only involve one or more performer(s) but also an audience. In live performances, the audience usually reacts to the performers who, in turn, react to the audience in a permanent cyclic interchange. Actors often acknowledge that they live on an audience’s energy, especially as far as comedy is concerned, and complain when the audience does not react in conspicuous ways. Artists’ performances will vary from one night to the next depending in large part on the audience’s feedback. The togetherness of both actors and spectators is a feature that helps making a distinction between performing arts such as theater, ballet or concerts, and cultural industries such as film and television. Along with the live presence of an audience, group participation distinguishes performing arts from plastic/graphic arts like painting or sculpture.

In the following paragraphs, a series of propositions are made about authenticity in the performing arts. These propositions are summarized in Table 1. First, a show could be qualified as “authentic” because it is performed more or less the way it was fixed in time several decades/centuries ago, this conception of authenticity fits into the idea of “genuineness” or “originality.” This question of original work often arises in “high” performing arts. Here, the word “authentic” refers to a class of performances that seek historical verisimilitude, typically through using period tools and attempting to recreate performance as in the past. According to some philosophers (Davies 2001; Dutton 2003), the historical reconstruction of

a performance (i.e., nominal authenticity) is not the best way to convince spectators of the artwork’s interest. One would not go back to Shakespeare’s productions in which boys performed females’ roles just because it was the way it should happen in Shakespeare’s time. In other words, we assume that Shakespeare would have chosen women to play these roles if had the option. Similarly, the Beethoven piano sonatas were written for the biggest, loudest pianos Beethoven could find in the early 19th century; there is little doubt that he would have favored the modern concert grand, if he had the choice (Dutton 2003). Nevertheless, in “high” performing arts, original texts, compositions or scores left by authors and composers are cues of authenticity spectators are still looking for because reputation and time have elevated them to a “sacred” status. We like to hear “good” French when attending Molière plays. We like to be meditative hearing Bach’s Passion. We often exhibit a kind of “respect” due the sacred character of the work in high performing arts. Precision and trustworthiness are more important than improvisation. Despite those “original” cues, spectators are now searching for creativity and renewal in performances. The very idea of a performing art allows performers a degree of interpretive freedom (Davies 2001). The best attitude towards authenticity in performing arts is when performers try to take the largest artistic potential out of the work.

Another conceptualization of authenticity in the performing arts adheres to the definition that the Greeks must have intended. Authenticity here derives from the quality of the relationship between the artist’s self and its performance on stage. The more honest this relationship, the more authentic is the art that emerges. Performing arts exist in a finite space and time; this means that a performance has a very short-lived existence. Another similar work of art may be created the next night, but the different audience and the differences in the performers themselves will make the performance different. Because performances of actors in a play or of musicians in a rock concert are never twice the same (uniqueness of the performance), it is impossible to reproduce such performances exactly in their original state (Evrard, Bourgeon, and Petr 2000). The artist(s) on stage has no right to make mistakes; s/he has to be committed, “true” and as honest as possible with respect to his/her public and fans. Benjamin ([1936] 1973) argues that new forms of imaging—such as film and photography—challenge traditional conceptions of art that emphasize genius, originality and uniqueness. These new forms of visuality are rooted in mechanical reproduction. A film print or photograph has no “original”—and, according to Benjamin ([1936]1973), no *aura*—in the conventional sense. Also, the aura that envelops film actor also vanishes in comparison with the stage actor because of new techniques (and the cult of the “movie star” that it generates). Performing arts’ spectators often perceive an *aura* emanating from the stage actor. This is most obvious when considering the charismatic power emanating from singers such as Mick Jagger and Bono or actors like Ethel Barrymore and Gerard Depardieu. This aura may be connected with indexical authenticity defined by Grayson and Martinec (2004) as “a person’s actions or expressions [that] are thought to clearly reflect who the person really is” (297). It is also in line with the concept of performance authenticity (expressive authenticity in philosophers’ terms) that may be defined as faithfulness to the performer’s own self and originality in that the performer does not ape someone else’s way of playing (Kivy 1995). In summary, the performance’s uniqueness (including live production, *aura*, indexicality) and irreproductibility seem to make the experience real and true and so, to be determinants of authenticity in the performing arts.

As mentioned before, in performing arts, the live presence of the audience is an essential element of the show. The existence of strong social interactions with the rest of the audience as well as

TABLE 1
Authenticity and Its Applications to Arts

	Plastic/Graphic Arts Painting, Sculpture	“High” PA Classical music performance, Opera, Ballet, Theatre	“Pop” PA Pop/Rock Concerts, Musical plays	Cultural Industries Movies, Photography, Music (records and tapes), Edition, Television, Radio
Originality	Can be reproduced but not always in its original state (fakes) and is often transmissible	Can not be reproduced in its original state but “sacred” original texts, compositions and scores	Can not be reproduced in its original state	Depreciation of authenticity because of multiple reproduction and transmissibility
Uniqueness and truthfulness	Uniqueness (challenged by reproduction)	Uniqueness of the performance, “live”	Uniqueness of the performance, “live”	No uniqueness
	Aura emanating from the artist	Aura emanating from the performer	Aura emanating from the performer	Lack of aura
	Indexical (and possible Iconic) authenticity	Indexical (expressive) authenticity	Indexical (expressive) authenticity	Highly possible Iconic authenticity
Endowment of the experience with authenticity	Existence without any audience	Existence through audience (moderate interactions)	Existence through audience (strong interactions)	Existence through audience (few interactions)
	Cult Value (but with multiple reproduction, increasing exhibition value)	Cult Value (more inner ritual)	Cult Value (more outer ritual)	Dominance of exhibition value
	Weak negotiation between fantasy and real	Negotiation between fantastic and real elements	Negotiation between fantastic and real elements	Strong negotiation between fantastic and real elements
No Authenticity	Postmodern View of Hyperreality			

with the performers (in comparison with the more anonym cinema) adds authenticity to the show. Aesthetic experience inspires and produces a reaction, but art is something that exists both independently and outside of the consumer of art, as well as within the human realm. It is through the interaction between the consumer and the art that aesthetic experience is materialized (Venkatesh and Meamber 2006). For the audience, attending performing arts is a major opportunity to establish and maintain social ties, to experience and share emotions. Social interactions contribute to authenticity through rituals and the emergence of a *communitas* of devoted spectators. This concept has been introduced by Turner (1969) and was redefined by Belk, Wallendorf and Sherry (1989) as “a social antistructure that frees participants from their normal social roles and statuses and instead engages them in a transcending camaraderie of status equality” (7). In other words, people who otherwise do not have anything in common interact and share experiences. Turner (1977) has characterized *communitas* as involving a “shared flow.” It should be noticed that, during the show, the balance between outer and inner manifestations of *communitas* may differ between high culture (i.e. opera, theatre) and popular culture (i.e.

rock concerts). For example, in a rock concert, a strong interaction between an individual and the rest of the audience is clearly illustrated by situations when spectators sing together with the performer or “bring the house down.” A larger and highly-involved audience gives more room for laughing, crying, shouting, or jumping together, which add authenticity to the show. The audience forms a collective identity (*communitas*) during the performance, which results in spectators’ feeling of having lived a “real” authentic experience. These interactions also imply rituals (Rook 1985). Various aesthetic products such as operas or theatre are commonly considered to be spiritually elevating, and their consumption is highly ritualized (Levy, Czepiel, and Rook 1981). Even less elevating aesthetic situations, such as heavy metal concert, are extensively ritualized episodes (for instance, some AC/DC fans also called “headbangers”, all shaking their head while following the beat). With these *communitas* and rituals, the cult value, beloved by Benjamin ([1936] 1973), persists and contributes to authenticity.

Fantasy in performing arts can also contribute to authenticity. Logically enough, performing arts experiences involve a steady flow of fantasies, feelings and fun. As in Rose and Wood’s study

(2005), attending performing arts results in an active negotiation of fantastic and real elements that leads to a constructed, authentic experience characterized as “hyperauthentic” (Rose and Wood 2005). Moreover, at the opera or during a theatre play, the participation to the show also implies a flow or peak experience. Flow experiences include a centering of attention, a loss of self, a feeling of being in control of self and environment and an autotelic aspect such that the activity is its own reward (Csikszentmihalyi (1975) referenced by Belk *et al.* 1989, 8). As pinpointed by Arnould and Price (2000), activities that induce flow or peak experience (intense emotions for instance) may be experienced as authenticating acts. The issue here (regarding strong social interactions and the blend of fantasy and real) is not whether the individual “really” experiences the authentic, but rather whether the individual endows the experience with authenticity (with empathy for example). So, authenticity of the performing arts may be constructed both socially and through spectator’s personal experiences. This idea is in opposition with postmodernists’ view of a “pristine world of uncontaminated art” i.e., a world where artists create aesthetic objects to realize their personal vision and to satisfy their own creative impulses and where the artistic enterprise is removed from the world of consumer whims and fantasies (Venkatesh and Meamber 2006).

CONCLUSION AND FUTURE RESEARCH

“Without culture, and the relative freedom it implies, society, even when perfect, is nothing but a jungle. This is why any authentic creation is a gift to the future” (Camus 1953, 186). This quote from Albert Camus summarizes pretty well which kind of authenticity performing arts spectators are looking for: the authentic (re)creation. In this paper, authenticity has been presented as committed, as resulting from personal expressions, as being true to one’s artistic self rather than to an historical tradition (Dutton 2003). The *aura* of the artists clearly survives. Really taking part to the show, the audience contributes to authenticity: the performing art’s experience is not objectively real but rather endowed with authenticity by the spectators themselves (Arnould and Price, 2000). That is why we have to accept that fantasy and real are blended and negotiated by the consumer. Moreover, the existence of the work of art with reference to its *aura* is never entirely separated from its ritual function (Benjamin [1936] 1973). With *communitas* and rituals, performing arts have something “sacred” that make them more authentic experiences. Nevertheless, some threats to authenticity exist like when adaptations are made in order to be in fashion or when performers lack honesty.

In addition to the quest for genuineness in performing arts, future research should be directed toward the concept of nostalgia that certainly is connected with authenticity. Some people are nostalgic when thinking about the *Woodstock* festival that Arnould and Price (2000) would certainly qualify as an authoritative performance, i.e., “a collective display aimed at inventing and refashioning cultural traditions” (140) such as the antiglobalization or anti-branding practices exhibited en masse during the Burning Man festival (Kozinets 2002). Perhaps present events such the *Live Eight* is a substitute for the *Woodstock*’s nostalgic persons and attempts to remind us what are the “true” values or what is a community so finally what is “authentic”.

Finally, more and more performers and producers spread political views through their shows. Philip Auslander has written about the Wooster Group’s political postmodernism (1992): the group uses to recontextualize historical texts and exposes the texts’ underlying political assumptions. Then they calls on audience members to formulate their own commentaries, their own answers

to the questions raised; in doing so, the group returns critical voices to the audience. In that way, they also create a kind of “authentic” experience, making spectators reflect on present reality. As mentioned by Turner (1982) in his book on theatre, “when we act on the stage, whatever our stage may be, we must now in this reflexive age of psychoanalysis and semiotics as never before, bring into the symbolic or fictitious world the urgent problem of our reality”.

Philosophers will certainly agree if we assume that the depth of authenticity in the performing arts finally remains in the communion of honest and “true” artists with a passionate audience...

Aesthetic Advertisements and Scientific Evaluations: Divergent Philosophies in Advertising Production

Aidan Kelly, Dublin Institute of Technology, Ireland
Katrina Lawlor, Dublin Institute of Technology, Ireland
Stephanie O'Donohoe, University of Edinburgh, UK

EXTENDED ABSTRACT

Art or Science? Advertising in Historical Perspective

Advertising has been recognised for its embodiment of aesthetic qualities (Brown 1995; Venkatesh and Meamber 2006), and some theorists have suggested that advertising in itself is a legitimate form of art (Gibbons 2005; Scott 2005). However, advertising fulfils a commercial business function for client sponsors, and the conflict between art and commerce within advertising agencies has been an omnipresent macro theme of advertising history (Frank 1997; Jackall and Hirota 2000). In the early twentieth century, there was a concern amongst clients and advertising agencies to minimise the risk associated with advertising through the application of scientific approaches to predict, measure and control the production and reception of advertisements (Kreshel 1990; Marchand 1985). The most significant proponent of the "scientific" approach to advertising was Claude C. Hopkins, who's landmark textbook "Scientific Advertising" (Hopkins 1998 [1923]) was extremely influential on how advertising was practiced during this time period, and his work inspired other practitioners to write highly popular and influential books detailing rational and rule-based scientific approaches to writing, developing and testing advertising that were pivotal to both commercial and creative success (Ogilvy 1963; Reeves 1961).

The 1950's and 1960's however brought about a global period of cultural and social change, and with it what became known as "the creative revolution" in advertising (Frank 1997). A new generation of creative advertising practitioners had arrived such as Leo Burnett and William Bernbach, who had a more aesthetic appreciation of advertising and rejected the scientific dominance and rules of the Hopkins advertising tradition. While the creative revolution in advertising took place in the mid-twentieth century, the divergence between aesthetic and scientific philosophies in advertising production has been an enduring feature of the industry up to the present day (Fox 1997; Steel 1998; Tasgal 2003). This philosophical divergence is most apparent in client's use of scientifically-orientated copy testing in the creative process, which is often based upon a "neo-positivist epistemology" (Hackley 2003, p. 324) to predict and measure consumer response to advertising, and is regarded as "pseudo-science" by creative teams (Kover 1996, p. 8). Creative cultures in advertising agencies have artistic ideologies (Hackley 2003; Hirschman 1983), while client cultures are increasingly adopting scientific approaches to creative processes (Tasgal 2003), and this philosophical division has sustained the conflict between art and science in advertising production (Bogart 1989; Eighmey 1988).

Research Method

The primary research for this paper draws from interview data collected during an ethnographic study of a full-service advertising agency in Dublin, Ireland in 2003. The purpose of the paper is to explore how advertising practitioners describe the dominant philosophies, ideologies and conflicts that exist in the production of advertising in a contemporary agency, and to investigate if the historic division between art and science in advertising is manifested within these discursive accounts (Fox 1997). Ten ethno-

graphic interviews were conducted in total (Spradley 1979); five interviews with advertising account planners, and five interviews with advertising creative teams of copywriters and art directors. The broad interview agenda was to gain informants reflections and observations on the process of producing advertising, the nature of everyday work practices in an advertising agency, the role of advertising clients in the creative process and the methods of advertising research used to evaluate the advertising produced within the agency. The interviews were tape recorded and fully transcribed into over 80,000 words of text. A discourse analysis approach was adopted for the collection, analysis and interpretation of the interview data (Potter and Wetherell 1987; Wood and Kroger 2000), to explore how advertising practitioners described and accounted for the practices and processes of developing advertising campaigns with corporate clients.

Data Analysis

Four central "interpretative repertoires" were developed from the interview data, which are the stylistic sets of terms, figures of speech and metaphors drawn upon by advertising professionals in the interviews to describe their work within the agency and the advertising process more generally (Hackley 2000). "*Client Ideology*" described the power relationship between large corporate clients and the advertising agency, which was based upon the economic dependence of the agency on the business of the client. This power relationship was reinforced in the ways in which advertising agency processes and practices in the development and evaluation of advertising ideas for large clients were constructed through dominant client ideologies. "*Scientific Rationality*" described the conflict between certainty and risk in advertising production, and how large clients rationalised the creative process within the agency through the application of scientifically-orientated copy testing methodologies to evaluate advertising. "*Tunnels of Mediocrity*" was drawn upon by the creative practitioners to describe how the "systematising" of advertising by clients through copy testing led to the production of advertisements that were "middle of the road" and "safe", and in this process advertising became "acceptable to all and exciting to no one" (Steel 1998, p. 226) from the creative perspective. Finally "*Managerial Accountability*" described how client representatives were increasingly being held personally accountable to managerial superiors within client organisations for advertising campaign decisions, which reduced the risk-taking propensity and bravery of clients in the creative process.

Conclusions

This paper has explored the historical conflict between art and science in advertising production, and has shown how this philosophical division is still both relevant and apparent in contemporary practice in an Irish advertising agency. While the study focuses upon one advertising agency within a specific cultural context, some conclusions can be drawn and recommendations for advertising practice can be made. The scientific paradigm of prediction, measurement and control was an implicit framework used by clients to evaluate the advertising produced by the agency, which was a source of underlying creative conflict and divergent philoso-

phy within the advertising process. A key finding of the paper is that the advertising cycle between art and science continues to perpetuate itself in contemporary advertising practice in Ireland (Fox 1997), and that science was the dominant paradigm for the evaluation of creative advertisements by large clients. Some suggestions for a cultural and aesthetic approach to research knowledge are offered as a viable alternative to the scientific paradigm in advertising production.

ROUNDTABLE

Disseminating Transformative Consumer Research: Getting Research Results Out of the Tower and Into Consumers' Lives

Stacey Menzel Baker, University of Wyoming, USA
David Hunt, University of Wyoming, USA
David Mick, University of Virginia, USA
Julie Ozanne, Virginia Tech University, USA

BACKGROUND—TRANSFORMATIVE CONSUMER RESEARCH

In the report on the ACR Task Force on Transformative Consumer Research (TCR), David Mick describes the mission of TCR as making "...a beneficial difference in the lives of consumers, both present and future generations, through the chosen focus and conduct of specific research, and in the communicating of its implications and usefulness. More simply stated, TCR is "...consumer research in the service of quality of life."

In addition to identifying a number of substantive topics for Transformative Consumer Research, members of the inaugural Task Force on TCR acknowledged the importance of *disseminating transformative research* in a form comprehensible to and valued by consumers. Task force members recommended several strategies including, special issues of academic journals, special symposia and published proceedings, development of the "for consumers" section of the ACR website, creation of the position of ACR chief communications officer, and development of media aimed at the general public. This initial dialogue provides a framework and some strategic options for moving the relevance of consumer research findings closer to the consumer.

ROUNDTABLE PURPOSE

In the spirit of the Task Force's call to develop and act upon the ideas that emerged from the initial dialogue, the purpose of the Disseminating TCR roundtable is twofold: 1) to further develop and clarify appropriate mediums for reaching consumers with transformative research, and 2) to bring to light existing resources where synergistic interest in substantive TCR topics generates opportunities for collaboration in the dissemination of transformative research to consumer audiences.

ROUNDTABLE STRUCTURE AND CONTENT

The proposed Disseminating TCR roundtable will include: 1) members of the inaugural Task Force on Transformative Consumer Research, 2) researchers actively involved in substantive topics relevant to transformative consumer research, and 3) experienced and aspiring consumer researchers interested in making their research relevant and accessible to consumers.

Panelists will be asked to share personal experiences with research projects in the area of TCR, and to discuss appropriate mediums and possible resources for disseminating their findings to consumers. It is expected that the ensuing discussion will stimulate interest in seeking synergistic collaborations with the express purpose of disseminating transformative research to consumer audiences.

Particular questions to be addressed include: Where and how should our findings be communicated? Who is the audience? Who should/could be involved in dissemination the findings? How can we leverage relationships within university environments to facilitate the information dissemination? How can we leverage information collected by state and federal agencies (e.g., needs assess-

ments) and how can we leverage their existing relationships with consumers to communicate our findings?

There are several potentially valuable outcomes of this roundtable. One would be a better understanding of how the "For Consumers" section of our ACR website should look (e.g., Who is the audience? How should the information be communicated? How can we leverage relationships within university environments and within consumer interest groups and agencies?). Another outcome would be exploring new publication options and collaborations with ACR for newsletters, books, and so forth that are aimed at the general public and its welfare. Another outcome would be exploring the development of a volunteer or partly-paid Communications Director position at ACR, a person who would have a large role in coordinating publicity and new findings related to ACR's venture in Transformative Consumer Research.

SPECIAL SESSION SUMMARY

Low-Fat Foods and High-Fat People: The Role of Anticipated and Experienced Consumption Pleasure and Guilt

Pierre Chandon, INSEAD, France

Brian Wansink, Cornell University, USA

According to Vohs and Baumeister (2004) "Eating is one of the most commonplace, yet least well understood, self-regulation domains." Indeed, how can one reconcile the rising obesity rates with the increasing availability of healthy foods and the increasing number of Americans who are on a diet and exercise regularly?

The objective of this special session is to examine how anticipated and experienced consumption pleasures and guilt can explain why we are a nation of low-fat foods and high-fat people. Specifically, the three presentations show that the guilt caused by the perceived healthiness of food influences the anticipated and experienced pleasure of consuming it, which in turn affects whether people choose healthy or unhealthy food and how much of it they consume. These papers also offer different insights for leading consumers toward healthier food consumption decisions.

In the first presentation, Raghunathan, Naylor, and Hoyer show that one of the reasons why consumers steer away from unfamiliar healthy food is that they expect that it tastes worse than unhealthy regular food. For example, they find that people expect that a new brand of crackers tastes better when it is high in "bad" saturated fat than when it is high in "good" unsaturated fat. They also find that people enjoy Mango Lassi more when it is described as "generally considered unhealthy". Their results hold regardless of whether consumers believe that unhealthy food is generally tastier than healthy food or not. This suggests that education programs and even taste tests aimed at convincing consumers that healthy food is tasty may be of limited impact.

In the second presentation, Wansink and Chandon show that, even if consumers have already chosen a healthy food alternative, even a familiar one, they are likely to overeat it and may therefore end up with a higher calorie intake than if they had chosen the less healthy food. For example, they show that labeling M&M's as "low fat" increases food intake during a single consumption occasion of people by up to 50%. They show that this occurs 1) because people erroneously infer that "low fat" means "low calories" and that a larger serving size is therefore appropriate for low-fat foods and 2) because "low fat" labels decrease anticipated consumption guilt. From a public policy perspective, they find that providing objective serving size information (e.g., "contains 2 servings") only reduces overeating among normal weight consumers, *not* among overweight consumers, who typically experience low levels of guilt.

The third presentation, by Goldsmith, Kim, and Dhar, integrates the findings of the first two presentations. They show that feelings of guilt caused by the perceived unhealthiness of food reduce anticipated and experienced consumption pleasure for unambiguous food but increase anticipated and experienced consumption pleasure for ambiguous food. They find that priming guilt reduces the anticipated enjoyment from eating a favorite dish and reduces the actual enjoyment from consuming ice cream. For novel food however, they find that priming guilt *increases* the expected and experienced consumption pleasure. These findings explain why Raghunathan, Naylor, and Hoyer, who focused on ambiguous food, found higher likelihood of choosing guilt-inducing unhealthy foods whereas Wansink and Chandon, who focused on well-known snacks, found a lower consumption quantity for guilt-inducing unhealthy foods.

SPECIAL SESSION SUMMARY
Thinking About the Future
Ying Zhang, University of Chicago

SESSION SUMMARY

Consumers' everyday choice of action is often based on future-oriented thinking. For example, consumers may decide to forgo a delicious dessert in anticipation of achieving their ideal weight by a certain date, or they may decide to open a college saving account with the hope to go to college in the future. Although a great deal of research has been directed toward the dynamics of self-regulation in consumer choice (e.g. Fishbach and Dhar, 2005; Kivetz and Simonson 2002), relatively less attention has been given to how thoughts about future goal attainment may influence consumers' current goal pursuit. Given the motivational power of future expectations or fantasies, this session seeks to explore the key principles of how future-oriented thinking may impact consumers' current goal pursuit.

When contemplating about future, consumers may think about what they would do (i.e., *actions*), predict how they would feel (i.e., *emotions*), and plan when they would take actions to pursue their goals (i.e., *temporal frames*). In this session we plan to address these different aspects of thinking about future. In terms of future actions, we explore how expecting obstacles in future goal pursuit influence people's optimistic predictions and how these predictions may then impact their actual goal pursuit. In terms of expected emotions, we are interested in how thinking about future emotional experience enhances one's motivation for ongoing goal pursuit. In terms of temporal frames associates with goal-setting, we present research exploring whether thinking about limited (vs. unlimited) self-regulatory resources make people focus more on goals set for the proximal, compared with for the distant future.

The three papers in this session are organized around the theme of impact of future-oriented thinking on self-regulation in the present, and they each addresses one specific aspect of thinking about future: planning actions, anticipating emotions and considering available ego resources. Specifically, the first paper (by Zhang and Fishbach) suggests that when consumers expect obstacles in future goal pursuit, they come up with more optimistic predictions to motivate themselves, and these optimistic predictions in turn elicit higher motivation for their goal pursuit. However, when consumers strive to be accurate in their predictions, they become more conservative when considering the effect of future obstacles, and their actual motivation for goal pursuit decreases as a result. For example, consumers who hold a saving-money goal would predict to save more in face a big end-of-holiday sale, and they would subsequently end up saving more compared with those who try to be accurate in making such predictions, and who may report less saving when facing a big end-of-holiday sale, and actually save less.

The second paper (by Keinan and Kivetz) builds on previous literature attesting that consumers often suffer from a reverse self-control problem, i.e., exercising too much self-control and forgoing short-term pleasures. This paper examines whether consumers can foresee the future detrimental consequences of excessive self-control at present. It demonstrates that anticipating future regret relaxes consumers' self-control efforts at present and motivates choice of indulgence. For example, thinking about the regret one might feel in the distant future for missing out on an indulgence may encourage the person to choose more temptation-related options in an immediate choice.

The third paper (by Mukhopadhyay and Agrawal) indicates that individuals' future-oriented goal setting interacts with their lay

theory on whether self-control is a limited or unlimited resource, suggesting that consumers who believe their self-regulatory resources are limited are more likely to act on goals that are temporally closer, whereas those who hold the belief that self-regulation is unlimited are more influenced by distally framed goals. For example, consumers who believe that self-control resources are limited may be willing to pay more for a gym membership when the keep-in-shape goal is framed for the near future, whereas those who believe self-control is unlimited may be willing to pay more when the same goal is framed for the distant future.

Each of the three papers in this session explores one aspect of future-oriented thinking—expected actions, expected emotions, and expected temporal frames. Collectively, they provide new insights on the understanding of self-regulation by studying how individuals' future-oriented thoughts may impact their ongoing actions. The set of papers will lead to an interesting discussion about the effect of such psychological factors as temporal distance on consumer choice. These papers further contribute to an emerging research area that is relevant to the diverse interests of many ACR members: those interested in self-control, motivated cognition, construal level, optimism and emotions.

“To Be Optimistic or To Be Accurate: How Self-Control and Accuracy Motives Influence Predictions of Goal Pursuit”

Ying Zhang, University of Chicago
Ayelet Fishbach, University of Chicago

Consumers' forward-looking predictions, such as how long it will take to complete certain tasks and how much one can save next year, consistently suffer from the optimism bias. Both cognitive (Buehler, Griffin, and Ross 1994) and motivational explanations (Kunda 1990; Taylor and Brown 1988) are offered to account for the optimism bias in predicting one's goal pursuit, arguing that insufficient attention given to obstacles and motivation to see oneself in positive lights are reasons behind the optimistic predictions. More generally, it is believed that when people intend to arrive in a particular and directional conclusion, they rely on some biased cognitive processes, such that the desired outcome can be attained through reasoning.

Whereas all existent accounts emphasize the impact of the desirability of outcome in causing the prediction biases, we propose that consumers come up with optimistic predictions in order to motivate themselves when anticipating obstacles to their future goal attainment. Specifically, we propose that the predications of future goal pursuit involve two competing motives: an accuracy motive, by which people try not to overestimate or underestimate their future goal pursuit, and a self-control motive, by which people seek to motivate themselves by making an optimistic prediction.

These two competing motives (accuracy vs. self-control) may lead to opposite predictions when people face obstacles for goal pursuit: while the accuracy motive points to a more conservative prediction, the self-control motive may push for a more optimistic prediction to motivate more goal pursuit. Which of the two competing motives takes the upper hand in predictions would then depend on whether the situation calls for greater accuracy or more self-control.

When people exercise self-control, anticipation of obstacles to the attainment of important long-term goals activates counteractive evaluations (Fishbach and Trope 2005; Trope and Fishbach 2000).

Therefore, it is possible that in situations where obstacles are present, the activated self-control motive fosters optimistic predictions as a demanding goal to elicit higher motivation. On the other hand, when the motivation to produce an accurate estimate is emphasized, people generate more conservative predictions. We further hypothesize that predictions affect actions, such that optimistic predictions induced by self-control would motivate more actual goal pursuit, compared with a more accurate but more conservative and hence, less motivating prediction.

Three studies were conducted to test our general hypothesis. In Study 1, participants were asked to predict the amount of their future goal pursuit either before or after they answer questions concerning possible temptation pursuit. The results showed that participants predicted that they would engage in more goal related activities (e.g., studying for exams) when they thought about temptations that may undermine their goal attainment first, compared with when they did not. However, when prompted to be accurate in their predictions, participants estimated roughly equal amount of goal pursuit before or after the thoughts on temptation.

Study 2 extends the basic finding using behavioral measures. In this study, participants were given a take-home exam to finish and were asked to give an estimated return date before they left. When participants were motivated to complete the exam early, those who expected interference in the exam completion, predicted to submit the exam earlier than those who did not expect interference. However, when participants were motivated to offer an accurate prediction, participants predicted to submit the exam later when they expected interference than when they did not. The subsequent measure of their actual submission time showed that those who predicted earlier submission did take less time to complete the exam.

Study 3 further investigated the effect of optimistic predictions on people's effort in goal pursuit. Participants in this study completed a word composition task while listening to some background music, and were either told that the music would help their performance or that it would hurt their performance. The results showed that when participants were motivated to perform well in the task, those who were told the music is harmful predicted to perform better, compared with those who were told that the music was helpful. However, this pattern was reversed when participants were motivated to be accurate in their predictions. The subsequent measure of participants' actual persistence in the task showed that those who predicted better performance despite harmful music showed the highest motivation to pursue the goal.

Taken together, this research identifies two different motives behind people's prediction of their future goal pursuit: a self-control motive, which is made salient by the presence of obstacles to goal attainment, and an accuracy motive, which foster more conservative predictions. As shown in three studies, the self-control motive fosters more optimistic predictions and promotes more actual goal pursuit, whereas the accuracy motive induces more conservative predictions and less goal pursuit as a result.

“Remedying Hyperopia: The Effects of Self-Control Regret on Consumer Behavior”

Anat Keinan, *Columbia University*
Ran Kivetz, *Columbia University*

“The trouble with resisting temptation is it may never come your way again.”—*Korman's Law*

Many purchase and consumption decisions involve an intrapersonal struggle between consumers' righteous, prudent side and their indulgent, pleasure seeking side. While purchasing and con-

suming utilitarian necessities and virtues (e.g. a practical car, a healthy food item) is considered responsible and farsighted, yielding to hedonic temptations (e.g. buying a luxurious car, eating a chocolate cake) is viewed as impulsive and wasteful. The perceived precedence of virtue and necessity over vice and luxury is at least as old as ancient Greek civilization (Plato and Aristotle argued that reason ought to rule appetitive and passionate elements). Similarly, consumer self-control research emphasizes the importance of exercising willpower and controlling desires (e.g., Hoch and Loewenstein, 1991; Prelec and Herrnstein, 1992). Much of this research has been premised on the notion that consumption and purchase of vices generate regret (e.g., Baumeister, 2002; Read, Loewenstein, and Kalyanaraman, 1999). According to this perspective, consumers are better off in the long-run if they chose virtue over vice, work over leisure, and utilitarian necessities over hedonic luxuries.

Recent research challenges this approach and suggests that consumers often suffer from a reverse self-control problem, namely excessive farsightedness and over-control, or “hyperopia” (Kivetz and Simonson, 2002; Kivetz and Keinan, 2006). Hyperopic consumers overemphasize virtue and necessity at the expense of indulgence and luxury. Kivetz and Simonson suggest that consumers, who recognize their tendency to avoid temptations and focus on doing “the right thing,” pre-commit to indulgences to ensure that the goal of having more fun and luxury is realized. Further, Kivetz and Keinan (2006) demonstrate that, while in the short-term it appears preferable to act responsibly and choose virtue over vice, over time such righteous behavior generates increasing regret. They argue that the passage of time attenuates regret about choosing vice and accentuates regret about choosing virtue due to the decay of indulgence guilt and the intensification of feelings of missing out on the pleasures of life.

The present research builds on the notion of hyperopia and examines whether consumers can foresee that such prudent behavior will evoke increasing regret. More importantly, we demonstrate that anticipating long-term regret can influence preference and motivate consumers to counteract their righteous tendencies and behaviors. The effect of anticipatory regret on real choices and actual buying behavior is examined using different methodologies, samples, and self-control dilemmas. The studies demonstrate that, whereas short-term regret impels consumers to select virtues and purchase necessities, long-term regret drives consumers to choose vices, purchase indulgent products, and spend more money when shopping.

Our findings are particularly important in view of the frequent use of anticipatory regret in advertising campaigns (e.g. state lotteries, V8, AT&T, Kodak), and the growing interest in the behavioral consequences of consumers' regret (see Cooke, Meyvis, and Schwartz, 2001; Simonson, 1992; Tsiros and Mittal, 2000). While past consumer research focused on imaginary regrets and hypothetical decisions, the present research demonstrates the effects of real regrets on real consumer choices and actual purchases in the marketplace. Furthermore, prior consumer research examined the impact of anticipatory regret on *immediate* preferences and choices. That is, previous studies emphasized for consumers the possibility of regret during the decision process. Since consumers do not typically make purchase decisions immediately following the exposure to a marketing communication (e.g., an advertisement), we examine in two field experiments whether anticipatory regret can affect real purchase decisions that occur a few hours and even a few days after the regret manipulation.

We report a series of five studies that test our conceptual framework. We begin with a pilot study that explores whether the effect of temporal distance on self-control regrets generalizes from

retrospective regret (see Kivetz and Keinan, 2006) to prospective (anticipatory) regret. We then present three studies that demonstrate the effect of self-control regrets on immediate preferences and choices. In these studies, choices of indulgence increase when participants judge the long-term rather than short-term regrets of others (Study 1), anticipate their own regret at the distant rather than the near future (Study 2), or reflect on their regret regarding an actual decision that they made in the distant rather than the recent past (Study 3). We conclude with two field experiments that examine the effects of anticipated self-control regrets on consumers' real purchases at a shopping mall (Study 4) and during the Thanksgiving Holiday (Study 5). Combined, the five studies demonstrate that when consumers consider long-term regrets they are more likely to anticipate regrets of righteous decisions and consequently correct their prudent behavior by indulging and splurging on pleasurable products. The studies also include process measures and examine consumers' mindsets and feelings of guilt and missing out under narrow, broad, and spontaneous temporal perspectives.

“Planning For Which Future? Lay Theories of Self-Control and the Temporal Framing of Goal-Directed Behavior:

Anirban Mukhopadhyay, HKUST

Nidhi Agrawal, Northwestern University

Goal-directed behavior generally consists of two stages—goal setting followed by striving (Bagozzi and Dholakia 1999). A key component of the goal setting process is the time frame associated with each goal—is this something we'd like to get done today, tomorrow, next week, next month or in a year's time? Getting to the goal would require self-control, the ability to resist temptations that may dilute one's pursuit of the relevant goal. This research examines how people's beliefs about the nature of self-control interact with the temporal frames of their goals to influence goal pursuit.

Lay theories have been shown to affect judgments and behavior in a number of domains (Furnham 1988). Specific to goal-directed behavior, Mukhopadhyay and Johar (2005) demonstrated that people's lay theories of self-control, i.e. the extent of the belief that self-control is a restricted resource (as per Muraven and Baumeister 2000) or not, can determine the number of goals set as well as success at these goals. We build on this research by investigating how the temporal framing of a goal can influence goal pursuit differentially for limited versus unlimited theorists of self control.

A growing body of research examines how time-lines that people set for their thoughts influences the nature of the goals they set and how they pursue those goals (Trope and Liberman 2003). Construal Level Theory suggests that when individuals take up tasks for the near future, they construe these tasks at lower levels. These lower levels of construal emphasize feasibility and means, focusing on constraints (Liberman and Trope 1998). The same task to be done in the distant future is construed at higher levels that emphasize desirability and outcomes and not constraints (Liberman and Trope 1998). Our key proposition is that limited theorists, who believe that reserves of self-control are small and finite, should be more concerned about the constraints and resources required to achieve their goal and hence more likely to take a proximal time perspective on their goals. Further, goals framed to be closer (vs. distant) in time are likely to emphasize concerns—of feasibility and resources—of greater relevance to limited theorists and hence likely to lead to greater intentions of pursuit. In contrast, unlimited theorists are likely to focus on the desirability of a goal and hence their time perspective is likely to be more distal. Moreover, goals framed to be distant (vs. near) are likely to emphasize desirability concerns that are more appealing to unlimited theorists leading to greater intentions of goal pursuit.

Given this context, study 1 examined the relationship between lay theories of self-control and goals set for the near vs. distant future in a 2 (lay theories: limited vs. unlimited) x 2 (time frame: week vs. year vs. self-generated control) between subjects design. Participants were asked how many times they planned to work out in the next week / year / a blank space containing the legend “fill in an appropriate time frame.” After an unrelated filler task, respondents' lay theories of self-control were measured as per Mukhopadhyay and Johar (2005.) The number of sessions listed was normalized across conditions to a per-week basis for ease of comparison. Results in the control condition indicated that limited theorists were more likely to pick shorter time frames than unlimited theorists. Further, limited theorists listed more exercise sessions per week in the week rather than year condition, but unlimited theorists had more intentions to work out per week in the year rather than week condition.

Study 2 extended the above by manipulating temporal distance (rather than time periods), manipulating rather than measuring lay theories, and assessing the extent of persuasion of a goal-relevant message. Participants primed with limited vs. unlimited lay theories wrote about the health related activities they planned to do during the course of a given week, either in the near (i.e., “the next week”) or in the distant future (“a week, one year from now”). Participants then read a brochure about a local Iyengar yoga center, and completed measures of attitude towards the center, willingness to pay for yoga class, and a measure of how much reading about Iyengar yoga made them want to join any type of exercise program. Consistent with our theorizing, the results revealed a significant interaction such that limited [unlimited] theorists in the near [distant] frame had more positive attitudes, were willing to pay more for yoga class (almost twice as much), and had greater intentions of joining an exercise program. For unlimited theorists, planning of distant (vs. near) future was more effective. Further studies investigate possible processes underlying the observed effects.

To summarize, we demonstrate that peoples' lay beliefs about self control impact whether people are more effective for near vs. distant goals. Or from another perspective, lay theories seem to induce systematically varying preferences on time frames chosen for goal relevant activities and attitudes towards goal-related activities/objects. These findings are not only of relevance to the immediate theoretical study of naïve theories and self-control, but indeed to many other domains where planned action towards single and/or multiple goals is involved (e.g. savings, investment, health-related behaviors). These studies contribute to our understanding of how people plan their personal goals, factors that might help or hinder their goal-directed behavior, and marketing strategies that might leverage this knowledge.

Special Session Summary

Order Effects in Multiple Choices: of Lost love, Spent Willpower, and Relinquished Control

Simona Botti, Cornell University, USA

SESSION SUMMARY

Most research on consumer decision making has focused on single decisions and their consequences for satisfaction, well-being, and motivation. This single choice paradigm excludes the common situation of multiple sequential decisions, either in the same or in different domains. The act of making multiple choices introduces additional factors that need to be considered when studying decision making. This session focuses on some of these factors, such as the emotional, cognitive, and motivational depletion caused by the interaction between multiple choices, and the influence of the structure of the decision process on the outcomes of sequential choices. Thus, this research cautions against studying decisions without considering the choices that precede and follow them—as we may be ignoring important moderating factors.

The first paper, by Botti and Meyvis, examines how the control one has over different stages of a choice process influences subsequent satisfaction with the decision outcome. Specifically, this paper studies the effect on satisfaction of controlling the consideration set formation, but not the final choice, versus controlling the final choice, but not the consideration set formation. Results show that, both when the initial information about the choice options is ambiguous and when it is not ambiguous, satisfaction is greater when participants control the choice set formation, rather than the final choice. The second paper, by Levav et al., investigates car buyers making a series of real-life choices. The order of these choices is manipulated such that it either proceeds from attributes with a greater variety of levels to those with a lower variety (Hi-Lo) or viceversa (Lo-High). Results show that, relative to those in the Lo-Hi condition, consumers in the Hi-Lo condition are more likely to accept a default option and experience less satisfaction with the final decision outcome. The third paper, by Vohs and Kim, reveals that making multiple choices depletes consumers' ability to engage in self-regulation, thereby decreasing participants' motivation to engage in tasks that require self-control. Interestingly, the relation between making multiple choices and self-regulation also works in the opposite direction, so that when participants' self-regulation resources are depleted their ability to engage in multiple choice-making is impaired.

This session is intended for researchers interested in consumer judgment and decision making, in choice theory and assortments, or in the effect of the choice process on product perception and preference. The three papers should also be of interest to marketing practitioners because they examine a more realistic model of decision making that involves series of choices instead of single choices.

The papers in this session suggest that studying decision making contexts involving multiple, as compared to single, choices present some unique challenges. These challenges derive from two main factors. First, each decision may influence the following one so that the sequence in which the choices are made can significantly affect consumers' evaluation of the decision outcome. Second, making multiple choices enhances the emotional and cognitive costs associated with making a single choice; consequently, prior results showing that making a single choice may negatively affect consumers' motivation and satisfaction can be extended to contexts in which this effect has not yet been found. The study of sequential decisions also has the potential to increase the ecological validity of

decision research as more often than not consumers are faced with a series of choices to make, instead of choices made in isolation. In spite of this importance, researchers have rarely investigated the effects of multiple and sequential choices on consumer behavior (with the notable exception of research in inter-temporal decision making).

“Setting the Stage or Making the Final Cut: The Timing of Control in the Choice Process”

Simona Botti, Cornell University

Tom Meyvis, New York University

Classic research in economics and psychology has found the provision of choice to have beneficial effects on consumers' psychological and even physiological well being. These benefits derived from the act of choosing have been explained both with the opportunity for preference matching and with an increased perception of control. More recent research has however investigated the cognitive and emotional costs often associated with choice to show that in some circumstances the advantages of choice may be moderated. For example, choosing from larger choice sets, as compared to smaller ones, can be emotionally daunting and lead to greater dissatisfaction or choice avoidance, especially when consumers' preferences are not clearly established (Chernev 2003; Iyengar, Jiang and Komenica 2006). A potential explanation for these results is the greater regret that choosers, as compared to non-choosers, experience when forgoing multiple options to which they might have gotten psychologically attached (Carmon, Wertenbroch, and Zeelenberg 2003). Thus, on the one hand, choosing allows people to feel in control of their own actions and select the most preferred alternative, but on the other hand, it involves emotional conflicts that may eventually spoil subsequent satisfaction with the decision outcome.

The present research investigates this interplay of positive and negative psychological consequences of choosing by hypothesizing that a key element in predicting whether the benefits of choice are going to overcome its detriments consists in the choosers' ability to make peace with their decision (Gilbert and Ebert 2002). We tested this hypothesis by manipulating the stage of the decision process in which consumers are allowed to make their choice. When consumers have to select a product, they usually form a consideration set based on the available options and then choose from that set. However, sometimes the first, screening phase is beyond their control (e.g., the store has only a limited number of brands available). Other times, consumers control the screening phase, but not the final choice (e.g., the travel agent selects a hotel from a list provided by the customer on the basis of availability). The act of choosing the consideration set, but not the final outcome, allows participants to control for the worst possible outcome and psychologically prepare themselves for this eventuality. In contrast, being deprived of control over the consideration set formation forces participants to confront a set of choices that have not been freely made, making it more difficult for them to make peace with their final decision.

The first experiment was a 2 (ambiguous vs. unambiguous) x 2 (choice/no choice vs. no choice/choice) between subjects design. Participants in the ambiguous condition were shown relatively non-diagnostic descriptions of nine photographs, whereas those in the

unambiguous condition were shown the actual photographs. Participants in the choice/no-choice condition first constructed a choice set of either three or four photographs and then were informed that the computer would make the final choice by randomly assigning them to one of the photographs from this set. Conversely, participants in the no-choice/choice condition were first assigned a random three or four-option set from the computer and were subsequently allowed to make their final choice by selecting one of the photographs included in the computer-chosen set. Participants were then shown the selected photograph and asked to evaluate it. Results show that participants in the choice/no-choice condition liked the photograph more than those in the no-choice/choice condition, but only when they were confronted with the actual photographs. When participants received relatively non-diagnostic photograph descriptions there was no difference between participants' satisfaction in the two experimental conditions. We explain these results with the assumption that making peace with the final decision was easier in a low-ambiguity than in a high-ambiguity context in that the actual characteristics of the photographs provided participants with more compelling justifications to convince themselves of the merits of the eventual final selection at the moment of the formation of the consideration set. The second study replicated the design of the first study after changing the initial number of pictures from 9 to 7 and fixing the choice-set size to 3. This way the expected ranking of the final photograph selection was controlled for without having to rely on the two different choice-set sizes as in the prior study. In addition, study 2 introduced a third condition (choice/choice) in which participants both constructed their initial choice set and made a final choice from it. This additional condition allowed us to understand whether the difference in satisfaction was due to the choice manipulation at the stage of the choice-set selection or at the stage of the final choice. Finally, additional process measures were collected to have a better understanding of the underlying psychological process. In addition to replicate results of study 1, study 2 results show that the effect on satisfaction was due primarily to the manipulation of choice at the choice-set stage. Consistent with our hypothesis, process measures indicated that participants in the no-choice/choice condition perceived a lower degree of control than those in the choice/no-choice condition, and they felt worse about forgoing the non-selected options both at the time of the consideration set formation and at the time of the final choice. The third study provided additional support to our hypothesis by showing that when participants were not given enough time to make peace with their choices and start the inoculation process, then the effect found in the previous studies were reversed: participants who were shown the photographs and given the opportunity to choose their consideration set evaluated the decision outcome lower than those who were granted choice only in the final stage.

- What factors determine choice demotivation? Iyengar and Lepper (2000) conclude that choice demotivation is a consequence of having too great a variety of options to choose from. In this paper we conduct two field experiments to test the effect of attribute order and variety in sequential choice, and show that demotivation can occur even when choice sets are small.
- Participants were prospective Audi car customers in Germany who had come to the dealership in order to configure and purchase an A4 sedan. We conducted two replications of the same study (with a few caveats mentioned below). The studies were conducted at a computer terminal using the same configuration software available to Audi customers who configure their car on the World Wide Web (see www.audi.de). Only customers who had not configured their car online were allowed to participate. The configuration process includes a sequence of decisions about approximately 40 attributes of the car, made one at a time, and takes approximately thirty minutes to complete. Each decision appears on a different screen, with a side-screen indicating the total price of the car to that point. At any point customers are free to revise their previous choices. For all decisions there is a default attribute level that is already checked-off. For almost all the default is the cheapest option and appears at the top of the list (e.g., engine), but for other attributes this is not the case (e.g., exterior color).
- We chose 8 target attributes (interior color, exterior color, engine and gearbox, rims/tires, steering wheel, rearview mirror, interior décor style, and gearshift style; in Study 2 we replaced engine with radio), and placed them at the beginning of the configuration sequence. Each attribute consists of different numbers of levels, and different levels have different prices; for instance, there are 56 interior colors and 13 types of rims to choose from. After completing a short questionnaire about their experience with Audi cars, the importance of each of the 8 target attributes using a constant sum scale (only in Study 1), and their willingness-to-pay for their new A4, participants were randomly assigned to one of three conditions. Our Hi-to-Lo condition ordered the target attributes from most to least variety (i.e., interior color was the first decision in the sequence and gearshift style the eighth); our Lo-to-Hi condition was the exact opposite (i.e., gearshift style was first and interior color eighth). A control condition simply used Audi's usual sequence, which is not systematically ordered according to attribute variety. Our dependent variable was participants' propensity to accept the default attribute level at each of the eight stages of the target decision sequence. We interpret acceptance of the default as a signal of choice demotivation. The remainder of the decision sequence was the same in all conditions. At the end of the configuration process participants were asked to indicate their satisfaction with the configuration software and the car, their likelihood of configuring the same car again, and the extent to which the car they configured matched their preferences. In study 2 participants were also asked to complete 8 complex addition problems in order to assess cognitive fatigue (there was no difference between the conditions).
- As one would expect from simple taste heterogeneity, we find that as variety increases the likelihood accepting the default de-

creases. Second, we find a main effect of depletion (i.e., fatigue) such that as participants proceed from one decision stage to the next, their likelihood of accepting the default increases. Third, in Study 1 greater attribute importance is associated with a decrease in default choice for that attribute (recall that importance was not measured in Study 2). However, this relationship is qualified by an importance by decision stage interaction, such that the effect of importance on the probability of accepting the default diminishes as participants advance in the choice sequence. It appears that the choice process overwhelms participants' ability or desire to best match their preferences even on their more important attributes. Most important to this investigation, we find that the slope of the depletion effect is steeper in the Hi-to-Lo condition than in the Lo-to-Hi condition. In other words, choice demotivation occurs even for small choice set sizes, provided these followed larger choice sets. Note that this effect persists even while we control for depletion. This finding suggests that demotivation may be a result of insufficient "emotional energy" to resolve a decision, and that when this energy is somehow "drained" (in this case by complex previous choices) then even small choice sets seem overwhelming. It provides a hint of the psychological process of choice demotivation. Finally, in both studies participants were overwhelmingly more satisfied and more confident in their choice in the Lo-to-Hi condition than in the Hi-to-Lo condition. Satisfaction was not correlated with default taking, or with price paid for the car. It appears that satisfaction was most sensitive to the process in which the decision was made. Furthermore, we were able to manipulate price paid for the car depending on condition and on the target attributes we included in the sequence. For instance, in Study 1 participants in the Hi-to-Lo condition paid more for the car because engine, a big ticket item, appeared early in their decision sequence and therefore they were more likely to pick a more expensive engine rather than the cheap default. However, in Study 2, where engine was removed from the target attributes and replaced with a cheaper attribute with few levels, this price payment difference disappeared. This result suggests that people's willingness-to-pay is malleable and can be affected by simple changes in attribute sequence.

"The Bidirectional Relationship Between Making Choices and Self-Regulation"

*Kathleen D. Vohs, University of Minnesota
Jungkeun Kim, University of Minnesota*

This research was motivated by a desire to understand the relation between choice and self-regulation. The results of four experiments are reported. Two experiments examined the effects of making a series of choices on later self-regulation, whereas two additional experiments examined the effect of self-regulation on sequential choices. In both sets of studies, we hypothesized that engaging in one process (e.g., choice) would affect behavior in the other sphere (e.g., self-regulation).

We understand self-regulation as resulting from the availability of self-regulatory resources, which are engaged when people self-regulate. This model predicts that because the (finite) supply of self-regulatory resources is reduced after an act of self-control, subsequent attempts at self-regulation will be less effective. The results of over 60 published experiments support the model. Making a choice may also draw upon self-regulatory resources, we hypothesized, for two reasons. 1) Gollwitzer's Rubicon model of action (Gollwitzer 1996) depicts decision making as occurring in two stages. The first is a deliberative stage, in which people evaluate options in as rational a style as they can; the second is an implemental stage, in which actions are geared toward the chosen option. Choosing requires resources insofar as it is taxing to move out of a

deliberative mindset and into an implemental mindset. 2) Strack's Reflective-Impulsive Model (RIM; Strack, Werth, and Deutch 2006) postulates that when people make a choice, they form a mental connection between the self and the chosen option. The formation of this linkage is conceptualized to take energy, above and beyond merely pondering options or forming preferences. If indeed choice and self-control are related, then we should see that engaging in one of these processes affect operation of the other.

In Experiment 1, participants logged onto the Dell.com website. They were either allowed to make choices from a set of options presented for each computer feature or they were instructed to choose a pre-determined option from the same set of options. Thus, all participants viewed the same stimuli, but only some made choices. Subsequently, participants were asked to solve anagrams. Persistence, as measured by length of time spent persisting, was the main dependent measure. As predicted, making choices affected self-regulation, such that participants who made choices performed poorer on the anagram task, relative to participants who had not made choices. In Experiment 2, participants in the choices condition made 60 binary choices between household products, whereas participants in the no-choices conditions gave their opinions regarding eight advertisements. Thus, participants in both conditions were thinking of their own preferences but only some were making choices based on those preferences. Subsequently, participants were presented with a healthy but bad-tasting beverage and were asked to consume as much as they could. As predicted, making choices rendered participants less able to drink the ill-tasting but healthy drink, relative to merely offering one's opinions.

In Experiments 3-4, we switched the independent and dependent variables to examine the effects of self-regulation on patterns of sequential choice. In Experiment 3, participants' self-regulatory resources were depleted with a task that first creates a habit and then requires the habit be broken in order to follow new rules. All participants first crossed off all instances of the letter "e" on a page of text. A second task separated the depleted from the nondepleted participants. For nondepleted participants, they continued to cross out "e"s on a new sheet of text; for depleted participants, however, their job was now to cross out all "e"s in the text, except when the "e" followed a vowel or appeared two letters before a vowel. The latter task has been found to tax people's self-regulatory resources more than the former task (Baumeister, Bratslavsky, Muraven, & Tice, 1998). Then participants were presented with three sequential choices. Each choice had one high price/high quality product and one low price/low quality product in the same category. The dependent measure was whether participants switched between choosing high price/quality options to low price/quality options (or vice versa) at any point during the three choices. As predicted, participants who earlier depleted their self-regulatory resources switched less (i.e., stuck with the same choice strategy) than participants who had not earlier overridden a habitual response. This finding presumably occurred because switching choice strategies requires volitional energy, which depleted participants lacked. In Experiment 4, we hypothesized that making a switch away from the status quo would require self-regulatory resources, insofar as this process calls upon the active self to diverge from what is already known. Accordingly, participants who were taxed of their self-regulatory resources were hypothesized to prefer a previously-chosen (status quo) option. All participants first made a choice between two options wherein one option dominated the other. Next, participants performed either a nondepleting or depleting version of the crossing out "e" task described above. Subsequently, all participants were presented with another a second choice task. They were presented with a new calculator, which was pretested to be equivalent to the high quality (i.e., dominant) option presented to partici-

pants in the first choice. They were asked whether they wanted to exchange their chosen option for the new option. Participants who had previously expended their volitional resources were less willing to exchange their chosen option for the new option, compared to participants who had not expended self-regulatory resources during the earlier task. Once again, we see that making the choice to switch away from the status quo requires self-regulatory resources.

In sum, choice and self-regulation are integrally linked. In four experiments, we showed that engaging in one process affects one's performance on the other. These findings suggest that there may be a plethora of other mental activities (e.g., problem solving) that will be influenced by earlier engagement in either choice or self-control.

SPECIAL SESSION SUMMARY

When Who I Am Affects Who and How Much I Help: Social Influences on Giving

Karen Page, University of Pittsburgh, USA

SESSION SUMMARY

Despite the fact that spending on donations and gifts is a large part of consumer spending, researchers often focus on consumers' consumption for themselves. In 2004 U.S. charitable donations totaled \$248.5 billion (Charity Navigator 2005). Yet, factors influencing donations and gift giving are not well understood, the unstated assumption being that the same factors that influence choices for self operate—in the same manner—on charitable giving and gift giving. This is unlikely to be the case. Believing that, giving is, in large parts, an activity motivated by social considerations, this session examines social influences in determining donation and gift-giving behavior.

We build on the literature examining the impact of social identities and social norms (e.g. Cialdini et al. 1987; Tajfel and Turner 1979), studying their role in donations and gift giving. Mindful of previous research on the social influences of giving (Lowrey et al. 2004; Reed and Aquino 2003), we seek to better understand the effect that social identities and social norms have on consumer giving. How does knowing the amount of donation given by the person preceding you affect your donating behavior, and why? Do women donate more to outgroups (e.g., Iraqis) than ingroup members (e.g., British), and why? Despite the extreme importance of personal survival, how and why did “giving” evolve in Nazi concentration camps? These questions are crucial to understanding consumers and their desire to connect with society through acts of giving.

The first presentation, co-authored by Jen Shang, Rachel Croson, and Americus Reed, examines the “mere social information effect” on donation behavior, examining when social information influences the level of donations. They find that the mere awareness of a single other's donation amount affects the target's donation level and this effect is enhanced when the consumer's gender identity is congruent and important and his or her decision is collectively focused. In the second presentation, Karen L. Page, Vikas Mittal, and William T. Ross study what influences the choice to donate to members of an ingroup (e.g., flood victims of Katrina in New Orleans) or an outgroup (e.g., flood victims of Tsunami in Asia). They find that internal moral identity and gender interactively influence judgments of relief efforts and monetary donation allocations to the ingroup and the outgroup. Tina M. Lowrey and Jill G. Klein, in the third presentation, explore giving in a highly charged context—Nazi concentration camps—where giving itself had severe consequences. Through the analysis of memoirs, findings indicate that giving and sharing occurred not only among those with close relational ties such as family, but also among strangers. The findings and practical implications of these presentations were addressed by Joan Nelson, the Director of Research and Evaluation for the Heart of Florida United Way.

“I Give, but “We” Give More: The Impact of Identity and the Mere Social Information Effect on Donation Behavior”

Jen Shang, Indiana University

Rachel Croson, University of Pennsylvania

Americus Reed, University of Pennsylvania

The impact of social information (e.g., information about what others have done in the past) is important in a variety of marketing environments (e.g. Reingen, 1982). In the absence of other information, consumers often rely on social information as a basis to make

their own consumption decisions (Amaldoss & Jain, 2005). In this research, we examine a particular kind of social information: another person's contribution to a nonprofit entity—and how that affects contribution behavior. We try to delve into the identity implications of this “mere social information” effect.

This package of studies makes several contributions to the field of marketing and to the knowledge of psychological processes in consumption and donation decision-making. First, it is the first study in marketing, to our knowledge, to demonstrate in a field study setting that social information significantly influences the level of contributions. There has been a call for consumer research to focus on more “messier” environments in order to buttress the mundane realism of the body of knowledge in the field (Cohen, 2005).

Secondly, there is a growing body of work in consumer behavior that illuminates the importance of activated identities on consumption decision-making (Reed 2004; Forehand, Reed and Deshpande 2002) and how identities shift as a function of contextual and situational cues (cf. DeMarree, Wheeler and Petty 2005; Mandel 2003). We demonstrate and build on this research in the domain of donation behavior. Third, an examination of key identity based constructs in the substantive domain of nonprofit giving should be informative for nonprofit marketing and consumption behavior research. These theoretical and practical contributions should also be informative for practitioners in charge of figuring out how to maximize charitable contributions.

In the first two field experiments we show a very subtle pattern of results we refer to as the “mere social information” effect: Awareness of even a single other's contribution amount can affect the target's contribution level (Experiments 1a and 1b). The first field experiment was conducted in an anonymous public radio station on the East coast in June and September 2003 during their on-air fund drive. Listeners responded to on-air appeals during the drive and called the station to make a pledge. After answering the phone with the station's identifier: “Hello, STATION_NAME member line”, experimenters asked: “Are you a new member or a renewing member of STATION-NAME?” After the caller answered, experimenters read (or did not read in the control condition) the following sentence: “We just had another member, they contributed \$300.” The question asked right after the manipulation was: “How much would you like to pledge today?” The dependent measure, the pledge amount, was then collected.

We find that the average contribution is significantly higher in the \$300 condition (\$119.70) than in the control condition (\$106.72). This is a \$13 difference, and would translate into a 12% increase in revenue for the station had all callers been offered the social information. Similar results were replicated in a different public radio station on the west coast using similar method (1a). Donors on average again contribute significantly more in the social information condition (\$65.4) than in the control condition (\$95.34).

In Field Experiment 2, we show that the effect can occur due to the congruence between the source of the social information and the target donor along the gender identity dimension. In particular, we show that this effect differs with the social similarity between the source of the information and the target donor. Here we tell callers the gender of the other contributor “s/he contributed \$300.” Same-gender donors are more responsive to the social information than different-gender donors; matched gender donors (\$141.88)

give significantly more than mismatched gender donors (\$105.7). This result compellingly argues that the *social* nature of the information is critical. This result compellingly argues that the congruence of the target's identity to the other is one possible precursor for the results (see Sirgy 1982).

Finally, in order to examine this effect more closely, we conducted a laboratory study to test at least one possible mechanism through which the kind of social information and congruent identity used in the previous field studies influence behavior. The study is a 2 (Identity Salience: Gender Match vs. Gender MisMatch) x 2 (Identity Self-Importance: low vs. high) x 2 (Collective Mindset: Individualistic vs. Collective) between subjects design with the latter two factors as measured covariates. Participants first read a scenario carefully developed to mimic the situation in public radio fundraising, where either a female or a male donor contributed \$70. In the high (low) identity salience condition, participants' gender matched (mismatched) the donors' gender in the scenario. Identity along the self-importance dimension was measured by modifying Luhtanen & Crocker's (1992) collective self-esteem scale to account for gender. Collective mindset was measured using two questions we developed. The dependent variable is a hypothetical contribution question on "how much would you likely contribute to this radio station? \$_____."

A hierarchical regression on the dependent variable showed that the impact of social information as a reference point for one's own contribution decision is most potent when an identity is activated through congruence with a contributing other, when that identity is chronically important to the giver, and when focal thoughts about how much to give are relatively more collective and interdependent in nature (cf. Mandel 2003). Our results suggest that the kind of effects found may be identification based (as opposed to compliance based). Our results suggest that social information influences behavior when the social information connects with the giver. Identity driven processes impact donors to give more, because "we" give more than "I" do.

This research does not only contribute to the academic understanding of the social identity based influence of social information, it also has significant practical implications. Our results suggest techniques to raise revenues without additional costs. The effect sizes are large, between 12% and 46% percent of revenue.

"Tsunami or Katrina?: Effect of Conflicting Identities in Donation Behavior"

*Karen L. Page, University of Pittsburgh
Vikas Mittal, University of Pittsburgh
William T. Ross, Penn State University*

Consumers hold multiple social identities (Reed 2004). We argue that these multiple social identities interact to jointly affect consumer donation to ingroups versus outgroups. Contrastive examples of such groups for Americans include: victims of Hurricane Katrina versus Indian Ocean Tsunami and families of terrorist victims in London versus Afghanistan. We examine two specific chronic identities—moral identity and gender identity. Specifically, we find that consumers' moral identity, a psychological expansiveness or psychological boundary of ingroups (Aquino and Reed 2002), and gender interact to jointly influence judgments and donations to such groups. Building on this, we also show that the impact of these chronic identities is contingent on the giver's activated interdependent or independent self-construal (Markus and Kitayama 1991; Singelis 1994).

This research enhances our understanding of consumers' multiple identities, even when they are in conflict. Whereas past research has examined effects of chronic versus accessible identities (Agrawal and Maheswaran 2005; Reed 2004), this research

considers the interplay of three novel identities—gender, moral identity, and activated self-construal. The effects of these multiple identities on consumer giving are not additive, but interactive.

The first two studies examine the joint effect of moral identity and gender on 1) donation allocation and 2) judgments of giving. The first study is a survey of adults who are given the option to allocate \$100 to the families of terrorist victims in eight different groups. The study focused on donations made to the U.S. in-group of London and a U.S. out-group of Afghanistan. A manipulation check confirmed that survey respondents perceived London as an in-group and Afghanistan as an out-group. The results indicate that gender and internal moral identity (IMI) interact to influence the extent of donations. Specifically, there is significant favoritism of the ingroup for males with high IMI (\$37.20 vs. \$9.90 donated to London and Afghanistan respectively) but no differentiation is made between the ingroup and outgroup by females with high IMI (\$17.68 vs. \$8.71 donated to London and Afghanistan respectively). Conversely, this effect is reversed for individuals with low IMI. Males with low IMI do not differentiate between the ingroup and outgroup (\$17.05 vs. \$12.90, respectively) whereas females with low IMI do differentiate (\$34.45 vs. \$3.12, respectively).

This effect is replicated in a laboratory study with a between-subjects design where we examine participants' judgments of relief efforts by manipulating the group (London vs. Iraqi terrorist victims) for which the relief effort is being made. The chronic identities of gender and internal moral identity are measured. Again, a three-way interaction of IMI, gender, and group is found. Similar to the donation allocations made in the first study, judgments of relief efforts by males with high IMI favored London over Iraq and judgments by females with high IMI did not differentiate between the groups (Males: 4.59 vs. 3.79; Females: 4.63 vs. 4.62, London and Iraq respectively). The reverse effects are found for males and females with low IMI such that females favor London efforts over Iraq efforts whereas males do not differentiate between groups.

In the final study, we examine the impact of a third identity, the giver's activated self-construal, on the effect of the chronic identities on giving. We manipulate participants' activated self-construal in this study. We examine the effect with judgments of giving to two groups of natural disaster victims, Hurricane Katrina and Indian Ocean Tsunami. This between-subjects design (Group: New Orleans vs. Indonesia) X (Activated Self-Construal: Independent vs. Interdependent, manipulated) X (IMI, measured) X (Gender) finds a four-way interaction of group, self-construal, IMI, and gender. In our sub analyses, we find that the two-way interaction of group and IMI is significant for males with independent priming, which is consistent with their chronic cultural self-construal, such that those with high IMI favor Katrina victims over Indonesia victims (5.41 vs. 4.10 for Katrina and Indonesia respectively) but those with low IMI do not differentiate (4.18 vs. 3.81 for Katrina and Indonesia respectively). The two-way interaction of group and IMI for females primed with an interdependent self-construal, which is inconsistent with their chronic independent cultural self-construal, is not significant. The results show that for these females with interdependent self-construal priming, no group differentiation occurs, regardless of IMI (High IMI: 5.55 vs. 5.45; Low IMI: 5.50 vs. 5.14, Katrina and Indonesia respectively). These results suggest that the interaction of these multiple social identities, which are in conflict at times, significantly influence consumers' judgments of giving.

Furthermore, the interaction of these multiple social identities does not simply result in an additive effect, but actually reverses or attenuates the extent of in-group favoritism on donation allocation and judgments of giving. These results not only have substantive theoretical implications for the effects of multiple, and sometimes

conflicting, social identities, but also practical implications for fundraising efforts and public policy issues.

“Giving and Sharing in Concentration Camps: The Impact of Third Party Influences”

Tina M. Lowrey, University of Texas at San Antonio

Jill G. Klein, INSEAD

The study of giving and sharing in the extreme setting of concentration camps (through the textual analysis of memoirs as case studies; see Stake, 1995) yields seemingly contradictory findings. On the one hand, survivors suggested that they and others around them were self-absorbed to the point of “every man for himself”—on the other hand, most survivors also described touching scenes in which they and others shared along a giving continuum. On one end of this continuum lay small tokens or mementos given to others in an effort to boost morale. On the other end of the continuum lay the potential sacrifice of one’s life for another (Klein and Lowrey, 2006).

Clearly, the likelihood of giving in this setting was linked to relations between individuals—the closer the connection between prisoners, the more likely giving and sharing was to occur. However, there were also incidents of giving and sharing with complete strangers:

“Human relations in the camps took as many forms as they generally take. The most narrow but intense social unit was the family; beyond that were old friends, and beyond that a sense of collective identity among those from the same town or area—bonds reinforced by the earlier ordeal of deportation which all had suffered together. Another strong basis for solidarity was nationality. There are endless tales of the toughness of national groups sticking together, and all survivors recall occasions when they received help from, or offered help to, a stranger who was a fellow countryman.” (Des Pres, 1976)

This calls to mind concentric circles of extradyadic relations (Lowrey, Otnes and Ruth, 2004), in which the immediate family is in the center, extended family in the next “ring” out, friends in the next, and so on. In addition to the strangers who were fellow countrymen mentioned in the quote above, however, there were also several survivors who recalled giving and sharing occurring between strangers who did not share nationality—in many of these cases the common bond was the shared tragic fate of Jewish heritage at a specific time in history, in others (where “outsiders” helped those in the camps despite potentially devastating results if discovered), the common bond was simply being human.

It makes perfect sense that one might be more likely to share more frequently with one’s own family member than a stranger. However, acts of giving and sharing in the camps were guided by social norms that, while perhaps rooted in everyday behavior from the outside, were more intense given the extreme setting. Social influence on giving behavior has been explicated in a more mundane setting (Lowrey, et al, 2004). In that study of Christmas giving, ten types of influence were identified that stemmed from five underlying relational processes. The first two types of influence, calibrating and practicing equipollence, stemmed from the process of making social comparisons. Clearly, this occurred in the camps, as the preceding discussion suggests. Calibrating is when a giver distinguishes recipients based on the type and/or closeness of the relationship (the idea of concentric circles explained above). The practice of equipollence is when a giver treats sets of recipients as

equivalent. This was very important among groups of friends in the camps who had bonded together to help each other survive.

The next two types of influence, reenacting third-party traditions and relinquishing tradition, were somewhat less likely to occur in the camps, although there were a few instances of such behavior (such as continuing a family holiday tradition despite the death of the originator). The underlying relational process for these influences is adjusting to disrupted relational traditions, which was very likely to occur. However, the impact of third parties in this setting was less influential.

Enrolling accomplices and using surrogates both stem from the process of accessing social support, but only the first was highly likely to occur. It was often necessary to enroll the assistance of another in order to procure physical gift items, as well as intangible gifts (such as getting a physician to label an inmate as too sick to work for a day). Very few instances of giving or sharing occurred through the use of surrogates (which entails giving a gift to someone “through” a revered third party specifically to minimize the risk of gift rejection, such as a woman giving a gift to her mother-in-law “from” the children). The use of surrogates is a rare behavior in any setting, but even more so in the extreme setting of the concentration camps.

Gaining permission from gatekeepers and adhering to group norms both stem from the process of acting within relational rules, but only the second was highly likely to occur. Indeed, adhering to group norms in the camps was highly correlated with the practice of equipollence. Finally, integrating and purging, both stemming from the initiation and severing of relationships, was very relevant in the camp setting. Again, some of this behavior was closely linked to norms regarding who should or should not be considered a part of the group.

Although these social influences and their underlying relational processes originally emerged in a study of Christmas shopping, the majority of them are valid descriptors of the behavior observed and described in the memoirs of concentration camp survivors as well. The difference is that the consequences of violating norms in the latter case could be much more severe. Indeed, giving and sharing strengthened bonds within social networks, and one’s very survival in the camps was directly related to the social networks to which you belonged:

“...survival...could only be a social achievement, not an individual accident...” (Weinstock, 1974, quoted in Des Pres, 1976).

The Effect of Unintended Information Acquisition

Lan Xia, Bentley College, USA

Kent B. Monroe, University of Richmond and University of Illinois at Urbana-Champaign, USA

EXTENDED ABSTRACT

Most research in consumer information search assumes that consumers know what product they want and the purpose of search is to acquire information to help them choose. However, information acquisition is a much broader activity than mere direct search. Indeed, information acquisition is a collection of activities through which consumers obtain product and service information, voluntarily or involuntarily, consciously or non-consciously (Xia and Monroe 2005). In addition to direct search, people can and do acquire information unintentionally through casual browsing such as looking at a retail display window, scanning an advertisement, skimming through a catalog or website, or even when walking through a store. Searching and browsing are two conditions under which consumers acquire information. While information regarding the search target is acquired under the searching condition, additional information regarding non-targets may be acquired unintentionally while browsing or searching. We propose that consumers acquire information both directly and indirectly, with and without intention, and yet such information may be available to them when facing a purchase task.

The difference between information acquired through different exposure conditions (e.g., searching and browsing) may show in consumers' recollection of the exposure. We use the remember versus know paradigm to examine these differences. Remembering and knowing are two subjective states of awareness (Gardiner and Richardson-Klavehn 2000). *Remembering* refers to past personal experiences and events that people can recreate with a mental awareness of reliving these experiences and events. *Knowing* refers to other past personal experiences and events that people are aware of, but in a more impersonal way. Knowing includes a general sense of familiarity and awareness of previous events but without reliving them mentally. Ample evidence shows that this sense of knowing is enough to influence people's subsequent judgments and choices (Gardiner, Ramponi and Richardson-Klavehn 1998; Holden and Vanhuele 1999; Rajaram 1993). Remember and know responses are sensitive to different manipulations (see Gardiner and Richardson-Klavehn 2000 for a summary). Remember responses are more sensitive to manipulations that facilitate conceptual and elaborative processing. On the other hand, manipulations facilitating perceptual processing affect knowing but not remembering (Rajaram 1993; Gardiner and Richardson-Klavehn 2000).

Using browsing and searching as two different encoding conditions and "remember" and "know" as the memory tests, we hypothesize that participants will "remember" more target items in the searching condition than in the browsing condition and will "remember" more non-target items in the browsing condition than in the searching condition due to different attention and processing resource allocation. However, there should be no difference in the number of "know" items since "know" responses are not sensitive to attention and processing resource allocation. Further, both searching and browsing conditions should reduce need for further information search when a purchase occasion arises due to the information acquired. Finally, we propose that the influence of information exposure, in both searching and browsing conditions should carry over to future unrelated purchase tasks.

Two studies were conducted. In the first study, participants were exposed to a simulated online store with various product

categories, product names, pictures, and brief product information. One group was asked to search for a target product with a purchase intention (searching). Another group was asked to evaluate the effectiveness of the website design (browsing). A control group was exposed to a different website with the instruction of evaluating the design. After the exposure and a distracter task, participants were given the memory test where they tried to recognize previously exposed products from a mixture of old and new products and indicate whether they "remember" or "know" the product. Finally, they were asked to make a purchase decision on the target product category and we measured their choice confidence and desire for further information. Results supported our predictions.

In study 2, we used the same stimuli and instruction but changed the dependent measures. After exposure and the distracter task, we gave participants a choice task where they were told it was a completely new task. In this task, they were to buy a graduation gift for their best friend from a list of product categories (a mixture of old and new) and then specific brands within the categories (a mixture of old and new). Results showed significant effect at the product category level but no effect was found at the brand level.

Overall, our research shows that consumers acquire information during both searching and browsing. In the "browsing" condition, participants acquired information through exposure although they had no intention to buy. And, browsing in one occasion may reduce the need for direct search when a purchase intention occurs later. In the "searching" condition, while participants searched the target product, they incidentally browsed other products either to figure out the information structure of the website or to locate the target product. Such browsing of the non-target products occurred without either purchase intention or full attention. Thus, even though participants may not clearly recall the exposure event, there was a sense of familiarity based on that exposure. Our studies showed that this sense of familiarity is sufficient in to influence certain choice tasks.

By examining information acquisition under a variety of conditions, we have broadened the scope of research on consumer information search. Since information acquisition is a crucial element of consumer decision making, our efforts in understanding browsing behavior and its potential influences on consumer decision making contributes to the existing knowledge of consumer information acquisition as well as consumer decision making.

Sex-related Cues Instigate the Urge to Splurge. How An Incidental Visceral State Renders Subsequent Behavior, Judgment and Decision-Making More Impulsive

Bram Van den Bergh, K.U. Leuven, Belgium
Siegfried Dewitte, K.U. Leuven, Belgium
Luk Warlop, K.U. Leuven, Belgium

EXTENDED ABSTRACT

Recent brain imaging research suggests that any factor that produces limbic activation, such as the sight, smell or touch of a desired object, may be associated with impulsive behavior (McClure et al. 2004). This is consistent with a wealth of evidence suggesting that activation of affective states accentuates temporal myopia (Metcalf and Mischel 1999). An increase in desire for food, water, sex, etc. is capable of engendering impatience (Hoch and Loewenstein 1991; Baumeister 2002). As such, visceral factors, such as hunger, thirst, sleep deprivation, physical pain, drug craving etc. bring about myopic, impulsive or short-sighted decisions and may drive impatient and impulsive behaviors (Loewenstein 1996).

Exposure to individuals possessing cues of easy sexual access intensifies men's romantic desires (Schmitt, Couden, and Baker 2001). Like other visceral factors, sexual desire may lead to impulse control difficulties. The basic tenet of the current research is that 'sex-related primes' are able to provoke a wide variety of impulsive behaviors among men. Our approach differs from earlier research in several ways. First, previous studies on the impact of visceral factors assume a good-specific collapsing of time perspective toward the present. Loewenstein (1996) explicitly states that the present orientation applies only to goods that are associated with the visceral factor. In contrast, we hypothesize that visceral factors produce effects in domains unrelated to the visceral factor and investigate whether sexual cues impact impulsive behavior in non-sexual domains. Second, our research differs from earlier studies in the subtlety of the sexual cues: Rather than exposing men to nude centerfolds of Playboy magazine (Loewenstein, Nagin, and Paternoster 1997) or asking participants to self-stimulate (Ariely and Loewenstein 2006), we expose men to relatively mild cues that are not distinguishable from the models that abound in print and TV ads. Third, we use a multi-task battery and demonstrate that sexual cues affect a diverse set of impulsive decisions, actions and judgments.

In the first study, we demonstrate that men have a heightened preference for immediately available rewards over larger, later monetary rewards after exposure to sexual cues. Participants had to specify the amount of money they would require in one week and the amount they would require in one month to make them indifferent to receiving €15 now. Male participants require more money after exposure to pictures of sexy women than after pictures of landscapes. An explanation in terms of mood is ruled out.

In the second study, we investigate whether men have difficulty in getting control over their impulses after exposure to sex-cues. Male participants engaged in a behavioral inhibition task in which they had to press a right-pointing arrow key on the computer keyboard when they saw a left-pointing arrow on the computer screen. After exposure to lingerie (vs. a T-shirt) male participants have more difficulties in inhibiting prepotent responses. Consistent with study 1, male participants require more money to make them indifferent to receiving €15 after exposure to a bra than after exposure to a T-shirt. As such, we demonstrate that sexual cues are capable of instigating impulsive behavior unrelated to wealth or material resources and we rule out the possibility that the impulsive behavior is driven merely by the presence of an individual. Again, a mood explanation is ruled out.

In the third study, we demonstrate that sexual cues affect other and even more distinct operationalizations of impulsivity. First, we show that sexual cues affect the tendency to participate in risky behavior. Men prefer a larger, more risky monetary reward over a smaller, less risky reward after exposure to pictures featuring female models high in sex-appeal (vs. pictures of elderly women and vs. pictures of young women with unrevealing clothes). Second, we demonstrate that sexual cues lead to changes in the perceived appropriateness of buying impulsiveness. Male consumers have less unfavorable opinions about an impulse purchase when they had been previously exposed to women high in sex-appeal. This study rules out an explanation in terms of both mood and cognitive load.

In this series of experiments a diverse set of behavioral measures is used to quantify the extent to which an individual acted impulsively following sexual imagery. We demonstrate that sexual cues lead to a heightened preference for smaller, immediate rewards; to difficulties in inhibiting prepotent responses; to a heightened preference for larger but riskier rewards, and to less unfavorable opinions about impulse buying. These findings lead us to conclude that exposure to sexual cues (lingerie or pictures of sexy women) causes male consumers to act impulsively. We rule out explanations in terms of mate attraction (Roney 2003), mood (Rook and Gardner 1993), presence of individuals (Luo 2005), attractiveness of female models (Wilson and Daly 2004) and cognitive load (Shiv and Fedorikhin 1999).

Our studies are consistent with the hot-system/cool-system analysis of behavior in which a cool, cognitive system and a hot, emotional system interact to enable or undermine attempts at self-control (Metcalf and Mischel 1999). Decisions made after sensory contact with desirable items or in the presence of cues that emphasize sensory pleasures are likely to be more impulsive than are decisions made in the absence of these types of visceral cues (Ditto et al. 2006; Loewenstein 1996; Metcalf and Mischel 1999). We show that the influence of visceral states induced by a prior, irrelevant situation carries over to decisions and judgments boldly unconnected to the visceral factor: Visceral states may persist and generalize beyond the eliciting situation and affect subsequent behavior. As such, we contribute to the literature by demonstrating effects of "incidental visceral states". This series of experiments adds to a growing body of research (Briers et al. 2006; Giordano et al. 2002; Wilson and Daly 2004) showing that visceral states may produce effects in or carry over to domains unrelated to the visceral factor.

Positive Implicit Memory Effects For Event Incongruent Sponsorship

Olivier Trendel, Grenoble Ecole de Management / Institut du Capital Client, France

Luk Warlop, K. U. Leuven, Belgium

EXTENDED ABSTRACT

One of the main goals of sponsors is to increase awareness (Walliser 2003). Congruence between the sponsor and the event sponsored is one important factor influencing awareness. Congruence can be defined as the perceived fit between a sponsor and the event sponsored (Speed and Thompson 2000). Several authors have shown that an increase in congruence improves aided and unaided awareness (Grohs et al. 2004; Quester and Farrelly 1998; Rodgers 2004). However, this result has no strong theoretical support (Stangor and McMillan 1992) and it may partly be explained by constructive processes of sponsor identification (Johar and Pham 1999).

Johar and Pham (1999) showed that sponsor identification is biased toward sponsors that are perceived as congruent to the event. Consumers will identify sponsors based on the fact that they find it more logical if an event is sponsored by congruent sponsors (whether true or not). Thus, when assessing sponsor recall and especially recognition, subjects may construct an artificial response according to their existing expectations. It is nevertheless important to assess sponsor awareness without the presence of such bias. The use of implicit memory measures enables to suppress this bias.

Implicit memory is defined as the non intentional and non conscious retrieval of information previously encoded in memory (Schacter 1987). Two types of implicit memory can be distinguished: perceptual implicit memory and conceptual implicit memory (Lee 2002). Perceptual implicit memory rests on an encoding of the physical proprieties of the stimulus whereas conceptual implicit memory rests on an encoding of the semantic proprieties of the stimulus. Implicit memory measures enable verifying the encoding of information and are not influenced by conscious retrieval strategies. However, implicit memory measures are not explicit memory measures (i.e. recall or recognition) without biases.

We used the associative network model (Crocker et al. 1984) and the encoding flexibility model (Sherman et al. 1998) to develop hypotheses on the relative encoding of congruent versus incongruent sponsors. The encoding flexibility model proposes that it is because consistent information is easily understood and confirms prior expectations that it will receive little attention and that the perceptual details of this information is not well encoded. After having extracted the basic gist of consistent information, individuals will direct their attention to other information harder to comprehend such as inconsistent information. Following the research of Lee (2002) we also chose to develop hypotheses concerning sponsor choice. Lee showed that perceptual implicit memory influences stimulus based choices and that conceptual implicit memory influences memory based choices.

We tested the hypotheses in an experiment on sports events sponsorships by brands. The experimental design used was the following: congruence (low vs. high) x processing capacity (low vs. high) x type of implicit memory measure and type of choice (perceptual implicit memory and memory based choice vs. conceptual implicit memory and stimulus based choice). Participants were exposed to 23 sponsorships of international events (8 congruent, 8 incongruent and 7 filler sponsorships). Half of the participants was under mental load whereas the other half was not. Implicit memory measures were introduced as a new test of brand awareness.

Participants were asked to identify brands flashed briefly (40 ms) on the center of the screen. Subjects had to identify 67 brands among which 7 congruent and 7 incongruent target brands. For perceptual implicit memory measures, the 14 target brands were the sponsoring brands. For conceptual implicit memory measures, the 14 target brands were brands in the same product categories as the sponsoring brands. Indeed, conceptual implicit memory of a brand rests on the activation of the link between the brand and semantically related concepts such as the other brands in the product category. The choice tasks consisted of 6 memory based or 6 stimulus based choices.

An awareness check questionnaire enabled us to classify 111 subjects as non conscious. We started by assessing criterion validity of the implicit memory measures used by showing that the perceptual implicit memory measure is not affected by a diminution of processing capacity but that the conceptual implicit memory measure is affected (Mulligan 1997, 1998).

For the memory measures, the dependent variable of interest was the proportion of congruent and incongruent target brands correctly identified. As hypothesized, for perceptual implicit memory measures, we found a main effect of congruence such as incongruent sponsors are better encoded ($M=.0.534$) than congruent sponsors ($M=.0.435$) and that whatever the level of processing capacity. For conceptual implicit memory measures, as hypothesized, we found a significant interaction between the type of sponsor and the processing capacity such as when capacity is high conceptual implicit memory is higher for incongruent sponsors ($M=.436$) than for congruent sponsors ($M=.399$) and when capacity is low conceptual implicit memory is higher for congruent sponsors ($M=.335$) than for incongruent sponsors ($M=.318$).

For stimulus based choices, we found that incongruent sponsors have more chance of being chosen than congruent sponsors (44% vs. 28% of choices) but, contrary to our hypothesis, only when processing capacity is high. For the memory based choices, we found, contrary to our hypothesis, that congruent sponsors and incongruent sponsors have the same chance of being chosen.

The results of this research suggest that some existing findings showing that an increase in congruence improves aided and unaided awareness may have been polluted by new response construction biases. Recognition measures, which mainly rest on perceptual processes, are particularly likely to have been polluted (Roediger 1990). This should however be tested in a follow up experiment using explicit memory measures corrected for response biases as dependent measures.

The use of implicit memory measures is nevertheless important as implicit memory can influence judgments and choices of consumers (Trendel and Warlop 2005). Moreover, the memory record of the association between a sponsor and the event sponsored is often weak (Walliser 2003). Thus, it is often the information encoded in implicit memory that will influence behavior and judgment of consumers and it appears that incongruent sponsors are often better encoded in implicit memory than congruent sponsors.

Implicit and Explicit Influences on Spontaneous and Deliberate Food Choices

Marie-Cecile Cervellon, International University of Monaco, Principality of Monaco

Laurette Dube, McGill University, Canada

Barbel Knauper, McGill University, Canada

Within the consumer research literature, there is a long standing tradition that focuses on deliberative and volitional aspects of consumer behavior. It is assumed that consumers are aware of their attitudes, which drive their behaviors through the mediation of behavioral intentions. Recently however, studies have shown that attitudes might be activated automatically and drive behavior without conscious awareness. Dijksterhuis, Smith, van Baaren, and Wigboldus (2005) even make the claim that the majority of shopping choices are unconsciously driven, influenced by automatically activated attitudes. The domain of food choices is particularly akin to this observation, when consumers claim they bought a chocolate snack displayed near the cashier "against their will". Shiv and Fedhorikin (1999; 2002) unraveled the interplay between unconscious and more controlled processes involved in food choices. In this article, we build and add to this line of study by highlighting the influence of the implicit (i.e. below awareness) attitudes and preferences on consumer behaviors involving control and deliberation compared to those more spontaneous and impulsive.

Evidences for the Existence of Implicit Consumer Attitudes

Several studies have recently provided strong evidences for the existence of implicit consumer attitudes. Among the earliest examples, the "subliminal mere exposure effect" underlies that an implicit attitude might be merely created in the context of an experiment. Holden and Vanhuele (1999) demonstrated that participants identify fictitious brands as familiar, without explicit memory of having been exposed to them in the context of the experiment. Also, in Shapiro, MacInnis, and Heckler (1997), participants who had been exposed to ads subliminally were more likely to include in their consideration set the products featured in the ads than participants in the control group.

Much of the impetus in studying implicit consumer attitudes has been given by research in social psychology on stereotyping and prejudice. Building on a priming paradigm, a variety of indirect tests-among them the Implicit Association Test (Greenwald et al. 1998) and the Go-No Go Association Task (Nosek and Banaji 2001) highlighted the existence of an implicit attitude that might be dissociated from the explicit or self-reported attitude, especially for socially sensitive attitude objects or issues (e.g. attitudes toward prejudiced groups such as homosexuals or African-Americans). As consumer attitudes are traditionally less subject to social desirability bias, implicit and explicit attitudes are expected to correlate for a large majority of consumer products. For instance, Brunel, Tietje, and Greenwald (2004) found a high implicit-explicit correspondence for attitudes toward computer brands. So did Maison, Greenwald, and Bruin (2004) in studies involving brands of yoghurts, fast-food chains or soft-drinks. Nonetheless, studies on implicit brand ethnocentrism reveal that in some instances and for certain groups of consumers, implicit and explicit consumer attitudes might be dissociated. In Maison, Greenwald, and Bruin (2003) study, Marlboro regular smokers report an explicit preference in favor of Marlboro over a local Polish brand of cigarettes yet showing more positive associations with the local brand on the IAT.

If we assume that consumers hold toward products both an explicit attitude that they exert a control on in self-report and an implicit one which they might not be aware of, the question becomes which of the implicit and explicit exert an influence on

consumer behaviors and choices, and under which circumstances will each attitude be a better predictor of behavior.

The Interplay Between Implicit and Explicit Influences in Driving Choices

Recent research on the differential role of implicit and explicit attitudes on behavior suggest a dissociation pattern, with explicit attitudes driving controlled and deliberative behaviors whereas implicit attitudes would be better predictors of spontaneous and more impulsive responses. In the domain of stereotyping and prejudice, explicit attitudes exert an influence on behaviors involving information processing such as choosing to employ people from certain groups. Yet, implicit attitudes were found to be better predictors of non verbal responses that lie outside of conscious awareness and control such as blinking and visual contact (Amodio, Harmon-Jones, and Devine 2003), friendliness of interactions with a black confederate or frequency of handing a pen to an African American vs. placing it on the table (reported in Wilson et al. 2000).

Such antagonistic effects of the implicit and explicit attitudes are particularly apparent in the case of temptations, where impulses resulting from an activation of the implicit attitude facilitate behaviors incompatible with deliberate evaluations (Karpinski and Hilton 2000). Offering a choice between a chocolate cake and a fruit salad, Shiv and Fedhorikin (1999; 2002) demonstrate that when decisions are made quickly and under impairment of processing resources, choices are driven by automatic affective processes, otherwise choices are influenced by the higher-order (more controlled) processes.

Recently, Perugini (2005) modeled the implicit and explicit influences specifically on spontaneous and deliberate behaviors in an experiment offering participants the choice between a snack and a fruit and using the recollection of their past behavior as proxy for controlled choice. His conclusions are strongly in favor of implicit preferences influencing spontaneous choice with no significant influence of explicit preference whereas explicit preferences clearly show the opposite pattern, with strong influences on deliberative behavior and no influence on spontaneous choice (study 2). Nonetheless, Perugini (2005) also found that the prediction of being a smoker or not (Study 1) is more effective when having both the implicit and explicit attitude entered as predictors, especially when explicit and implicit attitudes are congruent. Perugini proposes that spontaneous behaviors involve a mix of both automatic and controlled components, with the controlled components more likely to act as an overriding mechanism. His results also suggest that when attitudes are not congruent, the influence of the implicit might be magnified.

The Role of Depleted Cognitive Resources on the Implicit Influence

Precisely, Wilson et al. (2000) explains the existence of dissociation between the implicit and explicit attitude through an overriding mechanism. In some instances, people might block access to an implicit attitude they view as illegitimate or unwanted and replace it by an attitude which they believe good or instrumental with respect to their goals. This process requires motivation and cognitive capacity. For instance, Koole, Dijksterhuis, and van Knippenberg (2001) found a correspondence between implicit self-

esteem (positive bias towards the letter of one's name) and self-reported self-evaluation only under time pressure (study 3) and cognitive load (study 4). In the domain of consumer decision making, Shiv and Fedorikhin (1999; 2002) tested the effect of restricting cognitive resources on the choice between an alternative associated with more positive affect (a chocolate cake) and one associated with more positive cognitions (a fruit salad). Findings suggest that when resources are restricted, lower-order affect arising from more automatic processes might have higher impact on choice (leading to higher likelihood to choose the chocolate cake). On the contrary, when resources are not restricted, higher-order affect arising from more controlled processing might have more influence, leading to higher likelihood to choose the fruit salad. In line with this line of reasoning, we suggest that when consumers are able and motivated to control their choices, behavior will be determined by their explicit attitude whereas when consumers are less in control, due for instance to impairment in cognitive resources, behavior will be strongly determined by their implicit attitude.

In the following studies, we start (study 1) by testing the dissociation pattern (i.e. influence of implicit attitude on "spontaneous" choice and explicit attitude on "deliberate" choice) by proposing a choice between a chocolate bar and a yoghurt. Hetherington and Macdiarmid (1993) report that chocolate is the food item that is most likely to produce conflict and trigger loss of control. On the other hand, yoghurt is supposed to be a more rational option, more likely to be chosen deliberately for health reasons. The explicit attitude should be a strong predictor of deliberate choice (behavioral intention as proxy) whereas the implicit attitude should be a better predictor of a more spontaneous choice (i.e. real choice under pressure between a chocolate bar and a yoghurt). The second study directly tests the impact of restricting cognitive resources on a group of people likely to experience an implicit-explicit dissociation toward food items (i.e. restrained eaters). When restrained eaters are motivated and have the cognitive capacity to override their temptations, they control their eating and their food choices whereas when they release from self-imposed control they make choices dictated by their impulses (Ward and Mann 2000). We suggest that under high cognitive load, people experiencing an implicit-explicit dissociation (i.e. restrained eaters) will be more heavily influenced by their implicit attitude than when under low cognitive load. Non restrained eaters should be less affected by the cognitive load manipulation.

STUDY 1

Method

PROCEDURE. 197 persons (evenly distributed on gender) participated in the study in exchange of a \$25 compensation. The cover story for the experiment was the assessment of word categorization as an automatic skill. After filling out an informed consent form and a demographic / screening questionnaire, participants were seated in front of a desktop computer running the Inquisit® software. Participants undertook first the implicit tasks (I.A.T. and G.N.A.T. counterbalanced) followed by the explicit questions on computer. The category "chocolate bars" was selected as focal attitude object. The category "yoghurt" was chosen as contrasting category likely to yield more neutral implicit attitudes.¹ At the end of the section on

the computer, participants were brought one by one to another room where they were asked to make a choice between two products (i.e. a chocolate bar by Cadbury and yoghurt in tube by Yoplait). These two products were similarly convenient (e.g. no spoon needed for the yoghurt) and of same value (i.e. same price in vending machines). They were stored in an ice-bag during the experiment and were not visible except when participants were making their choice. Time taken to make the decision was below 5 seconds.

IMPLICIT MEASURES. The experiment's two indirect tasks used the same set of stimulus words. Ten adjectives-five pleasant and five unpleasant-were selected from Ottaviano, Hayden, and Oakes (2001) and the pleasant and unpleasant sets were matched on word length (average length 8.6 for pleasant words, 8.8 for unpleasant words). Ten target brands-five per product category- were selected via two pre-tests based on word length (chocolate 7.4 vs. yoghurts 7.2), familiarity (on a seven-point scale anchored by -3 to 3, chocolate 2.54 vs. yoghurts 2.41, $t(37)=0.72$, $p=.47$) as well as association with the target category and dissociation with the contrasting category (chocolate 2.89 vs. yoghurt -2.71, $t(19)=1.63$, $p=.12$).

IAT. The IAT used a complete sequence of seven blocks (see Greenwald et al. 1998): (a) evaluative attribute discrimination (b) initial target discrimination (c) practice initial combined task (d) test initial combined task (e) reversed target discrimination (f) practice reversed combined task (g) test reversed combined task. The evaluative attribute block included all pleasant and unpleasant words. Each target discrimination block included all target words. Each practice combined block (blocks c and f) included 20 trials including 10 evaluative attributes and the 10 target words. Each test combined block (blocks d and g) included 40 trials including twice each target word and twice each evaluative attribute.

GNAT. The Go-No Go Association Test (see Nosek and Banaji 2001) requires participants to respond to stimuli that represent the target category and the valenced attribute e.g. good (signal) and ignore other stimuli e.g. bad words (noise). Response latency and errors are compared between blocks presenting target + good and target + bad. The GNAT task was compounded of 8 blocks. First, four blocks of practice trials were presented at random. Each practice block was compounded of 10 trials, such as all evaluative and target words would be used once as signal and once as noise. Next, another set of four blocks mixes evaluative and target words as signal and noise. These four blocks appeared in randomized order. Each of these test blocks was compounded of 70 trials, and was preceded by 8 trials used as practice. The ratio of signal to noise was set at 1:1 for practice block, but 4:3 for test blocks to reduce the length of the test (see Nosek and Banaji 2001, Experiment 3). Signal stimuli appeared for 1000ms whereas noise stimuli appeared for 500ms (see Nosek and Banaji 2001, Experiment 5) in order to be able to use response latency in addition to errors as dependent variable.

EXPLICIT MEASURES. After the sequences of indirect measures, participants read on the screen that the next questions assess variables that could have an impact on the speed with which they categorized the words. The explicit attitude was assessed through three questions (randomized) "My attitude toward ___ is" on three seven-point scales anchored by "unfavorable-favorable", "positive-negative" and "bad-good" for both the chocolate bars ($\alpha=0.97$) and for the yoghurt category ($\alpha=0.95$). Behavioral intention was assessed through two questions: "To what extent do you expect to eat ___ in the upcoming week" (anchors definitively do not-definitively do) and "How likely is it that you will eat ___ in the upcoming week" (very unlikely-very likely) for chocolate bars ($\alpha=0.95$) and for yoghurts category ($\alpha=0.95$)

¹A pilot study (n=40) had been conducted in order to choose both product categories.

TABLE 1
Implicit attitude measures

	Av. Lat.	ConvLog	ConvMs	D
Yoghurt-chocolate	1151ms	0.11	114.36	0.27

Results

IAT. The analyses used Greenwald, Nosek, and Banaji (2003) improved scoring algorithm. The % of error in the test was low (6.38%) and will not be discussed further. Table 1 displays the average latencies (Av.Lat.) and the mean differences between the initial condition and the reversed condition (c and d and f and g steps) in log-transformed values (ConvLog.) and in milliseconds (ConvMs). Participants were faster in associating chocolate bars with good words (and yoghurt with bad words) than in associating chocolate bars with bad words (and yoghurt with good), indicating a positive implicit preference in favour of chocolate bars. Cohen's *d* indicates a small IAT effect (by convention 0.2 is considered a small effect).

GNAT. Analyses proceeded according to the algorithm defined by Nosek and Banaji (2001). First, *d*-prime was calculated as the difference in the proportion of hits (correct hit to signal) and false alarms (incorrect hit for noises) for each of four combinations of targets (chocolate or yoghurt) and attributes (good or bad) as signals. As expected, sensitivity was greater when subjects were jointly discriminating chocolate and good from distracters ($d' = 1.79$) than jointly discriminating chocolate and bad ($d' = 1.71, t(196) = 2.66, p = .01$). This result suggests that chocolate and good is more strongly associated than chocolate and bad. On the other hand, when the target concept was yoghurts, there was no significant difference in sensitivity between yoghurts + good ($d' = 1.69$) and yoghurts + bad ($d' = 1.74, t(196) = -1.58, p = .11$). The GNAT corroborates the IAT results in favour of an automatic positive attitude towards chocolate and tends to indicate a rather neutral attitude toward yoghurts. Second, the latencies to categorize the target words when associated with bad compared to when associated with good were analyzed as second dependent variable. Reaction times were log-transformed and subsequent analyses are based on log-transformed data, although presented in ms for meaningful purposes. The difference in reactions times when chocolate is associated with bad ($M_s = 587$) and when chocolate is associated with good ($M_s = 544$) is significant ($t(196) = 7.52, p = .00$), indicating a positive attitude toward chocolate (Cohen's $d = 0.41$). On the other hand, for yoghurt, the difference in reactions time when yoghurt is associated with bad ($M_s = 547$) vs. good ($M_s = 542$) is non-significant ($t(196) = 0.53, p = .60$), indicating a neutral attitude toward yoghurt (Cohen's $d = 0.04$). Overall for the GNAT, both dependent variables (sensitivity and latencies) are internally consistent and in line with the IAT, with a positive implicit attitude toward chocolate and a neutral attitude toward yoghurts.

PREDICTORS OF DELIBERATE AND SPONTANEOUS BEHAVIOUR. An index of explicit preference toward chocolate was created by subtracting the attitude toward yoghurt from that of chocolate ($M = -0.14, SD 2.42$). An index of deliberate choice (as proxy) was also created by subtracting the behavioral intention toward yoghurt to that of chocolate ($M = -0.21, SD 2.39$). Last, the actual binary choice between the yoghurt stick and the chocolate bar was entered as measure of spontaneous choice. Participants display an explicit preference toward the yoghurt over the chocolate and report being

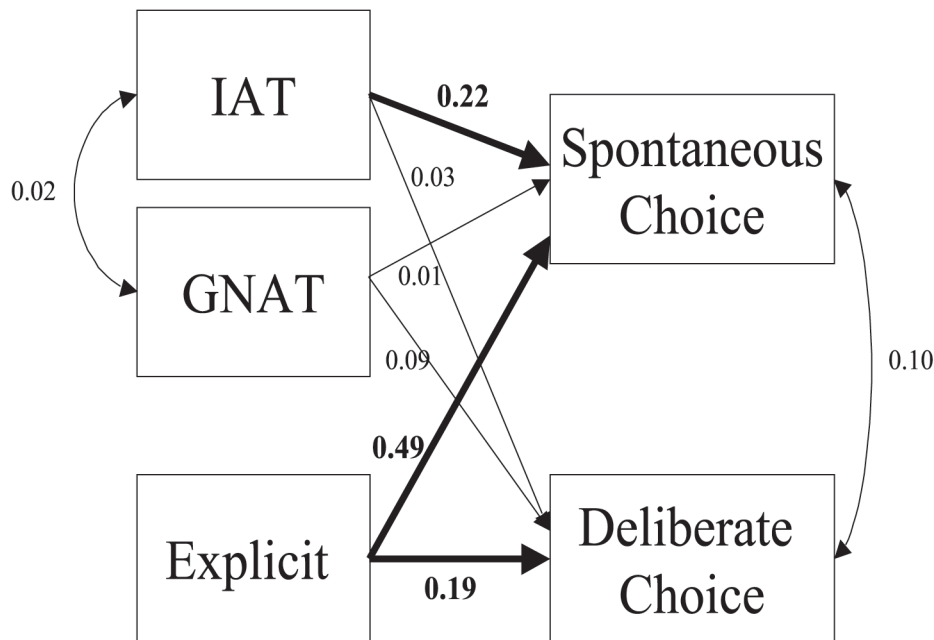

more likely to choose the yoghurt. Yet, in the binary choice task, 59.3% of participants chose the chocolate.

A Structural Equation Model (see fig 1) predicting simultaneously the spontaneous and the deliberative choice from implicit and explicit measures was fitted using the Mplus® software. The fit of this model is excellent, with a non significant chi-square ($p = .67$) and a CFI close to 1 (CFI=0.99). Nonetheless, because these traditional measures of fit have a rather low power to reject a model with binary outcome (Yu and Muthen 2002), two additional indicators of goodness of fit were taken into account, the RMSEA and the WRMR. Both indicated a very good fit, with a RMSEA close to 0 (RMSEA=0.001) and a WRMR below 0.9 (WRMR=0.072). The implicit preference (IAT, est./S.E.=4.80, $p = .00$) in addition to the explicit preference (est./S.E.=1.99, $p = .05$) contribute to the prediction of the spontaneous choice. The deliberative behaviour is significantly influenced by the explicit preference only (est./S.E.=2.48, $p = .01$). The GNAT measures do not help predict significantly neither the spontaneous nor the deliberate choice.

STUDY 2

Study 1 provides evidences that implicit preferences are a major predictor of actual and more spontaneous choices whereas the explicit preference exerts an influence on both spontaneous and more controlled choices (i.e. behavioral intentions as proxy). The second study was meant to provide a deeper understanding of the respective influences of explicit and implicit attitudes. We chose to assess the attitude toward two totally antagonistic products, one supposed to yield strong positive implicit attitudes (double stuff OREO) and the other supposed to yield strong negative implicit attitudes (reduced fat OREO). We manipulate the control exerted by participants on their choice through a cognitive load manipulation. Participants are split into a restrained group (controlling their diet and likely to have an explicit preference in favour of the reduced fat option and an implicit preference in favour of the double stuff option) and a non restrained group (likely to prefer the double stuff option both at implicit and explicit level). Tuorila and colleagues demonstrated that even though consumers had never tasted specific fat-free food in the past (i.e. cake, crackers and cheese), they had strong (negative) expectations on the taste of these products. In addition, the difference in attitude and behavioral intention toward reduced fat products (cakes and chocolate in particular) between restrained and non-restrained is well documented (see Tuorila, Kramer, and Engell 2001), with restrained eaters more positive toward reduced fat products and more likely to choose them over regular alternatives than non-restrained eaters. Access to cognitive resources was manipulated through a memory test. It was expected that restrained eaters in the high cognitive load condition (i.e. disinhibitive effect; see Ward and Mann 2000) would make a choice influenced by their implicit preference whereas they should make a choice more related to their explicit preference in the low cognitive load condition. Non-restrained eaters should be less affected by the manipulation.

FIGURE 1
Structural model of implicit and explicit influence on choice

Standardized parameters for the structural equation model on the group of respondents (N=197). Significant structural paths are in bold.

Method

SAMPLE. 120 Women were pre-screened over the phone fifteen days before the beginning of the study to be perfectly fluent in English, to have a correct vision and not suffering from serious food diseases. In addition, all of them were selected to have knowledge of the brand OREO cookies. The Revised Dietary Scale (Herman and Polivy 1980) was embedded in the set of questions. Participants were classified as restrained or non-restrained eaters on the basis of their score on this restrained scale: women with a score above 16 out of 35 (conventional cut-off) were considered as restrained eater.

PROCEDURE. Participants were tested individually.² Upon entering the experimental room, all participants completed the IAT and the GNAT (counterbalanced) in order to assess their implicit preferences between double stuff and reduced-fat OREO cookies. They also reported their explicit attitude toward both products and their behavioural intention toward each OREO variety on computer in the same procedure as study 1. Next, participants had to memorize words displayed one by one in the middle of the screen, each for five seconds, and participants had to memorize these words. One group of participants (low cognitive-load condition) had to memorize two words whereas the other group (high-cognitive load) had to memorize ten words. Afterwards, participants were offered a choice between a box of double stuff OREO cookies and a box of reduced-fat OREO cookies. 55% of participants chose the double stuff OREO.

Implicit measures. Both the IAT and the GNAT used the same procedure as described in study 1. The only change was on the target words. For each product, the five words describing best both

varieties of OREO cookies were selected in a pre-test (n=20 women). Both sets of words were evaluated as equally familiar (on a seven-point scale anchored by -3 to 3, set reduced-fat=2.75 and set double stuff=2.72, $t(19)=0.43$, $p=0.67$) and equally associated with the target category and dissociated from the contrasting category (on a seven-point scale from strongly associated with double stuff to strongly associated with reduced-fat, set reduced fat=1.52 vs. set double stuff=-1.48, $t(19)=0.09$, $p=.93$).

Cognitive load manipulation check. After making their choice, participants had to describe, as completely as possible, whatever went through their minds while they were deciding between the two cookie types (see Shiv and Fedorikhin 1999). The thought protocols were coded by two independent judges for the total number of thoughts. Along Shiv and Fedorikhin's (1999) procedure, any statement representing evaluations or descriptions of the food options, thoughts about the task, or prior experience with the options, or consequences of choosing one or the other option (e.g. on their weight), description of current state (hungry or thirsty) were coded as thoughts (all statements fell into one of these categories). Inter-coder agreement was high (96%) and discrepancies were resolved through discussion. A between-subject ANOVA with cognitive load condition as independent variable reveals that the manipulation was successful ($F(1,118)=8.73$, $p=.00$). Participants reported an average of 2.98 thoughts (SD 1.71) in the high cognitive load condition vs. 3.89 (SD 1.64) in the low cognitive load.

Results

ANALYSIS OF IMPLICIT ATTITUDE MEASURES. Analyses for the IAT proceeded as those of study 1. Conform to expectations, partici-

²The study reported in this article is part of a larger protocol.

FIGURE 2
% choice for double stuff OREO (over reduced fat)

pants were faster in associating double stuff + good (and reduced fat + bad) rather than double stuff + bad (and reduced fat + good) Cohen's d ($d=0.40$) indicates a moderate IAT effect, with no difference between restrained groups ($p=.18$). Analyses for the GNAT were conducted first on sensitivity scores and then on latencies (same as study 1), both for the double-stuff and for the reduced fat option. As expected, sensitivity was greater when subjects were jointly discriminating double stuff and good from distracters ($d'=1.90$) than jointly discriminating double stuff and bad ($d'=1.69$, $t(119)=4.64$, $p=.00$). This result suggests that the double stuff OREO and good are more strongly associated than double stuff and bad. When the target concept was reduced fat, sensitivity was greater when subjects were jointly discriminating reduced fat and bad from distracters ($d'=1.84$) than when jointly discriminating reduced fat and good ($d'=1.71$, $t(119)=-3.22$, $p=.00$). On this dependent measure, results indicate that participants display a negative implicit attitude toward reduced fat OREO cookies and a positive implicit attitude toward the double stuff version. The latencies to categorize the target words when associated with bad compared to when associated with good were analysed as second dependent variables. The difference in reactions times when double stuff OREO is associated with bad ($M_s=627$) and when double stuff OREO is associated with good ($M_s=545$) is significant ($t(119)=11.49$, $p=.00$), indicating a positive attitude toward the product (Cohen's $d=0.50$). For reduced fat, the difference between bad ($M_s=564$) and good ($M_s=578$) is also significant in the opposite direction ($t(119)=-1.99$, $p=.05$), indicating a negative implicit attitude toward reduced fat OREO (Cohen's $d=-0.11$). In terms of differences between conditions, a MANOVA with restrained status as between-subject factor indicates no difference between groups, neither for the reduced fat nor for the double stuff.

Overall for the GNAT, both dependent variables (sensitivity and latencies) are internally consistent and indicate, as was expected, a positive implicit attitude toward double stuff OREO and a negative implicit attitude toward reduced fat OREO. GNAT results are perfectly in line with IAT results, and indicate a clear implicit

preference in favour of the double stuff option, both for restrained and non restrained eaters.

PREDICTORS AND MODERATORS OF BEHAVIOR. An index of explicit preference toward double stuff was created by subtracting the attitude toward reduced fat from that of double stuff ($M=0.18$, $SD=2.46$). There is a significant difference between restrained eating groups, with restrained eaters preferring the reduced fat option ($M=-0.34$) and non-restrained eaters showing a marked preference for the double stuff ($M=0.68$, $F(1, 118)=5.32$, $p=0.02$).

A logistic regression with restrained status and cognitive load condition levels as predictors and choice between the double stuff and the reduced fat as dependent indicates differences both between restrained group and conditions ($\chi^2=11.88$, $p=.01$). In line with expectations, there is a main effect of cognitive load, with an increased likelihood to choose the double stuff option over the reduced fat in the high load condition (odds=4.67, Wald=13.52, $p=.00$). There is also a main effect of the restrained status on choice, with restrained eaters being more likely to choose the reduced fat over the double stuff cookie (odds=0.48, Wald=3.06, $p=.08$). Last, the interaction between restrained status and cognitive load condition is significant (odds=4.21, Wald=3.51, $p=.06$).

In order to test the influence of the implicit and explicit attitude on spontaneous choice, a second logistic regression was conducted. The explicit preference, the implicit preference (IAT), the implicit attitude (GNAT) toward high fat and reduced fat OREO were introduced as predictors of choice. The restrained status and the cognitive load condition were also introduced as categorical predictors. The model fits the data very well ($\chi^2(7)=37.30$, $p=.00$) and helps predict 71.2% of the choices. Corroborating the results of study 1, both the explicit preference (odds=1.51, Wald=11.51, $p=.00$) and the implicit preference (IAT, odds=1.87, Wald=2.85, $p=.09$) have an influence on spontaneous choice. The implicit attitude toward the reduced fat option (GNAT) is never significant, neither as main effect nor as interaction. The implicit attitude toward the double stuff is not significant as main effect. However, there is a restrained X condition X GNAT double stuff interaction

(odds=8.13, Wald=4.95, $p=.02$), with the implicit attitude toward the double stuff option being more influential for restrained eaters in the high load condition.

