> Ryan: I think it's quite funny that there's this PC thing now where like pubs and there like "we don't serve you to get drunk we serve drinks we don't serve drunks" (laughs)....it's just pathetic cos it's not what they're there for

> Laura: Yeah
> Ryan: To get everyone drunk and it's rammed down your throat that if you drink then you'll have a good time if you don't you'll go home

However, in addition to these ritualistic activities where alcohol is clearly *the* essential artifact, there are also stories of activities that *surround* alcohol consumption. Here the focus is less on the consumption of alcohol but on ritualistic activities which initially appear to be peripheral but emerge as central. These activities often revolve around pre-and post night out activities, which—particularly for female participants—seem to be an important aspect of the drinking occasion and also function as a bonding activity, providing key aspects of group membership. Female participants talk about preparing to go out as a very structured and organized activity in order to allow sufficient time for everyone to use the bathroom. Some female students mention what they term the 'fashion parade' as key preparation for the night-indicating their wish to involve friends in decisions about dress and appearance.

> Penny: [laughing] Started getting ready about three hours before we went out. Took me 40 mins to have a shower, shave and wash and dry my hair! Didn't have a clue what to wear so everyone is like a panel and they have to judge, and if they can't make a decision we don't get out any quicker! There's a lot of enjoyment in getting ready though, I quite like it, it kind of prolongs the evening…
> Hayley: I like getting ready, especially when you are with your friends and you are doing your make up or something.
> Penny: Get your music on and you might have a drink before hand!
> Rick: It's an operation!

However, this 'operation' is not a key ritual for the males.

> Joe: Err yeah, usually takes about two minutes to decide what I want to wear! Ten minutes to have a shower and five minutes to do my hair and that's about it! Listen to some music beforehand to get me in the mood.
> Rick: The nights that we go out, we tend to just go with the flow.

Related to this are the post-night-out rituals, which involve discussing the previous night's proceedings (and eating 'hangover' foods). These rituals are a key theme in all the groups and involve both male and female participants.

> Claire: We have one [discussion of the previous night] in the bedrooms in the morning don't we? Where everyone will go into someone's bedroom and sit on the bed and chat about what we did the night before

Similar to the pre-night rituals, these post-night out discussions provide a key marker of friendship groups, and function as a key bonding activity for the students involved. These are partly facilitated by the fact that second year students (our focus here) tend to live out of campus in shared accommodation within their friendship groups. This is a clear element of socializing that might differ significantly with other young people of a similar age–they might be deprived of the opportunity to develop these post-night out rituals in the same manner.

For all of the cases discussed above—whether *pre*, *post* or *during* nights out—alcohol represents an important aspect of the activities yet it is not always the central ritual artifact, in fact it sometimes took on a more peripheral role. These rituals can

illustrate the application of Rook's (1985) ritual components, but it is perhaps simplistic and even counter-productive to view alcohol as always *the* central ritual artifact (see Treise et al., 1999). Alcohol could more usefully be viewed as a *facilitator* for many of these rituals in the sense that while many of these rituals would not take place if alcohol is not involved, the performance roles and the manner in which these roles interact with the audience (students, peers) are perhaps more important. We would not go as far as to say that alcohol could be easily substituted with something else, but an alternative focus could possibly be found in some situations. Students' limited resources and their liminal state (and perhaps young peoples' generally) could mean alcohol provides the easiest or most accessible focus.

### Studenthood as a permission to binge?

During this liminal state, the very nature of 'being a student' is seen as providing support for excessive alcohol consumption. For our students there is a strong sense that they are fulfilling society's expectations of them as students. This reinforces their sense of being betwixt and between (childhood and adulthood), living away from adult authority yet without the expectations (responsibilities) that usually accompany adulthood. Many of our participants talk about the "uni experience", with student life seen as *the time* in your life to have fun and to party and, for many, drinking alcohol is viewed as a vital ingredient of this mix. Participants discuss 'making the most' of university, necessitating a full social life and the freedom which accompanies this period of liminality.

> Lisa: …… I don't think you would have the proper uni life if you didn't drink
>
> Vicky: When you subscribe to uni, part of the course is going out and getting pissed with your mates
>
> Ryan: The thing is you're only gonna be at university for three years, or four years for some people, and for those three years it's an experience you gotta.. I mean I wouldn't want to like to like look back and say at university I had a proper flat time like and it was shit

The other side of this general expectation regarding the role of alcohol in students' lives is evident in the generally negative experiences reported when students choose not to drink on social nights out. These negative experiences are primarily associated with the fact that as the majority of students do drink, those students abstaining are perceived to be different to their drinking peers. The following extract summarizes many of the issues: not enjoying the night because everyone else is drunk; a heightened (self) awareness that accompanies being sober; having to assume responsibility for drunken others' safety/well-being.

> Ryan: I actually went in a nightclub when I hadn't drunk before it was really crap [everyone signals agreement]
>
> Justin: ….Because you notice how…you notice how dodgy all the clubs are and how minging everything is [everyone nodding in agreement]
>
> Tina: And the sleazy sorts of people that are there
>
> Justin: Yeah you just notice more and things you don't normally see basically when you're sober
>
> Laura: And also when everyone else is drunk and they all seem to be having a really good time and you just want to be in that place, yeah
>
> Tina: Also when you have to, you have more responsibility then 'cause you're not drinking, 'cause when I went out it was someone's birthday and he got absolutely wrecked and everyone looked to me to look after him and it was

> just like hang on this is not my fucking problem and he was trashed and, yeah, anyway not something you want to do anyway

As well as this sense that students have general permission—or are expected—to drink more than the general public, there also seems to be an assumption that certain segments within the student group will drink in excess of the general student group. A clear example of this is the 'hard drinking' that is associated with sports teams.

> Melanie: When you [Hayley] and I went on hockey tour, they introduced us to a whole new culture of 'Drink fresher drink now and once you've finished that get another one and down that too!' Down it, down it, down it and then you got into the swing of drink down, drink down. And now 'cause we enjoy going out and dancing and now its like down it quickly 'cause you can't take the bottles onto the dance floor and then once you've had enough of that its get another drink and down that one and go dancing again.

The very nature of 'being a student', relating to the structures (or perceived lack of structures) surrounding studenthood and the expectations of others, serves to create the opportunity and accompanying expectations for students to drink excessively.

### Having a good story to tell… the student narrative

Linked with the 'need' to have a good social life at university was the importance of having a good story to tell. These stories demonstrate that the 'fun' associated with being a student does not solely concern the social scene but also the accompanying narratives, which have the function of communicating that 'fun'. During the discussion groups, a number of stories emerge which revolve around piecing together elements from a night out, usually culminating in something slightly shocking or embarrassing, an incident which is invariably linked with excessive alcohol consumption. Often these stories are known by other members of the group, who contribute additional details as the stories unfold, suggesting the stories have been relayed several times before.

> Carl: What happened was we like went to Toast and then erm you two were there then I went off from you two and I had no money, so I bummed a taxi with some girls I didn't know and then like went back to theirs and carried on drinking, and at about three I thought ahhhh man I'm gonna be sick I don't wanna be sick in front of strangers so I left and then…
>
> Laura: Or on strangers
>
> Carl: Yeah yeah I left and walked for like ten meters and I didn't know where I was so I just thought I know what I'll do I'll nap [Sarah laughs] and when I wake up I'll be more focused, so I went asleep two hours later
>
> Sarah: On the floor?
>
> Carl: Yeah
>
> Laura: On the floor on the path
>
> Carl: Just in a T-shirt and jeans, bloke comes up to me[and] goes 'you alright mate you've been asleep on the path for two hours' ….

In the examples we encountered, stories were shared as part of the post-night-out discussions ritual with the 'good story' enhancing the consumption experience itself. The stories provide an inclusive and exclusive function in the sense that they include

others who perhaps had not been present in the night's proceedings, but could also serve to alienate students without similar experiences to relate. They also function as shared histories, evidence of the good times that groups of friends have had together–demonstrating that they have 'made the most of' their time while at University.

## DISCUSSION AND CONCLUDING REMARKS

In post-industrial societies the transition to adulthood has become increasingly long and drawn out, often lasting from the late teens to mid-twenties and beyond (Arnett 2007), and this study has focused on one group of people in this transitional phase. Consumption activities play a key role in addressing ambiguous, incongruous and unsatisfactory aspects of the self concept and in helping to achieve greater coherence in emergent identities as people undergo a liminal phase of transition (Schouten 1991). During emerging adulthood young people engage in consumption activities that permit them to test their own boundaries and sense of control and mastery over their situation (Gentry and Baker, 1995). As they start to take on adult roles and begin to explore possible adult identities, they are subject to critical experiences from which they learn about the potential for self-direction and control within specific environments. In this period of 'emerging adulthood' (Arnett, 2000; Cote, 2002), young people have the opportunity to explore potential identities without having to make permanent adult commitments (Erikson, 1968). Noble and Walker (1997) note that this period of liminality is characterized by a state of instability, of not knowing what lies ahead, and that at these transient points in their lives, people seek out (symbolic) activities and possessions to help them feel more grounded and stable (before assuming a new role, via aggregation). In contrast, our study demonstrates how alcohol can help students to make the most of their liminal phase, allowing them the possibility of reveling in the ambiguity of their transitional phase (cf. Beccaria and Sande 2003). Essentially our participants purposefully sought out the instability that comes with intoxication, reflecting "calculated hedonism" (Measham 2004b, p.343). Our study therefore suggests that in this context, an extended period of liminality, and the accompanying instability, could be experienced positively, in effect lending students 'permission' to behave in a way that might otherwise (paradoxically) be considered unacceptable or rebellious. For these students, the transition to adulthood is even more protracted, and alcohol is used as a marker of the delayed assumption of adult roles and responsibilities. However, it should be recognized that alcohol could be counter productive once students reconfigure their identity and begin preparations for the stability of aggregation (life and responsibilities post-university), where the emphasis is less on the fulfillment of the social expectations of university but rather on securing academic potential and identifying a future role/place in society.

Our findings suggest that alcohol effectively reflects and marks a separation between students' two very different lives whilst at university; the more serious, structured, academic life and the hedonistic, unstructured, social life, which is expected to accompany this, what Measham and Brain (2005, p.267) term "leisure time out". There is a sense that our participants are doing 'what [most] students do' (see Banister and Piacentini 2006), with the rituals associated with alcohol helping them to live their lives to the full and enjoy the chaos associated with liminality before knuckling down to the responsibilities that life after university will entail. As discussed by Tucker (2005), large drinks companies are playing to these kinds of (hedonistic) ritualistic roles of alcohol in the form of the provision of establishments that support the type of drinking which is being indulged in (encouraging consumers to 'go for it' and 'let loose'), whereby the establishment itself (open spaces, limited seating) reflects the disorder associated with unrestrained drinking.

The key challenge for policy makers seeking to encourage a change in behavior is to seek to identify other means by which students (and young people more generally) can fulfill their wish to let off steam and fulfill their social expectations. When Treise et al (1999) apply Rook's framework to alcohol consumption, they state that alcohol is "obviously the essential artifact in our context" (p. 21). There is, however, a danger of simplifying the broader picture and downplaying the importance of associated behaviors that surround alcohol consumption. In our study, alcohol clearly provides the focal point of the rituals associated with alcohol, yet it provides the *facilitator* for a range of rituals, experiences and behaviors, rather than necessarily being the central ritual artifact, and this could provide hope for policy advances and social marketing activities in this area. This is particularly pertinent following the concern about the rising drinking levels of young women. We suggest that it is not always alcohol itself that attracts women, and not even the experience of being intoxicated, but often the (pre) grooming and social rituals that surround alcohol consumption. This suggests that organizations attempting to seek out ways to help young women to resist excessive consumption need to investigate other means of facilitating these key rituals–ways that do not rely on the (excessive) consumption of alcohol.

From this exploratory research we hope to have made some progress towards understanding the context in which young people (students) consume alcohol and the role it plays for them. The concept of liminality can perhaps help us to understand this sense of students as 'betwixt and between' different important life stages whereby alcohol assumes an important facilitating role enabling them to indulge in 'identity play', and most importantly fit in with their peer group at what can be a challenging time. This concept of 'disordered order' is very fitting as for the majority of students their approach is very ordered, in the sense that they can talk about when it is appropriate—and not appropriate—to be drinking and they also have clear ideas about when they will stop drinking, or stop their excessive style of drinking (moving towards aggregation). Our participants are able to separate their excessive approach to alcohol consumption from those of problem drinkers as they rationalize their excessive consumption as 'time off' from otherwise ordered lives. In sociological terms, the students are behaving as would be expected, in that they are having what George (1993) describes as "less predictable transitions in their early adulthood" (p. 359). They, themselves, view their lives as becoming more predictable as they get older, with alcohol playing a less dominant role as they 'settle down' into the next stage in their lives. The extent to which they manage to achieve this would provide an interesting topic for future investigation. Research should also focus on different groups of consumers—particularly other consumers experiencing liminal stages (either short or prolonged)—and the extent to which this affects alcohol consumption. It would be particularly interesting to compare and contrast the experiences of university students with those young people who go straight from school/college into paid employment, and question whether this represents aggregation and 'adulthood proper' or whether they also exhibit a liminal stage and whether alcohol plays a role in this.

# A Qualitative Approach for Conceptualizing Consumer Decision-Making in Online Auctions

Mengkuan Lai, National Cheng Kung University, Taiwan
Wann-Yih Wu, National Cheng Kung University, Taiwan
Shu-Mei Lin, National Cheng Kung University, Taiwan

## ABSTRACT

This study adopts a qualitative approach for conceptualizing consumer decision-making in online auctions from the perspective of goal-directed behavior. The results of in-depth interviews indicate that consumers' decision-making in online auctions is different from traditional purchases in which perceived risks and risk relievers are critical to decisions and behaviors. Moreover, different motives for using online auctions and subsequent decision-making, such as risk handling, are observed. Males tend to be task-oriented, thus focusing on uncertainty reduction, while females are more hedonic-orientated and emphasize loss minimization. Implications and limitations stemming from the results are discussed for strategic planning and further empirical research.

## INTRODUCTION

Given the proliferation of online auction users, relevant issues have been drawing the attention of researchers. Conceptual and empirical evidence on bidding strategies and behaviors (Ariely and Simonson 2003; Stern and Stafford 2006) has advanced our understanding of consumer behavior in online auctions. However, the majority of previous studies have focused on how to enhance purchasing through pricing and control mechanisms (e.g., Johns and Zaichkowsky 2003), with little attention being paid to the relationships between motivations and subsequent behaviors. This fragmentary evidence has rarely been able to offer a comprehensive picture for understanding consumption decisions in online auctions.

The goal-driven perspective assumes that consumers' goals may be one of the important factors influencing their actions and has frequently been adopted to explain how consumers make purchase decisions (Huffman and Houston 1993). The "how" of consumer purchase decisions has been a critical issue within the domain of consumer behavior, but primarily in the context of traditional markets. Researchers have been examining whether or not this perspective can explain and predict consumption decisions in a different context, such as the Internet, but few robust conclusions have been drawn (Garbarino and Strahilevitz 2004; Miyazaki and Fernandez 2001). In particular, a linkage of the stages in the purchase decision-making process, from motivation and cognitive deliberation to taking action, is rarely explored, especially for online auctions. With the intent to bridge a gap in the literature, this study adopts the perspective of goal-directed behavior to examine consumer decisions within the context of online auctions. Since the purpose of this study is to explore the association between consumers' inner motives and their behaviors, a qualitative approach is imperative to acquire insight into phenomena that are not easily understood through quantitative measures (Grace and O' Cass 2002).

## GOAL-DIRECTED BEHAVIOR IN ONLINE AUCTIONS

Research in consumer decision-making (CDM) has been dominated by the perspective that consumers always know what they need and accordingly take actions to satisfy these needs (Huffman and Houston 1993). Human motivations, whether cognitive or affective, are geared towards individual gratification and pleasure (Bayton 1958), and provide a theoretical background to examine the underlying reasons why people shop. To fulfill their needs, individuals set goals, commitments to a fixed and desirable end state (Fishbach and Dhar 2005), as guiding forces to determine which properties are relevant and useful for the task of creating meaning (Murphy and Medin 1985). In the context of online purchases, motives still transform into specific goals and become a guide to direct decision-making. Browsing online can be broadly categorized as task-related or hedonic-oriented browsing (Hoffman and Novak 1996). When a consumer's online purpose is task-oriented, will some performance criterion be used for purchase evaluation? When the purpose is hedonic-oriented, will the same criterion be used to guide purchasing? Previous studies regarding these issues are limited and further validation is thus required.

Despite high perceived risks, consumers still choose online auctions due to the perception that auctions may satisfy their needs. They may perceive that the benefits of using online auctions far outweigh the potential threat of fraud (Cameron and Galloway 2005). The primary reason is that perceived risk can be moderated by the consumer's ability to search out information online and utilize other risk relievers, consequently reducing purchase uncertainty (Massad and Tucker 2000). Among all risk relievers, the feedback system is the most direct method to ascertain the seller's reputation and is always viewed as a critical element in both selecting items to buy and decreasing fraud (Cameron and Galloway 2005; Weinberg and Davis 2005). The seller's reputation can serve as an important signal for evaluating the perceived risks towards a specific online auction. Moreover, user experience in online auctions is influential in bidding success (as measured by bidding success rate) because rich experiences usually increase the participant's abilities in judgment and value assessment, which can lead to more effective trading (Cameron and Galloway, 2005).

In addition, consumers are involved in elaboration and aroused emotionally during the bidding process because decision-making in online auctions is inherently complex (Ariely and Simonson 2003). Due to higher product involvement, online auction participants emphasize central cues and make decisions based on deliberate reasoning and thinking to ascertain product quality and the appropriate price level (Wang, Wang, and Tai 2002). In summary, decision-making in online auctions is primarily influenced by the individual's perceived risks, prior experiences, product type, and reputation evaluation (Cameron and Galloway 2005; Johns and Zaichkowsky, 2003; Massad and Tucker 2000). However, the fragmentary conclusions and lack of associations in the decision-making process of previous research requires a study to thoroughly explore the nature and characteristics of consumption decisions in online auctions.

## METHODOLOGY

The authors adopted grounded theory in conducting this study. Grounded theory is a general methodology (Eisenhart 2006) which has been extensively adopted in the research fields of education, nursing, and psychology, but has rarely been applied to consumer research. The grounded approach develops a theory which evolves during actual research and through continuous interplay between data collection and analyses (Rahman 2003). Researchers usually start with very limited a priori constructs about the research issues

and enquire deeply into related behaviors and events, extracting theoretical constructs, and ultimately forming a grounded model based on practical evidence (Leonard and McAdam 2004). In this study, the research process involves the following operations: (1) using theoretical sampling to select appropriate participants; (2) arranging in-depth interviews to gather firsthand individual experiences concerning online auctions; and (3) adopting grounded theory to code and analyze data and finally to construct an integrated framework to outline CDM in online auctions.

### Stage 1: Sampling

The theoretical sampling approach, similar to judgment sampling, is adopted to ensure that certain characteristics can be identified (Strauss and Corbin 1996). The similarity among global online users has been greatly increasing (Beilock and Dimitrova 2003). As such consumers from the largest segment of Internet users, aged 20 to 39, representing 75.5% of the total users in Taiwan (MIC, Market Intelligence Center, Taiwan, specialized in research in the IT industry 2006), were solicited to participate. Participants with at least one previous purchase experience in online auctions were eligible for in-depth interviews, which were used to extensively gather related experiences. Thirty-four qualified participants were interviewed (22 females and 12 males aged between 20 and 38 years old). Twenty-three interviewees had more than five online purchase and/or selling experiences and eight interviewees had only one online purchase experience. Among the female interviewees, sixteen were students and six were clerks working in government agencies or the private sector. Of the male interviewees, three were students, one was a teacher, and eight were clerks or engineers in business, financial or service sectors. The findings from this study can illustrate online auction phenomena in Taiwan and provide valuable insights to both researchers and practitioners.

### Stage 2: In-depth Interview

All in-depth interviews were guided and executed by one of the authors. In order to discover the truth behind the phenomena, unstructured personal interviews were adopted to ensure that the interviewees were least influenced by the interviewer (O'Cass 1996). Each interview took about 20 to 30 minutes. The interview started by asking if the interviewee had purchased in any online auctions. The questioning then proceeded by requesting the participants to recall and discuss their initial and subsequent experiences in online auctions. To avoid any mistakes and omissions, all interviews were recorded and then transcribed.

### Stage 3: Coding and Analysis

During coding, in case of any ambiguities in the descriptions or meanings given during the interviews, the authors arranged another interview with the same interviewee through telephone or e-mail to ensure that the codings were clear and correct. Each coded transcript was categorized by two judges (one of the authors and one Ph.D. candidate majoring in marketing) using the technique of microanalysis (Strauss and Corbin 1996). The judges first identified concepts, then grouped concepts into categories, which enabled the authors to reduce the number of units and thus have greater analytic power (Strauss and Corbin 1996). Through descriptions of properties and dimensions, a category can be clarified in terms of particular attributes and thus endowed with a precise definition. Table 1 summarizes the concepts, categories, and constructs for online auctions based on the 34 interviews. The inter-judge reliabilities for all concepts were greater than .86. Disagreements between the two judges were arbitrated by a third judge. There were no discrepancies encountered between the two judges in grouping concepts into categories and constructs.

The concepts of shopping convenience and information seeking, two common motivations for going online which emerged from this study, constitute the category of task-orientation motives, whereas the concepts of sensation-seeking and group influence are categorized as hedonic-orientation motives. The task-orientation and hedonic-orientation categories are eventually integrated as a construct for motivation as they represent identical properties in different directions within the framework of motivation. Similarly, the construct of perceived risks is generalized from two distinct categories of common risk and online-related risk. The former includes the concepts of product-related and financial risk, and the latter contains system and seller credit risks. A seller credit risk is a purchase-related uncertainty primarily caused by a perception that the sellers in online auctions may not be trustworthy and may even attempt to defraud the buyers. Security and privacy risks, which have been stressed in online environments and which are associated specifically with Internet usage (Miyazaki and Fernandez 2001), are labeled as system risk. The third construct, risk relievers, includes uncertainty reduction (i.e., information searching) and loss minimization (i.e., specifying an upper price limit prior to purchase). The fourth construct is purchase decision, which contains two decision categories–channel selection and auction mode. The final construct is post-purchase evaluation wherein the participant perceives either "I win" or "I gain" from the online auction.

## DEVELOPMENT OF AN ONLINE AUCTION MODEL

Based on the interview results, consumer cognitive deliberation of purchase uncertainty and risk relievers is highly stressed in online auction decisions, regardless of the number of previous online buying experiences. The perceived risks and relievers greatly depend on the individual's motives. Most task-oriented consumers, who have specified goals prior to entering an auction website (e.g., searching for specialty products or product information), usually become more involved in decision-making than hedonic-orientated consumers. They spend time and effort in searching for information and performing risk evaluation in order to make a better decision (Bloch et al. 1986). On the contrary, hedonic-oriented consumers, who are concerning with seeking intrinsic satisfaction, often attend to the ongoing search in auction websites for either the pleasure of the purchase itself or for product information potentially useful in the future. In such a context, it is observed that unplanned purchases and impulse buying occur frequently among such participants.

In addition, online-related risks, including seller credit risk and system risk, are strongly recognized by all participants as vital elements affecting their decisions. In particular, seller credit risk is a pervasive concern since online fraud is difficult to control in practice and reports of fraudulent transactions have substantially increased in recent years (Cameron and Galloway 2005). A female student recalled her first experience as follows:

*I often browsed websites but I never bought anything. One day I happened to see an item with a pretty good style and priced competitively…. However I was quite worried that the goods would not be delivered after payment and the disclosure of personal information. (Female-02)*

Thus, proposition P1 is derived from the findings and stated as follows:

*P1*: In addition to the common purchase-related risks found in the traditional market, consumers pay much more attention to online-related risks in online auctions, especially for initial online purchases.

**TABLE 1**
Summary of Coding Results

| Construct | Categories | Concept |
|---|---|---|
| Motivations (1.00) | Task-orientation (1.00) | Shopping convenience (.94)[a] |

Participants indicated that selecting reputable websites and evaluating the sellers via a feedback system were essential for assuring transaction security. The ability to access risk relievers moderates perceived risk (Massas and Tucker 2000). In addition, although the online environment itself provides different cues for buyers to make decisions (Stern and Stafford 2006), the lack of opportunity to examine the products prior to purchase makes many shoppers hesitant to shop online. Furthermore, it was reported that inability to examine the products, transaction security, and privacy were three crucial considerations for online purchase decision-making (MIC 2006). To minimize these uncertainties, some participants, especially task-oriented participants, reported that they actively engaged in searching for information from multiple sources (e.g., websites, word-of-mouth from peers, interacting with the sellers, and inspecting products in retail stores). A savvy male participant described his information search activities as follows:

*I went to stores to inspect the product and checked out the descriptions on the auction website. Besides, interacting with the seller by e-mail is important. (Male-06)*

Hedonic-oriented participants were less involved and frequently used simple decision criteria, aiming at minimizing loss, as a risk reliever. They set an upper price limit as a threshold to determine whether or not to buy the product. This upper price limit, in fact, represents a type of risk tolerance that primarily signals the consumer's ability to suffer purchase loss. An experienced female participant reported her decision rule as follows:

*The price of products must fall in the range that I expect. Online shopping is usually unpredictable so I would not consider buying expensive items from online auctions. (Female-03)*

Proposition P2 is thus inferred as below:

*P2*: The risk relievers used by task-oriented consumers are different from those of hedonic-oriented consumers. Task-oriented consumers actively search information to reduce purchase uncertainty whereas hedonic-oriented consumers limit potential losses to a certain level as a risk reliever.

Interviewees decided to enter the online auction once they concluded that the purchase was beneficial; otherwise, they might choose to purchase from retail stores or even delay the purchase. Rather than accepting the pricing established by sellers in the traditional market, buyers' ability to negotiate prices is greatly enhanced by the pricing system in online auctions. "Bidding" and "buying-now" are different transaction mechanisms for buyers to purchase the product. Most participants indicated that they usually select the "buy-now" price because it is easy to compare with the prices in retail stores. However, bidding is preferred for coveted items which are unavailable in the common markets. A male participant reported his decision criteria as follows:

*New items are largely sold at fixed prices without much opportunity for buyers to negotiate. Used merchandise is more suitable for bidding. …but the prices of used goods are not reasonable in some large-scale online auction sites — higher than the average. The prices of used goods are not comparable with the market prices because they are rarely sought out in the market. (Male-02)*

Purchase decisions may be concurrently driven by rational and emotional behaviors (Stern and Stafford 2006). However, our findings show that decision-making in online auctions are dominated by economic rationales since participants tend to choose purchasing at "buy-now" prices and evaluate decisions with the economic criterion of "what can I gain?". Most participants indicated they were quite satisfied with the results of online auctions

because the benefits of purchasing were perceived to exceed expectations. However, an evaluation-based decision may eventually turn into a more emotional-based behavior once consumers decide to bid for their favorite items. Five of the 13 participants who had bid for products reported that they had such an experience of competing with other bidders, motivated by the desire to win. Bidders are likely to experience an escalation of commitment because the web-based dynamic pricing mechanism used by online auctions often triggers an intense emotional response (Gupta and Bapna 2001) due to the utility of bidding and competing (Ariely and Simonson 2003). As the auction becomes intensively competitive, bidders must concentrate on the bids placed by competitors and use some tactics to win such as "sniping" at the last minute (Cameron and Galloway 2005). Those involved bidders are relatively more concerned with "how can I win the bid?" One female participant described her bidding strategy as follows:

*When I found a desirable auction item, I usually tracked but did not bid on the item until the last minute. This strategy has won me most of the auctions. (Female-01)*

Accordingly, propositions P3 and P4 are induced as follows:

*P3*:  Bidders are more emotionally involved in online auctions than those consumers buying directly at the "buy-now" price.

*P4*:  Consumers are mostly concerned with economic gain in an online auction but involved bidders stress comparatively more emotional factors during the decision-making process.

When the auction is closed and the products are delivered, consumers proceed to an internalization stage to reconfirm their decision. Although consumers often perceive high risks towards online auctions, almost every participant agreed that satisfied experiences positively influence repurchase intention because such experiences increase their confidence in making a correct decision. More importantly, experiences can be internalized and transformed into knowledge to improve future purchase decisions. Similar results have been reported by Cameron and Galloway (2006) where experiences in online auctions significantly led to more effective trading and facilitated participants' bidding success rates. Surprisingly, our findings reveal that negative experiences or fraudulent events do not necessarily impair the intention of bidding or purchasing in the future as the participants reported that they would continue to buy online even though they had encountered negative experiences, such as fraud. On the contrary, unpleasant experiences help them to develop better risk relievers and some strategies, such as sniping, to win the bids. A male participant described his experience with fraud as follows:

*I was very angry at that seller because he always made excuses to put off delivery after payment. Even worse, he ran away. After that, I was very careful with the trading methods used in online auctions. I insisted on delivering products face to face and repeatedly checked out the records for seller reputation prior to purchases. (Male-05)*

Therefore, P5 is induced as follow:

*P5*:  Satisfying experiences positively influence repurchase intentions in online auctions whereas unpleasant experi-

ences do not necessarily impair repurchase intentions but are of great value in developing better risk relievers for future purchases in online auctions.

**Gender Differences in Decision-Making**

Another interesting finding is that the motives for participating in online auctions are quite different between genders, leading to distinct behaviors in risk handling. Specifically, male participants usually engage in pre-purchase searches to assure the quality of their purchase decision whereas the females are prone to experience the pleasure of shopping, which facilitates impulse buying and unplanned purchases. This implies that to male auction users, an auction website signals a purchasing channel; whereas female auction users perceive it as a venue for entertainment. This result is supported by previous studies reporting that gender differences play a central role in Internet usage (Jackson et al. 2001).

Both male and female participants consistently perceive higher risks for entering an auction website versus in-store shopping; however, it is also found that the males bought much more expensive items (US$ 4545, US$1= NT$33) than females (US$ 206). This seems to imply that the level of risk perception and the ability to suffer loss differs between male and female buyers. If so, prior findings that women perceive higher levels of risk in online shopping than men (Garbarino and Strahilevitz 2004) can be supported by these findings.

As mentioned, hedonic-oriented buyers employ simple rules (i.e., loss minimization) to make decisions. Fourteen of the 22 female consumers engaged in hedonic-oriented behaviors and were inclined to use loss minimization as a risk reliever; that is, choosing cheap products or specifying an upper price limit as a threshold to limit potential losses and to ensure freedom from purchase risks. However, ten of the 12 male buyers engaged in information searches to reduce purchase uncertainty and to assure the quality of their decision in the online auction (Jackson et al. 2001; Miyazaki and Fernandez 2001).

Therefore, proposition P6 is stated as below:

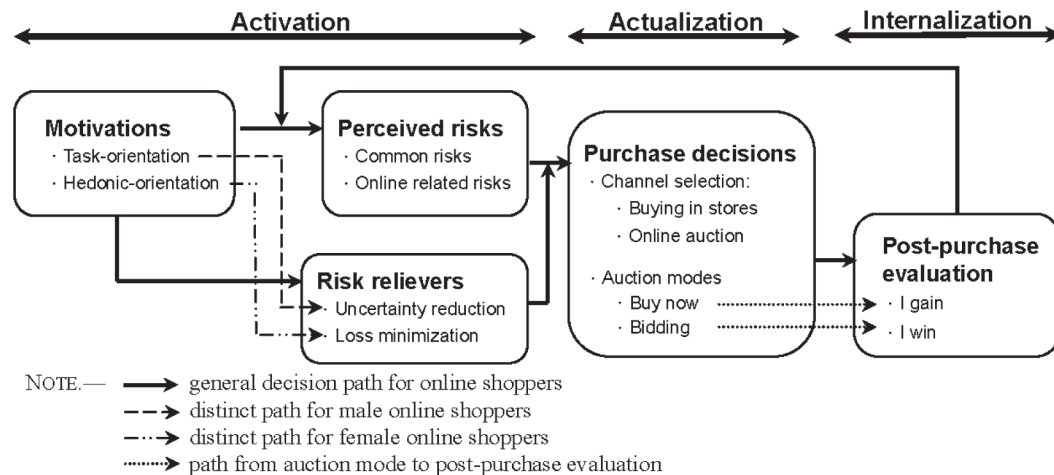
*P6*:  Males and females differ significantly in decision-making strategies in online auctions. Males tend to be task-oriented, thus focusing on uncertainty reduction. Females, on the other hand, are hedonic-orientated and emphasize loss minimization.

Based on the grouping procedures and propositions discussed, the authors identified the relationships among constructs and formulated an integrated model to describe consumer decision-making in online auctions (figure 1). The CDM in an online context is divided into three stages—activation, actualization, and internalization. Although the stages of CDM in online auctions appear to be similar to those in traditional markets, the nature and attributes of consumer decisions are different. Distinct from traditional purchase decisions, risk perceptions and risk handling strategies appear to be of critical concern during decision-making in online auctions. Besides, the impact of gender differences on purchase decisions can not be neglected. Different motives for using online auctions are reported between male and female participants.

## GENERAL DISCUSSION

Although there has been great progress in consumer research, the findings are fragmented (Simonson et al. 2001). This study adopts a qualitative approach to explore the successive and dynamic nature of decision-making in online auctions. The authors conceptualize consumer behavior in online auctions into three

**FIGURE 1**
CONCEPTUAL MODEL OF DECISION-MAKING IN ONLINE AUCTIONS



stages—activation, actualization, and internalization. The interrelationships among these three stages are further examined. Ariely and Simonson (2003) previously proposed a multi-stage conceptual framework for the online bidding process based on value assessments of information available on that site (e.g., number of competitors). However, their work sheds light on the impact of contextual cues on bidding decisions and behaviors without considering motivation and risk perception. The major contribution of this study is to further understand the association between consumers' decision-making and behavior in online auctions, with an integration of purchasing motivations, perceived risk, and risk reliever selection. However, exploratory evidence for the role of CDM in online auctions may need further investigation, since only a small group of respondents from a selected segment (Internet users in Taiwan aged 20 to 39) was used. Future research is recommended to apply different methods (e.g., quantitative approach) and different consumer segments to validate the proposed model.

Generally speaking, consumers' decision-making in online auctions corresponds with their motivation, either task-oriented or hedonic-oriented. Yet it should be noted that perceived risks and risk relievers are critical to decisions and behaviors. Risk has been reported to be an influential factor in online purchasing (Garbarino and Strahilevitz 2004; Miyazaki and Fernandez 2001). This study discloses that, instead of being driven away from online buying due to risk, buyers utilize either uncertainty reduction or loss minimization to handle risks. Therefore, marketers should actively implement risk relievers such as a reputation management system and payment security system (e.g., eBay's use of PayPal) to minimize the costs of risk relievers and thus facilitating online purchasing. Additionally, interviewees revealed that dealing with sellers recommended by friends can diminish perceived risks and increase purchase intention. A referral system that grants members credit which may be reimbursed for future purchases once the referrals complete a transaction is recommended to website operators. A referral system can serve as a platform for the "word-of-web" effect (Weinberg and Davis 2005) to decrease buyers' purchase uncertainty, which leads to enhanced purchasing and customer retention.

Moreover, the influences of gender on consumers' motivation and their preferable risk relievers have been neglected in the literature. The findings that different motivations for using online auction and decision-making exist between genders contribute to an explanation of gender differences in the perceived risks of buying online (Garbarino and Strahilevitz 2004). Although researching the reputation of the system is a common risk reliever for both male and female buyers, most hedonic-oriented females reported that they would rather buy expensive products in stores rather than in online auctions. Comparatively, male buyers actively search information from multiple sources and choose safe payment methods to control purchase risks once they determine the auction is beneficial. Therefore, sellers should notice the distinct characteristics in purchase decisions between males and females when designing appropriate marketing strategies. For females, sellers can provide unique items that are not available in stores or adopt competitive pricing strategies to compete with the traditional channels. When targeting male buyers, providing product information and quality assurance appears to be most effective.

This conceptual model provides a foundation for future empirical validation. The issues of linking motivations and risk handling as well as distinguishing gender differences in decision-making that were neglected in previous research also need to be validated in the future. Finally, participants are deeply concerned with the public policies of online auction security. The amendment of related legislations may greatly impact the future development of online businesses.

# To Start Being….The Anticipation of a Social Role Through Consumption in Life Transition: The Case of the First-Time Pregnancy

Elodie Sevin, EDHEC Business School/ERAM-IAE Lille, France
Richard Ladwein, EREM-IAE Lille, France

## ABSTRACT

In the present research, we focus upon an important life transition in women's lives: the experience of first-time motherhood in modern societies. After a presentation of life transition and motherhood literature, we discuss the results of a qualitative study based on interviews with pregnant women. The findings emphasize that pregnant women experience childbirth and anticipate their future role of mother through consumption. Finally, we highlight two dimensions in pregnancy: a *child oriented* dimension and a *role of mother* oriented dimension. These two dimensions are connected by a temporal focus and rooted in a sociocultural framework.

## INTRODUCTION

Whatever an individual's social or cultural status, his/her life may be understood as a cycle bounded by birth and death and punctuated by events that drive personal transformation. In the present research, we attempt to study the adoption of a new social role and status through transition in post-industrial societies. In this research context, we are particularly interested in sociocultural and symbolic aspects of consumption in the Consumer Culture Theory (CCT) perspective (Arnould and Thompson 2005). Many authors in marketing have shown that life transitions can be mediated through the consumption of goods and services (Belk 1989; Fischer and Gainer 1993; McAlexander 1992; Ozanne 1992; Roberts 1991; Rook 1985; Schouten 1991a, 1991b; Wright 1991; Young 1991); more precisely, consumption assists individuals in their learning of how to perform social roles (Solomon 1983; Belk 1988).

The life event chosen for this study is first pregnancy and new motherhood. There are two reasons for this choice. First, this event is generally presented as the most important event in a woman's life (Fischer and Grainer 1993). Secondly, academic interest–even marketing research–is low, despite the intensity of the consumption practices that accompany first-time pregnancy—an average of ?4,116 is spent during the first year of a child's life in 2004 in France (source: INSEE) and £52,605 is spent from birth to the age of five in the UK (source: The Guardian, 2005).

Consumer behavior in the first year of a child's life domain has been relatively understudied (Banister and Hogg 2006; Fischer and Gainer 1993; Houston 1999; Prothero 2002, 2006; Thomsen and Sorensen 2006). In contrast, marketing research often focuses on children's socialisation (Ward 1974), parents or children's influence (Moore-Shay and Lutz 1988; Moore, Wilkie and Lutz 2002), but not really on the baby and particularly not from the parents' perspective. In the present research, we approach first-time motherhood more specifically during the pregnancy phase, where consumption serves to materially prepare for the child's arrival.

In the first part, we discuss the theory of life transition including identity changes, new social role and the theory of rites of passage. Then, we specify the qualitative methodology used and present our findings. Finally, we discuss the managerial implications of our results and propose relevant developments for future research.

## LITERATURE REVIEW

### Life transition: a break in the path of life and the accession to a new social role

Life transitions are usually represented as a succession of important stages or events in an individual's life—birth, adulthood, marriage, divorce, retirement or death. These events appear central in the path of life, so much so that they "play a more important part than age in the break in the rhythm of the course of life" (Attias-Donfut 1991, p.79). Several expressions reflect the importance of such events, such as "life events" used by Attias-Donfut (1991, p.79), and "life crisis" used by English-speaking anthropologists. Life events represent a break in the path of life and create two periods, a "before" and an "after."

Two main conceptual visions are developed to shed light on life transitions. First, the life-cycle concept contains three elements of strict definition: the notion of stages, maturation and generation. The alternative conceptualization of life span or life course—the individual life history or biography—does not contain these three elements (O'Rand and Krecker 1990). The second vision is the rite of passage theory defined by Van Gennep (1909) and further developed by Turner (1969). This special form of rite marks the transition of an individual's social status in three universal successive stages which correspond to three sorts of rites: 1) a separation characterised by the removal of the individual from his/her previous social status; 2) the liminal stage, a period of transition in which the individual is neither endowed with the previous status nor with the new status; and 3) the incorporation into a new social state, when the passage is finally completed. Some French researchers who studied life transition through the rites of passage theory emphasized the difficulties of using it in contemporary societies (Bozon 2002; Lemaire 1995) and the potential lack of relevance of this theory to aid understanding (Sevin and Ladwein 2006).

These two conceptual visions show life transitions as breaks which lead to various changes in the individual on a physical, psychological and/or social level (Erickson 1963; Gould 1978; Levinson 1978; Lepisto 1985; Rivière 1995). While the events act on the identity and the personality of the individual and increase stress levels and consequently imply necessary adaptation (Holmes and Rahe 1967; Andreasen 1984), they also act on his/her social dimension by adjusting and redefining the existing systems of social status and roles (Levinson 1978; Lepisto 1985). Life transitions involve a new social role and status—closely dependent concepts that are the subject of an important theoretical past. Linton defines social status as a social position: "the place which a given individual occupies within a given system at a given moment will be named his/her status" (1947, p.330). A social role can be defined as the dynamic face of status. From a psychological perspective, the social role of an individual is a component of his or her identity (Linton 1936) and it is possible to see one's personality as a set of roles (Chappuis and Thomas 1995). Individuals have many different social statuses and roles. One status can be in effect while

another remains latent (Linton 1947). When individuals obtain a new social status or role, an adjustment of their system of roles and statuses is necessary. To incorporate social roles and statuses, individuals engage in the direct or indirect observation of other individuals. This is social learning according to the role model theory developed by Bandura (1976). Observation allows us to acquire information which is then used as a guide to our actions. The role models can be people who are close to the individual such as parents, family or friends. Interpersonal relations influence the attraction and the attention paid to these role models. They also facilitate direct contact and the exchange of information. Indirect role models are defined as those with whom direct relations are impossible—media communication considerably widens the number of available indirect role models. Thus, imitation is at the heart of observational social learning (Bandura 1976) and "by imitating a gesture, while playing it in our turn, we enter a social role" (Kaufmann 1995, p.250). Role models help the individual to adopt a role conforming to the values shared by society.

The theory on social learning distinguishes between different stages (Bandura 1976). First, the individual selects what is to be observed among the number of potential models–this is the attention stage. Then the individual learns by observing the behaviors of the role model–this is the acquisition phase. Lastly, there is the process that drives reproduction, where the individual translates the representations into actions according to the integrated behavior. "People do not translate into acts what they have learned" because of social norms (Bandura 1976, p.34).

In the context of such events, everyday life is modified, and so too are consumption practices. Thus, marketing researchers have developed a theory of segmentation through the life-cycle concept. In particular, marketing researchers use the family life-cycle concept to explain the succession of changes of family consumption practices (Rigaux-Bricmont and Davis 1974; Schaninger and Danko 1993; Wells and Gubar 1966; Wilkes 1995).

### Life transition: the role of consumption practices

The marketing literature has widely shown the various symbolic functions played by products in post-industrial societies and the meanings attached by individuals to material possessions. Objects exceed their utilitarian function (Baudrillard 1970) and play a role in the construction of identity as an extension of the self (Belk 1988)—"You are what you consume"—as well as in social relations (Solomon 1983). Consumption and purchases are vested with a "psychic energy" (Csikszentmihalyi and Rochberg-Halton 1981).

The role of consumption during transitional periods has received increasing attention in recent years. Many authors have shown that life transitions nowadays can be experienced through the consumption of goods and services (Belk 1989; Fischer and Gainer 1993; McAlexander 1992; Ozanne 1992; Roberts 1991; Rook 1985; Schouten 1991a, 1991b; Wright 1991; Young 1991). More specifically, the importance of consumer goods in the learning and performance of social roles is also recognised (Belk 1988; Solomon 1983). Some consumer goods will mark an ostentatious status. Thus, the various roles played by an individual are facilitated or inhibited by the presence or absence of material symbols (Solomon 1983). This is the active side of tangible property.

In life transitions, consumption intervenes more precisely in the reconstruction of the self (Schouten 1991b). Objects help us through change insofar as they facilitate the identification of the status and act as a support for social standards. Thus, Solomon (1985) shows that a suit can be seen as an accessory in the contemporary rite of passage that is a woman's entry into the professional environment. The author notes that clothing can communicate competency and professionalism. In a study into another modern life transition, divorce, McAlexander (1991) shows that the distribution of possessions resulting from the marriage has a symbolic value. Indeed, the choice made by the partners in relation to shared possessions is in accordance with the identity-linked desire to release oneself from the throes of marriage and the life that goes with it. The absence of initiation rites to enter adulthood is characteristic of our society (McCracken 1988). The consumption practices could compensate for the absence of initiatory rites (Ozannes 1992; Wright 1991).

### Motherhood: an important life-event for women

The experience of motherhood is one of the most important events in a woman's life and potentially a stressful life event in Holmes and Rahe's classification (1967). Motherhood should be understood through sociocultural and historical processes (Thompson 1996). In the rites of passage theory (Van Gennep 1909), first-time motherhood has been sequenced in three phases. Stopping of a job is the separation stage. Pregnancy is the liminal period. And childbirth is the incorporation stage.

In recent studies in different disciplines, researchers highlight the changes of identity of women (Bailey 1999; Smith 1999a, 1999b), the importance of possible selves (Banister and Hogg 2006), the role of consumption to reinforce the construction of the mothering identity (Jennings and O'Malley 2003), and the good mother identity in the eyes of others (Prothero 2002). Consumption also allows the construction of identity for their baby (Miller 2004; Clarke 2004). A few researchers have initiated the idea that certain objects such as prams can be vehicles for the acquisition and maintenance of the role of motherhood (Thomsen and Sorensen 2006). Fischer and Gainer (2003) have seen "baby showers" as a modern rite of passage which marks both an acceptance of the new role and a denial that anything fundamental would change.

A review of the literature suggests an emergence of interest in the role of consumption in life transition, new social status and identity changes. And in the present research, we propose to better understand the dynamic process of first-time motherhood by examining the construction of the role of mother and the anticipation of first-time motherhood through consumption.

## METHODOLOGICAL CHOICES: SAMPLE, DATA COLLECTION AND ANALYSIS

In this study, we attempt to carry out an in-depth exploration of life transition with interpretive logic (Holbrook and O'Shaughnessy 1988; Sherry 1991) to understand the different practice systems (Garfinkel 1967), what links them together (Blanchet and Gotman 1992) and the meanings ascribed to consumption practices (Thompson 1997). Thus, we propose to offer a wider ethnographical reading of the event and develop a theory based on the data (Glaser and Strauss 1967). We use individual interviews with pregnant women expecting their first child, with a focus on consumption practices.

We built our sample so as to benefit from diverse cases (Miles and Huberman 1994) in terms of age, socio-professional categories and the number of gestation months already completed. In order to obtain maximum variations, we diversified our sources and methods of recruitment. We initially enlisted the help of personal networks and later recruited respondents at ante-natal classes in midwifery clinics and a maternity hospital. Our final sample is composed of 27 pregnant French women (age 17-40, average age 28) who were expecting their first child.

It is necessary to point out that the interviewer has not yet experienced first-time motherhood. Contrary to Prothero's work which relies on researchers' subjective introspection (2002), we

prefer following Kaufmann's recommendations (1996 [2004]) about the researcher's position as "ignoramus."

Interviews were carried out by one interviewer. They were generally conducted in the place of residence of the respondents, though in certain cases the interviews were held in a café. The interviews, tape recorded to facilitate subsequent data processing, took place between February 14 and May 18, 2005. The duration of the interviews varied from half an hour to an hour and a half. To understand the symbolic meanings, we adopt a phenomenological approach. Then, three themes were systematically explored: 1) how pregnancy was construed, 2) what changes were caused by pregnancy 3) what preparation for childbirth had been carried out. Where necessary, the interviewer asked for further explanation on precise points and also explored new topics.

The 27 individual interviews were transcribed verbatim, so as to preserve as accurately as possible the initial character of the remarks. The interviews lend themselves to reading as they were recorded. The data was analysed using an iterative process of searching for recurrent themes (Miles and Huberman 1994) with a final axial coding. The coding is based on constant comparison: initially comparing data to data, later comparing data to theory (Spiggle 1994; Strauss and Corbin 1990). Three major themes emerge from the analysis of data and are discussed in the next section.

## FINDINGS: PRESENTATION AND DISCUSSION

### The decision to have a first child: process and meanings

Having a child is now a conscious decision, carried out in a reflexive mode, on two levels—both individual and collective. Thus, the analysis of data provides many elements on the decision-making process.

In most cases, the reflection process begins before the final decision is made. Motherhood is closely associated with the female identity, as early as childhood.

*"If he had told me I don't want to have any children with you, I don't think we would have stayed together."* [Joulia (31-year-old junior analyst)]

In the decision-making process, the couple undergoes pressure from their family and other relatives, their friends and colleagues and more broadly from society, through the standards which it imposes. First of all, the age of the pregnant woman is an element endowed with a highly normative character. Women, whose ages are very different to the national average—29.6 years old in France—like Amélie (17), Hélène (19) and Sophie (40) are seen by those who know them as exceptional cases. Owing to awareness of the cost incurred by child-rearing, the couple's economic situation and professional status become important criteria. Women anticipate the cost of a child's birth. At this stage, parenthood is associated with the material well-being of the child. Most particularly, in western societies, motherhood implies the purchases and utilisation of a lot of material goods for the baby. Attias-Donfut (1990, p.105) suggests that "the fact of viewing one's offspring as a source of wealth has now been replaced by viewing it as a source of expenditure, an evolution which characterises modern society."

*"It's true that financially we could have afforded it for a long time (…) Yeah; I've been working for 6 years already, and Vincent for 3. But you know, our relationship was a bit chaotic for a while, so we waited until our life as a couple was nice and steady."* [Ingrid (31-year-old primary school teacher)]

The child symbolizes an irreversible break from the past and introduces a sharp distinction between the previous life and the new life. Laetitia C. (a 31-year-old manager) spoke of the "beginnings of a new life". Sarah (a 28-year-old teacher) had the impression of finding herself "at a crossroads". For Céline (a 26-year-old nurse), "this is how life has to evolve." Through this decision, the woman is conscious that she will have a new social status with the attached role. In the case of first-time motherhood, the social status and role of the mother, publicly assumed at the time of the birth of the first child, are added to the marital and professional status and roles, which are then necessarily redefined (Linton 1947). In fact, when individuals obtain a new social status or role, an adjustment of their system of roles and statuses is necessary. Thus, when a woman takes up her role as a wife or a mother, she endorses the system of values and behavior which is attached to it. In daily life, women will have to juggle between their roles and various statuses (Cicchelli 2001). The new role of mother will have a significant impact on the identity of the woman, whose status shifts from that of her mother's daughter to that of a mother (Stern and Bruschweiler-Stern 1998). The decision anticipates the idea of new organisation of everyday life with a readjustment of the roles of both partners.

The notion of descendants is also at stake with the birth of the first child, as it constitutes an opportunity to create a direct descendant, a greater privilege than collateral descent (brothers, sisters or cousins), and perpetuate the family unit. Pregnant women evoke the idea of transmitting the familial's cherished possessions (Folkman Curasi, Price and Arnould 2004) or the family values, beliefs and attitudes including certain consumption practices. Thus, it's an anticipated conception of the intergenerational influence (Moore-Shay and Lutz 1988) and transgenerational capital (Ladwein, Carton and Sevin 2007).

The arrival of a child is a positive emotional event—understood as something remarkable occurring in an individual's environment (Augé 2003). Thus, the consumption practices undertaken in order to prepare for a baby's arrival are seen not as a chore but as a pleasurable activity.

### Pregnancy: transitional period with changes of everyday life consumption practices

Women experience pregnancy as a necessary stage towards motherhood. Pregnancy is the occasion for her to endorse a transitional role, that of a pregnant woman whose objective is the protection of her unborn child. During pregnancy, the everyday life of pregnant women goes through changes.

The majority of these changes are related to the presence of the child and the desire to protect him/her. Thus, the management of risk is different, with the risk limit being lowered. The new perception of risk modifies certain daily consumption practices (Thompson 2005). Their characteristics are the transitional dimensions of certain practices that exist only during the pregnancy and in relation to the role of pregnant women. We highlight some of these changes here. First, with the protection of the unborn child in mind, there is a search for a healthier life: expectant mothers give up tobacco and alcohol. Then, various patterns of food consumption develop. Food is closely associated with the good health of the baby, whom it can protect from various pathologies. As Sarah (a 28-year-old teacher) says "I think twice as much because we are two and I try to eat more healthily." Thus, pregnant women adopt a balanced diet with more dairy products, fruits, vegetables, enriched mineral water and health supplements. The cocooning attitude of certain pregnant women develops a new pattern of consumption such as internet purchases, home delivery services, home consumption of DVD movies (rather than go out to the cinema). Pregnant women need to be able to trust what they buy. Thus, she prefers

brands, food with labels or organic food. The advice of medical experts is more important for pregnant women.

Pregnant women look after themselves (Prothero 2002). As soon as the pregnancy is known, pregnant women buy a lot of cosmetics, leisure goods (books, music) and new clothes.

During the pregnancy, a more or less intense upheaval of the traditional distribution of domestic roles is observed. Normally, social norms prescribe the role that each partner will play in the couple (Roberts 1981). Thus, even if it tends to be moderated in some cases, women become more involved in domestic activities, such as cooking and washing, while men are in charge of the car and the D.I.Y. A more or less significant involvement of the man in household chores, such as shopping or washing—tasks more frequently carried out by women—is observed. As Virginie says laughingly, "he (her husband) helps me, he cleans the house, he prepares the dinner, all of which I did before!" This is one way for the man to become involved in the pregnancy.

Pregnancy is also the cause of a change in social behavior. It is characterised by decreased social commitments—leisure activities are reduced and professional activities are interrupted. In social relations, the status of pregnant women seems to dominate all others. The interviews show a "mystification" effect related to the social status of pregnant women, which materialises in a greater amount of attention being paid to pregnant women. For example, the customers who shop in Catherine's store (a 31-year-old store manager) show an interest in her pregnancy. Sophie (a 40-year-old secretary) is allowed to jump the queue at the post office, while Lucie (a 30-year-old journalist) says "in my family, I am the star". An inflation of unilateral social interaction is also observed. Pregnant women are seen as "attractive". Women who are already mothers initiate interactions with pregnant women. As former pregnant women, they feel the need to tell of their own experience with pregnancy as the narrative of the self (Ladwein 2004). The social interactions framework positions the women as pregnant women and future mothers.

These elements allow us to conclude that pregnancy can be associated with a period of transition between the former and future social roles, with everyday life changes. This period emphasizes the initiation of the anticipation and the reality of an expected child. Much more of these developed elements are focused on the child than on the role of mother. This anticipated process of an expected child continues through the consumption practices, which concern the material preparation for the anticipated child.

**The anticipation process of the role of mother**

During the pregnancy the child is not yet present, so the mother's social role and status are not yet official. However, progressively, pregnant women's social status moves towards the social status of mother and thus preparing them for their future role.

*The cognitive anticipation of the child's arrival*

The pregnancy is a period spent in expectation of the unborn child's arrival and during which preparatory psychological work with regard to the future role of mother takes place by way of the mental construction of the child (Stern and Bruschweiler-Stern 1998). Most pregnant women acknowledge having difficulties in giving a concrete form to the pregnancy for the first three months. Then pregnant women progressively internalise their state and the future arrival of the child through a succession of stages.

First, medical contact such as blood tests, antenatal classes, medical appointments and, finally, ultrasound scans provide chronological pace to the pregnancy. Ultrasound scans provide particularly important and memorable moments of the pregnancy because they reveal the first images (Fellous 1991) of the child and initiate the construction of the mental image of the future baby. In certain cases, the need to see and feel the growing foetus may constitute the first steps of the future visual tracking of the child, made material by several photos and films. We can underline the rise of a three-dimensional ultrasound scan in private centers or the recording on DVD. Each ultrasound scan appointment becomes a sacred experience and ceremonial time.

Furthermore, the ultrasound scan now makes it possible to predict the sex of the child. Choosing to know the sex of the child is then justified by a willingness to be able to personify the child and to personalise the material preparation, more particularly in terms of clothing items and decorating the baby's room. Thus, the knowledge of sex of the baby influences purchases. In the same vein, the choice of a first name also contributes to imagining the child. The naming of the child traditionally takes place at birth. That implies an anticipated choice, which is realised in a methodical and meticulous process with specific book or Internet research. The choice of a first name seems the first important decision for the future life of the child.

Moreover, two physiological events also make it possible to contribute to the reality of the child: the sensation of the baby's movements and the belly, which swells gradually, becoming the testimony to the pregnancy and to the presence of the foetus.

Lastly, the first purchases of material goods also contribute to reinforce the reality of the coming child with certain emotion. Then all along the pregnancy, each purchase solidifies the reality of the coming child—bedroom, push chair, clothes.

A new stage begins more actively: the learning of material preparation of the expected child which reinforces the construction of the role of mother.

*The social learning of the role of mother and the "knowledge-able consumer"*

During the pregnancy, women undertake the social learning of their future role as mother, a role that is unfamiliar to them. Pregnant women acquire the necessary knowledge, competencies (know-how) and attitudes in relation to the social role of motherhood. The role of mother is directly related to the idea of looking after the child's well-being on all levels—material but also educational and emotional needs. Thus, this learning also concerns consumption because becoming a mother is to develop as a "knowledgeable consumer." And a good praxis may be conditioned by possession of the correct objects. However, the child's welfare market is unknown to first-time pregnant women. That explains why, during pregnancy, women need a lot of information. Where we might see a simple external search for information on behalf of the pregnant women, it is necessary also to see the social learning of the role of mother. This means that the direct and indirect role models will serve to help pregnant women understand what to consume and will exert considerable influence on their purchases as well as the use of objects. Particularly in the field of consumption, role models are identified as any person with whom an individual can come into contact, directly or indirectly, and who is likely to influence the consumption-related decisions and the actions of that individual.

Pregnant women will quite naturally favour female role models. Direct role models are other mothers from her close circle such as friends, sisters or work colleagues. These models can be women who have already had children, very recently if possible so that they may be able to visualise the maternal role that the expectant mother awaits. This social learning by direct role models is justified by the desire of the pregnant woman to be a good mother in accordance with the social norms imposed by society and sociocultural patterns of motherhood.

*"Yeah, you know, then I'm afraid that, em, I mean it has to be perfect when he arrives and super clean and I don't want him*

*to be sick. I'll have to have somewhere to wash him and change him with something, and I'll need clothes to dress him but I don't have anything, you know, I mean I've got a couple of things, but, you know, I'd like to buy him clothes as well, stuff that I'll actually give him myself and not just stuff I've borrowed, you know."* [Naïma (27-year-old student)]

The pregnant woman observes the behavior of the other mothers in order to assimilate them and then to imitate them when the child finally arrives. It is therefore interesting to consider the experience of Sarah (a 28-year-old teacher) who accompanied a friend so as to observe her organisation with the baby. The direct contact with role models is a new form of social interaction that would not have taken place without the pregnancy. One of the potential role models is the pregnant woman's own mother. During the pregnancy, the mother and daughter link is reactivated. Fischer (1981) shows that "more reciprocal contact between them would then be observed." However, the mother can be a potential important or unimportant role model. Because of the rapid changes taking place in product offerings, the selection of direct role models in terms of consumer learning is made in accordance with how recently the role model in question experienced her pregnancy. This explains why some pregnant women have difficulty accepting their own mother as a potential role model. For certain respondents, their mother's experience is too remote and is no longer in phase with the changes in the marketplace and certain cultural aspects of society.

*"She is a bit old fashioned, I think, for example prams, there've been big changes. They didn't have Maxy Cosys that do everything for you back then. Before, they had the big Landaus and that was all, you know? She gives her opinion, but everything that comes out in the shops is a bit much for her, it's not at all like before."* [Céline (26-year-old nurse)]

On the contrary, for other, generally younger, respondents, the mother is a central model and may be ever-present. Amélie (17) and Hélène (19) particularly emphasise their mother's expertise. We notice that intergenerational influence is sometimes reactivated, particularly by way of nostalgic attachments of the pregnant women to their own infancy. For example, pregnant women often ask their mothers to remind them of the brands which were used when they were babies. Solène (a 27-year-old teacher) chose the push chair "Bébé Comfort" (french brand) because her mother bought this brand when Solène was a baby. We can observe nostalgic connections and emotional attachment to certain brands (Fournier 1998) as they put more trust in these brands.

Indirect role models can also be identified. Pregnant women may look for an indirect role model through various media sources like television, the press or the Internet. They will seek someone who generally corresponds to their experience or point of view.

*"I initially asked my sisters and went on to Internet forums for mothers. Yeah, I actually spent a lot of time on those sites and em, and that's it, you know, I read what they have to say and some of them talk about what they bought, which is what you need."* [Naïma (27-year-old student)]

However, the direct role model appears very powerful.

*"People with experience can give better advice—not necessarily, but because they have experience they know more about what needs to be bought than the magazines for example."* [Sarah (28-year-old teacher)]

Pregnant women make up their own minds about their future role. In fact, they observe social norms through the actions of their role models, which remain accessible. Then they adapt these observations to their own notions of what is good or bad (Kaufmann 1995). Finally, women engage in "D.I.Y" of their future role through additional observed data (Bandura 1977).

*"And people give a load of advice about everything to do with daily chores, hygiene, how to put the baby to bed, what to do for them every day, what products to use. I think it's good to give you an idea, you have lots of different opinions and then you can make up your own mind and have your own idea of what to expect."* [Céline (26-year-old nurse)]

*"I read it of course, yeah, and you know I learned some stuff, although not that much, I mean there's so much out there. I'm telling you when you're 20 you don't know much, but when you're 40 you're well informed about things and you know, you've got a lot of friends and family around you who have had kids, so you talk and observe."* [Sophie (40-year-old secretary)]

It is worth noting that the learning of the role of mother begins as early as childhood (Stern and Bruschweiler-Stern 1998). In fact, many pregnant women evoke memories of their childhood when they played with their dolls.

An exchange of the information acquired by role models can be observed between pregnant women. If a pregnant woman is at a more advanced stage of the pregnancy, she can become a role model for another pregnant woman. This was the case for Céline, whose sister was pregnant before her, allowing Céline to observe the way she dealt with the pregnancy. However, the social learning may begin before the pregnancy, but it continues well after childbirth (Stern and Bruschweiler-Stern 1998).

Furthermore, a learning phase can be initiated by purchases for other children. This allows the constitution of a minimal stock of information concerning the products available.

*"And then, em ... with regard to purchases, you start to buy things for the baby. It's a world that you might know a little indirectly; I have nephews and so I have bought them presents. I also have friends who have had children, so I'm always, you know, em (…) I also think that being a woman makes you a little softer about these things…"* [Catherine (31-year-old store manager)]

### The anticipated social role of mother through material preparation of the child's arrival

During pregnancy, women orchestrate a meticulous material preparation of the child's arrival necessary to the child's well-being. These goods correspond to two objectives: building the universe of the child (bedroom, clothing, toys and other child care goods) and preparing for maternity stay (maternity kit). Further, other consumption practices like those typical of women decrease and are replaced by consumption practices for a future baby.

*" I bought much fewer things for me, for expenses, there are Christmas then I bought for my family but for I bought much fewer I find. And I spend for her, for the baby. I spend much less than when I wasn't pregnant. It's a parenthesis, in your feminine life in fact.…"* [Sarah (28-year-old teacher)]

The material preparation is often a ritual dimension in Rook's structural acceptation (1985) with a belief system and a system of

symbolic action (Holt 1992). First, consumption helps to control the duration, which separates the pregnant woman from childbirth, i.e., the moment when the new role becomes active. Secondly, it can reduce the stress generated by the life transition (Schouten 1991a, 1991b). Finally, it allows pregnant women to adapt to the new role of motherhood. Even if the role is fully effective and recognised by the act of childbirth, a social recognition and an anticipation of the performance of the role will be operated through the material preparation. The consumption of goods becomes an indicator and an instrument of the role of mother. The material attributes have a double function: 1) to establish the role of mother through the eyes of others—object can be a vehicle (Thomsen and Sorensen 2006)—certain objects such as push chair or pram can have a strong social risk; 2) to facilitate the performance of this role before the child's arrival. Fischer and Gainer (1993) study a popular ritual in the USA known as a "baby shower". This is a prenatal party to celebrate the anticipated arrival of the baby. The authors show how this party serves to accompany the acquisition process of the role of motherhood. Young (1991), in a study of various life events, notes that consumption facilitates and validates the changes of status and role during a life transition. We choose to speak of consumer goods as "facilitators" of the role transition.

Furthermore, the involvement of family members, or people close to the couple, can be observed in the preparation of the child's arrival. This may involve an anticipated exchange of gifts, which normally takes place after the birth. The gifts do not have the same meaning when they are given after the birth. These gifts should be understood as a system of social solidarity within the complex sociocultural construction more than just an aggregate of dyadic exchange (Giesler 2006). In fact, the financial participation of the family in the preparation for childbirth—material gifts or money—symbolize its contribution to the birth (Cicchelli 2001). We can also see the role of consumption in facilitating the integration of the role of grandparents, uncles or aunts.

## GENERAL DISCUSSION

The findings are theorized in terms of the concept of the anticipation and the construction of the role of mother during the pregnancy. The preparation process of material goods ready for the unborn child's arrival, and the meanings ascribed thereto, contribute to construct the role of mother. Thus, consumption practices have not only a functional role in relation to the child's arrival but also help pregnant women to adapt to their future role. An interesting pattern can be proposed from the findings. In fact, we can define from coding process two dimensions: 1) consumption practices with a "child orientation" which are expressive of a protective role; and 2) consumption practices which are oriented towards the "social role of mother." The anticipation of the social role and status of motherhood are here emphasised. In this dimension, two functions of consumer goods can be exposed. On the one hand the material goods establish the role of mother. On the other hand, they imply an anticipated performance of the role by their purchase. As an accessory to the role, the tangible property is then a facilitator of this performance and reduces stress. Thus, the pregnancy offers an initial dramatisation of the role of mother through consumption. The major theoretical contribution of this study is the notion that consumption allows an anticipation of the forthcoming social role and status during the transitional period, at which time they are not yet in effect. Furthermore, we can see through consumption the sociocultural structure which maintains the form of social status and role of mother.

Many particularities of the framework can be exposed. First, a temporal dimension can link two stages. The new role of mother becomes increasingly solidified along the pregnancy phase. Each month of pregnancy influences both consumption of old roles and new consumption practices. Then, consumption is a result of social learning about the role of mother through the observation of direct or indirect role models. Thus the two dimensions make up a wide social interactions framework. Finally, this framework is rooted in sociocultural patterns. Then, we can suggest that consumption practices substitute for ritual practices in traditional societies.

## CONCLUSION AND RESEARCH PERSPECTIVES

Our research highlights how consumption practices offer an initial preparation and anticipated dramatisation of the role of mother. The major theoretical contribution of this study is the notion that consumption allows an anticipation of the forthcoming social role and status of mother during the transitional period, at which time they are not yet in effect. Finally, as Raulin (1986) suggests concerning childbirth that the "social birth seems to anticipate the biological birth", the birth of "mother" is socially anticipated by consumption.

The qualitative methodology is the best method to understand and capture the dynamic process of the construction of the role of mother. But some of the methodological limitations can be exposed. In fact, to enrich the findings our methodological choice should include photographic data of childcare material goods. Moreover, we could complement the data of interviews by observations in stores where pregnant women shop. Finally, the study should have been extended to another context in addition to the French context.

The present study suggests relevant developments in consumer behavior research. First, we propose as the next step of this research the exploration of the consumption practices immediately after first childbirth. Then, we are interested in exploring more specifically the transmission of consumption practices from mother to daughter in case of first-time motherhood to a daughter. This research could also be extended to the role of consumption in the passage to fatherhood, given the inability of men to become pregnant and the inherent difficulties they have in preparing for the child's arrival. Lastly, we can study the loan of objects between mothers and pregnant women through the consumer resistance theory.

# Exploring Consumer Fanaticism: Extraordinary Devotion in the Consumption Context

Emily Chung, University of Melbourne, Australia
Michael B. Beverland, University of Melbourne, Australia
Francis Farrelly, Monash University, Australia
Pascale Quester, University of Adelaide, Australia

## ABSTRACT

This paper explores the phenomenon of fanaticism through qualitative in-depth interviews to learn about the characteristics associated with extraordinary devotion to consumptive objects. Findings showed inertial (addictive and obsessive-compulsive) elements associated with fanaticism, however, contrary to common portrayals, this is not always detrimental to the individual. It also showed that fanaticism involves managing the fine line between extreme levels of enthusiasm that is positive and fulfilling, versus non-sustainable borderline-dysfunctional levels of enthusiasm that may turn into something darker or problematic.

## EXTRAORDINARY CONSUMER DEVOTION

Volkswagen Beetle, Apple computers, Nike sportswear, Harley Davidson motorbikes, Louis Vuitton bags and purses, Manolo Blahník shoes, Krispy Kreme doughnuts, Hello Kitty character-goods, and Martha Stewart magazines are just a few examples of brands enjoying a "cult-like" following (Belson and Bremner 2004; Hofman 2000; Rozanski, Baum and Wolfsen 1999; Wintour 2003). To many consumers, shoes serve a simple, functional need, but according to Wintour (2003, p.6), the editor-in-chief of Vogue Magazine, "Manolo Blahník's shoes inspire fanatical devotion". Fans of Manolo Blahník profess that they "fall at his feet and worship his temple" (Wintour 2003, p.73). *Sex and the City* actress Sarah Jessica Parker adds: "By now I can run a marathon in a pair of Manolo Blahník heels. I can race out and hail a cab. I can run up Sixth Avenue at full speed. I've destroyed my feet completely, but I don't really care. What do you need your feet for anyway?" (Wintour 2003, p.128). This illustrates not only the close bonds a consumer can form with brands, but also the fanatical nature of their loyalty to some brands.

Fanaticism is defined in this study as extraordinary devotion to an object, where "devotion" as conceptualised by Pichler and Hemetsberger (2007), consists of passion, intimacy, and dedication, and "extraordinary" implies going beyond the ordinary, usual, or average level (Taylor 1991). The "object" refers to "the object of fascination", which can include a brand, product, person (e.g. celebrity), television show, or other consumption activities (e.g. sports) (Thorne and Bruner 2006).

Fanatics are inclined to insist their ideas are the correct ones, ignoring any facts or arguments that may conflict with their thoughts or beliefs (Perkinson 2002). Their enthusiasm is so extreme it is sometimes considered excessive (Passmore 2003). Examples of fanaticism to a brand, product, or activity can be found in seminal studies of extremely loyal, brand-worshipping consumers, such as core participants of brand communities, brand cults, and various subcultures of consumption (e.g. Belk and Tumbat 2005; Belk 2004; Brown, Kozinets and Sherry 2003; Celsi, Rose and Leigh 1993; Celsi 1992; Kozinets 2001; Kozinets 1997; McAlexander, Schouten and Koenig 2002; Muñiz and O'Guinn 2001; Schouten and McAlexander 1995; Thompson and Troester 2002). Studies have shown that consumers can be extremely passionate about "their" sport or product to the extent of assigning them with sacred status (e.g. Ahuvia 2005; Belk 2004; Belk, Ger and Askegaard 2003; Belk, Wallendorf and Sherry 1989; Belk, Wallendorf, Sherry, Holbrook and Roberts 1988; Funk and James 2001; Oliver 1999;

Pichler and Hemetsberger 2007; Schouten and McAlexander 1995; Whang, Allen, Sahoury and Zhang 2004). Belk and Tumbat (2005) illustrated that some Macintosh users are so passionate about the brand that they take on missionary roles and recruit new users to the brand by insisting they are the better computers. Other extremely loyal brand users, as Muñiz and Schau's (2005) study on the Apple Newton PDA (Personal Digital Assistants) community have shown, would ignore or even retaliate against suggestions to upgrade or switch to other brands.

Fanaticism is a unique form of loyalty characterised by strong, intense, and extreme levels of commitment, allegiance, devotion, passion, emotional attachment, enthusiasm, and involvement (Bristow and Sebastian 2001; Cova and Cova 2002; Funk and James 2001; McAlexander et al. 2002; Muñiz and O'Guinn 2001; Oliver 1999; Redden and Steiner 2000). A cross-disciplinary review of the existing (business, social psychology, politics, philosophy, anthropology, sociology, history, and religion) literature on fanaticism have revealed that fanaticism is often considered a difficult concept to comprehend because the use of terms such as fans, fanatics, and fanaticism, have been inconsistent and confusing (Taylor 1991; Redden and Steiner 2000). As a result, there are uncertainties as to fanaticism's core attributes, and conflicting views with regards to its dimensions. While some studies view fanaticism as normal, ordinary, and respectable (e.g. Bird 1999; Hunt, Bristol and Bashaw 1999; Jindra 1994), many others have portrayed fanaticism as being overly obsessive, excessive, extremist, intolerant, and incoherent (e.g. Gautier 2002; Hofman 2000; Perkinson 2002).

Much of the existing literature is dominated by negative portrayals of fanaticism, with suggestions that fanatics suffer psychological disorders and require psychotherapy (Ellis 1986; Firman and Gila 2002; Slobodzien n.d.). In the marketing context, literature on consumer fanatics also carries similar negative connotations. For example, Redden and Steiner (2000) suggested that fanatical consumers should be avoided because "fanatics don't think like normal people" (p.337). Similarly, Rozanski et al. (1999) warns marketers that "fanatical followers" can become a brand's greatest enemy if they feel defrauded by marketer actions (p.51). Indeed, Brown et al. (2003) showed that fanatical consumers can sometimes act as a barrier to marketer activities, such as brand relaunch.

Although fanaticism has often been portrayed in a negative light, this paper suggests that a more comprehensive account of the phenomenon requires an open-minded approach that is not heavily skewed towards the disapproval of fanatics. Fanatical consumers could be regarded as valuable customers of a brand for a variety of reasons. For example, some fanatics have extreme and passionate consumption drives, which imply heavy usage and purchase patterns (Hofman 2000). They can act as opinion leaders to bring others' attention to the brand and attract new customers (Rifkin 1999). Furthermore, fanatics will go to great personal and financial lengths to support a brand, such as by joining and actively participating in brand communities or fan cultures (Funk 1998; Muñiz and O'Guinn 2001). Their support is consistent, persistent, and resistant to any attempts at reducing this attachment, which includes the active disregard of marketing messages from competitor brands

(James 1997). Hugenberg (2002) suggests that organisations become "wealthy as a result of fan loyalty" (p.178). Therefore, the phenomenon of consumer fanaticism deserves much needed research attention, which will also contribute towards the existing understanding of loyalty.

A recent study by Thorne and Bruner (2006) identified and provided empirical support for a set of four characteristics of consumer fanaticism (said to be common to fans even across different areas of fanaticism or fan genres): internal involvement, external involvement, a desire for interaction with others, and a wish to acquire source-related material. The identification of these characteristics (which are not loaded with negativity as they often were in the preceding discussions of consumer fanaticism) was important to draw stigma away from the phenomenon and to encourage further research in the area which is still at its early stage. It is proposed that exploration of fanaticism should be open to, and considers all (positive and negative) elements associated with the phenomenon.

## METHODOLOGY

The aim of this study is to further explore the characteristics and qualities of consumer fanaticism. To do so, it is important to obtain an intimate understanding of consumer fanatics. The collection of life stories were thought to be most appropriate as they can provide in-depth understanding of an individual's past experiences that may have shaped who they are today (Atkinson 1998; Atkinson 2002; Douglas, Roberts, and Thompson 1988; Rosenthal 2005). The collection of life stories took the form of in-depth face-to-face interviews, which led informants chronologically through their lives, from childhood, through adolescence, and to adulthood, examining issues, events, and people associated with the phenomenon of interest.

The interviews were conducted over the course of eight months on a sample of consumers who were reported as 'fanatics' or have experienced the 'fanatic' label. Five individuals were recruited via purposive sampling, as interviewer-informant familiarity can enhance candour and emotional openness when the subject matter may be sensitive, particularly due to the stigma associated with the 'fanatic' label (Price, Arnould and Curasi 2000). Informants were interviewed up to five hours each, which was audio taped. Verbatim transcripts were created, and life stories were constructed, where analysis was performed via line-by-line scrutiny of data, in order to uncover new concepts and novel relationships, and to systematically develop theoretical categories (Cavana, Delahaye, and Sekaran 2001; Strauss and Corbin 1998). Data analysis was conducted based on the qualitative manipulation operations described by Spiggle (1994).

Various strategies were adopted through this study to enhance the rigor of the qualitative research. This was achieved by ensuring credibility, transferability, dependability, and confirmability. These criteria were addressed by subjecting the raw data, data analysis, and data interpretations to triangulation (via corroboration between crosschecked data, and the relevant literature) and subject review (where some participants reviewed the data interpretations and findings) at various stages of the research process.

## FINDINGS

The aim of this section is not to report on the life stories collected. Rather, it draws on selected consumer testimonials that best illustrate the emerging themes gathered from the data, representing some common characteristics and qualities of fanaticism.

### Extraordinary Loyalty & Devotion

Extraordinary loyalty and devotion implies attachment that is beyond the usual, average, or ordinary level. Loyalty and devotion implies that fanaticism is beyond simple engagements between the consumer and the object (Funk 1998; Funk and James 2001; Funk, Haugtvedt and Howard 2000). That is, the notion of loyalty and devotion considers not simply the frequency of participation, such as usage or purchase patterns, but involves emotional attachments such as feelings of passion and love, intimacy and dedication as described by Pichler and Hemetsberger (2007) and Ahuvia (2005). This can be illustrated through Whitney's (AF27) testimonials about her love of luxury fashion brands:

Whitney… "One of my big things is handbags. Absolutely *adore* handbags… I currently have one Gucci and two Louis Vuitton's, which I love, love, love, love, love… I value clothes and shoes and bags more than things like food (laughs)… I love them to pieces, I probably used them about only ten times each 'cause I don't want to damage them… they're like my little babies. They're so precious to me. If anything happened to them I'll be so upset, I really would be devastated… I won't even carry my bag if I have moisturiser on my hands, because I don't want anything tarnishing or tinting it... And then, if I get in the car with it, it sits on my lap, I won't put it on the seat, or on the floor, it stays on my lap."

This example illustrates the love Whitney feels towards the product, and her extraordinary devotion to them, including an enthusiasm that is beyond the average, usual, or ordinary level. Her enthusiasm is beyond average because many, including her friends, do not understand her obsession or excitement. She claimed that her mother "would die if she knew how much I spent on one of those bags".

Whitney's extraordinary devotion to these products can also be illustrated by the extreme level of care used to handle them, and the protection she gives them:

Whitney… "I can spot a fake a mile away. I get really angry… uni(versity) girls or high school girls carry(ing) fake LV (Louis Vuitton)… I want to just *scream* at them… (my cousins) will go why would you spend six hundred dollars on a bag (when you can get an imitation for ten dollars)? I get *reeeeally* offended, and really pissed off"

Whitney gets worked up and emotional, and appeared angry as she described and demonstrated her ferocious protection of the brand. Such passion is beyond ordinary levels considering she has also made sacrifices in her pursuit of these brands, and actively recruits new admirers to the brand:

Whitney… "(I) will stop at nothing to get it… I would eat cheap food. Or, not eat. I just find ways to save money. So that I can (make these purchases)… even essential stuff, like fixing my car, my contact lenses, I would go without… If I go for lunch with my friends and we're just like half a block away, I'll be like, let's go into (the) LV (store) and have a look… I'm slowly getting (my boyfriend) into it… I'm slowly breaking him in 'cause I just talk about it so much… there needs to be more people that understands 'cause I need more people to talk to about it and obsess about it 'cause I get really excited"

The recruitment of new users to the brand also illustrates Whitney's extraordinary devotion to the brand. It is a unique behaviour usually displayed by devoted consumers (Fournier and Yao 1997; Pimentel and Reynolds 2004; Rifkin 1999; Rozanski et al. 1999; Thorne and Bruner 2006).

Ashley (CF27) is a fanatical toy collector. She used to work at a toyshop, and currently works at a toy warehouse. She has an

enormous collection (into the "thousands" number of items) that spans across at least three rooms of the family home, as well as other areas such as the garage and shed, toilet, kitchen and dining areas, as well as the car. Of the three rooms, all surrounding wall space is covered by toys (top to bottom, and even the ceilings), and one of them has only minimal standing space, and can no longer be used as a bedroom. Ashley compares her level of fanaticism with that of her brother's:

> Ashley… "I consider myself devoted, extremely loyal… I spend a lot of money on toys… I've got a lot of shrines and they're basically just trying to show the toys better… I did that at the toyshop [which she worked for, for four years]… I really took great pride in it. A lot of people at toyshops do it for a job but I'd make sure that all the Mattel stuff was all together and I'd make sure that all the Spiderman stuff was there… I missed my toys… I missed looking at them… I don't have time to set them up properly and I really want to but I can't really take time off work to set up my toys. Does that make me non-fanatical now?... I'm not as fanatical, Ben is a definite fanatic yeah he is... he's quite fanatical. And I sort of got caught up through it through him… 'cause' he's got such a passion for it… You should talk to him and you won't be able to shut him up if he starts talking about his toys and you will never, ever shut him up..."

Ashley explained that she misses her toys when she is away from them, which illustrates a strong level of emotional attachment to them. She feels that they need to be organised "properly" (e.g. into shrines of similar toys), but appears to be torn as she does not have the time to do so. Although, Ashley clearly shows devotion to toys beyond the ordinary level, she classifies herself as being less fanatical than her brother whom she believes initiated her interest and love of toys. This suggests that perhaps various forms or levels of fanaticism may exist to characterise different levels and extent of devotion to an object.

### Extreme Enthusiasm

Fanaticism often involves such extreme behaviours, and is often at such a high level of intensity that sometimes its pursuit cannot be sustained over long periods of time (in which case, the consumer may take a temporary break from his or her involvement). For this reason, much of the existing literature on fanatics has dismissed fanatics and fanatical behaviour as being "crazed" while mistakenly portraying it as being detrimental, destructive, dysfunctional, or counter-productive (Faber, O'Guinn and Krych 1987; Pollay 1987; Redden and Steiner 2000; Steiner 2004). Although sometimes arguably detrimental if sustained over long periods of time, the data showed that the consumer is often conscious and aware of this, and tends to exercise self-control to avoid any morbid or excessively negative consequences. For example, Anthony (AM24), who is a car model collector, explained:

> Anthony… "Car collection, it takes up most of my time, and most of my money as well. So I'm definitely devoted as such. Got over five hundred car models, and it doesn't seem like it's going to slow down anytime soon… (It's) a financial drain at this stage, losing all the money… I'm probably a little more crazy than I should be about cars… I've been trying to go on a mission of 90 days not-buying-a-car-model 'cause I was literally buying around two or three models a week. It was just getting out of hand. My room is just full of cars. And even then half of them are packed up in the boxes 'cause I have no space in my room."

Since Anthony feels that his involvement has reached a point of being "a bit too high", he tried to control it by consciously avoiding purchases for a set timeframe. This is his temporary escape from the intense level of involvement in his pursuit, which may otherwise be difficult to sustain over long periods of time.

Ashley's comments also demonstrated an awareness of the non-sustainable aspect of her extreme enthusiasm for toys:

> Ashley… "I spend a lot of money on toys… It's not ridiculous. If I need to spend money on something else that week, then I'll spend it on something else… I've had friends who think I'm crazy because they go, how can you spend all your money on that and not save up to buy a car or something. I'm like, well, it makes me happy… Some things I have to hold back on though. When I started my job at the toyshop, I had to *not* collect Beanie Kids because you know Beanie Kids, there's millions of them. I couldn't start or else I would have just gone broke but the bad thing was that my Canadian friends, I got them Beanie Kids when they went away and one of their presents back to me was a Beanie Kid and I'm like, no! You can't give me a Beanie Kid because now I have to start collecting them! So I've got four now and I'm very controlled."

Ashley appears to be aware of aspects of toy collecting that may lead to negative consequences, and manages her toy collecting carefully to avoid these circumstances. She is sensible with her spending, and would prioritise her expenses and responsibilities before attending to her toy purchases and acquisitions. These examples show that perhaps consumers who exercise self-control can avoid fanaticism turning into the darker and potentially problematic forms often portrayed in the existing literature on fanaticism.

### Inertial Involvement & Behaviour

Another reason fanaticism is often dismissed as dysfunctional is that it is sometimes associated with elements of obsessive-compulsive consumption and addiction-like behaviours (e.g. DePaulo, Rubin and Milner 1987; Redden and Steiner 2000; Scammon 1987). Addiction and obsessive-compulsive behaviours are often considered disorders that are intrusive to individuals and ultimately cause harm to them or to others (Doran and Kyrios 2005; Hirschman 1992; Moulding and Kyrios 2006; Pollak 1986). The data showed that consumer fanaticism often involves addictive and compulsive elements:

> Anthony… "Sometimes I feel compelled to buy. Sometimes I just feel like I need to buy for the sake of buying. But that's only been a couple of times… It sometimes gets (to the point of being) like somebody who is suffering from obsessive compulsive behaviour, it sometimes can be like that, where you're just buying for the sake of buying, not actually enjoying the model or the car, the purpose of it is totally defeated, you can't control it."

Anthony's descriptions appear to fit the definition of compulsive consumption, "a response to an uncontrollable drive to obtain, use, or experience a feeling, substance, or activity that leads an individual to repeatedly engage in a behaviour" (Hirschman 1992, p.158). However, rather than conceptualising this as a form of "uncontrollable" or compulsive behaviour, which often carries negative connotations because compulsive consumption is linked to consequences that "ultimately cause harm to the individual and/or to others" (Hirschman 1992, p.158), it may be more appropriate

to view this as a form of inertial behaviour–a drive or desire to interact with the consumptive object, which is not always linked to negative outcomes detrimental to the individual or to others.

Anthony… "There are different ways of being addicted. One is really extreme where you set up your house or whatever and you literally are just living for the thing, like the car, that sort of addiction takes a negative turn. The other addiction is probably (to do with being) a little bit more than obsessed about it. You constantly go looking for it to buy rather than being in the surrounding. In my case, I actually go to hobby shops and look for new hobby shops to find the particular car model if I'm after something. So I am so far in the positive addiction because it hasn't affected me negatively to the point where I'm putting all my social commitments around the collection or postponing a house or mortgage or anything like that because I need to buy that car model. So far it hasn't reached that."

Anthony's involvement with car model collecting appears to qualify as a form of process addiction, defined as "a series of activities or interactions that "hook" a person, or on which a person becomes dependent" (Schaef and Fassel 1988, p.58). For example, he feels compelled to buy through the inertia of fanaticism, and is hooked onto the act of constantly seeking out hobby shops to find and buy car models. He also shows other characteristics of addiction detailed in Schaef and Fassel (1988), including the tendency to deny the presence of the effect of addictions. For example, Anthony claims that car model collecting "has not affected me negatively to the point where I'm… postponing a house or mortgage", yet he has been unable to accumulate enough savings to take out a mortgage for the purchase of a house (and in effect, *has* placed buying a house on hold). The tendency to see addictive behaviour and processes as normal is another characteristic of addiction (Schaef and Fassel 1988). This can be seen in Anthony's suggestion of "I am so far in the positive addiction". Isolation and the illusion of control are also characteristics of addiction (Celsi, Rose and Leigh 1993; Schaef and Fassel 1988), and are evident in Anthony's explanations of "I like my own company a little more", and his attempts at enforcing rules (i.e. control) over not buying car models. His attempt at enforcing rules on purchasing is an illusion of control because Anthony has been unsuccessful at several attempts to curb his purchases.

It is important to note that contrary to common portrayals of addiction and obsessive-compulsive behaviours, the consequences here are not as morbid and detrimental as that resulting from pathological addiction (such as to drugs or alcohol), or other forms of consumer addiction (e.g. in DePaulo et al. 1987; Faber et al. 1987; Hirschman 1992). The data showed that some forms of fanaticism do not necessarily result in the same severe negative consequences that are generally associated with addiction and obsessive-compulsion. For example, Anthony's fanaticism has not had a detrimental effect on other areas of his life (i.e. it has not interfered with his ability to meet everyday responsibilities and performance at work). However, a stigma attached to the term 'fanatic' is apparent, with Anthony's refusal to be labelled one.

Anthony… "If I was a true fanatic, it's like my house would be shaped like a car, my bed would be like a car, I'll always wear something with a car on it… or my pen would be designed by Porsche or something like that. I haven't reached that stage yet. I think that's my definition, like, everything around you is just a reminder of what you're interested in… sometimes I think being a complete fanatic means you are entering a bit of negativity".

Although Anthony does not see himself as a fanatic, who he defines as someone that surrounds themselves with reminders of their interest, it was revealed that he in fact always keeps reminders of car models near him; two miniature car models which are kept in his bag and which he takes into the office everyday. He called this his "security blanket"; making him a fanatic by his own definition.

## Consumption as an "End to Itself"

In an attempt to define fanatic consumption, Lehmann (1987) suggested that "a fanatic devotee of anything continues the activity at least partly because the activity is an end to itself" (p.129). Evidence of consumption as an end to itself in fanaticism can be found in conversations with Ashley. In relation to her toy collection, Ashley explains that she thinks "it would be good to have a goal with it", such as being able to build a toy museum "to show the toys better", however, she comes to the realisation and describes toy collecting and its display and maintenance as "a never ending thing" and that "there's no end. None at all".

Anthony's comments also illustrated fanaticism as a consumption activity continued at least partly as an end to itself:

Anthony… "There's no goal in it… with a book there is a goal, once you start you have to finish it. With the car model collection, it's like, I don't see an end as such just yet. The fun hasn't gone yet. So I'll keep doing it until it starts to bore me. But I don't think that'll happen anytime soon"

In Anthony's case, he collects car models simply for the sake of having them and being able to have more of them close to him. This may resemble materialism, in that the acquisition of products may appear "mindless" and without purpose (Richins 2004; Richins, McKeage and Najjar 1992). However, consumption as an end in itself emphasises the experiential aspect of consumption, such as the fun aspect of the act of collecting (e.g. Holbrook and Hirschman 1982), whereas materialism emphasises the endlessly increasing goals of material acquisition and possession (Richins 2004; Richins et al. 1992). Contrary to materialism, Anthony's collecting is not driven by the goal of acquiring *more* car models, but it is done for fun and for having them near him as his "security blanket". Similarly, Jonathan (CM28), a self-confessed sports fanatic, explained:

Jonathan… "(Sports is) more an end to itself rather than anything else, and I just do it because I enjoy it…sometimes you play sport for fitness and stuff like that, I do that sometimes, but most of the times, it's just to enjoy it and do something that I like doing".

Jonathan used to train as a junior professional golfer, but he gave up golfing in high school due to the excessive pressure and the lack of enjoyment. He stopped playing golf for many years before "picking up" the sport again upon entering the workforce. He now plays golf frequently as a form of leisure activity, and is a fan of a football club, soccer team, and golf in general. Jonathan believes he is "brand loyal to sports" because he would "spend over half of the time that I've got remaining left in my life that I could spend on something, on sport" (e.g. "if I took out work and sleep and then daily chores and things like that, then of the remaining time, be whatever it is, I reckon I'd spend 60 to 70 percent of that time watching sport or doing something to do with sport and then I'd probably drill into some of that at work"). Similar to other consumer fanatics, Jonathan believes there are no goals driving his extreme devotion to sports. He "love(s) the side [i.e. his favourite team], and still love the sport… no matter how well or how poorly the sides are doing". His passion for sport is simply driven by the enjoyment it

brings. This suggests that fanaticism may be driven by the experiential (such as the intangible, non-utilitarian, symbolic, and hedonic) aspects of consumption, and that the process of consumption is intimately linked and may form part of the fanatic's goal of consumption. Thus, to better understand consumer fanaticism, research should not only focus on the consumer's enjoyment of the product, but also explore the associated process(es), as well as the underlying goals driving consumption.

**Personal Self-Sustaining Phenomenon**

Much of the existing literature places extreme brand loyalty in a social context of brand communities or consumption cultures (e.g. Belk and Tumbat 2005; Clesi, Rose and Leigh 1993; Kozinets 2001; Kozinets 1997; McAlexander, Kim and Roberts 2003; McAlexander et al. 2002; Muñiz and O'Guinn 2001; Muñiz and Schau 2005; Oliver 1999; Rifkin 1999; Rifkin 1997a; Rifkin 1997b; Shouten and McAlexander 1995). However, there is evidence to suggest that fanaticism can be an intensely personal phenomenon, which can occur in the absence of a group or social context. This departs from Oliver's (1999) proposal of the "ultimate loyalty state" (which is said to occur when community and social support provides the "impetus to remain loyal" (p.38)), because a consumer fanatic can be just as loyal without the support from their surrounding social network or community. This was shown in Whitney's case of continued devotion to luxury brands despite her friends' and mother's disapproval. She shows little care for what others may think, and would even be offended if someone criticises her extreme involvement. She explained:

> Whitney… "They don't know anything about it and for them to just say something insulting. It's offensive to me. Even my own relatives, like I said to you before, when my cousin said bad stuff (about Louis Vuitton), I get really offended. I get defensive. I would fully argue with them… because I spend so much money on it, I take so much pride in caring for it, and for you to just insult it like that, is a direct insult to me. It would be as if someone said your baby was ugly"

Whitney's extreme devotion to the brand continues despite disapproval from her cousin. She also claims to have no friends that share her passion, explaining that she would like "more people that understands". This illustrates that her enthusiasm for the brand can be sustained even without a supporting social network. Similarly, Anthony's car model collecting is private because he will not actively reveal his passion to others:

> Anthony… "Definitely more of a personal thing… (because) it's not like I'm trying to build a social club or a network… Socially, I have friends and stuff, but I like my own company a little more (laughs)"

Anthony does not participate in collectors' communities and would rarely show others his collection. Furthermore, his extreme devotion to car model collecting pervades without a supporting social network. This suggests that extreme devotion and loyalty to brands is not limited to only occurring in social contexts.

## DISCUSSION

The exploration of consumer fanaticism has led to further insights into the characteristics and qualities associated with this phenomenon, which were identified to include extraordinary loyalty and devotion, extreme enthusiasm, inertial (addictive and obsessive-compulsive) involvement, and consumption as an end to itself. The findings showed that fanaticism is characterised by high levels of loyalty and devotion that is beyond the average, usual, or ordinary level. The consumer has a strong emotional attachment to the object, which is associated with feelings of passion, love, and dedication as described in Pichler and Hemetsberger (2007) and Ahuvia (2005). However, the notion of extraordinary loyalty and devotion alone do not seem adequate in capturing the phenomenon of consumer fanaticism. Fanaticism seems to also be characterised by intense levels of enthusiasm and involvement so extreme it comes close to the dysfunctional borderline. Findings showed that the consumer fanatic's involvement can reach a point of being "too high" that, if sustained over long periods of time, may result in negative consequences. There is evidence to suggest, however, that the fanatic is aware of this and consciously attempts to control his or her involvement in order to prevent fanaticism turning into something darker or problematic (although some has shown to struggle occasionally).

The findings also showed that fanaticism involves addictive and compulsive elements, where the consumer feels "compelled to buy". However, contrary to common descriptions of addiction and obsessive-compulsive behaviours, the inertial involvement aspect of fanaticism does not usually lead to morbid consequences that are detrimental to the consumer or harms others.

It appears that consumer fanatics tend to sometimes engage in consumption at least partly as an end in itself, rather than a means to an end (Lehmann 1987). Although consumption as an end in itself can resemble materialism, where consumers consume for the sake of increasing material wealth and possession, consumption as an end in itself in the context of consumer fanaticism does not always involve acquisition of (more) products. This suggests that perhaps some consumer fanatics may be attracted to the experiential aspects of the consumption activity. Future research should further explore the experiential and intangible components, such as the feelings and emotions, associated with the enthusiastic pursuit of a passion.

The characteristics and qualities of consumer fanaticism identified in this study is different to those identified by Thorne and Bruner (2006) in that the characteristics proposed here emphasise the high levels of intensity and the strong emotional elements that are unique to and representative of consumer fanaticism. We feel that it is important to include the quality of "going beyond ordinary levels" towards extreme and almost borderline-dysfunctional forms of enthusiasm and devotion, in order to capture the phenomenon of consumer fanaticism more accurately.

This study led to some explanations for the stigma often associated with the phenomenon of fanaticism. For example, its close resemblance to addiction and obsessive-compulsive behaviours has led to the common mistake of dismissing it as a disorder. This suggests a need for future research to focus on the non-dysfunctional forms of fanaticism, especially because there is much need to understand the drivers and transitions that lead consumers to extreme levels of loyalty. For example, Oliver (1999) who developed a brand loyalty framework suggested a need to understand the "transitioning mechanisms" that move consumers to the state of ultimate loyalty where they "become near-zealots on the basis of adoration and devotion" towards the brand. Similarly, the need to investigate how individuals result at the "apex" of loyalty is emphasised in other conceptual papers (e.g. Funk and James 2001; Hunt et al. 1999).

The findings also revealed that fanaticism is not limited to only occurring in a social or group context as portrayed in much of the existing (e.g. brand communities and consumption subcultures) literature capturing extreme loyalty. New insights can be discovered through extending existing research with an alternative approach of exploring extreme loyalty and devotion to consumptive

objects that occurs in the absence of community or social support. Such intense and private interactions with brands have been overlooked (Pichler and Hemetsberger 2007). Questions that remain unanswered include: How does it sustain and why does it continue if there are no social drivers or motivators? Many have studied fans as a collective, showing social reasons for extreme devotion, however, without social reasons of obligation and conformity based on the desire for group acceptance, why do consumers continue to be so devoted? An exploration of the non-social influences that drive individual consumer fanatics' transition towards extreme loyalty and devotion will provide interesting insights.

Research conducted for this paper is exploratory, and further investigation is required to extend our understanding of this phenomenon. In particular, what drives and sustains this unique and extraordinary level of loyalty and devotion is still unclear (Funk and James 2001; Hunt et al. 1999; Oliver 1999). It is recommended that future research should be based on the collection of life stories, as this method allows exploration of the history of the individual and the influences that give rise to their involvement as a fanatic (Taylor 1991), thus allowing us to understand one's developmental progression towards fanaticism. Insights on the developmental progression towards fanaticism will also contribute towards the existing understanding of the loyalty construct.

## CONCLUSION

The aim of this paper was to explore the phenomenon of consumer fanaticism in order to bring clarity to our understanding of its nature, characteristics, and qualities. This study found that the key defining quality of fanaticism is a strong emotional attachment in the form of loyalty and devotion beyond the ordinary, usual, or average level, coupled with levels of enthusiasm and involvement so extreme, it may be difficult to sustain over long periods of time, and can be considered close to the borderline of being "dysfunctional". Fanaticism appears to also have addictive and obsessive-compulsive aspects, but evidence suggests that this can be controlled by the individual to avoid any severely negative consequences, and thus, unlike many existing portrayals, fanaticism do not usually cause harm to the consumer and to others. It is proposed that further research into consumer fanaticism is necessary, particularly for understanding the development and drivers of extreme levels of loyalty and devotion. This will allow bridging gaps and consolidating conflicting views amongst different disciplines particularly in terms of the positive and negative aspects of fanaticism.

# Are McNoodles and McDonald's Kinship Connected?
## Effects of Linguistic Information on Consumers' Categorization of New Products

Dengfeng Yan, Hong Kong University of Science and Technology, China
Allan K. K. Chan, Hong Kong Baptist University, China[1]

### ABSTRACT

This paper examines how consumers process prefixed brand names (e.g., iTunes, iPod, iPhone) from a categorization perspective. Our attention primarily focuses on two category features, which are prefix and product similarity. Results of two studies using real (i.e., McDonald's) and fictitious brand names as stimuli demonstrate that the likelihood that consumers would consider a prefixed brand name (e.g., McNoodles) as affiliated with a master brand (e.g., McDonald's) is jointly determined by (1) the diagnosticity of prefix, and (2) the similarity between focal product and master brand. More importantly, prefix which is proposed to be processed earlier was found to be able to bias consumers' perception of product similarity, lending support to a sequential categorization process model.

### INTRODUCTION

Consider two brand names: MacNoodles and iDog. What immediately comes to your mind? Will you guess that the MacNoodles is also a kind of fast food? Will you think iDog is an electronic toy which is offered by the Apple Company? The answers might be mixed. These example represent a ubiquitous branding strategy called prefixed branding or linked brand names (Aaker 2004) which has been largely neglected by consumer researchers. The prefixed branding strategy, whereby the new endorsed brand shares a prefix (broadly defined here) with the endorser, is becoming increasingly prevalent among marketers. The motivation of using prefixed brand names is that the prefix can provide a compact but strong link to the endorser. At the same time, the prefixed branding may be better than brand extension because it allows a way to have multiple distinct brands, each with its unique personality and associations (Aaker 2004). Companies adopting this strategy include Apple (iPod, iTunes, iPhone, and iBook) and IBM (now Lenovo) (ThinkPad, ThinkCentre, ThinkVantage, and ThinkPlus).

The research resources devoted to the prefixed branding phenomenon, however, is asymmetrically rare. To maximize the benefits and minimize potential problems (e.g., brand infringement[2]) of this strategy, marketers therefore are eager to understand how consumer process and respond to these prefixed brand names.

The present article is to fill this gap. We propose that the nature of consumers' processing of prefixed brands is a kind of categorization judgments. Under this theoretical framework, we aim to answer these questions as following: 1) what kinds of prefixes are more effective for prefixed branding, 2) how could a prefix impact on consumers' categorization of prefixed brand names, and 3) when could prefixed branding elicit more impact on consumers' judgments?

The article is organized in the following manner: first we present literature pertaining to peoples' categorization process; we then from an information processing perspective propose a sequential categorization theory modeling consumers' processing of prefixed brand names; hypotheses will be formulated in this part as well; two experiments are subsequently presented. We conclude with a discussion of the results, implication for categorization research and brand management.

### CONCEPTUAL FRAMEWORK

Categorization theory is borrowed to address the question previously raised. We suggest that consumers' perception and processing of prefixed brand names is a kind of categorization judgment.

Categorization has been one of the most fundamental mechanisms in consumers' information processing. People are expected to employ such a strategy especially when diagnostic information, such as product performance, is unperceivable (Sujan 1985; for a review, see Loken 2006). Take brand extension for example, when an extension (e.g., popcorn) could be categorized as a typical member of the parent brand (e.g., Coca-Cola), the beliefs and affect associated with the parent brand will transfer to that extension to help consumers quickly form an evaluation (Park, Milberg, and Lawson 1991).

#### Similarity Comparison and Feature Diagnosticity

Psychologists and consumer researchers have proposed many theories (for reviews, see Cohen and Basu 1987; Smith and Medin 1981) to model consumers' categorization process. These theories share a common assumption that categorization involves a similarity comparison process (Murphy 2002). A number of studies demonstrated that the target item is judged to be a category member if and only if it provides a sufficient match to prototypes or exemplars (Rosch 1978), and a sufficient match requires accumulating a critical sum of feature diagnosticity. In categorization research, feature diagnosticity reflects the accuracy that a feature can predict a category membership (Ahn et al. 2000).

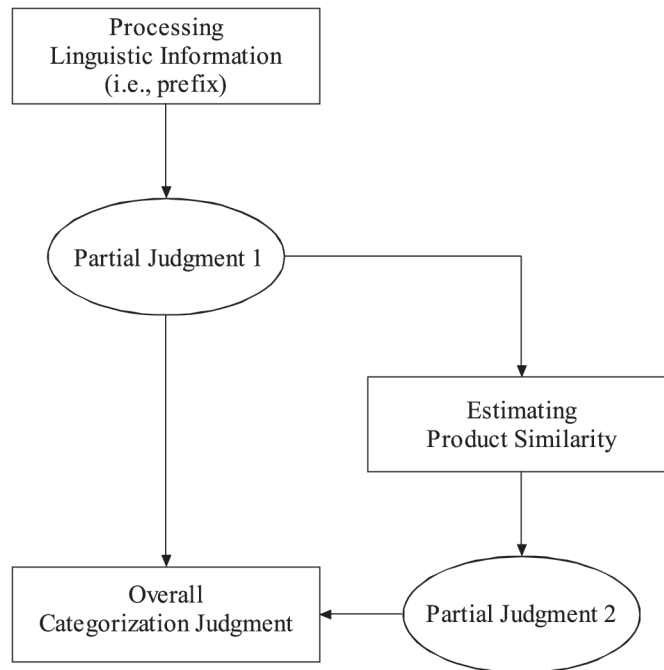
A prevalent model bearing on feature diagnosticity was proposed by Rosch and Mervis (1975). From a family resemblance perspective, the authors suggested that the most prototypical members within a category are those which bear the greatest family resemblance to other members of their own category and have the least overlap with other categories. Therefore, a category feature is most diagnostic when it is shared by in-group members as prevalent as possible, and shared by out-group members as rare as possible. The latter point could be illustrated by persons' names. For example, George Leonard and Sherry Leonard are more likely to be considered as members of one family, relative to George Smith and Sherry Smith, because as a category feature, "Leonard" is less frequently shared by irrelevant categories, compared to "Smith", although both are shared by all in-group members within each category.

---

[2]The MacNoodles is a real case happened in Singapore. In 1995, the FE applied to register "MacChocolate", "MacTea", and "MacNoodles" as trademarks in relation to its instant cocoa mix, tea, and noodles. The McDonald's, however, opposed this registration, arguing that the public will assume that the products may originate from McDonald's (for details, see Leong and Lwin 2006).

**FIGURE 1**

A Flowchart Describing Consumers' Processing of Prefixed Brand Names



## Effects of Prefix and Product Similarity

*Property of Prefix*. We extend Rosch and Mervis's (1975) model to investigate consumers' processing of prefixed names. Firstly, we propose that a prefix is diagnostic to the extent that it is shared by all the members of its own category. Suppose in the Apple's brand family only a few subbrands begin with the prefix "i" while others do not, consumers would be less likely to activate a connection between the prefix "i" and Apple and subsequently to consider a new prefixed brand name (e.g., iTalk) as affiliated with Apple.

Secondly, Leonard-Smith example implies that the rarer a prefix, the more likely consumers will infer that a new prefixed brand is endorsed by that master brand, and more likely positive attitude associated with the master brand will transfer to the new product. In converse, if the prefix is commonly used by different irrelevant brands, consumers are less confident to judge that a new brand with this prefix has some relationship with that master brand. Thus, suppose a new brand shares the same prefix with a master brand, we hypothesize that:

H1: Consumers are more likely to judge a prefixed brand as endorsed by a master brand if *a)* many names under the parent brand have the same prefix; *b)* the prefix is not used by other irrelevant brands.

*Product Similarity*. Another property of a prefixed brand which could influence categorization result is product similarity. Research bearing on brand extension has robustly established that consumers' extension evaluation is largely determined by the similarity between extension and parent brand. Aaker and Keller (1990), for example, demonstrated that participants evaluated Haagen-Dazs candy bar much more favorably than Haagen-Dazs cottage cheese (*M*s=4.81 and 3.13, respectively). Similarly, it is straightforward for us to expect that consumers' attitude toward a

prefixed brand will be more favorable if it is in a similar industry as the master brand.

H2: Consumers are more likely to judge a prefixed brand as endorsed by a master brand if this brand is in a similar product category to the master brand.

## Some Gaps

Hypothesis 1 and 2 investigate the effects of category features on categorization result independently. How consumers process these different features together remains unclear. Are these features processed simultaneously or piece by piece? Will features interact with each other? If yes, how will they interact?

These unanswered questions reflect some gaps in previous literature. First of all, previous categorization theories considered category features as orthogonal. Psychologists, however, have repeatedly demonstrated that consumers tend to process information in light of previously processed materials. Therefore, it is reasonable to suspect that category features may interact with each other. Secondly, previous categorization studies treated feature similarity as a fixed property and it could always be correctly activated from memory.

## A Sequential Categorization Model

To answer these questions, we propose a sequential categorization model modeling consumers' categorization process from an information processing perspective. Briefly speaking, this model consists of three assumptions: first, we assume that various category features are processes in a sequential manner; secondly, we suggest that such a sequence is determined by the varying perceptibility of different category features; this model lastly proposes that the early processed features can bias consumers' interpretation of later processes category features, as well as the overall categorization judgment (see figure 1).

*Sequential Assumption.* Sequential assumption has been widely adopted by information processing literature. Fiske and Neuberg (1990), for example, proposed a continuum model where consumers are theorized to process information in a progressive manner. Specifically, consumer would make an initial categorization immediately after encountering a person on the basis of information that becomes accessible concurrently with the initial perception of target individual. Consumers then may attend to, search, and process additional information under certain conditions and this information will finally be integrated with initial judgment. Research on information presentation order also provided substantial support to the sequential assumption (e.g., Bettman et al. 1988).

*Perceptibility: A Determinant of Processing Sequence.* Under the framework of sequential processing, how to determine the processing sequence becomes a crucial question. To answer this question, we introduce a concept of feature perceptibility which refers to the readiness of being processed (Bruner 1957). This concept comes from the distinction between perceptual and conceptual information. Perceptual features refer to these features which could be directly perceived by our sensory system, such as shape and color, whereas conceptual features are those semantic features which are more abstract and convey a deeper understanding of the category (John and Sujan 1990).

Information of different perceptibility varies in many ways. One of the most fundamental difference is that compared with less perceptual features, more perceptual features are much easier to process and will require less cognitive effort which is limited in capacity. On the basis of this difference, we propose that more perceptual features should be processed in prior to less perceptual features. This assumption is in line with the cognitive economy assumption which holds that low-effort processing mode is the "default processing mode" of consumer's cognition (Smith and DeCoster 1999), and people will process in this way unless special circumstances intervene (p. 324).

In many situations information could hardly be absolutely labeled as perceptual or conceptual, this research holds that perceptibility is a matter of degree. Different category features will be differentiated as of more and less perceptibility. Under the context of prefixed brands, we suggest that prefix is more perceptual information which could be easily received and processed by consumers while product similarity is a kind of conceptual information, the processing of which requires more cognitive resources.

*The Interplay of Prefix and Product Similarity.* The sequential processing assumption brings out another important issue: is consumers' processing of different features a statically additive or instead a dynamically interactive process? Our model suggests an interaction effect between two types of category features. Psychological literature bearing on primacy effect (Lingle and Ostrom 1979) and hypothesis testing theory (e.g., Snyder et al. 1979) suggest that consumers would form their hypotheses on the basis of first processed information or previously held beliefs, and these hypotheses bias their interpretation of subsequent information. Just following this research line, we suggest that consumers would like to form an initial judgment immediately after seeing prefixed names. This is similar to the stage of initial categorization proposed by Fiske and Neuberg (1990). This initial categorization can operate in much the same way as hypotheses, expectations, or current concerns (Yeung and Wyer 2004). In specific, if consumers hypothesize something, they are more likely to looking for evidences to confirm it, neglecting other contradicting information. They will selectively interpret evidences to support their hypotheses and could even "see" what does not exist (i.e., illusionary covariation; see Nickerson 1998, for a review of "confirmation bias"). In our research, for example, if someone is convinced by the "Mc" prefix that a Chinese restaurant named "McChina" is introduced by McDonald's, s/he will argue that both Chinese restaurant and Western fast food are in the same food industry. On the contrary, if individuals think that the "Mc" prefix could be seen everywhere and can not serve as a reliable indicator of McDonald's, they are more likely interpret Chinese food and Western fast food as two totally different things. Previous literature (for a review, see Nickerson 1998) also suggests that such a confirmation bias is more likely to occur if subsequently processed information is ambiguous and thereby is open to multiple interpretations. More formally,

H3: The overall classification judgments will be biased toward consumers' initial judgments about prefix diagnosticity. This effect is mediated by consumers' biased estimation of product similarity and will be moderated by the ambiguity of product similarity. In specific, the more ambiguous the product similarity, the more significant such an interaction will be.

## STUDY1

**Method**

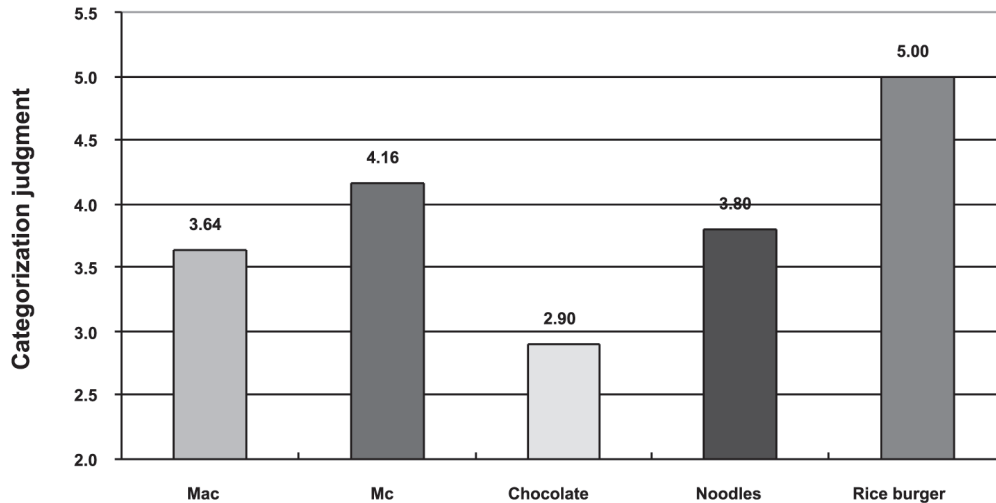
*Sample and Design.* Study 1 was designed to test hypothesis 1a, hypothesis 2, and hypothesis 3, and employed a 3 (prefix diagnosticity: high vs. low vs. control) X 3 (product similarity: dissimilar, moderately similar, vs. similar) between subjects design. Participants were 221 undergraduate students of a middle-sized university in Hong Kong. They were randomly assigned to those nine conditions.

*Stimuli and Procedure.* The first independent variable of this study is prefix diagnosticity, which could be operationalized in two ways according to hypothesis 1a and 1b. We used McDonald's which is well-known among subjects as a stimulus. Under the McDonald's umbrella, many of its prefixed brands (McChicken, McKids, McMuffin, and McEggs) have a prefix of "Mc", but a few (MacFries) may not. In this occasion, we inferred that Mc is more diagnostic than Mac. Accordingly, subjects in the high diagnostic prefix condition would be exposed to a new brand name which has a prefix of Mc, while those in low diagnostic prefix condition received brand names beginning with Mac.

Product similarity, another important independent variable, was manipulated on the basis of pretests. Three product categories, such as rice burger, noodles, and chocolate, were selected to represent high, moderate, and low similarity ($M$s=4.23, 3.65, and 2.77, $p<.01$).

Subjects in the six experimental groups were informed that the research was designed to understand their opinion toward a forthcoming product (e.g., McNoodles). "According to inside information, a new kind of product (e.g., instant noodles) named McSomething (e.g., McNoodles) will soon be available on the Hong Kong market. In your mind, how likely is this McSomething produced by or affiliated with McDonald's"? Subjects were required to rate the likeability on a seven-point scale, ranging from 1 (*very unlikely*) to 7 (*very likely*). After that three items (adopted from Aaker and Keller 1990; $\alpha$=.77) were used to measure their perceived product similarity between new product (e.g., instant noodles) and McDonald's hamburger. Subjects then were asked to judge the persuasiveness or diagnosticity of specific prefix, to rate their overall attitude toward McDonald's, as well as the familiarity with these products. In the control group where no prefix was presented, subjects were required to rate product similarity and other dependent variables.

**FIGURE 2**
Comparison of Means in Study 1



## Results

*Manipulation Checks*. In order to check our manipulation of product similarity, we calculated the difference of similarity judgments among three groups. The result demonstrated that participants' perceived product similarity was significantly influenced by the manipulation ($Ms$=2.89, 3.70, and 4.41, respectively, $F$ (2, 221)=36.65, $p$<.0001). This implies that our manipulation in this experiment was successful. Similarly, the difference between prefix persuasiveness is significant as well ($p$<.05).

*Effects of Prefix and Product Similarity on Categorization Judgment*. Hypothesis 1 and 2 predict two main effects of prefix diagnosticity and product similarity on categorization judgments: high prefix diagnosticity and product similarity each will independently increase the possibility that consumers would consider a new prefixed brand as affiliated with a master brand. The pattern of means is consistent with this prediction, as shown in figure 2. The differences between these means are significant, as for prefix diagnosticity, $Ms$=3.64 vs. 4.16, $F$ (1, 146)=3.66, $p$<.06; as for product similarity, $Ms$=2.90, 3.80, and 5.00, respectively, $F$ (2, 146)=20.97, $p$<.0001. The outcome therefore supports our hypotheses that both prefix and product similarity can impact on consumers' categorization of a new prefixed brand.

*Testing Interaction Effect*. We also predicted an interaction between prefix diagnosticity and product similarity, with the effect of prefix being greater when product similarity was ambiguous to judge. The results of ANOVA demonstrates that the interaction between prefix diagnosticity and product similarity is significant, confirming our interaction hypothesis ($F$ (2, 146)=3.93, $p$<.03, see table 1). As we suggested, such an interaction effect was caused by confirmation bias where consumers' interpretation of later processed information is usually biased toward these earlier processed materials. Such a confirmation bias is very likely to happen when later processed information is unclear or uncertain and thereby open to multiple interpretations. Specific to this research, consumers' interpretation of product similarity is expected to be biased toward consumers' judgment about prefix, especially when product similarity is ambiguous. To examine this mediating interpretation, three one-way ANOVAs were performed. The result showed that such a

biased interpretation of product similarity really happened in the ambiguous condition (i.e., noodles), but not in other two extreme conditions (i.e., chocolate and rice burger). As shown in figure 3, consumers' perceived similarity between noodles and hamburger was improved when prefix diagnosticity increases ($Ms$=3.13, 2.63, and 3.70, respectively), and such a difference was significant ($F$ (2, 70)=4.18, $p$<.02).

Therefore, hypothesis 1a and hypothesis 2, together with its underlying mechanism (H3), are all supported.

## Discussion

Generally our hypotheses are all empirically supported, yet we realized that using real brand names (i.e., McDonald's) as stimulus has some problems.

Firstly, the categorization process usually includes a retrieval procedure which could not be controlled in study 1. After seeing the Mc prefixed brand names such as McNoodles, various brand names may come to different subjects' brains. For example, some one may activate brand names as McChiken and McMuffin which are quite similar to noodles; some subjects on the other hand, may activate something like McKids which is a less typical product under the Mc prefix. Although we explicitly reminded participants to make their similarity judgments on the basis of McDonald's hamburger, we have little knowledge about what the real process was.

In addition, we also noticed that using real brand names may also influence subjects' perceived diagnosticity of prefixes. In our study 1, we assume that consumers would perceive Mc as more diagnostic than Mac since the latter is less widely shared within the McDonald's category. That is, only very few brands such as MacFries use the Mac prefix whereas the remaining majority all begin with the prefix of Mc. However, the actual retrieving may not be the case since McDonald's many products are named in Chinese in the Hong Kong market. Therefore, Hong Kong subjects may not be aware of those brand names and their difference as we predicted. To solve these problems, the second study was conducted where hypothetical brand names were created and used, thereby minimizing the uncertainty of subjects' information activation.

The Results of Two Anovas

| Factors | Study 1 (N=146) | | Study 2 (N=146) | |
|---|---|---|---|---|
| | F | p | F | p |
| Prefix diagnosticity | 3.58 | .060 | 4.14 | .044 |
| Product similarity | 20.33 | .000 | 16.71 | .000 |
| Prefix diagnosticity * product similarity | 3.93 | .021 | 2.91 | .058 |
| Gender | .00 | .981 | .43 | .51 |
| Age | .62 | .433 | .00 | .96 |
| $R^2$ | | .284 | | .250 |

## STUDY2

The biggest difference between study 1 and study 2 is the stimuli. We created a series of hypothetical prefixed brand names to manipulate the diagnosticity of prefixes as well as the level of product similarity. This approach allows us to test hypothesis 1b.

**Method**

*Sample and Design*. The design of study 2 is actually the same as that of study1. 221 undergraduates participated this study and they were randomly assigned to nine conditions according to a 3 (prefix diagnosticity: high vs. low vs. control group) X 3 (product similarity: dissimilar, moderately similar, vs. similar) experimental design. Subject number of each cell size ranges from 23 to 25. All nine experimental conditions and three control conditions were administered simultaneously.

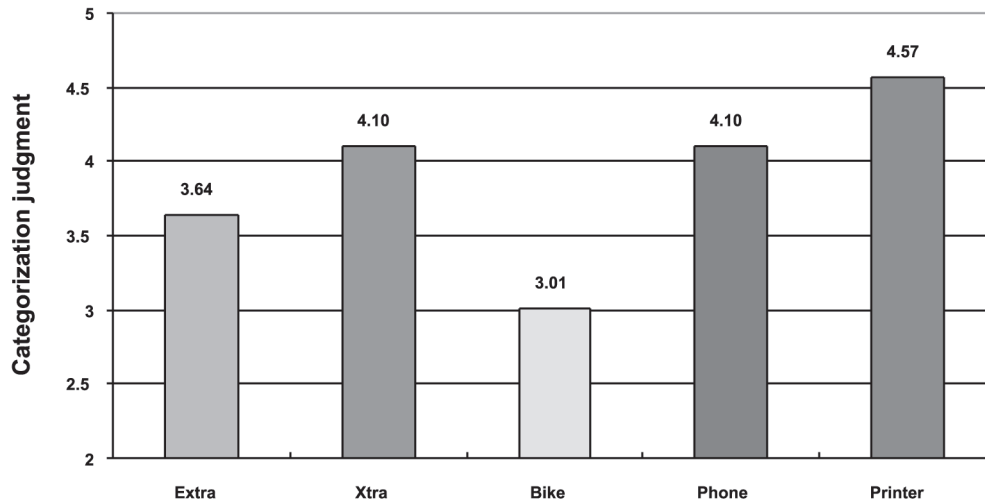
*Stimuli and Procedure*. The most challenging part of testing hypothesis 1b is to identify or create a pair of prefixes with different uniqueness levels. In specific, less frequently used prefix will be considered as more diagnostic and thereby would elicit more effect on consumers' perception of prefixed brands. However, choosing different kinds of prefixes may bring confounding variables. Take Nest- (e.g., Nestea) and Micro (e.g., Microsoft) for example, the first prefix is more unique and thus of higher diagnosticity com-

pared to the latter. However, it is widely documented that the meaning of brand names can influence consumers' brand evaluation and judgment. If we use such pairs of prefixes as stimuli, it may be difficult for us to exclude that confounding effects from our predicted effects. Similarly, the sound of brand name can also play an important role in consumer information processing (e.g., sound symbolism).

We finally found out a pair of prefixes (i.e., Xtra- and Extra-) which don't have previous mentioned problems. Xtra and Extra share the same meaning and pronunciation, thus we can rule out many confounding factors. The only obvious difference between "Extra-" and "Xtra-" is their frequency. In specific, "Extra-" is more widely used whereas the usage frequency of "Xtra-" is much lower. Therefore, the prefix diagnosticity would be manipulated. Pretest confirmed their different uniqueness level ($M$s=5.2 and 3.5,$p<$.001).

Subjects were told that XtraTech (or ExtraTech) is a famous personal computer brand in a foreign country. Suppose recently there is a new product (e.g., bicycle) named ExtraSomething/XtraSomething (e.g., XtraSpeed) is available on the market. Different products (i.e., bike, telephone, and printer) were used to represent different product similarity levels ($M$s=2.34, 2.72, and 4.34, $p<$.001). After receiving this information, subjects were asked to judge the extent to which they believe this newly introduced

**FIGURE 4**
Comparison of Means in Study 2



*Manipulation Checks*. In order to check our manipulation of product similarity, we calculated the difference of similarity judgments among three groups. The result demonstrated that participants' perceived product similarity was significantly influenced by our manipulation ($Ms$=2.36, 3.60, 4.31, respectively, $F$ (2, 202)=52.05, $p$<.001). Our manipulation of prefix uniqueness was successful as well ($Ms$=4.01 and 3.14, $F$ (1, 146)=15.05, $p$<.001). Moreover, both independent variables were not influenced by other factors (p>.10).

*Hypotheses Testing*. The ANOVA was used to test all the hypotheses. If our hypotheses are valid, both prefix diagnosticity and product similarity should have effects on consumers' categorization judgments. The data is consistent with such prediction (see figure 4). The differences between these means are significant ($ps$<.05).

In addition, in the ANOVA task (see table 1), we found a marginally significant interaction between prefix uniqueness and product similarity on categorization judgment ($F$ (2, 146)=2.91, $p$<.06). That is, when product similarity is moderate and thus ambiguous to estimate, consumers' overall categorization judgment would be biased toward their initial perception of the prefix per se which is usually processed at the first glance. As suggested by our model, this interaction is contributed by biased estimation of product similarity. To test this, the effect of prefix diagnosticity on product similarity was submitted to three one-way ANOVAs with prefix diagnosticity as a predictor. Consistent with our predictions, the ANOVA revealed that consumers' report of similarity between computer and telephone was significantly impacted by prefix uniqueness ($Ms$=2.92, 3.18, and 4.22, respectively; $F$ (2, 73)=9.09, $p$<.0001) and such effect was not found in other two conditions (i.e., bike and printer) ($ps$>.10) (see figure 5).

**GENERAL DISCUSSION**

To conclude, our three hypotheses have been supported in two studies where real brand and hypothetical brand were used as stimuli respectively. The data demonstrated that prefix, as a kind of linguistic feature, could influence consumers' categorical judgment in two ways. Firstly, consumers' categorization of new products could be directly influenced by linguistic information. This lends further support to Schmitt and Zhang's (1998) finding where the authors found that Chinese and Japanese consumers' categorization are significantly influenced "classifier words". Secondly, consumers' perception of product similarity could be molded by linguistic information. Further research is needed to investigate the relationship (cooperative vs. competing) between linguistic-based categorization and product feature/similarity based categorization.

The theoretical contribution of this research is to introduce information processing factors to the traditional categorization framework. Traditional categorization research focused on the diagnosticity of category features, while paying less attention on the information processing factors which could influence or even determine the categorization result. This article shows that introducing information processing factors in categorization research could enable a richer understanding of the actual mechanism underlying consumers' classification judgments.

Managerially, the present research also has important implications. First of all, this research will offer guidance for those brand managers who plan to employ a prefixed branding strategy to leverage their brands. A good prefix, according to my article, should not be widely used by irrelevant brands. Otherwise, it could not build a strong link between the new brand and endorser. In addition, this research suggests that those prefixed brands may not necessarily be constrained in similar product classes, given the prefix per se is very unique. Similarly, these findings could be extended to trademark infringement and public policy domain. The result of this article suggested that jurors and policy makers may need to adjust their current practice where product similarity is treated as an objective property (e.g., Nice Classification).

# Time Pressure and the Compromise and Attraction Effects in Choice

Chien-Huang Lin, National Central University, Taiwan

## ABSTRACT

Both the compromise effect and the attraction effect have demonstrated that deviation from preference among alternatives is independent of context. This study explores the effect of time pressure on the compromise and attraction effects, and demonstrates that the compromise effect is weaker and the attraction effect is stronger when consumers are under higher pressure to choose.

## INTRODUCTION

Both the compromise effect and the attraction effect have demonstrated that deviation from preference among alternatives is independent of context (Huber and Puto, 1983; Simonson, 1989). Independence from context occurs when a consumer prefers brand *x* to brand *y* in one context (for example, when only *x* and y are available), but then *y* cannot be preferred to *x* in another context (for example, when a third brand *z* is added to the choice set) (Simonson and Tversky, 1992). The compromise effect is an example in violation *of* the alternative *of* being independent *of* context The compromise effect (or extremeness aversion) indicates that the addition of an option to a set of two (non-dominated) options enhances the share of the adjacent alternative relative to the nonadjacent (existing) alternative (Simonson 1989; Simonson and Tversky, 1992). In a compromise effect example, the "core" two-option set might include a pair of binoculars with 7X magnification power that costs $30 and a pair with 10X magnification that costs $60. This core set might be expanded by adding a pair of binoculars with 13X magnification that costs $90, such that the 10X pair becomes the "compromise" (or middle) option and the 7X and 13X pairs become the "extreme" options. If the compromise effect occurs in this case, the addition of the 13X option should lead to an increase in the share of the 10X option *relative* to the 7X option. Consumers chose 7X in a two-option set, whereas they chose 9X in a three-option set, in violation of the alternative of being independent of context (Simonson and Tversky, 1992).

In a demonstration of the attraction effect, a group of consumers was asked to choose between a pen that cost $6 and an elegant more expensive Cross pen. A second group chose from among a pen that cost $6, the same elegant Cross pen, and a clearly less attractive pen (Houghton, Kardes, Mathieu and Simonson, 1999). The results showed that the addition of the less attractive pen increased the share of the Cross pen, independent of the context of the alternative of violation

Although compromise and attraction effects are interesting and have been demonstrated in many studies (e.g., Benartzi and Thaler, 2002; Chernev 2004a; Dhar, Nowlis and Sherman, 2000; Drolet, 2002; Huber & Puto, 1983; Lin et al., 2006; Malaviya and Sivakumar, 2002; Nowlis and Simonson, 2000), these studies typically looked at attraction and compromise effects in situations that allowed the decision maker to have an unlimited amount of time to perform the decision-making task. However, many real world decisions are made under some form of time constraint. Do decision makers use the same strategies when making decisions with and without time constraint? How do decision makers react when a deadline has been met or when a time constraint has been removed? This paper investigates these issues and proposes that

consumer preference is determined by the degree to which decision time is constrained, and that time pressure moderates the significance of compromise and attraction effects. The theoretical analysis, research hypotheses, and two empirical studies are described in the next section.

## TIME PRESSURE

Time pressure is often viewed as an external factor that influences consumer behavior. Relevant research has demonstrated that time pressure will constrain the quantity of information that is processed (Iyer, 1989). Hence, it is generally believed that increasing time pressure causes consumers to experience difficulties with decision making. In recent years, scholars have begun to examine the relationship between time pressure and choice deferral (Tversky and Shafir, 1992; Dhar, 1997; Luce, 1998). Dhar and Nowlis (1999) pointed out that when consumers are facing time pressure they will probably defer making a choice, but when they are facing the same attractive alternatives in a choice set, the proportion of decision deferral is lower under time pressure than without time pressure. Lin and Wu ((2005) demonstrated that that if consumers perceive that they do not have enough time to evaluate products carefully, then they will not make decisions. However, when consumers have too much time (without time pressure) to make careful evaluation, they also tend not to make decisions. This occurs because, when the decision is made and the time to consider is too long, the disadvantages of the selected alternative are accepted, and the merits of the non-selected alternative are given up. Only under moderate time pressure, is the no-choice option proportion relatively low.

Research suggests that decision makers tend to speed up the execution of decision strategies or switch to simpler strategies when under time constraints (Edland and Svenson, 1993; Johnson, Payne and Bettman, 1993; Benson and Beach, 1996; Smith, Mitchell and Beach, 1982). They also accelerate the rate at which they examine information when making decisions under time pressure (e.g., Ben Zur and Breznitz, 1981). When faced with severe time constraints, decision makers either filter information or omit certain information from consideration altogether (Miller, 1960) and rely most heavily upon negative information (Wright, 1974). Moreover, consumers who are making choices under time pressure may alter their decision-making strategies. In particular, a number of different studies suggest that a common response to limited time is for the decision maker to shift from using compensatory to non-compensatory decision rules (e.g., Payne, Bettman and Johnson, 1988; Svenson, Ediand and Slovic, 1990). Thus, consumers who are under time pressure are likely to simplify their selection decision by using less effortful, non-compensatory decision-making strategies. Although the use of such strategies may often be adaptive, consumers may, under time pressure, also use heuristics because they have no other choice (Dhar and Nowlis, 1999).

We can predict that when consumers are facing product attribute or choice set alternative conflicts, increasing time pressure will make them inclined to use a non-compensatory decision rule to form attitudes or make choices based on the values of important attributes. This paper proposes that consumer preference is determined by the degree to which decision time is constrained, and that

**FIGURE 1**
The Compromise Effect

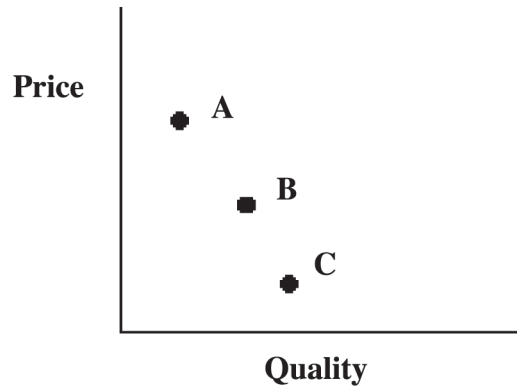

**FIGURE 2**
The Attraction Effect

time pressure moderates the significance of the compromise and attraction effects.

## COMPROMISE EFFECT

The compromise effect (or extremeness aversion) indicates that the addition of an option to a two-option set enhances the share of the adjacent relationship compared to the nonadjacent relationship (Simonson, 1989; Simonson and Tversky, 1992). As illustrated in Figure 1, the compromise effect occurs if the choice share of one option, B, relative to another existing option, A, is enhanced when a third option, C, which makes B a compromise option, is added to the set. The compromise is tested by comparing the relative share of the middle option with and without the third option in the set. For example, the binary choice set might include a pair of binoculars with a 7X magnification power that costs $30 and a pair with 10X magnification that costs $60. This binary choice set might be expanded by adding a pair with 13X magnification that costs $90, such that the 10X pair becomes the "compromise" (middle) option and the 7X and 13X pairs become "extreme" options. If the compromise effect occurs in this case, then the addition of the 13X option has led to an increase in the share of the 10X option relative to the 7X option. The magnitude of the compromise effect is typically assessed by comparing the relative shares of the two existing options with and without the third option in the set.

Extremeness aversion is the main cause of the compromise effect, which means that when all conditions are the same, the attraction of a relatively more extreme option will be lowered in comparison with other options (Chernev 2004; Simonson 1989; Dhar, Nowlis and Sherman, 2000; Kivetz, Netzer and Srinvasan, 2004; Tversky and Simonson, 1993). In the above example, among in the binary choice sets {A, B} and {B, C}, there is no extreme option. Only when the choice set becomes a trinary choice set, {A, B, C}, do options A and C become extreme options. Option B becomes a non-extreme option (compromise option), so that its attraction increases and the probability of it being chosen also increases.

The compromise effect, whereby brands gain market share when they become intermediate options in a choice set, is among the most robust phenomena documented in marketing behavioral research (e.g., Benartzi and Thaler, 2002; Chernev, 2004; Dhar, Nowlis and Sherman, 2000; Drolet, 2002; Nowlis and Simonson, 2000; Kivetz, Netzer and Srinivasan, 2004).

To understand the significance of time pressure on the magnitude of the compromise effect, the binary set {a, b} and the expanded trinary set {a, b, c} must be considered separately. In binary sets, the option to chose depends on personal preference. In trinary sets with time pressure, the compromise option is likely to lose a relatively large share to the non-compromise option because increasing time pressure makes decision makers inclined to use a non-compensatory decision rule to form attitudes or make choices based on values of important attributes. Therefore, when consumers are facing time pressure, they tend to focus on either price or

quality, which leads to the prediction that the non-compromise options will be chosen more often than the compromise option.

*H1: The compromise effect will be smaller when consumers are under time pressure.*

## ATTRACTION EFFECT

Huber and Puto (1983) propose that in the two-option choice set, the addition of a third option (called the "decoy") will increase the percentage of a similar option in the original choice set (called the "target"); this phenomenon is called the attraction effect. As shown in Figure 2, in the case of A and B options, when option A is much lower in price than option B, but option B is much higher in quality than option A, it is very difficult for consumers to make a choice between option A (competitor) and option B (target). After option C, the price of which is almost the same as that of option B but the quality of which is lower than that of option B, joins the choice set, consumers will tend to choose option B from among options A, B, and C. This occurs because after the inferior option C is added, the advantage of option B (target) becomes more conspicuous. Then it is easier for consumers to compare the advantages of these options and recognize that B is an excellent option, and its probability of being chosen increases.

The attraction effect also involves another very interesting phenomenon. The appearance of an inferior option will have an obvious influence on the consumer's decision making and choice, and this phenomenon opposes the independence of the irrelevant alternatives principle (Luce, 1977). The traditional economy deems that the preference or choice of one option is independent of whether or not other options exist. The attraction effect demonstrates that the existence of one inferior option is likely to make the advantages of a target option more conspicuous and increase the probability of consumers choosing the target option (Burton and Zinkhan, 1987; Huber and Puto, 1983; Malaviya and Sivakumar, 2002; Simonson, 1989; Simonson and Tversky, 1992).

The preceding explanation for the attraction effect focused on the dominance relationship. Such a relationship could provide a reason for preferring the relatively superior alternative. This finding is consistent with the notion that there is a fundamental difference between the compromise and attraction effects, in that the former is more cognitive, and the latter is more perceptual. In the compromise set, a choice of the middle option seems like a compromise and tends to be explained on the basis of its position between two extremes. Conversely, although people who are uncertain about their preferences gravitate to the asymmetrically dominating option, this more perceptual effect is not at all transparent, and most buyers use the asymmetric dominance relation to explain their choices (when explicitly asked, most rate asymmetrically dominating options as easier to justify (Dhar & Simonson, 2003; Simonson, 1989)). Under time pressure, consumers perceive that they do not have enough time (high time pressure) to evaluate carefully, and they are likely to simplify their selection decision by using heuristic strategy. The target option is explicitly relatively superior in comparison to a third option that is dominated by the target option, and this provides consumers with a reason to choose it. Thus, we predict:

*H2: The attraction effect will be stronger when consumers are under time pressure.*

## STUDY 1

Study 1 mainly aimed to explore whether time pressure influences the compromise effect. The study adopted a 2 (choice sets: binary or trinary) X 2 (decisions made either with or without time pressure) between-subjects design. A total of 320 respondents were randomly and equally assigned to either the high or low time pressure condition.

*Choice sets.* The choice sets were manipulated by asking that each subject make choices from either a binary option or a trinary option, and repeat the decision-making process with three kinds of products: microwave ovens, ovens, and binoculars. As has been described (see Figure 1), each category had a binary option version or a trinary option version so that the compromise effect could be tested. The binary option design is described in Figure 1 as options A and B, and the trinary set was formed by the addition of a third option C, which was a high price-quality option. The manipulation method of the choice set was adopted from Simonson (1989), and the binary choice set was distinguished from the trinary choice set using information from *Consumer Reports*.

*Time Pressure.* To avoid the potential problem in previous research whereby the time allowance was arbitrarily selected (Ordonez & Benson, 1997), 103 participants participated in a pretest in which they were asked to self-record the end time of the decision-making process. This data was used to determine the average time required to make a decision for either binary or trinary tasks. According to Benson and Beach (1996), high time pressure can be manipulated by subtracting one standard deviation from the mean. The results for the binary task, with 48 participants, indicated that the high time constraints were 39 seconds for microwave ovens, 32 seconds for ovens, and 41 seconds for binoculars. For the trinary task, with 55 participants, time constraints were 46 seconds for microwave ovens, 38 seconds for ovens, and 49 seconds for binoculars. Conversely, no time limit was set for subjects of low temporal pressure. Time pressure was manipulated by either giving subjects a total of either 112 (binary) or 133 (trinary) seconds to complete the survey (three product categories), or by allowing subjects an unlimited amount of time to make decisions. Time pressure was also manipulated by telling the respondents under time-pressure conditions that they had a certain amount of time to complete each decision. We then marked on the board each five-second increment until the final seconds were completed, and subjects were told there was no more time, and they had to move onto the next problem, where we repeated the procedure. Time pressure was measured on a seven-point scale ("no time pressure," "too much time," "more than adequate time available," "adequate time," "not adequate time available," "need a lot more time to do," and "too high time pressure") (Suri and Monroe, 2003).

## RESULTS

For the binary task, the high time pressure group reported significantly higher levels of stress than the low time pressure participants (4.4 vs. 3.46, $t_{158}=6.54$, p<0.001, for high time pressure and low time pressure groups, respectively). For the trinary task, high time pressure participants also reported significantly higher levels of stress than low time pressure participants (4.16 vs. 3.58, $t_{158}=3.31$, p<0.001). These results imply that participants who were under low time pressure condition were more likely to perceive that there was sufficient time to complete the questions than participants who were under the high time pressure condition. Therefore, the manipulation check for time pressure is accordingly regarded as successful.

*Time Pressure Effect in the Compromise Effect.* The compromise effect is typically measured by comparing the relative shares of choice alternatives between the core and extended sets. Thus, if P (B; A, C) is the share of option B relative to options A and C in a selection that is made from set {A, B, C}, then $P_C${B;A} is the

share of B relative to A in a selection that is made from set {A, B, C}, where

$$p_C\ (B;A) = \frac{p(B;A,C)}{p(B;A,C) + p(A;B,C)}$$

Consistent with previous research, the compromise effect was measured in terms of the changes in the relative share that are associated with the addition of an adjacent alternative to the choice set, that is, $P_C$(B;A)-P(B;A). This measure was used to examine whether the compromise effect was moderated by time pressure.

To test the compromise effect, an analysis was performed to compute the share of the compromise option in the binary set and the trinary set, which is denoted by "P" (see Chernev, 2004a for a detailed discussion of the measure of the share), as shown in Table 1. The compromise effect (ΔP) was measured in terms of the changes in "P" (the share of the compromise option) that are associated with the addition of an adjacent alternative to the core set. The significance of these data was examined using categorical modeling (Stokes, Davis & Koch, 2001) in which an individual's probability of selecting the middle option was a function of time pressure status. The analysis indicated a significant interaction effect between time pressure and the choice set ($\chi^2(1)$=4.08, p<0.05). Across the three product categories, the share increase of the middle (compromise) option differed significantly between the two time pressure conditions (see Table 1). The average increase in the share of the compromise option was much larger among the low time pressure participants (+30%) than among the high time pressure participants (9%), which indicates a weaker compromise effect in the participants with a high time pressure.

Overall, the findings on the choice of the compromise option and the occurrence of the compromise effect provide further evidence to support the prediction that time pressure influences choice behavior. Furthermore, the greater tendency to choose the middle option and to exhibit a compromise effect was much weaker in participants with high time pressure than in those with low time pressure, which supports the hypothesis of the moderating effect of time pressure on the compromise effect.

## STUDY 2

Study 2 mainly aimed to explore whether time pressure influences the attraction effect. The study conducted a 2 (choice sets: binary or trinary) x 2 (decisions made either with or without time pressure) between-subjects design, which is consistent with study 1. All of the 392 participants, who were enrolled in marketing courses, took part in the study on a voluntary basis and were requested to complete three choices with three categories: microwave ovens, ovens, and binoculars, and were randomly and equally assigned to one of four conditions. The design of the binary set is described in Figure 2 as options A and B, and an inferior option C relate to target option B was added to the binary set to become the trinary set. The manipulation of time pressure was identical to that in Study 1. A pilot test was firstly carried out to determine that time pressure was manipulated by either giving subjects a total of either 101 (binary) or 125 (trinary) seconds to complete the survey (three product categories). Without pressure allow subjects an unlimited amount of time to make decisions.

## RESULTS

*Manipulation Check*. The reports for the binary task indicate that the participants felt a much higher time pressure (mean=4.47) in the high pressure condition than in the low pressure condition (mean=3.5), $t_{194}$=84.19, p<0.001. For the trinary task, it was also found that the high pressure participants felt much higher pressure (mean=4.42) than the low pressure participants (mean=3.45), $t_{194}$=4.61, p<0.001. This supports that the manipulation of time pressure is successful.

*Time Pressure Effect in the Attraction Effect*. The measuring method for the attraction effect is the same as that for the compromise effect, as shown in Table 1. After the addition of a third option (C, the inferior option) the target option (B) increased its percentage of being chosen (attraction effect). In the case of participants in the low time pressure condition category, across the three product categories, the percentage of target option being chosen increased from 49% in the binary choice set to 56% in the trinary choice set, DP=7%. By contrast, in the case with participants in the high time pressure condition, the percentage of the target option being chosen increased from 51% in the binary choice set to 67% in the trinary choice set, DP=16%. The statistics show that there was a significant difference in the increase in the target option between high and low time pressure, $c^2(1)$=4.07, p<0.05, which indicates a stronger attraction effect in the participants with high time pressure.

## CONCLUSION

The data from Study 1 and 2 are consistent with H1 and H2, which state that the compromise effect will be weaker and the attraction effect will be stronger when consumers are under increased time pressure. Because of the significant implications of the finding that time pressure systematically moderates the magnitude of context effects, two follow-up studies will be conducted to test whether these results can be replicated and to gain further insights into the conditions under which high time pressure strengthens the attraction effect and weakens the compromise effect.

Previous work on behavior decision theory has shown how choice context affects decision preference in unlimited time conditions. The aim of this paper has been to show how systematic change in the compromise and attraction effects due to time pressure will influence preference change. This implies that context effects, such as the status quo, could be influenced by time pressure. The empirical investigation of this proposition is a promising area for further research.

# How Argument Structure Biases Acceptance of Advertising Claims: Explaining Deviations from Logical Reasoning in Terms of Subjective Probabilities

Charles S. Areni, University of Sydney, Australia

## ABSTRACT

Arguments in advertising are intended to maximize the acceptance of the product claims being made. The structure of the argument can influence claim acceptance apart from the quality of the substantiating evidence presented. Specifically, arguments having irrelevant but representative conditionals, hierarchically-related claims, multiple data propositions supporting a single claim, and irrelevant qualifications of conditionals trigger systematic deviations from logical reasoning and over-acceptance of the claim. Probability theory is used to contrast the logical relationships among the beliefs corresponding to each argument with the actual integration rule used by message recipients.

## INTRODUCTION

Given the importance of persuasion in marketing communications, the literature has surprisingly little to say about why some arguments are more effective than others (Areni 2002; McGuire 2002). This omission is, perhaps, due to the limited number of empirical paradigms adopted over the last three decades to study advertising and persuasion. Questions as to how to construct persuasive arguments have been given marginal status in research based on expectancy-value models (Lutz 1975; Wilkie and Pessemier 1973), cognitive response theory (Wright 1975, 1980), and dual-process models (Petty, Cacioppo and Schumann 1983; Ratneshwar and Chaiken 1991). The research reported below addresses this gap in the literature by linking judgment biases (Tversky and Kahneman 1982a) to structural aspects of arguments likely to trigger illogical reasoning (Areni 2002).

Illogical reasoning is expressed in terms of alternative rules for integrating relevant beliefs compared to the rules prescribed by logic. In some cases, actual reasoning deviates from logical reasoning because message recipients are unable to integrate their beliefs according to requisite mathematical rules (McGuire 1960; Wyer and Goldberg 1970), whereas in other situations, the deviation results from a conflict between inductive reasoning based on personal experience, and deductive reasoning based on the information actually presented (Evans et al. 1983; Sloman 1996; Cherubini et al. 1998). This research focuses on four argument structures commonly used in advertising: (a) representative but irrelevant conditionals, (b) hierarchically-related data propositions, (c) multiple data propositions supporting a single claim, and (d) irrelevant qualifications of conditionals. Probability theory is used to contrast logic with the actual reasoning processes adopted by message recipients, with the latter resulting in over-acceptance of the focal claim.

## ARGUMENT STRUCTURE AND MESSAGE ACCEPTANCE

Arguments are comprised of three basic types of propositions, *claims*–the fundamental points being argued, *data*–the evidence presented to support one or more claims, and *conditionals*–statements explaining how or why presented data support a given claim (Jaccard 1980; Toulmin 1958). All arguments are essentially arrays of data, conditionals, and claims, with the minimum requirement that at least two of the three proposition types must be explicitly stated rather than implied (Areni 2002). However, some of the propositions comprising an argument may be entailed or conversationally implicated rather than explicitly stated (Geis 1982; Leech 1974). The acceptance of a claim can be assessed in terms of the beliefs corresponding to the propositions in the argument, which can be represented as subjective probabilities ranging from complete acceptance (1.0) to complete rejection (0.0) (McGuire 1960; Wyer and Goldberg 1970). This is not to say that individuals form actual probabilities in response to arguments (Slegers, Brake and Doherty 2000). Rather, there is reason to believe that message recipients do something *like* forming subjective probabilities in response to persuasive communications, to the point of using probability markers that incorporate expressions of relative certainty (e.g., "undoubtedly," "probably," "unlikely," etc.) into verbal propositions (Fillenbaum et al. 1991).

Within this basic framework, arguments make take on a number of structures based on the various combinations of claims, data, and conditionals. However, arguments having (a) representative but irrelevant conditionals, (b) hierarchically-related data propositions, (c) multiple data propositions supporting a single claim, and (d) irrelevant qualifications of conditionals are particularly likely to trigger over-acceptance of the claim given the acceptance of the corresponding data and conditionals. As shown in Table 1, actual (i.e., but illogical) reasoning in response to each of these argument structures can be expressed as an alternative integration of beliefs compared to logical reasoning.

## REPRESENTATIVE BUT IRRELEVANT CONDITIONALS

Research regarding the representativeness of propositions given existing knowledge and experience lends insight to understanding how logical and actual reasoning differ in the processing of certain arguments (Tversky and Kahneman 1982a, 1982b). Specifically, arguments with conditionals that are consistent with previous experiences are likely to be accepted as valid when the datum and conditional do not logically establish the claim. For example, an actual 30-second television advertisement for LG washing machines states that:

> "A washing machine that shakes won't last. That's why LG have designed a direct drive system giving greater balance and durability."

Assuming the term "balance" refers to the absence of shaking and that "durability" refers to lasting a long time (i.e., by conversational implication), the propositional structure of this argument is:

| | |
|---|---|
| Datum: | LG washing machines don't shake. (-shake) |
| Conditional: | If a washing machine shakes, it won't last. (-last \| shake) |
| Claim: | LG washing machines will last. (last) |

The claim that LG washing machines will last a long time does not actually follow from the data and conditional because washing machines can break down for reasons unrelated to shaking. Nevertheless, this argument is likely to be persuasive because shaking is salient and typical of machines that do breakdown. Johnson-Laird (1986) suggests that message recipients generate "mental models" of the various possibilities suggested by an argument. Instances that confirm a representative conditional are easily brought to mind, whereas less salient instances that would invalidate the argument

**TABLE 1**
Logical Versus Actual Reasoning in Argument-Driven Persuasion*

| Structural Features of Verbal Arguments | Subjective Probability Theory (Actual Reasoning) | Objective Probability Theory (Logical Reasoning) |
|---|---|---|
| Representative But Irrelevant Conditional | $p(c)=p(-c|d)p(-d) + \ldots$ | $p(c)=1- [p(-c|d)p(d) + p(-c|-d)p(-d)]$ or $p(c)=p(c|d)p(d) + p(c|-d)p(-d)$ |
| Hierarchically-Related Data Propositions | $p(c)=p(c|d_1) + \ldots$ or $p(c)=\min[p(c|d_1),p(d_1),p(d_1|d_2),p(d_2)]$ | $p(c)=p(c|d_1)p(d_1|d_2)p(d_2) + \ldots$ |
| Multiple Data Propositions Supporting a Single Claim | $p(c)=p(c|d_1)p(d_1) + p(c|d_2)p(d_2) + \ldots$ | $p(c)=p(c|d_1)p(d_1) + p(c|d_2)p(d_2)$ $- p(c|1\cap d_2)p(d_1\cap d_2) + \ldots$ |
| Irrelevant Qualification of the Conditional | $p(c)=p(d_1) + \ldots$ | $p(c)=p(c|d_1)p(d_1) + \ldots$ |

*Where: $p(c)$=the subjective probability that the claim is true, $p(d)$=the subjective probability that the datum is true, $p(-d)$=the subjective probability that the datum is not true, $p(c|d)$=the conditional probability that the claim is true given that the datum is true, and $p(d_2\cap d_2)$=the conjunctive probability that datum 1 and datum 2 are both true.

---

are harder to imagine (Hastie and Dawes 2000; Kahnemann and Tversky 1982). For example, besides shaking, what salient symptoms are exhibited by a washing machine just prior to breaking down? To the extent that no mental models come to mind (e.g., odd noises, leaking water, etc.), the data that the machine doesn't shake makes a seemingly convincing case for the claim. So, representative conditionals often result in mental models with significant confirmation biases (Hoch and Deighton 1989), leading to the acceptance of invalid arguments.

According to probability theory, the subjective beliefs associated with this argument must be combined in one of two ways:

$1_a$. $p(last)=1-[p(-last | shake)p(shake) + p(-last | -shake)p(-shake)]$

$1_b$. $p(last)=p(last|shake)p(shake) + p(last|-shake)p(-shake)$

However, the argument as stated is not captured by either product on the right side of equations $1_a$ or $1_b$. In practical terms it is invalid because washing machines may break down even when they do not shake [i.e., $p(-last|-shake)p(-shake)$ could be substantially greater than 0]. In terms of logic, it is invalid because the conditional presents what will happen if the machine does shake, whereas the data establishes that it does not shake. This is the Aristotelian fallacy of denying the antecedent. But the representativeness of the conditional invites the following integration of beliefs:

$1_c$. $p(last)=p(-last | shake)p(-shake) + \ldots$

If the data and stated conditional are both accepted as being true, or at least plausible, then the argument makes a "convincing" case for the claim in that the term on the right side of equation $1_c$ must be relatively high. So, arguments with representative but irrelevant conditionals elicit greater acceptance of the claim than that which is logically warranted.

## HIERARCHICALLY-RELATED DATA PROPOSITIONS

Hierarchical arguments have multiple levels such that the claim of one argument serves as the data for another. For example, an advertisement for the Breville Express Cooker contains the following copy:

"The Breville Express Cooker cooks up to 8 times faster, that's because it's essentially an electric saucepan with a lid that has an airtight seal when locked. Once airtight, the Express Cooker becomes pressurised, resulting in food cooking much faster than normal."

This argument can be reduced to the following propositional structure, where one of the conditionals is implied rather than stated:

Datum 2: The Breville Express Cooker has an airtight seal. (seal)

Conditional 2: If a cooker has an airtight seal, then it creates pressure. (pressure | seal)

Datum 1: The Breville Express Cooker creates pressure. (pressure)

Conditional 1: *If a cooker creates pressure, then food cooks faster than normal.* (cook | pressure)

Claim: The Breville Express Cooker cooks food faster than normal. (cook)

The beliefs corresponding to this argument should logically be integrated as:[1]

$2_a$. $p(cook)=p(cook | pressure)p(pressure | seal)p(seal) + \ldots$

---

[1]A claim may be accepted or rejected for reasons other than those presented in the argument. This reasoning beyond the argument can be captured by additional subjective probabilities that complete each equation. For example, the complete system of beliefs corresponding to the Breville claim is $p(cook)=p(cook | pressure)p(pressure | seal)p(seal) + $ *p(cook | -pressure)p(-pressure | seal)p(seal) + p(cook | pressure)p(pressure | -seal)p(-seal) + p(cook | -pressure)p(-pressure | -seal)p(-seal)*. However, as each of the italicized products increases, some aspect of the argument is being rejected more and more (i.e., $[p(cook)=1-p(-cook)]$, etc.). The same is true for each of the other argument structures. In the interest of clarity, only the terms directly corresponding to the argument propositions are discussed, as logical versus actual reasoning pertains to differences in the integration of these beliefs.

However, research suggests that individuals do not assess hierarchical arguments according to equation $2_a$, but instead truncate the argument according to one of two rules (c.f., Kardes et al. 2001). The "as if" heuristic posits that people process hierarchical arguments in stages. If datum 2 and conditional 2 provide a reasonable basis for accepting datum 1, then datum 1 is accepted with certainty [i.e., p(pressure)=1] at the next stage of processing (Cohen, Chesnick and Haran 1982; Wyer and Goldberg 1970). So, if message recipients are persuaded that the product has an airtight seal, and that the seal increases pressure during cooking (i.e., the corresponding probabilities are reasonably high), then this level of the argument is considered to be established [i.e., p(pressure)=1], such that the probabilities corresponding to acceptance of the ultimate argument are reduced to:

$2_b$. p(cook)=p(cook | pressure)

The "weak link" heuristic suggests that individuals equate the likelihood of the claim with the minimum acceptable proposition in the hierarchical argument (Tversky and Kahneman 1982a). In short, the claim is no more plausible than the weakest link in the chain, or in terms of subjective probabilities:

$2_c$. p(cook)=min[p(cook | pressure), p(pressure), p(pressure | seal), p(seal)]

The implication of these truncations is that the message recipient will tend to be overly certain of the claim given the argument, or in other words, that the right sides of equations $2_b$ and $2_c$ are higher than equation $2_a$. Hence, hierarchical arguments should be terribly effective despite limitations in the individual propositions comprising the argument (Tversky and Kahneman 1982a; Wyer and Goldberg 1970).