GENERAL DISCUSSION

This research extends Shiv and Fedorikhin (2002; 1999) findings on spontaneous and controlled influences in the choice between an affect vs. a cognitive-based option. We demonstrate that spontaneous behaviors are strongly influenced by a combination of unconscious and conscious influences whereas our controlled behaviors and behavioral intentions are predicted mainly by those attitudes self-reported and endorsed (study 1). In addition, when a choice is made quickly or under impairment of cognitive resources, the implicit attitude has a stronger influence on the alternative selected, especially when there is a conflict between that attitude endorsed and “wanted” by the consumer (i.e. the explicit) and that overridden (i.e. the implicit). In study 2, restrained eaters with depleted control due to impairment of cognitive resources made a choice in favor of the double stuff option over the reduced fat option, in line with their positive implicit attitudes in favor of this option (and although they preferred the reduced fat option in self-report).

Results are of particular interest to researchers and practitioners alike involved in changing behaviors, especially in domains where there might be dissociation between implicit and explicit attitudes (i.e. condom, health-related attitude objects etc.). First, it is demonstrated that consumers might hold attitudes toward certain products which they are not aware of or which they deny. Self-report measures do not necessarily reflect the real or the full picture. Yet, these implicit attitudes might be assessed with reliability through quantitative methods, whereas until now qualitative methods only (eg. through projective techniques) could have access to this hidden side of the consumer. This finding offers the opportunity for marketers to dig deeper into consumers’ evaluation of their products. Second, results suggest that spontaneous and impulsive choices might often be driven by the implicit attitude whereas more deliberate choices are strongly influenced by the explicit attitude. Hence, for products which might lead to conflicted attitudes (chocolate, biscuits, candies etc.), any action in the store that constraint processing resources or encourage immediate choices (i.e. pressure of a salesperson; end-of-aisles) increases the likelihood that the implicit attitude will drive the behavior (Shiv and Fedorikhin 1999). On the contrary, any action in the store that would favor elaboration and deliberation (such as tasting sessions, presentation of information on leaflets etc.) increases the likelihood that the explicit attitude will drive behavior.

Investigating The Interactive Effects of Visual Imagery and Brand Familiarity on Brand Recall: A Cross-Cultural Study

Andrei Mikhailitchenko, Cleveland State University, USA

Galina Mikhailitchenko, Psychological Institute of Russian Education Academy, Russia

EXTENDED ABSTRACT

The issue of visual imagery in cross-cultural consumer research is addressed in the study. It investigates the relationships between the brand familiarity, visual imagery of an ad, and the brand claim recall in two distinct cultural environments—the U.S. and Russia.

A substantial research in cognitive psychology and consumer behavior is devoted to exploring sources, nature, specific features, and memory outcomes of human imagery. Memory recall is documented to be higher if associated with more intensive visual imagery activity rather than under conditions that are believed to be less imagery stimulating (Paivio and Csapo 1969; Elliott 1973; McKelvie and Demers 1979; Rossiter and Percy 1980; LaBarbera, Weingard, and Yorkston 1998). Therefore, the improving recall of ad contained information for imagery-intensive ads is hypothesized.

Another hypothesized effect is positive relationship between the level of brand familiarity and brand claim recall. The evidence for this relationship is provided by the signal detection and information organization theories as well as by the recent research on message processing and message response (e.g., Campbell and Keller 2003; Sagarin *et al.* 2002; Campbell and Kirmani 2000). The interaction between the two factors discussed above is considered as well.

Based on the cross-cultural consumer behavior and advertising research, it was proposed that there will be the difference between Russian and American consumers in terms of advertising image elaboration and, therefore, in relationship between imagery and brand claim recall.

The 2 x 2 factorial between subjects experimental design with two manipulated conditions—brand familiarity and imagery content of the ad—was applied in Study 1. The two chocolate brands—American (A) and Russian (R)—both of which operate on the U.S. and Russian markets, were chosen for the experiment. Two ads, one consisting of picture and text, and the other one consisting of text only, were created for each brand.

The students filled the questionnaire measuring the brand familiarity for brands they were assigned to, then rated the visual imagery level of ads. Then subjects were given a surprise claim recall test on the ads.

A two-way ANOVA followed by post-hoc tests produced the results that indicate at significance of both imagery and familiarity main effects as well as interaction effect (higher marginal influence of imagery on lower rather than on higher level of brand familiarity).

The Study 2 was conducted in two countries—USA and Russia. Each subject was randomly assigned to one of the treatments (HF/HI, HF/LI, LF/LI, and LF/HI). The 2 x 2 x 2 factorial between-subjects experiment was designed with three manipulated conditions—a subject's country of domicile, brand familiarity and imagery content of the ad. The same chocolate brands—Brand A and Brand R—were used. Attitude towards brand score (A_B) was measured as well.

An ANCOVA with A_B score as covariate was applied. The main effects of imagery rating and brand familiarity on brand recall remained to be significant after removing the covariate's effect. The higher imagery effect under low rather than high familiarity conditions was demonstrated as well. The significant 3-way inter-

action between country of domicile, brand familiarity, and imagery rating reveals different pattern of marginal influence of the imagery on brand claim recall for high familiarity vs. low familiarity conditions in two cultures. While in the U.S. imagery has much higher contribution to brand recall on low levels of brand familiarity, in Russia the difference of this contribution for high and low familiarity conditions is much less substantial.

To summarize, the Studies 1 and 2 provided highly significant support for brand familiarity and imagery effects on brand recall. Their interaction (higher contribution of imagery to brand claim recall on low rather than on high levels of brand familiarity) was supported by both studies as well. The significant differences of imagery influence on brand recall score in two countries was revealed by the significance of corresponding interactions. The difference of brand familiarity's influence on brand recall across two cultures was not supported.

The obtained results have important implications for both academic and practitioner research. The findings reported in this study attract attention to the issue of information processing resources that exist in consumer mind. The high level of brand familiarity creates the strong brand-related schema, that can use the cognitive capacity and interfere in the elaboration of the new image-evoked information. In contrary, the absence (or weakness) of such a schema for unfamiliar brands increases the availability of cognitive resources needed for image elaborating activity (Carlston 1980; Britton and Tesser 1982; Kardes 1986).

The study also demonstrates that the process of elaboration of image-initiated information is strongly influenced by social media. The need for image processing appears to be a cultural phenomena, that is influenced by spiritual traditions of the country, its media habits and dominating lifestyle. The strong cultural predisposition to reading the books and newspapers result in lower level of need for visualization, while media habits oriented at watching TV and reading colorful magazines create image-based information elaboration pattern. The associative links evoked by images result in higher attribute recalling abilities for consumers from image-intensive media environments, like USA. In contrast, consumers from reading-intensive environments, like Russia, have higher predisposition to elaborate textual rather than imagery information contained in the ad.

From managerial point of view, the study demonstrated that investment in image-intensive advertising will not produce the same return for different levels of brand familiarity and different international markets. The well established brands with higher familiarity rating require different communication strategies aimed at facilitating brand claim recall than low familiar ones. Image-intensive tools generate diminishing returns with increasing brand familiarity. The companies that are going global should also evaluate the degree of image intensiveness of the environments they are going to operate within. This is needed for assessing the "imagery advertising leverage" that global businesses will have in the particular culture.

The Safety of Objects: An Examination of Materialism and Brand Connections

Aric Rindfleisch, University of Wisconsin-Madison, USA

James E. Burroughs, University of Virginia, USA

Nancy Wong, Georgia Institute of Technology, USA

EXTENDED ABSTRACT

Consumers across many parts of the globe place considerable value on the acquisition of material objects. Over the past two decades, researchers have sought to establish how materialism is formed and how this value influences individual and collective well-being (see Burroughs and Rindfleisch 2002 for a review). While these studies contribute to our understanding of psychological functioning, they do not generally consider the impact of this value upon consumption behavior. Our research seeks to address this gap by examining the relationship between materialism and brand connections. Drawing insights from research on material values, cognitive needs, and branding, we suggest that individuals with high levels of materialism will exhibit strong ties to the brands they consume as a means of coping with uncertainty.

We assessed the relationship between materialism and brand connections by employing two survey studies. The first study was a nationwide mail survey in the United States ($n=363$), while the second study was a mall intercept survey in Singapore ($n=300$). The response rate for these two studies was 20% and 26%, respectively, and the demographic profile for both surveys closely mirrored the general population for each country. Two product categories were the focus of each study. In the US, respondents were asked to record the make of automobile they currently own as well as the brand of jeans they last purchased for themselves. In Singapore, respondents were asked to record the brand of cell phone they currently own, as well as the brand of wristwatch that they last purchased for themselves. Our brand connection measures were assessed in relation to these brands.

We assessed three different manifestations of brand connections, *brand loyalty* (Chadhuri and Holbrook 2001), *self-brand connection* (Escalas and Bettman 2003), and *brand community* (Keller 2003). We assessed materialism using the updated (Richins 2004) 15-item Material Values Scale (MVS). Our conceptual framework argues that materialism is positively related to brand connections because materialists use brands to fulfill their fundamental need for certainty. To assess the influence of this cognitive need, our Singapore survey included two specific measures from the need for cognitive closure (NFCC) scale (Webster and Kruglanski 1994). Conceptually, NFCC is defined as, "the desire for a definite answer on some topic...as opposed to confusion and ambiguity" (Kruglanski 1989, p. 14). Specifically, we focused on *need for order* and *need for predictability* as our key dimensions. All measures displayed good psychometric properties.

We tested the relationship between material values and brand connection through a series of multiple regression analyses using our three brand connection measures (i.e., loyalty, connection, and community) as dependent variables and material values as the key predictor variable. These regressions revealed that materialism exerts a negligible influence on brand loyalty for all four product categories: automobiles ($b=-.01$, ns), jeans ($b=.04$, ns), watches ($b=.07$, ns), cell phones ($b=.06$, ns). In contrast, materialism has a significant effect on both self-brand connection (SBC) and brand community (BC), for automobiles (SBC: $b=.19$, $p<.01$; BC: $b=.26$, $p<.01$), jeans (SBC: $b=.22$, $p<.01$; BC: $b=.23$, $p<.01$), watches (SBC: $b=.18$, $p<.01$; BC: $b=.20$, $p<.01$), and cell phones (SBC: $b=.23$, $p<.01$; BC: $b=.21$, $p<.01$). In sum, materialism exhibits a positive influence on two out of the three measures of brand

connections for all four product categories, providing general support for our claim that materialists attempt to manage uncertainty by establishing strong individual and communal relationships with their brands.

In order to probe more deeply into the nature of the relationship between materialism and brand connections, we investigated the cognitive motives that may underlie this relationship, namely the need for order (NFO) and the need for predictability (NFP). Because our tests of the effect of materialism on brand connections indicate that materialism has no influence on brand loyalty, this additional analysis focuses on materialism's potential role as a mediator between NFO and/or NFP upon self-brand connection and brand community. In order to assess this potential influence, we conducted a series of mediated regression analyses. These analyses indicate that among our two indicants of the need for certainty, only NFP is significantly related to materialism ($b=.38$, $p<.01$). Thus, materialism's role as a potential mediator of the link between need for certainty and brand connections appears to be related to its ability to provide a sense of predictability rather than a sense of order. In addition, these analyses show that materialism fully mediates the effect of NFP on both self-brand connections and brand community for both watches (SBC: $b=.09$, ns, BC: $b=.07$, ns) and cell phones (SBC: $b=.11$, ns, BC: $b=.06$, ns), as the inclusion of this variable reduces the effect of NFP on these outcomes to nonsignificance.

In order to give shape to the ephemeral constructs upon which we ply our trade, academic researchers often employ cognitive archetypes (Lakoff 1987). Thus far, the dominant archetype among materialism researchers is an image of materialists as selfish status seekers. For example, Belk's (1985) seminal article portrays materialists as greedy, envious, and possessive. This image appears to hold a considerable degree of verisimilitude, as materialism has been shown to be negatively related to concerns for family, community, and religion (Burroughs and Rindfleisch 2002). However, our research suggests that this archetype may not fully capture why materialists form strong connections to their brands. Thus, in order to understand the relationship between materialists and branded objects, there appears to be a need for a new archetype. Based on our findings, one potential perspective would be to cast materialists (at least in terms of their brand relationships) as communal meaning seekers rather than selfish status seekers. This image appears to be quite congruent with prior findings that materialism is a means to manage uncertainty (Kasser 2002), and may also stimulate new insights regarding how and why materialists engage in consumption.

Cultural Differences in Brand Extension Judgments and Feedback Effects

Kyeongheui Kim, University of Toronto, Canada

Jongwon Park, Korea University, Korea

Jungsang Yeo, Dong Guk University, Korea

EXTENDED ABSTRACT

Factors that influence the success of a brand extension and its feedback effect on the parent brand evaluations have been a great concern of theory and research in consumer judgment. It has been shown that an extension of a brand is evaluated more favorably when it is similar than dissimilar to the parent brand (e.g., Aaker and Keller 1990; Barone, Miniard, and Romeo 2000; Bottomley and Holden 2001; Broniarczyk and Alba 1994; Keller and Aaker 1992; Park, Milberg, and Lawson 1991; Zhang and Sood 2002). Further, a number of studies have found that unsuccessful extensions can influence perceptions of the parent brand such that dissimilar (vs. similar) extensions are likely to have a negative feedback effect on the parent brand evaluations (e.g., Loken and John 1993; Milberg, Park, and McCarthy 1997).

In this research we intended to extend the literature by investigating whether or not a cross-cultural difference (i.e., Eastern vs. Western culture) leads to a difference in magnitude of the "similarity effect" on extension evaluations and the "feedback effect" on the parent brand. It has been suggested that the Eastern culture is characterized by a prevention focus in motivation and self regulation, whereas the Western culture is relatively more promotion focused (e.g., Briley, Morris, and Simonson 2005; Lee, Aaker, and Gardner 2000). According to the literature, prevention-focused individuals are primarily concerned with presence/absence of a negative outcome of a decision alternative, whereas promotion-focused individuals are primarily concerned with presence/absence of a positive outcome (e.g., Higgins and Spiegel 2004). Further, the former individuals are less willing to take a risk in decision making than the latter, thus making fewer false hits and more misses in recognition tasks (Crowe and Higgins 1997). Perhaps, a dissimilar extension is more uncertain in terms of quality and thus perceived to be riskier than a similar extension. Consequently, we expected that the similarity effect in extension evaluations (i.e., the relative favorability of similar extension over dissimilar evaluations) would be more pronounced in an Eastern (prevention focus) culture than in a Western (promotion focus) culture. Further, people in the prevention-focused culture, compared to those in the promotion-focused culture, are likely to be more concerned with presence/absence of a negative outcome, and thus might be more sensitive to a failure of the extension. Thus, we also expected that an unsuccessful extension would have a negative feedback on the parent brand evaluations, but the dilution would be greater in an Eastern culture than in a Western culture.

These hypotheses were confirmed in three experiments. In two experiments data were collected from both Eastern and Western cultures (Korea and Canada). Results from both experiments indicated that extension evaluations were influenced by the parent-extension similarity and that as expected, this effect was greater in an Eastern culture than in a Western culture. Further, this difference was replicated over different product categories (durables and non-durables) and different parent brands (*Nike*, *M&M-s*, *J&J*). In addition, experiment 3 showed that unsuccessful extensions had a negative feedback effect on the parent brand evaluations and that as expected, the dilution was greater in an Eastern culture than in a Western culture. Theoretical and managerial implications of these findings are discussed.

Linguistic Differences between Chinese and English and Their Effects on Consumers' Ability to Generate Images

Beichen Liang, University of Illinois at Chicago, USA

ABSTRACT

This study examines how language influences subjects' ability to generate imagery. Experiment 1 shows that Chinese subjects who read Chinese messages tend to generate more images than do Americans who read English messages. High-imagery versus low-imagery words have no significant imagery-provoking effects on Chinese subjects who read Chinese, whereas they do have a strong effect on Americans who read English. Experiment 2 shows that the imagery-provoking ability of Chinese subjects differs when they read a different language. The imagery-provoking ability of Chinese subjects is inhibited when they read English.

INTRODUCTION

Much research has examined the effects of imagery on memory for verbal materials because it is one of the most powerful factors influencing memory. Studies have shown that certain words have higher imagery value and are more likely to facilitate the generation of imagery than other words (Paivio 1971; Paivio and Csapo 1973; Paivio and Foth 1970; Paivio, Yuille, and Madigan 1968; Richardson 1980). High-imagery words, concrete words, may induce images in people's minds, whereas low-imagery words, abstract words, may fail to do so. For example, such concrete words as apple, banana, table, chair, etc. are more likely to create an image in people's minds than such abstract words as love, freedom, justice, virtue, etc.

According to the dual coding model, two processings, visual and verbal processing, occur in subjects' minds (Paivio 1986). Words are represented as verbal codes and pictorial information, such as pictures and mental imagery, are encoded as imaginal codes. Studies also show that the likelihood of retrieval is strongly related to the number of alternative retrieval routes in memory (Anderson and Reder 1979). So high-imagery words are easier to recall than low-imagery words (Lutz and Lutz 1978; Richardson 1980; Sheehan 1972) because people may create visual and verbal codes in their mind when processing high-imagery words and use multiple retrieval routes to recall them, whereas people may form only verbal codes when processing low-imagery words and use one route to recall them. In a manner similar to the picture superiority effect (the superior memorability of pictures over words), the formation of two codes from high-imagery words results in smaller memory differences between pictures and high-imagery words than between pictures and low-imagery words (Paivio 1971; Paivio and Csapo 1969). Moreover, the effect of having pictures accompany high-imagery words may be minimized because images will be formed during the processing of such words and the addition of pictures is redundant (Unnava and Burnkrant 1991). In contrast, the addition of pictures increases the likelihood of recall in low-imagery verbal information because dual codes may serve the retrieval route.

The dual coding model, based on simple arousal of visual and verbal codes, can only offer an explanation at the level of the gross imagery effect (Kieras 1978). Kieras (1978) argues that to memorize a sentence, the subject must visually read the words in the sentence, access their meanings, do a syntactic analysis of the sentence, and construct a representation of the content of the sentence. Whether imagery is manipulated or not, that process must be carried out whenever a sentence is to be comprehended. Kieras (1978) further points out that both empirical evidence and computer

simulations of complex mental processes show that "perception and comprehension processes must operate in terms of deep units, such as concepts, relations, properties, features, and meanings, rather than surface units, such as word representations or copies of sensory input" (p. 533). So the dual coding model can only explain the effect of imagery on verbal memory at the surface level.

Many propositions have been developed to explain the imagery-verbal memory effect (see Kieras 1978 for a review). Three models, the prepositional representation model, the semantic elaboration model, and the imaginal elaboration model, seem plausible.

Propositional representation (Anderson 1984, 1985; Anderson and Bower 1973) argues that all knowledge can be expressed in a proposition. A typical example of a proposition is a network that consists of nodes interconnected by links. For example, remembering a pair of words like "monkey" and "bicycle" can be enhanced by imagining a monkey riding a bicycle. In this simple model, the proposition (monkey, bicycle and ride) would appear as a node for the concept MONKEY connected by a RIDING link to a node for the concept BICYCLE. All of the propositions can be retrieved by the activation of any proposition in the network.

The semantic elaboration model argues that the semantic representation of a sentence is derived and then related image(s) may be formed, but the image is not stored. The memory search, which involves image formation, produces additional information about the content of the sentence, such as inferences about the concepts and additional relations between the concepts. The redundant connects provide alternative retrieval routes when the subject suffers from incomplete storage or partial memory loss of the basic sentence content. The mechanism underlying the imagery-words effect is not the storage of image but more redundant semantic information available for storage.

The imaginal elaboration model is like the semantic elaboration model. But this model argues that the image is stored and provides redundant connections, giving alternate retrieval routes.

This research is based on psychology and cognition of Western languages, especially among American subjects. So their generalization and effectiveness across difference cultures is questionable. Recent marketing research has shown that language differences can influence consumer information processing because language, the core of a culture, is central to communication and closely related to thought (Schmitt, Pan and Tavassoli 1994; Tavassoli 1999). Studies have shown that linguistic differences between Chinese and English can influence consumer memory of verbal information by affecting mental representation (Schmitt, Pan, & Tavassoli 1994), judgment and choice (Schmitt and Zhang 1998), and verbal processing (Tavassoli, 1999). It is well known that Chinese is an ideographic language and English is an alphabetic language. So language differences may influence consumers' ability to generate images in their minds. The purpose of this paper is to check the effect of language differences between Chinese and English on consumers' imagery-generation ability.

LANGUAGE DIFFERENCES BETWEEN CHINESE AND ENGLISH

"Language is the most primitive and original mode of thought of human beings and is direct realization of thought" (Yang, 1990-1991, p. 48). Language, embedded in culture, is the essence of

communication and can shape mental processes (Schmitt, Pan, and Tavassoli 1994; Tavassoli 1999). All Western languages are based on an alphabet whereas Chinese is an ideographic language. So the different language structures may result in different mental structures and representations (Schmitt, Pan Tavassoli 1994; Tzeng and Wang 1983; Yik 1978) and ability to generate imagery.

The formation of Chinese characters follows several principles. The earliest Chinese characters were formed by drawing pictographs. The characters were originally pictures of people, animals or other things. For example, the sun was written as , the moon as , water as , an ox as , fish as , rain as , sheep as , a bird as , and so on. Second, Chinese created indicatives by adding a kind of sign to a character to indicate certain meaning. For example, by adding a point to “刀” (knife), a new word “刃” (blade) is formed; by adding one stroke to “一” (one), a new word “二” (two) is formed. Third, in order to express abstract ideas or concepts, ancient Chinese created “associated compounds” or ideatives by combining two or more elements or characters. For example, the sun and moon were written together to form a new character, , to express the meaning of “bright or brightness”; the sun over a line, , to express the meaning of “sun rise” or “morning”; “人” (person) against “木” (tree), “休”, to express the meaning of “rest”. Over centuries, the Chinese characters have evolved from irregular drawing to stylized forms, from picture-based hieroglyphics to ideographic “square characters”, but they have similar structure and grammar. For example,  (sun) is written as “日”;  (moon) as “月”;  (ox) as “牛”;  (rain) as “雨”. Since the Chinese characters are more like picture, the processing of Chinese is more likely to generate images in people’s minds.

Moreover, the structure of Chinese characters has nothing to do with their pronunciation. The pronunciation is based on “rote associative learning” (Tavassoli 1999, p.171). So the pronunciation provides no cue to the recall of the structure of the Chinese character. The learning, reading and memory of Chinese characters rely heavily on visuospatial information, on how to discern subtly different structures of characters. For example, in order to tell the difference among “己” (ji, myself), “已” (yi, already), and “巳” (si, snake), between “天” (tian, heaven) and “夫” (fu, husband), and among “甲” (jia, first), “由” (you, cause), and “田” (tian, cropland), people must pay attention to subtle structure differences rather than the order of different strokes.

According to Schmitt and Zhang (1998) and Norman (1988), Chinese, Japanese, Korean, and Thai widely use classifiers to categorize words into different groups. Words are classified based on their physical properties, such as shape, size, thickness, and length, and conceptual properties, such as bendable, elastic, and graspable. For example, in yi zhang zuo-zi (a table), zhang is used as a classifier for objects (such as tables, desks, photos, and paper) that have properties of flatness and extendedness. The processing of such classifiers also relies heavily on visual code. In contrast, English, French, Germany, and Spanish never use such classifiers.

Based on previous discussion, the processing of Chinese words may rely heavily on visual coding and ignore, at least partly, phonemic coding (Rozin, Poritsky, and Sotsky 1971; Sasanuma 1975; Schmitt, Pan Tavassoli 1994; Tavassoli 1999).

In contrast, the entire English alphabet consists of twenty-six meaningless letters whose orthography represents the pronunciation of words (Tavassoli 1999). English speakers subvocalize (phonologically recode) written words (e.g., McCusker, Hillinger, and Bias 1981) and rehearse words in short-term memory’s phonological loop (Baddeley 1986). Moreover, English speakers tend to phonologically recode visual information (McCusker, Hillinger, and Bias 1981). So the process of English is dominated by phonological representation (Schmitt, Pan, and Tavassoli 1994; Tavassoli 1999) and the ability to generate imagery may be inhibited by allocating mental resources to subvocalize words.

McCusker, Hillinger, and Bias (1981) argue that Chinese and English native speakers seem to use multiple codes to process the verbal information because studies have shown that the processing of Chinese may involve phonological coding (e.g., Huang and Tzeng 1981; Nomura 1979; Perfetti and Zhang 1991; Yik 1981) and that processing of English may involve visual coding (Parks et al. 1972; Posner and Keele 1967). But no study has demonstrated that phonological coding overthrows the visual coding in the processing of Chinese and that visual coding dominates the processing of English.

DEVELOPMENT OF HYPOTHESES

The foregoing discussion leads to the conclusion that Chinese rely mainly on visual coding to process Chinese characters and that the Americans rely primarily on phonological coding and less on visual coding to process English. So when Chinese subjects read the verbal message (Chinese) in an advertisement, they are more likely than readers of English to create visual coding in their minds no matter whether the words are highly imagery-provoking or not. In contrast, the visual coding of English may be mediated, at least partially, by phonological coding. Therefore, I expect:

- H1: High-imagery messages (versus low-imagery messages) have no significant imagery-provoking effect on the processing of Chinese.
- H2: Chinese subjects who read Chinese will generate more mental images than will American subjects who read English under all message conditions.

Studies have shown that for English, high-imagery words are more likely to facilitate the generation of imagery than low-imagery words, therefore, I assume:

- H3: High-imagery words (versus low-imagery words) have a strong imagery-provoking effect on the processing of English.

EXPERIMENT 1

The first experiment investigates whether language has a strong impact on the consumer’s processing of verbal messages.

Subject and Design

16 Chinese students and 16 American students who were taking the MBA class at a major mid-western university were selected. They received a gift, key ring, for their participation. The experiment relied on a 2 (Message: High Imagery vs. Low Imagery messages) X 2 (Country: Chinese vs. American) between-subject factorial design.

TABLE 1

High Imagery Version	Low Imagery Version
Picture a child's shiny face, happy smile, and dancing eyes as he blows out his birthday candle. The light of that one candle is enough for the Classa digital camcorder.	A Classa digital camcorder performs very well under low light conditions. With its new filters and lenses, a light as dim as a candle is enough.
Imagine screaming people on a roller coaster plummeting down the steep track. The excitement on their face can be captured clearly with high zoom ability of 12X optical zoom and 480X digital zoom.	The digital camcorder allows you to capture the scene from a long distance. The new lens gives you 12X optical zoom and 480X digital zoom. Because of the high zoom, you can get clear pictures even from a mile away.
It also helps improve your tennis. As your feet pound back and forth on the tennis court, under the hot sun, you know that every split second of every stroke you played has been captured forever by your Classa. The tape can be analyzed later, to the minutest detail, using slow motion and freeze-frame	The Classa can help you in several sports, too. It records all your movements with great accuracy and plays them back at different speeds. Its freeze-frame feature on playback helps you analyze your mistakes. Or you could choose the slow motion feature to play back everything you recorded at 1/15 the speed.
Makes a professional out of anyone! Ordinary camcorders produce rainbow "noise" between scenes. With the Classa, whether you are making a tape of the Statue of Liberty, a speeding firetruck, or a fast-paced basketball game, it goes from scene to scene cleanly.	Make professional videotapes. This camera does not create noise patterns between scenes when shooting some activity with a lot of scenes like games. The Classa erase head produces clean, clear transitions between scenes. Everything you shoot looks professional.

Stimuli

Stimuli were adapted from those used by Unnava and Burnkrant (1991) to ensure that there was no significant difference on such dimensions as believability, understandability, meaningfulness, distinctiveness, self-referencing, informativeness, or the perceived strength of arguments. Subjects in my study rated an imagery index adapted from Unnava and Burnkrant (1991) on three 10-point Likert scales. They were used to measure the imagery-provoking ability of the ad (not imagery-provoking/imagery provoking; dull/vivid; boring/interesting). A digital camcorder was used as the target product because it should be of enough interest to the subjects that they could process the target advertisement carefully. I chose a digital camcorder because consumers may be quite familiar with it, even they don't have one, so the ability to generate images may not be inhibited in a situation where little schematic knowledge exists (Wright and Rip 1980). A fictitious name (Classa) was used to minimize the effect of prior experience with established brands. The English version was translated to Chinese. A double translation was used to ensure the accuracy of translation.

Unnava and Burnkrant (1991) used seven advertisements as filler. But filler advertisements were not used in this study. First, research shows that immediate recall seems to be limited to about seven units (Solso 2001) and the target advertisement already has four messages, with more than seven sentences. The experiment might suffer from subjects' loss of memory if they were asked to read more than seven different advertisements and messages. Second, the purpose of this study is to check whether language can influence consumers' imagery-generation ability. A picture is also an outstanding external source to induce imagery (Alesandrini and Sheikh 1983; Bugelski 1983; Finke 1980; Lutz and Lutz 1978; Paivio 1971; Rossiter 1982; Shepard 1967; Singer 1978). Therefore, the experiment may be biased if subjects recall and write down imagery generated from filler advertisements.

The ad describes four attributes of the digital camcorder (low light performance, zoom, ability to capture sports action, ability to

switch between still and action scenes, and the availability of different modes).

Message

The messages for high- or low-imagery words were adapted from those used by Unnava and Burnkrant (1991). The messages are shown in Table 1.

Procedure

Subjects sat in the conference room and were asked to read an advertisement with four messages. They were told that they would evaluate the advertisements for a local magazine. The Chinese subjects read and answered the Chinese version. After reading the ad, the subjects were asked to complete a ten-minute questionnaire on basic information about the U.S. that has nothing to do with this study to clear their memory. Then, the subjects were asked to write down everything in their mind when they were reading the ad. Finally, the subjects were thanked and dismissed.

RESULTS

Manipulation Checks. An analysis of variance of the imagery index with country and message as fixed factors revealed a significant main effect for words ($F(1, 28)=7.201, p<.05$) and a significant interaction effect ($F(1, 28)=14.297, p<.01$). Since the interaction effect was significant, simple effect tests were performed. Pooled error from 2 x 2 ANOVA was used for simple effect tests. As expected, for the Americans, high-imagery messages were rated higher on the imagery index ($M=8.63$) than low-imagery messages ($M=4.88, F(1, 28)=36.058, p<.01$, see table 2). For the Chinese, there was no significant difference between high-imagery messages ($M=6.96$) and low-imagery messages ($M=7.58, F(1, 28)=1.002, p>.1$).

Generated Images. Two judges who were blind to the purpose of this study counted the images generated in the subjects' minds. The judges agreed on their number of 88% of the images. Disagree-

TABLE 2
Means for Imagery Index and Generated Images

Measure	American Subject		Chinese Subject	
	High Imagery	Low Imagery	High Imagery	Low Imagery
Imagery Index	8.63	4.88	6.96	7.58
Generated Images	3.88	2.13	4.38	4.13
n	8	8	8	8

ments were resolved by mutual discussion. The generated images were reported in table 2.

An ANOVA was performed on the number of generated images with country and message as fixed factors. The ANOVA revealed significant main effects for country ($F(1, 28)=33.333, p<.01$) and message ($F(1,28)=21.333, p<.01$). The ANOVA also showed a significant interaction effect ($F(1, 28)=12.000, p<.01$). Since the interaction effect was significant, simple effect tests were conducted. Pooled error was used for the simple effect tests. The simple effect tests indicated that for the Chinese subjects, there was no significant difference between high-imagery ($M=4.38$) and low-imagery words ($M=4.13, F(1,31)=0.667, p>.1$). Thus the H1 prediction that high-imagery words (vs. low-imagery words) would have no significant imagery-provoking effect on the processing of Chinese was supported. Simple effect tests also showed that American subjects generated more images when reading high-imagery words ($M=3.88$) than when reading low-imagery words ($M=2.13, F(1, 28)=32.667, p<.01$). The H3 prediction that high-imagery words would have a stronger imagery-provoking effect than low-imagery words on the processing of English was supported. Third, for low imagery words, the Chinese subjects generated more images ($M=4.13$) than did the American subjects ($M=2.13, F(1, 28)=42.667, p<.01$); but there was no significant difference between the Chinese subjects ($M=4.38$) and the American subjects ($M=3.88, F(1, 28)=2.667, p>.1$) under high-imagery words condition. So the H2 prediction that Chinese subjects tend to generate more images than do American subjects under all conditions was only partially supported. Chinese subjects only generated more images when reading low-imagery words.

Discussion. The effect of language differences on subjects' ability to generate images was generally supported by my findings. Chinese subjects were not influenced by the manipulation of messages (H1). They generated about the same number of images in their mind when reading different messages. In contrast, messages have a great impact on American subjects. They generated more images in their mind when reading high-imagery words than when reading low-imagery words (H3). Generally, the Chinese subjects generated more images than did the American subjects. But the effect was only significant under low-imagery word condition (H2). So H2 was only partially supported.

Although experiment 1 provided general support to my theoretical frameworks, other factors, such as different cognitions, which are not considered in experiment 1 may influence subjects' ability to generate images. My findings would be enhanced if the experiment would show that subjects have different imagery-provoking ability when reading different languages. In order to confirm my result in experiment 1, experiment 2 was used to test whether subjects had different imagery-provoking ability when reading different languages.

OVERVIEW OF EXPERIMENT 2

Findings from experiment 1 supported my hypotheses that language has a strong impact on subjects' ability to generate images. But in experiment 1, Chinese subjects only read Chinese messages and American subjects only read English messages. So if language does matter, subjects' ability to generate images should differ when they read different languages. In other words, the high imagery-provoking ability of Chinese might be inhibited by reading English because the processing of English is dominated by phonological coding, not by visual codes. So the purpose of experiment 2 is to test whether the Chinese subjects' ability to generate images differs when they read different languages (Chinese and English).

Design of Experiment

16 Chinese subjects who were not involved in experiment 1 were selected. The experiment relied on a 2 (Language: Chinese vs. English) X 2 (message: high vs. low imagery words) between-subject design. Stimuli, message and procedures were the same as those used in experiment 1, except that only Chinese subjects were involved in experiment 2 and they only read English messages (high/low imagery words). Results of Chinese subjects from experiment 1 were combined with results from experiment 2 to conduct an ANOVA analysis.

Manipulation Check. An analysis of variance of the imagery index with languages and message as fixed factors only revealed a significant interaction effect ($F(1, 28)=7.206, p<.05$). Since the interaction effect was significant, simple effect tests were performed. Pooled error was used for simple effect tests. As expected, when reading English, Chinese subjects rated high-imagery messages higher on the imagery index ($M=7.63$) than low-imagery messages ($M=5.38, F(1, 28)=8.827, p<.01$, see table 3); but when reading Chinese, Chinese subjects gave about the same rate to high-imagery messages ($M=6.96$) and low-imagery messages ($M=7.58, F(1, 28)=1.002, p>.1$).

RESULTS

Generated Images. Two judges who were blind to the purpose of this study counted the images generated in the subjects' minds. The judges agreed on their number of 90% of the images. Disagreements were resolved by mutual discussion. The generated images were reported in table 3.

An ANOVA was performed on the number of generated images with languages and message as fixed factors. The ANOVA revealed significant main effects for language ($F(1, 28)=24.138, p<.01$) and message ($F(1, 28)=8.690, p<.01$). The ANOVA also showed a marginal significant interaction effect ($F(1, 28)=3.862, p<.1$). Since the interaction effect was significant, simple effect tests were conducted. Pooled error was used for simple effect tests.

TABLE 2
Means for Imagery Index and Generated Images of Chinese Subjects

Measure	English Message		Chinese Message	
	High Imagery	Low Imagery	High Imagery	Low Imagery
Imagery Index	7.63	5.38	6.96	7.58
Generated Images	3.63	2.38	4.38	4.13
n	8	8	8	8

The simple effect tests indicated that when reading English, Chinese subjects generated more images in their minds when reading high-imagery words ($M=3.63$) than when reading low-imagery words ($M=2.38$, $F(1, 28)=12.066$, $p<.01$). In contrast, when reading Chinese, Chinese subjects generated about the same images for high-imagery words ($M=4.38$) and low-imagery words ($M=4.13$, $F(1, 28)=0.483$, $p>.1$). Under the high-imagery words situation, Chinese subjects generated more images when reading Chinese messages ($M=4.38$) than when reading English messages ($M=3.63$, $F(1, 28)=4.34$, $p<.05$). Under the low-imagery words situation, Chinese subjects generated more images when reading Chinese messages ($M=4.13$) than when reading English messages ($M=2.38$, $F(1, 28)=23.649$, $p<.01$).

Discussion. The findings from experiment 2 indicated that the image-generation ability of the Chinese subjects differed when exposed to different languages. Chinese subjects' ability to generate images was inhibited when reading English. They generated fewer images under all message conditions when reading English than when reading Chinese. Moreover, when reading English, Chinese subjects were influenced greatly by the manipulation of different messages, whereas they were not influenced by messages when reading Chinese versions. So the results from experiment 2 confirmed my findings in experiment 1: language does have a strong impact on subjects' ability to generate images.

GENERAL DISCUSSION

Findings from both experiments showed that language does have a strong effect on subjects' ability to generate images. Ideographic languages, in which the visual codes dominate, tend to spark subjects to generate more images in their minds than do alphabetic languages, in which phonological codes dominate. High-imagery words generally do not have a significant effect over low-imagery words on subjects' image-generation ability under Chinese conditions although high-imagery words do have a stronger imagery-provoking effect under English conditions. An interesting finding from experiment 2 is that the imagery-provoking ability of Chinese subjects was inhibited when they read English messages. So Chinese subjects generated more images when reading Chinese messages than when reading English messages. One possible explanation is that Chinese subjects might devote more mental resource to processing phonological codes, so their imagery-provoking ability was inhibited.

As with all research studies, this study has some limitations. First, I did not measure the effect of individual differences on imagery-provoking ability. Researchers have developed several categories for studying individual differences in imagery processing (Ernest 1977; Sheehan et al. 1983; MacInnis and Price 1987). The four basic categories are scales of imagery ability (vividness and controllability), scales of imagery content, scales of spatial

ability, and scales of imagery vs. verbal processing styles. A future study may focus on how individual differences can drive the imagery-provoking ability of subjects from different cultures. Second, I only examined the imagery-provoking ability of Chinese subjects when reading different languages. I did not investigate whether the image-generation ability of Americans also differs when they read different languages. A future study may explore whether Americans have different abilities to generate images when exposed to different languages. Third, I did not collect the measures for ad and brand evaluation in this study. The effect of imagery on ad and brand evaluation should be examined in future studies. Fourth, I did not examine the effect of imagery on memory. A future study should examine whether the effect of imagery on memory is similar across cultures. Fifth, I did not explore the mechanism underlying the effects of imagery and words. A future study can explore this issue. Sixth, the effect of addition picture is not examined in my study. A further study that examines the effect of addition picture can be conducted.

Media Technologies: Mediated Families

Shakeel Siddiqui, Dublin City University, Ireland

Darach Turley, Dublin City University, Ireland

INTRODUCTION

Contemporary lived experiences, as products of countless possible life-worlds, are ever evolving and thus many may remain outside existing conceptual boundaries (Thompson, Locander and Pollio 1990). Fluidity in means and modes of consumption allows a consumer to use any of the countless permutations and combinations of social, cultural and technological components to create a unique life-world (Bauman 2000). The dynamic nature of contemporary social, cultural and technological orders allows the creation of new 'social collectivities' (Holt 1997) around consumption that challenge the structure and dynamics of established social institutions (Kaslow 2001).

It can be argued that the problems and challenges faced by social units such as families are microsystemic representations of the larger contextual dynamism of economic, technological and socio-political orders. Experimentation with newer modes and forms of consumption (such as in cyberspace) creates a 'phenomenologically-global' that effectively erodes the control of the 'geographically-local' (Gergen 1991). Cyberspace has emerged as a new consumption enabler and, as a consumption space within Computer Mediated Environments (CMEs), acts as a locus of social and cultural existence for individuals and communities of consumption in trans-global social spaces. There are polarised views regarding the social impacts of cyberspatial consumption; resonant themes like consumer empowerment are countervailed by arguments that cyberspatial social ties negatively affect an individual's geographically-local social involvement (Kraut et. el. 1998).

Within consumer research, consumption of technology in familial contexts has been an under researched topic, and its impacts have thus not been fully explored. Families choosing to consume in CME are perhaps what Canniford (2005) calls an unconceptualised group. This research is aimed at addressing some of these voids by seeking to understand how individual acts of consumption in CME affect both family structure and dynamics.

In this paper, the possible roles consumption in CME plays in transforming family dynamics are examined through an ethnographic study carried out in Ireland. In the following sections, family consumption in general is contextualized. The methodology is then discussed, followed by some ideographic data. The four major themes that emerged out of data analysis are first presented independently, and are then placed in a family structure context to illustrate the impacts such forms of consumption can have. The paper concludes by discussing the applicability of such micro-level findings on society at large.

Conceptualizing Contemporary Family and Consumption

The traditional notion of a family is hierarchically structured around legally and biologically related individuals, with each individual assigned a certain role (parent, homemaker, breadwinner and child) and associated expected behaviour (Bloom and Bennett 1986, Blossfeld and Huinink 1991). However, newer socio/psychodynamic paradigms are defining the contemporary family; no longer limited to union through heterosexual marriage and biological offspring alone, contemporary families are best defined as groups of individuals living together with social, emotional or legal ties and mutual commitments (Ambry 1992, Kaslow 1995, Barnett and Hyde 2001, Lee and Schninger 2002). Changes in family structure and dynamics alter the consumption context for its members. Where consumption practices of traditional family

units are influenced by the presence of young children (Wilkes 1995), non-traditional family structures and composition yield unique family consumption behaviours (Schaninger and Danko 1993), driven more by self-fulfilling individual choices than by collective actions and commitments (Rindfleisch, Burroughs and Denton 1997).

METHODOLOGY

Deviations and re-alignments from social and cultural norms and structures are often exhibited at a geographically local level. Although consumption in a mediated environment, as a purely cyberspatial phenomenon, is not geographically bounded, it has profound impacts at the local level (Escobar 1994). Both Netnography (Kozinets 1998 and 2002) and traditional ethnography (Miller and Slater 2000) have been effectively used to explore many dimensions of consumption in CME. Studying social clusters such as families requires a geographically local approach. I thus chose traditional ethnography to explicate the impacts of consumption of CME technologies on family structure.

The data for this year long study was collected during my residency in a suburban housing scheme in Mullingar, about 60 miles west of Dublin. Twenty households were accessed during the study period (between August 2004 and July 2005). Immediate neighbours were the initial target group, but as happens with any longitudinal study, the target population shrank with time. All subject families with two exceptions boasted a traditional familial structure (married couples with children). The two exceptions were one divorced single mother and one unmarried couple. All subject families were upper-middle-class households possessing at least one computer with an online connection. Nine of these families had more than one computer and a broadband connection as well, and all except one had other immersive interactive consumption platforms like Play-station or Xbox console. Close liaison and contact with the subject families enabled access to all the members as well as some individuals from their extended social circle.

The dataset comprised several short and depth interviews, field notes from several participant observation sessions and notes on frequent front-door chit-chat highlighting the goings-on in daily lives. Many of the interviews and observation sessions were impromptu, informal and un-structured, and most were either transcribed longhand or recorded through field notes later.

Transcripts and field notes were periodically coded and interpreted to detect patterns of behaviour or identify themes. Sometimes when a strong theme or pattern was identified, the emic view was placed against the etic and new lines of enquiry were established. This evolving ethnographic approach using the emic-etic interplay to guide the process of data collection (Kozinets et.al. 2004), made reference and review of literature a permanent part of the study. Periodically, themes were pruned and readjusted and insignificant themes were replaced by newer stronger ones. However, since most data collection was naturalistic in a small sample of population, enquiry and explication along themes of interest was not always possible and thus some themes did remain unsaturated.

DATA SET

This section presents ideographic demographics (Table 1) and observational accounts through family sketches (Exhibit A). The intention behind presenting such an account is only to capture the

TABLE 1

Sample Family Demographics				
	Age/ gender	Status in family	Main occupation	Favourite passtime
Mike's				
Mike	34/M	Father / Spouse	IT Trainer	Gardening, woodwork
Lisa	30/F	Mother/ spouse	Secretary (Part time)	Gardening
Eric	4/M	Child	Growing up	Playing
Ben	2/M	Child	Growing up	Drooling
Adam's				
Adam	45/M	Father, Spouse	Engineer	Golfing, socialization
Sheila	42/F	Mother, Sister, Spouse	Secretary (part time)	Homemaking, socialization
Zoey	5/F	Child	Student	Barbies
Lorraine	17/F	Sheila's Sister	Student	Socialization
Jack	21/M	Lorraine's boyfriend	Salesperson	Rugby
Marks's

Jennifer	44/F	Mother, Partner	Homemaking	Online Poker
Jill	9/F	Child	Student	Music
Jack	7/M	Child	Student	videogaming

ethn
 totality of the ethnographic narrative. A non-analytical approach is used in preparation of this largely observational account and emic view, lived experiences and interrelationships between acts and impacts are presented and discussed later.

DATA ANALYSIS

In keeping with evolving ethnographic study, data collection and analysis in this study were concurrent activities. Although some observed behavioural and interactional phenomena were unique in contextual terms, there were similarities in the way they impacted on different families. Collective patterns emerged where diverse acts and situations enacted and experienced by different actors were observed as having similar impacts on the family as a unit. As themes emerged from this collective analytical process, they became part of a framework. Each time new data were analysed, this analytical framework was refined and updated. This procedure was repeated till saturation was reached for most themes. At the end of this process the thematic framework constituted of the following four themes.

1. Empowerment–Disempowerment
2. Social Aggregation–Social Alienation
3. Immersion–Disengagement
4. Experimentation–Deviation

These themes are presented as pairs where the first component highlights the operative condition and the second its possible resultant impact. Empowerment of an individual changes his relative position in the immediate social group which might manifest

ther
 individual. Social encounters and ties in cyberspace often alter the composition of an individual's social reference group and may result in social alienation with immediate family members. The phenomenological nature of immersive experiential consumption in cyberspace disengages an individual from his physical world, and finally experimentation in the virtual domain can manifest itself as social and cultural deviation. These themes are discussed in detail in the following.

1. Empowerment–Disempowerment

This theme highlights the empowerment accorded to consumers by CME technologies and the relative polar position of disempowerment. The internet has evolved as a social and commercial enabler. It empowers a consumer to work from home, shop from his bed; run errands while keeping children company; conduct research as well as entertain himself from the comfort of his home. But consumers who choose not to, or are unable to negotiate cyberspace, are disadvantaged by not being able to enjoy the convenience and benefits online marketplaces offer.

Within a familial context, computer proficiency can be an empowering resource for an individual. Conversely, inadequacy in the new technological realm may increase co-dependence in relationships. This is illustrated by the case of Sheila, wife of Adam. Her computer proficiency altered the status of co-dependence in their relationship.

Yeah, I got this NCT booking done online for my car. I also pay road tax online, I mean now that it is so easy, and can be done from home—I am not dependant on Adam in this way, In fact,

EXHIBIT A

Two family sketches

The Adam's: Adam's are a highly social and outgoing family. An avid golfer and Liverpool football club fan, 45 year old Adam works as an engineer in Dublin. His day starts at dawn as he has to travel 100 km to work. Occasionally he returns early and tends to his cars or garden. They are a three car family and Adam loves his brand new BMW convertible. Sheila is 40 and works part-time as a secretary in Mullingar town. Five year old Zoey is a precious child of the family as she had been diagnosed with cardiac dysfunction very early on. Like her parents she exhibits social tendencies and often holds her own children parties on the front lawn on summer evenings. Lorraine, Sheila's sister is a final year high school student and has recently got emotionally involved with Jack. Their house and garden are always kept very well maintained and cars always sparkling clean. Sheila likes flowers and her front porch is always full of season's best. Sheila likes to entertain as well as attend parties. Adam likes to spend his Saturdays on the local golf course and evenings at the pub watching and betting on football. Their social circle is wide and varied as they know how to entertain diverse groups. They often have over a dozen visitors on Saturday evenings, Sheila's sisters and their families; Lorraine's boyfriend as well as Adam's golfing partners all assemble together for dinner. Occasionally Jack stays over till Sunday morning, as do some of Adam's friends. They are a two computer family and have a broadband connection. Lorraine has her own computer in her bedroom and the family computer is in the living room, which has very infrequent use. Sheila and Adam are somewhat computer challenged and thus their computer time is generally task driven.

The Mikes: 34 year old Mike is an IT professional and works as a trainer for IBM Ireland. He commutes three to four times a week to Liexlip, about 70 Km from his home. His wife Lisa is a 30 year old mother of two and works part time as a secretary in Mullingar town. Eric is four and two year old Ben is the baby of the family. Since Lisa doesn't drive, they are a single car family, which is unusual for a working couple household in the neighbourhood. They have made child-minding a fulltime responsibility above their career or professional aspirations, and they work in alternate shifts so that one is always home to mind the children. Mike is a doting husband and a devoted father and has very few friends outside the family's social circle. They do their groceries on Saturday morning and occasionally attend the mass on Sundays. Since Mike usually works weekend evenings they have limited outdoor social life. They have a very large backyard with a large playhouse and patio. Because Mike partly telecommutes, his computer is almost always on, which Lisa occasionally uses. She is not very keen on media technologies and generally prefers tangible toys over video games for her children. Mike's time and relationship with his computer are variable; at times he may spend several hours at a stretch on his computer, while at others he may not touch it for a week. He occasionally plays online games and conduct random searches, but mostly his computer time is goal directed. Because he had been a builder (construction worker) for many years, he often spends his spare time in house repairs and maintenance.

Exhibit A

I do a few things for him.... like recently we were up for insurance renewal, I saw that ad on TV and went online and I found a much cheaper quote—for his car as well..... well yeah, now he says you go do it, may be he has realized that I can do it better. (Sheila)

Where at one level Sheila's computer proficiency had enhanced her stature in her co-dependant relationship with her husband, at another level this empowerment had given her a feeling of 'being better'. This somewhat competitive feeling of being better at some tasks often shifts the role and responsibility structures in families. It was observed that a few computer literate women were either delegated to, or themselves took the responsibility for performing online tasks like banking, paying bills and taxes, booking flights, hotel and appointments as well as buying cinema tickets.

Online product search and shopping is another significant area within this theme. Consumers who would normally find it difficult to negotiate the maze of supermarkets' brand constellations may become easily accustomed to the online format. Although shopping was evidently an interdependent family activity in the core informant group, there were also indications that use of the internet was mediating these interdependencies to some extent. As an illustration, in the early stages of the study, it was observed that because our informant Lisa did not drive, she was dependant on her husband Mike to take her shopping. Mike however, was mostly a passive participant in such shopping trips and depended on Lisa to make all decisions. Towards the end of the study, Lisa had started product searching and shopping online and Mike had now become an active

participant in this exercise. When probed, it became evident that technology's mediation was a significant contributor to this change.

It's not shopping, choosing what to buy is tricky, stressful really, and I make so many mistakes, but it's not like your car or machines where there are specifications to compare, yeah, but may be its cathartic to women I suppose (household shopping), they are natural at it, —online, it's a man's ball game—now you have tools to compare them side by side, I guess it's a good thing these days. (Mike)

But Mike's use of technology to negotiate the supermarket maze was not unique, as another informant Mark, employed the same means to a different end. Mark and his wife Lorna's use of online shopping was fairly sophisticated, as they had made shopping baskets of their preferred brands and products which they used in their shopping selection. They had discovered that with each online order their shopping baskets got more precise as the software remembered their usual requirements of weekly consumables, automatically adding them to their order, which they could modify if required. Lorna felt that online grocery shopping had not only reduced 'oh I forgot to get that' occurrences resulting in constant revisits to the store, but had also allowed her more time with her kids.

However, not all online shopping activities are so clearly goal directed and produce tangible life effecting results. Our informant John worked as a security supervisor in a Dublin bar and found his job physically and emotionally exhausting. He seldom participated

in household chores and specially did not like to participate in family shopping. However, as a keen surfer, he found bargain hunting through online auctions and clearance sales a very interesting activity. Although he would still not go shopping himself, he would compare prices on various store sites and provide tips to his partner Jennifer, who on the other hand, found such an exercise futile.

O Come on, I mean you don't buy things unseen, and you know what John does, he opens up a few sites, Aldi and Lidl and Tesco and Argos and he give me a summary, Oh its much cheaper there, this is new and that's a bargain, well do we really need it? And who knows about the quality—that's not how you shop! It's like his hobby you know, and I am happy for him. (Jennifer)

Here Jennifer is apparently dismissive of John's well meaning efforts to participate in family shopping decisions through his online search of supermarket sites. Her classification of his contribution as 'hobby' suggests that, in their household at least, the impact of online activity on the existing shopping power structure may be quite limited. Her espousal of 'real-world' shopping may well have more to do with maintaining this status-quo than with extolling the merits of one specific mode of shopping. On the other hand, because this 'online window shopping' was part of John's larger recreational use of internet, we can also see it as an attempt to buffer his job stresses by making him feel successful in finding bargains and being useful to the family (Barnett and Hyde 2001).

Work-life balance is one of the key quests in contemporary families. CME technologies empower individuals to enhance their work-life balance by working from home. Telecommuting allowed one informant to commit more emotional resources to his family. Mike, who worked partially from home (see exhibit A), felt the simultaneous multi-tasking in physical and cyber space was beneficial to him.

Well I could go five days a week, but why? Saves me driving, and allows me to be home more. I do have the computer on during the day and sort of keep an eye on the mail, you know, so they know I am available — I know it's a lifestyle thing, but I think its all about balance between your work and your family. (Mike)

Telecommuting in his case was empowering both spouses, enabling them to share parental and wage-earner roles. Where it allowed Mike to spend more time at home with their very young children, it empowered his wife to take up part-time employment. What is also important to note here is that working from home through telecommuting may offer a lot more potential than just working, as it has the propensity to become a lifestyle.

A majority of our cohort of informants considered that providing knowledge and information was a home computer's primary function, and on several occasions parents were observed encouraging children to go to the internet for information first. Some of these parents were also struggling to keep up with their children's quest for knowledge, occasionally finding them inadequately equipped. Home computers have been around for a few years now, and some teenagers in this study had been using them since early childhood. However, these 'generation txt' (Thurlow 2003a) teenagers, like Lorraine, have come to a point now where they would rather go to the 'net' than ask their parents.

'no it's much easier to find it on the net, isn't it? and then I mean I doubt the older generation know as much about what's out there now, I mean what's cool and what's passé (Lorraine)

Knowing what's cool and what is passé have always been at the forefront of social desirability for the youngest adult generation. Where permissive parents in our group acknowledged the existence of these generational gaps and were thus willing to allow their children's online activities, at the same time they did make a conscious effort to control the content their children accessed.

They are not allowed to go wild on the internet, at least not in this house. I mean kids, they have to be told their limits—now Nathan is good in this way, he knows what he is allowed. Kevin (pause) likes to explore, and so I have made Nathan the internet sheriff—to keep an eye on things when I am not there. (Jackie)

Jackie was not alone, as I found other parents trying to supervise their children's online activities by employing all possible means. Where Jackie had delegated this responsibility to one of the siblings by according him the status of a third parent, others had installed supervision software. Cyberspace, however, is a social world, and children may soon become entangled in the web and separated from their parent's reach and knowledge spheres. Internet thus empowers children to widen the generational gap at their discretion, and even disenfranchise parents from being a part of this process. Exploring the web independently, children may also try to evade adult company or supervision during the activity. The dilemmas parents face in trying to keep the situation under control is amply evident from Adam's response below.

Broadband, internet, it's funny but I find it very much like this world, you know, there are good things about it, and bad things on it.

And how do you deal with it?

Turn the freaking thing off, I suppose what else? I mean you have doors, right, and then you shut them to keep the evil out.... for your kids. Internet to my mind is that evil that got in through the doors, it's in your house now, and you have little control. (Adam)

Controlling and mediating the social and cultural encounters is one of the primary parental responsibilities. Parents do so by limiting and controlling the social exposure and children are discouraged from talking to strangers or watching adult television programs. Adam's feeling of loss of control over internet access represents the common parental fear of subversion of authority in terms of regulation of social exposure. The cyberworld, like a real world in virtual settings, can impact on an individual through social and cultural encounters. Unaware of their children's online social and cultural encounters, parents are unable to mediate this exposure and channel this learning process. In this study parents who would normally have debriefed children after independent social encounters like school, parties or playground sessions, would often fail to practice such a debriefing after online or video game sessions.

In summing up all the dimensions examined under this theme, it appears that family members can benefit from the products and services available in the CME by removing and overcoming many of their inadequacies and by becoming able to assume additional roles. Since empowerment is a relative position, this role assump-

tion can be complementary and facilitative as well as competitive in the family. It may also appear that in some cases one member's empowerment is at another's expense, and the empowered can thus assume stronger roles in the family.

2. Social Aggregation–Social Alienation

This theme contextualizes the social alienation family members sometimes experience when they utilize the aggregation potential of cyberspace to expand their social sphere. Because many members of a family also have biological relationships, their emotional ties to each other are qualitatively different from other types of social associations. Family members have always been considered a strong and closely knit social group because of the interdependencies and sharing in their collective lives. Sharing of values and heritage, space, objects and possessions as well as time makes their experiential repository similar in many ways.

With the advent of new modes of mediated consumption, the phenomenology of a consumption experience has become partly independent of the tangible environment. By dissolving the distinction of place, sense of time and value of objects, a mediated environment may allow an individual to create independent social worlds through networked communications (Schau and Gilly 2003) while still sharing space, objects and possessions with other family members. Social encounters and ties in cyberspace often alter the composition of an individual's social reference group and may result in social alienation from immediate family members (Kraut et. al. 1998). Distinctiveness and exclusivity is an inherent component of many familial relationships. Cyber-relationships take diverse forms and some cyber-emotional ties can compete for emotional space within a family. However, some informants believed that because of the ethereal nature of cyberspatial social ties, any emotional investment in this technologically created social order did not impact their familial bonds.

It's all about choices isn't it, I mean between my job and travelling, I have limited time for other things, you know what I mean, and my time on the net is my entertainment—so to say, I don't think I would be spending more time with Jen or kids if not online, ah but, ah maybe watch teevee or something. Can TV do the same for you?
Oooo No sure, no, maybe not, I mean net is alive, tv to me is a dead thing you know. I mean you meet people, see what they are doin, find new things— so it's it's a lot more interesting to me? Do so much more than sitting watching tv with the kids.
(John)

John's desire for social encounters in cyberspace is justified through presenting it both as a preferred and as a richer source of social aggregation. For John TV watching en' famille was apparently a disliked and disputed activity and furnished him with a rationale for opting for online engagement in its place. However, consumption in CME as a solitary immersive activity exhibits itself as 'being away while at home'. John's justification for 'doing more than watching TV with the kids' perhaps represents the separation in the family through his choice to spend the collective social time in a solitary activity.

In my observation of families, the strains on available resources of time and emotions were visible at many other times when an investment of these was made in cyberspace. Although the use of cyberspace as an alternate social platform varied considerably within our extended group of families, there were consistent indications that such social ties were impacting the family as a whole. The overall perspective of most of my informant families was that

they would like to have a balanced approach towards this alternate use of private time, and thus excessive solitary immersive activities (such as chatting sessions or video gaming) by an individual were often overtly disapproved of by other members. Jonathan's family was a case in point, where his wife Nora continually complained about his overtures on chat forums and considered it a minor form of infidelity.

Familial context is considered to have the greatest influence on consumer socialization and leaves lifelong imprints (Moschis 1985). Levels of family communication are indicative of close familial bonds and affect family members' independent consumption choices (Carlson, Walsh, Lacznik and Grossbart 1994). Such communication between family members is also conducive to social learning and patterning, and parents often use it to warn of undesirable external influences. However, digital textuality has altered the mode, form and content of communications of 'generation txt', and parents are often unable to communicate with their children because they simply speak a different language (Thurlow 2003b).

This digital lifestyle is apparently irreversible, and young people are increasingly socializing through digital means. It was observed that such socialization trends started as text chatting in children as young as 10 and, by the time they were 14, most were communicating and socializing through the internet on a regular basis. Cyberspatial socialization is not always entirely experiential and virtual, as in Irish chatrooms, it is quite common to be invited by strangers for a rendezvous. Forming new relationships in such a dramatic fashion appeared to fascinate one teenage informant:

Oh yeah, off and on you get this guy who wants to meet up. And have you ever met someone this way?
O gosh no, I have no reason, now I am not saying I might never will, who knows about the future (pause) now my friend met her boyfriend like that, through the net I mean, so I know you can meet some really nice guys like that. (Lorraine)

New relationships in cyberspace can either be manifested as real person to person social or emotional ties or seemingly innocuous cyber-chitchat with online others. Individuals' social and emotional involvements are relative to each other and each time an investment in new cyber-bond is made, familial bonds may risk deterioration.

3. Immersion–Disengagement

This theme is about separation of the phenomenal world from the physical, and the impact such separation has on both individuals and family. CME, because of its multi-sensory captive immersive ability (Biocca 1997), is a very potent platform for experiential consumption. Consumers have now come to accept simulations in lieu of the real, and multi-sensory immersion has thus become an alternate mode of consumption. The most common immersive applications of CME in my observation were the videogames, and I found our informant Lisa very concerned about the nature and content of this mode of consumption.

Its not all Barney and Barbie stuff out there is it, I mean most games are death and fire and destruction and kill kill, shhhhhh ... you should look at their faces when they are playing it. Lisa

When video-gaming is opted for as an alternative to a physical activity it may affect the way an individual perceives and reacts to his physical world. In a positive constructive manner, simulators using similar technology have long been used in training and practice for many sports and professions. However, recreational

videogames are not primarily aimed at imparting skills in a simulated environment. One of the critical reflections emanating from observations of video gaming sessions in participating households was that the majority of these games were hyperreal glorifications of violence in which gory aggression was presented as a form of sport. Although difficult to critically evaluate and empirically establish on the basis of existing data, one field note suggested that such violent video game players became *'disengaged from their immediate physical and social world'*.

I found Kevin (13) an extreme video-gamer. At the time of this study he was also learning Karate at the local gym. There were indications that his videogame obsession was disengaging him from real life as well as conditioning his responses. He had become so used-to surprise combatants in his video-games that he had started to live in fear of the next surprise appearance of a deadly foe in his real life. He once had a panic attack during his karate training sessions. It was a wonderful summer that year, but during this phase he seldom ventured out of the house. His mother told me that he was sleeping through the day and was scared of going into unknown buildings like new grocery stores or shopping malls. On occasions that I did see him outdoors, he was constantly looking over his shoulders and changing positions and would involuntarily hit siblings when they approached him.

4. Experimentation–Deviation

Cyberspace has emerged as a playground for experimenting consumers. Because cyberspace allows individuals to pursue their hobbies and fantasies in alternate social dimensions, ever since Rheingold (1993), it has continually been depicted as a domain largely populated by emancipated 'nerds' and wayward 'geeks' satiating their countercultural urges. However, I was observing and interacting with a very 'normal' segment of the society in 'traditional' social clusters, and within my cohort I observed diverse ways of experimental cyber-consumption; where cyber-sexual experimentation was a lifestyle for some, online gambling and competition was a source of recreation for others. Our informant Jennifer was an avid online poker fan and her partner John liked online adult content. The following dialogue between John and Jennifer highlights some of the contrasting views consumers may have regarding experimental consumption in cyberspace.

John: *she is the gambler*

Jennifer: *no I am not, poker, it's called poker and it's not gambling*

John: *you bet money, it's gamble*

Jennifer: *your eBay gamble too? you bet money there!*

John: *Yeah but I am sure to get something in the end—it's not a zero-sum game*

Here John's labelling of Jennifer's passion as gambling is an attempt to portray it as deviation from his own social and cultural viewpoint, and Jennifer's attempt to equate bargain hunting with poker is perhaps towards claiming legitimacy for her own actions. Technology has always been at the forefront of gambling and marketers now use it to control the odds and position it in larger segments of population. With the advent of new media technologies gambling as a form of consumption has entered traditional households and I found that Irish women were increasingly experimenting with it.

Sexual experimentation is another form of consumption in cyberspace. Ireland has its share of adult content websites and chat forums which have tens of thousands of members. John was one of these members, and he gave his view about a particular Irish website as follows.

Oh I love them, I mean if you look at the content, it's far richer than what your TV or videos or magazines would give you, and everything is on-demand and instant, well sort of, but most of it free anyway—yeah I'd say, go try one of them daily tips you have on www.xxxxxxxx (site identity concealed by authors), some are gags really, but there are gooduns as well. (John)

A cursory examination of adult sites reveals that some of them are designed to target teenagers and young adults. Many Irish teenagers access such sites for sexual information. Our informant Lorraine however denied accessing such sites on a regular basis.

Jesus no I don't, I mean I don't have the need, ah but I know my friends do... I mean, I mean Jack does, and, and sometimes he would be on the net and IM me to check something out—but then if I am home I can't risk going to such sites (pause), ah so normally I don't' (Lorraine)

Her crafty third person reportage of sexual experimentation in cyberspace indicates the pervasiveness of such form of consumption among teenagers. Concerns that children's access to such information reduces parental control over sex-education and awareness have been resonating in Irish print media for some time now. It has been argued that teenager visits to such sites affect the role adults play in their sex-education. Asked if such was the case with her, Lorraine commented:

Well Sheila (sister) is very supportive, more like a friend, but I really never had these many questions when I was young, I don't know but I mean maybe girls are not that crazy about sexual information, they take it as it comes and if they fancy I mean they would go with a guy, and I don't know—is it not getting very private now? (Lorraine)

Notions of not having questions and not caring about the answers generally indicate an independent path to discovery. Teenagers in the twenty-first century are empowered by their computer prowess to explore and experiment to their heart's content. However, very few of my informants (only after reaching a certain level of trust and comfort) did reveal such 'secrets', adding to my repository of revelatory moments and information, but such revelations were neither guaranteed nor forthcoming in all cases. I still feel that there are certain gaps in my understanding of this mode of consumption and that at least a few of my informants did have lives in the virtual world that I were not privy to.

DISCUSSION: CONSUMPTION IN CME TRANSFORMS FAMILIAL ROLES

Viewed from the position that consumption in mediated environments is often not shared but a solitary activity (Kraut et al. 1998), the four structural components of our thematic framework (Empowerment–Disempowerment, Social Aggregation–Social Alienation, Immersion–Disengagement, Experimentation–Deviation) appear to directly impact the structure of participating families in a variety of ways. In this section I argue that our four themes highlight the impacts families may face as a result of individual acts of consumption in CME by altering the functional roles and emotional spaces in family structure. I argue that in a dormant mode these roles are contested, and in an active mode conflicts may arise due to this contest; empowerment can result in role increment, as well as decrement, or role sharing and enhancement.

From the structural perspective, roles are the culturally defined norms—rights, duties, expectations and standards for behaviour—associated with a given social position. Although some

theorists argue that nature does not enforce gender-differentiated roles (Barnett and Hyde 2001), such roles have historically been a cultural norm in family structure. Family structures, however, have also been historically dynamic in nature; diversity and multiplicity of roles has constantly redefined family structure (Belch and Willis 2001). Such role transformation has been considered healthy for the emotional and physical wellbeing of its members on the basis of the argument that liberation from such an ideological standpoint through mutual acceptance and division of work results in strengthening of the family structure and relationships. Barnett and Hyde (2001) propose that “*the extent to which one holds traditional or non-traditional attitudes about the proper social roles of women and men moderates the relationship between multiple roles and a host of outcome variables*” (2001, p 789).

As our first theme of empowerment-disempowerment indicates, CME empowers individuals to assume additional roles in the family thus enhancing their sense of wellbeing. Telecommuting allows men to stay home and contribute towards cooking, cleaning and childrearing. Finding it easier to navigate the online environment, both men and women feel empowered to share additional household chores. Working women who break free from the traditional cultural role of a mother and homemaker by adopting a now socially acceptable ‘juggling supermom’ lifestyle (Thompson 1996) are also empowered in CME. Adjusting and adapting to the exigencies of contemporary society expose these juggling Supermoms to stressors of negotiating multiple roles through compromises and concessions to their primary roles. As a working single mother, our informant Jackie found CME empowering as she could perform a few tasks late in the evenings in the company of her children, without compromising her parental role.

Disempowerment, at both real and perceived levels, may also transform an individual’s roles in the family. Our informant Mike’s decision to partially work from home allowed his wife Lisa to work first shift. Although at the surface this may appear empowering to both the spouses, I found him feeling disempowered through assumption of this additional responsibility because of his belief that childcare was a mother’s responsibility.

Multiplicity of roles and social intertwining of contemporary work and family contexts can also become sources of conflict for both working men and women (Major, Klien and Ehrhart 2002). Flexibility and acceptance of gender diffusion and multiplicity of roles are prerequisites in resolving such conflicts. Men in dual earner couples who adhere to traditional gender role beliefs are more vulnerable to psychological distress when their work situations are troubled (James, Barnett and Brennan 1998). Our informant Adam who held traditional gender role beliefs was apparently in a constant state of stress. He believed that certain household responsibilities were solely the man’s domain. However, Sheila’s use of internet enabled her to handle many tasks that remained outstanding because of Adam’s demanding job schedule and habit of procrastination.

Although rigid distinctions in division of labour in child rearing are eroding (Nugent 1991), the father often plays the role of guardian and mentor in terms of introduction to economic, political and technological systems and mother supervises the social and cultural grooming (Coltrane 1988). With changes in the technological order it was apparent that in many situations neither of the parents in this study could assume their proper roles. Some of our informants felt disempowered by being unable to fully assume the roles of guardian and mentor when it came to CME technologies. Because children spent long hours online and were better versed in computer technology than their parents, parents were unable to monitor and mediate their social and cultural online encounters.

Children themselves have a significant role in the traditional family structure. Besides acting as an emotional nucleus for both parents, they are also given the responsibility for many menial household tasks (Gager, Cooney and Call 1999). CME technologies affect the children’s task-performing role in two ways. First, because children and young adults gain proficiency in using internet quicker than their parents, in many households teenagers have assumed the role of a technology supervisor and moderator. Such role enhancement arguably increases a child’s stature in the family structure. Second, many parents think that a child’s time online is being spent in the most useful way. This apparent empowerment either automatically exempts them from performing menial tasks when online or, because of the disengagement children feel while in CME, they may actually decline performing such tasks.

Decision to consume in CME: Why? Viewing consumption as a social phenomenon, we can argue that many alternates exist in social orders simultaneously and an individual’s choice reflects her position in her social world. Because consumption practices within a family often correspond between members, the role an individual is assigned or herself assumes within the family impacts her current and future consumption practices (Gager, Cooney and Call 1999).

I found that there is a symbiotic relationship between consumption in CME and family structure. Family dynamics at times initiate the move of a family member to cyberspace; equally, immersion of a family member in cyberspace can affect family dynamics at large. It was an observation that members from close knit family structures with strong social and emotional bonds used CME only as a partial extension of their total social and emotional sphere. On the other hand there were fragmented family units exhibiting multiple computers in the household with highly individualized CME consumption patterns that accelerated the pace of social and emotional isolation among family members.

MACRO-LEVEL IMPLICATIONS OF THE ARGUMENT

Domestication of technologies modifies and reforms societies permanently (Pantzar 1993 and 1997). CME technologies, through their systems and networks are dynamically evolving at a pace incomparable to any other ‘medium’ technology of the past. However, it is the non-technological social-content manipulated within this medium that has created a new social ‘life-form’ (Miller and Slater 2000). CME technologies have reached a level of domestication where consumers can now focus on the content and ignore the technology (BinsBergen 1998). Contemporary shifts in family consumption behaviour towards individualistic values and self-fulfilling aspirations at the expense of a decline in familial and religious values have been labelled as the core of the postmodern libertarian ethos (Gergen 1991). Consumption in CME accelerates this process of liberation by separating physical from the phenomenological, social from the geographically local, thereby altering social structures at both macro and micro level.

Live From Shopping Malls: Blogs and Chinese Consumer Desire

Xin Zhao, University of Hawaii at Manoa, USA

Russell W. Belk, University of Utah, USA

ABSTRACT

In this exploratory study, we examine a particular type of blog [web log] on which young Chinese consumers passionately write about their daily lives and consumption experiences, such as trips to shopping malls, dining experiences at restaurants, holiday travels, and clothing purchases. We seek to understand how such blogs function to spread consumer culture in cyberspace and among Chinese consumers who read and write consumption-oriented blogs.

INTRODUCTION

Started as a list of annotated links to other web sites, blogs [web logs] are gaining momentum in recent years (Serfaty 2004). They are different from other online resources such as BBS, online discussion groups, and personal web pages examined in prior research (Kozinets 2002; Shau and Gilly 2003). The blog is a form of online diary accompanied by up-to-date photos and music. Our focus on China and Chinese blogs is justified by the rapid growth of incomes and consumer culture in urban China (e.g., Davis 2000). After English, Chinese is now the most common language of the Internet. The same is true of blogs which have become a very popular collective forum among Chinese people around the globe. Consumption-oriented blogs are online diaries dedicated to the bloggers' everyday consumption activities, such as a trip to the shopping mall or an enjoyable dinner at a fancy restaurant. For example, "Jessie" updates the world on her blog about new additions to her private closet, and discusses her favorite possessions ranging from a pair of Converse shoes to Abercrombie shirts. She writes about what she already has and laments what she could not afford to have. Blogs like this spread knowledge about the latest fashion trends and the hottest products and brands. They not only record the blogger's everyday consumption, but also provide introspective accounts of how the products are connected to their lives. Consumption-oriented blogs thus provide a unique context in which to examine global consumer culture and the cultivation of consumer desire in the cyberspace. In this exploratory study, we take a discovery-oriented approach (Wells 1993) and seek to understand why consumers read, write, and post their private shopping experiences in blogs.

THE LITERATURE: CONSUMERISM

Consumerism is the value system in which consumption is naturalized as the source of meaning and happiness in life, and material goods are avidly desired for their extra-utilitarian values, such as hedonic value, envy provocative, and status-seeking (Belk 1998; Stearns 2001). Consumerism has been celebrated by some for its potential stimulation of cultural rebellion and social democracy, for its role in constructing meaningful life experiences, and for being conducive to social well being (e.g., Miller 1987; Wilk 1993). More often, consumerism is subject to criticism and held responsible for reproducing and establishing social stratification through consumption, precipitating epidemics of depression, and leading to anomie, commodity fetishism, exploitation of women, and the commercialization of culture (e.g., Adorno and Horkheimer 1944; Bourdieu 1984). The rise of consumerism around the globe has attracted multidisciplinary interest (e.g., Brewer and Porter 1993; Campbell 1987; Stearns 2001). However, most research is focused on traditional institutions of consumerism such as department

stores (e.g., Leach 1983) and advertising (e.g., Lears 1994; Marchand 1985). Comparatively little attention is given to the spread of consumer culture and cultivation of consumer desire in the cyberspace (e.g., Kozinets 1999; Giesler forthcoming). Consumption-oriented blogs provide such a context to examine such important issues.

METHODS

Netnography is an interpretive method for examining consumers and the culture of consumption present on the Internet (Kozinets 1998, 2002). It is a written account resulting from fieldwork studying the cultures and communities that emerge from on-line, computer-mediated, Internet-based communications, where both the field work and the textual account are methodologically informed by the traditions and techniques of cultural anthropology and market-oriented ethnography (Arnould and Wallendorf 1994; Kozinets 1998). Netnography adapts ethnographic research techniques to virtual communities (Kozinets 2002, p.62). It allows researchers to observe consumers in a naturally occurring environment in a way that is less intrusive than traditional market-oriented ethnography (e.g., Arnould and Wallendorf 1994). Our data collection follows the instructions of Kozinets (1998, 2002) and included two sources. First, consumption-oriented blogs were directly copied from blog web sites such as Blogcn, Blogbus, MSN Blog and Blog City, and then saved for analysis. Initial blogs were identified through the index pages on these website and other blogs were found through the links on the initial blogs. Secondly, our reflective fields notes based on observations of the bloggers communications [many blogs allow posting comments by readers] were recorded. Data collection continued until no new insights about our topic of interest were generated. Data interpretation was informed by Arnould and Wallendorf (1994), Spiggle (1994), and Thompson (1997). Attention was given to various consumer identity constructions and representations by the bloggers.

FINDINGS AND ANALYSIS

Consumption-oriented blogs describe bloggers' everyday consumption experience. They provide rich retrospective accounts of the bloggers' trips to shopping malls, dining experience at restaurants, clothing purchases, and holiday travels. Bloggers also discuss the movies, TV programs, fashion shows, and magazines they enjoy watching and reading. Most blogs in our study are maintained by Chinese women in their twenties and thirties, not only within China but also overseas. Some blogs are dedicated to one type of consumption such as food, but more common are blogs covering several subjects. We structure our analysis by first describing different types of consumption blogs commonly seen in the blogosphere, and then proceeding to exemplify some common themes related to the construction of consumer identity across these different types of blogs. In our conclusion we provide an account of consumption meanings revealed by a single blog across time.

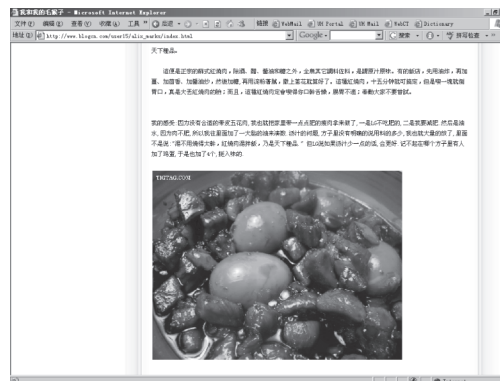

Blogosphere and Food Consumption

The blogs on food consumption symbolically extend the sharing of food beyond the geographic immediacy of neighborhood. Remote audiences and the blogger are connected by the vivid images of food images on these sites. One type of food blog describes the blogger's trips to restaurants and their dining

FIGURE 1
Food Blog with Dish Intro

FIGURE 2
Food Blog with Cooking Instruction

experiences there, usually accompanied by comments about and pictures of the meals they had, as well as images of the restaurants. Figure 1 is such a food blog maintained by “Michelle,” a female Chinese correspondent in Shanghai. Michelle writes about her dining experiences with restaurants in Shanghai, the majority of which are Western style restaurants. Another type of food blog posts tempting pictures of the food cooked by the blogger and provides detailed information about how the food was prepared, sometimes even with pictures of each step. This food is usually prepared for family members. Figure 2 is such a blog by a Chinese woman married to an American husband. The blog even provides detailed stories about the historical origins of the dishes she cooked.

Blogsphere and Consumption of Fashion

Fashion goods such as clothing, shoes, and cosmetics are popular items on consumption-oriented blogs. One type of fashion blog describes the blogger’s new purchase and recent trips to shopping malls. The blogger writes about the process of buying an item and discusses the latest fashion trends. “Versus,” a Chinese woman, who recently moved to Taipei from Beijing to work for IBM, documented one of her trips to a local fashion mall in Figure 3:

A second type of fashion blog discusses the blogger’s fashion collection, usually with images of their favorite possessions. Figure 4 is such a blog by “QiuQiu,” a female blogger in Shanghai

currently in search of a new job. In her March 3 blog of 2006, QiuQiu posts pictures of some of her summer and winter collection of different shoes and describes the different occasions for which she bought them. Each pair of shoes is accompanied by detailed description about how she could match the shoes with different clothes. Some of the shoes are even brand new, never worn, ones that go directly to her closet from shopping trips. She also describes things that happened in her life while wearing some of the shoes.

A third type of fashion blog is compiled with images of dream products that would be bought if the blogger were not constrained by money. Such blogs are usually packed with pictures that the bloggers found from advertising posters, fashion magazines, and various online resources. Figure 5 is “Ericyyoung’s” blog about the latest fashions for Spring on her blog of March 3 2006. Other fashion blogs also discuss the bloggers’ trips to fashion shows, exhibits, and street observations of the latest trends. The blogger also posts photos of these events. Figure 6 is such a blog that records “Camille’s” (a female Chinese student in France) trip to Thierry Mugler’s recently opened perfume boutique in Paris.

Blogsphere and Travel

Travel blogs are usually compiled with pictures of places the blogger has been to. Some bloggers write about their trips to remote exotic places such as Tibet and China’s national parks. Another type of travel blog is packed with pictures of the blogger’s overseas

FIGURE 3
Versus Trip to Fashion Mall

FIGURE 4
QiuQiu's Shoe Collection

FIGURE 5
Ericyoung Spring Dream Fashion

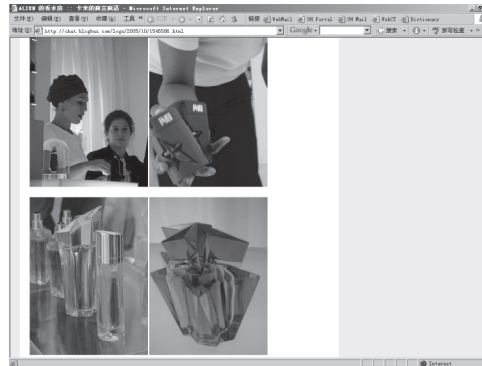

travel and many bloggers of this type are overseas Chinese students. A third type of travel blogger posts images of new discoveries in the familiar places where they live.

Live from Mall: Consumers in the Blogosphere

Consumption-oriented blogs construct various images of savvy consumers: the saving housewives who can always find sales products; the urban chic-seekers who know every detail about the latest fashion trends on the streets; the nostalgic dreamers whose purchases are often romanticized by connections to an idealized past era; the impulsive warriors who seem to never worry about the

financial consequences of impulsive buying; the photographer gourmands who are in constant search for the fanciest restaurant in town and always take tempting pictures of the foods before eating them; the cosmopolitan nomads who are always on the go and post photos of their trips; the energized party enthusiasts who are familiar with the most recently opened nightclubs; and the media guru who regularly review the latest movies and TV shows in real time. Bloggers also reveal multiple identities when it comes to different items on their must-have lists. The above categorizations are meant to exemplify rather than providing a comprehensive list of all consumer types in the blogosphere. In the following section,

FIGURE 6
Camille's Trip to Alien Boutique

we will demonstrate a few instances of these blogosphere consumer types.

For saving housewives, what matters is the money saved from regular prices, as seen in the following account from a blog maintained by an overseas female Chinese student in the U.S.:

“After buying the pot, we stopped by the liquor store. Wow, regular price \$39.99 and now it sells at only \$19.99, we can save \$15! For a person like me, how can I skip this? I grabbed two bottles of this type. There is another one that is also on sale, \$9.00 off the regular price. I took two of those too. When we checked out, the cashier said if there was 10% off if we bought 6 bottles in total. Wines won’t go bad anyway, so I grabbed a champion and something else. It cost about \$80 in total. On our way home, I thought of this and found I saved more than \$70 this time!”

As Miller (1998) found in the UK, such shoppers focus on how much they save rather than how much they spend.

The urban chic-seekers not only describe their private collections, but also comment about the latest fashions they see in magazines, movies, and on the streets. The following excerpt is from a female blogger currently pursuing her PhD in the U.S.:

“I am not the girly girl, I like the gorgeous Armani evening dress, but I seldom buy long skirts, bohemian tops, heels etc. The best summer look means comfortable yet trendy for me. This year it is white shirt+cut off shorts or Bermuda shorts+chunky bead necklace. If anyone has the legs for the cut off shorts, it’s those super models like Kate Moss, Gemma Ward...”

Clearly there is some self-fashioning going on here.

Food, fashions, movies, daily shopping trips, and nearly everything on the shopping blogs of nostalgic dreamers are represented as having mysterious connections with a romanticized past. “Wasa” is a female Chinese student in Paris. Her purchase of breakfast cookies results in an entry recalling her childhood experience of eating at a street-side eatery in China:

“Eating cookies with cocoa powder is like eating the fried Tofu when we were kids. We all knew that you could not put a lot of sauce on the small piece of fried Tofu, but we always asked for more and more. In the end, even the wraps were infused with the source so we could put it on the wall. Usually the one

who was willing to give us more sauce to put on the fried Tofu was most popular shop, although they always told us not to waste. French people in Paris know the secret of eating, they always give you lots of sauces, much more than needed. They are never frugal on this, usually they have more dressing on a salad than the salad per se, which is good.”

There are shades of Proust and *Remembrance of Things Past* here.

Blogs also construct images of impulsive warriors who usually buy stuff as a result of swift decisions. “QiuQiu” in Shanghai records on her blog of March 3, 2006, that she bought one of her favorite pairs of shoes while waiting for her friend to go dinner; the account is accompanied by a picture of her wearing her favorite jeans and the new shoes. QiuQiu is a shoe lover and posts pictures of her shoe collection (Figure 4) on her blog.

“Friday. Tonight Joanne and I are going to have dinner together. I bought this pair of shoes while I was waiting for her. It is coffee brown and looks perfect for my jeans. The color, the style, and everything, it is just right. I don’t know where these shoes will take me in the future, but all the memories they have brought me, good or bad, will be with me for ever.”

The shoes are considered to be a record of her cherished past, and are expected to bring her transcendental experiences in the future:

The energized party enthusiasts write about their clubbing experiences and comment on the hottest parties in town. In her blog, “Supermonica” described her weekend in Shanghai:

“There are all kinds of parties on weekends in Shanghai. This weekend the hottest one is definitely Sasha’s party at VIP (a night club in Shanghai). People in Shanghai love parties. You can imagine that no one would skip this one. VIP is packed with people, and the admission is RMB250. The private room costs RMB3500, although they only charge RMB1500 in regular times. Before we came to VIP, we also went to Pub 36 at Shangri-La Hotel to have a lychee martinithe night scene there is gorgeous, much better than the Cloud 9 at Hyatt. The music at Pub 36 is fabulous and even their restroom is full of surprises.”

So after being seen by the beautiful people at the club, Supermonica can be seen by others on her blog.

If I was a Rich Girl: Insights from Jessica's Blog

"Jessica's" blog is named "If I was a rich girl". Under this slogan are her favorable brands, TV show, and dream car: True Religion Jeans, the East Hamptons, Marc Jacobs, San Francisco, Puma, Sex and the City, Cadillac Escalade. Jessica is a Chinese student currently living in the U.S. In her blog on MSN Space, she writes about her daily life and her shopping experiences. The blogs are packed with images of the latest fashions, both from her own closet and from fashion magazines and advertisements. Jessica differentiates herself from those whom she considers as pseudo fashion experts. She does this by writing blogs about what she considers as real fashion and fine taste and through criticizing others' blogs. The central theme that emerges from her blogs is the importance of up-to-date knowledge of and access to the latest and authentic fashion magazines, movies, advertisements, entertainment, travel, and foods. These are not readily available and have only become the target of emulation and discussion by Chinese bloggers recently. Being in U.S., Jessica seems more intrigued by European fashion but she also displays her knowledge of the fashion trend in the U.S. as seen in her Feb 18 entry of 2006:

"As usual, I went to read Elle UK Edition, Vogue, and In Style UK Edition on the weekend. They are the magazines that I like and enjoy reading. I also like Teen Vogue, and Elle Girl, though they are a bit naïve. I just don't feel interested in the fashion magazines for general American adults. Nylon is so-so but Vogue and Elle (American Edition) are not worthy of even mentioning."

Hollywood blockbusters and Chinese TV programs are other sources from which Jessica demonstrates her knowledge of what is "in." Jessica also evaluates movies based on the fashions in the films:

"I've seen Brokeback Mountain. The trailer is moving but watching the movie was a great pain. We got there late and could only find a seat in the very front row. They spoke English with a heavy Southern accent and I couldn't understand it much. Especially that Heath who always spoke in low voice and I couldn't understand him at all... The Producers are lousy and I don't like it. The next movie I saw recently is King Kong, although everybody liked it, I don't find it very interesting. They simply wasted too much time on the island and I even went out to grab a pretzel in between... For all the recent movies, I like Match Point very much. I like this type of film, as well as Closer. Scarlet Johansson looks great in the white gown... A few words about Casanova, I am not good at London accents either, but I really like Sienna Miller."

Jessica not only looks for fashion trends through reading magazines and watching movies, but also criticizes the readily available marketplace discourse of fashion. Although the use of counter-discourses has been considered as providing consumers with alternative means to negotiate the power relationship constructed by marketplace discourses (Thompson 2004), Jessica's critique of fashion is aimed toward both market communications and other people's fashion beliefs. This confirms her identity as a knowledgeable urban chic-seeker who has her own fashion preferences. The intent of criticizing marketplace discourses is thus not to oppose to or escape from the marketplace (Kozinets 2002), but to affirm consumerist values by presenting what Jessica considers as "real" fashion. Nevertheless, there exists a tension between a self-assured urban chic-seeker and risky digression from what the mainstream fashion demands. This can be seen from the following

excerpt in which Jessica fluctuates between using makeup promoted by the dominant marketplace discourses and her preference of not using cosmetics:

"I seldom put any makeup on my face because of my super sensitive skin. And actually I don't like gals with too much makeup; I think they are way too fake. But whenever I read those fashion magazines, I so love the model's look: the fresh skin, the very kissable lips, the peach cheek and the sexy eyes. The only thing I don't like is tan or fake tan, cause I will never do tan I guess :-). Anyway, I am still a girl and I could not help spending money in Sephora. I bought foundation from Prescriptive, lip gloss from Lancome, shimmering powder from MAC, pinch blush from Origins.... But now I'm gonna give it all up. I did not put anything on my face for a month since I'm back from Shanghai, and my skin never looked so perfect as now!!! Simple is the most important rule in skin care, well, or should I say those makeups, including Biotherm and Clinique will make my skin even worse."

Few Chinese would think of tanning, as clear light skin is the Asian ideal. Another strategy of constructing and maintaining the urban chic-seeker identity revealed by Jessica's blog is through commenting on fashions in China, most of which is considered as not "real fashion" by her, especially when it threatens her unique sense of self.

Jessica writes about her love of Abercrombie and Fitch in her blogs, and is apparently annoyed by the cheap knockoff products that other bloggers post in their blogs as seen from the following excerpts. In the first entry Jessie expresses her passion for Abercrombie and Fitch, while in the second one she comments on other bloggers' purchase of this brand. The difference is between the purchase in the mall as more authentic love for Abercrombie and Fitch, whereas to get the brand on the streets at cheaper price is fake:

Excerpt 1: "I definitely became a denim addict. I love all kinds of jeans, the flare, the destroyed, the boot, even the straight leg, though I know I am not skinny enough and I never wear heels. The only style I hate is super flare or wide leg. I tried one pair of wide leg from 7 For All Mankind. Very funny, I don't know how to walk with those jeans. Every time I step into the mall, I will go directly to Abercrombie and the Fitch. I dunno how much money I've spent on that store." *Excerpt 2:* "Recently Qipu District (a shopping area) is getting hot in Shanghai, especially the Wangjiang Mansion. It is said there are lots of excess products originally for export, such as the jeans and sweaters from Abercrombie and Fitch. I've seen pictures of some blogs, and found it so ridiculous. Any clothing, as long as they put a moose sign or print a sign of 1892, is called Abercrombie. And the price is so cheap. The \$79.50 original jean is only sold for less than RMB100 [less than \$20] or cheaper..."

However, to construct an identity of a tasteful urban-chic seeker around the latest fashions requires considerable financial support. This constitutes a moral paradox between the pleasure of being the urban-chic seeker and a sense of guilt due to excessive spending. The desire to remain consistent with the ideal self often overcomes the concerns of over-consumption. Nevertheless, writing blogs and expressing such conflicting feelings toward consumption enables Jessica to symbolically write off the sense of guilt and resolve the moral conflicts, as seen from her blog entry on Sep 7 in 2005. The motivation for purchase was evoked by reading fashion magazines:

"Today I bought probably the most expensive shirt I've ever had. I liked the style of bubble shirt so much. I would have looked much better if I was skimmer. I felt regret right after I bought this shirt. After all, it is too expensive. With this trend, many other

brands will have the same style soon. I know there is something similar in H&M and I like this type of skirt that is just above the knee. But I couldn't find it today. I happened to find this Marc by Marc Jacobs that I've seen in magazines at least three times. I just couldn't resist it... I also found two pairs of Marc by Marc Jacobs shoes: one is red patent leather, it will look great with skinny jeans; the other one is golden flat, it can dress up or down. But I can't afford it. Money is a wonderful thing, how wonderful it would be if I could print money myself."

Seen from the excerpts discussed here, Jessica incorporates various elements available in the marketplace in her blog to construct and maintain her blogosphere identity as an urban-chic seeker. Images of various consumer goods and discussions of her consumption experiences are used to define her evolving self-identity. Writing blogs thus confirms consumerist values supporting the late capitalism, and the blog is an important means through which consumerism is reproduced and internalized. Blogs also constitute a symbolic consumption space onto which the bloggers' dreams and idealized consumerist selves can be projected. Blogs also blur the boundary between private self and public self. Presenting a consumerist public self that is acceptable to the blogger's audience, reinforces and internalizes the blogger's identification with consumer culture. Blog writing also connects a blogger's past and future, which is essential in the construction of a person's identity (Belk 1991). The past recorded in pictures of consumption experiences constitutes a self defined in terms of consumption.

DISCUSSION

Although these bloggers usually have an audience in mind while writing what they feel passionate about—shopping, consumption-oriented blogs are characterized by spontaneity and sudden bursts of creativity. Bloggers have worked blogs into their lifestyles, and thus what they record offers a unique opportunity to examine the personalized consumerist values of an emerging consumer society. Consumption-oriented blogs can be seen as a way of cultivating consumer desire and consumer culture through conspicuous consumption (Veblen 1899) in cyberspace. Such public displays of possessions and consumption experiences also contest the theory of envy-control through sharing or modesty (Douglas and Isherwood 1979). The blog invites the envy of its audience. Bloggers actively seek images and discourses to present their idealized selves (Schau and Gilly 2003). Similar to advertising that celebrates idealized images of consumers; consumption-oriented blogs construct various blogosphere consumer types, but through the endeavor of consumers rather than marketers. It is a self-fashioning in public.

Bloggers take pictures of what they already have, then post and passionately discuss them on their blogs. Writing blogs can be seen as a possession ritual through which the cultural meanings of products are transferred to the blogger (McCracken 1986). Writing blogs provides an opportunity for consumers to internalize the symbolic meanings embedded in products. On the other hand, posting possessions on blogs also constitutes a symbolic divestment ritual. To keep blogs updated, bloggers apparently need to go shopping more often and constantly post new acquisitions. The same clothing is rarely posted again and an item is symbolically abandoned in the blogosphere once it is made public. The blogger always sets out to find something new and the audience even leaves comments requesting updates. The bloggers are thus under pressure to symbolically divest the possessions and to search for novelty.

Consumption-oriented blogs also provide a context in which to examine the framework of extended self in the cyberspace. People are what they have and their material possessions constitute an extended part of the self (Belk 1988). Researchers have

investigated extended self experienced concretely through possessions in home settings (Belk 2001; Mehta and Belk 1991; Wallendorf and Arnould 1988) and in the workplace (Belk and Watson 1998; Tian and Belk 2005). Prior research on extended self is mostly focused on material possessions in real life. The Internet provides a new means of self-extension through posting images of the ideal self that the blogger aspires to identify with, thus going beyond the blogger's material and geographical constraints. By posting pictures of the goods that are too expensive to buy, the bloggers symbolically take possession of them and describe them in a way similar to the way they discuss their material possessions. Such symbolic possession through visual consumption in the cyberspace can potentially facilitate the extension of self. Our analysis here is descriptive and is restricted to the text of consumption-oriented blogs. Future research needs to take into consideration the bloggers' interpretations of their own blogs.

Virtual Onscreen Assistants: A Viable Strategy to Support Online Customer Relationship Building?

Kathy Keeling, University of Manchester, UK
Peter McGoldrick, University of Manchester, UK
Susan Beatty, University of Manchester, UK

ABSTRACT

The benefits of customer-salesperson relationships are difficult to obtain on retail websites when the interaction lacks direct human contact. This study verifies an association between the presence of a virtual Onscreen Assistant (OSA) and perceptions of functional and social relational benefits by potential customers. This has not previously been established. A theoretical model of relationships between relational benefit perceptions, trust building and patronage expectations is derived and tested. There is considerable potential for OSA use to build relational benefit perceptions but participants were only moderately positive about present OSA capabilities. Substantial technological development is still needed to support social interaction.

INTRODUCTION

Fostering relationships between companies and customers is of interest to both parties. Salespeople are important in producing and maintaining customer allegiance to a firm (Crosby et al. 1990). For retailing, Beatty et al. (1996) find the relationship between a salesperson and customer associated with customer loyalty, purchasing and positive word of mouth activity (Reynolds and Beatty 1999).

Customer relationship building is also important to e-commerce website profitability (Reichheld, Markey, and Hopton 2000). However, although Yen and Gwinner (2003) demonstrate some offline customer relational benefits are mirrored in the e-commerce context, the lack of opportunities for interaction lead them to explicitly exclude social benefits. Selnes and Hansen (2001) conclude that the removal of the 'social-bond mechanism' (p 88) in self-service technologies may damage customer loyalty. Thus, the additional benefits of customer-salesperson relationships are difficult to obtain online when the interaction lacks direct human contact.

In an effort to promote customer social relationship building, online organisations have tried e-mail response systems, live telephone support or text chat through Instant Messaging systems and building online communities (Reichheld et al. 2000). Unfortunately, whilst reasonably successful, these require human intervention and can prove to be an "*expensive step backward from the lower operating costs that were part of the web's promise*" (Demery 2003).

An alternative strategy is to help replace the customer-salesperson interaction with a believable, engaging, synthetic salesperson or salescharacter on computer screens. We argue that the possibility for interactions added by the presence of an OSA on a retail website that remind customers of face to face communication will stimulate customer perceptions of social relationship benefits. Consequently, as offline, a form of relationship building can be used to help the online business achieve the financial benefits of loyal customers but with reduced overheads. There are some published studies on the use of OSAs on retail websites but little, if any, information on the relational benefits perceived by customers from such a strategy.

The aims of this study, therefore, are twofold. First, to confirm an association between OSA presence on a website and perceptions

of relational benefits by potential customers; this has not previously been established. Yen and Gwinner (2003) excluded social benefits from their study of relationship benefit relevance in online retailing. Thus, we particularly seek to determine whether customers recognise potential for social benefits from the presence of an OSA on a retail website.

Second, to develop and test a theoretical model of the effects of relational benefits derived from an OSA on trust building and expectations of using a website. If customers feel that the presence of an OSA suggests relational benefits, then we need to understand and model relationships between such perceptions, trust building and interest in purchasing from the site. If such a model is developed and tested, the addition of an OSA represents an additional strategy for online retailers considering building social relationships with their customers.

THE POTENTIAL OF ONSCREEN ASSISTANTS

Characters representing the brand can be used to transfer meaning and positive attitudes to the products in the minds of the consumers; the use of animated spokes-characters is associated with brand preference and increased attention to advertising (Callcott and Phillips 1996). This suggests that introducing an OSA to a retail website will tap a familiar and attractive concept to customers with "remarkable endorsement power in modern commerce" (Stafford, Stafford, and Day 2002).

Furthermore, research suggests that customers will apply social rules and social expectations when interacting with computer technologies (Sundar and Nass 2000).

Despite this promising background and a broad literature on the study of animated interface agents generally, academic studies concerning the application of the OSA in e-retail are relatively sparse. Nevertheless, there is some agreement that on-screen characters can be more engaging and motivating for the user. In a study of female college students, Wood, Solomon, and Englis (2005) find the potential 'promising' as more than half were willing to use an OSA for online apparel product information for raincoats, lingerie and bathrobes. On the negative side, questions also arise about overall usefulness beyond novelty and entertainment; Sivaramakrishnan and Tang (2002) conclude that the OSA does not increase product evaluation or purchase intention.

A number of potential dangers are also highlighted. For example, Witkowski, Neville, and Pitt (2003) find great disappointment when characters with human features raise expectations about high quality interactions that are not fulfilled. Interaction characteristics or OSA appearance found inappropriate to the context can lead to negative responses from users (Keeling et al. 2004). Thus, mere presence of an OSA is not enough to improve human-computer interaction or increase purchase intentions (Sivaramakrishnan and Tang 2002).

RELATIONAL BENEFITS

Customer benefits are related firstly to the core product/service and secondly, to benefits that come through the relationship itself (Gwinner, Gremler, and Bitner 1998; Reynolds and Beatty 1999). In the context of customer relationships with service compa-

nies, Gwinner, Gremler, and Bitner (1998) suggest a typology of three relational benefit outcomes that are positively associated with customer loyalty and word of mouth. Confidence benefits follow from experience of successful transactions, with a company or salesperson, these help a customer to reduce uncertainty and risk about future transactions. Social benefits are drawn from social support and personal reassurance given by a salesperson. Special treatment benefits include advantages such as price savings, time-savings, preferential treatment, and additional services.

However, for retail settings, Beatty et al. (1996) and Reynolds and Beatty (1999) consider that just two types of benefits (functional and social) best explain customer perceptions. Reynolds and Beatty (1999) consider functional benefits to cover both confidence and special treatment benefits as found in service settings by Gwinner et al. (1998).

MODEL DEVELOPMENT

Offline Preferences

Hennig-Thurau et al. (2002) suggest customer relational preferences as a potential moderator of relational benefits and Beatty et al. (1996) advise that relationship motivation could be an important categorisation variable. Some customers may opt for self-service to avoid employee contact (Beatty et al., 1996). Thus, in the context of online shopping, customer preferences for assistance when shopping offline may be a significant factor in the perception of relational benefits from the presence of an OSA. For some online customers, the impersonal, efficient, and structured nature of the typical website 'interaction' may be an attraction, removing the need for time-consuming pleasantries or avoiding persistent shop assistants.

On the other hand, it is intuitive that those customers who prefer to interact with a salesperson during offline shopping should be more attracted to a situation that offers the potential to interact with an onscreen sales assistant. We propose that those who prefer salesperson assistance when shopping offline are more likely to associate the presence of an OSA on a retail website with potential relational benefits. Beatty et al. (1996) identify that customers engage in relationships with salespeople for functional and social benefits and also recognize the vital role of trust in the customer-salesperson relationship. Therefore, we expect that offline preference for assistance will be positively related to perceptions of functional and social benefits (see figure 1).

H1: There is a positive relationship between offline preference for help and perception of functional relational benefits.

H2: There is a positive relationship between offline preference for help and perception of social relational benefits

Online Relational Benefits

Online social benefits and onscreen assistants. In off-line retailing, the salesperson plays an important part in forming buyer-seller relationships (Beatty et al. 1996). The familiarity of the concept of a spokesperson/person (Callcott and Phillips 1996) and the automatic use of established 'rules' of communication suggests these characters should make the website appear friendlier, and customer interaction with the website more natural and appealing. The opportunities for shared interaction could also reintroduce customer perceptions of social benefits in what otherwise may be perceived as an impersonal experience. We define online social benefits as the perceptions of a friendlier, less impersonal experience where the retailer manifests a personal interest in

the customer and there are enjoyable social aspects to the website visit.

Online functional benefits and onscreen assistants. Offline functional benefits include time saving, convenience and better purchase decisions (Reynolds and Beatty 1999). Customers as decision makers have a bias to efficiency and reduced effort suggesting that a major benefit to customers would be to reduce search costs during online shopping (Semararo et al. 2003). Offline, the salesperson can substitute for customer effort; Beatty et al. (1996) find that customers engage in relationships with salespeople who help with problem solving. An early expectation of online shopping was that it would also provide time savings through easy product search and comparison and make recommendations based on previous purchases. Kim and Stoel (2003) confirm that these attributes are significant predictors of online purchase intent but that many online retailers are "failing to offer satisfactory online shopping experiences to their customers". Some customers may have concerns that a retail website interface will be difficult to navigate or that search facilities will be inflexible and inadequate to their needs. For these customers, an OSA could help refine their needs and find products and compare prices in a more timely and familiar way, through interactions resembling those with offline assistants. We define functional benefits online as perceptions of time saving through finding products that meet purchaser needs more quickly and better purchase decisions through finding best prices or special deals.

Trust and Confidence

Yen and Gwinner (2003) identify an additional role for building confidence benefits during online shopping. Confidence and trust are considered essential in online shopping because it is an environment with high performance ambiguity and considerable perceived risk. The chance to interact with an OSA may enhance trust perceptions as salesperson-customer interaction plays a significant role in building trust (Beatty et al. 1997). The interactive characteristics of the OSA produce familiar cues associated with social interaction and are thus likely to promote trust building (Bickmore and Cassell 2001) and could help the consumer build confidence in the integrity and security of a website. Trust is associated with loyalty because of the importance of confidence in security and privacy issues in online transactions (Park and Kim 2003). Beatty et al. (1996) suggest that interpersonal interaction between salespersons and customers facilitates the understanding and thus the fulfilment of customer needs. Consequently, social benefits can be associated with better fulfilment of functional benefits. Beatty et al. (1996) posit a further association between higher social and functional benefits and building customer trust.

Consequently, we hypothesise that (see figure 1):

H3: There is a positive relationship between perceptions of social benefits and perceptions of functional benefits

H4: There is a positive relationship between perceptions of social benefits and perceptions of trust/confidence

H5: There is a positive relationship between perceptions of functional benefits and perceptions of trust/confidence

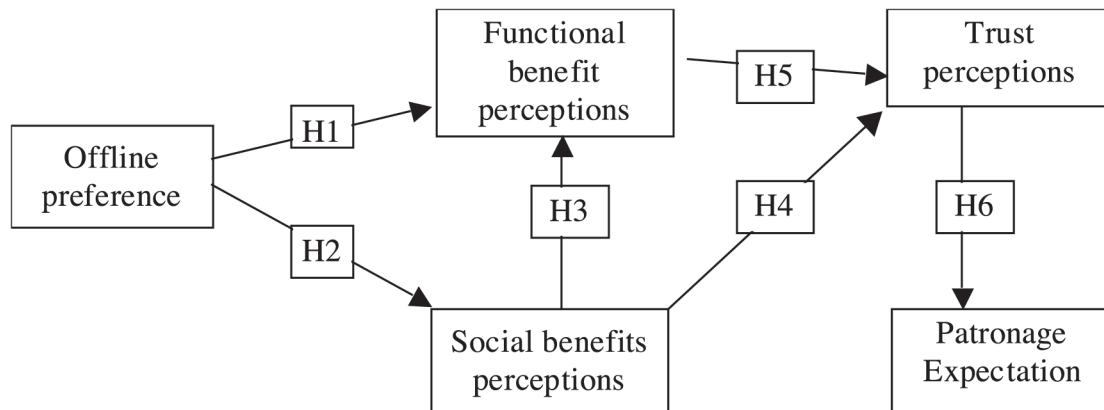

H6: There is positive relationship between perceptions of trust and patronage expectations.

METHOD

Online Assistant Pre-testing and Product Choice

User preferences for an OSA are very individual, so presenting respondents with no choice of OSA risks confounding perceptions

FIGURE 1
MODEL OF HYPOTHESISED RELATIONSHIPS BETWEEN PERCEPTIONS OF FUNCTIONAL BENEFITS,
SOCIAL BENEFITS, TRUST AND PATRONAGE EXPECTATIONS

of possible relational advantages with the effects of user preference. Consequently, pilot work comprising interviews with a convenience sample of 30 Internet shoppers followed by a preliminary web-based study with 450 participants determined the most generally acceptable representations of online assistant for two product types: books/CDs and travel insurance. For this study, participants had the choice of a male or female human photograph, a male or female cartoon and a cartoon character (either bookworm or globe depending on site). Books/CDs and travel insurance product types provided a contrast on the search-experience-credence continuum; books and CDs are search goods, while travel insurance is a credence good.

Procedure and Measure Development

Using a dedicated website, www.screenresearch.co.uk, participants in the experimental study were randomly assigned to two specially constructed Internet shopping sites, purporting to sell books/CDs and travel insurance. For each site visited, respondents choose either no assistant or one online assistant out of the five described above. Those who chose an online assistant responded to items about perceptions of functional and social benefits resulting from having an online assistant. Interviews with Internet shoppers in the initial studies provided some of these items, others were adapted from Gwinner et al. (1998), Hennig-Thurau et al. (2002) and Yen and Gwinner (2003). Respondents also assessed their perceptions of confidence and trust as well as increased/decreased likelihood of visiting, purchasing and recommending the website (patronage expectations) and gave information on Internet shopping experience, preferences for salesperson assistance when shopping offline and brief demographics.

Respondent Sample

Data were collected through a) e-mails sent to 2286 addresses on an opt-in mailing list on the www.screenresearch.co.uk website; b) a sample of 427 males and 503 females from the UK obtained through a commercial company. A prize draw was offered as an incentive. Of the 2114 Internet user respondents, 62% were female (1314) and 57% were aged between 25 and 44. The largest percentage (57%) was from the UK, with 21% from North America. Most respondents (92%) bought goods online; 57.3% of these for three years or more.

RESULTS

Choosing No Online Assistant

The 124 participants (just under 6%) who chose not to have an online assistant on either site provided at least one reason for their choice, altogether, 264 reasons were listed. More experienced online shoppers were less likely to choose an OSA for either the book site ($\chi^2=38.49$, df 4, $p<.001$) or the travel insurance site ($\chi^2=34.77$, df 4, $p<.001$). This effect of expertise holds true for both genders.

The majority of reasons (93.2%) fell into one of six groups of negative outcomes: arousal of negative emotions; offer no advantage to the user; interfere with the task or not compatible with preferred methods of accomplishing task; and incompatibility of appearance or with self-image of user (see table 1). These are broadly representative of many of the negative issues surrounding OSA use outlined previously.

Groups one, two and three signify severe aversion to previous poorly planned, inappropriate interactions. These were experiences with OSAs where expectations were not met, the interaction thought inappropriate, or worse, interfered with user task achievement. Violations of interaction expectancies seem to produce negative emotional reactions (annoying, irritating, patronising) that prejudice subsequent evaluations resulting in rejection of future OSA interaction.

For some, the mere presence of an OSA generated perceptions of possible negative consequences. Group five comments illustrate the consequence of inappropriate appearance; group four comments indicate these users may be using online retailers to suit their preference for shopping without assistance. Together with group six, the comments underline the need for care in OSA selection and giving customers the choice not to use an OSA at all.

Consequences of Choosing an OSA: Perceived Relational Benefits

A majority (94.1%) chose an online assistant for at least one of the sites, (91.7% travel insurance; 88.4% books/CD) and 85.9% chose an OSA for both sites. Most popular on either site and for both genders were the non-human OSA characters (globe and bookworm). The second most popular were human female photographs. (Wood, Solomon, and Englis (2005) found an idealistic female

TABLE 1
REASONS FOR NOT CHOOSING AN ONLINE ASSISTANT

Reason (no.)	Examples (no.)	Illustrative quotes
1. Arousal of negative emotions (69).	Online assistants are annoying (23), irritating (18), patronizing (12), disliked (11), confusing (2), offensive, creepy, misleading (1 each).	"I find that stupid paperclip and his alternates more annoying than words can say." "Flash animations etc. are the work of the devil ..."
2. No advantage in using OSA (62).	Online assistants are not needed (35), no help (11), pointless (8), a useless gimmick (6), wouldn't use it (2)	"I don' t see the point."
3. Interfere with task completion (47).	Distracting (20), online assistants add clutter (11), slow things down (6), intrusive (5), are a hindrance (3), add complications (2).	"They keep popping up and delaying what I' m doing." "I find them more of a hindrance than a help."
4. Not compatible with preferred task accomplishment (36).	Prefer to use FAQ or help (11), a search engine that is easy to use (12), to do it myself (8), information that speaks for itself (3), prefer reading details (2).	"I would prefer a help button if I got stuck." "I much prefer a logical search engine-i.e. decent Boolean search facilities."
5. Appearance not compatible with task (17).	Didn't like choice (11), not attractive/friendly/professional enough (5), not representative (1).	"None of the characters appealed to me ..." "Assistants do not look professional enough."
6. Not compatible with self-image (15).	Not the sort of person who needs an online assistant (10), experienced enough not to need one (5).	"Experienced web user-do not require assistant." "I am not an idiot."

photograph to be most popular but did not offer a non-human character as a choice).