## MULTIPLE DATA PROPOSITIONS SUPPORTING A SINGLE CLAIM

Arguments containing multiple data propositions present message recipients with numerous reasons for accepting a single claim. For example, an advertisement for EPSON Printers states:

"Thankfully with an EPSON Stylus Photo Printer you're always guaranteed great photo texture. How? First there's our Perfect Picture Imaging system with its unique Micro Piezo Technology. This controls the size, shape and placement of ink dots, giving superb levels of detail–even up to an amazing 2880 dpi. But the perfect photo look doesn't end there. EPSON Print Image Matching Technology ensures optimum photo quality."

In terms of propositional content, this argument can be represented as:

| | |
|---|---|
| Datum 2: | The EPSON Stylus Photo Printer controls the size, shape and placement of ink dots up to 2880 dpi. (2880 dpi) |
| Conditional 2: | *If a printer controls the size, shape and placement of ink dots up to 2880 dpi, then it provides great photo texture.* (texture\|2880 dpi) |
| Datum 1: | The EPSON Stylus Photo Printer ensures optimum photo quality imaging. (imaging) |
| Conditional 1: | *If a printer ensures optimum photo quality imaging, then it provides great photo texture.* (texture \| imaging) |

| | |
|---|---|
| Claim: | The EPSON Stylus Photo Printer provides great photo texture. (texture) |

Both conditionals are implied rather than stated explicitly.

According to probability theory, the subjective beliefs corresponding to the argument should be integrated as follows (Wyer and Goldberg 1970; Kardes et al. 2001):

$3_a$. p(texture)=p(texture | 2880 dpi)p(2880 dpi) + p(texture | imaging)p(imaging)–p(texture | 2880 dpi I imaging)p(2880 dpi I imaging) + …

However, there is evidence that individuals do not integrate their beliefs according to equation $3_a$. Instead, message recipients process the "sub-arguments" separately, basing their ultimate acceptance of the claim on the sum of each sub-argument (Hastie and Dawes 2000; Areni 2002). In terms of subjective probabilities, equation $3_a$ is truncated to:

$3_b$. p(texture)=p(texture | 2880 dpi)p(2880 dpi) + p(texture | imaging)p(imaging)

As the number of sub-arguments increases, the inflation of the probability associated with the claim increases, as more and more conjunctions are effectively counted twice, thrice, etc. (Van Wallendael and Hastie 1990). Hence, arguments with multiple data propositions promote greater message acceptance than logically follows from the corresponding beliefs.

## IRRELEVANT QUALIFICATIONS OF CONDITIONALS

Empirical arguments containing irrelevant qualifications specify additional conditions that either strengthen (e.g., "especially if…") or weaken (e.g., "unless…") the main conditional of an argument. In the former case, the qualification applies to virtually all message recipients, whereas in the latter case it applies to relatively few. An advertisement for Yasmin birth control pills includes a qualification that weakens the main conditional:

"A pill that works with your body chemistry? Yasmin is the only birth control pill that affects the excess sodium and water in your body while also maintaining, or in some cases increasing your potassium… How can you be sure that Yasmin is safe for you? …You should not take Yasmin if you have kidney, liver or adrenal disease because this could cause serious health problems."

This argument has the following propositional structure:

| | |
|---|---|
| Datum: | Yasmin birth control pills maintain or increase potassium. (potassium) |
| Conditional $1_a$: | *If a birth control pill maintains or increases potassium, then it is safe.* (safe \| potassium) |
| Conditional $1_b$: | Unless the user is suffering from kidney, liver, or adrenal disease. (safe \| potassium $\cap$ -disease) |
| Claim: | Yasmin is a safe birth control pill. (safe) |

The subjective beliefs relevant to the propositions in this argument can be represented as:

$4_a$: p(safe)=p(safe | potassium $\cap$ -disease)p(potassium $\cap$ -disease) + …

For the vast majority of message recipients, the qualification is irrelevant [i.e., p(-disease)⇒1]. If the qualification is deemed inapplicable, then the system of beliefs corresponding to the argument logically reduces to:

$4_b$:  p(safe)=p(safe | potassium)p(potassium) + …

That is, if p(-disease)=1, then equation $4_a$ is equivalent to equation $4_b$. However, there is evidence that discounting the qualification has the effect of bolstering acceptance of the main conditional toward complete certainty [i.e., p(safe | potassium) )⇒1], such that equation $4_b$ is truncated to:

$4_c$:  p(safe)=p(potassium) + …

In short, actual reasoning includes the inference: "Well, I'm not suffering from kidney, liver, or adrenal disease, so a pill that maintains or increases potassium will *definitely* be safe for me" (Areni 2002). The only remaining consideration is the data proposition (i.e., "does it actually maintain or increase potassium levels?"), which becomes the principal determinant of message acceptance. So, irrelevant qualifications lead to greater acceptance of the claim than that which is logically justified.

## TESTING FOR DIFFERENCES IN LOGICAL AND ACTUAL REASONING

Wyer (1975) developed an interesting approach for testing whether message recipients engage in logical versus illogical reasoning when presented with verbal arguments. To illustrate, for the data proposition in the LG advertisement, respondents would evaluate the statement "LG washing machines don't shake," using an 11-point scale anchored by 0 (not at all likely) and 10 (extremely likely). The subjective probability would then be derived by dividing the observed response by 10. The subjective probabilities corresponding to the remaining propositions in the ad would be measured in a similar manner.

These scales are interesting in that they create a measure ranging from 0.0 to 1.0, similar to actual probabilities. It is perhaps tempting to combine the measured beliefs according to the integration rules implied by logical versus pragmatic reasoning to determine which computed score best predicts the directly measured acceptance of the claim; but such an approach is valid only if the reported "probabilities" are ratio scale measures of the unobservable level of certainty regarding the truth of the corresponding propositions (Anderson 1982; Birnbaum 1973, 1974). Research regarding the measurement of subjective probability suggests that this assumption is not likely to hold (Fillenbaum et al. 1991), and as a result an incorrect function might predict the target belief more accurately than the actual integration rule used by the individual (Birnbaum 1973, 1974; Lynch 1985). However, functional measurement analysis necessitates only the more modest assumption that a monotonic relationship exists between the observed measure and the underlying construct (Anderson 1982; Birnbaum 1974). Under these conditions, logical reasoning can be tested against actual reasoning by including all the relevant subjective beliefs in a general linear model and noting which terms emerge as significant predictors of claim acceptance (Wyer 1975).

For example, consider the representative but irrelevant conditional in the LG washing machine advertisement. The subjective probabilities corresponding to the argument are: p(last), p(shakes), p(-shakes), p(last | shakes), and p(-last | shakes). Given these terms, the logical integration rule shown in equation $1_a$ implies that the p(-last | shake) x p(shake) interaction effect will provide incremental predictive power beyond the corresponding main effects, and

equation $1_b$ suggests that the p(last | shake) x p(shake) interaction effect will provide incremental predictive power beyond the corresponding main effects. On the other hand, actual reasoning involves a p(-last | shake) x p(-shake) interaction, which can be distinguished from the corresponding logical interactions based on the sign of the correlation with p(claim). That is, probability theory indicates a perfect negative correlation between the following pairs of probabilities: p(shakes) and p(-shakes), p(last | -shakes) and p(-last | -shakes), and p(last | shakes) and p(-last | shakes), so for actual reasoning, the correlation of the interaction term with claim acceptance must be opposite in sign to that for the logical interaction terms.

A similar approach can be applied to testing the remaining pragmatic integration rules against those prescribed by logic. For example, the actual processing of hierarchical arguments implies one of two simple main effects models. Either p(claim | $datum_1$) is the lone predictor of claim acceptance (i.e., the "as if" heuristic), or the minimum value of p($datum_2$), p($datum_1$ | $datum_2$), p(claim | $datum_1$) is the only significant term in the resulting model (i.e., the "weak link" heuristic). By contrast, the logical integration rule necessitates that the p(claim | $datum_1$) x p($datum_1$ | $datum_2$) x p($datum_2$) interaction effect provides incremental predictive power beyond the main effects and 2-way interactions in the model (Kardes et al. 2001).

Actual reasoning with respect to arguments with qualified conditionals implies that the subjective belief regarding datum 1 (i.e., Yasmin birth control pills maintain or increase potassium) is the sole predictor of claim acceptance (i.e., Yasmin is a safe birth control pill). Logic, on the other hand, requires that the p(claim | $datum_1$) x p($datum_1$) interaction effect provides incremental predictive power beyond the simple main effects. A strong test of logical versus actual reasoning would involve presenting respondents with either of two versions of the Yasmin argument–one with the qualifying condition and one without. Respondents in the latter condition should be relatively logical, such that the p(safe | potassium) x p(potassium) interaction term provides incremental predictive value. Respondents in the former condition who do not reject the qualifying condition as irrelevant should also reveal a significant two-way interaction. The pragmatic truncation should only emerge for respondents who reject the qualifying condition as irrelevant or implausible.

Perhaps the most difficult test of logical versus actual reasoning involves arguments where multiple data propositions support a single claim, due mainly to the challenge of measuring the conjunctive probabilities in the logical integration rule. For example, in the aforementioned ad for Epson printers, the conjunctive probability would necessitate that respondents answer the following item: "The Epson Stylus Photo Printer controls the size, shape and placement of ink dots up to 2880 dpi *and* ensures optimum photo quality imaging," in addition to the items for each data proposition separately. Although this basic approach has been used in previous research examining irrationality in assessments of conjunctive probabilities (Kahneman and Tversky 1982a), it is not clear that respondents would understand the distinctions among these items. Nevertheless, despite these measurement issues, the actual integration rule implies that the interaction effect involving the conjunctive probabilities provides additional predictive value beyond the main and 2-way interaction effects associated with p(claim | $datum_1$), p($datum_1$), p(claim | $datum_2$), and p($datum_2$).

## DISCUSSION

It seems likely that advertising copywriters have an implicit understanding of each of the principles identified above and exploit these limitations in reasoning to create "convincing" arguments.

Perhaps nowhere is this better illustrated than a recent 30-second television ad for Oil of Olay, which states that the skin cream keeps women looking younger by fighting the seven signs of aging. Each of these conditions is stated in succession by the voiceover with a corresponding visual showing how the product eliminates the condition. The magazine version of the ad also leverages the multiple data propositions with large, bold font stating that the product (1) diminishes the appearance of fine lines and wrinkles, (2) evens skin tone for younger-looking, more balanced color, (3) evens skin tone for younger-looking, more balanced color, (4) improves surface dullness, giving skin a radiant healthy glow, (5) minimizes the appearance of pores, (6) reduces the appearance of blotches and age spots, and (7) soothes dry skin, hydrating with Olay moisture. Given the integration of beliefs implied by equation $3_b$, even if the audience largely rejected each data-conditional combination, the claim would still be accepted with quite a bit of certainty.

Likewise, a magazine advertisement for Mountain Herbs Herbal Enhancement supplement makes the following hierarchical data argument.

"Treat the cause not the symptoms and simplify your life. Herbal Enhancer may reduce the symptoms of PMS by addressing the cause of the problem–hormonal imbalance. Herbal Enhancer contains a synergistic blend of 9 herbs that promote the healthy function of the hypothalamus with herbs that are phylo-oestrogens."

In this 3 level hierarchy, the herbal ingredients (i.e., $data_3$) promote a healthy hypothalamus (i.e., $data_2$), which regulates hormonal imbalance (i.e., $data_1$), which reduces PMS symptoms (i.e., claim). The corresponding conditionals are implied rather than stated. But note that the opening statement draws attention to the hierarchical nature of the argument by discussing the importance of treating the ultimate (i.e., further up the hierarchy) cause of PMS rather than the proximal (i.e., further down the hierarchy) causes, which are nothing more than symptoms of the true problem. In both cases, the ad copy seems to be designed to maximize the impact of the argument structure.

Does this mean that consumers exposed to these argument structures in ads are inherently illogical and prone to over-accepting product claims? Not all deviations from logic can be characterized as illogical, since the mental effort required for logical reasoning comes at a cost. Consumers using these and other heuristics may produce reasonably accurate beliefs on a relative economy of thought. In addition, consumers likely possess complicated beliefs systems linking the propositions in an argument to countless others. Actual reasoning may deviate from "logical" reasoning because consumers rely on exogenous beliefs not actually presented in the argument. Reasoning from experience is likely to result in numerous conscious and unconscious inferences that are perhaps best described as "extra-logical" reasoning.

# How Brands Enchant: Insights from Observing Community Driven Brand Creation

Johann Füller, Innsbruck University, Austria
Marius K. Luedicke, Innsbruck University, Austria
Gregor Jawecki, Innsbruck University, Austria

## ABSTRACT

This paper explores the emerging phenomenon of community-driven brand creation. Drawing on a longitudinal netnographic study of the "outdoorseiten.net" online community, it develops the concept of "community brands." Community brands are consumer-created brands that enchant their participants by providing creative social spaces, in which they innovate, discuss, manufacture, and brand customized products independently from corporate agents. The study reveals influential expressions of authenticity, creativity, community, and independence within such a social space and derives valuable implications for consumer culture theory and branding.

## INTRODUCTION

In July 2005, after a three-week process of exchanging ideas and discussing improvements, a group of outdoor enthusiasts and online community members decided on the name and symbol for their first own brand: "outdoorseiten.net". Following this event, community members began to label their jointly innovated and manufactured backpacks, jackets, and sleeping bags with their own logo and talk about themselves as the outdoorseiten.net community. The idea of creating a brand name for marking themselves and their products inspired the members to advance the next community project: creating a superior line of functional yet affordable outdoorseiten.net outdoor products. Two years after the development of the logo, the community introduced its first marketable prototype, a small tent, with the outdoorseiten.net brand name. This is only one example of the many brand products that are created by communities of common interests. Skibuilders.com, for instance, has been developing and marketing community-created skis since 2006. PMGEAR has been successfully selling ski gear for 3 years.

Why and how do these interest groups develop their own brands? Why do community driven brands create so much enchantment and commitment among community members? And, what differentiates these brands from corporate brands and their communities? With the unprecedented explosion of consumer-created content and innovation on the Internet and its rising financial, ideological, and social valuation by consumers, these questions become critical for marketing managers, consumer activists, and public policy makers alike.

This paper addresses this gap in knowledge by introducing the concept of "community brand." Community brands represent particular sets of manufactures and meanings that are created and perpetuated by members of online communities. These members share specific interests, such as outdoor sports or fashion. They channel their creativity and develop their skills by designing, producing, sharing, and consuming customized products within a group of fellow enthusiasts. Unlike brand communities which evolve around existing commercial products (Muñiz and O'Guinn 2001), community brands are self-created by members of an existing community. In the inversed process of brand community building, some communities begin to draw on commercial means of logo creation or offshore production for leveraging their own sense of belonging and for sharing their creations with others. Community brands are particularly meaningful, enchanting, and dear to the members that drive them most, but also appeal to community outsiders with an interest in consuming the mysterious aura of unique insider fabrics.

The outdoorseiten.net community provides an ideal context for researching the above questions. The longitudinal study of community processes reveals the particular motivations, meanings, and practices of an emerging crowd of online communities that syndicate their members' knowledge, ideas, and skills to create own branded products.

This article is structured as follows. First, we briefly introduce our context and describe the methods we used for approaching it. Then, we trace the evolution of the outdoorseiten.net community from its beginning to the launch of its first prototype to reveal the key phases of community brand development and the motivations for community members to move from one phase to the next. Subsequently, we use the insights of branding and brand community theory to illuminate the differences among community brands and "classic" brands in the enchantment of consumers. Lastly, we discuss our findings and theoretical implications and offer avenues for further research.

## THEORY

How do brands develop? Existing marketing theory speaks to the question of brand development by offering the concept of brands as "open systems" (Pitt et al. 2006, p.115). Pitt and colleagues identify four key dimensions that constitute a brand: physical, textual, experience, and meanings. These elements are influenced and co-created by consumers and companies in a social context. The physical dimension involves tangible products that are modified, individualized, and even invented by consumers (Prahalad and Ramaswamy 2004). The text dimension comprises brand-related stories, pictures, and videos that are generated by consumers and presented on portals such as MySpace, Wikipedia, and YouTube. Consumers' experiences also influence the brand and its meaning. Spectacles such as concerts, amusement parks, or brand fests rely on the contribution of the audience and their active involvement. Lastly, the meanings that are associated with and ascribed to certain brands can enrich the brand experience and even endow the most desired objects with cult status. Pitt et al's key theoretical argument is that brands are more open to consumer influences than previously assumed. Yet, whereas Pitt et al's work is useful for scrutinizing the dimensions of emerging brands, it lacks empirical insights into how and why consumers contribute to the development of brands over time.

Why do brands enchant? Consumer culture theory offers multifaceted answers to the question of why some brands are dear to people. Fournier and Belk, for instance, highlight the salient emotional values of brands used as human-like relationship partners and extended expressions of self. From an individual perspective within a social context, brands enchant through their symbolic value. As Levy (1959), McCracken (1986), and Thompson and Haytko (Murray 2002) reveal, brands become meaningful through the transfer of cultural resources, individual experiences, and social exchanges to the brand name. The better consumers can use brands as resources for individual identity projects (Holt 2002), the more they seem to enthuse.

From a sociological perspective, Muniz and O'Guinn (2001), Cova (2003), Kozinets (2002a), and McAlexander, Schouten, and Koenig (2002) argue that brands allow consumers to regain a sense of affectionate community within an exceedingly disinterested society (Tönnies 1957; Weber and Rheinstein 1966). These authors

show, how a shared consciousness, rituals and traditions, as well as a sense of moral responsibility weld groups of consumers together around an existing brand (Muñiz and O'Guinn 2001) or a common consumption interest (Cova 2003). At the same time, however, the same brands inspire antagonists and social activist for lobbying against meanings and corporations by creating doppelganger brands (Thompson et al. 2006), anti-brand websites (Luedicke 2006), or individual practices of resistance (Holt 2002).

Next to community and distinction, two further themes leverage brand enthusiasm on a consumer cultural level, namely, authenticity and creativity. Across these theories, authenticity is rated among the most desired characters of a brand's identity (Aaker 1995). According to Holt (2002), firms try to exploit authentic subcultural innovations for creating enchanting brands in a perpetuate circle of variation and co-optation. Consumers strive for creating "emancipated spaces" (Murray and Ozanne 1991) in which they can evade the "branding mill" or even the totalizing market logic (Kozinets 2002a). Consumer creativity in buying, using, modifying, enhancing, or alienating commercial offerings plays a key role in this attempt to evade the commercial mainstream (Muñiz and Schau 2005). Thompson and Coskuner (forthcoming) recently revealed in the context of community-supported agriculture that despite corporate attempts of co-cooptation, consumers are able to create sustainable countervailing markets. These consumer-driven market responses result from the creative use of market mechanisms for alternative ideological agendas.

In summary, existing theory reveals that identity, community, authenticity, and creativity are key characteristics of the most enchanting brands. The initial thesis of this article is that a longitudinal study of online community brands can provide new answers to the above research questions by masking the corporate branding bias.

## METHOD

To study the meanings and processes of community brand development, we selected online communities dedicated to outdoor sports, such as backpacking, wilderness camping, climbing or ski touring, for two reasons: First, outdoor sports are practiced by a great number of people around the world and we expected to find a high number of online communities dedicated to topic. Second, as the right choice of equipment is crucial not only for comfort but also for the safety during outdoor activities, equipment plays a key role for outdoor sportsmen. Hence, we expected to find not only reports of trips and adventures on outdoor websites, but also passionate discussions about outdoor equipment and brands.

Using community-specific and general search engines we identified more than 400 online communities dedicated to outdoor sports, ranging from day-hiking to wilderness camping to ice climbing. After evaluating each community on criteria such as the amount of equipment-related content, professionalism, posting frequency, and number of members we reduced the number of communities to thirty. We analyzed these thirty communities in-depth and finally selected „outdoorseiten.net" as the most promising context for our purpose. Outdoorseiten.net is a message board in German language with more than 4,900 members that is entirely dedicated to outdoor sports. Product-creation related discussions play an important role in the interaction among members. The forum even has a separate sub-section entirely dedicated to self-made gear and equipment.

A netnographic approach (Kozinets 2002b) was chosen for data collection. Netnography has its origin in ethnography (Arnould and Wallendorf 1994) and uses information publicly available on the Internet to study the nature and behavior of online consumer groups. It is mainly used to gain "grounded knowledge" (Glaser and Strauss 1967) concerning a certain research question. Data collection comprised community observation, participant observation, and interviews on community brand creation activities and motives.

We observed the outdoorseiten.net community over a period of 8 months, from Ocotober 2005 to May 2006. Conversation available in the archives dated back more than 2 years was included in our research. Purposive sampling was used by screening of more than 110,000 posts. Interviews were conducted with members of the outdoorseiten.net community. The most relevant statements were filed electronically, resulting in a database of 2,400 posts in 200 different discussions. We analyzed this data using qualitative content analysis. Interpretation was done in several iterative cycles including data received from other sources like press articles and other Internet sources to check the trustworthiness of information and get more sound interpretations.

The members of outdoorseiten.net are between 20 and 45 years old. They spend a significant amount of time in activities related to outdoor sports, ranging from actively doing the sport to reading magazines, preparing their equipment, or communicating with people who share the same interests, both on- and offline. Their high involvement in outdoor sports is shown, for instance, by their impressive stories of climbing the world's highest mountains. In each community, there is a small number of members that contributes the majority of all postings. It is not uncommon for the most enthusiastic members to have hundreds of postings on their community "resume" and–except when they are outdoors–to rarely miss out a day of posting messages. At the outdoorseiten.net community, 1% of all members have posted more than 1,000 messages, 8% are frequent posters (101–1,000 postings), 68% contribute messages from time to time (1-100 postings), and 23% of the total 3,000 members have not posted a single message yet and thus can be considered as lurkers (Nonnecke et al. 2004).

## EMPIRICAL EVIDENCE

In this section, we trace the process of community-driven brand creation, discuss differences among community brands and brand communities, and reveal on these grounds the ways in which community brands enchant their owners.

### Process of community driven brand creation

Four key phases mark the evolution of the outdoorseiten.net community from its creation in 2001 to the launch of its first product under the outdoorseiten.net brand in 2005 (see Table 1). In the following we describe these four phases, giving special attention to the fourth phase in which the outdoorseiten.net brand officially appears and starts producing its own products.

Briefly after its beginning, the outdoorseiten.net community became a preferred meeting place of dedicated outdoor sportsmen who enjoyed talking with like-minded others about their outdoor gear. Members often shared their experiences with outdoor gear and all products and brands on the market were extensively discussed in the community. In this first phase, used products were provided by established companies although some members modified existing products with the intention to better satisfy their needs.

Only two months after its beginning, a new facet of community activities emerged in the community. In order to better satisfy their specific product needs, an increasing number of members started to develop entirely new products on their own.

*Well I just purchased my sewing machine so I have officially jumped into making my own quilt, parka shell, and down vest/coat.*

The development of own products by members characterizes the second phase in the emergence of the outdoorseiten.net brand. The remarkable enthusiasm and dedication displayed in their innovation activities even led the community administrators to implement a new sub-forum termed "Make Your Own Gear". From then on, creative members posted pictures of self-made products in the "Make your own Gear" section and thus inspired other members to become active themselves. The typically very positive feedback to the posted pictures of self-made gear and the high number of members who used the posted guidelines to make similar prototypes illustrate the high quality of self-made gear.

The development of individual logos and brands marks the third phase in the emergence of the outdoorseiten.net brand. In May 2005, innovative community members started to develop their own logos to make perfect their innovation activities.

*To bring your self-made gear to a new level you should develop your own logo, then it's even more fun.*

They arranged the production of their logos by specialized companies and in the following attached their labels to both self-made as well as to bought products. From then on, members referred to products branded in this way as belonging to their own brand.

Attracted by the idea of individual logos, briefly thereafter the idea arose to develop an own logo for the community. The development of the outdoorseiten.net logo is the introduction of the fourth and final phase, which ultimately resulted in the launch of own products under the outdoorseiten.net brand. In the following, the evolution process from individual logos of some members to the community logo, to the development of own products under the outdoorseiten.net brand is elaborated in more detail.

The idea of developing an outdoorseiten.net logo came up in the discussion of two members: one who had just developed and showcased his own, personal logo and another one who was so attracted by the idea that he proposed an own community logo.

*I want something like this from our forum, for my backpack!*

An astonishing number of other members immediately expressed their enthusiasm in such a project and the creation process of an outdoorseiten.net logo was started. As part of the development process, which spanned 5 weeks, more than 10 different design versions of the logo were discussed extensively (see Figure 1). After several changes and modifications of the design, the name and the end-design of the new forum badge was chosen (see Figure 2). At the same time, the community consulted with different emblem shops about the kind of production and price, and organized the way of sale. Within a short time half of all logos were sold to community members. Even the member who took the initiative in distributing the logos was surprised as he did not expect such a high demand:

*Already half of all logos gone? Guys, do you make entire pants of it?*

Once the logos were distributed, community members began to attach the outdoorseiten.net logo on their self-made gear and bought outdoor equipment, in this case typically choosing to paste the logo over the original producers' logo. Immediately, products modified this way were referred to as belonging to the outdoorseiten.net brand:

*Now I have to think where to place the badges on my backpacks. At the moment I cannot think of anything better than*

*replacing the big Macpac-Label. Watch out: "outdoorseiten.net" as a new backpack brand…*

In 2006 the community initiated the development of its first own product: the outdoorseiten.net outdoor tent. The development process was started by one member who–driven by his perception of the vast product-related expertise prevalent in the community-introduced the idea to develop a tent by and for members. Although some members were hesitant at first, almost all agreed to give it a try:

*Boah, if this would work out... I can assume that we will already fail in the definition of details. But who cares, it's worth a try.*

Since then, more than 100 discussions have taken place in the community dealing with questions how the outdoor tent should ideally look like, ranging from its measurements, to materials used, to detailed construction elements. All key decisions were made in a democratic process, as suggested by one member:

*I think an open discussion thread would be a good idea and once we have enough discussion, let's make a poll–like in a political election.*

Overall, more than 200 members have contributed so far to the development of the outdoorseiten.net tent. At this stage, the design and construction details of the outdoorseiten.net tent are already transferred into a virtual, 3 D model. Simultaneously, members are discussing last changes and consider which manufacturer they should contact to produce their community's tent.

## Community Brand versus Brand Community

Brand communities are theorized as groups of people that cultivate close social relationships with and around their most admired brands (Muñiz and O'Guinn 2001). As such, brand community theory provides a suitable contrast for exploring the properties of community brands.

The research conducted at outdoorseiten.net, an online community for dedicated outdoor enthusiasts, has shown that community members replace the original logos of their expensive, high quality outdoor gear with their self-created community logo. Besides of that, the outdoorseiten.net community just started to market a self-developed tent under their own brand. Further a registered association was founded around outdoorseiten.net.

Those examples show that online consumer groups become active themselves, modify existing products, and create completely new ones. Further, in the near future firms may compete with consumer community brands who market their own products.

Community brands differ from other brands in various dimensions (see Table 2). First of all, community brands are created by interest groups, not firms. As we showed in the previous section, the outdoorseiten.net brand emerged from the interaction of numerous community members who all shared the enthusiasm for outdoor sports, after some time created their own branded products, and finally became a community brand. Another difference lies in the meanings associated with brands and how these meanings evolve. In the case of corporate brands, meanings are coined by a company and interpreted and appropriated by different interest groups including e.g. consumers. In contrast, community brands' meanings are created and shaped in the discourse between community members. Numerous statements indicate that for the members of the outdoorseiten.net community, the brand stands for individuality, high quality, and authenticity. Also, the brand's products are

regarded as capable to compete with existing products on the market, as shown by the following member statement referring to a backpack branded with the outdoorseiten.net logo:

*Yeah! I have a new backpack. A great piece. The best which currently exists on the market. Brand: outdoorseiten.net*

Traditional brands and community brands further differ in regard to who manages the key-tasks in the development of new products. Typically, design, production, marketing and distribution of products are carried out by companies. In contrary, products of the outdoorseiten.net brand are developed predominately by the community itself. The members conceptualize and market all new products and companies are only called upon in managing production and logistics.

A further aspect in which brands and community brands differ from each other is which groups ultimately consume the brand's product. While the customers of corporately advertised brands may be part of a variety of communities and interest groups, the products of the outdoorseiten.net brand are predominately used by the members of the community itself. Hence, in community brands producers and "customers" are one and the same group of people. But brands and community brands not only differ in regard to who uses their products and who manages the key-tasks in product development, but also *why* products are developed at all. While companies in most cases develop products with the aim to satisfy the needs of their customers and to earn enough money to ensure the company's survival and growth, the outdoorseiten.net brand first and foremost aims to provide the best products possible to its own members.

In their creative activities, strong emotional bonds emerge between the most active members of the creation process–marking another aspect, which differentiates community brands from other brands.

Finally, another dimension, which distinguishes conventional brands from community brands is the pattern of communication. In the case of commercial brands, brand related communication is conducted through mass media. In contrast, within community brands communication is managed through word-of-mouth and some respected members who take the role of community ambassadors.

**How Do Community Brands Enchant Consumers?**

What is it that drives community members to dedicate their entire spare time to the community and to the building of the community brand? Many members, especially those of the "Make your Own Gear" sub forum just love to create their own equipment, their meanings and their stories. Everything is centered around ability to do it themselves. Everything which does not fit 100 % is modified, tailored and created by them till they get a solution which meets their needs. Initially, the desire for unique solutions, need for better, more specific equipment, or to save money may trigger to engage in the community creation activities. Besides of the utility gained from their self-created solutions and the fun derived from the creative act, community aspects like sharing experiences and know-how with others, and striving for pride and recognition present further important aspects.

*…but who besides us can claim to wear a jacket of one's own brand???*

It is the enthusiasm and love for the activity which keeps them to spend loads of time. Further, outdoor community members like to identify each other as outdoorseiten.net community members even when they do not know each other and have never met before. Therefore they needed and created symbols and artefacts like such labels and special color codes to be able to recognize other members.

*Wouldn't it be cool if we meet and get to know each other at any place and at any time with a outdoorseiten.net logo?*

The pride of belonging to the community and to their own created label is that strong that some of the less skill community members buy e.g. pants or jackets from established manufacturers remove the original labels and replace it with their outdoorseiten.net logo.

*I had the same idea. Place them right on the Haglöfs Logo. I'm wondering if the size fits.*

*Yes. Directly on the firm logo. There, the logo is spotted best.*

For other community members, commercial brands are not really attractive, because they are associated with status and behaviors not desired

*I find brand labels as status symbols apish anyway.*

In addition to that the community members think that their self-created stuff is much cooler than offers from known brands at less cost.

*I get a lot of satisfaction (creative and otherwise) from knowing that I saved forty bucks by making my own silnylon tarp. I get satisfaction from knowing I can construct better than the gear companies. They don't make nice wide, genuine french-fell seams, with five rows of stitching. My four ounce home made cooking set that cost me under a dollar gives me satisfaction too.*

**TABLE 2**
Comparison of Brands with Community Brands

| Dimension | Brand (Community) | Community Brand |
|---|---|---|
| Initiation | Created by commercial companies | Created by community members, often members of interest groups |
| Community Type | Brand Community: Center around existing commercial brands | Interest Groups who create their own branded products and become a Community Brand |
| Meaning | Suggested by a company, interpreted and appropriated by different interest groups | Results from and is constantly shaped by community discourse |
| Products | Products are designed, produced and marketed by companies | Products are designed and marketed by the community. Production and logistics are outsourced and managed by companies |
| Narrative/ Archetype | Centered around the offering Provided by company and centered on attractive stories–artificial. | Centered around the community The community is the brand. All interactions and discourses of the community are part of the story and manifested through all members (texts, discussions, products, artefacts) |
| Customers | Members of various communities and interest groups; including commercial consumers only, symbolic free-rider | Predominantly members of the online community Self-supporters: producer=customer |
| Relationship | Typically professional rather than social bonds between "creators" of brands | Strong emotional bonds of the community members especially of those who actively engage in the creation process who form the core. |
| Control | By company and community | Community |
| Communication | Through mass media and community discourse | Word-of mouth through community ambassadors |
| Aim | To maximize earnings and make customers happy Ensure surviving of the company | To satisfy own needs! To ensure surviving of the community and provide best products |

For some community members, outdoorseiten.net is not just a hobby but a philosophy. It is one main reason for their existence.

## DISCUSSION

Using the concept of community brands, the paper presents empirical evidence for the emergence and evolution of community-driven brands and explores how these brands differ from other emotionally laden brands in their enchantment of their interest groups. Community brands are created by people who share common interests, not by firms. Community brands create motives, ideologies, and modes of self-organization that suit the majority needs of the active members rather than the needs of economically interested shareholders. Community brands are inspired by the independence, creativity, knowledge, and distinction of their members. The ability to commonly design products that exactly suit particular functional and symbolic needs at lower expenses and without the threat of being exploited or overtaken by the next fashion wave enchants the owners of community brands. The research shows that community brands are not limited to open source software, but also exist in the material world.

This study contributes to consumer culture theory in at least four important ways: First, Kozinets (2002a) has argued on the basis of an ethnographic study of the "Burning Man" festival that consumers can try, but succeed only temporarily at "escaping the market." In contrast, community brand members are not interested in evading the logic of the "market," but evading the dependence on corporate innovation and brands. Hence, community brands eagerly use market mechanisms such as branding or offshore production for their own projects, while liberating themselves successfully from the influences of corporations. In accordance with Thompson and Coskuner's (forthcoming) recent findings we show that consumers may create sustainable countervailing markets to evade the

power of brands and corporations, but certainly for fulfilling their own desires and authentic interests independently. In addition to Thompson and Coskuner, our context reveals that countervailing markets not only emerge in retro contexts of romantic agricultural ideals, but also prosper by advancing novel meanings, experiences, and things.

Second, according to Holt (2002) and others, brands must strive for authenticity to become successful "citizen artists." Community brands are systematically authentic, as they are driven by people that believe their own motives. As long as community brands successfully evade the impression of being commercially influenced, the sense of authenticity leverages trust, mystique, and meaning of the community brand. However, this impression can quickly arise, for instance, if salient community members are unmasked as corporate figures or the community explores options of selling some ideas to companies. Authenticity is also ensured by the mechanism of reputation by contribution. The group's most active members earn their kudos by sharing extensively, listening to creative members, and enhancing the value of the community brand in best accordance with the group.

Third, we find many members of self-branded communities to be highly loyal, passionate, and devoted to their brand. In contrast to classic branding theory, which distinguishes consumers from brands, the community brand concept suggests that the community is the brand. Hence, consumer-brand disputes that are discussed in the consumerism literature are of marginal relevance in the case of community brands. Here, consumer-brand struggles are internal differences among members.

Fourth, one salient motivating factor and source of enchantment is the independence of community brands from corporate influences. Classic brand enthusiasts are constantly threatened by corporate decisions, as they have no voice in the innovation process but only an exit option (Hirschman 1970). Apple introduced the Intel processor and abandoned the Newton handheld; Harley Davidson launched bikes for yuppies; and Hummer introduced a small mass-market sport utility vehicle. Consumers and admirers of these brands have struggled with these decisions for various reasons, but predominantly because they resented the destruction of a brand element that was important to the respective owner. Whereas firms can dictate the objects and strongly influence the meanings and experiences of brands, community brands create their own ideologies, define their own qualities, advance with their own pace, and define the prices they want to pay or charge democratically. This liberation and stability within a turbulent market environment perpetuates consumer creativity, participation, and esteem and creates a leveraged knowledge-elitist position that allows for ignoring the latest fashion (Holt 2002).

## CONCLUSION

In conclusion, our research reveals how groups of people with shared interests become brand creators by perpetuating a democratic, self-organized, creative community brand. The study provides valuable insights into the potential of community brands as enchanting, authentic brands that differ dramatically from traditional brands and their communities.

Given that production and design capabilities become more easily accessible for communities in the near future, the concept of community brands has the potential of drastically transforming the market (cf. Giesler forthcoming). Yet, even though these recent developments can present a threat to existing commercial organizations, they also entail new business opportunities (Thompson et al. 2006). Companies such as "Threadless" and "Spreadshirt," for instance, already profitably provide services for creative community brands. However, on a larger economic scale, the emergence of community brands challenges the common conviction that specialized product knowledge and branding proficiency are the most sustainable, inimitable resources for the western corporate world.

# Relationship Glue: Customers and Marketers Co-Creating a Purchase Experience

Edwin Rajah, Auckland University of Technology, New Zealand
Roger Marshall, Auckland University of Technology, New Zealand
Inwoo Nam, Nanyang Technological University, Singapore

## ABSTRACT

Co-creation occurs when a customer works together with a marketer to create a consumption experience that adds value to the purchase process. Although authors have proposed this idea before, this research reports the first empirical support. The research instrument first exposes different respondents to scenarios that differ in the extent of co-creation present whilst retaining exactly the same eventual purchase outcome. Then the research variables (Co-creation, Trust, Satisfaction, Relationship strength, and Loyalty) are measured. A structural equation model provides positive support for the hypothesized relationships, where co-creation does indeed strengthen the relationship through increasing levels of satisfaction and trust.

## RESEARCH FOCUS

A fundamental requirement for the evolution of the marketing function is to explore and develop marketing approaches that are customer-centric (Parasuraman and Grewal 2000). One new conceptual approach consistent with a customer-centric focus is co-creation, which can occur when a customer is actively involved in some way in the design, delivery, and creation of the customer experience(Sheth, Sisodia, and Sharma 2000). The literature suggests that the co-creation view shifts the focus onto the customer; hence, Sheth's assertion that co-creation is inherently customer-centric. In simple terms, co-creation creates a unique value for the customer elevating a transaction to a relation-building experience. The outcome for a company adopting a co-creative approach is a unique differential advantage that is difficult to imitate.

The aim of this research is to empirically test this concept, by investigating the extent to which customers who experience a co-created customer (purchase) experience derive increasing levels of satisfaction and trust, and consequently develop a stronger relationship with the company and become more loyal.

### The Meaning of Co-Creation

A co-creative customer experience means that the customer is actively involved and contributing in some way in the design, delivery, and creation of the customer experience. To achieve the co-created experience, the customer must interact with the marketing provider (and perhaps other relevant actors in the experience network) to enable the co-construction of the experience. The outcome of the active contribution of the customer makes each experience unique, personalized and may provide a customized solution to the client. Co-creation is a new marketing approach that offers the potential for creating value for customers to a greater degree than company-centric marketing approaches. In co-creation, the customer is an integral, active part of the value creating process. This is in contrast to the conventional Porter Value Chain framework, where the customer plays a passive role in the value creation process (Ramirez 1999; Wikstrom 1996a).

Customer purchasing processes in the co-creation perspective represent an important stage for value creation. Value, in the co-creation view, is a collaborative effort of all actors in the up and downstream stages of the value-creating process. All actors in the value-creation network act as facilitators in creating value, which is fully realized only when the customer uses the product for a specific problem-solving situation. This is acknowledged as the 'value in use' perspective (Ramirez 1999; Vargo and Lusch 2004). The degree of interaction with relevant actors is one factor that determines the quality and extent of the co-created solutions. In the context of co-created value, it is not only the product or service the customer purchases that generates value to the customer, but also the total customer experience gained because of the dialogue and interactions in the network of customer experiences. Thus, the total customer experience in the purchase process determines the degree of enhanced value derived from the co-created exchange. Co-created value is a sum of the derivation of the dialogue, interactions, personalized treatment, and level of customization co-created in the experience network. This degree of enhanced value is what differentiates co-created customer experience from conventional value derived from a company-centric customer experience.

In the conventional company-centric perspective, the marketing provider is the dominant player in the creation, management, and delivery of the product to the customer. The company-centric view holds that the customer is a passive player in the marketing process (Calhoun 2001; Prahalad and Ramaswamy 2000; Smith 2001).

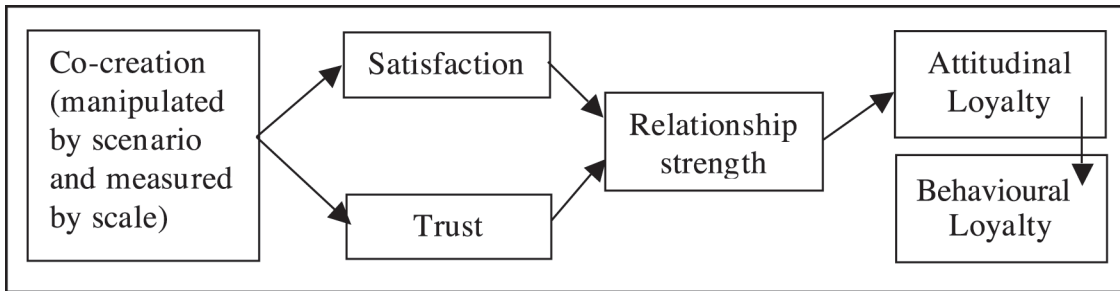
Despite increasing attention on the co-creation approach to creating value, there are differing views on the actual meaning and definition of co-creation. There is general agreement in the literature that co-creation is a customer-centric approach, however there is no clear consensus on the precise meaning of co-creation. Furthermore, there is a range of terms used to denote customer participation in the value creating process. Authors have employed terms such as customer participation, joint production, co-production, collaboration, and joint-value creation to mirror co-creation. However, these terms as applied in the literature do not always equate to co-creation, leading to a lack of clarity regarding the precise meaning of co-creation. From an analysis of the literature, the adoption and practice of co-creation seems to have developed in two discrete stages.

The first stage is where the producer is the primary value creator and customers participate in the co-creation process via toolkits set up by the company (Bitner, Faranda, Hubbert, and Zeithaml 1997; Jeppesen and Molin 2003; Kellog, Youngdahl, and Bowen 1997; Kotze and du Plessis 2003). An example of this view of customer co-creation is evident in mass customization strategies of companies such as Dell (Lampel and Mintzberg 1996; Piller, Schubert, Koch, and Moslein 2005).

The more mature conceptualization of co-creation is set in the context of how customers interpret and create new meanings in consumption. These meanings and interpretations are constructed jointly and collaboratively together with the actors in the value chain and or customers in the experience network (Flint 2005; Katz and Sugiyama 2005; Poulsson and Kale 2004; Prahalad and Ramaswamy 2003; Wikstrom 1996b). Co-created value is the outcome of the subjective, personalized consumption experience of the consumer. The focus here is on identity and image creation as an outcome of the interactions in the experience network. In this later approach to co-creation, the customer is the primary driving force and the company becomes the facilitator in the co-creation process.

In summary, co-creation is a process requiring an active participation of the customer and relevant actors in the experience

**FIGURE 1**
The Research Model



network. The dialogue and interactions between the customer and relevant actors leads to new, reconfigured, and enhanced problem solving solutions for the customer. These solutions cannot occur without the presence and interactions of relevant actors in a specific co-creation situation. Co-created value is a derivative of a combination of the interactions, degree of personalization and customization created in the context of customers' problem solving situation (Lundkvist and Yaklef 2004; Mascarenhas, Kesavan, and Bernaccchi 2004; Normann and Ramirez 1993; Ottensen, Ranes, and Gronhaug 2005; Ramaswamy 2005).

## CO-CREATION AND ITS OUTCOMES: A RESEARCH MODEL

Studies on co-creation up to now have focused primarily on understanding and clarifying the concept. A key issue for marketers is to develop a better understanding of the impact of co-creation on the key marketing outcomes of customer satisfaction; customer loyalty, trust, relationship strength and the consequent loyalty induced. Strong empirical evidence between co-creation and key performance measures, which is currently lacking, will provide impetus to adopt co-creation marketing. The discussion in this section will present theoretical links between co-creation and the key performance measures mentioned above and illustrated in Figure 1.

Co-creative enhancement of the quality of the purchase interaction over and above the value received from the product purchased from the business has two potential effects for the customer. Firstly, it reduces the costs of a transaction for a customer and secondly it reduces risk and uncertainty for the customer. Vandenbosch and Dawer (2002) suggest that co-creation can reduce interaction costs for customers, which in turn will lead to increased trust, satisfaction with the company and improve customer loyalty behavior.

### Satisfaction

One important factor contributing to customer loyalty is customer satisfaction (Garbarino and Johnson 1999). Consequently, dissatisfied customers–or even customers with low satisfaction levels–will generally not exhibit repurchase behavior. In this context, co-creation via active customer participation, interaction and personalization can affect customer satisfaction, trust, and create strong relationships between the company and customer. All these will have an impact on customer loyalty (Bitner et al. 1997; Kellog et al. 1997).

### Trust and Relationship Strength

The KMV (Key Mediating Variables) Model put forward by Morgan and Hunt (1994) postulates antecedents and outcomes in a buyer-seller relationship within a business-to-business context. The study reveals that trust does not form part of the relationship commitment construct, rather it is a separate mediating variable influencing the buyer seller relationship. A more recent article, however, takes the perspective that relationship strength is a better way to evaluating the buyer seller relationships (Hausman 2001). The Relationship Strength construct is a hybrid construct that combines the relationship commitment construct and the trust variable of Morgan and Hunt (1994) into a single construct. In both these approaches, the principal focus is the relationship itself–to understand the mediating role of the relationship between a set of inputs and outputs. The implicit assumption of both approaches is that the strength of the relationship will influence customer retention. It is postulated here that co-creation, via its interaction and personalization properties, will have a positive impact on trust and consequently strengthen the relationship between the company and customer ultimately leading to customer retention (Edvardsson and Johnston 2005; Malaviya and Spargo 2002).

## RESEARCH METHOD

In this preliminary study, the research exposes groups of undergraduates to three different scenarios designed to generate a broad range of perceptions of co-creation across the sample. The researchers measure these perceptions on an instrument that also gathers measurements of trust, satisfaction, relationship strength and both attitudinal and behavioral loyalty. The analysis employs AMOS 6.0 to construct and test the research model with structural equations.

### Sample

One of the researchers presented undergraduate students, in a research methodology class, with a questionnaire in class time. The exercise formed part of their curriculum studies and the class instructor has blanket ethical approval for collecting data this way as long as the work forms an integral part of the students' course. The database consists of 177 responses; the gender balance is approximately even.

### Materials, scales and procedure

Appendix 1 contains a complete questionnaire. The research depends upon a device used to give a spread of scores on the Co-creation variable itself. Prior to answering the questionnaire the respondents read one of three scenarios, each describing the same purchase situation for an identical airline booking, but each scenario contains a different level of co-creation. The three scenarios are in Appendix 2. After reading a scenario, each respondent answered the research questions, finishing with three questions asking their perceptions of the amount of co-creation in the scenario

they had read. The Alpha coefficient for the newly developed, three-item scale is .816. Relationship Strength has also never yet been directly measured and reported in the literature. One of the items used does not contribute to the scale Alpha and was thus dropped; the remaining two items are highly correlated (Pearson's correlation=.69, $p$<.001).

The research utilizes previously used scales for all other variables, which have satisfactory reliability, with the exception of Trust (three items drawn from Morgan and Hunt (1994). The analysts noted the low reliability of Trust (Alpha=.66), but all items do contribute to the Alpha score so they made a considered judgment to let the scale remain. Satisfaction, composed of three items from Ranaweera and Prabhu (2003) has an Alpha of .79. Loyalty is composed of seven items. Four are Behavioral Loyalty items from Garbarino and Johnson (1999), and three Attitudinal Loyalty items from Ganesh, Arnold, and Reynolds (2000). The Alpha for the composite Loyalty variable is .881. (Initially these two aspects of loyalty were to stand as separate variables, but their correlation is too high to allow modeling.)

The researchers validated the scales within the model by creating two first-order SEM measurement models. The first is for Co-creation, Satisfaction and Trust, the second for Relationship Strength and Loyalty. The fit statistics in Table 1 and the parameter estimates in Table 2 give further confidence to the model variables. A Maximum Likelihood extraction is used.

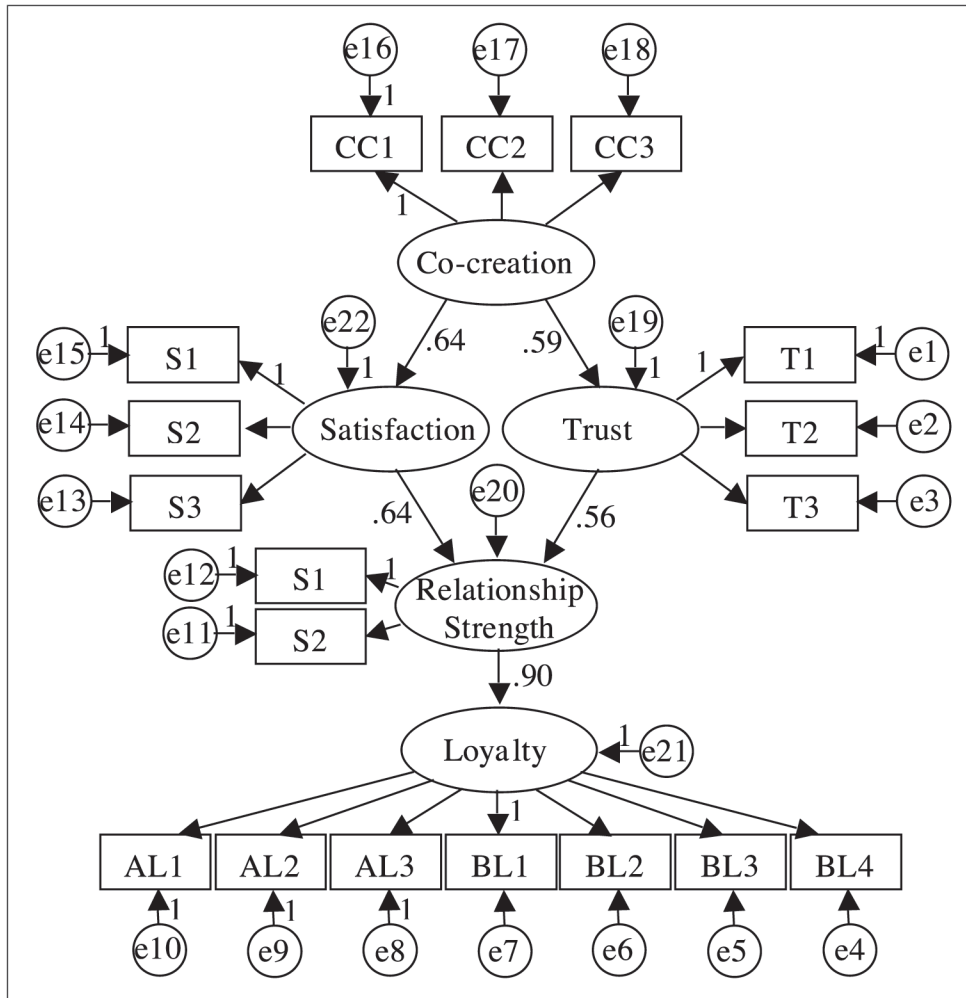
## ANALYSIS

Initially the analysts used a Maximum Likelihood estimation method to examine the structural model. The Model's fit statistics, however, are very marginal (GFI=.829, AGFI=.762, CMIN/DF=2.99, RMSEA=1.07). These statistics place the fit at the very lowest level of acceptance, even for a model using only 177 responses. Further inspection, though, reveals a multivariate kurtosis value of 82.5; a Mardia's coefficient value in excess of 1.96 indicates a problem with multivariate normality. Even a cursory consideration of the distributions of the variables in the model shows that most are severely leptokurtic (possibly due to the use of a student sample). In this circumstance, enlarging the sample by bootstrapping is unlikely to remove the bias so an Unweighted least squares estimation method is used. Although this relatively rarely used method does not yield a Chi square statistic, it does operate well regardless of the scales' non-normality. The consequent fit statistics are all well within the parameters indicating a well-fitting model (GFI=.963, AGFI=.949, NFI=.947, CMIN/DF=2.20). The Model in Figure 2 shows the parameter estimates as standardized regression weights.

## DISCUSSION

Both Satisfaction and Trust mediate the relationship of Co-creation with Relationship Strength. Although the model fit statistics remain satisfactory, the path estimate for a new path directly

**FIGURE 2**
SEM Structural Model with Estimates



from Co-creation to Relationship Strength has a negative value. Similarly, Relationship Strength provides partial mediation for Satisfaction and Loyalty (a path estimate of only .37) and full mediation for trust and Loyalty (a negative path estimate).

**Implications for theory**

Prior research has not reported that either Co-creation or Relationship Strength have been measured before. The sample used here was far from ideal and is rather small for structural modeling. Nevertheless, co-creation does appear to generate both satisfaction and trust, with the expected increase in relationship strength and loyalty.

There are many questions left unanswered, of course. There is a host of possible moderating variables, from product type (credence goods, hedonistic versus utilitarian) and industry type (B2B versus B2C) to purchase situation (online versus offline)–there is even a suggestion that co-creation is advantageous in discrete as well as relational purchase situations. Yet there is great promise here for a stronger, confirmatory study to show that the co-creation idea increasingly mooted in the literature does have an empirical foundation.

**Implications for practice**

Some businesses are already going down the co-creation path. It is not yet widely understood by many businesses, though, exactly what benefits can flow from such a course. Consumer marketing has become increasingly competitive in recent years. To develop sustainable competitive advantages marketers require strategies that are more resilient to imitation than attribute modifications. In this regard, marketers turned their attention to intangible resource strategies such as branding and relationship marketing as a means to ensure long-term competitive advantages (Gronroos 1994). There is evidence to show that a strong brand is an effective competitive strategy to develop customer loyalty (Neal, Quester, and Hawkins 2004).

A second competitive strategy based on intangible resources is relationship marketing. The basic thrust of this approach is to develop an on-going relationship with the customer. The benefits of a positive ongoing relationship are loyalty by way of repeat purchases and positive word of mouth communications for the marketing provider. Relationship marketing can also bring about cost reductions in running the business and consequently influence the bottom line of the business.

The consumer behavior environment in recent years has seen an increasing shift toward the consumption of lifestyle products. This shift signals a move toward satisfying higher-order needs of customers. While lower-order needs are still important, these represent the lower end of the spectrum of customer expectations. To create customer value businesses need to focus on competitive advantages that relate to satisfying higher order needs of customers.

**APPENDIX 1**
Scenarios

Imagine that you have been invited to stay in London with your married, older brother for a two-week holiday. The accommodation is, of course, free, and the prospect of an early summer holiday very attractive. There seems no problem, as the School has a between-semester break and your kindly brother has sent some cash toward the tickets.

Quite excited, you try booking your flights on-line, but it proves really hard and, anyway, you don't have a credit card so it would be impossible to pay on-line. So, off to the travel agent you go. Your friend has recommended an excellent agent situated in Holland Village; you have your travel dates all sorted out and ring the agency; John Tan answers and you make an appointment to see him.

When you arrive at the agency, John seems nice enough, and greets you with a smile. After chatting in general about your fabulous holiday offer, you tell John the days you wish to travel and ask him for the cheapest return ticket. John has no hesitation and states that Qantas have a flight that morning, priced at a very reasonable $1,506.00. It leaves at 11.00 in the morning and so you don't have to arrive at the airport at an uncivilized, early hour. You ask for a window seat and, after checking, John finds seat 34A for you, for both the outward and return flights. Finally, John assures you that he has noted your requirement for vegetarian food.

You leave the agency feeling very pleased with your purchase.

Additional material in the second version
…John turns to his computer and, a few minutes later, produces a list of four flights leaving that day for London. Of the four airlines, the cheapest one is leaving at 8.00 in the morning, and another two leave late but get into London very early in the morning indeed. Qantas have a flight leaving at 11.00 in the morning, so you don't have to arrive at the airport at an uncivilized, early hour, but it is slightly more expensive than the less convenient flights. You discuss this with John and decide that the Qantas flight is the best choice, priced at $1,506.00.

Additional material in the third version
…You ask for a window seat and John brings up the aircraft seating-plan on his console and turns it so you can see. You then discuss the relative merits of being on the escape hatch row near the kitchen versus another row away from the kitchen and toilets but with less leg-room. You decide on the escape-hatch row and John secures seat 34A for you, for both the outward and return flights.

---

In this context, it could be said that enabling good customer experiences is consistent with the satisfaction of higher-order needs of customers (Achrol and Kotler 1999; Vargo and Lusch 2004).

Finally, developments in communications technology are facilitating the adoption of co-creation strategies. For example, the Internet channel provides scope for greater interaction and an active involvement of the customer in the marketing process. There is a range of ways consumers can be involved from the simple act of finding relevant information to a high level of customer involvement in respect of customized solutions. Internet technology has also enabled consumers to interact and share information with each other e.g. customer communities and blogs. This interaction provides a platform for consumers to share experiences and to co-create customer-to-customer solutions (consumer-to-consumer co-creation). An example of this is customers networking with each other in a customer community, sharing ideas and solving problems jointly on a website (Achrol and Kotler 1999). In the context of co-creative marketing strategies, developments in communication technology add a touch-point for a greater level of involvement and interaction between customers and the experience network.

# Cultural Syncretism and Ramadan Observance: Consumer Research Visits Islam

Mourad Touzani, University of Tunis, Tunisia
Elizabeth C. Hirschman, Rutgers University, USA

## ABSTRACT

With the exception of work done by Ger, Sandikci and their collaborators, consumer behavior within Islamic cultures has been little investigated. The present study focuses on the Muslim holy month of fasting, Ramadan, as observed in contemporary Tunisia. We propose that current ritual practices and consumer understandings of this Islamic tradition represent a syncretic blending of Western and Oriental values amidst a culturally-constructed mélange of kinship, capitalism, materialism, asceticism and hedonism (Belk, Wallendorf and Sherry 1989; O'Guinn and Belk 1989).

## PRIOR RESEARCH ON CONSUMER BEHAVIOR IN ISLAMIC SOCIETIES

The present study builds upon research conducted by Ger, Sandikci and their colleagues from 2000-2005. These consumer researchers are largely responsible for introducing consumer research to issues and realities in Islamic societies. In the paper ("Flying Carpets", 2000), Ger and Csaba examined how traditional artifact production processes in Turkey came to be associated with the 'authentic' and 'exotic' Otherness of the Orient among Western consumers, resulting in sometimes staged production processes meant for tourist consumption. They discussed, as well, the reclaiming of authenticity by local Turkish carpet producers by recasting their work as personal aesthetic expression or as a revitalization of an ancient indigenous craft, practiced largely by women.

Another study (Ustuner, Ger, Holt 2000) examined the re-emergence of the traditional Islamic henna-night ceremony for an engaged woman as a new urban ritual, again within a Turkish context. In that study, discussion focused upon the transformation of a religious, patriarchy-enabling practice into a secular women-empowering activity that had been relocated from past to present and from rural to urban. As before, these researchers were careful to situate their interpretation within the politico-cultural transformation of Turkey from the Islamic Ottoman Empire to a modern-day secular republic. The repositioning of the henna-night event from the fiancée's home to a commercial supper club was one semiotic device used to achieve this transformation of meaning.

Sandikci and Ger (2001) addressed the issue of Islamic consumption styles in Turkey by investigating the apparel worn by observant women. In particular, female headcoverings were read as an example of fusion "at the intersection of the local and the global (p.1 online version)" and of intra-gender conflict over the roles of women in contemporary Islamic society. Islamic objects could be made into marketplace offerings–creating an interpenetration of the sacred and the secular (Hirschman 1988; Belk, Sherry and Wallendorf 1986).

In a later study (Sandikci and Ger 2002), they put forward a more comprehensive theoretical statement stressing the subtleties and syncretism typical of modernizing Islamic societies. Noting that culture change is neither universal nor unidirectional, they argued for the recognition of modern consumer behaviors that are "never singular, but always relational and contextual…[and which] cross-fertilize each other (p. 9 online version)". In the present study, these threads of thought will be used to weave an interpretation of the Islamic ritual of Ramadan in contemporary Tunisia.

## RITUAL FOCUS OF STUDY: RAMADAN

Ramadan, the fourth pillar of Islam, is observed during the ninth month of the Muslim (Hijri) calendar and dates from 638 CE (Esposito 1999). Ramadan commemorates the revelation of the Qur'an to the Prophet Muhammed. It is characterized by prayers, fasting, charity and self-accountability. All adult Muslims, who are not ill or infirm, are expected to ob- serve fasting (Arabic: 'sawm') during daylight hours for the entire lunar month (Lapidus 1996). To properly observe Ramadan, the faithful must abstain from all forms of sensory pleasure between dawn (fajr) and sunset (maghrib); these include the activities of eating, drinking, smoking and sexual intercourse. One is also proscribed from expressing anger, envy, greed, lust and verbal assaults on others, e.g., vicious gossip, sarcasm, insults. The faithful are expected to read and meditate upon the teachings of the Qur'an, and to avoid coming into contact with profane or sacrilegious objects or experiences.

Ramadan is ended by the sighting of the next new moon; the close of Ramadan is celebrated by a period of feasting: eid al-Fitr. During this time, food is given to the poor (zaka al-Fitr), each person bathes and puts on his/her best apparel, communal prayers are offered at daybreak, and the rest of the day is spent feasting and visiting friends and family (Esposito 1999, Lapidus 1996).

Despite these religious traditions, current Ramadan observance is most accurately characterized as a consumption festival, a communal experience that rallies all Moslems for a whole month (see e.g., Wallendorf and Arnould 1991). Although, theoretically, the individuals are commanded by God and the prophet to curb their desires, conspicuous over-consumption has become a noticeable occurrence in all aspects of daily life, especially in the purchase of foodstuffs, apparel and leisure activities. During this month, the commercial and media landscapes are transformed and directed toward urging individuals towards worldly and profane experiences. Resisting this cultural pressure becomes difficult, household spending rises dramatically, and hedonic desires are felt more strongly than ever. This modern Ramadan paradox, described by some authors as Ramadan *Christmasization* (Armbrust, 2002; Attia, 2001), makes this period so unusual that it has become a key research area for better understanding the importance of ritual syncretism–the fusion of oppositions–in the context of consumer behavior (O'Guinn and Belk 1989).

## SETTING OF THE STUDY: TUNIS, TUNISIA

Tunisia is situated on the Mediterranean coast of North Africa; it borders Algeria, Libya and Egypt. Because of its strategic location at the nexus of Mediterranean and Levant shipping lanes, Tunisia's history and culture have been subjected to many diverse religious, political and economic cross-currents. Tunisia's written history began in 814 BCE with the founding of Carthage, a city-state with an international trading and military network stretching from the British Isles in the West to Crete and Greece in the East. Greek military and trade interests frequently competed with those of Carthage in the ancient world, leading to repeated wars through 309 BCE. With the rise of the Roman Republic (300 BCE), a series of Punic wars ensued, lasting until 117 CE with the conquest of Tunisia. Its population was sold into slavery by the conquering Romans (Esposito 1999).

Subsequently, the Romans resettled the country, rebuilding Carthage as a Roman colony and establishing several new municipalities. When Rome, itself, fell to the pagan Vandals, Tunisia fell, as well, and later was conquered by the Byzantines of Central Asia. With each new conquest, novel aspects of religious and material culture were introduced.

In 670 CE, a Muslim army entered Tunisia from the Arabian Peninsula, bringing Islam to North Africa and founding the city of Kairouan. By 797 CE, the Muslim Aghlabid Dynasty had emerged, ruling the eastern portion of North Africa from 800–909 CE. The dynasty was cosmopolitan and multi-cultural with positions of influence being held not only by Arabs, but also by Berbers, Persians, Black Africans, Christians and Jews. Trade routes included not only the Mediterranean, but also the Sahara and Sudan (Esposito 1999).

By the 900's, the Fatimid Dynasty in Egypt had expanded to include much of the territory of North Africa, including Tunisia. In 1057, yet another conquest occurred when the Benni Hilali Bedouins sacked Kairouan and took control of Tunisia. Over the course of the Holy Land Crusades (1100-1300) Tunisia again changed hands repeatedly between European Christians and the Almohad Muslims of Morocco. Concurrently, alternative forms of Islamic theology flourished with its borders; among these were the philosophies of the Maliki jurists, the cults of Sufi holy men, and the neo-Platonic philosophies of Averroes. By 1492, Tunisia had been flooded by refugee Moors and Sephardic Jews ousted from the Iberian Peninsula by the Christian Reconquista. And in 1574 the country was incorporated into the expanding Ottoman Turkish Empire (Lapidus 1996).

The Ottomans sent not only Anatolian Janissaries (soldiers) to reside in Tunisia, but also many former Christians from Italy, Spain and Province, France who had converted to Islam. By the 1860's, Ottoman influence had waned, but bankruptcy forced the country to turn its economic governance over to the French, Italians and the UK. In 1881, France invaded Tunisia and declared it a French protectorate. Europeans were encouraged to immigrate to Tunisia and set up residence there. After a series of violent revolts against French rule, Tunisia achieved independence in 1956. Since that time, it has passed through phases of westernization, socialism, Islamic fundamentalism and militant secularism. Thus, its ancient, medieval and modern historical periods have been marked by diverse religious, cultural and economic influences (Esposito 1999; Lapidus 1996).

In spite of the big number of research studies about religion, culture and consumer rituals, the literature about consumer behavior during the month of Ramadan is very poor. However, this phenomenon touches millions of people all around the world. From an external point of view, Ramadan can be considered as a period of de-consumption due to the fasting practice (Marticotte and Cherif, 2003). The reality is much more complex and rich than it may appear at first, since during this holy month there is a radical transformation of the way of consuming and living. Studying consumption practices during Ramadan can offer a new perspective to analyze the relationship existing between rituals and consumer behavior. This holy month is rich of meaningful consumption acts that can be studied not only from a pragmatic but also a symbolic point of view. Besides, consumer research can bring an original and new insight to understanding Ramadan rituals, because consumption is certainly the archetypal domain in which the fusion of tradition and modernity can be observed and analyzed. In this perspective, the present research study will try to bring an answer to the following two major questions: what are the main ritual practices that manifest themselves during the month of Ramadan? What is the place of cultural syncretism in these ritual practices?

## METHODOLOGY

The informants were contacted according to qualitative sampling rules–i.e., a small, non-probabilistic sample whose size was not specified *a priori* (Miles and Huberman, 1994). This exploratory research was carried out among 27 Tunisian adult consumers in a way that provides diversity within the sample at the level of gender, age, and social background criteria. A minimum of 20 years was set, and we made sure that the informants made most of the purchases undertaken by their households. However, the sample was geographically limited to the great Tunis area: thus differences between the rural and the urban environments could not be investigated in this study.

The interviews were extended over the whole Ramadan month of the year 2005 to take into account potential behavior differences between the beginning and the end of the month. Thirteen interviews were conducted before breaking the fast, Sawma, and fourteen after. The data saturation principle was abided by. The existence of a theme saturation was obtained when no significant added input emerged during four additional interviews.

During the interviews, the objective was the generation of comments and opinions about Ramadan and consumption behaviors related to this month. The discussion guide was designed around four major themes: consumption habits during Ramadan, money and expenses, the relationship with the media and purchasing behaviors. A conversational approach was adopted and, to make the respondents feel more comfortable, discourse breaks, hesitations, and redundant developments were not subject to any comment or criticism. Moreover, the interviewees were allowed the choice to relate their experiences in Arabic, in French, or in both languages. The interviews lasted between 45 minutes and one hour and a half. They were recorded with a digital recorder, and then transcribed for the purpose of making analysis easier.

To identify the main themes on the basis of the qualitative data, each interview transcription was read several times. For the production of this paper, quotations recorded in Arabic or French were translated into English. When the words or expressions had no English equivalent or when they had connotations or references to semantic areas that do not convey the appropriate meaning in English, the Arabic wording was maintained and a rough translation was inserted between brackets.

## FINDINGS

The impact of Ramadan ritual practices (Rook 1985) on daily behavior was emphasized by all the respondents; they perceived a dramatic shift of their lifestyle during the holy month as they adopted practices and behaviors in conformity with the ones of their families and their society. Among the interviewees, it is worth noticing that "I" is often substituted by "we" and the use of expressions like "the people" or "everybody" is very common. These expressions underline the emergence of a 'w concept' (Zouagui and Darpy, 2005) revealing the extent to which collective awareness is present in the attitudes and behavior of the respondents during the fasting month. The observance of Ramadan was also pointed out by the respondents either directly or by the use of words like "rite" or indirectly by statements noting its existence (Rook 1985):

*There is a kind of pattern by which everybody seeks to be shaped: everybody goes shopping at the same time, cooks the*

*same dishes: "shorba" (a Tunisian soup), "breek" (a very prized traditional dish during Ramadan) at the same fast-breaking-time; in the evening everybody watches the same soap opera, the same TV programs. People want to conform with everyone else. They are carried away by an overwhelming movement (male, 37, artist).*

Three major ritual themes were identified in the data set: the practice of fasting *per se*, social rituals involving the family and the social environment of Islamic observers, and consumption rituals that were specific to the month of Ramadan.

*Fasting as a religious ritual.* During the holy month of Ramadan, all individuals observing the fast are expected to refrain from drinking, eating, and smoking *"as long as you cannot make a white thread from a black one"*, i.e. from sunrise to sunset. At nighttime, however, we witness the allowance of the forbidden, and night acquires a hedonic dimension. This practice reiterates the separation of the sacred and the profane forbidden practices by juxtaposing sensory pleasure against ascetic religious beliefs. It was derived as early as pre-Islamic pagan times through the use of powerful symbols such as the sun and the moon and the separation of bodily pleasures from spiritual observance. This period makes the individual closer to God and religion, since it is suitable for faith renewal and self-examination.

*During this holy month, people listen to the Quran, the Holy Book and read it. The Lord is omnipresent in our life. This is noticeable in many aspects. First, people often remember God during this month. Moreover, more prayers are observed; the faithful go for the "Taraouih", (the Ramadan nightly prayers) performed as a congregation in the mosque. The elderly, holding a "Sibha" (a rosary) in their hands, praise Allah all day long (male, 46, civil servant).*

The fasting ritual is intended to achieve two goals: on the one hand, it aims at allowing the individual to maintain self-discipline and exercise self-control; on the other hand, it is to establish a fellowship with the poor who lead a wretched life, so as to make the person fasting feel the same misery. This kind of self-submerging ritual strengthens religious values and contributes to the development of the cultural and social identity of the individual.

*It is the month when we feel more to be Arabs and Moslems. We implement this commitment not only through fasting, but also through our daily behavior: our attitude, our dressing, our purchases, and the TV programs we watch. Maybe it is the period of the year when we are least influenced by the West (female, 34, faculty staff).*

This aspect of Ramadan then makes more visible the tension between West and East, between capitalism and communalism, between individual identity and group belonging. It also constitutes an echo to some previous findings in the literature according to which during traditional and religious holy days and celebrations, individuals are less open to other cultures and record lower levels of acculturation (d'Astous and Daghfous, 1991; Al Ma'seb, 2006).

*Fasting as a purification ritual.* Most of the respondents stated that they felt purer because of not only restricting food consumption, but also by not smoking tobacco, not drinking alcoholic beverages and not using cosmetics or perfumes. This seems to contain elements of self-mortification and self-denial; that is the punishment of the body, in addition to the avoidance of hedonic gratification. This conforms to the widespread idea that all aspects of the body are impure and that individuals need to restore to the body its original purity by removing indulgences and experiencing discomfort (Jacobsen, 1996). Fasting during Ramadan provides a unique opportunity to achieve this goal. That is why many respondents said that they go to the "Hammam" (the Turkish baths) during the days that precede Ramadan, as part of their cleansing regime. A fifty-three year old female interviewee declared:

*Prior to Ramadan, I do the overall housework; I dispose of the useless stuff we have accumulated during the year, I get ready for welcoming and managing this month (female, 53, housewive).*

This speaks of a desire to unburden not only oneself, but also one's household of polluting, materialistic accretions that have gathered during the year. Beyond this purely physical aspect, purification bears a moral and spiritual dimension. In fact, among the 27 interviewees, 19 expressed the idea that their behavior also ought to be geared to the path of honesty, generosity, and abiding by the rules of righteousness, and that by this behavior a greater proximity to God could be accomplished.

*Diurnal Disorder: Day for Night.* One's daily life is thoroughly overturned during Ramadan. The social operating system has to adjust to the new fasting time (that lasts from dawn to twilight). The working hours are therefore reduced to a half-day working period; many businesses close their shops, and major projects are postponed to later dates. At night, which is usually quiet, the cities become busy with a friendly environment which encourages the outings of women and families after breaking their fast.

In this diurnal disorder, beyond simply being the frontier between day and night, the communal moment of breaking the fast also plays the role of a liminal ritual as defined by Durkheim (1912). This moment brings people from one state to another, as it constitutes an invisible chronological threshold, separating the moment when individuals, stressed and tired are doing their duty and the moment when interdictions are revoked. This threshold separates austerities and festivities. Praying, eating dates, and drinking milk appear to be transitional ritual practices helping individuals to move from one stage to another.

There is a role reversal of public as well as private locations both for men and women (Buitelaar, 1993). The coffee shops, the restaurants, the shopping malls, and the supermarkets, which are usually patronized during daytime, are almost deserted for the benefit of home and family gatherings. But during the night, these places will be once again be a gathering place for crowds of people. These changes have repercussions not only on the daily life of individuals, but also on the public places and commercial activity.

*All life momentum changes; there are no more only two meals; the working time changes as well, since people work only half a day, and the sleeping time is utterly displaced. During this period, the citizens are stressed out, as they are short of time to go about their business. Besides, wherever you go, you are hamstrung by thick crowds: in the market, in the shopping malls, in the streets and transportation (female, 33, civil servant).*

**The social rituals**

The "Ramadanian period" seems to be an auspicious occasion for bolstering all kinds of social links. Gatherings between relatives and friends are characterized by talking around the table, a sense of humor, a deep feeling towards the community, and an aversion for

formal rules; a festive mood conveys all the fundamental attributes of the depth of the rituals.

*Family and friend evenings.* At nightfall, worshipping is taken over by reunions and family life sharing. People are expected to meet, show a sense of solidarity, and all family members, friends and relatives should be side by side in order to consolidate the relations that tie them. In the evening, sitting around a table and giving each other support and love becomes more important, as the days are so hard. All the respondents stressed the interpersonal relations which become tighter and gain an enhanced importance.

*Whether it be the family evenings or the card games played with friends until dawn, it is essential to get together in the evening. It is the magic aspect of Ramadan! Furthermore, it is the best way to forget the stress of a tough day: traffic, moody colleagues or shopkeepers owing to "hchichet romdhane" (a state of want and tiredness due to the fasting) (male, 44, stationer).*

The Ramadan gatherings can be occasions for reunions where vigorous chats are more common and the debates are hotter (Chouikha, 1995); similarly, they can bear a feast aspect, where sensory pleasures are heightened.

*It's a kind of feast celebration within the family, and it is always spontaneous and happy. Everybody is delighted by these reunions. We exchange hugs and kisses; we sing and dance. We feel really deep emotions. I feel very moved when I talk about it. It is also an occasion to recall the celebration of the weddings, the circumcisions, or the summer delights. Then we eat delicious cakes, drink the sweet pine-seed tea, and meet everybody (female, 30, secretary).*

Words like "magic", "marvelous", "extraordinary", "warmth", "table companionship", and "love" were associated with these family reunions. These associations remind one of the myth of "the sociability miracle emanating from the holy" identified by Durkheim; the interpersonal ties contribute to the creation of a state of spirituality which further bolsters solidarity. A sense of community and a concern for the welfare of the other emerges in such circumstances (Durkheim, 1912).

This testimony, and similar ones, also emphasizes the existence of a fasting/feasting paradox that materializes itself through the coexistence of practices pointing to very different purposes. On the one hand, fasting is a duty imposed to the whole Muslim community, aiming at disciplining the body through restraint, abstinence and self-control. It serves as "penitence, expiation for transgression, the humbling of the self" (Grimm, 1996). On the other hand, feasting is rather associated with celebration, joy, conspicuous wasting consuming wealth without any pragmatic aim in return, and sometimes transgression, disorder, excess, and cancellation of the authority and the virtue (Maisonneuve, 2002). The permanent alternation of opposites related to this fasting-feasting antinomy appears to be the core of this celebration of consumption, the abstinence making the indulgence richer and more anticipated.

It is also interesting to notice that even here there is an emergence of the recurrent theme of the reversal between public and private spaces. During the rest of the year, home is supposed to be a "center of intimacy", a place protecting its inhabitants from the impersonal outside, from others' gaze, and permitting them to lose their inhibitions (Madanipour, 2003). However, during Ramadan, the permanent stream of neighbors, family members, friends, colleagues, and acquaintances gives home a public function that it usually does not have.

*Oblative rituals.* During the whole month one witnesses an exaggerated generosity. For instance, the sense of hospitality, the concern for helping others seems to gain a greater importance. This generosity reaches its peak as the "Eid" (End-of-Ramadan feast) draws near. During this period, the gift rituals as defined by Solomon (2002) become numerous and assume several forms. The baking of traditional sweet cakes is a main concern of the households:

*We must serve cakes to all our guests for the three-day feast. Some families don't do it, but when we pay a visit to friends or relatives, we take a plate filled with a wide range of cakes (female, 40, civil servant).*

There is a sense here of sweet foods indicating love and affection; i.e. the sweetness of life and friendship. Those who are unable to bake these gift cakes will be willing to spend extravagantly to purchase the cakes commercially so as not to miss this tradition. This period is also an occasion for expressing best wishes to everybody; not only in a high voice pitched to people we come across, but also by sending greeting cards, whose sale rises sharply during this period or by phone which undergoes line congestion owing to the spreading contagion of this phenomenon and more strikingly in recent years by e-mail or cell phone text messages. It is interesting here to note how new, modern technologies such as the internet and cell phones have actually assisted the maintenance of these ancient sacred rituals. Often technology is cast as the enemy of religion and family, but here it is used to bring people together.

The Eid is also a time when children request gifts from their parents, who wish to indulge them as part of the fast-breaking process:

*Parents purchase the cutest clothes of the year for them and all their whims are satisfied. At first, we parents refuse their demands when they ask for candies or sugary items, but then the children insist so stubbornly, that we have to yield (male, 27, manager).*

It is worth noting that as this gift giving to children goes on, it features new aspects in keeping with new technologies, highlighting once again the syncretism of culture. The statement given by this 41-year-old respondent and father of 2 children well expresses this idea:

*As our parents bought toys for us, we perpetuate this tradition and we buy toys for our kids. But, it's no longer the same. When we were offered a small toy-gun, or a plastic watch, a spinner or even a ball, we felt very happy. The electric train or the building games were a dream-come-true. Nowadays, children are not satisfied with such stuff. What they demand are electronic games, play consoles, and play stations or computer games. They desire gadgets that carry them away to a virtual world with fictional heroes and weird characters. Even soccer, they'd rather play it in front of a TV screen than in the "Huma" (the quarter) as we used to do in our childhood. So, the "Eid" gifts aren't the same anymore. But what matters is to satisfy our kids, doesn't it? (male, 41, senior executive)*

Another aspect of the modernization trend undergone by this rite is the interest shown by parents in the toys (Eickelman 2000). The gifts, and more particularly the games and the toys, do not only belong to the world of children, but also involve the parents who become stakeholders in the choice and purchasing process, as before, but also in the use and consumption of these products (see

also Burroughs and Rindfleisch 2002; LaBarbera and Gurhan 1997)). This radical change of the availability of the types of games and toys on the market, thereby yielded an alteration in the rite which until then, was confined to the privileged children's realm and a progressive shift toward greater parents' involvement and a wider family integration. Many parents stated *"that the toys are also for mom and dad"*, and that the video games should meet their taste, as well as their children's. This represents a syncretic aspect of the hedonic/materialistic aspect of Ramadan. It seems a reversal of the value of self-denial and appears to copy from Western norms that one is supposed to indulge during holiday as for example the American celebration of Christmas and Thanksgiving (Wallendorf and Arnould 1991).

## Consumption rites

During Ramadan meal behavior rules and values acquire a tremendous importance. Housewives cook treats like: "breeks with eggs, varieties of salads and soups, grilled salad and tajine (a thick lamb-stuffed omelette) etc…" Everybody expects that these very demanding and sophisticated dishes will be featured on the menu. The ingredients must be carefully selected (e.g., bread has to be spiced, vegetables fresh, Arbi eggs (country eggs) and cakes with the best flavors"), cooking must start earlier in the day and the dinner-table must be pompously displayed. This resembles the Jewish ritual meal of Passover, during which a huge quantity of food has to be prepared, but must follow very exacting preparation procedures–e.g., to be strictly kashrut (see Hirschman 1983). (All the Ramadan food, of course, must be halal.)

*When I break fast, starting with dates and milk, these are not only the favorite items of the Prophet that I eat. I also recall the thousands or millions of people who follow suit at this very hour of the day, and each time I have the impression of living an extraordinary feeling (male, 67, retiree).*

Hence, this consumption act, seemingly simple, assumes a communal and a very symbolic status, where brotherhood and solidarity encompass the fundamental principles. This act thereby, shifts into a privileged position to stir a feeling of community. It is a matter of consuming items proper to this period and giving up the purchase of products that do not fit the pattern. This sacrifice enables the individuals to abide by the rite more earnestly. But beyond that, these practices are a way of connecting each individual with the larger Muslim community worldwide, a way of belonging to the *umma* and contributing to its unity (Buitelaar, 1993). This is an illustration of the roles of the communial affectivity of rituals pointed out by Durkheim. As a matter of fact, it constitutes the expression of interpersonal links, as well as the basis of collective symbolism, and a moment of time where individuals, abstractly, but tightly close, reaffirm their common feelings and beliefs (Durkheim, 1912).

Even though it is supposed to be the month of abstinence, food is omnipresent during the month of Ramadan. During daytime, the majority of conversations are directly or indirectly about food.

*It's the only talk for everybody: the meal content, the ingredients used, the shortage of some products, each others' favorites, the delicious smells of food when coming home after work, the frequented markets, and the special utensils required for this month. It's unbelievable, but I guess during Ramadan, the kitchen becomes the center of gravity for the house (male, 43, faculty staff).*

This focus on food reaches its peak during fast-breaking time. The dinner table–being supplied with the widest varieties of food–is a banquet for all.

*"Plates of all kinds are set on the table: breeks, chorba, tajine, chicken meat, salad and fruits" (female, 36, middle manager), "While we listen to the Quran and the call for sunset-prayer broadcast on TV, our wives fill the table with thousands of plates that do nothing but whet our appetite" (male, 23, bank clerk) "The food odors sharpen our appetite so all the more, because we didn't eat anything all day long" (male, 48, engineer), "The table is laden with all types of dishes and colors" (female, 23, student).*

These passages recall multisensory stimulation and abundance–very like the Christian Christmas celebration. The intensity of sensorial stimuli is echoed in the feeling of community and in spiritual commitment, while it simultaneously responds to hedonist, oblative, and auto-expression needs. It is also echoed in the excessive aspect featured by several acts during the month of Ramadan. This excess, at the emotional level, bears a possible positive or a negative aspect; but it is the way the individual experiences the ritual, which determines whether the outcome is positive or negative. Some people use the enhanced reality to create spiritual enhancement, a pleasant time for oneself and others; others misuse it and feel a sense of guilt, desire and frustration. Each consumer satisfies whims in his/her own way.

## The nightly outings

By night, one or two hours after "Iftar" (the fast breaking-time), people leave their homes. Some hurry to the coffee-shops and the entertainment areas, while others take a walk downtown for window-shopping. Within the Medina and the city center during the Ramadan nights, there is a great deal of street entertainment offered by singers and other local music bands who attract crowds of people.

This reversal of day and night is also accompanied by a reversal of public and private spaces. During the other months of the year, there are gender-based clusterings of people in public areas. The men gravitate toward the coffee shops and cafes, especially along the sidewalk, while the women and girls walk along the sidewalk, but do not sit and observe, as the men do. However, since in Ramadan purity is supposed to be everywhere, women go out by night and to enter the usually restricted places such as cafés and coffee shops. By doing so, they have access to the four sub-dimensions defined by Madanipour (2003)-spaces, activities, information, and resources-helping to get a total appropriation of these places.

*All the year around, and for having fun, we go to the quarter café or to the lake, or we go farther to the northern Tunis suburbs. But during Ramadan, it is different. If we don't go to the Medina (the old town), we feel as though we missed something. If we decide to have a drink, we'd rather sip tea with pine-seeds in a Turkish café of the Medina decorated in a "dar arbi" fashion (an Andalusian style-house), scented with the delightful smell of the Chicha (a Tunisian hookah). It is really extraordinary; for me, the delight of Ramadan is to revive the atmosphere of the old times (male, 25, software engineer).*

In this passage we see references to historic events central to Tunisia's identity as an Islamic country–the Medina is Arabic in origin and constitutes the original city "square" or market. The Turkish café recalls the resplendent era of the Ottoman Empire; while the references to the *dar arbi* of Andalusia recall the arrival of the Moors to Tunisia.

These were time periods of Muslim conquest and dominance in the region not only militarily, but also in crafts, science and literature (Esposito 1999; Lapidus 1996).

*Faking Habits.* Despite the overarching observance of religious tradition during this time period, it is also the case that many people do not fast in Ramadan. Beside those who declare themselves to be non-believers or to not have enough faith, there are others such as children, the elderly and the sick, as well as pregnant and nursing women who are excused from fasting. Despite the clear exceptions made by Islam for the people belonging to this excepted category, there still seems to be a sense of shame and guilt for not engaging in the fast. The interviews with non-fasting respondents were characterized by much hesitation and discourse gaps revealing the embarrassment they felt conceiving their failure to fulfill this religious duty.

Several statements similar to the following were recorded:

*I'm ill and I can't fast. Those who eat, drink or smoke blatantly are despised, so I have to refrain from eating in public. It's complicated, because it's a whole fuss when you want to have a sandwich or smoke a cigarette. You have to hide away in a remote spot and be sure not be noticed (female, 56, assistant manager).*

*When we have to feed the kids, care must be taken not to let the neighbors smell the odor of the food. The situation is worse, when we make the morning coffee whose fragrance spreads to the neighbors' house. So we shut all the windows and the kitchen door; who knows when someone might drop by (female, 32, seamstress).*

In this regard, during all this month we witness the avoidance of any appearance or clue that a person is not fasting and does not abide by the somber mood of this holy month. That is why cosmetics and perfumes are temporarily set aside, and ostentatious items are avoided. There are some strong parallels here to Christian celebrations of Easter and Jewish religious celebrations. Especially among Jews, it is very embarrassing and a loss of face to not fast on Yom Kippur or to eat appropriate foods at Passover. Similarly, those in the US who do not eat traditional Thanksgiving foods or gather with their families at this time are looked upon as acting inappropriately (Wallendorf and Arnould 1991).

## DISCUSSION AND CONCLUSIONS

In one study, Sandikci and Ger (2001), note that "Islam… does not seem to oppose consumption or offer an alternative to consumerism… Most [Muslims] actively engage in consumption, albeit in an Islamic way… Consumption patterns can be and are appropriated into religiously acceptable styles without undermining consumption, itself (p.7, online version)". To this we would add the following: "Religious patterns can be and are appropriated into consumption styles without undermining Islam, itself". That is, a core part of a given Muslim observance can be— and is— enacted through consumption. As we have shown with the celebrating of Ramadan in contemporary Tunisia, the *presence* of certain consumption acts, such as taking sweet cakes to friends, eating banquets around a communal table with family members, giving gifts to one's children and donations to the less prosperous are all vital elements to many observant Muslims while enacting the rituals of Ramadan.

Our exploratory inquiry into Ramadan has also detected the syncretic tension between what may be construed as opposing forces: the desires of the body and the yearnings of the spiritual soul, the objective of self-restriction and asceticism framed by the heightened seductiveness of self-indulgence and hedonic gratification.

In addition, we detected not only a sense of increasing closeness to God during Ramadan among many observant Tunisians, but also the heightened saliency of identifying oneself as an Arab and a Muslim (Barber 1995). As one respondent noted, "at this moment, all my fellow [Muslims] are offering up the same prayer…"— united by a commonality of *practice* as well as belief. Even among those who are non-observant, there is an effort not to disrupt the activities of those who are.

Finally, let us consider briefly the juxtaposition of Islamic tradition in Turkey, as examined by Ger and Sandikci (and colleagues), with the present case of Islamic observance in Tunisia. In our view, while both contexts illustrate a modernized version of Muslim practice, as opposed to say Saudi Arabia or Yemen, they also display some important differences. As compared to Turkey, Tunisia would seem to be more directly tied to specifically Arabic notions of Islamic observance, which, though cosmopolitan and worldly, also bears ties to a stricter, more fundamentalist, view of the Qur'an and its teachings, and to the collective consciousness of Middle Eastern and North African histories and dynasties (Esposito 1999; Lapidus 1996). As consumer research delves more deeply into the Islamic world, these differences, though now seemingly subtle, will likely become more apparent.

# Place Attachment: The Social Dimensions of the Retail Environment and the Need for Further Exploration

Micael-Lee Johnstone, University of Otago, New Zealand
Denise M. Conroy, University of Auckland, New Zealand

## ABSTRACT

The purpose of our study was to explore the social dimensions of the retail environment. While factors such as atmospherics, service and tenant variety contributed to our participants' perceived pleasurable shopping experiences, the social dimensions of shopping were important because they fulfilled consumers' social needs. Indeed, for some of our participants, the social connection, whether it was direct or indirect, was more or equally important to their perceived pleasurable shopping experiences, as it contributed to whether they perceived the shopping experience to be pleasurable or not. Based on our preliminary findings, we suggest that there is a need for place-related identity concepts in retail research.

## INTRODUCTION

In the past, being a shopper was often perceived to be synonymous with being a purchaser (Shields 1992b); but as Tauber's (1972) study revealed, people often have different motives for going shopping, from role-playing and self-gratification to seeking social experiences outside the home. The purpose of our study was to explore the social dimensions of the retail environment in order to investigate what factors contributed to consumers' pleasurable shopping experiences, and whether these factors directed consumers' retail patronage choices. Based on our preliminary findings, we suggest that there is a need for place-related identity concepts in retail research. As Clarke and Schmidt (1995) note, the way place has been defined in marketing literature, to date, has been very narrow in its focus. Retail literature has tended to focus on the physicality of the location, whereas, in disciplines such as geography and psychology, place is viewed in terms of its temporal, spatial, natural and social dimensions.

## BACKGROUND

In both marketing literature and sociology literature, the experiential aspects of consumption have been regularly investigated because researchers have long acknowledged that 'consumption does not occur in a vacuum, products are integrated threads in the fabric of social life' (Solomon 1983, p.319). As Woods (1981), cited in Holbrook et al. (1984, p.728) states: consumers 'engage in imaginative, emotional and appreciative consumption experiences'. As one of our participants below reinforces:

*Sally (28yrs documentary production researcher):* And that's part of the experience…in second-hand stores you'll have a different experience, and in another store you'll have another kind of experience, if you go to a book store then you've got the smell of the books. I've always really loved the smell of the books and you just pull them out from the shelves and sitting down on the floor, and being able to just flick through. So I guess you just don't go for one kind of experience when you go browsing you look for a whole lot.

These types of consumption experiences are concerned with feelings, fantasies, and fun, and are very much multisensory and emotive (Holbrook and Hirschman 1982). However, one could propose that the interaction one has with others in the retail environment, whether it is direct or indirect, also contributes to consumers' multisensory and emotive retail experiences. However, despite the fact that disciplines such as sociology, geography and environmental psychology view the retail environment as a haven for social activity (e.g. Relph 1976; Morris 1988/2001; Miller, Jackson et al. 1998), very few researchers within the area of marketing or retail have investigated the social nature of the retail environment in terms of how retail sites or servicescapes are consumed within a social context (e.g. Goodwin and Gremler 1994; Tombs and McColl-Kennedy 2003); how people identify with retail sites and other persons within these sites (e.g. Sirgy, Grewal et al. 2000); the influence that such identifications may have on directing retail patronage choice (e.g. McGrath and Otnes 1995); or the emotional ties one establishes with places (Borghini and Zaghi 2006). And yet, as some sociologists contend, the retail environment is primarily a social environment (Prus and Dawson 1991; Shields 1992; Miller, Jackson et al. 1998). The reasons why people become attached to different locations extend well beyond the location's physical characteristics, the types of products it sells and/or the level of service it provides. As Prus and Dawson (1991, p.149) discovered, 'the desirable or enjoyable features of shopping tend to revolve around the ways in which people *involve their selves* in shopping activity'.

This has important implications for the marketer because, as it has been suggested *conceptually*, consumers are forming social links with others through their consumption activities (Aubert-Gamet and Cova 1999; Cova, 1997). Accordingly, Cova (1997) and Aubert-Gamet and Cova (1999) suggest conceptually that the link between consumers is perhaps becoming more significant than the actual product. We propose that the environment also facilitates these social links. While products may link people to one another via symbolic consumption, locations can also link people. For example, friendships can be nurtured through retail sites (e.g. Joan and Mary might only meet each other at café X), and relationships may be maintained via the patronage of certain locations (e.g. mother and daughter ritually shop together at Mall X). The consequence of this is that, while some forms of consumption may decrease, others may increase because consumers will choose locations not only for their use value (e.g. location X sells product x, y and z) but for their 'link value'. Therefore, we propose that social interactions within the retail environment may influence how one perceives and identifies with the environment, as well as influence how these sites are experienced, and socially constructed. Whilst we acknowledge that there has been much research within sociology with respect to the social dimensions of shopping and the retail environment (e.g. Shields 1992; Falk and Campbell 1997; Miller 1998; Miller, Jackson et al. 1998), we argue that marketers should take ownership of the "shopping environment" and study it from a social dimensions perspective.

## METHOD

Our preliminary study employed an interpretivist methodological approach because we were interested in exploring the participants' lived experiences (Crotty 1999). Since this study was interested in how individuals construct meaning, qualitative meth-

ods were used. The advantage of using qualitative methods is that it enables one to focus on ordinary events that happen in 'real life settings' (Lincoln and Guba 1985).

Using the snowballing technique, whereby each interviewee is asked by the interviewer to recommend other potential participants for the study (Spreen 1997), purposive sampling took place. However, to avoid possible network bias, we used multiple starting points when contacting women (McMahon 1995). Twenty women ranging in age from 18 to 74 were recruited and interviewed individually. We recruited women because we wanted to eliminate any possible gender effects because the interviewer was also a woman. However, we acknowledge that it would also be interesting to investigate male consumers and their experiences within the retail environment at a later date. Interviews varied in length ranging from one to two hours, were unstructured in nature, and took place in participants' homes. Pleasurable shopping experiences were restricted to physical settings, such as shopping centres, malls and so on.

Following phenomenological principles, thematic analysis was used to analyze the verbatim texts. The advantage of using thematic analysis is that it not only involves systematically analyzing the text and looking for patterns within the text, it is also an iterative approach, whereby initial categorization may be changed and moved in relation to other texts (Dittmar and Drury 2000, p.119). Two independent judges were recruited to assist with the thematic analysis. Initially this was performed individually, but later all researchers discussed and resolved issues of disagreement. The goal of the analysis was not to seek a single truth; rather the goal was to ensure the plausibility of our interpretation and trustworthiness of the data (Wallendorf and Belk 1989).

## FINDINGS AND DISCUSSION

The initial findings revealed that a number of factors influenced participants' perceived pleasurable shopping experiences and patronage motives. However, due to the page limit constraints we will only focus on the social dimensions. We define "social dimensions" as those factors that link people to each other, to their community, to their society. Three main themes relating to the social dimensions of the retail environment emerged: The *Social Connection Factor*, *A Sense of Community*, and *Cultivating Commercial Friendships*; although we do acknowledge that there is some overlap. We define *social connections* as the social link one feels with others either *directly*, e.g., one interacts with people in the retail environment, or *indirectly*, e.g., one feels a social connection with others in the retail environment but may not feel the need to interact directly with others in this environment; *a sense of community* is the desire to feel a sense of belonging and connection with one's community; and lastly, *cultivating commercial friendships* can be defined as the desire to create good social experiences within the retail environment. However, due to the page constraints, we will not focus on *cultivating commercial friendships* as our findings support previous research (e.g. Gwinner, Gremler et al. 1998; Price and Arnould 1999).

### The social connection factor

*Lorna (74yrs retired book keeper):* When I used to mind the two little ones, *Glenfield* before it changed [the old mall before it was renovated], used to have Christmas school holiday entertainment. And if I was minding the children on those particular days I would take them up to watch it. And you know everybody there, people chat and you chat and all the kids would sit down on the floor and watch it and participate. It's really good.

One of the most revealing findings in this study was the social connection factor. Whilst Cova (1997) suggests conceptually that people purchase products in order to form links with others, we propose that the retail environment itself also facilitates these links. Some of our participants formed attachments with various retail sites because they perceived these locations to be conducive to social interaction. Both Lorna (above) and Mary (below) refer to their favorite places when discussing why they regularly patronize these locations. In both cases, it was the contact they had with others, as well as the location that made the experience enjoyable.

*Mary (40yrs retail assistant):* We go out for fun. When there's the two of us, we go out for fun. Most of it is done through the different op shops [regular second-hand shops] on *The Shore* when we go out. And we have fun. And it's just because of the person you're with. It causes or adds to the fun, not what you're doing, it's the person you're with that causes the fun.

Shields' (1992b) argument that the market-place is an important space because it encourages social connection and provides a sense of belonging certainly resonated with some of our participants. This was particularly relevant to Kerry, a recent British immigrant, who had few friends in NZ. Kerry frequently visits "the mall" in her local area whenever she feels the need to experience a social connection.

*Kerry (33yrs postgraduate psychology student):* Certainly from going to the shopping mall I'd say because yeah, I'm very much going out to meet people. Or not to meet people, just to be around people. I mean it's almost like you feel a connection in that you know that people are there for the same kind of reasons that you're there for. I mean it's a very loose connection but you know, it's a connection of sorts...

Indeed, for many of the participants, it was the social contact with others, which contributed to their pleasurable experiences when visiting their favorite retail sites, whether it was indirectly as Sue's comments below suggest, or directly as in Lorna's case (see below).

*Sue (52yrs secretary):* Oh yeah I like the social contact, all the people the buzzy people…I think it's nice just seeing other people and seeing what they're wearing and, seeing all the little human dramas that are going on.

*Lorna:* Well every week I just wander in a have a look at a lot of these shops you know…I will chat to different ones [people] too. You know, I can give a smile on the way up the escalator and you know quite often if a couple of people are looking at something, you might sort of discuss it with them, although you don't know them from Adam.
*Interviewer:* Does that sort of make it nicer?
*Lorna:* Well I enjoy that, that's why it doesn't worry me shopping on my own. They might think "oh funny old girl" but it doesn't worry me.

Aubert-Gamet and Cova (1999) speak of current retail environments as being nonplaces, places in which people wander about invisible to others, i.e., invisible to other shoppers, invisible to sales staff. But the results from this study suggest otherwise. Participants from this study did interact within the shopping environment, whether it was directly or indirectly. And just like the findings in McGrath and Otnes' (1995) study, strangers in the shopping envi-

ronment were often quite happy to interact with other shoppers, for a variety of reasons. One reason being, to feel a sense of connection.

*Sue:* Well that's another thing. I think people maybe do go to the mall because they don't know their neighbors now, because we've lost that sense of community so at least going to the mall is your NEIGHBORHOOD. In a sense isn't it, I mean that's your neighborhood, you get to know it, the same as you would have years ago when you went to the local grocer and the local butcher and the local dairy and the little post office, you know those places don't exist anymore, so the mall is perhaps your, you know, community, it's your community neighborhood perhaps….

For some of our participants the social connection factor was often the main reason for going shopping, hence supporting sociology and environmental psychology research that suggests that people become attached to locations for the social connection (e.g. Low and Altman 1992).

*Kerry:* And just sometimes I won't have any particular desire to buy anything but I will go to the shopping mall [refers to a specific mall] just to be around people.

As Manzo (2003) states, one's relationship to places can be a conscious process as well as an unconscious one.

Because regularity and routine are part of our way of being-in-the-world, indeed we are not always conscious of our feeling for place (Hester 1993). Moreover, places that provide comfort and security tend to be places with which we are familiar, so we may be attached to them on an unconscious level (Manzo 2003, p.53).

Meaning may also be attributed to one's sense of place. People often acquire a sense of belonging and purpose via personal attachments with a physical location (e.g. Relph 1976), which in turn may give meaning to their lives. It is one's sense of place or rootedness that gives one a sense of belonging. If we move from retail and services literature to related areas in geography, psychology and sociology, we find recognition that the identity of place is not only restricted to its physical characteristics (e.g. Proshansky et al. 1983; Shields 1992; Miller et al. 1998), it is also related to the social constructions of place–those perceptions formed by individuals and groups (Lalli 1992). As Lalli (1992) states, it is a person's relationship with place and how they identify with place, not the identity of the place itself, that gives meaning to place.

**Sense of community**

Supporting the community or creating a "sense of community" was another reoccurring theme that emerged from our findings. In particular, locally owned shops were perceived by some of our participants as being representative of a community's spirit, unlike globally owned stores. And strip centres (shops that line a street) were perceived by some of our participants as being more in tune with community values when compared with malls because they believed strip centres were better at representing a local community's essence (e.g. uniqueness, hardworking values, local people, local businesses contributing to the community). This theme was probably best summed up by Toni, a 26-year-old television researcher:

*Toni:* …I feel best when I buy things from people that I like…compared to say the mall [versus strip centre], there's a

sense in both of those cases of people really putting their heart and soul into something. And I think that's the difference between going and buying at *Esprit* or somewhere compared to a second-hand shop that someone owns or even a designer shop that someone owns. You know they've actually really put some effort into it and it's not like it's just coming from the Swedish head office.

This is an interesting finding because we are dealing with perceptions rather than fact. In reality, the locally owned store may operate just like the globally owned store. And yet, one can relate Toni's comments back to self-esteem motives. People will often seek experiences that will contribute to his or her self-concept (Sirgy 1982; Markus and Kunda 1986). Toni's attitude may also tie in with the consumer resistance trend among small interest groups, or socially conscious consumers (Follows and Jobber 2000), as these sentiments are echoed by several of the participants in this study.

*Sally:* I do quite often consciously buy in smaller shops. Individually rather than brand big named shops because I'd rather support buying in a smaller community rather than something you know, big.... and *Borders* is the kind of contention mark for me. It's such a great shop but at the same time it is ultimately the American multinational.

One could therefore suggest that a pleasurable shopping experience, as well as one's level of attachment to a location, may also be influenced by an organization's identity. As Bhattacharya and Sen (2003) maintain, consumers' identification with certain companies often helps to satisfy one or more important self-definitional needs. If a person believes that his or her self-concept is incongruent with the store's image, he or she may experience uneasiness. If the organization's identity and values are not congruent with a consumer's values, the consumer may choose to shop elsewhere. Interestingly, some of the participants were often conflicted, as highlighted by Sally's comments above, and Tracy's comments below. The implication for retailers, therefore, should be to try and alleviate this tension. It would appear that some of our participants are searching for stores with which to identify with–such stores appear to be smaller and reflect the community to which they see themselves belonging to, and strongly identify with.

*Tracy (21yrs university student):* But I like the idea of department stores in the old fashioned way. But then I hate chain stores with a vengeance. Because I think, even though I buy at a lot of them, I just don't agree with the politics of them, I think they're pushing out nice boutique stores and you know, I hate to say it, but the mom and pop stores.

We would therefore suggest that the store's identity and/or retail location's identity is important to one's sense of community and even one's sense of belonging. The challenge for new shopping areas or areas that are undergoing change is to create or maintain a sense of community that reflects the values of the community in which the retail environment is situated.

A pervasive theme in Rowles' (1983) study was 'insideness'. She investigated place attachment in terms of its physical, social and autobiographical dimensions. 'Insideness' consists of three components–'physical insideness', familiarity of the physical environment; 'social insideness', integration with the community; 'autobiographical insideness', historical dimensions/ remembered

places–this relates to a sense of self (Rowles 1983). As Rowles (1983, p.308) states, 'imbuing places with meaning as [an] expression of one's identity serves several purposes'-it creates a sense of belonging, provides a sense of continuity between the present and future, and it plays a role in the adaptation of personal identity. 'To abandon these places either physically or, more importantly, cognitively, is to give up identity' (Rowles 1983, p.308). Twigger-Ross and Uzzell (1996, p.206) go on to note that one's attachment with a place may help to support and develop aspects of an individual's and/or group's identity. Consequently, changes within the servicescape, for some people, may represent a sense of loss and hence a loss of identity.

*Betty (70yrs retired shop keeper):* Oh yes. I mean when you're travelling, you know how you stop off at little towns. Each little town has got the old fashioned drapery store and things like that. That's FABULOUS to go in and look around. It's amazing what they've got that these shops haven't got…Well I don't know whether it's, I shouldn't say they're back waters because they're thriving places some of them, but yeah, it would be the culture of the town. It's a feeling of, a little humming little business centre. And it's not all offices in the streets. And you know it's a SHOPPING centre, it's not a BUSINESS centre.
*Interviewer:* Whereas…
*Betty:* Takapuna I think is more of a business centre now, isn't it. You know, there's banks and cafes, eating places. You can name on your hands how many shops that you could spend all day going in and looking at. I mean Birkenhead is more fun to go through, going up and down that street, looking at all their shops, than it is to go to Takapuna. It's different.

And yet, it is often during times of change that our feelings about places become conscious (Brown and Perkins 1992). As research shows, when there is a disruption to our daily lives, such as a burglary, relocation or disaster, it is accompanied by an increased awareness of our environment (Manzo 2003, p.53). This too could apply to the retail environment–for example, when a retail location's identity undergoes change due to physical or social transformations, one may become more aware of their local retail environment. For some people, they might experience a sense of loss whereas for others they might welcome a change. Overall, retail developers need to understand the relationship people have with place. Interestingly, Betty (see above) makes a distinction between shopping centres and business centres. Perhaps this is one of the reasons why some Central Business Districts (CBD) lack a positive shopping atmosphere; they are viewed as business hubs rather than community hubs, and individuals or groups can no longer identify with these locations.

## DISCUSSION

Based on the findings from this study, we maintain that the social dimensions within the retail environment may influence one's perceived pleasurable shopping experiences and consequently retail patronage behavior. Understanding the social dimensions of the retail environment and the shopping experience should not be undervalued because understanding our retail environment from the consumer's perspective can lead to better management of the environment. Secondly, few studies in marketing and retail literature have investigated the social and communal aspects of the retail environment and the influence this may have on retail patronage. It is becoming increasingly important to view these sites as 'community spaces' (White and Sutton 2001) because people play a role in

shaping the identity of place, just as they do in shaping self-identity. While factors such as atmospherics, service and tenant variety contributed to our participants' perceived pleasurable shopping experiences, the social dimensions of shopping were also important as they fulfilled consumers' social needs. Indeed, for some of our participants, the social connection, whether it was direct or indirect, was more or equally important to their perceived pleasurable shopping experiences, as it contributed to whether they perceived the shopping experience to be pleasurable or not. This may consequently influence consumers' retail patronage behavior. Therefore, the question marketers and retailers need to ask themselves is, how well are we accommodating these social needs?

## FUTURE RESEARCH

This exploratory research suggests a number of propositions to guide future research.

*Proposition 1. Current marketing theories have limited ability to expand our understanding of how people consume space and assign meaning to space.*

Accordingly, we suggest future research should draw upon theories outside the discipline of marketing, such as place-related identity (e.g. Proshansky et al. 1983), to better understand how people consume space and assign meanings to place; a sentiment also expressed by Borghini and Zaghi (2006). *Place* defines who we are and helps to answer the "Who am I" question and yet we as humans also define *place*. Consequently, one should view place not just as a point of geographical interest but also as something that may reveal essential information about the human ways of being-in-the-world (Stefanovic 1998, p.33). By understanding place in terms of its cultural identity and the rituals that eventuate in places, Clarke and Schmidt (1995) suggest that service organizations can enhance the overall environmental encounter.

Place-related identity is a term that is used within environmental psychology to explore the relationships between people and place (Lalli 1992). We suggest that the exploration of place attachment, a concept more commonly used in geography and environmental psychology, may further enrich marketing's understanding of retail patronage. And yet, place attachment is particularly relevant to retail research because the retail environment is primarily a social environment (Prus and Dawson 1991; Shields 1992; Miller, Jackson et al. 1998). Hence, the following proposition:

*Proposition 2. The reasons why consumers become attached to retail locations extend beyond the locations' physical characteristics, the service component, and/or the types of products they sell.*

Consequently, an exploration of place attachment is particularly relevant to retail research. Place attachment is the concept of people being bonded to places (e.g. Low and Altman 1992; Eisenhauer, Krannich et al. 2000). It involves an interchange between emotions (affect and feelings), cognition (thought, knowledge, and belief) and practice (action, behavior) (Low and Altman 1992; Vorkinn and Riese 2001). However, an attachment to a place does not have to be individually specific; groups and communities can collectively share attachments to places (Low and Altman 1992; Vorkinn and Riese 2001). At the same time, the degree to which one forms an attachment, i.e., the level of intensity can also vary (Rubinstein and Parmalee 1992).

When exploring retail literature, one can also make comparisons with recreation research. Within outdoor recreation research

there was a tendency to identify a setting's features when exploring visitors' motivations (Williams, Patterson et al. 1992). In other words, the commodity view of recreation places dominated recreation research (Williams *et al.* 1992). Like recreation research, much of the focus in retail literature has been on the physical characteristics of the location, in addition to the service component–but as Williams *et al.*'s (1992, p.42) study found, emotional attachments to a recreation place could not easily be captured by multiattribute concepts, i.e., the setting's attributes. We maintain that this also holds true for the retail environment, and suggest future research may care to examine the following proposition:

*Proposition 3. Emotional attachments to retail environment cannot be explained only in terms of the setting's attributes, rather there is likely to be an interchange between emotions (affect and feelings), cognition (thought, belief and knowledge), and practice (action, behavior).*

One's attachment to a retail location can also serve a number of functions for individuals, groups, and cultures (e.g. Low and Altman 1992; Eisenhauer, Krannich et al. 2000). On the one hand, place attachment provides one with a sense of security, familiarity, and continuity between the present and the past, as well as a sense of control and relaxation in one's everyday life. On the other hand, place attachment links people with others, links friends, families, subcultures and so forth (Low and Altman 1992, p.10), hence creating a sense of belonging (Rowles 1983). As Low and Altman (1992, p.10) state, 'place attachment may contribute to the formation, maintenance, and preservation of the identity of a person, group, or culture'. And yet, place is also moulded by the very people who occupy it. Hence the following proposition is posed for future consideration:

*Proposition 4. Place is co-created by the consumers' interaction with the retail environment.*

Findings from the study also highlighted other areas for potential research. It would appear that some consumers are searching for stores with which to identify with. If he or she believes that his or her self-concept is incongruent with a store's image, he or she may experience uneasiness and hence shop elsewhere to alleviate this conflict. Some of the participants were conflicted about shopping in certain locations/stores due to their sense of social responsibility. Consequently, retail managers ought to carefully consider tenant variety in both malls and strip centres. But, perhaps more importantly, retailers of multinational stores ought to consider incorporating strategies into their management practices to alleviate consumer tension and/or resistance, which may necessitate them to become more community focussed at a local level. Hence, proposition five:

*Proposition 5. Consumers prefer to patron stores with which they identify, therefore considering the consumer and the dominant culture is essential for retailers.*

Secondly, since community (or the perception of community) appears to be an important component for some of our participants, we suggest that retailers should attempt to create unique identities (and capture the community's spirit) when developing new retail sites, particularly if it is a franchise chain (i.e. malls). It appears that heterogeneous environments are preferable over homogeneous ones. Not only will this encourage people to identify with their local shopping centres, it may also encourage people to visit neighbouring franchise malls.

Lastly, it would be worthwhile to explore the retail environment from both from a male perspective and a female perspective to see how similar or dissimilar their shopping experiences are. How important is the social dimension for males–an environment that has generally been perceived as a gendered one (e.g. Jansen-Verbeke 1987; Shields 1992; Woodruffe 1997; Miller, Jackson et al. 1998). We suggest the following:

*Proposition 6. Place attachment in a retail environment is more likely to be of importance to females than it is to males.*

# The Mediating Role of Consumer Conformity in E-compulsive Buying

Yun Jung Lee, Purdue University, USA
JungKun Park, Purdue University, USA

## ABSTRACT

Both the convenience of online shopping and the lack of normative standards on the Internet can cause online compulsive buying. Considering the negative consequences of online compulsive buying, Internet tools for reminding consumers of social norms are needed to reduce online compulsive buying. Virtual communities can affect consumer buying behavior because they also can be social groups. Accordingly, the objective of this study is to explore the relationship between conformity in virtual communities and online compulsive buying tendencies. This study also attempts to examine the influence of two external variables, member expertise and the sense of belongingness on conformity.

## INTRODUCTION

As the Internet has developed, more consumers have been enjoying online shopping. While the Internet serves as a convenient way to shop, the convenience of the Internet also causes some negative effects on consumers. For example, consumers might experience unregulated consumption behavior when they shop online. One of the uncontrolled consumption behaviors on the Internet is compulsive buying. Compulsive buying can be defined as chronic, repetitive, and excessive buying as a result of negative events or feelings (O'Guinn and Faber 1989). Compulsive buying might cause consumers to suffer from economic and/or psychological problems. For example, compulsive buyers are inclined to spend more money than they have, and this excessive spending can destroy their own and their families' lives (D'Astous 1990; Faber and O'Guinn 1992). In addition, although consumers have short-term positive feelings after compulsive buying, they experience significantly negative feelings in the long run (Faber and O'Guinn 1989; O'Guinn and Faber 1989). Accordingly, compulsive buyers often return the purchased products (LaRose 2001). Moreover, they might communicate negative feelings about their shopping experience after compulsive buying. Therefore, compulsive buyers are not likely to be welcome customers for retailers in the long run. Thus, it is important to prevent consumers' compulsive buying for retailers as well as for consumers themselves.

Consumers can enjoy shopping via the Internet with relatively low social interaction. This lack of interaction and social environment can also affect consumers' online compulsive buying. Previous studies in social psychology found that important others such as peer groups and friends may often have significant influence and give information in the attention-directing stage of the buying process (Venkatesan 1966). For example, when we go shopping with friends, we often ask their opinions about what we want to buy. When hearing positive opinions, we are more likely to buy the products. On the other hand, if we hear negative information about the products, we are reluctant to purchase them. Furthermore, based on previous studies in consumer behavior, it is clear that social norms have an effect on compulsive buying (Lee, Lennon, and Rudd 2000; Schlosser et al. 1994). Accordingly, it is not surprising that compulsive buyers don't want to be alarmed by others, which would cause the compulsive buyers to become aware of their compulsiveness and would prevent them from buying unnecessary products. For this reason, the Internet might be a preferable place for compulsive buyers to purchase what they want without being interrupted by normative standards for buying (LaRose 2001).

Considering both the negative outcomes of online compulsive buying for both retailers and consumers and the lack of reminders of normative standards for buying on the Internet, tools for reminding consumers of social norms on the Internet are needed to reduce online compulsive buying. Then, what could play the role of important others like friends and families when consumers shop online? Where is the place for consumers to interact with others on the Internet? The virtual community is a place to meet others and share their opinions on the Internet through networking. Thus, this study examines the role of virtual communities in online compulsive buying: whether virtual communities discourage online compulsive buying or not. For this objective, the study explores the relationship between conformity in virtual communities and online compulsive buying tendencies. This study also attempts to examine the influence of two external variables, the sense of belongingness and member expertise on conformity.

## LITERATURE REVIEW

### Online Compulsive Buying

In general, compulsion refers to "repetitive and seemingly purposeful behaviors that are performed according to certain rules or in a stereotyped fashion" (American Psychiatric Association 1985). On the other hand, compulsive buying includes the meaning of excessive buying or out-of-control buying (Faber, O'Guinn, and Krych 1987). Compulsive buying also can be defined as "chronic, repetitive purchasing that becomes a primary response to negative events or feelings" according to previous studies (O'Guinn and Faber 1989).

Compulsive buying does not simply result from one simple factor. In fact, many researchers have tried to examine factors which result in compulsive buying, and they agree that it may result from multiple factors (Faber 1992). Among others, Faber and Christenson (1996) suggested biochemical, social, and psychological factors.

One major gap in the research is a lack of empirical studies dedicated to measuring and exploring the topic of online compulsive buying. However, the unique characteristics of online shopping like high accessibility, much inventory, and attractive online displays have been thought to increase online compulsive buying (Eastin 2002). Moreover, many compulsive buyers want to avoid being reminded of normative standards, by important others (LaRose 2001). Accordingly, they tend to shop alone, at night, or through home shopping channels (Lee et al. 2000; Schlosser et al. 1994). Therefore, online shopping can be the best way for compulsive buyers to shop in isolated shopping environments.

### Virtual Community and Conformity

Rheingold (1994, 57–58) defined a virtual community as "social aggregations that emerge from the Net when enough people carry on those public discussions long enough, with sufficient human feelings, to form webs of personal relationships in cyberspace. A virtual community is a group of people who may or may not meet one another face to face, and who exchange words and ideas through the mediation of computer bulletin boards and networks." Similarly, Romm, Pliskin, and Clarke (1997) defined a virtual community as a group of people who communicate with one

another via electronic media and share common interests unconstrained by their geographical location, physical interaction or ethnic origin. More recently, Ridings, Gefen, and Arinze (2002) defined a virtual community as a group of people with common interests and practices that communicate regularly for some duration in an organized way over the Internet through a common location or mechanism. Based on these definitions, it is assumed that a virtual community is a source of social influence on the Internet. Since people do live with others, their behavior influences others. This social influence has been identified as conformity. While Allen (1965) defined conformity as one manifestation of social influence due to the opposition of the other group members to an individual's views, Burnkrant and Cousineau (1975) defined conformity as the tendency of opinions to establish a group norm as well as the tendency of individuals to comply with the group norm.

While normative conformity has been more emphasized, the dichotomy of conformity has been represented by a dual process dependency model of social influence (Pendry and Carrick 2001). Deutsch and Gerard (1955) asserted that conformity consists of two categories, informative and normative conformity motivations. They define informational conformity as the influence to accept information from others to evince the truth of reality. On the other hand, they refer to normative conformity as the influence to conform to the expectations of others.

Consumers consider that the information from a group is credible when the group has expertise (Kelman 1961). According to previous studies, consumers might internalize and manifest information from others when they can believe others' expertise (Kelman 1961; McGuire 1969).

*H1*: Member expertise has a positive relationship with informative conformity.
*H2*: Member expertise has a positive relationship with normative conformity.

Furthermore, it is believed that the role of group belongingness in conformity is more important than classical explanations had assumed (Pendry and Carrick 2001). Luo (2005) found that the influence of peers or family is greater when the group is more cohesive.

*H3*: Sense of belongingness has a positive relationship with informative conformity.
*H4*: Sense of belongingness has a positive relationship with normative conformity.

Informative conformity affects consumers' buying behavior. Consumers search for information when they buy products or services. While word-of-mouth has been considered a major factor in consumers' buying decisions (Richins and Root-Shaffer 1988), the rapid development of the Internet has extended the place of word-of-mouth from offline to online. Considering that consumers cannot see and touch the real product on the Internet, information from others who have already experienced that product might be critical for consumers.

Normative conformity also plays an important role in consumers' buying behavior. Consumers sometimes feel responsibility to respond to concerns of what others thought or how others reacted to their product choice and usage (Calder and Burnkrant 1977). Consumers even observe others' purchasing behavior in order to check whether their own purchase is acceptable in society (Bearden, Netemeyer, and Teel 1989). According to Luo's experimental

study (2005), while the presence of peers increases impulsive purchasing, the presence of family members decreases it.

*H5*: Informative conformity has a negative relationship with e-compulsive buying.
*H6*: Normative conformity has a negative relationship with e-compulsive buying.

## METHODOLOGY

To accomplish the research objective, an online survey was conducted to collect data. Two thousand e-mail invitations were distributed to a randomly selected national sample purchased from an independent research company. A total of 302 respondents participated, representing a 15.1 % response rate. Furthermore, the panel members were limited to those who engage in at least one virtual community, and the usable sample was 179 after the screening process. Sample Characteristics are presented in table 1.

The measures in this study were adopted from previous studies. The questionnaire consists of these tendencies: member expertise, a sense of belongingness, online consumer conformity, and online compulsive buying. Member expertise was developed based on a fifteen-item scale which was initially a consumer expertise measure (Kleiser and Mantel 1994). A sense of belongingness was measured using a three-item scale (Kember and Leung 2004). After purification, only 10 items were used. Online consumer conformity was measured using a twelve-item scale (Bearden et al. 1989). We developed an online compulsive buying measure based on a compulsive buying measure in the previous study (Faber and O'Guinn 1992). Before conducting structural equation modeling, a confirmatory factor analysis was used to verify the measurements. In addition, all of the final multiple scales in this study demonstrate high reliability (table 2).

## RESULTS

The proposed conceptual model (figure 1) was tested by using structural equation modeling. The fit of the overall measurement model was estimated by various indices. The results indicate an excellent fit of data for our conceptual model (table 3).

The path coefficients are presented in table 4. According to the results, member expertise has a positive impact on both informative and normative conformity and supports hypotheses 1 and 2. About the strength of the relationship, member expertise has a stronger influence on informative conformity than on normative conformity. Sense of belongingness also has positive influences on both informative and normative conformity. Therefore, hypotheses 3 and 4 are supported as well. However, the strength of the relationship between sense of belongingness and conformity shows a different pattern from the relationship between member expertise and conformity. Sense of belongingness has more influence on normative conformity than on informative conformity. In sum, both member expertise and sense of belongingness have positive influences on both informative and normative conformity. In contrast, while member expertise has more influence on informative conformity, sense of belongingness has more influence on normative conformity. The hypothesized relationship between informative conformity and online compulsive buying tendencies was not significant. Thus, hypothesis 5 was not supported. Finally, the relationship between normative conformity and online compulsive buying tendencies is supported by the results of this study. Concerning the direction of the relationship, the negative relationship is also confirmed between normative conformity and online compulsive buying tendencies. It means people more likely to have normative

conformity with members in a virtual community are less likely to be online compulsive buyers.

**DISCUSSION**

While compulsive buyers should consider social norms when they purchase something offline, online shopping gives more isolated shopping environments to consumers. Thus, the purpose of this study was to examine the role of virtual communities on online compulsive buying tendencies. This study examined the relationship between normative and informative conformity in virtual communities and online compulsive buying tendencies. It also confirmed the influence of two external variables, member expertise and the sense of belongingness on conformity in virtual communities.

The positive relationship between member expertise and conformity in virtual communities means that consumers have higher

**TABLE 2**
Summary of Measurement Scales

| Construct | Measures | α |
|---|---|---|
| Member Expertise | The virtual community members enjoy learning about the product/service I sought advice about. | .944 |
| | The members of the virtual community are knowledgeable about the product/service. | |
| | The members of the virtual community are familiar with almost all existing brands of the product/service. | |
| | The virtual community members search for the latest information on this product/service before purchasing. | |
| | The virtual community members' knowledge of this product/service helps them to understand very technical information about it. | |
| | The virtual community members can recognize almost all brand names of this product/service. | |
| | The members of the virtual community keep current on the most recent developments of this product/service. | |
| | Virtual community members use their knowledge of this product/service to verify that advertising claims are in fact true. | |
| | Virtual community members can recall product-specific attributes of this product/service. | |
| | Virtual community members can recall brand-specific attributes of the various brands of this product/service. | |
| Sense of Belongingness | I feel a sense of belonging to my virtual community. | .831 |
| | I am able to relate to the virtual community. | |
| | I feel that I have established a relationship with the virtual community. | |
| Online Consumer Conformity | I often consult others in the virtual community to help choose the best alternative available. | .900 |
| | If I want to be like someone in the virtual community, I often try to buy the same brands that they buy. | |
| | It is important that others in the virtual community like the products and brands I buy. | |
| | To make sure I buy the right product or brand, I often observe what others in the virtual community are buying and using. | |
| | I rarely purchase the latest fashion styles until I am sure the virtual community approves of them. | |
| | I often identify with others in the virtual community by purchasing the same brands they purchase. | |
| | If I have little experience with a product/service, I often ask the virtual community about it. | |
| | When buying products/services, I generally purchase those brands that I think the virtual community would approve of. | |
| | I like to know what brands and products make good impressions on the virtual community. | |
| | I frequently gather information from the virtual community about a product/service before I buy. | |
| | If other people can see me using a product/service, I often purchase the brand the virtual community expects me to buy. | |
| | I achieve a sense of belonging by purchasing the same products and brands that the virtual community purchases. | |
| Online Compulsive Buying | I felt others would be horrified if they knew my online spending habits. | .854 |
| | I bought things online even though I couldn't afford them. | |
| | I bought something online when I knew I didn't have enough money in the bank to cover it. | |
| | I bought something online in order to make myself feel better. | |
| | I felt anxious or nervous on days I didn't shop online. | |
| | I made only the minimum payments on my credit cards. | |
| | If I have any money left at the end of the pay period, I just have to spend it online. | |

| Informative Conformity | → | Online Compulsive Buying Tendencies | NS |
| Normative Conformity | → | Online Compulsive Buying Tendencies | - .196 ** |

\* p<.05 \*\* p<.01 \*\*\* p<.001

conformity when they perceive the members in a virtual community have expertise. It can be supported by a previous offline study confirming that a consumer's belief in the credibility of the information from a group depends on the group members' expertise (Kelman 1961). The results of this study also confirm Pendry and Carrick's (2001) suggestion that belongingness should be considered more important in conformity. As Luo (2005) found that social influence is greater when the group is more cohesive, consumers showed more conformity when they felt more sense of belongingness.

Another interesting finding in this study was that while normative conformity in virtual communities has a significant effect on online compulsive buying, informative conformity has no effect on online compulsive buying. The negative relationship between normative conformity and online compulsive buying is consistent with many previous studies showing social norms have a negative relationship with compulsive buying (Lee et al. 2000; Schlosser et al. 1994). Although informative conformity on the Internet (e.g., online word-of-mouth) might affect normal consumers' buying decisions (Richins and Root-Shaffer 1988), it is not related to online compulsive buying. It can be explained by the fact that compulsive buying is unplanned behavior without much information search. The results of this study confirm the possibility of virtual communities playing an important role in preventing compulsive buying by reminding consumers of social norms. Therefore, online stores, like virtual communities, can also provide consumer reviews not only to give information but also to prevent online compulsive buying. As indicated in this study, consumers who feel a greater sense of belongingness in a virtual community have greater normative conformity, thus showing less online compulsive buying tendencies. Consequently, it is important to maintain a virtual community where members can feel belongingness.

In this study, we used a broad concept of virtual communities to obtain data. However, there are many kinds of undefined virtual communities in the real world with different characteristics. Thus, future research needs to examine whether the role of a virtual community in online compulsive buying is different across various virtual communities.

# Fashion and the College Transition: Liminality, Play, and the Structuring Power of the Habitus

Mark A. Rademacher, University of Wisconsin–Madison, USA

## ABSTRACT

Fashion has long been a signifier of social divisions within the education system as well as society at large. This paper seeks to examine how young people's use of fashion varies in two distinct social milieus–the high school and college peer cultures. Interviews with 19 college freshmen were conducted to ascertain how fashion contributed to, or hindered, social divisions within each milieu. While informants recognized numerous social divisions marked by fashion choices within the high school milieu, during their initial weeks on campus no social divisions were identifiable. In this new milieu it appears fashion contributed to a sense of communitas among college freshmen. However, over time, this sense of communitas diminished as freshmen acquired the requisite levels of cultural capital to identify the signifiers of social divisions. Implications of this research are discussed in terms of freshmen's limited ability to play with their identity, as expressed through fashion, as a result of the structuring power of the habitus.

## INTRODUCTION

Indeed there exists a correspondence between social structures and mental structures, between the objective divisions of the social world–especially the division into dominant and dominated in the different fields–and the principles of vision and division that agents apply to them.

- Bourdieu 1989a, 1

The work of Pierre Bourdieu, despite being based on research conducted primarily in 1970s France, has been applied to a number of social phenomena within the contemporary American context by consumer behavior researchers. His work, especially the argument presented in his seminal work, *Distinction* (1984), has been applied to varied phenomena such as consumer tastes (Friedland et al. 2007; Holt 1998) and the selection of an institution of higher learning (Allen 2002), among others. A less often cited work, *The State Nobility* (1989a), however points to a need to examine the field of higher education as locus of class struggle. Institutions of higher education, especially elite schools, "produce a *consecrated* elite, that is, an elite that is not only distinct and separate [from the masses], but also recognized by others and by itself as worthy of being so" (Bourdieu 1989a, 102, emphasis in original). Through conferring not only educational credentials but also this mutual recognition, institutions of higher education legitimate and reinforce existing social divisions rather than serve as an equalizing force in class struggles.

Yet American college students do not view the college experience in such terms. Rather, they view it with excitement as an opportunity to reinvent themselves (Karp et al. 1998). And as colleges have experienced a two-fold increase in enrollment since the 1970s, an increase from 7 million to 15 million students (U.S. Census Bureau 2002) more young adults have entered college with this expectation in mind. The question remains, however, about how much agency individuals possess to reinvent themselves in this context? Does college represent a play-community (Huizinga 1950) that shares this collective illusion? And more particularly, how do college freshmen perceive and use fashion as a tool in this reinvention process; for fashion has long been a source of social differentiation (e.g., Bourdieu 1984; Hebdige 1979; Milner 2004) and as a means of expressing personal identity (e.g., Goffman 1959; McCracken 1988; Thompson and Haytko 1997)? Moreover, how does students' use of fashion reproduce or undermine the social divisions present within the high school milieu?

To examine these questions, the current study is based on interviews with college freshmen during the liminal period (Turner 1969) of the high school to college transition. The analysis of college freshmen's use of fashion at a single, large Midwestern university provides a nice contrast to Bourdieu's studies because, unlike the differences between students attending the selective *grandes écoles* and less selective universities, students' practices, especially in regard to fashion, are subject to the same structural constraints. Therefore, the differences in students' use of fashion may be attributable to "the dispositions of agents, their habitus, that is, the mental structures through which they apprehend the social world…[which is] essentially the product of the internalization of the structures of that world" (Bourdieu 1989b, 130).

### Structure, Liminality, and Play

Questions regarding the influence of social structures on individuals' agency have long been the central inquiry of social scientists. For example, scholars have examined the effects of the structural differences between rural and urban communities on the human experience (Gans 1991; Simmel 1971; Wirth 1938). In contrast, other scholars have argued individuals' subjective interpretations of the social world are the only valid way to explore the human experience (e.g., phenomenologists). These scholars believe social structures exert little influence on individuals' practices; individuals possess a great deal of agency to determine/create their own lives. But Bourdieu (1977) has rejected both of these approaches, arguing for "an experimental science of the *dialectic of the internalization of externality and the externalization of internality*" (72, emphasis in original), essentially a merger of the two approaches.

Bourdieu's ouvre of work is dedicated to demonstrating how such an integration of two divergent social science approaches can be applied to real world experience. Essentially, Bourdieu argues that the habitus, "understood as a system of lasting, transposable dispositions which, integrating past experiences, functions at every moment as a *matrix of perceptions, appreciations, and actions* and makes possible the achievement of infinitely diversified tasks" (Bourdieu 1977, 83, emphasis in original), negotiates between objective structures and practices and, ultimately, produces strategic action. In other words, Bourdieu proposes individual and collective action is limited by both objective social relationships and structures manifest in the habitus, which reproduce existing patterns of social interaction. Yet practices are not to be simply reduced to the structuring power of the habitus; practice results from the interplay of the habitus, the types and composition of capital individuals possess, and the rules dictated by a particular "field," (e.g., the college peer culture) structured spaces in which individuals struggle to maintain or achieve specific types or combination of capital, and consequently their social position. Individual agency exists within a realm of possible possibles–those possible actions that are possible despite the constraints of one's relative position in the field of power, their habitus, and the demands of the field.

Like Bourdieu, Turner (1969) also examines the relationship between social structures and practices, but his analysis can be classified as objectivist in nature. That is, he focuses his research on the structuring power of the ritual process and views individuals as

possessing limited agency to alter the ritual experience. Yet, he argues within the liminal spaces produced by social rituals, where the influence of social structures is subjugated by the power of anti-structure, social hierarchies are inverted (e.g., those with status are marginalized, the marginalized take a position of power) or eliminated all together (e.g., all are equal). In this way, liminal spaces are similar to the "intermediate positions of social space" where "the indeterminacy and objective uncertainty of relations between practices and positions is at a maximum, and also, consequently, the intensity of symbolic strategies" (Bourdieu 1989b, 133). The liminal phase, however, represents only the middle phase of rites of passage (Van Gennep 1960), which arguably, college is for those who experience it. It is preceded by the separation phase and followed by the aggregation phase. During the separation phase individuals are detached "either from an earlier fixed point in the social structure, from a set of cultural conditions (a 'state'), or from both" (Turner 1969, 94). Once separated from society and the stable structure it represents, the initiates, in this case college freshmen, become liminars, those who are "neither here nor there; they are betwixt and between the positions assigned and arrayed by law, custom, convention, and ceremonial" (Turner 1969, 95). Their daily activities occur in a distinct place, in this case the college campus, and are governed by different rules than society at large, and thus their social position is ambiguous. The ultimate goal of rites of passage is to pass to the initiate the collective wisdom of the group and then to reintegrate the initiates into the collective, returning to a social order previously inverted (Turner 1969).

Whether considering the college experience as a whole as a liminal period, or just students' first semester, this paper argues college represents a different stage of life than students have previously experienced, complete with its own cultural norms and rules. And upon completion of the liminal stage initiates are reincorporated into the general social structure, applying their newfound knowledge in a manner that reproduces the existing social structure. Therefore the ritual cycle completes itself, "men are released from structure into communitas only to return to structure revitalized by their experience of communitas" (Turner 1969, 129). As a result, communitas, "a sense of the generic social bond between all members of society…regardless of their subgroup affiliations or incumbency of structural positions" (Turner 1969, 116), is fleeting–it is unsustainable. The previously existing social structure reemerges.

But within liminal spaces individuals appear free, relatively, from the power of structure. Although individuals are never completely free from the influence of social structures and norms (Bourdieu 1977; Turner 1969) because liminal spaces exist "outside 'ordinary' life," are governed by rules (e.g., those imposed by tribal elders), and represents a period of "make-believe", at least in comparison to real life, they approximate the characteristics common to play spaces and games (Caillois 1961; Huizinga 1950). Yet, the other characteristics of play and games do not appear to apply to rites of passage like attending college. In particular, participation in traditional rites of passage is obligatory, not voluntary. Moreover, increasingly, the outcome of individuals' participation is not uncertain. By participating in the rite, individuals know that when the rite concludes they will have obtained a new position in society (e.g., a college graduate), replete with all the status that title confers. Finally, because rites of passage transmit social knowledge (i.e., forms of capital), which ultimately contribute to the reproduction of the existing social structure, rites of passage are best conceptualized as a productive activity rather than an unproductive activity.

However, despite these issues with the theoretical conception of play and games, within the liminal phase of contemporary rites of passage individuals appear able to play—at least in comparison with previous behavior. This claim, of course, requires substantiation. This paper attempts to do just that by examining play within a specific liminal phase, the transition from high school to college, and within a particular field, the fashion field. Certainly college as a whole is separated from everyday life, but when students leave the relative stability of high school for the relative uncertainty of transitioning to the college peer culture, they are certainly "betwixt and between" social positions. They are no longer adolescents but have yet to become adults. They are no longer high school students but have yet to become "true" college students. Moreover, they transition from occupying a position of power within one peer culture (i.e., that of a high school senior) to occupying a position of limited power within another (i.e., that of a college freshmen). The primary question, therefore, is when freed from the objective social structure of high school how do freshmen utilize fashion in their new peer culture?

## METHOD

The current study is based on depth interviews with 19 college freshmen at the beginning and end of the 2004 Fall semester, their first semester at a large Midwestern university. Interviews began with "broad stroke" questions (Thompson, Locander, and Pollio 1989), such as "tell me a little about yourself and your family." Follow up questions addressed a broad range of topics, including informants' use, and their perceptions of others' use, of clothing during the transition period. The first interviews began with a discussion of informants' high school experience, including a discussion of their clothing preferences and their perceptions of how clothing differentiated social groups. The interview then transitioned to students' initial impressions of college, as well as discussions about whether their clothing preferences had changed since high school. The second interview focused specifically on how students felt they fit into the larger social structure of the college and whether their life had changed over the past four months. Interviews ranged from 26-60 minutes. Of the 19 informants in the first interview, 14 (74%) participated in the second interview. Interviews were conducted either in a location of the informant's choosing (e.g., their dorm lobby) or in the lead author's office. The study resulted in 33 individual interviews, just over 26 hours of discussion, and 308 pages of transcribed text.

Data were analyzed following the hermeneutic method (Thompson 1997). Analysis began with an impressionistic reading of the transcripts and the identification of recurring themes within each individual interview. Subsequently, differences in informants' descriptions of fashion across the two interviews were also noted to explore the evolution of informants' clothing preferences and perceptions of others' clothing evolved over time. A second analysis of the data involved cross-informant analysis, the goal of which was to identify global themes that emerged from informants' descriptions of fashion. Analysis then integrated extant literature to help interpret how these themes fit within the larger discourse regarding structure, liminality, and play. Because any qualitative analysis is an iterative process, a third reading sought to identify any emergent themes not previously identified or themes that contradict the extant literature.

## FINDINGS

**The High School Milieu: Structure at Work**

The ability of fashion to mark social positions is apparent in informants' descriptions of their high school experience. Although a consistent description of "appropriate" high school fashion emerged across informants' descriptions of the clothing common in their schools, individual groups manipulated the fashion code to distin-

guish their group from the various other groups populating the high school milieu. Sally, who attended a large public high school, provided a general overview of the accepted high school fashion norm. As she commented, "Our school is kind of like the preppy school. So everyone wore Abercrombie [& Fitch] and American Eagle [Outfitters] and stuff." Other informants' descriptions corroborated the fact that the "preppy" look was common across high schools but added additional brands such as The Gap, Hollister, Aeropostale, and, in some instances, high-end brands like Banana Republic, Express, and Juicy Couture, to the list of acceptable brands. In addition to specific brands, the fashion norm also included specific items of clothing. Sally felt males would wear "Like just jeans or khakis and then like a collared shirt or like a t-shirt…no one really like dressed up differently than the next person for guys." Kelly, who also attended a large public high school, described the female version of the "preppy" look thusly: "Girls wear mini-skirts, t-shirts, like fitted t-shirts, button downs, polo shirts were big, flip-flops all the time."

Despite this general fashion norm, informants' comments unearthed distinctions between high school cliques, not only in regard to social activities, but also in regard to how they manipulated the fashion norm. The students who generally adhered to the norm, but purchased high-end brands as markers of distinction, represent a group termed the "Populars," although this title does not necessarily reflect whether informants viewed these students as popular. In contrast, those who deviated from the norm belonged to a group termed the "Outcasts." In between these two groups resided the "Normals." Clothing, therefore, marked relative positions within the social milieu, and therefore represented a from of agônistic play—which is "always a question of a rivalry which hinges on a single quality [in this case, fashion]…exercised, within defined limits and without outside assistance, in such a way that the winner appears to be better than the loser in a certain category of exploits" (Caillois 1961, 14).

When describing the social distinctions present in their high school, informants' descriptions suggest the Populars (e.g., "the jocks," "the pretty ones," "the party people") are the winners of the fashion game. As a result of their mastery of the high school fashion code, they are able to translate their high levels of cultural capital within the high school field, along with other potential attributes such as athletic performance or physical attractiveness, into a position of social dominance. The price students pay to achieve this social position, however, is perceived to be conformity. To belong to this group non-group members believe one must conform to the group norm. When asked to describe the Populars, Elaine, a self-described Normal at a private, all-girls high school, stated "Um, homogenous I guess would be a good word…I mean maybe they prefer it that way, like to fit in with their friends and wear similar clothing." Similarly, Eva, a Normal from a large rural high school, believed the Populars "all tried to be the same and nobody is comfortable being themselves or truly being themselves or being an individual. So they're really mainstream. They're the people who don't explore different things."

However, in reality, members of the Populars did not conform to the stereotypical high school fashion norm. Instead, their group conformed to an idiosyncratic form of the norm, one that emphasized high-end brands to distinguish themselves from the other peer groups; brands that communicated students' access to both cultural and economic capital. Yet, this mark of distinction was relatively subtle. The style of these high-end clothes mirrored those of the mainstream brands—jeans, khakis, polo's, and button-downs—what differed was the status of the brands. Hence one must possess the requisite level of cultural capital to be able to distinguish the nuance between the Populars' fashion norm and that of the general

high school population. When asked what brands the Populars favored, Dana, a self-described Popular at a large public high school, suggested they "would wear BeBe, they would wear Juicy…guys wore like Lacoste shirts, guys would wear Burberry shirts." By wearing these brands, according to Susan, another Popular at a large public high school, the Populars were able to stand out from their peers: "You know if you're going to be shopping at Saks Fifth Avenue and all that stuff you're going to have like nice trendy clothes. If you're going to be shopping at the mall you're going to be generic or whatever." By wearing high-end brands, the Populars both expressed their relatively higher levels of capital as well as perceived themselves as being different and original, especially in comparison to their "generic" peers.

In comparison to informants' descriptions of the Populars' predilection to conform to their group norm, members of the Normals perceived themselves as free to deviate from their respective group norm, a norm that is far more in line with the general high school fashion norm–jeans, khakis, t-shirts, and button downs. Eva, for example, described her personal style as motivated by a desire to avoid looking like everyone else. As she explained, "Like I don't want to look the same as everybody else. I don't want to blend or something. So I guess you wear what they don't wear." By not conforming Eva believes she is able to express her individuality and occupy a distinct place in the social universe. Rather than being a member of a clique or group, she is simply Eva. Jessica, another self-described Normal from a large public high school, also attempted to avoid wearing brands that she felt the majority of her peers wore. As she stated, "I don't like to buy stuff from Abercrombie because everybody has it. It's like mass produced and it's, you become mass produced when you wear that type of stuff." Through conforming, a trait often attached to members of the Populars, the Normals believe they are sacrificing their individuality. Hence, they perceive their fashion choices as being driven not by group pressures but rather by their own personal tastes; they perceive a great deal of agency. Yet a contradiction arises when comparing this idealized quest for individuality and other descriptions of Normals' fashion preferences. In later comments, Eva, despite her desire to stand out from her peers, claimed: "I like the Gap a lot!" Similarly, April, who attended a smaller suburban public high school, stated that she and her group of friends, all Normals, "wore like Hollister, American Eagle, Abercrombie, and stuff like that." Normals, like their Popular peers, have acquired the requisite cultural capital to act out the appropriate script within their peer group. Through this act of conformity, an act that Normals do not interpret as such, they can be confident in their knowledge that members of their peer group present a unique group identity to anyone who observes them, a unique group identity at least in comparison to the two other main peer groups in their high school environment, the Populars and the Outcasts. Consequently, they too can be considered part of the agônistic game. They may not spend as much on high-end brands as their Popular peers, but through their use of fashion, specifically their "sustained attention, appropriate training, assiduous application…" of a group fashion norm they express their "…desire to win" (Caillois 1961, 15) at the game of fashion, if the game is viewed as a means by which social divisions are communicated, including some while excluding others.

In contrast to the Populars and Normals, informants' descriptions of the Outcasts suggest this group occupies a distinct position among the high school groups in relation to the approved high school fashion norm. Whereas descriptions of the Populars and Normals suggest these groups adhered relatively closely to the norm, albeit with slight group specific deviations, the Outcasts (e.g., "losers," "nerds," "Goths," "stoners") appear to opt out of the high school fashion game. Although no self-described Outcasts

were interviewed for this study, informants' perceptions of this group are still informative. For instance, Eric, a self-described Normal from a public high school, perceived the nerd sub-segment of the Outcasts as not "car[ing] about clothing. They just wanted to show up and do their work or whatever. They didn't want to make a statement or look good or whatever, I guess." Julia, a Normal from a suburban public high school, also perceived a greater emphasis on academics than fashion among this group. Nerds, she stated, "don't care as much about the way they look…They'll just wear really simple clothes. They don't usually worry about like how, like doing their hair especially." Likewise, hippies and stoners were also perceived as ignoring the accepted high school fashion norm, but in a different way than the nerds. As Eva commented: "[Hippies] sort of rebel against mainstream things. They don't necessarily need to match. They don't really obsess about that…They're more interested in vintage things as opposed to new clothes." Even the Goth students, according to Gage, had a specific "uniform," just a uniform that was different from that of the Populars and Normals. As Gage, another Normal from a suburban high school, elaborated, "The Goths or skaters usually wore torn up clothes…[they] would wear stuff from Hot Topic or something. Metal prods on the clothing would be considered Goth." Whether because of a lack of cultural capital necessary to understand, or a conscious effort to reject, the established high school fashion norm, informants viewed the Outcasts as dressing drastically different from the vast majority of high school students.

Whether a "winner" of the high school fashion game exists is a rather subjective question–depending on who one asks, and their relative position in the social milieu, the answer will most definitely differ. The Populars will argue they are the winners, same with the Normals and the Outcasts. Yet, what remains consistent across these three groups is that within the high school environment fashion remains a central, albeit contentious, component in students' attempts to express individual and group identities (Danesi 1994; Goffman 1959; Milner 2004) while simultaneously communicating what type of person they are not (Bourdieu 1984; Englis and Solomon 1995).

### Liminality, the College Transition, and Fashion

When students graduate high school and transition to college, students enter a new field, replete with new rules, norms, and markers of distinction. That is not to say that they do not remember the social divisions that existed in high school, or how fashion contributed to marking those distinctions, for the high school experience remains a salient schema. Despite students' ability to apply the schema learned in high school to their new environment, it looses some of its efficacy. For college represents a distinctly different environment than the students have previously experienced. In most cases students have left the security of their adolescent homes to move into a residence hall, they are now living a semi-autonomous life free from the daily oversight of parents, they have had to sever some, if not all, of their high school friendships, and their daily life no longer revolves around the familiar norms and schedules of the high school peer culture, among numerous other changes. Consequently, college freshmen, especially during the first few weeks on campus, experience something similar to the second phase of rites of passage: margin (or *limen*) (Van Gennep 1960). They are betwixt and between two distinct phases of their lives: they are no longer high school students but they have yet to become entrenched in the college peer culture and, therefore, are not truly college students either. Although they have been labeled as freshmen, a label that positions them as occupying a low social status within the college social environment, within the freshmen class they represent "threshold people" (Tuner 1969). Among their

peers within this smaller sub-segment of the college milieu individuals "elude or slip through the network of classifications that normally locate states and positions in cultural space" (Turner 1969, 95). Because students possess limited cultural capital within this new field they are less equipped to classify themselves and their peers.

Informants' comments, therefore, suggest they viewed college fashion as representing a different type of game than the agônistic game of high school fashion. The college milieu was perceived as free from the competitive environment characteristic of high school. Students, therefore, began the year as equals. For example, Annette, a Normal in high school, commented:

I feel like in high school there is to a certain extent, to where everyone has that mentality of where you have to be what everyone else wants you to be… because it's not so structured of this social ladder that you have to climb…I think that it is the freedom… you don't have to worry about offending anyone or like being, being yourself.

Similarly, April, also a Normal, believed distinct social divisions were not present on campus.

I guess there's new groups forming but college is just different from high school. So I think the groups will always be open…I guess groups are going to form but I think everyone is just nicer in college and more open to meeting people because it's less cliquey. There's so many people around.

Both Annette's and April's comments illustrate the belief that college is not structured in the same manner as high school. They believe individuals are free to be whomever they wish, socialize with whomever they want, and freely switch between social groups. In other words, in contrast to the regimented high school milieu the college milieu is an environment where they are able to play.

Students' perceptions of campus fashion seem to reinforce this feeling of freedom and the lack of social divisions. Despite, as April commented, the fact college fashion is "pretty much the same [as in high school]. Like I said before, American Eagle, Abercrombie, stuff like that," students added certain components to their wardrobe in an attempt to fit into the college peer culture. In particular, every informant mentioned how prior to arriving on campus he or she purchased university branded apparel, clothes that were worn either on a daily basis or on special occasions such as football games. Ultimately, the shared consumption and display of university branded clothing generated a feeling of communitas (Turner 1969) among freshmen and the members of the larger university community. As Eva articulated, she purchased university branded clothing because

I thought "hey, if I go to [University name] I should probably have something that says it." Just because it sort of, it's not like it identifies you but it's a part of you now. Like I go to this school and you want to reflect that sometimes. So you want to have something that reflects it without having to say it. You just wear it and people see you and they know.

In her attempts to fit in, Sally bought university branded clothing to replace the high school branded clothing she previously wore. "Like I always wore [high school] t-shirts. But I feel stupid because I don't go [there] anymore. So I want [name of university] clothes for that purpose." Not only did wearing high school branded clothing make Sally feel stupid, it also appears to prevent her from fitting in with her peers; it communicated that she was different

from everyone else. In contrast, wearing university branded clothing allowed students to perceive themselves as part of the larger college community by minimizing differences and emphasizing similarities.

In addition to continuing to wear brands like the Gap, Abercrombie & Fitch, and others, along with university branded apparel, informants also mentioned how shopping at Urban Outfitters, a retail store centrally located on campus, that carries a wide range of youth-oriented apparel, aided their attempts to fit the college fashion norm. As Melissa commented, " a lot of kids wear [Urban Outfitters] hear just 'cause it's everywhere." Although informants viewed the store's convenient location as the primary reason students shopped at Urban Outfitters, by wearing its clothes students felt more confident in their ability to communicate a "true" college identity. Yet, like the Normals' assertion that the clothes they purchased were unique and helped them express their individuality, college students view shopping at Urban Outfitters in a similar manner. As Julia suggested, Urban Outfitters is "not your run of the mill Gap or Express and, that like mass produces the like same thing over and over. It's just really fun and, I don't know, creative." Thus, subjectively, shopping at Urban Outfitters was viewed as an act of non-conformity, while objectively, due to the number of students who shopped there, it can be viewed as a form of conformity contributing to a feeling of communitas, similar to that developed by wearing university branded apparel.

Through their similar use of fashion, college freshmen generate a sense of communitas that helps them transition into their new role as college students. That is, they appear to minimize their distinct high school identity (e.g., as a member of the Populars) in favor of maximizing the similarities between members of their new peer group. In essence, college freshmen appear to engage in a game of *mimicry*. Freshmen apply the limited cultural capital they have acquired during their first few days and weeks on campus, especially in regard to fashion, to make themselves believe, or make others believe, they are someone other than whom they truly are (Caillois 1961), or at least a different person than they had previously been categorized as in high school. Moreover, instead of accepting a position as a liminar freshmen play with fashion, by wearing university branded clothing or shopping at Urban Outfitters, to convince themselves and others that they belong on campus, that they are indeed college students.

**The End of the Liminal**

Despite the initial feelings of communitas generated by wearing similar clothing, communitas is inherently a temporary state. As mentioned previously, informants stated that college fashion was very similar to that in high school, with slight deviations. As such, the nuanced styles present in high school ultimately reappeared on the college campus as well. These nuances were masked, however, by students' desire to fit in on campus, the desire that contributed to feelings of communitas. However, as time progressed and students become more confident in their new identity as college students, the feeling of communitas dissipated and social divisions reemerged. Although students remained in a liminal phase in regard to their position within society at large, feelings of communitas ended.

Although during the first interview informants' discussion of fashion focused on how similar students' fashion was, during the second interview informants' comments centered on how students' fashion differed, and how these differences represented social distinctions. In addition to discussing fashion distinctions in similar terms to those described when discussing high school fashion, informants mentioned two brands distinct to the college peer culture. The North Face and Ugg Boots, unlike brands prevalent in the high school context, were not common in informants' high schools and, therefore, were perceived by informants as symbolic of a college identity. April's comments are illustrative of how informants discussed these items:

It's funny because me and my roommate were talking about the status symbols on campus…cause we went and got North Face fleece for Christmas, like from our parents. But we went and got 'em because they don't really have 'em at home. And um, we're just like "Oh, all we have to do now is get some Ugg Boots and an iPod and we'll be like everyone else on campus." 'Cause that's really how it is. Like there's things that you want and you don't even know why you want them. But like when you think about it, you look around and everybody has 'em. Like everyone has North Face fleece and like, sure, yeah, it's warm and it's nice. But I probably wanted it because everyone else has it. It's the same with Ugg Boots and iPods; everyone has 'em.

Although representing a symbolic marker of belonging, these brands, despite April's perceptions, were not nearly as prevalent on campus as university branded apparel, especially among freshmen. One potential explanation to this fact is that freshmen acquired the needed cultural capital to recognize these items over time, especially since they were not present in their high school milieu. In other words, they did not initially realize that at this university these brands were markers of belonging. Another interpretation, however, could be that unlike purchasing university branded apparel, a relatively affordable item (t-shirts begin at $5), and shopping, or simply browsing, at Urban Outfitters, acquiring a North Face fleece ($70+) or Ugg Boots ($160+) required a higher level of economic capital. Thus, despite being fairly prevalent on campus, not all members of the peer culture could afford them. For instance, April, who comes from a middle-class background, got her North Face fleece as a gift from her parents. However, due to her self-described limited financial situation she was unable to purchase Ugg Boots. Consequently, they remained a marker of status in her mind. As she later commented:

I can remember one time that me and my roommate were like sitting there and we saw this girl that we see a lot and she was like "she's so pretty." And she's like, "Ahh, look. She has those Ugg Boots. And they're real Ugg Boots!" Because they have like the fake ones and all that. But it was like she has the real ones, she must be rich…If we see someone with them we'll be like "Oh those are so cute. And they're real!"

Although Ugg Boots appear to become the focus of an ongoing joke between April and her roommate, it also becomes illustrative of how April feels left out, to a certain extent, of the college peer culture. Because she views Ugg Boots as a marker of a college identity, a marker she has yet to acquire, she is quite aware of others who possess them. Moreover, this example illustrates that agôn, the competitive form of play, manifests itself even in mimicry. April aspires to dress like those individuals who possess all of the markers of a college identity, but when she is unable to do so she expresses her longing through observation of, and commentary on, others' fashion choices. In this case, a particular brand, a brand that potentially could have served as a source of communitas, served as a source of social division due to the necessary economic capital needed to purchase the item.

Other fashion choices also emerged over time that contributed to social divisions. For instance, informants' consistently commented how the fashion choices of sorority members differentiated

them from the larger peer culture. Commenting on sorority members, Annie, a non-sorority member, stated:

> Oh you know! The sorority girls are just very, they're very, you can just tell. They are either wearing huge sunglasses and their purses and the collared polo shirts, driving Range Rovers. You can just tell. It's actually, they have a very distinct crowd. They are very rich, they get to wear, they're on mom and dad's dime so they get to wear whatever they want and it definitely shows.

Here the tension April felt in regard to her inability to purchase Ugg Boots becomes even more palpable. Annie, who came from a professional middle class background, interpreted the clothes, accessories, and automobiles sorority members owned as requiring high levels of economic capital. Because she could not afford or chose not to purchase these items she recognized a social divide between these individuals and herself. The distinction between those possessing high levels and those possessing lower levels of economic capital, a tension extremely apparent in contemporary American society, not surprisingly appears to manifests itself in the college setting as well.

Another social division that emerged over time appeared not to revolve around fashion per se, but more on behavior. Specifically, informants discussed a division between those who partied, define by the students as going "out" numerous times a week, drinking was often discussed but was not required, and those who did not. Despite being a division based on behavior, it was a division that was reinforced by fashion. While non-partiers and partiers alike were described as following the typical college fashion norm (i.e., a more relaxed version of the high school fashion norm) during a typical day, partiers adhered to a different fashion norm when they went out. According to Emma, a non-partier, it was quite easy to tell who goes out and who doesn't. "I mean in my opinion it's a lot like high school. They take forever to do each others' hair and makeup and pick out the perfect outfit." And, as Emma elaborated, if students were going out, then "the clothes better have a label!" Jessica, another non-partier, was able to provide a more detailed description of how she perceived partier's clothes differing from the non-partiers. "[Girls who go out] have the clubbing type clothes. You know, like the short skirts and the tops [that] always have sequins or beads on it, and you know, very low cut." In contrast, non-partiers did not alter their daily dress during the evening, and as such, were identifiable as non-partiers.

Through informants' comments it becomes apparent that, in comparison with the communitas felt during the early part of the semester, over time the social environment fragmented. The feelings of social cohesion that accompanied students' arrival on campus dissipated as students became better integrated into the peer culture, not only in regard to their fashion knowledge and choices but also in regard to forming peer groups and participating in campus activities. Fashion, a marker ignored other than to reaffirm social cohesion early in the semester, returned as a symbolic marker of social divisions recognized by members of the peer culture. In other words, the presence of agônistic play so prominent and divisive in the high school peer culture gave way to mimicry during the early part of the semester, which ultimately gave way to a more agônistic divisive form of mimicry and the return of agônistic play at the end of the first semester.