Participants evaluated several outcomes relevant to potential relational benefits on five point Likert-type scales ($1 = disagree strongly$, $5 = agree strongly$). Means and standard deviations are shown in table 2.

The measurement model. The research model depicted in figure 1 was tested using Structural Equation Modelling (LISREL 8.7). At the initial analysis, Confirmatory Factor Analysis (CFA) of the constructs of offline preference, functional and social benefits, trust/confidence and patronage expectations indicated the measurement model was an acceptable fit to the data but two items were deleted as poor indicators of their latent constructs (for items, see table 2). The chi square statistic can be distorted by sample size; thus table 3 reports three additional fit indices that all indicate a good fit of the data and the factor structure is taken as an acceptable fit of the data. Further, the composite reliability (corresponding to Cronbach alpha), and the R^2 values for all measures suggest an adequate overall fit, no further modification of the measurement model was considered necessary.

Test of model and hypotheses. The test of the structural model estimates the fit of the hypothesised model to the data. The first analysis provided a moderate fit to data on the fit indices (see table 3). Hypothesis one is upheld. In the presence of an OSA, offline preferences are reflected in perceptions of functional benefits. However, there is a stronger association from offline preferences to social benefit perceptions (hypothesis two). Hypothesis three is also upheld; there is a strong relationship between perceptions of

social benefits and perceptions of functional benefits. Thus it appears potential customers may believe that, as offline, social interaction will facilitate understanding of their needs and the retail transaction (Beatty et al. 1996).

Hypothesis four is confirmed, perceptions of social benefits influence perceptions of trust and confidence. However, there is a much stronger impact of functional benefits on trust/confidence, confirming hypothesis five. Hypothesis six, the proposed positive relationship between trust/confidence and patronage expectations is accepted; perceptions of trust and confidence in the online vendor are associated with website patronage.

Perceptions of functional benefits are fully mediated by trust/confidence benefits and influence patronage expectations through their effect on trust. However, the modification indices strongly suggested the addition of a direct path from perceived social benefits to patronage expectations resulting in a significantly improved fit of the data on the fit indices (see table 3). Thus, in this study, perceptions of social benefits have both indirect and direct effects on patronage expectations (see figure 2). Perceptions of social benefits in themselves may be a powerful motivator for website patronage.

DISCUSSION

Firstly, the results confirm an association between OSA presence on a website and perceptions of relational benefits by potential customers. This had not previously been established. In particular, we show that customers recognise potential for social benefits from the presence of an OSA on a retail website. Consequently, this work

TABLE 2
MEASUREMENT MODEL: ITEM MEANS, STANDARD DEVIATION, STANDARDISED FACTOR LOADINGS, RELIABILITY

Construct	Reliability	Item	Mean	SD	λ	var	R ²

extends Yin and Gwinner (2003) to include the recognition of social benefits in online services and retailing in addition to confidence and special treatment benefits.

Second, this study proposes a theoretically derived model of the relationships between offline preferences, customer perceptions of social and functional relational benefits and trust building and patronage expectations. The model is a good fit to the data and all hypothesised paths are statistically significant suggesting the viability of this model (see table 3). Offline preferences are reflected in online perceptions, the stronger the preferences for salesperson help offline, then the stronger the perception of possible relational benefits from an OSA. The impact of perceptions of functional benefits on patronage expectations is wholly mediated by trust/confidence (see figure 2). The inference is that interaction with an OSA could facilitate the customer information seeking and purchasing task and that this builds customer confidence in the service, reassuring them about buying from the site and supporting the formation of trust. The strength of the relationships found in this study indicates a more modest role for social benefits in trust building than the role of functional benefits. The implication is that a design of OSA interaction that concentrates on task help that customers find useful is most likely to facilitate the formation of trust. Social benefits have a less strong direct effect on trust but play a strong part in building perceptions of functional benefits, so have an indirect effect as well.

Perceptions of trust fully mediate any effects of functional benefits on patronage expectations but not social benefits. The strongest effect on patronage expectations is the extra path from social benefit perceptions. An explanation for this may be found in Beatty et al. (1996) that the formation of friendship in itself is a driver of repeat patronage. The relationship strength suggests that many online customers miss the social and interpersonal aspects of shopping and do not believe present interfaces meet their needs. They judge an OSA has the potential to improve their experience in this regard. Another possibility is the attraction of the novelty value of an OSA. Potential customers may find the website friendly and appealing but not associate this with anything but increased pleasure in visiting the website. Either way, this attraction acts, at least in part, independently of feelings of trust.

A further contribution is evidence that offline preferences for salesperson assistance are associated with preferences for the presence and particular types of help that could be given by an OSA.

Well-learned offline routines carry over into the online environment, that is, many customers will try to apply their offline expectations, prejudices and strategies for shopping to the online shopping task. Recognising and facilitating these can help alleviate difficulties with the use of retail websites and encourage website patronage.

Nonetheless, caution is advised in OSA use on retail websites for social relationship building. Whilst the relationships in figure 2 suggest considerable potential for relationship benefits to add to customer trust and interest in the site, the means for the individual items (table 2) indicate that participants were only moderately positive about present OSA capabilities. The 6% of participants choosing not to have an online assistant provide additional insights. The OSA purpose must be clear to the user and the interactions planned around making the shopping task easier rather than to attract customer attention. Currently the optimum role for an OSA is probably to enhance relationships by providing advice and help to the customer with less emphasis on social features unless there is substantial technological development to support the less predictable aspects of social interaction.

Further, this study confirms that social rules and social expectations are easily engendered, raising concerns that OSA interaction could be used to exploit social mechanisms. Shoppers might be persuaded that it is safe and financially prudent to make purchases or to omit the search for more concrete cues to trustworthiness. Even with the best intentions, there is a fine line between helping people overcome inaccurate risk perceptions and reducing risk perceptions too far.

The major limitation of this study is that respondents did not interact with the proposed OSA. Therefore, perceptions are of the potential for relational benefits offered by an OSA, not the reality. However, at this stage of OSA development, we feel this is defensible as we, amongst others, have already noted the capacity for disappointment or annoyance when onscreen characters do not live up to their promise. This was an experimental study using just two examples of online retailing, albeit popular and reflecting the credence-search goods continuum. OSA presence may be more or less welcome on other types of retail website. Further, the respondents in this study were mostly from the UK or Northern America. Thus, further research is needed to test the model and clarify the potential for OSA presence on other types of retail website and with customers from other countries.

Consuming Hyperplaces: Servicescape, Service-Escape, and the Production of the Servicespace

Chris Houliez, University of Saskatchewan, Canada

EXTENDED ABSTRACT

This study develops a new theoretical perspective on the marketplace, one grounded in Ascher's (2003) model of the hypermodern society, Henri Lefebvre's (1974/1991) work on space, and existential phenomenology. These views on the concept of space, even though never the object of a comparative analysis, revealed to be complementary.

According to Ascher (2003; 2004), increased mobility and new technologies have led to a "hypermodern society" where "sequences of activities overlap and interweave, a society where social ties are chosen, constructed, formed, but also dissolved more freely. This hypermodern society generates new places—hyperplaces" (Ascher 2003). A hyperplace is a "space of connectivity" (Desportes 2005), not a space of physical, Euclidian contiguity. In hyperplaces, individuals can, if they want, participate in different activities quasi simultaneously in multiple social fields, and with the people they have chosen to be with, whether they are actually or virtually present.

According to existential phenomenology, the Euclidian (i.e., three-dimensional) view on space is a scientific reduction which does not reflect the complexity of the concept. More precisely, Lefebvre (1974/1991) sees space as produced through spatial practices (i.e., the set of actions taken by the space user). Space conceivers (e.g., urbanists, store managers) can influence space consumers' "production" of space by suggesting specific spatial practices (e.g., pathways in a store). However, the space consumers usually prefer to avoid such guidance, and will try to experience instead a "fully lived space", i.e., a space emancipated from any spatial practices required or suggested by the space conceivers.

Based on these perspectives on space, a new model of the marketplace was developed, in which the space of retail experienced by the shoppers (referred to as the *servicespace*) is "produced" by the shoppers themselves. The production of this *servicespace* is naturally influenced by the three-dimensional *servicescape* designed by marketers. However the *servicespace*, as lived by those consuming it (i.e., the shoppers) is also based on elements located beyond the physical walls of the tangible, three-dimensional *servicescape* (in an "Elsewhere" of the shopping experience so far left unexplored in consumer research). Three different types of spatial practices (labeled "hyperspatial practices") involving elements located outside of the *servicescape* (i.e., in what is referred to as the "outscape") were identified during the fieldwork. Firstly, shoppers may decide to "Reach for Information"—i.e., reach for the outspace in an attempt to bring product- or service-related expertise into the inscape. Secondly, they may connect to the outspace (i.e., to "service-escape" the *servicescape*) whenever their immediate physical environment does not provide an optimized level of arousal and/or pleasure (a hyperspatial practice labeled "Reaching for Affect"). Thirdly, shoppers may decide to tap into their (physically) distant social contacts (for utilitarian reasons, or simply as a reassuring reminder of their "place" in the social fabric). Lastly, by combining at will these three new types of spatial practices, shoppers can "reach for hyperplaceness", i.e., for a liminal and intangible space, a *servicespace* that is much richer, in its social, informational, and affective dimensions than the ordinary *servicescape* suggested by *servicescape* conceivers.

Multiple data collection processes were used during the fieldwork—participant and nonparticipant observation, depth interviews, autodiving interviews, and focus group. In total, the fieldwork resulted in 541 pages of single-spaced pages of transcribed interviews, 30 pages of field notes, 1,661 photographs, and 69 hours of videotaped observation. The age of the five informants (four female and one male) ranged from 19 to 32.

The methodology developed for this research, the "Day-In-The-Life" (DITL) protocol, borrows from the Shopping-With-Consumers (SWC) protocol (Otnes, McGrath, and Lowrey 1995), but also extends its scope by allowing the researcher to study the shopping experience in its everyday-life context: as the informants went through their entire day (from dawn to dusk), the researcher stayed a couple of feet behind them, so that he could observe and take still photos of the informants' various activities. In addition, during the follow-up interviews, informants were shown, to prime their memory, a set of photographs taken during the fieldwork. An average of 208 still captions were presented to the informants during each of the depth interviews.

By introducing a new conceptualization of the marketplace, this research sheds a new light on the meaning creation and re-appropriation processes to which shoppers have access: in the proverbial consumer/producer struggle for the domination of the marketplace, with the *servicescape* finally "de-secluded", space users can now leverage elements (e.g., flux of information) located in the outspace. Once a "ontological place" (Heidegger 1927), the *servicespace* has now become a ontical place.

Lastly, this research contributes to the ongoing debate on the type of sociality consumers want to experience in the marketplace, by assessing whether a sense of place and its accompanying sociality is still perceived by shoppers as a valuable element of the *servicespace*, or is just part of a self-reassuring (and self-deceiving) discourse on "the *servicescape* as a modern bazaar" or "the *servicescape* as the new utopia" held by *servicescape* producers and marketers.

ROUNDTABLE

Grant Funding Opportunities and Challenges for Transformative Consumer Research

Cornelia Pechmann, University of California, Irvine, USA

Eric Johnson, Columbia University, USA

Last year's ACR president David Mick identified the need for scholarship in ACR which is "purposely designed for and directly conveyed to consumers" (see <http://www.acrwebsite.org/vanessa/TaskForceonTCR.doc>). Mick labeled this type of research "transformative consumer research" because of its potential to have an "important and constructive influence, including the potential for uplifting change." Mick convened an ACR task force on transformative consumer research which then identified a need for grant funding to support academic research on topics such as vulnerable consumer groups (e.g., people in poverty, children, the elderly, handicapped), behaviors that are personally or socially negative (e.g., tobacco use, drug abuse, compulsive buying), and positive or prosocial behaviors (e.g., recycling, sustainable consumption, organ donation).

The aim of this roundtable was to provide guidance to academics who are interested in obtaining grant funding for transformative consumer research, or other related types of consumer research. The roundtable brought together experts from major U.S. funding agencies (National Science Foundation, Marketing Science Institute, Advertising Research Foundation), academics from different academic disciplines (marketing, psychology, communication) who have received substantial grant funding, and academics who have not yet received funding but are interested in possibly applying for it. Fifteen individuals participated, including David Mick who discussed ACR's transformative consumer research grant initiative. Participants shared personal experiences and discussed grants that they have applied for and/or reviewed.

The following specific topics were discussed:

1. Realistically, which agencies or entities are most likely to provide funding for transformative consumer research or related consumer research, both nationally and internationally? Which agencies have funded the roundtable participants' research? Can businesses help to fund transformative consumer research, or must we rely on government and nonprofit groups? Potential sources of funding that were listed in the ACR transformative consumer research task force report are:
 - USA National Science Institute
 - USA National Institute of Health
 - USA Center for Disease Control
 - Marketing Science Institute
 - American Association of Retired Persons
 - International bodies such as the World Trade Organization and the World Health Organization
 - Foundations such as Robert Wood Johnson, Ford, MacArthur, Sloane, Fetzer, Templeton, Rockefeller, and Gates
 - Corporations such as Body Shop, Ben and Jerry's, Anheuser Busch, and Philip Morris
2. What are the elements of a successful grant proposal? Participants addressed issues such as these:
 - identification of specific research aims
 - need for pilot tests and power analyses

- sample characteristics and sample size
- research methods (e.g., survey vs. experiment vs. modeling)
- research measures (e.g., attitude vs. intent vs. behavior)
- focus on theory vs. substantive issues
- focus on internal vs. external validity
- consultants

3. Should grant writing be undertaken using the more traditional "single principal investigator" approach or the emerging multi-investigator, multi-disciplinary approach? Some of the ACR transformative consumer research task force members opined as follows: "Many of the potential funding organizations are only seeking research highly pertinent to their stated missions and goals (e.g., poverty, health, children), and may be less likely to support general proposals for non-specified research topics under the general umbrella of transformative consumer research. Hence, it was suggested that the most effective strategy might be for consumer researchers, facilitated by ACR, to come together as teams that hold strong interests in particular topics within transformative consumer research. The teams could then write collective grants to the organizations or agencies that best suit their topics." (See <http://www.acrwebsite.org/vanessa/TaskForceonTCR.doc>.) What are the strengths and weaknesses of this multi-investigator approach, as opposed to the more traditional "single investigator" approach? What has worked for the roundtable participants?
4. If a research grant is obtained, how can it be implemented effectively? For instance, how can the investigators minimize the time spent on hiring staff, budgets, IRB, and report paperwork? What has worked for the roundtable participants?

In sum, this roundtable brought together funding agency representatives and junior and senior academics to identify more and less effective approaches for obtaining and managing grant funds for transdisciplinary consumer research and related consumer research.

SPECIAL SESSION SUMMARY

Cultural Identity and Judgment—To Bias or not to Bias

Cristel Antonia Russell, San Diego State University, USA
Ana Valenzuela, Baruch College, USA

SESSION OVERVIEW

This session demonstrates when and how cultural identity affects how consumers make decisions, respond to consumption situations, and react to persuasive communications. The rationale behind cultural identity-based research is that exposure to different ecological factors and social structures perpetuates different cultural values and ideals and thus certain judgment “biases” are likely to be more prevalent in one culture than another (Triandis 1995). The lack of systematic research in this domain has left us with little understanding of why such an identity variable may matter. This session provides a theoretical understanding of these phenomena using existing models of information processing.

All papers draw from experimental findings to demonstrate how cultural identity affects consumers’ decision-making (1st paper), persuasion (2nd paper), and choice (3rd paper). However, each paper differs in the insights it provides on these effects. The Valenzuela, Darke and Briley paper documents and explains why consumers of different cultural identities (here American vs. Chinese) also differ in how they make decisions. The focus is on differences in control orientations that lead to different sensitivity to luck and in turn impact decision-making. The Briley and Aaker paper demonstrates the boundaries of when cultural identity affects persuasion and judgment by studying the conditions affecting consumers’ reliance on cultural versus personal knowledge when forming judgments. Finally, the Russell and Russell paper documents the potential for cultural identity prompts to activate animosity toward another culture and in turn affect consumer choices, thus demonstrating that cultural identity salience can be manipulated and in turn affect choice.

Collectively, these papers provide a coherent message about these beliefs that are universally held and have an impact on memory, motivation, decision making and performance. Angela Lee, the discussion leader, draws from her research in the area of cross-cultural consumer behaviour to synthesize the findings of the different papers and develop an agenda for future research. Moreover, her insights help underscore how theoretical research can advance our understanding of different judgment and decision biases.

“Cultural Identity and the Antecedents of Risky Decision-Making: Am I Good or Lucky?”

Ana Valenzuela, Baruch College

Peter Darke, University of British Columbia

Donnel Briley, University of Sydney

Previous literature has found that lucky experiences have a paradoxical effect on expectations of future performance (Darke and Freedman 1997). Subjects who thought luck was a personal, stable factor reacted to a lucky event with higher expectations for performance, while those who perceived luck as completely random had lower expectations following initial luck. As a consequence, beliefs in good luck may buffer people from feelings of uncertainty and enhance risk taking. These results are quite similar to findings in the self-esteem literature concerning ego-threat (e.g., Baumeister et al. 1993). In fact, self-esteem has been shown to predict risk-taking particularly in the domain of gains (Josephs, Larrick, Steele and Nisbett 1992). However, respondents’ cultural identity is expected to moderate these effects. People have implicit

theories about whether behavior is driven merely by an individual’s ability (internal locus of control) or by situational forces (external locus of control). Individual responses to success or failure are likely to differ depending on the theory to which they subscribe. Individuals that believe in external locus of control may be more likely to shift their expectations for future performance depending on whether they are lucky or not (Hong and Chiu 1988). Research by Weisz, Rothbaum and Blackburn (1984) indicates that East Asians tend to exhibit more external locus of control than North Americans. Additionally, Heine and Lehman (1997) also identified cultural differences in self-esteem maintenance for Japanese vs. North Americans. They found that many self-esteem related effects such as post-decisional dissonance occur with North Americans but not with Japanese. As a consequence, we expect that individuals who subscribe to different implicit theories of behavior (North American vs. Chinese) will differ in their sensitivity to luck and self-esteem in risky decision-making. In other words, people seem to use important dimensions of their self-concept as a buffer against different kinds of threats—in this case the risk of getting no money when taking a chance on winning a larger sum of money. Self-affirmation on the dimension of ability should be more effective in buffering the risk of the gamble in western cultures while self-affirmation on personal luck should be more effective in buffering risk in the eastern cultures. Three studies investigate this proposition.

In Study 1, we use a risky decision task to analyze whether cultures differ in their sensitivity to luck and self-esteem. Subjects were asked to choose between an option with a certain outcome and another option (or prospect) with a probabilistic outcome. Despite differences in the level of risk involved, the expected outcomes were the same for both options. In addition, decisions pertained to either gains or losses, depending on the decision frame. For example, a positively framed decision would give subjects a choice between a sure gain of \$30 and an 85 percent chance to gain \$45; whereas a negatively framed decision would give subjects a choice between a sure loss of \$30 and an 85 percent chance of losing \$45. We ran the study using undergraduate students from both Canada and Hong Kong. Subjects completed a set of 10 decisions (5 with a gain frame and 5 with a loss frame) presented on a computer screen. The order was randomized by subject. The alternatives in each decision differed only in terms of the amount of risk involved. When subjects chose a risky option, the final outcome was determined using a lottery procedure. There was also an initial luck manipulation: Half of the subject got \$5 from the start while half had to participate in a lottery to win them (although everyone won). We measured Beliefs in Good Luck (Darke and Freedman 1997) and self-esteem (Rosenberg 1965).

Results show that neither self-esteem nor beliefs in luck affect behavior in loss domains for either culture. People seem to be so averse to losses that individual differences are just not that important. In other words, loss aversion seems to be universally felt, though gain pursuit was not. In the gain domain, Canadian (but not Hong Kong) respondents chose the risky option more often when they rated high on self-esteem. Also in the gain domain, Hong Kong (but not Canadian) respondents chose more risky options when they had stronger beliefs in good luck. Only in Canada did the initial luck manipulation interact with self-esteem: High self-esteem subjects

took more risks after winning the initial lottery. In the case of Hong Kong, the initial luck manipulation did not interact with individual's beliefs in good luck. Instead, those who believed in luck tended to take more risks regardless of context induced by initial luck.

Study 2 replicated Study 1's design (without the initial luck manipulation) and added a between-subjects priming manipulation. U.S. Caucasian and Hong Kong undergraduate students were primed to think either about their good luck or their strong ability by describing a situation in which they were either lucky or skillful. The results showed that U.S. Caucasian respondents that were primed to think about their skill tended to choose more risky options than those that were primed about luck. Respondents that had to describe a skill-based situation felt that they were describing something more important about themselves than those that described a high ability situation. In the case of Hong Kong students, luck-beliefs priming did not enhance the effect of individual's beliefs in good luck, which again support the idea that beliefs in good luck are not as context-dependent as individual self-esteem.

In sum, our results support the idea that cultures differ in the way people deal with uncertainty in everyday life (Weisz, Rothbaum and Blackburn 1984). North Americans tend to believe in their own capability to control the situation. As a consequence, they are willing to make more risky decisions when a positive event enhances their self-esteem. In contrast, Asian cultures tend to assess the favorability of the situation and take more risk when they believe their personal good luck will put the situation in their favor. In addition, the effects of self-esteem on risk taking seem to be more context-dependent than beliefs in good luck. Further study in risky domains that are skill-based instead of luck-based would bring more light to this research question.

“When Does Culture Matter? Effects of Personal Knowledge on the Correction of Culture-based Judgments”

Donnel A. Briley, University of Sydney

Jennifer Aaker, Stanford University

You need a new computer. You log onto the Web and spend time thoughtfully perusing various vendor sites to determine the best fit for your needs. You think you've made up your mind. But then you're whizzing down the highway and pass a billboard touting a different computer. You only have a few seconds to absorb the advertising message, but you're swayed in ways you hadn't anticipated. What's going on? According to new research, it may have to do your cultural biases. Or, to be more specific, the instances in which culture matters—and the times it doesn't.

When *does* culture influence consumer purchasing decisions? Four experiments reported in this research show that culture-based differences are found when information is processed in a cursory and spontaneous manner. So when you passed that roadside billboard, you were likely to be influenced by advertising that appealed to values held in high regard in your particular culture. But when you had the time to deliberate more—such as examining information on the Web—attempts by advertisers to rely on cultural factors are less likely to be successful.

For example, in a pilot study, students at a California university with an ethnically diverse population (both Anglo and Asian Americans) were asked to view advertisements for Welch's grape juice. Some participants were instructed to give their immediate reactions to the advertisements, while others were told to think more carefully before evaluating the effectiveness of the ads. Half of the ads were “promotion” in their appeal-focused on the benefits that could be gained by drinking the juice (e.g., higher energy levels, great-tasting as well as energizing, fun to drink). The other

ads had preventive appeals, highlighting problems that could be avoided by drinking Welch's (e.g., the risk of some cancers and heart disease, helps keep arteries clear so that blood can flow freely, and is healthy to drink).

The results were instructive. When participants gave their immediate reactions to the advertisements, Asian American participants heavily favored the prevention messages; Anglo Americans had the opposite reaction, rating the promotion messages as more effective. This tallied with the researchers' theories that Americans, who value achievement, accomplishment, and independent thinking, would focus on the positive consequences of their purchasing decisions. On the other hand, Chinese subjects, who tend to value protection and security, and have more interdependent ways of viewing the world, were expected to concentrate on the negative consequences of their actions or decisions. All this bore out when subjects gave only a cursory glance at the ads. Yet, importantly this disparity disappeared when participants engaged in more thoughtful deliberations. There were simply no significant differences in how the two groups rated the effectiveness of the advertising when asked to be more careful in their evaluations. So what determines whether culture matters? A key factor is the extent to which you draw upon cultural versus personal knowledge when making purchasing decisions.

General cultural knowledge includes implicit theories about the world we live in that are largely shared by the members of our society. But in addition to this shared set of ideas, we also have personal knowledge that can conflict with accepted, culturally derived practices. For example, a boy growing up in China may generally accept the importance of his relationships with others, and therefore seek to keep harmony with family members. But more personal knowledge—such as being exposed to pictures of American cultural icons like Green Day or Madonna—may lead him to sometimes wear clothes that his parents don't like. In other words, when pressured to form a quick judgment, we generally rely on cultural norms as a “default.” But when making a thoughtful deliberation, we're more likely to engage in an internal debate, and waver. These results underscore the idea that culture simply does not exert the constant, unwavering effect on consumer judgments as previously thought.

As the perceived importance of cultural issues increases, fueled by new technologies that allow marketers to reach consumers across country boundaries, this research has important implications. Marketers are spending increasing amounts of time and effort trying to understand subtle cultural differences. But for a message to be effective, they must understand not only how to tailor a message to a particular culture, but *when* such cultural-values-based messages are most effective. Additionally, the finding that culture sometimes guides consumer judgments and behaviors, and at other times does not, helps to understand conflicting findings in extant research. For example, although numerous studies have found cultural differences matter significantly to consumers, in other studies such differences sometimes fail to appear. Such failures tend to offer uninteresting findings, and often remain unpublished. The present research suggests that such null effects may be due to differences in the conditions under which participants provide their responses. Researchers may also want to consider the distinction between personal and cultural knowledge. When will personal knowledge override socio-cultural norms? Answers to such questions will further illuminate the psychology of consumers across cultural contexts, and shed insight on what types of global marketing efforts may be most effective.

“Cultural Identity Salience as a Catalyst of Consumer Resistance”

Dale W. Russell, INSEAD

Cristel Antonia Russell, San Diego State University

This research explores the possibility that feelings of animosity may be latent and resistance due to animosity may occur through implicit as opposed to explicit means. In particular, the potential for cultural identity prompts to serve as catalysts of animosity is tested. Previous research suggests that consumer resistance usually requires strong awareness or deep resentment (Ger and Belk 1996). Yet, at the same time, some evidence suggests that consumers may be able to separate their feelings toward a nation from their purchasing behavior. The underlying construct of consumer resistance against products from a particular country is animosity, which reflects the “remnants of antipathy related to previous or ongoing military, political, or economic events” (Klein et al. 1998, p. 90) and can adversely impact the consumption of products from another country. This research compares two catalysts of animosity: an explicit experimental scenario designed to enhance or reduce animosity and an implicit catalyst, cultural identity salience (Aaker and Lee 2001; Briley and Wyer 2002). The consumer psychology literature suggests that calling people’s attention to their own cultural identity induces feelings of allegiance to one’s country and increases the tendencies to espouse values common in that culture (Briley and Wyer 2002). Thus, making one’s own cultural identity salient could increase one’s attention to products from their own country. Similarly, prompting another culture could impact resistance to foreign products but, unlike an explicit scenario designed to openly activate animosity, it might do so in a more implicit fashion. In particular, making salient a culture perceived as invasive might increase the threat of cultural incursions and render consumers more defensive and resistant to foreign products.

These propositions were tested experimentally with consumer movie choices, a context especially fitting given the threat of worldwide domination by Hollywood and the presumed cultural homogenization by the U.S. through film and television (Mathy 2000; Ger and Belk 1996). The research was conducted in France where triggering animosity toward a country perceived as invasive or detrimental to the local culture was posited to foster resistance. It was predicted that combining a U.S. high animosity manipulation with exposure to a U.S. film synopsis would trigger resistance to American productions. This condition, making the cultural threat of Hollywood salient, was expected to activate a prevention-focus amongst French consumers (Briley and Wyer 2002), who should revert to domestic movies.

In a first study, French participants were randomly assigned to a 2 (animosity: high vs. low) X 2 (movie origin: U.S. or France) between-subjects experiment with the incentive of free movie tickets. Animosity was manipulated explicitly by having respondents read a press article about trade relations between the two countries before participating in a movie survey sponsored by either the American or the French Film Institute. The key dependent variable, movie ticket choice was an actual choice task at the outset of the study. Results showed evidence of cultural resistance: choices were equally split between domestic and U.S. movie tickets except in the high animosity-U.S. movie condition. In that condition, the majority (58.3%) selected domestic movies and fewer (31.7%) selected U.S. movies compared to the other conditions where between 39.7% and 45.1% opted for U.S. movies. As expected, preference for domestic movies increased when French consumers’ animosity toward the U.S. was heightened and they were reminded of the U.S.’s presence in their movie industry.

The second experiment relied on a cultural salience prompt as an implicit resistance catalyst. It was proposed that making another

culture salient may operate similarly to the high animosity manipulation used in the first study, if that other culture is perceived as invasive or detrimental to the local culture. The study was on a 2 (cultural salience: France vs. U.S.) X 2 (movie origin: French vs. U.S.) between-subject experiment with participants randomly assigned to conditions and offered the incentive of free movie tickets of their choice. Cultural salience and movie origin were manipulated by exposing participants to a picture association task prompting their own or the other culture (Briley and Wyer 2002; Hong et al. 2000), before introducing them to either the fictional American or French Film Institute survey. As expected, the U.S. cultural prompt-U.S. movie condition triggered animosity and generated cultural resistance: participants in that condition were more likely to favor domestic movies than those exposed to a U.S. culture prompt and a French movie (82.6% vs. 55.6%). Thus, exposure to a U.S. cultural prompt and a U.S. movie synopsis served as implicit catalysts of resistance, awaking French consumers’ animosity toward the U.S. and in turn increasing their preference for French movies.

Not only do these experiments demonstrate that animosity can be manipulated and its effects on consumer behavior tested experimentally, they also extend cultural identity research by showing that making salient a culturally threatening nation can generate resistance and induce feelings of allegiance to one’s own country and its products.

SPECIAL SESSION SUMMARY
“New Thoughts and New Possibilities”:
Frontiers in Consumers’ Interpretations of New Products

Reetika Gupta, Lehigh University, USA
Sankar Sen, Baruch College/CUNY, USA

SESSION OVERVIEW

How do consumers make sense of new products? Consumer research has largely focused on new product interpretations based on a single categorization cue (e.g. New product is a PDA) or a single analogical cue (e.g. New product is like a PDA). However, with the abundance of new products in the marketplace that defy straightforward categorization (e.g. hybrid products), single cue based interpretation is often insufficient. Recent research in psychology posits that the “ability to combine concepts in novel ways allows us to think new thoughts and imagine new possibilities” (Costello and Keane 2001). The purpose of this session is to present ongoing research that examines how consumers combine or compare multiple concepts or categories to construct interpretations of new products.

Together, the papers provide a broad perspective on how consumers combine and align multiple concepts to derive property or relation based meanings for novel products. Further, the papers provide insights into the factors that influence the interpretations, the processes underlying the interpretations, as well as the outcomes resulting from the interpretations. The papers shed light on several new product scenarios in the marketplace ranging from instances where the new product is a combination of multiple concepts (e.g. PDA phones) to instances where the new product is compared to analogous concepts (e.g. New product is like a Jacuzzi and a Therapist).

The first paper by Moreau, Dale and Kirmani, analyzes data from two experiments to demonstrate that the similarity of concepts, the category level of the concepts (basic vs. superordinate), and the order in which the concepts are presented influence the nature of interpretations (property vs. relational) and preferences for the new product. The second paper by Rajagopal and Burnkrant, analyzes data from two experiments to illustrate that the nature of interpretation strategy primed (property vs. relational), leads to differences in the new product inferences (multiple category vs. single category). Finally, the paper by Gupta and Sen, analyzes data from three experiments to investigate how and why the distance between analogous concepts (far vs. near) used to describe the new product, influences the interpretations and preferences for it.

EXTENDED ABSTRACTS

“From Combination Products to Brand Alliances: How Conceptual Combination Influences Consumers’ Preferences”

Page Moreau, University of Colorado, Boulder

Jen Dale, University of Colorado, Boulder

Amna Kirmani, University of Maryland, College Park

Consumers encounter a variety of novel combinations in the marketplace, including hybrid products (e.g., PDA phones; camera pens; GPS radios) and brand alliances (e.g., Hewlett Packard and Starbucks). In most cases, consumers are familiar with each element of the combination but have not considered the meaning of their union. As shown in recent work in psychology, the way in which consumers construct a representation for the new product or fused brand will influence their preferences for it.

Under the heading of conceptual combination, psychologists have examined the cognitive processes that people engage in when trying to make sense of novel word combinations. Costello and Keane (2000) identified five classes of interpretations: relational (a relation is asserted between the two objects), property (a property of one object is asserted onto the other), hybrid (a blend of both objects), conjunctive (a combination of both concepts), or known-concept (focuses on a known-concept related to the two objects). The majority of interpretations fall in the relational or property categories, with hybrid, conjunctive and known-concept interpretations occurring only rarely. However, little research has examined the conditions under which these different interpretations occur. We hypothesize that similarity of the words, the category level of each noun (e.g., basic vs. superordinate), and the order in which the nouns are presented should influence how consumers interpret novel combinations.

Specifically, we predict that more abstract superordinate categories will enhance the likelihood of a relational interpretation while basic level categories will focus consumers more on concrete features, thereby increasing the likelihood of property interpretations. This effect should be more pronounced when the two nouns are more similar, because similarity should facilitate alignment in the comparison.

In perfect hybrids, word order should not matter (e.g., a drill screwdriver should have the same interpretation and preference as a screwdriver drill). In the marketplace, however, we expect that perfect hybrids are rare and that word order does matter. From conceptual combination theory, the header (i.e., the second word) has been shown to carry the categorization information with the modifier (i.e., the first word) providing more specific, descriptive information (Costello and Keane 2000). Even in the case of the drill/screwdriver combination or the HP/Starbucks alliance, we hypothesize that simply changing word order may change preferences via categorization processes because the word position (header vs. modifier) is likely to remain a powerful interpretation cue.

Study 1 assessed the impact of category level and noun similarity on consumers’ interpretations of conceptual combinations. The study was a mixed design with three factors manipulated between subjects: 2 (modifier category level: superordinate or basic) X 2 (header category level: superordinate or basic) X 2 (similarity: similar or dissimilar). 115 participants were presented with four novel noun-noun combinations and asked to provide two definitions for each combination. The category level of both the modifier and header were manipulated independently, with either being superordinate or basic. In addition, the relationship between the two nouns was either similar or dissimilar.

Two judges classified each definition into one of the five types. Judges also assessed the primary source of knowledge and assessed the type of information transferred from both the modifier and header to the new concept. Preliminary results indicate that the category level of the header, and the interaction between the category level of the modifier and the header significantly influenced the likelihood of relational and property interpretations. A superordinate header increased the likelihood of a relational interpretation ($F=19.33$, $p<.0001$), and this effect was enhanced when

the modifier was also superordinate ($F=6.87, p<.01$). Further, when the nouns were similar, relational interpretations were less frequent ($F=56.5, p>.0001$). When relational interpretations declined, property interpretations increased. Overall, the incidence of pure hybrid interpretations was low. Taken together, this study provides crucial understanding of the conditions under which different types of interpretations occur. However, the nouns participants saw were different across conditions. In the next study, we hold the nouns constant across all conditions but vary the order in which they are observed. This manipulation allows for a more controlled test of the influence of position (header vs. modifier) on interpretation.

Study 2 manipulated a single factor between-subjects (word order). Participants provided their own definitions of and preferences for each novel combination as well as plausibility ratings for a fixed set of possible definitions. Half the subjects saw one set of conceptual combinations (e.g., vitamin-coffee, laptop-projector, computer-purse, purse-sock, and chair-basket), while the other half saw the same set with the words reversed. The results show that word order significantly influences a) participants' interpretations of the conceptual combination, and more importantly for marketers, b) preferences for the combined concept.

"Conceptual Combination and Inferences about Ambiguous Products"

Priyali Rajagopal, Southern Methodist University

Robert Burnkrant, Ohio State University

A robust finding in the categorization literature has been the finding that inferences about an object are limited to a single category (Malt, Ross and Murphy 1995; Murphy and Ross 1996; Ross and Murphy 1994). For example, if an object is categorized as a cell phone, then inferences about the object will be limited to those appropriate for a cell phone and will not include any inferences from other categories. This finding suggests that people do not seem to hold multiple category inferences about single objects, i.e. they do not believe that an object can possess attributes of more than one category. However, many products that exist in today's marketplace are ambiguous with respect to the product category to which they belong and possess attributes of multiple categories. For example, products like the Handspring Treo possess features and functionalities of a cell phone and a PDA while crossover vehicles like the Nissan Murano and Chrysler Pacifica possess features of a minivan and a SUV. Success for such products depends to a large extent on being able to convince consumers that they possess features of more than one category. Hence the finding with respect to single category inferences needs to be re-examined to suggest how multiple category inferences can be induced. The current paper therefore aims at understanding how single category inferences can be extended to multiple categories so that a single object can be perceived to possess features of more than one category.

We refer to the literature on conceptual combinations to overcome the problem of single category inferences. The literature on conceptual combinations focuses on how people interpret novel noun-noun combinations such as "whale boat". Past research in this area has found that people predominantly interpret novel combinations in one of two ways—property interpretations and relational interpretations (Costello and Keane 2001). Under property interpretations, attributes from both nouns are transferred to the combination. For example, a whale boat could be a boat that is very large (like a whale). Under relational interpretations, thematic linkages are drawn between the two nouns and properties of only the head noun are retained in the combination. For example, a whale boat could be a boat that is used to watch whales. Property interpretations therefore lead to the presence of attributes from more than one

category in a single object. Hence, we suggest that priming respondents with property interpretations (versus relational interpretations) will enable them to make multiple category inferences.

We further explore why property interpretations induce multiple category inferences and suggest that greater attention is paid to both categories under property interpretations which allows for easy retrieval of both sets of category attributes during product judgments. Under relational interpretations, greater attention will be paid to the head category's attributes, leading to faster retrieval of only one category's attributes during product judgments.

Two empirical studies were conducted to test our research propositions. In Study 1, we primed respondents with different interpretation strategies (property vs. relational) and exposed them to information about an ambiguous product that was labeled as either a PDA or a Camera. As expected, we find that when primed with a property interpretation strategy, respondents are able to make multiple category inferences and believe that the product will possess attributes of both a PDA and a Camera. When primed with a relational interpretation strategy however, respondents make single category inferences and believe that the product will either possess features of a PDA or a Camera but not both. Hence, property interpretations appear capable of inducing multiple category inferences.

In Study 2, we examine why property interpretations induce multiple inferences by incorporating a response time variable to measure accessibility to information about the two categories. As predicted, we find that under property interpretations, respondents exhibit no differences in speed of retrieval of information about both categories while under relational interpretations, respondents are significantly faster at retrieving information about one category as compared to the second category.

From a theoretical standpoint, this research contributes to the literatures on categorization and conceptual combinations. We combine research from two different literature streams—traditional categorization theories and psycholinguistics—to examine how inferences about one category can be influenced by inferences from other categories. The finding that all product inferences are not derived solely through categorization, but also from the type of interpretation strategy used is a radical departure from traditional categorization theory findings, which predict that inferences are derived from a single category. From a managerial perspective, this research provides a better understanding of the comprehension processes of ambiguous products by consumers and suggests ways by which marketers can promote acceptance of their products.

"Learning and Liking through Comparison: The Influence of Multiple Analogies on New Product Interpretations and Preferences"

Reetika Gupta, Lehigh University

Sankar Sen, Baruch College/CUNY

Previous research in marketing and psychology (e.g., Gentner, Ratterman, and Forbus 1993; Roehm and Sternthal 2002) has asserted that analogy cues with their emphasis on structural relations communicate the core functionality of a new product effectively. However, researchers have highlighted the shortcoming of a single analogy cue by showing that in the absence of surface similarity between the new product and an analogy cue, consumers may not be able to detect the common relation between the new product and analogy cue. This shortcoming can be eliminated and the unique benefits of analogies can be realized if consumers can compare the new product to multiple analogous concepts in a synergistic manner so that the underlying benefit is illuminated. Marketers of new products, which defy straightforward categoriza-

tion (e.g., Metronaps, Forerunner) could benefit from the use of multiple analogous concepts in their communication as it helps engender superior understanding of the new product and influence preferences for it.

Stemming from the structural alignment paradigm, the theory of analogical encoding (Ferguson 1994; Ferguson and Forbus 1998) suggests that if consumers are presented with two analogous concepts, their comparison and alignment illuminates the common underlying functionality, leading to superior knowledge transfer to the new product. However, in a new product context, the nature of analogous concepts used would determine if this process indeed occurs and how the interpretations influence the preferences for the new product. We hypothesize that the distance between the two analogous concepts (*far concepts*: shared functionality but no shared surface attributes vs. *near concepts*: shared functionality and shared surface attributes) used to describe the new product will influence consumers' interpretations and preferences for the new product.

Specifically, we predict that by comparing and aligning two far analogous concepts (e.g. jacuzzi and therapist), which have no shared attributes, consumers can identify the common alignable functionality (provides relaxation) while the use of two near analogous concepts (e.g. jacuzzi and sauna) focus consumers on the shared attributes (e.g. high temperatures) and shift attention away from the common alignable functionality.

At the same time, research has shown that the ability to categorize a product results in confidently held inferences (Gregan Paxton and Moreau 2003). Therefore, while the use of far concepts facilitates the transfer of the core functionality, the inability to categorize the new product weakens the effect of superior knowledge transfer, leading to lower preferences for the new product. On the other hand, when two near concepts are used, due to the focus on shared attributes, consumers have a tendency to categorize the new product into one of the two base categories, leading to greater preferences for the new product. We theorize that if the new product can be situated within a superordinate category (e.g. leisure product for far analogous concepts, jacuzzi and therapist), the uncertainty associated with the inability to categorize is eliminated, and the gains of analogical encoding are realized by reversing the preference patterns. In other words, when the consumer is no longer uncertain about the superordinate category in which to situate the new product, the deeper inferences drawn from the far analogy cues drive the positive evaluations towards the new product.

We further shed light on the underlying process of abstraction that leads to greater preferences for the new product, in the far concept condition. Using temporal construal theory (Liberman and Trope 1998), we suggest that when the new product purchase is construed in the distant future, the effects on preferences will be stronger, as the individual is primed to think at a more abstract relational level. In contrast, when the new product purchase is construed in the near future, the effects on preferences are undermined, as the individual is primed to focus on the concrete attributes.

Studies 1 and 2 exposed subjects to scenarios where the new product was compared to two analogous concepts of varying distance (near vs. far). In Study 1, participants were presented with four replicate scenarios and asked to provide descriptions of the new product in an open-ended format, based on the pair of analogous concepts. Judges assessed, if the shared functionality and shared features were transferred to interpret the new product. As expected, the far concepts facilitated a higher transfer of the common underlying functionality, while the near concepts resulted in a higher transfer of attributes. In Study 2, participants first

provided their own description, and subsequently responded to preference and certainty measures for that interpretation. The interpretation results of Study 1 were replicated. The ability to categorize provided a certainty for consumers in the near scenario resulting in greater preferences than in the far scenario. A closer analysis showed that in the near concept scenario there was a higher tendency to categorize the new product into one of the two base categories.

In Study 3, the scenarios were created based on an existing new product, and the superordinate category of the new product was provided to the participants. Further, the time construal of the new product purchase was varied (near future vs. distant future). The main effects revealed that with the elimination of the categorization uncertainty, the far concept scenario was preferred than the near concept scenario. Also, the interaction effects of time construal confirmed that the process of abstraction drives preferences towards the new product. Specifically, when primed with a distant future purchase, the far concept scenario reported a greater preference than the near concept scenario. In contrast, when primed with a near future purchase, there was no significant difference in preferences between the far and near concept scenarios.

Theoretically, these findings have implications for the theories of analogical processing and temporal construal. From a managerial perspective, these findings suggest effective means of communicating the core functionality of new products.

SPECIAL SESSION SUMMARY

From First to Second Generation: Moderated Nonconscious Behavior Effects

Christian Wheeler, Stanford University, USA

SESSION SUMMARY

Consumer behavior researchers are becoming increasingly aware of the variety of nonconscious influences on behavior (e.g., Dijksterhuis, Smith, van Baaren, & Wigboldus, 2005; Chartrand, 2005; Simonson, 2005; Janisewski & van Osselear, 2005), and it is now generally acknowledged that stimuli can affect people's behavior without their intention or awareness. Research in this area is entering its second generation. Whereas most previous research was aimed at demonstrating that these effects occurred, more recent research is aimed at illuminating moderators for these general effects. Can the same prime have different effects on different groups of people? Can established effects be reversed? Can primes have the same effects on behavior, but operate via different mechanisms under different conditions and for different people? The present session outlines several individual difference and situational moderators of established automatic behavior effects. These moderators illustrate the boundary conditions that identify when and among whom these effects occur, but also lend evidence regarding their mechanism.

The first presentation, by Wheeler and Berger, shows that the same prime can have different, and sometimes opposite effects on choice, depending on the unique personal associations recipients have with the prime. Across three experiments and using both demographic and individual difference segmentation variables, they show that the effects of primes on choices of different groups of people can be predicted by understanding their personal prime associations. The experiments further demonstrate that the differential priming effects are mediated by the unique personal associations the recipients have with the prime.

The second presentation, by Dalton and Chartrand, examines how exposure to relationship partners affects goal pursuit. Whereas previous research has demonstrated that exposure to relationship partners leads to pursuit of the goals they have for the prime recipient, the current studies show that these effects can be reversed. The first study shows that accessibility of overly controlling relationship partners actually leads to pursuit of goals incompatible with those the relationship partner has for recipients, presumably in an attempt to restore personal freedom. The second study lends additional evidence for this account by showing that low reactance individuals pursue the goals of salient relationship partners, but high reactance individuals do not. Hence, reactance can automatically moderate nonconscious goal pursuit and can manifest both as a function of prime targets and individual differences.

The final presentation, by Smeesters, Wheeler, and Kay, examines direction of focus as a moderator of whether primes will affect behavior via perceptions of others or more directly. They hypothesized that when features promote focus on other individuals in the situation, perceptions of those individuals will be biased by activated constructs, and changes in behavior will be mediated by such perceptions. When features promote self-focus, on the other hand, behavioral changes will not be mediated by perceptions of other people. Across a series of studies, and using both manipulations and measurements of self-focus vs. other-focus, they supported these hypotheses. Their studies show that primes can generate the same effects on economic decisions, but via different mechanisms, depending on the level of other focus.

EXTENDED ABSTRACTS

"Same Prime, Different Effects: Segmentation in Nonconscious Behavior Influence"

S. Christian Wheeler, Stanford University
Jonah Berger, Stanford University

Segmentation has long been recognized as a critical procedure in influencing consumer behavior. The varying needs, wants, experiences, and psychological characteristics of different consumer groups require individualized marketing attempts tailored to these subsets of people. Although the need for segmentation has been widely acknowledged for traditional marketing campaigns, the importance of segmentation for more non-conscious influence attempts has not been recognized. Indeed, one part of the power of such influence techniques is the assumed potential for them to influence different people in similar ways. Because such influence techniques rely on basic associative processes, it has been implicitly assumed that stimuli should exert consistent effects across different types of people.

In the present experiments, we demonstrate that the same primes can exert different, and sometimes opposite effects on recipients, depending on the unique personal associations they have to the primed stimulus. Much as unique experiences and associations can affect responses to more deliberate influence attempts, we show that they can also affect less overt influences. Across three studies, and using both demographic and individual difference segmentation variables, we show that different subgroups of consumers exhibit predictable differences in their responses to primes. Specifically, we show that primes can significantly affect consumer choice, but that the effects differ across subgroups of individuals who tend to have different prime associations.

The first experiment used the domain of clothing shopping. Pretests indicated that men and women have different shopping associations. Whereas men tend to be more "purpose-driven" or pragmatic and efficient, women tend to be more "possibility-driven" and browse just to see what is out there. We predicted that these different tendencies, once activated, would influence participants' subsequent choices in an unrelated task. Thus in the main experiment, men and women were randomly assigned to write about either clothes shopping or a control topic (i.e. geography).

Then in an ostensibly unrelated study they were asked to make a series of hypothetical choices, some of which between more “purpose-driven” and “possibility-driven” options (e.g., driving a direct route cross-country vs. taking the scenic route). Results indicated that the effect of the prime on subsequent choices differed based on participants’ gender; writing about shopping (versus geography) led women to make more possibility-driven choices in the subsequent context whereas it led men to make more purpose-driven choices.

The second experiment used the domain of formal events. Pretests indicated that when attending a formal event, men have a goal to dress rather similar to others, whereas women have a goal to dress rather differently from others. Thus in the main experiment, men and women were instructed to write about attending a formal event (or geography) before choosing between different products. Results again indicated different effects of the prime based on gender; women who wrote about the formal event (versus geography) subsequently chose more unique items whereas men who wrote about the formal event tended to choose more common items.

In the final experiment, introverts and extroverts were instructed to write about attending a party (or geography) before selecting different items they would like to receive in a drawing. Previous research has demonstrated that introverts and extroverts have different optimal levels of arousal. Introverts are aroused more easily than extroverts. As a result, they prefer lower-arousal situations and tend to be more easily over-aroused than extroverts. Consequently we predicted that thinking about a party would affect the subsequent choice of introverts and extraverts differently; introverts should be subsequently more likely to choose more low-arousal prizes, consistent with their desire to lower arousal at parties, whereas extroverts should be less affected by the prime. Results confirmed this hypothesis. Further, additional analyses showed that these different effects were mediated by the different associations (i.e. level of stimulation) that introverts and extroverts have with parties.

“Nonconscious Relationship Reactance: When Significant Others Prime Opposing Goals”

Amy Dalton, Duke University
Tanya Chartrand, Duke University

Numerous empirical investigations demonstrate that goals can be activated by the environment and pursued outside of individuals’ conscious awareness and intent (for a review, see Chartrand, Dalton, & Cheng, in press). Recent research demonstrates that one environmental antecedent of nonconscious goal pursuit is “significant others.” Fitzsimons and Bargh (2003) reported that filling out a questionnaire about a friend led participants to nonconsciously pursue an interpersonal goal to help others. Likewise, Shah (2003) found that subliminally priming the name of a significant other led participants to nonconsciously pursue a goal that a significant other had for them. These and other studies (Aarts, Gollwitzer, & Hassin, 2004; Anderson, Reznik, & Manzella, 1996) demonstrate that unobtrusively activating significant other representations can put associated goals into operation automatically. But do individuals always assimilate to the goals they associate with significant others? Can goal contrast occur, even at a nonconscious and automatic level?

Despite the importance of preserving social relationships (Shah, 2003; Fitzsimons & Bargh, 2003) and the strength of social influences in general (e.g., Milgram, 1963; Rosenthal, 1985), sometimes individuals behave in opposition to social influences. For instance, when individuals feel that social forces threaten their autonomy, they are compelled to behave in oppositional ways. This

motivational state and the resulting behavior have been labeled *reactance* (Brehm, 1966). We reason that the motivational state of reactance is not unlike other motivational states: the frequency and consistency with which one has experienced it in a particular situation will determine whether it can be nonconsciously activated. Therefore, individuals who have habitually experienced reactance while interacting with a significant other should come to have this motivational state automatically evoked upon exposure to the significant other. Following from this view, we conjecture that whether individuals’ goal pursuits automatically assimilate to, or contrast away from, their significant other’s wishes will depend on whether or not individuals perceive their significant others as threats to their personal freedoms. We test this hypothesis in two experiments.

Experiment 1

Embedded in a large mass testing session, students completed a Significant Others Questionnaire. In it, students indicated the first names of the people who most want them to work hard, have fun, and 8 other goals (included to hide the purpose), and then rated these people on various dimensions. Students were later recruited for the main experiment if they listed different people for the work hard and have fun goals, and if their ratings for those two people fell within the upper quartile of responses to the questions, “how much does that person trigger that motive or emotion in you?” and “how much does that person want to control you?”.

When they arrived for the experiment, participants were randomly assigned to be subliminally primed with the name of the significant other who wanted them to work hard or have fun, under the guise of a “visual acuity task.” Next, participants completed a 17-item anagram task, followed by a funneled debriefing that probed for suspicions about the experimental procedures.

We predicted that subliminal exposure to the name of a controlling significant other would produce automatic reactance, such that participants primed with the name of a controlling significant other would answer fewer anagrams correctly when that significant other wanted them to work hard compared to when that significant other wanted them to have fun. This is precisely what we found. Moreover, participants (in both Study 1 and 2) were not suspicious of the true relation between the experimental tasks or aware of the nature of the primes, suggesting that the significant other primes affected participants’ anagram performance nonconsciously. These results suggest that people who perceive a significant other as highly controlling automatically and nonconsciously reject the wishes of that significant other and instead pursue goals that oppose those wishes.

Experiment 2

We reasoned that people’s perceptions that their relationship partners are controlling might often be related to a more habitual tendency to believe that people in general wish to control them. Thus, rather than measuring the extent to which individuals perceived significant others as controlling, in Study 2 we measured trait reactance. In addition, we sought to examine the role of trait reactance as a moderator of the influence of significant other primes on goal-directed behavior, so we included participants who expressed reactant tendencies to varying degrees on an individual difference measure.

In the experiment, participants first completed the Significant Others Questionnaire. Next, in a so-called “divided attention task,” participants were subliminally primed with the name of the significant other who wanted them to work hard, relax, or an 8-letter string that did not resemble a word (control condition). Participants then

completed a 28-item anagram task, the 11-item Hong Refined Reactance Scale (Hong, 1992; Hong & Faedda, 1996), and finally, a funneled debriefing.

We predicted that trait reactance would moderate the effect of significant other priming on goal-directed behavior. As predicted, in response to significant other primes, low reactant participants pursued the goals their significant others had for them, while high reactant participants pursued opposing goals. Our results also showed that trait reactance was associated with perceptions of control: high reactant participants rated their significant others as more controlling than did low reactant participants. Therefore, although the triggers of reactance varied from other people (in Study 1) to individual differences in reactance (in Study 2), the data suggest that the mechanism underlying automatic reactance in both studies is the perception of significant others as threats to autonomy.

Conclusion

Our research demonstrates that it is possible for people to reject the wishes of significant others and engage in behaviors that directly oppose significant others' wishes, all without conscious intention or awareness. We have identified two triggers of this effect, both based on perceptions of control: (1) significant others perceived as controlling, and (2) individuals chronically high in reactant tendencies, who tend to see others as controlling. Both triggers result in automatic and nonconscious reactions against significant others' wishes.

"Nonconscious Effects on Economic Decisions: The Role of Perceptual Construals in Mediating Priming-to-Behavior Effects"

Dirk Smeesters, Tilburg University

S. Christian Wheeler, Stanford University

Aaron Kay, University of Waterloo

Recent consumer behavior literature has suggested that research should investigate to the extent to which behaviors thought to be deliberate can be influenced by non-conscious processes (e.g., Bargh, 2002; Dijksterhuis, Smith, Van Baaren, & Wigboldus, 2005). Many seemingly deliberative behaviors (e.g., answering quiz questions, Dijksterhuis & van Knippenberg, 1998) can be influenced by factors that operate outside of awareness. Although researchers have established a wide range of non-conscious influences, the mediational paths by which effects operate have received relatively little attention (Bargh, 2006; Wheeler & Petty, 2001). The present paper examines (a) to what extent decisions made in various economic decision-making situations (e.g., the ultimatum game) can be non-consciously influenced, and (b) potential mediational paths (e.g., perceptual construal of an interaction partner) for such effects. The present studies also provide evidence of moderated mediation; that is, our studies provide insight into when different mediational paths will be responsible for economic choices in these situations.

We have conducted several studies in which we examine how priming of cooperation-related constructs (e.g., kindness/unkindness, cooperation/competition) affects behavior in various economic decision-making situations. These situations are interpersonal—a decision maker must decide whether to make a relatively cooperative or competitive economic decision toward another person. In some cases, primes could affect these economic decisions indirectly by affecting perceptions of the other person (e.g., seeing them as more competitive) and hence one's own behavior (e.g., allocating less to them). In other cases, primes could affect these decisions through other routes (e.g., directly influencing behavior). A critical determinant of how primes may affect decisions in these contexts could be the extent to which the decision maker is focused on the other person (Neuberg & Fiske, 1987).

As the focus on the other person increases, the likelihood of the prime biasing perceptions of the other person should also increase. The extent to which one is other-focused can depend on the situation as well as dispositional factors. Some situations require greater focus on other people and some individuals are more chronically other-focused than others. We predicted that when other-focus is increased in economic decision-making situations, individuals will form impressions of the other person consistent with accessible constructs and these impressions will mediate their choices. For example, if one is primed with competitiveness, one will perceive the interaction partner to be more competitive, and as a result, act more competitively oneself (van Lange & Kuhlman, 1994). Therefore, when other focus is *high*, primes should *indirectly* affect decisions, mediated via perceptual construal of the interaction partner. On the other hand, when other-focus is *low*, primes should *directly* affect perceptions, without affecting perceptual construal of the interaction partner.

In our first study, participants were invited to play an ultimatum game. In this game, participants propose a division of money between themselves and an interaction partner. If the partner accepts the division, each person gets the proposed amount. If the partner refuses the division, neither person receives any money. We were interested in whether and how the primed constructs would affect their decisions. This study had a 2 (priming: unkind primes vs. neutral primes) x 2 (other focus: high vs. low) between-participants design. Participants were either subliminally primed

with unkind-related concepts or neutral concepts. In addition, participants were assigned to either the high or low other-focus condition. This was manipulated by using a translation task developed by Davis and Brock (1975), in which participants guess the meaning of foreign words using either first-person pronouns or third-person pronouns. We measured each participant's impression of their interaction partner as well as their level of cooperation in their allocation.

Results supported our hypotheses. In the low other-focus condition, the primes affected level of cooperation, but not impressions of the interaction partner. Participants were less cooperative when primed with the unkind words, but their impressions of their interaction partner were unaffected. In the high other-focus condition, the primes affected both level of cooperation and impressions of the interaction partner. Participants were less cooperative when primed with the unkind words, and they also perceived their interaction partner to be less kind. Mediation analyses showed that their allocations were mediated by their perceptions of the interaction partner. Thus, priming can both directly and indirectly affect behavior, depending on the level of other-focus.

Two additional studies replicated and extended these results using different situations (i.e., reciprocal and non-reciprocal dictator games), different primes (i.e., competition and cooperation primes), and an individual difference variable of other focus (i.e., communal orientation, Clark, et al., 1987). They illustrate that in games promoting high levels of other-focus (i.e., reciprocal dictator games), effects of primes on behavior are mediated by impressions of their interaction partner. In games with low levels of other focus (i.e., non-reciprocal dictator games), the effects of primes on behavior are *not* mediated by impressions of the interaction partner. They also find that the effects of the primes on behavior are mediated by perceptions of their interaction partner for individuals high, but not low, in communal orientation.

These studies show that behaviors traditionally assumed to be rational and deliberate can be non-consciously influenced by making cooperation/competition-related concepts more accessible. In support of Bargh's (2006) plea to outline the different pathways by which primes can affect social behavior, we demonstrated that primes can affect decisions in both direct and indirect ways depending on recipients' level of other-focus. This moderated mediation approach provides new and exciting insights into the multiple means through which accessible constructs can guide behavior as well as when each mechanism is likely to be in operation.

SPECIAL SESSION SUMMARY
Variety, Expectations and Choice
Alexander Chernev, Northwestern University, USA
Ryan Hamilton, Northwestern University, USA

SESSION OVERVIEW

Consumer's choices, and the satisfaction consumers derive from these choices, are often dependent on the expectations they hold. This session uses consumer expectations as a foundation for investigating the role of product assortment and variety-seeking in consumer choice and satisfaction. Building on the existing literature (Chernev 2003a; Iyengar and Lepper 1999; Iyengar and Lepper 2000; Kahn and Wansink 2004), this session investigated the role of variety and consumer expectations as they affect the choices consumers make, the satisfaction consumers derive from their choices, as well as the satisfaction consumers derive from choices made on their behalf. The session unified the findings of the individual papers into a broader framework for conceptualizing the psychological mechanisms underlying the impact of consumer expectations on satisfaction and choice in a variety of different decision contexts. Specifically, the session addressed the following issues:

Research presented by Chernev and Hamilton examines how assortment size influences consumer choice among assortments and, in particular, how assortment attractiveness moderates this process. They propose that, based on consumer expectations of the attractiveness of the options comprising the available assortments, the preference for larger assortments is likely to decrease as the overall attractiveness of both assortments increases. The data from five experiments offer converging evidence in support of this prediction.

In the second paper, research by Diehl and Poyner examines the role of consumer expectations when choosing from assortments. In particular, they argue that larger assortments raise consumers' expectations of how well options from an assortment will fit their preferences. Higher expectations may give rise to negative disconfirmation when searching a particular assortment thus reducing satisfaction with any chosen option. Findings from three studies show that larger assortments can lead to lower satisfaction due to expectation-disconfirmation.

In the third paper, three experiments by Aggarwal and Botti investigate the role of expectations in consumer evaluations of an option from a given assortment that is self-chosen versus the same option if it were chosen for the consumer by the marketer. In particular, they argue that consumers' satisfaction with choice is a function of their expectations about the motivations driving the marketers' decision. These motivations, in turn, are inferred using the norms guiding the consumer-marketer relationship; satisfaction will be lower in the context of exchange relationships, which are based on the principle of *quid pro quo*, than in communal relationships, which are based on the principle of mutual concern for well-being.

At the end of the session, the discussion leader, Barbara Kahn, led a research dialogue to integrate the individual presentations into a more general framework. In doing so, she engaged the audience participants in a discussion aimed at facilitating a broader understanding of the role of consumer expectations in shaping preferences and satisfaction.

EXTENDED ABSTRACTS

“Too Much of a Good Thing? Option Attractiveness and Assortment Choice”

Alexander Chernev, Northwestern University
Ryan Hamilton, Northwestern University

On a daily basis, consumers are faced with decisions that involve choosing among sets comprised of multiple options, such as choosing among the assortments offered by different retailers. These assortments may vary in size, defined by the number of available alternatives. Assortments may also vary in terms of the attractiveness of the options of which they are comprised. In this research, we examine how assortment size influences consumer choice among assortments and, in particular, how assortment attractiveness moderates this process.

Most prior assortment research has focused on understanding consumer decision processes associated with making choices from a given assortment (Hoch, Bradlow, and Wansink 1999; Kahn and Wansink 2004; Schwartz et al. 2002; for a review see Broniarczyk forthcoming). Relatively little research has examined how consumers make choices among assortments prior to selecting a particular option from one of the available assortments. In particular, the extant research on choice among assortments has focused on issues such as the role of preference uncertainty (Kahn and Lehmann 1991), choice set structure (Gourville and Soman 2005; Sood, Rottenstreich, and Brenner 2004), and decision focus (Chernev 2006). The question of how the attractiveness of the options comprising the available assortments influences consumer preferences for these assortments has remained largely overlooked by prior research.

Building on the notion that choice among assortments is a function of the balance of their advantages and disadvantages, we propose that the choice of an assortment is a function of the relative attractiveness of the options comprising the available assortments. In particular, we argue that when choosing among assortments, consumers aim to minimize the cost-benefit tradeoffs associated with selecting a particular assortment. Thus, on the benefit side, consumers expect larger assortments to offer a greater variety of options, which increases the probability of a better fit between a consumer's preferences and the available choice alternatives. On the cost side, consumers choosing from larger assortments might expect to expend greater cognitive effort in evaluating choice alternatives and have greater difficulty in making a choice.

In this context, we argue that the expected advantage of the larger assortment with respect to the smaller one is greater when assortment attractiveness of both assortments is low rather than when it is high. This proposition is based on the concavity of the value function, which implies that an increase in an object's value on a particular attribute will be associated with a decrease in this attribute's marginal utility, and, as a result, the perceived difference between two alternatives will decrease with the increase of the options' overall attractiveness.

The validity of this prediction is tested in a series of five empirical studies. The first experiment examines the impact of option attractiveness on choice among assortments by asking participants to choose between large or small assortments in a

variety of different consumer situations. This experiment documents that smaller assortments are more likely to be chosen when the attractiveness of the options in both sets is high rather than when it is low. In fact, the data show not only a decrease in the relative share of the larger assortment, but in some cases, also a preference reversal in which the choice share of the smaller assortment was actually greater than that of the larger assortment. Building on these findings, the second experiment lends further support to the experimental predictions by showing that the predicted relationship between attractiveness and assortment choice by matching the items in the choice sets with participants' previously revealed subjective preferences. The data from this experiment are consistent with the findings from experiment 1.

The third experiment directly tests the cost-benefit theory of the impact of option attractiveness on assortment choice by examining how the magnitude of the difference in the sizes of the larger and the smaller assortments moderates the impact of assortment attractiveness on choice. We argue that when choosing among assortments comprised of more attractive options (relative to assortments comprised of less attractive options), the marginal benefits of the extra options present only in the larger assortment are likely to be smaller, weakening the preference for the larger assortment. Experiment 3 tests this prediction by asking participants to choose between either more attractive or less attractive assortments of varying sizes. To illustrate, in this experiment, some participants chose between assortments of 9 and 18 options (small relative size difference) and other participants chose between assortments of 9 and 54 options (large relative size difference). The data show that not only was the smaller assortment more likely to be chosen when both assortments were comprised of relatively attractive options, but also that this effect was more pronounced when the relative size difference between the assortments was greater.

The fourth experiment examines how decision focus moderates the impact of option attractiveness on choice among assortments. Prior research has argued that the cognitive costs associated with choices from larger assortments are likely to be more salient when consumers shift their focus from the task of choosing an assortment to the task of choosing an item from the selected assortment. The results indicate that the assortment attractiveness effect reported in the first two studies is stronger when consumers are asked to justify their choice of an item from the selected assortment than when they are asked to justify their choice of an assortment.

In order to gain more insight into the decision processes underlying the observed effects, the fifth experiment examines respondents' information-search patterns. The results are consistent with the other experiments and show that the impact of assortment attractiveness on choice also extends to search behavior: participants were more attracted to larger rather than smaller assortments only when the attractiveness of the available assortments was low; when assortment attractiveness was high, the pattern of initial preferences was reversed in favor of smaller assortments.

This research demonstrates that choice among assortments is a function of the perceived attractiveness of these assortments, such that the relative preference for larger assortments is likely to decrease as the overall attractiveness of both assortments increases. In fact, the data show not only a decrease in the relative share of the larger assortment, but in some cases, also a preference reversal in which the choice share of the smaller assortment was actually greater than that of the larger assortment.

“Great Expectations?! Assortment Size, Expectations and Satisfaction”

Kristin Diehl, University of Southern California

Cait Poyner, University of South Carolina

A long line of research demonstrates that consumers value greater selection (e.g., McAlister and Pessemier 1982) and that they react negatively to restrictions imposed on their selection (e.g., Fitzsimons 2000). Recently, however, researchers have demonstrated that consumers can experience too much choice. This stream of research shows that larger selections decrease purchase likelihood (Iyengar and Lepper 2000) as well as decision confidence (Chernev 2003b) and proposes choice overload and heightened decision complexity as the underlying drivers.

We demonstrate an additional downside of larger assortments, lowering satisfaction with the chosen option, and establish the underlying mechanism causing this effect. We suggest that larger assortments raise consumers' expectations of the degree of preference match they can achieve. Higher expectations can lead to greater disconfirmation when searching an assortment, thus reducing satisfaction with the choice. Findings from three studies show that larger assortments can lead to lower satisfaction due to expectation-disconfirmation over and above the effects of information overload.

Study 1 used a principal-agent task where participants imagined choosing a birthday card for a male coworker (see Diehl, Kornish, and Lynch 2003). Participants imagined going to a store that featured a selection of either 25 or 250 birthday cards (between subjects). All participants then saw the same, single option, pre-tested to be perceived as a good option. Participants were told they had chosen this card and were asked to indicate their satisfaction with the card as well as the extent of expectation-disconfirmation they experienced. Replicating prior findings, participants were less satisfied with the target card when this card ostensibly came from the larger as opposed to the smaller assortment. Moreover, the larger assortment led to significantly greater negative disconfirmation than did the smaller assortment, and expectation-disconfirmation mediated the effect of assortment size on satisfaction.

Study 1 isolates our proposed mechanism from any choice overload effect since all participants only saw a single option. Study 2 replicates the mediating effect of expectation-disconfirmation in a real choice situation, where participants actually experienced different assortment sizes. Study 2 asked participants to search and choose computer wallpaper for themselves. Before searching the assortment, participants indicated one of six categories from which they expected to choose. Participants wrote a brief description of their imagined wallpaper and also sketched a picture. Assortment size was manipulated between-subjects as either small (60) or large (300 wallpapers), with 10 or 50 wallpapers per category. Participants saw a list of all options, grouped by categories and identified by category and a number. Clicking on an option brought up a small thumbnail of the wallpaper. Participants searched as long and in any order they wanted. After choosing an option, they viewed their choice full screen, rated their satisfaction with the choice, choice difficulty, and their degree of expectation-disconfirmation.

Contrary to prior work on choice overload, assortment size did not affect perceived choice difficulty, perhaps due to the visual nature of the stimuli. Still, we statistically control for choice difficulty. Replicating study 1, participants were less satisfied if they chose from the larger assortment. Further, larger assortments led to greater expectation-disconfirmation than did smaller assortments and expectation-disconfirmation mediated the effect of size on satisfaction. Study 3 further teases apart the overload mecha-

nism from the expectation-disconfirmation mechanism we propose. We manipulate assortment size as well as the order of questions assessing satisfaction and overload. An overload account would suggest that asking participants to assess overload prior to rating satisfaction would prompt them to attribute at least parts of their negative state to the experience rather than the outcome, thus attenuating the negative effect of assortment size on choice satisfaction (Schwarz and Clore 1983). Our proposed mechanism, however, would predict no differential effect of question order on satisfaction: whether overload was assessed *a priori* or not, expectation-disconfirmation should still drive differences in satisfaction.

We test these predictions using a principal-agent task that asked participants to select a camcorder for work. Participants browsed a catalogue of 8 or 32 (between subjects) camcorders and made their selection. Participants either rated their satisfaction with their choice before rating how overwhelmed they felt or vice versa. As before, larger assortments decreased satisfaction with the chosen option, and here also increased feelings of overload. However, there was no interaction of size and question order, suggesting that asking about process dissatisfaction first did not alter outcome satisfaction. Further, assortment size had a significant effect on expectation disconfirmation, which in turn mediated the effect of size on satisfaction.

Recently, researchers have challenged the ideal that more choice is always desirable. Our work contributes to this stream by identifying an additional psychological mechanism triggered by choice abundance. By increasing consumers' expectations of what should be available and therefore what will be considered acceptable, consumers may grow more demanding and may become frustrated in an environment that seemingly offers a lot of choices, but still does not live up to their expectations.

“Do I Like It if You Choose for Me? The Influence of Relationship Norms on Consumer Satisfaction”

Pankaj Aggarwal, University of Toronto

Simona Botti, Cornell University

Prior research has demonstrated that personally-made, as compared to externally-dictated, choices lead to greater task enjoyment, superior cognitive performances, and more positive affect (Brehm 1966; Festinger 1957; Langer 1975; Taylor and Brown 1988). Recent research, however, has found that cultural and social norms regulating interpersonal exchanges may moderate these beneficial effects of self-choice. The present research hypothesizes that the norms underlying different types of relationships between marketers and consumers moderate consumers' satisfaction with a self-chosen relative to a marketer-chosen outcome. This hypothesis draws on recent research suggesting that consumers' responses to the marketer's actions are a function of the relationship norms between the two (Aggarwal 2004; Fournier 1998). Two types of consumer-marketer relationships are examined: communal and exchange (Mills and Clark 1982). In a communal relationship, people give benefits to relationship partners due to a concern for their well-being. Thus, if in a communal relationship the marketer makes the choice, it is expected that it would have acted in the best interest of the consumer; consequently, the consumer is likely to be satisfied with this choice. Conversely, an exchange relationship is based on the principle of *quid pro quo*. People know that benefits are given in order to get something in return. As such, if in an exchange relationship the choice is made by the marketer, consumers will expect the marketer to be motivated by its own interests, and they will be less likely to be satisfied with it. We therefore hypothesize that the consumers' satisfaction with a marketer-chosen outcome will be lower compared to a self-chosen outcome when they have

an exchange relationship than when they have a communal relationship with the marketer.

Study 1 was a 2 (relationship: communal vs. exchange) x 2 (choice: self-made vs. marketer-made) between subject design, and scenario descriptions were used to manipulate the participants' relationship with a hypothetical bookstore. Participants were told that as part of a promotion the bookstore was giving away one of four novels to its customers. In the self-choice condition, participants selected a novel from this assortment, while in the marketer-choice condition the novel was chosen by the bookstore from the same assortment. Results showed that exchange participants experienced lower satisfaction with the marketer-chosen book than with the self-chosen book, while communal participants perceived no difference in satisfaction across the choice conditions. A thought protocol analysis provided further evidence by showing that when the choice was made by the marketer, exchange participants, relative to communal ones, expected the marketer to act more in its own interest and less in the consumers' interest.

Study 2 was designed to replicate these results and to rule out a reactance-based alternative explanation according to which participants in an exchange relationship would evaluate the marketer-chosen outcome less positively, not because of different attributions about the marketer's motivations but because of the greater perceived violation of their freedom to choose. To test this rival explanation, we allowed participants to either choose the novel themselves or let the marketer choose it. If the reactance account were driving the results of study 1, then we should observe a weaker or even a reverse effect in study 2, especially for participants in the exchange condition. However, if the attribution based account were the primary driver, then the results of study 2 should replicate those of study 1. Results yielded an interaction effect mirroring those of study 1 consistent with an attribution rather than a reactance explanation.

It was somewhat surprising that the exchange non-choosers experienced lower satisfaction than choosers in spite of their voluntary decision to relinquish the choice to the marketer. Could they have not foreseen this lower satisfaction, in which case they should not have relinquished their right to choose in the first place? It is likely that by providing the participants information about the four alternatives we gave them the opportunity to form 'own' preferences. When these preferences were not consistent with the marketer's choice, participants may have tried to explain this mismatch by using the relationship norms. Thus, communal consumers may have interpreted the mismatch as evidence of the marketer's knowledge of another, equally satisfying option, whereas exchange consumers may have interpreted the same mismatch as evidence of its selfish motivation.

Study 3 tests this explanation. Prior work on Deviance Regulation Theory (Blanton and Christie 2003) suggests that when people behave counter-normatively, they put greater weight on the positive features of that behavior. Given that exchange participants who gave up choice behaved counter-normatively, we expect them to evaluate the marketer-chosen alternative more positively if they cannot compare it with their own preferences. Thus, in this study we replicated the design of study 2 except that there was no information given about the four alternatives. Consistent with our hypothesis, we found a reversal of the effect for exchange non-choosers—who evaluated the final outcome more positively than exchange choosers—whereas no significant difference was observed between communal participants in the two relationship conditions. Further, this interaction was mediated by participants' expectations about the marketer's motivations, suggesting that these inferred attributions drove the differences.

Overall, consumers' satisfaction with the outcome of a self-chosen versus a marketer-chosen outcome depends on the norms underlying the consumer-marketer relationship, and the resultant differences in attributions made by the consumers.

To Add or Not To Add? The Effects of Add-ons on Product Evaluation

Marco Bertini, London Business School, UK

Elie Ofek, Harvard Business School, USA

Dan Ariely, MIT, USA

EXTENDED ABSTRACT

“Add-ons” come in many shapes and sizes. For example, restaurant menus often list numerous toppings, condiments, spices, or other ingredients that patrons can add to a standard order. In the consumer electronics markets, manufacturers of goods such as digital cameras, portable music players, laptop computers, and video game consoles encourage consumers to “accessorize” with various types of plug-in modules, kits, expansion packs, and carrying cases. Similarly, car manufacturers sell accessory packages and extended warranties for most new vehicles; domestic airlines offer meal service and in-flight entertainment at additional cost to passengers; fitness centers charge separately for locker rental, towel service, and many supervised group activities; telephone companies market a range of value-added services such as caller ID, call waiting, and call forwarding; and so on across a wide variety of industries.

Given the widespread appeal of add-ons, it is becoming increasingly important to understand their impact on purchase behavior. From a marketing standpoint, the literature on product assortment suggests that consumers can benefit from the availability of add-on features as long as these provide greater variety in choice (Bayus and Putsis 1999; Hoch, Bradlow, and Wansink 1999; Kahn 1998). Another suggested advantage of add-ons is to offset competition on the sale of base products (Ellison 2005; Verboven 1999). While these perspectives certainly deal with some of the key issues underlying the popularity of add-ons, we believe that add-ons are also likely to influence the inferential process consumers engage in when evaluating product information. Recent studies have demonstrated that while people have a hard time assessing products in absolute terms, they are often attentive to relative values and respond to a variety of contextual cues (Ariely, Loewenstein, and Prelec 2003, 2006; Bettman, Luce, and Payne 1998; Tversky and Simonson 1993). The relevance of these findings becomes apparent when one considers the possibility that context effects are based on inferences about the marketplace (Wernerfelt 1995), and therefore that information from the mere presence (but not the purchase or use) of add-ons—their type, quality, etc.—may create a context that consumers use to form or update their preferences.

In the present research we develop this additional perspective. In particular, by characterizing the add-on space according to the type of augmentation supplied by the firm—*vertical* when the enhancement upgrades an existing attribute (e.g., extra memory for digital cameras), *horizontal* when the enhancement introduces a new feature (e.g., condiments for coffee)—we propose two independent effects: vertical add-ons influence product evaluation by inducing a reassessment of specific features while horizontal add-ons influence product evaluation by cuing inferences about overall product quality.

The objective of our studies is to demonstrate these effects and to specify conditions under which the presence of an add-on is beneficial or, more surprisingly, detrimental to product evaluation. In experiment 1 we show that offering an optional extension on an existing product attribute more attractive (a vertical add-on) can increase the reference level for that feature and, consequently, make the base product alone seem less appealing. Conversely, offering an optional reduction on an existing product attribute less attractive (a vertical “strip-down”) can decrease the reference level for that

feature and make the base product seem more appealing. A follow-up experiment demonstrates that both effects disappear when sufficient external information on appropriate attribute levels is provided.

In experiment 2, we turn our attention to horizontal add-ons and demonstrate that participants infer a positive correlation between the observed quality of the new feature and the unobserved quality of the base product, but that the effect is conditional on the perception of fit between the two objects. Finally, in experiment 3 we show that the negative effect of vertical add-ons and the positive effect of horizontal add-ons can occur on the same base product, a result which underscores the fact that not all the optional features that consumers may find inherently valuable should find their way into the marketplace. We conclude with a general discussion of the implications of our findings.

Segmenting and Targeting American University Students to Promote Responsible Alcohol Use: A Case for Applying Social Marketing Principles

Sameer Deshpande, University of Lethbridge, Canada

EXTENDED ABSTRACT

Binge drinking at American colleges is widespread, and so are its consequences (Wechsler et al. 1994). Colleges, lawmakers, and surrounding communities have employed a variety of educational, legal, and skill-oriented programs over the last two decades to convince students to improve their drinking behaviors, but with limited success (Wechsler et al. 2002). The number of binge drinkers across 140 American campuses has remained steady since 1993. The campaigns have proven to be ineffective, perhaps because the campaign managers do not attempt to satisfy students' underlying need to drink, treat students as one undifferentiated group, and create homogeneous social change campaigns. To bring in a much needed target focus, this study employs social marketing principles. The author hopes that by segmenting students by their drinking habits and by profiling them by their reasons to drink, we would be able to evolve targeted social change solutions that effectively promote responsible alcohol use among university students.

An exploratory study of 37 freshmen and a survey among 294 freshmen and sophomores enrolled at a large mid-western university was conducted. Two alcohol-consumption behavior questions asked about "intention to consume a number of drinks in the next two-week period" and "frequency of intention to binge drink in the next two-week period." In addition to demographics, students were also asked questions related to Theory of Planned Behavior (TPB) (attitude, subjective norms, and perceived behavioral control). Students were segmented based on the intended frequency to binge drink in the next two-week period. Four clusters emerged: responsible drinkers who do not intend to binge drink (23.5%), light binge drinkers who intend to binge drink once (25.2%), moderate binge drinkers who intend to binge drink two to three times (34.4%), and heavy binge drinkers who intend to binge drink four or more times in the next two-week period (17.0%). If students were not segmented by their drinking habits, the average frequency to binge drink for all students as well as binge-drinking students would have been similar to moderate binge drinkers.

Segments were profiled based on demographic and binge drinking related TPB variables. All segments had a sizeable representation of women (around 66%). In terms of ethnicity, fewer Caucasians were represented among responsible drinkers than the light binge drinkers. Responsible drinkers, light and moderate binge drinkers tended to live in dorms, while heavy binge drinkers tended to live in houses or apartments or private residence halls. Moderate and heavy binge drinkers had a higher membership in fraternities or sororities than responsible drinkers and light binge drinkers. Moderate binge drinkers and responsible drinkers reported higher religious intensity than heavy binge drinkers. TPB variables displayed consistent statistical differences among segments. In general, responsible drinkers differed from the other three segments.

Correlation was calculated among demographic and TPB variables with intention to drink in the next two-week period. Across segments, gender was positively correlated with drinking habits. Within each segment, men were likely to drink more than women. Among responsible drinkers, two attitude variables (useful and moral) were positively correlated with drinking habits. These variables had a negative mean score, and the negative usefulness

and moral association with drinking habits was having a desirable negative association with their drinking habits. Opinion of friends had a positive mean and was positively correlated with drinking habits. Finally, self-efficacy and presence of friends had a positive correlation with drinking habits of responsible drinkers. Similar to opinions of friends, presence of friends seemed to act as an encouragement to drink responsibly. This finding is contrary to the stereotype that friends only encourage drinking. Similarly, self-efficacy also played a positive role in promoting the responsible drinking habits among this segment.

Among light binge drinkers, opinions of friends, campus norms (percentage who drink same), and self-efficacy had a positive correlation with their drinking habits. Additionally, utility of binge drinking to socialize had a marginal positive relationship with drinking habits. Among moderate binge drinkers, religious intensity significantly negatively correlated with drinking habits. There was, however, a marginal negative relationship with morality to binge drink. Among both light and moderate binge drinkers, the association of the two campus norms scores with drinking habits revealed an interesting pattern. While the perception of students who drink the same had a positive association, the perception of students who drink more had a negative association. Students in these two segments are thus willing to drink at a level similar to others on the campus, but not more. Among heavy binge drinkers, self-efficacy had a positive significant correlation with their drinking habits. Perceived control was marginally associated.

Based on the group profiles, one can conclude that the primary reason why students drink is to socialize and conform with peers. Their beliefs about the utility of binge drinking to socialize were also built around perceptions that the majority of the students on the campus binge drink. Self-efficacy similarly had a strong association with drinking habits. Students seemed to have a strong sense of "I can do it" mentality with regard to their drinking habits. The exploratory study data also revealed that the perceptions about availability of alternative opportunities influence students' binge drinking habits. Alcohol-free alternatives are considered boring and not useful to socialize. Students believe that the only way to socialize on campus on weekend evenings is to visit a bar or a house party.

Based on the reasons to binge drink, appropriate social change strategies are proposed using Rothschild's (1999) framework of Education-Marketing-Law model. Among light binge drinkers, an education campaign rectifying social norms coupled with a marketing campaign promoting an alcohol-free dance club may be useful. Among moderate binge drinkers, it may be useful to run an education campaign that highlights the role of religion on practicing socially positive behaviors, and education campaign that rectifies social norms. Finally, for heavy binge drinkers it might be useful to promote counseling sessions based on personalized feedback and motivational interviewing.

Money: A Bias for the Whole

Arul Mishra, University of Iowa, USA

Himanshu Mishra, University of Iowa, USA

Dhananjay Nayakankuppam, University of Iowa, USA

EXTENDED ABSTRACT

The role of money as a medium of exchange makes it an important element in consumer behavior and economic theories. However, little attention has been paid to how consumers perceive different currency denominations. We investigate if peoples' willingness to spend differs depending on whether they hold money in the form of a whole (a \$100 or \$50 bill) or in the form of parts (ten \$10 bills or ten \$5 bills). We report a consistent differential evaluation, which we call a 'bias for the whole', where people display less willingness to give up the whole (i.e., the bigger denomination) as compared to its constituent parts (i.e., monetarily equivalent smaller denominations) to acquire an object. The issue has both substantive economic importance (cash is used in \$1.3 trillion worth of retail transactions in the U.S. alone) and theoretical importance as such a bias violates the concept of descriptive invariance (Tversky, Sattath and Slovic 1988).

What is the underlying psychological process that might account for the bias for the whole? The Gestalt notion has been demonstrated in highly diverse domains ranging from summarized events (Ariely and Carmon 2000), extended experiences (Ariely and Zauberma 2003) and intertemporal choice (Loewenstein and Prelec 1993). We suggest that the bias for the whole occurs because money in the form of a whole possesses Gestalt properties of cohesion and economy and can be perceived and processed more rapidly than multiple bills. A single bill has a single interpretation of its value—e.g. a hundred dollars. On the other hand, an equivalent amount of money in parts (ten \$10 bills) does not possess these Gestalt properties as the parts retain their individual characteristics. Further, the parts can be combined together to form multiple value points—twenty, fifty or hundred dollars—hindering the processing of a unique overall meaning. Thus, money in the form of a whole is processed more fluently than the constituent parts. Past research has shown that processing fluency gives rise to positive affect (Bornstein and D'Agostino 1994). Thus, positive affect due to higher processing fluency results in a preference for money in the form of a whole.

We suggest that multiple bills combine to form multiple value points, hindering the processing of a unique overall value. Therefore, the more the value points, the larger will be the bias. Also, there is the alternate account of convenience. It could be argued that people prefer to spend with money in parts, so as to eliminate the clutter of carrying many bills of smaller denomination. Equivalent money in a larger denomination appears uncluttered and seems more convenient, reducing the willingness to part with it. To test this participants were either given a \$100 bill, five \$20 bills or a \$50, two \$20, and two \$5. The \$100 bill (the whole) formed just one value point. However for the remaining two conditions, while the amount of money and the total number of bills were the same, the five \$20 bills grouped together to form five different value points (\$20, \$40, \$60, \$80 and \$100) while the combination of \$50, two \$20 and two \$5 bills came together to form sixteen different value points (\$5, \$10, \$20, \$25, \$30, \$40, \$45, \$50, \$55, \$60, \$70, \$75, \$80, \$90, \$95, and \$100). Subsequently participants' willingness to buy three products was measured. Results were consistent with the proposed account. Participants with \$50, two \$20 and two \$5 indicated the highest willingness to buy, followed by participants with the five \$20, and participants with the \$100 bill were least

willing to buy the products. These results were inconsistent with the alternate account.

To demonstrate the role of processing fluency, in experiment 2 we primed either decreased or increased processing fluency with tasks that either had participants break whole objects into individual parts or group together parts to form whole objects. Priming grouping reduced the bias for the whole while priming breaking enhanced the bias for the whole. Affect ratings were also obtained and they showed that the influence of higher processing fluency on willingness to buy was mediated through positive affect.

Experiment 3 provided converging evidence for the role of processing fluency by moderating the bias for the whole with changes in stimulus familiarity. Past research has shown that stimulus familiarity increases its processing fluency (Whittlesea 1993). Thus, by increasing familiarity with smaller bills (which suffer from a lack of processing fluency), we were able to moderate this effect.

Experiment 4 explicated the role of affect. Using a misattribution paradigm (Reber, Schwarz and Winkielman 2004) the affective reactions arising due to processing fluency were rendered non-diagnostic, which in turn moderated the bias for the whole.

In sum, these findings suggest that money is not perceived as just a medium of exchange but as an object of evaluation in its own right, a finding of considerable interest to market-level theories as well as theories of individual consumer behavior.

Shedding the Cocoon: A “Mortal Embodiment” Perspective of Organ Donation in Supporting and Enhancing Life

Ai-Ling Lai, University of Gloucestershire, UK
Janine Dermody, University of Gloucestershire, UK
Stuart Hanmer-Lloyd, University of Gloucestershire, UK

ABSTRACT

This paper explores how potential female donors in the UK negotiate their ambivalent perceptions of cadaveric organ donation from a ‘mortal embodiment’ perspective. Specifically, we explore how the decision to dispossess body parts in the event of death challenges the notion of the body as the marker and annihilation of self under the contours of late modernity. Using a hermeneutic approach, multiple active interviews have been conducted with potential female donors, aged 21-30 who claim to harbour ambivalent perceptions towards organ donation. Through our ‘rich and thick data’ we reveal how potential donors actively rework socio-cultural constructs of the body by enacting various interpretive repertoires to make sense of their embodied self. We propose that the current organ donation promotional message of the “gift-of-life” should take into account the embodied self as an ongoing project of transitions and transformation that transcend biological death. Our paper therefore supports the research programs proposed by scholars of ‘Consumer Culture Theory’ and contributes to the recent call for ‘Transformative Consumer Research’.

INTRODUCTION

“Then, at the time of death, we shed this cocoon and are once again as free as the butterfly.”

-Elizabeth Kubler-Ross (1991), *On Life After Death*

The field of consumer research has reached its prime of life and increasingly academics are prompted to reflexively consider their roles in “*enhancing consumer welfare*”. The increasing interdependence between social agents within the discourse of consumption has led to an introspection to delve more deeply into the understanding of “*transformative consumer research*” (Mick 2006). This is exemplified by the recent establishment of the ACR Transformative Consumer Research task force where there is a call for

“investigations that are framed by a fundamental problem or opportunity, and that strive to respect, uphold, and improve life in relation to the myriad conditions, demands, potentialities and effects of consumption.” (Mick 2006: 2)

The task force identified organ donation as being one of the most pressing research agendas within “*transformative consumer research*”. In this paper, we reveal that the decision to become an organ donor is grounded within the broader sociocultural world that provides potential donors with a framework of meanings to negotiate their ambivalent perceptions towards cadaveric organ donation—further illuminating organ donation as a decision involving social interdependency.

This is reflected in the dominance of the “gift-of-life” discourse so prevalent within the promotional messages aiming to appeal to organ donors (Fox and Swazey 1992; Ohnuki-Tierney 1994). The meanings encoded within the “gift-of-life” discourse have intrinsically adopted a Judeo-Christian ideal of altruism, where potential donors are encouraged to donate the “gift-of-life” in the collective goal for common humanity (Ohnuki-Tierney

1994). Yet, the latest UK statistics indicate that while 90% of the population have expressed a willingness to donate their organs after their death, only 20% are registered on the NHS Organ Donor Register (BMA May 2004; UK Transplant 2004). Despite its altruistic connotation, Moloney and Walker (2002) argue that such hypothetical support expressed by potential donors tends to reflect the normative dimension of organ donation and fails to appreciate the existential tensions evoked by having to dispossess the embodied self through the act of organ donation (Robbins 1996).

Therefore to derive deeper understanding in encouraging organ donation, “*transformative consumer research*” needs to recognize potential donors as active interpretive agents, who are “*not simply consumers who are duped by medical ideology*” (Williams and Calnan 1996: 1632). There is a need to understand how potential donors’ interpretation processes unfold within their lifeworld. Our paper therefore supports the recent development of *Consumer Culture Theory* or CCT (Arnould and Thompson 2005)—CCT scholars contend that consumers are “*embodied interpretive agents*” who actively negotiate their consumption experience in the fashioning of their identity projects (Arnould and Thompson 2005; Thompson and Hirschman 1998; Patterson and Elliot 2002).

Despite the increasing interest in exploring the theory of ‘embodiment’ (e.g. Joy and Venkatesh 1994; Thompson and Hirschman 1998), the notion of “mortal embodiment” remains a relatively uncharted terrain within consumer research. The imminence of death becomes a constant threat, which reveals the ultimate futility of embodied projects within consumerist societies (Shilling 1993). Within the context of organ donation, potential donors are confronted with having to contemplate the meanings of *embodying mortality* and to consider dispossessing their embodied self in the event of death. The notion of embodied self poses a significant challenge for the altruistic ‘gift-of-life’ discourse—where transplantable body parts are regarded as disembodied “social gifts” devoid of identity (Lock 2002; Ohnuki-Tierney 1994).

This paper seeks to contribute to the exploration of organ donation from a ‘mortal embodiment’ perspective—specifically how the embodiment of mortality shapes ambivalence surrounding cadaveric organ donation among young British female potential donors. In so doing, it offers an alternative critical appraisal of the “gift-of-life” discourse ingrained within the marketing of organ donation.

LITERATURE REVIEW

We will critically review the literature concerning the existential contradictions of dispossessing the mortal body under the conditions of what Giddens (1991) calls late modernity. Specifically we will highlight how the decision to become a cadaveric organ donor is situated within the existential contradictions of *finitude* and *the continuity of self-identity*—which arise as a consequence of embodying mortality.

Dispossessing the Mortal Body in Late Modernity

Organ donation involves the decision of potential donors having to contemplate dispossessing their “*mortal body*” (Haddow 2000). This decision is rendered increasingly problematic in the

condition of late modernity¹—a post-traditional order in which modern trends have become radicalized (Williams and Bendelow 1998; Giddens 1991). The encroachment of modern technology within the consumerist landscape presents individuals with the possibility of exerting control over corporeal determinism (Bordo 1993) and to transform physical capital into symbolic capital (Shilling 1993; Bourdieu 1973). As a result, under the contours of late modernity, the body becomes increasingly malleable (Shilling 1993), plastic (Bordo 1993) and bionic (Synnott 1993). In other words, late modernity renders the body as the site for consumers to construct their self-identities. As Shilling (1993: 1-3) observes:

“The body becomes increasingly central to the modern person’s sense of self-identity...with the decline of religious frameworks which constructed and sustained existential and ontological certainties residing outside the individual, and the massive rise of the body in consumer culture as a bearer of symbolic value, there is a tendency for people in high modernity to place ever more importance on the body as constitutive of the self.”

Concurring, Belk’s theory of the extended self (1988, 1990)—where the body is conceived as the self or possession of the self—significantly challenges the biomedical notion of the body as machine—a metaphor which informs the “gift-of-life” discourse (Robbins 1996).

Additionally, Belk (1988; 1990) maintains that the centrality of body organs to the individual’s perceptions of self is related to *cathexis* (investment of emotional energy). Individuals in late modernity are increasingly involved in the *cathexis* of their body through various body projects (Thompson and Hirschman 1998; Shilling 1993), where the body becomes “a project to be worked at and accomplished as part of an individual’s self identity” (Shilling 1993:5).

Bauman (1992) argues that individuals engage in body projects—such as diet and exercise—as a strategy against mortality. He adds that “the more people prioritize issues relating to the self, the more they invest in their bodies, the more difficult it becomes for them to face up to and cope with their own demise” (Bauman 1992 in Williams and Bendelow 1998: 88).

The existential contradictions pertaining to the finitude and continuation of self-identity

As the self is increasingly embodied in late modernity, individuals are also becoming painfully subjected to “existential contradictions”—*the contradictory relation of human beings to nature, as finite creatures who are part of the organic world, yet set off against it* (Giddens 1991:55). According to Mick and Buhl (1992) existential concerns are represented by life themes, commonly born out of one’s sociocultural background and transformational experiences (e.g. death). Death becomes the ultimate betrayal of embodied projects—where the struggle between the “*time-binding mind*” and the “*time-bound fleshy casing*” (Bauman 1992) represent the ambivalence of embodying mortality. The paradox of embodying

corporeality lies with the obdurate fact that our material existence will one day come to an end (Seale 1998).

“The body is the ‘natural enemy’ of survival and the only uncontrived enemy. A paradox indeed—and the seat of perhaps the deepest and most hopeless of ambivalences: in the struggle aimed at the survival of the body, the would-be survivors meet the selfsame body as the arch-enemy.” (Bauman 1992: 36)

Consequently, organ donation requires potential donors to reflexively reorder the narratives of their self-identity (biography) around their ever-changing embodied self (Seale 1998; Thompson and Hirschman 1998). If the body is the marker of the self, it is not surprising that dispossessing body parts through organ donation conjures up ‘existential questions’² of *finitude* and the *continuity of self-identity* (Giddens 1991; Lock 2002) for potential donors.

Since one cannot “experience” death and live to talk about it (Bauman 1992), death is as Kierkegaard (1941) points out a “subjective death.” Subjective death is “*an absolute uncertainty*” (Shilling 1993: 184), which, by its very nature is difficult to conceive, as it is non-being (Tillich 1952). Thus, while biological death is a clinical certainty, “subjective death” raises questions about the persistence of the embodied self (Giddens 1991).

Giddens (1991) maintains that the subjective nature of death leaves room for the production of imaginary discourse (Lock 2002), where social constructions of the afterlife offer the possibility for individuals to transcend time and space. Lock contends that

“the departure of the soul, person, or spirit is socially constructed and depends on the conception of the relationship between the physical body and the soul or person.” (2002: 197)

Davies (1997) argues that this uncertainty and the fear of death have pushed humanity to generate a belief in an immortal soul, currently a dominant belief³ in Britain (Walter 1996; Davies 1997). This belief affirms the self as essentially indestructible (Tillich 1952). However, at the same time it evokes existential questions regarding the embodied status of the soul (Lock 2002). Additionally, Walter (2001) has found that the idea of reincarnation is being increasingly entertained in an emerging post-Christian West. The Western idea of reincarnation is appealing because it facilitates the continuity of the self beyond biological death through an infinite cycle of life trajectories (Lock 2002; Walter 2001).

Organ donation lies at the uneasy intersection between the materialist, rationalized view of death—“*when you are dead, you are dead*”—and the more ambiguous transcendental view of the afterlife. While it perhaps offer potential donors the chance to transcend biological death—through the symbolic resurrection of “living on” in the donor recipient’s body—(Lock 2002; Sharp 1995)—it leaves

²Existential questions “*concern basic parameters of human life*” (Giddens 1991: 55).

³However, it is important to note that most people do not hold fixed or coherent beliefs about the afterlife and are often weaving different ideas about it to fit into the circumstances of different contexts, life stage and experiences (Davies 1997; Walter 1996). The subjective nature of death means that afterlife beliefs are often a speculation and an expression of hope (Walter 1996; 2001) rather than a firm belief (though to a lesser extent among populations who hold firm religious beliefs).

¹We concur with Giddens (1991), where he refutes that we have moved into the epoch of postmodernity where we witness the collapse of grand-narratives (Lyotard 1979). Grand narratives such as the self and various social institutions (e.g. medical, religion) have not become redundant; rather they have become increasingly reflexive and radicalized under the contours of late modernity.

many unanswered questions about the status of the (dis)embodied 'self'.

Our review of the literature stresses the centrality of understanding the "human dimension" (Belk 1990) of organ donation through 'mortal embodiment'. This perspective posits that the "gift-of-life" discourse needs to recognize the

"shifting sand of sentiment regarding the proper disposal of bodies after death; a multi-layered concoction of religious, quasi-religious and superstitious beliefs that contradict the mind/body dichotomy and assert that the body is more than simply the sum of its physical parts...(These) confirm the importance of recognizing the embodiment of social, cultural and spiritual values." (Robbins 1996:191) [emphasis in original]

METHODOLOGY

In recognition of the polysemic meanings surrounding organ donation as being embedded within the human and cultural context (O'Connell 1996), we have adopted a hermeneutic-phenomenological approach (Thompson *et al.* 1994). This approach enabled us to become immersed in our participants' field of perception (Daymon and Holloway 2002) and to understand the contextualization of potential donors' embodied perceptions (Thompson *et al.* 1994)—since their backgrounds provide participants with a frame of reference to actively construct a personalized narrative using symbolic metaphors⁴ about their body and more specifically about organ donation (e.g. the gift-of-life message).

Accordingly, we adopted an active interviewing technique (Holstein and Gubrium 1995), enabling us to move beyond participants' superficial views of organ donation. The tenet of the active interview presumes participants to be active narrators who, together with the researcher, explore possible interpretive repertoires and experiential narratives—thereby enabling the participants to move beyond the minimalist level of interpretations (Holstein and Gubrium 1995). This has proven to be a particularly useful method to explore topics that are not casually topical, but socially relevant such as organ donation.

Multiple active interviews, of approximately 4 hours each, were conducted with 14 female potential organ donors, aged 21-30, who harbour ambivalent perceptions towards organ donation—generating extremely 'rich' and complex data. Participants were recruited using snowball sampling (Miles and Huberman 1994). All the interviews were audiotaped, transcribed verbatim, and analysed using the NVivo software. *Intratext* analysis was conducted, where individual transcripts were analysed in their entirety to gain a sense of the whole (Giorgi 1989 in Thompson 1997). Emerging themes are isolated as meaning units (Giorgi 1985) for further analysis against the participants' biographical particulars and sociocultural constructs of the body. We then conducted an *intertext* analysis, where we looked for contradictions across different interviews and the literature (Thompson 1997). NVivo eased the interaction between these interpretive cycles, enabling us to explore the countervailing meanings concerning organ donation, in a more holistic manner.

FINDINGS AND ANALYSIS

Our analysis reveals the emergence of multiple interpretive

repertoires, which expose the limitations of the Cartesian philosophy underpinning the "gift-of-life" message. This has been analyzed in greater depth elsewhere. Participants' narratives are marked by ambivalence and tensions which transgress the boundaries between the (1) Body As the Embodiment and Disembodiment of Self (2) Life and Death (3) Human and Non-Human (4) Nature and Culture and (5) Self and Other. In this paper we concentrate on the first theme (1) how the decision to dispossess the body in the event of death challenges the notion of the body as the marker and annihilation of self-identity—illustrated through the 'rich and thick' narratives of 6 participants.⁵

Willingness to Dispossess the Lived Body

In this study, participants seem to assume a strong body-self integrity which they identify as an impediment to organ donation. Participants foster relationship(s) with the lived bodies through the *cathexis* of body projects (Belk 1988; Shilling 1993). By enacting culturally familiar symbolic metaphors, participants illustrate how they form relationships with their bodies and how the notion of the embodied self has shaped their ambivalence towards organ donation as Estelle explains below:

"I just think it depends on how you see your body. If you are like, the body is just a shell, no part of me, then will be no problem at all being like, "oh I'll give them parts." That's absolutely fine. I am not that one-sided. I am more mixed. And like obviously, if you are a person who is like, "no, my body is my temple. It has looked after me really well." Then I can fully understand why obviously you wouldn't want to give your parts to someone else. I think people find it harder to answer that question just because we don't fully talk about death and don't fully understand about death." (Estelle, Age 21)

Here, Estelle locates her ambivalence as a potential donor within two opposing interpretive repertoires drawing on cultural metaphors such as *the body as a shell* and *the body as temple* (Belk 1988) to reinforce the centrality of the personhood ingrained within the mortal body. Estelle's narrative demonstrates that organ donation is imaginable from a disembodied perspective where it is devoid of the self (Lock 2002; Sharp 1995).

Late modernity presents participants with a vista of lifestyle choices to fashion their embodied self (Thompson and Hirschman 1998; Shilling 1993). For example participants are actively engaged in *self-care regimes* (dieting and exercising), *preventative health regime* (complementary medicine), *performance arts, sports* as well as *clothing*. Body projects enable them to participate in the world (Csordas 1994) and provide them with a meaning of life. As Sophie explains:

"Cause I feel that my body is me. So I express myself through everything I do with my body isn't it? At the end of the day, this is my body. This is how I am. This is what I am. And life and

⁴Symbolic metaphors are exemplary images or events that convey a nexus of assumptions, concerns, values and meanings that systematically emerge throughout the interview dialogue (Thompson *et al.* 1994)

⁵In order to present a thick analysis of participants' narratives, we have selected 6 participants whose account of embodiment and organ donation represent the theme of this paper—i.e. how the relationships they foster with their lived body impinge on their perceptions of the (dis)embodied nature of the afterlife. Participants have identified this theme to be salient in their ambivalence towards organ donation. Due to space limitations, we have decided to present the narratives of 6 participants to reflect the richness and depth of the data in fulfillment of the hermeneutic approach we adopted (Thompson 1997).

everything. But this is my body. This is me... This is my body, I don't want anybody that I don't want, invading my body." (Sophie, Age 23)

The recurrent view among most of the participants who engage in body projects, is the perception of 'if you look after the body, it will look after you'- thereby engendering the partnership between them and their bodies. As a result, this investment becomes an obstacle for them to confront the prospect of mortality—supporting the work of Williams and Bendelow (1998). Consequently organ donation comes to be perceived as a threat of disembodiment the self as portrayed by Carmen's narrative below:

"Definitely, again, it (the body) is your possession. The more you use it, the more you value it, the more prize possession it becomes, the less you want it harmed, or taken apart, or damaged or illness to come to you. So it could very much be connected with me not yet having an organ donation card because it is my body that I am maintaining, engineering and living in." (Carmen, Age 21) [emphasis added]

Carmen's narrative illustrates the way in which she resists the "gift-of-life" discourse, by actively weaving-into a personalized narrative-the contrasting symbolic metaphor of the *Body as Machine* and the *Body as Possessions* (Belk 1988). Carmen describes how her body has become her prized possession (*Body as Self*) through the cathexis of Body Projects. Organ donation "harms" and "damages" her prized body, and thus we can begin to understand why it becomes difficult for her to let go of her lived body-which she has mastered like a machine. Similarly, Sophie's life project has come to be intimately integrated with body projects:

"Well because obviously I am worried about fat and stuff. I have to like, get rid of all that. I have tried to make an effort with my body. I have tried to look after it. And I tried to maintain it as well as it can be. I feel like... because I have done that throughout my whole life, whatever age I decided to go. That you know... at the end of it, that is what I have done. That is my achievement to keep my body or go on as well as possible or whatever. And then to have it taken away, I wouldn't be happy. Yeah I would be kind of upset if they take my bits away... I have always wanted to be the way I want it to be and I don't want people to invade it. All that. And I think that has a big impact on what I do when I die. Even when I am dead... sounds really stupid but I still want my body to be me when I die. And I know it is going to disappear or whatever but I still, when I die, I want my body to stay as me." (Sophie, Age 23) [emphasis added]

Sophie's relationship with her embodied self is engendered by vigilantly working to 'maintain' and 'keep' her body the way she 'wants it to be.' She perceives organ donation as not only invading her body, but invading her 'self'. When contemplating the eventual disintegration of her body, Sophie is adamant that her body should be buried as a 'whole' as body integrity symbolizes the continuity of her embodied self—"I want my body to stay as me."

However, the control over the body does not always foster a close relationship between the body and the self. For participants who have developed an eating disorder, embodying the anorexic self binds them to the body in an ambivalent relationship as Neve's narrative demonstrates:

"Logically when you think about it, it seems reasonable to me that...because of the way I viewed my body and the way I really

kind of hate it, surely I'd want to get rid of it. And I'd be like...cut it up. Have what you want. But because it is so important to me and because it affects my life so much, that's why I am still really tied to it....My body is like my worst enemy but at the same time, I am pretty close to it cause it does affect my life in a really strong way" (Neve, Age 21) [our emphasis].

Neve views her body as an enemy (she refers to her body as "it"), with her mind holding a privileged position over it. Yet having to exercise unprecedented control over her body has meant that such a bond, albeit negative, remains difficult for Neve to relinquish. This echoes Bordo's (1993) observation of anorexic women where their ability to exert total mastery over their body becomes a symbol of accomplishment and independence and therefore a source of pride. While Neve perceives her existence as being chained to her 'unruly' flesh, Cyd—a recovered bulimic perceives the ability to control her body as an ally (friend) in the most difficult time of her life. The body, thus, becomes instrumental for Cyd to make sense of her self-identity. For Cyd, the body is at once an object and an extended-self (friend). Cyd describes:

"I wasn't happy with my body weight and my body, and how I look and stuff. And I think at that time in your life (adolescence), you don't feel in control of a lot of things. And so it starts with, "oh well. I can use this to lose a bit of weight." And then it turns into, "this is something I can control.".... Most aspect of my life is through this thing...it's erm...it became like a friend. It's like a thing... that's your thing. I'm not really sure why...I think it's...that's why. Because it was something I can control and what's going on around me were...my parents didn't have a lot of money and we moved and gone through that big upheaval of going to the States and...it was all really chaotic.... Because in a lot of sense, yes, the body is the enemy because you are trying to get rid of certain part of it that you don't like. Yeah. So it is the control aspect of it and the fact that you got control of it, that's the thing that become like a friend.... I want to end my life whole. And I think that's a big thing for me as well. I don't want anybody to take anything from me. I would like to die as I am and then, whatever happens, happen after that...I don't know what I really think (of organ donation). I think part of it might have to do with the fact that I saw that I have worked hard...for my body and the weight it is now and looked after it in the last few years. So I want it all (low tone). It is MINE (laugh)." (Cyd, Age 21)

Cyd insists that her body should remain intact in the event of death as her body has not only become an embodied project, but is also a friend to her in life. Therefore dispossessing her organs is tantamount to dispossessing a friend.

Although not all participants in this study engage in body projects, organ donation unsettles the existential questions regarding the *finitude* and *perceived continuity of the embodied self* (Thompson and Hirschman 1998; Giddens 1991). Organ donation requires participants to reorient their self-narratives by projecting into the future trajectory (Turley 1997) and construct imaginary discourse concerning the nature of (dis)embodiment in the afterlife (Lock 2002). This will now be discussed.

Finitude and Perceived Continuity of the Embodied Self

The subjective nature of death (Kierkegaard 1941) enables participants to explore and elaborate on various imaginary repertoires concerning the *finitude* and *perceived continuity of self-*

identity. Thus the ethereal realm becomes the site of constant negotiation between embodiment and disembodiment. Contemplating this, Carmen maintains:

“But when it comes to giving away your parts or saying you would after you die, it is a little difficult for people to, well for me to kind of like comprehend... Because of the view that when you die, you leave your body behind and your soul goes to heaven...erm or hell... Well it is difficult because I still see people... OK my vision of heaven still has people in the same embodiment as they were on the earth. But the actual...but the body doesn't disappear. It must stay on this earth and be dealt with in whatever way it is chosen to be dealt with. I didn't list organs to be taken out the day before being buried or burnt. There is a danger of, “do we need it?” Because on the one hand, it is left behind, on the other, “what do you have to live in, you know in the next life?” Or are we like reincarnated and come back as something else or in another body? No idea and if it is unknown, it is hard to make a decision.” (Carmen, Age 21)

Here Carmen is expressing the difficulties in comprehending the persistence of the embodied self in the afterlife. Carmen's speculations to remain embodied in the afterlife is not surprising as her body is a vehicle for her to experience the world while alive (Csordas 1994)—thus it becomes difficult to imagine a disembodied existence despite the “evidence” that our material existence is subjected to biological disintegration. Organ donation compels the participants to make a decision away from the locus of death (Horton 1991). Consequently, the ‘subjective’ nature of death (Tillich 1952) produces the interpretive repertoires where participants juggle between the *materialist* view (Walter 1996), which perceives the ultimate finitude for the embodied self, and the *transcendence* view—as Estelle's narrative illustrates:

“See that's the hang-up. Because when you die, is there a thereafter? Which there probably isn't? Erm...it doesn't matter anyway. But it is just the fact that because you have to make the decision when you are still needing the parts, I think that's the hardest thing. It's like, obviously, when you pass away, you don't need them. They are just objects that are no good being still in this body of yours. But when you are like, “oh my heart is actually beating now,” it is hard to think about giving it away because you are still picturing it as something that's needed for yourself type thing. Do you see what I mean? You can't picture it as being something you could give away. You think you need it forever which you don't.” (Estelle, Age 21)

Organ donation is conceivable from a materialist point of view as the embodied self is diminished—so at the point of death, donated organs can be objectified as merely biological entities (*just objects that are no good*). Estelle denotes that one's existence is reliant on one's embodied senses—therefore to reflect on the possibility of dispossessing her still-beating heart is symbolic to the annihilation of the self, forever engulfed in the void of nothingness. Estelle's anxiety of nothingness ensues in her speculation of the possibility of transcendence where retaining specific organs which embody her ‘self’ may ensure her continual existence in the ‘afterlife’ as she explains:

“And I just think the whole idea of there being nothing...the whole idea of nothingness is horrible. Because it is just like you are...you are no more. We are in a world where there is

everything everywhere. There is like now... (your) senses rely on it... Erm... Cause I don't really think there is a next life...not anymore...remember I said I did when I was younger. It will just be the one, the organs that mean the most to me that I'll have the most hang-ups about. I will still be a bit eerie if other parts of me are taken. But I don't think I would need the other parts as much as the ones (that's important to me). I won't be me anymore would I, if I pass away? So it is really confusing. That's why it is so hard because you are having to talk about a condition that you are only in when you are in it.” (Estelle, Age 21)

Estelle's narrative supports Belk's (1988) theory of extended self which argue that not all body parts are equally central to the self. Like Estelle, Kierra argues that the heart acquires cultural currency as a symbol of the ‘self’ (Manning Stevens 1997). Kierra postulates that the symbolic meanings attached to specific organs are culturally constructed. Therefore retaining the heart becomes symbolic to preserving the essence of the self.

“So you know... and you are dead, so in the afterlife, you may not need bits that don't...don't know...it all becomes...it all kind of become a bit silly. It does. I can hear myself and thinking, “God, what are you saying, woman?” ...but yeah, I know that I need everything to function now and I know that I need my eyes just as much as I need the toes for balancing or whatever. And one (organ) is slightly more important than the other. I guess it is in terms of identity and...because you know, culture kind of states that these organs are associated with identity and personality, which is internalized by you as the member of society. I think...you know, heart, you associate with identity, and heart that you associate with soul...but then that's stupid because you can't live without your liver you know. And it always...I don't know...I don't know what to say really.” (Kierra, Age 24)

Preserving organs perceived to embody the self is also essential for Kierra to attain a form of closure and resolution, thereby releasing the soul from the cocoon of the body. Kierra witnessed the passing of her Grandmother in which the discolourization of her body was perceived as the releasing of her soul (*she wasn't there anymore*). Kierra has also had a spiritual encounter where she saw butterflies landing on the portrait of her deceased Grandfather, where the vicar at the funeral told her that the butterflies were her Grandfather's soul taking flight. These experiences enable Kierra to weave together the ideas of the transmigration of the soul and reincarnation—supporting the work of Walter (1996, 2001) and Kubler-Ross (1991)—where the soul is perceived to go through stages like the metamorphosis of a butterfly. Kierra continues:

“I think being a donor, that doesn't have a final resolution at the end of someone's life...You don't have a kind of release or closure, or you are out of this world, it is always like you are in a kind of limbo, if you know what I mean... if there was an afterlife, whether my spirit will be whole without my heart. Whereas if it was a kidney or something, yeah, have it. No question asked. But brain and heart and eyes and things I feel very closely to my personal being, I am not sure of it. You know my Granddad kind of disappeared into butterflies and things. I want to get to that stage. And if I give it to somebody else, does it mean I will get there or not... So, I think, in order to get there, you need to go through certain stages like erm... your body is the only part left of you, isn't it? Your dead body...you may wander off and be a little ghost somewhere, looking like

you, and leave your body, like I felt with my Gran (Grandmother) maybe. She wasn't there anymore. Maybe she is herself, somewhere else. But then if someone took her heart, would she still be there? Would she still be Gran? Would my Gran be living in the body of somebody else? I'd be happy to know that the heart had gone and saved somebody. That's great. But I'd be worried that my Gran wouldn't be where she needed to be. I am not quite sure how I'd feel about it. I don't think I ever will be. I'll be happy that she saves someone but worry for her that she wouldn't be wherever she needs to be with all her bits (Laugh)." (Kierra, Age 24)

Kierra's narrative helps us to better understand her perceptions towards organ donation. For her the way in which the dead body is treated—such as the removal of organs—may interfere with the transmigration of the soul, subjecting it to a state of limbo. For Kierra, then, donating her organs threatens the coherent narrative (Giddens 1991) of her 'self' in the afterlife.

Kierra's thoughts are similar to those of the other participants, who believe that the body needs to be whole in order for it to be reunited with the soul. Accordingly the marring of the case/vessel (Belk 1990) through organ donation prevents the soul re-entering the body to create a united 'self'. Explaining the need for her body to be 'whole' in life and death, Neve states:

"I don't want my body to be tampered with in any way. It is just kind of like.....I know people when you die, like, the soul is released from your body, cause in that sense, the soul is literally just like.....sorry the body in that way is like just a case for your soul to live in. But at the same timecause I really believe obviously in the spirits like I say before and ghosts and stuff and the afterlife.....it is almost like if my body is not in the ground completely whole and it is been tampered with, then I won't be able to come back like even if it is in the spirit world. I will be missing...say...it is a head or a liver or stuff like that.....say if I am in heaven or my spirit is in heaven, I won't be me and I would be missing if I don't go into the ground as a whole." (Neve, Age 21)

For participants, the journey of the soul is far from a linear progression, but a circular transition occupying the liminal space of birth and death. For example, Carmen maintains:

"Unless organs of the body have been taken and put into another body to continue to give life..... It did extend life; you hear stories where people do finally get (an organ)... they have been waiting a long time, and they finally get an organ through. And then, they are over the moon and then they say, 'unfortunately somebody has to die because of it'. But it is all about the circle of life, and one life being lost so another can be given. And sometimes they.... It doesn't have anything to do with organ donation but... you heard sometimes when one dies... you might know somebody who has died, and then you know somebody who has given birth. And it is kind of like, one life has gone away and another life has entered the earth. So it is all about the circle of life again, going back to the very beginning of circle of life." (Carmen, Age 21).

Carmen's personalized view of reincarnation (the circle of life) spiritualizes her view of birth and death, which influences her perceptions of organ donation. Transplantation enables the body to complete what she calls the 'circle of life'—where, when one life is lost, another begins. Walter (2001) found similar thinking in his

research on reincarnation. Carmen's construction of the 'circle of life' is derived from her idealized embodied project (Thompson and Hirschman 1998) as revolving around her wish to become a mother in the future. As a woman, her body is the giver of life, a gift that presents life with a purpose—to nurture, to teach and to continue the circle of life. So, for Carmen, by imagining the body as a giver of life, organ donation becomes conceivable:

"I would say one great life is one great circle of people being born and dying and there are many little life circles within it..... I always have it in me to be like maternal..... I just feel that, that is like the greatest gift that we could give.... Because I would like to love, to nurture, to teach... continuing the life circle." (Carmen, Age 21)

The "gift-of-life" discourse inherently views body-self as a Western epistemology of dualism (Scheper-Hughes and Lock 1987) where disembodiment of the self in the event of death is embedded in the "gift-of-life" message. The circle-of-life embraces a holistic view of body-self (Scheper-Hughes and Lock 1987) where the embodied narratives of the self persist in an infinite circle of death and rebirth (Walter 2001). When asked if the circle of life would appeal to her as a means of promoting organ donation, Carmen agrees that by normalizing the notion between life and death, as part of existence, would help her to consider becoming an organ donor. As she explains:

"It puts more of a positive shine to it because if things look positive and harmless, people will be more willing to accept. If there is an element of danger and unknown and uncertainty, they might shy away from it. Because it is also about change, quite a lot of people are against change, fear of change. Whereas the circle of life suggests no change, it is rather moving. This is normal, this is life." (Carmen, Student, Age 21)

CONCLUSION AND IMPLICATIONS

Through the construction of personalized narratives pertaining to their sense of 'mortal embodiment', the young female potential donors in our study have shed light on the 'human dimension' involved in beginning to understand the complexities and ambivalence surrounding the perceptions of cadaveric organ donation.

Although we acknowledge the need highlighted by the 'transformative consumer research' task force to focus on the upstream or 'push factors' pertaining to organ donation (Mick 2006), our research concurs with current research (e.g. Lock 2002; Haddow 2000; Fox and Swazey 1992; Williams and Calnan 1996) in recognizing that potential donors are active consumers who creatively "rework and reinterpret media and advertising ideals and ideological inducements" (Scott 1994). In other words, we posit that potential donors retain the ability to appropriate and even resist such cultural inducements (e.g. presumed consent). Our paper therefore supports the CCT tenet in conceiving potential donors as interpretive agents who creatively employ interpretive strategies to decode marketplace ideologies (Arnould and Thompson 2005).

Participants in this research, for example, express their awareness of the "gift-of-life" discourse, in which they have been familiarized through the normalization of shared cultural meanings. The "gift-of-life" discourse draws its hegemonic (dominant) position by representing the Western epistemology of Cartesian philosophy, which views the body as a disembodied machine. At the same time, the "gift-of-life" discourse has been 'romanticized' by infusing

intertextual meanings of Judeo-Christian ideals of altruism to emphasize the survival of the social body. This reflects Johnson's (1999) view that embodied metaphors form the fabric of our moral understanding and experience. It also supports Moloney and Walker's (2002) assertion that the hypothetical support expressed by potential donors tends to reflect this normative dimension of organ donation. Therefore, articulating countervailing discourses involves potential donors having to actively negotiate their positions against the social grain of morality. Participants offer polysemic meanings surrounding organ donation by appropriating other countervailing discourses.

By creatively drawing on culturally available symbolic metaphors of the body (e.g. body as machine, temple), our participants occupy a range of interpretive repertoires (Holstein and Gubrium 1995)—for example (1) *body as self—body as machine* (2) *transcendence—materialist*—to reveal the existential anxiety underlying the nature of embodying mortality. As such, the sociocultural context provides a frame of reference for participants to fashion their embodied projects—further acknowledging the CCT tenet of consumer as weaver of cultural and symbolic resources in forging their identity projects (Arnould and Thompson 2005).

Additionally, late modernity's preoccupation with the body (e.g. through investment in body projects) is increasingly bound to the construction of self-identity and has evoked the existential tension between *finitude* and *perceived continuity* in the afterlife—which causes them to experience ambivalence about donating their organs. Organ donation catapults the embodied self within the liminal transitions between life and death and therefore raises questions of whether the nature of embodiment is essentially 'time-bound' (Bauman 1992). This occurs because, for them, their body is the essence of their 'self' and thus symbolic to them in life and death. Indeed, as sentient beings whose very sense of existence is embodied (Csordas 1994), the notion of inhabiting a disembodied metaphysics in the netherworld conjures up significant anxiety—it is difficult for them to donate their organs and retain their sense of 'self.' The 'mortal embodiment' perspective has thus provided some valuable insights to explore organ donation—by acknowledging the existential concerns held by potential donors, such research is 'transformative'.

What, then, are the implications for the "gift-of-life" promotional campaign? This campaign is rooted in the Cartesian philosophy of 'man as machine'—where body and self are disembodied. Our findings reveal that, while the "gift-of-life" message still has some relevance to this group—since it forms part of the western dominant social paradigm—its meaning is being reworked by these women to embrace a more embodied perspective. Consequently the "gift-of-life" message, for this audience, needs to extend beyond the altruistic life theme of saving the lives of the transplant recipient (Lock 2002) and to address the existential anxiety concerning the persistence of the embodied self—perhaps by embracing a holistic view of embodiment (e.g. circle-of-life) through spiritual transcendence? Hence, the integrity of the embodied self becomes integral to their decision to become an organ donor. Attempts to connect with this group's wider life themes and life projects (which are embodied) would enable the "gift-of-life" message to bear connotative meanings (Mick and Buhl 1992)—helping it to become more relevant to potential, ambivalent female donors in the future.

Finally, by exploring the issue of organ donation from a 'mortal embodiment' perspective, our research has contributed to the disposition aspect of the consumption cycle (an area recognized by CCT scholars to be under-researched). Our paper indicates that identity transitions do not traverse across a linear temporality of life stages (Schouten 1991; Van Gennep 1961). Instead the embodied

self is an ongoing metamorphosis of transitions and transformation in an endless 'circle of life'. Future research may explore the implications of 'mortal embodiment' on identity transition through immersion into the lifeworld of transplant recipients upon acquisition and possession of an organ.

In conclusion, the 'mortal embodiment' perspective enables us to provide insights into potential donors' lifeworld—thereby illuminating organ donation as a 'real world' consumption and social phenomenon (Deighton 2005 in Mick 2006). In so doing, we are able to provide implications for the 'gift-of-life' campaign to appeal to potential donors, whose embodied self negates their obligation as citizens to enhance the health of society. As citizens of the world, we urge future researchers to emerge from their cocoon in advancing the metamorphosis of consumption discourse towards the spirit of 'transformative consumer research'. We leave you with the thoughtful reflection from David Mick (2006).

"There is much contentment and joy, and many marvels and triumphs in our world. Consumer behaviors particularly have the capacity to support and enhance life... On the whole, there are many affirmative consumer behaviors and related dimensions of life that consumer researchers could not only derive deeper understanding of, but also share the insights with the people who would most benefit from them."

Consumer Culture Matters: Insights from Contemporary Representations of Cooking

Paul Hewer, Strathclyde University, Scotland
Douglas Brownlie, University of Stirling, Scotland

INTRODUCTION

The dynamic of this paper is partly driven by curiosity about the apparent lack of curiosity regarding food, its preparation, presentation, serving and consumption, which suggest themselves as interestingly constructed and contestable sites of knowledge about contemporary consumer culture. A number of useful ethnographic studies have analysed notions of homemade food (Moisio, Arnould and Price, 2004; Wallendorf and Arnould 1991) and the practices of unbranding foodstuffs (Coupland, Iacobucci and Arnould 2005), paving the way for a focus upon representations of food and their attendant spaces of appropriation and practices. We build upon their lines of thought by arguing that cooking must be understood to mark the “*transition between nature and culture*” (Levi-Strauss 1970: 164). If this is so, then it clearly suggests a potentially rich vein of social inquiry about how consumers construct their worlds in and through texts and its attendant talk around food. For such representations we believe are so bound up with our lives that they can be seen to do all sorts of identity work and can be read as providing consumers with what we term *recipes for life* instructing them on the whys and wherefores of consuming, providing quick, easy and tailored solutions to time-strapped, harried consumers to resolve in an imaginary fashion the problems of contemporary life (Hewer and Brownlie, 2006).

This line of argument draws upon the work of Appadurai (1988) who suggests that framing culture as ‘text’ offers one way forward for an adequate empirical study of culinary culture and its naturalized forms of representation in cuisine and commodity cookbooks. But also, after Miller we argue that “goods [cookbooks] represent culture because they are an integral part of that process of objectification by which we create ourselves as an industrial society, our identities, our social affiliations, our lived everyday practices. The authenticity of artefacts as culture...derives from their active participation in a process of social self-creation in which they are directly constitutive of our understanding of ourselves and others” (1987: 215). Like others (cf. Cook and Crang 1996: 132) we follow Miller (1987) in understanding culture as “involving processes in which cultural life is objectified, in which objects are constructed as social forms, and hence in which cultural artefacts have to be understood in relation to their social and spatial contexts” (1987: 215).

We argue that the study of culinary culture, as represented in commodity cookbooks is largely neglected by consumer researchers. However, textual analysis, as a device for illuminating the meaning of social phenomena is not; nor is its important conceptual inversion asserting that texts read us, as much as we read texts, or, that they think us as much as we think them. Indeed Hebdige argues that “it requires a literary sensibility to ‘read’ society with the requisite subtlety.” (1979: 8). By means of this line of argument interpretive consumer researchers can assert that society reproduces itself through a process of naturalization, where particular sets of social relations, particular ways of organizing the world, appear as if they were universal and timeless. They can investigate, among other things, the possibility of symbolically repossessing ‘objects’ as placed cultural artifacts, in order to discern the veiled messages inscribed on their glossy surfaces and trace them out as ‘maps of meaning’ (Hebdige 1979: 18); reading them *otherwise* (Bennett and Royle 1995: 162), for the possibility of ‘contrapuntal readings’ (Said 1993: 78).

Interpretive consumer researchers are already sensitive to the useful insights gained from scholarship that situates its object of inquiry in the contested cultural dynamic of multiple representations. Indeed, Belk urges that studies of consumption can “no longer afford to ignore the broader consumption issues being raised in other disciplines” (1995: 62). So, for instance, consumer researchers have turned to literature (Fitchett 2002; Eid 1999; Stokes 1997; Brown 1996), film (Denzin 2001; Holbrook 1986), poetry (Sherry and Schouten 2002; Holbrook 1990) and art (Schroeder 1999; Brown and Patterson 2000; Fillis 2000) for cultural artefacts capable in Geertzian (1993) terms of rendering the curve of social discourse into an inspectable form.

This essay builds on these lines of thought, rendering cookbooks as cultural artefacts (commodity cookbooks) which have to be understood as part and parcel of their social context. In so doing, the wider ambition of the essay is to explore the potential contribution of the textual approach for enriching our understanding of contemporary consumer culture with regard to the preparation, presentation and consumption of food.

TURNING TO COMMODITY COOKBOOKS

In our view such work demonstrates the potential of this form of critique to generate a disciplinary space from within which to begin to problematise representations of contemporary culture, including representations of contemporary culinary culture. Schroeder (1999) shows how to accomplish this problematisation, and thus to read contemporary society through the device of textual analysis. In this way, we argue, after Pilchner (1995), that cookbooks can be treated as a literary genre that is part of the fabric and expression of our culture and which, in an analytical sense, serves to reproduce culture. This view is echoed by Appadurai when he states that “we need to view cookbooks in the contemporary world as revealing artifacts of culture in the making” (1988: 22). Or, as Tobias writes, “Cookbooks contain not only recipes, but hidden clues and cultural assumptions about class, race, gender and ethnicity. They reflect many of the dramatic transformations that have come to define the boundaries of the modern public sphere.” (1998: 3).

This material establishes our central point that, from an analytical perspective, commodity cookbooks must be understood, not merely as instrumental texts, conveying, by means of recipes, information about ingredients, their assembly, processing and presentation. Rather, they also offer access to “unusual cultural tales” (Appadurai 1988: 3) which generate representations of food as a placed cultural artefact, suggestive of where we have been, who we are and where we may be going. This point is underlined in Pilchner’s research when he approaches cookbooks as voices, capable of speaking “unique tales of home and nation” (1995: 301). So, understood as a form of placed cultural artefact (Gagliardi 1990), we can conclude that commodity cookery books can then be studied for what they reveal about the constitutive effects of time and space (Neuhaus 1999), questions of identity (Zafar 1999), the construction of gender norms (Tobias 1998; Neuhaus 1999) and the reproduction of dominant culinary values (Curtin 1992).

Tobias (1998) analysed cookery books published in eighteenth-century America, concluding that they served to position women and define their role in society. Pilchner (1995) continues this theme in his analysis of Mexican cookbooks, arguing that they served as sources of ‘cultural capital’ for women in Latin American

society. Likewise, in her analysis of two black women's cookbooks, Zafar (1999) notes that they represent a space through which cultural identity is 'recreated'. In this way she likens her analysis to that of an ethnographic journal, providing a "reading of what we eat, to understand how we construct a self around the axes of food" (1999: 463). Zafar sums up the revelations of her analysis as placing "...African-American cuisine in a political context, record[ing] a social history that must not be forgotten, and relat[ing] the lived experience of the writer and/or her family." (Zafar 1999: 464).

Zafar thus suggests that cookbooks represent, or function as 'recoveries', or 'recastings' of the culture of African-American consumption, as signs of refusal and of forbidden identity. This use of cookbooks as cultural artefacts can also be traced in the work of Novero (2000). Her analysis of cookbooks published in Weimar Germany, between the First and Second World Wars, reveals how they function to "reconcile nutritional and economic precepts with an ideology of taste and a modern lifestyle" (2000: 163). This is most evident where she reveals how the representations situate cooking as a technical skill, mediated by the rhetoric of instrumental rationality and efficiency. For instance, in her analysis of a cookbook by Kopp, entitled *Bache nach Grundrezepten* (Bake with Basic Recipes 1933), Novero shows how its content, that is the recipes, are rendered as if they were "...formulas that have been tested and perfected" (2000: 167).

This scientific representation of cooking is further conveyed through the use of over five hundred black and white photographs illustrating the 'precise' stages of food preparation. It is clearly framed as 'rationalized work' (Novero 2000), and Novero struggles to find a place for any notion of 'pleasure' in the representations. In a study of the changing contents of food columns in popular UK women's magazines between 1967-1992, Warde arrives at similar conclusions. He observes a discourse of compliance, noting that: "Information is now given fairly routinely, not only about precise quantities of ingredients and cooking times, but also about preparation time, nutrient contents, sometimes shopping instructions too...science, measurement, the use of information derived from experiment, rather than trial and error and *ad hoc* judgement, appear more frequently in the food columns." (1994: 24).

This discourse of compliance contrasts with the notion of culinary practice as a site of resistance. Bracken's publication *The I Hate to Cook Book* (1960) is indicative of the social tensions of the late 1950s. It provides tales of the drudgery of cooking and the repression of women in male dominated society. In coded form the book suggests how women might avoid this drudgery through using processed foods and avoiding elaborate recipes, yet still be seen to fulfil the expectations of their defined role. This text functions in a subversive and liberating way to clearly contest and encourage resistance to the dominant gender norms of the 1950s.

QUESTIONS OF METHOD

This essay has its origins in questions raised during a wider empirical study of attitudes towards food and cooking among young people in the UK.¹ During interviews and focus groups, informants suggested with noticeable frequency that two particularly popular TV cooks and their cookbooks performed a key role in making the routine and mundane everyday practice of cooking appealing and 'sexy' to them: Jamie Oliver's *The Return of the Naked Chef* (2000) and Nigella Lawson's *Nigella Bites* (2001).

Following Barthes (1973) and Zafar (1999) whose studies both drew on a critique of two texts, we also selected two texts (Oliver and Lawson) as an appropriate way to set off on a modest exploratory textual journey, intending, through the reportage of our contrapuntal readings, to generate information to help consumer researchers decide if representations of contemporary culinary culture do indeed have the potential to enrich our understanding of consumption. Our research thus maps out the three core themes to emerge from a reading of the cookbooks, these are organised as follows: re-enchanting the kitchen, stoveside pottering and culinary tourism.

THE RE-ENCHANTMENT OF THE KITCHEN

One of the key themes to emerge from the research is how the two cookbooks attempt to situate their various representations of culinary practice against the backdrop of contemporary events and social trends. This is accomplished in a number of interesting ways. First is in terms of how the contents are organized. That is, in eschewing the traditionally popular approach of organizing recipes by main type of produce, eg meat, pasta, or fish, Nigella's chapter structure is almost existential in its use of headings evocative of the angst of contemporary lifestyles. Chapters with accompanying images are positioned as envelopes for recipes, as soul food of therapeutic value for the following occasions: 'Rainy Days', 'Slow-Cook Weekend', 'Comfort Food' (arranged according to "our life, our timetable and our mood").

This is echoed in the aestheticized (Featherstone 1991) 'look' of the cookbooks where the focus is very much on design intensity, glossy, colourful and artful image-based communications of the kind found in lifestyle magazines targeted at the 'sophisticated and cultured'. Many of the images foreground the kitchen and its associated technological paraphernalia as key signifiers of lifestyle. For example, the image which heralds chapter one in *Nigella Bites*, entitled 'All-day breakfast', stages truth effects in support of a claim that our notions of breakfast are, or at least should be, undergoing considerable rethinking, as a site of resistance to popular notions of the stressful rushed breakfast. In this sense the stylised aspirational representations of culinary culture delivered in Nigella's book can not only be thought of coded responses to changes affecting the community as a whole. They can also be seen as an attempt to reposition and recontextualise the 'commodity cookbook', by subverting their conventional uses and inventing new ones—in this case as a site of resistance to contemporary cultural imperatives.

Throughout this cookbook, Lawson's poetic language literally engulfs the reader ("I want to be there in the kitchen with you; my words are merely my side of the conversation I imagine we might have"), as do the images of Nigella herself which precede each of the eight chapters in the book. Alongside, or more appropriately preceding such description the reader is presented with a full double page image of Nigella in long silk dressing gown, hair in curlers, pouring a cup of coffee, clearly with time on her side socialising with an imaginary friend/reader. On her kitchen units sit a number of unused stainless-steel utensils, each arrayed with their brand logos clearly decipherable. Providing further glimpses of an aspirational lifestyle statement, there is the liminal presence of a *Kitchenaid* Mixer and a *Dualit* Blender—both branded tools, representing the essential scaffolding of a lifestyle kitchen for the culinary guru. The subtle backgrounding of fetishized machinery and foregrounding of the beautiful female gastro-guru, reveals a discourse of recovery through distance and control which is at odds with the notion that human conduct is increasingly subject to forms of control and constraint delivered by machines. It reproduces notions of technology in its place, as a tool of power to be controlled

¹This data was selected from a broader study of young people's living skills, in total twenty young people aged from sixteen to twenty-two years, living in the UK were interviewed during 2002.

and used to support and facilitate human activity, not to dominate or constrain it. These objects are not mere accoutrements though. As aspirational brands they can also be understood as vital props, as wands for negotiating the jungle of contemporary culinary culture and achieving some of the new magic of the sexy culinary guru. They are also important symbols by means of which to imagine the re-enchantment of the commodity kitchen, as a magical place to conjure up food which will transform the reader. A space in which the emphasis is strictly opposed to the logic of rationality, rather the emphasis is upon the kitchen as a space in which to dwell or inhabit to counters the strains of contemporary life. The chapter entitled *Templefood*, opens with the following suggestion:

“I think I’d better start by explaining what Templefood is: it’s my term for the soothing, pure, would-be restorative food I make for myself after one binge or late night too far. ‘Temple’ as in ‘my body is a...’ Well, mine’s not, but this is what I eat when I want to feel it is. And don’t think—as if—I’m counselling deprivation or restraint, but rather the holy glow of self-indulgently virtuous pleasure...” (2001, p.223).

The section entitled *Comfort Food* explores what we might term a *recipe for life*, which emphasises the idea of food as transformative:

“If I’m being honest, for me all food is comfort food, but there are times when you need a bowlful of something hot or a slice of something sweet just to make you feel that the world is a safer place. We all get tired, stressed, sad or lonely, and this is the food that soothes.” (2001, p.32).

Food in this sense is re-presented as embodying magical, enchanting and transformative potentiality, capable of soothing the weary consumer in times of strife, anxiety and doubt.

STOVESIDE POTTERING, MAKING THE KITCHEN ‘HABITABLE’

The kitchen space is also part and parcel of this magical transformation as the text positions this site as stripped of drudgery, toil and failure, rather as a space of magical self-realisation and imagined social affiliation. For Oliver the practice of cooking appears to be very much secondary to the act of consuming. Many of his recipes in this respect focus upon the temporal dimension, justifying their use in terms of their speediness to prepare. For example, his recipe for ‘beef tomatoes, basil, ham and mild cheese on thick toast’ states “This brekkie or snack takes precisely 1 minute to make...Very simple, very tasty” (2000: 30). The recipe for ‘braised five hour lamb with wine, veg and all that’ starts with the lines: “This is a real hearty and trouble-free dinner. There’s barely any preparation, just a nice long cooking time which will reward you with the most tender meat and tasty sauce.” (2000: 174). Thus many of the images work hard to convey the pleasures to be had from the sociability that surrounds consuming and preparing food, or as he prefers ‘tucking in’. This view is reiterated in Nigella’s approach which elaborates upon the importance of home-made (see also and its powerfully evocative nostalgic potential. Granted we are given images of cooking as a ‘low-effort undertaking’ (2001: 190), but alongside such talk she suggests ‘stoveside pottering helps me unwind’ (2001: 55). Surely a recipe aimed especially to warm the heart of any world weary, time-strapped consumer. In her recipe for Lemon risotto this theme of ‘stoveside pottering’ is explored:

“This is comfort food on so many levels. For one, risotto has to be one of the most comforting things to eat ever. What’s

more, although everyone goes on about the finickiness and crucial fine-tuning involved, I find risotto immensely comforting to make: in times of strain, mindless repetitive activity—in this case 20 minutes of stirring—can really help.” (2001: 43).

We are thus told that for Nigella the act of cooking is symbolic of ‘temperament and habit’. This more care-driven and emotional approach attempts to deny the calculative rationality of weights and measures, in her recipe for mashed potato we are told: “I hesitate before giving quantities, so please regard the specifications below as the merest guidelines.” (2001: 32). Additionally, in ‘granny lawson’s lunch dish’ we are told “Cooking isn’t just about ingredients, weights and measures: it’s social history, personal history.” (2001: 162). A representation which attempts to imbue the act of cooking with extraordinary relevance. The practice of cooking in this sense is about making the space of the kitchen ‘habitable’, a scene for numerous ‘silent productions’ or ways of ‘making do’, if we adopt the poeticism of de Certeau (1984: xx). Images of the practice of cooking is thus much more than unspectacular mundane acts, it is where the ordinary is made extraordinary akin in other words to a form of *praxis* wherein, to paraphrase Miller (1991: 207-208) philosophical conundrums and contradictions are worked out but by other means.

INVOKING CULINARY TOURISM

The idea of cookbooks as offering consumers some kind of easy made solution to the dilemmas of contemporary life is extended through a discussion of the games of distinction played out in the texts. Warde (1994) considers recipes as ‘messengers of taste’, a point reiterated in the work of Gallegos who read such texts as ‘manuals of taste’ (2005). A recipe provided by Oliver for: “*Seafood broth, ripped herbs, toasted bread and garlic aioli*” serves to illustrate this point. Let’s start with the title, reference to the ingredient ‘aioli’ appears salient: “The aioli is not essential with this, but it is fantastic and you should give it a go.” (2000: 90). In other words, a game of distinction (Bourdieu 1984) appears to be being played out through the exotic ingredients included, a game which on the surface offers to the consumer an apparent sense of the abundance of choice, but such choice is paradoxically constraining, especially if you lack the required vocabulary to understand. The term Aioli we might suggest serves to exclude and distinguish those without the required cultural competence, or as Bourdieu prefers: “Consumption is...an act of deciphering, decoding, which presupposes practical or explicit mastery of a cipher or code. In a sense, one can say that the capacity to see (voir) is a function of knowledge (savoir), or concepts, that is, the words, that are available to name visible things, and which are, as it were, programs for perception.” (1984: 2).

To help understand how cookbooks stage and reconstruct moments of cultural difference we invoke the work of Cook and Crang (1996), who refer to the ‘local globalization of culinary culture’. Herein, the cookbook becomes akin to a site from which to experience and practice such local globalization, a space from which to participate in metrocentric global culinary culture. To demonstrate this we are given the following gamut of recipes by Nigella wherein ‘American pancakes with wafer bacon and maple syrup’ followed by ‘Asian-spiced kedgeree’ is followed by a trip to the Orient in ‘Masala Omelette’ and then a trip back to Europe through ‘Apple and blackberry kuchen’. The cookbook in this sense reads like the enchanted and all too enchanting visitors guide for a grandiose symbolic tour across the world in miniature, that is from the U.S. to Asia to Europe in the space of fourteen pages. In this sense the cookbooks not only provide geography lessons, but

symbolically this world becomes the embodiment of McLuhan's 'Global Village'. We argue that through the deliberate use of enchanting streams of symbols of travel and exotic places, they also manufacture the global diversity of culinary culture and bring this difference to your tabletop. As Cook and Crang remark "the touristic quality of these constructions [is] particularly apparent when [it] allows consumers to bring the experience of travel to their own domestic culinary regimes" (1996: 136). So, you can think of cookbooks as offering you a holiday for your tongue which, as Lash and Urry observe, "encourages us to gaze upon and collect the signs and images of many cultures—to act as tourists in other words" (1994: 272). Therefore, even if the recipes are not made and the exotic food is not eaten, the reader can still gaze at colorful constructions of far flung places of the globe and achieve imaginary gratification (Smart, 1994) and transformation therein.

DISCUSSION

This paper has follows in a long line of previous studies that have attempted to read consumer culture through its array of popular culture texts (Arnould and Thompson, 2005). We have sought to render cookbooks as cultural artefacts to thereby make them amenable to textual analysis, in order to counter their taken-for-grantedness amongst consumer researchers. It is further argued, that the turn to contemporary culinary practices and their representations serves to enrich our understanding of consumer culture, enabling us to illuminate not only dominant discourses, ie. with respect to notions of food as cultural capital and culinary tourism but also counter-discourses emerging forms of meaning. In this respect we seek to position and read off cookery books, as windows through which to glimpse and problematise representations of contemporary culture. But more, we want to suggest that through their representations are gleaned instances of culture in the making. Chief amongst these is the turn to what might be termed a discourse of compassion through which culinary culture is positioned as rather than simply consumption or production, but as a form of distribution through which emerge new patterns of sociality. In addition, we traced the emergence of what we might refer to as a mystification of the kitchen itself, as a pocket of resistance, a location for magical practices. The kitchen space represented as a site where acts of apparent mundane consumption assume the form of extraordinary consumption, a space for the practicing of what Fiske might term the little 'victories' (1989) wherein cooking, or at least through its representations and discourses, becomes a tactic to make the kitchen space habitable. A counter-discourse to all those notions of junk food and convenience, where the logic of *doing the right thing* is the order of the day. Such a line of argument concurs with the work of Firat and Dholakia who suggest that "...the social transformation of our day can be expected to occur through pockets of resistance, not in terms of a frontal attack or challenge...but in terms of ignoring authority and insisting on doing 'one's own thing'" (1998: 155). In this manner, we hope we have demonstrated that such cookbooks are never simply instrumental and instructional texts about ingredients, their assembly, processing and presentation, rather cookery books reveal and offer glimpses of very unusual tales of cultural transformation.

An Investigation of Household Decision Making Among Immigrants

L. Wakiuru Wamwara-Mbugua, Wright State University, USA

Whenever an immigrant crosses the borders of one nation and enters another, they begin a complex adjustment process. This adjustment is oftentimes characterized by conflict otherwise known as acculturative stress (Berry and Annis 1974). Researchers have sought to understand this conflict at both the group and individual levels. At the group and national level, for example, changes frequently occur in social structures, economics and political organizations, while at the individual level changes are of identity, values, attitudes and behaviors (Berry et. al 1992; Williams and Berry 1991). It is apparent that if these stressors are evident at the group and individual levels that they will manifest themselves in the new households that immigrants must reconstitute. Part of this reconstitution of their lives involves the acquisition of a myriad of products. In many cases, there are numerous decisions to be made quickly, such as housing, transportation, work, child care and in all other domains of life. Thus, understanding immigrant adaptation necessitates our understanding of household decision making.

Research on household decision making has examined the roles that husbands and wives play in the consumer decision making process. In general research on spousal decision making has primarily focused on levels of influence between couples in the consumer decision making process (cf. Davis 1970). Other research has examined the impact of sex role orientation in decision making (Qualls 1987). In his research, Qualls (1987, p. 264) noted that research on household decision making primarily focused on: "1) which family member makes the decision; 2) outcomes of household decision behavior and 3) factors that determine which family member makes the decision." Similar sentiments have been articulated by Webster (1994, p. 321) who noted "there is general consensus in the findings of previous research that traditional role specialization has influenced purchase behavior in three major ways: First, it affects which spouse has dominance with respect to specific products," (Davis and Rigaux 1974) with males being dominant for such things as automobiles (Green et. al 1983); insurance (Davis and Rigaux 1974) etcetera. Wife dominant decisions are associated with the woman's role as a homemaker and the products where the wife has been found to be dominant are: appliances (Green et. al 1983) groceries (Davis and Rigaux 1974) and washing machines (Woodside and Motes 1979). Further, Webster (1994, p. 321) noted, "traditional role specialization has been shown to influence relative dominance with respect to product attributes." Men have been found to be concerned with functional attributes such as price while the women may concentrate on the aesthetic product attributes such as color (Davis 1970). Finally, Webster (1994, p. 321) observed that men have traditionally been dominant in the more important phases of decision making such as the decision to buy, while the women have been more dominant with the minor phases of the decision making such as suggesting the purchase.

Although research on household decision making has made some important contributions, it has primarily examined spousal or household decision making in western nations such as the United States. Researchers have begun to question the adequacy of these models in understanding the spousal decision making processes of individuals from non-western contexts. Webster (2000, p. 1035) noted that spousal decision making is a culturally situated phenomena. Since there are so many different cultures, then it is obvious that models that have been developed primarily for a western

context may not hold true when the "deciders" are non-western. In discussing current theories, Webster (2000, p. 1036) states: "the inadequacy of current theoretical bases is even more apparent outside the countries (mainly the United States), in which it was established. In particular, there is evidence that western theories do not fully explain the marital power patterns that can be found in a country such as India."

According to U.S. census data, the foreign born population represents 10.4% of the U.S. population. Therefore, it is important for researchers to expand their investigations beyond western household decision making. There have been some efforts on the part of researchers to understand household decision making in some non-western contexts. Ethnic identity has been found to be important in household decision making. For instance, Webster (1994) suggested that there was a positive relationship between identification with Hispanic culture and husband dominance in decision making. Further Webster showed that husbands in couples "with a higher identification with their modified patriarchal parent culture have more influence in decision making, p. 328," and that as the family assimilates, that there is a "shift in marital power away from the husband to the wife, p. 328." Maldonado and Tansuhaj (1999) demonstrated that the immigrant's ethnic identity and role destabilization influenced their self concept and ultimately their symbolic consumption.

Cross-cultural studies have found that as nations become more developed, household decision making generally becomes less husband dominant (Green et. al. 1983). This is an interesting point, because it examines changes in household decision making based on the level of development of a nation. Immigration by definition involves the transplantation of individuals from one cultural context to another. When immigrants originate from less developed countries to more developed countries, they may find themselves facing pressures to become more like their counterparts in the developed country. This, no doubt creates some tensions within the household.

Research by Ganesh (1997) has shown that the decision making of Tamil Indians in the United States falls consistently between that of the US respondents and Indian Tamil households in India, for most of the decision making stages and for most of the products. This research suggested that the immigrants were integrating aspects of American culture into their Indian culture. The acculturation strategy of the U.S. Tamil Indians would be characterized as one of integration.

Berry (1980) defined four different acculturation strategies that an immigrant was likely to adopt, and these strategies are a function of whether the immigrant desires a positive relationship with their culture of origin as well as their culture of immigration. Berry (1980) defined those strategies as a) assimilation; b) integration; c) rejection and d) marginalization. Cross-cultural psychologists have shown that there is strong evidence that supports a positive correlation between an integration strategy and good psychological adaptation during acculturation (cf. Berry and Sam 1997).

Because of the role that consumption plays in our lives, researchers have examined the consumer acculturation of immigrants. Penaloza (1994) developed a comprehensive model of consumer acculturation with research conducted on Mexican immigrants. Oswald (1999) examined culture swapping among Hai-

tian immigrants and Mehta and Belk (1991) looked at the favorite possessions of Indians in India, and Indian immigrants in the United States. There are numerous studies on immigrant acculturation and the examples above serve as illustrations of studies rather than as an exhaustive illumination of research in this field. Even so, it is noteworthy that spousal decision making has largely been absent from these studies.

Gendered patterns of behavior

In every culture there are gendered patterns of behavior. These gendered patterns of behavior are evident in all aspects of life, and consumption activities are not exempt. Therefore, when an immigrant is transplanted from one culture to another, their gendered patterns of behavior might be brought into question. These gendered patterns of behavior will certainly be evident and will be renegotiated within the household. The purpose of this research study, therefore, is to examine household decision making among recent Kenyan immigrants. Our central focus within the household is spousal decision making. As noted elsewhere, researchers have already documented that some decisions are husband dominant while others are wife dominant. Therefore, this study examines the underlying reasons why a particular decision may be wife or husband dominant, and the meanings that are attributed to these decisions. Our study is consistent with the views expressed by Webster (2000, p. 1036) who noted that there has been a scarcity of research on "the antecedents or reasons why one spouse is more powerful or has influence than the other in decision making."

METHOD

The data from this study were undertaken from a larger study of immigrant acculturation. One of the problems with research on spousal decision making has been the interviewing or data gathering from one spouse. This has been identified as a weakness by Davis (1976) who recommended interviewing both spouses (separately). Consistent with the recommendations of Davis (1976) husbands and wives were interviewed separately. The interviews of the eight couples were conducted one on one rather than together in order to ensure that the couples would be free to express their own opinion. Whenever possible the interviews were conducted on the same day, in the homes of the couples. All of the interviews were conducted in English and lasted on average one hour. The interviews were audio-taped and transcribed verbatim. Six of the couples were married to Kenyans, and they were members of four different Kenyan tribes. The other two couples represented the intermarriage of Kenyans with African Americans. The length of marriages ranged from 2 years to over 20 years. In addition, three of the couples were married in Kenya and had had a household in Kenya. Four of the couples were married in the United States and the households had been formed in the United States. One of the couples got married in Europe, yet their household had been established in the United States.

Although the couples were not observed while making purchase decisions, the field researcher participated in various community events in order to further understand the lived experience of the immigrants. Informants were recruited for the study using the snowball method. The snowball technique affords the researcher maximum variation among the informants on characteristics that are pertinent to the research. Consistent with Wallendorf and Belk (1989), triangulation across sources and researchers was done to ensure the trustworthiness of the data. The integrity of the data collected in interpretive research depends upon the practice of proper interview techniques (Wallendorf and Belk 1989).

In our research we examine immigrant decision making with regards to grocery shopping, first car buying experiences and the influence of the extended family in the allocation of family resources. Although some of these categories have been examined in prior research, this research differs from previous studies because we examine the antecedents (or meanings) of these decisions rather than which spouse is dominant in the decision.

ANALYSIS

The data from the in-depth interviews were analyzed to see whether any themes emerged using the constant comparative method (Glaser and Strauss 1967). In the analysis, themes were identified and coded with key words and then subsequent data was analyzed to identify similar instances of the themes. The emergent themes were further collapsed to reflect the final themes that are presented here. It is important to note that the analysis of the data did not commence after the end of the data collection period. Instead, as themes were identified, they were used to guide future interviews in order to explore similar issues with subsequent informants. This proved to be very helpful since issues discussed by one informant could be explored with subsequent informants. This offered some excellent triangulation of the household decision making since we could compare across households, within households and across spouses. Some selected conclusions were submitted to the informants and in general they concurred with the plausibility of the interpretations (Schouten 1991). The data was analyzed consistent with the suggestions of Spiggle (1994).

FINDINGS

This research reports spousal decision making with regards to grocery shopping, car buying and allocation of household resources to their extended family. In reporting our findings, we rely on the words of the informants to illustrate important points. As such we do not edit the words of the informants since this is their "lived" experience. Our findings suggest that there is role reversal in decision making because of a) prior market place experience in the new cultural context; b) logistical constraints such as lack of access to a car and c) adjusting to the needs of a non-Kenyan spouse.

Role reversal—market place experience

In general, Kenyan men have adjusted to going grocery shopping. It is remarkable that among the couples who had been married in Kenya, there was a distinct pattern of decision making which involved relegating the initial decision making to the spouse with the most U.S. marketplace experience. In all of the cases, the spouses who had previously been married in Kenya, arrived in the United States separately and therefore, this gave one of the spouses more experience and expertise in the marketplace. Therefore, at first the spouse who had arrived first was the primary decision maker on major decisions pertaining to the reconstitution of their households. For example, these spouses, made decisions about where to live, what type of car to buy and furnishing for the homes prior to the arrival of their spouses and children. Consequently, the spouse who arrived first had to make decisions with or without expertise and without regard to normal gendered patterns of decision making. Consequently, in the beginning the spouse with longevity in the U.S. is the primary influencer of the household decisions. As result of this pattern of immigration, we document instances of role reversal in the decision making even after their spouses arrive in the United States. When asked to talk about his first car, Mwanza described how he had relied on his wife's opinion about the best car.

Mwanza: At that time I was, I actually relied on my wife because she had been in the country for some time and I drew from her experience. And when she said [brand] was a good vehicle, I said yes. It was good. Actually, it was a very good car and I had service for a very long time.

What is particularly interesting about this example is that his wife did not have a car when they lived in Kenya and indeed did not even know how to drive. Yet in the United States, she became the expert since she had been in the United States longer. Hence we see evidence of role reversal based on longevity in the United States rather than prior experience with car buying in Kenya. Mwanza had owned several cars when he had lived in Kenya. Kenya is a paternalistic society and therefore, male female relationships are well defined with the male occupying a dominant position (Abbott 1983). So the reliance of the wife in the decision making for a consumer durable such as a car represents changes and adaptation on the part of Mwanza.

Another example of this role reversal is evident from the comments of Mutumia who relies on her husband to recommend needed household items. Mutumia below illustrates the complexity of grocery shopping in her new environment. When asked who goes grocery shopping, Mutumia had the following comments.

Mutumia: When I went for shopping, the first time with him, it was amazing..... we needed some things, we needed food,....so I didn't really struggle much because my husband had already been here four or five months before we came so he knew where we needed to pick things but also I was interested also to know how to pick these things and in which area to get this and this.

Mutumia: Well, like the first time I came it was a real big change because I remember when I got this food and I came into the house and prepared the food, it had a kind of a smell and I asked my husband, um they don't look fresh I don't think they are fresh. And then I asked him, mmm, for the time we are going to be here, is this the type of food we are going to be cooking? And he said yes.

Even after the food is prepared, Omariba (mutumia's husband) remains the expert. Once again, prior experience with the marketplace makes the husband the expert on grocery shopping. This is an interesting development in this household because prior to immigration, Omariba was not involved in grocery shopping.

Mutumia: Well, that is something interesting. Because back in our country sometimes you find that most of the time I was to do my groceries, but here, I can, we both can, me and my husband. Sometimes in case if he is not available, I just go for groceries, in case I am the one who is available, or if he is the one available and I'm not available, he will go for groceries.

Omariba confirmed that he is the one who mainly goes grocery shopping.

Omariba: Well, everybody goes. I go most of the time actually. I cannot really have specific number of times that we go because I, I could go buy the groceries by the time I come back, I'm told this is not there, go back.

It is worth mentioning that the husband has become dominant in this decision making because of logistical constraints, in this case his

wife's lack of access to a car. At the time that the interview was conducted, Mutumia had recently gotten her own car.

Role Reversal due to American Spouse

In our research we document the fact that Jaramogi (LaTonya's husband) has moved away from his cultural orientation by becoming the official cook and grocery shopper in his household. This situation would be untenable in a Kenyan context because of cultural norms. It can be noted that perhaps as a result of his marriage to an American woman that the pressures to conform are somewhat lessened by the fact that the American spouse does not have the same notions of gender separation as a Kenyan spouse.

Jaramogi: Surprisingly my wife is not a grocery shopper. She doesn't even accommodate me so I do most of my grocery shopping. She hates grocery stores. The only thing, she'll go with me, is because I spend lots of money. I buy anything I come across. She is more a dollar person.

LaTonya: God knew what I needed because I hate being in the kitchen you know but he loves to go grocery shopping, he'll go and loves cooking and just preparing meals for us but that meat thing, I had to work on it, I'm like baby when you go to the store, you have to buy you know other things and we like a lot of snack food.

LaTonya noted that whenever her husband would go shopping, he would buy a lot of meat and frozen vegetables and no snacks. During the interview she stated that she had managed to convince her husband to buy other things other than meat. Webster (1994, p. 329) noted that research that examines whether some product categories are more culturally sensitive than others will further our knowledge of the U.S. subcultural family in transition. Our findings show that the purchase of meat is indeed very sensitive to cultural practices. More specifically, goats have enormous cultural capital and Jomo Kenyatta (1938) described the importance of goats in ceremonies such as in ascension to manhood and in numerous ways (see for example, Kenyatta 1938, p. 192-193).

Grocery Shopping—Meat Buying

An interesting finding of this research is with regard to the buying of meat. We found that this was a husband dominant decision. However, the acquisition of meat in this instance is not just a simple purchase of needed protein, for the family but is tied to very strong cultural practices. It is strongly tied to their sense of "manhood": and to maintain these cultural practices we found that the acquisition of the goat meat is very ritualized. In general, this acquisition is achieved in one of two ways: a) purchasing the meat from a butchery or b) slaughtering the animal such as a goat for oneself.

Rituals have been found to be comprised of: "a) episodic string of events; b) a linkage of the episodic event strings in an exact fixed sequence and c) repetition of the event sequence over time (Rook 1983, p. 252)". We describe the ritual nature of getting goat meat. The immigrants get the goats for specific occasions and these occasions necessitate the acquisition of the goat. Once the occasion is known, the immigrants either call a farmer to slaughter the goat for them, or more often than not, they call other men to accompany them in this quest for the goat. In general we found that this ritual of getting goats is a "men only" affair. The final aspect of this ritual involves the consumption of the meat which in most cases occurs with other individuals outside of the nuclear family. According to Hofstede's (2001) dimensions, Kenyans are collectivistic and there-

fore the conduct of activities in groups is not surprising. This is consistent with practices back in Kenya where a man slaughters a goat and then calls his family and friends to share. Mbithi's comments illustrate the ritual of slaughtering a goat and sharing with others.

Mbithi: Most times I call my Kenyan people around here, they come and sit here, I either slaughter a goat, we eat with them, or just barbecue, usually barbecue, drink a beer and relax.

When asked how often they get goat meat Mbithi and Jaramogi had the following comments.

Mbithi: Any good occasion or thanks giving or sometimes when I have many people, more than 5 people coming to visit me, I go look for the goat.

Jaramogi: No when I buy a whole goat it is for an occasion when me and my friends decide to do that.

In Kenya, the slaughtering of a goat when there is an important occasion is generally considered important and the person for whom the goat has been slaughtered generally feels very important (Kenyatta 1938). Traditionally only the wealthy men would have been able to provide a goat for friends and family since goats were stocks of wealth. As such the slaughtering of a goat for friends and family sends a message to others about the social standing of the man and is strongly tied to his self-concept as a man. The women value this and the men conform to this as is evident by the role that meat has started to play, even in the marriages of Kenyan women to African American men. Wilberforce an African American married to a Kenyan [Imani] noted that he was introduced to goat by Kenyans.

Researcher: So you got introduced to goat by Kenyans?

Wilberforce: Absolutely.

Researcher: Have you barbecued goat yourself at your house?

Wilberforce: I have.

Researcher: Learned how to kill the goat?

Wilberforce: Yeah.

It is interesting to note that the American men who were married to Kenyan women have learned to appreciate the culture associated with "goat" eating and in some cases have learned how to slaughter the goats or figured out where to get the goats. Another respondent, Zawadi who is married to an African American does all of their grocery shopping with the exception of meat. Her husband, mostly buys meat. Zawadi's husband has had to adjust to her gendered notions of meat purchase.

Researcher: You said you go for groceries. Does your husband go grocery shopping?

Zawadi: He mostly does the meat. He goes to buy the meat because he goes to the butchery. We try not to go together anymore. The first time, the first times when, the first years that we were married, we used to go together but, I guess it was more time consuming going with him.

It was also noted that the men were willing to expend a lot of effort to get goat meat. In many cases they traveled out of town, in some cases close to 75 miles to go and buy the goat. The comments of the

informants illustrate the effort that they are willing to expend in order to get the goats.

Mbithi: I get them from [name of town], I got a black farmer an American, black, a black American a friend of mine so I just call him and I tell him, I am coming for a goat, so we go there and he slaughters for us, he cleans it up, I just bring the carcass.

Ideally the immigrants would like to get goat meat from the farms, but when they are not able to slaughter the goat themselves then they go to the international stores such as those described by Jaramogi in order to satisfy their meat needs.

Jaramogi: There are some farm and stores in [name of city] have some. Some Mediterranean stores or African stores and I already know some Mediterranean and Indian stores that already sell them.

Researcher: You also said slaughter a goat

Jaramogi: In Mississippi, Tennessee. they are people that sell goats for a living.

Summary of Goat Acquisition

The acquisition of meat remains "sacred" to these immigrants and they engage in elaborate ritualistic behaviors. Therefore, we see the American male adjusting to the "sacredness" (Belk, Wallendorf and Sherry (1989) of the male buying of meat in order to enable his wife to continue practices common in Kenya. We also see evidence of this with the African American husband who learns how to slaughter and eat goat so that his wife can maintain the "sacredness" of who makes this purchase. So, indeed there are those things that the immigrants hold sacred, and others that are profane, such as going grocery shopping yet, particular consumption objects might be "sacred" such as the meat buying.

Kenyan familial relationships

"For African peoples, the family has a much wider circle of members than the word suggests in Europe or North America. In traditional society, the family includes, children, parents, grandparents, uncles, aunts, brothers and sisters who may have their own children, and other immediate relatives (Mbithi 1969, p. 138). Kenyans tend to stay married for long and divorce is virtually non-existent. Abbott (1983) noted that in Kenya: "marriages link two patrilineally based families in continuous obligation to each other." These life long obligations to both sides of the family call for the utilization of household resources in meeting these obligations. The self concept of many Kenyans includes their extended family such as their clan. "What happens to the individual happens to the whole group, and whatever happens to the whole group happens to the individual. The individual can only say: "I am because we are; and since we are, therefore I am, p. 141." According to Mbithi (1969) this is a cardinal point in understanding the African view of man. This view is crucial in understanding why the Kenyans allocate their household resources to extended family members in Kenya.

Family Resources: Allocation

The allocation of funds to send to Kenya is deeply rooted in the immigrants' self-concept. Ma and Schoeneman (1997) have correctly noted: "in traditional African cultures, family and kin are the most important aspects of an individual's life." The African tribal group conception of self is defined by feelings toward wealth, property, family and position in the community (Mwaniki 1973). Mbithi (1969) asks "what then is the individual and where is his

place in the community? In traditional life the individual does not and cannot exist alone except corporately. He owes his existence to other people, including those of past generations and his contemporaries. He is simply part of the whole.” Similar views were expressed in *Facing Mt. Kenya* by Jomo Kenyatta (1938) who described: “An individualist is looked upon with suspicion He may lack assistance when he needs it. He cannot expect that everything he does will prosper, for the weight of opinion makes him feel his crime against society . . . in Gikuyu community there is really no individual affair, for everything has a moral and social influence p. 115.” Gikuyus are a Kenyan tribe who are represented in the sample. The comments of Wilberforce highlight this belief in prosperity based on helping others as expressed by his Kenyan father in law.

Wilberforce: He believes the strengths of everything that he has, comes from his assistance to other people. You know kind of like he’s reaping his blessings from being helpful to other people.

As such the society expects those with wealth and prosperity to bring up their family members. In their 2003 study Bonsu and Belk examined cultural versus global capital in Ghana and they noted how Ghanaians who had global economic capital were able to convert this into cultural capital. The same situation is evident here, where the Kenyans send money home in order to increase their (and here we mean “immigrant and his/her family’s) social standing in the community. Research on household decision making has not examined the impact of the extended family on the allocation of family resources. Kenyan families have complicated familial obligations that last for life. As a result the income of the family is distributed among the nuclear family as well as the extended family. This is done through: a) sending money to Kenya to support their parents and siblings; b) paying tuition for their siblings and relevant others; c) the sending of money to family members for sustenance or for self-development and d) sending of physical items. Our research also uncovered differences in the types of things that the different spouses will send to Kenya, and it was found that the women were more likely to send material goods than the men. As the immigrants live longer in the United States they stop buying things to send and rely more on sending money back to Kenya. The comments of Mbithi show the changes that have occurred over time.

Mbithi (Lela’s husband): When we came here, most of our family members that we care about didn’t have enough clothing so when we came here the clothing say you go to garage sales and sometimes you get new clothes which have never been used so every time we used to buy, buy, buy like if you go to my wife’s wardrobe, it is full so at the time, we get a ticket or somebody decides to go home, we just throw the things in a bag and just label them for so and so and then we would carry and then we started changing the technique a little, we found out that every time we would be here, and we are going home, they think we are bringing and that doesn’t help them and so we started saying that we will go home and see somebody who we think has an idea and we ask them, what do you think if you got some money like so much what do you think you can do with that money.”

Lela(Mbithi’s wife): I just send them money. I send them clothes too. But right now, I’m not so big with the clothes coz I send them and it’s just never enough. And I don’t think I can

afford doing that. Sometimes I just think I can send them money.

Sending Things to Kenya

Again as noted above there are gender differences in the types of things being sent to Kenya. The following comments clearly illustrate this.

Mwanza(Nyokabi’s husband): Yeah, we do not send many items, articles. What we do if we want to help is send money. Of course if we travel, for me as a person, I like giving money and letting someone choose what they want to buy. My wife of course would buy items to give which is different. So I do not normally buy articles and items to send. I give money if I want to help someone.

Nyokabi (Mwanza’s wife): When I buy things and I keep them up and when my sisters come here or when I go home, I fill everything that I don’t wear anymore, what I bought on sale, . . . So if I’m not wearing them, I haven’t worn anything for a year, I put it and take it home.

Immigrants described sending money to help their parents as well as educate their siblings.

Omariba: Well, at least we have parents to help so we do not, fortunately we do not have anybody in school now, but my wife and myself, so all that we do is maybe help the parents and help those who are out of school sometimes.

Kariuki: I just say money that’s what I do. I don’t have any other brothers going to school, everybody is through, we just send money to help out my mama, . . .but I, mostly it is money.

Zawadi: Both my parents, my mom is retiring in December so, my dad has retired so there is no income for them. So I try and send money every month for them to pay their bills and to help them out.

Pay Tuition for Siblings

Imani: What I do, I pay tuition, I pay fees for most of my family and especially some of them are finishing this year thank God.

Zawadi: I am mostly the one who put my small sister through school. I mostly send money home. When I know they are okay, when I know that everything is okay, then I am okay.....so I tend to send money.

CONTRIBUTIONS

This research questions the adequacy of existing models of household decision making in non-western contexts. The allocation of household resources to the sustenance of extended family members is largely absent in these decision making models. Our research highlights the need for research that examines the role of extended families in household decision making. Research on household decision making has primarily been concerned with dominance in decision making within the household. Our research has demonstrated that for immigrants, longevity in the United States might better explain the dominance in household decision making rather than their gender. We illustrate how longevity in the United States has resulted in role reversal in decision making among the immigrants. It is noteworthy that our pre-occupation with gender as one of the primary influencers of household decision making has

resulted in gender attributions to observed household decision making. This research questions the efficacy of these gender attributions. An additional contribution of this research is to suggest that some decisions might be "sacred" and others "profane" based upon the cultural meanings associated with the acquisition of particular products.

CONCLUSION

This research has examined spousal decision making among Kenyan immigrants. We have found that through the process of acculturation, that the immigrants adapt to their new consumption environment. For these immigrants, duration of stay in the United States might better explain dominance in decision making rather than their gender. Further, we found that the purchase of some products such as "meat" have significant cultural meaning. In our research we have found that the immigrants have a strong connection with their family in their home country and as such, their household decision making cannot be understood without examining the allocation of household resources to their extended families. Our study demonstrates that there are deep rooted reasons for supporting the extended family. A February 2006 statement by the Governor of the Central Bank of Kenya indicated that Kenyans in the Diaspora are remitting over 500 million dollars annually (Mulei 2006). Clearly, this research has important implications for marketers as they develop strategies for households. If current U.S. population growth trends prevail, the number of non-western households will continue to increase. Hence, understanding the differences in household decision making processes of western and non western household will be important for marketers as they fine-tune marketing strategies for households.

We Love to Hate You: Discourse Between the Distance Running Subculture and Mainstream Media

Tandy D. Chalmers, University of Arizona, USA
Hope Jensen Schau, University of Arizona, USA

EXTENDED ABSTRACT

Subculture researchers have tirelessly sought to understand the relationship between subcultures and mainstream society. Within this work, some research posits a positive relationship while other research presents a negative relationship. The purpose of this study is to understand the relationship between subcultures and mainstream society and presents a conceptualization of this relationship as symbiotic in nature.

Consumer research is one of many fields that embrace subculture research with many researchers examining a variety of subcultures, including but not limited to, Harley Davidson riders (Schouten and McAlexander 1995), sky-divers (Celsi, Rose, and Leigh 1993), extreme sport participants (Quester, Beverland, and Farrelly 2006), the Australian hip-hop community (Arthur 2006), tattooists (Bengtsson, Ostberg, and Kjeldgaard 2005), and *X-Files* and *Star Trek* fans (Kozinets 1997, 2001).

While each of these studies offer different theoretical insights into the nature of subcultures, they all converge on the notion that subcultures and subcultures of consumption are characterized as thriving on a sense of exclusivity (e.g. Arthur 2006; Donnelly and Young 1988; Hebdige 1979; Quester et al. 2006; Richardson 2006; Schouten and McAlexander 1995) and are opposed to appropriation into the mainstream culture: with 'going mainstream' viewed as detrimental to the subculture as a whole (e.g. Fox 1987; Irwin 1973; Schouten and McAlexander 1995).

On the other hand, some elements of going mainstream are beneficial to subcultures. For example, media can serve an informative role in which it differentiates the subculture from the dominant culture, articulates possible behaviors of members, and works to expand the subculture by reaching new members (Celsi et al. 1993; Donnelly and Young 1988; Irwin 1973; Kozinets 2001; Wheaton 2000). Thus, the overall nature of the interaction between media and subcultures is ambiguous and begs the question: how do subcultures that value exclusivity navigate the tensions inherent in mainstream popularity?

To explore the relationship between subcultures and mainstream media, we conducted a detailed analysis of the distance running subculture. The distance running subculture was selected because it is a well-defined subculture with a clear and distinct culture that is also experiencing mainstream popularity. We use a combination of semi-structured depth interviews (McCracken 1989) and online message board observation (Kozinets 2002; Muniz and Schau 2005). Purposive sampling and snowballing techniques were used to recruit informants from the local running community, university running associations, and personal contacts.

Interviews were conducted with 41 self-identified distance runners (19 female, 22 male) with varying levels of involvement with running. The majority of the runners interviewed were recreational runners; however, interviews were also conducted with some key community leaders and elite runners. To balance the perspectives of the recreational runners, we conducted an analysis of an online message board catering to more serious runners. Using naturalistic observation techniques, we used the interview findings to guide our selection of threads to observe, seeking out avenues for both confirmation and disconfirmation of emerging themes. Interviews and online observations were transcribed and then coded,

first using free coding and then using QSR NVivo 1.2 and standard data analysis and interpretation procedures (Glaser and Strauss 1967; Thompson 1997). Important themes and tensions were uncovered through across informant and within individual informant analyses.

Analysis of the data revealed two primary themes: (1) a tension within the subculture remaining an exclusive entity, grounded in the core values of achieving emancipation through the pursuit of modernist elements of achievement, competition, and measurement of time and distance (Chalmers 2006), and the adoption of a more inclusive attitude that encourages mass participation and (2) subculture members using mainstream media and popularity as a tool to assert their exclusivity.

The first finding of this study is subculture members simultaneously supporting subcultural exclusivity and being inclusive. Runners supporting exclusivity is manifested in four ways within the distance running subculture: (1) explicit references to being part of an exclusive group, (2) a desire to see running glorified in the eyes of the mainstream public, (3) an emphasis on supporting elite athletes who epitomize the athleticism of running and (4) a disdain for mainstream media undermining the sport's competitiveness. On the other hand, there is an emphasis on inclusivity and mainstream popularity. This is evidenced in three ways. First, runners enjoy seeing the running mentality applied to areas outside of running by mainstream media. Second, runners express a desire for more television and advertising coverage of recreational runners. Third, runners express a sense of evangelism and encourage mass participation in the sport.

The second theme in this study outlines how members of the running subculture manage the tension between exclusivity and inclusivity. The data from this study reveals that runners use mainstream media and the popularity of the running activity to assert their exclusivity. There are three ways in which this is done. First, runners use mainstream media portrayals of running to show their insider knowledge of the subculture. Second, runners differentiate themselves by showing that they are unique in their appreciation of running media. Third, runners justify the mainstream popularity of the sport by proclaiming that it supports them in their exclusive running lifestyle.

This study serves to enhance current conceptualizations of subcultures by illuminating a previously overlooked type of interaction with the mainstream culture. The findings of this study are particularly important for consumer researchers. First, they show how subculture members react to and use advertisements and other media to enhance their own agendas. This represents an interesting type of co-production of meanings that blurs the boundaries between what is included and excluded in a subculture. Second, the tension inherent within a subculture highlights the sometimes overlooked variation and complexity of subcultures. Subcultures are generally conceptualized as being fairly homogenous within their bounds, and while these findings do support the notion that a subculture has a core set of values, a tremendous amount of variation exists as to how these core values manifest themselves. Finally, these findings show the important role that media can play in maintaining subcultures, especially those that operate as mundane, yet salient, consumption activities.

Mood Self Verification Explains the Selection and Intake Frequency of Comfort Foods

Brian Wansink, Cornell University, USA
Collin Payne, Cornell University, USA

EXTENDED ABSTRACT

Comfort foods are those foods that provide a dimension of psychological comfort when they are consumed. These foods have often been associated with unintended weight gain (Ganley 1989; Wansink, Cheney, and Chan 2003). However, it is not known whether systematic associations exist between a person's mood (psychological state) and the selection and intake of different types of comfort foods. Awareness of any such biases could enable people to more knowingly make food choices that will benefit their health. Based on a self-verification framework, it is examined whether the foods that obese and non-obese individuals claim they eat for "comfort" may have unknowingly been selected to verify their mood.

In contrast to self-enhancement, which suggests people are psychologically motivated to increase their positive self regard, self-verification contends that people are psychologically motivated to confirm self-impressions for reasons of prediction and control (Geisler and Swann, 1999). For example, if a man has low-self esteem on a particular occasion, he may be more likely to seek, accept, and agree with negative feedback more so than positive feedback (Swann and Ely 1984; Swann, Stein-Seroussi, and Giesler 1992). Similarly, bulimic individuals with poor body self concepts were more likely to self-verify by seeking an interest in negative feedback that corroborated their self concepts, thereby leading to an aggravation of bulimic symptoms (Joiner 1999). From this, it is not difficult to assume that it may be the case that bulimics use food to serve their conceptions of themselves, thus supporting the idea of mood self-verification. Indeed, negative emotions, which preceded binge eating, actually increased after the binge eating episode (Lynch, Everingham, Dubitzky, Hartman, and Kasser 2000). This suggests that people may use food as a means to confirm how they feel about themselves, rather than to improve their negative mood states.

In addition, there is reasonable evidence to suggest that individual characteristics, such as age and gender, may also influence mood. Research indicates that both women and younger people have a relatively greater intensity of negative affect than men and older people (Cheng 2004; Robins et al. 2002; Charles and Pasupathi 2003). Because women and younger people have been shown to have a greater intensity of negative affect (as compared to men and older people), they should tend to be more likely to consume less-nutritive comfort foods, which is consistent with an attempt to verify their relative stronger negative mood state intensity.¹

A content analysis of clinical eating records (diaries and interviews) of obese individuals, were combined with results of three focus groups to better understand the relationship between mood and the consumption of what individuals commonly refer to as "comfort foods." Based on self-reported commonly experienced moods and self-reported commonly eaten comfort foods, a phone survey of 1014 randomly selected North Americans was conducted to determine which foods were most likely to be consumed under

various mood states. Chi-square tests examined how one's selection of a comfort food varied across differences in mood, gender, age, and obesity. In the interview, participants were asked whether they would be likely to consume (yes or no) ten different comfort foods when experiencing each of ten specific moods.

Both positive and negative moods were associated with the reported likelihood of consuming comfort foods for both obese and non-obese individuals. Importantly, however, positive moods were robustly associated with the reported likelihood of more nutritive food consumption while negative moods were associated with the reported likelihood of less nutritive food consumption.² Females, in comparison to males, were more likely to report consuming comfort foods in negative mood states. Similar results were found when comparing younger adults to older adults, and when comparing normal weight adults with overweight adults.

This study provides an important first step in understanding the ecological correlation between mood states and reported comfort food consumption. While this study used self-assessment surveys and interviews as exploratory tools for research, self-assessment surveys and interviews are important in obtaining information about past behavior. Although laboratory tests would confirm the results of this study, they generally obtain information only for a single consumption experience. Further support for mood self-verification in comfort food consumption could come from research that measures mood *before* consumption and *after* consumption. A similarity of mood, in both pre- and post-consumption would provide additional evidence of mood self-verification, and it will also test for boundary conditions that define situations when this may or may not occur. Last, knowing what other factors (besides gender, age, and BMI) could influence mood could facilitate a better understanding of what types of interventions could be had to increase consumption of more nutritive foods. The resulting interventions would have implications for clinical settings (i.e., weight loss) and the consumer.

When selecting comfort foods, people appear to consume foods that match their mood. Weight loss strategies, which focus on negative emotions for compliance, may actually be responsible for the maintenance or even exaggeration of a person's weight. This research suggests that this is because when a person experiences negative mood states, they will attempt to verify these moods by eating less nutritive foods. In this way, a person can predict and control how they feel about themselves by matching their mood with the corresponding comfort food. Therefore, a vicious cycle, based on reinforcement of mood, may ensue.

As one is made to feel guilty (a negative emotion) about a particular failure to lose weight, they will eat less-nutritive food, which could increase their weight. Once their weight increases, they may feel even more negative emotion, which would correspond to further non-nutritive consumption of comfort foods. As is suggested by this research, women, younger people, and overweight people could be particularly vulnerable to this vicious cycle. This implies that these people should pay particular attention to their mood when searching for comfort food. In this way, instead of

¹Interestingly, the literature also suggests that while there may be differences in negative affect intensity for females and younger people compared to males and older people, these differences disappear for positive affect intensity (Cheng 2004).

²The "more nutritive" "less nutritive" distinction is one that has been commonly used in comfort food research (Wansink, Cheney, and Chan 2003)

the tendency for searching for a less nutritive comfort food when in a negative mood state, as suggested in this research, a more cognizant decision can be made about comfort food choice.

Going Along Versus Going Alone: When Fear and Romance Alter the Influence of Reference Groups

Vladas Griskevicius, Arizona State University, USA
Noah Goldstein, Arizona State University, USA
Chad Mortensen, Arizona State University, USA
Robert Cialdini, Arizona State University, USA
Douglas Kenrick, Arizona State University, USA

EXTENDED ABSTRACT

Research has demonstrated that consumers are strongly influenced by reference groups and word-of-mouth (e.g., Cialdini 2001; Pechmann and Ratneshwar 1994). Although consumer research is currently experiencing a resurgence in work on emotion (e.g., Bosmans and Baumgartner 2005; Garg, Inman, and Mittal 2005), almost no research has examined how consumers' emotional or motivational states influence their susceptibility to reference group information.

The current studies were aimed at redressing this imbalance by investigating how the emotional states of fear and romance influence consumer preferences when people are aware of the preferences of their peers. Study 1 used a chat room design and examined how being in a fearful, romantic, or neutral state influenced preferences for artwork. Study 2 extended the research by examining several boundary conditions: First, it investigated whether the effects of emotion will be different depending on whether the consumer decision concerns products that are subjective vs. objective in quality; and second, it examined how the effects of emotion might change depending on the degree of consensus within the reference group (e.g., whether peers are unanimous versus split on a preference).

Both going along and going against the group can confer powerful benefits, such as making more accurate decisions and facilitating affiliation on the one hand (Cialdini and Trost 1998; Chartrand and Bargh 1999), and by establishing uniqueness on the other (Snyder and Fromkin 1980). Given the power of emotional states to motivate specific cognitions (e.g., Maner et al. 2005), one useful way to ascertain whether a consumer will go along or go against the preferences of a reference group may be to examine the consumer's current emotional state.

Consistent with research on stress and affiliation, as well as Terror Management Theory, a state of fear is likely to motivate people to want to fit in with their group and not draw attention to themselves (Pyszczynski, Greenberg, and Solomon 1997; Taylor et al 2000). In contrast, a romantic state, which motivates a person to attract a member of the opposite sex, is likely to lead that person to want to stand out from the crowd. However, men and women tend to value somewhat different traits in a romantic partner (Buss 2003; Baumeister and Sommer 1997; Campbell 2001), suggesting a possible gender difference in conformity when in a romantic state.

Given these theoretically derived predictions, in Study 1 participants were put into either a fearful, romantic, or neutral emotional state by reading a pre-tested short story. Then, they went into a chat room and indicated their preferences on art (while being able to see the unanimous preferences of their peers). When participants were in a fearful state, both men and women were more susceptible to group influence than in the neutral condition. In contrast, a romantic state led men to nonconform (i.e., men went against the preferences of the group), while a romantic state led women to conform more than in the neutral state.

Study 2 extended the findings by examining two theoretically derived boundary conditions for the effects of a romantic state: (1)

whether the consumer choice is *subjective* (e.g., there are multiple products of relatively equal quality in a category) versus *objective* (i.e., there is a verifiably superior product in a category); and (2) whether the opinions of the reference group are unanimous toward preferring a product versus split into a majority and a minority preference.

After inducing a romantic or a neutral state, participants indicated their preferences in a survey in which they could see the responses of the previous four individuals. Half of the survey questions were subjective consumer preferences (e.g., do you prefer a Mercedes-Benz or a BMW), and half of the questions were objective in nature (e.g., do you think it's more expensive to live in New York or San Francisco). Furthermore, for half of the questions the previous responders were unanimous in their selections (e.g., 4 preferred the BMW and 0 preferred the Mercedes), while for the other half, the previous responses were split (e.g., 3 preferred the BMW and 1 preferred the Mercedes).

Results again indicated that when choices were subjective (like that for artwork in Study 1), a romantic state led men to go against the group and led women to conform significantly more. However, consistent with predictions, when choices were objective, a romantic state led both men and women to increase their reliance on group information. That is, when conformity could produce higher accuracy in decision-making, a romantic state increased both men's and women's tendency to follow the reference group. However, also in line with predictions, the effects of the romantic state persisted only when group judgment was unanimous. When the responses of the 4 people were split 3/1, the effects of the romantic state were muted. That is, when nonconformity could not lead men to appear independent to the group, and when conformity could not lead women to appear more agreeable to the entire group, a romantic state did not influence susceptibility to reference group information.

In summary, both the emotional states of fear and romance influenced people's tendency to follow a reference group in a strategic manner. Interestingly, as evidenced by Study 2, the effects of emotion persisted even when people's responses were completely private. The current studies expand on previous consumer research regarding reference groups and word-of-mouth, and provide a significant contribution by showing that specific emotions can influence consumer susceptibility to reference groups. The findings also have multiple practical implications. For example, a romantic desire will lead men to make purchases that make them seem unique, while being in a fear state will lead people to purchase the same products as the majority. Moreover, when attempting to market a product that is unique, marketers are advised to activate romantic desires. We hope these findings serve as a springboard in furthering consumer theories of emotional influence.

Side Effects from Fear: The Automatic Inhibition of Threat-Relevant Brand Advertising

Jesper Nielsen, University of Arizona, USA
Stewart Shapiro, University of Delaware, USA

EXTENDED ABSTRACT

This paper seeks to broaden our understanding of the impact of fear appeals. Specifically, we investigate whether, and under what conditions, the processing of fear appeals automatically suppresses the activation of concepts that are semantically associated with the threat and in turn decrease attention to threat-relevant brand advertising.

Social marketers have widely used fear appeals as a persuasive communication strategy, with the underlying assumption that threatening messages reduce maladaptive behaviors and/or encourage adaptive behaviors. To this end, fear appeals have been studied in the context of reducing unhealthful behaviors, such as smoking (Keller and Block 1996; Pechmann et al. 2003), drug use (Brown, D'Emidio-Caston, and Pollard 1997), the spread of sexually transmitted diseases (LaTour and Pitts 1989; Tanner, Hunt, and Eppright 1991), aggressive and inattentive driving (Mowen, Harris, and Bone 2004), and alcohol abuse (Mider 1984; Moscato et al. 2001). Fear appeals have also been studied in the context of promoting appropriate behavior, such as practicing good oral hygiene (Janis and Feshbach 1953), obtaining vaccinations (Dillard and Anderson 2004), and using sunscreen (McMath and Prentice-Dunn 2005).

We seek to add to this literature by exploring another theoretically driven consequence of using fear appeal communications that is also of importance but has not yet received attention in the literature; that is, we investigate the ability of fear communications to automatically inhibit the processing of stimuli that are semantically associated with, but not explicitly linked to, the threat. An example of such stimuli is threat-relevant brand advertising. We define "threat-relevant brand advertising" as industry advertising that promotes a product that could be instrumental in causing the very behavior the fear appeal is attempting to prevent. For example, an advertisement that promotes Budweiser or Absolut Vodka would be considered threat-relevant brand advertising for a fear appeal message that focuses on the dangers of drinking and driving. Although Budweiser and Absolut Vodka are not the focal elements of the threat or explicitly mentioned in the threat, they are relevant to an anti-drinking-and-driving fear appeal message because they are specific brands of alcohol that can be consumed before driving.

Various theories have been proposed to account for peoples' reactions to fear appeal messages. Some of these theories, including Sutton's (1982) expectancy value model and Rogers's (1975, 1983) protection motivation model, assume an effortful, cognitive process. However, other theories exist that allow for a more automatic route to persuasion. For example, Ray and Wilkie's (1970) parallel process model and Witte's (1992) extended parallel process model assume that exposure to a fear appeal message engages two processes: a danger-control process and a fear-control process. The danger-control process is a deliberative, cognitive process that includes thoughts of how to avoid the threat (e.g., don't drive after drinking, use a designated driver). In contrast, the fear-control process is believed to be automatic and involuntary and, potentially, to occur outside conscious awareness. This process is viewed as being maladaptive (Ruiter et al. 2001; Witte 1992) in that fear control aims to eliminate the unpleasant feeling elicited by a threatening message through denial ("I won't get hurt if I drink and drive"), reactance ("This message can't stop me from drinking and driving, and in fact, I bet I am a better driver after I've had a few

drinks"), or defensive avoidance ("this is too scary to think about"; Witte and Morrison 2000). It is through the fear-control process that we propose that suppression of semantic associates occurs. Thus, in this sense, we view the fear-control process as being beneficial rather than maladaptive, as others have argued.

The results of Study 1 provide the initial support for our hypotheses that exposure to a fear appeal message leads to the suppression of other concepts semantically related to the threat. Specifically, after reading an anti-drinking and driving fear appeal PSA, participants performed worse in a reaction time task featuring words semantically related to the threat of drinking and driving (bottle, beer, party, alcohol).

Study 2 provided us with two important results. First, based on a surprise recall task, study 2 confirms the findings of study 1 that fear appeals can lead to the automatic suppression of threat-related stimuli. Second, study 2 adds the dimension of testing these hypotheses in an environment of more direct relevance to marketers and consumer advocates. Participants who were exposed to an anti drinking and driving PSA were less likely to notice alcohol ads surrounding magazine articles of interest than were participants who were exposed to the control fear appeal PSA.

In addition, study 2 included a measure of cognitive avoidance, an individual-level variable predicted to impact the likelihood of a participant relying on fear-control processes. This variable was shown to significantly moderate the effect of fear-appeal PSAs on the suppression of threat-related ads.

“Hopelessly Devoted to You” Towards an Extended Conceptualization of Consumer Devotion

Elisabeth A. Pichler, University of Innsbruck, Austria
Andrea Hemetsberger, University of Innsbruck, Austria

INTRODUCTION

In the Western consumer society, a world of wealth and abundance, yet a world almost demystified, secularized, and seemingly controllable, people feel an increased desire to find new forms and opportunities to give sense to their lives. Some consumers evidently fill this void by sacralizing products in order to fulfill their deeply rooted desire for spiritualism (Belk et al., 1989; Belk et al., 2003; Firat and Venkatesh, 1995; O’Guinn and Belk, 1989; Muniz and Schau, 2005).

Through an extended conceptualization of consumer devotion, this article attempts to further our understanding about strong emotional bonds between consumers and products. Consumer behavior literature offers rich research insights into emotional consumer relationships with products, possessions, and objects in general. The Consumer Odyssey constitutes one of the first, seminal attempts to grasp the deep meanings of possessions resulting from long-lasting relationships between consumers and objects (Wallendorf et al., 1988; Belk et al., 1989). These early and influential contributions all agree on the importance of non-utilitarian functions of objects, possessions, consumption activities, and rituals (Wallendorf and Arnould, 1991; Arnould and Price, 1993; Celsi et al., 1993; Schouten and McAlexander, 1995) and emphasize the strong connection of objects and activities with consumers’ selves and lives. Research has established that favorite objects contribute to an intensified sense of self, may serve as replacements for desired aspects of life; allure extreme attention and devotion; and often attain a sacred status.

Since the advent of postmodernist thought in consumer behavior, interest in extreme forms of emotional bonding with products has dramatically increased. Concepts, such as attachment, desire, passion, brand enthusiasm, fetishism, brand cult, fandom, and devotion have been introduced in the literature and attracted research attention (Ball and Tasaki, 1992; Wallendorf and Arnould, 1988; Belk et al., 2003; Belk, 2003; Belk and Tumbat, 2005; Kozinets, 2001; Pimentel and Reynolds, 2004).

In a recent article Pimentel and Reynolds (2004) related devotion primarily to socio-cultural phenomena, such as sports fandom, and suggest an extension of their model to a product context. Their work offers an important integration of consumer devotion-related literature. Yet, we believe the concept needs a sharper delineation from collective phenomena, and further clarification, particularly with regard to its psychological foundation. We will focus on the individual experience of such strong relationships to objects and concentrate on its privately lived aspects.

To this end, we will first provide an overview of related phenomena portrayed in consumer behavior literature. We will juxtapose these concepts with theories of love relationships in psychology and related concepts in theology. In the following synthesis emphasis will be put on both the emotional states that characterize devotion, and related acts of devotion. Finally, we will conclude with a discussion of the implications for future theorizing and research.

THEORETICAL UNDERPINNINGS

Devotion in consumer research

Pimentel and Reynolds’ (2004) work is the first in the marketing literature to address the phenomenon of consumer devotion as a distinct concept. Their conceptualization of devotion locates the devoted consumer within the larger group of committed consumers. Their extremely high level of emotional bonding with the brand justifies the distinction of devotees from the rest of loyal and committed consumers. Considering football fans as an example of devoted consumers, Pimentel and Reynolds (2004) show how devotees use special objects, as for instance fan utensils, to demonstrate a relationship to the brand. By assigning extraordinary importance and personal value to those objects, objects attain a sacred status, similar to objects of religious worship.

To the devotee, the sacred object does not only represent a resource for defining and developing personal identity, but also a means of conveying this identity-construct to the environment (Pimentel & Reynolds, 2004). Pimentel and Reynolds (2004) further contend that the need for distinction, the need to belong, or a felt void, serve as antecedents to engaging in a consumer-brand relationship. Consumption can relieve these states of emotional discomfort; it eventually leads to affective commitment towards objects. Once fans are devoted, they engage in ‘proactive sustaining behaviors’, such as pilgrimage, rituals, sacrifices, or displaying behavior, which prevent the object of devotion from re-secularization.

Pimentel and Reynolds’ (2004) approach to devotion focuses on groups and their social experiences and behaviors, similar to what has been defined as fandom in the literature (Hunt et al., 1999; Kozinets, 2001). The individual, private side of strong emotional bonds with objects has gained much less attention in the literature. By highlighting the individual facets of devotion, we offer an alternative perspective with useful consumer behavior implications.

Related concepts in the consumer behavior literature

Concepts in consumer behavior research regularly discuss two common elements of devotion. First, devotion is depicted as a highly emotional concept, reflecting very intense relationships between consumers and objects, or activities. Second, it has been argued that the term ‘devotion’ also implies religious fervor (Pimentel and Reynolds, 2004). Pimentel and Reynolds’ work also indicates that devotion is connected to strong feelings related to love, as well as feelings of spiritual or religious excitement and adoration. Hence, devotion is characterized by *states* of devotion and results in devotional *behavior*, which are spiritual in nature.

In consumer behavior literature, we can find a number of related, yet distinct concepts. Ahuvia’s (2005) notion of ‘object-love’ seems rather close to the emotional aspect of the concept of devotion. Drawing on Belk’s (1988) notion of the extended self, Ahuvia maintains that the objects we love have a strong influence on our sense of who and what we are. Several authors (Wallendorf and Arnould, 1988; Fournier 1998; Belk, 2003) have adopted a similar perspective with regard to the importance of loved objects

to individual identity. Ahuvia (2005) extended these insights with his findings that love objects might also assist with symbolically demarcating the boundaries between the self and identities the consumer rejects. In other instances, they serve to support an identity that combines potentially conflicting aspects of self. Furthermore, particularly in connection with activities and consumption experiences, objects also serve the purpose of self-completion, personal growth, and renewal of the self (Schouten, 1991; Arnould and Price, 1993; Celsi et al., 1993).

Another related concept has been promoted by Belk et al. (2003). Consumer passion and desire is portrayed as a strong, highly emotional, captivating, and motivating force, which makes us want the particular object of desire. Hence, desire is defined as a highly emotional, positive *state*. Based on mimetic theory (Girard, 1977) and Foucault's work on strategies of modern governance (1984), Belk et al. (2003) describe desire as being deeply linked to the social world, its values and lifestyles. Belk et al.'s (2003) findings reflect the passionate character of desire, fueled by danger and immorality, distance and inaccessibility, desire for otherness and sociality. Hence, desire is rather characterized by powerful feelings of urge, and lacks the notion of commitment.

In order to elaborate the two defining elements of devotion-emotional state and behavior-we will draw on literature on love and romantic relationships in psychology. Research findings on religious sensations, religious worship, and its manifestations should provide a theoretical foundation of the religious aspects of devotion. Furthermore, we want to draw attention to the fact that feelings and actions towards objects of devotion might take on various forms, just like in interpersonal love relationships.

Love and devotion in psychology

Before love can grow out of a romantic relationship between two individuals both persons have to possess the ability to fall in love (Kernberg, 1995). They must be ready to idealize the partner and willing to enter into the commitment of an emotional relationship. Also reciprocal erotic desire is a prerequisite for love. Once, these circumstances are established, love ideally evolves towards an altruistic act of loving, where being able to give is more important than taking (Fromm, 1976). Love is seen by Fromm as a perpetual activity. According to him, it comprises four basic mutual elements: concern, responsibility, and respect for and knowledge of the object of the union.

Sternberg (1997) sees intimacy, passion, and decision/commitment as the three building blocks of love. Intimacy relates to closeness and bondedness in relationships, while passion stands for physical attraction and sexual desire. When looking at typical behaviors and attitudes that make up intimacy in this construct, Fromm's basic elements of love can be recognized as sub-elements of Sternberg's intimacy. Decision/commitment describes the conscious decision at the beginning of a relationship to love one's partner, and later on, the commitment to keep this love alive. The interplay of these three elements of love can result in eight different forms of love, stretching from non-love, to the most complete form, consummate love, depending on how extensively each component is present. Non-love is a state where none of the three components are present. In most of the love kinds, two components are dominant, while the third one is only weak or absent. Consummate love is the only kind of love that is a product of all three components (Sternberg, 1997).

As opposed to Sternberg's eight variations of love, Lee only determines six love styles (Lee, 1973). These love styles, basically, rest upon the same underlying elements, namely passion, intimacy and decision/commitment. Lee's three primary love styles (Eros,

Ludus and Storge) find their equivalent in three of Sternberg's types of love. While Eros, which is the combination of passion, intimacy and commitment, equals Sternberg's consummate love, Ludus represents a state of love where commitment does not play a big role, just like Sternberg's romantic love. The third primary form, Storge, is a mixture of intimacy and decision/commitment in the absence of passion, equivalent to Sternberg's companionate love.

Function and purpose of love (relationships)

Erich Fromm (1976) sees romantic love as driven by a need to overcome the sense of separation. The perceived separation from the outer world occurs to humankind because we have evolved from an instinct-dependent being to rational homo sapiens. The mental and physical unity with a beloved person can help us to get rid of this deep-seated disparity.

Djikic and Oatley (2004) present a second dominant approach to the purpose of love and romantic relationships that can be found in the literature. According to them love is supposed to add meaning and sense to our lives. Beck and Beck-Gernsheim (1994) follow this stream of reasoning, suggesting that romantic relationships should fill the life of those involved with sense and substance. Additionally, they argue that another significant purpose of love is to grant emotional stability and security. Ideal love relationships should foster the autonomous personality development of both partners (Djikic and Oatley, 2004; Beck and Beck-Gernsheim, 1994). In this case, the exchange among the partners leads to a process of self-reflection and self-discovery for both. As a positive relationship in this sense can only be established if both partners open up freely to each other, intimacy, self-disclosure, mutual understanding, and respect are essential (Djikic and Oatley, 2004; Beck and Beck-Gernsheim, 1994; Fromm, 1976).

Love and devotion in theology

Function and purpose of religions

According to Erich Fromm (1976) religion serves as a frame and guideline for thinking and acting. It provides the individual with a means of orientation and an object of devotion. Religion offers a set of explanations and values which helps in making sense of what is going on around us. But religion also confronts us with something higher that is worthy of adoration. Whereas Max Weber also defines religion's main function as problem-solving, Sigmund Freud (1912) sees religion's primary purpose as providing consolation, and granting security to those who feel lost and threatened in an increasingly complex and insecure environment.

Religious love, just like interpersonal romantic love, is derived from a deeply rooted human need to overcome the feeling of separation from the outer world (Fromm, 1956). The objects of devotion that religions place at their center allow the individual to build up mental and spiritual connection. This artificial bond to a higher being delivers the "lost" individual from his state of separation.

Manifestations of religious devotion

Religious devotion often reveals itself in the form of worship of objects or persons and religious rites (Giddens, 1991; Freud, 1912; Lévi-Strauss, 1963; Mol, 1979; Durkheim, 2001; Fromm, 1956). In primitive religions totems play a central role (Mol, 1979; Durkheim, 2001; Lévi-Strauss, 1963). Idols made of wood or clay in the shape of human bodies were believed to possess supernatural powers and therefore be appropriate for public and private adoration (Fromm, 1956). Today, religions still have sacred objects such as altars, shrines and relics. Representatives of a religion (e.g. saints, the pope, the Dalai Lama) are also venerated as object of religious devotion because they embody the values and beliefs of the religion (Martignetti, 1998; Nicholls, 1996). They serve as

tangible objects towards which believers can direct their devotion (Mol, 1979; Forster and Ranum, 1982).

Rites constitute purposive acts associated with religious symbols (Durkheim, 2001; Giddens, 1991). Social rites are extremely numerous in primitive religions, including rites of passage, rites of initiation, ascetic rites, rites for sacrificing and rites for commemorating (Durkheim, 2001; Eliade, 1959; Mol 1979; van Gennep, 1960). In Christianity, events like baptism, marriage or going to confession are common examples of rites (Forster and Ranum, 1982). Rituals are either performed individually or as collective ceremonies (Giddens, 1991).

Religious aspects of love

Beck and Beck-Gernsheim (1994) describe love as earthly religion, which contains a certain kind of utopia; just like religious systems. Both, love and religion, enable the experience of transcendence. While in the case of love, sexual sensation leads to transcendent moments, religion's transcendent aspect is determined by the belief that a higher powerful being exists. The conviction that a better life and a superior self are possible is the common foundation for individuals seeking love and religion.

SYNTHESIS

The following section provides a synthesis comprised of the psychological underpinnings of love relationships, devotion as an emotional state, and the religious acts associated with consumer devotion.

"You light up my life"—the psychology of person-object relationships

Similar to what Ahuvia (2005), Belk (2003), Belk et al. (1989), Wallendorf and Arnould (1988) have described, objects of love are a repository of meaning in life. They represent important means of identity-building. In order to give their lives meaning, consumers build up highly emotional, long-lasting relationships with love objects (Fromm, 1976; Fournier, 1998; Vézina, 1999; Shankar and Fitchett, 2002). They help people cope with complexity in life. Confronted with almost endless options of how to live one's life, and with an unprecedented amount of things to consume and possess, love objects differentiate sheer consumption objects and valued objects from the ones we love and relate with. They provide a frame of reference, reflect our values system, and display our *Weltanschauung*.

Those objects are loved for what they do to the consumer, particularly in times of change. They are essential for the development and definition of one's identity. Human beings are confronted with various life tasks, current concerns, and times of transition (Fournier, 1989), which are waiting to be mastered. Objects can help us to overcome those challenges by physically and psychologically helping us to gain skills and perform better, giving us hope for the future. They are means for transformation and can help to overcome tensions between different identities. As reported by Belk (2003), for instance, high heeled shoes can help transform an insecure high school girl into an elegant and adorable lady (2003).

However, consumers do not necessarily become devoted to all objects that help in this respect. Research in psychology teaches us that love relationships are also characterized by a secure feeling, by reciprocity and unity. According to Fromm (1956, 1976), humans engage in religious practices and love relationships because of a deeply rooted human desire to overcome the feeling of being separated. Fournier (1998) has found similar brand relationships, which are characterized by the feeling that the other is irreplaceable.

A further reason to engage in those relationships is our striving for transcendental, spiritual experiences (Beck and Beck-Gernsheim,

1994). Objects and persons may be mediators of such experiences and play a central role in an individual's spiritual life. From the literature on totemism (Mol, 1979; Forster and Ranum, 1982; Durkheim, 2001) we know that individual totems are used as concrete objects to which the believers can direct their devotion.

"Is it love?"—devotion as an emotional state

As Fournier (1998) has reported, consumers engage in various different forms of brand-relationships among which we also find feelings of love. Such relationships require the ability to idealize an object, which is an antecedent for desire. Hence, love objects are perceived in a somewhat distorted and idealized manner. Furthermore, in order to be loved an object must fulfill the 'personification qualification' criterion, which enables an object to be perceived as an active partner who can also reciprocate in a way (Fournier, 1998; Rozanski et al., 1999).

Whereas our intuition undoubtedly tells us how it feels to love and to be loved, love from a theoretical standpoint is a much more complex emotional state and encompasses many different forms. Passion and desire are often cited components of love (Hazan and Shaver, 1994; Sternberg, 1997; Kernberg, 1995; Fournier, 1998; Belk et al., 2003). Along with passion comes idealization and adoration of the beloved. The passionate component of devotion is responsible for the intensity of emotionality that comes with love however it does not reflect the intensity of love as such. Passion rather circumscribes the desire and (physical) attraction that is evoked by the object of love. Hence, passion and desire is to be understood as an important component of love, although not equivalent to love. Authors agree that love also implies a feeling of connectedness and intimacy (Beck and Beck-Gernsheim, 1994; Fournier, 1998; Hazan and Shaver, 1994; Sternberg, 1997). Person-object relationships, therefore, are also very close and trustful, which necessitates that both partners are highly committed and dedicated to this relationship. Dedication describes the conscious decision at the beginning of the partnership to keep this love alive. Passion and dedication are fueled by transcendent experiences, which are sought after in love relationships (Fromm, 1956, 1976; Belk, 1989; Kozinets, 1997, 2001; Pimentel and Reynolds, 2004; Scholes, 2004; Muniz and Schau, 2005). Those experiences make partners feel close to each other and uphold a certain intimacy, which is needed for love to gain substance.

Devotion as an emotional state can be described as a tripartite state of *passion*, *intimacy* and *dedication*, similar to Sternberg's triangle of love. Depending on the intensity of those three components, different facets and intensities of devotion might exist (Shimp and Madden, 1988). As described by Sternberg (1997) and Lee (1973), several love styles are possible, from non-love to consummate love, which we expect to exist in person-object relationships in a similar way. Acts of devotion perpetuate and refuel the loving feelings for the loved, sacred object.

"Loving you, loving me"—acts of devotion

It is at the very beginning of a love relationship that individuals engage in a process of sacralization of the loved object, for instance by means of sacrifices, adoration and worshipping, rites and rituals, and objectification of the sacred (see: Belk et al., 1989 for a comprehensive overview of sacralization processes). However, ecstatic as one might feel upon a first transcendental experience and loving feeling, this sacred status may soon be lost through habituation, forgetting, or encroachment of the profane (Belk, et al., 1989). Belk et al. (2003) provide important findings on the dynamics of consumer passion and desire. They report that desire is perpetuated through imagination, by dwelling on the love object

and so intensifying our feelings. However as soon as we possess the object of desire, it transforms into familiarity, and eventually boredom. Only our desire to desire, our fear of being without desire, and hope to be able to realize our desire eventually upholds this state.

As opposed to desire, devotion is characterized by a much more altruistic attitude, by responsibility, and dedication. Therefore, devoted individuals do not hesitate to sacrifice their time, money, and energy in order to maintain this intimate and passionate relationship. The religious zealotry of devoted individuals is exhibited by consumers who make such sacrifices, engage in consumer advocacy (Rozanski et al., 1999), and oppositional brand loyalty, as for instance described by Muniz and O'Guinn (2001) or Pimentel and Reynolds (2004). Loyalty in words and deeds is a distinct element of consumer devotion. It reflects a voluntary emotional bond between an individual and a love object. From Ahuvia's (2005) work we have learned that love objects receive much attention and dedication from consumers rather than provide simple pleasures. Individuals seem to put much energy in these objects, which makes them meaningful and helps integrate them into their sense of identity (2005). When put to the extreme, individuals even cease consuming and start producing their own love objects in an effort to achieve a state of individuation and self-realization (Hemetsberger, 2005). These objects are outcomes of 'labors of love' (Ahuvia, 2005; Hemetsberger, 2005) reflecting that 'pleasure can be bought, but love is made'.

We can also learn from Fromm (1976) that love involves knowing each other. Hence, devotees are eager to gain knowledge about their love object. Individuals dedicate a considerable part of their life to the things they love. We know from theology that individuals engage in rites, rituals, prayers, singing, fasting, adoration and worship. People travel to holy places, adore and worship spiritual leaders, collect things, build altars and shrines, all which are sacred to them. Regarding love objects we are still unaware of much of the private rites and worshipping behavior. However, we know from introspection that we fast for *the* wedding gown, that we pray for good weather to be able to ride our bike, and that we caress and polish our cars. We even make pilgrimages to the Museum of Modern Art in order to see the original design of our love object. Whereas some behavior becomes public at some point, other devotional acts are kept private. Knowledge about private meanings of possessions is rich (Csikszentmihalyi and Rochberg-Halton, 1981; Richins, 1994), but we know much less about how individuals act upon love objects and keep this love alive, apart from public spheres.

DISCUSSION AND DIRECTIONS FOR FUTURE RESEARCH

As developed in our synthesis, devotion conveys the meaning of love, close connectedness, and a religious form of zeal. From our discussion of the extant literature derives a tripartite, yet closely interwoven, concept of devotion encompassing *passion*, *intimacy*, and *dedication*. In future research, an investigation into the interplay among the three elements will provide important empirical underpinnings of consumer devotion, and provide a categorization of person-object relationships. Sternberg (1997) and Lee's (1973) love styles could serve as a starting point for an extension to objects and brands.

As with regard to the behavioral aspects of devotion, we should further look at the intimate and private acts of devotion and how they contribute to consumers' self-identity and personal growth. Acts of devotion might reflect particular forms and intensities of consumer-object relationships, which we don't know yet. A brand

could facilitate and support those acts of devotion, for instance by providing 'holy' places where the devotee can adore the brand; by facilitating private rituals; or by inviting devotees to create their own love object.

Devotees also show their dedication to their worshipped brand to others. Their role as ambassadors of the brand should not be underestimated. Being convinced of their object of devotion and its centrality in their lives, devotees share their opinion and feelings concerning the brand with others. Thus, they might influence potential consumers to the advantage or disadvantage of the brand. However, they might act differently in this respect as compared to other members of a brand community, because of their intimate, private relationship with the brand. Hence, future research is needed to clarify their role within a broader social context.

Considering that each partner in an interpersonal relationship has chosen his complement for good reasons, there might be specific characteristics in products or brands that increase their adequacy as object of devotion. Gender could make a difference regarding men and women's propensity to become devoted to different objects. Monga (2002) has already reported findings that men and women do not engage in brand relationships in the same way.

Investigations into the intensity of consumer devotion seem important as it could be both enriching and detrimental to consumers and consumer-brand relationships. Just like pathological forms of love exist in interpersonal relationships, pathological forms of devotion to a brand or product can emerge. Findings from research into compulsive consumption and addictive behavior show an increased vulnerability of individuals with a general addictive predisposition and low self-esteem to develop pathological forms of devotion (O'Guinn and Faber, 1989; Hirschman, 1992). We expect that an investigation on the propensity of different human personalities to addictive forms of devotion will contribute to avoid potentially detrimental consequences.

A potential harm for consumers might also arise from a late awareness that there is a decisive difference between interpersonal relationships and relationships with objects. When love objects are treated as substitutes for human relationships, which are essential in human life, ethical concerns arise. If a brand cannot fulfill the expectations of the devotee, the devotee might not only quit the relationship but also feel abused, disrespected and betrayed by a brand. Hence, for one thing, as Holt (2002) maintains, brands need to be authentic. Additionally, encounters between brands and consumers should reflect respect and concern.

It might be challenging for consumers and companies to draw the line between an enriching devotional relationship with a brand and its pathological counterparts. Yet, we should not close our eyes before the potential perils of pulling consumers into such tight and personally challenging relationships with a brand. True and authentic brands should aim to contribute to a re-enchanted world and enable both, the consumer and the brand, to grow.

When More May Be Less: The Effects of Regulatory Focus on Responses to Maximal/Minimal Comparative Frames

Shailendra Jain, Indiana University, USA
Nidhi Agrawal, Northwestern University, USA
Durairaj Maheswaran, New York University, USA

ABSTRACT

We examined the consequences of regulatory focus on exposure to two types of comparative advertising frames—a maximal (“Brand A is superior to Brand B”) and a minimal claim (“Brand A is equivalent or similar to brand B”). Experiment 1 featured brand vs. brand comparisons while experiment 2 compared a brand with a normative standard. For promotion-focused people, a maximal frame simply represented a gain over a minimal frame leading to more favorable elaboration and greater persuasion. To prevention-focused individuals, maximal frames represented either a “no loss” or a “deviation from the norm”. The former representation led the two frames to be equally persuasive. The latter representation led to greater negative elaboration of maximal frames, making them less persuasive.

INTRODUCTION

Recent research has found that the effectiveness of comparative advertising is moderated by several message features (valence of comparison: Jain and Posavac 2004; gain/loss framing: Shiv, Edell, and Payne 1997, 2004; alignability: Zhang, Kardes, and Cronley 2002; featured attribute’s typicality: Pechmann and Ratneshwar 1991) that systematically affect persuasion. We examine the differential persuasion effects of a *maximal* claim where the sponsor brand claims superiority over a comparison object, and a *minimal* claim where the sponsor brand claims parity with the comparison object (Buchanan and Smithies 1989). An example of maximal claims is Visa’s claim that it is accepted more widely than American Express. Minimal claims are exemplified by Nissan Altima’s claim that it has the same trunk space as a BMW.

While these examples suggest that maximal and minimal claims are mostly made in a brand vs. brand context, claims of brands comparing themselves against an established standard or a norm are also observed. For instance, manufacturers of dietary supplements cite their brands as meeting specific dietary and nutritional guidelines established by the FDA (e.g., % daily recommended value of vitamins, fiber, and other nutritional ingredients). Several automobile brands are often advertised as meeting specific regulatory standards relating to fuel emission and/or safety (e.g., performance in a crash test). We investigate minimal and maximal claims in brand vs. brand as well as brand vs. standard comparison contexts. Besides identifying and investigating different types of comparisons, our research makes two additional contributions. One, it examines regulatory focus (Higgins 1997) as a moderator of effectiveness of these two comparison frames; and second, it provides insight into the processes underlying this moderation.

REGULATORY FOCUS

Regulatory focus theory suggests that distinct motivational systems govern people’s drive to attain desired outcomes. To achieve these outcomes, a consumer may choose to either “approach outcomes that match the desired end-state” or “avoid outcomes that mismatch the desired end-state” (Crowe and Higgins 1997). Some consumers might prefer to maximize the occurrence of positive outcomes (e.g., hopes and achievements). Thus, they are driven towards scenarios representing ‘gains’ and away from

scenarios associated with ‘non-gains’. In contrast, others may focus on minimizing the occurrence of negative outcomes (e.g., duties and responsibilities). They are motivated by the absence and presence of undesirable outcomes and are thus more driven towards approaching ‘no loss’ situations and avoiding ‘losses’. The motivational system that approaches positive outcomes is termed promotion focus while the system that is driven by avoiding negative outcomes is called prevention focus (Higgins 2000).

Recent research has examined the role of regulatory focus in persuasion and has shown that the effectiveness of an appeal advocating attainment of prevention/promotion goals varies depending on the context and/or frame of the appeal. Chernev (2004) found that prevention-focused individuals show a greater preference for status-quo than promotion focused individuals. Lee and Aaker (2004) demonstrated that gain-framed appeals were more persuasive for promotion-focused individuals, but loss-framed appeals were more effective for prevention-focused individuals. However, research on regulatory focus has not examined how the effectiveness of different types of comparisons may differ for promotion- and prevention-focused individuals. We suggest that maximal frames are more persuasive under a promotion orientation while minimal frames, depending on how they are perceived, are either equally or more effective than maximal frames under a prevention orientation. Further, we examine the processes that may underlie the judgments evoked by exposure to different frames by consumers with different regulatory foci.

HYPOTHESES

Higgins (1997) suggests that individuals with a promotion focus work towards *maximizing* gains and/or minimizing non-gains. In contrast, a prevention focus is driven towards *minimizing* losses and/or maximizing non-losses. Promotion-focused individuals follow an ‘inclusive’ approach—they focus on striking ‘hits’ and avoiding misses. Alternately, a prevention focus fosters an ‘exclusive’ approach—the focus is on incorporating correct rejections and steering clear of ‘false-alarms’. In particular, promotion-focused individuals avoid committing errors of omission while prevention-focused individuals avoid making errors of commission (Crowe and Higgins 1997). Because of their drive to approach hopes and aspirations, promotion-focused individuals are open to change and prefer advancement to maintaining their existing states (Chernev 2004; Liberman et al. 1999), and are likely to set maximal goals (Crowe and Higgins 1997). Thus, when a brand is presented as superior to or exceeding a comparison brand versus being similar to it, promotion-focused individuals would be more persuaded by superiority rather than similarity claims. This outcome is predicted because in the ‘superior (vs. similar) to a comparison brand’ frame, the sponsor brand presents a gain (non-gain) and an advancement (vs. no improvement) from the norm.

Prevention-focused individuals focus on stopping losses and attaining non-losses. When a brand is presented as being at parity with a comparison brand, it represents a non-loss to them. Similarly, when the sponsor brand is seen as exceeding the comparison brand, any positive movement from an accepted entity is also likely to be perceived as a non-loss. Higgins (2000) states, “the duties, obliga-

tions, and responsibilities (that drive a prevention-focused individual) function more like minimal goals which a person must attain." Thus, under a prevention-focus, a brand that is similar to a comparison brand is acceptable because it meets established expectations. A brand that is superior to the comparison brand also offers the same 'non-loss'. Hence, prevention-focused people should find both minimal and maximal framed comparison equally appealing.

H1: In a brand vs. brand context, promotion-focused individuals will be more persuaded by maximal (vs. minimal) frames while prevention-focused individuals will be equally persuaded by minimal and maximal comparative frames.

Valence of Elaboration. Regulatory focus is expected to guide the valence of message-related elaboration. Promotion-focused individuals are likely to think more favorably of a maximal (vs. minimal) comparative frame because it represents their gain-driven goals. Hence, maximal (vs. minimal) framed comparisons should lead to more favorable elaboration. For such individuals, more positive thoughts and fewer negative thoughts should be evidenced in response to maximal frames than minimal frames. To prevention-focused individuals, both, maximal and minimal appeals represent non-losses and hence should be equally desirable. So, the valence of the thoughts generated by the prevention-focused individuals should not vary as a function of frame. To examine this 'nature of elaboration' prediction, we relied on a valenced elaboration index of positive minus negative thoughts (Maheswaran and Chaiken 1991).

H2: For the promotion-focused individuals, the valenced elaboration index would be more favorable when featuring a maximal frame. However, prevention-focused individuals will have equivalent valenced elaboration index across both frames.

EXPERIMENT 1

97 undergraduate students participated in a 2 (promotion vs. prevention focus) x 2 (maximal vs. minimal comparison frames) between subjects experiment in two purportedly unrelated studies in exchange for course credit. The first study manipulated focus through a brand name recognition task (see Higgins et al. 1994-experiment 4). Participants were informed that the task will require them to solve anagrams that were 'jumbled-up' brand names and they will be assigned points for each name. In the promotion (prevention) focus condition, respondents began with 0 (12) points and were informed that they will gain (lose) 2 points when they got a brand name right (wrong) and will not win (not lose) 2 points when they didn't get the brand name right (wrong).

Next, respondents completed a second study that exposed them to a toothpaste advertisement. In the maximal (minimal) frame condition, the sponsor brand was described as preventing cavities 'more effectively than' ('as effectively as') the comparison brand. Specifically, the copy stated: "Crown is more (as) effective in preventing tooth decay than (as) the leading brand, Gloss. Research has consistently shown that Crown provides cavity protection that is superior (similar) to Gloss. Try Crown today and experience superior (similar) cavity prevention to Gloss." In addition, the sponsor brand was described as having a "Fresh Mint" flavor. The brand names were fictitious to control for prior brand knowledge/preference and were counterbalanced. This counterbalancing did not influence the dependent measures. After looking through the advertisement at their own pace, respondents went to the next page. Respondents then filled all measures (thoughts and

evaluations counterbalanced) and manipulation checks for focus and comparison frames, responded to a suspicion probe, were debriefed and dismissed. The suspicion probe revealed no evidence of hypotheses guessing.

Dependent Measures and Manipulation Checks

Brand Evaluation and Elaboration. Participants evaluated the sponsor brand on four 7-point scales anchored by 'will definitely not consider buying-will definitely consider buying', 'very bad-very good', 'very unfavorable-very favorable', and 'negative-positive' (higher scores indicate more positive evaluations). These items were averaged into an overall evaluation for the target brand ($M=.91$). Thoughts were coded by two independent raters (blind to the hypotheses) as message-related positive, negative, and neutral statements, as well as irrelevant statements (Chaiken and Maheswaran 1994; Jain 2003; Jain and Maheswaran 2000). The judges agreed on 89% of the thoughts and resolved the disagreements through discussion. Positive thoughts indicated positive thinking and approval of the claims presented in the appeal (e.g., "This toothpaste seems like a good one"); negative thoughts indicated thoughts that reflected negatively on the product or were challenges to the claims presented in the appeal (e.g., "I am not sure if what they are saying is true."); neutral statements did not clearly have a positive or negative evaluative implication on judgments (e.g., "The ad was for toothpaste."). Thoughts appearing unrelated to the experimental materials were coded as irrelevant (e.g., "I am ready to head to work"). The number of negative thoughts was subtracted from positive thoughts to yield an index of valenced elaboration.

Manipulation Checks. The manipulation check for the comparative frames elicited participants' rating of the similarity between the two brands on two items anchored by "most different (1)-exact same (7)" and "totally dissimilar (1)-totally similar (7)" ($r=.72$). The manipulation for regulatory focus was assessed using two items. In a 'follow-up on brand name quiz' study, the promotion-focused item assessed the extent to which participants focused on scoring more points and was anchored by "not at all (1)-a lot (7)". The measure for prevention focus assessed the extent to which participants focused on not losing any points with the same end points and numerical anchors.

Results

Manipulation Checks. A 2 (Focus) x 2 (Frame) between-subjects ANOVA was used to analyze the data. The comparative frame manipulation check yielded only a significant main effect-the two brands were seen as more similar in the minimal frame condition ($M_{\text{maximal}}=4.18, M_{\text{minimal}}=4.98; F(1, 92)=12.38, p<.01$), confirming the success of this manipulation. Further, promotion focused participants were concerned marginally more with gaining points ($M_{\text{promotion}}=4.70, M_{\text{prevention}}=3.94; F(1, 93)=2.99, p=0.08$) and significantly less with losing points ($M_{\text{promotion}}=3.31$ vs. $M_{\text{prevention}}=4.63; F(1, 93)=8.51, p<.01$).