## DISCUSSION

The findings presented above present an interesting paradox. In a new milieu, a milieu that students perceive as being devoid of social divisions, fashion ultimately contributes to the formation of social divisions among peers. Despite feeling constrained by the divisions fashion created and maintained within the high school peer culture freshmen, after experiencing a brief period of communitas with their peers, appear content to let social divisions reemerge, with fashion as a symbolic marker of these divisions. The initial feelings of togetherness freshmen experience upon arriving on campus, a feeling facilitated by their separation from high school friends and family, cannot be maintained. Freshmen's perceptions of college as being representative of a utopian environment where everyone is free to be himself or herself and to be treated as equals crumble as objective social norms and structures reassert their dominance (Turner 1969). Although it is a relatively isolated environment (Bourdieu 1989a), the college environment is not so removed from the culture within which it is embedded as to be completely resistant to the structuring power of society at large.

Yet the experience of freshmen during the liminal phase of the college transition suggests that feelings of communitas can exist among people who share emotional experiences together. Whether the experience manifests itself during the liminal period of the college transition or during other liminal periods (e.g., Belk and Costa 1998; Kozinets 2002), fashion contributes to forming a sense of community among otherwise disparate individuals. By dressing in a similar fashion, students who may be struggling to feel a part of a larger community, and in many cases have yet to develop stable friendships on campus, are better able to deal with the uncertainty of their new environment. Fashion allows them to perceive that they are just like their peers; that they share something in common despite coming from different backgrounds. Moreover, fashion provides an opportunity for people to play with their identities, to present a specific identity to their peers, regardless of whether or not it is consistent with the reality the student experienced prior to arriving on campus.

To this point, however, it is necessary to mention that students' ability to play with their identity, whether expressed through fashion or other means, remains constrained by the habitus. That is because, as Bourdieu (1977) asserts, the habitus is transposable from one social environment to the next. It relies more on past experiences than it does on future experiences to determine practices. Consequently, although informants perceived themselves as free from the social constraints of high school and capable of enacting any identity they chose in the college environment, informants' personal style and perceptions of others' style did not alter drastically from how they described these things in regard to their high school experience. Informants who described themselves as Populars during high school continued to view themselves in this manner. Moreover, they often mentioned how they owned and wore North Face fleece jackets, Ugg Boots, and high-end brands in college. Likewise, informants who described themselves as Normals continued to rely on brands like Abercrombie & Fitch, American Eagle Outfitters, and the Gap as staples of their college wardrobe. Even when informants incorporated new brands into their wardrobe in their attempts to express a new college identity the vast majority of their practices and perceptions remained consistent with their high school practices and perceptions. For instance, April purchased a North Face fleece but still primarily wore the brands she wore in high school. Moreover, she viewed individuals who were able to purchase high-end brands as "rich," a term she did not use to describe herself.

The overall lack of informants who attempted to significantly alter their personal style, however, indicates the structuring power of the habitus. It appears the inertia of the habitus, the "*modus operandi* of which he is not the producer and has no conscious mastery" (Bourdieu 1977, 79), allows individuals to remain comfortable with their practices even when they transition to a new

field, a transition that arguably provides an opportunity for people to play with their practices and identity. Yet, practice rarely strays from "the limits of the group of agents possessing the schemes (of production and interpretation) implied in their production" (Bourdieu 1977, 80). In other words, the clothing students wore and felt comfortable in can be considered reflective of their past experience, the social class they belong to, and the composition of their collective levels of capital (Bourdieu 1984).

Therefore, it appears that not only does college control the allocation of status and privilege in contemporary society through the conferral of educational credentials it also continues the socialization process begun by primary and secondary educational institutions. That is, the socialization of students into a specific cultural tradition—a tradition which recognizes the symbolic nature of clothing and its ability to reinforce individuals' position in society. Moreover, this idea is reinforced by the fact that the way a student dresses may have ramifications in regard to what social groups individuals end up joining—which ultimately can influence potential career opportunities and future capital accumulation (Bourdieu 1989a).

In light of these conclusions, it is necessary to address some limitations of the current study. First, fashion is but one factor in a complex phenomenon, the structuring of society. So although clothing appears to contribute to the creation and reproduction of social divisions, the current study does not claim it is the only factor responsible for this process. Future research should continue to attempt to identify additional factors that contribute to this process. Second, gender differences may color the findings discussed above. The majority of informants in the current study were female, and as they mentioned, in contrast with female students, male students appeared less concerned with fashion choices and, in general, dressed in a very similar fashion. Again future research with a more representative sample of males and females, as well as with individuals possessing differing ethnic, racial, and income backgrounds is needed to support the centrality of fashion as a symbolic marker of social status on college campuses. Third, future research should include more diverse institutions of higher learning (e.g., private, liberal arts, technical colleges) to determine how the idiosyncratic nature of the various institutions may contribute to, or hinder, the use of fashion as a marker of social divisions.

The ultimate conclusion of the current study, however, is that individuals' ability to play, even during liminal periods, maintains an agônistic undertone and remains severely constrained by the power of the habitus. The consequence of this reality is that as individuals progress throughout their life course they remain on a relatively stable trajectory, albeit a trajectory that situates them within the competitive social structure of society. Although slight alterations may occur that result in a slight shift in trajectory for one particular individual, in general, social practices, specifically in this study the clothes one wears, reproduce and reinforce objective social structures.

# Heard but Not Seen: A Teenage Centric Approach to Music Consumption Research

Peter Nuttall, University of West of England, UK
Julie Tinson, University of Stirling, UK

## ABSTRACT

There are significant problems with published work on youth and music which principally involve methodological approach and data collection. This paper seeks to explore and develop the concept of teenagers designing their own questions, collecting their own data and interpreting their findings to contribute to an understanding of adolescent music consumption. Findings indicate that using a teenage centric approach generates insight into actual behaviour of respondents thus reducing social desirability issues and that the teenage interviewers were able to distinguish differing responses from friends and members of their friendship group.

## INTRODUCTION

Talbot (2005) argues that faced with an increasing array of competing 'lifestyle' products aimed at young consumers (e.g. television, films, games, mobile technology, and the internet) pre-teens may not be drawn to music as much as they once were. As these pre-teens mature then, there would be a dearth of music enthusiasts negatively impacting upon the sales of crossover acts currently helping the record industry to survive. It is now appropriate and perhaps essential for the industry to consider a more sophisticated way of researching and targeting a youth audience that has historically been regarded as a homogenous group of consumers.

Bennett (2002) indicates that there are significant problems with the existing published work on youth and music and makes an appeal for a more ethnographic approach when researching music. Cohen (1993) also suggests that attempting to place the participant in the context of their "day to day activities, relationships and experiences" (p124) is lacking from existing studies. The significance of contextualising and the inter-relationship between the individual and their environment ought not to be precluded from research studies on youth and music.

This study focuses on what respondents (participants) take into account and not, as with social science, what the researcher may wish to account for in an *a priori* fashion. Pollner and Emerson (2001) suggest that more recent forms of ethnographic research are concerned with 'living' the lived order. As such, there is a demand on the researcher to immerse him/herself more deeply into the actual practice or endeavour under investigation. A study is only accessible to those with the competence to participate in it. In this research therefore, it was necessary to interact as and with teenagers. In other words, the researchers attempted to achieve as closely as possible what Pollner and Emerson (2001) describe as "an auxiliary to the practitioner profession or work site under consideration" (p124). Given the age of the authors, it was impossible to interact with the teenagers as a teenager and obtain a fully ethnographic account of their 'lived' world.

Even though an ethnographic approach has been identified as having a number of methodological issues and limitations (see for example researcher guidelines: ESOMAR, 1999; MRS 2000), there are a number of positive attributes of employing *aspects* of this approach notwithstanding calls for this type of method to be employed. These include allowing the adolescent a greater opportunity to engage, design and interpret the research using a language that is familiar to them. As such the interviewer and interviewee will be able to engage in the mutual construction of meaning (Mills, 2001).

Kraak and Pelletier (1998) suggest an adult moderator should be replaced by a trained youth peer to obtain more reliable information and that this information should be collected in familiar surroundings. The trained youth peer (in the practitioner context discussed by Kraak and Pelletier) will typically be asking questions or facilitating activities that have been predetermined by the research teams for the benefit of the client organisation. Similar work conducted by Shermach (1996) discussed the use of peer guides aged 8-19 years who worked in pairs to lead team activities among 4-12-year-olds. Adult moderators behind the scenes, however, fed questions to the peer moderators to address specific consumption issues.

The limitations of these approaches are two-fold: there appears to be no input from the peer moderators in designing the questions and, perhaps as a result of this, the research does not consider what is important to the respondent (only what the researchers or clients think is relevant). Particularly with adolescents, negating the relevance of what is important to them will not facilitate a holistic understanding of their consumption behaviour. This may be particularly relevant in relation to popular music consumption which has traditionally been seen as pertaining to a youth market.

## MUSIC INDUSTRY YOUTH RESEARCH

Age, gender and class are the main criteria for presenting statistics and survey findings across a range of market and consumer data produced by the British Phonographic Industry (BPI), the International Federation of the Phonographic Industry (IFPI), Mintel,[1] Keynote, and Euromonitor (2005). However any distinctions that are made between groups within the teenage segment of consumers are limited to only some categories within the main statistical reports provided by these organisations and distinguish between early adolescent age groups (12-14 years) and older adolescents (15-19) with respect to 'choice of music', 'music downloading', 'purchasing by outlet' and 'music attitude statements' (Mintel only). All other adolescent consumer data is collapsed into the broader age classification of 12-19 years. This clearly produces a composite and only partial view of the adolescent consumer of popular music and represents a weakness in the industry's understanding and knowledge of their younger consumers. This research aims to contribute to an understanding of attitudes towards music, listening habits and preferences as well as positing an innovative approach to data collection and as such illustrates that a teenage centric interview method may be more insightful than research methods designed and implemented by adult researchers and traditionally used to elicit data from adolescent consumers.

## ADOLESCENCE AND MUSIC CONSUMPTION

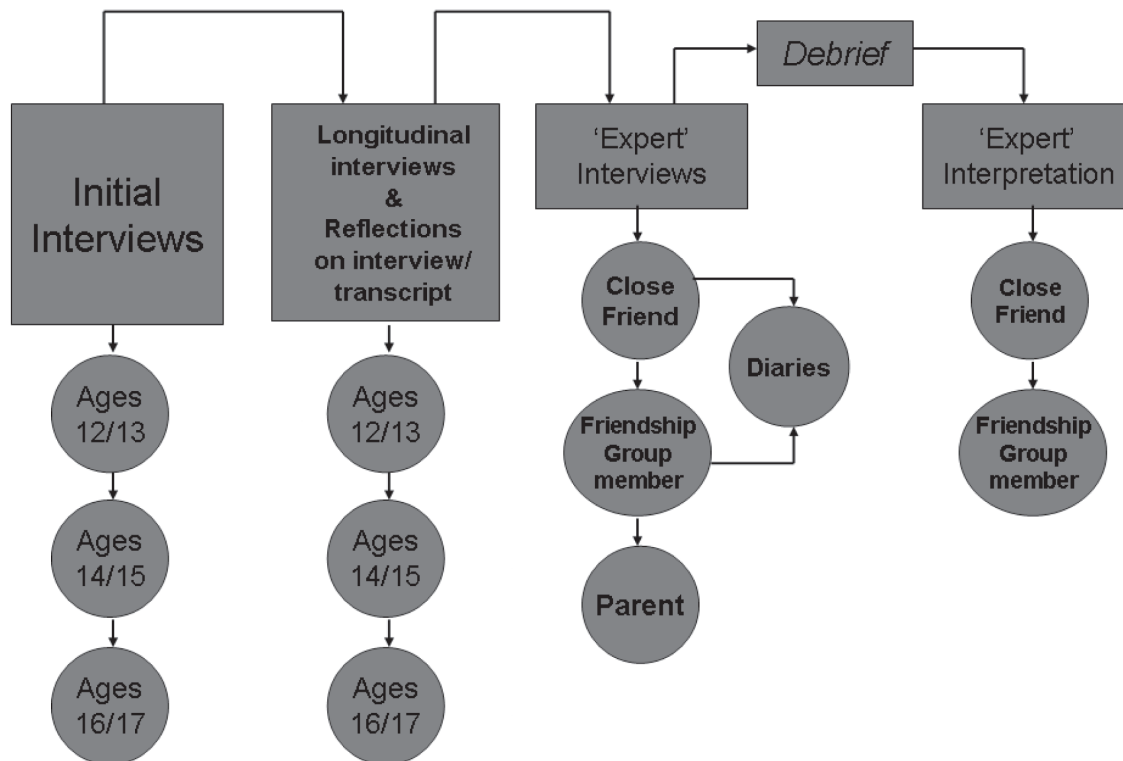
Music is known to be important in the social and personal lives of adolescents and as such many researchers have examined the role music has played in satisfying particular emotional needs (strategies for coping), social needs (belonging and identity) and developmental needs (the socialisation 'journey') [See Arnett, 1995b;

---

[1]Mintel also segments music purchasing data, retail outlet data and attitude statements by 'Working Status', 'Respondents Own Children', 'ACORN' and 'Lifestage' categories.

**DIAGRAM 1**
Overall Programme of Research

## Teenage centric method



Larson *et al*, 1989; Larson and Kubey, 1983; Levy and Windahl, 1985; Lull, 1987, 1992; Rubin 1994]. What perhaps is less obvious is an understanding of the contradictions teenagers often display relative to popular music consumption and the sometimes seeming inconsistency of their choice and use of music. It is this that would be of most use to the recorded music industry.

### THIS STUDY

This research therefore attempts to contextualise the data (in relation to what the teenagers believed was most important to them, how they consumed and used music, how often they listened to music and, perhaps most importantly, how they used it to express their identity) in order to move towards a more ethnographic approach by creating an opportunity for greater adolescent involvement in both designing and interpreting their own interviews. This method is akin to that used in the psychology discipline known as Interpretative Phenomenological Analysis (IPA) as described by Smith & Osborn (2003). The IPA method considers how an 'insider's perspective' can be obtained when the researcher cannot do it themselves either directly or completely. This approach could be considered an 'ethno-extension' method as it builds upon our traditional understanding of ethnography.

Diagram 1 provides an overview of the way in which this research followed both a sequential and emergent approach where later stages in the research were both influenced and informed by previous stages. The initial interviews built on previous exploratory work conducted and published by the authors. This pilot work included conducting a mini-group (a simulated situation in which the teenagers were asked to be DJs playing to selected group of friends) followed by a number of exploratory interviews. As a consequence of the findings from this previous research the author

became increasingly aware of the need to employ a more ethnographic approach.

### RESEARCH METHODOLOGY QUESTIONS

* Can a greater understanding of adolescent music consumption be achieved by using teenage interviewers?
* Will using a more teenage centric approach provide different results to more traditional methods?
* Are there implications for future studies conducted with adolescents?

### METHODOLOGY AND RESEARCH APPROACH

Initially teenagers were interviewed in a traditional manner to explore their music consumption habits to allow accurate and inclusive personal accounts to be recorded. In-depth interviews were designed to be purposeful, ensuring interviewee time was carefully utilised and interviewer effects were minimised by the use of specific questions (Hollway and Jefferson, 2000). The appealing feature of interviews as a research tool is the opportunity for the interviewee to respond in their own words to express their own personal perspectives. As the intention was both to explore music consumption and to allow the researchers to immerse themselves in the phenomena under investigation the in-depth interview approach was considered an appropriate method.

However, in order to employ a more ethnographic approach to the study, the authors then recruited 10 teenagers (all of whom had been interviewed twice for the longitudinal research) to conduct their own research on a close friend and a member of a friendship group in relation to music use, choice and consumption and the way in which this was expressed through identity formation. It has been noted that it is necessary to differentiate the roles of close friends

and the wider social group and to consider the influence of non-parental adults (Arnett, 1995b; Buysse and Oost, 1997; Claes *et al*, 2005 and Vincent and McCabe, 2000). Aggregated findings that consider friendship groups or families as a whole are known to mask the distinct differences between the two. As such, the expert interviews sought to establish if there was a difference between the two groups in terms of music consumption.

While the initial interviews provided breadth and depth of data, allowing the authors to explore the key themes identified in the literature and subsequent issues that emerged from the initial stages of research, a more ethnographic approach could potentially add a further dimension to the overall findings. It is acknowledged that any interviewer (regardless of age) can affect the rate and quality of responses (Singer, Frankel and Glassman, 1983). Yet the draw of a more ethnographic approach, which would afford an otherwise unobtainable insight into the culture, cultural text and sub-text of adolescents (including language short-hand), was appealing enough to find a way in which the research could be conducted by adolescents ranging from 12 years to 18 years albeit with some limitations. It would also offer the opportunity to triangulate the data, that is, "use different kinds of measurements which provide repeated verification" (Miles and Huberman 1984: 234) from the initial interview stage.

## CONTEXT

The 'expert' interviews were to give another social context in which the research could be conducted. The interviewers were known as 'experts' as (a) they were familiar with the context and objectives of the research and (b) they were possibly able to obtain data otherwise impossible for the author to collect because of their age and their position within their friend and peer groups. Additionally, (c) they were given a 'training session' on interviewing and they designed their own interviews through tasks (i.e. collage construction) with the authors and (d) they would 'interpret' the data.

To maximise the conversational and ethnographic aspect of the expert interview, the questions used in the interview were designed by the adolescents themselves, based on the themes generated within the study's conceptual framework (See Tables 1a & 1b). Two groups of experts were invited to participate (12-14-year-olds and 15-18-year-olds). These two age 'groups' were chosen as Harvey and Byrd (1998) indicate that *early adolescence* is mostly about acquiring information and experience, while *late adolescence* is characterised as being a period of identity development in which the information obtained earlier is used to build and consolidate a new identity. As such, the importance of the social context might change over the course of development and this would be easier to determine if these two age groups were used.

As can be seen in Table 1a & 1b the interview questions designed within the given themes by the older adolescent group differ in various ways from the questions created by the younger group. As may have been expected the older group produced on average a greater number of questions under each theme. They tended to be more sophisticated and enquiring in nature. The older group also demonstrated their better understanding of the research and its objectives by positing questions that were designed to explore in more depth aspects related to identity, social contexts and behaviour relating to music consumption and use.

## DESIGN

The questions the teenagers asked their friends arose from discussions that centred on collages the recruited experts made together at the start of each 'training' session. The teenage research-ers were given a variety of music/teenage interest magazines and were asked to generate collages using clippings from the magazines under a number of relevant headings. The adolescents then made up their own questions discussed and agreed within the group. They were then supplied with the materials to conduct the interviews, instructions on ethical issues and means of contacting the researchers in cases of difficulty and/or need for more general support.

Having conducted the interviews with their friends, all of the experts provided an interpretation of their peer interviews. To facilitate the interviews, the experts chosen were provided with the transcripts of the interviews they conducted with their friends and audio recordings of the same interviews. The experts were then asked to go through the transcripts and listen to the tapes after which they were asked to interpret the findings. A tape-recording was made of the experts' interpretations as they discussed their own interviews. The interpretation of each interview transcript was divided into the 10 themes related to the meaning of music, identity and self expression through music and music listening and consumption. These were identified during the initial phase of research. At each stage, very brief prompts were provided by the researcher and are summarised below:

- In your own words, what did you understand about what your friend was telling you here?
- How easy was it for your friend to answer these particular questions?
- Do you think your friend was hiding anything or did s/he surprise you with anything they said?
- How honest do you think your friend was being?

## SAMPLE

Each expert interviewed two friends (a close friend and a member of a friendship group). There are a greater number of female 'expert' adolescents (7 female and 3 male experts) but this is because they were more interested in taking part in the study. This interest in the research was a factor in recruitment as the author believed the research process was likely to run more smoothly if the experts were 'engaged' with the project. Of course a limitation of using the approach is that those with good communication skills were more likely to volunteer and as such their sample of friends chosen for interview may reflect this. However, as this aspect of the overall research study was both exploratory and experimental, the sampling frame was considered appropriate to meet the objectives of this aspect of the research.

## RESEARCH METHOD FINDINGS

The insights, where observed, will be discussed under the headings of Interviewer Effect/Social Desirability Issues and Context, Friendship Type and Stage of Adolescence. To help illustrate the findings relevant quotes from the discussions the researcher had with the teenage interviewers during the self interpretation stage of the study are provided under each heading.

## INTERVIEWER EFFECT/SOCIAL DESIRABILITY ISSUES AND CONTEXT

The self-interpretation of the interviews conducted by the teenage expert was extremely insightful–particularly in relation to the methodological contribution. That is, by asking the teenager researchers to interpret their own interviews, a rich context could be added to the basic transcribed words from the interview (Mills, 2001). Courtesy of the 'personal' knowledge that the teenage interviewer possessed about their friends, the *actual* behaviour of the teenage respondent was often used to support the expert's

**TABLE1A**
Interview Questions Designed by Each Group of Experts

| InterviewThemes | Early (Younger) Adolescent Sample | Later (Older) Adolescent Sample |
|---|---|---|
| **1. Things which are really important** | *Questions E1*<br>• What is important to you in life generally?<br>• Give examples of brothers & sisters, other family, friends, fashion, money, health, lyrics, advice on life, looks and appearance, clothing, etc<br>• Do you have a role model? If so, does it affect you in the way you dress, talk and behave? | *Questions L1*<br>• Would you listen to music just because it made you laugh?<br>• Do you listen to music just because other people do?<br>• If you could only take one thing with you to a desert island would it be music related?<br>• What is really important to you and why? |
| **2. Places they would listen to music on their own** | *Questions E2*<br>• Do you listen to music on your own?<br>• If so, where do you listen to music on your own?<br>• Would you rather listen to music through headphones or in a room on your own with the door closed and blast it out? | *Questions L2*<br>• Do you listen to music in your underwear? Why?<br>• Where do you listen to music?<br>• If you listen to music alone will it be of a more subdued genre than that which you would listen to amongst companions?<br>• Do you need to listen to music to help you concentrate?<br>• Do you feel less on your own when you listen music on the bus? |
| **3. Music they would listen to with their friends** | *Questions E3*<br>• Would you be influenced by your friends?<br>• What types of music would you listen to with your friends?<br>• (If female/Male) Is it just male/female artists you listen to? And why? | *Questions L3*<br>• Do you dance when you listen to music with your friends?<br>• Do you feel that you have to listen to certain types of music to get new friends? Or more better friends?<br>• Do you feel more free when you listen to music with friends?<br>• Would you sing along to music with friends in public? |
| **4. Music they would listen to with their family** | *Questions E4*<br>• Do you and your family listen to music together?<br>• Do your parents listen to music they grew up with or do they listen to a bit of both?<br>• Do you listen to music with your brothers and sisters? If so what? | *Questions L4*<br>• Have your parents influenced your taste in music?<br>• Is the music you listen to with your parents the same music you listen to with your friends/or on your own?<br>• Do your siblings influence your music taste? How?<br>• Would you know your parents' music tastes enough to buy them a CD for a present? |
| **5. Things that influence or have influenced the music they like** | *Questions E5*<br>• Do male or female celebrities influence the music you choose?<br>• Do awards influence the music you like?<br>• Do your moods influence the music you choose? | *Questions L5*<br>• Would you buy a CD just on the recommendation of your friends?<br>• Would you go to a concert before they heard a CD?<br>• Does fashion and style influence the music you listen to? |

**TABLE1B**
Interview Questions Designed by Each Group of Experts

| Interview Themes | Early (Younger) Adolescent Sample | Later (Older) Adolescent Sample |
|---|---|---|
| **6. Music says something about who they are / what other people are like** | *Questions E6*<br>• Does you personality show through your music?<br>• Are you sometimes mistaken for someone you're not because of the music you listen to?<br>• Does the music you like reflect your attitude towards things?<br>• Does music say something about what other people are like? | *Questions L6*<br>• Do people change depending on what music they listen to?<br>• If someone asked you what bands you like would you only mention bands you thought would make you look good?<br>• Would you think less of someone if they liked crap music? Why? |
| **7. What music means to them and how it makes them feel** | *Questions E7*<br>• What does music mean to you?<br>• Do you listen to music for a specific reason?<br>• If you are happy or sad does that affect the music you listen to? | *Questions L7*<br>• Do certain songs remind you of certain people? Why?<br>• Does music make you feel individual?<br>• If you were depressed could music cheer you up?<br>• If there are problems in your life do you listen to music that makes you feel sad? |
| **8. Music that's in** | *Questions E8*<br>• In your opinion what music do you think is in?<br>• What about these styles: R'n'B, Hip Hop, Rock, Pop or Indie | *Questions L8*<br>• Even if you didn't like a band, would you stalk them just to say you had met them?<br>• Would you avoid music cause everyone else likes them? Why?<br>• Do you listen to or watch programmes that promote music e.g. Popworld, CD UK, TOTP? |
| **9. Music they listen to that's cool** | *Questions E9*<br>• Do you think the music you listen is cool or not?– What kid of music is that?<br>• Do you follow the crowd or do you just listen to music you like? | *Questions L9*<br>• Is retro music more cool than modern music?<br>• Define cool? What makes music cool?<br>• Is cool music different to good music? |
| **10. Things they buy or own that show others the kind of music they like** | *Questions E10*<br>• Does your style or the way you dress show your personality to others?<br>• What do you buy or own that shows others the kind of music you like– examples: clothing, hair styles, ring tones, CDs, the way I dress | *Questions L10*<br>• Would you wear PVC trousers/clothing even if it made you feel really uncomfortable because they linked to your music?<br>• Would you dress like members of bands you appreciate?<br>• Would you wear clothes to advertise bands you are into? Why? |

interpretation of the interviews. The following quotes from the researcher's discussion with the teenage interviewer during the self interpretation stage of the research help illustrate this point:

(Key: *R*–Researcher T–Teenage Interviewer)

*R -  Do you know her brothers and sisters and her family? (See Questions E4, Table 1a)*

T -  Yes, I'm staying with them in 11 days

*R-  So do you agree that's how your friend behaves when she's with her family?*

T -  Yes because I do know that she does listen to music with her family, I mean that's very honest, she didn't cover anything up there. I would have thought some people would have been a bit maybe embarrassed or they didn't really want to say they listened to The Lighthouse Family, Tina Turner. Obviously she laughed when she said Tina Turner because maybe she thought, oh that may be quite funny for somebody else. Maybe she was trying to make a joke of it as if to say, well I do listen to it but maybe if I make it into a joke or try and make it funny, then maybe they won't take it that way.

This reduced the impact of interviewer effect and addressed some of the social desirability issues in relation to the responses provided and gave the findings from the interviews a context and meaning that the researcher would have found extremely difficult to obtain on their own merit. Again, quotes from the self interpretation stage of the research help illustrate this:

*R -  This is your close friend responding to question 5 (See E5, Table 1a). What did you understand about what your friend was telling you here?*

T -  There is a lot to say about that one. When I said, do [music] awards influence the music you like? It was a very quick response, she said 'yup'. I don't think she does, I just think she said it just because she said yes to the first question, yeah they do and then she kind of yup, yup. I think she was just trying to get through it, I don't think that's particularly true. I don't think she was being honest and obviously the last one I had to keep prompting her, you know hand movements and whispering.

*R -  This is the response from your other friend to question 5. Tell me about this. How honest do you think your friend was being? (See E5, Table 1a)*

T -  Well she took a bit of a pause when she answered. She's very into watching like soap awards and soaps and all that and obviously like celebrity things, you know like Celebrity Love Island and all that. But I think that's very true, I don't think celebrities do influence her at all because she likes different types of music, she's not one of those people that just has one, you know like R and B for example and that's all she listens to, she listens to like heavy rock and if her sister wants to listen to pop she'll quite happily listen to that. So she was being quite honest.

## FRIENDSHIP TYPE

The teenage 'expert' interviewer indicated that closer friends were less nervous when being interviewed and the interviewer was more inclined to challenge the answers of the closer friend. This may also somewhat explain the inconsistency of music use and choice as closer friends may feel more comfortable choosing and using their preferred music when they are more confident in the

company they keep (situational consumption). During the self interpretation stage the following teenage interviewer commented:

*R -  Tell me about this response to question 7 from your other friend (not close friend) (See L7, Table 1b)*

T -  When I asked what does music mean to you and how does it make you feel, instead of saying, oh it means a lot to me, she just said, I kind of relax and be myself and just go completely mad. I think she went for the 'feel' bit of the question rather than the actual question, she just kind of focused on the, how it made her feel rather than what it means to her.

*R-  When you were listening to her answers what did you think?*

T -  Well I could tell that she was trying to expand rather than tell me what she felt. I think maybe the questions were too long or she didn't understand which part she had to answer. I think she goes off the point a lot, so I said if you're upset would you want to listen to the lyrics and she said, the lyrics have something that maybe relate to what happened in your day, say you had a fight and there's maybe a lyric or two that kind of sound like what happened in your day, or do you listen to the tune, if it's like really angry type of music. But she went on to say that she liked singing, yes she does but that wasn't the question. She was using her body language, again she was moving around a lot. I think at one point her head was like there and you know the tape player was over here, so I had to kind of say like, sit up, can't hear you, she was using body language as if to say, oh I'm a bit nervous.

Perhaps one of the most interesting 'expert' findings relates to the differences that the teenage experts perceived between their close friend and the member of their friendship group. The teenage researcher was more readily able to identify instances of multiple selves (Goffman, 1963) in the member of a friendship group, but less able to do so for the close friend. It's possible that the close friend expressed fewer 'selves' generally, but a more likely explanation may be that the close friend only showed a 'particular self' to the teenage interviewer or that the teenage interviewer only chose to see the 'self' of the respondent that most reflected who they thought their friend was (and as such allowed the teenage interviewer to position themselves socially within a larger friendship group).

*R -  So, your close friend's response to questions 8 and 9? Tell me about this answer. (See E8 & E9, Table 1b)*

T -  She says R&B is cool and then she was trying to think of something else to say because she realised she kept saying the same thing and then she repeated what I said, I said so a bit mixed and she was like, yeah a bit mixed. Then I said, do you follow the crowd and then she kind of huffed, I think she was trying to make a point–'I don't follow the crowd, I listen to music I like'. I think you know when I said that, she was kind of, I listen to music I like. I think she gave me, not a frown exactly but just maybe a look…you know do you follow the crowd type of thing and she kind of went 'No I like the music I like', you know evil eyes.

## STAGE OF ADOLESCENCE

Although a reduction in socially desirable responding has been noted already as one of the key benefits to be gained from a

teenage centric approach, more sensitive and personal aspects of music consumption were still difficult to ascertain within the teenage peer interview stage. The self interpretation stage of the research provided further insight into the differences between younger and older adolescents with respect to music consumption, self concept and self identity.

As noted earlier, Harvey and Byrd (1998) have indicated that subtle but important differences exist between *early adolescence* and *late adolescence* with regard to identity development. Findings gathered during longitudinal depth interview stage of the study revealed that peer group influence appears to be more intense for younger teenagers and it seems more difficult for adolescents in this age group to "commit" to what music they liked as opposed to what they disliked. As Hogg & Banister (2001) suggest, the reason for this may be that the negative aspects of consumption choices carry significant meaning in creating personal, social and cultural identities. This also emphasises the social significance of music. Indeed sharing music is very personal for this younger age group and knowledge of other peoples' music taste is considered intimate. As a result this is likely to be a subject area that is more difficult to explore and identify even within the peer interview research stage.

The longitudinal interviews also suggested that older teenagers were more philosophical about music tastes and were far less likely to display any anxiety about listening to music publicly or privately. The following quotes from the self interpretation stage, firstly with a younger teenage interviewer followed by an older teenage interviewer help to illustrate further the value of this research method in offering greater insight into particularly sensitive or personal aspects of the research:

> R- *Tell me about this answer. How honest do you think your friend was being? (See Questions E1, Table 1a)*
>
> T - I think she hesitated here, I think she was thinking of how to say it. I think she was…..well not quite embarrassed but quite shy of saying that she didn't have a role model, I think it's because she was a bit doubtful about saying too much, and saying no I don't have one. She probably just thinks that because I asked her that, that most people have one maybe and she thought, oh I don't have one and she was trying to think whether she should say yes and just think of one, or say no.
>
> R - *Do you think your friend was hiding anything, did he surprise you with his answer at all? (See Questions L1, Table* 1a)
>
> T - Not really, I think he knows what he likes and doesn't really mind being open about it. He'll put up with my music coz we have that sort of understanding you know. As a rule most people are going to be more open-minded when they're with their friends because they've got to put up with other people's music taste. Normally, if the friends are close enough and there's no real option of escaping it, then that can lead to mutation I guess.

## TRADITION VERSUS INNOVATION

The first reason for employing an 'ethno-extension' approach was to ascertain if a more teenage centric approach would provide a deeper understanding of music consumption and use than that obtained by the researchers alone during the initial teenage interviewing stage. It has clearly been identified above that there are specific advantages to recruiting teenagers to conduct research and interpret findings. The second research question was whether a traditional approach would provide different findings to those obtained by the researchers. This triangulation (teenage 'experts' exploring music choice, use and consumption) however supported the initial findings of the longitudinal in-depth interviews that identified that those raised in blended and single parent families used music to build bridges, intensify relationships or exclude family members and that teenagers raised in 'intact' or traditional families were more eclectic in their music tastes.

Interestingly, 'shared knowledge' between the friends made questions about specific music tastes (from teenager to teenager) obsolete and were considered 'unnecessary' or boring by respondents. This may indicate that using both a traditional research approach and a more ethnographic approach in combination will yield greater understanding of the subject in question as a more holistic view is likely to be achieved.

## IMPLICATIONS FOR FUTURE RESEARCH

This methodological approach contributed to a richer understanding of the themes within the research as the teenagers wrote their own questions in their own words. This automatically provided a more teenage-centric piece of research design and would potentially elicit a different response to the questions posed by the authors. This approach also afforded significant methodological contributions including: (a) insight into actual behaviour of respondents thus reducing the ability of the teenager to self present an alternative reality, (b) the teenage researcher was able to recall 'body language' used during the interview and the implications this had for what was being said and (c) the differences in perception between close friend and member of a friendship group. The contribution made by this method also encompassed the fluidity of the interview and interviewee credibility in terms of trust and familiarity. Finally, their understanding of the context of the responses given by their friends (personal knowledge) allowed the interview to evolve in a more ethnographic fashion through greater contextualisation of the discussion, much of which was recorded in the transcript. Future researchers ought to be encouraged to employ aspects of ethnography where a full ethnographic approach is unattainable given the positive and cohesive results from this particular study. Ethical issues, however, are paramount and the design and context of the study ought to be fully considered and approved before research is commenced.

# On the Role of Materialism in the Relationship Between Death Anxiety and Quality of Life

Bertrand Urien, Université de Bretagne Occidentale, France
William Kilbourne, Clemson University, USA

## ABSTRACT

The role of death anxiety as a factor in consumption behavior has received considerable attention recently. While death anxiety and materialism have been examined together, as have materialism and quality of life, the relationship between the three concepts simultaneously has not been tested. The purpose of this paper was to examine the three constructs in a single structural equation model to determine their direct and indirect relationships. It was shown that death anxiety did affect materialistic values which then influenced quality of life perceptions. There was no direct effect for death anxiety and quality of life.

## INTRODUCTION

The influence of different aspects of the experience of death on consumer behavior has been investigated for about 10 years. This stream of research first dealt with the painful subject of the death of a spouse (Gentry et al. 1995a). This research analyzed what Gentry et al. (1995b) referred to as liminality, the state of vulnerability throughout the transition period during which a person is experiencing the trauma caused by the death of a beloved subject. Another death related subject has been the disposition of special possessions (Lastovicka and Fernandez 2005; Young and Wallendorf 1989). Stevenson and Kates (1999), for example, analyzed the meaning of the "last gift" in the specific context of dying from AIDS. Finally, and more recently, marketers examined the importance of a new psychosocial theory dealing with death called Terror Management Theory (TMT) (Greenberg et al. 1990; Greenberg et al. 1992). This research examined various consumption implications in marketing and new ways of understanding classical consumer research topics like conspicuous consumption and materialism (Arndt et al. 2004b). These studies broadly show that death saliency can precipitate forms of materialism. However, if death anxiety (DA) could be considered as a new variable in materialism, then much remains to be known about the strength, nature, and consequences of this relationship.

Conceptually and empirically, DA has typically been considered as a psychological state. Although Kasser and Sheldon (2000) demonstrated that materialism can be enhanced when a mortality related situation is induced in individuals, it is still not clear that DA, as a trait, can be a good predictor of materialism. In addition, Richins and Dawson's (1992) values approach to materialism, while it has received considerable empirical support in several different contexts, has not been tested in relation to DA. In their approach, materialism is characterized as a three dimensional construct with happiness, success, and centrality as the three values dimensions.

Finally, while DA and materialism have been examined together, as have materialism and quality of life (QOL) (see for example Arndt et al. 2004a; Rindfleisch and Burroughs 2004), the relationship between the three concepts simultaneously has not been tested. Is there a direct or indirect relationship between DA and quality of life? Could materialism be considered as a whole or partial mediator between DA and quality of life? Questions like these remain to be answered. The purpose of this paper is to examine the three constructs in a single structural equation model to determine their direct and indirect relationships. We will first examine DA and its related coping behaviors and then propose hypotheses relating the three constructs.

## The Concept of Death Anxiety

Since the first studies carried out by Feifel (1995), more than a thousand papers have dealt with the definition, causes, and behavioral consequences of DA. For instance, the two American journals, *Journal of Death and Dying: Omega* and *Death Studies* are entirely dedicated to this topic. Considering the huge volume of available literature about DA, this field of study is very important in thanatology. From the various definitions and reviews extant, we will first introduce the primary characteristics of DA, and then we will offer a working definition of the concept as used in this paper. This is not with the intention of providing a unifying definition, but to provide clarity within the discussion that follows.

While many authors qualify DA as an emotional reaction, Neimeyer (1994) is more precise and defines DA as a set of attitudes held by a person faced with death. The attitudes are characterized by negative feelings such as fear, anxiety, and discomfort. One should note that the concept currently includes a range of emotional reactions of varying intensity. More recent attempts to define DA refer to anxiety about the idea of a state during which the self does not exist (Tomer and Grafton 1996).

Dimensionality of the construct is also at issue. While the first studies introduced DA as a one dimensional construct, attempts are now made to distinguish between several sub-dimensions (see review by Neimeyer 1997-1998). Neimeyer (1994) suggests that, while an overall anxiety about the idea of ceasing to be is likely, anxiety can be broken down into several sub-dimensions depending on the type of death-related thought (destruction of the body, physical and mental condition, etc.) upon which one is focused.

The nature of DA is also an unresolved issue. DA could be considered either as a state or as a trait. Dickstein (1972) and Neimeyer (1994) consider it as a personality trait that can slightly change according to one's position in the individual life cycle. The considerations mentioned above led us to define DA operationally as a set of negative emotional reactions of variable intensity induced by the idea that the self does not exist (Urien 2003; Urien 2007).

## Variables Affecting Death Anxiety

Everyone may experience DA, but to varying degrees. Many studies have tried to determine the socio-demographic and psychological profile of persons who show a more or less anxious tendency when confronted in some way with death. Pollak (1980), in a review of the literature, tried to structure the studies related to DA and highlight the important contradictions in the results.

Contrary to what one might intuit, however, death awareness and its related anxiety are not restricted to the elderly. The first studies on DA had been based on the assumption that the elderly, who are approaching the end of their lives, feel more anxious about death. This assumption has been called into question by various empirical studies (Rigdon et al. 1979). This prompted Gesser et al. (1987) to propose a nonlinear relationship between age and DA. Other studies have shown that older adults are less concerned about death than other ages (Neimeyer et al. 1988; Neimeyer and Van Brunt 1995), and anxiety becomes more stable at the end of life (Fortner and Neimeyer 1999). The interpretation of this result is still open. One of the suggested explanations is based on the psychosocial theory by Erikson (1963). This states that, over their lives, people progress through a series of stages, or crises. By the end of their lives, throughout the last stage, the elderly can attain ego

integrity in the acceptance of their own deaths. But this is only a tendency. Indeed, individual differences do exist inside this age group depending on whether the retrospective vision of one's life focuses on missed opportunities and numerous failed objectives or leads to the conclusion that life was rich and full with few regrets.

Culture and religion can also affect DA. Cross-cultural empirical studies, focusing on the comparison of Western and Eastern cultures (mainly Chinese, Malayan, and Indian cultures) show that the Western cultures are generally more anxious than the Eastern cultures (McMordie and Kumar 1984; Schumaker et al. 1991; Westman and Canter 1985). An important explanation can be found in the systems of Eastern religious beliefs. Buddhism and Hinduism are examples of religions beginning with the precept that the most effective manner to overcome death is to accept it as the fist element of life (Schumaker et al. 1991; Weisz et al. 1984). However, beyond the religious confession, the role held by religiosity appears also important. A comparative study (Schumaker et al. 1991) shows, paradoxically, that the Japanese (Eastern culture) appear overall more anxious about death than Australians (Western culture). One possible explanation is that the intensity of beliefs and religious practices is particularly low in Japan.

## Coping Behavior and Death Anxiety

We now turn to the behavioral mechanisms involved in the adaptation to DA. When individuals are confronted with the idea of their own death, various theories have shown that they develop means through which the preservation of the self ensues. The means can be direct, taking the form of physiological necessities, and/or indirect, taking the form of symbols. Only the symbol forms have been the subject of investigations by researchers in DA. In this respect, two major theoretical consequences have resulted. The first was the development of Terror Management Theory (TMT) (Solomon et al. 1991) which deals with self-esteem and faith in a cultural worldview. The second is evidenced by the development of several theories dealing with the extended self and generativity.

## Terror Management Theory: A Broad Outline

Related to Becker's (1973) earlier theory of the denial of death, TMT constitutes one of the main psychosocial theories published in the past fifteen years. First identified by Greenberg, Pyszczynski, and Solomon (1990; 1992), this theory states that DA is the emotional manifestation of the fundamental instinct of self-preservation. Preservation of the self may be fulfilled through direct means (e.g., remaining healthy, avoiding bad food), but also, and more importantly, through symbolic means related to the individual's culture. To be more precise, there are two symbolic and closely linked self-preservation mechanisms. The first is unfailing support of the worldviews and values of one's culture, and the second is increasing one's self-esteem–a goal which may be reached by adopting culturally valued behaviors.

While culture can offer immortality through religion, it also contributes to creating a cultural framework or "worldview" composed of values clearly identifiable by individuals. Indeed, faith allows us to feel at one with other people from the same culture, and this makes us feel like we belong to a structure larger than ourselves. As for adaptation grounded on self-esteem, the more individuals subscribe to and respect the values of their culture, the more their self-esteem increases and the less anxious they feel about their own deaths. Experimental studies have shown that behavioral adaptation can lead, among other things, to materialism, conspicuous consumption, and greed. Of these, materialism is the adaptive behavior upon which the present study is focused.

Regarding materialism as an adaptive behavior, Arndt et al. (2004b) concluded that, after the terrorist attacks of September 11, 2001, Americans started buying more houses, cars, electrical appliances, furniture, etc. This resulted in an increase in annual consumer spending of 6% between October and December of 2001. Data analyzed on the basis of Terror Management Theory showed that, following the attacks, Americans had to come to terms with death saliency that was subtly present in the fringes of their consciousness. To do this, they needed to increase their social standing within their own culture by behaving in agreement with cultural values such as materialism, that is, according to Bredemeyer and Toby (1960) and Fromm (1976), a value strongly anchored in the American culture. Such behavior can enhance self-esteem and relieve DA by engendering a kind of symbolic immortality (Tomer 1994).

To test this notion, Mandel and Heine (1999) found a higher interest in the purchase of luxuries under mortality salience conditions, and Kasser and Sheldon (2000), demonstrated that individuals with enhanced mortality salience expected more material wealth. Money itself, far from being considered in its utilitarian role as a means of exchange, would constitute "a new ideology of immortality" (Solomon et al. 2003). Arndt (2004b) demonstrated that a situation with mortality salience enhanced individuals' greediness for money. Kasser and Sheldon (2000) and Dechesne et al. (2003) similarly demonstrated that respondents under the mortality salience condition developed greediness toward money. According to Arndt et al. (2004b), money, and its associated possessions, provides a means for humans to distance themselves from the realization that they are destined for death. This suggests that death anxiety could intensify materialistic desires in people for whom such material pursuits are a salient barometer of self-worth.

Thus, the evidence extant suggests that there is a direct link between DA and materialism in the sense that material acquisitions might increase security of individuals by providing answers to their existential insecurity and sense of mortality. By behaving according to their cultural worldview, people have a feeling of comfort and security in daily life, and the accumulation of possessions, which will live on after one's death, allows the individual to live on through them. It is worth noting that humanistic theories also suggest that people focused on making money and amassing wealth try to overcome feelings of insecurity. As argued by Kasser and Sheldon (2000), Maslow believed that security and safety needs concern an avoidance of harm and danger. These are concepts associated with death buttress.

## Materialism and Quality of Life

Arndt et al. (2004b) also suggest that when materialism is activated as a dominant cultural worldview at the expense of intrinsically oriented goals, individuals' assessment of their personal well-being is diminished. This is consistent with a significant amount of research suggesting similar consequences amongst high materialists. Belk (1985), for example, found that the traits of possessiveness, envy, and non-generosity are negatively correlated with satisfaction and happiness in life. Richins and Dawson (1992) found that materialism was negatively related to satisfaction with income, family life, and life as a whole. They also found a negative correlation between materialism and self-esteem. Sirgy's (1998) reasoning about this result is that materialistic people tend to engage in upward social comparisons involving remote referents who have a high standard of living. This leads to dissatisfaction with their own standard of living that spills over to cause dissatisfaction with life in general. As a result, people motivated by extrinsic goals (finan-

cial success, social recognition, and appealing appearance), rather than intrinsic ones (affiliation, community feelings, etc.) experience lower perceptions of well-being.

Numerous studies have confirmed the potentially negative consequences of materialism and Mick (1996), as a result, has labelled materialism a "dark side" variable. It has also been argued that the consequences of materialism extend beyond the individual and impact society as well (Bredemeier and Toby 1960). Burroughs and Rindfleisch (2002) argue that materialism stands in opposition to collective oriented values, and that those who have collective values will experience diminished perceptions of well-being. Kahle, Beatty, and Homer (1986) found, for example, that materialists consider personal financial security an important value and interpersonal relations as less important.

Thus, we may be able to distinguish between two types of subjective well-being, or QOL. One relates to aspects of well-being that affect individuals directly and a second that affects them indirectly through their community. These are similar to what Sen (1999) refers to as growth led (economic) and support led (cultural) development. He argues that the latter is a necessary condition for the former to be effective. These characterizations of DA, materialism, and QOL lead to the following set of hypotheses on the relationship between the constructs.

H1: Death anxiety is positively related to materialism. As DA increases, measures of materialistic values will increase.

H2: Materialism is directly related to QOL. Specifically, materialism is negatively related to both personal well-being and social well-being.

H3: Social well-being is positively related to personal well-being.

## METHODS

### Sample and procedures

This study was carried out on convenience sample of American students in a large public university. The final sample size was 283. The sample was 41% female with an average age of 20.3 and 40%. The student sample was considered appropriate here for two reasons. First, death anxiety, materialism, and quality of life are pertinent concepts for young adults. Second, this approach also allows for control of the possible influence of age differences. The questionnaire was distributed and completed in class, and all participation was voluntary.

Following the procedures set forth by Anderson and Gerbing (1988), we tested each measurement model independently before testing the causal model. Thus, for each scale an exploratory factor analysis (EFA) was first carried out, and then a confirmatory factor analysis (CFA) was performed. As fit criteria we used the comparative fit index (CFI), Bollen's incremental fit index (IFI), and the root mean square of approximation (RMSEA).

### Death Anxiety Scale

With the aim of better understanding individual differences in DA together with their causes and consequences, DA and related scales have been developed over the last decade by researchers such as Neimeyer (1994). For example, the Death Concern Scale (Dickstein 1972) is composed of 30 items and two dimensions: a dimension representing the conscious contemplation of death and a second dimension representing a negative evaluation of the first. However, only the second factor is regarded as specifically characterizing DA. The first dimension does not correspond to a negative emotional reaction toward death but to the conscious thoughts of the

first. In an analysis of this scale, Klug and Boss (1976) showed that it could be reduced to 14 items, and the factor relating specifically to DA consisted of 5 items. Urien (2001), using CFA, confirmed that the five items found by Klug and Boss (1976) composed a factor relating to DA. It is important to add that DA, as measured by these five items, is considered here to be a general measure. This short version of the DA scale was used in the final questionnaire with three additional buffer items to reduce response bias. Results of the CFA for this DA scale indicated that the uni-dimensionality of the short scale was supported. The fit statistics were all well above the cut-off scores suggested by Hair et al. (1998) with CFI=.99, IFI=.99, and RMSEA=.057. The items all loaded significantly on the single dimension intended with all factor loadings above .5. Coefficient alpha for the scale was .85 indicating high reliability.

### Materialism Scale

Materialism has been argued to be a personality trait (Belk 1985) or values related to material goods (Richins and Dawson 1992). Measurement scales have been developed for both perspectives, but the approach most frequently taken is that materialism reflects a set of values. Richins and Dawson (1992) developed and validated a measurement scale, called the material values scale (MVS), that has been validated and used extensively for the last decade. Richins (2004) also developed a short form of the MVS that was used in this study. It contains nine items used to measure each of three constructs, success, happiness, and centrality.

CFA of the MVS scale indicated that the *a priori* dimensions were supported. The fit statistics for the three factor model were CFI=.98, IFI=.98 and RMSEA=.051 which were all well within the cutoff scores suggested by Hair et al. (1998). The items all loaded significantly on the dimensions intended with all factor loadings above .5. Coefficient alpha for the sub-scales were .82 for success, .68 for centrality, and .83 for happiness. In addition, similar to the original scale, the correlations between the dimensions were significant indicating the possibility of a second order factor model. A second order model was tested and found to satisfy all fit criteria as well. Thus, materialism was entered into the structural equation model as a second order factor model with three first order factors.

### Quality of Life Scale

For purposes of measuring individual perceptions of QOL, a variation of the Personal Wellbeing Index (PWI) was used. The scale contains eight items measuring different domains of well being. One of the items is a measure of overall satisfaction with one's life. In this application, a seven point Likert scale was constructed to be consistent with the rest of the items in the questionnaire.

While the PWI is typically used as a single dimension with summated ratings, the instrument was subjected to factor analysis and yielded a two factor solution with three items measuring social well-being (safety, security, and community) and five items measuring personal well-being (overall, health, standard of living, achievement, and personal relationships). The two factor model was subjected to confirmatory factor analysis and found to satisfy all of the fit criteria specified with CFI=.96, IFI=.96, and RMSEA=.074. Individual items loaded significantly on their respective latent constructs with all factor loadings above .5. Coefficient alpha for the two sub-scales were .80 for personal QOL and .69 for social QOL. Thus, for the QOL measure, a two dimensional construct was used with the first dimension measuring personal QOL and the second measuring social QOL. These two dimensions are supported by Sen (1999) who argues that that there are two paths

to enhancing one's QOL. These roughly equate to the personal and social dimensions of QOL used here. The rationale is that before one can be confident of their personal well-being, there must be social institutions that offer protection for both the individual and their material assets. Thus factors such as community and safety precede personal well-being.

## CAUSAL MODEL

The proposed causal model, presented in Figure 1, was tested in the final phase of the study. In the proposed model, it was hypothesized that DA would have a direct influence on materialism. Moreover, as supported in the literature, we hypothesized a path between materialism and the two dimensions of quality of life: a path from materialism to social quality of life and another path from materialism to personal quality of life. In addition, the relationship between DA and materialism was hypothesized to be positive. A direct relationship between materialism and QOL was also hypothesized, but these relationships were hypothesized to be negative. The structural model was tested for overall fit, and the results were acceptable with CFI=0 .95, IFI=0.95 and RMSEA=0.048. The analysis of the causal model partially confirmed the hypotheses established. The paths from DA to the second order materialism factor, from materialism to personal quality of life, and from social quality of life to personal quality were all significant. However, the path from materialism to social quality of life was not. In addition, the path coefficients, shown in Figure 1, were all in the predicted directions. The path from DA to materialism was positive, from materialism to personal QOL was negative, and from social QOL to personal QOL was positive. The exception to the hypotheses was, again, the path from materialism to social QOL which was negative as predicted, but not significant.

Finally, to know whether materialism could be considered as a mediating factor between death anxiety and the different factors of quality of life, as suggested by Baron and Kenny (1986), we first used the Lagrange multiplier test to determine if there was a direct relationship between death anxiety and quality of life. Mediation refers to a process by which an independent variable exerts influence on a dependent variable through an intervening variable, or mediator. The first condition indicating a mediation relationship is that the independent variable has a significant effect on the dependent variable. The results indicated that the univariate increment of the Lagrange multiplier test was not significant. Because the first condition was not satisfied, materialism could not be considered as a mediator but only as an intermediate variable between death anxiety and quality of life.

## SUMMARY AND CONCLUSIONS

Researchers are consistently seeking new and more complete explanations for existing consumer behavior. Materialism, as a type of consumer behavior, has received significant attention as a part of that agenda. Within the study of materialism, multiple perspectives have been incorporated including the negative consequences of materialism *per se*, the antecedents of materialism, the social and personal outcomes of materialism, and, more recently, the positive personal attributes of materialism. One of the recently introduced constructs considered an antecedent of materialism is death anxiety. It was argued that, because of existential difficulties with death, consumers might adopt consumption strategies that attempt to circumvent their inevitable demise. Growing evidence suggests that this might be the case as DA appears to increase certain aspects of materialism.

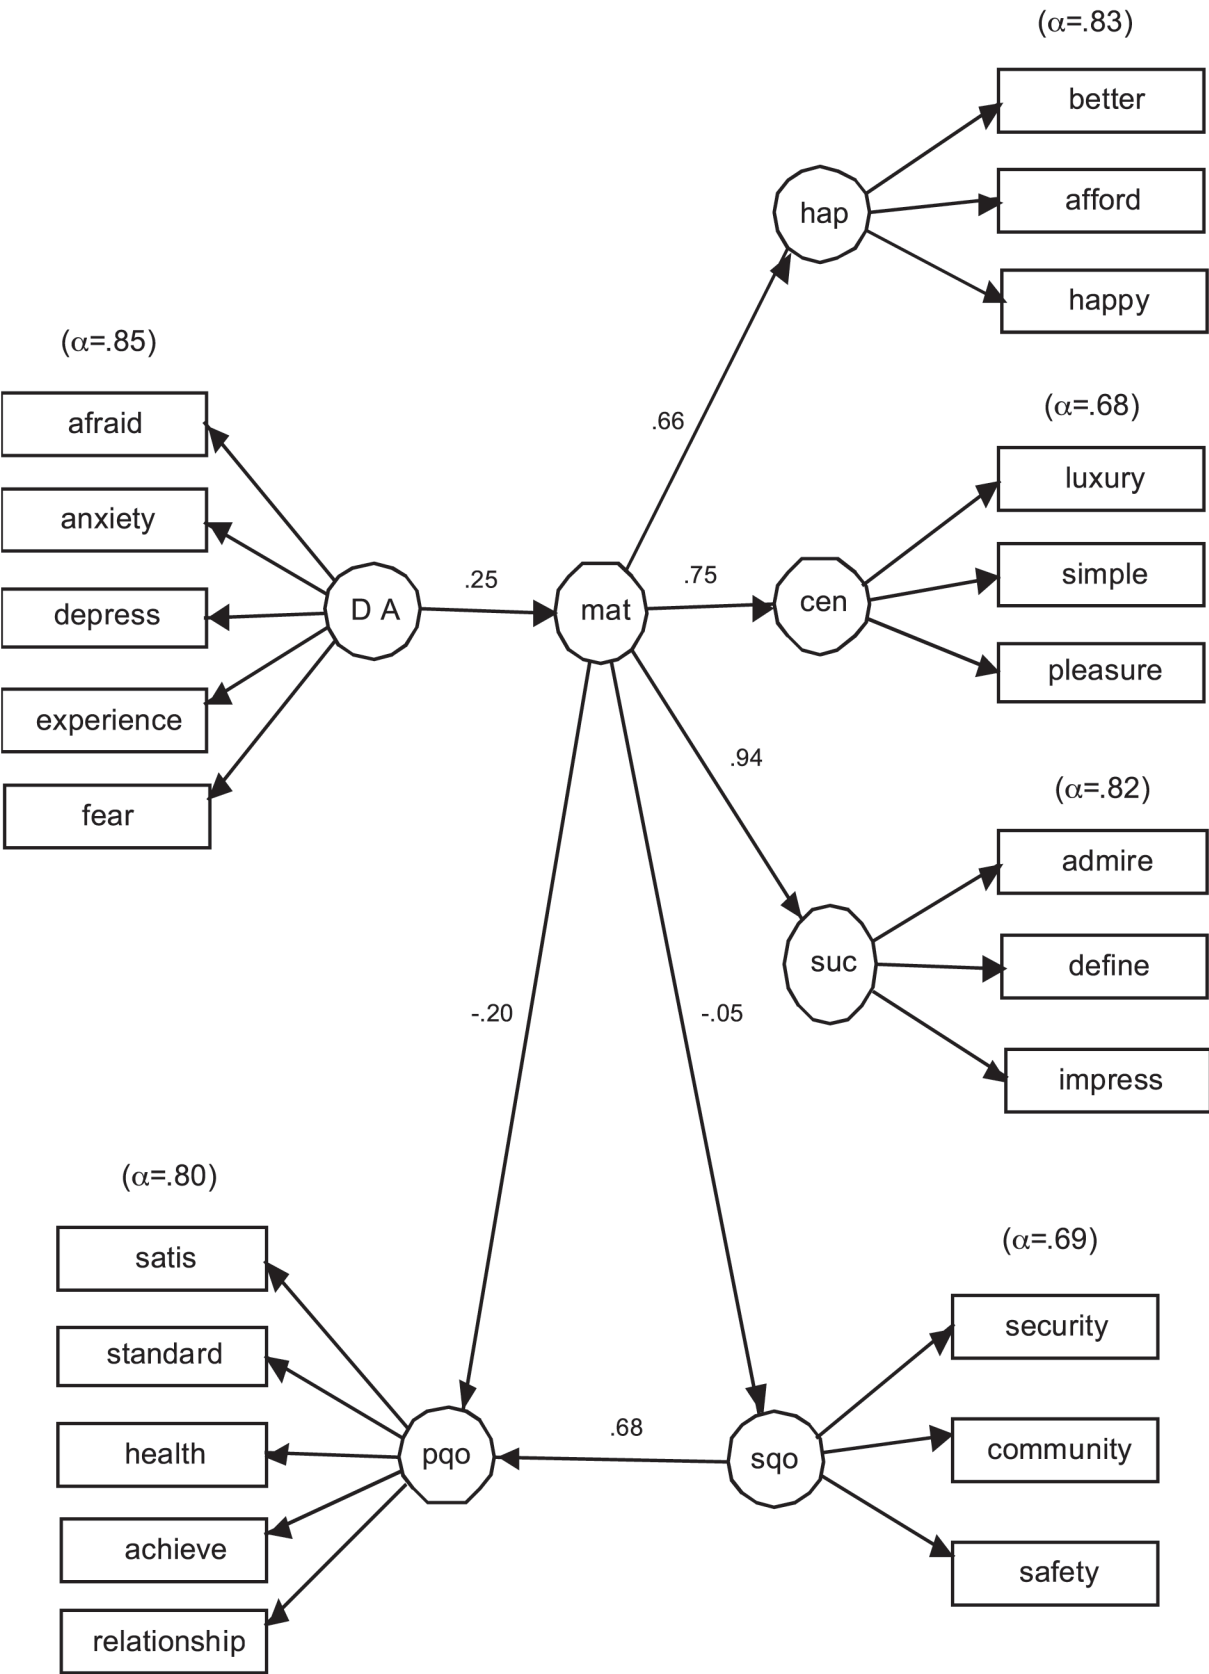
Another research stream suggests that materialism as a mode of consumption behavior has consequences for individual percep-

tions of subjective well-being. Substantial research has address this issue and found fairly consistently that, while consumers believe that increasing their material possessions will enhance their perceptions of well-being, quite the opposite appears to be the case. Those who believe in the positive relationship between material possessions and QOL seem to be disappointed with their lives in general. Thus, the ideology of consumption suggesting that increased level of material possessions will lead to happiness, is increasingly called into question.

Taking the above results together suggests a causal sequence linking DA, materialism, and QOL. The purpose of this paper was to examine this causal sequence empirically. The results of the study were consistent with previous research on DA and materialism within the US context. But within this research, DA and materialism were considered to be durable dispositions (traits or values). Individuals who experience higher levels of DA showed higher tendencies toward materialism as measured by a reduced form of the MVS. Because the results of the study were consistent with the limited research linking DA and materialism within the US context, this research adds to our knowledge of the relationship. However, we have to be cautious about the conclusions. Although mortality salience situations increase as we age because, as we get closer to our own death, the deaths of relatives (family, friends, etc.) tend to be more frequent, it does not necessarily mean that as we get older, we are more materialistic. Actually, Belk (1985) demonstrated that, as we get older, products and status possessions become less important to our self-image. Rindfleisch and Burroughs (2004) call for further investigation of the discrepancy between TMT concepts and materialism empirics. One possible explanation for the discrepancy is that death anxiety is considered a personality trait in the present study. And many previous empirical studies have shown that death anxiety is somewhat lower on average in senior citizens because of increases in generativity. Then, the more we age and approach death, the less we fear death, and consequently, materialistic tendencies are reduced. Indeed death anxiety, as a trait, slightly and slowly decreases and thus moderates the causal link between a mortality salience condition and materialistic tendencies. As for the link between DA and QOL, the effect is indirect. The effect of DA on QOL was only through the materialism construct. Consequently, materialism could not be considered as a mediator but only as an intermediate variable.

Another contribution of the research relates to the conceptualization and assessment of QOL. In the measure of QOL, it was found that there are two types of QOL, personal and social. While it was hypothesized that materialism would be negatively related to both personal and social QOL, this was not the case. As with previous research, the path from materialism to personal QOL was negative, but the path to social QOL was not. This suggests that individuals who are materialistic are less satisfied with their personal lives as a whole, and this is consistent with previous research. Materialism did not, however, have an effect on social QOL. This suggests that one's perception of community, safety, and security are not directly related to materialistic values. Rather, this aspect of QOL is rooted in other aspects of life than possessions. Consistent with the theory proposed, however, social QOL was directly related to personal QOL.

It was argued that an important character of personal QOL is its security. It is well known that in competitive market societies such as the US, one's well-being is never assured. The vagaries of the market can modify one's opportunities and fortunes very quickly, and the inhabitants of such societies are well aware of this. Because of this character of market societies, feelings of insecurity can rise even as one's success increases. Fromm (1976) addresses

**FIGURE 1**
Proposed Model of Death Anxiety, Materialism, and Quality of Life


this issue directly in this notion of "characterological having" in which individual well-being is tied directly to what is possessed. While materialism can serve to reduce perceptions of subjective personal well-being, increases in social QOL, unrelated to materialism, increase feelings of security. This yields the paradoxical condition alluded to by Fromm (1976) who argued that, in competitive market societies, individuals can only become secure in their insecurities.

What the results of this study suggest is that among the many factors that may support materialism, DA is a contributing factor in the US. This belies practical philosophy in market societies. While individuals pursue material possessions with almost religious fervor (Bredemeier and Toby 1960), that which they really seek escapes their grasp. The suggestion that materialism has become a religion in the US, takes on enhanced meaning in this context.

The conflation of standard of living with QOL and the juxtaposition of both with immortality suggests that consumption has, in some small sense, taken on the role of religion as an intervention between life and death.

While the conclusions for the present study are only tentative because of its exploratory nature, they are consistent with both previous empirical research and conceptual models of materialism going back more than forty years. The study is certainly limited by the student sample and even more so by the single culture examined. But the results suggest that there is sufficient justification to pursue further research in different ways : 1) While it has been shown that materialism could be an adaptive reaction to a mortality salience condition, it should be very interesting to differentiate the nature and the length of mortality salience. Hence it would be useful to distinguish "death warning" as opposed to "death sentence" or "pending" and "terminal" death. Those differences could help to explain other contradictory results linking death anxiety to more pro-social behaviors demonstrated by financial support for charities (Jones et al. 2002). 2) Finally, a more qualitative approach underlain by Consumer Culture Theory could be used with more representative samples and multiple cultures. On this last point we have seen that some Eastern cultures could be less anxious facing death. In that way, it would be interesting to study the concept of "Death Acceptance" (Wong et al. 1994) and its relationship to Materialism and Quality of life.

# Factors Influencing Consumers' Evaluation and Adoption Intention of Really-New Products or Services: Prior Knowledge, Innovativeness and Timing of Product Evaluation

Qing Wang, University of Warwick, UK
Scott Dacko, University of Warwick, UK
Marwa Gad, University of Warwick, UK

## ABSTRACT

This paper empirically examines factors influencing consumers' evaluation and adoption intention of really new products. Combining construal level theory with literature on new product evaluation and adoption, we found an asymmetry in the conditional importance of benefit and cost, both as mediators and as antecedents of adoption intention. As mediators, consumer innovativeness does not affect perceived cost, but leads to greater perceived benefit and greater adoption intention. As antecedents, cost is important only if the adoption is highly beneficial, but benefits remain important regardless of cost. Finally, we found that the salience of costs increases as the temporal distance decreases, whilst the salience of benefit remains constant. We discuss implications for marketing of really new products.

## INTRODUCTION

A number of individual, social, and product factors have been shown to be related to the adoption of new products (Rogers 1995; Gatignon and Robertson 1985). However, most existing studies in marketing have focused on incrementally new products, examining the effects of adding new product features to existing products on product evaluation or brand choice (see Nowlis and Simonson 1996; Brown and Carpenter 2000; Mukherjee and Hoyer 2001). Until recently, we have little knowledge of the higher risk, higher reward realm of really-new products (Moreau, Lehman, and Markman 1997; Urban, Weinberg, and Hauser 1996). Really new products are important sources of growth for many companies. From a consumer perspective, really new products are innovations that defy straightforward classification in terms of existing product concepts (Gregan-Paxton and Roedder John 1997; Moreau, Markman and Lehman 2001). As Hoeffler (2003) has shown, consumer uncertainty can make pre-purchase consumer tradeoffs highly labile, making it difficult for firms to estimate adoption intention for really-new products using conventional methods.

This paper intends to fill this important gap by investigating a number of personal, situational and product factors that may particularly affect adoption intention of really-new products or services. Firstly, the adoption intention of a new product is predicted to differ systematically between consumers with varying level of product knowledge, consumer innovativeness and perceived newness. Secondly, really new products or services promise greater benefits (i.e. desirability) than incrementally new products or services, but consumers are uncertain of the utility of those benefits and anticipate that they will have to change their behavior to attain potential benefits (i.e. feasibility) (Hoeffler 2003; Alexander, Lynch, and Wang, in press). Drawing on Libermann and Trope (1998)'s theory about differences in mental representation of the desirability vs. feasibility of an action in the present vs. the future, we examine the salience of benefit and cost in consumers' evaluation of really new products or services along varying temporal distance (i.e. whether they are evaluating a new product for an immediate adoption or a future adoption).

We use a new mobile feedback service as the stimuli for our study. We chose the mobile feedback service because it was a really new service, and it was not yet available in the market when the field studies were carried out, so the condition of high uncertainty and the manipulation of time frame would be assured. In Study 1, we tested the effect of product knowledge, innovativeness and perceived product newness on adoption intention either directly or mediated by perceived benefit and cost. In Study 2, we tested the relative effects of perceived benefit and cost of the new service on adoption intention, and in study 3, we tested the differential effect of temporal distance (i.e. in six months vs. tomorrow) on the salience of benefit and cost considerations. We find:

1. The effect of consumer innovativeness on adoption intention is significant both directly and indirectly via perceived benefit; whereas the effect of product knowledge on adoption intention is significant only indirectly via perceived newness.
2. The effect of perceived newness on adoption intention is significant.
3. The effect of perceived benefit on adoption intention is significant; whereas the effect of perceived cost on adoption intention is only significant when perceived benefit is relatively high.
4. The greater the temporal distance from product evaluation to actual adoption, the greater the effect of perceived benefit and the less the effect of perceived cost on adoption intention; whereas the smaller the temporal distance from product evaluation to actual adoption, the greater the effect of perceived cost on adoption intention.

## PRIOR KNOWLEDGE, CONSUMER INNOVATIVENESS, PERCEIVED NEWNESS AND ADOPTION INTENTION OF REALLY NEW PRODUCTS

Consumer product knowledge has two major components: familiarity and expertise (Alba and Hutchinson 1987). Familiarity is defined as the number of product-related experiences that have been accumulated by the consumer. Expertise is defined as the ability to perform product-related tasks successfully. The perceived newness of a product service refers to its originality, novelty and uniqueness as perceived by individuals (Dahl, Chattopadhyay, and Gorn 1999). In this paper we intend to study the links between product knowledge, perceived newness and adoption intention of really new products. Really new products are innovations that defy straightforward classification in terms of existing product concepts and are unrelated to direct or in-direct consumer experiences (Gregan-Paxton and Roedder John 1997). Therefore, the familiarity element of product knowledge is likely to be extremely low for all consumers (including both experts and novices). The expertise element of product knowledge on the other hand is expected to assist consumers in more accurately assessing the novel functionality and uniqueness of a really new product. Therefore, we reason that individuals with great product knowledge will be able to understand and appreciate better the newness of a really new product compared to those with little product knowledge. We hypothesize that:

*H1*: Product knowledge is significantly and positively related to perceived product newness.

*H2*: Perceived product newness is positively and significantly related to adoption intention.

Research on consumer innovativeness focuses on the characteristics that differentiate consumers by the speed or willingness with which they adopt new products (Hirschman 1980). Drawing on Manning, Bearden and Madden's (1995) work, consumer innovativeness in this paper refers to the desire to seek out new product information and new product experience. Really new products create new product categories, consumer learning involves developing preferences for new products that are unrelated to direct or indirect consumer experience (Robertson 1971; Nabih, Bloem and Poiesz 1997). Therefore we hypothesize that:

*H3*: Consumer innovativeness is positively and significantly related to perceived benefit.

*H4*: Consumer innovativeness is positively and significantly related to adoption intention.

## PERCEIVED BENEFIT, PERCEIVED COST AND ADOPTION INTENTION OF REALLY NEW PRODUCTS

Consumers who buy a really new product or service expect that the benefit they receive from the product or service exceeds the cost of obtaining the new product or service. When evaluating a new product or service for possible adoption, consumers weigh the benefit against the cost of adoption, and if the perceived benefit overweighs the perceived cost, consumers are more likely to adopt. However, we know little about the specific effect of benefit-cost interaction on consumers' adoption intention.

Construal level theory (CLT) suggests that the costs of adopting a new product or service (e.g. monetary cost, learning effort, time commitment) are construed as low-level, subordinate aspects of the new product or service, whereas the benefits of adopting a new product or service (e.g., that which enables one to do new things) are construed as high-level, superordinate aspects of the new product or service. The subordination of low-level construal aspects to high-level construal aspects entails an asymmetry in the conditional importance of these two types of aspects (Eyal, et al. 2004). This asymmetry suggests that the importance of such low-level aspects depends on the value of the high-level aspects more than the importance of the high-level aspects depends on the value of the low-level aspects. For example, when considering the possible adoption of a new product or service, feasibility considerations are important only if the adoption is desirable, but desirability remains important whether feasibility is high or low. Desirability of a new product or service would thus result from the perceived benefits of adopting the new product or service, whereas feasibility would be derived from the perceived costs of adopting the new product or service. Thus, given a context of a really new service to be evaluated for possible adoption, it is hypothesized:

*H5*: Perceived benefit is significantly and positively related to adoption intention.

*H6*: Perceived cost is significant and positively related to adoption intention only when perceived benefit is relatively high.

## TEMPORAL DISTANCE AND TIME-DEPENDENT CHANGES ON THE RELATIVE EFFECTS OF BENEFIT AND COST ON ADOPTION INTENTION

In deciding to adopt a new product or service, individuals often construct arguments in favour of the action as well as arguments against the action. Such arguments may be made a short time or a long time before actually performing the action as well. What is perhaps under-emphasized in the new product/service adoption literature is how time may systematically influence how individuals value the worth of losses and gains in a new product/service evaluation context. For example, in one conceptualization of a potential systematic temporal influence, the time-and-outcome valuation (TOV) model put forth by Mowen and Mowen (1991), valuations occurring long before an outcome are hypothesized as leading to psychological valuations of gains that are greater than psychological valuations of losses. Similarly, CLT suggests that, because *benefits* constitute a higher level of construal than *costs*, the temporal distance from a future action should differentially influence the salience of benefit and cost considerations. More specifically, it predicts that benefits should be relatively more salient than costs in decisions regarding an action occurring in the distant future relative to the same action occurring in the near future. Because distant future actions are construed at a higher level than are near future actions, benefits become more salient as temporal distance from the action increases, whereas costs become more salient when temporal distance decreases. Therefore, when people think about the possible adoption of a new product or service in the distant future—say, in six months' time, they tend to construe the action of adoption at a higher level, that is, at the level associated with *benefits*, which in turn should positively affect their adoption intentions. However, if individuals think about the possible adoption of a new product or service in the very near future—say, tomorrow, they tend to construe the action of adoption at a lower level, that is, at the level associated with costs, which in turn should adversely affect their adoption intentions. Therefore, in the context of a really new service to be evaluated for possible adoption, it is hypothesized:

*H7*: For those who consider adopting a new service in six months' time, the effect of perceived benefits on adoption intention will be greater than the effect of perceived costs on adoption intention.

*H8*: The effect of the perceived benefit on adoption intention will be greater among individuals considering acquiring a new service in six months' time than among individuals considering acquiring the new service tomorrow.

*H9*: The effect of perceived costs of adopting a new service on adoption intention will be greater among individuals considering acquiring the new service tomorrow than among individuals considering acquiring the new service in six months' time.

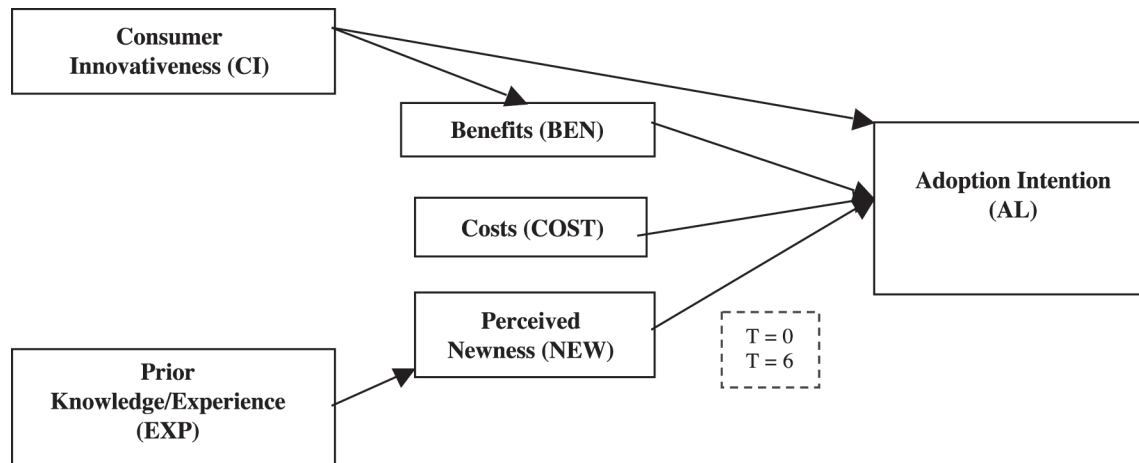
A conceptual model of summarizing the research hypotheses concerning the factors influencing consumers' product evaluation and adoption intention of really new products or services is shown in Figure 1.

## EMPIRICAL STUDIES METHODS

### Samples and procedures

In order to test our research hypotheses, we obtained permission from a new mobile feedback service provider in the UK to use

**FIGURE 1**
Model Representing Hypothesized Relationships among Key Variables



the company's newly developed mobile feedback service as the stimuli for our study. We chose the mobile feedback service because it was a new service not yet available in the market, so the manipulation of time frame would be assured. In the study, 220 undergraduate students enrolled in a year-long marketing module were then invited to participate in a survey in which they were given a 230-word description of the new service and were then asked to evaluate the service for possible adoption as well as provide some personal information. The description of the really new service is shown below:

"Collecting feedback from customers, employees and general publics on issues of importance such as service quality, customer satisfaction, are essential for organizations and government bodies. However, with today's busy lifestyle, collecting feedback from a large group of people has become increasingly difficult and challenging. The Mobile Feedback Service makes it easier for people to actively participate in group surveys using their existing mobile phone whenever and wherever they are. That is, the Mobile Feedback service is a way for you to be an active participant in two-way mobile feedback. It enables you to easily give your on-the-go feedback to anyone asking for your input or comments regarding any activity in which you are involved. Individuals (friends, associates, co-workers) can send to your mobile phone multiple-choice question surveys or open-ended question surveys, where you can then text your replies with minimal effort. Those initiating the surveys can then send to your mobile phone summaries of the collective feedback obtained from everyone participating. Of equal importance is the fact that the Mobile Feedback service allows you to create an initiate your own mobile feedback surveys at any time. That is, you can create surveys involving multiple-choice or open-ended questions and send the surveys to any number of individuals with whom you associate. As a result, those individuals can then easily provide you with "on-the-go" feedback that you can then review in summary form at any time".

Each survey participant was randomly assigned one of two conditions: a near term condition (i.e., tomorrow) or distant time condition (i.e., six months). Survey instructions therefore stated, "When answering the following questions imagine you will have the new service available to use *tomorrow*" or, alternatively, "When answering the following questions imagine you will have the new service available to use in *six months' time*." To encourage participation, a raffle ticket number was attached to each questionnaire, and there was a prize of £50 in cash given out to one lucky winner immediately after they completed the questionnaires. 178 usable questionnaires were returned, resulting in a response rate of 80.9%.

**Measures**

Where possible, existing measures were used for all variables of interest including the likelihood of adoption (AL), perceived benefits (BEN), perceived costs (COST), perceived product newness (NEW), consumer innovativeness (CI), and product knowledge (EXP). The survey instrument was pre-tested for face validity and reliability. The resulting items were measured on 7-point Likert scales. A summary of the constructs, measurement scales and sources is shown in Table 1.