Brand Evaluations and Processes. A 2 x 2 ANOVA on sponsor brand evaluation yielded a marginal effect of regulatory focus ($M_{\text{promotion}}=4.38, M_{\text{prevention}}=3.93; F(1, 93)=3.52, p=.07$) as well as a significant focus x frame interaction ($F(1, 93)=4.91, p<.05$; see table 1). Consistent with hypothesis 1, follow-up contrasts indicated that promotion-focused individuals found maximal frames more persuasive ($M_{\text{maximal}}=4.80, M_{\text{minimal}}=3.95; F(1, 89)=6.60, p<.05$) while prevention-focused individuals were indifferent between the two ($M_{\text{maximal}}=3.84, M_{\text{minimal}}=4.03; F<1$).

An ANOVA on the valenced index (positive minus negative) of thoughts yielded two significant effects: a main effect of frame ($M_{\text{maximal}}=.96, M_{\text{minimal}}=-.04; F(1, 93)=8.79, p<.01$) and a focus

TABLE 1
COMPARING TWO BRANDS
MEANS OF KEY DEPENDENT MEASURES (EXPERIMENT 1)

Regulatory Focus	Promotion Focus		Prevention Focus	
	Maximal Frame	Minimal Frame	Maximal Frame	Minimal Frame
Evaluations of Sponsor Brand	4.80	3.95	3.84	4.03
Valenced Elaboration	1.67	-.48	.26	.40

x frame interaction ($F(1, 93)=11.40, p<.001$). Supporting hypothesis 2, follow-up contrasts revealed that promotion-focused individuals had more favorable elaboration when exposed to a maximal frame ($M_{\text{maximal}}=1.67, M_{\text{minimal}}=-.48; F(1, 93)=20.34, p<.001$). For prevention-focused participants, the valence of elaboration did not vary across the two frames ($M_{\text{minimal}}=.40, M_{\text{maximal}}=.26; F<1$).

EXPERIMENT 2

Findings of experiment 1 are consistent with our prediction that focus moderates the effectiveness of comparative frames. In the next experiment, we tested this moderation in a brand vs. standard context guided by the prediction that for the prevention-focused individual, a minimal appeal will be *more* persuasive. The reasoning for this expectation is as follows.

Prevention focus fosters a preference for stability and maintenance of the status quo rather than risking a move to a 'better' position (Liberman et al. 2001). Therefore, prevention-focused individuals find a new brand that meets a credible standard (as in a minimal appeal) acceptable because it represents stability. On the other hand, a maximal claim represents a movement from or challenge to the status quo and hence carries uncertainty with it. Thus, it could be interpreted in one of two ways by a prevention-focused individual: a) simply as a 'non-loss' or b) as a deviation from the norm that may be perceived as a potential source of loss (a.k.a. a 'false-alarm').

In experiment 1, as reasoned earlier, the presentation of a brand as being superior to a competing brand induced perceptions of non-loss. Consumers routinely encounter advertising that promotes a brand as superior to another brand and to that extent, such claims may be simply coded as non-losses. Also, brands might not be associated with being 'guidelines' or 'standards' in quite the same way as, say, an FDA requirement. Thus, under prevention focus, a maximal 'brand vs. brand' comparison is as persuasive as a minimal frame. In a brand vs. standard domain, a brand's claim that its performance exceeds a standard may be perceived as a deviation from an established norm-'false-alarm' or 'possible loss'-that should be avoided. Hence, prevention-focused individuals may find a maximal comparison less persuasive based on their aversion to steering away from the status-quo and their preference for avoiding 'false-alarms'. However, when the brand claims to meet

the normative standards (as in minimal frames), it represents the desirable end-state of 'no loss', and should thus be more persuasive.

H3: In a brand vs. standard context, promotion-focused individuals will be more persuaded by maximal (vs. minimal) frames. Prevention-focused individuals will be more persuaded by minimal (vs. maximal) frames.

The valence of elaboration should also reflect our theorizing. If prevention focused individuals indeed sense a maximal framed comparison to an established standard as a potential loss, then this perceived risk of a loss should be reflected in the valence of thoughts such that maximal (vs. minimal) frames should lead to more unfavorable elaboration. Hence, we predict:

H4: For the promotion-focused individuals, the valenced elaboration index would be more favorable when featuring a maximal frame. However, prevention-focused individuals will elaborate more favorably on a minimal (vs. maximal) frame.

Method

We tested hypotheses 3 and 4 in a 2 (promotion/prevention focus) x 2 (minimal/maximal frame) between subjects experiment conducted among 122 undergraduate participants in two purportedly unrelated studies. In the first study that manipulated regulatory focus, promotion- (prevention-) focused respondents were asked to write down and explain how their 'hopes and aspirations' ('duties and obligations') differed from those they had in their childhood (see Liberman et al. 2001).

Next, in a 'second study', participants were exposed to an ad for a nutrition bar, the copy for which stated: "The FDA (U. S. Food and Drug Administration) and the NAS (Food and Nutrition Board of the National Academy of Sciences) have set up recommended Dietary Allowances and Daily Values (DV) of most nutrients, vitamins, and minerals that we should consume. The Nutri-Bar® was designed to meet (*exceed*) these standards of health and nutrition. Developed to be the body's most efficient source of fuel, each Nutri-Bar® packs 10 grams of complex carbohydrates. That means you can easily satisfy the energy demands of your hectic daily schedule. Add to that our exclusive vitamin formulation

TABLE 2
COMPARING BRANDS WITH STANDARDS
MEANS OF KEY DEPENDENT MEASURES (EXPERIMENT 2)

Regulatory Focus	Promotion Focus		Prevention Focus	
	Maximal Frame	Minimal Frame	Maximal Frame	Minimal Frame
Evaluations of Sponsor Brand	5.07	3.45	3.57	4.64
Valenced Elaboration	1.26	-.61	-1.13	.17

Note: Cell sizes range from 30-31.

which includes 105% DV of the antioxidant vitamins C and E and 105% DV of all eight B-complex vitamins to aid energy metabolism, plus 9-10 grams of high quality protein to help muscles recover and rebuild. These ingredients all add up to nutrition in a convenient, no-melt, no-crumble bar that fuels your daily activities, no matter where your adventures take you. Available in several flavors. The Nutri-bar meets (*exceeds*) the standards. The Nutri-bar meets (*exceeds*) your needs.”

As indicated by the italicized words in parentheses above, only the framing of the comparison of the target brand with a credible standard (FDA and NAS) as meeting/exceeding was varied. Participants then filled the dependent measures as in experiment 1, responded to manipulation check items for the independent variables, were probed for suspicion, debriefed, thanked, and dismissed. No evidence of hypotheses guessing or demand was found.

Dependent Measures and Manipulation Checks

Brand Evaluation, Elaboration, and Manipulation Checks. Brand evaluations ($n=93$) as well as thoughts were collected and analyzed as in experiment 1. Focus manipulation checks asked participants the extent to which they focused on their hopes, aspirations, responsibilities, and obligations on separate 7-point scale items for each of these goals, with the scales items anchored by ‘not at all’ (1) and ‘a lot’ (7). Hopes and aspirations were averaged to form a promotion index ($r=.90$) and responsibilities and obligations were averaged to form a prevention index ($r=.89$) (Liberman et al. 2001). The manipulation check for the frame asked participants to indicate the extent to which they believed Nutri-bar met/exceeded FDA’s requirements, with anchors ‘meets standards set up by FDA’ (1)-‘exceeds standards set up by FDA’ (7).

Results

The data were analyzed using a 2 (Focus: promotion / prevention) x 2 (Frame: maximal / minimal) between subjects full-factorial design. No effects were observed based on the order of administering the dependent variables.

Manipulation Checks. Promotion-focused individuals indeed thought more about hopes and aspirations ($M_{\text{promotion}}=4.06$, $M_{\text{prevention}}=3.18$; $F(1, 118)=6.67$, $p<.05$) and less about duties and obligations ($M_{\text{promotion}}=3.39$, $M_{\text{prevention}}=4.53$; $F(1, 118)=8.85$, $p<.01$). In addition, respondents in the minimal frame condition

thought that the advertised breakfast bar met standards while those in the maximal frame condition thought it exceeded standards ($M_{\text{minimal}}=4.02$, $M_{\text{maximal}}=4.82$; $F(1, 118)=5.56$, $p<.05$).

Brand Evaluations and Processes. An ANOVA on the evaluation of Nutri-bar yielded only a significant focus x frame interaction ($F(1, 118)=26.15$, $p<.001$; see table 2). Follow-up contrasts indicated that promotion-focused participants were more persuaded by the maximal frame ($M_{\text{maximal}}=5.07$, $M_{\text{minimal}}=3.45$; $F(1, 118)=19.34$, $p<.001$) while the minimal frame was more effective under a prevention focus ($M_{\text{minimal}}=4.64$, $M_{\text{maximal}}=3.57$; $F(1, 118)=8.11$, $p<.01$).

As predicted in hypothesis 4, an ANOVA on the valenced index of thoughts yielded the predicted focus x frame interaction ($F(1, 118)=29.28$, $p<.001$). In particular, participants with a promotion focus were more favorable in their elaboration under the maximal frame condition ($M_{\text{maximal}}=1.26$, $M_{\text{minimal}}=-.61$; $F(1, 118)=20.73$, $p<.001$) while prevention focus elicited more favorable thoughts in the minimal frame cell ($M_{\text{minimal}}=.17$, $M_{\text{maximal}}=-1.13$; $F(1, 118)=9.68$, $p<.01$).

GENERAL DISCUSSION

We examined the effectiveness of maximal/minimal comparative messages under different foci when the comparison benchmark was a brand (experiment 1) and a normative standard (experiments 2). Consistent with the promotion-focused goal of seeking gains, the maximal message was more persuasive and favorably elaborated upon. However, under a prevention-focus, its claim of being better than a recommended norm undermined persuasion. When a brand was compared to a brand however, maximal and minimal frames were equally persuasive. Process measures provided insights into the mechanisms that may account for the differences in the judgmental effects of maximal comparison under a prevention-focus. When maximal frames represented a “no loss” (as in experiment 1), then the two frames were equally persuasive. But when maximal frames were perceived to be a deviation from an established norm (experiments 2), they led to negative elaboration and attenuated persuasion.

While past comparative advertising literature has examined gain/loss framing (Shiv et al 1997), valence (Jain and Posavac 2004), and alignability (Zhang et al 2002), our research examines the frame of the ‘extent’ of claimed difference in comparisons. In

the process, it extends comparative advertising literature by identifying two types of comparison—comparison with a norm and minimal (similarity) comparison. While industry practice often relies on a standard-based comparison in advertising, relatively little insight is available on the effectiveness of this frame. We identify conditions under which such a comparison would be productive. Second, while considerable research has addressed the effectiveness of maximal comparisons, the effects of minimal frames have not been well understood. Our studies suggest that minimal frames by themselves may be an important comparative advertising execution since they could be more persuasive than maximal frames in some situations. Also, while most research assumes that maximal comparisons might always be more persuasive, our research shows conditions when maximal frames may be less persuasive than minimal comparative frames.

The present research also extends the literature on regulatory focus. Our findings provide support for the expectation that relative to a current state, promotion-focused individuals are geared towards advancement while prevention focused individuals toward maintenance. In addition, our results are novel in suggesting that prevention-focused individuals might process information pitching a non-loss differently, based on the uncertainty or 'possibility of loss.' That is, for prevention-focus respondents, different contexts may prime different degrees of losses or non-losses. For example, exceeding (vs. meeting) a recommended norm may lead to discomfort and uncertainty about attainment of a non-loss. But being superior to another brand presents as much a non-loss as being equal to another brand. Future research could identify more conditions when prevention-focused individuals may see the same information as representing a 'non-loss' versus a 'potential loss' depending on differing frames or contexts.

One concern across experiments one and two is the difference in domain. In experiment 1, the toothpaste category may be associated more with preventing losses than with promoting gains. The breakfast bars might be more associated with gain-domain. We investigated the differences in gain/loss domain in an ancillary study. We examined category associations by asking 79 undergraduates to rate four categories (breakfast bars, condoms, ice creams, and toothpaste) on two scales regarding the extent to which respondents perceived they "reduce negative feelings"(1)/"increase positive feelings"(7) and "prevent problems"(1)/"promote benefit"(7)" ($r=0.78$; lower scores indicate more loss/prevention association). Besides the finding that the difference in means for the two stimulus categories was not statistically significant ($M_{\text{breakfast bars}}=4.37$, $M_{\text{toothpaste}}=4.18$, $F<1$), their average rating was around the mid-point of the scale, suggesting that their domain (gain/loss) was ambiguous (in comparison, condoms received a rating of 2.7 suggesting a strong prevention/loss focus and ice creams were rated at 6.2 suggesting a strong promotion/gain focus). Hence, the difference in gain and loss domains does not explain our findings. However, future research would benefit from testing circumstances where gain and loss domains might lead to differential effects for regulatory focus or comparative frames.

A limitation of our research is that we have used different categories to represent different contexts in separate experiments. It would be useful to test our predictions either by controlling for the category or through category replicates. In particular, an important task for future investigations is to identify factors that may systematically activate the non-loss and deviation mechanisms under a prevention-focus. Also, follow-up inquiries could help identify conditions other than prevention focus that might influence the effectiveness of norm versus brand-based comparisons. Future research could also investigate the effects of regulatory focus on comparative frames using further measures of processing (time

spent, elaboration) and effectiveness (ad credibility, claim believability, evaluations of competing brands). We have proposed an individual's regulatory motivation moderating the impact of different comparative ad frames. There has been an increasing interest in individual differences (e.g., Sorrentino and Roney 2000) and motivational variables (e.g. Agrawal and Maheswaran 2005a; Jain 2003; Jain and Maheswaran 2000) as predictors of a host of process and persuasion-related measures. While our research examines regulatory focus differences in a specific comparative context, examining other variables such as self-monitoring (Snyder 1974), self-construal (Agrawal and Maheswaran 2005b), and cultural differences (Gürhan-Canli and Maheswaran 2000; Maheswaran and Agrawal 2004), may further deepen our understanding of framing effects in general and comparative advertising effects in specific.

“Be All You Can Be”: The Influence of Advertising Slogans on Regulatory Focus and Consumer Spending Behavior

Marieke L. Fransen, University of Twente, The Netherlands

Bob M. Fennis, University of Twente, The Netherlands

Ad Th. H. Pruyn, University of Twente, The Netherlands

EXTENDED ABSTRACT

Advertisers and marketers often try to influence consumers' choices by creating advertising slogans that appeal to our future goals, dreams and wishes (e.g., “Let’s make things better”, “Just do it”, “Be all you can be”). Associating brands with personal dreams and ambitions may imply that purchasing these brands can help us achieve and express our ideals and aspirations. In two studies we test the proposition that exposure to advertising slogans containing values related to achievement and personal goals will make consumers aware of the discrepancy between the person they are at this particular point in time (actual self-state) and the person they desire to be in the future (ideal self-state). We propose that this slogan-induced discrepancy can be decreased by various forms of consumer behavior, not necessarily related to the advertised product.

Regulatory Focus Theory (Higgins 1997) states that individuals adopt a *promotion* focus orientation when they are concerned with reaching their ideal selves. Individuals with this strategy regulate their behavior towards desired end states and positive outcomes in order to decrease the experienced discrepancy between their actual and ideal state. Based on earlier research, showing that advertisements focusing on the independent self can induce promotion-related values (Hamilton and Biehal 2005), we expect that advertising slogans reminding us of the goals and ideals relating to our hopes, wishes, and aspirations are suited to directly induce the self-regulation mechanism of promotion focus. Furthermore, we hypothesize in study 1 that this activated promotion orientation influences personal spending intentions. We predict that participants who are exposed to promotion-related slogans intend to spend relatively more money on means that will help them achieve their goals and aspirations (i.e., education) than on means unrelated to valued promotion ideals (i.e., entertainment).

Study 1

We tested our hypotheses in a 2 (slogan: promotion-focused vs. control) x 2 (spending: education versus entertainment) design with repeated measures on the second factor. Participants' focus orientation was manipulated by either exposing them for 40 seconds to four promotion-based slogans for various products (e.g., “Straight to your dreams”) or to four different neutral control slogans for the same products (e.g., “Getting you around”). After exposure, participants completed an adapted version of the proverb-task (Stekelenburg and Klandermans 2003) which measured participants' state focus orientation. Subsequently, they were asked to estimate the amount of money they were planning to spend on their academic education and entertainment in the upcoming month.

As expected, we found that participants in the promotion-focus condition were more promotion focused than participants in the control condition. Moreover, compared to participants in the control condition, we found that participants in the promotion-focused condition planned to spend relatively more money on means related to aspirations and accomplishment, i.e. on their academic education, than on entertainment.

Study 2

In study 2 we extended the results found in Study 1 by focusing on actual spending behavior. Based on the “value from fit” principle (Higgins 2000), entailing the notion that individuals experience a

regulatory fit when they pursue goals that match their (current) focus, we propose that participants are more inclined to donate money to a charity that expresses values that are congruent with their current orientation, than when the charity's values and goals are incongruent with their current orientation. Furthermore, we test whether private self-consciousness moderates the effect of orientation fit on charity donation. People with a high private self-consciousness are more attuned to their inner state and feelings than people with a low private self-consciousness. We expect that this salience of inner feelings and state intensifies the experienced focus orientation and therefore increases the experienced fit or misfit, which will affect the amount of money donated.

These hypotheses were tested in a 2 (orientation: fit versus misfit) x 2 (private self-consciousness: high versus low) between-subjects design. To measure participants' individual differences in private self-consciousness, participants completed a translated version of the Private Self-Consciousness Scale (Vleeming and Engelse 1981) originally developed by Fenigstein, Scheier, and Buss (1975). We used the same focus orientation manipulation as in study 1 wherein half of the participants were exposed to promotion-based slogans and half of the participants to control slogans. After the ostensible end of the experiment, participants were asked to donate some money to an unrelated charity aimed at helping educational projects in third world countries. Before they had to decide whether and how much money they wanted to donate they received information concerning this charity. This information contained clear promotion orientation goals and values related to accomplishment and achievement. This enabled us to create a fit condition (promotion-based slogans and promotion-oriented charity) and a misfit condition (control slogans and promotion-oriented charity).

The results showed that actual spending behavior was affected by exposure to promotion-based slogans. Participants donated more money when the expressed values of the charity matched their own regulatory focus than when there was no such fit. Furthermore, as expected, we found that private self-consciousness moderated the relation between orientation induction and donation. Participants high in private self-consciousness donated more money to the charity when it matched their orientation than when it did not fit with their current orientation. For participants low in private self-consciousness, the impact of orientation fit on amount of money donated was less pronounced. This suggests that participants with a high private self-consciousness are more aware of their current orientation state and experience “the value from fit” more intensively than participants with a low private self-consciousness. Interestingly, for these individuals, a regulatory focus induced by advertising slogans was found to carry over and affect consumer behavior in an unrelated domain: i.e., donating money to charity.

These results have important theoretical as well as practical implications. We found that a slogan-induced orientation state can affect actual spending behavior. Furthermore, we extended earlier findings on the impact of regulatory focus on consumer behavior by assessing the role of the consumer's self-consciousness and found evidence for the notion that the “value from fit” perception requires a “mirror on the self”. On a practical note, our findings are of importance for marketers as they should keep in mind that activating desired goals and ideals may benefit other causes than their own.

**Does Confirmation Trump Valence?
Confirmation and the Effects of Negative and Positive Political Advertising**

Joan M. Phillips, University of Notre Dame, USA

Joel E. Urbany, University of Notre Dame, USA

Thomas R. Reynolds, University of Texas at Dallas (Emeritus) and SRDA, USA

EXTENDED ABSTRACT

In spite of long discussion of the detrimental aspects of negative advertising in a political domain, it continues to be a widely used, almost fundamental element of many election campaign strategies. Recent academic research has suggested that negative advertising may actually be ineffective because it only appeals to those who are already predisposed to dislike the targeted candidate (i.e., “preaching to the choir”). Yet, this research does not provide direct evidence of advertising reactions. We explore negativity by comparing the effects of negative (anti-opponent) and positive (pro-sponsor) advertising on voting intentions shortly before the November 2004 U.S. presidential election, accounting for voters’ prior preferences. Our initial hypothesis that confirmation (i.e., seeing an ad for the preferred candidate) would trump valence (positive or negative advertising) did not hold true—negative advertising got generally poorer reviews and produced more counterarguing than did positive advertising whether it was for the favored candidate or the opponent. In spite of this, however, negative advertising was more likely than positive advertising to produce shifts in voting intention *in the direction of the ad*. While small given the strong priors of our participants at this late date in the election cycle, these effects included both reinforcement/strengthening of priors *and* preference-changing shifts. We explore the implications of our results for the effectiveness of negative advertising.

Perceived Variability, Category Size, and the Relative Effectiveness of “Leading Brand” Versus “Best in Class” Comparative Advertising Claims

Xiaojing Yang, University of Wisconsin, Milwaukee, USA
Shailendra Jain, Indiana University Bloomington, USA
Charles Lindsey, State University of New York, Buffalo, USA
Frank Kardes, University of Cincinnati, USA

EXTENDED ABSTRACT

Direct comparative ads map an advertised brand to a specific strategically-selected competing brand (e.g., “Visa is better than American Express”; “Pepsi is better than Coke”), and indirect comparative ads imply superiority to other brands without mentioning any specific competing brands by name (e.g., “Benadryl Allergy Relief is 54% more effective than the leading prescription antihistamine”; “Chevy is the biggest truck in its class”, and “You are more certain of safe delivery of your urgent documents with FedEx than with other carriers”). Two major types of indirect comparative ads are frequently used: “Better than the Leading brand” indirect comparative ads state that the advertised brand is better than the leading member of the product category, and “Best in class” indirect comparative ads state that the advertised brand is generally the best brand in the product category. “Leading brand” indirect comparative ads invite consumers to compare the advertised brand to a specific instance or member of a product category, whereas “Best in class” indirect comparative ads encourage consumers to compare the advertised brand to a global abstraction-based representation of a product category. Our research investigates the antecedents and consequences of instance- versus abstraction-based comparative processing.

It is proposed in the paper that exposure effects to these different indirect comparative ads are moderated by two factors: (1) perceived variability or the perceived dispersion of category instances around the prototype or the abstraction of the central tendency of category members on a given attribute (Park and Hastie 1987) and (2) category size. When perceived variability is high, consumers focus on specific instances and engage in confirmatory search, regardless of category size (Mussweiler 2003; Sanbonmatsu, Posavac, Vanous, and Ho 2005). “Leading brand” claims are likely to be more effective than “Best in class” claims and the matching hypothesis is supported.

Disconfirmatory or negative search is likely to occur when perceived variability is low (Mussweiler 2003; Sanbonmatsu, Posavac, Vanous, and Ho 2005). When category size is large, consumers prefer to focus on abstractions and “Best in class” claims that encourage consumers to compare the advertised brand to an abstraction-based representation facilitate disconfirmation. Consequently, “Leading brand” claims are likely to be more persuasive. When category size is small, consumers prefer to focus on instances and “Leading brand” claims that encourage consumers to compare the advertised brand to instance-based representations facilitate disconfirmation. Consequently, “Best in class” claims are likely to be more persuasive. Thus the mismatching hypothesis is supported.

Two experiments were conducted to test our expectations regarding the interaction between perceived variability, category size, and advertising claim. Both experiments were 2 (type of indirect comparative ad: “Leading brand” vs. “Best in class”) x 2 (category size: large vs. small) x 2 (perceived variability: high vs. low) full-factorial between-subjects design. Participants were asked to review an indirect comparative ad (“leading brand” or “best in class”) and complete a questionnaire containing relevant dependent variables (brand evaluations, covariates) at their own pace. The

differences between the two experiments are as follows: (1) Real product categories were used for each cell in the first experiment. By contrast, perceived variability and category size were manipulated using a fictitious survey in the second experiment. (2) In the second experiment, process data was collected (level of counterarguing to measure confirmation/disconfirmation; type of information relied on—instance vs. abstraction based) to enable a direct test of mediation. Analysis of the data obtained from the two experiments revealed support for our hypotheses.

SPECIAL SESSION SUMMARY

Regulatory Focus and the Use of Time in the Evaluation of Persuasive Messages

Anne-Laure Sellier, New York University, USA

Brian Sternthal, Northwestern University, USA

SESSION OVERVIEW

In recent years, consumer researchers have increasingly studied self-regulation issues, acknowledging that consumer decisions do not take place in a “motivational vacuum” (Pham and Higgins 2005). In particular, regulatory focus theory (Higgins 1997) proposes two distinct motivational systems regulating behavior: promotion and prevention focus. Individuals in a promotion focus follow a strategy emphasizing the pursuit of gains (or the avoidance of non-gains). Individuals in a prevention focus follow a strategy emphasizing the avoidance of losses (or the pursuit of non-losses). Considerable consumer research showed that these foci differ not only in how goals are framed, but also in how they influence persuasion (e.g., Lee and Aaker 2004), which suggests that regulatory focus influences both the type of evaluative content and the type of evaluation strategy that follows (Pham and Higgins 2005). Our objective in this session is to show that the duality of promotion and prevention also does not express itself in a temporal vacuum, and that consumers in these foci *actively and differently use time* in shaping their attitudes (Pennington et al.; Sellier and Chattopadhyay; Jain et al.). Therefore, the topic we propose is: *how consumers in different regulatory foci differently use temporal cues in shaping their evaluations and ways of thinking*.

While the notion of time as a resource is not new to consumer research, almost no work has been examining how time interacts with regulatory focus (except Pennington and Roesch 2003). We present instances of how consumers in a promotion or a prevention focus strategically use time when evaluating messages. We operationalize time in three ways: construed time (Pennington et al.), experienced time (Sellier and Chattopadhyay), and time processed (Jain et al.).

If all three papers look at the persuasive impact of the interaction between time and regulatory focus, they each address substantially different questions: Pennington et al. ask if a prevention-framed versus a promotion-framed message is equally persuasive when a product is to be purchased in the near versus the distant future. Sellier and Chattopadhyay examine whether a short rather than a moderate download time always lead to more positive website evaluations. Jain et al. ask whether consumers process different parts of comparative ads at different times, depending on their regulatory focus. In addition, these papers present findings of both theoretical and practical significance: Pennington et al. find that when a purchase is temporally *proximal*, consumers prefer prevention-framed rather than promotion-framed messages; when a purchase is temporally distant, consumers equally like prevention- and promotion-framed messages. Jain et al. find that when processing a comparative ad, prevention-focused participants have lower evaluations of the comparison brand when they are exposed to a negative rather than a positive comparison frame; promotion participants evaluate the comparison brand equally across both types of frames. One reason for this asymmetry is that prevention-focused consumers evaluate the comparison brand first, while promotion-focused consumers evaluate the advertised brand first. Thus, *when* different parts of the message are integrated leads to different evaluations of the comparison brand. Finally, Sellier and Chattopadhyay find that while promotion-focused participants evaluate a website more negatively when experiencing a moderate (5-10 s.) rather than a short (0-1 s.) download time when they click

on a link, the reverse occurs for prevention-focused participants. Together, our findings suggest that *depending on their motivational approach, consumers differently use time when shaping their evaluations; time is attributed distinct values, resulting in the same persuasive message to predictably vary in persuasiveness*.

EXTENDED ABSTRACTS

“The Pressing Preference for Prevention: The Impact of Temporal Construal on the Persuasiveness of Prevention versus Promotion Framed Product Information”

Ginger L. Pennington, University of Chicago

Jennifer L. Aaker, Stanford University

Cassie Mogilner, Stanford University

Persuasive messages often convey “motivationally loaded” information that may encourage consumers to view a product or service in either approach or avoidance terms. This research examines the influence of purchase proximity on the effectiveness of prevention- versus promotion-framed product claims and explores a possible mechanism by which such effects occur.

The literatures on construal level theory (CLT; Liberman and Trope 1998; Trope and Liberman 2003) and regulatory focus theory (RFT; Higgins 1997) suggest hypotheses concerning the effect of time on the persuasive impact of prevention versus promotion-framed messages. First, consider the need to make an immediate purchase. Imagine you have a dinner party planned for that evening. As you are driving home from work, you realize you should buy a bottle of wine. Work on CLT suggests that in an instance of temporal constraint, feasibility and operational concerns become salient to you, and thus the concreteness of actions should assume priority (e.g., “how can I get a bottle of wine, pronto?”). Your mind should race to specific actions that are necessary to avoid potential impediments to goal fulfilment. Unlike promotion frames, prevention frames focus on such requirements (Brendl and Higgins 1996). That is, prevention frames recognize the possibility of a negative outcome but provide the consumer the concrete means to avoid it. In contrast, promotion frames do not have such a concrete focus; rather they center on the possibility of a positive outcome and excite the consumer with eagerness to achieve it. Consequently, we predict that when consumers have to make an immediate purchase decision, they will prefer products framed with a prevention message over those framed with a promotion message.

This preference for prevention-framed messages should, however, decline when the purchase does not need to be made immediately. When the dinner party, for example, is next month rather than tonight, the wine presented in a prevention-framed message should be as popular as a wine presented in a promotion-framed message. This hypothesis is supported by the finding that high-level construals (associated with temporal distance) reduce individuals’ reactivity to contextual factors (e.g., Nussbaum, Trope, and Liberman 2003)). Therefore, a consumer facing a distant purchase is expected to think about the purchase in terms of his or her overarching goal (e.g., “why do I want this?”), showing little sensitivity to the prevention versus promotion framing of persuasive messages.

Three studies tested the predictions that when a purchase occasion is close at hand, prevention-framed messages that focus on avoiding negatives will be more persuasive than promotion-

framed messages that focus on the presence of positives. And by contrast, when the purchase occasion is in the distant future, the frame of the message will not affect its persuasiveness. One reason for these effects may be that temporal perspective alters the way in which individuals cognitively construe the purchase situation (Trope and Liberman 2003). We examined this mechanism through tests of moderation where cognitive construal was manipulated and tests of mediation where cognitive construal was measured.

In Study 1, participants imagined themselves in a purchasing situation that was described as distant (one month away) or proximal (2 days away). Participants were then presented with either a promotion-framed message (e.g., “the satisfaction of getting a good deal”) or a prevention-framed message (e.g., “the satisfaction of never paying too much”). As expected, the prevention-framed message was preferred in the temporally constrained conditions, whereas both messages were equally liked in the distant purchase conditions.

Study 2 tested whether consumers in a concrete, detail-oriented mindset (the type of thinking adopted for proximal events) would be more persuaded by prevention-framed messages, while consumers in an abstract mindset (the type of thinking for distant events) would be equally persuaded by prevention- and promotion-framed messages. Participants in this second study evaluated one of four types of advertisements for athletic shoes. The text of each message was altered to manipulate regulatory focus (promotion/prevention) and construal (abstract/concrete). Consistent with a moderating role of construal level in the temporal effect found in Study 1, participants preferred prevention-framed messages when concrete thinking was emphasized but were indifferent between prevention- and promotion-framed messages when abstract thinking was emphasized.

Study 3 tested whether the perceived temporal immediacy of a purchase differentially affected consumers’ motivations to purchase prevention-framed versus promotion framed products. Participants thought of a product, which they planned to buy in approximately two weeks that would either help bring about a desirable outcome (promotion) or help prevent an undesirable outcome (prevention). Perceptions of temporal proximity were manipulated through small differences in the instructions (e.g., “relatively soon” vs. “later on”), and the participants’ associated thoughts were coded as representing either a high- or low-level of construal. The results showed that prevention-framed products were viewed more favorably than promotion-framed products in the context of proximal purchases, but that they were viewed similarly in the context of distant purchases. One reason for this effect was the evocation of low-construal thoughts when participants considered purchasing a prevention- (vs. promotion-) framed product in the near future.

Taken together, these results suggest ways in which managers might effectively target consumers at different stages in the purchasing process and identify the cognitive processing underlying consumers’ evaluative responses.

“Faster Is Not Always Better: Regulatory Focus and the Interpretation of Download Time”

*Anne-Laure Sellier, New York University
Amitava Chattopadhyay, INSEAD*

We challenge the assumption among academics and practitioners that the faster the average download time (DT) experienced while surfing, the more positive consumers’ evaluation of a website will be (e.g., McKinney, Yoon, and Zahedi 2002). Drawing on regulatory focus/fit theory (Higgins 1997; Higgins et al. 2003) and the literature on conversational norms (see Moon 1999), we show

that moderate DTs (5 -10 s.) can lead to more positive website evaluations than short DTs (0-1 s.). While there is empirical evidence suggesting that long DTs (>10 seconds) negatively impact attitudes toward the object with which the delay is associated compared to short DTs (1 second), no research has examined the impact of short DTs compared to more moderate DTs (5-10 s.), on website evaluation. This is important, as companies are investing significant amounts to achieve DTs lower than one or two seconds globally (Pappalardo 2005).

Regulatory focus theory (Higgins 1997) distinguishes between two strategies that consumers adopt when approaching their goals: a promotion or a prevention focus. This distinction applies to the study of online behavior, given that web-surfing is a goal-directed action (e.g., Alba et al. 1997). Of particular relevance, promotion-focused people adopt eagerness as a strategic inclination (Crowe and Higgins 1997). This inclination should make people prefer a website more, the shorter the average DT, because of a better regulatory fit (Higgins 2003). In contrast, people in a prevention focus adopt vigilance as a strategic inclination, and present a high sensitivity to norms (Crowe and Higgins 1997). For them, a moderate DT (5-10 s.) may generate a more positive website evaluation than a short DT (0-1 s.) for two reasons: first, consumers may have a greater fit experience when DT is moderate rather than short. This regulatory fit has a limit: when DT gets too long (>10 seconds) as the goal approach is disrupted (Nielsen 1993), and hence website evaluation gets adversely affected. A regulatory fit explanation would also predict that web users would find the information they are processing more correct when experiencing fit rather than non-fit (Camacho, Higgins, and Luger 2003). Also, they should enjoy their web surfing task more when experiencing fit rather than non-fit (Freitas and Higgins 2002).

A second explanation is that because of their conservative bias, consumers in a prevention focus mindlessly apply conversational norms when interacting with a website (i.e., they treat clicking on a link as though they were asking the website a question). A conversational norm which was speculated to extend to human-computer interaction (Moon 1999) is that too fast (too long) an answer is perceived as less credible than an answer provided after a few seconds. We tested whether these explanations were supported in three studies.

In study 1, participants surfed a prevention-framed website for a fictitious sleeping pill. Participants either experienced a short (0-1 s.), a moderate (5-10 s.) or a long (13-18 s.) DT. They then reported their website evaluation. A quadratic contrast showed that the website evaluation was more positive when DT was moderate rather than short/long.

In a second study, we created a website for a home HIV test, and manipulated its content, so that participants would adopt either a promotion (e.g., “the quick and easy FDA Approved home test for everyone, so the eradication of AIDS becomes a reality”) or a prevention focus (e.g., “the FDA Approved home test for detecting the HIV-virus”). Participants either surfed the promotion-framed or the prevention-framed website, and either experienced a short (0-1 s.) or a moderate (5-10 s.) DT. All participants then reported their website evaluation, as well as a source credibility scale and their enjoyment with the task. Results revealed an interaction of regulatory focus and DT, and the analysis of simple effects showed that participants in a promotion (prevention) focus evaluated the website more positively when experiencing a short (moderate) DT. The evaluation of source credibility mediated this effect, and was higher in the fit compared to the non-fit conditions. Also, participants in the fit conditions enjoyed the web surfing task more than participants in the non-fit conditions.

A third study provided a competing test of the regulatory fit and the conversational norm account. All participants surfed the prevention version of the website in Study 1, experiencing either a short or a moderate DT. Subsequently, a third of the participants evaluated the website directly, as in Study 1 (control condition). For those participants, we expected to replicate our findings that a moderate rather than a short DT leads to enhanced website evaluations. A third of participants rated how they felt about their goal pursuit before they evaluated the website. Because their attention was drawn to the source of the experience of fit, we expected the effects in Study 1 to either disappear or be significantly attenuated if regulatory fit was causing the effects observed in Study 1 (Schwarz and Clore 1983). Similarly, a third of participants rated to what extent they felt they applied interpersonal conversational norms to their communication with the website before they evaluated the website. We replicated the effect from Study 1 in the control conditions; the effect disappeared in the fit conditions, but not in the conversational norms conditions. In sum, our data supported the regulatory fit account more than the conversational norm account.

These results show that we can manipulate content to improve the fit between the DT associated with a website and consumers' regulatory focus. Therefore, DT is not a necessary evil.

“Regulatory Focus and Direct Comparative Ad Framing”

Shailendra Pratap Jain, Indiana University

Charles D. Lindsey, State University of New York at Buffalo

Nidhi Agrawal, Northwestern University

Durairaj Maheswaran, New York University

Which brand do consumers evaluate first in a direct comparative ad (where an advertised brand compares itself with an explicitly-named comparison brand)? How does this temporal sequence of evaluation influence overall persuasion? Importantly, how do consumers evaluate the comparison brand and what are the implications of such evaluations for persuasion? We address these issues by integrating regulatory focus theory with comparative message framing research.

A direct comparative ad frames the advertised brand as better (positive frame; e.g., “Brand A is better than B”) or the comparison brand as worse (negative frame; “Brand B is worse than A”). Promotion-focused people focus more on and display greater eagerness for a positive outcome (advertised brand) than away from its absence (comparison brand). Further, because they desire to secure hits and avoid misses (Higgins 1997), a positively framed comparison permits an inclusion of the advertised brand while not necessarily excluding the comparison brand. Hence, the advertised brand being more effective should not have implications for the evaluations of the comparison brand. In contrast, prevention-focused individuals focus more on the presence of a negative outcome (comparison brand) than on its absence. They emphasize identifying correct rejections and avoiding incorrect ‘hits’. A negative frame indicates that while the comparison brand should be rejected, the advertised brand may be a safe hit. In the positive frame, the comparison brand is merely the absence of a positive, a less appealing proposition for prevention-oriented people. Therefore, avoiding the comparison brand in the negative (vs. positive) frame should lead to less favorable attitudes towards the comparison brand.

We are thus able to predict that promotion-focused participants will evaluate the comparison brand equally across both types of frames while prevention-focused participants will evaluate the comparison brand lower under negative (vs. positive) frames. Also, prevention (promotion) focused participants will evaluate the comparison (advertised) brand first. As a result, prevention (promotion)

focused participants will recall more comparison (advertised) brand information. Finally, because promotion (prevention)-focused individuals place lower (greater) weight on prior choices in making future decisions, they may have lower (higher) preference for consistency (PFC). Because of this difference in PFC, promotion-focused participants' inter-brand ratings should be uncorrelated whereas prevention-focused participants' ratings should be significantly and negatively correlated.

We tested these predictions in two studies. Our first study was a 2 (focus: promotion/prevention) x 2 (comparative frame: positive/negative) between-subjects design featuring home made comparative ads. Following a focus manipulation, participants viewed one of two comparative ads (positive or negative frame), completed the dependent measures (advertised and comparison brand evaluations, counterbalanced), manipulation checks, and the PFC scale.

We observed a significant frame x focus interaction for advertised brand's evaluations as well as comparison brand's evaluations. Promotion-focused participants expressed higher advertised brand evaluations under a positive frame while prevention-focused participants did so under a negative frame. Further, prevention focus led to lower evaluations of the comparison brand under a negative frame while promotion focus resulted in equivalent evaluations across frames. Also, prevention-focused participants exhibited a higher PFC than promotion-focused participants. Finally, inter-brand attitudes were negatively correlated under prevention focus and uncorrelated under promotion focus.

A second study was identical to study 1 except that it featured more dependent measures consisting of two counterbalanced brand cognition probes and a recall task. One brand cognition probe asked participants to “evaluate both brands on a scale of one to seven where 1=extremely bad and 7=extremely good. You can evaluate either brand first.” The second question, presented on a separate page, asked the participants: “which brand did you form an opinion of first?” Next, following a distractor task, participants' recall about each brand was elicited separately.

Mirroring experiment 1, we found that promotion-focused participants evaluated the advertised brand higher in the positive frame while prevention-focused participants did so in the negative frame. Further, prevention focus led to lower comparison brand evaluations in the negative frame while promotion focus led to equivalent evaluations across frames. Prevention-focused participants were more likely to evaluate the comparison brand first (proportion of initial evaluations: advertised brand=.38; comparison brand=.62). The opposite was true for promotion-focused participants (advertised brand=.75; comparison brand=.25). Also, prevention-focused participants were more likely to form an opinion about the comparison brand first (proportion of first opinions: advertised brand=.43; comparison brand=.57). The opposite held for promotion-focused participants (advertised brand=.73; comparison brand=.27). Finally, promotion-focused individuals recalled more advertised brand information while prevention-focused participants recalled more comparison brand information.

SPECIAL SESSION SUMMARY

How Consumers Evaluate the Quality of Purchase Decisions

Justin Kruger, New York University, USA
Gerald Häubl, University of Alberta, Canada

SESSION OVERVIEW

The research presented in this session is centered around the important question of how consumers evaluate the quality of their own and others' purchase decisions. The session features the work of three research groups, each of which has been examining a specific aspect of this general question. The three papers to be presented in this session are highly synergistic in that the implications of each individual piece of work become more significant if considered in conjunction with those of the two other papers.

Prior research has shown that consumers usually prefer choosing for themselves over having others make choices on their behalf because they believe that they can select the best choice option, therefore maximizing outcome satisfaction. That is, consumers assume that their final evaluation of a decision outcome depends solely on the quality of the outcome itself; however, they may fail to consider that the quality of the decision-making process may also influence this evaluation. The research presented by Botti and McGill investigates this hypothesis by showing that consumers' evaluation of a decision outcome is a function of the relevance of the affective experiences associated with the decision-making process and the extent to which decision makers see themselves as instrumental in having had these experiences. When the goal of the decision-making task is hedonic, consumers like choosing more than not choosing and this preference is reflected in greater satisfaction with the decision outcome for choosers as compared to non-choosers. Conversely, when the goal of the decision-making task is utilitarian, affective considerations matter less than objective evaluative standards; as a result, consumers' preference for choosing is mitigated, resulting in a lower difference between choosers' and non-choosers' outcome satisfaction.

Hence, in some circumstances, consumers' satisfaction with their own choices may depend on their perception of the quality of the decision process rather than on that of the decision outcome. In fact, the research presented by Häubl, Dellaert, and Usta suggests that outcome satisfaction may or may not have anything to do with the *quality* of the outcome. This research shows that, although the availability of personalized recommendations (provided, e.g., by a salesperson, a realtor, or a computer-based decision aid) tends to improve the objective quality of consumers' product choices, it does not necessarily increase consumer's satisfaction with their decisions (Häubl and Trifts 2000). The reason? Because this type of decision advice tends to omit undesirable alternatives, consumers must select from an exclusively positive choice set. Although advantageous from the standpoint of decision quality, this lack of differentiation between options can have a negative impact on decision satisfaction. First, it becomes more difficult for consumers to identify the subjectively most attractive option, and this reduces consumers' subjective assessment of, and satisfaction with, their purchase decisions. Second, to the extent that a consumer's satisfaction with a purchase decision is a function not only of the attractiveness of the chosen alternative but also the attractiveness of the rejected alternatives (Mellers 2000), not being exposed to any unattractive alternatives can diminish the subjective assessment of the decision.

That said, the research presented by Kruger and Burrus suggests that rejected alternatives tend to have far less of an impact on evaluations of decision quality than one might think. When evalu-

ating the quality of a decision, consumers tend to focus on the objective features of the option chosen and underweight the objective features of the option(s) rejected. As a consequence, decisions tend to be deemed wise when the chosen option is positive and foolish when it is negative—occasionally even when the rejected option(s) are just as positive or negative. This is true not only when evaluating the wisdom of one's own choices, but also (and perhaps especially) when evaluating the decisions of someone else.

Taken together, the research described in this special session is aimed at providing a better understanding of how consumers evaluate the quality of their own (and others') decisions. This collection of work not only provides significant new theoretical insights, but it also has important practical implications in terms of consumer welfare, and human well-being more generally. Therefore, it fits this year's conference theme particularly well. The session is likely to be of interest to a wide range of audiences, particularly those interested in the psychology of consumer choice, consumer decision processes, decision assistance for consumers, and customer satisfaction.

We were very fortunate to have a leading expert in the field, Mary Frances Luce of Duke University, to serve as discussion leader. All three presentations are based on work that is in progress and that is expected to be submitted to a major journal shortly after the conference.

EXTENDED ABSTRACTS

“Do the Means Justify the End? The Effect of Choice on Evaluation of Hedonic versus Utilitarian Outcomes”

*Simona Botti, Cornell University
Ann L. McGill, University of Chicago*

Prior research indicates that consumers prefer making their own choices rather than having others choose on their behalf and that they are more satisfied with self-chosen as opposed to externally-dictated outcomes (Brehm 1966; Langer 1975). These results have been recently challenged by findings demonstrating that, although people generally prefer choosing, choosers are not always more satisfied than non-choosers. This more recent research builds on the idea that consumers' utility derives both from the decision process and the decision outcome (Thaler 1985) to suggest that the evaluation of an outcome is a function not only of its objective worth but also of the manner in which it is obtained. For example, choosers' satisfaction with a desirable outcome is greater than that of non-choosers because they enjoy contemplating a greater number of pleasant thoughts during the decision task; conversely, choosers' dissatisfaction with an undesirable outcome is exacerbated relative to that of non-choosers by the greater number of task-related unpleasant thoughts (Botti and Iyengar 2004). This enhancing effect of the choice-based affect on outcome evaluation has however been found only when choosing is perceived as instrumental in determining the quality of the outcome. In this case, relative to non-choosers, choosers' satisfaction for a desirable outcome is augmented by self-credit whereas their dissatisfaction is exacerbated by self-blame. On the contrary, when the quality of the outcome is perceived as being virtually independent from the choosers' actions, the act of choice does not seem to add any value to the worth of the selected item (Botti and McGill 2006).

These prior studies have nevertheless investigated choice only in relation to hedonic consumption. It is possible therefore that the enhancing effects of choice on outcome satisfaction may be restricted to such hedonic contexts. Hedonic tasks are inherently self-rewarding whereas utilitarian tasks are undertaken to pursue higher-end goals. Further, affective considerations are usually more important in the former than in the latter case (Pham 1998). Hence, choice-based affect may influence satisfaction more in hedonic domains than in utilitarian ones. That is, how one comes to an experience may affect satisfaction more for hedonic than utilitarian outcomes, which are established mostly on objective, external standards. The present research tests this assertion.

Specifically, we hypothesize that in the positive domains studied in the present research, perception of oneself as being instrumental in the experience of a hedonic outcome augments the pleasure derived from it. Consequently, choosers will be more satisfied than non-choosers because they can credit themselves for the fun and excitement associated with the hedonic outcome. Conversely, utilitarian decision outcomes' evaluation will depend more on its objective value than on the affective value associated with the decision process. Hence, as long as utilitarian outcomes are perceived as meeting specific objective standards, choosers' satisfaction with those outcomes will be more similar to that of non-choosers.

We test these predictions in two studies in which the hedonic versus utilitarian nature of the decision task was determined only by the goals assigned to participants. The first study was a 2 x 2 in which participants engaged in a computer-simulated visit to a photography museum. The hedonic goal was manipulated by asking participants to pretend being tourists visiting the museum just for fun; the utilitarian goal was instead manipulated by asking them to pretend being art students visiting the museum to collect material for their bachelor's thesis. Choosers allegedly selected the format of their visit among four options, whereas non-choosers were informed that the museum's curators had chosen the format for them. Unbeknownst to participants, however, they all eventually experienced the same virtual visit. As predicted, participants' perceived value of the decision-making task was moderated by the goal of the visit: Participants liked choosing more, and were consistently less willing to give away the choice opportunity, in the hedonic as compared to the utilitarian condition. In addition, choosers liked their visit more than non-choosers when the goal of the visit was hedonic, but there was no difference between choosers and non-choosers' satisfaction when the goal was utilitarian.

Study 2 replicated these results even when the outcome in the no-choice condition was dictated by fate rather than by an expert, and the decision outcome was not directly experienced but simply imagined. This study was again a 2 x 2 in which participants were asked to imagine receiving a massage in a spa. Participants in the hedonic condition were told that the massage was a way to reward oneself for recent academic success, while those in the utilitarian condition were told that the massage was intended to heal mild back pains and a state of general soreness. After being shown the same list of five different massages, with relative brief descriptions, participants were told that they would use a gift certificate to buy the massage. In the choice condition the certificate allowed for participants to freely choose one of the massages, whereas in the no-choice condition the certificate specified what massage they would receive. Results show that choosers liked the choice-task more than non-choosers and hedonic participants liked the choice task more than utilitarian ones. In addition, choosers were more satisfied with their massage than non-choosers when the decision-making goal was hedonic; however, there was no difference between choosers

and non-choosers' satisfaction when the decision-making goal was utilitarian.

This research contributes to prior studies challenging the assertion that choice is always beneficial by showing that choosers were more satisfied than non-choosers only when the goal of consumption was hedonic but not when the goal was utilitarian. When the goal is hedonic, the value of the alternative is inherently subjective and is experienced more positively as a consequence of how it was obtained. This research supports the view that pleasant tastes, smells, touches feel different, better, depending on how one came to experience them. By contrast, when the objective is utilitarian, then the means by which the outcome was obtained does not affect its value.

"The Opposing Effects of Personalized Recommendations on Objective and Subjective Decision Outcomes"

Gerald Häubl, University of Alberta

Benedict G.C. Dellaert, Erasmus University Rotterdam

Murat Usta, University of Alberta

Many important consumer purchase decisions in domains with heterogeneous preferences are made in the presence of some form of personalized recommendations that are based on an understanding of a consumer's subjective preference. Such decision assistance may be provided either by a human advisor (e.g., a salesperson or a realtor) or by a computer-based decision aid (e.g., an electronic recommendation agent). It has been shown that the availability of personalized recommendations tends to improve the objective quality of consumers' product choices, and that the magnitude of these effects can be substantial (Häubl and Trifts 2000). However, this prior research also revealed that, despite these significant increases in objective decision quality, consumers tend *not* to feel any more satisfied with their choices when these choices are made in the presence of personalized recommendations.

The objective of the present paper is to explain these paradoxical findings. Our central thesis is that the availability of personalized recommendations has separate, *opposing* effects on objective and subjective decision outcomes, and that these effects are driven by the particular representation that these recommendations take on.

The first effect is based on the fact that the provision of personalized recommendations typically involves the pre-screening of a large set of available alternatives by an agent external to the consumer and the sorting of alternatives in terms of their likely attractiveness to the consumer. Consequently, the availability of

such recommendations allows consumers to more quickly identify, and focus their decision efforts on, those alternatives that are of greatest appeal to them—i.e., that represent a close fit with their subjective preferences. This explains why personalized product recommendations enable consumers to achieve objectively better decision outcomes (Diehl, Kornish, and Lynch 2003; Häubl and Trifts 2000).

At the same time, however, we propose that by disproportionately (or even exclusively) drawing attention to alternatives that are highly attractive to consumers, personalized recommendations tend to have a negative effect on subjective decision outcomes. One mental process by which this may occur is based on the notion that the selective focus on the best alternatives results in a high level of *decision difficulty*. That is, it becomes more challenging for consumers to identify their subjectively most attractive alternative (see Shugan 1980). In line with Iyengar and Lepper (2000), we hypothesize that, all else being equal, such an increase in the difficulty of making a choice reduces consumers' subjective assessment of, and satisfaction with, their purchase decisions.

A second consequence of the disproportionate attention drawn to a small set of alternatives that are all highly attractive to the consumer is that this tends to prevent the latter from observing the (subjectively) least attractive alternatives. To the extent that a consumer's satisfaction with a purchase decision is a function not only of the attractiveness of the chosen alternative, but also of the attractiveness of the alternatives that were not selected (Mellers 2000; Mellers, Schwartz, Ho, and Ritov 1997), not being exposed to unattractive alternatives can diminish the subjective assessment of the choice. Therefore, we hypothesize that, by "protecting" consumers from having to consider products that don't match their subjective preferences, all else being equal, personalized decision assistance reduces consumers' satisfaction with their purchase decisions.

To summarize, we hypothesize that the presence of personalized recommendations has the following distinct component effects: (1) it *increases* the objective quality of consumers' product choices and, (2) given the level of objective decision quality, it *lowers* consumers' subjective appraisal of their decisions. While it is conceivable that the second effect might be offset by the recognition of an extremely good choice (in objective terms) that could not have been achieved without personalized recommendations, we suggest the possibility of the following type of reversal between objective and subjective decision outcomes: Compared to unassisted consumer decision making, which involves searching the space of available products without any pre-screening or sorting of alternatives, the presence of personalized decision advice can lead consumers to make objectively better purchase decisions and yet experience lower satisfaction with their choice outcomes.

We report the results of two experiments designed to test the above predictions. In each of the studies, participants were presented with sets of golf courses, each described on four attributes, and asked to choose their most preferred one from each set. The choice sets differed in terms of the following properties: (1) whether the alternatives in the set were a random sample or the most attractive ones from what is available in the market, (2) whether the alternatives were sorted, in decreasing order, by their likely attractiveness to the decision maker, (3) the number of alternatives included in the set, and (4) the absolute attractiveness of the best alternative in the set. These factors were manipulated both within and between subjects. After making a choice, participants responded to a number of rating-scale questions intended to measure different aspects of decision appraisal, including their satisfaction with both the outcome and the process, their confidence in having made the right choice, and their affective appraisal of the decision.

Experiment 1 provides a demonstration of the predicted reversal between objective and subjective decision outcomes. Compared to choosing from a randomly-selected set of golf courses, being presented with a pre-screened set (of equal size) of highly attractive courses led participants to choose objectively better alternatives, but to feel less satisfied with, and less confident about, their decisions. The results of Experiment 2 shows that the low levels of subjective decision appraisal in the presence of personalized recommendations are due, at least in part, to a lack of exposure to unattractive alternatives. Specifically, subjects were more satisfied with their decisions when they chose from a sorted set of golf courses that was larger (and included some undesirable alternatives) than when they chose from a smaller sorted set that included only the (objectively dominant) top half of the alternatives. We discuss the theoretical and practical implications of these findings with a view towards broadening the notions of decision quality and consumer welfare.

"Between a Rock and a Hard Place: Focalism in Evaluations of Consumer Choice"

Justin Kruger, NYU

Jeremy Burrus, Columbia University

Consumers are frequently called upon to evaluate the quality of purchase decisions—be it their own or someone else's. Logically, that quality is a function not only of the option *chosen*, but the option(s) *rejected* as well. The wisdom of purchasing a particular automobile, for instance, is a function not only of *its* price, performance, and luxury features, but also the price, performance, and luxury features of the competition. As such, in order to arrive at an accurate assessment of decision quality consumers must compare the features of the chosen option with the features of the rejected option(s).

We suspect, however, that when people evaluate the quality of a decision they focus on the objective features of the option chosen more than on the objective features of option(s) rejected (even when they are known). As a result, decisions tend to be deemed wise when the chosen option is positive and foolish when it is negative—occasionally even when the rejected option(s) are *just* as positive or negative.

We base our predictions, at least in part, on recent research on another type of comparative judgment: social comparisons. When people compare themselves with others—be it in terms of their abilities, their contribution to joint tasks, or their likelihood of

winning a competition—they tend to focus on the features of the target of the comparison (i.e., the self) more than on the features of the equally relevant referent of the comparison (i.e., others) (Giladi and Klar 2002; Kruger and Burrus 2004; Moore and Kim 2003; Windschitl, Kruger, and Simms 2003). For instance, when people compare their ability to drive a car with that of the average person, they focus on their own skills behind the wheel more than on the skills of the average person (Kruger 1999). This leads to an overestimation of relative standing in domains in which skills tend to be high (such as driving a car or operating a computer mouse), but to an underestimation of relative standing in domains in which skills tend to be low (such as programming a computer or telling a really good joke).

In much the same way, and for much the same reason, we argue that when people evaluate the quality of a decision they focus on the features of the target of the implicit comparison (the object chosen) and underweight the features of the referent of that implicit comparison (the option rejected). As a result, people tend to overestimate decision quality when all options are positive and underestimate decision quality when all options are negative.

The research presented here was designed to test this focalism hypothesis, while at the same time distinguish it from several alternatives (Baron and Hershey 1988; Botti and Iyengar 2004; Dhar and Sherman 1996; Dhar and Simonson 1992; Tversky 1977). In one study we presented participants with a series of hypothetical product choices supposedly made by another consumer. Some of the choices were between exclusively attractive options (such as a choice between two new sports cars) and others were between exclusively unattractive options (such as a choice between two older cars with mechanical problems). For each choice, participants evaluated the consumer's decision on a scale from -5 (*definitely the wrong choice*) to 0 (*neither the right nor the wrong choice*) to +5 (*definitely the right choice*). On average, participants thought that the consumer made the "right" decision when choosing among attractive options and the "wrong" decision when choosing among unattractive options. This was true regardless of the option chosen, and regardless of the fact that the option set was mutually exclusive and exhaustive (i.e., no other options were available).

What caused these differential evaluations of decision quality? Our thesis is that when people evaluate the quality of a decision, they focus on the option chosen and underweight the option(s) rejected. Consistent with this thesis, we found that participants' evaluations of decision quality were predicted far better by their evaluations of the option chosen than their evaluations of the option rejected.

In a follow-up study we investigated the interpersonal implications of this phenomenon while at the same time extending the results to a real decision with real consequences. Pairs of participants were recruited for what they were told was a conceptual replication of the classic Ross, Greene, and House (1977) false consensus effect study in which participants were asked whether they would be willing to walk around campus wearing an embarrassing sandwich-board style sign that said "Eat at Joe's" or "Repent." Unlike in the original study, however, the decision was not whether to comply with an experimental request to wear a sign (and then predict how many other subjects would do the same), but rather to choose which of *two* signs to wear.

Also unlike in the original study, participants were told that the decision would be made not by the subject him or herself, but his or her *partner* in the experiment. Specifically, participants were told that one member of the pair would be randomly chosen to be the *sign-wearer*, and the other the *sign-chooser*. Next, participants were escorted to private rooms whereupon both participants were

incorrectly led to believe that they had (unfortunately) been assigned to the role of sign-wearer.

As expected participants thought their partner made the "wrong choice" and a "poor decision," and this was true regardless of the sign ostensibly chosen. But more than that, these evaluations of the decision made trickled down to evaluations of the decision *maker*. Compared with a no-decision control group, participants thought that their partner was inconsiderate, unsympathetic, and unkind.

SPECIAL SESSION SUMMARY

The Role of Consumption in Re-establishing Cultural Stability: Case Studies of Disaster Recovery

Michelle F. Weinberger, University of Arizona, USA

SESSION OVERVIEW

This session draws noted scholars together to empirically address how consumption is implicated in the processes of recovery, repossession, and reconstitution of tradition. By examining consumer activities in the aftermath of large-scale disasters, these papers add to our understanding of the physical, social, and rhetorical tools and resources that consumers employ in producing cultural stability. Extreme cases of destruction are theoretically important not only in their own right, but also for studying the role of consumption in the construction and maintenance of social collectivities.

All three papers take a socio-cultural perspective on efforts to respond, recover, and rebuild in the wake of mass destruction. In such situations, consumption is used collectively to reconstitute social cohesion and connection for neighborhoods, metropolitan areas, or nations. The papers examine reconstruction both at the personal and at the group level. All papers address the means by which the collectivity is glued back together again, partially through consumption activities. Recovery of meaning through consumption following large-scale disasters is an excellent context to empirically build theory about consumption's role in creating social cohesion, long-noted as a necessary precondition for social stability (Parsons 1951).

The first presentation examines the process of re-possession following the Tsunami. Jill G. Klein and Laura Huang examine the meanings of objects sought by adolescents post-disaster. They aim to understand choice behaviors and replacement processes that occur when access to resources beyond the bare necessities is highly restricted. This paper highlights power issues that surface when aid is appropriated from one culture to the next. Through depth interviews with adolescent survivors, the paper develops a theoretical understanding of repossession. Drawing on these theoretical findings, policy implications for recovery efforts are developed. Jill Klein's award-winning research with holocaust survivors and experience interviewing individuals about profoundly negative experiences (Klein 2003) brings both human compassion and theoretical expertise to this vulnerable context and important theoretical domain.

In the second presentation, Jean-Sebastien Marcoux examines a different theoretical question and empirical context in the same overarching domain of recovery. This research explores the social construction of memory through the means of consumption at Ground Zero, site of the 2001 terrorist attacks in New York City. The presentation sorts through the ideological values, images, and meanings associated with the site, and examines how they are negotiated by interest groups to form social memory. Ultimately, this ethnographic research looks at the role of values and practices associated with space and memory in the recovery process. The author's unique position as an anthropologist trained in material culture studies with prior publications on the meaning system at Ground Zero (Marcoux 2005) credential his methodological sensitivity and appropriateness in studying such profoundly difficult contexts.

In the third presentation, Michelle F. Weinberger and Melanie Wallendorf unpack the role of tradition in community reconstitution in the wake of the 2005 devastation of New Orleans by

Hurricane Katrina. This paper uses ethnography to develop an understanding of how local families and communities use participation in Mardi Gras parades in recovery. The research aims to understand the role of deeply embedded consumption rituals at the parades in the process of change, renewal, and reconstruction. The authors are well-suited to study this context and theoretical domain. Weinberger began studying the theoretical issues associated with continuity and change at New Orleans Mardi Gras in 2001. This history combined with her education in sociology situate her to unravel the social dynamics of this community's recovery of tradition and social solidarity. Prof. Wallendorf draws from her prior study of the role of tradition and change in Thanksgiving celebrations (Wallendorf and Arnould 1991).

Taken together, the empirical results presented in these papers provide fodder for discussion on social recovery processes led by John Sherry. Prof. Sherry is uniquely suited to this role because of his training as an anthropologist and his expertise on recovery issues through his prior employment as a substance abuse treatment and recovery counselor. Further, his discussion draws from his scholarship on culturally grounded meanings of consumption.

The session addresses pivotal issues that are timely, interdisciplinary, and transformative. Issues concerning recovery from large-scale disasters are important not only because of their practical implications, but because they provide rich sites for deep theoretical development from observation of cultural change processes.

EXTENDED ABSTRACTS

"Meeting the Needs of Adolescent Disaster Survivors: Getting the Right Consumer Goods into the Right Hands"

Jill G. Klein, INSEAD

Laura Huang, INSEAD

Our study of adolescent survivors in their process of re-possession after the tsunami disaster suggests that the special needs of teenagers were severely underserved. In the second phase of relief that followed the basic necessities of food, water, clothing, shelter, and sanitation, adolescents received very little or nothing in terms of additional consumer goods.

We have conducted multiple interviews with seven adolescent tsunami survivors from a fishing village in Thailand. The interviews were conducted from Feb 2006 to June 2006, in multiple settings, including the homes of the teenagers, family shops, and other settings within the village (e.g., two adolescent girls asked to take the interviewer to see the village tsunami memorial). For a few of the interviews, family members attended and participated in the discussion. All interviews were conducted with a native Thai interviewer who also speaks English, and at least one English-speaking researcher (one or both of the authors). Most interviews were videotaped and transcribed into English. For the others, notes were taken. Our informants had all suffered extensive losses due to the disaster. Some lost family members and all lost friends, and most were completely dispossessed of all belongings, as well as their homes.

We found that while young children received age appropriate gifts in the second (post-survival necessities) phase of relief, the

needs of adolescents appear to have been routinely overlooked. When adolescents *did* receive goods, they were often inappropriate for them or completely unneeded. One female adolescent informant related:

“When they came to give us things, it was nice, but never things that we wanted. It was things that they wanted us to have.”

One boy declared:

“I never wanted to see another pack of Ramen noodles.”

Given the consumer behavior literature on the extended self and symbolic consumption (e.g., Belk 1988) as well as research from psychology on Terror Management Theory (e.g., Greenberg, Solomon and Pyszczynski 1997), adolescent survivors are in particular need of possessions that will allow them to express their identity and build self-esteem. In spite of their particular vulnerabilities and needs, teenagers in the village were not targeted by relief organizations. One possible reason for this is that it is difficult to diagnose the material needs of adolescent survivors. It is relatively easy to find objects that young children will enjoy, yet little is understood about the treasured possessions of teenagers (Kamptner 1995).

Thus, we wanted to gain a better understanding of the kinds of possessions these teenagers valued, what they would have most appreciated receiving in the months after the tsunami, and which lost goods they sought to replace. We also wanted to understand what methods of distribution would have been most valuable.

In conducting our interviews a set of themes emerged that guided the adolescents in their choices and behaviors in the replacement process. Among the most valuable possessions of our informants prior to the tsunami were objects that made up collections, such as coins, stuffed animals, or comic books. Re-starting a collection appears to have been a priority for teens and thus, when asked what kinds of objects they would most like now, they often mentioned items to restart a collection or to contribute to a recently restarted collection.

In addition, the adolescents repeatedly mentioned the ‘downtime’ that they experienced post-tsunami. There was a sense of restlessness and helplessness that the adolescents felt during this period, when most were in camps and schools had not reopened. The teens yearned for things that would help them occupy time, to give them something to do. When asked what kinds of gifts they would like to have received during this time, objects mentioned by girls were embroidery sets, craft materials, books, puzzles, crossword puzzles, and badminton equipment, and boys wanted building sets, sports equipment (e.g., footballs), and comic books. When asked, they said that these objects would help them occupy their time in the camp. Involvement in the distribution also appeared to have benefits, though teens were rarely asked to participate in relief work. One respondent mentioned that he was able to help aid organizations distribute goods. This activity kept him occupied and made him feel like he was contributing by helping others.

Informants reported that in the weeks after the tsunami they tended to try to obtain replacement goods for their families from relief workers, and when asked generally about what they would have liked to receive at that time, they often referred to food and equipment that the whole family could use. However, when asked, “Imagine if three weeks after the tsunami we took you to a store that only made things for kids your age, what would you want us to get for you?” most had no trouble listing items such as those mentioned above. This led us to develop a menu-based selection process that

informants found accessible and easy to use, and we make suggestions to relief organizations based on these findings.

More generally, the techniques we commonly use in marketing can be applied to disaster relief efforts to help the repossession process. Marketers are very adept at understanding how to uncover and measure consumer needs and desires, and how these vary across segments. Marketing tools can be used to make targeting decisions to help resolve resource allocation issues, and focus initiatives on those who will be most responsive. NGOs have become more and more skilled at marketing to potential donors, and it would be highly beneficial to recipients of aid if these skills were also applied to gaining a better understanding of survivor needs. This suggests an excellent corporate social responsibility opportunity for businesses (and business schools) by sharing marketing knowledge to assist NGOs in better understanding survivor needs.

“The Construction of Memory in the Aftermath of 9/11”

Jean-Sébastien Marcoux, HEC Montreal

Since the end of the second World War, numerous researchers and philosophers such Battaglia (1995), Lowenthal (1997), Nora (1984), Pomian (1999), and Ricoeur (2000) have reflected on Maurice Halbwach’s notion of collective memory. The moral imperative to keep alive the memory of the Shoah, the need to prevent a tragic event such as this one from sinking into oblivion, the necessity to honour what Primo Levi (1995) has called the ‘memory duty’, have lead researchers to define memory more broadly than what is usually the case in psychology, but also look at it as a process which relates to the ways people give meanings to the past, and the ways they approach the future.

Even though the research on social memory remains largely unknown in consumer research, it acquires a particular importance in the aftermath of the attack on the World Trade Center on September 11th 2001; a context where sentences like “*We will never forget*” has invaded a multitude of commodities, souvenirs and memorabilia. The relationship between collective memory and consumption becomes even more important in regard to the recent development of death tourism (Lennon and Malcolm 2000; Lloyd 1998; Saunders 2003; Sturken 1997, 2004) on sites as contested as Ground Zero, that are invested with political and ideological values, as well as images of horror. Whereas researches on dark tourism such as those of Sturken (1997) have highlighted the relation between this activity and the formation of a national identity, not to say patriotism, few researches have actually reflected on the role played by consumption in the construction of collective memory. More importantly, consumer researchers themselves have failed to examine critically and reflexively the role of consumption in the construction of memory, as well as the criticisms and the disgust that consumption may raise. Yet, in contemporary situations such as the post 9/11 context, the marketplace provides primary resources involved in the process of memory construction.

The aim of this paper is to unveil the relationships between consumption and collective processes of memory construction. It explores the complex character of the dark tourism that is taking place at Ground Zero. In doing so, it analyses what attracts pilgrims, tourists and voyeurs to this site, as well as the kind of memory that is taking shape as a result of the commodification process. The question that directs this paper is: how is consumption related to the social construction of memory in the aftermath of 9/11?

This paper is grounded in an ethnographic research conducted since March 2003, on and around the site of Ground Zero. It can be situated along the line of the works on social memory undertaken in social sciences, in humanities, in arts history as well as in philosophy. As such, this paper attempts to move beyond the psychological dimensions of the memory; an issue that consumer

researchers have explored in depth, and which is still attracting a great deal of attention. This paper also draws on CCT research (Arnould and Thompson 2005) and CCT researchers' interest for collective memory (Marcoux 2005). An ethnographic analysis of the social construction of memory does not only promise to fill in an important gap in consumer research. It may also help push the reflections on memory conducted outside of consumer research in sensitive directions that still need to be explored.

“Tradition and Renewal: Reconstruction of Culture through Consumption”

Michelle F. Weinberger, *University of Arizona*

Melanie Wallendorf, *University of Arizona*

This research examines how local residents used the annual tradition of New Orleans' Mardi Gras as a tool for community recovery following one of the largest national disasters in U.S. history. We address collective reconstitution of culture by examining how consumption traditions and consumption rhetoric are used to assert social solidarity and demonstrate cultural hegemony.

While other consumer research has studied how individual consumers recover from extreme hardships (c.f. Hill and Stamey 1990; DeLorme, Zinkhan, Hagen 2004), that is not our focus. Instead, we use community activities 6 months after this natural disaster as a vivid context for understanding consumption's role in the development of social solidarity and community. Theoretically, this research aims to explicate how consumption is used collectively to reconstitute social cohesion and connection for neighborhoods and metropolitan areas. It addresses the means by which the collectivity is glued back together, partially through consumption activities, and the form that the reconstituted culture takes.

The Mardi Gras (Carnival) festival in New Orleans provides a rich context for understanding how deeply embedded consumption traditions are used by locals as a tool for cultural recovery. Certainly, New Orleans' tourist economy, particularly at Mardi Gras, has grown in importance over the past 30 years (Gotham 2002). Increasing tourism, the popularization of the exchange of beads for nudity (Shrum and Kilburn 1996, Shrum 2004) and the proliferation of excessive drinking within a small French Quarter section of New Orleans has grown to dominate the media and marketing images of Mardi Gras. But our focus is not on the tourist experience (MacCannell 1976) of Mardi Gras evident in these sites.

Instead, our focus is on the festival as a central component of New Orleans culture for residents of the city's neighborhoods and surrounding areas, dating to 1835 (Mauldin 2004). New Orleaners and their extended family members from surrounding areas spend the weeks leading up to Carnival twenty blocks and a cultural world away from the French Quarter scene. Bearing more resemblance to tailgate parties before a football game than to a wild party, their activities include spending days in folding chairs along grassy St. Charles Avenue with family, friends, and strangers waiting for the many parades that occur periodically through the day. It is a time for spending days socializing, playing, eating, participating in the parades, and collecting during the parades, in the way many of their families have done for decades.

Public celebration of Mardi Gras was threatened in 2006. The destruction that occurred following Hurricanes Katrina and Rita and the subsequent levy breaks produced a mass exodus of residents and highly politicized discussions concerning the future of the city of New Orleans. At the same time, a fierce debate erupted as to the city's ability to hold and afford the public festival. A rhetoric of consumption for the sake of tourism dollars was leveraged against a rhetoric of restraint both out of respect for the dead and for reallocation of the public funds that would be required for the

rebuilding effort. Ultimately, the festival was given clearance from the city, and many community members returned to New Orleans to participate in the event. During the event, however, locally-oriented participants articulated a different collective reaction: a rhetoric of renewal. The data reveal strong expressions of the importance of the event both at the individual level and the cultural level. While cultural capital continued to mediate the roles that various types of individuals played within the events as Krewe riders, band members, and catchers at different locations along the parade routes (Bourdieu 1984), participants' *emic* articulations were ones of inclusion, community, and togetherness. Despite the wider cultural prominence of mechanical solidarity and division of labor in U.S. society and at the event, participant expressions and actions asserted the key role of organic solidarity (Durkheim 1960 [1893]) in the recovery process. While rituals such as funerals have long been used to smooth the change required in recovery processes after disasters (van Gennep 1909 [1960]; Turner 1969), this research demonstrates how traditions other than those designed for bereavement and change are used as a tool for the cultivation of social solidarity and cultural recovery.

Data collection for this research occurred in February 2006 as a sited ethnography in New Orleans during the first Carnival following Hurricane Katrina. The data are based on participant observation and in-context interviews as well as a collection of ancillary material objects, 472 photographs, and media documents.

Two emergent themes provide an understanding of the role of collective consumption in the reconstitution of social solidarity. First, data reveal that this calendric tradition of consumption was perceived by residents to be a fundamental and invaluable component of New Orleans' culture, one in which families participate year after year. Through participation, cultural normalization and symbolic solidarity are constructed and proven, despite their simultaneous reinvention of the cultural categories of race, class, and gender as a system of social stratification. Second, attempts to hold market forces at bay in order to maintain and prove cultural authority were reflected in anti-sponsorship rhetoric by residents. Ironically, however, the economic boon to the local production system comprised of float makers, costume designers, and bead makers was often used as a secondary justification for the festival's occurrence, in an unquestioned rhetoric of the moral imperative of economics. Taken together, the data provide key theoretical insights into the means by which consumption is used to (re)constitute social solidarity, and the forms of solidarity that consumption reifies.

SPECIAL SESSION SUMMARY

That's Not What I Wanted: Perspectives on Unwanted Choice Options and Outcomes

Merrie Brucks, University of Arizona, USA

Wendy Attaya Boland, University of Arizona, USA

SESSION OVERVIEW

This session brings together three papers that examine consumer choices and outcomes through a lens that centralizes what the consumer does not want. This view is complementary to the bulk of the choice literature, which has focused on antecedents, processes, and consequences of consumers getting what they do want. More specifically, this session examines consumer reactions to “things they don’t want” at three points in the choice process: as an option in the original choice set, as a denial of the first choice followed up by a second choice, and as a denial of choice followed by affective reactions. The first two papers posit that subsequent choices are affected by subtle changes in the perception and weighting of attributes associated with the unwanted/denied option. The third paper expands our view by including motivational, affective, and individual difference factors.

The first paper (by Wijnen, Bettman and Huber) focuses our attention on the importance of a truly unacceptable option in the consumer choice process. Although such options could easily be eliminated from consideration without comparison to other choice options, the authors show that unacceptable options can affect consumers’ evaluative processing of the remaining options and resultant choice share in a set of three experiments.

The second paper (by Boland, Brucks and Nielsen) also demonstrates that a non-feasible option affects preferences for remaining options in the choice set. In contrast to the first paper, Boland and her colleagues’ infeasible option is the most preferred option in the choice set. It is infeasible because of unavailability after the choice. When asked to make a second choice among the remaining alternatives, the authors show that consumers may abandon their original runner-up choice in favor of one that superficially resembles the denied option.

Similar to the second paper, the third paper (by Moore and Fitzsimons) considers how consumers react when they learn that a preferred option is no longer available. This paper goes beyond the preference construction process to consider affective, social, and individual difference factors. Specifically, the paper takes the view that consumers experience psychological reactance when their first choice is denied. The authors find support for the novel hypothesis that consumers may experience reactance on behalf of other individuals, and that this experience is stronger for consumers with an interdependent self-construal.

Deborah MacInnis concludes this session by presenting an overarching framework addressing issues related to all possible combinations of “wanting”, “having”, “not wanting”, and “not having.” This discussion highlights the similarities and differences among the topics of the three papers comprising this session and offers directions for future research.

EXTENDED ABSTRACTS

“Gone, But Not Forgotten: The Role of Unacceptable Options in Decision Making”

Katrien Wijnen, Ghent University

James R. Bettman, Duke University

Joel Huber, Duke University

Imagine Mr. Jones wants to buy a digital camera and uses a recommendation agent website to find the brand that suits him best.

If the list of recommended brands contains an option with a ‘truly unacceptable’ attribute level, how will he react? Will he choose a different brand from the one he would have chosen if the ‘truly unacceptable’ option was not included? Does the presence of an unacceptable option affect the consumer’s choice among the remaining options?

One common hypothesis is that the truly unacceptable option is eliminated in an initial editing phase and does not influence choice. Our research argues for a more subtle role for the truly unacceptable option. Even if discarded in an early stage, the information characterizing the unacceptable can play a role in the further decision process by helping to define the context (i.e., the relationships between the options in the set) within which the final choice is made. For example, depending upon its attribute values, the unacceptable option could make another target option either asymmetrically dominating or compromise options. If so, the unacceptable option could enhance the choice share of the target option. The unacceptable option in our studies is designed to be such a decoy, with the truly unacceptable feature implemented as a third, categorical attribute with two possible values, either acceptable or unacceptable. We argue that people’s initial examination of the unacceptable option allows it to affect the context within which the other options are perceived. Thus, perception of the viable options in the set will be ‘contaminated’ by how the unacceptable option contributes to the context of the choice set. Such contamination is difficult to detect and correct, due both to people’s limited access to their mental processes and also to the lack of observable ‘symptoms.’

In our first study, we measure whether people’s judgments and inferences are affected by the unacceptable option by comparing choices with or without unacceptable options. Choices are made in each of eleven product categories. For each category, we define a two-option choice set containing a target and a competitor and four three-option sets, two with an asymmetrically dominated relationship and two with a compromise relationship. For each context (asymmetric dominance or compromise), one three-option set has a decoy with an unacceptable value and the other has an acceptable decoy. Participants make choices from all eleven categories but select from only one type of choice set for each product category, with the type of set rotated across categories. We show first that we replicate classical asymmetric dominance and compromise effects. Comparing the three-option, acceptable decoy set to the two-option, no decoy set, a significant increase in relative choice share was found for both context settings. Next, we compare the two-option, no decoy set and the three-option, unacceptable decoy set. As hypothesized, even though the decoy is unacceptable, the choice share of the target relative to the competitor significantly increases for both asymmetric dominance and compromise. Finally, we compare the relative magnitude of the effect of the unacceptable and acceptable decoys and show that the context effect is not attenuated because of the unacceptable nature of the decoy. These findings indicate that editing is rarely as surgical as often assumed. The presence of a truly unacceptable option in the set biases the consumer’s final choice by affecting the perceived context within which this final choice is made.

In a second study, we examine whether making the truly unacceptable option more salient triggers a correction process,

hence reducing the effect on final choice. We make the unacceptable option more salient or 'explicit' by having participants mark truly unacceptable levels and corresponding options in an initial phase. Participants subsequently choose from a set still listing the screened out option(s), with the unacceptable level(s) in red and marked with a red asterisk. Participants chose from a three-option set containing an explicit unacceptable decoy and an asymmetric dominance relationship for one of two product categories. To examine whether relative choice share decreased when comparing this explicit unacceptable case to the implicit one, we compared these results to those from our first study. The results show that correction is moderate when making the option's unacceptability salient in the set. Thus, the distorting effect of the unacceptable on choice seems surprisingly robust.

Our third study examines whether consumers retain knowledge of other attributes associated with alternatives containing an unacceptable attribute and whether what consumers report is in accordance with what they actually do with regard to the treatment of these other levels. In an agent task involving selecting a camera for a friend, unacceptable attribute levels (and hence unacceptable options) are defined by the friend's preferences.

Participants overwhelmingly report (98%) that other attribute levels for truly unacceptable options are not examined further. In contrast to this reported lack of attention, an unannounced recall task shows that participants do retain memory for other attributes of truly unacceptable options. For the option with an unacceptable number of rapid fire shots (camera size), 89.5% (42.1%) of participants retained accurate gist information about at least one aspect other than the unacceptable level. Thus, although participants report that they pay no attention to values other than the unacceptable attribute level for unacceptable options, they retain information about other attribute values in an unexpected recall test.

Our results emphasize the importance of truly unacceptable options in the decision process. The influence of an unacceptable option can linger even after it has been 'rejected' by helping to define the context and thus influencing which option to choose. In addition, the important role of context in decision making is once again confirmed, as context matters even if it is (partially) defined by an option that is truly unacceptable.

“Constructive Preferences for Rejected Options: When You Can't Get What You Want”

Wendy A. Boland, University of Arizona

Merrie Brucks, University of Arizona

Jesper H. Nielsen, University of Arizona

What happens when consumers have made a thoughtful decision, only to find out that their first choice is no longer available? One might expect that consumers would simply revert to their second choice, especially if it was a close call between the two alternatives. But anecdotal evidence led us to question that assumption. In this paper, we demonstrate that consumers may reject an option previously ranked as second best in favor of an even lower ranked option. Two explanations may account for this effect: scorn for the “also-ran” or a preference reversal phenomenon due to shifts in attribute weights.

Consider a purchase choice situation in which the consumer is faced with many competing alternatives that may be characterized by a set of attributes. In many cases, a consumer will reduce the choice set based on an initial set of focal attributes. Within that final set, the consumer will probably consider additional criteria to discriminate among them, such as lower-weighted attributes. At the moment the consumer distinguishes their first choice from their second choice; such attributes have more salience than they did

earlier in the choice process. Under certain conditions, such a shift in attribute salience could produce a preference reversal. Specifically, if the remaining alternatives are reevaluated with the updated attribute weights, a lower-ranked alternative may become more attractive. Thus we hypothesize that (1) a segment of consumers will switch from their second choice to a lower ranked option when the first choice is denied; and (2) the switch can be explained by increased salience of the attribute used to distinguish the first choice option from the second choice option. Two experiments were conducted to test these basic hypotheses.

Study 1 provides evidence that some consumers do switch from their second choice, and they do so in a predictable way. In this study, participants examined pictures and descriptions of eight pens, rated the favorability of each pen, and indicated their first and second choices. Participants believed they would receive their chosen pen. The set of eight pens was constructed so that two pens were dominant on each of the attributes identified as potentially relevant to the decision via a pretest. Within each pair, the pens were differentiated by an attribute rated as less important in pretests (the “tie-breaking” attribute). This design allowed us to trace the impact of individual attributes on choice. Upon completion of an unrelated study, participants were informed that their first choice pen was unavailable but that the other seven options remained. The participants then made a new selection from that set (and received the pen they selected). In support of our hypothesis, we found that a significant proportion of participants (20%) abandoned their original second choice by selecting an option that was originally lower ranked. Of these participants, nearly all (91%) selected the pen that shared the tie-breaking feature found in their original first choice, even though this pen was obviously weaker on the original focal attribute.

In the second study we replicated the existence of the phenomenon, increased the efficiency of the experimental design by altering the stimulus set, and ruled out the possibility that a “scorned option” explains the results. In this study, participants were randomly assigned to “unavailable” or “available” first choice condition. In the unavailable condition, participants were told that their first choice was unavailable and were asked to choose a different option in the same manner as Study 1. In the available condition, the experimenter told participants that she had lost their ratings of each of the pens, asked them to complete the rating task again, and then gave them their first choice. All participants rated the favorability of all the pen alternatives before and after completing the unrelated study, allowing us to measure changes in evaluation at the individual level. The results from Study 2 provide even stronger support for the hypotheses than Study 1. Nearly half of the participants in the unavailable condition rejected their second choice option when asked to reselect (46%). In nearly every case of 2nd choice rejection (98%), participants switched to a pen that shares the original 1st choice's tie-breaking feature but is clearly weaker on focal attributes. Results from analysis of the ratings data support the constructive preference explanation while refuting a “scorned option” hypothesis. Favorability ratings of the 2nd option remain stable (comparing before and after measures), whether or not the 1st choice becomes unavailable. Favorability ratings of the option sharing the tie-breaking feature increase over both availability conditions.

These results add to our understanding of why attribute importance weights can change throughout the decision process, and highlights how those changes can induce a re-ordering of preferences when a choice is found to be unavailable. Our findings help to explain how “what I nearly chose” becomes “what I no longer want.”

“What’s Yours Is Mine: Self-construal and Reactance on Behalf of Others”

Sarah Moore, Duke University

Gavan Fitzsimons, Duke University

Humans have been described as having two fundamental but conflicting needs: one for autonomy and one for belonging (Baumeister & Leary, 1995; Brewer, 1991). This paper considers two areas where these needs are recognized. First, the literature on self-construal focuses on our needs for independence from and interdependence with others (Markus & Kitayama, 1991; Triandis, 1989; Singelis, 1994). Individuals with independent self-construals view themselves as unique, autonomous persons that are separate from others, while interdependent individuals view themselves as connected with others. Second, the literature on psychological reactance focuses on individual needs for freedom in choice and decision making (Brehm, 1966; Hong & Faedda, 1996). Reactance theory posits that individuals have negative psychological and contrary behavioral responses when their freedom to make a decision is restricted or removed.

We propose an extension of reactance theory’s traditional focus on individual autonomy to incorporate reactance on behalf of others. Further, we suggest that experienced reactance, whether for oneself or on behalf of others, is affected by self-construal. Although we expect independent and interdependent individuals to experience reactance both for themselves and others, individual or situational differences that emphasize one need over another should be reflected in different reactions to self and other restrictions of freedom. Individuals who are more focused on needs for uniqueness should react most strongly, as traditionally shown, when their own needs for autonomy are restricted. Individuals who are focused on needs to belong should react strongly both when their own and when others’ needs for autonomy are restricted.

A scenario study examined the moderating effect of self-construal on experienced reactance for self and others. Individuals were asked to imagine that they had gone to a restaurant with a good friend to spend some time together. Across conditions we manipulated whether or not individuals received what they ordered. In the control condition, both the individual and their friend got what they ordered. In the self-restricted condition, individuals were told that the waiter had forgotten that the restaurant was out of their chosen item and that they would have to choose again. In the other-restricted condition, the individual’s friend was that told their item was unavailable and they would have to choose again. In a restaurant situation, individuals expect freedom to choose menu items and expect to receive what they have chosen; not receiving a chosen item and being asked to choose something else should induce reactance to this elimination of freedom.

We measured experienced reactance using a composite measure that included satisfaction with the restaurant and negative affect experienced during the scenario (frustration, anger). An ANOVA on condition (control vs. self-restricted vs. other-restricted) and measured self-construal (independent vs. interdependent) was performed on experienced reactance and revealed a main effect of condition and the expected interaction between condition and self-construal. Planned contrasts exploring the interaction revealed that participants in the control condition experienced less reactance than individuals who had been in either of the restricted conditions. A second ANOVA that included self-construal and only self- and other-restricted conditions also showed a significant interaction, indicating that self-construal influenced responses to the different restrictions. To clarify the differences in responses by independent and interdependent individuals in the restricted conditions, a spotlight analysis was conducted. As predicted, independent individuals in the self-restricted condition showed more reac-

tance than independent individuals in the other-restricted condition, while interdependent individuals showed no differences in reactance in the self- versus other-restricted conditions.

These results were confirmed by participants’ answers to two open-ended questions (in the restricted conditions), which were coded by an individual blind to our hypotheses. The first question assessed negative emotional reactions toward the restaurant, while the second assessed the attractiveness of the unavailable menu item. Reactance theory predicts that individuals should find unavailable items more attractive—thus, individuals who are experiencing more reactance should rate the menu item as more attractive. Mirroring the results above, independent individuals who were restricted were more upset at the restaurant than independent individuals who witnessed their friend’s restriction. Interdependent individuals, on the other hand, showed no difference in their emotional reactions, regardless of whether they or their friend was restricted. Further, independent individuals in the self-restricted condition, who ought to have been feeling the most reactance, described the unavailable item as more attractive than independent individuals in the other-restricted condition, while there was no difference between interdependent individuals’ responses in the attractiveness of the unavailable item.

This study is a promising initial demonstration of reactance on behalf of others. Our results suggest that the restriction of a close other’s freedom elicits reactance from individuals, just as individuals react to personal restrictions of freedom. Thus, for both independent and interdependent individuals, to some degree, “what’s yours is mine.” However, for independent individuals, even more important is the idea that “what’s mine is mine”—individuals with an independent self-construal react more strongly to personal restrictions of freedom than to restrictions of others’ freedom.

SPECIAL SESSION SUMMARY
The Flavors of Emotions: Interplay of Affect and Decision Making
Monica Wadhwa, Stanford University, USA

“Let’s not forget that the little emotions are the great captains of our lives and we obey them without realizing it.”...*Vincent Van Gogh*

SESSION OVERVIEW

Emotions have been traditionally been considered at war against reason. Ancient wisdom suggests, “rule you feelings lest your feelings rule you.” Similarly, Greek Philosophers such as Plato and Tertullian considered human soul to be the seat of reason. On the other hand, sentimentalists such as David Hume emphasized the critical role of affect in moral judgments and choices and considered reason “the slave of the passions”. In the domain of consumer research not much attention was paid to the role of emotions and feelings in consumer decision making. However, consumer researchers freed themselves from the worship of reason in the early 90’s, and turned their attention to the role of affect in decision making (see, e.g., Hoch and Loewenstein 1991, Kahn and Isen 1993; Luce 1998, Luce, Bettman, and Payne 1997, Shiv and Fedorikhin 2000). The importance of the role of affect in decision making is further supported by the neuroscientific evidence (Bechara, Damasio, Tranel, & Damasio 1997). The broad purpose of this session is to present work that adds to the growing body of research on the interplay of affect and consumer decision making.

The more specific objective of the proposed session is to examine the prevalence of affective processes in a variety of consumer choice contexts. The three papers in this session explore the role of affect in consumer choice, yet they represent a diversity of topics relevant for consumers, ranging from consumption of negative feelings (Andrade and Cohen), to the role of emotional and cognitive systems in preference consistency (Lee, Ariely and Amir), to reward-seeking behaviors (Nowlis, Shiv and Wadhwa)

The session will begin with a focus on consumption of negative emotions. Eduardo Andrade will present his work with Joel Cohen that focuses on why people choose to consume negative feelings such as watching a horror movie. Andrade and Cohen provide evidence for the coactivation of negative and positive feelings when seemingly aversive events (e.g., watching horror movies) are experienced. Furthermore, they show that such coactivation of negative and positive feelings is particularly likely when people are in a “protective frame” and can detach themselves from “harm” resulting from the experience.

The focus of the session will then shift to the role of the emotional and cognitive systems in preference consistency (transitivity). Leonard Lee will present his work with Dan Ariely and On Amir that examines the conditions under which violations of transitivity are more and less pronounced. Lee, Ariely and Amir demonstrate that the emotional system, and not the cognitive system, is associated with a higher degree of transitivity.

Finally, Monica Wadhwa will present her work with Baba Shiv and Steve Nowlis that focuses on the impact of sampling on reward-seeking behaviors. Nowlis, Shiv and Wadhwa demonstrate that sampling a beverage high in incentive value prompts the activation of a general motivational system leading to an increase in subsequent consumption of not only the sampled drink but also food items. Furthermore, they show that the impact of sampling on reward-seeking behaviors is modulated by the state of deprivation.

This session will have the services of Antoine Bechara as a discussant. Bechara is a leading neuroscientist whose research focuses on the neurobiology of emotion and decision making. As a discussant, he will contribute insights about the three papers and the general session theme from the outside field of neuroscience, which is of great interest and appeal to many consumer behavior researchers.

“On the Consumption of Negative Feelings”

Eduardo B. Andrade, University of California, Berkeley

Joel B. Cohen, University of Florida

Is there a conflict between the basic hedonistic assumption and people’s willingness to experience negative affect? If not how can we best explain the latter without discarding the former? Precisely, when and how is pleasantness experienced as people choose apparently “aversive” events? Traditionally, two groups of accounts have been provided. One possibility is simply that there is no such contradiction because people who expose themselves to stimuli observers perceive to be aversive may not be experiencing any meaningful level of negative affect and may actually be experiencing pleasant arousal (Zuckerman 1996). Even for negative affective states, the *intensity* of arousal has been shown to be individual specific and susceptible to adaptation. Further, responses to lower intensity arousal vary considerably, and, because of that, one person’s discomfort can be another’s pleasure. (e.g., “When I watch a horror movie I’m not afraid; I enjoy the excitement!”). A second group of hypotheses proposes that people are focusing on the *aftermath* (Berlyne 1960; Solomon and Corbit 1974; Zillmann 1980). Once the aversive stimuli are removed and some level of arousal remains, subsequent feelings of relief or pleasantness emerge (e.g., “Bungee jumping is fun, when it is over!”). Thus, people may be willing to endure the fear and unpleasant experiences in order to enjoy the positive feelings brought on by relief.

Explanations for exposure to aversive stimuli originating in these two groups of models adopt the traditional assumption that individuals can not experience opposite feelings at the same time. However, there is growing evidence suggesting that mixed feelings or coactivation is not only possible but quite common (Larsen et al. 2003; Larsen, McGraw, and Cacioppo 2001; Schimmack, 2001; Watson, Clark, and Tellegen 1988; Williams and Aaker 2002). We argue that explanations for counter-hedonistic behavior should be consistent with newer evidence that people can simultaneously experience conflicting emotions, though that is presently not the case.

In a series of four studies horror movie watchers and non—horror movie watchers (hereafter “fear avoiding” [FAV] and “fear approaching” [FAP] participants) are exposed to horror movies and asked to report their positive and negative feelings, either after (experiment 1), or during video exposure (experiments 2, 3A, and 3B). An online affect scale (OAS) and an online affect grid (OAG)—adapted from Larsen, Norris, and Cacioppo 2005—are used to continuously capture the intensity and pattern of affective states while participants watch the scenes.

The results show *first* that positive and negative feelings can actually co-occur when people are exposed to apparent aversive stimuli (e.g., a horror movie). Also, such co-occurrence appears in

the shape of a positive correlation between feelings of “opposite” valence (e.g., fear and happiness) *during the exposure* to the event (e.g., “It may seem masochist, but the more scared I feel watching a horror movie, the more I enjoy it!”). *Second*, and contrary to the existing intensity model assumption that negative arousal is experienced *instead* as pleasurable, we show that those who pursue such apparently aversive events, actually experience a similar level and pattern of negative feelings as those who have deliberately avoided them. This is an important demonstration that positive affect does not merely replace negative affect because of interactions with arousal (particularly at relatively low levels). *Third*, we demonstrate that two aspects of existing aftermath models are untenable. If we can establish coactivation of positive and negative emotions during exposure to aversive stimuli, the assumption that people can only experience positive affect in response to feelings of relief *after* the aversive stimulus has been removed needs to be abandoned. We also find that feelings of relief can be stronger among those who have *avoided* the experience in the past compared to those who have frequently chosen to expose themselves to such stimuli. The opposite should be true under aftermath model assumptions since feelings of relief (and consequent positive affect) are held to be decisive in leading people to approach rather than avoid fearful experiences. *Finally*, we propose a moderator that is critical for co-occurrence to be a stable state and that is likely to affect repeated pursuit of “aversive pleasures” such as horror movies as well as truly dangerous activities. To this purpose we adopt the notion of “a protective frame” (Apter 1982, 1992) and directly manipulate this perceived frame of mind to show that individuals can learn how to experience positive feelings while still being absorbed by the fearfulness of the event.

In short, we believe these studies advance our understanding of the consumption of negative feelings by providing evidence of coactivation of negative and positive feelings and the importance of a protective frame as a critical moderating variable as well as by further refining the two prevailing theoretical positions in this domain. The approach and avoidance decisions people make when confronting contexts that are likely to generate negative affect are quite significant (and some may be key stepping stones to reaching important longer-term goals). We need to learn much more about both the conditions favoring and hindering such behaviors and about how subsequent emotional responses (and how they might be modified) affect continuing goal pursuit.

“In Search of Homo Economicus: Transitivity, Emotions, and Cognition”

Leonard Lee, MIT

Dan Ariely, MIT

On Amir, University of California, San Diego

In this work, we report a set of experiments where we presented participants with many pairs of choices and measured their degree of transitivity. Our objective is not to demonstrate intransitivity caused by systematic biases in decision making, but rather to examine intransitivity attributed to *inconsistency* in decision making as decision makers encounter these decisions over time. Across all experiments, we manipulated whether the experimental conditions caused participants to use their emotional system or the cognitive system when making these choices, and we examined which of these two general systems better comply with the transitivity axiom and hence rationality. We examine the role of these two systems in transitivity for four reasons: first, because the degree of transitivity individuals exhibit over a set of choices can serve as a measure for how consistent they are in “reading” and computing their utility for the alternatives they face; second, because the distinction between the functions of these two systems has been evident across a wide array of research programs; third, because both prior research and lay beliefs suggest that the cognitive system might be more tightly linked to rationality, and the emotional system more to irrationality; and fourth, because despite these commonly held beliefs, there is some evidence from prior research suggesting that decisions makers might have more consistent preferences when they rely more on their emotional system rather than their cognitive system.

In all experiments, we first presented participants with the names, pictures, and short descriptions of a set of electronic gadgets (such as a pen with a built-in FM tuner and a voice-recording keychain). Participants were next given all pair-wise combinations of these products and instructed to choose a product within each pair according to a particular criterion. Some participants were asked to decide in a manner that we expect to rely more heavily on the cognitive system, and others to decide in a manner that we expect to rely more heavily on the emotional system. As a measure of preference consistency, we computed the number of transitivity violations (e.g. $x \geq y$, $y \geq z$, and $z \geq x$, where \geq means relative preference) participants committed during the task.

In Experiment 1, we manipulated emotional versus cognitive processing by manipulating the stimuli that respondents saw. Participants were randomly assigned to one of three conditions: the pairs of products were presented either in terms of their names (*low affect* condition), their pictures (*high affect* condition), or both their names and pictures. The results revealed that participants in the high affect condition committed significantly fewer transitivity violations than those in the low affect condition. (Interestingly, when the product pairs were displayed in terms of both their names and pictures, the average number of violations was similar to that in the low affect condition, but greater than that in the high affect condition, suggesting that the availability of product names was sufficient to activate the cognitive system and deteriorate choice consistency.)

We turned our attention from the mode of stimuli representation to the state of the decision maker in Experiment 2: half the participants in the experiment were asked to memorize a three-digit code during the choice task (*low-load* condition) and the other half a ten-digit code (*high-load* condition). The results revealed that the high-load participants (whose attentional capacities were constrained by the code memorization and who presumably had to rely more on their gut reactions and emotional responses during choice) were significantly more transitive than the low-load participants, suggesting a close association between preference consistency and the emotional system.

We next attempted to generalize our findings to explore whether decisions based on hedonic evaluations are more transitive compared to decisions with non-hedonic aspects. In Experiment 3, we manipulated the goal of the choice task: Participants were asked to choose the product they *preferred* (hedonic) within each pair, the product they thought was *more expensive* (non-hedonic), or the product they considered *more popular* (non-hedonic). We found that participants who had to choose their preferred product made fewer transitivity errors than those who chose the more expensive or the more popular product, indicating that evaluations that focus on hedonic aspects and that more heavily involve the emotional system are more consistent than evaluations that focus on non-hedonic aspects.

In sum, these experimental results converged to the same general conclusion: the emotional system, and not the cognitive system, is associated with a higher degree of consistency and transitivity. These results suggest that at least one aspect of Homo Economicus—transitivity—might reside in the emotional system.

“Tantalizing Effects of Sampling: The Influence of Sampling on Motivational States”

Steve Nowlis, Arizona State University

Baba Shiv, Stanford University

Monica Wadhwa, Stanford University

“Let the stoics say what they please, we do not eat for the good of living, but because the meat is savory and the appetite is keen”

Ralph Waldo Emerson

Consider a situation involving sampling of a food or a beverage item—an experience that most people are likely to be familiar with. Marketers frequently employ such sampling as a mean to stimulate consumer’s interests. Despite the growing popularity of such sampling, it poses a dilemma for marketers. On the one hand, food and beverage sampling is considered an integral part of promotion mix. On the other hand, common intuition would suggest that such sampling could also make consumers less hungry or

thirsty and, therefore, reduce their subsequent consumption-related behaviors. The results of a short survey that we conducted with twenty-one marketing experts are in concordance with the common intuition.

The above conclusions arising from common intuition and the opinions of marketing experts, however, go against an emerging body of work on consumption cues and drive states. Emerging theories in this domain suggest that a consumption cue high in incentive value can strengthen drive states and, thereby, stimulate reward-seeking behaviors (e.g., Berridge 2001, Toates 1986), a notion we refer to as “reverse alliesthesia.” In other words, reverse alliesthesia suggests that sampling a tasty bit of food or beverage is actually likely to intensify rather than satiate hunger or thirst and, therefore, increase subsequent consumption-related behaviors.

Building on research on consumption cues and drive states, our first goal in this research was to demonstrate that sampling a consumption cue high in incentive value prompts the activation of a general motivational state, thereby, leading individuals to engage in reward-seeking behaviors. We achieved this goal by randomly assigning half of the respondents to a beverage-sampling task. Thereafter, we asked respondents to proceed to a second room, where we had different food items and the sampled drink served for them. We then measured the subsequent consumption behaviors related to food and drink. We also recorded the time taken to cover the distance from the first to the second room. Prior studies conducted in animal laboratories demonstrate that rats when primed with a food pellet work harder for more food, than when they are not primed with the food pellet (Grant and Milgram 1973, Terry 1983). Following the same argument, we had predicted that if sampling activates a motivational state then respondents should walk faster for their reward when they have sampled a drink high in incentive value than when they have not. Regarding the consumption behavior related to food and drink, we had predicted that if our results are consistent with reverse alliesthesia then sampling a drink high in incentive value should positively impact subsequent consumption-related behaviors.

Consistent with our predictions, sampling the drink high in incentive value led to an increase in consumption of not only the sampled drink but also the food items. Furthermore, respondents who had sampled the drink walked faster to the room with food and drink served than those who had not sampled the drink. Study-1, therefore, demonstrates that high incentive-value consumption cues activate a more general motivational state, prompting individuals to engage in reward-seeking behaviors in general.

The nascent evidence that exists in the literature supporting reverse alliesthesia, however, suggests that the effects of reverse alliesthesia operates at three different levels of specificity—specific to the consumption-cue, specific to a drive state and a more general-motivation level. Cue specific hypothesis suggests that eating a bit of food or beverage item is likely to increase the subsequent consumption of the sampled food or beverage item only (Cornell et al 1989). Drive-specific hypothesis suggests that sampling a bit of beverage (say, Hawaiian Punch) should lead to an increase in subsequent consumption of not only the sampled item (Hawaiian Punch) but any drink (Pepsi), but not food and vice versa (Toates 1986). Finally, Kambouropoulos and Staiger (2001) provide evidence in support of a general motivational hypothesis. In their study, they show that presenting individuals with a Beer-can not only led to an increase in urge to drink but activated a general motivational state making individuals more engaged in reward-seeking behaviors related to money in a subsequent task. Thus, the level of specificity at which reverse-alliesthesia effects operate is unclear.

Results from study-1 support a general motivational hypothesis; however, these results do not explain the ambiguity related to the level of specificity at which the reverse alliesthesia operates. Our second goal, therefore, was to examine the factors that could moderate the level of specificity at which reverse-alliesthesia effects operate. Extant research on the neurobiology of motivation suggests that in a deprivation state (e.g., when one is thirsty), behaviors should be directed at specific goal stimulus (say, for e.g., a glass of water); on the other hand, non-deprivation state should result in behaviors that are more exploratory in nature. Building on this stream of research we predicted that when individuals are thirsty, sampling a consumption cue (e.g., Hawaiian Punch) high in incentive value should lead to more drive specific effects, that is, it is likely to increase the subsequent consumption of only drive-relevant stimulus (e.g., only drink). However, when one is not in the deprivation state, sampling a consumption cue high in incentive value should lead to more general effects. In other words, when one is not thirsty, sampling a beverage (e.g., Hawaiian Punch) high in incentive value is likely to lead to an increase in subsequent consumption of not only another drink but also food. In study-2, therefore, we manipulated the state of deprivation and examined its impact on subsequent consumption-related behaviors. In accordance with our predictions, we demonstrate that level of specificity at which reverse-alliesthesia effects operates is moderated by the state of deprivation. To elaborate, when respondents were thirsty, sampling a drink high in incentive value led to an increase only in the subsequent consumption of another drink; however, when respondents were not thirsty, sampling a drink high in incentive value led to an increase in subsequent consumption of not only drink but also food.

In sum, our findings suggest that sampling a consumption cue high in incentive value can activate a general motivational state leading individuals to seek anything rewarding, and these effects are modulated by the state of deprivation. Our findings have important implications for the marketers. These results suggest that sampling a food or beverage items in a grocery store is not only likely to increase the purchase of the sampled food or beverage items but rewarding items in general.

SPECIAL SESSION SUMMARY

Catching Up With Consumer Visuals: Theory, Evidence, Upgrades, and Plug-Ins

Linda Scott, University of Oxford, UK

SESSION OVERVIEW

In the past twenty years, the landscape of consumer imagery has changed substantially. Not only have the number, size, and venues of pictures continued to expand, but the balance and relationship between images and verbal material has shifted measurably (Phillips and McQuarrie 2004). Even the visual representation of typeface and the space surrounding the images have come to carry meaning—and images are now widely used to represent quantities and statistics (Henderson et. al. 2002; Pracejus et. al. 2006; Tufte 1990). In turn, new technologies from digital cameras to Photoshop have put sophisticated image-creation tools into the hands of ordinary people. Indeed, technology has so profoundly affected the everyday material culture that the objects being pictured are *themselves* often new and strange. Further, as the planetary economy draws cultures with disparate sign systems into closer contact, differences in cognitive approaches to pictures versus language are being studied (Tavassoli 1999). The ubiquity, accessibility, and manipulability of imagery may have even created the world's first democratic pictography (Scott 1993, Scott and Vargas 2007). In sum, the face of popular imagery has changed so much in recent years that new research frameworks are needed to make consumer response intelligible.

This session brings together leading researchers in consumer response to imagery to begin addressing this gap. Our intention is to point to observable phenomena in commercial imagery not currently addressed by research and to propose theoretical extensions for updating scholarly approaches. We believe this session will command attention because of the prominence of imagery in both public and academic discussions of media and the global economy. We also believe the session will have core appeal to a large subgroup of CB scholars who study visuals under a variety of methods and rubrics (see Scott and Batra 2003; Scott and Vargas 2007).

We will use rhetorical theory as the framework for this session. Language theorists have already heralded the 21st century a rhetorical age, a turn brought about by the spread of consumer culture and mass media, the decline of print communication, and the rise of multiculturalism (Bender and Wellberry 1990; Wess et. al. 1996). A robust stream of work has also emerged in consumer behavior since Scott's (1994a) proposal that rhetoric would provide a workable theory for the study of advertising images (McQuarrie and Mick 1992, 1996, 1999; Phillips 1997; Phillips and McQuarrie 2002, 2004). However, this work has focused so strongly on tropes that the field's perception of the rhetorical approach is in danger of being reduced to a "theory of figures," much as rhetoric was during the 19th century (Bender and Wellberry 1990). Therefore, this session will show how other basic theoretical building blocks—identification, argument, and genre—can be used to build a broad theory of rhetorical imagery *beyond* the study of pictorial metaphor.

The three aspects of rhetoric were chosen as a focus because of their foundational importance to theory-building. *Argumentation* has been understood as the skeletal structure of persuasion since ancient Greece. Any true theory of pictorial rhetoric would need to show how pictures can make statements, list evidence, offer reasons, and argue a proposition. *Identification* was the primary building block in the philosophy propounded by the 20th century's leading rhetorical theorist, Kenneth Burke (Burke 1969; Wess et.

al. 1996). *Genre analysis*—sketching the outlines and rules of identifiable types within a corpus of texts—is the essential first step in making sense of any large body of symbolic forms. Thus, we believe this session will help the researchers in attendance to develop fruitful studies of their own. We hope also to stimulate them to look further into rhetorical theory as a basis for grasping trends in picturing.

A quick look at the references provided here will underscore the participants' expertise in consumer imagery. We also wish to remark that our discussant, David Mick, is not only distinguished in the area of visual research, but in both sign theory and consumer relationships to technology as well. Therefore, we anticipate a high quality synthesis for this session.

EXTENDED ABSTRACTS

"Imagining Identity: Technology and the Body in Marketing Communications"

Jonathan E. Schroeder, University of Exeter

Peter Dobers, Mälardalen University

A key strategy of contemporary marketing is to create a compelling image for products and services by associating brand names to some aspect of personal or group identity. The human body forms a basic building block of this strategy—the body functions as a radiating landmark for innumerable product, social, and emotional attributes ascribed to a vast array of products, services, and ideas in ads, websites, annual reports, and promotional brochures (Schroeder, 2002; Schroeder and McDonagh, 2005). Sophisticated, high-tech products often incorporate the ancient, basic human form within their marketing strategy, attempting to make physical and tangible complex, ethereal, and often invisible goods and services.

This paper takes a pervasive visual theme—the human body and its representation—and investigates its identity building functions within the high-tech category. In a survey of recent IT marketing efforts, information technology products and services were represented in increasingly social ways, infusing their materiality with anthropomorphic and cyborg qualities of human body and soul. We develop a typology of the body in IT ads, drawing on semiotic analysis and interviews with technology and media students, and discuss how images of the body have come to signify technological innovation. We present an interdisciplinary analysis of how the body communicates about IT to illuminate central strategic issues in marketing and representing technological innovations.

We find that within contemporary marketing communications, boundaries between the body and technology have become blurred. Consumers are encouraged to see people and bodies as if they were dispersed and fluid systems of flesh and digits. These cyborg images provide provocative themes for advertisers (e.g., Venkatesh, Karababa and Ger, 2002); this paper joins recent research efforts to theorize the cyborg within consumer culture (Campbell, O'Driscoll and Saren, 2006; Geisler and Venkatesh, 2002). Recent ads collected from magazines such as the *Economist*, *Wired*, and *Time* provide compelling evidence. In print, technology seems to be entering the body, exemplifying the extending capacity of IT—shifting time and space to allow humans to communicate in

FIGURE 1
Sample Ad—Ericsson ‘Designer Technology’ ad, 2001

spectacular ways by expanding our cognitive, physical, perceptual, and intellectual abilities. For example, Ericsson has a series of ads that feature nearly nude bodies, painted blue, that reveal a network of circuits, cables, and computer chips integrated into the body's skin (see figure 1). One ad portrays a bald headed woman, crouching with her palms

resting on the floor, knees splayed out, staring blankly into the camera. Her pose is amphibious—she/it resembles a big blue frog, with the curious addition of computer circuits morphed onto her skin. (Consumer responses to this image vary—some find resonance with the body and the cellphone, whereas others find the image perplexing, revealing the variability of consumer response to rather abstract visual rhetoric.) Radio, internet, and television ads also give technology human-like features and attributes, thus making the nonhuman anthropomorphous. For instance, Swedish tele provider Telia ran spots that showed human “digits”—people labeled with 0s and 1s—discussing the human effects of information technology.

We argue that such ads open up a window of how identity is represented in the electronic economy. Our analytic approach draws on the cultural code of the body as conceptualized from four theoretical domains: (1) life and growth as a controlling paradigm for economics, in which growth, development, nurturance, and life cycles are routinely invoked to discuss economic activity; (2) metaphorical thought, as articulated by George Lakoff and Mark Johnson, about the great chain of being (cf. Wilk, 2004). This overarching metaphor places humans—and their bodies—at the top of a ‘great chain’ of life, with animals below; (3) Michel Foucault’s work on how social, economic, and political institutions interact with and influence the body; and (4) the body as an important genre in visual representation, for example the figure in painting and the body in photography (e.g., Shilling, 2005). Further, we discuss the broader significance of the body in marketing imagery, particularly when it is recruited to signify technological progress and information technology products. The paper ends with some speculations on the changing nature of representation in information technology ads (cf. Phillips and McQuarrie, 2002), and offers some conclusions about the body as a basic element of marketing communication.

“Reason and Realism: Image as Argument”

Linda M. Scott, Oxford University

Patrick Vargas, University of Illinois

Past CB research on advertising visuals has often presumed either that images do not carry brand attribute information or that images of products are used only “realistically” to warrant quality and credibility (Scott 1994a; Scott and Vargas 2007). For images to present arguments on behalf of products, they must be capable of carrying information about product features; however, a key issue emergent from new image technologies is the status of pictures as representations of the real. Not only is there a persistent concern about the alteration of images through various forms of digital retouching, the increasingly stylized visual environment raises questions about the place of the “realistic” in the context of such meaningful variety.

This presentation will begin to explore the new visual environment for brand information and product representation in an effort to conceptualize the image as a form of argument. We will begin by briefly recapping the results of our study (forthcoming JCR 2007) showing that pictures are now capable of representing as specific a list of brand attributes as are words—and that consumers accurately infer the features thus listed.

We will then show new research that explores the range and validity of pictorial “realism” in the representation of objects. This research, like our previous study, makes use of both experiments and interviews to investigate consumer response to object images. Several tasks are employed to investigate how sensitive the perception of “realism” is to context and order effects, to ask what the basis for a judgment of realism is, and to illuminate the ways that the “realistic” and the stylized are attributed meaning in a commercial context. Results in hand already suggest that the notion of “realism” in picturing is undergoing significant revision, becoming quite fluid and subject to shifting interpretations in use.

Our contention will be that evidence points to a response model in which pictures in consumer culture are making “rational” arguments, used to list attributes and to display evidence, but that previous assumptions about the centrality of realism need to be reexamined in light of emergent technologies.

“Pictures, More Pictures, Nothing But Pictures: Image as Genre”

Barbara J. Phillips, University of Saskatchewan

Edward F. McQuarrie, Santa Clara University

A distinctive feature of advertising is its reliance on pictures to persuade. Moreover, documentary evidence suggests that the emphasis on pictures over words in print ads has steadily increased throughout the last century (Pracejus et al. 2006). Unfortunately, there is still not much consumer or marketing theory available for differentiating and organizing the variety of pictorial strategies on display. Though the range of pictorial choices that can be implemented in an ad is now vastly larger because of advancing technology, consumer theory has not kept up.

Our contention is that a separation of advertising images into genres is now required to help researchers make sense of the exploding array of visual strategies. Genre is a combination of a flexible set of constitutive rules and representative members that apply to texts from more than one creator and time period (Fishelov 1993). A genre encompasses a loosely structured set of shared features that can be identified by individuals (Gibbs 1994, p. 49; Stern and Russell 2004); for example, the genre “game” encompasses Monopoly, pin-the-tail-on-the-donkey, and tag. Just as consumers classify movies using genres to frame their expectations and interpretations of the movie’s content (e.g., western, science fiction, romantic comedy), it is our belief that consumers classify advertising images in the same way. That is, the style of the image in an ad provides a supplementary message that presents information to the viewer about expectation, comprehension, and ultimately, response.

One genre of advertising has eschewed most use of verbal copy for decades now is fashion advertising. Ads that present clothing as the embodiment of the latest aesthetic (Entwistle 2000) account for more than half of the pages in men’s and women’s fashion magazines. The clothing industry in the U.S. tops \$180 billion in sales and a one-page ad in *Vanity Fair* or *Vogue* costs more than \$110,000. Despite this economic significance, the genre of fashion images has not been examined in consumer research, perhaps because fashion has long been considered a frivolous, wasteful, or even wicked practice beneath serious consideration and study (Entwistle 2000). Alternatively, it may be that fashion images have been ignored because they are considered “natural” and do not require cultural interpretation—like a catalog picture, fashion ads are believed to represent the clothes to be sold. Although some fashion images are composed this way, many others present models in narrative story situations, and a large number of fashion ads present images that are unnatural, odd, or even inexplicable. As Scott (1994a) reminds us, even the most “representative” ads require cultural interpretation, and researchers have found that fashion ads are not easily coded into the visual categories that neatly organize ads for other products.

We suspect it is consumer knowledge of genre rules that helps fashion advertising to succeed. This suggests that other kinds of primarily visual ads may also make use of, or rely upon, the genre expectations of consumers. Genre expectations, when available, may help to counteract the risk to ad comprehension posed by the absence of verbal copy. This, in turn, indicates an opportunity to define and explore such sub-genres within the print advertising space.

In this paper we define the meaning and operation of genre rules using fashion advertising as an example. We then situate the effort within a broader body of work that attempts to differentiate the visual element within advertising (e.g., the visual rhetorical figure, as discussed by Phillips and McQuarrie [2004]). In short, we

attempt to address the need for better theory and more differentiated accounts of how consumers process pictures in advertising by focusing on extreme cases where the picture *is* the entire advertisement.

The Moderating Role of Need for Cognition and Counterfactual Thinking on Product Evaluation

Kai-Yu Wang, University of Wisconsin-Milwaukee, USA

Minli Liang, SUNY-Brockport, USA

Laura Peracchio, University of Wisconsin-Milwaukee, USA

EXTENDED ABSTRACT

Counterfactual thinking (CFT) refers to the process of reflecting on past events and simulating alternative possible outcomes. Consumer researchers have explored related issues, such as how anticipation of counterfactual regret influences decision-making and behavior (Hetts, Boninger Armor, Gleicher, Nathanson 2000) or how CFT affects information processing (Krishnamurthy and Sivaraman 2003). However, scant research has investigated how and when CFT influences consumers' product evaluations after a purchase success or failure.

Research investigating CFT has found that moods and counterfactual direction may serve as reciprocal antecedents and consequences of each other (Sanna, Turley-Ames, and Meier 1999). For example, suppose a consumer finds that a recently purchased product does not meet the consumer's expectations; the consumer is not happy about the result. As an antecedent, the unhappiness produces upward counterfactuals. The consumer might think, "If I could choose again, I might have made more comparisons and could have bought a much better product." The more the consumer thinks of the negative consequences of the chosen product and the positive consequences of other alternatives, the more dissatisfied the consumer becomes. This dissatisfaction will inevitably produce more upward counterfactuals. Consequently, upward CFT and mood constitute a reciprocal cycle.

We propose that need for cognition (NFC; Cacioppo, Petty, and Kao 1984) may provide a potential boundary for the reciprocal cycle of upward CFT. From a theoretical point of view, an investigation of the moderating effect of cognitive elaboration on the CFT reciprocal cycle may provide an alternative explanation of a contradictory finding.

Two experiments were designed to examine the moderating role of CFT and NFC on product evaluations. The first experiment investigates whether high NFC can break the reciprocal cycle of upward CFT when people encounter a purchase failure and explores the effects that underlie this process. Experiment 2 provides a replication and extension of experiment 1 to establish the robustness of the documented findings.

In experiment 1, two computer purchase scenarios (positive-outcome and negative-outcome) and two thinking instructions (no CFT instruction and CFT instruction) were manipulated. We hypothesize that in a negative purchase outcome condition, respondents engaging in more extensive purchase scenario processing (high NFC) should produce more favorable product evaluations when a CFT instruction is provided after purchase. In contrast, respondents engaging in less extensive purchase scenario processing (low NFC) should produce more favorable product evaluations when a CFT instruction is not provided after purchase. The results are consistent with our predictions. Examination of thought measures provides additional support for the hypotheses.

Experiment 2 replicates the negative-outcome conditions by replacing the CFT instruction with a follow-up customer service survey. In addition, processing extensity was manipulated with motivation instead of being measured as NFC in experiment 1. Our procedure explicitly manipulated respondents' motivation to engage in extensive processing of purchase scenarios in experiment 2.

We propose that the moderating effects of NFC and thinking instruction observed in experiment 1 should be replicated under negative purchase outcome conditions. Specifically, when a follow-up survey was provided after purchase, individuals with high processing motivation evaluated the product more favorably than individuals with low processing motivation. But, when no follow-up survey was given, respondents with low processing motivation evaluated the product more positively than respondents with high processing motivation. Our predictions are supported. Examination of thought measures also provided additional support for the predictions. The results in experiment 2 are important in advancing our understanding of the effects that underlie the process in negative purchase outcome conditions.

Together, the two studies support our proposed theorizing regarding how NFC and CFT can affect people's product evaluations after a positive or a negative purchase experience. The studies reveal that with a CFT instruction, individuals engaging in more extensive processing generate more downward counterfactuals than upward counterfactual after a purchase failure, resulting in higher product evaluations. Individuals engaging in less extensive processing invoke upward CFT as part of a reciprocal cycle after a purchase failure, thus producing lower product evaluations. Furthermore, we find that without a CFT instruction, individuals who engage in more extensive processing generate lower product evaluations after a purchase failure than those who engage in less extensive processing do.

The findings of the two studies contribute to both psychology and consumer research. For psychology, this research suggests that sufficient resources or ability can break the negative cycle that consumers may encounter after a purchase failure. The results not only offer a resolution to the previous contradictory findings, but also provide evidence that cognitive ability or resources impacts the direction of CFT.

Our contribution to consumer research is also substantial. Our research suggests that high NFC or motivated consumers generate more downward counterfactuals and fewer upward counterfactuals, thus producing higher product evaluations if they are given a follow-up customer service survey after a purchase failure. It extends the research domain from the structure of counterfactual thoughts to product evaluation.

From a managerial standpoint, this research has implications for postpurchase marketing efforts. Specifically, marketers can use some postpurchase efforts, such as a follow-up customer service survey in experiment 2, to influence consumers' CFT direction. Comment cards and satisfaction surveys are widely used in the service industry, such as hotels, restaurants and etc. This research enhances our understanding of how postpurchase marketing influences consumers' product evaluations.

Visualization and New Product Evaluation: The Role of Memory- and Imagination-Focused Visualization

Min Zhao, University of North Carolina, USA
Steve Hoeffler, Vanderbilt University, USA
Darren Dahl, University of British Columbia, Canada

EXTENDED ABSTRACT

Really new products (RNPs) allow consumers to do things they have never been able to do before. To help consumers learn about the new benefits associated with RNPs, mental simulation of product usage has been identified as an effective cognitive tool (Dahl, Chattopadhyay, and Gorn 1999; Dahl and Hoeffler 2004; Hoeffler 2003). For example, research has demonstrated that mentally simulating the usage of an RNP increases consumers' ability to predict the benefits of an RNP accurately (Hoeffler 2003). However, because humans tend to be "cognitive misers" (Bettman, Luce, and Payne 1998; Fiske and Taylor 1991), they are reluctant to engage in the extensive cognitive thinking that might be required. Consequently, in the new product domain, when people are asked to visualize new product-related activities, they underestimate the usefulness of the radically new features (Dahl, Chattopadhyay, and Gorn 1999; Dahl and Hoeffler 2004). Consumers base their mental images on their memories about prior consumption routines, which are more easily accessible. Yet focusing on prior consumption patterns may highlight the requisite behavior changes and thus enhance learning-cost inferences associated with adopting an RNP (Mukherjee and Hoyer 2001). As a result, overall evaluations of an RNP are discounted (Dahl and Hoeffler 2004). In this research, we incorporate visual mental imagery with an imaginative focus into new product learning and examine the impact of the imaginative focus on the evaluation of RNPs.

Visualization and Evaluation of RNPs

In the new-product-design domain, Dahl and colleagues (1999) find that when designing a product, use of imagination-focused visual imagery (e.g., going beyond previously seen images, visualizing new and never-before-experienced events) results in more original product designs than use of visual imagery based on existing memories. These findings suggest that changing consumers' focus of visualization from a simple prior product usage to imaginative new uses of a really new product could enhance their evaluations of an RNP. However, for an INP with a low level of complexity, when consumers focus on existing consumption patterns, less behavior changes are required and lower learning costs are involved (Mukherjee and Hoyer 2001). This implies that consumers have the mental resources to estimate the value of the INP's new capabilities, which they would naturally do when focusing on the potential new uses of the product. Therefore, switching the focus of visualization from existing usage situations to new usage situations will not have a large impact on evaluations of an INP. Thus:

H₁: Imagination-focused visualization leads to higher evaluations of an RNP than memory-focused visualization; however, a visualization focus (memory versus imagination) does not affect evaluations of an INP.

Ease of the Visualization Task

Recent research on the accessibility of experiences hints at the potential for the difficulty of the visualization exercise to affect evaluations. Notably, Schwarz (1998, 2004; see also Sanna and

Schwarz 2004) finds that people rely more on the accessibility of experiences (i.e., ease of retrieval) than the accessibility of content. In a marketing context, Wanke, Bohner, and Jurkowitsch (1997) find further evidence of the impact of accessibility. They demonstrate that when participants named ten reasons for choosing a focal car, their evaluations were lower than when they named only one reason. This finding was primarily due to the ease of retrieval. In the new product domain, research has demonstrated that the difficulty of the visualization task can mediate the impact on evaluation (Dahl and Hoeffler 2005). Visualizing others using the new product was easier than self-visualization for RNPs, and that greater perceived ease with visualization led to higher product evaluations.

On the other hand, research has also indicated that for INPs, for which participants have some experience in the domain, preferences will be less susceptible to subtle context effects (e.g., experienced ease during the visualization exercise). In particular, recent research has shown that the level of knowledge can influence the perception of how diagnostic ease of retrieval is likely to be (Tybout et al. 2005). For example, when people were asked to generate thoughts about a focal car, those to whom the features were more familiar relied more on the retrieval content. Thus:

H₂: In the context of imagination-focused visualization, greater perceived ease of the visualization task leads to higher evaluations of an RNP than lower perceived ease. However, ease of visualization has no impact on the evaluation of an INP.

Results and Implications

In Experiment 1, we compared the impact of memory-focused visualization with that of imagination-focused visualization and demonstrated that imagination-focused mental imagery increases the evaluation of an RNP but has no impact on the evaluation of an INP. In Experiment 2, we manipulated the difficulty of imagination by prompting participants to come up with one or eight new activities that they could perform with the new product. The results showed that imagination lowered the evaluation of the RNP when eight activities (vs. one activity) were required but it had no effect on the INP. In Experiment 3, we manipulated the ease of imagination by providing participants with one or eight activities related to the new product. The results show that because of the greater perceived ease, participants who were given eight examples had higher evaluations of the RNP than participants who were given only one example. In both experiments 2 and 3, ease of imagination had no impact on the evaluation of INP.

Our results add significantly to recent research on mental simulation and new product learning by identifying different types of visualization focus. We emphasize the concept of "imaginative-new-usage focus" and show that only if people are explicitly instructed to rely on imaginative new uses will their visualization enhance product evaluations of an RNP.

Our research also extends the accessibility literature with a traditional *retrospective* view (i.e. ease of *retrieval*) by demonstrating the role of ease of imagination from a *prospective* view.

Design and the Big Five: Linking Visual Product Aesthetics to Product Personality

Frédéric F. Brunel, Boston University, USA

Rishtee Kumar, Boston University, USA

EXTENDED ABSTRACT

Design is not just a cultural phenomenon; it is also a key strategic variable that can assist companies in securing or defending a marketplace advantage. Even though practitioners and consumers have embraced design, consumer research seems to lag behind, and design research is rather fragmented (Veryzer 1999, Bloch, Brunel and Arnold 2003). We believe that this is an important area for consumer researchers and that design research can impact theory and practice.

This research concentrates on visual product aesthetics or those characteristics that create a product's appearance and have the capacity to affect observers and consumers (Lawson 1983). Such characteristics include materials, proportion, color, ornamentation, shape, size and reflectivity. Visual product aesthetics influence consumers' perceptions in at least three ways. First, product design distinguishes products from competitors and helps gain market recognition (Bloch 1995; Schmitt and Simonson 1997). Second, product aesthetics serve a symbolic role that influences product perception, comprehension, and evaluation (Yalch and Brunel 1996). Finally, product appearance is a central channel through which consumers might form relationships with products (Hollins and Pugh 1990; Lewalski 1988), and as such it has been shown to be a source of product attachment (Govers and Muge 2004).

In this project, we contend that visual product aesthetics are marketing variables that can be used to create and influence consumers' perceptions of brand and product personality. We focus our investigation on understanding how visual aesthetic characteristics are linked to product personality perceptions (how the physical product is described in terms of human personality characteristics) (Jordan 1997). It has been shown that consumers' perceptions of product personality can be influenced by variations in design shapes (Govers, Hekkert and Schoormans 2004) and material choices (Kesteren, Stappers and Kandachar 2005). Further, it has been evidenced that designers seem able to convert abstract personality descriptions into actual designs and that downstream, consumers are able to identify these intended product personalities (Govers, Hekkert and Schoormans 2004). Finally, it was demonstrated that consumers prefer product designs with product personalities congruent with their own (Govers, and Schoormans 2005). Yet, even though these findings provide valuable evidence for the importance of the product personality construct, they do not provide a systematic understanding of the perceptual processes that link product design aesthetics to product personality perceptions.

Based on psychological studies on interpersonal personality judgments, we know that attributions of personality traits based on superficial visual judgments are not only prevalent, they are also efficient. Second, although there might be a "hard-wired" ability to perform these personality judgments, it seems that learning and experience also play a key role. Finally, it has been advanced that these attributions or perceptions are implicit and might happen automatically, without direct awareness of their sources.

Though consumers might not be aware of the implicit processes that they automatically use in making product personality perceptions, they can nonetheless reveal to us what their product personality perceptions are and we can also ask them to explicitly articulate evaluations of the design facets of target products. With these two sets of data, across individuals and products, we uncover

the relationships between design facets evaluations and product personality perceptions. Following this research approach can provide insights into the sources and processes behind product personality assessment.

To this end, we conducted a laboratory study designed to test that systematic relationships between visual product aesthetics and product personality could be established. Real products (without identifiable brand names) were used. We selected products in multiple categories automobiles, telephones, TV sets, and wall-clocks) and with varying design executions. Two hundred fifty one students participated in this study. Each participant was randomly assigned two products (not in the same category) to evaluate. We used Aaker's (1997) 42-item scale to assess the five dimensions of product personality (sincerity, excitement, competence, sophistication, and ruggedness), and we used Ellis (1993) 43-item scale to measure seven design facets (simplicity, harmony, balance, unity, dynamics, timeliness/fashion, and novelty) Manipulation checks based on an overall product style measure confirmed that the products selected for this study reflected different levels of design.

With respect to evaluations of the individual aesthetic characteristics (facets), the results showed significant differences across and within product categories. We also found significant differences for all five product personality dimensions. Although not unexpected, this is a rather remarkable result as respondents had no other information about the products besides the physical appearance as shown in a black and white picture (no brand or feature information was provided). This seems to confirm that consistent and visually-based assessments are made across individuals.

In the second part of the analysis, we used multiple linear regressions to investigate the relationships between each product personality trait (as dependant measure) and the seven aesthetic facets (used as independent measures in the regression). All five models were significant. This result alone is supporting evidence for our contention that product aesthetic evaluations are linked to product personality perceptions, and that our research approach can uncover underlying perceptual processes that drive perceptions of product personality. Further, it should be noted that for at least three personality traits, the variance in product personality that was explained was rather large (adjusted R^2 for excitement: .811; sophistication: .588; and competence: .385).

In summary, three main sets of findings emerged: 1) there were systematic differences in aesthetic facets and personality evaluations across the eight products, suggesting that consumers are able to produce convergent assessments based solely on the visual information about the products; 2) the regression analyses provided convergent evidence that evaluations of product aesthetic facets are linked to perceptions of product personality, and in some cases it seems that this association is very strong and explain a large portion of the variance, but 3) there is a need to further research the linear combinations of different aesthetic facets in order to uncover their potential interactive effects.

Product Design Perception and Brand Categorization

Robert Kreuzbauer, University of Illinois at Urbana-Champaign, USA
Alan J. Malter, University of Arizona, USA

ABSTRACT

This paper proposes a theoretical framework for the perceptual processing of information picked up from product design elements (such as product form) and its influence on consumers' conceptual knowledge and categorization of brands. This view of consumer knowledge and brand categorization draws from the ecological approach to visual perception, principles of object recognition by components in perceptual psychology, and the emerging perception-based theory of cognition as a perceptual symbol system. The authors describe four bases of brand categorization derived from product design information, provide examples of each, review empirical findings, and discuss implications for consumer research and new product design.

Despite the increasing importance of aesthetic elements of product design in making products and brands more appealing than others, few marketing or consumer researchers have integrated product design into a more general marketing-theoretical framework (for exceptions, see: Bloch 1995; Veryzer 1993; Wagner 2000). Product design often plays a primary role in creating the identity and value of brands, such as the characteristic styling of Alessi kitchen equipment or the typical shape of a Piaggio Vespa motor scooter, which have become defining elements of the entire brand. Recent research suggests there are at least three central relationships between design and brands (Kreuzbauer and Malter 2005). First, design facilitates product and brand categorization and also influences consumer beliefs about the product and brand (Bitner 1992; Bettman 1979; Berkowitz 1987). Recognition of a new product as belonging to a certain brand category is strongly influenced by brand-typical design attributes. Second, design elements communicate information about the specific functions of a product and how people can physically interact with and use the product or specific brand. Third, designs that are aesthetically appealing lead to positive brand evaluations.

In this way, design elements constitute essential parts of brand concepts, which are stored in long-term consumer memory. Some of these elements are so familiar and accessible (e.g., the shape of the Coke bottle) that when perceived they immediately cue recall of masses of knowledge about the particular brand. Thus design, which we define as the form or shape of a product, to a great extent influences the process of brand concept development as various product signals become transformed into a clear and unmistakable brand construct in consumer memory. One of the primary functions of this conceptual understanding of a brand is that it facilitates a consumer's identification of a new product as a member of a particular brand category. In this paper, we examine consumer information processes that transform product design information into a brand concept, based on a perceptual theory of how specific elements of product design play a key role in the process of brand categorization (i.e. determining whether product X is member of brand Y).

Most brand research based on an information processing approach focuses on a presumed hierarchical relational structure of brand knowledge (Keller 1998). We believe a proper understanding of how product design becomes embedded in brand knowledge also requires consideration of perceptual processes. In the present context this means how product design information is "picked up" by

human sensory systems and integrated into a consumer's conceptual understanding or knowledge of a brand. More specifically, we propose a general theoretical framework of consumer information processing of product design elements and its effects on brand categorization. We focus on the process by which product design signals are visually perceived and become mentally represented and organized as brand concepts within consumer memory (see figure 1). We further discuss the subsequent influence of product design information on brand categorization.

The proposed framework can be used to study possible consumer response to a range of new design alternatives or extensions of existing brands. Thus, the model can be used to consider consumer response to such design questions as:

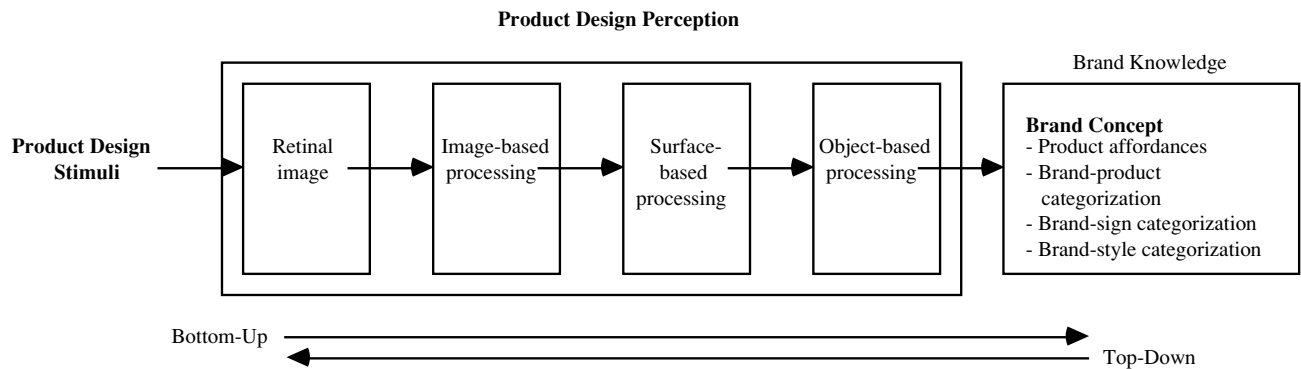

- (1) *Within a given product line (such as Volkswagen cars), which design parts can be transferred to a new model (such as the Tuareg) to ensure brand familiarity? (i.e., that the new model would be considered a member of the Volkswagen brand family);*
- (2) *In the case of a model extension, which design parts from an old model need to be transferred to a new model to ensure brand familiarity? (e.g., when the Volkswagen Golf 5 is introduced, which parts from the Golf 4 need to be transferred to the Golf 5 to ensure that consumers perceive the new model to also be a Golf);*
- (3) *Or more generally, to support strategies to reposition brands through product design, e.g. when a car brand seeks to be positioned as higher in luxury, which design elements need to be added to the design of the car to create the appearance of luxury?*

A FRAMEWORK FOR PRODUCT DESIGN INFORMATION PROCESSING

According to cognitive science and most academic literature on branding, brands can be considered cognitive constructs relating to a certain company's product offerings (Aaker 1996; Keller 1993; Meffert 1998). Thus, product and brand knowledge stored in long-term memory constitutes a mental *concept* (Anderson 2000; Barsalou 1992a, 1999). In general, a concept is the knowledge and accompanying processes that allow an individual to mentally represent an entity or event adequately (Barsalou 1999). For instance, a person's concept of *car* is their mental representation of this specific entity. Yet the car concept is not a simple picture in the mind of one or more perceived cars, but rather an organized unit of a *general car*-derived from several prior car experiences-which enables the individual to identify other objects with similar attributes to cars (Barsalou 1999; Mandler 1992). Consequently, concepts determine whether or not a new object or event belongs to a certain *category*, whereby a category is a set of related entities from any ontological type (e.g., *robins, sweaters, weddings, plans*) in the human brain (Barsalou 1993, 1999; Lakoff 1987). Thus, a concept is the organized set of attributes, features, rules and relations which represent an entity or event. For example, the concept for car might, in part, include the features *4-wheels, sheet metal, consumes diesel fuel or gasoline*. But concepts, and hence rules, for category membership are never fixed and may vary from context to context as a result of situational goals (Barsalou 1983) or developmental experience and physical

FIGURE 1

Framework for product design information processing (adapted from Palmer 1999; Gibson 1979)

action (Mandler 1992; Smith 2005). For example, the car concept constructed on a different occasion might include the features *4-wheels, synthetics, consumes diesel fuel or gasoline or electricity*.

As the framework in figure 1 shows, to gain a proper understanding of how product design stimuli affect the development of specific brand concepts and thus influence brand categorization, we must consider aspects of both (1) perception and (2) knowledge representation and organization. Scholars of brand knowledge representation and organization (Keller 1993; Lawson 1998; Sujan 1985; Zaltman 1997) have applied some findings from cognitive psychology but have paid little attention to product perception in general (cf. Veryzer 1993; Veryzer and Hutchinson 1998) and largely neglected the role of design in brand perception (Keller 1998; Mowen and Minor 1998). While general *gestalt* principles (Köhler 1947; Wertheimer 1912, 1924) were articulated in the early 20th century, these and more recent theories of visual perception and object perception from perceptual psychology (Biederman 1987; Hoffman and Richards 1984; Goldstein 1997; Marr 1982; Palmer, 1990; Treisman 1969, 1993) have not been integrated into theories of consumer information processing or brand concept development. In contrast, our research specifically examines the role of perceptual processing of product design information in brand categorization.

How do consumers process perceptual information such as product design elements? Within product design perception, a process of *selective attention* focuses a consumer's information processing on information relevant to a particular goal (Barsalou 1992a). As shown in figure 1, the process of perception passes through several stages: retinal image, image-based stage, surface-based stage, object-based stage (Palmer 1999). Whenever stimuli are considered relevant, attention is selectively focused on them and concepts are developed and stored in memory. In parallel to this bottom-up process, an existing concept, in a top-down manner, influences the attention to and perception of particular stimuli. Consequently, both bottom-up processes and top-down processes influence product and brand perception. Thus, product and brand perception are, to a large extent, controlled by previously stored brand knowledge as it shapes the consumer's interest and thus the attention that provides guidance in perceiving specific product stimuli. Therefore, with the exception of the retinal brand impression, a consumer's attentional processes operate at each individual stage of product and brand perception where processing capacity is allocated to certain product stimuli (cf. Bettman 1979; Mowen and Minor 1998).

Perceptual Psychology and the Process of Product Design Perception

As suggested by theories in perceptual psychology (Biederman 1987; Marr 1982; Palmer 1999; Treisman 1993) brand design perception follows a four-stage process. The first stage describes a two-dimensional *retinal image* which is a first impression of a visual product stimulus that is projected to the viewpoint of the observer's eyes. A retinal image is perceived without the consumer's attention, and the information is unstructured and uninterpreted (Julesz 1984; Treisman 1993). In the second stage, the two-dimensional retinal product impression is further processed, so that elements such as lines and edges are detected and "sharpened" (*image-based stage*). Further in the *surface-based stage*, general surface and spatial information is recovered. True three-dimensional processing first occurs in the final stage, called the *object-based stage*, since the product perception process does not end with the mere representation of all the visible surfaces. Instead, it is assumed that during perception surface information is related to general stored knowledge about the intrinsic nature of the three-dimensional object (Palmer 1999). An example would be aspects of a product that are occluded from the current viewpoint, such as the back or underside of a camera, TV, car, bottle, etc. Thus, by simply perceiving the curved surfaces of a bottle, the observer is able to make clear predictions regarding the probable appearance and properties of the back of the bottle. Therefore, hidden assumptions about the nature of the visual world are also required to enable the inclusion of information about unseen surfaces or parts of surfaces.

There is also a growing consensus in research on visual perception that representing the functions of an object involves dividing the object's shape into parts (Baylis and Driver 1995a, 1995b; Bennett and Hoffman 1987; Biederman 1987; Biederman and Cooper 1991; Hoffman and Richards 1984; Hoffman and Singh 1997; Marr 1977, 1982; Marr and Nishihara 1978; Palmer 1975, 1977; Tversky and Hemenway 1984), leading perceptual psychologists to seek ways to recover the part structure of an object. Once a set of parts has been identified, higher-level parts can then be constructed by grouping together the more general parts. Biederman (1987) introduced a recognition-by-components (RBC) theory of object perception and recognition whereby objects can be specified as a spatial arrangement of so-called "primitive" or primary volumetric components, which he called *geometric icons*, or *geons*. The idea behind geons is analogous to speech perception, in which all kinds of words can be coded using a relatively small set of primitive elements, or phonemes (Marslen-Wilson 1980). In visual percep-

FIGURE 2
Examples of different object structures composed of the same primitive geons

tion, the primitive elements (geons) are a modest number of simple geometric components such as cylinders, blocks, wedges, and cones (Marslen-Wilson 1980). A major assumption of RBC theory is that the mental representation of an expected object (including products) is a volumetric structural description composed of geons. Depending on the size and type of geon, as well as the relationships between several geons (see figure 2), any kind of object can be represented by the human conceptual system. For example, a geon can be a generalized cylinder (or cone), which is a volume constructed by sweeping a two-dimensional shape around an axis (Biederman 1987; Binford 1971; Marr 1982). To determine how a geon-object structure is constructed, one needs a set of rules for designing geons and the necessary relations among them for constructing a huge number of object representations. For a detailed description of “geon-rules” and other examples of simple object representations, see Biederman (1987) and Palmer (1999).

Organization of Product Design Knowledge and Brand Concept Development

Of past research on brand knowledge organization (Keller 1993; Sujan 1985) perhaps the best-known framework is Keller’s (1998), which distinguishes between two main dimensions: brand recognition and types of brand associations. Although both dimensions may potentially include aspects of design, neither Keller’s model nor other traditional theories of brand knowledge structure (Grunert 1996; Meyers-Levy and Tybout 1989; Mitchell and Dacin 1996; Olson 1978; Sujan and Dekleva 1987) explains how or which types of visual design attributes enable brand recognition or lead to specific brand associations.

A cognitive theory better able to account for visual knowledge representation is Barsalou’s (1999) theory of *perceptual symbol systems* (PSS). In this view, knowledge represented in the human brain is based on an organized set (frames) of *perceptual symbols*, which Barsalou defines as records of the neural activation that arises during perception. Perceptual symbols are neural representations in sensory-motor systems that function either consciously or subconsciously and are also schematic (Barsalou 1999). Through selective attention, a consumer perceives information and stores in long-term memory a record of the neural state at the time of perception. For example, if selective attention focuses on product design elements, the neurons representing these parts are selected and a record of their activation is stored (Kreuzbauer and Malter 2005). Note that perceptual symbols are componential and not holistic (Barsalou 1999). Thus, an object such as a laptop computer is not stored as a whole image but is composed of several perceptual symbols that represent design parts (overall shape, monitor, keyboard, touch pad, etc.). Perceptual symbols are further organized within mental frames or schemata, which explain the underlying stability and yet flexible organizational structure of knowledge (for a more detailed description of frames, see Barsalou 1992a, 1992b).

An important function of a perceptual symbol system is its capacity for constructing mental simulations as a basic cognitive process. Related perceptual symbols become organized within a frame, which then functions as a *simulator*, allowing the cognitive system to construct specific mental simulations of an entity or event in its absence (Barsalou 1999; for applications to social cognition, see Niedenthal et al. 2005; see also Markman, Maddox, and Baldwin 2005; Zwaan 1999). Thus, a person’s mental frame for *computer* can be used to mentally simulate several types of computers based on exemplars that have been previously experienced. Since perceptual symbols are componential, a person is also able to combine different frames and produce novel mixed simulations that have not been experienced previously. For example, a consumer can combine perceptual symbols of the computer frame with perceptual symbols that represent Alessi style brand designs in order to construct a coherent mental simulation of a hypothetical Alessi style computer. Such a computer does not yet exist and hence has never before been experienced, but it can easily be simulated mentally. Similarly, it is also possible to develop mental simulations of novel conceptual combinations that derive from different concepts. For example, consumers can construct a simulation with the concepts *computer* and *luxury* to develop a mental simulation of a “luxury computer,” or they can combine a specific brand (e.g. B&O) with the computer concept to simulate a hypothetical B&O computer.

Simulating conceptual combinations blending various shape and brand concepts produces specific brand categorization effects. We propose four major ways in which product design influences brand categorization through perception: (1) the perception of product affordances; (2) brand-product categorization; (3) brand-sign categorization; and (4) brand-style categorization. The following sections describe and integrate these four bases of brand categorization into the general framework of processing product design information.

FOUR BASES OF BRAND CATEGORIZATION

(1) *Product Affordances*. The functional properties of some products are so closely aligned with visually observable characteristics (product size or shape) that the actions the product affords to the observer, such as how the observer can interact with the object or what they can do with it, can be directly perceived or “picked up” by the observer’s visual system (Gibson 1979; see also Brunswik 1943, 1952; Vicente 2003). Examples of such product affordances are the handle of a mixer that affords “grasping” by the observer’s hand, or a chair that affords “sitting on” by the observer’s body, given its shape and possible movements. During visual perception of product design elements, affordances may be ascertained in the surface-based as well as object-based stages. For example, a smooth texture and surface or an appropriate geon-organization of a handle can afford “grasping” (see figure 3a). These affordances then

become embedded within a particular brand concept. Although these types of products may project certain unambiguous affordances, the essential functional properties of some products, e.g. mobile phones or computers may be more abstract and not directly perceivable. These require additional information from another source (product manual, advertising, direct experience of product use) to identify and comprehend the product's innate meaning or functionality. For instance, a consumer can directly perceive that a mobile phone handset affords grasping and carrying but would need additional input in order to understand its function as a communication tool, portable music player or camera.

(2) *Brand-Product Categorization.* Brand-product categorization represents the 'generic' product-brand relationship. Any brand concept consists of both brand-level design information and also information about the generic product category. For example, the Mercedes brand concept contains both brand design knowledge about Mercedes car models and generic knowledge about the general concept of *car*. Brand-product categorization is chiefly determined by geon-structures in the object-stage process. The link between geon-structures and knowledge organization has been experimentally examined by Kreuzbauer and Malter (2005) who found that motorbike sub-categories (street and off-road motorbikes) can be represented through flexible geon-structures composed of combinations of perceptual symbols in product frames. They further show how alternative organizations of geon-structures enable the consumer to classify a product into either the *off-road motorbike* or *street motorbike* category. Drawings of motorbike designs containing different geons typical of either off-road or street motorbikes produced hybrid product impressions. A motorbike model containing more geon-structures of product-design elements typical of a specific product sub-category (off-road or street motorbikes) was more likely to be perceived as a member of that sub-category.

(3) *Brand-Sign Categorization.* In addition to purely generic product information, branded products also convey information that is characteristic of a particular brand, such as the lights and grill design typical of a BMW car front. As suggested by semiotics and cognitive semiotics (Kreuzbauer 2002; Mick 1986; Nöth 1990; Peirce 1931-1958) brand-sign categorization can be more specifically divided into *brand-symbolic* categorization processes and *brand-iconic* categorization processes. The former occurs when abstract product design elements do not refer to any major external knowledge units except those within the brand concept. For example, the Volkswagen logo does not communicate any inherent meaning by itself but simply represents the Volkswagen corporation. In contrast, brand-iconic categorization derives from design elements that originally refer to non-brand specific concepts, for instance the typical front perspective of a BMW car ("BMW-face") that resembles a predator. Such design characteristics may facilitate analogical transfer of meaning from attributes of the predator-concept such as aggressiveness, dominance, and speed to the entire BMW brand concept and hence to all members of the BMW brand category.

During perception and processing of product design, surface-based processing can lead to brand-sign categorization. Once a product's surface has been perceived by the consumer it becomes embedded within the brand concept, which then facilitates brand-sign categorization processes. Surfaces often determine brand-iconic categorization, since they frequently relate to additional non-brand specific knowledge units. For example the surface of a hypothetical "Philips Alessi" mixer (soft and long radii, non parallel; see figure 3a) suggests an organic body because it shares characteristics with the surfaces of human bodies. Thus, "organic" becomes part of the "Philips Alessi" brand concept. In contrast,

there are product surfaces that are so particular to certain brands that reference to other concepts becomes non-specific, such as the distinctive characteristic line (surface edge) of the body of a BMW automobile (see figure 3b). Brand-sign categorization is also determined by geon-structures. For example a geon-structure of a Volvo station wagon has a particular form and becomes embedded within the Volvo brand concept. In order to be visually perceived as a member of the Volvo brand, another automobile would need to consist of a similar geon-structure.

Brand-sign categorization also frequently occurs during the object-based processing stage. Here the sub-process of brand-iconic categorization is chiefly determined by principles of perceptual grouping such as closure, continuity, proximity, common fate, and similarity of orientation or size (for a detailed description see Palmer 1999; Palmer, Brooks, and Nelson 2003). This is of particular strategic relevance for the extension of existing brands, for example, when a new BMW 5-series model is introduced in the market and partially resembles the old BMW 4-series model. In this case, the new model needs to incorporate enough essential elements from the previous model (see figure 4a) so that the new model will be at least minimally recognizable as a member of the parent BMW brand concept. Similarity here is produced by rules of perceptual grouping such as closure, similarity of orientation and size of salient surface attributes, for example the inner headlights and the overall shape of the headlight assembly. Thus, brand familiarity of product design (shape) elements is important in the case of product line extensions. As shown in figure 4b, the overall shape of the handset and orientation of the keys in two Nokia mobile phone models is likely to produce the desired effect of brand-sign categorization.

(4) *Brand-Style Categorization.* Brand-style categorization describes a special case rather than a distinct process of brand categorization. More specifically, certain style-concepts are determined by various combinations of surface- and object-based perception processes. For example, the "luxury" style concept may include design attributes such as *chrome, shiny, ornaments, etc.* Attaching these attributes to branded products, such as a Volkswagen automobile, produces a conceptual combination of "luxury Volkswagen." Similar examples exist for object-based processes, such as sturdy protective components from the concept of *sports equipment* that when added to a Nokia mobile phone produce a conceptual combination of "sporty and durable Nokia mobile phone."

FUTURE RESEARCH DIRECTIONS

Although it is not surprising that design affects brand categorization, the proposed framework is a first step toward better understanding how the perception of product design elements influences consumer development of brand concepts and use of brand categorization processes. Future testing of the framework is needed to better understand the relationships and boundary conditions between specific product design characteristics and brand categorization. First, future experiments can test the possible interactions of different combinations of design elements attached to different brand concepts. For example, country-of-origin effects may constrain the acceptance of certain conceptual combinations, as in the case of shiny chrome metal (part of the luxury concept) producing a mental representation of "luxury car" when linked to the concept of car brands from certain origins (Audi from Germany) but not others (Chery from China). Similarly, further research can examine the effects of conceptual combinations of different style and brand concepts.

Second, although brand familiarity can be produced by several product design attributes in combination with existing brand knowledge, some design attributes may be more suitable than others.

FIGURE 3A

FIGURE 3B

BMW surface (abrupt step)

FIGURE 4A

Perceptual grouping of BMW car front

FIGURE 4B

Perceptual grouping of Nokia phones

Additional research is needed to better understand which design components can most effectively induce perceived similarity, including effects of salience perception within the described perception processes. Third, it is important to study the interaction between design innovativeness and brand categorization processes. When new product models are introduced there may be a trade-off between increasing the probability of brand familiarity through familiar product design attributes and creating arousal through the introduction of very novel design attributes that risk being unrecognizable or unacceptable as members of the brand category. Kreuzbauer, Schoormans, and Snelders (2006) show that both brand familiarity and novelty can be produced when products share similar line and surface structure. However, since line perception is an earlier process during object perception than surface perception, shared line structure ensures stronger brand familiarity than a shared surface structure.

Finally, future research is needed to better understand the process and degree of analogical transfer, including how brand categorization processes affect dependent variables such as consumer perceptions of quality and aesthetic appearance.

IMPLICATIONS FOR NEW PRODUCT DESIGN

The proposed linkage between product design and brand categorization has several important implications for product designers seeking to effectively communicate intended product and brand meanings to targeted consumers. Both designers as well as brand and product managers need to incorporate product design (form and shape) elements within brand strategies more purposefully. For example, managers need to decide which surface or object components can and must be used to support a given brand strategy. This is of particular strategic importance for brand and line extension strategies or for composite branding strategies, such as producing similarity effects between a parent brand and brand extensions, between old and new models, or between two brands. Currently, brand managers must often rely on the designer's feeling about how best to elicit an intended brand-categorization effect. Our proposed framework provides a more principled and theoretically-grounded structure that can be used to consider alternative product design concepts and their effects. This approach may prove useful in evaluating which of many possible design elements can best support a particular brand strategy.

Playing Games Efficiently: Hedonic Learning and Loyalty

Kyle B. Murray, University of Western Ontario, Canada

Steven Bellman, Murdoch University, Australia

EXTENDED ABSTRACT

Time is saved to be spent doing other things. Less time spent on work means more time for leisure; consumers tend to prefer efficiency in utilitarian tasks, to achieve desired benefits with a minimum investment of time and effort (Payne, Bettman and Johnson 1993; Simon 1955). During hedonic tasks, however, consumers are much less concerned with (even oblivious to) their expenditure of time and effort, which is defined primarily by the quality of the experience (Hirschman and Holbrook 1982; Voss, Spranger and Grohmann 2003).

Consumer behavior on the internet can be utilitarian or hedonic. Consumers are attracted to the internet because it can save them time (Bellman, Lohse, and Johnson 1999) and online shoppers prefer websites that they can use more efficiently (Johnson, Bellman, and Lohse 2003), but longer site visit times are positively correlated with the quality of the users' internet experience (Novak, Hoffman, and Yung 2000). While efficiency is preferred for utilitarian behavior, experiential factors dominate during hedonic consumption (Hirschman and Holbrook 1982). For example, during a "time-filling" (Rubin and Perse, 1987, p. 59) experiential task such as 'surfing' the net, consumers can experience a state of "flow" and be "unaware of the passage of time" (Hoffman and Novak 1996, p. 65; flow applies also to goal-directed tasks where it is associated with, e.g., inhibition of distractions).

The human capital model of consumer choice (Ratchford 2001) contends that both types of consumer behavior can be explained by the efficiency resulting from the accumulation of knowledge, skill or expertise. Specifically, the more human capital a consumer has invested in a particular behavior the higher its utility and the more likely s/he is to repeat that behavior in the future.

The importance of efficiency (i.e., time savings) is intuitive for utilitarian consumption, such as buying a specific book online. The faster the purchase, the greater the return for the time invested. However, it is less clear that efficiency applies to hedonic consumption; in some cases, it is extremely counter-intuitive. For example, will a consumer maximize utility when browsing for a book if the browsing finished faster? Would playing a game be more enjoyable if the game ended sooner? In fact, for many types of hedonic experiences, it would be very surprising if they were more enjoyable the less time they took.

We predict that rather than acquiring skills to achieve maximum value in a minimum amount of time, during hedonic consumption people will acquire skills that allow them to maximize utility within the time available. Hedonic and utilitarian tasks bound a continuum characterized by the increasing importance of the learning component of the task. For hedonic tasks, practice makes this learning component more efficient, increasing the enjoyment of the task (Holbrook, Chestnut, Oliva, and Greenleaf 1984). For example, playing a video game, which is clumsy and slow for a beginner, will be fluid and automatic in a skilled player. But this type of efficiency would not be apparent in task completion time, the typical measure of learning effects (e.g., Johnson et al. 2003; Murray and Häubl 2007). Instead, we expect that efficiency in hedonic tasks will be "hidden" and the power law of practice (see Newell and Rosenbloom 1981 for a review) will be evident only when the learning component is isolated (e.g., game score achieved per second, rather than total score, measures hidden efficiency).

In addition, we predict that the way efficiency affects loyalty is different in hedonic versus utilitarian consumption. Although

ease of use (efficiency) is a sufficient explanation of loyalty toward utilitarian tasks (Murray and Häubl 2007), for hedonic consumption we predict that attitude toward the task will completely mediate the already hidden effect of efficiency on loyalty. Specifically, because hedonic consumption is a multi-sensory and emotive experience (Hirschman and Holbrook 1982; Voss, Spranger and Grohmann 2003), we expect that liking and enjoying the task will dominate efficiency in determining loyalty (as it is for most tasks: Sheppard, Hartwick, and Warshaw, 1988),

To test our two primary predictions, we built a fighter jet video game similar in style of play and playing time to the Flash-based games used as promotion tools on websites such as CandyStand.com and NabiscoWorld.com. The game was played online and we recorded game time and game score for each game played. We used a sample of the general public that varied widely in video game experience ($n = 118$), who participated for the chance to win one of two Apple iPod minis, awarded via lottery rather than highest score to motivate all players to do their best, even if they were not experienced gamers.

Our results indicate that human capital invested in a hedonic product can be an important determinant of consumer loyalty. In contrast to previous work on learning and loyalty in utilitarian tasks (Johnson et al. 2003; Murray and Häubl 2003, 2007), practice with the product (1 game vs. 10 games) had no effect on overall task completion times. That is, we found "flat" learning curves. Furthermore, practice had no effect on perceived ease of use or loyalty to the product (measured by intention to play the same game again). As predicted, however, we did find evidence for "hidden efficiency" within a hedonic task; people really did get better the more they played the game. With practice, players scored more points per second, which made them more loyal to the game (one standard deviation [28 s] increase in game time to achieve the same score reduced loyalty by .3 on a 7-point scale), but this effect was masked by equal loyalty whether players played one or ten games. Increasing hidden efficiency also made the game more enjoyable. In addition, we found that this positive attitude toward the task completely mediated the impact of human capital on loyal behavior in hedonic tasks (attitude was distinct from loyalty: 95% CI for $r = .59$ to $.78$). This was another contrast between hedonic and utilitarian tasks, for which loyalty results solely from improved ease of use (Johnson et al. 2003; Murray and Häubl 2007). [1000 words]

Using Public Commitment to Gain Customer Compliance

Stephanie Dellande, Chapman University, USA

Prashanth Nyer, Chapman University, USA

ABSTRACT

We investigate the role of public commitment in gaining customer compliance in a long-term service (e.g., online education) where customer adherence to his/her role when away from the service provider is important in the successful delivery of the service. Given the major role customers have in the delivery process of services it is important to understand how service providers can influence customers to comply with their service role. Dellande, Gilly, and Graham (2004) found that motivation is a key customer attribute in gaining long-term compliance when the customer is away from the provider. We examined the effect of manipulating public commitment to motivate customer compliance behavior.

INTRODUCTION

Increasing numbers of services now require customers to comply with their service roles to ensure the successful delivery of the service. Examples of these include weight loss and educational programs, financial services, and others whose clients have to engage in certain prescribed behaviors to gain the maximum benefit from the service provider. Weight loss clients have to comply with the recommended exercise and dietary regimen to lose weight, students have to do the assigned work on a regular basis to learn effectively, and investors have to save money regularly to accumulate enough wealth to create an adequate retirement nest egg.

Gaining customer compliance can be difficult even when the service provider and the client meet face-to-face on a regular basis. For example, non-compliance with physicians' directives has been reported to be upwards of 80% (Dellande and Taylor, 2004). As such, motivating customers to comply with prescribed behaviors becomes exceedingly challenging when the service provider and the client meet infrequently. Since the advent of the Internet, more and more services are being delivered via technology. This may mean that a customer never sees the service facility or personnel (Bitner, Brown, and Meuter, 2000).

Under these circumstances, the provider must find ways of influencing the customer to ensure adherence to his/her roles (Dellande, Gilly, and Graham 2004). We propose that service providers can encourage their clients to make a public commitment to their goals, and that this will result in significantly higher levels of long-term customer compliant behavior. The research findings in this study are important for providers of any service in which customer compliance, particularly long-term compliance, with his/her role determines the success of the service delivery process.

THEORETICAL CONSTRUCTS AND HYPOTHESES

Public commitment

While the concept of public commitment has been around for some time, it has gained renewed attention of late in the consumer behavior literature. Nyer and Gopinath (2005) used public commitment to explain the differential effects of complaining behavior and word-of-mouth on subsequent customer satisfaction levels. Public commitment was shown to increase resistance to counter-attitudinal persuasion (Nyer and Gopinath 2006).

Kiesler (1971) posited that commitment is a binding of the individual to the position implied by his act or decision. He indicated that a key factor that determines the magnitude of the

commitment is the publicness with which the individual declares his/her commitment to a position. According to Pallak, Cook, and Sullivan (1980) attitudes stated publicly are relatively stable and are more likely to result in consistent behaviors. Pallak and Cummings (1976) have shown that when homeowners make a public commitment to energy conservation, they are more likely to comply, compared to homeowners who make the declaration in a less public manner or those who do not make a public commitment at all. Public commitment to a goal is an action (e.g., placing a sticker supporting a presidential candidate on one's car) which contributes to one's motivation to act due to anticipated personal and social disapproval and penalties for failure to follow through with the promised activities (Parrott et al. 1998). For example, the action of recommending a practice has been shown to increase one's behavior via a sense of personal commitment to behave in the prescribed fashion to avoid feelings of hypocrisy. People have a strong desire to appear consistent and rational in the eyes of others (Tedeschi, 1981). The more publicly one states one's attitudes, the more one is committed to and locked to that position (Hollenbeck, Williams, and Klein, 1989). Thus the act of making a public commitment, which is usually but not necessarily, the result of a deeply-held commitment to a goal can also be used to strengthen the commitment that individuals have towards various goals and to ensure behaviors consistent with those goals. The above literature supports the following hypothesis.

- H1: Higher levels of public commitment to a target behavior will result in higher levels of compliance with that behavior.

Goal importance

Foot-in-the-door (FITD) is a behavioral influence technique frequently used to increase compliance. The technique is based on the premise that an individual who accedes to a small request is more likely to agree to a much larger request later. The psychological process of self-perception has been the most popularly suggested explanation for FITD outcomes (Burger, 1999; Tybout, Sternthal, and Calder, 1983). Bem's (1972) self-perception theory posits that people infer how they feel about an issue by examining their past behavior. This inferred attitude then influences future behavior. Thus individuals who make a public commitment to a goal by engaging in a token act (for example, by wearing a Breast Cancer Awareness pin) may later evaluate the goal as being more important because they use their past behavior as a cue to their beliefs on the issue. This research leads us to the following hypothesis:

- H2: Individuals who make a public commitment to a target goal will evaluate the goal as being more important compared to individuals who do not make a public commitment. Further, the effect of public commitment on compliance with the goal will be partly mediated by the evaluation of goal importance.

We hypothesize that goal importance will only partially mediate the effect of public commitment on compliance behavior since we believe that public commitment will have significant direct effects on compliance behavior. In other words, we suggest that the

change in goal importance can only partially explain the totality of the effect of public commitment on compliance behavior.

Susceptibility to normative influence

As discussed earlier, individuals who make a public commitment to a goal are less likely to behave in a manner contrary to their publicly stated position so as to avoid social disapproval and feelings of hypocrisy. However, would all individuals be equally likely to be induced to behave in a manner consistent with their publicly stated goals through a fear of social disapproval? Clearly not all individuals are equally influenced by the opinions of others. Individuals who are high in *susceptibility to normative influence* (SNI) are more willing to conform to the expectations of others (Bearden, Netemeyer, and Teel, 1989). These individuals are also more hesitant to engage in behaviors that may lead to the disapproval of their peers (Wooten and Reed II, 2004). We therefore believe that individuals high in SNI will be more likely to engage in the promised behavior following a public commitment compared to individuals who are low in SNI. However SNI is not likely to affect subjects who make no public commitment to the target behavior. Thus, we propose the following hypothesis.

- H3: The effect of public commitment on compliance will be moderated by *susceptibility to normative influence* (SNI) with effects as indicated above.

METHODOLOGY

Design

The study uses a 3 x 2 full factorial design manipulating three levels of public commitment (no public commitment, low public commitment, and high public commitment), and using a median split to generate two levels of SNI (low and high).

Subjects

In this study we investigated the effect of manipulating public commitment on sustained paper conservation behavior among 102 students of an online introductory marketing course. The online course context was selected for this investigation because it was ideal for manipulating the independent variable (public commitment) and for observing the dependent variable (compliance behavior). Also, using a sample comprised of students is a realistic sample given the context of the study—paper conservation in an online course.

The online course was designed for non-business undergraduate students pursuing various degree programs and located in a few geographically dispersed academic centers. All lectures, assignments, quizzes, and tests were conducted online, and the students met face-to-face with each other and with the instructor for the first time on the last day of the term. All assignments were designed to be done by individual students, and since the class roster was not made available online, the students had no direct means of knowing the identity of their course mates.

Procedures

During the first week of the course students accessed the course introduction module which included an outline of the course, instructions on how to read online lectures, take online quizzes, etc. This introductory module also included a one-page essay on the importance to society of minimizing the wastage of paper. It noted that despite the early promise of computer technology promoting a ‘paperless society,’ it had done the opposite by making it easier for computer users to print documents at the touch

of a button. The essay suggested that a significant reduction in paper use could be achieved if computer users were to read online documents off the screen without printing the documents. The manipulations described below were conducted only after it was verified (using the tracking system built into the online system) that each student had accessed this online essay.

The students were randomly assigned to one of three conditions (no public commitment, low public commitment, and high public commitment). Each subject in the ‘low public commitment’ condition was sent a personalized email message a day after he/she had first accessed the course introduction module. This email message included a survey question which asked the student whether he/she would be willing to make a commitment to reducing the use of paper by reading course lectures online. These subjects were advised that they were under no compulsion to make this commitment and that they could ignore any promise made to conserve paper if they felt that it was affecting their ability to do well in the course. Within twenty-four hours after each student responded, they were sent a personalized reply acknowledging his/her decision. All but one student in the ‘low public commitment’ condition agreed to read the course material online. The student who declined to make the commitment was eliminated from the study.

Each subject in the ‘high public commitment’ condition was sent a similar email message asking whether he/she would be willing to make a commitment to conserving paper. These ‘high public commitment’ subjects were informed that the instructor would acknowledge the students who had agreed to conserve paper by listing their names in an email to be sent to their classmates. These subjects too were informed that they were under no compulsion to make this promise and that they could renege on any promise made to conserve paper if they felt that it was affecting their ability to do well in the course. All subjects in the ‘high public commitment’ condition agreed to read the course material online. Within twenty-four hours after each student responded, he/she was sent an email that included what was claimed to be a partial list of the students who had agreed to engage in paper conservation. This list included the individual subject’s name and the names of nine fictitious students. The list sent to the students included fictitious names so as to prevent students from identifying their fellow course-mates (this was required by the Institutional Review Board to protect student privacy). Further, the list sent to students was claimed to be a partial list to prevent subjects from speculating about the percentage of the class that had agreed to the request to conserve paper, and to reduce the likelihood that the subjects would discover the manipulative intent of the researchers. Subjects in the ‘no public commitment’ condition were not contacted and were thus not asked to make a public commitment to conserve paper. However, it was verified that all 102 subjects (including those in the ‘no public commitment’ condition) had accessed the online essay about the importance of paper conservation.

Measures

A few days after the manipulation of the various public commitment conditions, all subjects were sent an email message containing an online survey designed to assess the clarity of course objectives. This survey also included two measures of *importance of paper conservation* and six measures of *susceptibility to normative influence* (adapted from Bearden, Netemeyer, and Teel, 1989). The questions were measured on a seven point scale ranging from ‘Strongly Disagree’ to ‘Strongly Agree.’ See Exhibit 1 for a list of the questions used to measure importance of paper conservation and susceptibility to normative influence.

Each online lecture was available in two formats—one optimized for online viewing and the other optimized for printing, both of which were available to all students. The lectures designed for online viewing were broken up into numerous easy-to-read screens, while each print optimized lecture was available as a single printable file. The online course was set up in a manner that permitted us to measure the amount of time each student spent on each of the fifteen online lecture modules. Data from the first lecture module was not included in the study since students may have been unfamiliar with the online lecture delivery system during the first week of the semester. In addition to the above, the system also measured the total number of print-optimized lectures that were accessed at least once by each student. At no point during the course were students informed that the instructor had the ability to monitor their online behavior. Further, during debriefing, no student indicated knowing or having suspected the instructor of having the ability to monitor students' behaviors within the online course environment. Thus it is unlikely that the compliance behavior exhibited by the students was a result of the students' need to please their teacher or caused by a fear of negative consequences for not complying with his instructions.

We make the assumption that a student who reads a lecture online is likely to spend more time viewing the lecture online, compared to a student who prints the document. We also assume that a student who reads the lecture online is not as likely to access the print-optimized page, compared to a student who prints the lecture. While the time spent viewing the online lecture material (or the accessing of the print-optimized pages) can be influenced by many external factors, we believe that the process of random assignment of subjects to the three experimental groups will cancel out most, if not all extraneous influences, leaving compliance with the paper conservation request as the main determinant of the time spent online.

After eliminating students who did not complete the course, we were left with data from 96 subjects (32, 33, and 31 subjects respectively in the no, low, and high public commitment conditions). The only direct meeting between the instructor and all the students enrolled in the course took place on the last day of the course. At this time subjects were asked to estimate the number of lectures they had read online (as opposed to the number of lectures that they had printed), and this estimate was found to be strongly correlated to the number of print-optimized lectures that were accessed ($r=-0.72$) and to the amount of time spent accessing the online lectures ($r=0.79$). A debriefing session was conducted at that time during which subjects were found to have no knowledge of the manipulative intent of the researchers. As indicated previously, the debriefing also revealed that subjects were neither aware nor suspicious that the instructor had the ability to monitor students' activities within the online lecture modules. Further, no subjects reported having downloaded the online lectures onto their personal computers for offline viewing.

RESULTS

The impact of public commitment on compliance behavior

The time spent online on each of the fourteen lectures was added together to yield a new variable representing the total time spent online on the lecture material (TIME). A simple analysis of variance indicated that the level of public commitment had a significant impact on TIME ($F_{2,93}=44.79, p=0.00$). Subjects in the high public commitment condition spent significantly more time online (385 minutes) than subjects in the low public commitment condition (335 minutes; $F_{1,62}=5.79, p=0.02$) or those in the no

public commitment condition (205 minutes; $F_{1,61}=79.90, p=0.00$). Further, subjects in the low public commitment condition spent significantly more time online than those in the no public commitment condition ($F_{1,63}=55.11, p=0.00$).¹

A similar analysis was performed on the number of print-optimized lectures accessed (PRINT) by each subject. The public commitment conditions were found to have a significant impact on PRINT ($F_{2,93}=13.88, p=0.00$). Subjects in the high public commitment condition accessed significantly fewer print optimized lectures (5.23 lectures) than subjects in the low public commitment condition (7.52 lectures; $F_{1,62}=7.10, p=0.01$) or those in the no public commitment condition (9.75 lectures; $F_{1,61}=34.17, p=0.00$). Further, subjects in the low public commitment condition accessed significantly fewer print-optimized lectures compared to those in the no public commitment condition ($F_{1,63}=6.00, p=0.02$).

The above analyses indicate that manipulating the act of public commitment can be very effective in motivating individuals to engage in sustained compliance with a target behavior. Also the degree of compliance obtained with high public commitment was higher than that obtained with low public commitment or with no public commitment, while low public commitment resulted in higher levels of long-term compliance compared to no public commitment.

Prior studies have shown that the degree of compliance declines as the regimen duration increases (Rorer, Tucker, and Blake, 1988; Cummings, Baker, Kirscht, and Levin, 1982). To examine whether the paper conservation compliance behavior was sustained throughout the fourteen week period, we divided the fourteen weekly lectures into two halves and calculated the time spent online on the first seven lectures (TIME1), and on the last seven lectures (TIME2) and we repeated the previous analyses on these two new variables. The level of public commitment had a significant effect on both TIME1 ($F_{2,93}=14.31, p=0.00$) and TIME2 ($F_{2,93}=25.51, p=0.00$). During the first seven weeks subjects in the high public commitment condition spent insignificantly more time online (TIME1=222 minutes) than those in the low public commitment condition (197 minutes; $F_{1,62}=1.52, p=0.22$). However subjects in both the high public commitment condition ($F_{1,61}=27.03, p=0.00$) and those in the low public commitment condition ($F_{1,63}=18.49, p=0.00$) spent significantly more time online compared to the no public commitment subjects (126 minutes). During the second seven week period subjects in the high public commitment condition spent significantly more time online (TIME2=163 minutes) than those in the low public commitment condition (138 minutes; $F_{1,62}=3.65, p=0.06$). Moreover subjects in the high public commitment condition ($F_{1,61}=49.18, p=0.00$) and those in the low public commitment condition ($F_{1,63}=29.22, p=0.00$) spent significantly more time online compared to the no public commitment subjects (80 minutes).

Direct comparisons of the time spent viewing online lectures in the two halves of the semester is not meaningful since the complexity of the topics covered, and the length of the lectures in

¹The online lecture material was not designed to replace the hard-copy text book (which all subjects were required to read), but rather represented a commentary by the instructor that expanded upon or provided a different perspective on some of the topics discussed in each text book chapter. In addition to reading the online lecture notes and the hard-copy text book, students had to complete various online and offline assignments and take numerous online quizzes. The times spent online on these other activities were not included in our measurement of TIME.

EXHIBIT 1

Measures

Measures of Importance of Paper Conservation

- I think conserving paper is an important objective
- The goal of reducing paper wastage is a worthwhile one

Measures of Susceptibility to Normative Influence (SNI)^a

- If I want to be like someone, I often try to buy the same brands they buy
- It is important that others like the products and brands I buy*
- I rarely purchase the latest fashion styles until I am sure my friends approve of them
- When buying products, I generally purchase those brands that I think others will approve of
- I like to know what brands and products make good impressions on others
- I achieve a sense of belonging by purchasing the same products and brands that others purchase

^a These six measures of SNI were used after a pretest of the entire eight item subscale revealed that two measures did not have very high reliability.

* This item was dropped from the analysis in the main study because of low reliability.

the two halves of the semester were not identical. However that does not diminish the significance of the above findings since the analysis was successful in demonstrating that high public commitment resulted in sustained compliance behavior over the entire fourteen week period, and that the weaker low public commitment while not as effective in eliciting compliance over the long run, was better than no public commitment in sustaining long-term compliance behavior.

The preceding analyses indicate that public commitment motivates individuals to engage in sustained compliance behavior and that the degree of compliance obtained varies with the degree of publicness with which the commitment is declared. Further, the compliance obtained through the manipulation of high public commitment was sustained throughout a fourteen week period.

Goal importance as a mediator

Given the prior results, an important question to examine is how public commitment influences subsequent compliance behavior. We suggest that the act of making a public commitment to a goal such as paper conservation will make the goal more salient and important to the individual. Further as suggested by H2, the subjects' evaluation of the *importance of paper conservation* (IMP) is expected to mediate the effect of the experimental manipulation of public commitment on the time spent online (TIME) and on the number of print-optimized lectures accessed (PRINT). Exhibit 1 includes the two measures of IMP. These measures did not show any evidence of scale compression, with the observations ranging from 1 to 7 on the seven-point scales and standard deviations of 1.23 and 1.35 for the two measures.

To verify H2, a two-step MANCOVA was performed. This analysis follows the procedure suggested by Baron and Kenny (1986) where mediation is tested using four steps. First, the independent variable (the manipulation of public commitment) should be shown to have a significant effect on the mediator (IMP). Second, the independent variable should be shown to have a significant effect on the dependent variable (TIME). Third, the mediator should be shown to have a significant effect on the dependent variable. In the final step, the effect of the independent variable on the dependent variable should be shown to be non-significant when the mediating variable is introduced as a covariate. If all four of these steps are met, then the data are consistent

with the hypothesis that the mediator variable completely mediates the effect of the independent variable on the dependent variable, and if the first three steps are met but step 4 is not, then partial mediation is indicated.

Steps 1 and 2 were done using a simple MANOVA performed with TIME, PRINT and IMP as dependent variables and the public commitment conditions as the independent factor. As required by Baron and Kenny (1986), the public commitment conditions had a significant effect on TIME ($F_{2,93}=44.79, p=0.00$), PRINT ($F_{2,93}=13.88, p=0.00$), and IMP ($F_{2,93}=12.33, p=0.00$). Steps 3 and 4 were done using MANCOVA, where IMP was introduced as a covariate, with TIME and PRINT as the dependent variables, and the public commitment conditions as the independent factor. IMP had a significant effect on TIME ($F_{1,92}=25.72, p=0.00$), and on PRINT ($F_{1,92}=16.80, p=0.00$). The final step of the test for mediation was to test if the introduction of IMP as a covariate led to the impact of the public commitment manipulation on TIME becoming insignificant. The F test indicated that public commitment continued to have a significant direct effect on TIME (now $F_{2,92}=25.63, p=0.00$ compared to the previous $F_{2,93}=44.79, p=0.00$) and PRINT (now $F_{2,92}=5.40, p=0.01$ compared to the previous $F_{2,93}=13.88, p=0.00$). In keeping with Baron and Kenny (1986), we conclude that the importance placed by the subjects on paper conservation partially mediated the effect of public commitment on the time spent online and on the number of print-optimized lectures accessed.

Susceptibility to normative influence as a moderator

Susceptibility to normative influence (SNI) was hypothesized to be a moderator of the effect of public commitment on long term compliance. Factor analysis revealed that five of the six measures of SNI formed a uni-dimensional construct with principal components extraction leading to factor loadings ranging from 0.69 to 0.86.

After eliminating one SNI measure, (refer to Exhibit 1) the remaining five measures were found to have high reliability (Cronbach $\alpha=0.85$), and therefore a combined scale was formed by averaging the five SNI measures. A new dummy variable SNI was created with a value of 0 to indicate subjects whose combined SNI was at or below the median, and a value of 1 to indicate subjects whose SNI scores were above the median. A two factor ANOVA

FIGURE 1
TIME by Public Commitment and SNI

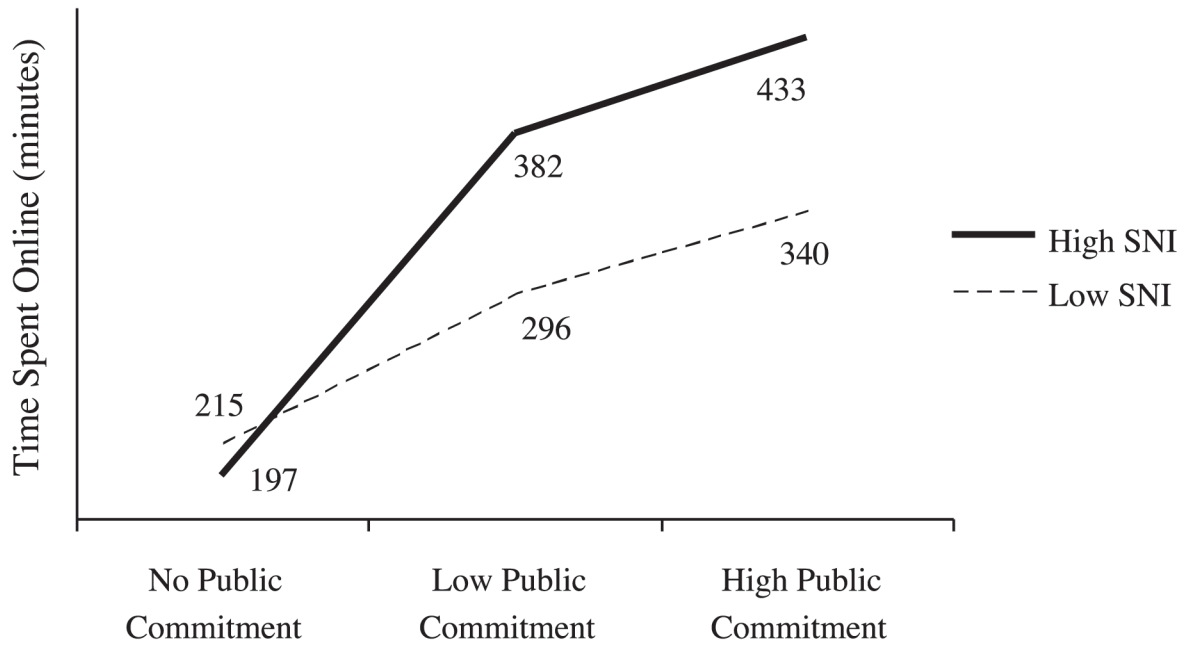

TABLE 1
TIME and PRINT by Public Commitment and SNI

	TIME		PRINT	
	High SNI	Low SNI	High SNI	Low SNI
No Public Commitment	197.10	214.96	10.35	9.07
Low Public Commitment	382.21	295.70	4.73	9.83
High Public Commitment	433.01	340.54	4.67	5.75

(Public Commitment and SNI) was run and both Public Commitment ($F_{2,90}=57.17, p=0.00$) and SNI ($F_{1,90}=14.20, p=0.00$) were found to have significant main effects on the time spent online (TIME). More interesting was the significant two-way interaction between Public Commitment and SNI ($F_{2,90}=6.32, p=0.00$) depicted in Figure 1. Similar results were found when using the number of print-optimized lectures accessed (PRINT) as the dependent variable. Public Commitment ($F_{2,90}=17.00, p=0.00$) and SNI ($F_{1,90}=6.78, p=0.01$) were found to have significant main effects on PRINT. Once again there was a significant two-way interaction between Public Commitment and SNI ($F_{2,90}=8.98, p=0.00$).

To explain the interaction we examined the values of TIME and PRINT for the three experimental conditions for both the high and low SNI subjects (see Table 1 and Figure 1). Subjects high in SNI spent significantly more time reading lectures online compared to the low SNI subjects under conditions of low and high public commitment. There was no significant difference in the time spent online between the high and low SNI subjects under the no commitment condition. Similar results were obtained with PRINT as the

dependent variable. These analyses provide support for our hypothesis that *susceptibility to normative influence* (SNI) is a moderator of the effect of public commitment on long term compliance. Thus the low public commitment manipulation was adequate to ensure high levels of compliance from subjects high in SNI, but the high public commitment condition was required to gain maximum compliance from subjects low in SNI.

DISCUSSION

This study contributes to the consumer behavior literature by identifying a technique that providers can use to gain compliance when customer compliance with his/her role once away from the firm is integral to the successful delivery of the service. We determined that public commitment was a significant motivator in ensuring compliance behavior over an extended time period. Subjects who made a public commitment to conserve paper by reading lectures online were found to have done so compared to subjects who made a less public commitment, and compared to those who made no commitment at all. This result is particularly interesting

because the study participants did not benefit significantly from the outcome (paper conservation). Public commitment should have an even more significant impact on customer compliance in the case of services where consumers directly benefit from being compliant—services such as weight loss programs, long-term financial planning, and debt management programs.

Further it was found that the act of making a public commitment to a goal caused subjects to assess the goal as being more important. This appraisal of the importance of the goal was found to mediate some of the effect of public commitment on the compliance behavior (paper conservation). Finally we found the personality trait *susceptibility to normative influence* (SNI) to be a determinant of how effective public commitment would be in gaining compliance. Subjects high in SNI were more likely to be affected by public commitment, compared to those lower in SNI. Providers may want to explore alternate motivators for consumers low in SNI.

Prior investigations of long-term compliance in the medical arena have shown that regimen duration is predictive of compliance, with compliance decreasing with increasing regimen length. Long-term regimens tend to be more complex and often involve substantial behavior modification and this usually results in low levels of compliance. This despite the fact that the behaviors being requested are ones that the subjects should be highly motivated to comply with, e.g., weight loss, cholesterol reduction, hemodialysis treatment (Fishman, 1995).

In this study, we investigated compliance with the request to conserve paper by reading online course material off the computer screen rather than printing the online material for offline perusal. This compliance request required customers to engage in a modified behavior over an extended time period (fourteen weeks)—a behavior which is not intrinsically motivating to most subjects, and which was to be performed outside of the purview of the service provider. Under these circumstances, the ability to find significant differences in compliance behavior lends greater support to our hypothesis that the publicness with which a commitment is made will have a significant and favorable impact on long-term compliance behavior.

MANAGERIAL IMPLICATIONS

The study examined the role of public commitment as a means of motivating customers of an online marketing course to comply with a one-time request to conserve paper. The findings of this study have important managerial implications for services marketers and others as it addresses how they can manage behavior when the customer is away from the provider and gain compliance needed to create the service.

First, public commitment was found to have a significant impact on compliance behavior despite the fact that the outcome of paper conservation did not significantly benefit the subjects, illuminating the potency of public commitment. Thus service providers should consider requesting their customers to make at least a low level public commitment to comply with his/her service role. Secondly, a one-time request to make a public commitment was asked of subjects, a more conservative test than found in most real life situations. Nevertheless, the impact of the one-time request, to make a public commitment, on compliance was robust. Repeated public commitments by subjects may significantly boost their motivation to comply with their stated goals. For example, in weight loss programs, counselors should repeatedly remind clients to “eat right.”

Thirdly, service providers may want to determine, in advance of providing the service, the importance of goal attainment to customers. Customers who evaluate a goal as being important may be more inclined to stay on task, e.g., adhere to a debt management

program. And lastly, service providers should determine whether customers are susceptible to outside influence. Providers have more influence over customers who are concerned about hypocrisy or social disapproval. For example, individuals who are more susceptible to such social influence could be reminded of the undesirable consequences of not complying with the prescribed actions. At the same time, service providers may want to use other means of eliciting compliance behavior from those customers who are not susceptible to normative influence.

STUDY LIMITATIONS AND FUTURE RESEARCH

Though we found that subjects in the public commitment condition evaluated paper conservation to be more important than the subjects in the no commitment condition, we were unable to measure the pre-post change in *Importance of Paper Conservation* (IMP) caused by the manipulation of public commitment. The way this study was structured, there would have been only a few days between the two measurements of IMP. We concluded that two measurements of IMP in quick succession would have caused subjects to base their second response on their recollection of their previous response and also cause them to suspect the manipulative intent of the researchers. Thus IMP was measured only once, following the manipulation of public commitment, but before the measurement of compliance behavior began.

Future research should examine whether the manipulation of public commitment causes a change in the assessment of the importance of the target behavior by utilizing pre and post measures of goal importance. Additionally, future research should investigate and attempt to validate the role of public commitment in gaining compliance in the context of other services with different types of subjects and compliance behaviors. While this paper has examined the personality factor susceptibility to interpersonal influence, there are other individual factors, e.g., preference for consistency, which could impact conformity (Lasco and Zinkhan, 1999) and should be studied.

Consumer Experiences and Market Resistance: An Extension of Resistance Theories

Angeline Grace Close, University of Nevada Las Vegas, USA

George M. Zinkhan, University of Georgia, USA

Consumer scholars have “yet to develop an integrated theoretical perspective of the phenomenon that considers the many and varied ways in which resistance of the marketplace and its offerings impacts consumer behavior” (Fournier 1998 p.89). Penaloza and Price provide (1993) a conceptual overview as a basis to understand consumer resistance. While we may never be able to understand consumer resistance to *all* aspects of the marketplace, perhaps we may work towards tackling this issue by striving to understand consumer’s resistance to certain “markets” in their unique contexts. For instance, one may consider holiday markets.

Marketed holidays (e.g., Christmas, Valentine’s Day, Halloween) represent one type of market that is in part resisted by consumers. Holiday festivities are a key aspect of contemporary consumer culture, yet scholars have not devoted research to understanding consumers’ resistance of traditional holiday markets. Valentine’s Day is an event charged with consumer meaning (Close and Zinkhan 2006) and it is an interesting context to study consumer resistance because it is the holiday for love—typically one of the most desired, involved, and uplifting human experiences.

Thus, we seek to advance understanding of consumers’ resistance manifest in the Valentine’s Day market. Our objectives include:

1. to introduce a definition of “market resistance”,
2. to understand and explain consumer experiences that are associated with resistance to a market and its related events,
3. to show what consumers are moving towards via their acts of resistance.

To address the objectives, we use multiple methods. We focus on describing a category of experiences that are associated with resistance and creation of new traditions. The article is organized as follows. First, we conceptually define terms and introduce relevant areas of resistance theories. Second, we discuss the analytical methods, data analysis, and theme development. Then, we present findings and interpretation of meaning. To clarify the processes, we deploy constructs based in resistance theory. We ultimately discuss limitations, implications, and avenues for future research.

CONCEPTUAL DEVELOPMENT AND RESISTANCE THEORIES

In general, resistance entails an opposing or retarding force (Dobscha 1998). Resistance is the:

counter-hegemonic social attitudes, behaviors, and actions that aim at weakening classifications among social categories and that are directed against the dominant power and against those who exercise it, with the purpose of redistributing equality (Fernandes 1988 p.174).

Here, we define *market resistance* as *an opposition to traditions in the marketplace, with the purpose of creating new behaviors*. Market resistance is not a “non-behavior”; it entails purposive behavior to re-create the traditions manifest in the marketplace. Our definition has some key advantages. Past definitions from psychology apply to resistance to one particular message, or “persuasive attack,” (e.g., Tormala and Petty 2002) within a short period. We

focus on resistance to a *lifetime* of messages, promotions, marketplace activities, and consumers’ built-up associations. Second, our focus is on behaviors—specifically alternative-consumption behaviors, for example, consumer rebellion behaviors as described by Dobscha (1998) or consumer activism behaviors as described by Kozinets, Robert and Handelman (2004). In contrast to our proposed definition, past definitions focus on affective or cognitive components of resistance.

In the literature, resistance theories include two key areas that apply to the objectives of this study: 1) ambivalence and 2) avoidance. In resistance theory, ambivalence refers to a consumer’s neutral attitude about change (Arkowitz 2002). As Valentine’s market-based activities and “events” (e.g., card exchange, romantic dinners) have become a holiday tradition, the ambivalent consumer may be less likely to participate in such traditional activities and events.

Other consumers may purposefully avoid the holiday and the associated traditions. Avoidance of unpleasant feelings is another aspect of resistance (Perls et al. 1951). For some people, this holiday may trigger negative memories or feelings of inadequacy or loneliness. While some people reconstruct memories (Braun-LaTour and LaTour 2005), others may try to avoid unpleasant feelings and avoid the marketplace completely on the holiday. Resistance theorists agree that while consumers act ambivalent or avoid the holiday exchange, they often have a purpose of doing so. We revisit these aspects of resistance after describing the methods and findings.

METHODS

We employ synergistic methods spanning several years. Table 1 summarizes the methods, sample sizes, informants, period, and research focus.

Sampling and Procedure

We recruited consumers in various relationship stages to participate in the study. We did not specify sexual orientation, although most were in a heterosexual relationship. Many informants were recruited through advertisements in the city newspaper and were paid \$30. Others participated as part of an extra credit class assignment.

One hundred forty-nine consumers in various relationship situations, professions, and geographic backgrounds wrote diary entries about their experiences and any resistance surrounding this holiday and the related marketplace activities. To complement the offline diaries, we collected e-diary entries/postings about the holiday for rich, less-censored sentiments. To incorporate group interactions, we conducted group interviews with females in romantic relationships because this is more of a female-oriented holiday. Females (half in a dating relationship under six months and half in a relationship of six months or more) discussed their experiences and resistance points with the female moderator for ninety minutes as a female author took notes and reviewed body language.

Data Analysis and Theme Development

We iteratively analyzed the data based on the objectives, theories, and themes identified in the literature. Via axial, open, and selective coding, we grouped similar findings and observations into categories of meaning. This contributed towards revealing emer-

gent patterns (Wolcott 1990). Authors reviewed each other's data interpretations until saturation. In the process, many new themes became apparent; however, we focus on findings of consumer resistance. We used suggested approaches (Spiggle 1994) to increase validity and reliability. Multiple methods were employed in order to depict a holistic understanding as suggested by Creswell (1998). We triangulated the data in quest of a full phenomenological understanding (Moustakas 1994).

FINDINGS: CONSUMER EXPERIENCES AND MARKET RESISTANCE

We find that a segment of consumers challenge the norms of the holiday market due to financial reasons as well as non-financial reasons. Some resistant behaviors are overt, and others are more covert. The less-financially motivated, more overt resistant behaviors tend to be more creative. These consumers creatively resist traditions of the holiday and create new rituals. Creative resistant consumers rename the holiday as "Singles Awareness Day," or "Maximized Profit Day." They spread negative experiences via (electronic) word-of mouth. More extreme examples include boycotting marketers or creating defaming/satiric websites; however such cases are not the norm and may be more deeply-rooted. Some examples are shown in Figure 1.

Key consumer experiences associated with market resistance are unfulfilled expectations, exclusion, terminal materialism, obligations, role exhaustion, and low need perception for the holiday (Figure 2). Note that three of the consumer experiences appear to influence market resistance and in turn are influenced by market resistance. The framework is shown in Figure 2.

Unfulfilled Expectations

A primary reason that Valentine's Day seems to breed market resistance is that many people have high expectations that often go unrealized. Many do not verbalize these expectations, as they are internal and build from a lifetime of Valentine's experiences. Consumers often do not know or are unclear about what they expect, or what others expect from them. Unfulfilled expectations of Valentine's Days often begin with childhood, as the rituals develop along with the person.

Egalitarian Expectations. Informants reference childhood as a time that primes expectations for this holiday. In grade school,

rituals of card, candy, and exchange of affection are often egalitarian; everyone expects involvement. Valentine exchange is for every child at school. Such early behaviors seem to prime expectations for a lifetime of being recognized.

Dates, Sex, and Intimacy. Informants have expectations surrounding dates, sex, and intimacy. Some expect the evening will entail sex. Although some novice daters appear to have little clue about what their date expects [G],¹ most males in a dating relationship of six months or longer know what is expected of them [S]. Furthermore, males expect to "be expected to" spend first. Sex and food are two things males mention with their expectations for Valentine's. This food is not always the characteristic food of Valentine's Day (e.g., chocolate) or even the more expensive steak or seafood dinners. Sometimes it is simple as sex and pizza (in that order).

Reactions to unfulfilled expectations sometimes affect third parties who otherwise may have had a delightful day, such as in the case of this resistant woman's roommate:

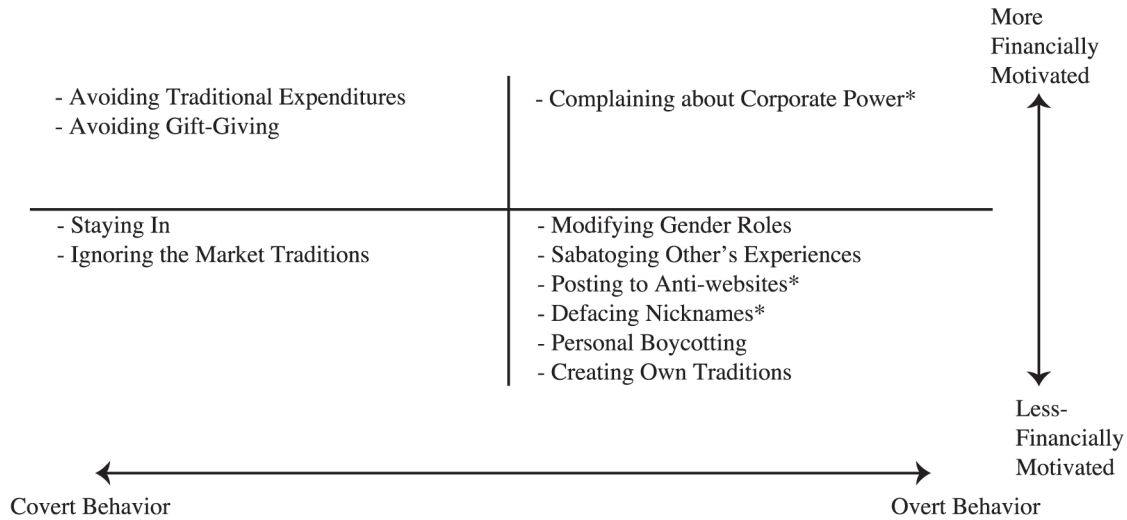

I did not have a Valentine today. My roommate did though. When she was out having dinner with her lover, I ate all her candies and cut up all her flowers. When she got home and saw what I did, she was so angry with me! I told her to not be so uptight... the situation was actually hilariously funny. If someone bought me a box of candy or flowers, this never would have happened.... Even the cheap-o brand chocolates that say "I choo-choo-choose you!" would have been great. Now I am fat and alone. Maybe I'll fall down the stairs. Great. [F, 2-14-2003, E]

This woman expects something, even a "cheap-o" box of chocolates. Chocolate is embedded with meanings of sensuality (Belk and Costa 1999) and here, with self-loathing and expectations of loneliness. A more common expectation, however, is for recognition, intimacy, and love.

Expecting Love. Some expect love during this season, and are disappointed if they do not experience or share love. Consumers

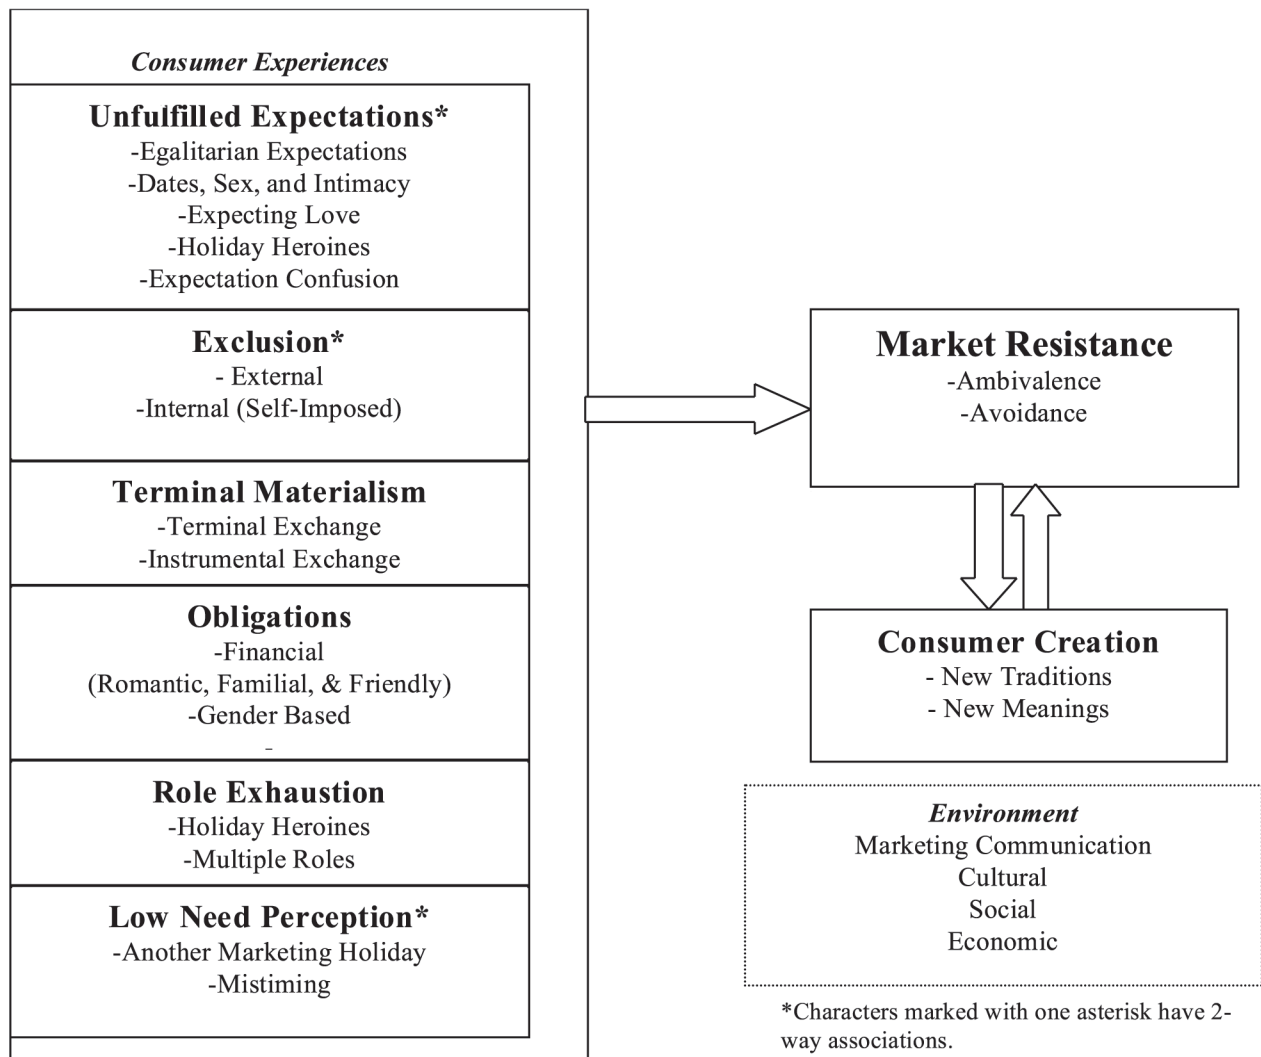

¹[G] indicates a finding from the group interviews; [S] survey; [D] diary; [E] electronic diary.

FIGURE 1
Market Resistance Behaviors

* These entries represent negative word-of-mouth behaviors.

FIGURE 2
Consumer Experiences Associated with Market Resistance

equate love with the purpose of this holiday. Moreover, they expect to see unavoidable signs of it everywhere:

The purpose of Valentine's Day is to tell your loved ones that you love them. Everywhere you go everything is red and all about Valentine's Day. You can't get away from it. But I had to work, so I then heated up leftovers and studied. [F, 22, Dating, D]

Love between friends—especially females—is a large part of this holiday. Consumers do not limit their expectations to romantic love. Philosophical contexts of romantic exchange, as during Valentine's Day, link to love's psychological significance. Various theorists address love. Freud claims that falling in love is a substitute for personal achievement. One may not excel in his or her career, but he or she still may succeed in the love department. Flowers and other visible exchanges on Valentine's Day announce this success. A competing idea is that falling in love is an attempt to obtain qualities that one lacks (Reik 1944). Valentine's Day is a socially acceptable time to pursue a lover. In some ways, this pursuit is to complete the self.

Holiday Heroines. Valentine's Day caters to females—the “heroines of the holiday.” Many females share expectations for an extraordinary day. One woman describes her lavish evening:

I went to dinner with my husband. We also went to a movie. We took in some dancing at the restaurant. I received roses on Valentine's Day. [F, 44, Married, D]

She contributes her night out to making her expectations clear to her husband. Without “instructions,” some informants are confused about what is expected from them.

Expectation Confusion. Confusion surrounds whom to recognize for this holiday. Some wonder if there is an expectation to give to family members, friends, or colleagues. One woman sees her bosses' disappointment each year, so she took the role of her husband:

I gave a rose to my manager. Her husband of ten years had never given her anything (for Valentine's Day)! [F, 24, Single, D]

Sometimes expectations are high from years past. As a result, the behaviors become more extravagant every year. However, fanciness peaks, and the couple adapts to a low-key version of the holiday with acts of voluntary simplicity. Such consumers still recognize the holiday, yet they do not buy the traditional goods associated with the mainstream Valentine's market. They exclude themselves from such culturally constructed normative behavior.

Exclusion

Exclusion is an experience that appears to influence market resistance and, at times, is influenced by market resistance. Exclusion is traditionally associated with power loss (Skvoretz and Willer 1993). Much extant knowledge of exclusion assumes that the person does not choose to be excluded. Although some informants exclude themselves from mainstream behavior (i.e., internal exclusion), many informants also cite instances of perceived (external) exclusionary forces. In this way, exclusion may be a confidence-reducing, negative force.

External Exclusion. Some informants feel excluded from activities and events (e.g., dinner packages; vacations). In considering Valentine's Day as an event, some feel uninvited. Relation-

ship status often serves as a basis of this “invitation.” Many describe it as a market for couples' only. One male suggests to re-name it **Singles' Awareness Day**. A single woman writes how Hallmark reminds her that she feels left out during the holiday seasons:

Well it's been almost 2 months since Christmas, and us single folks are finally recovering from the psychological damage making it through the holiday season does to us. So as I am almost fully recuperated myself, I would like to extend a warm thanks to Hallmark, the official sponsor of Valentine's Day, for reminding me that without a significant other, how truly worthless my life is. [F, Single, 2-14-04, E]

One woman, although in a dating relationship, feels excluded nonetheless:

I could not see him (her boyfriend) on Valentine's Day and I was constantly reminded of that. [F, 22, Dating, D]

In these cases, retailers, other couples, and marketed holiday events are externalities that appear to stimulate exclusion from the marketplace. Singles, separated individuals, and those in non-traditional relationships feel excluded and often, in turn, exclude themselves from this holiday.

Internal Exclusion. Self-imposed, internal, exclusion may be gratifying, empowering experience. Still considering the holiday activities as an invitation-only event, some do not want to be invited. In these cases, exclusion is welcomed. For example, some are relieved after hearing denial of dinner reservations on this night or that the store is out of red roses. Many informants do not imply that their excluded state is set in stone. Some end their diary entries with future-oriented statements (e.g., “next year I will be out for a romantic dinner”). Just as relationships are dynamic, so is the quantity and quality of gift exchange each year.

Terminal Materialism

Many informants exchange gifts because it is “the thing to do,” or because the holiday is about “going to dinner and exchanging gifts.” Gift exchange becomes a means without an end. Instead, the things exchanged have become the focus for what is meant as an intimate holiday. One male highlights misdirected materialism as a source of resistance:

Guys are pursued to make romance happen through tangible items. [M, 23, Dating, D]

Terminal Exchange. Materialism theories provide guidance for understanding resistance to the traditional Valentine's Day market. Materialism is the importance a person attaches to material possessions and the belief that certain possessions are a main source of happiness (Belk 2001). Terminal materialism is consumption for the mere sake of consumption (Csikszentmihalyi and Rochberg-Halton 1981), elements of which are apparent during Valentine's Day. We present the concept of “terminal gift exchange” to describe exchange that is without a deeper meaning.

I don't like the cheap chocolate, teddy bears, etc. And my boyfriend doesn't like the flowers... especially for specific occasions such as Valentines. Even though it doesn't make me want to buy any of the traditional Valentines products... it does get me excited before hand when I see decorations. [F, 22, Dating, D]

For some, lavish nights out and “stuff” become a fixation. A common feeling is that the time together and shared experiences are much more valuable and desired, yet downplayed.

Instrumental Exchange. Valentine’s has distinct gift exchange traditions (e.g., red roses, jewelry, cards), some of which bring enjoyment and further relationships. Informants in more established relationships note that exchange should represent meaningful human emotions.

You always hear stories from men who missed the mark on the gift and give the woman an exercise tape while she gives him sand gathered from the beach where they first said ‘I love you.’ [M, 44, Married, D]

In this case, otherwise little valued items (e.g., some sand) become cherished items. Known as instrumental materialism, possession of things serves goals that are independent of greed, and these goals are associated with forming bonds or links with other human beings (Csikszentmihalyi and Rochberg-Halton 1981). Thus, gifts serve as vehicles to bring people together. Resistance may breed however, with feelings of obligation (e.g., to give such gifts).

Obligations

Most informants feel obligated to some extent for this holiday. Most obligations are financial, with the majority of the burden going to the male. Males who are dating especially feel obligated.

Males *have to* take the girls out to eat and give them presents. [M, 22, Dating, S]

Often the obligation is towards meeting the partner’s expectations:

Males are expected to give their partner gifts because they don’t want to get in trouble— instead of because they want to or because they love the person. Women love the idea of romance so they usually have high expectations and give good gifts to their partner in return. [F, 23, Dating, D]

Females do not feel as obligated to purchase a gift for their partner, and they do not feel as much pressure as males (Otnes et al. 1994). Women feel more obligations to buy for friends and family.

Males are robots, always doing the same thing. Females hate Valentine’s Day because of their male partner. It is geared toward females because that’s what advertisers want us to see. [F, 21, Single, D]

Obligation appears to be associated with negative attitudes towards marketing and retailing. The consumer may feel subordinate (i.e., has less power than the marketer or retailer) as he or she is in a perceived state of purchase “necessity” stemming from obligatory feelings. This state seems quick and intense, partially due to the last-minute purchases common to the season. Negative attitudes may form towards the holiday and associated marketers and retailers, other consumers, and an internal desire to carryout multiple roles.

Role Exhaustion

Gender roles govern Valentine’s Day. Where Superbowl Sunday is a “man’s day,” this is the female day. Some males feel uncomfortable stepping out of their masculine norm:

It’s not very masculine. There are ways of marketing “love” without making us feel like pansies. Most companies can’t figure it out though. [M, 23, Dating, D]

Females are the heroines of this holiday, where males enact roles that often recognize the female.

Holiday Heroines. Some note the gender roles in terms of who does the “wooing”:

The male role is to sweep the female off of her feet. The female role is to be swept away.... Males should be the ones to show how sweet they can be because of romance’s history. [M, Dating, D]

Wooing sometimes places pressure on the male:

Males play the role of somebody that cares about their significant other on this day. I feel that a lot of pressure is put on men to plan an acceptable Valentine’s Day. [F, 41, Married, D]

Traditionally, the male is the giver, yet we see a move towards the females gaining a giving role.

Multiple Roles. Some consumers serve multiple roles, which exhaust them. For example, some women recognize their significant other, mother, friends, sisters, colleagues, and neighbors. Other women strive to fulfill the sexy and the practical role:

How many women buy something other than a sexy outfit for their husbands? I bought my boyfriend something practical—a back scrubber and guitar tuner. [F, 21, Dating, D]

Women who are interested in taking the relationship from girlfriend to wife seem especially concerned with fulfilling sensual and practical roles. They appear to show that they are fun and sexy; yet, someone who would also make a good partner and mother in the future. For some, this is a good chance to show the ability to enact multiple roles. Others see no need for the holiday.

Low Need Perception

Another Marketing Holiday. Some informants do not want to set aside one particular day for love—feelings they can express on a day of their choosing. This is an example of a kind of avoidance, in that consumers avoid celebrating the holiday on February 14th. At the same time, there is a creation process as consumers identify a new time for celebration. Others feel that the holiday is “wholly unnecessary” or not needed to maintain a healthy relationship.

I personally do not make a big deal out of Valentine’s Day. I know the traditions involved, and I have participated in some in the past, but at this point of my life, it’s just another day. My husband and I just make it a point to spend some time together and eat dinner at the dining room table, instead of at the breakfast bar or in front of the television. I don’t need anything fancy from him, because, honestly, I like a 3 Musketeer’s bar more than a box of expensive chocolates, and my husband brings home flowers at least once a month. [F, 38, Married, D]

Mistiming. Love... Now! Some consumers resist commands of *when* to show their love, not the concept of the holiday itself. People feel that they should not reserve love for this day. It is rare that someone makes a connection with why February 14th is specifically “the day” for romance.

I don’t necessarily disapprove of the holiday, but I don’t see why I should suddenly feel more or less romantically inclined on a certain day just because the general public, with eager support from retailers, has decided that this day should be celebrated in a certain way. [M, 33, Single, D]

Such individuals do not like having an external source dictate when to exhibit affection. However, some may “put up” with the holiday because of the perception that women enjoy it.

DISCUSSION: RESISTANCE THEORY AND CONSUMER CREATION

Our research shows that consumers resist and re-create. Based on resistance theory, we introduce a definition of market resistance, which is seen when a consumer does not engage in culturally established or ritualized marketplace behaviors. Some consumers are ambivalent to and other consumers resist traditional activities and the pre-packaged solutions that business has developed. Situational and socio-cultural factors facilitate and moderate this evolving behavior (Figure 2). We find that the day arouses strong attitudes that appear to trigger behavioral resistance. The process may be partially explained by struggles with business, society, culture, marketing communication, economic and other environments.

The findings help to extend two key areas of resistance theory—ambivalence and avoidance.

Extending Resistance Theory

Ambivalence. Here, ambivalence refers to uncertainty or indecisiveness as to which course to follow. In the literature, resistance entails a feeling of ambivalence about change (Arkowitz 2002), and ambivalence often includes coexisting opposing attitudes. However, in this context, we find consumers are certain about which course to follow. Furthermore, they are often either pro-change or anti-change. The two polarities often do not coexist within a person. That is, with little ambivalence, people have strong opinions (e.g., for or against partaking in Valentine’s Day traditions) and are highly involved (e.g., with the holiday memories).

Avoidance. Research states that resistance entails avoidance of unpleasant feelings (Perls et al. 1951). We find that consumers who report unpleasant feelings or experiences associated with Valentine’s Day avoid the holiday traditions in the formal marketplace. However, facilitated by the growth of electronic environments, we see counter-trends emerging. Using new communication media, consumers who avoid the traditional marketplace often find new “places” to share negative feelings. Thus, we revive the works of Perls et al. (1951) into the digital age by making the distinction that consumers do not avoid their negative feelings completely. Instead, they often create new (e.g., electronic) channels for the negative feelings that are less apparent in the traditional marketplace.

Considering the nomological framework as a whole, we clarify the role of consumer creation with market resistance. Along with acts of market resistance, consumers create new traditions, meanings, rituals, and trends. While some informants are passionate to maintain traditions, many are *changing or re-creating* traditions. Informants commonly welcome a change in tradition and serve as change-agents. Often, advocates seek to bring sincere romance to a day that many feel that has become overtly commercial and expensive. Advocacy to create new holiday rituals and traditions are based on motivations that are financial and non-financial.

Limitations and Avenues to Extend this Study

This framework serves as a base for scholars to continue theoretical development. Given our research design, we focus on one U.S. consumer holiday. We encourage cross-cultural extensions—especially considering the emerging international status of

holiday markets and related events. On a broader scale, more insight is needed in the areas of the resistance to the globalization of holiday markets and events.

Few researchers have focused on what motivates people to resistance markets at different stages of life. For instance, while we found financially-based motivations for resistance behaviors, children likely would not recognize the financial component. Our findings suggest that resistance against traditional holiday behaviors build from memories and years of experiences beginning in elementary school. Valentine’s Day begins as an egalitarian holiday with gender-neutral exchanges of cards and gifts. How does all of this change by the adult years, which focus attention on the female? Behaviors and potential resistance drivers learned at an early age evolve over the course of a lifetime and merit further study.

Further, other antecedents to resistance behaviors are thought to stem from the broader marketing communication environment during unique markets and events. For instance, perhaps advertising seen after experiences (such as during Valentine’s Day and its related events) may alter a person’s memory of the experiences (Braun-LaTour and LaTour 2005), and in turn, impact one’s market resistance behaviors. Future studies should recognize and depict how these marketing communications and message timing issues interplay with a consumer’s resistance.

Reducing Reactance Induced Backlash Responses to Recommendations

Yael Zemack-Rugar, Virginia Tech, USA
Gavan J. Fitzsimons, Duke University, USA
Donald R. Lehmann, Columbia University, USA

EXTENDED ABSTRACT

This research examines factors that might reduce reactance induced backlash effects to persuasion. Marketers often seek to persuade consumers, however, such influence attempts may fail due to a variety of reasons including poor message delivery (Kardes et al. 2005; Zhang & Buda 1999), lack of attention (Petty et al. 2005), dislike for the ad (Edell & Burke 1986) or suspicion of marketers' intent (Friestad & Wright 1994). This research focuses on another, less oft researched, reason for the failure of marketers' persuasion attempts, *consumer reactance*.

Reactance is a motivational state that individuals experience when they perceive their freedom to choose or act is being threatened (Brehm 1966). Prior research has shown that due to this freedom-motivation, consumers often react against marketing communications. In doing so, consumers do not merely ignore reactance-inducing messages, but rather act against them, generating backlash effects (Mann & Ward 2001; Plant & Devine 2001). For example, individuals provided with a recommendation against an option not only failed to decrease choice of that option, but instead increased choice of it (Fitzsimons and Lehmann 2004).

Such reactance-induced backlash effects (e.g., when consumers increase a recommended against behavior) are of particular concern to marketers. In this research we examine four factors that might affect reactance induced backlash and some strategies marketers might undertake to reduce such effects. The four factors examined are: freedom of choice, substitute availability, repetition, and elaboration.

In study one, we examine both freedom of choice and substitute availability. Substitute availability may be an important factor in reactance because when consumers adhere to a marketing-communication, they may be forced to change their preferences and may end up with an option they were initially less interested in. Such switching may carry significant opportunity costs. We vary these opportunity costs by varying the availability of close versus distant substitutes and examine whether reactance induced backlash levels are affected. If reactance is driven by high opportunity costs, it should be significantly reduced when a close substitute is available.

At the same time, we also vary the psychological costs of reactance by manipulating perceived freedom of choice. If reactance is caused by a perceived threat to freedom, it should be significantly reduced if no freedom exists to begin with. We conduct a 2 (Freedom of choice: Yes/No) by 2 (Opportunity cost: Close/Distant substitute) between subjects design with a recommendation against a given product. We find that individuals who perceive they have freedom of choice enact high levels of reactance, choosing the recommended against option almost 80% of the time; the presence of a close/distant substitute has no effect on the level of reactance. However, when no freedom of choice is given, reactance is significantly reduced (25% and less).

These findings suggest that reactance is driven by psychological rather than opportunity costs and that attempts to minimize reactance via changes to the product mix may not be effective. Instead, marketers should reduce the psychological cost of adhering to recommendations, for example, by embedding messages in less threatening environments (e.g., product placement), or constructing messages that do not as obviously dictate a certain path for behavior (e.g., comparative ads or elaboration; see study 3).

In study two we examine the effects of multiple recommendations on consumer reactance. Although advertising research has shown that repetition can serve to enhance message effectiveness (Appel 1971; Hasher, Goldstein, and Toppino 1977; Haugtvedt et al. 1994), this may not be the case when reactance is involved. Specifically, individuals who find one recommendation as an attempt to limit their freedom may find ten such recommendations an even stronger, more reprehensible freedom-limiting attempt.

We find that whereas low levels of repetitions (i.e., 1) increase reactance, higher levels (i.e., 3 and 10) serve to reduce it. These findings suggest marketers might be wise to repeat their messages to gain compliance. However, this tactic may only work under certain circumstance. First, the recommendations used in this study differed from one another. Additionally, the message source was reportedly other consumers, a source likely to elicit less suspicion than marketers might (Friestad and Wright 1994). Thus, to maximize the effectiveness of repetition, marketers should attempt to convey the same message via different means repeatedly, using slightly different messages, and attempting to enhance credibility of message sources.

In study three we examine the effects of externally provided versus internally elaborated upon behaviors on consumer reactance. It is possible that reactance is caused by consumers' elaboration on the behavior recommended; such elaboration can be balanced (considering both pros and cons) or can be negative only, considering why the behavior is being recommended against. If elaboration underlies reactance, patterns of behavior in elaboration and direct recommendation should be similar. Such similarity is important to identify, since some marketing communication (e.g., comparative advertising or "teasers") may involve elaboration (Chebat et al. 2001).

Additionally, in this study we examine a real-life, long-term, consequential behavior, pursued outside of the lab. Such reactance responses have not been examined to date, and this study allows us to see whether reactance effects have lingering real-world effects. We also examine whether any of these effects are affected by chronic individual reactance (Hong 1992).

In study four we find that reactance is not driven by an elaboration process, as responses to balanced/cons only elaboration differ from responses to direct recommendations. We find responses to a direct recommendation are affected by chronic individual reactance, whereas responses to elaboration are not. Specifically, individuals high in chronic reactance who received a direct recommendation against a behavior, showed the highest levels of engagement in that behavior. This finding suggests that reactance induced backlash effects persist outside of the lab and thus should be a cause for concern for marketers.

At the same time, study three shows that elaboration (especially on the cons only of the behavior) seems to provide a strong remedy against reactance induced backlash effects.

Thus, the utilization of open-ended (albeit guided) communication with consumers in which they are allowed to reach their own conclusions may be a strong remedy for reactance induced backlash behaviors.

SPECIAL SESSION SUMMARY
Advances in Understanding Consumers' Price Sensitivity
Joseph Simmons, Yale University, USA

**“The Persuasive Power of Quality: Consumers’
Misprediction of their Reactions to Price Promotions”**

Cenk Bülbül, New York University

Tom Meyvis, New York University

Consumers often need to predict how they would react to changes in price or quality. Results from six experiments indicate that consumers often overestimate the relative impact of quality differences on their consumption decisions. Consumers underestimate their sensitivity to promotions on low quality products, overestimate their sensitivity to promotions on high quality products, and overestimate the general effect of quality on the amount they will consume. We conclude that consumers’ predictions rely on an abstract image of themselves as principled consumers and ignore pragmatic realities, such as the need to consume more low quality products to achieve the same level of utility.

ing whether or what to purchase. Our research suggests, however, that opportunity costs are not spontaneously considered. In four studies, manipulations that increased the salience of opportunity costs either deterred purchase or increased price sensitivity by inducing a shift toward the cheaper of two competing products.

**“Intuitive Confidence: When Consumer Choices are
Sensitive to Matching Prices”**

Joseph P. Simmons, Yale University

Leif D. Nelson, New York University

When choosing between equated alternatives, people often choose the option that is superior on the most important, or *prominent*, dimension. Investigating consumer decisions, we show that this *prominence effect* disappears when we make people less confident in the prominent option’s superiority before equating the options on price. This occurs even when we decrease confidence by having people list too many reasons for their preference, and by presenting the options in a difficult-to-read font. Generally, people’s choices are more sensitive to willingness-to-pay responses when they are uncertain that an option is superior in quality than when they are certain.