All variables in the survey were operationalized using multi-item measures. To assess the reliability of the constructs, coefficient alphas were calculated for all variables. Correlations between items were examined for each construct in order to refine the scale further and ensure internal consistency and reliability. Thus, where appropriate, scale items were reduced where inter-correlation coefficients were relatively low and where construct reliabilities were improved by removing them. After refining the scales, co-efficient alpha estimates were calculated as 0.888 for AL, 0.812 and 0.764 for BEN and COST, respectively, and 0.69, 0.903, and 0.886 for NEW, CI, and EXP, respectively. Alpha levels for each of the factors exceeded the acceptance level of 0.7 (Nunnaly 1978). Hypotheses were subsequently tested by examining the association between these variables, where multiple regression analyses were performed using SPSS using data from the questionnaires either in combination, where all the data for the two time conditions (tomorrow and in six months' time) were used, or separately (split into two data sets based on the time condition) depending on the hypothesis under examination.

# RESULTS AND ANALYSIS

## Study 1: Prior knowledge, consumer innovativeness, perceived newness and adoption intention for really new products or services

To test H1, the effect of product knowledge (EXP) on perceived newness (NEW) was examined using combined data set. A significant association was found between EXP and NEW, with significance of 0.030 and an $R^2$ of 0.030. These findings support H1, where prior product knowledge is positively and significantly related to perceived Newness. To test H2, the effect of perceived newness (NEW) on adoption intention (AL) was examined using combined data set. A significant association was found between NEW and AL, with significance of 0.000 and an $R^2$ of 0.104. This supports H2, where perceived Newness of a product or service will positively and significantly influence its adoption intention.

To test H3, the effect of consumer innovativeness (CI) on perceived benefit (BEN) was examined using combined dataset. A significant association was found between CI and BEN, with significance of 0.022 and an $R^2$ of 0.034, which supports H3 as consumer innovativeness positively and significantly influences consumer's perceived benefits of the product or service.

To test H4, the effect of consumer innovativeness (CI) on adoption intention (AL) was examined using combined dataset. A significant association was found between CI and AL, with significance of 0.000 and an $R^2$ of 0.087. This also supports H4, as consumer innovativeness is positively and significantly of influence relative to likelihood of adopting the new product or service.

## Study 2: Perceived benefit, perceived cost and adoption intention of really new products or services

In testing H5, the effect of perceived benefits (BEN) on adoption intention (AL) was examined using the combined data set as well as the two separate data sets for each time condition. A significant association was found between BEN and AL in all three cases, with significance of 0.000 and an $R^2$ of 0.127 for the combined data (tomorrow and in six months' time), significance of 0.001 and $R^2$ of 0.142 for tomorrow, and significance of 0.002 and $R^2$ of 0.117 for the six months' time condition. These findings clearly support H5, where the level of perceived benefits has a significant effect on adoption intention of a new product or service.

In testing H6, the effect of perceived costs (COST) on adoption intention (AL) was examined based on the relative level of the perceived benefits (BEN). To do that, the data set was sorted based on the level of BEN, whereby the two extremes of high and low BEN were examined for their influence on the association between COST and AL. When perceived benefits (BEN) are relatively high, the effect of COST on AL was found to be significant at 0.017, with an $R^2$ of 0.153. However, when perceived benefits (BEN) are relatively low, the effect of COST on AL was found to be insignificant at 0.219, with an $R^2$ of 0.053. This finding supports H6, as it shows that, perceived costs have a significant effect on adoption intention when perceived benefits are relatively high; but perceived costs have an insignificant effect on adoption intention when perceived benefits are relatively low.

## Study 3: Temporal distance and time-dependent changes on the relative effects of benefit and cost on adoption intention of really new products and services

To test H7, the data for the distant future condition (six months' time) was analysed. Results of the regression analysis indicates that the effect of perceived benefits (BEN) on adoption intention (AL) in six months' time is significant at 0.005 relative to the effect of perceived costs (COST), which itself is insignificant at

0.484, and where there is an $R^2$ of 0.123 for the overall model. Thus, H7 is clearly supported where, for those who consider acquiring the new service in six months' time, the effect of perceived benefits is greater than the effect of perceived costs on adoption intention.

To test H8, regression analyses were run using the two separate data sets to compare the timing effect. The effect of perceived benefits (BEN) on adoption intention (AL) of a new product or service was significant for both the tomorrow and six months' time conditions (at 0.01 and 0.02). This result does not reflect a greater influence of perceived benefits on adoption intention among those individuals considering acquiring a new service in six months' time compared to those individuals considering acquiring the new service tomorrow.

In testing H9, regression analyses were performed using the two separate data sets for each time condition (tomorrow and six months time) to compare the influence of perceived costs on adoption intention. Results of the statistical analyses indicate that the effect of perceived costs (COST) on adoption intention (AL) is more significant for the tomorrow condition than the six months' time condition, with statistical significances of 0.020 and 0.156, respectively, and $R^2$ values of 0.069 and 0.026 for the tomorrow and six months' time conditions, respectively. These findings clearly support H9, where perceived costs affect adoption intention of a new service in the nearer than the distant future. The results are summarized in table 2.

# DISCUSSION

Numerous studies have examined how variations in personal characteristics such as prior knowledge and innovativeness or social interactions such as word-of-mouth can influence people's evaluation or prediction of the benefits of a new product or service (Rogers 1983; Moreau, Lehmann, and Markman 2001; Greg-Paxton and Roedder John 1997). These personal and social factors help to explain why some people may evaluate a new product or service more positively than others. Yet, a positive evaluation of a new product or service itself may not lead to actual adoption. Indeed, marketers of new products or services have long attempted to understand why, despite having indications of positive intentions to adopt, some individuals fail to turn their stated intentions into actual purchases at the time when the opportunity arises to acquire or use the new product or service.

By combining construal level theory with literature on new product evaluation and adoption, this research makes several contributions. First, it provides additional evidence for the effect of individual characteristics such as prior knowledge and consumer innovativeness on adoption intention of really new products or services. It also provides evidence that consumer innovativeness does not affect perceived cost, but it leads to greater perceived benefit and greater adoption intention. Put it differently, when evaluating a new product or service for possible adoption, cost is not an important consideration for individuals with high innovativeness trait. Secondly, it shows that there exists an asymmetry in the conditional importance of benefit and cost considerations for adoption intention. Our results show that, when considering the possible adoption of a new product or service, cost considerations are important only if the adoption is desirable (i.e. high level of benefit), but benefit considerations remains important whether cost is high or low. Thirdly, the salience of cost considerations is found to increase as the temporal distance to anticipated adoption action decreases, whilst the salience of benefit considerations remain constant.

These results are important to marketing strategists who analyse consumer behavior in an attempt to understand how benefit and cost are evaluated, and how timing of such evaluation may

differentially affect adoption intentions and purchase actions. Understanding the factors that influence adoption intention for a new product or service can help marketers decide on the segmentation and positioning strategies and the timing of conducting effective market research studies and whether they may resort to time-based advertising strategies.

There are several limitations to this research. One of the main limitations is the data. While useful and benefiting from a high response rate, it uses a student sample and is based on a single product category, i.e. telecommunications service. Further research should extend the scope to studying several product categories, and should preferably include both really new products and incrementally new products to ascertain that the findings are generalizable in a broader context.

The single hypothesis rejected in the current research also opens the door for further examination of the relative strength and weakness of benefit measure in future research. Testing the benefit-temporal distance relationship using a different measure that ex-

# "Set the table": Women Communicating Status at Home

Katherine Sredl, University of Illinois, Urbana-Champaign, USA

## ABSTRACT

Why do women in Zagreb, Croatia set the table the way they do? In my work, the main assumption is that it is done in to makes legitimate women's claims of social status. Holt's work provides a guideline for researching this and relating it to consumer research on the social patterning of consumption (1998). Holt asks if Bourdieu's theories about consumption and class are transferable from one context to another (Bourdieu 1984; Holt 1998). My research takes theories of consumption developed in one context, the United States, and explores if they transfer to a different context, Zagreb, Croatia, using ethnographic research conducted in the fall of 2006 and the winter of 2007, to explore how women express status through social practices of consumption in an environment of changing gender dynamics.

## INTRODUCTION

Preliminary fieldwork in Croatia from 2002 to 2003 suggested to me that tableware has a specific meaning for women from different generations in Zagreb. Sunday is a day for rest, for hobbies, for visiting the countryside or walking in nature, for attending Mass, for being with family, almost always for going to mom's or aunt's house for lunch, or preparing that meal for the older generation. Over years of frequently visiting my aunt's house for lunch on Sunday, where the table always is covered with a tablecloth, for lunch, the tone when my aunt ate with my cousin and me and when my cousin and I ate alone was completely different. Not just because of the tone and topics of conversation would be different when the sixty year old aunt is present, but how the tableware framed the difference. When just my cousin, a single woman in her early thirties who lives at home, and I were eating lunch on Sundays, she served me soup from the same pot on the stove in which the soup had been prepared. It is easier. The stove is handy to the drawer with the spoons and the cabinet with the plates and bowls, and it can all be carried to the table at the same time. However, this would not do if her mother joined us. In that case, she took a porcelain soup tureen from the cupboard in the dining area, brought it to the stove, filled it, carried it to the table and placed it in the center, then carried the plates and soup bowls to the table, then the cutlery, and served us at the table. In other words, the social practices of using tableware in Zagreb are a consumer practice with a specifically gendered and generational meaning.

## THEORETICAL FRAMEWORK

Why do women in Zagreb, Croatia set the table the way they do? In my work, the main assumption is that it is done in a way that makes legitimate women's claims of social class status. Holt's work provides a guideline for researching this and relating it to consumer research on the social patterning of consumption (1998). Holt asks if Bourdieu's theories about consumption and class are transferable from one context to another, in this case from France to the United States, (Bourdieu 1984; Holt 1998). He argues that yes, they are, considering socio-cultural correction. My research makes the same move as Holt: it takes theories of consumption developed in one context, the United States, and explores if they transfer to a different context, Zagreb, Croatia.

The context of class and consumption Zagreb is different from the United States because of the mix of market and planned structuring from 1945 to 1991 and because of the rapid pace of change from 1991 to 1997 (Croatia was a republic of the Socialist Federal Republic of Yugoslavia from 1945 to 1991), presenting considerable contrasts to the United States. This research uses the same group of theories that argue social categories are related to consumption (Holt 1995). This research is concerned with the context transferability of consumer behavior theories of class as much as it is concerned with the tablecloths of women from three class positions in Zagreb (Wallendorf and Belk 1989).

One of the basic theories in culturally oriented consumer behavior research is that goods communicate status (Douglas and Isherwood 1979). Consumer research on status often assumes that the establishment of status is based on a male household representative (Coleman 1983). It is often defined by money: husband's employment means status (Coleman 1983). The establishment of status is male, related to employment and the public sphere. When women communicate status, it is implied they are communicating status someone else has established (Veblen 1899/1953: 30). Growing concern about this conception of status as only defined by men led to questioning of its assumptions. One reason for that concern has been changing demographics in the United States: increasing numbers of households are led by women (they are single or single heads of families) or women are primary breadwinners or contribute significantly to family income (Coleman 1983). The trend is similar in Croatia. There have been qualitative changes in understanding status as well: status is more than just VALS data or buying expensive goods, but what style is presented (Holt 1997). The time has come to re-think assumptions about gender and status. My research looks at status as something women can also establish and communicate through the tableware they bring into a marriage and/or acquire through the course of a marriage. That is, it sees the establishment and communication of status as a task for women.

The biography of goods, in this case tableware, tells also the story how social reproduction is organized within consumer culture (Kopytoff 1986). A special meaning of tableware comes from its movement through categories of time and place. It comes from the past through inheritance, it shows the family's status in the past compared to the present. Because cultural customs dictate the tableware will move towards female blood relatives and away from not males or women who married into the family, it connects past, present and future. If it is bought, the china or cutlery pattern represents a certain style. Its cost, quality and quantity (cutlery for four, six, eight, ten or twelve place settings) suggest affluence and status. Only women, their family and intimate friends come to the table to consume the tableware and the food. Prior research has considered consumption in the context of a small group of people, for example when exploring dispossession, but it has not explored the difference, if any, between why money is spent on private versus public display (Price, Arnould and Curasi 2000). McCracken argues, through historical research, that legitimating public claims of status is the task of household goods, especially in the context of social tensions (McCracken 1988). My research takes these assumptions into the homes of women in Zagreb to explore private spaces as a site of women's consumption. The way tableware is used connects people with consistencies and changes over time in the embodiment of class practices, not just for society in general, but more specifically for their family. For example, it means using a tablecloth at each meal or placemats. Thus, it is particularly important to look at the history of things as it is materialized in the lives of women involved in this research. It also requires a historical perspective on the context of this research, meaning looking care-

fully at what came before as a way of understanding the present (Scott, Chambers, and Sredl 2006).

Creating a middle class consumer culture was part of the effort to build socialism in Yugoslavia. It may seem like a contradiction to think of it that way. After all, the ideologies of state socialism focused on class and gender equality as well as on labor. Consumer culture tends to be thought of as part of class and gender inequality and the alienation of the laborer. These things are supposed to go with capitalism, consumer culture is supposed to go with capitalism. Yet that is just one way to look at consumer culture. And it is a view that is perhaps focused more on the conditions of consumer culture in the United States rather than on consumer culture as a phenomenon after World War II in Europe and in North America. Historians in Croatia, for example, point to the development of a consumer society in across western Europe after World War II, driven by rebuilding, the Marshall Plan, and the arrival of US companies. They argue that consumer culture in Yugoslavia from the mid 1950s on was part of that historical moment in Europe (Duda 2005). It was not a betrayal of socialist ideals. In fact, raising the standard of living of most citizens so they could enjoy a modern standard of living was in harmony with socialist ideas of class equality. Yugoslavia created a consumer culture within its own morality of state socialism (Sredl 2004).

No one would be surprised, however, to learn the new era meant the official end of old forms of social distinction, both their material and, for example, linguistic manifestations. Privately held assets from apartments to factories were nationalized. Titles of social rank to address other people no longer officially existed. Mr. and Mrs. became "*Drug*" and "*Drugarica*," or "Comrade" and "Comradese." It may seem more surprising, however, to consider that many social and business practices were re-introduced to fit the context of state socialist ideologies and the postwar context. For example, the government consolidated and nationalized the advertising industry into the Advertising Bureau of Croatia (OZEHA *Oglasni Zavod Hrvatske*) in 1945. In 1954, Interpublic opened an office in Zagreb. Etiquette guide books were printed in Zagreb starting in 1953. A well known book was *Illustrated Etiquette & Protocol (Ilustrirani Bonton & Protocol)*, published in Zagreb in 1963 with ten editions through 1989 (Zelmanovic). The illustrations indicate a proper table for a meal should show be set on an undecorated white tablecloth with flowers and a candle. Each place setting should have glasses for each type of beverage: water, white wine, red wine, and aperitif. There should be plates as needed: soup, salad, bread and main course. Forks and knives should be provided for each course including desert and placed at the left, right and top of the place setting. Napkins are folded over the plates and at the top of the place setting. There should be a tureen plus salt and pepper servers. All of the dishes in the illustrations are fine china, the cutlery silver. To an outsider, it looks like just another etiquette book based on continental European norms.

For the author of the etiquette book, that is the point. Zelmanovic writes in the introduction to the tenth edition of the book an explanation of its popularity. Since 1963, the book had ten editions over twenty six years; the last publication run was 135,000 for a market of about four million people. The author describes two changes, or revolutions, in local society since 1945, urbanization and structure, as influences on the book's popularity. Urbanization meant an explosion in the sizes of cities and towns and a transformation in the ways people interacted in daily life. Simply put, this etiquette book provided a guide to new circumstances in social life. Every era, society and place has its social customs, even the village, and he is presenting contemporary ones in the form of a book. Next, the author presents an answer to the implied question, "why a guide based on these norms?," with its specific connotations after the

class revolutions of state socialism and the youth movements of the 1970s. The author has already argued that etiquette books simply codify national behaviors and folkways. This has a specific meaning in the political contexts of state socialism across Europe. The politics of state socialism in Yugoslavia and many other states, village customs often served as a means of making legitimate policies. For example, communism was considered a natural fit for many states because villages were allegedly communal; of course, villages also had hierarchies, but this was often officially glossed over (Kligman 1998). So, if it was the norm in villages to have customs or rules about gift giving, dowries, hospitality, setting the table and serving food, then codes about that behavior in the cities were only an outgrowth of communism and other national customs. Regarding the postwar era, the author notes sectarians in the early phase following the socialist revolution may focused on destroying not just the social traditions of the past, but how those behaviors served as symbols of petit-bourgeois prejudices, for example, wearing a hat or tie. Zelmanovic notes the sectarians presented other behaviors as alternatives, but these practices did not present an advancement in social theory, only a move back. Thus, local society, adapting to urbanization and new social structures, has reinterpreted the correct customs, with their foundations in the local past, for the modern city. One way to read this, perhaps the official way, would be that etiquette presented in the socialist era is not about differentiating people by their class-based behaviors but about maintaining local customs of behavior as they are adapted to middle class city life in the modern era. Thus, the use of tableware in a specific way is officially appropriate because it is a local custom adapted to modern circumstances. Tableware is not new in Zagreb, it is not the sole domain of one class, nor is it an exclusively pre-socialist good. The use of tableware is part of the changes and consistencies of gendered consumer practices of the past and present and relates to social and market structures. This makes it an important object of research. Issues of urbanization, of new social structures and of standing the test of time, of modernization, because they were part of the consumer experience of state socialism lead me to the assumption they might come up in research as well.

## METHODS

The research presented here is ethnographic research including long interviews with twelve female informants who represent three class positions in Zagreb, Croatia: upper class, middle class and working class. Nine of the interviews were with women alone and three were multi-generational: mother-daughter pairs. All of the informants were accessed through the snowball method, starting with a key informant at the University of Zagreb and the social network of the researcher. The heuristic employed for informants' class was education and employment: professionals who had completed advanced University degrees, then skilled laborers who finished high school and may have some further education, and unskilled laborers, working for hourly wages outside the official economy, who had completed compulsory education. In the case of mother-daughter interviews, class mobility across generations was defined by the same characteristics: the mothers were laborers while the daughters were professionals. The goal of all interviews was to use the biographies of women and their tableware to explore class in Zagreb during and after state socialism. The multi-generational interviews explored these issues as well as multi-generational class movement, taste and class. Women informants who came of age during state socialism (using a heuristic cut off date birth before 1963) were sought with the goal of discussing memories of tableware use during state socialism. Date of birth 1970 or after was the heuristic for second generation informants. The

ethnographic research was conducted during the fall of 2006 and the winter of 2007 as part of the author's dissertation research.

In the interviews, there was a mix of open-ended questions and an interview guide (Patton 1990). Interviews (in Croatian) were tape recorded and video recorded. They opened with questions about the informant's parent's place of birth, migration and education, and then her place of birth, migration, education, marriage, work, childbearing, and childcare. In multi-generational interviews, it was sometimes unnecessary to ask the same questions to the daughter. Then the interview moved on to about seven open ended questions taken from a printed interview guide that developed iteratively in the research process. Tableware can be understood in this article as: china (*posudje za stol, stol servis*), fine china (*tkani porcelain*), glasses (*salice*), crystal (*kristal*), cutlery (*bestek*), silver cutlery (*srebro*), tablecloths (*stolnjak*) and napkins, serving dishes (*rostfraij*) and tureens (*zdela*), candlesticks and napkin rings. This operationalization, or definition, was driven by informants' descriptions of how they set their tables, of the researchers' participation in family meals in Zagreb, and by observation of what is on offer for tableware at posh and midrange department stores in Zagreb. It should be typical of what most people in Zagreb would expect to find on a table for a family meal, regardless of the style of the objects. Across the interviews, discussing residence changes easily led to discussion of favorite tableware, its movement across generations, its arrival into the household, meanings in different cultural contexts in recent history, and social linkage.

## DATA

In interviews, discussion with informants of their biographies revealed most working or middle class women arrived in Zagreb after finishing high school in the village in which their family has lived for generations, working as unskilled or semi-skilled agrarian laborers. Their parents often had no formal education. Matija (no real names are used), a middle class woman, aged about 45, when asked why she left the village, laughed and said, "It is a tiny village [in Podravina, a region of Croatia known for farming and the food industry] with no jobs, boring, and no future. I ran from there in 1981, after I finished high school. My husband did the same [he is from the same village]." A working class woman, Slavica, mentioned the differences between Zagreb and her village in Eastern Croatia as well as the change moving to Zagreb brought in her life, "I came here 'naked and barefoot' as they say, from that tiny village, in 1960, when I was 18 and finished school. I went to the employment office and found a job at TEZ [a light bulb factory] and worked there for 33 years. I met my husband in Zagreb. I went back to the village for the baptism of my brother's child after I came to Zagreb. I took the train to the closest village and then walked all night, in the dark, through the forest, to get there and I'll never forget how scared I was. I would never live there. Zagreb has streetlights and trams, everything is easy." Social class mobility has a lot to do with migration.

Most upper middle class women have roots in cities. They are either from Zagreb or moved to Zagreb from another city. Their mothers had always finished high school, and their fathers finished one or more University degrees. One woman was describing her family legacy, "My mother, all the women in my family, have always been educated and we have always been from Zagreb." It seemed clear to me that her framing of her personal history as constant is a contrast to larger changes in political and market structures. To probe the issue further, I asked her if any of these changes had influenced their status. She replied, "Of course not." Another upper class woman described her family roots this way, emphasizing that although her father was not from Zagreb, he was from a city rather than a village, he was educated, and his family had

been educated and powerful for generations "My father, he had a PhD, he wasn't from Zagreb, he was from Varazdin, and he was from a noble family."

I asked an informant, Hannah, an upper middle class Zagreb native, why she and other informants emphasize their roots. She told me a story about ways of communicating status. A businessman from Hercegovina, a poor mountainous region to the Southeast of Zagreb, who arrived in Zagreb in the 1980s and went on to make a great success. After a short time here, he asked the owner of a 180 square meter apartment (very large by local standards) on Masarykovia Street, in the center of town and across from the Croatian National Theatre, to sell him the apartment and everything in it. He wanted the apartment and its paintings and furniture. The owner just needed to take his few personal things and leave the rest. I asked why he would want to buy this. She said, "So he can have people in his house, at this address, people he is trying to impress, people he wants to do business with, and show them the paintings on the walls and say, this has been in my family for generations. Just to show that he has roots and is someone." Hannah mentioned, "My son and his wife have almost nothing on the walls of their apartment, they have a minimalist style. But when you come to my house, the walls are full of paintings." Another upper middle class informant and Zagreb native, Dora, talking about different places in town to shop, described the Sunday antiques fair at Britanski trg, a traditionally affluent neighborhood in Zagreb, as a "place for the newly rich to buy roots, to have old things in their apartment." So, given the social tensions in Zagreb, it is interesting to consider how people use private spaces to communicate status, and to whom.

Communicating status may be a dilemma only for threatened natives from the upper middle class. What about the consumption of the middle and working classes at home? Here, it is useful to consider meaning of home in the context of social changes. Middle class security in state socialism was something that most people shared, people who were workers or professors or dentists. It meant a place to live and insurance. Privatization shattered this security by bringing unemployment. For many people who worked as skilled laborers during state socialism, to have an apartment after privatization is a sign of success. The state did sell the apartments it owned to the people living there for very good prices in 1991. But to have been able to afford to not sell it in the late 1990s, when the price of real estate skyrocketed, or even to have bought an apartment at that time, as Lina, an upper middle class and Matija, a middle class informant did, is an accomplishment. In Croatia, having a home, as Matija described, means "having a space where you are protected, shielded from the outside, that no landlord can knock on the door and ask you for something." The interview with Matija went well in part because it was easy to feel at home there and talk about the things in it. The owners could afford not only their mortgage but also to use a tablecloth that is ironed, clean and attractive, but not luxurious, as a sign of middle class status.

After the interview and a meal at their home, Matija's daughter, Ivana, a University student, drove me home. In the car, Ivana remarked, "I'm glad my mother has a cozy home, that is important to her and it feels nice. She has nice textiles and things." I asked her why this is so important, and she said, "Well, a lot of girls, they wear really expensive clothes, but the way they live at home, their mothers don't have anything, and that isn't good." So, to be able to have a home that is cozy, that has nice things, inherited or not, is, for the working and middle class, an affirmation of status that is more "right" than displays on the street. It communicates keeping alive social practices. Visiting Martina, a working class maid who supports her veteran husband and daughter, felt quite different. Martina's family moved last year across town from her home of twenty or more years to an apartment the state pays for because of

his veteran's status, was a different experience. The table was bare. Martina had brought nothing of her tableware from her old apartment, and in fact she had very little to bring. The absence of this object brought up questions that were difficult to ask and answer.

For most women interviewed, tablecloths were often the most treasured objects in the category of tableware, often for their relationship to female ancestors. They presented tablecloths, or *stolnjak*, that were inherited at their wedding from female blood relatives (inheritance customs dictate goods move first to the blood line, then to the female, so that a woman inherits from her mother and her mother's mother or from her aunt and her aunt's mother, but rarely from her husband's mother. Women are expected to bring goods into the marriage). These were always pulled out of drawers, where they sleep, neatly folded, cozy in paper and lavender (or rosemary as is the habit of women from Dalmatia) wrapping, clean and ironed, until the time comes for use. Which, according to the informants, is hardly ever. They are almost too precious, too delicate, too sacred for wine and soup stains and subsequent bleaching. For working and middle class women, the textiles were always handmade on a loom by a female ancestor from the village and their decoration fits textile motifs from villages in that region. For upper middle class women, the difference is not inheritance but the production of and decoration on the textile. The mark of ancestry is not the loom and regional motifs but delicate, decorative needlework such as lace and flowers applied by hand.

Some of the physical characteristics of tableware make it important for research in Croatia. Csikszentmihalyi and Rochberg-Halton, in their study of what objects in the home people cherish, talk about plates as important for their associations with people or places of origin (1981). Many people have migrated to Zagreb following World War II and the war from 1991 to 1995. Also, plates and crystal are fragile, as they point out, and their preservation is a way to suggest that the owner and ancestors who also owned the tableware have survived forces of social, economic and political upheaval (1981). This would also be relevant in Zagreb, as World War II devastated the assets of many women, but not all. Also, many women were killed or displaced during the war and after. Thus, the local political history frames the conditions and meanings of having or not having inherited tableware. It also frames generational differences regarding perceptions of preservation, of new and old things and styles, between those women who lived through or were born after the war and those born in the peace of the Yugoslav era. Many working and middle class women referred to favorite plates as desert plates given to them from friends from the village or from Zagreb who move to Germany to work. Upper middle class women referred to full services of fine china inherited from their mother's family. They all mentioned the things were valuable as associations with other people.

One question I frequently asked was, do you have more "fancy" dishes (*tanki porcelain*), how did you acquire them, how do you use them, and if it was bought, was it expensive and how did you pay for it? I asked the same question about "everyday" dishes (*posudje*). Most of these questions referred to acquisition, trying to point out the differences between what is inherited and bought, as well as the meanings surrounding buying and inheriting. Most of the upper middle class women described inheriting dishes as well as buying dishes, for example everyday dishes for a new residence after a move. Matija and Hannah, a middle and an upper middle class woman, both described buying new plates for daily use when they recently moved into (finer) residences. The difference was the type of plates: the middle class woman bought glass plates at a discounter, while the upper middle class woman bought plates by Villery & Bosch at the most elegant department store in Zagreb. In a mother-daughter interview, I asked about the mother's biography

first, as in all interviews. When Petra, a middle class woman, mentioned her husband died in 1988 when her daughter, Vanja was ten, I expressed sympathy. The daughter assured me it was for the best, as they lived in a 32 square meter (345 square feet) apartment, her parents were divorced but lived together since no one had anywhere else to go, and her father was an alcoholic who died of cirrhosis of the liver, and if they had gone on like that, who knows what would have happened. Later in the interview, I asked if they had everyday china as well as china for special occasions. When they said yes, they do have china reserved for special occasions, they revealed the china was expensive and they bought it locally, at Nama, a department store in Zagreb. I asked them how they paid for it. The daughter, a teacher at a private high school, returned to the earlier stage of the interview to talk about the death of her father. She said, "We bought that china, it isn't fine china but it is very nice, with the money that we got when my father died. When my father died, as my parents were divorced, my mother did not receive any money from the state, but I did, and we bought the china with that." I asked them when they use these plates and they said rarely, perhaps for guests. They are wrapped and stored in a cabinet at home. They use other plates because "if they break when you wash them, you can throw them away, but the others are a set." However, an upper middle class informant, Dunja, whose mother died about twenty years ago mentioned that she inherited Rosenthal fine china and used it daily, washing it in the dishwasher. She said she has so much of it, she feels guilty if she doesn't use it. Use or non use of china differs according to class positions.

Cutlery *(bestek)*, at least the "good" cutlery, is also pulled out of a storage, where it is kept either in a paper box or in a container that is a small suitcase with a combination lock. It isn't hidden away out of fear that it will dissolve. Of course not, stainless steel is a durable material, unlike cotton that is at least half a century old. But that isn't the point of not using it. It is hidden away until it can be passed down to the daughter, until she marries and starts her own household. Informants describe that it is bought to give it away. Middle class women described buying *bestek* when their daughters were young. They bought the *bestek* at considerable cost and effort. One mother described buying *bestek* and paying for it monthly, over two years, in 1997. Incidentally, the war ended in 1995, and her husband returned from a short period in the military during which contact was not possible, and while her employment was stable, his was stabilizing at that time. Furthermore, the overall economic condition could not be described as optimistic. They mentioned buying the *bestek* so they could pass it to their daughters, who, in most cases, were not considering marriage at that time as their were barely or still teenagers at the time.

There were generation differences communicated through tableware. Daughters did not show interest in inheriting the *bestek* or any other tableware from their mother as it did not fit their style or personality. In a multi-generational interview, Ivana, an unmarried University student, what she might take with her if she moves out and marries, she said, "A plant that is in the hallway that my parents have had since I was little." I asked about the cutlery bought for her and she said, "I'm not really interested in it." In another multi-generational interview, a daughter, Tamara, a professional in her mid-thirties, who lived with her parents, said, while I was looking at her mother Vera's inherited, hand-loomed tablecloths, "you know, we don't really like to have those in modern houses, it isn't relevant or stylish, we like to have modern things." Another daughter, Vanja, who lives with her boyfriend and appears to be moving into the upper middle class commented in front of her mother, Petra, that she does not want to inherit things from her mother. She likes "glasses, especially from Ikea, not any of the old styles." In the case of upper middle class women, *bestek* is some-

thing they bought or inherited when they married and set up their home. These difference might not simply be about class mobility, however. Hannah again mentioned her son and his wife, a dentist. They have their own style, she said, like every generation, and bought their own things when they set up house. Hannah implied, however, they have nice things and know how to use them "I put a tablecloth on the table, but they don't, they are from a different generation that does things differently. They use placemats as it is less complicated. And they have a beautiful wood table and you can see it, it really is nice they don't cover it up." The differences between middle class mothers and their socially mobile daughters might reflect changes in perceptions of status as something to communicate through style of tableware and through style of acquisition: purchase rather than inheritance.

## DISCUSSION

This research asked if theories about social class developed in the United States transfer to other contexts. The data suggest they do. Indeed, social categories are related to consumption in Croatia. Data suggested the use of tableware is a social practice informed by class. It also suggested three factors influenced class: education, migration and employment. Women who were educated professionals from cities tended to be upper middle class. Women who were working in the unofficial economy, finished high school and were migrants tended to be working class. Women who finished high school, worked in skilled jobs and were migrants tended to be middle class. Acquisition patterns, inheritance and purchase, co-vary according to social class group. Inherited items make up the most of the upper middle class woman's table, although there is a strong presence of purchased items, especially for everyday meals. Purchased items make up most of the middle class woman's table; inherited items are usually stored. Purchased or received items tend to make up most of a working class woman's tableware; inherited objects are few and tend to be limited to tablecloths. These patterns also co-vary according to patterns of living in a city. Women who's roots are in cities have more inherited and purchased items than women from villages. Women from cities tend to be upper middle class as well. Women from villages tend to be middle or working class. They tend to have fewer inherited items. It is worth noting that most fighting during wars in Croatia took place in villages or small towns, but not cities, which may account for the lack of inheritance of working and middle class women. Yet it must also be noted the dowry of working class women would have been nonexistent. In the case of middle class women with village roots, china was received as a wedding gift, but it was not used, because the woman did not like the style.

One difference that emerged between Holt's data and the data presented here is the type of change the informants must manage in the course of their lives. In the case of women in Zagreb, rapid and dramatic historical change has been a part of their lives while this has not been the case for most of Holt's informants. Perhaps this is one reason the informants in this research focus on consistencies in social practices of spending on the home and using nice things in the home, even though the styles change. For example, even though Ivana, Tamara, and Vanja, three daughters who participated in multi-generation interviews, expressed no interest in inheriting tableware from their mothers, they all talked about how they liked to have nice things in the home. Hannah, a mother who talked about stylistic differences between her use of a tablecloth and her son's use of placemats, emphasized that her son's wood table looked beautiful. Styles change, but setting the table still communicates status and its meanings. In this case, Hannah is talking about a son who will probably not inherit her tableware–it will go to her niece, a female blood relation. Even if the goods move forward in

extended directions, or move forward and are not, as would probably be the case for Ivana,, Tamara, and Vanja, the status they communicate would continue in practices with new goods.

Another question for this research has been women's roles as status makers in families. Working class women certainly made the largest contributions to their family's income and status. Their contribution during state socialism was about equivalent and their job status was also equivalent but their contribution is much larger now: Martina and Sanja were the main breadwinners in their households. Sanja was responsible for bringing almost all of the goods into the house as they were gifts to her. Martina's situation must be understood in the context of the recent war: her husband was a veteran who worked before the war but has found work sporadically since then. In both cases, their husbands were not contributing income. For upper middle class women, their contribution to family status came after they finish their education and established themselves professionally. In most cases, this happened during state socialism. They have been in a position to benefit from the opportunities of expanding public and private sectors ever since. Their contributions remain more or less equivalent, but both their and their husband's income has increased. For middle class women, their position has not changed too dramatically during and after state socialism, although their daughters stand to benefit from growing up middle class. For both upper middle and middle class women, their husbands had similar employment and education status as they. It would be difficult to separate who is responsible for status. Thus, for upper middle and middle class families, status may have more do with gender dynamics than gender dominance and female contributions than has been recognized in the literature so far. Women's consumption of bought tableware may be a way of showing her status as middle or upper middle class in the broader context of social and demographic changes, they show her as one of the successful ones, in a way that using inherited tableware can not. Maintaining the social practices of a class position in the home, which requires knowledge about them and how to use them correctly, can connect the dots. Future research could look at women's consumption of status goods for the home. Finally, consumption of fine china for home use communicates to a smaller audience compared to consumption of, say a dress worn to a concert, and is often more expensive. The symbolic power comes in assuming the public communication has been taken care of or is not relevant.

## APPENDIX A
### INFORMANT DESCRIPTIONS

| Name | Age | Description |
|---|---|---|
| Irina | 60-65 | Professor. PhD, From city, moved to Zagreb in 1991. Most tableware inherited, but lost in recent war. Upper Middle Class |
| Lina | 60-65 | Professor. PhD. From city, moved to Zagreb after WWII. Inherited and bought tableware. Upper Middle Class. |
| Dunja | 45-50 | Professor. PhD. From Zagreb. Inherited tableware. Upper Middle Class. |
| Dora | 60-65 | Company Director, very prestigious firm. MSc. From Zagreb. Tableware inherited and bought. Upper Middle Class. |
| Hannah | 55-60 | Professor, PhD, From Zagreb, Tableware inherited and bought. Upper Middle Class. |
| Ivana | 20-25 | Matija's daughter. University student. From Zagreb. Research Assistant. Wants to buy new tableware rather than inherit. Middle Class. |
| Matija | 45-50 | Ivana's mother. Skilled worker in a factory. From village. High school. Some inherited, mostly textiles, but mostly bought tableware. Moved from Working to Middle class. |
| Vera | 55-60 | Tamara's mother. Middle class. High School. From village. Mostly bought tableware, inherited textiles. |
| Tamara | 30-35 | Vera's daughter. Manager. MSc. From Zagreb. Wants to buy new tableware rather than inherit. Moving from middle to upper class. |
| Petra | 55-60 | Vanja's mother. High School. Moved to Zagreb. Retired. Bought tableware. Middle class, children's help keeping them out of working class. |
| Vanja | 25-30 | Petra's daughter. University degree. Teacher at a private high school. From Zagreb. Wants to buy new tableware rather than inherit. Moving into the upper middle class. |
| Martina | 45-50 | Retired factory worker. Now works in the unofficial economy as a maid. From Zagreb. High School. Recently moved into social housing, left tableware behind (most of it bought). Working class. |
| Sanja | 50-55 | Retired factory worker who now works in the unofficial economy as a maid. From village. High School. All tableware received as gifts from friends, relatives. Working class. |

# Peeps, Beemers and Scooby-doos: Exploring Community Value amongst Scottish Car Cruisers

Paul Hewer, Strathclyde University, Scotland
Douglas Brownlie, Stirling University. Scotland
Steven Treanor, Ipsos MORI, Scotland
Pauline Ferguson, Stirling University, Scotland
Susan Hamilton, Stirling University, Scotland

## INTRODUCTION

"Crucially important to the ethnographic imagination of life as art is that we recognize and explore the scope of creativity in the use of commoditized and electronic materials, their profane possibilities as mobilized in concrete contexts." (Willis, 2005:50).

This paper is inspired by the approach to consumer culture which Willis (2005) sets out to unravel with respect to the forms of creativity expressed through consumption practices. We examine in particular one such context that of the cruiser community who gather together once a month at a site in central Scotland locally referred to as the 'The Falkirk Wheel' (see http: www.thefalkirkwheel.co.uk). At this car park, of what is must be said is a very imposing canal lock, the 'Falkirk Cruise' is performed. Similar gatherings can be witnessed in cities and towns throughout the UK, where cars sporting thousands of pounds worth of modifications are temporarily brought together for the spectacle of what is termed 'The Cruise'. Despite the significance of such events to those concerned, little is known about them beyond the charged tone of the media coverage which seeks to represent them as troublesome, secretive gatherings of 'joy riders' and 'boy racers' intent on inflicting their deviant practices on an unsuspecting public (Campbell, 1993; Mulford, 2000; Evening Times 2002a, 2002b, 2002c, 2003). The effect of such media representations, as previously noted by Thornton (1997), is not merely to stigmatize cruising as anti-social, but to construct participants as committed members of a menacing collective expression, the unacceptable face of the 'reality' of youthful resistance and irresponsibility.

We argue that this topic is worthy of consumer researchers attention not least in that it gives us a glimpse into a specific instance of consumer culture in the making (c.f. Brownlie, Hewer and Horne, 2005). Moreover if we are to understand consumption as a way of doing and performing community (Muniz and O'Guinn, 2001) then such a context speaks of the bonds of sociality that constitute the collective, enabling us to open up to question what Maffesoli terms 'the relational component of social life' (1996: 123). The social bond, or as Cova (1997) describes it, *the link*, is the important mediator here; as are what Peñaloza and Venkatesh (2006) refer to as the agentic practices which are an essential component for the 'co-creation' of *meaning and value in exchange and use*. In this sense it speaks of enabling us to rethink notions of tangible and intangible brand assets, especially when the brand is secondary, subverted and an object to be played with to inflect and produce their own meanings (or as they simply prefer 'debadged') by way of generating the intangibility of community value. Drawing on the recent work of Lury (2004) we consider brands as simply objects in motion, an interface of connectivity and interactivity, where "The 'is' of the brand is also its 'may-be'; in its being–its objectivity–it has the potential to be otherwise, to become." (2004:151). This paper then seeks to make an advance by turning our attention back to the significance of social relations for the understanding consumers and culture. But also to demonstrate the inconsequential role which brands play in negotiations over social value (Dant, 1996); what Bauman in his discussion of culture as *praxis* refers to as the "hard core of actual interaction…the lasting, time-spanning, little-changing, skeleton of the societal practice…the kernels of stability in the husk of floating events." (1973:106). This viewpoint alerts us to the merit of considering a specific cultural context where people choose to come together to forge what we see as their social and cultural identities through their relationships with their cars and others.

## EXPLORING THE SOCIALNESS OF CARS

Until recently research has highlighted the "dark underside of auto freedom" (Sheller 2004:224) where the motor car has been constructed as a 'bad object', as a sign of alienation and the source of environmental, urban and social problems of contemporary society (Miller, 2001; Noble and Baldwin, 2001). The car has been condemned as a machine which could only accelerate the decline of community and the decay of social solidarity, both facilitating and symbolising "the flight into privacy" (Hawkins 1986 cited in Dant and Martin 2001:7). As Urry and Sheller (2003:116) argue, in the car, "the public world beyond the windscreen is an alien other, to be kept at bay through the diverse privatising technologies incorporated within the contemporary car". Similarly, Edensor (2004) argues that time spent in cars becomes normalised and the road becomes "socially sterile, purified and single purpose" (Sibley 1988 cited in Edensor 2004:110). Roads become in Auge's (1995) words 'non-places'; to be contrasted with 'places' wherein identities, relationships and a story can be played out. Non-places, on the other hand, effect a certain detachment between the individual and the spaces they negotiate "where solitudes coexist without creating any social bond or even a social emotion" (Auge 1995 cited in Merriman 2004:148). Bull further suggests that we think of the car as an extension to the home in which individuals, "physically cocooned" (Jacobsen, 2000 cited ibid), inhabit a "free dwelling" in motion on the road (2001:185). For us this individualised approach is insufficient since it fails to address what Riggins (1994) refers to as the 'socialness' of such material objects.

Miller (2001) has contended that the car has become so central and 'second nature' that its significance has been overlooked to the detriment of an accurate understanding of the extensive role it plays in people's lives. He argues that the car has been viewed as the "taken for granted mundane that hides the extraordinary found in this material expression of cultural life" (ibid, 2). We concur with Miller's (2001) call for a rethinking of the car and a consideration of its evident humanity. Indeed, in the 'Car Cultures' collection he demonstrates "just how simplistic a concept such as 'alienation' appears to be when set against a relationship to cars which is not just contradictory but convoluted in extreme" (2001:2). The car's humanity, he argues, "lies not just in what people are able to achieve through it, nor yet in its role of destruction, but in the degree to which we see ourselves as human" (ibid:2). For us, it is the cars sociality which matters most, for example Dant (1996) sets out to avoid the fetishism of the object through understanding the car as

an inherently social object, a point of connection or 'vector of communion' (Maffesoli, 1996) through which people are able to share their enthusiasms and passions to produce what Maffesoli might refer to as ephemeral, local emotional communities (Maffesoli, 1996). This paper seeks to explore and produce an 'emphatic account of car consumption (Miller, 2001:8) to thereby open up a set of questions around community value and the social construction of such value.

## TURNING TO CAR CULTURES

Within consumer research, studies of bikers (Schouten & McAlexander, 1995) to those on goths (Miklas & Arnold, 1999; Goulding, Saren & Follett, 2004), rave cultures (Goulding, Shankar & Elliott, 2002), gay men (Kates, 2002), mountain men (Belk & Costa, 1998), trekkies (Kozinets, 2001) and X-Philers (Kozinets, 1997), have all sought to understand the situated nature of consumption practices, and in doing so have highlighted the value of what might be termed a cultural approach to consumer researchers. Such an approach draws upon the early work of the CCCS (cf Hodkinson, 2002, 2004; Skelton & Valentine, 1998; Gelder & Thornton, 1997; Malbon, 1998; Hall & Jefferson, 1993; Hebdige, 1991; Willis, 1978) offers a useful approach to cultural analysis framed through the notion of subculture. In the case of studying the subculture of skinheads, Clarke writes that "Skinhead style represent(ed) an attempt to recreate, through the 'mob', the traditional working class community as a substitution for the real decline of the latter" (1993:99). He argues that groups of similar minded youths were able to resist the "people on our backs" within their 'community', with solidarity expressed through the symbolic construction of taste and style (1993:99). In this way, the subculture is manifested through a collective response to changes taking place in wider social conditions, organized around style-based allegiances, especially to fashion and music. Early debate around the value of the CCCS notion of subculture centred on the idea of taste and style as articulations of symbolic capital and as the basis for strategies of resistance enacted through the conspicuous consumption of style-inscribed commodities (Clarke et al., 1993).

The work of Schouten and McAlexander (1995) imports a subcultural framework into their ethnographic research among a community of bikers, albeit with little reference to prior ethnographic studies of bikers (Willis, 1978) or the work of the CCCS (for example, Hall & Jefferson 1993; Bennett, Martin, Mercer & Woollacott 1986). They also introduced the term 'subculture of consumption' as a means of characterizing individual and group organizing structures, such as clearly defined hierarchical fields, systems of formal and informal membership, a unique ethos or shared set of beliefs, rituals, jargon and modes of symbolic expression. Although these characteristics, in particular shared rituals and modes of symbolic expression, seem extremely similar to those which mark neo-tribes (Cova, 2002), there are fundamental differences. For instance, a 'subculture of consumption' recognizes that subcultural groupings are defined by clear hierarchical social structures that may identify the status of individual members. Expanding on the work of Fox (1987), Schouten and McAlexander (1995) explain how subcultural groupings can be characterised by a concentric social structure and related consumption practices, signifying three levels of involvement based on commitment to the ideology of the group. 'Hard core' members exhibit a "commitment and ideology that is full time and enduring" (ibid:48). This grouping act as opinion leaders to the 'soft core' members, who demonstrate less commitment and in turn their role is subordinate to and dictated by the 'hard core'. Finally, 'Pretenders' show great interest in the subculture but only "delve superficially" into the ethos serving as

an audience and material support to the hard core and soft core members.

Another distinction between neo-tribes and subcultures as ways of framing cultural collectives relates to formal and informal membership practices. Maffesoli (1996) argues that neo-tribes are distinctive on the basis of their ephemerality, since they do not have any permanent membership other than through the duration of rituals (Maffesoli, 1996). Also it appears possible to belong to more than one neo-tribe through switching allegiances, where one mask is dropped and another is worn (Malbon, 1998). Within a subcultural framing then, identity is theorised as being unified and fixed. Membership is seen to be static, one mask being permanently worn, in that distinct dress codes and a specific stable way of life permeates everyday activities. On the other hand, membership framed through the concept of neo-tribes is represented as being temporary, unstable and shifting, making possible simultaneous membership of several sites, so that the individual can live out a temporary role or identity in one site, before relocating to another to assume a different role or identity. And those roles or identities are not simply class-based. As Maffesoli argues, "in contrast to the 1970s-with its strength such as the Californian counterculture and the European Student Communes-it is less a question of belonging to a gang, a family or a community than of switching from one group to another" (1996:76). Recent research into 'rave cultures' (Bennett, 1999; Goulding, Shanker & Elliott, 2002; Malbon, 1998) has been critical of the relevance of subcultural theory. Bennett maps out some of the objections, namely that it may be inappropriate to utilize "structuralist accounts to explain what are, in effect, examples of consumer autonomy and creativity" (1999:599). For example, it is suggested that subcultural activities may be better understood as expressions of self identity and creative solidarity rather than resistance against domineering forces in what is becoming a progressively classless society (Goulding, Shanker & Elliott, 2002). As a raver in Goulding's research stated "Going to a rave is like going to a massive party where everyone is in the same wavelength. Dancing kind of draws people together, not in any kind of sexual way, it's just like you're sharing something exhilarating, dancing till you nearly drop" (2002:273). Bennett (1999) prefers the notion of a neo-tribe as membership to such groupings is based not on conformity nor exclusivity, but an ambience, a state of mind that binds fellow individuals, even strangers, together into one tribe (Bennett, 1999; Goulding, Shanker & Elliott, 2002; Malbon, 1998). In contrast, Hodkinson (2004) argues for a reworking and clarification of the notion of subculture itself as he suggests that elective groupings such as goths are "less notable for their fluidity than their levels of what might be termed cultural substance" (ibid:141) as expressed through a consistent distinctiveness of values and tastes, a sense of shared identity, but also their practical commitment or immersion in the scene and the relative self-sufficiency of the grouping from mainstream commercial culture. Stahl (2004) in his research on music-making opts for the analytical concept of scene to account for the loose affiliations and 'webs of connectivity' that may define participants' everyday practices.

Turning to studies of car consumption we find that most have tended to adopt the subcultural approach rather than that of the tribal framework. Two cross cultural studies, in particular, have documented the practices of 'Raggare' culture in Sweden (O'Dell, 2001) and the Kortteliralli in Finland (Vaaranen and Wieloch, 2002; Vaaranen, 2004). The latter study revisits the CCCS approach to explain the practices of Finnish street racers as emotion fuelled opposition to their 'bitterly remembered' working class childhood. Resembling other CCCS inspired studies, the existence of the Kortteliralli as a car centred collective was underplayed in favour

of a theorisation of their practices as working class resistance against the bourgeois ways of consumption (Vaaranen, 2004). As Vaaranen and Wieloch (2002:92) argue "the affection felt for the cars unites these boys. Still, even stronger bonds are based on mutual history due to bitterly remembered school years and shared living conditions in the housing projects surrounding Helsinki". O'Dell's (2001) study of the Raggare ('Working class Greasers') is presented in a similar manner. He argues that working class youth purposely adopted "all but beautiful" American cars of the 1950s as symbols of their resistance to the 'good taste' of middle class Swedish culture.

We argue that the value of such studies lies in the attention they draw to the creativity embedded in the everyday (Willis, 2005), most notably through cultural practices and their social potential. For example, while the Raggare became "something of a vulgarity" in the public domain, O'Dell highlights the positive social role of the car for these young people. He argues it is possible to liken the car to a mobile family room, a semi public sphere in which friends congregate and socialise. Furthermore, through acts of bricolage the cars of the *Raggare* were customised and decorated outlandishly with two-tone paint serving as a forum for self expression for these young people. As he clarifies, "more than just an object, the car is a room in and around which working class youth can develop their own modern identities" (O'Dell 2001:124). Or as Willis suggests: "[consumers]…adopt and make use of capitalist consumption commodities–clothes, drink, cigarettes–not only to resist domination but to make, project and believe in versions of their own worldliness and superiority. They penetrate the shells of fetishized commodities to find new social use values." (2005:36).

## ON METHOD

In terms a method capable of bringing such creative practices to light, our work is largely inspired by the work of Cova and Cova (2001), who suggest that in order to understand neo-tribes the consumer researcher is "well advised to cast aside the more traditional mono-disciplinary, systematic approaches and to favour practices based on detecting signs, foraging for faint hints and sighting glimmers of shadow" (2001:71). In following this advice data generation employed a multi-method approach combining desk based research, face to face participant observation and online computer mediated communication (Kozinets, 2002).

First, to build an understanding of the jargon, rituals and aesthetic ambience shared by the group, a review of popular discourse was undertaken, involving websites and newspaper coverage. The dedicated fanzines *Max Power* magazine and *Fast and Modified* provided accounts of "key [cruise] events memorialized in words" (Fetterman 1998:92). This material was then coupled with a phase of participant observation, which involved an episodic "deep hanging out" (Wolcott 1999, cited in Elliot & Jankel-Elliot 2003:215) with tribal members over a six month period at a number of specific cruise events across the breadth of Central Scotland. Observations (including the taking of photographs) focused on uncovering the symbols and rituals (Fetterman 1998; Swidler 1986) to attempt to grasp the role of uses and meaningfulness of objects, and their role in the performativity of the 'social drama' of social life (Turner, 1982). As Swidler (1986) testifies, to understand culture, researchers must attempt to understand the symbolic vehicles of meaning that comprise it. In particular, she argues that beliefs, ritual practices, art forms, ceremonies, and informal cultural practices (Language and gossip) are the means through which "social processes of sharing modes of behaviour and outlook within a community" takes place (Hannerz, 1969 cited in Swidler, 1986). These methods were then supplemented by recourse to 'consumer

voices' (Stern, 1998, cited in Cova & Salle 2003, 10) as a means of accounting for of the lived experiences and everyday practices of cruisers. First, as Elliot and Jankel-Elliot (2003) advise, interviews took the form of impromptu discussions between researcher and informants. Thereafter, web forums provided an invaluable environment in which to probe the lived experiences of Cruisers (Kozinets, 2002). In utilising the web forums, initial questions formed during observations were, in the first instance, posted on the open message board where people could choose whether they wanted to respond or not. In line with the suggestion of Illingworth (2001) this provided an interesting and dynamic environment in which group members could dispute or co-construct meaning. Anyone who responded was subsequently contacted personally and asked whether they would become a research contact. Combined, these strategies formed part of a concerted ethnographic effort to give the group a voice, to in other words explore and understand their everyday practices of meaning-making. It could be argued that a strategy of non-participant observation may indeed serve only to impose an outside interpretation on the activities of a group already objectified in public discourse. It was important, as Kusenbach (2004) reminds us, that we checked whether our 'savvy' academic observations were shared by, or meant anything to, any of the respondents. Accordingly, forums and attendance at the cruises provided a less intrusive opportunity to take Cruisers on their own terms and allow them to articulate their own activities.

### "Anti-Social": A contradiction in terms

Unsurprisingly, in defining their practices respondents sought to distance themselves from the images presented in public discourse. In particular, they rejected three major characterisations. First, the respondents defined themselves in contrast to the 'boy racer' or 'ned' label that they are frequently subjected to. Accordingly this differentiation formed a discursive boundary through which Cruisers could define themselves as legitimate and mark out their own meaning-making. As these respondents testify, despite a small element of 'boy racers' existed within the culture, they do not share the same values as Cruisers,

> "Cruising goes by what it says in the dictionary to go somewhere in no great hurry or speed. There's a difference between boy racers and Cruisers".

> "I wouldn't ever deny that there are young lads who like to race about and yes it is dangerous, however a Cruiser and a boy racer/ned are completely different things".

It is unsurprising that respondents defined themselves in this manner. Indeed a person's identity is said to be conditioned, not only through an inward looking self consciousness, but, more significantly by defining who one is not and differentiating members of the group from 'others'. Identity is largely constructed in relation to an 'other' (Bauman, 1990; Triandafyllidou, 1998). As Kedoune articulates, "there is duty laid upon us to cultivate our own peculiar qualities and not to mix or merge them with 'others'" (1992 cited in Triandafyllidou 1998:596), an argument which was validated during fieldwork at Edinburgh Cruise (Saturday 25th June 2006).

> *A sports car came into the car park (A slick black looking FTO?) and over in a clearance started performing burnouts and what they described as 'attempting to drift'. Surprisingly, only a few people went to watch. As an outsider on the search for exciting data, I went to go over, only to be stopped and told,*

*"don't go over mate, you'd only be encouraging him. He's being an arse. You watch the police will be here any minute" . The guys started laughing at the 'point' of wasting 'a good motor' and a good set of tires.*

This sentiment is supported by this respondent,

"A boy racer will 9 times out of 10 have a pretty standard car which they think is amazing and they race about or do burnouts/hand-break turns. Why would someone spend thousands on a car and possibly the same on insurance to kill it like that?"

In essence, respondents were knowledgeable of their position as labeled by the media,

" It's just the fact we're young and have modified cars we all get tarred with the same brush as being 'boy racers' but we don't race. It's just a gathering of car enthusiasts that get painted in the media as menaces."

Secondly, respondents hinted at the 'normality' of Cruising and rather interestingly, likened the act of Cruising to everyday mundane activities. Furthermore, respondents contrasted the morality of Cruising against other popular forms of social interaction such as drinking and taking drugs. In essence, the act of being parked up in a car park to them was no different to non-Cruisers doing the same. If anything, respondents felt it was safer to be doing this than being out on the streets 'drinking'.

"Cruising is a chance for people to meet likeminded folks from all walks of life without fear of being abused or attacked physically. People who love their cars and don't spend their hard earned cash getting drunk or doing drugs. How is that a THREAT to local communities?"

Thirdly, in relation to Cruising being perceived as an Anti-social behaviour, respondents indicated that while small minorities of individuals at Cruises are 'anti-social', they felt it was unfair to label all Cruisers in this way. Indeed, despite Anti-social behaviour taking place during other leisure activities, respondents felt the whole culture was victimized,

"How is lots of young people meeting up to have a chat and enjoy each other's company "anti social". That would be a contradiction in terms. Yes, there are people who do burnouts, handbrake turns etc but then again when you go out to 'socialise' at the pub there are people who like to randomly glass strangers, or look for fights with bouncers. Does that make all drinkers and pubs dangerous and they should be labeled as anti social?"

In sum, the definitions of Cruising from inside the group were markedly different from the definitions of the practices of the group provided by the media. Indeed, the definition of their actions as everyday is heavily linked to the persistence of respondents to define themselves as 'normal'. Respondents maintain, their interest in Cruising does not mean they have a repertoire of values that are discontinuous with the centre (Jenks 2005). As this respondent is keen to explain, Cruisers are implicated in the values of everyday society as much as anyone else,

"Most people think of cruisers as trouble makers etc. Most would be surprised if they found out I actually work full time

and study part time for my accountants degree….Not exactly the image people have in mind of a Cruiser….anything which is done to my car is insured and paid for through hard work."

**Decommodification–or simply standing out in a *home away from home***

In broad terms modifications attempt to appropriate 'standardised' cars and create a personalised creation that 'stands out from the crowd'. Interestingly, respondents did not feel that these actions were different to other everyday consumption rituals. These sentiments are articulately expressed by these respondents,

"A couple of things I usually say when people ask, 'Why bother doing it' .... Well to the first one my answer would be, why bother decorating your house. Why not leave it plain white with floorboards and no curtains? Because you want to make it your own that's why. Why bother buying a 4x4 off road vehicle when all you do is drive your kids to school or to the shops? Because you want people to think better of you because you can afford that 4x4."

"Cruising is a chance to make something your own and is an extension of your personality and individual style."

In this manner some of the respondents explained their passion for modifying cars in terms of the desire to be "unique", to possess what they termed a "one-off", but also "To be as different as possible from anyone else". However, this assertion is also framed in terms of what the CCCS (Hall and Jefferson 1993) might define as the values of the parent culture. As some of the participants suggested:

"In a world where everyone had a grey coloured car, wore grey suits, had grey wallpaper and carpets would there be much to live for?"

By this reckoning the name of the game is not simply a spectacle of escape and freedom (Goulding, Shanker & Elliott, 2002), but also appears geared to expressing resistance through symbolic means to broader cultural imperatives:

"The reason is to be different from standard. Standard is boring and you can see standard cars at any time of the week. It's all about individuality and standing out from the crowd."

It is as if in a drab humdrum world such groups are searching for the glamour of the spectacle, the glamour of conspicuous consumption and production to forge their social identities through solidarity and communion with others. Their being-as-a-group, or as they prefer "standing out from the crowd", can be reaffirmed in their resistance or antipathy the logic of the market, what Willis refers to as the "shit of capitalist production" (1978, 178), and their desire to inflect their own meanings from such commodities. Debadging being one such act of reappropriation which appears to represent a symbolic attempt to escape the market and it's characteristic brand-dominated culture (Holt, 2002).

Interestingly, a standardised car is underwhelming for the group, it is as they suggest "nobodies dream machine". Despite their obvious love for cars, with the exception of a few chosen models such as Subarus (Evos) and Sierra Cosworths (Cossies), most standard models of cars fail to fascinate or interest the group. While most in society purchase specific models as status symbols, to Cruisers, cars are merely blank canvases onto which they can paint their own styles:

"It's personal choice and I don't own a house I rent so my car is my canvass, my way of expressing myself and making me stand out a wee bit.".

The majority of cruisers, although not all, were likely to be aged from 17-25. In this way, they were unlikely to own their own house have other responsibilities of 'adulthood'. As a result, their cars are the most expensive and important object that defines them. Previously, Northcote (2006), after Turner (1982), has conceptualized clubbing as part of the symbolic work by youth in a phase of liminality. As she argues, youth leisure pursuits are fundamental to "defining a lifestyle set apart from everyday worlds- a setting apart that is in fact integral to dealing with the pressures and demands of the everyday world." Indeed, Turner's (1982) liminality may be an interesting means of understanding the practices of Cruisers. As well as defining these practices, as Northcote (2006) does, as a rite of passage between childhood and adult responsibilities, liminality may account for the ways in which, through the creative leisure pursuit of Cruising, Cruisers reappropriate the taken for granted cultural symbols of cars that, or as Turner argues, "In liminality people 'play' with the elements of the familiar and defamiliarise them" (1982:27).

Indeed, defamiliarising and personalizing the commonly held aesthetics of cars is the main function of car modifications. The addition of 'body kits', spoilers, alloys, bore exhausts, to name but a few (see Table 1), reappropriate the exterior of the car in line with the personal taste of the owner. At the same time, the removal of familiar brand symbols of the car through 'debadging' attempts to give the car as smooth look as possible. This active decommodification of the car seeks to subjugate the centrality of brand symbols as signs of distinction. Through debadging, Cruisers actively seek to personalise the car by removing the car of its previous cultural meanings imposed by manufacturers and advertisers. Consequently, Cruisers manufacture their own creations. In this situation, car badges serve no other purpose than to advertise the company:

"I think it's advertising from the company, everyone knows it's a Clio for the shape. Why have the badges to prove it?".

In sum, debadging, and other exterior modifications, can be understood as an explicit attempt by Cruisers to position themselves as different; and as Noble and Baldwin (2001:87) highlight, often we construct ourselves as different to "contain the terrifying ordinariness of our lives….in appropriating objects, we are not simply personalising them, transforming them from a generic, commodity status to something unique and our own; we are personalising and subjecting ourselves, pursuing our own 'distinction'".

While the attention paid to the 'look' of their cars allowed respondents to receive self validation by enhancing their sense of visibility through standing out from the crowd of 'standard' cars, it was interesting that no such codes existed around the 'look' of members, as no particular cruiser 'uniforms' appeared to exist. Significantly, the projection of the car and its exterior provides, to use a Goffman term, a 'front' for Cruisers that is markedly different to that which is achieved by other props in everyday social interaction. Conventionally, self presentations are based on makeup, hairstyles and clothing. However, these did not appear important to Cruisers. Indeed, resembling Vaarenen and Wieloch's (2001) Finnish street racing culture, the self presentation of cruisers seemed to favour the car over the driver.

Similar to wearing makeup and clothing as the central aspect of a person's performance, however, Cruisers' presentation of self is the result of a large amount of time spent backstage. Considering the amount of time taken to design, save for, and complete modifications, we concur with Northcote (2006) when she explains, in relation to Clubbing cultures, that presentation is usually the outcome of sustained backstage work. Indeed this was obvious given the condition of the cars at Cruises that were evidence of the hours of care, attention and modifying lavished upon their cars. However, it could be theorised that cars and clothing differ regarding the level of embodiment of the owner. As well as providing an exterior to enhance visibility, as the contradictory mix of interior-exterior modifications indicates, the employment of modified cars as the central aspects of one's public identity can provide a retreat for the endless task of self management. In this respect, modified cars exemplify Featherstone's (2004) argument that the projection of the car as identity impairs traditional communication. In this regard, their cars provide a sense of solitude, where Cruisers can, in a sense, go 'backstage' and delegate the front stage work to the car. The car, therefore, serves as a "go-between" (Goffman 1967:15) in public life, thereby protecting the self evaluation projected by clothes and the manner of the driver. The car as an extension of the person, facilitates social interaction as the person. The driver becomes decentred and dislocated and, in this regard, the car acquires 'front stage' status. As Goffman (1967:15) explains, "The surest way for a person to prevent threats to his face is to avoid contacts in which these threats are likely to occur". The car then can provide a convenient vehicle to place a barrier between such threats:

"I feel great when I'm in my car. I feel free from most other things in my life, it's a place to escape to".

This is actively sought from the modification of tinting. As this respondent indicates, having tinted windows is a deliberate attempt to obscure the visibility of the driver:

"…to stop people having a nosey in my car. I feel like I am in a fish bowl with no tinted windows"

Indeed other interior based modifications reinforce this observation. Similar to Miller's (2001) study in Trinidad, a contradiction is inherent in the modification of I.C.E (In-Car-Entertainment). While the installation of large subs, speakers and other parts of sound systems, like exterior modifications, made individuals stand out from the crowd and enhanced visibility, other I.C.E are reflective of an attempt to recreate the style and but more importantly comforts of household room, to give it an air of *homeyness* (McCracken, 1989).

The central aspect of enhanced invisibility is centered on the installation of very loud music systems. In many cases, music is played so loud it can easily be heard outside the car. However, this effect allows further visibility for owners that is not possible with standard music systems,

"It's a form of identification and a cruise thing. I wouldn't be able to drive my car everyday without having some subs for bass and amps for my speakers. It's like listening to a portable radio and then being in a club."

"I love music so usually have a loud system to sing along to. I like to be heard"

Paradoxically, the centrality of I.C.E in the social worlds of cruisers, is also related to the large amounts of time spent backstage in their cars, and the comfort afforded by I.C.E during this time. Thus,

**TABLE 1**
A List of Common Tribal Modifications

| MODIFICATION | DESCRIPTION |
|---|---|
| **Debadging** | Involves removing all the badges of the car manufacturer so as to reveal a blank shell. |
| **Smoothing** | Removing or inverting locks from car doors and boot as it is perceived that the smoother the car is, the better it looks |
| **Spoiler** | Usually used for preventing lift on the car and increasing the downward force on the car. However spoilers have largely been adopted as a style feature on their cars. These can vary in size and proportion. Prices range from £50 to £300 |
| **Body kit** | Body kits are molded panels applied to the original shell of the car which makes the car, at times, unrecognizable according to shape and manufacturer. Prices range from £200 to £1000 |
| **Neon lights** | Neon lights are fitted under the car to light up the underside of the car. Usually neon blue in colour these lights are perceived to add style. |
| **Exhausts** | Wider bore exhausts are purchased to replace standard exhausts. As well as for style and performance purposes, exhausts result in the car sounding louder and as a result is noticed more. Prices range from £100 to £700 |
| **Paint effects & Transfers** | Paint effects can vary from smaller stencilled graphics to full bodywork coverings. The most popular style is multi lustre 'flip' paint but more recently glitter paint effects have become widespread. |
| **Tints** | Tinting involves darkening the windows of the car so that it is difficult to see inside the car. Recent legislation has made some tinting illegal, depending on how dark the windows have been made. As a result many Cruisers who previously modified windows have now discovered their windows are breaking the law. |
| **Alloys** | One of the first purchased modifications a Cruiser is likely to make. Purely for style purposes. Ranging from £120 to £1000's for a set of 4, they can form a considerable expense. Sizes range from 10" to 22" and are available in a number of colours (White, Black, Powder Coated, Gun Metal Grey, and most common, Chrome). It is generally perceived that the larger the alloys, the more fashionable they are. |
| **I.C.E (in car Entertainment)** | Given the time Cruisers spend in their cars many have extensive in car entertainment. I.C.E varies in extent and variety. The most common I.C.E is a stereo system to listen to music. Frequently Cruisers dedicate the whole boot to install their sound systems and 'sub woofer' speakers that increase bass power and volume. Other examples observed in the field included flat screen DVD players in the passenger seat of cars and even Playstation consoles. |
| **Custom Lights and Clear Indicators** | All lights on the car can be modified to suit individual tastes and styles. An example of custom lights are 'angel eyes' which are LED powered light rings, forming a halo effect, that replace standard lights. Clear direction indicators involve replacing the conventional yellow indicator and making it clear. |
| **Lowered Suspension** | Usually prioritizing style over practicality, lowering involves sinking the suspension. It is generally perceived that the lower the car is the better it looks. However extremely low cars prevent anyone from sitting in the rear seats. Moreover driving over speed bumps is likely to damage the underside of the car, especially the exhaust usually lowered by 30mm to as much as 150mm. |
| **Body Vents** | Used to increase the flow of air and provide greater stability in rallying. Cruisers use them for styling. |
| **Engine Modifications** | Used primarily for performance enhancement engine modifications take many forms. Examples include the following: conventional engine 'swaps' where one engine, is replaced by another; Turbo charges and dump valves are installed to give more power. Such modifications do not only increase performance of the car, but also serve to increase the subcultural capital ascribed to its owner. The intense sound of a highly tuned engine gives great pleasure to Cruisers. More style based engine modifications include colour coding the engine with different coloured leads and hosing, and installation of push button starters whereby the engine can be started at the push of a button. |
| **Misc. Engine Modifications** | Given the amount of time Cruisers spend in their cars it is unsurprising that that the interior of the car tends to be stylized to the same extent as the exterior. A small selection of interior modifications include: Stylized seats including bucket, leather, recliners, racing etc.; Replacing standard dials with custom images or coloured varieties; Additional dials added to show extra elements of the car not provided by original manufacturer; Replacement of floormats, steering wheels, handbrakes, pedals (Available with neon lights) and gear shift sticks, with versions to suit personalized comfort and style ambitions. |

the installation of, for example, Playstations and DVDs, provides home comforts for drivers during the large amount of time spent not driving. As these respondents highlight,

> "ICE is just to make the car more comfortable. If a Cruiser spends more time in the car, parked up, it'll be like his home away from home, hence the DVD players and stuff like that as well. Anywhere you spend a majority of your time in, you'll want it to have personal qualities about it".

### THE CRUISE AS AN EMANCIPATORY SCENE

In addition, our research reveals that central to their enthusiasm is the spectacle of the cruise itself, whereby cars meet periodically at a pre-arranged meeting place, usually a sizeable public car park, details having previously been circulated by internet, phone and email. The convoy which follows enables participants to express solidarity and defiance by travelling in tandem along public roads.

Comparisons here can be made to Hebdige's accounts of the Mods and their symbolic scooter charge on Buckingham Palace (1991; 1993), or even Harley Davidson chapters riding in tandem (Schouten and McAlexander, 1996). That is to say, the convoy and cruise represent the imaginative marking out of territory, or better space, a symbolic attempt to 'win contested space' (Clarke, Hall, Jefferson & Roberts, 1993, orig. 1975), but also to convert non-places into spaces (Auge, 1995) where the social itself is reinvigorated and brought to life. In this sense they exist as performances delivered on the public and commercial stage of the car park, whereupon the tribe marks its own 'unique' existence through rituals of display and performance. In terms of interpreting such cultural events we argue that such spectacles are not defined simply by their public visibility, but also as Kahn Harris (2004) and Butler (1997) prefer it is essential to view the scene as a space for performance, a stage on which the cruisers mark out their visibility and the creative forms that their cultural practices take to each other. Taking this line of argument further, we might suggest that the cruise functions to energize and vitalize this space, providing it not only with legitimacy, but also producing an ephemeral community where emergent socialities are produced, what Maffesoli might refer to as a form of 'undirected being together' (1996: 86) where the 'social glue' acquires a less intangible form.

While we found it difficult to estimate the numbers involved, we concur with Cova and Cova's (2001) evaluation of the in-line skater tribe that hundreds of individuals may share in the vogue surrounding modified cars and cruising. Outward manifestations of this include the movie *Fast and Furious* and its sequel, as well as a variety of internet sites and chat forums, what we might term neo-tribal spaces, where regular exchanges of information on modifications are facilitated but also where the identity of each regional cruise is marked out and a counter-discourse to the dominant media representations is produced. As the following response posted on one of the cruise forum conveys:

> "Well the BBC certainly got one over us, what a fucking embarrassment to those that are genuine ruisers... This "Inverness posse" bunch of twats climbing out car roofs and in through windows while on the move, smart! Good show for the camera's and exactly what the folk in Crail need to see when they get Crail shut down....It was basically a bunch of neds selected to show us up, well done." (Edinburgh Cruise Forum Tuesday March 23: 2004).

The internet is in this way not simply giving rise to new forms of community, but operates as a cultural resource enhancing group solidarity through the affirmation of a 'them' and 'us' mentality mediated specifically in terms of local affiliations and differences.

### Feesties, Beemers and Scooby-doos: Unruly Bricolage or simply exploring peeps and their mods

As suggested the spectacle of the cruise is central to the collective display of the sensibilities of taste and style that mark out the imaginative territory of the cruise; alongside this exist the forms of customization made to the 'look' of the car itself and the associated modifications made to this cultural object. In this way, it is not just the spectacle that cements and animates the group, but through the prior acts of modification (or as they prefer *mods*) and the social codes which regulate such changes to instigate the attribution of community value upon specific forms and styles of modification. A synopsis of the main modifications of car cruisers gleaned from observation (see Table 1), revealed that designs of alloy wheels are the apparent 'calling card' for cruisers, where they, like the Mods before them (Hebdige 1991; 1993) are not merely passive consumers of culture, but creative reappropriators of such commercial sources of value. Their modifications then provide the cruisers with a means of acquiring *distinction*, displaying their tribal *cultural capital*, and, perhaps more significantly belonging. In short, we argue that the cultural practice of modifying one's car represents an attempt to solidify the role of the car as a central aspect of respondent's sense of self. Further, these appropriations of a taken for granted cultural object allowed such individuals to, despite its misinterpretations, gain control of the front that they project in part of daily life. As McCracken (1990) highlights, these modification rituals are an opportunity to revise the conventional meanings which surround the car, but also this act of reappropriation appears to serve as a means for the individual and collective consciousness of the group to be expressed.

By means of reworking their vehicles, removing original features and building-in or appropriating others, the vehicle is imaginatively removed from its original context. Bricolage involves then a 'hyper-stylisation' of the car, achieved for instance through the deliberate lowering of the suspension, or the addition of elements to attract the gaze of spectators such as bonnet vents or unique paint effects, debadging, neon lights, body kits and spoilers, smoothing, or I.C.E, illustrating that some commodities are constantly in flux and occupy shifting positions for consumers. Through transcending the style boundaries imposed by the commodity aesthetics of marketing and branding the cruisers are continually striving to express their individual creativity and autonomy whilst at the same time invoking their affiliation with fellow cruisers (or as they refer *peeps*). So, we understand customization, even where it involves removing the accoutrements of brand recognition ('debadging') that many other consumers seem so keen to cherish and display, as significant in the formation of tribal capital. More importantly we suggest that it is through language and their creative cultural practices that the commodity-dominated world is reimagined as a land of *Beemers*, *Feesties* and *Scooby-doos* (see Table 2). That is, a world where through cultural commodities social and community value are exchanged and foregrounded over forms of commercial value. Here then we witness how the development of a unique argot provides the cruisers with a palette of expressions to not only endorse their own individual status and being-within-the-group but also to exclude non-members or outsiders. The language of metaphor and affiliation, be it through talk of *peeps* engaging in *mods* to their *Beemers* and *Scooby-doos* and displaying their aesthetic endeavours at *cruises*, enables the community to reinvent and reimagine the mundane world, but more importantly perhaps serves to reinvigorate and reawaken the social as something other, that is with a tangible presence and form. Suggesting perhaps that the

**TABLE 2**
The language and argot of Scottish Car Cruisers

| TRIBAL TERM | DEFINITIONS |
|---|---|
| Mods | Modifications |
| Peeps | Endearing term for friends/other members |
| Fourteens/Sixteens/Eighteens etc | 14/16/18 inch Alloys |
| Scooby-doo | Subaru |
| Evo | Mitsubishi Evolution |
| Cossie | Ford sierra Cosworth |
| Feestie | Ford Fiesta |
| Chinq | Fiat cinquecento |

| Beemer | BMW |
| Zorts | Exhaust |
| Rims | Alloys |
| Dusties | Fancy Dustcaps |
| Tunes (Choons) | In Car Entertainment (ie. Sounds systems and Playstations) |
| Rims | Wheels |
| Smoked | To have been Overtaken |
| Honnie | Handbrake Turn |
| Donut | Rear-wheel drive car in a continuous circle |

death of the social (Baudrillard, 1983) in a media-saturated world may have been premature conclusion to make, or at least brought forth particular forms of cultural practices and community value.

**In departing**

By way of conclusion, in this paper we employed the lens of cultural practice (Willis, 2005; Warde, 2005) as a device to help frame social relations circulating around the cultural form of the 'car', as particular manifestations then of consumer culture in the making. We sought to interrogate questions of identity making and the affiliative work of objects to unravel the complex processes by means of which consumer culture is instantiated in the particular milieu of the car as an object of bricolage; a site where cruisers improvise collective responses to the wider social structures which constrain their lives. Consumption practices then become the flip-side of logics of appropriation and reappropriation which cruisers (or similar tribes) employ to capitalize on their difference and pursue strategies of authenticity, largely through the creative re-working of available resources to forge not only their own identity but also to rework and reconstitute the social world as something other to its mundane and everyday form. In our minds, cars like many other cultural objects appear perfectly suited to this task, the job that is of expressing the relational nature of social life (Maffesoli, 1996) where what matters most is the social bond (Cova, 1997). An

approach to consumers where as Cova asserts "the link is more important than the thing" (Cova, 1997:311); and where consumers are considered as important co-producers of value (Vargo and Lusch, 2004). As we have sought to demonstrate through reference to the cruiser community the extent to which value is as much a community and social affair as a matter of commercial exchange is significant, and by this token brands appear to play only bit parts in the drama and spectacle staged within these ephemeral gatherings. The cruise then can be viewed as a performance of such community value, an enactment where negotiations over meaning in *use and exchange* are paramount and take a visible and tangible form. More so, our contribution is to demonstrate that in some instances of consumer culture in the making the brand is merely a cultural resource to be contested, subverted and erased; an object to be played with through the 'dialogic ritual' (cf. Gilroy, 1987) of debadging which serves to inflect and produce their own participa-tory and celebratory meanings in the name of making explicit the all-too-implicit, taken-for-granted and intangible qualities of com-munity value.

# Driven by Devotion–How Consumers Interact with their Objects of Devotion

Elisabeth A. Pichler, Innsbruck University, Austria
Andrea Hemetsberger, Innsbruck University, Austria

## ABSTRACT

Taking Belk and Coon (1993) and recent criticism by Bajde (2006) as starting points, we develop an other-related view of consumer-object relationships. By exploring acts of devotion in the light of the dialectics of self and other, this article draws attention to so far neglected consumer behaviors and their meaning in relation with objects of devotion. The objectives of the article are, first, to further examine consumer acts motivated by high emotionality as in the case of consumer devotion, and second, to challenge the usefulness of a one-sided self-centered perspective with regards to consumer-object relationships.

## INTRODUCTION

Western society's shift towards a more materialistic, possession-oriented way of living has been widely recognized in research (e.g. Fiat and Venkatesh 1995). Nowadays we live in a culture of consumption (Slater 1997) where objects play many different roles in the lives of consumers. Objects bear special meanings (e.g. Csikszentmihalyi and Rochberg-Halton 1981; Richins 1994). They communicate social status and class membership; they reflect personal style; they help to express one's identity. We also know that consumers build and maintain diverse relationships with brands and products (Fournier 1998; Wallendorf and Arnould 1988).

The researchers of the Consumer Odyssey were among the first to describe the deep meanings of possessions resulting from long-lasting relationships between consumers and objects (Wallendorf et al. 1988; Belk et al. 1991). Since then researchers have reported about collecting behavior (Belk et al. 1991), compulsive consumption (O'Guinn and Faber 1989), addiction (Hirschman 1992), impulsive behavior (Rook 1987), consumer desire (Belk et al. 2003) and brand love (Carroll and Ahuvia 2006), just to mention a few oft-cited concepts.

Attempts to explain why individuals feel such strong urges to act upon favorite objects usually concentrate on the self and self identity projects in the lives of consumers as the ultimate rationale for favorite objects and possessions. Belk (1988) explicitly relates meaningful objects to the consumer's self, and introduces the 'extended self' metaphor of meaningful possessions. Ever since the introduction of the extended self (Belk 1988), self-brand connections, self identity, self-construal (Escalas and Bettman 2005), and other self-related constructs have proliferated through the literature as explanations for strong emotional bonds between consumers and objects. In a first attempt, Ahuvia (2005) opens up a new perspective. He asserts that self-extension can not be equated with the love of certain objects. Although love objects importantly contribute to the consumer's self, they are not incorporated into the consumer's core self.

Belk and Coon (1993) were among the first in consumer behavior research that acknowledged the existence of consumer behavior which can not be sufficiently explained under the prevailing exchange paradigm. In their analysis of gift-giving they come to the conclusion that a significant amount of interactions transcends exchange orientation. Their agapic (unselfish) love paradigm should grasp this kind of interaction, taking into consideration that *" in the intense love that we feel toward certain goods … we exhibit a self-less passion that may transcend materialism. To regard consumer behavior as only instrumental is to preclude any real understanding…"* (Belk and Coon 1993, p.413).

Bajde (2006) picks up the thread suggesting that other-centered behavior deserves ample consideration in consumer behavior research. Based on a critical reflection of the presumption of self-interest versus interpretations of other-centered behavior, he concludes that in the existing literature of our field the complexity of the socio-cultural character of consumption could not be unraveled due to a voluntary restriction to the idea of self-centered exchange-oriented individuals. As a consequence, he calls for the acknowledgement of consumers' other-interest in relation with consumption in order to shift views away from purely monadic interactions governed by the individual's self-interest (Bajde 2006).

In accordance with this position, we seize Bajde's (2006) suggestion and develop a view of consumer-object relationships as dyads marked by equality and reciprocity. The ground for the relationship view was laid by Fournier's (1998) influential work on consumer-brand relationships, which proves the legitimacy of brands as active relationship partners and empirically confirms the importance of consumer-brand bonds for consumers.

We embrace Fournier's (1998) results and attempt to go one step further. We perceive the object as distinct other whose condition and needs matter to the consumer, precisely because the person accepts his object as distinct, independent other and does not take it for an extension of his own self. Carrying the idea further leads us to the conclusion that consumers' acts in such relationships must differ from those noticed in relationships where the object represents an incorporated aspect of the self. It appears logical that one treats a cherished autonomous other differently than something that is subjected to and/or even merged with oneself. First and foremost, the accordance of otherness to the object also presupposes the acknowledgement of the other's individuality, personality and will. Therefore, acting upon and with the object as other, the consumer has to take into consideration the object's interest (cf. Habermas 1999).

We have settled on the exploration of emotionally intense consumer relationships, namely the case of consumer devotion (Pimentel and Reynolds 2004; Pichler and Hemetsberger 2007) because it comprises both aspects that we perceive as relevant for our study. Firstly, it provides an individual view on very strong emotional bonds with objects. In these relationships, it is more likely that consumers overcome their obsession with the instrumental value of the objects. Secondly, consumer devotion covers the behavior-related side of these relationships. Hence, we can analyze the so-called acts of devotion (Pichler and Hemetsberger 2007) in the light of the dialectics of self and other.

The article is organized as follows. First, we describe the concept of consumer devotion as it is defined in the consumer behavior literature. Second, we concentrate on acts of devotion which have already been explored in literature. In a third step, we deal with the dialectics of self and other in the context of interpersonal love relationships. This theoretical background originating from the fields of philosophy and psychology provides a balanced notion of relationships where both partners at the same time remain autonomous individuals (i.e. do not give up their self) and still take the other into consideration. Then we apply this view to devotional

consumer-object relationships. In a last step, a discussion with future research proposals sums up the article.

## CONSUMER DEVOTION

Several authors describe the same behavior nowadays subsumed under the term of consumer devotion in different contexts. Rozanski, Baum and Wolfsen (1999) portray consumer behavior typical of devotees, like high affective commitment, high involvement and a high propensity to act according to one's beliefs in relation with the worshipped object, but call it brand zealotry. Kozinets (2001) reports of Star Trek fans which choose the term devotion themselves to make plain the depth of their bonds to this TV series. In their study of Macintosh customers, Belk and Tumbat (2005) discovered extreme brand devotion fueled by religious motifs.

In summary, two common elements are regularly discussed in connection with consumer devotion. First, devotion is depicted as a highly emotional concept, reflecting very intense relationships between consumers and objects, or activities (Rozanski et al. 1999, Pimentel and Reynolds 2004; Kozinets 2001; Belk and Tumbat 2005). Second, it has been argued that the term 'devotion' also implies religious fervor and zeal (Pimentel and Reynolds 2004; Kozinets 2001; Belk and Tumbat 2005)

Pimentel and Reynolds' (2004) work is the first in the marketing literature to define the phenomenon of consumer devotion as a distinct concept. They locate devotees within the group of committed consumers. Consumers of this sort are more than just loyal and committed, though. Devotees can be characterized by extremely high commitment leading to an outstanding level of emotional bonding with a brand. To be more precise, Pimentel and Reynolds' (2004) work indicates that devotion is linked to strong feelings like love, as well as feelings of spiritual or religious excitement, and adoration.

The model of consumer devotion shows how consumers gradually develop more and more commitment, get ever more involved and ultimately reach the emotional state of devotion. This state of high affective commitment in relation with high involvement and feelings of love and fervor may be attained as well as perpetuated via 'pro-active sustaining rituals'. These actions affect the object of devotion directly. Their objective is to prevent its re-secularization and the waning of the consumer's high emotionality at the same time (Pimentel and Reynolds 2004). Pilgrimage, rituals, sacrifices, or the display of the object of devotion are just a few examples of such pro-active sustaining behaviors.

In terms of reasons for building and maintaining these intense relationships with objects, Pimentel and Reynolds (2004) draw attention to the sacred object's function as a source for identity construction and maintenance, but also as a means of communicating this identity to others.

Pimentel and Reynolds' (2004) approach to devotion focuses on groups and their social experiences and behaviors, and thus likens what has been defined as fandom in the literature (Hunt et al. 1999; Kozinets 2001). Thorne and Bruner (2006) also use the term devotion to circumscribe special fan behavior. In their typology of fan characteristics, devoted fans are those who profess deep involvement, and are willing to invest in, and sacrifice for their object of fascination.

In a recent article, Pichler and Hemetsberger (2007) try to further delineate devotion. They maintain that the individual and private aspects of strong emotional bonds with objects have been neglected in the literature as opposed to social phenomena, which are vastly dealt with (e.g. (sub)cultures of consumption (Schouten and McAlexander 1995; Kozinets 1997, 2001), brand tribe (Cova and Cova 2002), brand communities (Muniz and O'Guin 2001; Muniz and Schau 2005), brand cult (Belk and Tumbat 2005), and fandom (Kozinets 2001)).

By carving out devotion's individual facets, they attach more importance to consumers' non-conspicuous and intimately personal interaction with objects of devotion. Via the integration of dedication as behavior-related component into the concept, they draw further attention to the acts of devotion, and suggest that examination of these should be warranted in future research. Even if they mention a quasi-altruistic quality of devotion, which might be responsible for the enormous amount of actions undertaken by devotees explicitly for their object, they still neglect to go deeper into this idea.

## ACTS OF DEVOTION

Literature on emotional connections with brands, products, or objects in general, reports many ways in which consumers express and act out these bonds. Consumers can show their feelings for objects in very subtle ways. Wallendorf and Arnould (1988) found that the physical closeness to the favorite object, e.g. leaning against the object or touching it, in photographs is expressive of the consumer's felt degree of attachment to the object.

More active and obvious deeds motivated by the consumers' strong emotionality are emblematic for consumer devotion. Ahuvia (2005) speaks of "*labours of love*" (p.182), which require considerable investment of time and money, but are deliberately and willingly done, accepting that "*pleasure [can] be bought, but love [is] made*" (Ahuvia 2005, p.182). Along the same lines, Fournier (1998) refers to consumers' actions related to especially beloved brands. Aiming at the sustenance of personally valuable brand relationships, "*constant relationship work*" (Fournier 1998, p.361) is needed, mainly in the form of frequent consumer-brand interaction, consumption rituals and brand pledges.

Acts of devotion also help in securing the sacredness of objects. Keeping the sacred spatially or temporally separated from profane things may avoid their (re-) secularization, according to Belk et al. (1989). Thus, by setting the object apart from simple commodities one ensures, and simultaneously demonstrates, its special status. The continuous and repeated engagement in particular rituals fulfills the same function, i.e. it preserves and enforces sacredness; at the same time, it prevents the consumer from getting habituated to the object, with the effect that the object stays unique and central in the consumer's life.

A rather long enumeration of pro-active sustaining behaviors in relation with objects of devotion is given by Pimentel and Reynolds (2004). They list rituals, shrines, display behavior, collecting, creative efforts, pilgrimages, sacrifices, sharing/extolling, recruiting, and betting against odds. In the following we will take a closer look on a selection of those that have also been brought up elsewhere in the literature.

Ritualistic consumer behavior has first been investigated in depth by Rook (1985). His research set ground for understanding consumers' actual behavior in symbolic consumption. Rituals are sequences of expressive activities, which are dramatically scripted, performed, and repeated over time (Rook 1985). They may be acted out in private or in public, and aim at transforming an object symbolically (Belk et al. 1989). During these consumer-object interactions objects get imbued with private meanings (Richins 1994). Simultaneously, rituals structure the individual's daily life and add meaning to it (Rook 1985). One of Pimentel and Reynolds' (2004) informants, for example, narrates how he makes sure that he drinks at least one can of Coke a day and how he purposefully ritualizes the experience of drinking.

With regard to display behavior, Richins (1994) states that displaying possessions assists in the cultivation of assigned personal meanings. Pimentel and Reynolds (2004) and Kozinets (2001) both found that fans voluntarily show their venerated object, and even build shrines in order to enhance the object's visibility and presence in their home. These enshrinements of sacred possessions not only constitute worthy places dedicated to the objects; they also function as showcases and, maybe even more importantly, protect the objects from contamination with the profane (Belk et al. 1989).

Consumers with a high degree of emotional attachment have also been found to spread positive word-of-mouth (Carroll and Ahuvia 2006). High self-relevance of products entails active word-of-mouth, too (Chung and Darke 2006). Devotees are likely to act as missionaries trying to persuade and convince others of their object of devotion (Pichler and Hemetsberger 2007). Likewise, passion for an object has been shown to lead to consumers evangelizing others (Matzler et al. 2007). Exemplary cases can be found in Belk and Tumbat's (2005) work on Macintosh cult followers, where the authors also confirm that *„Mac believers engage in proselytizing and converting non-believers"* (Belk and Tumbat 2005, p.211).

An examination of collectors shows how they sacralize items by integrating them into their collection. As soon as objects are incorporated into the larger context of a collection they transcend profanity and become sacred. This process happens on volition of the collector; it nurtures, but also reveals his personal attachment to the single object as well as to the whole collection (Belk et al. 1988). Within the boundaries of the collection the composed things remain special. Collections serve as element of a person's extended self and thus are hypothesized to contribute to the collector's self (Belk 1988).

All of the afore-mentioned acts can be interpreted in the light of the prevailing paradigm, which stresses the focus on self-interest and identity. However, another perspective might shed light on additional behavioral patterns, or aspects of acts, that have been ignored so far. We propose to regard the object of devotion as an equal other in a mutual love relationship with the consumer. Similar to Belk and Coon's (1993) argument for the application of the agapic love paradigm in consumer behavior research, we want to show that this new perspective can offer rich insights into behaviors that cannot appropriately be accounted for within the self-centered perspective.

Just to give a short example, we would like to refer to one of the numerous examples of collecting behavior cited in Belk et al. (1991). Among these, the illustration of Sigmund Freud as private collector of antiquities bears considerable insights into the emotional profoundness and the behavioral consequences of enthusiastic collecting. Apparently, Freud's study room was full with antique objects from Asia. In sittings with his patients he had the habit of taking one of these antique objects, touching and fondling it. Furthermore, every morning before he sat down at his desk he formally greeted a special statue (Belk et al. 1991). These actions might seem peculiar and are only known to us because they have been witnessed, and later on bequeathed, by his patients. Belk et al. (1991) use the example of Sigmund Freud to portray typical aspects of collecting behavior. Still, they overlook exactly these two actions described above and consequently ignore their meaning. For a definition of typical collecting behavior these acts are negligible; nevertheless, from a point of view where emotional relationships to objects as equal other are at the center of attention, they deserve further thought.

## THE DIALECTICS OF SELF AND OTHER IN CLOSE INTERPERSONAL RELATIONSHIPS

In psychology as well as in philosophy many theories on love establish its becoming and developing, its components, as well as the contributing and deteriorating factors. In Fromm's (1976) theory, love is a productive orientation which implies that one cares for another, knows the other, is responsive and committed to the other, approves the other, and is pleased by the other. He defines concern, responsibility, and respect for and knowledge of the object of love as the four essential elements of love. Ideally, a so-constituted kind of love enables both partners to grow personally. Consistently, Beck and Beck-Gernsheim (1994) highlight love's purpose and ability to foster the autonomous development of the partners' personalities.

Fromm (1956) further posits that love's aim is union with the other, i.e. to feel one with the other. Even if the term "union" might be misleading, Fromm's idea is that when this union is achieved both partners keep their integrity, and thus remain independent individuals. Union, in his terms, does not imply the merging of the two personalities; neither does it lead to a giving up of individuality by the partners. According to him, the object of love does not influence the way one loves, since love is part of a person's character orientation and thus precedes the actual relationship. Consequently, the object of love may not only be a person, but also an idea, or a material object (Fromm 1976).

A caring relationship as defined by Mullin (2006) bears resemblance with Fromm's concept of ideal love. It involves reciprocity; it requires that both partners are aware of the other as a distinct individual, exhibit willingness for self-disclosure, and actually engage in self-disclosure; it needs the awareness of the relationship with the other from both partners; and it implies a mutual interest in the respective other. Consequently, the other person is valued for his/her particularity as an individual as much as for his/her contribution to the shared dyadic relationship (Mullin 2006).

Solomon (1990) also asserts that love relationships do not necessarily entail the abandonment of a person's individuality or independence. He maintains that more importantly love enables a negotiation of the interests and the independence of the self with, and in the face of, the beloved other's desires and motivations.

Describing the motivations for unselfish actions in love relationships, Luhmann (1986) states that *"love motivates one to act, not for concrete effect, but because such action has, or is assumed to have, a symbolically expressive, love-exhibiting meaning"* (Luhmann 1986, p.26).

Looking at devotional consumer-product relationships from this perspective clearly shifts attention to certain behaviors, and more importantly, to their meaning which has previously been ignored in consumer research.

## INTERACTING WITH THE OBJECT OF DEVOTION AS OTHER

Extensive information seeking can now be explained as an intense desire for getting to know the other intimately, to grasp the object's personality fully, and to gain a profound understanding of who "it" is. The resulting expertise in relation with the object of devotion not only reflects the genuine interest of the person in the object, it even signals a high degree of intimacy within the relationship. In so doing the person also enables the object to self-disclose. By letting the person explore the objects' unique characteristics, the object in turn enables the person to learn from it.

Consumers who assign certain special places or even rooms within their own dwelling to their venerated objects could be motivated by the idea of literally giving room and space to the object so that it can live and breathe. They build a realm of its own for the object, where privacy, security and shelter are guaranteed, and where the object can experience freedom and unrestrictedness.

Consumers in a relationship with an object of devotion are not likely to use the object in order to enhance their own status or to boast about it. More likely, they will treat the object with respect, as they perceive it as an individual personality. Their respectful interaction with the object will also be influenced by and expressed through their care for the welfare of it, as well as their consideration of its needs. One can think of collectors who pass on their collections to a carefully selected heir before their death (Belk et al, 1989; Belk et al. 1991). They might act in accordance with the presupposed interests of their object of devotion, i.e. their collection. If they feel they can no longer truly and adequately care for it, they might rather pass it on to the hands of someone who treasures it just as much, and who they hold to be a good partner. Similarly, in interpersonal relations, we know of persons who ask their children to take care of their spouse at times when they feel that their live is endangered or when they are already facing death.

The concern for the object of devotion may also lead to certain ways of treating it. Polishing, cleaning, and adjusting loved objects can be witnessed in many cases when observing enthusiastic consumers. Furthermore, careful restoration of the object ensures its ongoing existence, and is often a time-intensive proof of the consumers' love, concern and care.

Additionally, the genuine concern for the object's well-being can inspire more extreme types of consumer behavior. Complaining behavior and consumer resistance could result from a preoccupation with regard to a company's plans either to alter the product (which the consumer worships as object of devotion) or "harm" or "endanger" its unique personality in any other way. Consistently, word-of-mouth and related consumer activism can be interpreted as standing up or speaking for the object of devotion. All of these very active kinds of support convey the consumer's commitment to the object of devotion.

As the possibility for development and growth of the partners' personalities are crucial in ideal love relationships (Beck and Beck-Gernsheim 1994; Fromm 1956), a consumer who considers the object of devotion as equal other should also allow and nurture its self-expansion. This could be realized by means of transforming the appearance of the object as it can be seen in consumer innovations. Still, it is relevant to make sure that the core essence of the object remains unchanged. In an ideal and equal relationship the aim is not to change the object; it is to facilitate its own development instead.

Reciprocity is a basic requirement for all interpersonal relationships (Fromm 1956). Consumers can ensure this reciprocity in relation with the object of devotion by sharing what they have; be it their time, space or money. As a result, their relationship will stay vital and even evolve, and perceived intimacy and closeness may increase, as shown by Pimentel and Reynolds' (2004) in their account of the usefulness of proactive sustaining behaviors. Consumers who encounter intimate and close relationships with objects that are respectfully regarded as a personality of its own will also respect the other's needs in terms of space, time, and freedom. Devotion, therefore, is enacted differently than sheer passionate, compulsive, or addictive forms of relationships.

## DISCUSSION AND FUTURE RESEARCH

"The legacy of self-interest" (Bajde, 2006) has dominated consumer research for decades. Early critics of a purely self-centered view have been fruitful, but the paradigm of self-interest still prevails. In this article we strive to promote a different view of the consumer as both–interested in developing her self *and* the other. Despite all self-related and self-interested behavior, which we do not disavow, consumers also show other-related behavior towards objects of devotion and special possessions. Consumer devotion goes beyond ordinary feelings of desire, emotion, or attachment toward products. Consumer behavior literature has widely dismissed other-related consumer behavior and exiled it in the domain of social and cause-related marketing. However, devoted consumers are more than silly-looking adorers and bragging evangelists of their fetishes. Instead, they engage in respectful and caring relationships with objects and their producing companies in an attempt to compensate for their widely de-enchanted, mundane and self-centered lives (cf. Fromm, 1976). Instead of exploring the motivational definition and debate of other-related behavior, we decided to emphasize the behavioral aspect instead. Thus, the concrete acts of consumers in these specific object-relationships are the focus of our interest.

By doing so we strive for contributing to the development of the concept of consumer devotion. Using the distinct perspective explained above we were able to uncover forms of behaviors or acts of devotion, which cannot solely be explained by sheer self-interest, self-centeredness, or by the need to define or develop self-identity. We contribute to current research on consumer-object relationships by carving out distinct, private patterns of behavior, or acts of devotion that have been commonly overlooked, as for instance behaviors related to "giving room to" the other to develop her own identity and personality; or which bare new meanings upon closer inspection. Objects, then, are not (always only) 'mine' thus are no possessions, but rather self-standing and respected, 'outstanding' objects of devotion. This leads consumers to show respect for, take care of, gain expertise in, give room to, engage in sharing with, giving freedom to, help develop (innovate), carefully restore, and pass on their objects of devotion.

We also contribute to the extant literature on consumer-object relationships by introducing a complementary yet distinct concept apart from desire, brand cult, fandom, and other community-related forms of consumption hype: consumer-object relationships which encompass respectful, close, and cheerful acts of devotion.

Future research is needed that aims to uncover, investigate, and understand these acts of devotion. By introducing the gift-giving and love metaphor, Belk and Coon (1993), and Ahuvia (2005) have opened the field to a more balanced view of consumer behavior. We should further engage in research that accounts for both, self-centered and other-oriented consumer behavior, for several reasons. First, it allows consumer behavior theorists to better understand seemingly peculiar behavior and motivations. Secondly, it provides valuable insights for consumers themselves; how they should relate with their favorite objects without overextending relationships with objects; how they should construct their intimate relationships with objects without getting addicted and jeopardizing their personal relationships.

The main limitation of the present work is that our theoretical findings cannot be justified by empirical evidence within the scope of this article. Our further research will try to account for this lack and provide data.

# Skin Lightening and Beauty in Four Asian Cultures

Eric P. H. Li, York University, Canada

Russell W. Belk, York University, Canada
Junko Kimura, Hosei University, Japan
Shalini Bahl, University of Utah, USA

## ABSTRACT

"Whiteness" or having white skin is considered an important element in constructing female beauty in Asian cultures. A dramatic growth of skin whitening and lightening products has occurred in Asian markets. Contemporary meanings of whiteness are influenced by Western ideologies as well as traditional Asian values and beliefs. In this study, we analyze print advertisements for skin whitening and lightening products in four Asian societies—India, Hong Kong, Japan and Korea. We compare the verbal messages and visual images for both global brands and local brands and across countries. We find that whiteness in these Asian cultures is both empowering and disempowering as well as both global and local in character.

## INTRODUCTION

"White skin" has emerged as a central desideratum of consumer culture in affluent Asia. Not only does skin lightness affect perceptions of a woman's beauty, it also affects her marital prospects, job prospects, social status, and earning potential (Ashikari 2003b; Goon and Craven 2003; Leslie 2004). The beauty ideal of white skin in Asia predates colonialism and the introduction of Western notions of beauty (e.g., Wagatsuma 1967). Contemporary meanings of white skin combine Western mass-mediated ideologies and traditional Asian cultural values. The popularity of Caucasian and Eurasian models reflects the postcolonial structure of commoditization and consumerism and is still influenced by a colonial past (Goon and Craven 2003). Western-centrism and cultural hegemony interact with Asian ideologies like Confucianism in strengthening the ideal of whiteness (Russell 1996).

Asian countries have long histories of utilizing white skin as a key criterion of personal beauty. In Korea, flawless skin like white jade and an absence of freckles and scars have been preferred since the first dynasty in Korean history (the *Gojoseon Era*, 2333-108 B.C.E.). Various methods of lightening the skin have long been used in Korea, such as applying *miansoo* lotion and dregs of honey (Jeon, 1987). In Japan, applying white powder to the face has been considered a woman's moral duty since the *Edo* period (Ashikari 2003a; 2003b; 2005). In India, white skin is considered as a mark of class and caste as well as an asset (Leistikow 2003). Historically, women (especially married women) in South India bathed with turmeric. Apart from the health benefits involved, it also has skin lightening and anti-inflammatory properties. In China, "milk-white" skin is a symbol of beauty and some Chinese women used to swallow powdered pearls in the hopes of becoming whiter (*China Daily* 2006). Although there are cultural variations, the desire for light skin is universal (Isa and Kramer 2003; Russell, Wilson and Hall 1992).

"Whiteness" remains an important element in contemporary postcolonial Asian understandings of beauty and has become a commodity in the marketplace (Goon and Craven 2003). Skin lightening products are popular not only in Asian cultures, but in other non-white cultures as well (e.g., Burke 1996; Del Giudice 2002; Duany 1998; Hall 1995; Lovell and Wood 1993). Fueled by increasing Asian wealth and growing consumer cultures, skin whitening and lightening products have recorded dramatic growth in Asia during the past several decades (Ashikari 2005). Mass media and the fashion industry play important roles in reinforcing the yearning for white skin. Advertisements also play important roles in shaping ideal self images for consumers (Belk and Pollay 1985), and are the focus of our research.

We studied how advertisers portray skin color to women in Asian cultures. Content analysis and semiotic analysis were used in exploring the notion of white skin in four Asian societies (India, Japan, Korea and Hong Kong). We compared the cultural similarities and differences in advertising skin whitening and lightening products by both global brands and domestic brands. We also studied the metaphors used in advertisements in order to understand the process of constructing the meanings of "whiteness" in different Asian cultures.

## THEORETICAL PERSPECTIVES

### Globalizing Notions of Beauty

In India, the words for fair and beautiful are synonymous (Franklin 1968; Hall 1995). In one view "whiteness" and "paleness" are distinct but related concepts, "signifying both distinction between, and collusion with, the historical myths of paleness associated with feminine discourses of beauty, and 'whiteness' as an imperialist, racialized value of superiority" (Goon and Craven 2003). Although, as we have already noted, ideals of whiteness embedded in Asian notions of female beauty predate colonialism and other forms of contact with the West, the prevalence of Caucasian models in many Asian advertisements for beauty products raises the possibility that beauty ideals are or are becoming global. According to a study of the Human Relations Area Files more than 20 years ago, of 312 different cultures, 51 used skin color as a criterion of beauty, and in all but four of these lighter skin was preferred (Van den Berge and Frost 1986). Russell, Wilson, and Hall (1992) note that while white is associated with purity, righteousness, decency, and auspiciousness, black is associated with wickedness, villainy, menace, and illegality. In Asia, skin lightening as well as cosmetic surgeries that provide a more Western appearance (e.g., Kaw 1993; Miller 2003) have been taken by some as evidence of the global appeal of Western and Caucasian standards of beauty (Goon and Craven 2003; Isa and Kramer 2003). But others reject this conclusion, pointing for example to the desire of white Western men for the dark exotic "Other" (e.g., Hunter 2005). This is a weak argument however in that the transgressive desire for Otherness may offer an element of perceived danger and excitement but has hardly brought about the homogenization of skin pigmentation through widespread intermarriage of dark skinned and light skinned people.

During the colonial era, and arguably before and after as well, rather than a homogenizing blending of skin color, there has instead been an attempt to distinguish the dark Other as "primitive" and inferior, thereby supporting the mission of the light skinned colonialist to conquer and control the natives of Africa, the Americas, Australia, New Zealand, and Polynesia (Torgovnick 1990). A

part of this project has entailed equating dark skin color with dirt, filth, and defilement (Spurr 1993). When Charles Darwin (1839) encountered the natives of Tierra del Fuego, he described them as "stunted in their growth, their hideous faces bedaubed with white paint, their skins filthy and greasy, their voices discordant, their gestures violent and without dignity." As Torgovnick analyzes William Rice Burroughs' Tarzan series, she finds that "As the series develops, it increasingly affirms existing hierarchies, including the hierarchy of male over female, white over black, West over rest" (1990, 46). And McClintock (1995) shows how advertisements for Pears soap depict its ability to magically cleanse the body of a black child and make it white, vividly illustrating the association of darkness with dirt. At the same time, advertisements suggest that the colonial mission of "civilizing" native populations necessarily involves imposing a global standard of Caucasian beauty.

## Cultural Meanings of Whiteness

In Japan, the Tokugawa government effectively sealed off the country from Western influence in 1639. It was not until 1853 that Commodore Perry and his American "black ships" forced Japan to reopen its ports. During the subsequent period of the Meiji Restoration, both Japanese men and women began to self-consciously imitate the clothing, hairstyles, and appearance of Westerns (Wagatsuma 1967). While early paintings of Western sailors show the men with dark tans (note too the image of black ships), Western women were shown as pale and white. By the 1920s, anything Western was regarded as modern and desirable (Wagatsuma 1967; Kinmonth 1981). This was also the case during and following World War I and World War II (Kato 1965). Wagatsuma (1967) reports a survey of Japanese men that found that they valued white skin as a significant element in judging the beauty of Japanese women and associated it with femininity, chastity, purity, moral virtue, and motherhood. In addition he found that the quality of *mochi-hada* ("skin like pounded rice") had sexual connotations for many of these men. However, this is a beauty ideal that is not the same as the Western use of cosmetics to enhance or change appearance. Instead it is a uniform fitting-in that has only become somewhat less severe than the use of lead-based face whitening in the Meiji era (Ashikari 2003b). More than 90 percent of middle-class Japanese women adopt this face in public and even those who tan their bodies avoid tanning their faces and use the standard color of foundation makeup (Ashikari 2003b). Japanese whiteness is thus about Japanese racial identity and according to Ashikari (2005) it is seen as quite different from and even superior to Western whiteness. Caucasian women are regarded as beautiful in Japan, although Caucasian men are more likely to be described as big-nosed "hairy barbarians." Still, they are regarded more positively than blacks who are described by some Japanese as bestial and animal-like (Russell 1996; Wagatsuma 1967).

In traditional Chinese culture, the idiom "one white covers up three uglinesses" (Bray 2002) still has currency. Most of the portraits of goddesses and Buddha have white skin. But in China too there was an historical influence of Western notions of beauty and fashion during from the late 19th and early 20th centuries, with strong similarities to contemporary China following the "open door" policies introduced in the late 1970s (Belk and Zhao 2003). Shanghai, along with four other Chinese "treaty port cities" and Hong Kong, was forced to open to the West after losing the Opium War in 1843. Western goods, fashions, films, and inventions flooded Shanghai as a result. This was a jarring development compared to previous periods when China regarded itself as the center of the universe and was largely impervious to attempts to import foreign goods. Women's appearances became increasingly Westernized in the 1930s and incorporated high heel shoes, furs, bobbed hair, and Western beauty products. Chinese women who adopted such fashions also became the target of an anti-foreign and anti-consumerist movement, the *Kuomintang* or New Life Movement. The Japanese invasion of China and World War II intervened, but this movement eventually led to civil war and the establishment of the communist party in China. Women's looks and clothing became decidedly less consumerist and Western under communism until the late 1970s. The recent rise of consumerism in China has brought about a resurgence of Westernized fashions. But the legacy of foreign conquests and humiliations of China have also led to a simultaneous love/hate relationship with the global and foreign in contemporary China (Belk and Zhao 2003; Zhou and Belk 2004).

In the long tradition of Korean shamanism, a person with white skin is respected. The myth of the Buryat Mongols of South-Central Siberia, where Korean shamanism originated, tells that the first superhuman was born white. In Korea, people who have white skin have long been told that they look noble. In the upper class of the *Koyro* dynasty (918-1392), children washed their faces with peach flower water to make their skin clean, white, and transparent, and girls before marriage were desperate to have white skin. Even for men, the skin complexion of a noble man was almost always expressed as being like pale jade (Jeon 1987). After the opening of its seaports to the foreign Powers since 1876, Western clothing, accessories, hairstyles, and make-up were distributed in the cities of Korea. "New women," who were also called modern girls, were very active in embracing Western standards of beauty. Names like *Marlene Dietrich*, and *Greta Garbo* were mentioned often describing beauty (Yoo 2001).

In Indian culture, "black" is associated with underprivileged people and is a symbol of "dark," "dirty," "wrong," "hell," and "unfairness" and is opposite to "good," "bright," and "well-being". White skin is always associated with positive messages in Indian and Hindu culture. It is taken as s sign of "beauty," "purity," "cleanliness," and "happiness," and is a symbol of power and privilege (Arif 2004). In Hindu religion, *Kali*, a dark-skin goddess, is a symbol of ugliness, cruelty, and destruction (Arif 2004; Leeming 2001) and manifests the negative association of dark skinned women in Indian society.

In sum, "whiteness" is an important sign in presenting and constructing beauty in many non-white cultures. Also, whiteness is associated with perceptions of gender, virtue, and cultural identity. Desires for "whiteness," under this chain of associations, is pursued for mixed reasons by women in everyday life. In the social context, white face and white skin can be identified as a form of performance (Goffman 1967, 1979), which presents and re-represents the beauty and virtue of an individual within the community.

## Classism and Racism: White Privilege

Differences in skin color are not only perceived as marking physical differences between and among groups of people, but also to mark social and cultural distinctions in terms of racial and historical background. Classism and racism develop socially rather than biologically, but markers may be artificially coded in terms of differences in skin colors. In color-ranking societies like America (Hall 1995), "double-consciousness" (DuBois 1969) and a dual perspective (Norton 1993) were common social phenomena in inter-ethnic interactions. The "light at the top" phenomenon spread over non-white cultures. Those with light skin and Caucasian-looking features have also enjoyed more respect in their communities (Russell, Wilson, and Hall 1992). Euro-centric ideology took root in many cultures with the rise of colonialism in the eighteenth century and with the spread of mass media and consumer goods in

the twentieth century. White males occupied the top of the social hierarchy while non-white females, especially black females, were at the bottom. People from non-white cultures, like African Americans, "bleached" themselves (first with folk preparations and later with commercial skin lighteners) in an attempt to blend in the dominant society (Hall 1995).

As Banton (1967) observes, race and ethnicity become the signs that lead to the assignment of positions in the overall system of exploitation. Mass media and marketers have aided and abetted this phenomenon by portraying distinctions between races and ethnic groups. Hollywood movies and mass media in the West frequently portray darker skin people as lower class, dirty, and evil, while white or light skin people are depicted as morally purer, better educated, more intelligent, and cleaner. Even Spike Lee's 1988 film *School Daze* emphasizes this prejudice. Dark skin continues to be associated with unpleasantness, dirt, crime, and disruption of society (Russell, Wilson, and Hall 1992; Hall 1995) as well as lower social status, while light or white skin is associated with purity and higher social class. This social stratification process exists in non-Western cultures as well. Dark skinned people in Japan are perceived as lower class (or farmers) since they work under the sun while light skinned people are more likely to have been sheltered indoors rather than working outside.

According to Lipsitz (1998, p. 3), "the power of whiteness depended not only on white hegemony over separate racialized groups, but also on manipulating racial outsiders to fight against one another, to compete with each other for white approval, and to seek the rewards and privileges of whiteness for themselves at the expense—literally—of other racialized populations". Stereotypes among whites and non-whites spread from the inter-cultural arena to intra-cultural contexts. "Civilized White" and "Barbarous Black" (Russell 1996) ideologies became internalized in non-white cultures. Light and fair skin tone become the desired skin tone and was perceived as "sign" of prestige within the non-white cultures on each of the world's continents.

## METHODOLOGY

### Data Collection

Advertisements for skin-related products are the focus of our analysis. As advertising is one of the important archival records for storing cultural images and texts (Belk and Pollay 1985), we sought to study how brands project ideologies and create or reinforce new standards via their images and messages. Six magazines (*Cosmopolitan*, *Elle*, a local high fashion magazine, a similar magazine for working women,[1] a movie magazine, and a bridal magazine) were collected from each of four Asian societies (India, Japan, Korea and Hong Kong) for a fixed time frame (March, June, September, and December issues in 2005). We focused on advertisements for cosmetics, skin care products, skin care services, foods and beverages claiming to improve skin quality, and other skin-related products and services. We did not include advertisements for shampoos, hair products, or plastic surgery. After removing duplicates, 620 advertisements were coded for comparison: 108 ads from India, 103 from Japan, 225 from Korea, and 184 from Hong Kong. Promotional articles, advice columns, and editorials were also examined, but are not analyzed here.

[1]A magazine for housewives was used instead in Korea because a prominent magazine for working women is not available.

### Data Analysis

Content analysis and semiotic analysis were used in this study. In the initial content analysis we recorded: information about (1) model's identity (Caucasian or Asian; local or foreign), (2) background color, (3) skin color of the model(s), (4) slogan, (5) product depiction (present or not present), (6) brand and product name(s), (7) function of products, (8) technology/ingredient(s) claims, (9) language used, and (10) appearance of model(s) (posture, body parts included, hair-style, hair-color, accessories). Skin color was coded using a standardized color wheel and involved fourteen possible categories ranging from soft ivory to cocoa. Each advertisement was coded by a research team member from the country in which the ad appeared. We then met to present, compare, and discuss the results of the analysis. This lead to more qualitative comparisons of the ads, cultural background discussions, and refinement of the codes employed.

In the subsequent semiotic analysis we focused on studying the metaphors invoked in the advertisement. Here we explored the implicit messages of the advertisements. We identified the signifiers and signifieds in the advertisements following Barthes (1964). We compared similarities and differences between global and local brands as well as cultural differences between ads from the four societies studied. The research team made these comparisons as a group following individual analyses of ads from each country.

## FINDINGS

### Notions of "Good Skin" and "Bad Skin"

Skin care advertisements in each country emphasized that "*good skin*" should be smooth, young, pore-less, line-free, bright, transparent, white, full, and fine. "*Bad skin*" is referenced in the ads as skin with fine lines, wrinkles, aging marks, pores, or yellow spots, and skin that is dark, scratchy, dry, dull, loose, or rough. The major causes of bad skin are presented as being aging, dryness, ultraviolet radiation (or exposure to strong sunlight), stress, air pollution, slow metabolism, lack of rest, overuse of cosmetics, and the formation of melanin.

### Functions/New Technology/New Ingredient

Product advertisements typically made multiple claims for their products. The main functions claimed for the skin care products in the advertisements are repairing skin, smoothing/removing wrinkles/lines/deep spots/yellow spots/black eyes/baggy eyes, itching/dullness/oil/grease/dirt, improving fairness of complexion, rejuvenating, brightening, cleansing, whitening, smoothing, or restoring skin, increasing moisture retention, maintaining elasticity, and preventing the formation of melanin. Statistics and survey results as well as government approval certifications were found in the skin color ads across the studied countries in order to suggest scientific proof of the efficacy of the products. Examples of these claims include the percentage of users who agreed that they had improved skin quality after using the product. Results of experiments were also cited to show effects, including increased moisture retention levels and reduced pore size. In Korea, although a few skin care advertisements included survey or lab test results, they were not emphasized as much as in the Hong Kong and Indian ads. Instead, acknowledgement of official approval of claims (e.g. wrinkle reduction, UV screening, and whitening) by the Korean Food and Drug Administration was common. Some of the ads emphasized formulation for Asian women's skin specifically. Technologies referenced included the use of Nano-technology in extracting essences from natural materials, dissolution of dirt, UV protection, and the addition of a protective layer to the skin. At the

same time, there were frequent claims of natural ingredients and extracts or essences of natural ingredients in the ads. Emphasis was very commonly on "natural" beauty as opposed to "artificial" or "man-made" beauty.

### A Lighter Shade of Pale

Caucasian models were most often used in ads for global brands like Estee Lauder and L'Oreal. Forty-four percent of Korean and fifty-four percent of Japanese ads used Caucasian models. Local models did not often appear in global brands' ads in Korea, Hong Kong or Japan but eighty-two percent of the Indian ads used Indian models or celebrities. One reason for this may be the recent globalization of Indian beauty as affirmed by a number of Indian winners of such global beauty contests as Miss World and Miss Universe. From 1990-2006 Indian models won 11 of these titles. The dominance of Bollywood film in India also diminishes the impact of Hollywood ideologies in Indian culture. Indian celebrities appear to be the dominant body ideals for Indian women. Domestic and regional brands (including Asian brands like Shiseido) use more local models in each of the countries studied. In Japan, celebrities who participated in Hollywood movies, including Kaori Momoi from *Geisha* and Koyuki from *Last Samurai*, are used in ads for global brands (e.g., SK-II). In contrast to the global brands' localization strategies (e.g., "for Asian skin"), here the Hollywood reference claims a more global status for local brands, playing on local pride. In other words, local models in Asian cultures are moving upwards towards the global standard–the western standard (Wilk 1995).

In the case of Japan, Korea and Hong Kong, the skin color of the model, whether Caucasian or local, is primarily soft ivory, classic ivory, and natural ivory. In the case of India, the skin color of models (who were predominantly Indian) tended to be more fair and Caucasian-looking. The skin color of models in advertisements that emphasize "natural" tended to be moderately light—either soft ivory or natural ivory. Models in these ads had minimal make-up, conveying a "natural beauty" look. The skin color of models for prestige brands, and ads emphasizing a somewhat older "classic" or "elegant" image, tended to be a lighter classic ivory. Thus, skin color is conflated with class and whiter skin costs more.

### Globalized Products, Localized Slogans/Themes/Metaphors

Global brands like Estée Lauder and L'Oreal distribute the same product lines in each Asian market studied. Variations of their product lines occur, but are minor. But localized advertising messages are used. We focus on Chinese ads for illustration in this section. For example, advertisements referencing Chinese traditions found in the Hong Kong magazines included: inner-body/ internal treatment, the power of white tea, claims of herbal ingredients, and combinations of herbal medicine and Western technologies.

Metaphors used in Hong Kong included collagen derived from sharks, presumably because shark fin soup is a luxury food served at Chinese banquets. Pandas were used to present the black eyes since "Panda's eye" is commonly used to describe a person who lacks sleep or is in an exhausted and extremely tired condition. Internal treatments of blood and the importance of harmonizing the body internally were often emphasized. This relates to *Qi* and the balance of *yin* and *yang* as well as the basic elements in Chinese foods and medicines. Also, skin care advertisements sometimes claimed that they follow the traditional Chinese Imperial Palace secret formula. Pearls, gold, and platinum were used to emphasize luxuriousness in these ads, while water, clear sky, and natural environment were used to suggest naturalness. Symbols like gold, aristocrats, and luxury foods like sharks' fins and birds' nests were

found in the skin care advertisements in Hong Kong. Other ingredients like *Ling Zhi* and *Song-Yi* mushroom (*Matsutake tricoloma*), which were used traditionally by upper class families and emperors for retaining the skin whiteness are now touted in skin whitening ads (Onions 1998).

"Natural" was found repeatedly in advertisements of each country, In Hong Kong these appeals were also localized with natural ingredients like the essence of white tea (Origins), Chinese herbal medicine (like *Ling Zh*i and *Agaricus*), and minerals from volcanoes or hot-springs. Common slogans for skin lightening products and services included rejuvenating yourself, brightening and lightening your skin, stopping time (associated with aging), perfecting your skin, creating pearl-like (MaxFactor)/water-like/ baby-like skin, climbing the peak of beauty, controlling your future (Olay), increasing confidence and attractiveness. For example, Missha's "Illuminating Arbutin Skincare" collection emphasizes that the product can turn users' skin as white as the snow. "Many messages ask for close attention to the deeper level of skin. Seemingly unproblematic skin turns out to be the problematic when it is seen from its roots. The detection of early symptoms of bad skin and the correction of defects as early as possible is emphasized. Technology also played an important role in these messages with frequent references to advanced technologies bringing in "new" methods to skin care and magical effects to the skin. For example, Sofina's "Whitening Deep Science" emphasizes the newly developed technology that can avoid the formation of melanin. The appeal to advanced technology emphasizes belief and trust in science to minimize poor or declining skin quality.

## DISCUSSION

### "White Skin" as "Cultural Capital" in Asian Society

White Skin, in our findings, combines with other socio-cultural symbols such as the natural environment, fresh air, blue sky, and water, in order to emphasize purity and naturalness. Also, in Asian cultures, white skin is perceived as a sign of luxury and prestige. Asian celebrities with white/fair skin also link their success with whiteness/fairness. Altering skin color implies success in controlling the body and thereby achieving an ideal body image (Miller 2003).

Thompson (2004) introduced the Gnostic mythos, which refers to the "ideological wedding of technology and transcendence" (Noble 1999; Thompson 2004). A similar emphasis on technologies in skin care and whitening industry played an important role in building consumers' expectations for the Cinderella-like transformative power of the products advertised. Natural ingredients or essences create a sense of natural health for consumers (Thompson and Troester 2002) and emphasize the natural beauty of the skin. Since ingredients were frequently touted as derived from naturally existing organisms (especially plants), it was also implied that our (consumers') bodies can adapt to these components with minimal side-effects like allergies.

At a theoretical level, whiteness is a source of symbolic cultural capital (Bourdieu 1984, 1986) that is associated with upper class images, luxury, prestige and success in Asian cultures (Rhada 2007). Also, a natural white skin is associated with advanced in technology, while at the same time claiming natural ingredients, and body control as discussed below.

### Body Control, Empowerment and Disempowerment of Asian Women

From our findings, white skin is always linked with naturalness. In "naturalizing" skin it is implied that this is the natural order of things from which we have departed. Women who have white and

fair skin were perceived as "normal" and others who fail to achieve a fair complexion are suggested as failing to manage and control their bodies. Internal factors that are accused of causing "bad skin" include aging, stress, inadequate relaxation, and abnormal body conditions, while external factors are suggested to include air pollution, dryness, humidity, and strong sunlight. In Thompson and Troester's (2002) study, restoring the harmony of the body is one of the conceptual goals of natural health. Having a healthy skin, according to Crawford (1985), is a matter of self-control, self-discipline, self-denial, and will power. Skin care product advertisements frequently call consumers' attention to tiny defects of skin or invisible sources of troubles and ask them to control these things in order to have good skin. In order to have good skin, consumers are required to apply the advertised products every day. This self-surveillance and internalization of skin care regimens underwrite most of the advertisements. Fear of the invisible enemies of the skin creates skin care disciplines and exemplifies strategies of modern governance (Foucault 1984, 1985). Skin care products are advertised as capable of improving skin quality as well as controlling the skin's quality under extreme conditions. Naturalness is essential in the skin care context, and advertisements use words like "recover," "rejuvenate," "repair," "prevent," "refresh," "retain," and "revitalize" to emphasize that the product will help to regain and maintain the user's skin rather than "change" and "alter" it like plastic surgery. "Flawless" skin is presented as the fundamental skin type of humans and any flaw is therefore unnatural. Success in controlling the human body and reversing the natural order is appealed to through controlling and altering skin color. It is the outward sign of inner beauty. The emphases on technological advancement and new ingredients promise to enhance this control by adopting Western technologies, but also celebrate the broader human control over nature.

Whitening and lightening skin has both empowering and disempowering functions for women. In Asian cultures, women were oppressed for long periods of time. In China, women were labeled as mere attachments to men. The Confucian Doctrine of Threefold Obedience (*san cong*) was established in *Li ji*, and held that women were subordinates to their fathers as girls, to their husbands as wives, and to their sons as widows (Raphals 1998). Likewise in Korea during the Choson dynasty (1392-1910) middle class women were sequestered within the center of the household and were not allowed to venture forth uncovered or on their own (Song-mi 2003). The ability of whitening and lightening skin to empower women lies in delivering power in controlling their own skin tone as well as bodies. This empowering action also liberates women from men's control. Along with the increasing social status of women in contemporary Asian societies, women become important agents both at home and in the workplace. However, contemporary women are disempowered in the same manner. Women, even when empowered to control their bodies and skin tone, still follow the external control of a beauty standard. As noted above, they also succumb to a strategy of modern self-governance. In this sense, women are still following the social norm and are working hard to achieve social acceptance in order to secure their social status as well as accumulate social capital in society.

## CONCLUSION

Whitening and lightening skin products have recorded a dramatic growth in Asian markets over the past two decades and are the best-selling product categories in the Asian beauty industry. The long histories of the desire for white skin and fair skin has collided with technological developments and marketing forces. Skin whitening and lightening products not only promise to fulfill the desire for white and fair skin as a route to higher status, but also empower women to control their own bodies and alter nature. On the other hand, whitening and lightening skin are a social norm that "forces" women to follow such trends and standards as well as marketplace mythologies (Thompson 2004). Failure in following this norm will result in low self-esteem and social status. In social interaction contexts, white and fair skins are social symbols and regimes. The notion of beauty is socially constructed and its meanings are changed and maintained by social forces.

The desire for white and fair skin is a global phenomenon especially in non-white cultures and is not limited to Asian contexts. African, South American and Middle-Eastern cultures also have their own traditions of skin whitening and lightening. This study explores how skin whitening and lightening products construct the contemporary notion of whiteness in Asian countries and interprets how this notion reinforces the embedded meanings of whiteness and beauty in Asia.

# Keeping it in the Family: How Teenagers Use Music to Bond, Build Bridges and Seek Autonomy

Peter Nuttall, University of West of England, UK
Julie Tinson, University of Stirling, UK

## ABSTRACT

This paper seeks to explore teenage use and consumption of music within families and to develop the concepts of 'connection' and autonomy seeking within families relative to popular music consumption. Social trends indicate that the composition of the family will continue to change and, as such, this research will also examine the impact of changing family structures on music use and consumption. This research involved 24 in-depth interviews with both early and late adolescents. The findings from this research sample suggest connection (bonding and building bridges) through music is most relevant for teenagers raised in step parent families. Evidence of affinity or autonomy seeking behaviour may also be ascribed to family type.

## INTRODUCTION

The significance of popular music and the importance of it to people's everyday lives has received little attention among the marketing and consumer research academy (Holbrook, 1986; Holbrook and Schindler, 1989; Lacher & Mizerski, 1994) although researchers have more recently examined the role music has played in satisfying particular emotional needs (strategies for coping), social needs (belonging and identity) and developmental needs (the socialisation 'journey') of adolescents [See Arnett, 1995b; Larson *et al*, 1989; Larson and Kubey, 1983; Lull, 1987, 1992; Rubin 1994].

To further understand adolescent music consumption and the way in which music facilitates or impedes teenage familial relationships, an exploration of music consumption within the context of this social environment will enhance our comprehension of music consumption. As Shankar (2000:28) posits, "*to fully understand consumption, researchers need to move beyond the purchasing of products as the focus of investigation and consider what people do with the products they purchase. Popular music consumption is an excellent example of when the experience of using the product (as opposed to the act of purchasing the product) is fundamentally important to help our understanding of popular music consumption in general*". If the experience of using music is important, the ways in which music can be used in a variety of teenage familial relationship situations and how and why this varies will contribute to knowledge in this area.

## SOCIOLOGICAL RESEARCH AND MUSIC CONSUMPTION

De Nora (2000), in her sociological research on music in everyday life, suggests that in order to fully understand how music is used and understood by others the investigator ought to consider how music 'actually comes to work in specific situations and moments of appropriation' (pg.31). That is, the force or significance of music is dependent on situational circumstance and human-music interaction. It would appear that by generating an insight into the teenage situational music consumption within families and the varying levels (force) of the influence of music, a deeper understanding of consumption and the use of music can be realised. However, it is also clear that researchers cannot decide what music means to others and it is important to identify *for the respondents* how and in what ways music works in specific social situations (Cohen, 1993; Bennett, 2002).

Frith (1996) argues that music can articulate a sense of social meaning and as such can be inclusive or exclusive. Music, however, has principally been discussed with reference to it being inclusive or the way in which it facilitates belonging, solidarity and consensus (Negus and Velazquez, 2002). Further to this DeNora (2000: 109) suggests that music can be used to connect: "*Music can be used to organise disparate individuals such that their actions may appear to be mutually oriented, co-ordinated, entrained and aligned*". Yet the use of music is equally applicable in situations of autonomy seeking and ambivalence. How might teenagers consume and use music to facilitate or impede their familial relationships? What is the role of music within these changing structures and how might teenage consumption and use of music vary in different familial types and situations? Indeed, there is a growing necessity to consider differences between family constitution (intacts, stepfamilies and single parent families) [See for example: Falci, 2006] and this research is pertinent given that social trends indicate that the composition of the family will continue to change.

In 2005, Ekström highlighted that while marketers, social policy makers and consumer advocates had historically taken an interest in family consumption, the focus tended to be on decision-making within families. A call for research that required "rethinking both the concept of the family and consumption in a family context" supports the very essence of considering teenage music use and consumption within familial relationships and against a backdrop of changing family structures. Further to this, Ekström poses the question "To what extent does consumption connect or disconnect families?" (p493). This research specifically considers connection and disconnection relative to adolescent music consumption.

## FAMILY RELATIONSHIPS

During adolescence the teenager remains connected to important family members but seeks to redefine these relationships in relation to his or her increasing sense of a unique and competent self (Burns and Dunlop, 2002; Youniss and Smollar, 1985). Normal adolescent development is marked by an interactive exchange in which both parents and adolescents seek a balance between conflict and alliance (Jory *et al*, 1996) or autonomy and regulation. Indeed, the quest for autonomy as illustrated by Csikszentmihalyi and Rochberg-Halton (1981: 118) is a fundamental part of adolescence: "*…for the teenager mastery over the inner states…is paramount. One must become 'captain of one's soul'–this is often accomplished by becoming 'cool' which is the easiest way of showing one's self control or independence [autonomy] of outside forces*". Music is one way in which this can be achieved.

In addition, the 'day-to-day' window on everyday lives within families (car journeys, watching TV together, listening to and the role of music) may afford a greater opportunity to explore not just points of conflict but ways in which parents bond/interact with adolescents and *vice versa*. It could be that adolescents display coping strategies through music in an effort to maintain the equilibrium and that 'connecting' may be akin to affinity seeking which is defined as "the different ways young people get their parents to feel positive about them" (Flint, 1992, p418).

## MUSIC GENRES AND FAMILIES

Schwartz and Fouts (2003) report that eclectic music tastes are more usual for teenagers who have less difficulty negotiating their adolescence. That is, they have fewer family problems, better peer relationships and do not experience significant issues regarding self-concept. Several authors [See Hansen and Hansen, 1991, Bleich and Zillman, 1991, Arnett 1995a] have noted how the consumption of different genres of music by teenagers is influenced by the felt state of conflict with parents and/or restrictive conditions of their teenage lives. What these studies have not attended to is the role that music plays in facilitating or impeding relationships with parents and siblings and if consumption of specific music genres are related to specific family relationships and familial structures. It may be that when individuals journey through adolescence or experience change (e.g. family disruption) '*the altered self has to be explored and constructed as part of a reflexive process of connecting personal or social change*' (Giddens,1991:33) and a number of possible selves may emerge (See: Goffman, 1963).

## THIS STUDY

Adolescent use and consumption of music is explored here within the context of the family. The research is designed to consider if and how music facilitates connection or disconnection within families. Further to this, teenage music consumption in a variety of family structures and types (single parent, blended and traditional) is examined to explore if there is any association between music consumption and family type.

## METHOD

Given the exploratory nature of this study and the complexity and sensitive nature of the phenomena (family life) in question, in-depth interviews appeared to be the most appropriate method to address the issues raised. The main thrust of this research involved 24 longitudinal in-depth interviews with adolescents to gauge the way in which they chose, used and consumed music relative to their environment. That is, twelve adolescents were interviewed and then the same adolescents re-interviewed six months to a year later. Music vouchers (£15) were used thank the respondents for their involvement in the study.

Whilst it is possible to consider different age groups of adolescents and provide a 'longitudinal' view where variables are consistent (using gender, socio-economic group, level of education, race), the accuracy of this approach is not as reliable as 'following' individuals through time. This is particularly true where individuals experience different situations over a period of time (illness, parental divorce, exams, change of friendship groups etc). It is only by asking the same individual to consider their experiences over time (and in this case how it influenced music choice, use and consumption and subsequent expression of identity) that a true reflection of an adolescent's 'journey' can be proffered. The teenagers were shown a diagram that included words such as exams, illness, new friends etc. during their second (longitudinal) interview to help them identify anything that had happened to them over the previous 6-12 months that may have influenced their music consumption. The sampling was purposive where respondents were handpicked on the basis of their typicality (age, gender and family type). See Table 1.

## DESIGN

The interview was designed in three phases. Initially, photographs were taken by the adolescents before they arrived at the interview so they could be presented and discussed as an opening to the start of the dialogue. This was to look at what they valued most in their personal life and to contextualise their responses and also

how this may change over time. This was repeated for the second interview. Harvey and Byrd (1998) indicate that *early adolescence* (12-14 years) is mostly about acquiring information and experience, whilst *late adolescence* (15-18) is characterised as being a period of identity development in which the information obtained earlier is used to build and consolidate a new identity. The longitudinal interviews also allowed differences between age groups to be identified.

The second phase of the interview utilised the 'draw and write' (projective) technique, designed to encourage the adolescents to express what music meant to them. This technique was employed during interview to elicit greater insight into how they felt about music (external view) and also as a basis for discussing the meaning of music to them personally and what role it played socially (within the family). Finally, when the interviews were finished, the respondents were asked to complete a blank card with their thoughts on the interview. The interviewer then wrote their thoughts on the interview on the other side. In this way, a record was maintained of the interviewer-interviewee perception of what had been discussed. This was taken into account when interpreting the data (e.g. one respondent, for example, felt he was being encouraged to discuss specific artists when he wanted to convey meaning about specific genres).

## DATA ANALYSIS

The data collected from the interviews was analysed using the Ritchie and Spencer (1994) *Framework* analysis method. This method depended on the manual coding, charting and mapping of the data. Initially the researcher familiarises themselves with an overview of the range and diversity of material which has been gathered. Secondly a thematic framework was identified. During this stage, the key issues, concepts and themes were further explored. The data collated from the interviews was systematically indexed (relative to the key themes of identity, music and family). Finally compiling charts for each subject area with headings and sub-headings drawn from the index allows comparison between the themes and issues as dictated by the respondents. The transcripts were also referenced to allow each source to be detected. Key themes and sub themes from all phases of the interview data (including the photos, draw and write technique etc.) were drawn together and interpreted.

## FINDINGS

The data analysis facilitated a greater understanding of the way in which music was used and consumed within families. This research further developed the ideas of Shankar, 2000) relative to the experience of consuming as opposed to purchasing popular music, in addition to considering music consumption in a variety of social situations (See Cohen, 1993; Bennett, 2002). It was evident that although music was used by the adolescents to seek autonomy from the confines of the family (developing the work of Csikszentmihalyi and Rochberg-Halton, 1981), there were also many examples of music being used within the family to 'connect' or 'disconnect' with parents and siblings. There was greater evidence of music being used by teenagers to connect with families where their families were blended (step parent families) or single parent families. Interestingly music was also used by their parents to 'connect' with their children. Teenagers raised in intact or 'traditional' families appeared to be less inclined to use music to form 'connections' within the family.

The following section initially examines how teenagers use and consume music within families to elicit a deeper understanding of music use, followed by how music is used to 'bond' (connect). Finally the extent to which music is used to seek autonomy will be

## TABLE 1
Sample of Adolescent Respondents for In-Depth Interviews

explored (disconnecting). A discussion will follow to consider if a window on 'day-to-day' behaviour can contribute to our understanding of consumption within families.

### CHOOSING & USING MUSIC

To establish the extent to which music was shared within the family, the teenagers were asked if they ever listened to music as a family and how that made them feel. While all respondents did listen (if somewhat infrequently) to music as a family, the respondents raised in intact families were more vocal in their dissent: *"I've tried to listen to it [parents' music] with them but I just don't get that feeling I get from other types of music."* (Initial interview: Male, 16). This was true of both early and late adolescents in intact families.

Although consuming music as a whole family was rare, it seemed that trips in the car were the most regular and perhaps the most obvious opportunity for families to listen to music together. It was adolescents raised in intact families who most frequently commented on music consumption in the car and, in some cases, made disparaging remarks about their parents' tastes in music. However, adolescents also had strategies for ensuring that the choice of music in the car would be to their liking. This quote (See B/1: Intact 2:Table 2) is from a late adolescent who was more likely to have consolidated his identity (Harvey and Byrd, 1998) and was keen to illustrate the way he managed music consumption. He was planning a trip to France in the car with his family and had made up a number of cassettes with a mix of music on them.

Some teenagers raised within intact families however, admitted to borrowing some of their parents CDs (both during early and late adolescence)–perhaps reflecting a more eclectic taste. This further supports the work of Schwartz and Fouts (2003).

Those raised in intact families also appeared to encourage eclectic music taste among younger family members. This may be because they were encouraged to have a diverse music taste themselves (Tarrant *et al*, 2000) and were in turn socialising younger siblings. This was particularly true of late adolescents.

Respondents raised in blended or single parent families certainly seemed more accommodating in their music consumption within the family. Many of the respondents acknowledged they perhaps had different tastes than other family members but were quick to provide excuses (ie generation gap etc). They often appeared to yield to the tastes of other family members (siblings) or simply used music as a way of maintaining and developing familial relationships. For teenagers raised in single parent families, music appeared to be a very significant part of the family culture, transcending generations in both early and late adolescence (See B/8: Single 2: Table 2).

The issue raised here is the way in which parents may simply pass on their taste in music and that stereotypically negative music consumption by adolescents may not reflect their felt state of confidence or self-worth (See Tarrant *et al*, 2000). Indeed, it would seem, at least in this case, that the music consumption in this single parent household was an inherent strand of the familial culture.

Finally, position within the family appeared to relate to acceptable types of music consumed by family members. While one late adolescent respondent discusses her younger brother, she is adamant he cannot like the same band as her (Placebo) and clearly disassociates herself from his other music tastes (Busted)-See A/6: Single 1: Table 2.This suggests that in some cases, the adolescent perceives that it is better to listen to the music their parents listen to as opposed to being seen to like the music their younger siblings prefer–perhaps to illustrate a consolidated identity. Of course, the extent to which teenagers engage in consumption of music with other family members may be attributable to the 'connection' or relationship they have with their parents or siblings. The following section explores the way in which the adolescents in this research project had a 'connection' to maintain or develop within the family and how this affects music consumption.

### CONNECTING

The concept of connecting is considered by the authors to be a gesture or behaviour that is displayed by the teenage respondent that suggests the teenager is attempting to bond with a family member or maintain a position within the family as part of the family culture. The issues covered in this section therefore reflect this concept and bonding, affinity seeking behaviour and building bridges are considered here.

When considering the respondents' level of bonding with family members during the initial phase of interviewing, it seemed apparent that females, early adolescents and those raised in single parent or blended families, appeared most likely to attempt to bond with family members and/or seemed to place more importance on the family than their peers raised in intact families.

Reviewing the longitudinal data suggests both early and late male and female adolescents raised in single parent and blended families are more likely to place a greater level of importance on family members and the relationship they have with their parent/s even if that parent no longer resides in the family home. Whilst the sample was small, this pattern was evident in this data. Using ways in which to bond or seek approval from a parent/s appeared to be notable for those raised in blended and single parent families (See B/4: Blended 2: Table 3). Interestingly, this quote supports the assertion by Youniss and Smollar (1985) that fathers are more judgemental. Even though this father lived outside of the family home and although this male adolescent appeared to be an active negotiator (Jory *et al*, 1996) there was an obvious need to justify or support decisions that had been made.

Even in single parent families where the communication approaches seemed particularly poor, there still seemed a desire to be convergent, whether this materialised or not (See A/4: Single 1: Table 3).

Bonding closely with family members certainly seemed more characteristic of teenagers raised in single parent and blended families. As Solomon (2002) suggests, it may be that because

**TABLE 2**
Choosing & Using Music

| Case No./ Family Type/ Interview | Choosing Music | Case No./ Family Type/ Interview | Using Music | Case No./ Family Type/ Interview | Socialising other family members |
|---|---|---|---|---|---|
| **B/1 Intact 2** | *"Well I'll have to make enough tapes to not get boring and I expect my parents will probably have a choice between each tape that will be made by me anyway. In France [on holiday] they'll think they have control but it will be like voting in China."* | **A/3 Blended 1** | *"I listen to the type of music my mum listens to. If I didn't then I reckon that that would be something that my mum didn't have in common with me…our relationship would be a little bit more down because we talk about [music] a lot."* | **A/4 Single 1** | *"I try to influence my little brother [taste in music] he started listening to Red Hot Chili Peppers the other weekend, I think that's more just because I do it so he wants to do it as well, like copying."* |
| **A/5 Intact 1** | *"They like different types of music that I'm not so fond of– you've just got to feel sorry for them, they obviously have no taste."* | **B/8 Single 2** | *"I was kind of brought up on it because my mum liked Nirvana and stuff and when they were out [I listened to it] and I was just brought up listening to it and then as I got older I liked it more and more and developed my interest in it."* | **A/6 Single 1** | *"He doesn't really listen to music but he pretends to like Placebo, or he has got the Placebo CD but I don't think he really listens to it. He likes Busted which is nothing to do with me."* |

'openness' or democracy with a family is always undermined by a struggle for control, that convergence for teenagers raised in single or blended families was a strategy for maintaining or developing an element of control in their relationships. Autonomy seeking behaviour as posited by Csikszentmihalyi and Rochberg-Halton (1981) may be less important in these family environments and autonomy seeking behaviour may be replaced by affinity seeking behaviour.

Music was also used to make a 'bond' more special where new family members had come into the existing family environment.

There were however, a similar number of examples where music was used as a barrier that allowed the adolescents to seek autonomy from the family confines (more obvious but not confined to early adolescents). Specifically the issues raised by the respondents in relation to autonomy seeking were: the role of conflict, the role of additional family members, number of 'selves' and social stroking. These will now be considered in turn.

**DISCONNECTING**

When considering the data from the respondents raised in intact families, it was evident that this sample of teenagers was less concerned with appearing to seek autonomy from the rest of the family particularly in late adolescence. This may have been because they were encouraged to be more eclectic in their music tastes (as indicated by Schwartz and Fouts, 2003) or may have been because they were less fearful of conflict and felt able to seek autonomy as illustrated by Csikszentmihalyi and Rochberg-Halton (1981).

The respondents raised in blended or single parent families largely appeared also to have different music tastes from their immediate family (parents/siblings) but were clearly using an additional family layer (uncles/aunts) to source music that they recognised their parents, in particular, would not welcome. Interestingly, girlfriends of adolescents' fathers living outside of the family home also featured as a source of (different) music or appealing music tastes (See B/4: Blended 2: Table 3). (Coping) strategies then were employed to express autonomy. That is, for these respondents, the intensity of autonomy seeking from the family was no greater (force) or quicker (time) than that of the interviewees raised in intact families, but there was evidence of a different strategy in order to express this autonomy from the family.

It is known that adolescents' gender and self-esteem may affect their coping styles (Mullis and Chapman, 2000). Indeed Moos (1990) reported that adolescents with low self-esteem rely on emotion-based strategies (ventilation of feelings) in coping, whereas adolescents with high self-esteem relied on strategies directed at problem solving. This research suggests that those raised in single parent and blended families did not necessarily display lower levels of self-esteem in this instance as their strategies appear to have been solution-oriented.

What these findings also seem to indicate are that teenagers raised in blended and single parent families appear to have a greater number of identities. That is, Goffman (1963) describes individuals as having a number of 'selves' and it would seem that the teenagers raised in intact families have fewer 'selves' or do not feel the need to have a number of multiple selves. This may be because they are less concerned with what others think of them or because they have a level of stability not felt by teenagers raised in blended or single parent households.

Finally, it seemed as if respondents raised in blended or single parent families looked for reassurance (social stroking) to a greater

**TABLE 3**
Examples of Bonding, Affinity Seeking & Disconnecting

| Case No./ Family Type/ Interview | Choosing Music | Case No./ Family Type/ Interview | Using Music | Case No./ Family Type/ Interview | Socialising other family members |
|---|---|---|---|---|---|
| B/4 Blended 2 | *"I'd probably show my dad the picture of my guitar because he'd like to know what I'm doing and I'm interested in that. My dad was one of the people I had to try and convince that I was going to be committed to it. I mean he knows now that I am committed…and I think it would be nice for him to know that I'm really serious about it and I want to carry on."* | A/4 Single 1 | *"I think it's because I like my friends and I want them to come across well because I want to help mum see what great people they are."* | A/9 Intact 2 | *"It' s none of their business really is it [what my parents think of what I do]. Obviously if they say to me, I don't want you to listen to that, then it's going to make me listen to [music] it more, so I'll end up doing it anyway.…"* |
| A/7 Blended 1 | *"My mum likes Kenny Rogers and Michael Bolton and I suppose it's not that bad."* | B/4 Blended 1 | *"I think when they were younger things were different and as they've grown up they've forgotten about the music they used to like so I asked them, did you like the Monkees and they'd say oh I can't remember and it was like… they probably did, they probably had posters all over their walls."* | B/3 Intact 1 | *Interviewer : So they might want their parents to be fashionable?* *"They might say, after they're picking them up, please for one night just play this music and don't do what you usually do please."* |

extent. That is, it appeared that they needed to know that escaping the family confines was 'normal' and asked their parent/s about their own 'disconnection' experiences (See B/4: Blended 1: Table 3). This may have simply been curiosity or the mark of normal adolescent identity characterised by a balance between conflict and alliance (Jory *et al*, 1996) but the necessity for social stroking was regularly raised within this category of respondents as an issue and therefore would seem to reflect a consistent pattern although this needs further exploration.

## DISCUSSION & CONCLUSION

This research sought to explore and develop an understanding of music consumption within families and illustrated that music plays a significant role in connecting families whilst allowing some (early) adolescents the opportunity to use music as a barrier to connection. The key themes that emerged from the findings were connection and disconnection. Each of these themes illustrated that there is merit in further exploring the role of family type relative to popular music consumption. Whilst this sample was limited, the data was rich and it was evident that there was an emerging pattern relative to family type and the role of music although clearly these cases cannot be generalized.

Teenagers raised in intact or traditional families appeared to display an eclectic approach to music and early adolescents could be readily dismissive of their parents' music. Late adolescents raised in blended households in this sample were more inclined to use music to build bridges with new family members and also retain a link with family who no longer lived in the same household. There was evidence of intergenerational fandom and also illustrations of coping mechanisms. The extra 'layer' of family (e.g. father's girlfriend) utilized by teenagers raised in blended and single parent families raises the notion of kinship and a wider sense of community where previous studies have focused on materialism and individualism.

Possibly the most important aspect of this research is the notion that it is possible to learn about influences on family consumption from the everyday behaviour of adolescents and their families. For example, the apparent reticence of late teens raised in blended households to engage in conflict relative to music consumption may translate into more compliant behaviour in other consumption situations. The concept of those raised in blended households illustrating a greater number of 'selves' also supports and develops the study of Rindfleisch *et al* (1996) which suggests that children raised in disrupted families are more materialistic

possibly to maintain a greater number of selves. As future research ought to explore the extent to which the building and maintenance of social relationships are key factors in understanding brand choice (Auty & Elliott, 2001), this initial exploratory study may provide some insight into family life and its relationship with consumption.

Examples of late adolescent brothers socializing their younger siblings (intragenerational learning) may also apply to other consumption situations and may be relevant for both practitioners developing communication campaigns and policy makers considering key opinion leaders who may be influential in facilitating campaigns associated with specific behavioural concerns (e.g. underage drinking, smoking, unhealthy food choice).

In the future it would be interesting to explore how long the blended or single parent families had been such, especially if the teenager had been part of an intact family to begin with and whether this makes any difference in their needs expressed through music. Conversely, exploring how parents use music (affiliation versus autonomy seeking needs) may also add to the body of knowledge in this area.

Given the continuing change in the West with regard to family structure, the findings of this research may be indicative of the changing nature of consumption. Although this research has not taken into account other salient factors that may affect consumption (peers, media, school) it contributes by considering connection, disconnection within families to contribute to an understanding of popular music consumption.

## ABSTRACT

This study investigates the effects of three trust dimensions on relationship commitment. The results of a survey of 989 customers subscribing to a media service indicate that integrity has the strongest influence on relationship commitment, followed by competence and benevolence. The effect of integrity on relationship commitment is negatively asymmetric both in the early and later stage of the relationship. The effect of competence on relationship commitment is negatively asymmetric in the mature stage of the relationship, while the effect of benevolence on relationship commitment is positively asymmetric in the mature stage of the relationship. That is, benevolence becomes more important in the mature state of the relationship. Managerial implications are discussed.

## INTRODUCTION

Long term relationships between a firm and its customers provide many benefits for both the firm and the customers. Studies have found that firms practicing relationship marketing indeed enjoy increased competitiveness (e.g., Morgan and Hunt, 1999), reduced transaction costs (e.g., Aulakh *et al*., 1996), reduced uncertainty (e.g., Johnston *et al*., 1999), improved financial performance (e.g., Kalwani and Narayandas, 1995; Jap, 1999; Johnston *et al*., 1999), and increased marketing productivity (e.g., Naidu *et al*., 1999).

With the introduction of trust-commitment theory (Morgan and Hunt, 1994), many studies have focused on the development of trust and its consequences (e.g., Doney and Cannon, 1997). Researchers have found that trust complements and solidifies the relationship between the firm and the customer (Rousseau *et al*., 1998). Studies also have identified three dimensions of trust: competency, benevolence, and integrity (Mayer *et al*., 1995; Ganesan, 1994; Sako, 1992).

While these studies have provided managers with some understanding on the role of each dimension to ensure relationship performance (Sirdeshmukh *et al*., 2002), we still have a limited understanding of under what conditions each trust dimension has a significant influence on relationship commitment. Furthermore, we still do not know whether the enhancement of trust dimensions has a symmetric effect on relationship commitment as compared to the depletion of trust dimensions (Gefen, 2002).

The main objectives of this study are twofold. First, the study will examine the relative efficacy of trust dimensions on relationship commitment. Second, the study will examine whether the enhancement of a trust dimension has an impact equal to the depletion of the trust dimension in forming relationship commitment. Understanding of relative efficacy and effect symmetry will help managers set priorities to enhance each of the trust dimensions for further developing a committed relationship.

*Figure 1* describes the conceptual model of this paper. The model posits that integrity, competence, and benevolence are antecedents to relationship commitment. The model also depicts the symmetry effects of trust dimensions on relationship commitment, moderated by relationship duration.

The paper proceeds as follows. We first discuss the three trust dimensions and follow with the hypotheses to test the relative efficacy and symmetry of their effects on relationship commitment. We then discuss the method and study results. Managerial implications are discussed last.

## CONCEPTUAL DEVELOPMENT

### Dimensions of Trust

In the literature, trust has been conceptualized in many different ways (e.g., Barney and Hansen, 1994; Lane, 1998; Shapiro *et al*., 1992; Zucker, 1986). Following the work by Mayer *et al*. (1995), this study conceptualizes trust as having three key dimensions: integrity, competency, and benevolence. That is, we treat the key dimensions of trust as antecedents to commitment (Butler and Cantrell, 1984; Butler, 1991).

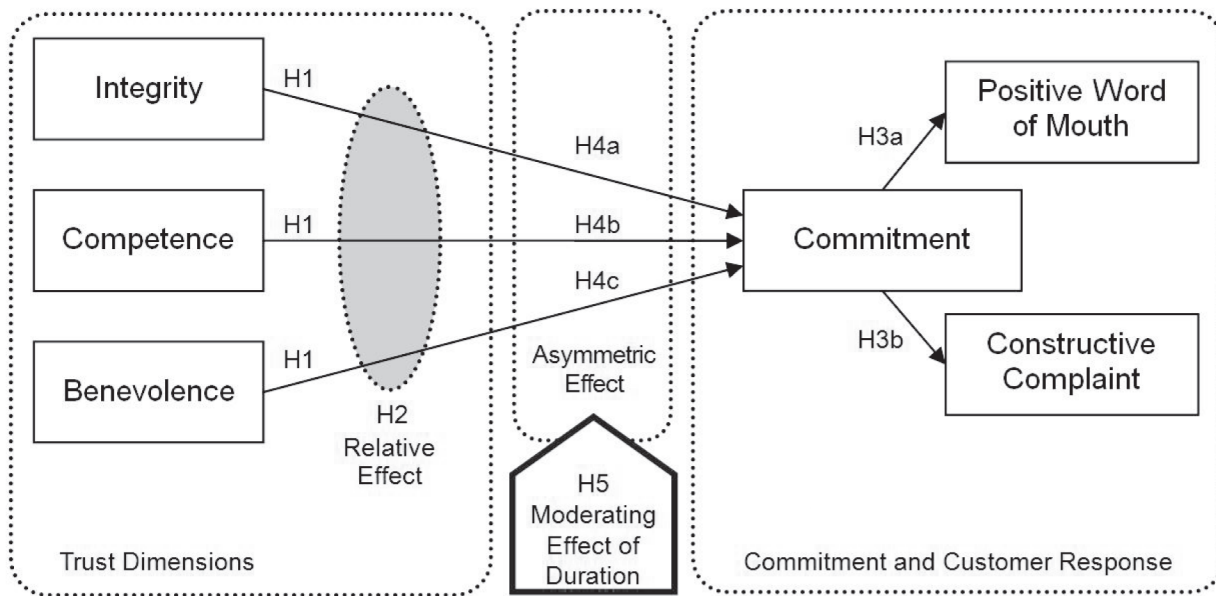
*Integrity*: Integrity refers to the trustor's perception that the trustee adheres to a common set of principles that the trustor finds acceptable (Mayer *et al*., 1995). In other words, the trustor's perception of the trustee's integrity is related to a set of common principles between trustee and trustor (McFall, 1987). These common principles include consistency of past actions, credible communications, a strong sense of justice, and congruent actions with the trustee's words (Mayer *et al*., 1995).

Integrity influences overall trust since it allows prediction of future events, especially under high uncertainty (Doney and Cannon, 1997). Studies have identified integrity as having a meaning similar to such concepts as value congruence (Sitkin and Roth, 1993), consistency (Butler, 1991; Butler and Cantrell, 1984), character (Gabarro, 1978), and openness/congruity (Hart *et al*., 1986).

*Competence*: Competence is defined as a group of skills and characteristics that enable a party to have influence within some specific domain (Mayer *et al*., 1995). Some researchers have argued that the trustor's perception of the trustee's competence is a prerequisite for the viability of repeated transactions (Sako, 1992). The concept of competence is task and issue-specific; competence is not an overall characteristic of a trustee. Rather, competence comes from knowledge (Butler, 1991; Butler and Cantrell, 1984; Lieberman, 1981; Rosen and Jerdee, 1977), capability (Cook and Wall, 1980; Jones *et al*., 1975; Sitkin and Roth, 1993), and expertise (Giffin, 1967; Bartol and Srinivastava, 2002).

*Benevolence*: Benevolence refers to the extent to which one party believes that a second party has intentions and motives beneficial to the first party (Ganesan 1994). At the center of benevolence is one firm's willingness to help the other (Gao and Brown, 1997). Examples of benevolence include provision of support, expression of consideration for the exchange partner's welfare, restraint of self-serving opportunism, and willingness to assume fiduciary responsibilities (cf. Atuahene-Gima and Li, 2002; Sirdeshmukh *et al*., 2002). A benevolent trustee shows consideration and sensitivity to the needs and interests of the trustor, acting in a way that protects these interests, and refrains from opportunistic

**FIGURE 1**
The Conceptual Model



behaviors (Atuahene-Gima and Li, 2002). In this study, we define a trustee's benevolence toward a trustor as the trustee's extra-contractual helping behavior that enhances the well-being of the trustor.