**“Lay Scientism: Ignorance of Value in Compensation
Decisions”**

Claire Tsai, University of Chicago

Christopher Hsee, University of Chicago

How should one compensate a consumer who loses something irreplaceable because of someone else’s fault? Normatively, compensation should equal the value (utility) of the lost item and thus make the victim as happy as she would be had the damage never occurred. Our experiments demonstrate that people’s compensation decisions often ignore value and are based on the normatively irrelevant factor of cost (the price that the victim originally paid for the item). We explain this phenomenon in terms of lay scientism (a tendency to base decisions on objective factors) and discuss how the popular cost-based compensation rule hurts consumer welfare.

**“The Effect of Opportunity Cost Salience on Purchase
Decisions”**

Shane Frederick, Massachusetts Institute of Technology

Nathan Novemsky, Yale University

Jing Wang, Yale University

Ravi Dhar, Yale University

Stephen M. Nowlis, Arizona State University

Opportunity cost is a fundamental concept in economic theory, but little is known about the degree to which consumers incorporate (or exclude) opportunity costs from their consideration when decid-

SPECIAL SESSION SUMMARY

Belief Confidence and Consumer Reactions to Persuasive Messages: Measures, Models, and Mechanisms

J. Wesley Hutchinson, University of Pennsylvania, USA

Yanliu Huang, University of Pennsylvania, USA

SESSION OVERVIEW

Consumer confidence in their knowledge is an emerging issue in consumer research (Alba & Hutchinson 2000). The central issues that unite the three papers in this session are (1) the measurement of consumer confidence in their own beliefs about the costs and benefits of products, (2) how advertising and other persuasive messages affect belief confidence, and (3) the role that belief confidence plays in determining attitudes and behavior. Although each paper addresses the construct of belief confidence, each does so from a distinctively different perspective. The Albarracin paper treats belief confidence as an individual difference variable and shows that people who are high in confidence are more willing to expose themselves to counter-attitudinal information. She reports the results of lab and field studies on information seeking behaviors concerning HIV-prevention (see also Albarracin et al. 2005). The methodological perspective of this paper is that of attitude research. The Huang and Hutchinson paper treats belief confidence as an indicator of the elaboration of an idea during exposure to an advertisement. They observe response, reaction times, and confidence ratings for specific beliefs and show that they can be reliably connected to the contents of advertising and (therefore) the likely cognitive responses experienced during ad exposure. The methodological perspective of this paper is that of memory. The Soll perspective treats belief confidence as a subjective probability that a belief is correct to within some specific interval of error. The reported empirical evidence reveals overconfidence and confirmation bias, and he presents a knowledge sampling model that predicts these effects as a form of sampling bias. The methodological perspective of this paper is that of judgment and decision research.

As can be seen from this brief synopsis, the three papers draw upon different literatures and experimental paradigms, but have intriguing areas of overlap (cf. Wyer and Albarracin 2005). The Albarracin and Soll papers each examine how confidence leads to vulnerability in decision making. In Albarracin's work, this vulnerability arises from openness to *disconfirming* information; in Soll's work the vulnerability is in the overweighting of *confirming* information. The Albarracin work uses psychometric methods to measure a *stable individual trait* that affects virtually all beliefs; Soll's work and that of Huang and Hutchinson use stochastic models of decision processes to measure *dynamically changing levels of confidence in specific beliefs*. By juxtaposing these three perspectives on belief confidence, we hope to (1) provide an introduction to each area of theory and method, (2) identify more precisely where the same constructs are intended and where different constructs are intended, and (3) begin to resolve apparent conflicts and synthesize a broader, more unified perspective.

EXTENDED ABSTRACTS

"Believing That One is Strong as a Defensive Weakness: Using Defensive Confidence to Attract Reluctant Audiences"

Dolores Albarracín, University of Florida

Amy L. Mitchell, University of Florida

Marta R. Durantini, University of Florida

Allison Earl, University of Florida

Justin Levitt, University of Florida

Joanne Gunnoe, Alachua County Health Department

History presents abundant examples that people who strongly advocate and defend a given attitudinal position often change this position, becoming "converted" to points of view that are opposite to the ones they initially held. We argue that one reason for such changes is the degree to which individuals perceive that they can defend their attitudes from attack. Ironically, this trait can make them vulnerable to attitude change (Albarracín, 2002; Albarracín & Mitchell, 2004). Presumably, people who are confident that their attitudes will survive future challenges are more willing to examine evidence that both supports and contradicts their prior attitudes. In contrast, people who doubt their defensive ability may prefer proattitudinal information over challenges (see also Byrne, 1961; Olson & Zanna, 1982b; for related views in other domains, see Tesser, 2001). Although denial may in many ways be relatively a primitive defense mechanism, avoiding counterattitudinal information may preserve the attitudes of people who doubt their defensive abilities. In contrast, individuals who believe that they will effectively self-defend may willingly receive counterattitudinal information that succeeds in changing their prior attitudes.

The present paper addressed various questions about the role of defensive confidence and the way to use it to the persuader's advantage. First, we were interested in determining whether people vary in defensive confidence. If so, we were also interested in analyzing the origins and structure of defensive confidence as an individual difference. Because general demographic and personality variables are often inadequate to predict attitude change (Eagly & Chaiken, 1993), it is important to understand stable individual differences that relate specifically to people's attitudes and their responses to persuasion. In addition, we investigated whether high (vs. low) defensive confidence renders people more open to receiving and changing more in response to counterattitudinal information. Identifying the consequences of defensive confidence is critical to producing change in different populations.

Defensive confidence is defined as people's perceptions that they can defend their attitudes when information coming from the environment contradicts these attitudes (Albarracín & Mitchell, 2004). These perceptions of defensive capacity should lie at the heart of one's resolution of the conflict between approaching information that challenges one's attitudes and approaching information that supports these attitudes (Festinger, 1957, 1964; see also Cannon, 1964). That is, individuals who trust their defensive abilities may also expect to trust their initial attitudes. Similarly, people who are high (vs. low) in defensive confidence should anticipate more effective counterarguing of the discordant information and possibly greater self-enhancement. Thus, the effects of

defensive confidence may be mediated by attitude confidence, expected effective counterarguing, expected self-enhancement, and expected information novelty or strength.

The ultimate influence of defensive confidence on attitude change was also of interest. We hypothesized that people who doubt their defensive abilities should be more cautious in approaching counterattitudinal information. In contrast, those who believe they will successfully self-defend may be more apt to confronting information with which they disagree. Hence, they may become vulnerable targets of persuasion attempts. One of our studies examined the influence of defensive confidence on approach to proattitudinal information and on ultimate attitude change, as well as the perceptions that mediated these effects.

Consistent with our hypotheses, our research indicated that people who lack confidence in their ability to defend their attitudes prefer information that agrees with their views. In contrast, people who are confident are less biased in their selection decisions. Instead, they appraise information regardless of whether or not it agrees with their own position. We also found that people who trust their defensive ability expect to counterargue attitude-inconsistent communications effectively, to continue to trust their initial attitudes despite the communication, and to receive novel information. In addition, chronic defensive confidence increased exposure to counterattitudinal communications and ultimately, attitude change, by mediating influences on expected counterarguing success, attitude confidence, and information novelty.

We then used these findings to design ways of attracting audiences to a target program. These methods were tested in two field studies. Participants were clients from the Alachua (FL) County Health Department and were recruited through flyers or direct referrals. Referral was made to what was described as a "health survey" and participants who called were asked various questions about health, including sexual activity. Only participants who were sexually active in the last six months and not currently pregnant were considered eligible and scheduled to come in for an interview at a subsequent time. At the time of this interview, after signing the informed consent, the participant responded to a questionnaire administered by a member of the research team. Among other things, the questionnaire measured prior attitudes about condom use and actual condom use. Critical to the research problem of interest in this paper, halfway through the interview, the interviewer paused the administration, announcing a 30-minute break. At that point, a confederate entered the room pretending to do work unrelated to the interview, and unobtrusively observed the participant's exposure behavior. Specifically, participants had the opportunity to (a) read six HIV-prevention brochures, (b) watch a video on HIV-prevention, and (c) participate in a brief HIV risk-reduction counseling session that the interviewer offered to him or her. Thus, the behavior of the participant could be recorded with respect to the brochures, the video, and the counseling. Following this ostensible break, the interviewer returned and administered measures of material recognition, among other things.

The second field study manipulated the introduction to the brochures, the video, and the counseling in different ways. In one of the conditions (defensive confidence), the introductions highlighted that the materials/program did not impose a point of view and that most people exposed to them remained unchanged. In a second condition (change confidence), the introductions highlighted that the materials/program were highly effective at inducing condom use. The third and fourth conditions were control groups. Analyses indicated that instilling defensive confidence was more effective at increasing participation.

"Counting Every Thought: Indirect Measures of Cognitive Responses to Advertising"

Yanliu Huang, University of Pennsylvania

J. Wesley Hutchinson, University of Pennsylvania

The traditional method of measuring the cognitive responses to an advertisement focuses on the thought-listing technique (e.g., Cacioppo and Petty 1981; Ericsson and Simon 1980). Specific responses have seldom been used to predict attitudes. Usually, the cognitive responses are coded for valence and summed to form measure of net affective response. This measure is a reliable and strong predictor of attitude. Recently, the confidence expressed by people in the validity of their cognitive responses has been shown to also be a strong and reliable predictor of attitude (Brinol, Petty, and Tormala 2004; Petty Brinol, and Tormala 2002).

In this research, we focus on the key assumptions (1) that specific cognitive responses occur during the processing of persuasive messages and (2) that each such response exerts some effect on subsequent attitudes. Despite their success in predicting attitudes, thought-listing techniques are necessarily introspective. As such, they are suspect because retrospective methods rely on memory processes that are potentially errorful and biased and concurrent methods create potential problems of reactivity that could distort the measurement of cognitive responses and the processing of ad information itself (e.g., Nisbett and Wilson 1977). To address these concerns, we desire methods that have a clear causal relationship to the occurrence of specific cognitive responses and are less susceptible to the contaminating biases of introspection.

The first method we examine is *thought recognition*. In the research reported here, we used a common sentence frame within which a single sentence was varied across trials. An example is "When viewing advertisements, people often have a variety of thoughts and reactions. Regardless of what you believe now, when viewing the magazine ads earlier in this experiment, did you ever think to yourself, 'The Fiat SUV is fast'?" The final sentence varied across trials and the underlined word occurred after a delay. The target attribute was suggested or implied by the target ad but was not explicitly mentioned in the ad. Subjects pressed buttons to indicate "Yes" or "No" responses. Reaction times for this response and confidence ratings in its validity were also collected. Although the response itself is explicit and introspective, reaction times are not easily controlled consciously and such conscious process are detectable because the greatly increase time compared to natural responses.

The second method we examine is *belief verification*. As for thought recognition, we used a common sentence frame across trials (e.g., "The Fiat SUV is fast." and the underlined word occurred after a delay). Subjects pressed buttons labeled "Agree" or "Disagree". Belief verification should be much less susceptible to contamination than thought listing or thought recognition because the task makes no reference to the advertisement. Thus, all measures derived from this task (i.e., the response, valence, reaction time, and confidence) are indirect.

All of the experiments reported here manipulate the likelihood that an advertisement will produce a specific cognitive response using target ads (for which thought-listing pretests showed a high likelihood of a specific thought) and control ads. The thoughts that people have when reacting to advertisements should leave a measurable memory trace. Moreover, the tasks that should reveal that memory trace include thought recognition and belief verification for sentences that express those thoughts. In these tasks, the memory trace should reveal itself in a variety of ways, and these expected effects of memory traces form the basis of our experimental hypotheses.

First, an advertisement that has a high likelihood of eliciting a specific cognitive response (i.e., target ads) should yield more positive responses than an advertisement that has a low likelihood of eliciting that cognitive response (H1). Strong support for this hypothesis was found for both thought recognition and belief verification.

Second, target ads should yield faster positive responses than control ads (H2). For both tasks, the cognitive response is a form of elaboration that should enhance the accessibility of the information required to make a positive response. The mechanism is similar to that postulated for many standard priming and sentence verification tasks, as well as for attitude judgments. Strong support for this hypothesis was found for both thought recognition and belief verification.

Finally, target ads should yield higher confidence ratings for positive responses than control ads (H3). Confidence should increase because more positive evidence is retrieved from memory. Strong support for this hypothesis was found for both thought recognition and belief verification.

Although H1-H3 were strongly supported in our experiments, they pertain to positive responses only. This is because the evidence used for negative responses in these tasks is neither obvious based on common sense nor well-known in the related literatures. To test our hypotheses using both positive and negative responses, we estimated a Poisson counting of jointly observed responses, latencies, and confidence ratings (similar to those commonly used for traditional perceptual and recognition tasks). The key model parameters are the rates with which positive and negative evidence is recruited by memory processes. Model estimation provided strong evidence that the rate parameter for positive evidence was larger for target (vs. control) ads and that the rate parameter for negative evidence was smaller for target (vs. control) ads. These rate parameters are indirect in the sense that the measures were indirect and the relationship between observed measures and the rate parameters are complex; however, theoretically are the construct most directly related to the occurrence of a specific thought during ad exposure.

A third experiment replicated the results of the first two and showed that, in predicting attitude, reaction times and confidence ratings accounted for significant incremental variance in a regression model that also included response valence. A fourth experiment used a battery of belief statements to construct indices reflecting a variety of beliefs and showed that valence-weighted indices based on reaction times and confidence ratings predicted incremental variance in attitude judgments when the baseline was valence-weighted indices based on agree/disagree responses.

“Sampling, Overconfidence, and Consumer Decisions”

Jack B. Soll, Duke University

Joshua Klayman, University of Chicago

Consumers often make decisions based on estimates and predictions. For example, consider a consumer who is deciding whether to drive to next town to buy a television set. The consumer is confident that the store closes between nine and ten in the evening, and that the television is cheaper than in the local store. Everything may go as expected, in which case the consumer happily returns home with the television. However, it is also possible that the consumer will be surprised. The store may be closed when the consumer arrives, or the price may be higher than anticipated. More positively, the television may unexpectedly be on sale.

A robust finding in the literature on judgment and decision making is that people are overconfident. In this talk I will focus on interval estimates, which are typically associated with high levels of overconfidence. Studies of intervals typically ask participants to

give lower and upper bounds for unknown quantities. For each interval, the participant is supposed to be 90% sure that the correct value lies inside the specified range. For example, the consumer above may be 90% sure that the store closes between nine and ten. Across many judgments, the intervals should contain the correct answer 90% of the time. In many studies, however, the “hit rate” is closer to 40%.

In several recent papers (Klayman et al., 1999; Klayman et al., 2006; Soll & Klayman, 2004) we have sought to explain overconfidence in intervals. Both confirmation bias and statistical effects are implicated. Interestingly, both of these explanations can be construed as a form of sampling bias. Consider confirmation bias, which holds that evidence that favors an initial hypothesis has a retrieval advantage. Our consumer may initially recall other stores that close late, which leads to an initial hypothesis that the store closes late, which leads to the generation of reasons that support a late closing (e.g., “Best Buy is open, Circuit City is open, so Joe’s Stereos should be open late also to compete”). The fact that Joe needs to compete may indeed be a good reason. However, it is only one reason drawn from a population of reasons. Overconfidence will result when the process of sampling of reasons is slanted toward the initial hypothesis, provided that additional processing fails to correct for this bias.

Confirmation bias is sufficient but not necessary for producing overconfidence. There are two ways in which random error alone can lead to biased judgment. First, Soll and Klayman (2004) considered the possibility of random error in setting interval width. In theory such error can lead to overconfidence, but Soll and Klayman showed that the effect of error is small compared to the effect of intervals simply being too narrow. Second, for some types of judgments intervals may be inferred from a sample of related instances. For example, a consumer might recall the closing times of other stores in order to estimate the unknown closing time of a specific store. People will be systematically overconfident if they infer variability in the population from variability in the sample (Klayman et al., 2006).

In this talk I will offer data that is consistent with both explanations for overconfidence. I will also discuss two methods for reducing overconfidence and improving judgment. Both methods are related to sampling. The first method involves asking multiple questions (“What is your upper bound? Ok, now what is your lower bound?”), rather than just one question (“What is your range?”). When multiple questions are asked, people appear to sample knowledge multiple times rather than just once. The effect is not only wider intervals, but also intervals that are better centered on the truth. This method improves both calibration and forecast accuracy simultaneously (Soll & Klayman, 2004). Note that the first method entails extracting non-overlapping samples of evidence from the same person. The second method involves sampling across people. To the extent that people rely on different samples or are prone to different errors, averaging across people should improve calibration and accuracy for point estimates.

Understanding the mechanisms that underlie overconfidence is important to consumer behavior. One reason is that, in many cases, marketers would be better off if consumers were surprised less often. It may be possible for marketers to encourage consumers to sample more (either from memory or by asking others). The desired result of such interventions is reduced overconfidence and greater information search. In other situations, marketers might actually benefit from consumer overconfidence. To discourage information seeking, a leading brand might pose questions to a consumer in a way that encourages limited as opposed to expansive sampling.

SPECIAL SESSION SUMMARY

Recent Research on Implicit Motivation

Andrew Mitchell, University of Toronto, Canada

SESSION OVERVIEW

Recent research in social cognition has examined implicit motivation or how goals operate in implicit or nonconscious ways. While some research in this area has examined whether goals can be activated nonconsciously, recent research has examined the complex ways in which both consciously and nonconsciously activated goals influence thought or behaviour through a variety of implicit mechanisms.

The three papers in this session address a number of questions with respect to implicit motivation: Which “mind” leads to more efficient goal pursuit—the conscious or the unconscious? Can the automatic evaluation of a goal predict goal-relevant behaviour better than explicit measures? And finally, in the context of a self-control dilemma, does a positive automatic evaluation of the goal make one more resistant to temptations?

In the first presentation, Gordon Moskowitz and Kai Sassenberg argue that conscious and unconscious goal pursuit may vary in effectiveness. In some cases, conscious goal pursuit may trigger interfering cognitive routines that deter successful goal pursuit which does not occur with unconscious goal pursuit. They demonstrate that conscious goal pursuit of the creativity goal may activate associations that inhibit creativity, while the unconscious pursuit of this goal will inhibit these associations.

Melissa Ferguson suggests that an automatic evaluation toward a goal should reflect a person’s tendency to approach that goal, which in turn should predict goal-consistent behavior. In a series of experiments, she finds that an automatic evaluation of goal constructs (i.e. abstract, desirable end-states) significantly predicts goal-relevant behavior. Interestingly, the automatic evaluations of the goal served as a better predictor of goal consistent behaviour than explicit attitudes, explicitly measured goal commitment, and automatic evaluations of concrete, goal-relevant objects.

In the last presentation, Darlene Walsh and Andrew Mitchell examine automatic goal activation and automatic evaluations on consumption under high and low cognitive load. And rather than focusing on more general temptations and goals, they focus on a specific self-control dilemma among only restrained eaters. They find that only individuals who automatically activate a goal while exposed to a real temptation activate an automatic self-control process. Interestingly, they find no relationship between behaviour and automatic evaluations of the goal. However, they do show that activation of a goal during exposure automatically decreased the positivity of automatic evaluations towards objects not useful in attaining that goal. In other words, although these restrained eaters had an automatic positive evaluation of the temptation before exposure to the temptation, during exposure their automatic evaluation became neutral. Participants who did not automatically activate a diet goal during exposure to the temptation did not have an automatic positive evaluation of the goal; however they did have an automatic positive evaluation of the temptation and there was a relationship between the positivity of the automatic evaluation and consumption.

Taken together, this session should be of interest across a broad range of research areas including self-regulation, automatic evaluation, implicit attitude, goal activation, and automatic goal pursuit. The three papers in this session examine implicit motivation from somewhat different approaches and results converge in some cases, and diverge in others. Given this, the purpose of this

session is actually two fold: first, we want to expose consumer behaviour researchers interested in implicit motivation to some recent theoretical approaches used in the area; and second, we want to highlight the differences in the papers in order to resolve what may appear to be inconsistencies, consequently leading to a more complete understanding of the implicit motivation and its effects.

EXTENDED ABSTRACTS

“Unconscious Goals and Creativity: Activating Creativity Goals Breaks Established Associations and Leads to the Generation of Original Ideas”

Gordon B. Moskowitz, Lehigh University

Kai Sassenberg, University of Jena

It is known that the unconscious mind can be smart. People asked to consciously ruminate over important decisions can make worse choices than those simply asked to sleep on it and let the difficult options tumble through the unconscious (Dijksterhuis et al., 2006). Can the unconscious mind also be creative? Our research illustrates that creativity goals, and an associated “think different” mindset, operate in the preconscious to produce novel solutions and inhibit old/established associations—people exhibit unconscious creativity.

Being creative implies, by definition, the attempt to avoid the conventional routes of thinking and, therefore, the avoidance of the activation of typical associations. Research on idea generation has painted, however, a fairly bleak picture regarding human ability to consciously pursue the goal of being creative. Despite participants being explicitly instructed to generate new, original ideas, and not to copy any feature of some examples that are provided, participants copy the given examples (or at least certain features of them). If asked to generate a novel and creative name for a new pasta and being provided with sample pasta names (e.g., spaghetti, fettuccini, linguini), people produce something that sounds perfectly non-creative, a blending of the existing names (e.g., fellini). Individuals are not able to control this so-called inadvertent plagiarism intentionally. The conformity to given examples did not decrease when participants were explicitly instructed to create ideas that were very different from the examples, even though they were able to list the features they were asked to avoid (Smith, Ward, & Schumacher, 1993; Marsh, Ward, & Landau, 1999). The plagiarism occurs most likely because examples are highly accessible during idea generation, and this activated knowledge impacts idea generation without awareness (Marsh, Bink, & Hicks, 1999) and thus beyond intentional control.

While these findings point to the fact that thinking differently by conscious intent is difficult, the implicit volition model (IVM; Moskowitz, Li, & Kirk, 2004) suggests that unconscious goals may have greater success. Implicit motivation and preconscious goal pursuit involve processes of goal shielding that occur outside of awareness that are not subject to the pitfalls of conscious intent. As an example, considering the case of creativity goals, facilitation and inhibition processes help to implicitly allow for goal pursuit, by keeping goal-relevant concepts (such as being novel) accessible and keeping goal-competing concepts (such as being typical) inhibited. A mindset to “think different” is triggered by the creativity goal, and this mindset has preconscious effects on cognition that promote goal pursuit, with wide ranging consequences.

In our research it is established that the priming of creativity goals allows participants to overcome inadvertent plagiarism. Moreover, the rebound effect (i.e. higher accessibility of features of the examples after they have been suppressed successfully) is not found after creativity priming. Subsequent research further suggests that typical associations between stimuli and concepts are less likely to be activated after being primed with creativity. This is tested first in the important domain of stereotyping. We expected that the African American stereotype would be less likely to be automatically activated after seeing the face of an African American when people were primed with creativity beforehand (compared to a control condition). The “think different” mindset was shown to break the typical association, thus allowing people to free their thoughts from the shackles of the stereotype. People primed with faces of African Americans had stereotypes triggered in control conditions, but not when primed with creativity goals. In another experiment this effect of “inhibiting typical associations” was found to generalize to the underlying phenomenon: the automatic activation of any “typical” associations was reduced by priming creativity. Thus, associations between “bread and butter” and “doctor and nurse” that have been broadly replicated in research paradigms using lexical decision tasks were found to not exist when creativity goals were being unconsciously pursued.

Taken together, being primed with creativity allows for generating original ideas because one is able to think differently without the unwanted side effects of suppressing thoughts triggered by the intention to suppress them. The “thinking different” mindset induced by priming creativity operates by reducing the automatic activation of typical associations, all without the person’s conscious intent or awareness. Importantly, this preconscious goal pursuit allows for the control over automatic stereotype activation. Advantages to this method of stereotype control are that a) it is a proactive strategy of stereotype control, one that prevents stereotypes from ever coming to mind (as opposed to strategies that require one to suppress the use of stereotypes after the fact or attempt to prevent these activated concepts from biasing one’s judgment; e.g., Devine, 1989), and b) it is not restricted to preventing the activation of a single stereotype, but most likely undermines the automatic activation of any stereotype and other unwanted thoughts (unlike interventions using the training of new associations, goals and intentions, and developing new expectancies; e.g., Blair & Banaji, 1996; Kawakami et al., 2000; Monteith et al., 2002; Moskowitz et al., 1999, 2000, 2003). The unconscious mind is not only smart, it is an efficient goal pursuer, and thus can be highly creative.

“The Automatic Evaluation of Goals”

Melissa J. Ferguson, Cornell University

Research in social cognition has demonstrated that people immediately and unintentionally evaluate the people, words, pictures, faces, letters, and even odors they encounter (e.g., Bassili & Brown, 2005; Fazio & Olson, 2003; Greenwald & Banaji, 1995; Musch & Klauer, 2003; Zajonc, 1980). The automatic activation of an evaluation, or attitude, toward a stimulus can occur even when one is unaware of the respective stimulus itself (e.g., Greenwald, Klinger, & Liu, 1989). To date, this body of work has almost exclusively addressed the automatic activation of attitudes in response to stimuli that denote objects that one can literally move toward or away from in physical space—in other words, “graspable” stimuli such as concrete objects (e.g., apple, garbage) and group members (e.g., Blacks, elderly; Bargh, Chaiken, Govevender, & Pratto, 1992; Fazio, Jackson, Dunton, & Williams, 1995; Greenwald, McGhee, & Schwartz, 1998; cf. Nosek, Banaji, & Greenwald, 2002).

In contrast, there has been virtually no research on the attitudes that are automatically activated in response to more abstract constructs such as the goals and values that govern behavior more generally within and across situations. This relative lack of attention might stem from assumptions about what attitude objects typically do and do not entail. Whereas one’s evaluations of physical objects (e.g., puppy), people (e.g., the elderly), and issues (e.g., abortion) are normally classified as attitudes, one’s evaluations of end-states (e.g., being thin) and modes of conduct (e.g., egalitarianism) tend to be classified as indices of goal importance or strength (and sometimes values; Allport, 1961; Feather, 1992, 1995, 1996; Hitlin & Piliavin, 2004; Locke & Latham, 1990; Maio, Olson, Allen, & Bernard, 2001; Rohan, 2000; Rokeach, 1968, 1973, 1980; M. J. Rosenberg, 1960; Schwartz, 1994, 1999; cf., Eagly & Chaiken, 1993). However, such assumptions notwithstanding, an attitude object can consist of anything one can imagine (Allport, 1961; Eagly & Chaiken, 1993; Fazio, 1986). From this perspective, attitude objects are clearly not limited to the targets of one’s behavior, such as other persons and items, but rather can include any “psychological object” (Thurstone, 1931) including the abstract goals, values, and social norms that might more generally guide our behavior across various targets.

What would an automatically activated attitude toward a goal construct reflect? If the evaluative information that is automatically activated on perception of a stimulus is reflective of the person’s approach versus avoidance tendencies toward that stimulus (e.g., Cacioppo, Priester, & Berntson, 1993; Fazio, 1986, 1989, 2001; Ferguson & Bargh, 2002, 2004; Katz, 1960; Lang, Bradley, & Cuthbert, 1990; Öhman, 1986; Pratkanis, Breckler, & Greenwald, 1989; Roskos-Ewoldsen & Fazio, 1992; Smith et al., 1956), then one’s automatic attitude toward a goal construct should reflect the person’s tendency to approach (i.e., pursue) that goal, which in turn should predict her or his goal-consistent behavior. For example, just as automatic attitudes toward stereotypically Black names can predict subtle and overt behavior during a subsequent encounter with a Black person (e.g., Fazio & Olson, 2003), automatic attitudes toward egalitarianism might be equally or differentially predictive of egalitarianism-related behavior. In this way, the evaluative information that is automatically activated in response to a goal construct might be understood as an implicit index of that goal’s likely influence on the person’s behavior.

To address this possibility, the current set of experiments tested whether automatic evaluations of goals predict and influence goal-pursuit. In the first experiment, the goal of egalitarianism was subjected to subliminal evaluative conditioning. The goal (i.e., the words fair, equal) received positive, neutral, or no conditioning. Participants then were asked to read a vignette and make a hiring decision according to ethnicity. Those who received positive conditioning were significantly less likely than both those who received neutral and those who received no conditioning to exhibit prejudicial decision-making. This finding suggests that the implicit positivity associated with an abstract goal causally increases the likelihood of behavior relevant to that goal.

In the second experiment, the predictive validity of automatic evaluations of goals was compared with that for explicit attitudes toward the goal and explicitly measured goal commitment. The goal under investigation was the goal to be thin. Participants were asked in the first phase of the experiment to complete the 3 types of measures mentioned above. Participants were then contacted after 1 week or longer, and asked to indicate the number of times over the past week they had resisted eating tempting foods (a strategy identified by pilot testing as important for the goal to be thin). Only participants’ automatic evaluation of the goal was a significant predictor of the reported behaviors.

In a third experiment, the predictive validity of participants' automatic evaluation of the goal to be thin versus their automatic evaluation of a tempting food was examined. Participants' were told that they would be sampling either a tempting or non-tempting snack. They then completed an implicit attitude measure (toward the goal as well as the tempting food). They then sampled the snack, and the amount they ate was measured. Participants' automatic evaluation of the goal significantly predicted how much of the tempting snack they ate (but not the non-tempting snack), while their automatic evaluation of the tempting food did not.

Together, this set of findings extends the work showing that automatic evaluative processes play an important role in goal pursuit and self-regulation (e.g., Ferguson & Bargh, 2004). In particular, they suggest that automatic evaluations of abstract, desirable end-states possess predictive validity for goal relevant behavior, more so possibly than explicit attitudes, explicitly measured goal commitment, and automatic evaluations of concrete, goal-relevant objects.

“Automatic Evaluations and Self-Control”

Darlene Walsh, University of Toronto

Andrew Mitchell, University of Toronto

Research on implicit motivation has shown that the activation of a goal automatically increases the positivity of automatic evaluations towards objects useful in attaining that goal (Ferguson & Bargh, 2004). In addition, Custers and Aarts (2005) find that creating automatic positive evaluations of a goal enhances the motivation to achieve the goal i.e. a positive automatic evaluation towards a goal “pushes” you to succeed. However, in the context of a self-control dilemma, it is unclear whether a strong positive automatic evaluation of a long-term goal guarantees successful self-control. Thus, the role that implicit motivation might play in terms of the self-control process is the central focus of the research described below.

A secondary focus of this research is to examine the mechanism underlying self-control. Traditionally, the process underlying self-control process has been thought of as a controlled process (e.g. Baumeister, Heatherton and Tice, 1994; Muraven and Baumeister, 2000; Trope & Fishbach, 2000). Recent research, however, finds that pursuing goals does not always involve deliberate, conscious intention (see the auto-motive model by Bargh, 1990). Applying this to self-control, the process that underlies successful self-control need not always be controlled. In support of this concept, Fishbach, Friedman and Kruglanski (2003) have shown that exposure to short-term temptations may automatically activate one's long-term goals and consequently prevent these temptations from influencing one's behaviour. However, in a previous experiment, we found that although restrained eaters with automatic goal activation prior to exposure to a temptation were able to resist a temptation under low cognitive load, they nevertheless succumb to temptation when placed under high cognitive load (Walsh and Mitchell, 2006). While these results are intriguing, we do not know whether they hold when goal activation is measured while exposed to an actual temptation. Said differently, will individuals who automatically activate the goal during exposure to a real temptation also succumb to temptation when placed under high cognitive load.

In order to tackle the research issues outlined above, we designed two experiments that incorporate both theoretical approaches (i.e. implicit motivation and goal activation) to better understand the self-control process. Rather than focusing on more general temptations and goals, we focus on a specific self-control dilemma among restrained eaters the ability to resist fattening foods. In the first study, we measure goal-temptation associations

and automatic evaluations of both goals and temptations before exposure to a real temptation, and then again while participants are exposed to a real temptation—mini-chocolate chip cookies. Participants were then left alone in the room with the cookies for approximately 2 minutes under either low or high cognitive load. The main dependent measure was the amount of cookies each participant consumed under the two cognitive load conditions.

Interestingly, we found differences in terms of goal activation before and during exposure. In fact, we classified restrained eaters on 2 dimensions: whether they activate the goal before exposure (or not), and the whether they activate the goal during exposure (or not). Under low cognitive load, restrained eaters with goal activation (regardless of whether the goal activation occurred before or during exposure), are better equipped to deal with temptations as shown through their consumption patterns, relative to the individuals without activation, suggesting that goal activation facilitates self-control. Under high cognitive load, restrained eaters who automatically activate the goal during exposure do not succumb to temptation when placed under high cognitive load, suggesting that temptations are capable activating an automatic self-control process. However, individuals who do not show goal activation before or during exposure consume the same regardless of load. And individuals who automatically activate the goal before, but not during exposure, consume much more under high cognitive load. These individuals seem to inhibit the diet goal when faced with a temptation.

In terms of automatic evaluations, all restrained eaters have strong positive automatic evaluations of cookies before exposure to the real temptation. The interesting theoretical question is whether these evaluations change when measured during exposure to the temptation. Interestingly, the individuals who automatically activate the diet goal while exposed to a temptation no longer have a positive automatic evaluation towards the temptation during exposure—the evaluations become neutral. We also found a positive relationship between the automatic evaluation of cookies and consumption among those who do not automatically activate the diet goal. In terms of automatic evaluations towards dieting, only those who show goal activation before exposure automatically evaluate diet as positive before exposure. Similarly, only those who activate the goal during exposure to the temptation have an automatic positive evaluation of the goal during exposure. Interestingly, there was no significant correlation between consumption and automatic evaluations of diet.

In a second study, we again measure goal-temptation associations and automatic evaluations of goals and temptations before and during exposure to a real temptation (e.g. tray of mini-chocolate chip cookies). This time we measured moment-to-moment tracking of their approach and avoidance reactions to a temptation i.e. we elicited spontaneous reactions to the cookies via a joystick that recorded evaluation every second. We found that over time, individuals who activate the goal during exposure neither avoid nor approach the temptation. Restrained eaters who inhibited the diet goal when faced with a temptation, however, initially approach the temptation, but over time, they begin to strongly avoid the temptation. Finally, those who never activate the diet goal mainly approach the temptation; over time, they begin to lose the approach, but never to the point where they avoid the temptation.

The present research makes important contributions to the literature. We find that individuals who automatically activate a long-term goal while exposed to a real temptation activate an automatic self-control process. We also show that activation of a goal automatically decreases the positivity of automatic evaluations towards objects not useful in attaining that goal. We interpret

this to suggest that the self-control process is one that modifies the evaluation of the temptation. Further, individuals who automatically activate the diet goal before exposure, but not during exposure, succumb to temptation when placed under high cognitive load, suggesting that exposure to real cookies inhibit the diet goal among these individuals. Cognitive resources are required in order for these individual to convince themselves that the temptation is not appealing, which will then lead to successful self-control.

SPECIAL SESSION SUMMARY

It's All in How You Look at it—The Impact of Having an Incremental or Entity Theory on Consumer Behavior

Subbu Sivaramakrishnan, University of Manitoba, Canada

SESSION OVERVIEW

It is well known that people have lay or implicit theories—informal theories about different phenomena, often not based on any scientific evidence. One such category of implicit theories is the theory that people have about how likely something is to change. Research in social and developmental psychology by Dweck and her associates (see Dweck 1999 for a review) has posited that everyone holds a theory, with varying magnitude, on the extent to which their traits are likely to change, which they term “self-theories”. For example, those with an *entity theory* of personality believe that personality consists of fixed, static traits and people are inherently made in a certain way that cannot be changed. On the other hand, those with an *incremental theory* of personality believe that personality consists of dynamic personal qualities that can be changed and developed. A number of studies by Dweck and her associates have shown that entity theorists hold attitudes that are relatively rigid and are more likely to make stereotypical judgments from limited information. In contrast, incremental theorists, who believe that people’s behavior is not static, hold attitudes that are relatively malleable and are much less prone to making stereotypical final judgments and instead base their evaluations on a variety of available information (Erdley and Dweck 1993). Dweck posits that entity or incremental theories can be held for any trait pertaining to the self—personality, intelligence, social skills, etc.

It can be easily seen how people could have an incremental or entity theory about variables that are of interest to marketers and have significant implications for consumer behavior. For example, one may have an incremental or entity theory about how likely a salesperson’s personality is to change, to what extent a particular brand’s traits can be extended to other products, how likely a particular product category is to change what it claims to (e.g., weight loss programs, hair growth formulas, memory-enhancing supplements), and so on. These are just some examples of consumer behavior research in a domain that the larger marketing academic community has had limited exposure to. While implicit theories can play a major role in consumer behavior, research pertaining to the concept is only beginning in our area.

The objective of this proposed special session is three-fold. First, it will provide a forum for consumer behavior researchers to be exposed to the richness of the research on implicit theories, specifically self-theories—a domain that is yet to be tapped in the consumer behavior literature. This will be accomplished to a large extent by the first presenter, complemented by the next two presenters. Second, it intends to highlight the relevance and implications of self-theories in consumer behavior. This will be done through two presentations that will present research examining the role of self-theories in two quite different consumption contexts—the first on perception of salespeople and the second on acceptance of brand extensions. Third, the most valuable objective of this session is to kindle interest and encourage consumer behavior research involving self-theories. With the exception of Flaherty and Pappas (2000), to our knowledge, there is no current published research in marketing that has addressed self-theories. Therefore, the content of this session will be novel and informative to the conference audience. All three presentations have been chosen such that they are based on research at the completion or near-completion stage (working

manuscripts will be made available). The first presentation is based on thirty years of published and unpublished research; the second and the third presentations are each based on three empirical studies. Concurrent with the third objective, the discussion and Q&A session is expected to initiate substantive interaction and generate interest in an area rich in consumer research potential.

The first talk will be by Carol Dweck (Stanford University), who has researched implicit theories for over thirty years. She has numerous papers on the role of self-theories in journals such as *Journal of Personality and Social Psychology*, *Psychological Inquiry*, *Journal of Experimental Social Psychology*, *Personality and Social Psychology Review*, *Developmental Psychology*, and *Child Development*, to name a few, besides several books on the topic. In Dweck’s talk, she will review existing research on implicit theories, present new work (not yet published), and describe the implications of her work for consumer behavior. Dweck will explain how self-theories guide people’s attitude and behavior, both in marketing and non-marketing contexts. Using data from numerous fascinating studies, she will demonstrate that when people believe that an ability is dynamic and can be developed, they are motivated to do so, but when people are led to believe that ability is static and cannot be changed, they adopt a performance orientation trying to prove they already have the ability. In particular, Dweck’s talk will include the role that having an entity or incremental theory plays in consumer behavior, such as how the theory (incremental or entity) that consumers have determines the products and brands they buy, how they react to celebrity endorsements, and how they form impressions of salespeople in retail encounters.

The second presentation by Subramanian Sivaramakrishnan (University of Manitoba), Harish Sujan (Tulane University), and Mita Sujan (Tulane University) will be on the moderating role of implicit theories in cognitively busy consumers’ ability to revise their initial judgments of salespeople. They will present the results of experiments in which they examine the role of self-theories on consumers’ ability to revise their negative initial judgment of a salesperson while interacting with the salesperson. In study 1, they establish that judgment revision is a resource-consuming task that can be impaired by cognitive busyness caused by thinking of questions. In study 2, they show that whether the consumer has an incremental or entity theory of personality moderates the effect of cognitive busyness on judgment revision. In study 3, they show that information signals enable judgment revision even among those cognitively busy consumers whose initial judgments may be relatively rigid. Their research argues that when the initial impression of the salesperson is malleable (incremental theory), overcoming cognitive busyness caused by active listening is possible. Even entity theorists can overcome cognitive busyness and make a judgment revision, provided they are given pointers of the information to follow.

The final presentation by Eric Yorkston (Texas Christian University), Joseph Nunes (University of Southern California), and Shashi Matta (Ohio State University) will demonstrate how the theories people have about their own personality impact their assessment of brands’ personality, particularly in the case of brand extensions. They will present the results of three experiments in which they examine the role that the theory one has about one’s own

personality traits influences their theory on the malleability of product traits. In study 1, they show that incremental theorists are more accepting of brand extensions or repositioning. In study 2, they show that acceptability of a brand extension is based on the implicit theory that the consumer has and not on the number of brand extensions generated. In study 3, they examine boundary conditions for how far incremental theorists are willing to stretch a brand's traits before they experience a violation of their implicit theory. Their research presents an alternative view to product adoption by suggesting that early versus late product adoption may not be as much a function of risk tolerance as it may be of the implicit theory (incremental or entity) that consumers carry about their personality. Specifically, those with an incremental theory are more willing to adopt new products due to the malleable view they have of product traits.

EXTENDED ABSTRACTS

“Implicit Theories: Implications for Consumer Behavior”

Carol S. Dweck, Stanford University

My research on implicit theories has demonstrated the power of simple beliefs to affect people's judgments, motivation, and behavior. In this talk, I will review past work on implicit theories, I will present new work (not yet published), and I will describe implications for consumer behavior. The implicit theories I have focused on relate to whether individuals believe that human qualities are fixed or malleable. An “entity” theory posits that human traits, such as intelligence or personality, are immutable entities: Each person has a certain amount of intelligence or a certain personality and cannot do much to change it. In contrast, an “incremental” theory rests on the idea that human traits can be developed: Everyone can take measures to increase their intellectual or social abilities.

What is the impact of these implicit theories? The research shows that they affect two broad classes of phenomena. First, implicit theories affect the personal goals people pursue and, second, they affect the judgments and decisions people make about others. I discuss each in turn.

Self-Theories

It has been consistently shown that when people hold an entity theory, their primary goals revolve around *proving themselves*. In other words, if you only have a fixed amount of competence, then you will be invested in documenting its adequacy. Entity theorists may reject valuable learning opportunities—even at great risk to their future success—if there is a danger of making errors or revealing a deficiency. They may also give up readily in the face of setbacks, worrying that the setback reflects on their ability. In contrast, when people hold an incremental theory, their primary goals revolve around *improving themselves*. For them it is not about presenting and glorifying, but bettering the self. As a result, they welcome challenges and see errors and setbacks as a natural part of learning.

In several new neurophysiological studies, we monitored people's brain waves (ERP: event-related potentials) as they worked on a task. We found that entity theorists really harnessed their attention (and showed strong reactions) to information that told them whether their answers had been right or wrong. Once they knew that, they had little interest in further information. In contrast, incremental theorists paid most attention to information that taught them something new.

Perhaps most important, we have shown that implicit theories can be primed or changed—and when they are, motivation and

behavior are changed as well. That is, when people are led to believe that an ability can be developed, they become motivated to do so, but when they are led to believe that the ability is carved in stone, they simply want to show they already have it.

Implications of Self-Theories for Consumer Behavior

This work on self-theories has a number of implications for marketing and consumer behavior. First, it suggests that entity theorists are more likely to seek status, popularity, and the appearance of competence through their product purchases—brand names and the status of other product users will matter more to them. In contrast, incremental theorists will seek growth and will favor products that foster self-development. In line with this, the work also suggests that if a product's appeal will be mostly for entity theorists or for incremental theorists, then messages may be best communicated by inducing an entity or incremental theory mindset at the start of the message. If a product requires a period of learning (as did, for example, the Nordic Track exercise machine), entity theorists may too quickly conclude they are incompetent at it and may reject the product. In short, individuals with different implicit theories are looking for different things, and messages or products that match their mindset will be processed and reacted to preferentially.

Theories About Other People

When people believe that human qualities are fixed, they seek to judge those qualities in others—in other individuals and in other groups. Moreover, they believe that these fixed traits are readily apparent and easy to judge. As a result, entity theorists form rapid judgments—and stereotypes—that are hard to overturn. In contrast, incremental theorists, not believing in fixed traits, form their impressions over time, taking account of the situation and readily updating first impressions in light of new information. Moreover, they are more impressed by people who gain competence over time than those who start off with competence but don't use it.

New research, for example, shows that entity theorists are far more likely to fall prey to the “fundamental attribution error.” When forming an impression of a new person, they are much less likely to take account of the situation the target person is in and much more likely to think the behavior reflects underlying traits. In contrast, even when under cognitive load, incremental theorists factor the situation into their judgment of the person.

Implications of Theories About Other People for Consumer Behavior

Because entity theorists make rapid and rigid judgments, their first impression of a product or a marketer are paramount. A negative impression will be hard to overcome. However, this also means that once a positive impression has been made, entity theorists may be more loyal to the product and to the marketer. This also suggests that attaching a star, an authority, or a high status individual to a product will affect entity theorists' judgments more. They will invest these individuals with more credibility than will incremental theorists, and will also desire the products they think these individuals use. More compelling to incremental theorists would be individuals who have stretched, struggled, and overcome obstacles, for it is these people that they hold in higher esteem, and they are likely to attach more credibility to their testimonials.

In summary, implicit theories tell us a great deal about people's motivation and decision processes, and hold promise of revealing much about consumer behavior.

“Revising Negative Initial Judgments of Salespeople: The Role of Implicit Theories in Overcoming the Perils of Active Listening”

*Subramanian Sivaramakrishnan, University of Manitoba
Harish Sujan, Tulane University
Mita Sujan, Tulane University*

Consumers often cope with persuasion attempts by careful message and source scrutiny, active counterargumentation, or source derogation. Such coping strategies require the consumer to be an “active recipient” of the persuasive information being presented while attempting to evaluate the persuasion agent. For example, during a retail encounter, a consumer may ask the salesperson questions about the product while simultaneously trying to assess whether the salesperson is trustworthy or is merely trying to make a quick sale. Research on making judgments and judgment revision suggests that when the consumer is an active recipient of the information, versus a passive recipient, the information is more likely to be utilized in making judgments due to greater comprehension and/or elaboration (Greenwald and Leavitt 1984; Petty and Cacioppo 1986). However, there is also research that points to the contrary. Krugman (1965) suggested that actively processing television commercials results in counterargumentation and hence, less persuasion. Gilbert, Pelham, and Krull (1988), in the context of person judgments, demonstrate that counterargumentation is not necessary—even simple active listening (which they argue causes cognitive busyness) results in perceivers lacking the cognitive resources to use the information. More recently, research by Campbell and Kirmani (2000) and Johar and Simmons (2000) also concur with the finding that when cognitive capacity is constrained, it prevents integration of the information in the judgment process, although the information may be encoded.

In this research, we identify contingencies under which cognitive busyness produced by a questioning mindset is indeed debilitating for making accurate judgments on the source of the persuasive message. After establishing that a questioning mindset causes cognitive busyness, impairing the ability to revise initial judgments, we study two further issues: 1) ascertain for which individuals a questioning mindset is indeed debilitating. Specifically, we isolate lay theories of people’s personality change (Dweck 1996) under which cognitive busyness indeed impairs (does not impair) judgment, and 2) examine whether information signals (Lorch Jr. and Lorch 1985) enable judgment revision based on information for those who hold an entity theory of personality change that prevents them from revising.

In the context of a customer-salesperson interaction, we examine consumers’ revision of the initial judgment of a salesperson whose behavior is inconsistent with the initial judgment. In study 1, we establish that a questioning mindset results in cognitive busyness, thereby rendering consumers unable to integrate information pertaining to a negatively stereotyped salesperson’s positive behavior to revise their initial impression of him/her. In study 2, we show that those consumers with an *incremental* theory of personality (a belief that personality is not static and is changeable) are able to overcome the debilitating effects of cognitive busyness and integrate information on the salesperson’s behavior for judgment revision whereas those with an *entity* theory (a belief that personality is fixed and difficult to change) are unable to. In this study, we argue that when the initial impression of the salesperson is malleable (incremental theory), judgment revision requires fewer cognitive resources allowing incremental theorists to overcome cognitive busyness to revise their judgment. In study 3, based on research by Lorch Jr. and Lorch (1985) and Plaks et al. (2001), we show that when consumers are provided information signals in the form of

pointers for questions to ask the salesperson, it encourages processing the sales pitch and makes the stereotype-inconsistent information explicit, enabling judgment revision even among cognitively busy entity theorists.

In the context of implicit theories, this paper makes two important contributions. First, it has been argued that actively processing persuasive information can result in the lack of integration of the information into judgment (Gilbert, Pelham, and Krull 1988; Johar and Simmons 2000; Krugman 1965). We demonstrate that this depends on the malleability of the initial judgment; when the initial impression is malleable due to an incremental theory of personality, integration is possible. Second, we extend research by Plaks et al. (2001) by demonstrating that when consumers are presented with information signals in the form of pointers for asking questions, even cognitively loaded consumers with an entity theory of personality can integrate information and revise their initial judgments.

“The Role of Implicit Theories in Brand Extendibility”

*Eric Yorkston, Texas Christian University
Joseph Nunes, University of Southern California
Shashi Matta, Ohio State University*

For decades, consumer behavior research has devoted attention to the set of human characteristics people associate with brands, such that the construct of *brand personality* has begun taking on a life of its own. As researchers moved away from the historic conceptualization of the self possessing a stable set of personality traits, support for brand personality theories continued to amass. Recent work now often takes into account the notion of malleable or multiple self concepts. In her work on the self-expressive role of brands, Aaker (1999) argues that different situations lead consumers to evoke different self-schemas that vary in their associated personality traits. While demonstrating how usage situations, brand personality and self-concept interact, Aaker (1999) accepts the brand’s traits as fixed while considering the consumer’s malleable. There is evidence to suggest, however, that consumers make inferences as to the malleability of the brand, suggesting that the traits associated with a particular brand might be more flexible than previously thought.

Research in social psychology supports the notion that people possess lay theories about the malleability of their own personality traits and that these “implicit theories” affect the inferences made when judging the traits of others (Dweck, Chiu, and Hong 1995). Therefore, an individual’s predisposition to view his or her own personality as fixed or malleable as well as external prompting will affect how fixed or malleable the personality of another person, or even a brand extension, is subsequently judged. Accordingly, the ability for a brand to assume the appropriate traits for a particular situation should depend on the consumer’s implicit theory of the self and whether it is fixed or malleable.

In study 1, we find evidence suggesting that one’s implicit theory of the self applies to brand personality such that, the more malleable one sees an individual’s traits, the more likely they are to see a brand as being malleable, reflected in the endorsement of a greater number of brand extensions. The results provide evidence that a brand’s traits can be affected by implicit theories with regards to the fixedness or malleability of one’s traits.

Study 2 demonstrates that the effects of implicit theories affect beliefs about the underlying nature of brands (personality traits) and do not trigger a general belief that things can “change”. In other words, we sought to exhibit how implicit theories operate by affecting beliefs in a brand’s traits just as they affect beliefs in individual’s traits, rather than by affecting beliefs in a brand’s

ability to alter its physicality. In doing so, we reveal how implicit theories, studied exclusively to date in the domain of human personalities, affect how individuals perceive brand personalities. As such, we add to the growing literature on brand personality and offer a new perspective from which to examine the fit of a brand extension.

In study 3, we manipulate rather than measure people's implicit theories of the self. We find that by activating generalized trait beliefs we can affect how malleable consumers believe brand can be. This has important implications for marketing managers, as persuasive communication can either lead consumers to believe that their brand is more malleable or more fixed with respect to traits.

In study 4, we explore what happens when people's implicit theories are violated. Plaks, Grant, and Dweck (2005) have found that implicit theory violation creates a "warm state," wherein individuals are motivated to protect their activated theory in the face of disconfirming evidence. Violations should therefore engender negative attitudes towards the extension that goes too far, as attempts to maintain cognitive consistency between a parent brand and its extension are thwarted. Although incremental theorists are more willing to stretch a brand's traits than entity theorists, we've seen evidence in the first three studies that incremental theorists will not stretch traits indefinitely and too far of a stretch should violate their implicit theory.

This research presents an alternative view to product adoption by suggesting that early versus late product adoption may not be as much a function of risk tolerance as it may be of the implicit theory (incremental or entity) that consumers carry about their personality traits. Specifically, those with an incremental theory are more willing to adopt new products due to the malleable view they have of product traits, in comparison to those with an entity theory.

Minority Consumers' Experiences of Marketplace Discrimination in Services: A Conceptual Model of Antecedents and Customer Outcomes

Gianfranco Walsh, University of Koblenz-Landau, Germany

Donna McGuire, University of Strathclyde Business School, Scotland

ABSTRACT

Marketplace discrimination is common in commercial transactions, and is mainly experienced by members of ethnic minorities. However, discrimination can be attributed also to age, gender, physical ability, and sexual orientation. Drawing on Social Identification Theory, marketplace discrimination is conceptualized as an outcome of service employees distinguishing between customers in terms of in-group and out-group members, whereby the latter are perceived more negatively. The aim of this research is to develop a conceptual model that links perceived marketplace discrimination to potential determinants as well as customer outcomes. Based on a review of the literature and depth interviews, specific research propositions are developed that offer insight into the types of discrimination members of different minority groups experience and of their coping strategies.

INTRODUCTION

The probability of discrimination in any given service encounter is roughly one to five percent (Siegelman 1998). However, the important question of how consumers perceive and cope with the internal strains produced by discrimination remains an under-investigated topic in service marketing. This study has several goals. First, drawing on Social Identification Theory, we attempt to explain why marketplace discrimination occurs in service-delivery contexts. Second, potential antecedents of discrimination are discussed. Third, we examine which disadvantaged groups experience marketplace discrimination and pay particular attention to consumers with limited physical ability and gay and lesbian consumers. Fourth, based on the review of the literature and the qualitative survey a conceptual model (see Figure 1) is proposed that integrates determinants and consequences of marketplace discrimination, and key propositions are suggested.

BACKGROUND

By drawing on Social Identification Theory (Tajfel and Turner 1986) it is possible to explain *why* marketplace discrimination happens. Identification, which can have a powerful influence on behavior, is viewed as the perceived belongingness to a group of which the person is a member, and with which a person identifies. Social identity consists of salient group classifications, usually based on such observable traits as gender, race or demographic categories (Bhattacharya et al. 1995), but can also include factors such as religion, physical ability, and sexual orientation. Social Identity Theory generally suggests that individuals are alert to out-group members and will evaluate in-group members (people perceived as members of the same category as self) with an in-group bias and more positively than out-group members of a different category (Deshpandé et al. 1986). When processing group-related information, people tend to classify others on the basis of their similarities or dissimilarities with the evaluator (i.e., service employee) and thus create an in-group and an out-group when serving customers. Similarly to research on customer outcomes, *antecedents* of marketplace discrimination have received limited attention. It is likely that two basic types of determinants can cause discrimination, employee- and firm related determinants. Two types of variables appear relevant in regards to employee-induced customer discrimination, employee attitudes/tolerance and demographics.

Firm-related determinants include; an employee's customer orientation and job satisfaction as well as the existence of service scripts. We suggest the following key antecedents-related propositions.

- P1. The more positive attitudes a service employee has toward minority consumers and the more tolerant he/she is, the less likely will he/she engage in discriminatory behavior.
- P2. Service employees' level education is negatively related to customers' perceived discrimination.
- P3. Service employees' age is positively related to customers' perceived discrimination.
- P4. Service employees' gender is related to customers' perceived discrimination, such that female employees are less likely to engage in discriminatory behavior.
- P5. Service employees' customer orientation is negatively related to customers' perceived discrimination.
- P6. Service employees' job satisfaction is negatively related to customers' perceived discrimination.
- P7. The restrictiveness of service scripts will have a negative impact on customers' perceived discrimination.

METHOD

Data for the present study were collected through forty depth interviews with consumers from disadvantaged groups (ethnic/immigrants, women, senior consumers, consumers with disabilities, and gay and lesbian consumers). The interviews were conducted from the perspectives of the participants, i.e., had a phenomenological focus (Thompson et al. 1989). During the interview informants were encouraged to talk about as many negative service experiences, that they had experienced first-hand, as they wished. The researchers asked informants to talk about what they thought was intentional and unintentional discrimination. A topic list and interview guideline was created which outlined a broad agenda to be followed during the interview.

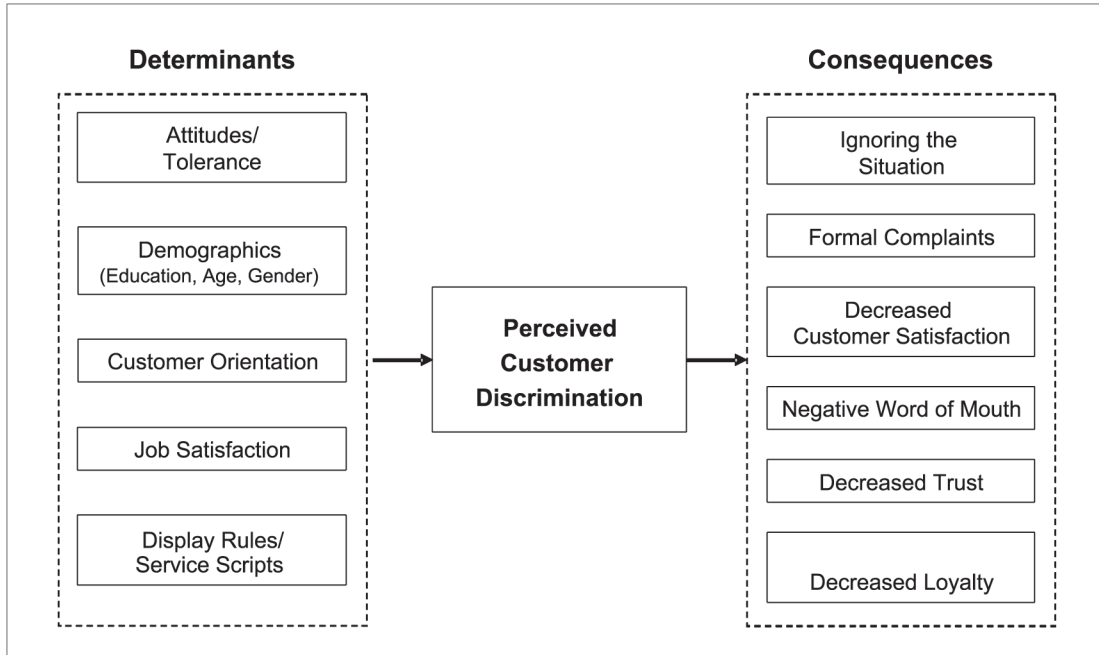

FINDINGS AND DISCUSSION

All informants stated that they experienced discrimination at least occasionally. During the interviews informants were also instructed to talk only about coping strategies in relation to perceived discrimination. The individuals interviewed all employed a variety of coping mechanisms. The most common responses were; 1) Ignoring the situation, 2) Formally complain, 3) Decreased satisfaction, 4) Engage in negative word-of-mouth, 5) Decreased trust, and 6) Decreased loyalty.

Through this research, we demonstrate that several disadvantaged groups experience marketplace discrimination in service establishments. Using Social Identification Theory, we argue that service employees perpetrate marketplace discrimination against consumers from minority groups because they view them as dissimilar, and implicitly inferior, to themselves. By exploring potential determinants and identifying consequences of marketplace discrimination through depth interviews we can propose a conceptual model which is shown in Figure 1.

Our conceptual model and the propositions derived from it support the notion that perceived discrimination is a relevant phenomenon. Disadvantaged or minority customers, who experi-

FIGURE 1
Conceptual Model

ence marketplace discrimination, will become frustrated and dissatisfied, and take their business to other service firms. An implication of our findings is that service firms need to find means which allow them to identify marketplace discrimination in their organization and to rectify the problem. Service firms could use mystery shopping to find out how well their employees comply with company procedures, ethics policies, and whether they display discriminatory behavior toward minority consumers.

Future research could investigate if our findings can be confirmed across different service types. When we interviewed informants we did not ask them to talk about their experiences in a specific service context. Using a service taxonomy, marketplace discrimination could be examined in low, medium, and high interaction services. This would allow researchers to detect context-specific discrimination. Finally, this study examined only one side of the service employee-customer dyad. All of the findings are based on the self-reported perceptions of the customers. Ideally, service employees would have been questioned to ascertain that their (discriminatory) behavior was deliberate.

Brand in the Hand or Sand in the Hand? A Contextualized Account of Adolescents' Mobile Phone Consumption

Ian Grant, University of Strathclyde, Scotland

Stephanie O'Donohoe, University of Edinburgh, Scotland

ABSTRACT

This paper contributes to the movement away from the "solitary subject", offering a contextualized account of adolescent experiences of mobile phones. It reports on discussions with sixteen small groups, informed by phenomenological principles. The antipathy towards commercial applications suggest that the technology brings marketers no closer to this elusive target. This is attributed to the roles it plays in the social lives of adolescents: to include and exclude, to organise, experience, re-live, and redefine everyday experiences. Young people's relationships with practitioners were more akin to the elusive "sand in the hand" than the hoped for "brand in the hand".

INTRODUCTION

The mobile phone has had a profound effect on social behaviour over the last decade (Pedrozo and Wilska 2004), quickly becoming essential to contemporary living. Mobile phone penetration was recently estimated at 89% of all households in the UK (Office of Communications 2005), with almost universal use by adolescents beyond the most deprived of communities (Harper and Hamil 2005). Indeed, by March 2006, there were on average 103 mobile phones in use for every 100 people in Western Europe (Ahonen 2006). Given such high levels of penetration, and the convergence of audio, video, and data services within a single device, Steinbock (2005) echoes the belief of Anssi Vanjoki, executive vice president of Nokia, that mobility will be the "glue" binding different media together. However, consumer acceptance will play at least as significant a role as technological capabilities in shaping the future of mobile communications, and this highlights the need for consumer research in this field. Indeed, as Agnelli *et al* (2004:1) observe,

"The adoption of mobile communication devices has been as fast as subtle, as radical as invisible: in the past ten years, a number of battery powered devices, unconceivable only a few years before, have come to constitute such an intrinsic part of everybody's life (at least in first world countries) that it has become difficult to imagine a world without them. The consequences of this worldwide invasion have still to be properly mapped and understood."

Young people's consumption of mobile phones merits particularly close attention. Adolescents are highly literate consumers of media and advertising in general (Ritson and Elliott 1999), and have been dubbed the 'electronic generation' in light of their considerable exposure to, and consumption of, new forms of media (Buckingham 2002). For these reasons, the 'youth market' has become extremely attractive to mobile phone marketers, and mobile phones are increasingly seen as an exciting medium for targeting and interacting with young people (Rohm and Sultan 2005).

Research on mobile phone consumption is still in its infancy, however, with many studies treating consumers as "solitary subjects" (Ritson and Elliott 1999:260), isolated from their social and cultural contexts. This is particularly problematic when the focus is on young people, whose primary use for mobile phones appears to be connecting with and mobilizing peer networks (Berelowitz

2005). In this paper, we offer a critical review of existing research in this area, particularly amongst young people, and present findings from an interpretive study of British adolescents' consumption of mobile phones in the context of their everyday lives.

RESEARCH ON MOBILE PHONE CONSUMPTION

Research to date has largely been influenced by individualistic theories concerning personal demography, lifestyles and motivations for media use. Researchers have sought to link mobile consumption with age (Mante-Meyer and Haddon 2001), gender (Igarashi *et al*. 2005), social background and technological literacy (Skog 2002), and lifestyle traits (Leung 1998). Studies of user motivations are typically grounded in uses and gratifications theory, assuming a positive mediated experience, and an active, goal directed orientation. Leung and Wei (2000), for example, identified seven gratifications: 'fashion/status,' 'affection/sociability,' 'relaxation,' 'mobility,' 'immediate access,' 'instrumentality,' and 'reassurance'.

Recent studies into mobile consumption point to more negative consumer experiences, in terms of personal concerns and relationships with external agencies. Problematic issues identified include the potential for increased surveillance and the difficulties of drawing boundaries between spaces for work, leisure and consumption, or between the private and public domains (Dholakia and Zwick 2003; Agnelli *et al*. 2004). Feelings of anxiety and ambiguity (Moisio 2003) have also been reported, as has irritation at commercial communications (Monk *et al*. 2004).

Adopting a personal-cognitive perspective, many previous studies of mobile phone consumption fail to acknowledge the wider socio-cultural context of consumption practices (Holt 1995). Indeed, social theorists such as Geertz (1983) have argued that conceptualizing practices as contextualized, local understandings offers a richer understanding of phenomena. Given the nature of mobile phone use, it is surprising how few studies have recognized mobile consumption as contextually influenced, socially constructed and at times contradictory in nature. One exception to this was Moisio (2003), who discussed the irritations, anxieties and ambiguities surrounding mobile consumption.

A contextualized understanding of mobile consumption is increasingly important as mobile devices attract increasing interest from commercial advertisers: mobile interactivity, personalisation and timeliness provide powerful incentives for marketers seeking new forms of engagement with consumers (Rohm and Sultan 2005; Spurgeon 2005). As Morris (2000:49) has observed,

"The old advertising mantra of creating relevant, distinctive and involving messages... was only ever applied to the *content* of the advertising. In the new media world it will have as much to do with the *context* of the message and how the connection is made with the target".

Practitioners and academics seeking to improve advertising media effectiveness have long studied media context (Dahlén 2005). Unfortunately, most studies continue to focus on "the semantic context that surrounds the message rather than the social context in which the reader or viewer (of the advertising message) is located" (Ritson and Elliott: 1999: 260), privileging the cognitive

interpretation arising from a particular context rather than the socio-cultural interplay of medium and environment.

Furthermore, many studies of mobile phone use aim to improve commercial communication effectiveness rather than to deepen our understanding of consumption phenomena. Research is needed that recognises consumers as “interpretive agents” in this context (Arnould and Thompson 2005), allowing them to voice potentially critical accounts of mobile consumption experiences, not least as a counterpoint to the existing literature which is often practitioner-orientated and largely celebratory.

TOWARD AN EXPERIENCE-BASED UNDERSTANDING OF ADOLESCENTS’ MOBILE PHONE CONSUMPTION

In this paper, we seek to explore adolescents’ mobile phone consumption experiences, both positive and negative, as they are woven into rather than separated from their social and cultural context. The paper draws on a broader study which aimed to explore young people’s relationships with contemporary forms of media in the context of their everyday lifestyles. Mobile phone consumption was therefore never isolated from other aspects of their lives, including other forms of mediated activity.

Thompson *et al* (1989) argued that an approach based on the principles of existential-phenomenology allows for analysis of context-dependent, ‘lived-in’ experiences; researchers ask participants to articulate their own “personalised understandings of consumption phenomena” (Thompson and Haytko 1997: 19). This implies that any meanings derived from an experience are always situated in their current experiential context. For this study, experiences of mobile consumption were recounted in the context of adolescents’ everyday lives beyond school hours, in order to provide thematic descriptions of the consumption phenomena in question (Thompson *et al* 1989: 137). Our focus on adolescents reflects not only their status as media- and marketing- literate (Buckingham 2002) and as heavy, enthusiastic and sophisticated users of mobile phones (Harper and Hamil 2005), but also their role as barometers of social change, impacting on society and surrounding culture (Widdicombe and Woffitt 1995). In a new media context, Tapscott (1998) emphasized that young people are often the opinion formers and market mavens in markets for cultural commodities such as mobile phones, mp3 players and games consoles. More broadly, this age-group merits particular attention since the transition from adolescence to adulthood leads to the constant questioning and development of identities, behaviors, attitudes and values (Roth and Brooks-Gunn 2000), with attendant implications for consumption practices.

RESEARCH METHOD

In keeping with phenomenological principles, this study used a series of mini group interviews completed by Spring 2004 with adolescents in the east coast of Scotland. Three schools were selected on the basis of geographic area and socio-cultural background, incorporating McLoone’s (1997) deprivation criteria; the resulting sites were a rural state school, a (less affluent) suburban state school, and an urban fee-paying school with a more affluent student profile. Across the three schools, a total of forty five 14-17 year-olds took part in the study. Naturally forming ‘friendship triads’ were created by asking participants to select friends they would like to join up with. Such mini groups provide for more intimate discussion, with each individual given greater space to express their ideas (Krueger 1994). Sixteen groups were recruited, reflecting a range of social background, age, gender and attitudes towards new media.

Each group met with the first researcher three times over a period of several weeks. The first meeting served as an ice-breaker and orientation to the study. Each participant was at that time given a disposable camera, and asked to take photographs of a week in their lives. The second meeting involved participants talking about these photographs; this autodiving or photo diary approach (Heisley and Levy 1991) allowed them to locate mobile phone consumption in the context of their everyday lives, and offered them time and space to reflect on their own experiences and interpretations of the world (Russell and Tyler 2005). In the final meeting, participants talked about their experiences of “new” media and their relationships with brands and marketing communications.

Once transcribed, the data were analysed using phenomenological interpretation as advocated by Thompson *et al.* (1989). The first stage sought an understanding of each transcript, identifying broad themes emerging out of the photodiary discussion and media consumption transcripts. Salient themes, recurring ideas and patterns of beliefs linking people and cultural setting together were identified. A second stage then involved relating patterns of commonality between different transcripts and seeking different interpretations of similar phenomena. Wittgenstein (in Thompson *et al.* 1989) referred to this as ‘seeing as’-identifying similarities or differences in how participants experienced a situation.

RESEARCH FINDINGS

Kline (2004) argued that patterns of contemporary media use are diverse but intrinsically bound together by lifestyle and cultural forces. Throughout these research discussions, it was evident that mobile phones were an interwoven, omnipresent (Kopomaa 2000) and normalised (Livingstone and Bober 2004) aspect of adolescents’ everyday lives. Indeed, mobiles were taken for granted to such an extent that few participants even considered taking photographs of them. The exception was the emerging generation of multi-media phones which at the time of the fieldwork had novel content features such as photo messaging and enhanced WAP access.

It should not however be assumed that mobile omnipresence translated into a stream of positive experiences. In and out of home, young people’s experiences were both positive and negative, contingent on the socio-cultural context rather than the attributes of the consuming object. Four themes emerged from the analysis, each showing the interaction between context and consumption.

Social Engineering: Including and Excluding

For most adolescents, their mobile phone represented a constant companion, a social necessity that rarely left their side:

A: Mine is on 24/7 and through the night and everything and if it’s charging, it is still on. I leave it on all the time. I know a lot of people that do that, just in case something happens... (female, 14, suburban state school)

Frequent texting, sometimes almost continuously, was reported from very early in the morning till late into the evening. Nightly sessions of texting back and forth were not uncommon, characteristic of Pedrozo and Wilksa’s ‘addictive texters’. For A., having a phone constantly at her side was as much about the fear of missing out as about social gratification. The phone had become an essential aid for negotiating everyday social relations, an ‘always-on’ link to closest friends and wider peer networks. The dynamism of youth culture requires constant synchronisation between peers (Tully 2002). In this sense, mobile phone consumption enhanced

social relations, providing the stimulus to foster and sustain networks of relationships.

Social engineering through mobile consumption had differing consequences dependent on geographic locality. For those living in more rural contexts, mobiles were used to maintain social connections when distance was prohibitive. The ability to exchange gossip and stories at any precise moment meant that texting was often preferred to cheaper options such as the internet or landline phones (which would typically be paid for by parents). It also acted as a ready replacement for getting together. As two boys explained:

Researcher: Tell me why it is important to you then?

M: Because I can just talk to my friends and text my friends

A: It is a way of going out without going out

M: Yes, it's a way of going out with your friends whilst you are in your bedroom

(males, 14, urban fee-paying school)

This example illustrates how mobiles have further contributed towards the media richness of 'bedroom culture' (Brown *et al.* 2004), encouraging adolescents to retreat further into their own personalised spaces, safe in the knowledge that their social participation can continue whilst at home. This suggests that new media forms are creating new patterns of socialisation which no longer rely on physical presence. This was not restricted to cases where there were significant geographic barriers to meeting, however: one 14 year-old girl explained how one of her favourite activities on the way home from school was exchanging texts with her cousin-even though she lived in the same street and shared a bus home. Even spending time with "best friends" did not preclude being in mobile contact with others. S. for example, could not imagine spending any time away from home without her mobile phone as this provided her with her virtual link to a wider network of friends, and if needed, parents.

S: ... well most nights when I go out, I usually go down to A.'s for a cup of tea. I usually go to her house for a cup of tea and then into her back garden for a fag basically, most nights, because no-one in her house smokes like...sometimes we go into the kitchen and get the chocolate biscuits out when I'm starving ...

I don't go anywhere without my phone, it's always next to me (female, 15, rural state school)

As Moio (2003) points out, mobile phone consumption can also have negative consequences. Ling (2000) suggested that from mid-teens onward, a minority of young people are ideologically opposed to mobile consumption, exhibiting cynicism towards such status-driven attractions. The mobile phone can therefore be the catalyst for rejecting social conformity. In this context, one group was keen to explain that although they owned mobiles, they were not "obsessed" by them, and had reservations about their social impact:

Researcher: Tell me about why you haven't taken pictures of mobile phones then?

B: I don't have one but my brother lends me one

S: Mine is about sixth hand, I do use it sometimes when we go out to keep in contact with my friends

Researcher: Describe how important it is to you...

E: We aren't obsessed with it

S: E. used to be obsessed with it!

E: I wasn't obsessed with it but I realised that I don't really need to use one now. But we wanted to have a phone because

my brother is always on the internet. Or his phone is engaged.

We can hardly ever get through

E: But I think phones are anti-social... because everyone that has got a phone, is just sitting there, speaking with the phone.

I get annoyed when T. always has his on. His is a video camera on his phone, which is quite sad that people can't live without their phone. (mixed group, 16, rural state school)

For this group of older adolescents, mobiles represented an almost unwanted necessity, at odds with their identity and underlying values, and perhaps even stimulating a search for alternative ways of expressing their sense of self. They also expressed concern about using mobile phones in company. As Agnelli *et al.* (2004) observe, mobile phone etiquette is not particularly well established. This was the only group which appeared troubled by such matters however.

Social Facilitation: Organising, Enhancing and Re-Living Experiences

Mobile phones facilitated the organisation, enhancement and re-living of cultural experiences. Two contrasting examples show how cultural context influenced out of the home mobile consumption. The first example relates to the use of mobiles to organise the activities of larger groups of adolescents, referred to by Petersen (1996) as 'gangs' or 'cliques'. In this case, adolescents from a radius of over fifty miles got together for a snowboarding 'expression session' at their local dry ski slope (Hillend):

D: This is us on snowboards [looking at photograph]. We hike the jump at Hillend, getting the toll, to hike up three hundred meters up the slope and jump

Researcher: Tell about who goes to these sessions?

D: Anything up to fifty people really. I mean there's a lot of people you don't know as well who come up for it. Maybe twenty you know by name. We go on a Friday night after school...

Researcher: ...so how do such evenings happen?

D: Well, we all exchange numbers and when someone makes the first call, well it just goes from there. It's a spontaneous kind of thing. (male, 15, urban fee paying school)

Such sessions allowed adolescents to demonstrate their skill and creativity in social, often sport-related contexts, as members of loose 'subcultural' or tribal groupings (Maffesoli 1996), bonded together, even temporarily, over common interests. Sometimes, groups could be half a dozen; other times almost one hundred people strong, depending on formality of arrangement and chosen location. As D. suggests, mobiles played a peripheral role in the actual event but an essential one in organizing it. D. went on to discuss how on the way home, participants constantly exchanged texts to re-live and dissect the evening's experiences. This example shows how intrinsically linked mobile consumption is to adolescents' out of home experiences. Gillard *et al.* (1998) referred to this constant adjustment of everyday activities as 'micro-coordination', using the flexibility of mobile texting to respond almost immediately to an ever-changing cultural context. A more extreme example in which mobiles have moved from the periphery to the forefront of cultural experiences as been the 'flash-mobbing' phenomenon, the orchestrated formation of apparently 'spontaneous' crowds of people through their mobiles.

A second example involved the use of camera phones to disseminate visual images of cultural experiences. Images taken from a musical concert were swiftly disseminated to best friends and sometimes wider networks of peers, even before the event had

finished. Such practices show vividly how new forms of media such as camera phones extend cultural experiences to a wider audience, offering visual as well as verbal exchange. Such practices were conducted with complete disregard for any legal contraventions; the risks involved might even have heightened the consumption experience. Furthermore, they appeared to provide an outlet for asserting peer group credibility, contributing to an enhanced sense of self-identity. The subsequent texts and postings on bulletin boards continued the practice, intensifying word of mouth through either positive or negative feedback. This illustrates how new forms of media speed up and broaden the process of consumption, altering the consumption context almost instantaneously.

Social Reconstruction: Re-Defining ‘Private Space’

Mobile consumption can also be understood as a means of reconstructing social norms and space. Ling and Campbell (2006) argue that wireless communication is contributing to new spatio-temporal contexts, changing definitions of public and private space. Texting transformed what might have traditionally been considered a public place into an intensely private one:

A: You can say what you want without having to say, it’s more private. If you want to say it to someone and maybe they are in a public place, they can beep and they can read it without anybody else hearing that conversation (female, 15, suburban state school)

This can have both positive and negative consequences, depending on the nature of that communication and the impact on significant others nearby. In this research, young people valued the increased intimacy such communication allowed, enabling them to conduct social interchange in contexts that might discourage face-to-face communication. Texting in this example allowed young people to conduct social conversations in public places sometimes in close proximity to those not included-friends, teachers, or of course parents. Notwithstanding one group’s concerns about the etiquette of this, using mobiles in this way can be understood as a way of circumventing social barriers and potential embarrassment. Indeed, a recent study amongst British 11-21 year-olds found texting to be preferred over talking by phone or emailing for flirting, arranging a first date, and even ending a relationship (Haste 2005).

Mobiles also allowed young people to extend their ‘private space’ well beyond the home, safe in the knowledge that they had a tangible link back to home and their parents. Mobiles were seen an important way of increasing independence whilst maintaining a virtual connection:

A: When I go out, I always make sure I have got my phone on me, in case they need to contact me or I need to get in touch with them. It makes them feel better and I know they won’t be worrying about me (female, 15, suburban state school)

Indeed, by reassuring parents that they were always within reach, carrying a mobile phone may have allowed them to venture further afield or even stay out later.

Social Screening: Resisting the Intrusion of the Commercial Text

Adolescents recounted a torrent of negative experiences involving text-based commercial communication, both solicited and unsolicited. Even when they had granted permission, continual commercial texting built up feelings of resentment. Attempts to unsubscribe were seen as excessively complex. As J. and M

explained, commercial advertising through mobile phones were intrusive, blocking the everyday exchanges of communication between friends:

J. Because my phone only holds about ten text messages, and then you are getting sent messages from others taking up your whole box, and then you might get excited, because you think your friends have texted you, and you get this boring phone message from a company you don’t want to hear from... (female, 16, rural state school)

M: You just want to hear the voice of the person you are talking to, a mobile for me is like not receiving any junk mail or whatever or just wasting your time. Whereas I use my mobile phone to talk to my friends (male, 14, urban fee-paying school)

In general, the intensely private and time-sensitive nature of mobile communication highlighted earlier left little room for commercial communications. There were few examples of participants responding to commercially orientated communication, and these only occurred at a time and place that suited them; in this sense at least, the asynchronous nature of digital forms of media (Ruggiero 2000) such as mobile phones could work in marketers’ favour. Such positive examples, however, were far outweighed by accounts of insensitive and persistent attempts to initiate or extend relationships with young people. The concept of an active, skeptical “reader of texts” is a familiar one in traditional advertising contexts (Scott 1994), and these findings in relation to new media are consistent with other forms of consumer resistance (Holt 2002). This is not a case of pockets of resistance: most young people in this research were deeply sceptical towards attempts at mobile (and indeed internet) marketing, regarding such actions as invasive and intruding on their rights to personal privacy. Literally and metaphorically, they “rejected the text”.

DISCUSSION

In keeping with this paper’s focus on the social context of consumption, we recognise that the findings reported here are specific to a particular group of adolescents, living in particular parts of Scotland, at a particular time. Indeed, this market is so dynamic that the technical capabilities and pricing structures of mobile devices have changed considerably since these participants talked about their experiences. Nonetheless, we hope that these findings raise questions and challenge assumptions about mobile phone consumption in other contexts, amongst other groups.

Ritson and Elliott (1999) have highlighted the range of social meanings and uses surrounding British adolescents’ consumption of advertising. This study suggests that social context is also fundamental to their mobile phone consumption. In some respects, this is hardly surprising: by definition, there can be no solitary subject of mobile phones, since their key purpose is to connect people to each other. Despite this, much prior marketing and consumer research on mobile phone consumption has focused on private and intrapersonal rather than interpersonal factors.

Although the social purpose of mobile phones is self-evident, this paper highlights the different forms and meanings of social connection it offered the adolescents in this study. Mobile phones were their constant companions, but in contrast to marketers’ visions of an exciting new medium for reaching and engaging with youth audiences, participants in this study resented and resisted commercial messages intruding into the main business of mobile phones: including or excluding their peers; organising, enhancing

and reliving experiences; and redefining social spaces. This asymmetry between marketers and their young audience resonates with Gronröös's (1994) argument that if relationship marketing is to work, it must benefit companies and consumers alike. In this context, marketers would do well to reflect on the following metaphor:

"Relationships-of all kinds-are like sand held in your hand. Held loosely, with an open hand, the sand remains where it is. The minute you close your hand and squeeze tightly to hold on, the sand trickles through your fingers. You may hold onto some of it, but most will be spilled. A relationship is like that. Held loosely, with respect and freedom for the other person, it is likely to remain intact. But held too tightly, too possessively, the relationship slips away and is lost." Anonymous quotation, Thinkexist.com 2005

Commercial messages that respect the socially constructed nature of mobile consumption—and offer young consumers some form of social capital—may allow marketer-consumer relationships to bear fruit. If, however, marketers' enthusiasm for mobile phones as a "brand in the hand" leads them to grip young people too tightly through intrusive and insensitive mobile-directed messages, they may find their market slipping away like the "sand in the hand" depicted above.

These findings contribute to the 'marketplace culture' strand of consumer culture theory (Arnould and Thompson 2005), in that they illustrate how a group of adolescents "forge feelings of social solidarity and create distinctive, fragmentary, self-selected, and sometimes transient cultural worlds through the pursuit of common consumption interests..." (p.873). The centrality of social networks and consumption communities to their consumption of mobile phones resonates with Cova's (1994) argument that in postmodern societies, goods and services may be desired more for their "linking value" than their functional or private symbolic value.

Just as consumers' responses to ads cannot be determined by the texts themselves (Scott 1994, Mick and Buhl 1992), the patterns of social exchange arising from these adolescents' use of mobile phones were wider, richer, and more nuanced than could be inferred from their technical specification. This suggests little room for manoeuvre by marketers seeking to communicate with adolescents through this medium, or for researchers who examine such phenomena through the lens of the "solitary subject" rather than that of the agentic, socially situated consumer.

A Multivariate Segmentation Model of the Older UK Consumer Market

Lynn Sudbury, Liverpool John Moores University, UK

Peter Simcock, Liverpool John Moores University, UK

EXTENDED ABSTRACT

In terms of sheer size, longevity of demand, and potential profitability the older consumer market is an increasingly important one (Barak and Rahtz 1999). However, there is tendency for older consumers to be treated as a homogenous mass by marketers, despite the fact that as people age they become more dissimilar (Moschis, Lee and Mathur 1997).

Early attempts to segment older consumers tended to be based on a limited number of socio-demographic variables (for example, McCann 1974). Over time, new segmentation models applicable to older consumers emerged, but were generally industry specific (Oates, Shufeldt and Vaught 1996; Sellick 2004). Only a small number of studies, not applied to specific product categories, incorporated a variety of social, psychological and biophysical measures (for example, Sorce, Tyler and Loomis 1989; Moschis, Lee and Mathur 1997). Although these could be considered as models for segmenting the older market generally, they were all developed in the United States and there was no evidence to suggest that they had any relevance to the UK market. Therefore, this paper presents the first general market segmentation model of the older (50+) market in the UK.

As part of a wider study into the consumer behaviours of older UK adults, a self-administered questionnaire containing questions relating to socio-demographics, health, media usage, lifestyle, and a battery of scales relating to a range of psychographic, psychosocial and consumer behaviours was developed. In order to attain a sample that mirrored the older UK population in terms of age bands, quota sampling was employed. This procedure resulted in a usable sample size of 650 adults aged between 50 and 79. Using the age and consumer behaviour variables, cluster analysis was performed. The clusters were then profiled using ANOVA, Kruskal-Wallis, and Chi-squared techniques, using those variables not included in the initial analysis. The result of these processes was the identification of five clusters—or segments—that differed significantly on a range of variables. A profile of each follows.

'Solitary sceptics' comprise 5% of the market. This group are the least healthy, and prefer solitude to socialising. Their scepticism is reflected in negative attitudes towards marketing and consumerism, their lack of market maven tendencies, and their aversion to credit. They are the most materialistic and the most nostalgic of all the segments identified.

'Bargain hunting belongers' comprise 38% of the market, and is the oldest group with an average chronological age of 70, but perceive themselves to be in their early 60s, perhaps because they feel healthier than the solitary sceptics. Unlike solitary sceptics, these consumers are not particularly nostalgic, they do place great importance on a sense of belonging, and they see their friends more frequently than any other segment. This group has relatively positive attitudes towards marketing and consumerism, enjoy talking about shopping, and likes a bargain.

'Self-assured sociables' comprise 6% of the market. They are on average 59 years of age, but feel only 48. They are healthy, energetic, and would much rather go out with others than stay at home watching TV. They are self-assured because they value a sense of accomplishment and have high levels of self-esteem. As consumers, they are not particularly venturesome, are not inclined to talk about shopping, and although they are highly price conscious, they hate the idea of senior discounts.

'Positive pioneers' comprise 30% of the market, and are the youngest segment in terms of both chronological age (average 56 years) and cognitive age (average 46 years). The segment is relatively affluent, despite having the fewest empty nests. Positive pioneers enjoy energetic activities, and take the most vacations abroad. As their name suggests, they are by far the most venturesome segment, have the greatest market maven tendencies, the most positive attitudes towards marketing and consumerism, have relatively high levels of materialism and are not particularly price conscious. They are low consumers of radio, only average consumers of TV and newspapers, but show relatively high levels of magazine readership and Internet usage.

'Cautious comfortables' comprise 21% of the market, and again are a young group with an average chronological age of 58 and a cognitive age of 48. By far the most affluent segment, with the majority being empty nesters, it is also the healthiest, the most active and energetic and takes more vacations (domestic and foreign combined) than any other segment. Cautious comfortables are diametrically opposed to positive pioneers in that they are the least venturesome, and display by far the fewest market maven tendencies of all the segments. Although they are unsure about senior discounts, they have low levels of price consciousness and highly positive attitudes towards credit.

The segmentation model presented here proves that the older consumer market in the UK is not homogenous, and it has a number of advantages over existing models. First, it is more comprehensive than most of the earlier models, using more measures of chronological and cognitive age, biophysical, psychological and social aging, psychographics and consumer behaviour. Second, the model presented here is not limited to a specific product or product category, a major disadvantage of other available models. Finally, the model meets the criteria for effective segmentation in that the resulting segments are measurable, accessible, substantial and differentiable.

Given this, the model provides organisations wishing to target older consumers a starting point for a range of marketing decisions. Product policy, for example, should be informed by differences between segments in terms of cognitive age, marital status, health and fitness, and income. Pricing policy should take into account not only levels of income, but also price consciousness, and attitudes towards credit and senior discounts. Finally, targeting, positioning and advertising strategies can be improved by employing the wide range of information regarding cognitive age, values, attitudes and psychographic details provided for each segment.

Demographics in Sales Promotion Proneness: A Socio-Cultural Approach

Kyoungh-Nan Kwon, Michigan State University, USA

Yoo Jin Kwon, Iowa State University, USA

ABSTRACT

We investigate the impact of demographics (i.e., income, education, and gender) on promotion proneness and provide socio-cultural explanations why certain demographic groups are more promotion prone. Shopping is a domain where consumers accumulate their expertise and skills. To be deal prone requires not only the motivation for monetary savings but also the legitimate possession of human capital in shopping including cognitive abilities, information, and shopping experience and skills. The positive effects of education and income on the use of coupons and rebates are discussed along with the influence of gender and psychographics such as shopping enjoyment and psychological gender congruency.

INTRODUCTION

Modern America has been characterized as a consumption-oriented culture. As consumption became a focal point of American life, retailing became a critical part of the culture as well as the economy. One distinctive characteristics of the U.S. retail market is that it is extremely price promotion driven. NCH Marketing reported that in 2002, approximately 248 billion coupons were distributed and consumers redeemed 3.8 billion of these, saving more than \$3 billion (as cited in Park and Gómez 2004). Electronic methods have become popular, and channels of distribution have been diversified to include magazines, direct mails, targeted frequent shopper mails, frequent shopper cards, and online coupons as well as traditional free-standing distribution and newspaper inserts. Rebates are becoming popular among manufacturers because of the low redemption rate—only 5–10 percent—and the direct contact with consumers (“Coupons and Rebates” n.d.). On the consumers’ side, the current retail environment requires strategic decisions to maximize savings out of an attractive range of diverse sales promotions.

In response to this kind of retail market, there has been a tremendous amount of research on price promotions. Consumer behavior towards promotional deals is explained in terms of cost and benefit (Henderson 1994). Economics-based research has dealt with such benefits as monetary savings, increased quality, and the convenience of reduced search costs and factors related to the opportunity cost of time (e.g., Blattberg et al. 1978; Narasimhan 1984; Urbany et al. 1996). Psychological approaches have covered emotional incentives such as self-expression as a smart shopper, stimulation, entertainment, and social disincentives (Ashworth, Darke, and Schaller 2005; also see Chandon, Wansink, and Laurent 2000).

While economic approaches and psychological constructs are typically studied topics, socio-cultural approaches have been lacking in promotion research. Demographic characteristics including income, education, family status, gender have been researched mainly for profiling purposes. The underlying reason that a certain group of people are more promotion prone than others has not been studied. Furthermore, some general assumptions—“females are more promotion prone” or “low-income families use coupons more”—have never been empirically, consistently supported (inconsistent empirical findings are discussed in the next section.)

The purpose of this study is twofold: (1) to empirically test the impact of demographics (i.e., income, education, and gender) on promotion proneness (i.e., coupons and rebates) and (2) to provide socio-cultural explanations why certain demographic groups are

more promotion prone. The concepts of human capital and gender differences are employed to provide socio-cultural accounts of the general promotion prone behavior of American people, as part of their consumption activities, not specifically for particular product lines or categories.

We used large-scale consumer survey data from the 2003 DDB Lifestyle Survey to test the influence of demographics, which, we believe, increases the generalizability of our findings, compared to the studies using small scale consumer panel or survey data and modeling research to estimate promotion responsiveness for specific product categories.

HOMO ECONOMICUS OR THE CONSUMPTION CULTURE ELITE?

Findings in the literature have been inconsistent regarding who is more promotion prone: *homo economicus* or the consumption culture elite. Some researchers have reported that lower income/education families are more promotion prone, while some have argued that promotion prone consumers exist evenly in all income groups (Blattberg and Neslin 1990 for review; Montaldo 2006). According to the tradition of neo-classical economics, human beings behave to maximize their utilities. Economic man decides whether or not he uses a coupon and a rebate based on the monetary saving expected and the redemption costs (i.e., time and effort). Economic man will use the coupon or rebate only when the financial incentive of doing so exceeds the opportunity cost of its redemption. Redeeming coupons and rebates requires time and effort browsing newspapers and advertisements, clipping coupons, locating the particular brands promoted, and mailing proof of purchase for rebates. As the opportunity cost of coupon or rebate redemption is likely to be lower for lower income/education people, they are thought to be more prone to use coupons and rebates than those with higher income/education. The concept of opportunity cost provides a reasonable account for the higher coupon and rebate redemption behavior of low income/education consumers. In fact, a number of studies have reported a negative relationship between coupon and rebate redemption and income and education (e.g., Jolson, 1987; Moody 1987 cited in Blattberg and Neslin 1990). The familiarity of retail stores, wages per hour, free time, and the ability to organize time were also studied as surrogates for opportunity costs of coupon redemption. (Blattberg et al. 1978; Mazumdar and Papatla 1995; Narasimhan 1984 cited in Blattberg and Neslin 1990).

Empirical findings also contradict the opportunity cost-based explanation of coupon redemption behaviors. Teel et al. (1980), Blattberg et al. (1978), and Bawa and Shoemaker (1987) reported higher deal proneness by higher-income consumers. A few studies argued for an inverted U-shape effect, suggesting coupon proneness peaks at middle income (Nielsen 1985 and Narasimhan 1984 cited in Blattberg and Neslin 1990). Some studies even suggested that psychographics are much better discriminators than demographics (Rosen 1985 cited in Blattberg and Neslin 1990; Park and Gómez 2004).

In spite of a tremendous amount research done in the area of demographics and promotion proneness in past decades, there has been little effort to address these contradictory findings. Further, there have recently been dramatic changes in the retail industry, including more diverse retail channels (i.e., the Internet and cata-

logues) and a variety of deal formats and delivery methods (e.g., paper coupons, email coupons, online coupons, in-store coupons, and rebates). We propose in this study that the theory of human capital would provide possible explanations for the relationship between demographics and the use of coupons and rebates.

Gary Becker's theory of human capital allows for conceptualizing household consumption activities as another type of production. Human capital refers to people's knowledge, skills, health, or values that could yield useful outputs like any other financial or physical asset (Becker, 2002). Becker (2002) views education and job training as investments in human capital. Bourdieu's (1984) cultural capital is a similar concept to Becker's, emphasizing human competence and the effect of competence on consumption. Bourdieu (1984) maintained that the social origin that affects early socialization, formal education, and adult experience serve to form skills for specific fields of consumption. Both Bourdieu and Becker's theories posit that consumers seek an optimal level of satisfaction from the combination of their financial resources and their consumption skills (Gershuny 2000).

Human capital consisting of knowledge and skills is operationalized differently in different production activities. For instance, it is realized as employees' qualities such as dedication and motivation in human resource management (Boudreau and Ramstad 2005; Marrewijk and Timmers 2003) and as the owner's education, previous business experience, and technical skills for successful entrepreneurial ventures (Madsen, Neergaard, and Uthøi 2003). With regard to consumption, human capital refers to consumer knowledge (Ratchford, 2001). Ratchford (2001) argued that consumer choice of product, brand, or lifestyle is the most efficient one based on holdings of human capital formed by education, informal education, and consumption experiences associated with learning by doing. Studies on price search measured human capital by market knowledge, investment search, and perceived time management skills (Putrevu 1997; Urbany et al. 1996).

Efficient shopping requires human capital, including knowledge and the individual's ability to collect, process, and organize various information available in the market. In the heavily promotional retail environment, the goal of shopping is not only to acquire the right products. Consumers are driven to find the right products at "better" or "best" prices. To achieve shopping efficiency by paying lower prices requires the use of one's assets relevant to this consumption behavior. To be deal prone requires not only the motivation to save money but also consumption/shopping experiences and cognitive abilities. Price researchers have explored various research topics (e.g., remembering price, price expectation, forecast for future prices) assuming serious cognitive effort to collect and process price information. If using deals and discounts is a serious cognitive activity, then it is plausible to propose that one's level of human capital will influence promotion response behaviors. If one has a high level of human capital accumulated in his/her consumption, he or she may show greater use of sales promotions.

We propose that shopping is a domain where consumers accumulate their expertise and skills, and that deal proneness requires the legitimate possession of human capital in consumption. We measure human capital in consumption behaviors by consumers' education and price/promotion knowledge. Formal education is generally believed to improve one's cognitive capacity to seek out deals (e.g., coupons and rebates), the ability to organize, locate, and use them, and the ability to manage time, which consequently reduces the opportunity cost of promotion redemption. We believe that market knowledge, including price knowledge and exposure to sales promotion information, forms human capital that enhances consumption skills and practices. Market knowledge contributes to

reducing decision costs when shopping or deciding whether or not to participate in a sales promotion.

- H1: Promotion proneness will be greater when the level of human capital is higher.
- H1(a): Those with a higher level of education use coupons and rebates more.
- H1(b): Those with more price/promotion knowledge use coupons and rebates more.

Literature discusses the effect of income on deal proneness along the same line as the education effect. The underlying assumption is that income and education define one's social standing. Income as an index of class reflects a traditional Marxist notion. Other sociologists including Weber and Warner make social stratification multi-factored, including social honor or network (Coleman 1983; Giddens 1989). Identification of social status is now believed to be influenced by educational credentials, occupation, family history, social skills, status aspirations, cultural level, community participation, and more (Coleman 1983), because all of these factors have effects on social life. In this study, we propose an opposite direction for the effect of income from that of education (H1). We suggest that high education represents a cognitive resource to store knowledge as human capital, while high income reflects the high opportunity cost of the use of sales promotions. As reviewed earlier, a number of past researchers have argued for a negative effect of income on deal proneness from the perspective of the opportunity cost of time. We hypothesize that those with a higher income are less prone to seek out sales promotions, as the opportunity cost of time spent to respond to or redeem promotions increases when income rises. Moreover, upper-class people are generally known to value quality merchandise over low price (Coleman 1983), so consumers with a high income, those who have fewer economic constraints, will not be drawn to the sales promotion that has the financial or emotional appeal of "paying less."

- H2: Those with higher income use coupons and rebates less.

DO WOMEN LOVE PROMOTIONS?

Numerous studies have suggested that women are more promotion prone (e.g., Harmon and Hill 2003; Mazumdar and Papatla 1995). However, little research has provided explanations for this behavior. Historically, the separation of consumption from production is rooted in the Cartesian dichotomy distinguishing play from work and the private from the public in Western tradition (Firat and Dholakia 1998). Similarly, gender as a socially and symbolically constructed identity was constructed based on the meanings that were generated from the roles attributed to public and private domains, assigning female to the consumer role and male to that of the producer (Firat and Dholakia 1998). Although the roles of men and women have changed and gender coding is now less clear, the gender ideology associating the attributes of the ideal consumer with feminine traits underlies society and literature. Since Veblen (1899) accounted for the role of women in conspicuous consumption, women have been still prominent in the area of everyday consumption such as clothing and furnishing (Collins 1992).

Studies have shown that women overall use coupons more than men (Harman and Hill 2003; Mazumdar and Papatla 1995). This is partly because household purchases have traditionally been the role of women, but we argue that it is also because women are more socialized to shop and accordingly develop more experience and thus more human capital in consumption. Regardless of their personal interests or abilities, women tend to develop expertise as

good shoppers compared to their male counterparts. The difference in consumption between genders is also affected by the identity of gender with product use, for example associating attendance in performing arts events with female identity (Caldwell and Woodside 2003; Gainer 1993). We propose that different forms of consumer-oriented sales promotions are associated with different gender identities, which lead to differences in participation: price-off coupons would be identified as more female than male, because coupons have been used to promote products with female associations such as groceries. We hypothesize that manufacturer's rebates would be more gender neutral. Rebates do not appear to take on any gender identity because they are often used for sales promotion of non-grocery products. (Harman and Hill 2003).

H3(a): Women use coupons more than men.

H3(b): There is no difference in the use of rebates between women and men.

We propose that the gender effect on deal proneness could be moderated by psychological gender identity. Women who have more congruency to their gender (i.e., women who like to be perceived as feminine) might be more prone to promotions with female identity such as coupons. On the other hand, for men, those with more congruency (i.e., men who like to be perceived as masculine) would be less prone to promotions with female identity (e.g., coupons). However, we do not expect gender congruency to affect for the use of rebates, since rebates may be considered gender-neutral, as hypothesized in H3(b).

H4(a): Gender congruency will moderate the relationship between gender and coupon use: congruency in women is positively related to coupon use, while congruency in men is negatively related.

H4(b): Gender congruency will not influence the use of rebates for either men or women.

We propose that the effect of human capital would be less manifest in men than in women. For men, the effect of human capital will decrease for a type of promotion that suggests a female identity. The association between coupons and female identity is likely to inhibit men from developing their expertise in the consumption using coupons. However, we do not expect such an interaction effect for rebates, which are perceived to have a gender-neutral identity.

H5(a): The effect of human capital (education and price/promotion knowledge) on coupon use will be less for men than for women.

H5(b): The effect of human capital (education and price/promotion knowledge) on rebate use will not be different between men and women.

We also propose a moderating effect of shopping enjoyment on the gender-coupon use relation. Optimizing the use of personal resources, human beings are selective in developing their expertise. Those who enjoy shopping would locate their cognitive resources as well as other resources such as time in that domain. A significant number of studies support the role of shopping enjoyment as a predictor of shopping behavior such as price search (Putrevu and Rachford 1997; Urbany et al. 1996). These days, shopping is not a domain exclusive to women any more. We argue that shopping enjoyment could be a way to lower the socio-psychological guard that has kept men from being responsive to coupon promotions due to the female gender identity association. However, we do not

expect such a moderating effect for rebates due to the gender-neutral identity associated. Therefore, we hypothesize

H6(a): The positive effect of shopping enjoyment on coupon use will be manifest for men compared to women.

H6(b): The effect of shopping enjoyment on rebate use will not be different between men and women.

METHOD

Data

To test the hypotheses proposed in this study, the 2003 Lifestyle Survey database conducted by DDB, an international marketing communication firm, was used. The survey was sent to adult male and female members of the Market Facts' Consumer Mail Panel. The members were chosen using an annual standing-panel quota sample similar to the U.S. adult population in terms of age, gender, income, geography, and other demographics. Of 5000 questionnaires, usable responses were received from 1440 males (48%) and 1581 females (52%) (response rate of 60.4%). The data set included a wide range of questions encompassing attitudes, interests, opinions, activities, shopping channels, and media use. In the past, numerous researchers in their respective fields of advertising (Shrum, McCarty, and Lowrey 1995), consumer research (Lastovicka et al. 1999), communication (Holbert, Shah, and Kwak 2004), health (Bergman 2003), and psychology (Shah, Friedman, and Kruglanski 2002) have repeatedly used the DDB Lifestyle Survey data.

Measurement

Dependent Variables. Dependent variables include the use of coupons and manufacturer's rebates. Respondents were asked to indicate how often they "used a 'price-off' coupon" and "sent in for a manufacturer's rebate" during the past 12 months. Responses were ranged on a 7-point scale: 1. None in past year; 2. 2-4 times; 3. 5-8 times; 4. 9-11 times; 5. 12-24 times; 6. 25-51 times; 7. 52+ times.

Independent Variables. Independent variables include education, price/promotion knowledge, income, gender, gender congruency, and shopping enjoyment. The data set includes self-reported information on education, income, and gender. Education was classified into two categories: college degree or above versus less than college degree. For income, those who had annual household incomes of less than \$40,000 were classified as the low-income group¹ and those with over \$40,000 as the high-income group. The U.S. Census reported the median household income in 2003 as \$43,318 (U.S. Census 2003).

Price/promotion knowledge was measured by four items. Responses on the following two items, "I always check prices even on small items" and "I shop a lot for specials" were assessed on a six-point scale from "I definitely disagree" to "I definitely agree." Another two items asking whether they read newspaper Sunday magazines and newspaper retailer inserts were used to measure price/promotion knowledge. The global score for price/promotion knowledge was calculated by summing the standardized scores of responses to the four questions, which reflects the amount of price/promotion knowledge obtained from shopping experiences and promotion media.

Respondents were asked to indicate the degree to which the words "masculine" for male respondents and "feminine" for female

¹Household income was measured by categories. The 2003 U.S. household median income fell in the range from \$40,000 to \$49,999.

respondents describe the person they would ideally like to be. Their responses ranged from 1 "Definitely does not describe ideal self" to 6 "Definitely does describe ideal self." This item measures one's motivational level to display the traits of biological sex. Respondents were grouped into either a high or low level of gender congruency by mean split.

Two items were summed to measure the consumer's degree of shopping enjoyment: "I view shopping as a form of entertainment" and "Shopping is no fun anymore,"² which were anchored at 6 points from "I definitely disagree" to "I definitely agree." Responses to the two items were summed. Respondents were grouped into high versus low by a mean score. The correlation of the two items was .303.

RESULTS

A Multivariate Analysis of Variance (MANOVA) was conducted to test the hypotheses proposed. Independent variables and interaction terms tested in the analysis were education, price/promotion knowledge, income,³ gender, shopping enjoyment, gender x gender congruity, gender x education, gender x price/promotion knowledge, and gender x shopping enjoyment. The effects of these variables were tested on the two dependent variables, the use of coupons and use of rebates.

The analysis reveals significant multivariate effects of education, price/promotion knowledge, income, gender, shopping enjoyment, and gender x shopping enjoyment [$F(2, 2373)=7.804, p=.000$; $F(2, 2373)=85.121, p=.000$; $F(2, 2373)=38.889, p=.000$; $F(2, 2373)=34.742, p=.000$; $F(2, 2373)=14.966, p=.000$; $F(2, 2373)=6.029, p=.002$, respectively], but no significant effects of gender x gender congruency, gender x education, and gender x price/promotion knowledge. We further examined univariate results for significant effects on each dependent variable, the use of coupons and rebates.

H1(a) and H1(b) are supported, which indicates the positive effect of human capital on promotion proneness. Those with a higher level of education appear to use coupons [$F(1, 2374)=5.837, p=.016$] and rebates more [$F(1, 2374)=13.634, p=.000$]. Those who are high on price/promotion knowledge show greater use of coupons and rebates than those who are low on knowledge [$F(1, 2374)=146.388, p=.000$; $F(1, 2374)=66.991, p=.000$, respectively].

H2 posits a negative income effect on the use of coupons and rebates, which is not supported. The univariate result rather suggests a positive income effect. Surprisingly, those with higher incomes appear to use coupons and rebates more [$F(1, 2374)=28.822, p=.000$; $F(1, 2431)=68.125, p=.000$, respectively].

The gender effect reveals interesting results. Women use coupons more [$F(1, 2431)=48.038, p=.000$], while men show greater use of rebates [$F(1, 2374)=5.900, p=.015$]. Thus, only H3(a) is supported.

There is marginal support for H4(a), such that gender congruency is positively related to coupon use for women, while gender congruency is negatively related for men [$F(1, 2374)=3.093, p=.079$]. The use of coupons appears to increase as psychological female identity increases and male identity decreases. There is supporting evidence for H4(b) such that gender congruency does not appear to influence the use of rebates regardless of gender. There is no significant difference in effects of human capital (i.e., education

and price/promotion knowledge) by gender; H5(a) is not supported, and H5(b) is supported

H6(a) proposing a moderating effect by shopping enjoyment on the gender-coupon use relation is supported. As depicted in Figure 1, higher shopping enjoyment appears to lead to greater coupon use for men [$F(1, 2374)=11.566, p=.001$]. However, women's coupon use does not appear to be influenced by their degree of shopping enjoyment. A marginally significant interaction effect by gender on the use of rebates emerged. That is, the positive effect of shopping enjoyment appears to be more manifest for men compared to women (Figure 2) [$F(1, 2374)=2.754, p=.097$].

DISCUSSION

This study examined the effect of demographics (i.e., education, income, and gender) on promotion proneness. The effects of demographics were further investigated in relation to psychographic traits such as enjoyment of shopping and gender congruency. The effects of demographics were examined in terms of what benefits or costs those represent for shoppers to gain monetary savings from sales promotions. We employed the concept of human capital to explain deal proneness. Ratchford (2001) argued that the model of human capital could provide unique insights into the role of consumer knowledge, skills, and expertise in explaining various consumer behaviors (e.g., brand loyalty and lifestyles). Consumers strategically maximize consumption efficiency using their economic and human capital. Shopping for most household goods and personal goods such as clothing or food is a repetitive task. Increasing human capital is economical, because unlike economic capital, human capital is accumulated, not used up, through purchasing activities. Thus the benefits of sales promotions increase as costs decrease by accumulation of human capital. We consider opportunity cost to be a long-term effect of participation in repetitive shopping tasks.

The human capital of consumption is developed through informal training of consumption skills and updates in market knowledge in addition to investment in formal education. Previous studies of sales promotion simply treated education as the ability to organize time or reported a positive correlation without sufficient explanation (Mazumdar and Papatla 1995; Narasimhan 1984). We interpret the observed influence of education along with price/promotion knowledge as the effect of consumer human capital. In consumption, human capital is information and skills (assets) that consumers can use when they choose products or brands. Becker's theory (2002) emphasizes investment in education to form human capital. Those with higher education have a better cognitive ability to process and organize information and accordingly develop more human capital for consumption activities. We also interpret the positive effect of price/promotion knowledge as that of human capital in consumption which requires continuous updates of market information.

As a post hoc test, we ran the same MANOVA model without the income variable. Instead, income was entered as a covariate to test whether the human capital effect would remain significant after the income effect was controlled. This post hoc analysis yielded nearly identical results in terms of significance of the main and interaction factors tested. This result confirms the strong effect of human capital on proneness to promotions. The insignificant gender and human capital interaction effect also suggests a consistent positive role of human capital in promotion prone behaviors across gender.

Human capital in consumption cannot be obtained in a day. It is formed through repeated shopping experiences. In contrast to the assumption that high-class people use coupons less because of their high opportunity cost, consumers with high income are more prone to respond to sales promotions, because they have more opportunities

²Responses to this item were reverse coded in calculating the sum scores.

³Multicollinearity diagnostics were run for education and income. Tolerance, Variance Inflation Factor, and Condition Indices suggest no evidence of multicollinearity problems (Garson 2006).

for various retail experiences through which they accumulate consumption skills and information on products, brands, and promotions.

Another contributing factor to the positive effect of human capital and income, contrary to past research findings, reflects various changes brought to the retail industry and environment. Since coupons were first introduced in 1895 by C. S. Post, the producer of ready-to-eat cereals (Blattberg and Neslin 1990), coupons were distributed mainly through newspapers until a couple of decades ago. However, today those are provided in various formats (e.g., clipping coupons/rebates, stand-alone inserts, and

email coupons/rebates) through a number of distribution vehicles (e.g., in-store, print media, mass media, coupon books, and coupon/rebate Internet sites). Furthermore, due to the market power shift to retailers from manufacturers, the U.S. retail market has become extremely sales promotion-driven (Belch and Belch 2004). Because of these changes in the retail market, shopping is not a simple chore as it used to be. Maximizing consumption efficiency through various sales promotions requires market knowledge and expertise, which is a form of human capital that is accumulated over time.

Gender difference was significant in deal proneness. Women use coupons more than men do. For rebates, we hypothesized no

gender identity association. Surprisingly, men showed higher use of rebates than women. Because coupons are likely to have female identity, women use coupons more than men do. It would be plausible to interpret this result as an association of rebates with male identity. However, hypothesis testing did not find any significant effect of male gender congruency on the use of rebates. Current literature provides few explanations for men's greater use of rebates. Mazumdar and Papatla (1995) reported men are more price elastic and affected by shelf prices in stores (rather than coupons), and weigh more on acquisition value than transaction value. The perception of acquisition value may drive the use of rebates, as the redemption does not occur at the moment of purchase, unlike coupons. Therefore, men's greater use of rebates may not be the result of masculine identity associated with rebates; rather it could be attributed to their greater perception of acquisition value from rebates. However, further investigation on the gender effect on the use of rebates is suggested.

There was an interaction between enjoyment of shopping and gender. Women consistently showed high use of coupons and low use of rebates regardless of the level of shopping enjoyment. However, for men, those who enjoyed shopping more were more prone to promotions, that is, used more coupons and rebates. The effect of shopping enjoyment appears to be more prominent for men. Men might develop a tendency to respond to promotion deals, as they have emotional involvement in shopping, while women's deal prone behaviors are more consistent regardless of their enjoyment of shopping. This result could be attributed to the traditional gender role that forces women to engage in shopping related activities such as participating in promotions.

We found partial evidence for the gender congruency effect for coupons. As explained in the measurement section, gender congruency was measured by female and male traits. Another post hoc analysis revealed a significant positive correlation of shopping enjoyment to female traits. Therefore, enjoyment of shopping may be associated with female identity. The socio-cultural meaning of shopping should be further explored in relation to psychological gender traits.

A limitation of our study is the use of secondary data, which restricts the development of ideal measures, for example, for price knowledge. However, using secondary data was a way to test demographics, which was one of the main purposes of our study. The goal could not be achieved otherwise. Notwithstanding the limitation, we believe the nature of the data that were collected from an over 3000-participant sample representative of the U.S. population provides external validity for our findings.

Information Search and Consideration Set Formation in a Web-Based Environment

Girish Punj, University of Connecticut, USA
Robert Moore, Mississippi State University, USA

ABSTRACT

The research reported here attempts to understand information search and consideration set formation in a web-based choice environment. A conceptual model is used to propose hypotheses that link information search and consideration set formation with antecedent factors that are typical of online settings. A study that simulates information search and consideration set formation in a web-based choice environment is conducted to test the hypotheses. The empirical findings offer qualified support for the conceptual model. The implications of the model for understanding how consumers make choice decisions in an electronic environment are discussed.

INTRODUCTION

A recent U. S. Census Bureau report shows that e-commerce sales are growing at 28 percent as compared to 9 percent for sales through off-line retail channels <http://www.census.gov/mrts/www/ecom.html>. The rapid growth of web-based stores has created a need to understand how people search for and evaluate products while shopping online. Online settings offer consumers immense choice and great convenience, but finding products that match needs can sometimes be a *difficult* task. Consequently, most web-based decision environments now make a “smart agent” or “recommendation agent” available to facilitate the decision-making process.

Electronic decision aids can assist in a variety of decision making tasks that may be automated. For instance, an electronic decision can help people search and evaluate products by screening and/or organizing information about available alternatives. Specifically, two important functions that can be performed by such an aid are information filtration (i.e., sorting) and integration. Examples of these types of aids may be found at <http://www.amazon.com> and <http://www.expedia.com>. They enable consumers to use a preferred alternative screening strategy (e.g., select flights based on “lowest price,” or books based on “publication date” and “title words”).

Individuals may be able to screen alternatives and rapidly identify the most attractive options in an online setting. But, they may also “over-screen” alternatives (i.e., use too many selection criteria), leading to the premature elimination of attractive choices or (at the extreme) the recommendation of a null choice set (e.g., the “no matches found” message). The number of alternatives in the relational database linked to the electronic decision aid may influence the extent to which consumers are able to find alternatives that match needs. Likewise, the amount of time available may determine whether consumers are able to re-set selection criteria and re-screen alternatives to match needs. When confronted with too few alternatives and/or too much time, consumers may adopt less efficient calibration strategies by setting wider or lower attribute cut-off levels, thereby diminishing the usefulness of an online environment. Consequently, it is important to understand how two important task environment factors (i.e., number of alternatives and time available) influence information search and consideration set formation in a web-based choice environment.

CONCEPTUAL MODEL DEVELOPMENT

The proposed model of information search and consideration set formation in a web-based environment, like its traditional counterpart, assumes a two-stage decision process. During the first

stage, alternatives are searched (i.e., screened and examined) with the use of an electronic decision aid to form a consideration set. In the second stage (which is not considered here), alternatives in the consideration set are evaluated in more depth through available online information and/or through retail visits. There are several (at least seven) important influences on information search and consideration set formation in a web-based environment. These are first presented and discussed individually and then linked together in the proposed model.

First, search costs are assumed to be lower in a web-based environment. Yet, the evidence on whether consumers exploit the lower search cost to make better quality decisions is mixed. While some studies provide (limited) evidence that search is increased in web-based environments (Lynch and Ariely 2000), the dominant finding is that consumers do not search more in these settings (Haubl and Trifts 2000; Johnson et al. 2004). The divergence in findings suggests that consumers possibly encounter new (i.e., unexpected) search costs that influence the overall cost of search. One such cost in a web-based environment is the cognitive cost of using the available electronic decision aid. This cost can be viewed as being akin to the cost of controlling the information flow (Ariely 2000) or the cost of planning (Benbasat and Todd 1996).

Second, more use of digital attributes can be expected in a web-based environment, because search costs for these attributes are lower (Lal and Sarvary 1999). The distinction between digital versus non-digital information is useful for understanding search and evaluation in an online store, because it is conceptually similar to the distinction between price and quality information. Previous research has found that electronic shopping can lower the cost of acquiring quality information and thus *decrease* price sensitivity (Lynch and Ariely 2000). But, when a “smart agent” is made available price sensitivity may *increase* even though the cost of acquiring quality information may still be lowered (Diehl, Kornish and Lynch 2003). The effect can be attributed to the information filtering (i.e., sorting) capability of the electronic decision aid. Extrapolating these findings suggests that the *digital sensitivity* (which may be defined in a manner analogous to price sensitivity) of consumers is likely to be heightened in a web-based environment where an electronic decision aid is available. Consequently, the use of digital attribute information is likely to be enhanced.

Third, more preference construction is known to occur in a web-based environment. Consumers are more likely to discover new alternatives and/or attributes (Bettman, Luce and Payne 1998) as they navigate through the product assortment in an online setting. The available electronic decision aid makes it easier for consumers to control the display of information (West et al 1999) and also restructure information on available alternatives (Coupey 1994). Consequently, stimulus-based influences on preference construction (e.g., number of available alternatives, time available, etc.) are likely to be enhanced (Lynch and Srull 1982). Previous research has found that the mere inclusion of an attribute in a web environment makes it more prominent during product evaluation (Haubl and Murray 2003).

Fourth, the search process in the web environment can be expected to be iterative (Payne, Howes and Reader 2001). Research using the human-computer interaction (HCI) paradigm suggests that the search process in an electronic environment interactively combines search planning with action. Another phenomenon that suggests that search in electronic environments is more iterative is

that of “information foraging” (Pirolli and Card 1999) in which individuals move from one information resource (or “patch”) to the next depending on a cost-benefit rule. A related idea of how individuals examine information in a web environment is that of “wayfinding” (Hodkison, Kiel and McColl-Kennedy 2000) where the search process alternates between examining inter-site and intra-site information.

Fifth, more use of elimination-type screening strategies (e.g., where selection criteria are exclusionary) for evaluating alternatives can be expected in a web-based environment, because they are easier to use in an online setting. Additive-type screening strategies (e.g., where selection criteria are inclusionary and exclusionary) require making trade-offs between attributes, which is more difficult in a web-based environment. While elimination-type strategies can help rapidly narrow the set of available alternatives, they are relatively rigid (i.e., inflexible) in their application which could lead to the premature elimination of otherwise attractive alternatives (Widing and Talarzyk 1993). A greater use of elimination-type strategies may also be observed because they are more congruent with the information format in a web-based environment (Payne, Bettman and Johnson 1993).

Sixth, more browsing behavior can be expected in a web-based environment, because of the increased significance of browsing behaviors (in comparison to directed-search behaviors) in electronic environments (Marchionini 1995; Rowley 2000). Likewise, more exploratory behavior may also be observed as consumers are distracted by the visual salience of attribute information (Jarvenpaa 1990). Some researchers have proposed that the psychological state of “flow” may be important in an online setting (Hoffman and Novak 1996). The time-distortion effects commonly associated with the phenomenon can be expected to lead to more browsing behavior. Further, a greater tendency toward exploration and novelty seeking has been found to result from the “atmospherics” of an online store (Menon and Kahn 2002).

Seventh, the electronic screening of information has been identified as the most important development in online shopping (Alba et al 1997). The typical web-based environment includes some type of electronic decision aid (Haubl and Murray 2003; Iacobucci, Arabie, and Bodapati 2000). An electronic decision aid can strongly influence search and evaluation in a web-based store. For example, an electronic decision aid can be used to reduce search costs or improve the quality of the consideration set or do both. Also, consumers seem to be willing to trust the product recommendations offered by an electronic decision aid (Haubl and Murray 2003), particularly when it only acts as a “clerk” (West et al 1999).

As mentioned earlier, whether or not consumers are able to screen alternatives in an electronic environment to match needs may depend on two important task environment factors (e.g., number of alternatives and time available). These factors have been studied in off-line decision environments as potential causes of information overload. The available electronic decision aid makes information overload less of a concern in online settings. In fact, to the contrary, information *underload* may be a greater concern, because of the *need* to re-set selection criteria and re-screen alternatives if few alternatives are available and/or the *opportunity* to do the same if there is too much time. Thus, two task environment factors that are known to influence search and evaluation in off-line settings may also do so in a web-based environment, but with very different consequences. In order to predict these effects we incorporate the two task environment factors and the seven influences on search and evaluation discussed above into a conceptual model of information search and consideration set formation for a web-based environment (see Figure 1).

HYPOTHESES

Embedded within the conceptual model are several hypotheses that link information search and consideration set formation to antecedent factors that are typical in online settings and the two task environment factors mentioned above. These hypotheses are presented next.

Information Search

Information search in an online setting is more iterative is because it combines planning with action (Payne, Howes and Reader 2001). The use of an electronic decision aid results in a greater emphasis on the initial (i.e., screening) phase and a lesser emphasis on the subsequent (i.e., examination) phase of search. The initial phase involves screening (and re-screening) choice alternatives by performing *search iterations* to identify alternatives that match preferences. Once identified, alternatives may subsequently be *examined* (i.e., scrutinized) for more detailed information.

Number of Search Iterations. In the web environment, consumers can be expected to conduct more iterative search (Payne, Howes and Reader 2001). Hence, they are likely to perform multiple search iterations as they seek to identify alternatives for inclusion in the consideration set. Lynch and Ariely (2000) found evidence of more (insert term) search, which is similar to iterative search. Chu and Spires (2000) found evidence of broader (i.e., less selective) information search when a DSS was used. As the number of alternatives increases, the number of search iterations is likely to decrease in the web environment due to the reduced likelihood of criteria over-specification (Widing and Talarzyk 1993) and less “information foraging” (Pirolli and Card 1999). However, as the time available increases more search iterations can be expected due to browsing (Marchionini 1995), greater likelihood of “flow” (Hoffman and Novak 1996), and the increase possibility of being distracted by the visual salience of information (Jarvenpaa 1990).

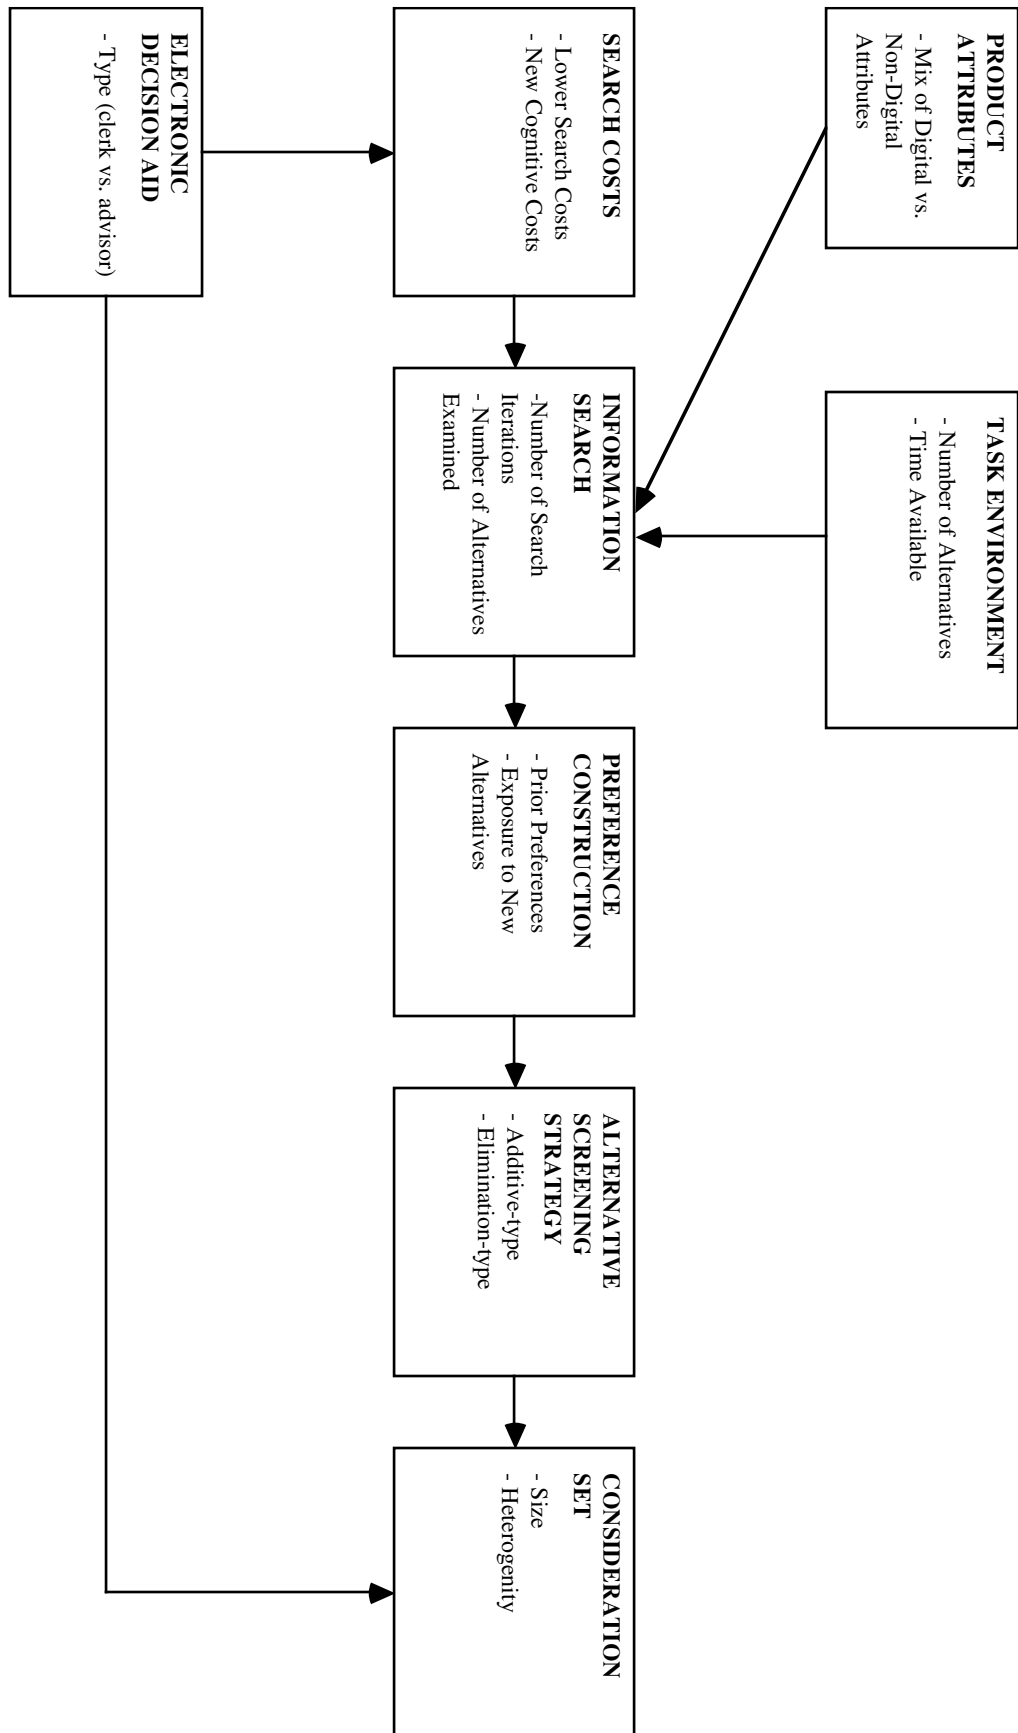

H1: There will be fewer search iterations in a web-based environment as the number of alternatives increases.

H2: There will be more search iterations in a web-based environment as time available increases.

Number of Alternatives Examined. A consequence of more search iterations in the web environment is that fewer alternatives may actually be examined (i.e., scrutinized) for information. The web environment offers a lower search cost, but this feature offers little benefit in terms of the cost of inspecting every screened alternative. Haubl and Trifts (2000) found evidence of fewer alternatives being examined for information. Also, consumers are likely to trust the electronic decision aid when it is only acting as a “clerk” (Haubl and Murray 2003), and may feel little need for examining every screened alternative for further information. As the number of alternatives increases, fewer alternatives are likely to be examined for information because of the greater likelihood of screened alternatives matching needs (Widing and Talarzyk 1993) and the reduced need to de-construct preferences or restructure information (Bettman, Luce and Payne 1998; Coupey 1994). But, as time available increases, more alternatives are likely to be examined for information due to exploratory and novelty seeking behavior (Menon and Kahn 2002) and browsing of screened alternatives (Rowley 2000).

H3: There will be fewer alternatives examined for information in a web-based environment as the number of alternatives increases.

FIGURE 1
 PROPOSED MODEL OF INFORMATION SEARCH AND CONSIDERATION SET FORMATION IN A WEB-BASED ENVIRONMENT

H4: There will be more alternatives examined for information in a web-based environment as time available increases.

Consideration Sets

Consideration Set Size. In the web environment, consumers are likely to use more attributes to screen available alternatives while forming a consideration set. The electronic decision aid makes it easy to include even unimportant attributes during the screening process (Todd and Benbasat 1994). Also, consumers are likely to use elimination-type screening strategies due to information format and processing style congruence (Bettman and Kakkar 1977). These two influences are likely to lead to smaller consideration sets compared to off-line decision environments. Haubl and Trifts (2000) found evidence that consumers develop smaller consideration sets in online settings. However, as the number of alternatives increases, consideration set size will increase because of the increased likelihood of more alternatives matching needs and the diminished need to re-calibrate the electronic decision aid and re-screen alternatives (Payne, Howes and Reader 2001). But, as time available increases, consideration set size will decrease due to more information foraging (Pirolli and Card 1999) and the greater use of elimination-type screening strategies (Payne, Bettman and Johnson 1988).

H5: The size of the consideration set in a web-based environment will increase as the number of alternatives increases.

H6: The size of the consideration set in a web-based environment will decrease as time available increases.

Consideration Set Heterogeneity. In the web environment, the tendency toward more browsing (Marchionini 1995) and iterative search will result in heterogeneous consideration sets. Also, changing selection criteria as consumers re-calibrate the electronic decision aid will also result in consideration set heterogeneity. As the number of alternatives increases, consideration set heterogeneity will increase because of more dissimilar alternatives being included in the consideration set (Roberts and Lattin 1991). But, as the time available increases, consideration set heterogeneity size will decrease due to the use of additional selection criteria resulting in more similar alternatives being included in the consideration set.

H7: The heterogeneity of the consideration set in a web-based environment will increase as the number of alternatives increases.

H8: The heterogeneity of the consideration set in a web-based environment will decrease as time available increases.

METHOD

Study Design

A study that simulated consumer decision-making in a web-based environment was conducted to test the hypotheses. The scenario consisted of undergraduate students choosing an apartment to rent near a hypothetical university. The web environment was characterized by the availability of an electronic decision aid that could be used to search a relational database of available apartments. Apartments were profiled using photographs and written descriptions.

The study employed a 2 number of alternatives (many, few) x 2 time available (more, less) x 2 web environment (web, web-auto) design. The first two factors are the two task environment influ-

ences of interest in the study. The two web environment conditions were collapsed because the distinction between them related to particular features of the electronic decision aid used, which were not pertinent to the study purpose. Prior to pooling the data on the third factor, homogeneity tests revealed no significant difference between the two web environment conditions.

Stimulus Development

Selection of Product Category. The selection of (hypothetical) rental apartments as the product category was based on a number of considerations. First, the product category is familiar to student subjects. Second, alternatives in the product category can be objectively evaluated. Third, attribute importance normally differs across individuals leading to preference heterogeneity. Several experimental studies of decision behavior have used rental apartments as a product category (Payne 1982; Todd and Benbasat 1992).

Task. Subjects were instructed to role-play a student transferring to another university who needed to find an apartment. They were asked to develop a list of apartments that they would like to visit for further consideration on arrival at the new campus. The purpose of the task was to search for apartments and form a consideration set. Profiles for apartments were constructed using a fractional factorial design based on attributes such as rent, location, number of bedrooms, and the number and type of amenities. Each profile described the apartment on twenty attributes. Unrealistic and dominated alternatives were eliminated.

Task Environment. The web environment was simulated by converting the apartment profiles into web displays. An electronic decision aid and relational database of apartment profiles similar to those at apartment search sites (e.g., <http://www.apartments.com>) was developed. A "search page" provided the interface between the electronic decision aid and the relational database. Subjects used this page to query the database about apartments that met their selection criteria. A screen indicated whether matching apartments had been found (or not). If matches were found, a screen displayed a list of matching apartments, with each listing being hyper-linked to the corresponding apartment profile. Hyper-links gave the subject the ability to: 1) return to the list of matching apartments, 2) return to the search page, or 3) add the apartment to their list of selected apartments.

Experimental Conditions. The number of alternatives available was set at 30 in the "few" alternatives condition and at 99 for the "many" alternatives condition based on guidelines provided in previous research (Widing and Talarzyk 1993). A pre-test indicated that subjects were able to complete the task in both conditions. In a second pre-test, subjects completed the experimental task with a certain number of alternatives (many or few) with no time constraint. The time pressure conditions were then created by multiplying the median time for task completion in each manipulation by 0.90 for the "low" and by 0.70 for the "high" time pressure condition based on guidelines provided in earlier studies (Ben-Zur and Breznitz 1981; Payne Bettman and Johnson 1988).

Experimental Procedure

One hundred and twenty undergraduate students participated in the study. Subjects were randomly assigned to the experimental conditions with approximately 15 subjects per cell. Each experimental session involved a single participant. The incentives for participation included extra course credit and a chance to win a \$100 lottery. Subjects first undertook a training task to familiarize themselves with the navigational features of the web environment. Then, for the main task, subjects used the electronic decision aid to create a "shopping cart" consisting of "apartments that they would

TABLE 1
CORRELATIONS AMONG VARIABLES

	Number of Search Iterations	Number of Alternatives Examined	Consideration Set Size	Consideration Set Homogeneity
Number of Search Iterations	—			
Number of Alternatives Examined	-.44**			
Consideration Set size	-.33**	.59**	—	
Consideration Set Homogeneity	-.04	.17*	-.02	—

** Correlation is significant at the 0.01 level (2-tailed)

* Correlation is significant at the 0.05 level (2-tailed)

seriously consider.” Subjects were told that they could modify the “shopping cart” during the session, but were not told how many apartments were available or how many apartments they should select.

Dependent Variables

Number of Search Iterations. The web server tracked the number of queries elicited from the relational database. The number of search iterations was calculated by counting the number of queries in the log file of the web server.

Number of Alternatives Examined. The number of alternatives examined (i.e., inspected) was determined by an inspection of the log file of the web server.

Consideration Set Size. Consideration set size was determined by tallying the number of different alternatives placed in the “shopping cart.”

Heterogeneity of the Consideration Set. The heterogeneity of the consideration set (HCS) was measured by calculating the average weighted Euclidean distance between all pairs of alternatives included in the consideration set. The weights were based on self-reported attribute importance ratings collected before the experiment. Prior to estimation, the attribute importance weights were standardized to avoid over-weighting.

RESULTS

Manipulation Checks and Reliability Assessments

A GLM-ANOVA model, with the perceived number of alternatives as the dependent variable and the number of alternatives present (many vs. few), time pressure (low vs. high), and environment (web vs. web-auto), as the independent variables was used to assess the manipulation. As expected, a significant main effect for

the number of alternatives manipulation (many vs. few) was found [$F(1,112)=4.72, p<.05$]. More alternatives were perceived to be present by subjects in the many alternatives condition ($\bar{x}=6.6$) than in the few alternatives condition ($\bar{x}=5.9$). Further, there was a marginally significant main effect for the time pressure (low vs. high) manipulation [$F(1,112)=3.42, p<.10$]. More alternatives were perceived to be present in the more time available condition ($\bar{x}=6.0$) than in the less time available condition ($\bar{x}=6.6$). Therefore, the manipulations were assessed to be successful. Table 1 provides the pair-wise correlations among the dependent variables. Table 2 provides descriptive statistics for the dependent variables.

Individual Hypotheses Results

Number of Search Iterations. H1 posits that there will be fewer search iterations environment as the number of alternatives increases. The main effect for number of alternatives was marginally significant [$F(1, 112)=2.76, p<.10$]. Inspection of the marginal means shows that the number of search iterations was lower in the many alternatives condition ($\bar{x}=7.3$) than in the few alternatives condition ($\bar{x}=8.5$). Thus, H1 is weakly supported. H2 posits that there will be more iterations as time available increases. The main effect for time available was significant [$F(1, 112)=4.93, p<.05$]. Inspection of the marginal means shows that the number of search iterations was significantly higher ($t=-2.22, p<.05$) in the more time available condition ($\bar{x}=8.9$) than in the less time available condition ($\bar{x}=7.3$). Thus, H2 is supported. The number of alternatives x time available interaction was not significant.

Number of Alternatives Examined. H3 posits that fewer alternatives will be examined for information as the number of alternatives increases. The main effect for number of alternatives was not significant [$F(1,105)=2.70, ns$]. Inspection of the marginal means shows that more alternatives were examined for information in the

TABLE 2
DESCRIPTIVE STATISTICS: MEANS AND STD. DEVIATIONS

	Web Based Decision Environment			
	Few Alternatives Available		Many Alternatives Available	
	Less Time Available	More Time Available	Less Time Available	More Time Available
Number of Search Iterations	7.81 (2.87)	9.25 (3.89)	6.87 (2.32)	8.27 (2.87)
Number of Alternatives Examined	7.60 (3.52)	8.50 (3.60)	8.20 (2.88)	10.56 (5.75)
Consideration Set size	4.63 (1.65)	3.79 (1.23)	4.80 (1.40)	4.73 (1.71)
Consideration Set Homogeneity	21.84 (9.25)	21.75 (10.71)	21.48 (11.06)	21.38 (11.41)

Note: Entries are cell means with standard deviations shown in parentheses.

many alternatives condition ($\bar{x}=9.3$) than in few alternatives condition ($\bar{x}=8.0$). Thus, H3 is not supported. H4 posits that as time available increases, the number of alternatives examined for information will increase. The main effect for time available was significant [$F(1,105)=4.67, p<.05$]. In the contrast comparisons, the number of alternatives examined increased in the expected direction as time available increased ($t=-2.16, p<.05$). Thus, H4 is supported. The time available x number of alternatives interaction was not significant.

Consideration Set Size. H5 posits that the consideration set size will increase as the number of alternatives increases. The main effect for number of alternatives was significant [$F(1,112)=3.63, p<.05$]. Inspection of the marginal means shows that the size of the consideration set was larger in the many alternatives condition ($\bar{x}=4.8$) than in the few alternatives condition ($\bar{x}=4.2$). Thus, H5 is supported. H6 posits that as time available increases, consideration set size will decrease. The main effect for time available was marginally significant [$F(1,112)=2.75, p<.10$]. In the contrast comparisons, the size of the consideration set decreased in the expected direction as time available increased ($t=-2.16, p<.05$). Thus, H6 is weakly supported. The time available x number of alternatives interaction was not significant.

Heterogeneity of the Consideration Set. H7 posits that the alternatives in the consideration set will be more heterogeneous as the number of alternatives increases. The main effect for number of alternatives was not significant [$F(1,112)=0.04, ns$]. Inspection of the marginal means shows that there was little change in consideration set heterogeneity between the few alternatives available ($\bar{x}=21.8$) and the more alternatives available ($\bar{x}=21.4$) conditions,

with higher values indicating more heterogeneous consideration sets. Thus, H7 is not supported. H8 posits that as time available increases, heterogeneity of the consideration set will decrease. The main effect for time available was not significant [$F(1,112)=0.01, ns$]. Inspection of the marginal means shows that there was no change in consideration set heterogeneity between the less time available ($\bar{x}=21.6$) and the more time available ($\bar{x}=21.6$) conditions. Thus, H8 is not supported.

DISCUSSION

Overall, the results provide some support for the hypothesized relationships, with five of the eight hypotheses receiving partial or full support. The findings relating to search when many alternatives are available show that while consumers conduct fewer search iterations (weak support for H1), they do not actually examine fewer alternatives for information (lack of support for H3). In contrast, the findings relating to search when more time is available show that the number of search iterations conducted increases (support for H2) but so does the number of alternatives examined (support for H4). Thus, an increase in the time available has the predicted effect on search, while an increase in the number of alternatives does not. The empirical results relating to consideration set formation show that consumers form larger consideration sets when many alternatives are available (support for H5), but form smaller considerations sets when more time is available (support for H6) as predicted. The heterogeneity of the consideration set remains unaffected when either more alternatives or more time is available (lack of support for H7 and H8).

GENERAL DISCUSSION

Overall, the empirical findings offer qualified support for the conceptual framework. While not all hypothesized relationships were significant, the main prediction of the model that the two task environment factors have an important influence on information search and consideration set formation seems to be upheld. When more alternatives are available, consumers conduct fewer search iterations but yet develop larger smaller consideration sets. When more time is available, they conduct more search iterations, examine more alternatives, but form smaller consideration sets. The two task environment factors seem to have independent effects on search and alternative evaluation in a web-based environment. In contrast, the two task environment factors are known to have an interactive effect in off-line settings, because more alternatives and less time are associated with task complexity. Further, when more alternatives are available consumers seem engage in risk-averse behavior, because such is implied by larger consideration sets (Roberts and Lattin 1993). But when more time is available, consumers engage in risk-taking behavior, because they form smaller consideration sets. Thus, as predicted by conceptual model, the two task environment factors seem to have the opposite effect in online settings compared to their influence in off-line decision environments.

An interesting pattern of inter-relationships can be observed among measures normally associated with decision quality and the two task environment variables. Decision quality seems to *improve* in a web-based environment as more alternatives are available and there is less time. A possible reason for such an effect is information *underload* in a web-based environment. In other words, when there are few alternatives available and there plenty of time, the task becomes "difficult."

An important implication that emerges from the study results is that electronic decision aids in web environments may impose new search costs on consumers that offset the overall lower search cost offered by these environments. These costs could have a detrimental effect for relatively straightforward choice tasks. As the task becomes more difficult, the unfavorable influence of new search costs can be expected to decline, thereby allowing the favorable influence of the overall lower search cost to have a greater impact on the decision process. Decision aids are often closely tied to the environments in which they are used because they are frequently "designed" for those environments. It seems that decision aids suitable for a particular environment may be ineffective in other environments (Olson and Widing 2002). Thus, marketers may need to build in more "flexibility" into their electronic decision aids so that they perform well at varying levels of task complexity. Anecdotal reports in the business press suggest that there is a movement toward the development of flexible electronic decision aids (Maes 1999; Perez 2002; Reda 2002).

Selective Versus Comprehensive Processors: Gender Differences in Web Consumer Behavior

Marie-Odile Richard, HEC-Montreal Business School, Canada

Jean-Charles Chebat, HEC-Montreal Business School, Canada

Zhiyong Yang, Concordia University, Canada

Michel Laroche, Concordia University, Canada

EXTENDED ABSTRACT

The Internet is rapidly becoming an important platform for diffusing product information and purchasing products. However, little is known about how Web atmospherics impact consumers' web browsing behavior. In addition, we do not have any knowledge about whether the same Web atmospherics influence males and females in a different way. To address these research gaps, this study proposes a model of information seeking in an online retailing environment. The moderating effects of gender are examined to see how and why males and females are impacted by different elements of a Web environment.

According to Meyers-Levy's *selectivity model* (Meyers-Levy and Maheswaran 1991), males are selective information processors, acquire information heuristically, and tend to miss subtle cues, whereas females engage in effortful, comprehensive, and itemized analysis of all available information. Gender differences in information processing are also attributed to their difference in cranial hemispheric activity (Meyers-Levy 1994). Specifically, males are right-hemisphere-dependent, excelling at nonverbal processing, visual acuity, and visual spatial processing, whereas females are left-hemisphere-dependent, excelling verbal processing, attentiveness to detail, and superior reading skills.

Based on an extensive literature search, we developed an Experience-Atmospherics-Behavior model of Internet consumer behavior. This proposed model incorporates consumer experience and atmospherics cues (quality of the information) on online behavioral variables. The quality of the information was operationalized as site structure, informativeness, and effectiveness of information content. Entertainment was also included to reflect the hedonic function of a website. Online behavior included site attitude, site involvement, exploratory behavior and pre-purchase intentions.

The hypotheses are partly based on the propositions of the selectivity model and on findings in internet and communication research: Since women are characterized as comprehensive processors of information, they will exhibit a more complex search process than men. Consequently, during the visit the effect of: (a) entertainment on exploratory behavior should be more important on men than on women; (b) challenges on exploratory behavior should be more important on women than on men; (c) challenges on pre-purchase intentions should be more important on women than on men; (d) structure of the web site on attitudes toward the site should be more important on men than on women; (e) informativeness on exploratory behavior should be more important on women than on men; (f) effectiveness of information content on exploratory behavior should be more important on men than on women.

The proposed model was tested with a convenience sample of real consumers who responded to a questionnaire after navigating through an existing pharmaceutical web site. Using exploratory and confirmatory analyses, the ten-factor structure was confirmed, and convergent and discriminant validity were verified. Prior to full invariance tests, two baseline structural models were tested, one for males (N=116) and the other for females (N=145). For both, all measurement model paths were significant and 11 out of 14 causal paths were significant and in the hypothesized direction for both

males and females, and the standardized results of these models were very good. To test our hypotheses, a multiple-group analysis using EQS tested the equality of both measurement and structural paths across purchasing modes, by imposing equality constraints on parameters of the male and the female models, and a number of paths were found to differ between the two groups.

The first finding relates to the differences in the number of significant paths for males and female respondents, indicating that the female model reflects a more complex information search process than the male model. Second, females seem to use skills and challenge to impact exploratory behavior, while males only use challenges to impact site attitudes and pre-purchase intentions. Third, a similar interpretation holds for the impact of effectiveness of information content impacting site involvement only for females, as well as the impact of effectiveness of information content and exploratory behavior impacting site involvement, also significant only for females. Fourth, there is no gender difference in the impact of entertainment on site involvement and attitudes. However, females should like highly-entertaining sites that impact positively their exploratory behavior, meaning they browse and scroll more in order to get more enjoyment. This is not surprising as entertainment is a peripheral cue and both males and females are assumed to process it heuristically. Fifth, effectiveness of information content had effects only on the males' exploratory behavior, while this variable has more complex effects on females by having also a link with site involvement. They collect more information about the product they search for.

Finally, site attitudes are impacted by structure only for males. This is the only central cue to affect attitudes toward the website. This short path, the use of this variable and the negative path between informativeness and exploratory behavior indicate less than comprehensive processors. On the other hand, females use more central cues and a longer process to develop site attitudes through the mediation of site involvement and exploratory behavior. In conclusion, the hypotheses partially based on the selectivity model are supported and our findings provide new original insights into gender differences in online information processing.

Forced vs. Voluntary Exposure Web Ads: Immediate and Long-Term Impact of Ad Avoidance on Communication Outcomes

Patrali Chatterjee, Montclair State University, USA

EXTENDED ABSTRACT

Generating long-term memory for an ad and the advertised brand are key advertising objectives since most choice and purchase decisions are made after a temporal delay from ad exposure. However, in natural media consumption environments, ad avoidance is a norm rather than an exception. This issue is especially relevant in the Web medium as advertisers grapple with banner blindness and declining clickthrough rates and use increasingly intrusive and large ad formats. Little is known if increasing ad sizes and using forced exposure ad formats can improve communication outcomes and if these gains generated immediately after ad exposure persist over time.

We investigate the role of advertisement size (large vs. small) and ad exposure format (forced vs. voluntary) on immediate and delayed brand recall, ad recognition and brand attitude in web-based media. Drawing upon prior research in advertising, consumer behavior, marketing and psychology we propose that ad exposure format induces consumers to cognitively or physically avoid ads. Voluntary exposure ad formats like banners and text ads are more likely to be cognitively avoided since it is an automatic, subconscious process that occurs in parallel with the browsing activity and does not require any behavioral action by the consumer. Forced exposure formats that interrupt browsing activity and demand immediate response are more likely to be physically avoided by closing them.

Cognitively avoided ads are preattentively processed, consumers have implicit memory for the ad but not explicit memory for the brand. Physically avoided ads generate explicit memory for the ad and brand through heightened attention and hence immediate recall and recognition measures are likely to be higher for forced exposure rather than voluntary exposure ads. Further immediately after ad exposure the strength of (implicit or explicit) memory traces will be higher for large ad stimuli compared to smaller stimuli. However in delayed conditions explicit memory for forced exposure ads will decay rapidly however implicit memory can endure over time for the same level of ad exposure. Hence delayed brand recall and ad recognition measures will lower for forced exposure and large ads compared to voluntary exposure and small ads.

Trafleton's memory model suggests that the interruption of browsing activity by large forced exposure ads leads to negative brand attitudes immediately after ad exposure compared to voluntary exposure ads. However after a delay, the ad context will be forgotten while familiarity based sleeper effect will contribute to higher brand attitude for forced exposure ads in delayed condition. Further, brand attitudes are not expected to differ across small forced and voluntary exposure ads.

The experimental design for our experiment had two between-subjects factors (two ad exposure conditions; banner ad (voluntary exposure) vs. pop-up ad (forced exposure) and two ad size conditions; large vs. small) and one within-subjects factor (time of measurement – immediate vs. delayed). One hundred sixty three undergraduate students participated in the study to evaluate a student newspaper site and provided measures in three stages.

Mixed model ANCOVA results indicate that forced exposure ads generate higher immediate recognition and recall of the advertised brand but lower brand recall in delayed conditions. Gains in

recognition from using forced exposure ad format accrue when ad sizes are small, i.e. recognition scores for small banner ads significantly decayed over time, but not for small pop-up ads. Hence small pop-ups perform better both immediately after ad exposure and over time. There were no significant differences for large ad sizes for recall and recognition measures.

Brand attitude for banner ad was significantly higher than pop-up ads in immediate and delayed conditions. The significant two-way interaction of ad format and time under large ad size condition indicates that the negative impact of large pop-up ad use on brand attitude does not decay with time. In the small ad size condition, brand attitude for small banner ad was significantly higher than small pop-up ad immediately after ad exposure but not in delayed conditions.

Our results indicate that online advertisers face a formidable challenge in generating memory (especially recall) for their brand even when using intrusive ad formats. Recall scores are significantly lower than recognition scores indicating that few ads are centrally processed. However most ads are preattentively processed and endure over time, so recognition measures and use of large size ads with similar features will generate higher returns over time. We suggest practical implications for advertisers in selection ad execution features in optimizing immediate and long-term communication outcomes.

“Is it Really Complicated?” Motivational Differences in the Effects of Structural and Outcome Complexity on Consumers’ Web site and Brand Evaluations

Reetika Gupta, Lehigh University, USA
Stephen J. Gould, Baruch College/CUNY, USA

EXTENDED ABSTRACT

As marketers spend significantly to enhance the aesthetics and sophistication of consumer experiences, they are increasing the complexity of interactive consumption environments. However, little is known about how consumers react to such complexity, in terms of their evaluations. In this research, we examine two specific types of complexity: 1) *Structural Complexity*, defined as the number of distinct cues (e.g., information categories, length of text, audio, video, animation) at the web site that the consumer has to process, and 2) *Outcome Complexity*, defined as the abstractness of icons and symbols that the consumer uses to navigate the web site (e.g., ambiguous icons at a web site that does not allow the consumer to form clear outcome predictions). While these types of complexity maybe more memorable, communicate more information and are likely to engage consumers, they often make the web site difficult to navigate and use. In this research, we investigate if complexity in the form of multiple cues and abstract icons will lead to positive or negative outcomes at a web site.

Extant research on complexity advocates two divergent views of complexity. Research on stimulus complexity (Berlyne 1960) suggests that (moderately) complex environments will evoke the most favorable evaluations since it creates a stimulating environment. On the other hand, according to cognitive load theory (Sweller 1988), complexity can be perceived as superfluous and inefficient, leading to unfavorable evaluations. This paper attempts to address this conflict by focusing on individual motives. There is research to suggest that motives such as goal directed (focused on the end goal) and experiential (focused on the experience) persuade individuals to adopt separate mechanisms that guide evaluations (Hoffman and Novak 1996), implying that individuals belonging to these two different motive groups will have varying outcomes to complexity in an online environment.

We posit that distinct consumer motives (goal directed vs. experiential) will interact with the level (low, moderate, high) and type (structural, outcome) of complexity to determine consumer evaluations of the web site and brand. It is proposed that the congruence between the complexity level and needs of specific motives will drive the favorable evaluations toward a web site. Experiential consumers who are looking for an engaging experience will find the moderate complexity web site stimulating and challenging, triggering favorable evaluations; while the goal directed consumers who are seeking efficiency will find the low complexity web site ideal for pursuing their goal in a linear manner. In addition, we predict that due to the conceptual nature of the end goal (seeking specific information), individuals in a goal directed motive display higher sensitivity for low outcome complexity. On the other hand, individuals with an experiential motive are stimulus driven, and more focused on the elements of the stimulus that make the process of browsing engaging and stimulating, displaying higher sensitivity for moderate structural complexity.

These predictions are tested across two studies. Study 1, across 48 web sites designed as a 3 (Low, Moderate or High Structural Complexity) X 2 (Goal directed or Experiential Motive) demonstrates that the match or mismatch between consumer motives and complexity levels leads goal directed and experiential consumers to vary in their evaluations of complexity, but only at moderate and low levels. In Study 2, a second type of complexity, outcome

complexity was introduced to examine the interplay between the two complexities, structural and outcome in influencing consumer reactions. Study 2, designed as 2 (Low Structural or Moderate Structural Complexity) X 2 (Low Outcome or Moderate Complexity) X 2 (Goal directed or Experiential Motive) confirms the findings of Study 1 by illustrating that goal directed individuals display a higher preference for the low complexity level (low structural-low outcome) than experiential individuals. Conversely, the experiential individuals display a higher preference for the moderate complexity level (moderate structural-moderate outcome) than goal directed individuals. In addition, the results indicate that goal directed individuals are sensitive to changes in outcome complexity but not sensitive to changes in structural complexity, while experiential individuals are sensitive to changes in structural complexity but not sensitive to changes in outcome complexity.

If corroborated, this research has theoretical and practical relevance. In particular, these insights contribute to complexity literature by explaining that motivation is a key moderator of consumer reactions to complexity, and may help reconcile conflicting findings on complexity reported previously. From a practical standpoint, the framework suggests that marketers should tailor the complexity of the environment to align to the motives that consumers bring to the consumption task. For example, a marketer may choose to differentiate among consumers based on their motives, and direct them to environments of varying complexity.

Mothers' Perceptions of their Control over their Children's Diets

Simone Pettigrew, University of Western Australia, Australia

Michele Roberts, University of Western Australia, Australia

ABSTRACT

In an era of rising rates of childhood obesity it is increasingly important for parents to ensure their children consume healthy diets. Given current trends in childhood obesity, it would appear that many parents are failing to engage in effective feeding practices. As mothers remain the major influence on family eating patterns (World Health Organisation (WHO) 2000), the extent to which they consider themselves to be in control their children's diets is important as it indicates where possible solutions to childhood obesity may lie. This paper explores the factors that mothers feel diminish their control over their children's diets to provide insight into why obesity is a growing problem in countries such as Australia despite the ready availability of low-energy nutritious foods and the good intentions of parents.

BACKGROUND

There is a growing awareness of the need to prevent and treat obesity because of its serious health implications which include heart disease, hypertension, diabetes, gallbladder disease, some forms of cancer, and psychological conditions (WHO 2000, 2004). Obesity is now so prevalent in Western society that it has been labelled an epidemic (Spiegel and Alving 2005).

Targeting childhood obesity has been proposed as the most effective way to prevent adult obesity due to the tendency for overweight children to become obese adults, the higher rates of long term weight loss maintenance among children, and the difficulties involved in changing behaviours later in life (Bouchard 1996; Sothorn and Gordon 2003). The prevention and treatment of childhood obesity is also necessary due to the increasing prevalence of obesity-related illnesses among children such as Type 2 Diabetes, sleep apnoea, orthopaedic complications, and weight-related depression (Dietz 1998; WHO 2000). In Western Australia, the context of this study, 23% of boys and 30% of girls were overweight or obese in 2003, an increase from 9% and 10% respectively in 1985 (Glasson et al. 2004; Hands et al. 2004). There is an urgent need for multi-disciplinary research to develop possible solutions to this rapid rise in childhood obesity (McGinnis 2006; Spiegel and Alving 2005).

The health literature highlights the role of parents in managing their children's diets and body weight (American Dietetic Association (ADA) 2004; O'Dea 2003). Parents' influence over their children's diets is postulated to occur through three food-related roles: food providers, models of food consumption, and controllers of the eating environment. In their role as food providers, parents control which food products are kept in the home and in what quantities they are made available to children (Birch and Fisher 1998). The role of modelling food consumption is important because children mimic the eating behaviours of those with whom they share meals (Birch and Fisher 1998). The role of controlling the meal environment relates to how parents use mealtimes as opportunities to educate children about nutrition and promote the consumption of a wide range of healthy foods (Gable and Lutz 2001). Such behaviours can make long-term differences to children's food choices (ADA 2004).

Despite the potential of parents to control their children's food consumption behaviours and guide their future food choices, there is ample evidence that children's diets are suboptimal. Many Australian children's diets are deficient in specific vitamins and

minerals such as calcium, zinc, and vitamin A (McLennan and Podger 1998). In addition, consumption of fruits and vegetables remains well below target levels despite these foods being readily available in almost all areas. A Western Australian survey found that 45% of the children sampled had not consumed any fruit on the previous day and 30% had not eaten any vegetables (Hands et al. 2004). The study also found that the consumption of vegetables among children is actually decreasing (Glasson et al. 2004). Combined with the rapidly increasing childhood obesity rates, these figures demonstrate that many parents are not adequately managing their children's diets.

There are several possible causes for parental failure to achieve control over children's diets. These include an insufficient knowledge of nutrition, a lack of motivation to ensure children eat well, and an inability to control children's food consumption behaviours. This study focuses on the latter possibility. Although obesity models in the nutrition literature emphasise the role of parents in determining their children's body weight outcomes through genetic inheritability and child feeding practices, numerous other environmental variables are also understood to play a role. These variables include cultural, social, marketing, and economic factors (Birch and Fisher 1998; McGinnis 2006; Spiegel and Alving 2005). Unfortunately, there has been almost no investigation of the relative influence of each of these factors (Hastings et al. 2003). Understanding the environmental forces against which parents must work to manage their children's diets is important for developing consumer education programs and public policies aimed at reducing obesity and vitamin deficiency among children.

METHOD

As mothers tend to be at the coalface of child feeding on a daily basis (WHO 2000), this investigation focused on mothers' attitudes to nutrition and child feeding. It was a grounded study in that particular issues were not foreshadowed prior to data collection. Two focus groups and 12 depth interviews were conducted with 20 mothers of young children. Middle class mothers were selected because of their accessibility and their ability to articulate the complex issues surrounding child feeding practices. Mothers were recruited to achieve representation of single and two-parent families, working and non-working mothers, and a spread of child gender and age (one to 12 years). Interviewee age ranged from 30 to 44. The mothers were sourced from two schools within the same geographic area—one a government school and the other a Catholic school. Personal contacts within the schools were initially contacted and a snowball method was then used to facilitate further recruitment.

The focus groups were kept intentionally small (four or five members per group) to facilitate detailed contributions from all participants. An interview guide was used to ensure coverage of specific issues (e.g., attitudes to particular food categories, current and ideal food choices, and experiences when grocery shopping), but interviewees were given considerable latitude to introduce other topics. The interviews ranged in length from 40 minutes to 1.5 hours, with the focus groups tending to run longer than the individual interviews. The interview transcripts were imported into NVivo 2.0 for coding and analysis. Data were coded to 87 nodes and node intersections were performed to facilitate closer examination of the data. Iterative sweeps between the nodes, node intersections,

and the full transcripts enabled the primary themes to emerge. One of the most apparent themes was mothers' feelings of regular loss of control of their children's eating behaviours. The findings relating to this theme are outlined below.

FINDINGS

In line with recent research in the US that found that mothers want to provide their children with a healthy diet (Sherry et al. 2004), all the mothers interviewed expressed a high degree of interest and involvement in their children's diets. They seemed aware of the importance of good nutrition to children's growth and development and were obviously keen to be good mothers in terms of their feeding practices. While there were occasional variances in stated beliefs about the types of foods that are healthy for children to consume, overall there was strong convergence on this issue. Most interviewees described at length how they make consistent attempts to provide healthy meals and snacks that their children will enjoy. Despite these efforts, however, they perceived that numerous factors interfere with their ability to achieve this goal. These factors include the behaviours of other caregivers, the stresses involved in managing family life, and the wearing effects of pestering. Each of these tensions is discussed below.

When I'm Not Around

The interviewees mentioned a range of other caregivers whom they felt at times undermined their ability to control the quality of their children's diets. Fathers were perceived to be the worst offenders, followed by members of the extended family, teachers, coaches, and even medical practitioners. School canteens were also often viewed as a source of nutritional contradiction in terms of the foods offered to children.

Husbands. The interviewees typically described themselves as the food gatekeepers in the home. Whether they were full-time homemakers or working mothers, they saw an important part of their parenting role being food decisions and food education. Their husbands, by comparison, were not generally viewed as being skilled or motivated in this area. According to the interviewees, the role of father is viewed by husbands to include the authorisation of exceptions to household food rules and the provision of 'treat' foods. While some mothers were amused by this difference in approach to child feeding, others found it confronting and frustrating:

He does like to indulge them far more than I do in treats and sweets, and often you feel kind of a party pooper in a way, you know, raining on everyone's parade. That's the way of Mums isn't it? You're always the bad guy... Their father sees me as being a bit too militant in my policing of what goes into them. I don't see it as policing at all-it's parenting. I'll turn it around until I end up feeling guilty about it.

Some of the mothers attributed the differences in parenting styles between mothers and fathers to different knowledge levels. They felt that mothers are more likely to consider the nutrient profile of the meal being offered while fathers take a more global view of eating that prioritises hunger satisfaction and energy consumption: "*They haven't actually balanced anything, but they've fed them.*"

Extended Family. Grandparents, uncles, and aunts were also often accused of sabotaging mothers' efforts to control the quality of their children's diets. While this sometimes resulted in anger and resentment, the interviewees almost always portrayed the offender as well-intentioned. Most commonly, the family members were

understood to be trying to please their children and create an emotional bond:

My sister-in-law takes her there (McDonalds) because they think I am mean because I don't take her... They think it's something she would like.

I know it is something that allows him (grandfather) to have that special bond, that special time where he's the greatest, just for that small moment in time when Mum's not here and it's just us.

This tendency to empathise with the offender often resulted in the behaviours going unchallenged. The interviewees understood that going to fast food restaurants is an inexpensive and convenient way for family members to entertain young children and provide an outing that will be considered special and exciting. They were grateful for their family members' desire to spend time with their children which made it difficult for them to criticise their choices.

Dependence on extended family members can be particularly difficult for single mothers who have few childcare alternatives. One interviewee was a single mother with three young children. She described how juggling the competing demands on her time and attention is made all the more difficult by the need to monitor the feeding practices of other caregivers and manage the outcomes when her requests are ignored:

You can try and put your points of view across, but to have that maintained and supported by other caregivers within the family unit has been a problem for me-a very big problem over the years. There is a conflict of beliefs, and so where they're indulged in something which I don't allow, they're always questioning me as to why their father or their grandfather has said yes.

Some interviewees discussed how the indulgences provided by well-meaning others had multiple implications for mothers. These included the more intensive parenting required as a result of the behavioural changes in their children after consuming foods high in sugar and additives and the heightened pestering for treat foods that could persist for an extended period after exposure. There is very little recognition in the literature that members of the extended family can constitute barriers to mothers implementing effective dietary control (see Bruss, Morris, and Dannison 2003 for an exception).

Teachers and Coaches. While the interviewees could excuse to some extent their family members' dietary indiscretions with their children, they were much less forgiving of the same behaviours when enacted by teachers. Given their position of authority and presumed knowledge, teachers were expected to uphold healthy eating practices. The interviewees expressed confusion as to why teachers would provide their children with unhealthy foods and frustration at their inability to intervene. This inability stemmed from not being present at the time and a reluctance to deprive their children of special treats being enjoyed by their peers:

This is one thing that annoys me about the school-they get so many sugary treats. My son loves his teacher, but he would get like a whole block of chocolate each week. My son would come out with a block of chocolate this big and the teacher would say to me, "Oh, is it okay if I give him a block of chocolate?" But I'm not going to say, "No, my child should be the only one in the class who doesn't have one."

Some mothers also described it as incomprehensible that sports coaches would disseminate vouchers for fast food restaurants as a reward for participation or success in sporting events. Concern was expressed that this is sending the wrong message to children who are likely to respect and admire their coaches and interpret the vouchers as an endorsement of the food products being awarded. Once again, mothers are put in a difficult position as to reject the voucher would disappoint their child. As one mother noted, "Where do you draw the line?"

School Canteens. It was generally agreed that the school environment should be supportive of healthy eating principles and that this should be reflected in the canteen menu:

I think it's a shame that they don't have a few more healthy options on the canteen menu. Like nice pumpkin or tomato soup-we used to have that at school.

The influence of the school canteen on children's nutrition was understood to be complex. Not only do canteens signal to children the foods that are appropriate for them to consume, they also provide the nourishment that children need to meet their academic potential. In addition, canteens were understood to be a potential source of peer pressure:

Having my son start school this year I'm appalled to see what they sell in the canteen-just sausage rolls, pies, junkie sort of stuff that I would just never serve them at home. So it makes me sad because there are going to be kids that go to school who buy their lunch every day and my son will come home from school, because of peer group pressure, saying he wants to buy his lunch too...I just think it's appalling. You can't expect children to learn well in class if they've got that kind of rubbish in them.

Medical Practitioners. The most surprising "others" identified by mothers as being unsupportive of healthy eating practices were medical practitioners. Doctors, dentists, and nurses were discussed as sending children inappropriate messages about nutrition. The interviewees noted that medical practitioners are increasingly bestowing "bravery award" food vouchers from fast food restaurants to reward children for good behaviour during a procedure.

When my son had his stitches taken out, he got a certificate from McDonald's for a free burger and fries. It's issued through the doctor's surgery!...Just think about the signals. They are so little and they pick up symbolism everywhere and the doctor is saying that McDonald's is good for them.

Such actions by health care workers have implications for mothers who are attempting to control their children's diets and favourably influence their food beliefs. As parents are not consulted prior to the child being given the voucher, they are in a difficult position if they require their child to refuse the reward. They face the prospect of disappointing a child who may have just had a frightening or painful experience and also possibly alienating a health care provider on whom they may need to rely in the future.

I'm Not Coping

Most of the mothers acknowledged that their children's diets were not as good as they would like them to be because of the stresses of managing family life. They talked about the numerous educational, sporting, work, and social commitments that can result in a reliance on fast foods and take away meals to cope. Even those

mothers philosophically opposed to the large fast food chains reported succumbing when life gets too hard:

The whole concept of this super corporation-I have real problems with that. But of course all of my militaristic views and ideologies are out the window when I have three children saying: "Mummy, I'm hungry" and I don't have the time to cook, or the energy, or it's the weekend.

In such circumstances, unhealthy foods take on the mantle of a necessary evil. They are time-saving and kid-satisfying, and thus provide real benefits to beleaguered mothers. Unfortunately, these benefits can be accompanied by a sense of guilt over their children's health and their own adequacy as mothers. It has been noted that this reliance on unhealthy foods is becoming more common as larger numbers of women enter paid employment and look to convenience foods to help them cope (WHO 2000).

Pester Power

Many of the mothers talked about the power of their children to pester them into buying foods they consider to be unhealthy. They understood pestering behaviours to be a symptom of a learning stage during which parents need to hold their ground to set behavioural parameters and teach children appropriate ways of eating. Most interviewees gave the impression that their usual response to pestering is to say no, although most acknowledged that they do give in at times to keep the peace. This reported behaviour of refusing most requests is at odds with previous observational research in the US that showed acquiescence to be the more typical reaction (Burr and Burr 1977; Isler, Popper, and Ward 1987; Taras et al. 2000). The difference in outcomes between these previous studies and the present study may be the result of self-report versus observational data collection methods and/or cultural disparities.

While pestering children were described as irritating and frustrating, most mothers looked beyond their child to forces further down the pester chain that encourage their children to repeatedly request unhealthy foods. Often referred to generically by the interviewees as 'marketing', these forces included television, advertising, sales promotion, premiums, and packaging. Peers were also raised as sources of pester power, although this was typically in the context of peers being exposed to the same marketing stimuli as their child.

Television and Advertising. Television was often equated with advertising by the interviewees because of the significant licensing of television characters in children's food marketing. The interviewees also seemed to associate television exposure with peer pressure as the influence of both forces tended to converge in accounts of how their children have become aware of new food products and subsequently engaged in pestering behaviours:

With my kids it's something they've seen on TV and perhaps someone has had it at school and they're very excited about it, so that's perhaps why they ask. But I don't know why they ask, perhaps they're just thinking "One day she will. Get her at a weak moment. One day she'll say yes."

There was often a sense of surprise among the interviewees that their children had been exposed to advertising for such a wide range of unhealthy foods when they considered themselves to be vigilant in monitoring the television watched by their children.

My daughter doesn't watch children's shows. She's not allowed to watch TV in the mornings or the daytime. Not even a video. So she doesn't watch a lot...sometimes I'm amazed

that she's seen ads for things that I don't even know what they are. But I am around when she watches TV, so she must soak it up more than I do.

This lack of awareness among mothers of the extent to which their children are exposed to advertising has implications for their ability to control their children's diets. Exposure has been found to be related to requests for the products advertised and parental purchases of these products (Taras et al. 2000). In light of the interviewees' comments about the tendency for other people to provide their children with foods of which they disapprove, it seems likely that children's triggered desires for advertised products will be indulged to some degree by husbands and extended family members. Bandyopadhyay, Kindra, and Sharp (2001) have noted that where parents have difficulty filtering advertisements reaching their children, there is an important role for public policy makers to protect children's interests. If this sample of middle-class mothers had difficulty monitoring their children's exposure to advertisements for unhealthy foods, many other parents may experience a similar problem.

While in the marketing literature there is considerable debate and confusion over the power of advertising to affect children's food-related beliefs, attitudes, and behaviours (Kunkel 2005; Livingstone 2005; Young 2003), there was no doubt in the interviewees' minds that much of their children's pestering behaviours originate from advertising: "*A lot of their requests at the supermarket are most definitely driven by the ads.*" The extent to which advertising was perceived to influence children led some mothers to suggest that advertising to children is inappropriate as it reduces parental control:

I think what would be better is not to have the advertising on TV when kids are watching. That would probably be better because other things you can control-when or not you go out, where you go. Whereas sometimes you're sitting at the TV and they see that advertising, it gives them the idea and they can pester.

Sales Promotion, Packaging, and Premiums. Most of the mothers with younger children (approximately one to six years of age) bemoaned their regular trips to the supermarket as a form of torture. They identified sweets at the checkout, junk food in the aisles, licensed characters on packets, and products bearing premiums as major hurdles to overcome while shopping. The placement of snack foods at the checkout was considered by the interviewees to be a very deliberate strategy by store management to increase sales by making their lives miserable:

Talking about checkouts, that's a pain because they're very clever. They get you at a very weak spot there because the kids at that stage are tired and you want something to keep them quiet so you can get through your stuff. You tend to weaken a bit and you buy stuff at the checkout.

While it was acknowledged that some stores provide a "family" checkout aisle, it was noted that the waiting time at this aisle is usually longer because of the greater demand for the service than is being provided for by the store. As a result, the longer waiting time becomes just as great an inconvenience as the pestering that occurs at the other aisles.

According to the interviewees, the sheer amount of unhealthy food sold in stores means that requests can be endless and entire aisles can become no-go zones for weary mothers:

You name it, there's something in every aisle. Can we have chips, can we get lollies, can I have a treat, can I have a Kinder Surprise, can I have a Yowie? No, no, no, no.

The interviewees discussed at length the proliferation of licensed products that can be irresistible to children and therefore the source of heart-felt pleading. They were convinced that food manufacturers intentionally use cartoon characters and bright colours on packaging to capture children's attention and encourage them to request products from their hapless parents.

They seem to spot it a mile off, to be able to spot The Incredibles or whatever the latest thing is... They'll even take stuff that I know they're not going to eat because they've seen the picture on the front.

Grocery shopping with young children was often described as being similar in nature to psychological warfare. Mothers have to plan ahead to avoid product displays that are sure to incite excited and urgent pleas. They have to brave themselves for the onslaught of demands that need to be refused in such a way that the shopping trip can continue without excessive duress for all parties. Some mothers discussed how they organise baby sitting to avoid taking their children to the store. The picture painted was very different to Rust's (1993) interpretation of observations of mother and child grocery shopping. According to Rust, shopping with young children is a pleasant teaching and learning activity for parents and children. Perhaps his observational data were not able to show the level of internal discomfort experienced by the mothers observed.

The tendency for many producers of children's food products to use premiums to increase sales can be a further source of hardship for mothers. Premiums were associated in the mothers' minds with peer influence as once a child's friends had a particular premium it increased the pressure exerted by the child to buy the product. The fast food restaurant chains were noted as being particularly effective in their use of premiums, especially when the premiums are part of sets that become available gradually, thus necessitating multiple visits:

It really appeals to them, but that also makes them want to go back and they're nagging me to go back more than once a week because they want to get the next one. They're worried that they're going to change the promotion before we get back there... I noticed that they were trying to push us to come more often, there was something on the tele saying "Don't miss out", and the kids really wanted to go.

DISCUSSION

The findings from these interviews with well-educated and predominantly affluent mothers show that they perceive a range of external forces to interfere with their ability to exert an ideal level of control over their children's diets. Perceived control is an important element of consumer decision making as it has been related to the ability to perform tasks and tolerate frustration and the levels of self-confidence experienced when dealing with a particular product (Hui and Bateson 1987; O'Bearden, Hardesty, and Rose 2001). In addition, past research suggests that when individuals experience low levels of perceived control they form weaker intentions to enact the behaviour of interest (Kokkinaki 1999). In this case, mothers' perceptions of their lack of control over their children's diets could result in weaker intentions to monitor and manage their diets in the future. Mothers' perceptions of dietary control are thus important to understand and address.

The external forces that were perceived to be especially problematic included family members and other caregivers, the difficulties associated with managing family life, and the wearing effects of pestering. While each of these forces is acknowledged in different bodies of literature, it is rare for them to appear together in accounts of parental feeding practices. Understanding how these forces impede mothers' efforts to optimise their children's diets provides insight into how parents can be empowered to enhance health outcomes for their children. Specifically, the findings indicate that efforts could be made to: (1) develop family and community education programs to bring different carers' nutrition knowledge and behaviours more into line; (2) encourage the food industry to develop healthier convenience foods; and (3) introduce more stringent regulations to curtail the extent to which children are the targets of marketing activities.

Family and Community Education. Children look to their parents, teachers, and other caregivers for guidance on how to eat well and to support them in making appropriate decisions (O'Dea 2003). As noted by some marketing academics who oppose a more regulated advertising environment, parental influences on diet are strong and it is often the case that it is parents who are buying unhealthy foods for children in younger age brackets (Eagle et al. 2004). Educating parents and other carers about the ideal diet as defined by health authorities and providing them with the knowledge and skills they require to manage the effects of marketing activities and time deficits have the potential to make a positive difference to children's diets. In particular, a disconnect needs to be introduced between giving children a treat and feeding them unhealthy foods. Education programs could outline the various alternatives that are available that fulfil the same need to delight children. Community education needs to extend to the school environment to ensure school canteens are providing nutritious foods and actively demonstrating the ideal diet to parents and children (Glasson et al. 2004).

Healthier Convenience Foods. The growing reliance on convenience foods puts greater responsibility on the shoulders of food producers. In the WHO (2000) report titled *Obesity: Preventing and Managing the Global Epidemic*, the argument is made that the food industry has taken advantage of the tendency for fat to increase food palatability to enhance sales of processed foods. This is problematic as the highly processed nature of many foods prevents people from being able to determine energy density and regulate intake accordingly. As mothers increasingly rely on pre-prepared foods to assist them manage family meal times, there is a need for the food industry to develop and promote healthy convenience foods. The discipline of Consumer Behaviour can contribute much to this process by investigating the aspects of food preparation and consumption that determine the attractiveness of convenience foods to parents. The results can be used to develop and promote healthier food options.

Regulation. This is a contentious area as some believe self-regulation of the advertising industry is adequate for all audiences (e.g., Eagle et al. 2004), while others disagree on the basis that young children in particular are vulnerable to advertising because of their inability to differentiate between commercials and programming and their lack of awareness of the persuasive intent of advertising (e.g., McGinnis 2006). Numerous studies have demonstrated that the foods most heavily advertised on children's television are those that are high in fat, salt, and sugar (e.g., Zuppa, Morton, and Mehta 2003). Children are thus likely to receive competing messages about nutrition from the media and caregivers and as a result can be confused as to which is correct (Donkin et al. 1992).

The negative effects of advertising on children's diets are being increasingly appreciated (McGinnis 2006; WHO 2004), although direct causation is difficult to demonstrate and indirect effects are suspected to be substantial (Hastings et al. 2003; Livingstone 2005). As the evidence mounts it is hoped that governments will heed the concerns of parents and health agencies and act to protect children from marketing forces against which they have little immunity.

In conclusion, there is growing agreement that the childhood obesity problem needs a multi-sectoral solution that includes the efforts of governments, international agencies, the media, communities, the food industry, and consumers (McGinnis 2006; WHO 2000). Such efforts could improve parents' real and perceived control over their children's diets and thus empower them to improve their children's health outcomes. Parents continue to play a critical role in addressing childhood obesity, but the issues identified in this research demonstrate that they require assistance in the face of numerous adverse environmental forces.

Relationships Can Disappear in a Puff of Smoke: A Test of TMT and Risk Perceptions on Smoking Behavior

Ingrid M. Martin, California State University-Long Beach, USA

Michael Kamins, University of Southern California, USA

EXTENDED ABSTRACT

In old Hollywood movies, it is difficult to avoid a recurring scene in which the condemned man is granted a last wish, which more often than not turns out to be a “final cigarette”. Although we all know that cigarette smoking is “hazardous to your health”, when staring mortality in the face, who can blame the smoker when he/she takes a last long puff and exhales into eternity. When death is made salient, consumers react in ways designed to manage the terror brought about by that realization, which is the essence of Terror Management Theory (Goldenberg, et al. 2000). According to the theory, in reaction to the terror, the individual engages in psychological defenses which function as a means by which one can obtain and maintain a sense of self-esteem within their meaning system. In short, they behave in ways which enhance their self-esteem and reaffirm the vibrancy of their life. Hence, anti-smoking ads which make the risks of negative health effects prominent, may simply serve to motivate individuals, who derive their self-esteem from smoking, to continue smoking. This can and has been found to result in a boomerang or “Forbidden Fruit” effect by increasing smoking behavior, which is of course, at odds with the original intention of the advertisement. Clearly another approach is needed in an effort to convince smokers not to smoke.

We believe that Terror Management Theory, may hold the key to providing the theoretical rationale for the effectiveness of an anti-smoking campaign which makes salient “social disapproval” mortality as opposed to “physical” mortality, since young adults aged 18-24 years old may be of the opinion that the risks of health effects to smoking lie on a distant time horizon to which they are relatively immune. Indeed, a “social disapproval” mortality approach to an anti-smoking campaign may be found to be more effective in general, than emphasizing health effects for smokers of all ages, particularly if the optimism bias is widespread across demographic age groups.

In this research, we investigate the impact of mortality salience and smoking self-esteem on whether college-age smokers will comply with anti-smoking messages and the impact of those messages on health risk perceptions. For those who in part, derive their self esteem from smoking, feeling good about oneself is a crucial way for such individuals to feel secure and protected from anxiety and in the extreme, serves to insulate them from an awareness of the potentially negative health consequences of the behavior and their susceptibility to these consequences. However, the derivation of self esteem through smoking may make such individuals susceptible to a campaign highlighting when smoking can lead to negative social consequences. Hence, we predicted an interaction between mortality salience and smoking self esteem. In addition, we investigate the influence that mortality salience and smoking self esteem has on smokers’ perceptions of the health risks—both to themselves and to others around them.

To test the hypotheses, 137 college-age smokers participated in this study. The methodology followed the process used in TMT research (Pyszczynski, et al. 2004). Participants viewed two anti-smoking messages and then completed the smoking self-esteem scale. The two messages were focused either on health effects or on the social disapproval related to smoking. The PANAS-X scale was administered to determine if negative affect was confounding the results. This was followed by a distracter task unrelated to the research question and then the dependent measures of behavioral

intention to quit smoking and health risk measures were taken. The entire experiment was conducted in an online environment. The results show no significant effects of fear arousal or affect on the anti-smoking messages, thus providing support for mortality salience.

A set of 2x2 ANOVAs with planned contrasts was conducted to investigate the impact of self-esteem (high versus low smoking self-esteem) and mortality salience (health versus social mortality) on behavioral intent among college age smokers. Results revealed a main effect for mortality salience ($F_{1,133}=28.02, p<.0001$) and a marginal effect for Smoking Self Esteem ($F_{1,133}=3.58, p<.06$) as well as a significant interaction effect ($F_{1,133}=4.32, p<.04$).

A pair of 2x2 ANOVAs was run to determine the impact of self-esteem and mortality salience on risk perceptions among smokers both for themselves and others. The results of the ANOVA for the health risk measure, revealed a significant main effect for mortality salience ($F_{1,133}=11.27, p<.001$) for the risk perceptions linked to the smoker. That is, those individuals who viewed the social mortality message perceived the risk of smoking to their health as significantly higher than those who saw the health effects message ($M=5.4$ vs. $M=3.4$). We also investigated the risk perceptions of participants related to others in the form of second hand smoke in a 2x2 ANOVA format which again revealed a significant main effect for mortality salience ($F_{1,133}=16.71, p<.0001$). That is, those individuals who viewed the social mortality message perceived the risk of smoking to others in the form of second hand smoke as significantly higher than those who saw the health effects message ($M=4.60$ vs. $M=3.84, F_{1,133}=16.71, p<.0001$). There was no significant smoking self esteem main effect ($M=4.10$ v. $4.33, F_{1,133}=1.60, n.s.$).

Overall, we found that advocating social norms is more effective compared to advocating health effects messages for smoking behaviors. We also found that focusing on the interaction between self-esteem and different thematic approaches has an impact on whether smokers will consider reducing their smoking behavior. The implications of these findings are that attention should be paid to the manner in which anti-smoking messages are positioned to increase the probability of compliance with these types of messages. We also see that by using a health effects message, public policy and consumer behavior researchers are actually increasing the probability of noncompliance among college-age smokers. This research provides an extension of TMT research into the arena of using actual death-related visual images such as anti-smoking messages. In this study, actual PSAs were used to test the impact of mortality salient messages compared to esteem-enhancing messages as a means to communicate risks concerning smoking.

The Dark Side of Brand Community: Inter-Group Stereotyping, Trash Talk, and Schadenfreude

Thomas Hickman, Loyola University, USA

James Ward, Arizona State University, USA

ABSTRACT

Prior work on brand communities has emphasized the positive aspects of community participation on brand involvement and loyalty. Qualitative studies have noted the possibility that involvement in brand communities may encourage participants to adopt disparaging views of rival brands and their users, but little research has tested these assumptions using structured measures. The present study investigates the relationship between identification with a brand community, and such “dark” behaviors as inter-group stereotyping, “trash talking” rival brand communities, and feeling pleasure at the misfortune of rival brands and their users.

The sociological aspects of consumer behavior, and in particular the phenomena surrounding membership in brand communities, have become a focus of increasing research attention in recent years. Prior work (e.g., Muniz and O’Guinn 2001; McAlexander, Schouten, and Koenig 2002; Muniz and Schau 2005; Algesheimer, Dholakia, and Herrman 2005) has concentrated on exploring the effects of community membership on loyalty toward a brand, and the effects of participation on involvement with other brand loyal consumers. The potential for brand community membership to provoke negative attitudes and actions toward rival brands and their users has been noted, but not systematically investigated using structured measures. The focus of the present paper is to explore how loyalty to one brand community provokes negative views of not only rival brands but their users. Moreover, we introduce and explore the concept of “trash talk”—negative communication about a rival brand provoked not by specific unsatisfactory experiences with the brand (like negative word-of-mouth) but instead provoked by a sense of inter-group rivalry. Our study furthermore explores the effect of inter-group stereotyping on emotions toward the rival brand, and particularly the emotion of “schadenfreude,” a German term denoting pleasure felt in response to another’s misfortune. The present study’s investigation of the relationships among identification with a brand community, negative stereotyping of rival users, “trash talk,” and feelings of schadenfreude makes distinctive contributions to consumer research.

THE POSITIVE EFFECTS OF BRAND COMMUNITY PARTICIPATION

Past research on brand community participation has emphasized the effects of participation on brand loyalty. Schouten and McAlexander (1995) explored how participation in the Harley-Davidson motorcycle subculture encouraged users to link their biker personas more closely to the Harley-Davidson brand. They observed that participants in the brand community required ownership of a Harley-Davidson to be accepted an authentic “insider” in the community. Once inside, they noted that community status was related to the purchase of progressively higher status Harley-Davidson bike models. Members also engaged in status competition with respect to the assemblage of “authentic” branded parts, accessories, and apparel related to their biker persona. As members became involved in user groups such as “HOG” (the Harley-Davidson Owners Group), they became bound to the brand through social ties to other members. Through these ties, the Harley owners studied exchanged mutual ratification and social support in their usage of the brand. Schouten and McAlexander (1995) note, but do not emphasize, the tendency of Harley owners to make invidious

distinctions between Harley-Davidson and other motorcycle brands, especially Asian brands.

Muniz and Schau (2001) explored the positive aspects of brand community among Macintosh and Saab owners. The researchers investigate how brand communities are defined by, and engender, shared consciousness, rituals and traditions, and a sense of moral responsibility among members to the brand and one another. Muniz and Schau observed that participants in brand communities tend to develop a “consciousness of kind,” a sense of “we” versus “them.” The positive consequences of this sense of wholeness included, in their observation, a focus on rituals and traditions involving celebration of the brand’s distinctive, positive qualities often through the sharing of stories about the brand’s extraordinary performance (e.g., the ability of Saab’s to negotiate icy roads or the power of Macintosh computers to render graphics). Moreover, they found that participation in a brand community entailed a sense of “moral responsibility” to the brand and fellow owners. Thus, community participants felt an obligation to recruit new members to the community, encourage new users to become involved with the brand, and lend technical as well as moral support to fellow users. In a later study, Muniz and Schau (2005) found that participants in the Apple Newton brand community displayed a devotion to their obsolete brand bordering on religious fervor. As Newton users interacted with one another, they constructed a shared mythology emphasizing the unfair abandonment of their brand, its miraculous abilities, and its potential resurrection in the form of a rumored new model. They found that community participation and interaction tended to reinforce the reality of this brand mythology encouraging users to continue to use an outmoded technology.

Building on past work, Algesheimer, Dholakia, and Herrman (2005) introduced a conceptual model emphasizing the relationships among brand community identification, community engagement, normative community pressure, brand loyalty, and such behavioral correlates of loyalty as brand re-purchase. Their study emphasizes the positive impact of community identification on community engagement and loyalty behaviors, but notes that community engagement can also result in an unwelcome feeling of reference group pressure to conform to community norms for participation and brand use. Algesheimer et al (2005) test their model using structured measures and a large sample of European car club members. Their study illustrates an effort to test and quantify insights about the largely positive effects of brand community using structured measures drawn from prior work in social psychology. Our study follows in this tradition, but focuses on the “dark side” effects of brand community.

THE “DARK SIDE” OF BRAND COMMUNITY IDENTIFICATION

Past work, particularly in the qualitative research tradition, has noted that brand community members may define their identities in opposition to rival brands. For example, Muniz and Schau (2001) discuss the concept of “oppositional brand loyalty.” They observe that groups define themselves not only in terms of who they are, but who they are not. They observed that Macintosh users were prone to view themselves as different from, and perhaps better than, PC and Windows users. In general, Apple users seemed to characterize themselves as more individualistic and creative than PC and win-

dows users, dimensions convergent with Apple's brand image as a computer for creatively inclined individualists. In a later qualitative study of the Apple Newton community, Muniz and Schau (2005) likewise found that Newton users contrasted themselves favorably with the users of more mainstream PDAs. In particular, they seemed to view themselves as more individualistic, creative, and technically adept than mainstream PDA users. In both studies, Muniz and Schau suggest that inter-group rivalry, and particularly the threat users of a small market share brand felt from dominant competitors and mainstream users played a role in the genesis of hostile views toward the out-group. Although Muniz and Schau have provided rich qualitative insight into what brand community members say about rival users, little work has so far investigated these perceptions using structured measures. Moreover, the influence of inter-group rivalry on the perception of rival users personalities, although hinted at by Muniz and Schau's work, has been little investigated. Finally, the relationship of negative inter-group stereotyping to community members' communications about rival brand communities and their emotions toward these communities has been little explored by past studies.

In recent work, Escalas and Bettman (2005) found that consumers felt stronger self-brand connections to brands whose images were consistent with the consumers' in-groups, and felt less connection to brands whose images were not consistent with their in-groups. Furthermore, they found that brands whose images were consistent with consumers' out-groups were less likely to be rated as close to the self. Their study demonstrates the powerful effect of group membership on the brand-self connection. Relevant to "dark side" effects, they show that consumers are reluctant to connect brands associated with out-groups to their self-image. However, their study little explores the potential for highly identified brand community members to derogate out-group brand users, engage in negative communications toward these users, or feel pleasure at their misfortunes.

THEORETICAL FRAMEWORK: SOCIAL IDENTIFICATION, STEREOTYPING, AND BRAND-RELATED TALK

Henri Tajfel, an influential scholar in the development of social identification theory, defined social identification as 'the individual's knowledge that he belongs to certain social groups together with some emotional and value significance to him of the group membership,' (Tajfel 1972, p. 292 as cited in Hogg and Terry 2000). When individuals adopt a social identity, they are motivated to think of themselves as positively distinct from other groups. Thus, social identification implies inter-group stereotyping. When a consumer identifies himself or herself as a member of a social group (e.g., a young person or an old person) or, more relevant to the present study, a member of a brand community, that consumer will have a natural tendency to seek information that positively discriminates his or her own brand community from others (Hogg and Terry, 2000). In most cases, consumers seek favorable information about their own group, and either seek or accept negative information about others groups. Inter-group stereotyping is especially likely to emphasize the negative aspects of out-groups that are perceived as in competition for scarce resources or threatening. In the case of brand communities, the threat posed by one brand to the resources of another may not at first be apparent. However, consumers may be aware that dominant brands often seek to eliminate weaker brands from the market, and thus deny further purchase of the brand to loyal users. Muniz and Schau (2001) note such concerns among Apple computer users. In communities of sports fans, rivalry over which team (and set of fans) will win a game and

eventually progress to championship games is likely to encourage inter-community hostility.

Trash Talk

Social identification theory predicts that group members have a strong motivation to portray their group in a positive light (Spears, Doosje, and Ellemers 1997; Tesser 2001). Drawing on social identification theory, Schnake and Ruscher (1998), leading scholars in understanding intra-group communication about out-groups suggest that motives to create a positively differentiated group identity and build group cohesion typically encourage group members to develop and repeat shared negative beliefs about out-groups. In a series of studies (e.g., Ruscher and Hammer, 1996; Schnake and Ruscher, 1998; Beal, Ruscher, and Schnake 2001), Ruscher and colleagues have confirmed that in-groups are strongly motivated to develop negative views of out-groups that tend to be repeated and affirmed in intra-group communication. These negative beliefs help the in-group achieve a sense of positive differentiation from other groups, and promote intra-group cohesion. In the present study, we borrow a term from the sports world to describe such negative intra-group communications about rival brands and their users. We use the term "trash talk" to describe such communications to underline the differences between trash talk and "negative word-of-mouth," the type of negative consumer communication most often studied by marketers. In past studies, negative word-of-mouth has usually been conceived and studied as negative communication about a brand resulting from a specific unsatisfactory experience with the brand. Thus, the assumption has been that negative communications about a brand are most likely to result from the purchase or use of the brand, and the failure of the brand to perform to an expected level. Thus, negative word-of-mouth has been conceived as originating from individual transactions and largely controllable causes. In contrast, trash talk arises from the desire of brand communities to positively differentiate themselves from rivals, is a fundamental sociological process, and is largely uncontrollable.

Hypotheses

Figure 1 depicts the full model tested in the research. All relationships are hypothesized as positive unless noted. The model begins with the construct of social identification. The study predicts that consumers who identify more with a brand community, will be more likely to hold negative stereotypes of out-group brands, and in particular the users of these brands. The model in particular predicts that consumers who identify more highly with their own brand community will perceive members of rival brand communities to be less warm and less competent than members of their own community. Our focus on warmth and competence is drawn from work by Fiske, Cuddy, Glick, and Xu (2002) who found that in-groups structure their perceptions of out-groups along two primary dimensions: warmth and competence. We thus predict that:

- H1: Brand community members who identify more strongly with their brand community will (a) rate their brand as better than rival brands, (b) will perceive their fellow brand community members to be more warm than the members of other brand communities, and (c) will perceive their fellow brand community members to be more competent than rival community members.

We further predict that consumers who have a stronger bias against rival brands will engage in more intra-group "trash talk" about the rival brand. Moreover, we predict that brand community

FIGURE 1

members who perceive their members as more warm (rivals as more cold) will engage in more trash talk about the rival brand community. In addition, we predict that brand community members who perceive their own community members as more competent (rivals as less competent) will engage in less trash talk about the rivals, since they represent less of a threat to their personal brand community and identity.

H2: Brand community members who report more inter-group bias on (a) brand ratings and (b) user warmth ratings will report engaging in more intra-group trash talk about the rival brand. However, (c) group members that report more inter-group bias on the competence dimension will report less frequent intra-group trash talk.

In addition, we predict that brand community members who engage in more intra-group trash talk about rival brands will emerge as “apostles” of the rival brands failings to people outside the brand community. Thus, we predict that:

H3: The level of intra-group trash talk is positively related to respondents’ tendency to communicate negatively about a rival brand to people outside the brand community.

INTER-GROUP STEREOTYPING, COMMUNICATION, AND SCHADENFREUDE

The emotional feelings that rivals have for each other cannot be taken lightly. The animosity typically spills over to feelings of satisfaction and joy whenever the rival suffers failure. Schadenfreude is a social hostility that has been defined as the malicious pleasure that an individual or group derives by observing the failure of a relevant out-group (Feather and Sherman 2002; Leach, Spears, Branscombe, and Doosje 2003). Leach et al (2003) believe that while schadenfreude is directed at others, it is essentially a product of self-identity. They lend further insight with their finding that Dutch soccer fans with a higher interest with the sport experienced more malicious pleasure at the failures of German soccer than did those fans who responded lower on the interest scale. Put another way, those with greater passion for their team felt greater joy in the

demise of their rival. As a result of the close connection between social hostility, trash talk, and schadenfreude we believe that:

H4: Group members who report more frequent trash talking will experience higher levels of schadenfreude

METHODOLOGY

The hypotheses were tested in a field study using actual members of two sets of competing brand communities. We sought two sets of brand communities meeting a number of criteria. In each set, we sought two communities of consumers devoted to rival brands. Although little investigated, communities of users who perceive themselves in competition with rival brands are common (PC vs. Apple users, Chevy vs. Ford owners, fans of rival sports franchises). For the present study, two sets of brand rival brand communities in widely different industries were chosen. One set of rival communities included a user club devoted to Apple computers and a user group devoted to personal computers (PCs). The other set of rival communities included fan clubs devoted to two college football teams—one devoted to the University of Iowa and one devoted to Purdue. Although seemingly not a classic “brand” context, sports teams are brands that a large percentage of the world’s population spend time and money to support. Moreover, inter-community rivalry can be intense in these communities (e.g., the riots that sometimes accompany soccer competitions around the world). Although not classic rivals, the fans of Iowa and Purdue compete in the same conference, and thus issues of which brand is the “best” are salient.

The research team attended group meetings and events prior to the collection of structured measures to better understand the social dynamics of each community and build trust. We found that each user group—the Apple club, the PC club, the Iowa fan club, and the Purdue fan Club—was a living brand community with at least 50 active members. Each club meant periodically (usually about monthly) to celebrate its brand. At the computer user group meetings, participants focused on talking about their own brands, but also indulged in comparing their computer brand to rivals, usually to the rival’s disadvantage. The research team observed the classic signs of brand community in each group—consciousness of kind, a

sense of moral responsibility to the group, and special catch phrases describing the brand and its rivals (Muniz and O'Guinn, 2001). Moreover, variance in devotion to the brand was observed among the active members of each of the four brand communities.

The leadership of each club agreed to encourage members to complete a set of structured measures. The structured measures were distributed to club members via e-mail lists that each club maintained. Each respondent completed a survey that included a three item social identification scale adapted from Elmers, Van Knippenberg, and Wilke (1988). (Example item: "I identify with this group" measured on a 7 point strongly agree-strongly disagree scale). Respondents rated their image of their own brand (e.g., Apple) and their rival brand(s) (PC computers) on a three item brand image scale adapted from Brown (1995). (Example item: "Compared to all other brands, I believe Macintosh to be the very best" on a strongly agree-strongly disagree scale). In addition to brand images, respondents rated their image of the users of their own brand and rival brand(s) on scales measuring "warmth" (three items) and "competence" (three items) adapted from Fiske, Cuddy, Click, and Xu (2002). (Example items are: "How warm are members of this group?" "How competent are members of this group?") Once again, these items were measured on seven point strongly agree-strongly disagree scales. Participants rated their propensity to engage in "trash talk" about their rival brand(s) to other group members on an adaptation of Homer's (1995) scale of within group communication. This scale included three items measured on seven point always-never scales. (Example item: "Other group members and I talk about how negative we feel about [the rival]"). Respondents reported their tendency to "trash talk" rivals to people outside their group on a three item word-of-mouth scale adapted from Zeithaml, Berry, and Parasuraman (1996). (Example item: "Say negative things about [the rival] to other people" measured on a seven point very likely-not very likely scale).

As part of the survey, respondents read a scenario that describing a blow to the brand equity of the rival brand. In the computer users groups, respondents read a scenario in the form of a news article describing a serious virus afflicting the rival brand of computers. In the college football fan clubs, participants read a scenario describing their rival team reeling from scandals involving player recruiting violations and player misconduct off the field. Following exposure to the scenario, respondents were asked to rate how they felt about reading news of their rival's misfortune. The respondents' tendency to feel schadenfreude was measured on a three item scale adapted from Feather and Sherman (2002). (Example item: "I would feel joy" measured on a seven point strongly agree-strongly disagree scale").

RESULTS

The Apple club completed 108 surveys, the PC club 64, the Iowa club 77, and the Purdue club 105. Relative to the number of "active" members of each club (subjectively estimated on the basis of recent event attendance), roughly half the active members of the computer user groups responded to the survey, and roughly one third the active members of the college fan clubs responded.

In order to assess the hypotheses, we utilized structural equation modeling (SEM) with the Analysis of Moment Structures (AMOS) 5.0 software developed by Arbuckle (2003). Prior to analysis, we computed difference scores to measure intergroup bias. For each respondent, we computed the difference between the respondent's rating of their own brand and their rival brand (or set of brand when PCs as a group of brands are considered) on the 1) brand image ratings, 2) user warmth ratings, and 3) user competence ratings. For example, to the extent a respondent rated his or her own brand as better than a rival brand, the resulting difference

score would be more positive. Thus, a positive regression coefficient relating social identity and inter-group brand image bias would mean that as respondents reported identifying more highly with their own group, they tended to rate their brand more positively relative to the rival brand. All measures had Cronbach's alphas greater than .7.

The hypothesized model (recall Figure 1) had a good fit to the data according to the CFI of 0.936 and the RMSEA of 0.079. Moreover, discriminant and convergent validity were tested through a matrix of latent variable scores and individual indicators variables. We found that virtually all the indicator variables were more highly related to their intended latent variable than other latent variables. Overall, the factor loadings displayed strong convergent and discriminant validity.

Hypothesis H1a predicted a positive relationship between social identification with a brand community and inter-brand bias as measured by the brand image measure. This hypothesis was supported by the data. These measures were related by a .473 regression coefficient with a critical ratio of 5.23, significant at $p < .001$. As respondents identified more highly with their own brand community, their tendency to rate their own brand as better than rival brands increased.

Hypotheses H1b and H1c predicted, respectively, that respondents who identified more strongly with their own brand community would tend to rate users of their brand as more competent (H1b) and more warm (H1c) than users of rival brands. These hypotheses were confirmed. As respondents reported higher levels of identification with their own brand community, they rated users of their brand as more competent than users of rival brands (Regression estimate=0.234, critical ratio=5.021, $p < .001$). More identified respondents rated users of their brand as more warm than users of rival brands (regression estimate=.305, critical ratio=6.12, $P < .001$). These results demonstrate that brand users who feel a stronger sense of social identity with their brand community not only feel that their brand is better than the rival, they feel that users of their brand are both more competent and warmer than users of a rival brand. These findings are thus among the first to demonstrate that brand community involvement can result in inter-group stereotyping on such broad dimensions of person perception as competence and warmth.

Hypothesis 2a predicts that brand community members who report a higher degree of bias in favor of their brand's image over their rival brand's image will report a greater tendency to trash talk the rival brand within their own brand community. This hypothesis was confirmed (regression coefficient=0.150, critical ratio=3.57, $p < .001$). Hypotheses 2b and 2c make contrasting predictions about the effect of inter-group bias on the dimensions of warmth versus competence on within group trash talk about the rival brand. Hypothesis 2b predicts that respondents who report that their own brand community members are more warm than rival community members will tend to indulge in more trash talk about the rival brand. Hypothesis 2b was confirmed (regression estimate=0.231, critical ratio=2.79, $p < .01$). Hypothesis 2c predicts that respondents who perceive that their own community members are more competent than the members of the rival community will be less prone to trash talk the rival brand. Convergent with Fiske et al (2002), brand community members who perceive their rivals to be less (vs. more) competent will perceive them as less of a threat, and thus feel less of a need to derogate their brand within their own community. Hypothesis 2c was confirmed (regression estimate=-0.228, critical ratio=-2.52, $p < .05$).

Hypothesis 3 proposed that the level of intra-group trash talk should predict trash talk to people outside of the brand community. The model shows strong support of H3 (regression estimate=0.333, critical ratio=-6.82, $p < .001$). Thus, users who are prone "trash talk"

rival brands to their own brand community members emerge as more likely to be “apostles” of negative word-of-mouth about the rival to people outside the community. The relationship between brand community loyalty and the tendency to engage in negative word-of-mouth about rival brands prompted by inter-group bias, not specific negative experiences, has been little documented in past studies.

Finally, hypothesis H4 predicted that individuals who were active in derogating a rival brand to fellow brand community members would be especially prone to derive pleasure from news of their rival’s misfortune. Once again, this hypothesis was confirmed (regression estimate=0.168, critical ratio=4.24, $p<.001$). Apparently, highly identified community members who enjoy deriding rival brands also derive emotional pleasure (schadenfreude) from news of their rival’s failures. Perhaps they perceive such news as confirming their own position and providing fodder for further negative talk about their rival brand.

General Discussion

Bhattacharya and Elsbach (2001) illustrate the fire and ice relationship that an in-group and an out-group can have by demonstrating that organizations with a strong and divisive set of values tend to spark feelings of support or opposition and lead to highly polarized opinions. This research amplifies the importance of strong brand communities by providing an in-depth examination of brand community members’ judgment of rival brands and rival brand users. By implementing a quantitative methodology, linkages were found that demonstrated that those members who more strongly identified with the community were more likely to engage in intergroup stereotyping. In turn, this stereotyping was shown to lead to active derogation of the out-group as measured by trash talking. Finally, it was shown that those members who most actively trashed the rival and its users within the group were the most likely to trash the rival to members outside of the community and were the most likely to experience schadenfreude.

Theoretical Implications

This study extends the theoretical knowledge of previous inquiries into our comprehension of brand community behavior by examining two sets of rival brand communities and their perceptions of the rival group. Because this research utilized quantitative measures, it represents one of the most systematic analysis of the impact of social identification of the brand community on the dimensions measured.

This study was also able to successfully extend the work of Fiske et al (2002) through usage of a new construct introduced to the literature—trash talk. It was shown that as brand community members view users of a rival product as increasingly cold that the derogatory commentary directed at the out-group product will increase.

The necessity of the introduction of the trash talk construct becomes clear once the distinction is drawn between it and its more commonly studied predecessor—negative word of mouth. Trash talk is the unusual assessment of negative word of mouth that the commentator has no previous experiences with and has no intentions of using. This lack of usage is diametrically opposed to traditional word-of-mouth studies that rely on past usage with the product.

Finally, this research explored schadenfreude, or the malicious pleasure in the suffering of another. While social psychology has given the topic some recent consideration (Feather 1999; Hareli and Weiner 2002), schadenfreude has largely been neglected in the consumer research arena. Despite the oversight, schadenfreude has

been conjectured about for nearly 200 years dating back to 1817 with Adam Smith’s essay. He stated that, “The hatred and dislike, in the same manner, which grow upon habitual disapprobation, would often lead us to take a malicious pleasure in the misfortune of the man whose conduct and character excite so painful a passion” (Smith 1817/1997). True to the words of Adam Smith, this study showed that brand community members that had a higher propensity to derogate a rival within the brand community were more likely to take pleasure in the hypothetical demise of the rival brand.

Limitations

Like any study, this research is not without its limitations. In terms of data collection, members who are more attached to the group might also be more motivated to complete a survey that allows them to state their feelings about the group. This problem is somewhat mitigated in that academicians and brand managers alike are interested more with the thoughts and actions of dedicated brand community members than they are with peripheral members.

A second limitation is that the sample size collected for each group was too small for individual analysis. This shortcoming is balanced by the fact that the study grouped four diverse brand communities. It was shown that the theory was able to hold across a number of contexts, which is a cornerstone of generalizability. Similar studies utilizing brand communities should have an understanding of this potential shortcoming and choose communities with a large enough base to increase the likelihood that at an adequate sample will be collected to test the hypotheses of the research.

A Meta-Analysis of Humor Effects in Advertising

Martin Eisend, Freie Universität Berlin, Germany

EXTENDED ABSTRACT

Although the pace of humor research in advertising has quickened over the past decades, the body of empirical evidence regarding humor effects in advertising remains equivocal. Previous qualitative reviews barely provide generalizable conclusions on the question *if* humor is effective or *when* humor in advertising is effective. Both issues, the search for generalizable results and for factors that moderate the impact of humor in advertising are specific tasks to be addressed by application of a meta-analysis. Assumptions for the analysis are based on theoretical models and on previous qualitative reviews.

Theoretical Models and Previous Qualitative Reviews

Two types of models, cognitive and affective, have been used to explain the impact of humor in advertising. The models suggest a positive impact of humor on attitude towards the ad (A_{AD}), attitude towards the brand (A_{BR}), purchase intention and behavior. Effects on attention, comprehension, recall, and recognition may be positive in case humor impact follows an information processing perspective. However, if humor causes distraction, humor decreases elaborate processing and reduces cognitive responses (CR); it harms comprehension and probably also memory effects. The overall conclusions reached by the authors of previous qualitative reviews are fairly consistent with respect to some of the outcome variables. They infer that humor attracts attention and awareness, enhances source liking (A_{ADV}), ad liking, and brand liking, but is not very effective in bringing about actions/sales. However, it is not clear if humor detrimentally affects comprehension and recall or not, if it enhances or decreases source credibility, and if it is more persuasive than serious messages or not.

Previous studies vary with respect to several characteristics related to product, placement, humor, and method that have been discussed as possible moderating variables in the literature. Advertisers believe that humor is best suited for low involvement products, particularly for hedonic/feeling products compared to functional/thinking products. Humorous ads are said to be more successful for existing than for new products. Furthermore, ad executives believe humor to be most suited in radio and TV-advertising compared to print advertising. Humor seems to work best for younger and well-educated consumers, particularly males. Two method factors may be important that allow for more control and should hence lead to increased effects: the way the control ad is chosen and if humor research is field research or performed as laboratory study. The crucial moderating factor, however, is apparently the humorous stimulus. Advertisers seem to conceive humor as the degree of personal recognition and appreciation of humor. Humor ads that vary in the level of humor they evoke in the target audience lead to variations in advertising effect variables as well. The relationship between humor intensity and ad effectiveness can be conceived as either linear or curvilinear.

Method

The literature search for the meta-analysis revealed 64 studies investigating the impact of humor in advertising; 47 studies provided enough data to calculate relevant effect sizes. The effect size metric selected for the analysis is the correlation coefficient between humor and dependent variables. Since most papers reported multiple measures, also multiple effect sizes from single studies for particular relationships were included. Altogether, 443 effect sizes were available for the purpose of the meta-analysis. Integration of

effect sizes is performed based on sample size weighted and attenuation corrected correlations. In order to consider multiple measures per study, correlations between the same constructs from a single study were averaged for integration purposes. If the integration of effects sizes yielded heterogeneity, a WLS regression analysis applying moderator variables was performed. Moderator variables were coded by two coders based on information given in the studies.

Results

The integration results show that humor significantly enhances A_{AD} , A_{BR} , attention, comprehension, cognitive responses, positive emotions, purchase intention, recall and recognition. Humor reduces credibility and negative emotions. Humor has no impact on A_{ADV} , distraction, and purchase behavior.

The results of the moderator analysis come up with rather consistent findings. Contrary to expectations, humor works better in influencing attitudes for high involvement products and thinking products than for low involvement or feeling products. No effects were found for established vs. new brands. Also media have an effect that contradicts previous assumptions: humor effects are stronger for print media than for broadcast media for A_{AD} . Ads are also more liked when the program context is rather humor incongruent than congruent. Repeated exposure enhances A_{BR} , but shows no effect on other dependent variables. Finally, reception in social group leads to less attention compared to reception of humorous ads alone. No difference was found for different demographic groups. Also culture does not influence attitudes and memory, but attention: humorous ads do enhance attention particularly for US consumers compared to other countries. Methodological factors impact only the attention measure such that more controlled ads and laboratory studies enhance the effects on attention.

Results of nonlinear regressions of humor intensity on ad effectiveness show that perceived humor does not affect A_{AD} or attention, but brand attitudes and memory. While A_{BR} increases with perceived humor which is in line with the idea of conditioning theory, memory effects rather follow a curvilinear relationship for humor intensity; particularly, they increase with strong levels of humor intensity.

Discussion

The results go against some previous assumptions of advertisers who believed that humor is mostly appropriate for low involvement products presented in broadcast media. The managerial implications of those generalized results seem quite obvious.

The results give first evidence that humor rather impacts variables as suggested by affective models; humor does not lead to distraction, but shows an effect on attention and memory. The results let us also question the idea that humor effects are either based on mere affective reactions or mere reasoning, rather it seems that both processes play an important role for humor effects and can interfere to some extent. Particularly, memory effects seem to be related to affective reactions as well. Further conceptual developments should allow for bringing together reason and affect in order to explain the impact of humor in advertising more thoroughly.

The considerations have tentative character and need further proof, preferably by applying causal models to the data against the background of different conditions of the studies, e.g. high involvement vs. low involvement conditions.

EXTENDED ABSTRACT

In recent years there has been an increased interest in studying the effects of power over different consumer behaviors and cognitive processes, including the context of consumer decision making (Flurry and Burns 2005; Roedder-John 1999; Webster 1996), marketing (e.g., Berthon, Pitt, Ewing and Bakkeland 2003; Hunt and Nevin 1974, Rosenberg and Stern 1971) and purchasing behavior (Joy, 2001; Ruth, Otnes, and Brunel 1999; Rugimbana, Donahay, Neal, and Polonsky 2002), choice of selling and influence tactics (Anderson, Lodish, and Weiz 1987; Gaski and Nevin 1985; Keith, Jackson and Crosby 1990; Kim and Hsieh in press; Mallalieu 1998), and budgeting (Henry 2005).

Despite this importance, very little research has been done relating power and persuasion (e.g., Festinger and Thibaut 1951; French and Raven 1959). The present research provides a first and initial step to address this gap by examining whether power can influence consumer attitudes by affecting the confidence people have in their own thoughts.

Building on previous research demonstrating that power is associated with approach tendencies (Galinsky, Gruenfeld, and Magee 2003), we argue that greater levels of power might be associated with increased confidence in one's thoughts. Because power singles action, individuals can be confident in and rely upon whatever thoughts they have in response to an advertisement.

This reasoning leads to the prediction that if power does influence the confidence with which people hold their cognitive responses (study 1) to an advertisement, we would expect high power to increase thought effects on attitudes relative to low power (Briñol, Petty, and Tormala 2004). One way in which the direction of the thoughts (favorable or unfavorable) in response to the ad can be manipulated is by varying the quality of the arguments contained in the ad (study 2). Another approach to vary thought-direction consists of asking consumers to think about positive and negative aspects of a given proposal (study 3). If power does influence the confidence with which people hold their cognitive responses to advertisement, we would expect power to increase thought-direction (e.g., argument quality) effects.

This finding would be important because it would a) suggest an entirely unexplored role for power in the persuasion process, b) introduce a new variable for the existing work on self-validation, and c) provide a completely new mechanism for the literature of power.

Experiment 1

Eighty participants were randomly assigned to the high-power or low-power conditions in a between-subjects design. Power was manipulated by asking participants to play the role of a supervisor or an employee in a work simulation game (Galinsky, et al. 2003; Kipnis 1972). Following this induction, participants rated their confidence and feelings of power. We predicted and found that participants in the high-power condition felt more confident and powerful than low-power individuals. After demonstrating the link between power and confidence, we tested the role of power (confidence) in consumer persuasion.

Experiment 2

Eighty-two participants were first exposed to a printed advertisement promoting a new cell phone containing either strong or weak arguments. Argument quality was varied in this study to lead participants to generate mostly positive or negative thoughts toward the consumer product. After participants read the ad and wrote their cognitive responses about it, power was experimentally induced using the same role-playing technique described in experiment 1. Finally, all participants reported their attitudes toward the product.

If power does influence the confidence with which people hold their thoughts, we would expect power to increase the argument quality effects, that is, more persuasion with the strong than the weak ad. In line with this self-validation hypothesis, we found that the effect of argument quality on consumer attitudes was greater when consumers had high rather than low confidence in their cognitive responses. Thus, with relatively high confidence, consumers relied on their thoughts in forming attitudes, but with relatively low confidence, consumers did not use their thoughts to judge the product (producing a lower attitude-thought correspondence). Experiment 3 turned to examine the proposed a mechanism as well as test the plausibility of rival explanations.

Experiment 3

In order to manipulate the direction of participants' thoughts (i.e., negative or positive), sixty-eight participants were asked to write arguments supporting or opposing a new university policy. After listing their arguments, we manipulated power by asking participants to remember two situations in which they had power over others (high-power condition) or two situations in which others had power over them (low-power condition). Then, participants rated the confidence they had in their arguments about the policy and their attitudes towards the policy.

We predicted and found a significant interaction between power and direction of thoughts generated. High-power participants reported more positive attitudes toward the policy than low-power participants when they wrote pro-arguments, and high-power participants reported less positive attitudes toward the policy than low-power participants when they wrote counter-arguments. It was also confirmed that power affected participants' confidence in the validity of their own thoughts and this in turn mediated the observed differences in attitudes.

Discussion

Across different manipulations of all the variables, we predicted and found that power can influence consumer attitude change by affecting the confidence with which consumers hold their own thoughts in response to an ad. As a consequence of the link between power and confidence (study 1), power was shown to increase argument quality effects in a classic paradigm of persuasion consumer research (study 2) and the persuasive impact of the direction of thoughts on a traditional self-persuasion paradigm (study 3). Of most importance, we demonstrated for the first time that the effects of power on consumer judgment can be mediated by

changes in thought confidence (Experiment 3). Taken together, these findings are important not only because they provide an entirely unexplored role for power in the persuasion process, but also because they highlight the importance of power as a new variable to consider when studying the consumer of persuasive attempts.

The Good, the Bad, and the Ugly: Firm Reputation, Advertising Correction, and Consumer Defensiveness

Peter Darke, Florida State University, USA
Laurence Ashworth, Queens University, Canada
Robin Ritchie, University of Western Ontario, Canada

EXTENDED ABSTRACT

Corrective advertising is one means by which regulators address problems that arise from misleading ads. However, research has found it to be a double-edged sword: Corrective advertising is somewhat effective in correcting false beliefs (Wilkie et al. 1984), but it can also have undesirable effects by undermining valid beliefs about other product benefits (Mazis and Adkinson 1976) and by damaging the firm's reputation (Armstrong et al. 1982; Johar 1996).

This paper reports the findings of three studies that suggest the undesirable punitive consequences of corrective advertising are much broader than previously thought: Correction of a misleading ad diminished the persuasiveness of subsequent ads from not only the offending firm (specific effects), but also from unrelated second-party firms (generalized effects). This occurred regardless of whether the correction was attributed to an independent regulator or the firm itself, in response to both subtle and blatant instances of advertising deception, across both similar and very different product categories, and regardless of the strength of the arguments in the second ad. Correction also undermined the reputation of both the offending firm and other firms, even when these firms had a positive prior reputation. Together, these findings imply that correction may be a less appealing remedy to deceptive advertising than previously thought, in that it has the potential to seriously compromise the effectiveness of future advertising concerning other products from the same firm, and also undermines the ability of other, unrelated firms to promote their products.

Our studies also identify the mechanism responsible for these effects. Specifically, they demonstrate that corrective advertising can cause consumers to feel tricked or fooled, leading to a defensive bias in the way that they process subsequent ad claims. Exp 1 finds that correction of one advertisement undermined the perceived trustworthiness of subsequent advertisers, which in turn had a negative effect on the resulting product attitudes. Exp 2 builds on these initial findings by offering more direct evidence of a defensive bias: Under objective processing, strong arguments should be less vulnerable to distrust than weak ones (Petty and Cacioppo 1986), yet the distrust induced by the ad correction had a negative impact on attitudes regardless of the strength of the arguments in the second ad. Further, these effects were not cognitively mediated, suggesting that the underlying process is heuristic/automatic rather than systematic/effortful. These findings are consistent with the predicted defensive stereotyping mechanism (Darke and Ritchie 2006), where negative stereotypes are evoked to undermine the credibility of the subsequent advertiser, leading to more negative attitudes, and thereby reducing the threat of being fooled.

Exps 1 and 3 also examined the role played by the source of the correction, and found there were negative effects on subsequent attitudes regardless of whether the correction originated from an independent regulator or the company itself. Exp 3 also found that correction by a regulator prompted more negative perceptions of the offending firm than corrections from the firm itself. Together, these findings suggest that the source of correction is relatively unimportant when it comes to product evaluations, but that there

may be more subtle effects of the corrective source on the reputation of the offending firm.

Firm reputation proved to be a complex moderator of the effects of corrective advertising. Exp 1 considered the reputation of the *offending firm*—specifically whether it was well-liked—and found that it made little difference in terms of whether the distrust caused by ad correction generalized to second-parties. Exp 2 manipulated the reputation of the *subsequent second-party advertiser*, comparing an unknown firm to one that was previously trusted by subjects, and again found that firm reputation was ineffective in stemming the negative effects of correction. Exp 3 further examined firm reputation and discovered that a positive reputation can offer some protection against correction-induced distrust, but only when the second firm's ethics are endorsed by an independent regulator. This is consistent with the notion of subtyping in the stereotyping literature (Taylor 1981), whereby stereotypes are deemed not to fit certain members of the category (i.e., this is not the typical kind of advertiser).

From a theory-building perspective, our findings build on existing work concerning deceptive advertising and defensive stereotyping (e.g., Darke and Ritchie 2006) by better specifying important boundary conditions. Specifically, we find that the distrust arising from deceptive advertising is less likely to generalize to ads from firms that are endorsed by an independent regulator, as well as to product information provided by an independent, trusted source (i.e., *Consumer Reports*). This is consistent with predictions made by Rotter (1967), who suggested that specific sources of trust should be preferred to more general sources. Interestingly, however, it appears that the specific information must come from an independent source in order to be effective.

For managers, our work once again sounds a cautionary note about the consequences of misleading advertising, and the need to avoid it. Revelations of deceptive advertising have the power to adversely affect advertising as a whole, not just the specific firm involved in the deception. For regulators, our findings suggest that careful consideration must be given to the punitive effects that such practices can have in reinforcing negative stereotypes about advertising in general. Further, the evidence suggests that regulators also have some role to play in protecting firms against the unintended consequences of correction; namely by publicly endorsing ethical firms. Our findings also imply that the broad distrust that is induced by corrective advertising may actually harm—not aid—consumer welfare, by decreasing the likelihood the consumer will recognize valid information. Corrective advertising is thus a tool that must be used judiciously, so as to strike a balance between the cost of erroneous product beliefs in the marketplace and the potential damage that correction can do to advertising as a whole, to honest advertisers in particular, and to consumers themselves.

The Impact of Perceived Advertising Creativity on Ad Processing and Responses

Xiaoqing Yang, University of Wisconsin, Milwaukee, USA

Robert Smith, Indiana University, USA

EXTENDED ABSTRACT

Recent years have witnessed a steady increase in creativity research in marketing, especially in the strategy literature (e.g., Andrews and Smith 1996; Im and Workman 2004; Moorman and Miner 1997). However, with the exception of a handful papers, creativity research in a consumer/advertising context is scarce (e.g., Burroughs and Mick 2004; Zinkhan 1993). Even these few papers only focus on the effects of ad creativity on a limited set of outcome variables such as recall/recognition and attitude.

A primary goal of the present paper is to provide process explanations of how creative ads work by proposing an integrative structural model to capture the impact of perceived advertising creativity on consumer ad processing and response. A second objective is to investigate the mechanisms through which creative ads are effective in reducing consumer resistance to persuasive messages. A third objective is to delineate the boundary conditions of the effects of advertising creativity. A fourth goal of the paper is to expand the list of outcome variables currently focused upon by the creativity literature. Specifically, cognitive responses, affective responses and conative responses will be examined (e.g., MacKenzie, Lutz and Belch 1986).

In the current paper, creative ads are defined as ads high in both divergence and relevance. In an advertising context, divergence refers to the extent to which an ad contains elements that are novel, different, or unusual in some way. While divergence is deemed as the central element to the definition of creativity, the ad also must be relevant—it must be meaningful, appropriate or valuable to the audience.

For the structural model, perceived advertising creativity is proposed to affect ad response variables (cognitive, affective and conative responses) via two routes. In the cognitive route, perceived advertising creativity activates an open-minded approach of information processing (heightened desire to postpone closure), which in turn leads to fewer negative statements and more curiosity statements about the brand. Accordingly consumers' brand attitude is more favorable and their intentions to view the ad again and purchase are enhanced. In the affective route, the positive affect engendered upon viewing creative ads affects downstream ad processing and response variables by (1) indirectly affecting consumers' desire to postpone closure (2) directly transferring to brand attitude and intention to view the ad again.

The proposed structural framework was examined in a 2 (divergence: high vs. low) x 2 (relevance: high vs. low) x 2 (exposure conditions: directed exposure vs. incidental exposure) experiment. Participants were asked to review an ad embedded in an entertainment news program and provided their answers to a set of questions aiming to measure their ad processing and ad responses. The proposed structural relationships received good empirical support (9 out of 12 hypotheses were supported), providing reasonable support that desire to postpone closure plays the key mediating role in explaining the effect of perceived advertising on ad processing and response variables. Both cognitive route and affective route were found to impact consumers' ad processing and responses.