## THE CONCEPTUAL MODEL

The conceptual model of our study, *Figure 1*, posits the effects of trust dimensions on relationship commitment, the symmetry between the enhancement effects vs. the depletion effects on relationship commitment, and the moderation effect of relationship duration.

### The Effects of Trust Dimensions on Commitment

Studies have confirmed a positive relationship between trust and commitment (e.g., Morgan and Hunt, 1994). Although several studies have identified the relative effects of trust dimensions on overall trust (Bigley and Pearce, 1998; Mayer *et al.*, 1995; Sirdeshmukh *et al.*, 2002), we still have a limited understanding of the relative efficacy of each trust dimension on relationship commitment.

Relationship commitment is defined as a belief that an ongoing relationship with a partner is so important as to warrant maximum efforts to maintain it (Morgan and Hunt, 1994). That is, commitment to a relationship is defined as one firm's intention to continue its relationship with another (Anderson and Weitz, 1989).

*Integrity and Commitment*: Firms develop trust to gain commitment from customers (Doney and Cannon, 1997; Morgan and Hunt, 1994). Integrity is an essential dimension of trust, and it reflects fulfillment of written and spoken promises (Ganesan, 1994). Integrity fosters overall trust since it allows exchange partners to predict future behaviors under uncertain environments (Doney and Cannon, 1997).

Integrity allows exchange partners to predict future events and to protect one another from the dangers of opportunistic behavior. By reducing future uncertainties through ethical and honest

behaviors, integrity fosters commitment among exchange partners (Iven, 2004; Kaufmann and Stern, 1988). Studies have found that integrity of an exchange partner fosters the other party's commitment to the relationship (Coote *et al.*, 2003; Simon, 1999; Sonnenberg, 1994).

*Competence and Commitment*: The second dimension of trust is competency. Competence is based on the expertise and reliability of the transaction partner (Moorman *et al.*, 1992; Lindskold, 1978). Competence allows exchange partners to expect consistent levels of performance. Competence of an exchange partner enhances the other party's commitment to the relationship since it reduces variability in output and reduces transactional costs (e.g., Doney and Cannon, 1997; Ganesan, 1994).

Studies have determined that competence leads to a customer's willingness to repurchase and to be loyal (Wetzels *et al.*, 1998; Sako, 1992). In addition, competence-based trust increases long-term orientation of exchange partners because it reduces transaction costs and the risk of poor performance in the future (Ganesan 1994).

*Benevolence and Commitment*: Benevolence refers to helping behaviors beyond the call of duty for the well-being of exchange partners (Lee *et al.*, 2004). This study posits that benevolence increases commitment because benevolence communicates caring motives and goodwill to exchange partners by providing care and favors (Doney and Cannon, 1997), reducing transaction costs (Green, 2003), and enhancing relationship performance (Lee *et al.*, 2004). Based on the discussion above, we propose the following:

H1: An exchange partner's perception of integrity, competence, and benevolence has a positive influence on relationship commitment.

### Relative Efficacy of Trust Dimensions on Commitment

Which trust dimension has the strongest effect in forming relationship commitment? This study posits that integrity has the strongest impact on relationship commitment, followed by

competence and benevolence. This is because integrity allows exchange partners to predict future behaviors that facilitate ongoing transactions (Sako, 1992; Mayer *et al.*, 1995). Exchange partners with integrity keep their promises and maintain high levels of ethical standards. Ethical behavior is a necessary condition for any successful business relationship. Integrity allows a firm to predict future actions of exchange partners, especially under high uncertainty (Doney and Cannon, 1997).

Competence affects relationship commitment because high performance resulting from competence motivates a firm to continue the relationship. Competence also increases relationship commitment by providing benefits to the exchange partners. Competence-based commitment is largely based on a calculative process in that it is based on the costs and benefits of remaining in the relationship. Competence provides high performance while reducing transaction costs.

Competence without integrity, however, can have detrimental effects on the relationship, such as introducing opportunistic behaviors. One can argue that loosing integrity can have a devastating blow on relationship commitment regardless of past performance. Thus, we posit that integrity has a more direct and immediate impact on commitment than competence does.

Benevolence has the weakest impact on relationship commitment as it increases commitment by communicating the benevolent party's underlying intentions. Benevolence is a helping behavior and it motivates firms to work closely, thereby increasing relationship performance (Lee *et al.*, 2004). Yet, one can argue that benevolence is voluntary in nature and plays a supplementary role for a long-term relationship. With integrity and high performance, benevolence has only a marginal effect on relationship commitment. Benevolence is not a required condition for a long-term relationship, and the influence of benevolence on commitment is situation specific (Sako, 1992). Based on this discussion, we propose the following:

H2: An exchange partner's integrity has the strongest influence on relationship commitment, followed by competence and benevolence.

### The Effects of Commitment on Positive Word of Mouth and Constructive Complaints

Commitment to a relationship reflects a customer's intention to continue the relationship with a firm (Gilliland and Bello, 2002). Affective commitment reflects a commitment based on identification and involvement with the exchange partner, while calculative commitment refers to commitment based on the costs and benefits of remaining committed (Gilliland and Bello, 2002; Lee *et al.*, 2004). When exchange partners are committed to one another, they are willing to cooperate, proactively share information, be flexible, and engage in referral behaviors (Mangold *et al.*, 1999). Commitment will lead exchange partners to improved efficiency and profitability.

This study posits that a customer's commitment has a positive influence on his or her positive word of mouth. When customers are committed to a relationship, they tend to have a favorable attitude toward the firm, which facilitates positive word of mouth (Brown *et al.*, 2005; Verhoef *et al.*, 2002). Positive word of mouth is motivated by the need for self-consistency and self-esteem. Creating negative word of mouth when one has a positive attitude toward a firm represents self-denial, which results in cognitive dissonance within the individual. Studies have found that a customer's commitment indeed has a positive influence on that customer's positive word of mouth (Bettencourt, 1997; Harrison-Walker, 2001).

Based on the above discussion, we propose the following:

H3a: Customer's commitment has a positive influence on the customer's positive word of mouth.

Customers who are unsatisfied with products or services can quit their relationships with the unsatisfactory firms. Alternatively, customers can express their dissatisfaction to the firms (Kirpalani, 2004; Hirschman, 1970). Receiving constructive complaints, defined as customers' expressions of dissatisfaction, is important for a firm's service recovery strategies.

This study posits that when customers are committed to a relationship with a firm, they tend to express constructive complaints. If customers are not committed to a relationship, they simply quit the relationship over dissatisfying incidents. However, when customers are committed to a relationship, they provide constructive complaints to the firm because they share the feeling of identification with the firm and are involved with the firm (Bhattacharya *et al.*, 1995; Schappe, 1998). Based on this discussion, we propose the following:

H3b: Customer's commitment has a positive influence on the customer's expression of constructive complaints.

### Symmetry of the Effects of Trust Dimensions on Commitment

Several studies have proposed that trust and distrust may have independent and asymmetric influences on commitment (Singh and Sirdeshmukh, 2000; Sirdeshmukh *et al.*, 2002). That is, distrust does not necessarily mean a low level of trust (Sitkin and Roth, 1993). One can have a high level of trust and a high level of distrust at the same time.

Regarding the effects of trust dimensions on commitment, researchers have not determined whether they are symmetric or asymmetric. That is, will a particular amount of increase of trust dimensions have the same effect on relationship commitment as an identical amount of decrease in trust dimensions? We argue that the effects of trust dimensions on commitment will be asymmetric in that one unit increase in trust and one unit decrease in trust may have different effects on commitment.

According to Herzberg's two factor theory (1966), the three trust dimensions can be interpreted as hygiene factors and motivator factors. Hygiene factors are considered to be more basic and extrinsic; they are "must have" factors. Customers are very sensitive to hygiene factors when a firm underperforms them. One can argue that a hygiene factor has an asymmetric effect for poor performance since customers are more sensitive to negative performances.

Motivating factors are considered to be more situation-specific and intrinsic; they are "good to have" factors (Rattanawicha and Esichaikul, 2005). Since motivating factors are considered as good to have, one can argue that customers are less likely to be sensitive to motivating factors when the firm underperforms on them. A motivating factor tends to generate an asymmetrically positive effect for good performance since it is more sensitive to positive performance.

We argue that integrity is a hygiene factor since it is a basic, must have factor for any business relationship (Agustin and Singh, 2005). We posit that a decrease in integrity has a greatly negative influence on commitment, while an increase in integrity does not necessarily increase commitment significantly. That is, we posit that as integrity increases, commitment also increases, but at a decreasing rate. The effect of integrity on commitment increases to a certain threshold and the effect curve becomes flat after that threshold.

We argue that benevolence is a motivating factor, which provides customers with additional positive feelings toward the firm. An increase in benevolence allows exchange partners to better understand each other's caring intentions. Firms appreciate benevolence of their exchange partners increasingly as benevolence is reciprocally exchanged. Therefore, we argue that as benevolence in a relationship increases, relationship commitment also increases, but at an increasing rate. This is because understanding of an exchange partner's caring intention enhances the level of benevolence.

Competence, we argue, is both a motivating factor and a hygiene factor. An increase in competence reflects an increase in relational benefits, while a decrease in competence reflects a decrease in relational benefits or an increase in costs. Therefore, we postulate the effect of competence on relationship commitment to be linear and symmetric.

Based on this discussion, we propose the following:

H4: Trust dimensions have different effect symmetry on commitment.

H4a: An exchange partner's integrity will have a negatively asymmetric effect on commitment.

H4b: An exchange partner's competence will have a symmetric effect on commitment.

H4c: An exchange partner's benevolence will have a positively asymmetric effect on commitment.

**The Moderation Effect of Duration**

We posit that the symmetry effects of the relationship between trust dimensions and commitment are moderated by relationship duration. As stated previously, integrity is a hygiene factor and it is negatively asymmetric. The importance of integrity remains the same regardless of the relationship duration since it is considered as a "must have" factor. Thus one can argue that integrity's effect on commitment is negatively asymmetric regardless of the relationship duration.

Competence, as discussed previously, has the characteristics of both a motivator factor and a hygiene factor. As a relationship evolves over time, however, competence tends to be taken for granted and becomes a hygiene factor. Exchange partners come to expect a certain level of performance and competency becomes a necessary condition for a long-term relationship. Thus, one can argue that as the relationship duration increases, competency's effect on commitment becomes negatively asymmetric. That is, competency becomes a hygiene factor as the relationship matures (cf. Tang, 1993).

Benevolence, we argue, is a motivating factor regardless of the relationship duration. This is because voluntary helping behavior beyond the call of duty is highly appreciated as a motivating factor regardless of the length of the relationship.

Based on this discussion, we propose the following:

H5: The effect symmetry of trust dimensions on commitment is moderated by the relationship duration.

H5a: An exchange partner's integrity will have a negatively asymmetric effect on commitment regardless of the relationship duration.

H5b: An exchange partner's competence will have a symmetric effect on commitment in a new relationship. Competence will have a negatively asymmetric effect on commitment in a mature relationship.

H5c: An exchange partner's benevolence will have a positively asymmetric effect on commitment regardless of the relationship duration.

## METHOD

### Sample

In order to test the model in this study, we conducted a survey with customers of a media services firm. We selected this research context because development of customer trust and commitment is crucial for long-term success in the media services industry. Data were gathered from the respondents who were subscribing to a major newspaper. The sample consisted of 989 respondents after random sampling and phone survey. In order to examine the non-response bias, we compared demographic characteristics of respondents with the population, and found no significant differences between the two groups. The respondents were aged 39.73 years, on average; 504 were men and 485 were women. On average, respondents had been receiving the media services for 36.6 months. Thirty-nine percent of the respondents were college graduates, and the average monthly income of respondents was $3,045.

### Measurement Model

We measured our constructs using a structured questionnaire. To ensure content validity of the measures, we first reviewed the relevant academic literature. The measurement items were based on previous measures of trust (Mayer *et al.*, 1995; Moorman *et al.*, 1992; Leik and Leik, 1977; Verhoef *et al.*, 2002; Kolarska and Aldrich, 1980). We then conducted in-depth interviews with eight industry experts and managers to better understand the meaning and dimensions of consumers' trust toward the media services firm.

Integrity is the belief that the firm adheres to a set of principles acceptable to readers, such as honesty and keeping promises (Mayer *et al.*, 1995). Competence is the set of skills, competencies, and characteristics of the firm (Mayer *et al.*, 1995). Benevolence reflects the extent to which the firm is believed to do good to customers (Mayer *et al.*, 1995).

Commitment is defined as an enduring desire to maintain a valued relationship (Moorman *et al.*, 1992) and a customer's unwillingness to consider partners other than those in the current relationship (Leik and Leik, 1977). Positive word of mouth reflects the extent to which customers advise other customers to do business with the focal newspaper (Verhoef *et al.*, 2002). Constructive complaint refers to consumers' behavioral intentions to express their dissatisfaction to authorities, either directly or indirectly, without termination of subscription (Kolarska and Aldrich, 1980).

The results of the reliability and validity tests are summarized in Table 1. We purified items based on item-to-total correlations. We then ran a cross construct confirmatory factor analysis with the variables in a model. Eight items were eliminated based on an analysis of standardized residuals and modification indices. The results of the CFA indicated a good fit to the data ($\chi^2_{(120)}$=419.23, RMSEA=.049, NFI=.93, CFI=.95, RMR=.03, GFI=.96) (See Table 1). The CFA results indicate that all items are significantly loaded to their hypothesized factors without high cross loadings, indicating the convergent validity of measurement items.

Discriminant validity was tested in the following ways. First, we examined the confidence interval of latent factor correlations and found that none of the 95 percent confidence intervals of the latent factor correlation matrix contained a value of 1.0. Second, we conducted a series of Chi-square difference tests for each pair of constructs between the constrained model and the unconstrained model. In all cases, the unconstrained model provided a significantly better fit to the data than did the constrained model ($p$<.01). Third, the phi matrix indicated that the variance of underlying constructs was higher than the correlations between constructs. Furthermore, the construct reliability was above the .60 cutoff for all measures, and the composite reliability was above the .50 cutoff for all

**TABLE 1**
Reliability and Validity Assessment of the Theoretical Construct Measures

| Construct | Lambda Range | Alpha | CR | AVE |
|-----------|-------------|-------|-----|-----|
| Integrity | .63-.73 | .70 | .70 | .44 |

The reports of this paper are balanced.
The articles of this paper reflect various viewpoints.
In spite of changing the situation, the paper maintains consistent voice.

| | | | | |
|-----------|-------------|-------|-----|-----|
| Competence | .59-.77 | .64 | .66 | .40 |

The paper's contents are professional.
The articles of this paper are well-written and contain deep analysis.
The paper often contains in-depth reporting on social issues.

| | | | | |
|-----------|-------------|-------|-----|-----|
| Benevolence | .54-.71 | .70 | .71 | .46 |

The paper provides me a lot of useful information for daily life.
The paper provides me interesting articles.
The paper provides me with abundant reading materials.

| | | | | |
|-----------|-------------|-------|-----|-----|
| Commitment | .57-.78 | .72 | .72 | .47 |

I will continue to subscribe to this newspaper.
Even if other newspaper companies give premiums for subscription, I will not switch to another newspaper.
I am proud of being a reader of this newspaper.

| | | | | |
|-----------|-------------|-------|-----|-----|
| Positive WOM | .79-.90 | .87 | .87 | .70 |

When people ask me to recommend a daily newspaper, I usually recommend this one.
I recommend this newspaper to others whenever I can.
I usually recommend this newspaper to people who are subscribed to other newspapers.

| | | | | |
|-----------|-------------|-------|-----|-----|
| Constructive Complaint | .56-.82 | .74 | .75 | .51 |

Even if I am unsatisfied I keep subscribing to the newspaper. However, I make suggestions to the newspaper.
Although I do not quit subscribing to the newspaper, I complain about the newspaper to people around me.
Although I keep subscribing to the newspaper, I express my complaints on the Internet.

$\chi^2_{(120)}$=419.23, RMSEA=.049, NFI=.93, CFI=.95, RMR=.03, GFI=.96

**TABLE 2**
Correlation Matrix

| | Mean | 1 | 2 | 3 | 4 | 5 | 6 |
|---|------|-----|-----|-----|-----|-----|-----|
| 1. Integrity | 3.58 | 1.00 | | | | | |
| 2. Competence | 3.71 | .65 | 1.00 | | | | |
| 3. Benevolence | 3.58 | .64 | .62 | 1.00 | | | |
| 4. Commitment | 3.32 | .48 | .56 | .42 | 1.00 | | |

| 6. Constructive complaints | 2.57 | .11 | .14 | .18 | .19 | .40 | 1.00 |

measures. All these results support the convergent and discriminant validity of the measures used in the study.

**Hypothesis Testing**

In order to test the hypotheses, we first estimated the direct effects of three dimensions of trust on commitment. Then, we examined the asymmetric effects of these trust dimensions on commitment. We also identified the consequences of commitment. As we needed to estimate the multiple regression equations simultaneously, we performed the following path analyses.

$$CMT= \beta_0 + \beta_1 \cdot INT + \beta_2 \cdot COMP + \beta_3 \cdot BENE + \beta_4 \cdot D \cdot INT + \beta_5 \cdot D \cdot COMP + \beta_6 \cdot D \cdot BENE + \varepsilon_1$$

$$WOM= \beta_{0w} + \beta_{1w} \cdot CMT + \varepsilon_2$$

## TABLE 3
### Estimated Coefficients for Research Model: Total Set[a]

| Path | | | Coefficient (*t*-value) | $\Delta$ for Positive Performance (*t*-value) |
|---|---|---|---|---|
| Integrity | $\rightarrow$ | Commitment | **.43(7.39)** | **-.21 (-3.65)** |
| Competence | $\rightarrow$ | Commitment | **.21(3.85)** | -.02 (-.40) |
| Benevolence | $\rightarrow$ | Commitment | **.09(2.58)** | .05 (1.58) |
| Commitment | $\rightarrow$ | Positive Word of Mouth | **.44(13.38)** | |
| Commitment | $\rightarrow$ | Constructive Complaint | **.13(3.66)** | |

$\chi^2$ (*p*-value)=123.97 (.00), *df*=13, GFI=.97, CFI=.90, NFI=.90, RMR= .07

[a]Significant coefficients (*t*>2) are in bold.

$$CPN= \beta_{0c} + \beta_{1c} \cdot CMT + \varepsilon_3$$

CMT=commitment; INT=integrity; COMP=competence; BENE=benevolence; D=dummy variable; WOM=positive word of mouth; CPN=constructive complaint

We then estimated the asymmetric effects of trust dimensions on commitment. Following Sirdeahmukh *et al.* (2002), we introduced dummy variables in the equations. The dummy variable for each trust dimension was coded 1 when the trust dimension score was above the mean score. The dummy variable for each trust dimension was coded 0 when the score was below the mean score. In this way, the estimated coefficients for dummy variables indicated the incremental effect of the corresponding trust dimension on commitment at a positive performance phase. When trust dimensions had asymmetric effects on commitment, the corresponding coefficient of the dummy variable was statistically significant (Cohen and Cohen, 1983; Sirdeshmukh *et al.*, 2002).

Table 3 shows the results of coefficients and fit statistics. The results indicate a good fit to the data ($\chi^2_{(13)}$=123.97, *p*-value=.00; GFI=.97; CFI=.90; NFI=.90; RMR= .07).

H1 posits that the trust dimensions have a positive influence on commitment. We found that all three dimensions of trust indeed have significant effects on commitment. That is, customer commitment is influenced significantly by integrity ($\beta_1$=.43, *p*<.05), competence ($\beta_2$=.21, p<.05), and benevolence ($\beta_3$=.09, p<.05). The results provide support for H1.

H2 deals with the relative efficacy of trust dimensions on relationship commitment. We posit that integrity has the strongest influence on commitment, followed by competence, and then benevolence. In order to find the relative efficacy of trust dimensions on commitment, a series of Chi-square difference tests were conducted. In a constrained model, the beta coefficient from integrity to commitment was set to be equal to the beta coefficient from competence to commitment. The results indicate that the Chi-square of the constrained model ($\chi^2_{(14)}$=128.48) is significantly greater than that of the unconstrained model ($\chi^2_{(13)}$=123.97). The results indicate that integrity has a stronger effect on commitment than competence does ($\Delta\chi^2_{(1)}$=4.51, *p*<.01).

The results of a series of Chi-square difference tests summarized in Table 4 indicate that integrity has the strongest effect on commitment, followed by competence and benevolence,

respectively. The results provide support for H2.

H3 states that commitment has a significant influence on positive word of mouth and constructive complaints. The results indicate that commitment indeed has a significant influence on positive word of mouth ($\beta_{1w}$=.44, *p*<.05) and on constructive complaints ($\beta_{1c}$=.13, p<.05), providing support for H3a and H3b.

H4 presents hypotheses on the symmetry effect that each trust dimension has on commitment. A trust dimension is considered symmetric when the dummy variable for the dimension is not significant. When the dummy variable for a trust dimension is not significant, the slope representing the effect of the trust dimension on commitment is equal, indicating a symmetric effect.

A trust dimension is asymmetric when the dummy variable for the dimension is significant. This significant dummy variable will adjust the slope representing the effect of the trust dimension on relationship commitment. That is, the effect of the trust dimension on relationship commitment when the trust dimension is above its mean score is different from the effect of the trust on relationship commitment when the trust dimension score is below the mean.

We found that integrity is the only dimension that has a negatively asymmetric effect ($\beta_4$=-.21, *p*<.05). We found a symmetric effect for the relationship between competence and commitment ($\beta_4$=-.02, *p*>.05) and for the relationship between benevolence and commitment ($\beta_4$=.05, *p*>.05). These results provide support for H4a and H4b, but not for H4c.

In order to test the moderation effect of relationship duration on the effect symmetry, we divided the respondents into two groups based on relationship duration. The long-term relationship (over two years) group was comprised of 558 respondents, and 431 respondents were included in the short-term relationship (less than two years) group. The results of two group path analysis indicate that the paths are significantly different ($\Delta\chi^2$=12.2, *p*<.05, *df*=5).

Table 5 shows that although integrity and benevolence have nearly the same impact on commitment in both groups, the path coefficient of competence in the long-term relationship group ($\beta$=.40, *p*<.05) is stronger than that of the short-term relationship group ($\beta$=.24, *p*<.05).

H5a posits that an exchange partner's integrity will have a negatively asymmetric effect on commitment regardless of the relationship duration. The results indicate that the effect of integrity on commitment was negatively asymmetric (hygiene factor) both in short-term and long-term relationships. Therefore, relationship

**TABLE 4**
Relative Effect Power of Trust Dimensions on Commitment

| Model | Constraint | $\chi^2(df)$ | $\Delta\chi^2(df)$ |
|---|---|---|---|

| Commitment | $\rightarrow$ | Positive Word of Mouth | **.50 (13.32)** | | | **.50 (13.32)** |
| Commitment | $\rightarrow$ | Constructive Complain | **.17 (4.30)** | | | **.17 (4.30)** |

$\Delta\chi^2$(*p*-value)=184.30 (.00), *df*=31, GFI=.97, CFI=.96, NFI=.96, RMR= .06

[a]Significant coefficients (*t*>2) are in bold. Significant differences between groups (*p*<.05) are in italic.

duration does not moderate the relationship between integrity and commitment. These results provide support for H5a.

H5b states that an exchange partner's competence will have a symmetric effect on commitment in the younger relationship and a negatively asymmetric effect on commitment in the mature relationship. The results indicate that the effect of competence on commitment is symmetric in the short-term relationship, but it becomes negatively asymmetric in the long-term relationship. This implies that as the relationship evolves over time, competence is considered a given and treated as a hygiene factor. These results provide support for H5b. H5c states that an exchange partner's benevolence will have a positively asymmetric effect on commitment regardless of the relationship duration. The results indicate that the effect of benevolence on commitment is symmetric in the short-term relationship, but it becomes positively asymmetric in the long-term relationship. Therefore, the results fail to support H5c.

## DISCUSSION

In this paper, we tested the effects of trust dimensions on commitment. Previous researchers have found that all three trust dimensions have a positive influence on commitment. Among them, integrity has the strongest influence on commitment, followed by competence and benevolence, respectively. We also found that integrity has a negatively asymmetric effect on commitment regardless of the relationship duration. Competence has a symmetric effect on commitment in the early stage of a relationship, but its effect on commitment becomes negatively asymmetric in the later

stage of the relationship. Benevolence has a symmetric effect in the early stage of a relationship, but its effect becomes positively asymmetric in the later stage of the relationship. Commitment is found to have a positive influence on positive word of mouth and on constructive complaints.

**Managerial Implications**

The findings of this study provide managers with the following managerial implications. *First*, while all three dimensions of trust have a significant influence on commitment, this study's findings suggest that managers need to put a higher priority on maintaining and enhancing integrity because this trust dimension has the strongest influence on commitment. The resulting commitment will lead to positive word of mouth and constructive complaints.

*Second*, this study's findings indicate that integrity is a hygiene factor regardless of the relationship duration, another reason for mangers to focus on this trust dimension. Customers tend to be more sensitive to integrity as a hygiene factor than to motivating factors. It means that managers should put higher priorities on integrity to enhance relationship commitment.

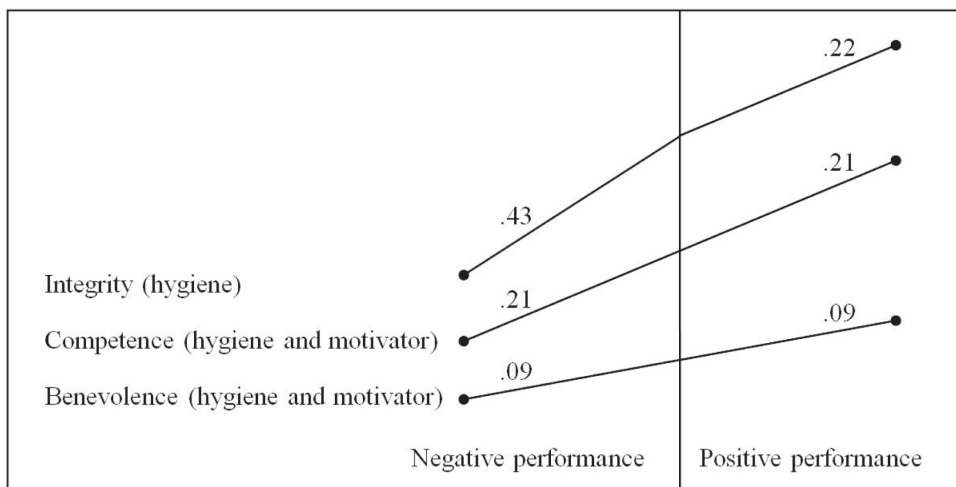
*Third*, the study's findings suggest that competence has a symmetric effect on commitment in the early stage of a relationship, while its effect becomes negatively asymmetric in the later stage of a relationship. This implies that as the relationship evolves, competence is considered a given and regarded as a hygiene factor. Competence is a necessary, but not a sufficient, condition for commitment in the later stage of the relationship.

**TABLE 6**
Hygiene and Motivator Factors of Trust Dimensions on Commitment: Total and Two Different Duration Groups[a]

|  | Total | Short-term Duration | Long-term Duration |
|---|---|---|---|
| Integrity | .43/.22(hygiene) | .40/.36(hygiene) | .40/.34(hygiene) |
| Competence | .21/.21(hygiene/motivator) | .24/.24(hygiene/motivator) | .40/.36(hygiene) |
| Benevolence | .09/.09(hygiene/motivator) | .09/.09(hygiene/motivator) | .09/.13(motivator) |

[a]The former numbers are coefficients of negative performance and the latter numbers are calculated coefficients of positive performance.

**FIGURE 2**
The Asymmetric Effect of Trust Dimensions on Commitment



*Fourth*, benevolence has a symmetric effect on commitment in the early stage of the relationship, but its impact becomes positively asymmetric in the mature stage of the relationship. This implies that the role of benevolence on commitment grows to be more important as it becomes a motivating factor in the later stage of the relationship. We suggest mangers focus on benevolence to improve customer commitment in the later stage of a relationship.

**Limitations and Future Research Directions**

Despite its merits, this study has several limitations. *First*, the study has focused on customers who subscribe to a media service. To generalize this study's findings, it is necessary to examine a thorough set of replications in different samples and product contexts.

*Second*, this study treated trust dimensions as exogenous variables. Future studies should identify the antecedents to each trust dimension. While many studies have focused on the antecedents of overall trust, antecedents of individual trust dimensions in a business-to-customer context are yet to be determined (Morgan and Hunt, 1994; Ganesan, 1994; Doney and Cannon, 1997).

*Third*, this study focused on overall commitment as a consequence of trust dimensions. Previous studies have identified different types of commitment. For example, Allen and Meyer

(1990) presented the affective, continuous, and normative components of organizational commitment. Geyskens *et al.* (1996) classified commitment into affective commitment and calculative commitment. Future studies can extend the conceptual model of this study by incorporating these various types of commitments.

*Fourth*, the findings of this study are based on cross-sectional data with a survey method. Future studies using longitudinal data will provide a deeper level of understanding on the changes in the roles among the three trust dimensions (cf. Mowday *et al.*, 1982). Future studies using multiple methods can add confidence on the findings of this study.

*Fifth*, the development of proper tools for measurement is one of the essential tasks of relationship marketing (Sirdeshmukh *et al.*, 2002). Developing valid measurement items of trust dimensions in various product and industry contexts may provide a comprehensive measurement adoptable in various contexts. The measurement items of trust need further refinements in the contexts of various product and services.

Despite the above limitations, this study represents an important step in the identification of the relationship between trust dimensions and commitment. It is hoped that future studies will be directed toward identifying the conditions in which specific trust dimensions become more important than other trust dimensions.

# Consumers Faced with Telephone Selling: Metacognition, Resistance and Strategies

Dominique Roux, IRG-University Paris, France[1]

## ABSTRACT

This research aims at deepening knowledge of resistance phenomena by exploring individuals' perception of telephone selling. Analysis of the corpus constituted by written account of telesales episodes, followed by long, semi-structured interviews with 24 respondents, enriches four levels of understanding: respondents' cognition of telesales and their pre-existing schemas when faced by this type of influence; the way in which their metacognition is constructed over time; the strategies they adopt and the levels of resistance these reveal; and the individual and situational factors that possibly moderate their reactions.

## INTRODUCTION

Consumer resistance has been the subject of numerous studies since the pioneering work of Peñaloza and Price (1993). Some of these have explored the collective aspects of resistance through protest organizations and groups committed to oppositional activities or ways of bypassing the market (Friedman 1999; Giesler 2006; Hemetsberger 2006). Others have endeavored to look at individual manifestations of resistance from the standpoint of the rejection of codes and brands (Duke 2002; Moisio and Askegaard 2002; Thompson and Haytko 2002; Klein 1999; Holt 2002; Dalli, Gistri, and Romani 2005), of anti-consumption and voluntary simplicity (Dobscha and Ozanne 2001; Shaw and Newholm 2002; Shepherd 2002; Zavestoski 2002) or of various persuasion devices such as advertising (Rumbo 2002) and sales techniques (Kirmani and Campbell 2004).

Despite the need emphasized by Holt (2002) to situate understanding of resistance mechanisms on an interactionist–rather than simply critical or postmodern–basis, few studies succeed in highlighting the linkage between consumers' reactions and the motives giving rise to them. Many papers emphasize the static finding of consumers' dissatisfaction, withdrawal and opposition without necessarily grasping what provokes these or what processes have resulted in them. At the theoretical level, studies of consumer resistance have provided many more descriptive accounts than frameworks of analysis suitable for explaining the phenomenon. In this respect Friestad and Wright's (1994) Persuasion Knowledge Model (PKM) offers interesting perspectives for understanding how individuals construct a representational system of the market and its influencing mechanisms. From this standpoint, analysis of individuals' perception of telephone selling provides a relevant context for understanding how the representations they construct of this type of enticement form the basis of their resistance mechanisms and of the strategies they develop. Adopting the perspective offered by Kirmani and Campbell (2004) on the various kinds of responses to sales personnel's influence attempts, this approach aims at deepening knowledge of resistance phenomena by selecting situations particularly favorable to their emergence. However, in contrast to the conditions studied by these authors–in which respondents initiate the contact with an influence structure –, they are subjected here to a relation that they have not chosen in terms of either its timing or its content. This difference, which is likely to

accentuate potential resistance reactions, enables us to observe how, in the interaction, individuals interpret the influence attempt and what processes follow in terms of coping strategies. Further to the work carried out by the above-mentioned authors, the present study aims to reveal individuals' pre-existing cognitive systems and to show how these are directly linked to the forms of response adopted.

Analysis of the corpus constituted by written account of telesales episodes, followed by long, semi-structured interviews with 24 respondents, ultimately enriches four levels of understanding: respondents' cognition of telesales and their pre-existing schemas when faced by this type of influence; the way in which their metacognition is constructed over time; the strategies they adopt and the levels of resistance these reveal; and the individual and situational factors that possibly moderate their reactions. We discuss the implications of our findings and indicate avenues of future research on consumer resistance that these results suggest.

## CONCEPTUAL BACKGROUND

Approaching consumer resistance through "marketplace metacognition" opens up a significant line of research for understanding both its reactive nature and its construction over time (Friestad and Wright 1994; Wright 2002). These authors indeed show that consumers possess, to a greater or lesser extent, a set of beliefs about (1) their own mental states and processes–a metacognition (Matlin 1989) –, (2) general procedures of persuasion and influence, and (3) the expertise firms have in regard to these. Marketplace metacognition thus consists of awareness individuals have about persuasion techniques, their relevance and effectiveness in convincing them, and their own susceptibility to these tactics. Such cognitive schemas vary in extent and are linked to people's development. They depend on their environment, culture and what they have successively acquired in the course of social interactions in the private and market spheres. However, faced with these tactics, individuals try to remain effective in their coping, i.e. continue carrying out their physical and psychological activities independently of what the influencer is trying to obtain. From this perspective, consumer resistance can be analyzed as the implementation of particular coping strategies "for struggle, opposition or delaying tactics" (Fournier 1998), that aim at thwarting the influence attempt. This reaction is activated through the perception of elements incongruent with the individual's own orientations, which can be expressed in three registers–freedom of choice, autonomy in decisions and willingness to cooperate or not with a market partner (Roux 2007). According to Friestad and Wright (1994), such discordant notes can arise from the discrepancy between the individual's representations of the situation and the moral principles acquired in childhood, as well as behavior perceived as ethically acceptable when one views himself as an influencer.

Nevertheless, for an individual to resist the techniques used by firms, these must have previously been categorized as capable to acting upon him/her. In other words, persuasion attempts are likely to influence if a connection is established at a given moment between a situation and certain characteristics that will be noticed because their nature and effect are perceived. This particular form of awareness–which Friestad and Wright (1994) call "the change-of-meaning principle"–tends to displace, at a given moment, the attention given to the content of messages onto a broader perception

of influence mechanisms. Thus there enter into the consumer's resistance the knowledge he/she has both of influencing processes and of his/her own reaction and defense mechanisms against the tactics used. This vulnerability, which underlies the effectiveness of persuasion techniques, derives from decoding the processes deployed, as well as the emotional reaction they give rise to (Friestad and Wright 1994). In the course of time, the progressive and cumulative incorporation of cognition and felt emotions thus contributes to feeding pre-established operational schemas. The consumer becomes capable of mobilizing "tactic recognition" heuristics that enable him/her to evaluate influence situations, even in the absence of precise knowledge of the agent or the subject of the message (Friestad and Wright 1994). On this point, inference mechanisms play a key role in the construction of "marketplace metacognition": negative judgments about a firm's communications skills are liable unfavorably to contaminate other perceptions such as those of its relational capacity or the quality of its products and services. Moreover, the encoding processes of influencing mechanisms and devices lead consumers to acquire increasingly extended knowledge over time: it therefore seems essential to explore the way in which this categorization provokes adverse reaction states, according to the meanings that are attributed to them.

## RESEARCH METHODOLOGY

The exploration of representations of telephone selling thus called for a comprehensive approach, which was implemented through a two-stage program: first, the collection, from 24 respondents, of a series of written accounts of telesales experiences they were asked to recall; second, a semi-structured in-depth interview lasting about an hour on average, conducted at the latest a few days after receiving the account. Respecting the principle of purposive sampling and of information saturation, 24 diaries were collected from individuals who were regularly contacted by phone telesales operatives in relation to a variety of product categories–such as telephony, cable TV, insurance, tax reduction schemes, renewal of windows, and wine offers. Having agreed to participate in this study, respondents were instructed to write one or more telephone selling episodes they still recalled. They were asked to mention the aim of the call and what was being sold, and then to describe the conversation as they had experienced it. It was made clear, in as neutral a way as possible, that the purpose of the questioning had nothing to do with marketing or any connection with the telephone selling business, but was guided by research aiming at a better understanding of telephone dialogue situations.

The final composition of the sample consisted of a slightly higher proportion of men (13) than women (11), aged from 23 to 76, with an average age of 38. Overall they were in employment in tertiary sector professions, living in an urban environment and with completed secondary education at the minimum (Table 1). The sample displays the characteristic of being relatively young, professionally active, educated and city dwelling. The number of episodes provided by the respondents lay finally between 1 and 4, with a mean of 1.75 per individual, that is to say, 42 episodes for 24 respondents.

Although the data collection can show biases, it does offer two advantages relevant to this topic over a real-time journal system (Kirmani and Campbell 2004). Its drawbacks, first of all, are due to the fact of increasing the risk of a memory bias among respondents insofar as it is impossible to be sure of the accuracy and the exhaustiveness of the recollections recounted. It is therefore difficult to control the nature of the material collected and to be able to confirm, from outside, that the facts really occurred as recounted. Hence this method is unable to control situational differences

relating to episodes collected other than by relying on what respondents allege, which compromises the quality of the sampling. On the other hand, a major advantage is being able to collect, more than purely factual stories, the salient elements that respondents have reacted to and which are then liable to influence their future behavior. Indeed, the processes of elaborating a message occur not only during the persuasion attempt, but afterwards as well (Friestad and Wright 1994). As a consequence, the narration of one or more past episodes allows the recovery of "sedimented" information on representations of telephone selling. The interview then enables the strata to be reconstructed, thereby bringing to light certain processes through which the cognitive elaboration of individuals is progressively constructed. The second advantage is being able to reduce the risk of artifacts (Rosenthal and Rosnow 1997), whose importance and effects are rarely discussed. Indeed, overly structured and insufficiently "naturalistic" conditions for collecting information are liable to give rise to inferences and interpretations among the respondents. Influenced by the effort to ascertain and understand the motives for the study, they can then be led to modify their mental attitudes and evaluations of the situations proposed. When too much pressure is put on a respondent, the bias possibly prompted by a repeated and restrictive protocol on the part of the researcher can be a major problem (Boring 1969).

## FINDINGS

The written accounts of telesales experiences reveal a broadly similar narrative structure among the respondents. The narratives begin with a description of the object of the phone call and most often with their recollection of the telesales operator's opening words. Then follows a discursive section containing exchanges between them and the telesales operator as well as the repertoire of procedural knowledge and "ready to use" strategies that they mobilize according to the circumstances. Four themes structure the discourses in these episodes of influence: the updating of metacognition, its processes of construction, procedural knowledge and coping strategies which respondents use, and the situational and individual factors which moderate their resistance reactions and in which emotions play a large part.

### Marketplace metacognition in action

The accounts given of telesales episodes are articulated around a pre-existing categorization of the objectives, intentions and mechanisms underlying such techniques, that respondents have classified over time. Several informants said they immediately spotted attempts to influence them and described the "tactic recognition" heuristics used in this type of telephone approach (Friestad and Wright 1994): "I know right away when it's a sales call" [1, F, age 53], "nine times out of ten, it begins with 'Hello, Mrs. D.' but I already know they're trying to sell me something" [10, F, age 50], "I see straight through their strategy" [19, M, age 26].

The accounts are categorized around two types of judgment on telephone selling. Some, highly negative, focus on the technique itself and on three of its characteristics: its intrusive aspect, its impersonal nature, and its often-suspected dishonesty.

- Calls to the individual's home are perceived first of all as acts of invasion of one's personal territory (Goffman 1971): "apart from advertising, home is the only place one can escape this pressure to consume, so these calls disturb that peace" [18, F, age 33]; "they disturb you at home, always in the evening or during mealtimes" [16, M, age 23]. In certain cases, cold calling is even seen as an infraction of the codes of decent behavior and an intolerable breach of respect for the individual: "it's a real violation of one's private life, it

**TABLE 1**
Summary of respondents' characteristics

| Id | Age | Gender | Family situation, profession, educational level, residence | Type of products/business |
|---|---|---|---|---|
| 1 | 53 | F | Married, 3 children, medical secretary, technical diploma, affluent suburb | Health insurance |
| 2 | 23 | M | Cohabiting, no children, secondary, outdoors centre organizer, affluent suburb | Double glazing |

| 24 | 76 | F | Divorced, 1 child, retired nurse, poor suburb | Alarm systems |

bothers me hugely and I'd like to be able to stop it" [10, F, age 50].

- In addition, the impersonal nature of these methods is frequently emphasized. Most of all, respondents feel "chosen at random from data bases" [15, M, age 32] and as a result the products being offered are usually of no interest to them. The combination of selection perceived as random and the insistence on crossing the boundary of their privacy thus creates a particularly strong resistance to the feeling of being manipulated and reified: "The salesman doesn't know the person being called. He doesn't know your desires or your needs. He knows nothing about you. From my side, I don't see him either and I don't know who's calling me" [15, M, age 32]. The caller's tone of voice also contributes to this feeling of standardization and robotization of human relations: "I hate how they introduce themselves. It's impersonal, totally formatted. And if they're disturbing you, they just don't care, they go on asking their inevitable little questions" [6, F, age 33]; "I can't stand their mechanical, repetitive, stereotyped patter. I always get the impression they take me for a complete idiot. Can't they teach them how to speak normally? They're talking to human beings, after all! [24, F, age 76].
- The third theme reflects the fear of being trapped by an appealing offer, but one which necessarily has a snag: "They dazzle you with their offers, and in the end they're not so advantageous as all that… Or you find you can't cancel the contract afterwards" [19, M, age 26]. Doubt, mistrust, and the suspicion of dishonesty are the complaints often voiced in relation to these procedures: "The moment the salesman reaches you, he's out to rip you off" [11, M, age 51].

As well as the telesales technique, the salesman himself is subject to specific negative pre-established attitudes in terms of arguments he uses. While these vary according to the different products being promoted, recurrent features appear in terms of the way of operating, mainly in relation to the caller's insistence and lack of consideration for the respondent's time and requirements: "I get the feeling of harassment and that they are pushing us into a corner [18, F, age 33]; "it gets on my nerves, they really bug me, they never call at a convenient time and always tell you about things you don't need" [13, F, age 47].

Alongside the majority of fixed negative opinions of telephone selling are found some features that temper the severity of judgments made about these practices. Some respondents thus include in their evaluations the difficulties of doing the job and sympathy for the salesperson: "I know it's not much fun, a job like that, and it must be difficult" [2, M, age 23]; "at the end, I wish them all the best, because it's crappy work" [23, M, age 51]. Nevertheless, such considerations about the salesperson's activity do not necessarily lead them to change their attitudes in the actual situation, as was indicated by one of the respondents: "I can understand they've got a lousy job, but anyway, once I know they're tele-selling, I never buy anything" [4, M, age 28].

**Recursive construction of Marketplace metacognition**

While many respondents have pre-established representational schemas on telephone selling, some of them recount how these were constructed as the result of one or more interactions, thereby testifying to the recursivity of resistance phenomena. We give the example of a female respondent [22, F, age 44] who was contacted by a company selling windows:

*As I had a window in poor condition and was called up on the phone in this area, I wanted to give it a try. I had already inquired at a specialist shop. The salesman gave me a sales pitch for half an hour about the quality of his product, then on the basis of the measurements I gave him, he offered to call me back a while later. At that point, he quoted me a price, which I considered to be excessive. My problem in fact was that I had French window with a rounded top that allowed water to seep into the room at the base. At my outright refusal to replace the window, he made a big fuss. He put me on hold, during which time he supposedly called his boss, who was willing to make a huge reduction, 50%, but I had to decide immediately. I refused to do this, and he gave me 24 hours to make up my mind. I confess that I very nearly accepted. In the meantime, I took the advice of a friend who backed me up on the idea that one should never take a decision under pressure to give a quick response… and I repaired the window myself. Since that occasion, I know immediately when someone is trying to sell me something and I always answer in the same way: "Thank you, but I'm not interested".*

The episode recounts a series of interactions in which the initial interest of the respondent was eroded by her perception of an excessive price, manipulated by a framing effect–the promised reduction by 50% –, as well as by the temporal pressure introduced by the salesman. These mechanisms appear to be the main determinants giving rise to resistance. This was then expressed through an evasive reaction, in particular because the financial advantage was offset by a temporal constraint. The respondent's recourse to external advice also played a determining role in reinforcing resistance. This provided a point of view outside the context of the interaction, which was able to resolve the internal conflict experienced by the respondent and to strengthen her initial reaction. The conclusion of the episode illustrates the "change-of-meaning principle" (Friestad and Wright 1994) insofar as it led to a lasting categorization of telesales events, all of which were subsequently perceived as attempts to influence and manipulate, and resulted in a systematic avoidance strategy.

The same construction mechanism of resistance attitudes is illustrated by another respondent [6, F, age 33] who dates her suspicion of telephone selling precisely to an episode that occurred some ten years previously with a company selling fitted kitchens. After being contacted for "having won a magnificent Hi-Fi unit through a prize draw", she remembers going to the shop with her husband to collect her prize. She was surprised, and later angry, to find that the Hi-Fi unit consisted of two shelves supported by four plastic feet "which collapsed under the weight of the television". On the other hand, she and her husband were perfectly well aware that their joint visit, expressly requested by the shop, had no other purpose than to try and sell them a new kitchen, which they had no need of at the time. These tactics, which she viewed as "dishonest and crude", gave her from then on a very low opinion of telephone selling. The coding of the perception of this respondent was organized around metaphorical images of fishing: "the hook of the free gift", "bait to catch people" which "had the sole aim of fishing for people by phone to bring them into the shop".

**Procedural knowledge and response strategies to telephone selling**

Recognition of an influence attempt leads to the deployment of relatively fixed response patterns, though these vary with the respondents. Few of them turned out to have adopted what Kirmani and Campbell (2004) call *seeker strategies*, which involve a reflec-

**TABLE 2**
List of situational factors affecting perceptions of TELESALES

| *Emotional situational factors* |
| Behaviour of the salesperson |
| Time of calling |
| Personal state of the prospect |

tive and collaborative reaction in the face of telesales pitches. In such cases, their main interest lies in obtaining information "about being able to compare offers and gaining time in seeking information" [17, M, age 24]. However, because the initiative for these calls does not come from the respondents, few of them mentioned that they coincided with their current needs, contrary to what Kirmani and Campbell (2004) observed when people go to stores.

Conversely, most respondents make use of *sentry strategies* (Kirmani and Campbell 2004), i.e. vigilant and not very cooperative reactions in relation to telesales. In comparison with the range of responses revealed by these authors in face-to-face interactions, different emphases become apparent here. The narrative sequences collected recount the conversational exchanges remembered by the respondents, in which, fairly briefly as a rule, the salesman's discursive procedures and their own fully prepared arguments follow on from one another. Indeed a number of respondents deploy pre-established strategies of the type "if... then", particularly recognizable in their accounts: "*when* I realize they're trying to sell me something, *I say* I'm not interested... *But* the guy insists... *Then* I *again* say I'm not interested" [3, F, age 25]. Others refer more explicitly to having recourse to "ripostes". The term is used no less than three times in the account of a female respondent [13, F, age 45], who presents herself as a kind of catalogue of replies deployed according to the arguments put forward: "With pseudo-companies which are supposed to save me money on my taxes, the *riposte* is to ask them to send me a brochure rather than an adviser; they reply, 'there are too many figures, it's best that someone advises you in a personal way', the *riposte* 'no, I know how to read and I don't have time to see anyone'. ...Or else, with telecom operators, I have another *riposte*. My husband works in France Telecom and I make a joke of it: 'If I change operator, my husband will divorce me.' They don't usually have any answer to that."

From the range of responses deployed by respondents, there emerges, after analysis, a gradation along a continuum of reactive intensity. The first stage is usually polite listening: "at first, I let them speak" [3, F, age 25], "I listen out of politeness to the beginning of the explanations" [5, M, age 24]. Then come avoidance tactics that enable the respondent to treat the caller respectfully and to preserve the "face of the other" (Goffman 1963): the delaying manoeuvres include asking for time to reflect: "I'll think about it, I've decided never to buy anything without thinking it over" [7, M, age 52] or lying about their identity or the information asked for by the salesman: "They often call my mother, but I pretend to be her so she won't be disturbed" or "when it's about tax matters, I always say I'm below the tax threshold, so that they'll leave me alone" [9, M, age 23].

At a third stage, and mainly if the salesman insists or does not realize that his approach is inopportune, respondents refuse to continue the conversation or resort to verbal aggression: "I asked him not to insist and to try someone else" [12, F, age 25], "He insisted and I cut him off to make him stop" [21, F, age 32]. These reactions are experienced by respondents as a direct response to the aggression they feel directed at them by telesales operators, even if what is recounted lies sometimes more in the register of intrusion or harassment: "More than anything, it's this insistence I can't stand. When I tell them 'no', it's as if they don't hear me. They just go on. I find this aggressive attitude very disturbing" [13, F, age 47]. Some of these reactions, as they are related, contain a certain degree of violence, which is probably more restrained and socially acceptable in reality than when subsequently reported in the course of the interview.

**Degree of resistance to telephone selling and factors affecting the reactions expressed**

Finally, analysis of telesales episodes brings out a continuum of resistant reactions (Fournier 1998), of which the weakest correspond to seeker strategies and with those of growing intensity indicating recourse to sentry strategies (Kirmani and Campbell 2004). However, among the latter, various situational factors presented in Table 2–cognitive and emotional–moderate resistance reactions. At the individual level, the gender of respondents emerges as a salient element in the different reactions observed.

- The degree of resistance to telephone selling is strongly influenced, as has been emphasized above, by pre-existing knowledge on the part of individuals and in particular by negative attitudes they have developed in the course of previous experience of this type of selling techniques. Further, as the literature on persuasion has clearly brought out, the degree of interest–or involvement–individuals have in what is being sold also influences their willingness to pay attention to the message (Petty and Cacioppo 1983). Lastly, whether or not the salesperson's company is known to the individual is also a major factor influencing respondents' reactions of trust/mistrust: "A man introduces himself and gives the name of the company. I don't know it, and I say to myself: There's no way, I'm not going to buy anything" [14, M, age 37]. The metaphor of "a wolf in sheep's clothing" [22, F, age 44] expresses the strong sense of the potential risks, all the more so since the prospect has no information for verifying the salesperson's claims, with often even the origin of the call appearing under an unlisted number. Like

the wolf who hides his identity in order to get close to his victim–what Cochoy (2004) depicts as a major market "capture device"–telephone selling is a dubious and threatening intrusion.

- At the same time, other factors influence the emotional response of the prospect, first and foremost the telesales operator's behavior. In this regard, argumentative insistence, the tone adopted, and the psychological motives used are most frequently the factors triggering negative responses: "On one occasion it was a charitable organization. I explained to him that I already contributed to a number of other charities, but he tried to make me feel guilty. It was very unpleasant! And when he asked how I earned, well, it was too much, and I told him, 'I'm not interested, thank you, goodbye.'" [14, M, age 37]

Reactions of anger are also reported when the telesales operator pays no attention to what the respondent is saying: "She was carrying on without letting me speak while I was telling her I was only interested in the SMS, but she was trying to make me take more. So I tried to bring in the competition by mentioning a competitor's all-in package to see if she offered me something better. But without a moment's hesitation she tried to prove to me by 2+2=5 that what she was offering was cheaper. As a result, I hung up on her" [20, M, age 25]. Anger can also be provoked in return by the telesales operator's irritation–because of his/her thwarted attempt to persuade –, resulting sometimes in disagreeable rejoinders addressed to the prospect. In such instances, the feeling of annoyance, doubly fed by the approach itself and by the uncalled for behavior of the salesperson, takes hold in a more lasting way: "She was raving about some new wine shop which has just opened in the neighborhood, and that the people involved think very highly of their services. This kind of secondhand recommendation from someone I don't know just simply irritates me. As a result, I couldn't help showing my exasperation, and then she said I was being rude. I went ballistic! These people intrude on you at home, then to make matters worse, they slag you off!! I almost called up the company to complain about people who aggress me in my own home when I've not asked them for anything." [6, F, age 33]

Reactions of surprise as to the reason for the call, due to the telesales operator's manipulative techniques, can also result in anger and rejection on the part of the respondent who feels deceived: "The most recent said to me: 'Hello, Mrs R, I'm your adviser So-and-so. Do you remember me?' I first thought it was someone I knew, because she introduced herself like that. I was surprised and irritated, and then I hung up" [1, F, age 53]. Conversely, a polite, respectful approach on the part of the sales operator and carefully judging and responding to the signals given out by the prospect are perceived as factors mitigating negative emotional reactions. "I gave him the brush-off, saying I wasn't at all interested. In the end, he got the message and said goodbye quite politely…" [15, M, age 32]. Apart from the behavior of the telesales operator, the time of the call and the physical and psychological state of the respondent play an important role in his/her response. Although most calls are made in the evening to increase the chance of making contact, some companies recognize that this is often not a good time because people are tired after returning home from work. Tiredness is frequently mentioned as a reason for rejecting telesales approaches, but sometimes too it results in lowered resistance to an aggressive sales technique. "I was tired from work, so I let him talk" [4, M, age 28]. In reality, whatever the time of the call, its unpredictability for the respondent often makes it seem like an inappropriate time–calls made too early in the morning, daytime calls characterized as "weird, because people are working then" [3, F, age 25], calls coming when the respondent is about to go out or in the middle of doing something.

At the individual level, analysis of the discourses and interviews indicates major differences according to respondents' gender. Although the results cannot be generalized, they do provide possible indications of a difference in perception of sales approaches. Generally speaking, women tend to be more susceptible to, irritated by and aggressive towards this type of approach than men. The number of accounts containing expressions of negative emotions, violent feelings and reactions of rejection is larger among female respondents, in a proportion of more than 60%, while women represent only 45% of the sample. These reactions seem to be even more pronounced when female telesales operators call them. "I've found it's worse with women than with men. Men are generally careful and reasonably pleasant, they don't insist too much. But the women think they can do anything. They're arrogant and aggressive" [18, F, age 33]. Men, on the other hand, mostly seem to be more tolerant of these influencing tactics, using irony or humor to withdraw from intrusive or undesirable situations.

## DISCUSSION, LIMITATIONS AND IMPLICATIONS

The aim of the research was to explore the nature of representations attached to the respondents' experience of telephone selling. These situations, liable to give rise to resistance reactions, provide a suitable analytic framework for identifying the determinants and consequences of such phenomena. The small size of the sample in this study does not permit the results to be generalized, but it does contribute to in-depth exploration of representations of this influencing technique. The accounts show in particular that far from reconstituting only the content of the interpersonal exchange with the telesales operator or the strategies adopted in response to his arguments (Kirmani and Campbell 2004), the interviewees provide many indications of the cognitive schema in which the decoding of the situation experienced lies. This in turn contributes to enriching their knowledge and shaping their later opinions of these practices. Such metacognition of market relations, as well as of their intentions and mechanisms, leads to the construction of a repertoire of avoidance strategies that in varying degrees reflects a high level of resistance. At the individual level, gender seems to influence the way telesales calls are perceived. However, it would be interesting to investigate in a more detailed way how these role identities, experienced through the concepts of masculinity and femininity, influence their reactions.

In relation to the many descriptive and comprehensive approaches to resistance phenomena (Dobscha and Ozanne 2001; Duke 2002; Peñaloza and Price 1993; Thompson and Haytko 1997), bringing to light the principles of construction and mobilization of market metacognition shows the importance of elucidating the conflict of representations from which adverse reactions to firms and the market arise. They constitute a unique terrain compared to other techniques of persuasion and of creating resistance, both because they engage people in an interactive relationship–unlike advertising which communicates in an impersonal way and which can partially be protected against by avoidance behaviors (Roux 2007)–and because this interaction has not been chosen by them, in terms either of time or content or the caller, in contrast to relations at points of sale (Kirmani and Campbell 2004). Other contexts can also be addressed with the help of this framework for analysis, since over time consumers construct a repertoire of representations of market functioning. Firms' various schemes–their offerings and discourses and more generally the macro-

economic vision that supports the system as a whole–to a large extent feed these representations. The social fabric in which consumers develop also influences their beliefs. The progressive encoding of events in their environment thus contributes to the building of a structure of knowledge through which they categorize the situations and events they are exposed to and that as a consequence orient their consumption choices or non-choices.

The metacognition approach appears to have a number of important implications. As the results show, the heuristics of recognizing tactics, when these have been perceived, categorized and memorized, appear to be lasting and relatively unresponsive to the contingent arguments from the influencing agents. Resistance is simply triggered by the perception of the persuasion mechanism, independently of the content of the message it is transmitting (Friestad and Wright 1994). On the other hand, it is interesting to notice that most of the negative perceptions collected in this study bear more upon the telesales agents than on the sponsors of these approaches. The opaque nature of the techniques, with the respondent not always aware of its original source and possible attribution, is possibly the origin of this relative lack of comment on the brand itself. On the other hand, respondents' focus on telesales episodes has possibly contributed to a concentration on their comments on this subject rather than on the companies behind these operations. A more detailed exploration of the repercussions of these techniques on brand perception is thus a line of research to be developed.

The constructed and sedimented nature of respondents' awareness also shows that when a change of meaning has taken effect in the perception of a persuasive encoded mechanism, resistance increases. Friestad and Wright (1994) point out in this respect that the more educated and informed the consumer, the more he/she is capable of proceeding through "self-generated" warning signs and of opposing attempts to influence by defensive tactics. This last point questions the possible development of consumer/firm relations, such as Holt (2002) attempts to do when making various recommendations on brands' positioning arguments and their link with consumer resistance. Although the market is undeniably an incessant "polylogue" that absorbs and recycles criticism (Boltanski and Chiapello 2006), there is every reason to imagine what forms of action firms can deploy without fuelling conflicts that feed consumers' resistance. One of the main difficulties no doubt lies in the fact of pinpointing these conflicts. In this respect our results suggest several important recommendations for reducing negative reactions to telesales. First, a respectful attitude to customers proves to be essential. The lack of availability of the prospect at the time of calling should lead to polite withdrawal on the part of the telesales operator, even if it means renewing the call later and with the prospect's agreement. Lack of interest in a product should also be dealt with tactfully, by trying to find out the reasons for this and whether they are temporary or long term. Promises through which prospects are attracted to points of sale should also be restrained and should not turn out to be crude traps when the prospect arrives at the shop. The profession as a whole would gain by reducing and controlling pressure on people, in order not to generate, in the long term, systematic reactions of refusal that would generally jeopardize its effectiveness.

Extending our perspective, it would be important to obtain not only the prospect's perception during the influencing episode, but at the same time also that of the telesales operator–which is not necessarily symmetrical–and to analyze possible distortions between the two systems of representations (DeCarlo 2005). The lead-ins, lines of arguments and types of response used by telesales operators would require being previously tested in practice in order to understand the perceptions they give rise to among the respondents. Thus a new technique used recently by telesales operators involves leaving a few seconds of silence, after the prospect has answered, to give him or her time to identify, through the background noise of the service, that it is a telephone sales call. The fact that the prospect abruptly hangs up without waiting for the operator indicates refusal to cooperate and constitutes an index, acquired in a less intrusive yet nonetheless very explicit way, of his or her intentions.

Another route would be to explore, over and beyond the telephone approach, the whole sequence of a sale and the meanings that it gives rise to throughout the process, including its possible recursive effects on the perception of telesales approaches which are often their point of departure. Finally, the difference in elaborations of cognitive systems according to people's age and educational level could make it interesting to study the mechanisms to which particular groups of respondent are, or become, sensitive and which contribute, at a given moment, to activating their resistance.

# The Relationships Between Dissatisfaction, Complaints and Subsequent Behavior in Electronic Marketplace

Anne-Francoise Audrain-Pontevia, Rouen School of Management, France
Christine Balague, University of Sciences and Technology, Lille, France[1]

## ABSTRACT

This paper investigates customer dissatisfaction and complaining behaviour's effects on a large data-set for a major pure play e-tailer. It presents a theoretical framework and empirically examines twelve propositions. It first investigates the relationships between e-dissatisfaction (Web site and e-purchase dissatisfactions) on customers' exit, voice and word of mouth. It then focuses on customers' e-complaining behaviour subsequent variables such as exit and referral. In particular, customers satisfied with the company's response to their complaint are compared to others. Last, findings are discussed and contrasted to the traditional marketplace literature.

## INTRODUCTION

The marketing literature reveals that complaint handling is strategic for companies. Effective complaint management has been shown to increase customer satisfaction and loyalty. It is now commonplace that a customer is worth the value he is complaining for (Fornell and Westbrook, 1984). A great deal of research has investigated customer complaining behaviour in offline environments. Surprisingly, in spite of the importance of marketing defensive strategies for e-tailers, still little is known regarding customer complaint processes and behavioural outcomes in this sector. Indeed, in year 2000, over 92% of online merchants were actively building a loyalty program (Abbott, Chiang, Hwang, Paquin and Zwick, 2000). Though, little research has been done to analyse and understand customers' online dissatisfaction and complaining behaviour outcome, but Cho, Im, Hiltz and Fjermestad (2002), Bansal, McDougall, Dikolli and Sedatole's (2004) researches. Cho *et al.* (2002) have investigated the impact of e-dissatisfaction on exit and propensity to complain, in both online and offline environments. They also analysed customers' propensity to complain impact on repeat purchase intention. Bansal *et al.* (2004) have explored the relationship between the overall web-satisfaction, referrals and retention. No research to our knowledge has empirically examined the impact of e-complaining on exit and referral in an Internet environment. This study explores the behavioral consequences of customers' dissatisfaction and complaints on customers' propensity to exit and recommend the Web site. It relies on a large data-set of over 7000 customers reporting their overall satisfaction, complaints, repeat purchase intentions and referrals for a major e-retailer: Expedia, the world-wide Internet travel leader. This research is the first one to the best of our knowledge to investigate the relationships between customer complaining behaviour and subsequent constructs such as exit or referral in electronic marketplace. Precisely, its purpose is two-fold. Firstly, it analyses the interrelationships among customer e-dissatisfaction, exit, complaining behaviour and referral. In this respect, it deepens Cho *et al.*'s (2002, 2003) and Bansal *et al.*'s (2004) researches. It then focuses on customers e-complaint consequences: Exit and referral. In particular, we investigated exit and referrals for complainers who were satisfied with the resolution of their complaint ('satisfied complainers') in contrast to non complainers. Similarly, we compared exit

and referrals for satisfied complainers to 'dissatisfied complainers' (i.e. complainers who were not satisfied with the resolution of their complaint). Lastly, we explored the above mentioned behavioural outcomes considering the nature of the complaint.

This paper is organized as follows. It first presents the research's conceptual framework. It then exposes the method and the results. Finally, the main findings are discussed, analysed and compared to what is known in the traditional marketplace.

## CONCEPTUAL FRAMEWORK

Over the past decades, customer satisfaction, dissatisfaction and complaining behaviour have been shown to be the very cornerstone of marketing defensive strategies. Numerous researches have underlined that a satisfied customer is more loyal, buys more (Anderson and Sullivan, 1993), is less sensitive to product /service prices (Fornell, Johnson, Anderson, Cha, Everitt and Bryant, 1996), buys other products/services from the same company (Fornell, 1992) and generates positive word of mouth (Anderson 1998). Besides, it was found that satisfaction plays a key role in building companies shareholder value (Gruca and Rego, 2005). Fornell, Mithas, Morgeson and Krishnan (2006) reveal that firms which do better in terms of satisfying customers tend to generate a superior return on investment and yield higher profits. Similarly, dissatisfied customers have been identified as less loyal, to complain more and create negative word of mouth (Bearden and Teel, 1983). In the Internet settings, it has been argued that dissatisfaction and complaining behaviour can be detrimental to companies' long term profits (Reichheld and Shefter, 2000). However, there is a paucity of research on both e-dissatisfaction and e-complaining behavior's outcomes. Relying on Hirschman's (1970) micro-economic seminal framework as well as on previous findings in online or offline environments, we define an e-dissatisfaction and complaining behaviour framework.

### Customers' e-dissatisfaction behavioral's consequences

According to Hirschman (1970), dissatisfied customers might exit (stop consuming the product / service), voice (tell the management what is wrong and what is expected), or remain loyal (continue to purchase the product / service). Numerous researches have investigated consumer dissatisfaction in offline environments. Scholars have suggested or shown that dissatisfied customers with the firm are more likely to exit (Maute and Forrester, 1983; Bolton and Bronkhorst, 1991). In online settings, Bansal *et al.* (2004) show that Web site satisfaction / dissatisfaction is significantly related to referral (likelihood to recommend), retention (likelihood to repurchase) and online conversion (number of online buyers and visitors expressed as a percentage). They define e-satisfaction as a Web site satisfaction, but do not investigate the e-purchase satisfaction's outcomes. Yet, the literature distinguishes two kinds of satisfaction: Satisfaction with the Web site (Reibstein, 2002) and satisfaction with the purchase process (Symanski and Hise, 2000; Anderson and Srinivasan, 2003). To our knowledge, no research has empirically investigated the consequences of e-purchase satisfaction on constructs such as complaining behavior, recommendation or exit. In line with these findings and definitions, we propose that customers who have lower levels of either Web site or e-purchase satisfactions are more likely to exit.

$P_{1a,b}$: *Customers who have lower levels of Web site satisfaction ($P_{1a}$) / e-purchase satisfaction ($P_{1b}$) are more likely to exit the Web site.*

In the traditional marketplace, scholars have shown that satisfaction is positively linked to word of mouth defined as informal communications between private parties concerning evaluations of goods and services. Silverman (1997) highlights that word of mouth is important to marketers because it can be a major potential source of future business. Anderson (1998) also demonstrated that dissatisfied customers engage in a greater word of mouth than satisfied ones. In an e-commerce context, Bansal *et al.* (2004) have shown that Web site satisfaction is also significantly related to referrals (they define as the likelihood to recommend) but did not investigate the impact of e-purchase satisfaction on likelihood to recommend. In line with this, we propose that customers who have lower levels of either web or e-purchase satisfactions are less likely to make positive recommendations to a relative.

$P_{2a,b}$: *Customers who have lower levels of Web site satisfaction ($P_{2a}$) / e-purchase satisfaction ($P_{2b}$) are less likely to recommend the Web site.*

Consistently with Hirschman's (1970) framework, researches have demonstrated that dissatisfied customers are more likely to give voice than others. Cho *et al.* (2002) find that as degree of Web site dissatisfaction increases, so does the customer propensity to complain. We therefore propose that customers who have lower levels of either Web site satisfaction or e-purchase satisfaction are more likely to complain.

$P_{3a,b}$: *Customers who have lower levels of Web site satisfaction ($P_{3a}$) / e-purchase satisfaction ($P_{3b}$) are more likely to complain.*

**Customers' voice behavioral's consequences in the e-commerce**

Numerous scholars have shown that complainers are more likely to exit (Solnick and Hemenway, 1992). In online environments, it has been argued that searching and switching costs are low (Reichheld and Schefter, 2000). It is very easy for customers to exit the Web site. We therefore expect that customers who complain are more likely to exit the Web site.

$P_4$: *Customers who complain are more likely to exit the Web site than customers who don't complain.*

Although complaints may have severe consequences, a great deal of research has popularized the idea that satisfactory service recovery is profitable for companies (Hart, Heskett and Sasser, 1990; Smith and Bolton, 1998). TARP's (1979) results have highlighted that complaint resolution lead to increased loyalty. A well-handled problem of complaints will produce customers who are actually more loyal than those experiencing no problem at all. Additionally, Walther (1992) finds that complainers are more likely to buy again than non-complaining but dissatisfied customers. Therefore, knowing exit is just at a mouse click in the e-commerce, we may expect that,

$P_{5a}$: *'Satisfied e- complainers' (complainers who are satisfied with the complaint resolution) are less likely to exit the Web site than 'e-dissatisfied complainers' (complainers who are not satisfied with the complaint resolution).*

$P_{5b}$: *E-complainers are less likely to exit the Web site than non-complaining but Web site dissatisfied customers.*

TARP's results also reveal that 'satisfied complainers' recommend more strongly the company to relatives than 'dissatisfied complainers' (those who were given a dissatisfactory response). Reichhed and Schefter (2000) underlines that is also true for the e-commerce and points that the Internet amplifies the effects of word of mouth. Therefore, we propose that,

$P_{6a}$: *'Satisfied e- complainers' are more likely to recommend the Web site than 'e-dissatisfied complainers'.*

Bolton and Bronkhorst (1995) suggest that complainers' loyalty varies in magnitude according to the nature of their complaint. More precisely, relying on Gilly and Gelb (1982), they propose that customers complaining about a monetary loss are more likely to be satisfied with the firm's response and are less likely to exit. It is well known that customers often choose to buy on the Internet because they can compare prices and get the best price. We may therefore infer that, in online environment,

$P_{7a,b}$: *E-customers who complain about a payment problem are more likely to be satisfied with the firm's response ($P_{7a}$) and less likely to exit the Web site ($P_{7b}$) than customers who complain about other problems.*

## METHODOLOGY

This research investigates dissatisfaction and complaining outcomes in the Internet fast growing industry. To do so, we explored a large and unique data set of over 7000 Expedia's customers. Expedia.com is the online leading travel planning and flight-booking site.

**The sample**

7458 customers answered an on-line survey three days after having bought on Expedia's Web site in 2006. The response rate was 29.5%. 46.9% of the respondents were men, 53.1% female. Interviewees' average age was 42 years old. Complainers were identified from a survey question about the purpose of calls to the customer service center (cf. Exhibit 1). Out of the 7458 interviewees, 1188 (15.92%) contacted the customer service center among which 561 complained (7.5%). Customers' complaints were classified in three categories: a) Payment problem; b) browsing / connection problem or c) problem related to the service they bought (cf. Exhibit 1).

**The survey questionnaire**

The survey consisted of online questionnaires. It measured customers' overall Web site satisfaction, overall e-purchase satisfaction and intention to recommend and repurchase on the site. Interviewees were also asked to submit some demographics and to indicate i) whether they contacted the customer service center; ii) the nature of their complaint and iii) their levels of satisfaction regarding the response given by Expedia to redress the problem they encountered. Overall Web site and e-purchase satisfactions were measured on single items. The scales consisted of five points Likert scales anchored very dissatisfied to very satisfied (cf. Exhibit 1). Intention to buy again is used here as a proxy measure of exit (a customer answering no to this question is considered as exiting the Web site). Intention to buy again on the Web site and to recommend the Web site to relatives were measured on five points scales anchored 'yes certainly' and 'no, certainly not'.

<center>**EXHIBIT 1**
Survey items</center>

---

**Satisfaction items**, measured on 5 points Likert scales (anchored 1= very satisfied to 5=very dissatisfied)
1. *Overall, how satisfied are you with the buying process?*
2. *Overall, how satisfied are you with Expedia's Web site?*

**Loyalty item**, measured on a 5 points semantic scales (anchored 1= Yes, certainly to 5 certainly not)
3. *Do you intend to buy your next trip on Expedia?*

**Recommendation item**, measured on a 5 points semantic scale (anchored 1= Yes, certainly to 5 certainly not)
4. *Would you recommend Expedia to one of your near relative?*

**Customer service**
5. Did you call Expedia's customer service during your shopping experience? (Yes/No)
6. If you have contacted the customer service, you did it in order,
- *to have an information not available on the Web site*
- *to have side information,*
- *because you encountered a problem on the Web site (connection / browsing)*
- *because you prefer to pay by phone than on the Internet*
- *to claim regarding a purchase*
- *because you encountered a problem when paying on the site*
- *to get a customized piece of advice.*
7. How satisfied are you with the answer that was given to you in comparison to your expectations, measured on 5 points Likert scales (anchored 1= very satisfied to 5=very dissatisfied)

---

<center>**RESULTS**</center>

**Respondent demographics**

The data indicate that 53.5% of the e-purchase dissatisfied customers are men while 50.1% of the Web site dissatisfied customers are women. Customers who declare dissatisfaction are 43 years old on average. Among the 561 complainers, 116 (20.7%) lodged more than one complaint. A total of 691 grievances were identified. Precisely, 44.1% of the complaints dealt with a payment problem, 36% with a Web site (either connection or browsing) problem and 19.82% with the purchased travel.

**Customers' e-dissatisfaction behavioural consequences**

To investigate the first two propositions ($P_{1a}$ and $P_{1b}$) we compared the Web site satisfaction and e-purchase satisfaction for two groups: People who want to exit and people who do not want to exit. To do so we ran two chi-square tests. The results are presented in Tables 1a and 1b.

Consistently with our predictions and with the marketing offline literature, the data revealed that we should reject the null hypothesis $H_0$ in both cases (i.e. for both $P_{1a}$ and $P_{1b}$). Customers who have lower levels of Web site satisfaction ($P_{1a}$) are more likely to exit ($\chi^2$=788.71; p<0.01). Similarly, customers who have lower levels of e-purchase satisfaction ($P_{1b}$) are more likely to exit ($\chi^2$=708.92; p<0.01).

In a similar fashion, we ran two chi-square tests to assess $P_{2a}$ and $P_{2b}$. The results (cf. Tables 2a and 2b) support $P_{2a}$ and $P_{2b}$. In both cases, the null hypothesis $H_0$ is rejected. Customers showing lower levels of Web site satisfaction are less likely to recommend ($\chi^2$=1103.22; p<0.01); which is also the case for customers having lower levels of e-purchase satisfaction ($\chi^2$=1380.44; p<0.01). Like in off-line context, customer satisfaction (either towards the Web site or e-purchase experience) is positively linked to customers referral.

Web site dissatisfaction has been shown to determine customer complaining behavior ($P_{3a}$). However, customer e-purchase dissatisfaction's impact on complaints has not been investigated yet. To examine $P_{3a}$ and $P_{3b}$, we ran two chi-square tests. The results (cf. Table 3a & 3b) lead to reject the null hypothesis $H_0$ in both cases. Customers having lower levels of Web site satisfaction are more likely to complain ($\chi^2$=312.93; p<0.01), which is also the case for customers having lower levels of e-purchase satisfaction ($\chi^2$=144.113; p<0.01). Interestingly, the data indicate that, like in offline environments, a majority of dissatisfied customers does not complain. Tables 3a and 3b show that only 32.3% and 34.8% of web / e-purchase dissatisfied customers lodged a complaint.

**Customers' e-complaints behavioural consequences**

In line with the marketing offline literature, we proposed that complainers are more likely to exit the Web site than non complainers. To examine this proposition, we compared complainers versus non complainers' exit intentions with a chi-square test. Complainers were identified here as the people who called the customer service center either because they encountered a payment, browsing/connection problem or because they voiced about a purchase (cf. Exhibit 1). As shown in Table 4, the chi-square test's result clearly indicates that there is a significant difference between complainers versus non complainers ($\chi^2$=24.85; p<0.01). Indeed, 36.5% of the complainers' say they will exit versus 22.9% for the non complainers.

Yet, this finding might need qualifying since we cannot analyse customers who did not answer the survey. We may hypothesize that these customers were non-complainers who exited. Though, on the basis of the completed online questionnaires, we find that complainers are more likely to exit the Web site than non complainers. Interestingly also, 63.5% of the complainers declared they will not exit the Web site.

**TABLE 1A**
Web site Satisfaction & Exit ($P_{1a}$)

|  | Very dissatisfied | Somewhat dissatisfied | Neither satisfied / nor dissatisfied | Somewhat satisfied | Very satisfied |
|---|---|---|---|---|---|
| Exit | 64 (97%) | 181 (58%) | 117 (62.2%) | 1188 (24.5%) | 195 (9.5%) |
| Don't Exit | 2 (3%) | 131 (42%) | 71 (37.8%) | 3659 (75.5%) | 1850 (90.5%) |
| Nb. Obs | 66 | 312 | 188 | 4847 | 2045 |

**TABLE 1B**
E-Purchase Satisfaction & Exit ($P_{1b}$)

|  | Very dissatisfied | Somewhat dissatisfied | Neither satisfied / nor dissatisfied | Somewhat satisfied | Very satisfied |
|---|---|---|---|---|---|
| Exit | 102 (78.5%) | 156 (62.4%) | 39 (54.2%) | 1037 (27.4%) | 411 (12.7%) |
| Don't Exit | 28 (21.5%) | 94 (37.6%) | 33 (45.8%) | 2743 (72.6%) | 2815 (87.3%) |
| Nb. Obs | 130 | 250 | 72 | 3780 | 3226 |

**TABLE 2A**
Web site Satisfaction & Recommendation ($P_{2a}$)

|  | Very dissatisfied | Somewhat dissatisfied | Neither satisfied / nor dissatisfied | Somewhat satisfied | Very satisfied |
|---|---|---|---|---|---|
| No Rec | 98 (75.4%) | 114 (45.6%) | 28 (38.9%) | 366 (9.7%) | 159 (4.9%) |
| Rec | 32 (24.6%) | 136 (54.4%) | 44 (61.1%) | 3414 (90.3%) | 3067 (95.1%) |
| Nb. Obs | 130 | 250 | 72 | 3780 | 3226 |

**TABLE 2B**
E-Purchase Satisfaction & Recommendation ($P_{2b}$)

|  | Very dissatisfied | Somewhat dissatisfied | Neither satisfied / nor dissatisfied | Somewhat satisfied | Very satisfied |
|---|---|---|---|---|---|
| No Rec | 63 (95.5%) | 125 (40.1%) | 107 (56.9%) | 389 (8%) | 81 (4%) |
| Rec | 3 (4.5%) | 187 (59.9%) | 81 (43.1%) | 4458 (92%) | 1964 (96%) |
| Nb. Obs | 66 | 312 | 188 | 4847 | 2045 |

To assess the propositions $P_{5a}$ and $P_{5b}$, we also ran chi-square tests. The first analysis (cf. Table 5a) revealed that 'satisfied complainers' (i.e. customers who received a satisfactorily answer from the company) are less likely to exit the Web site than dissatisfied complainers' (i.e. than customers who did not receive a satisfactorily answer), which is consistent with the traditional marketing literature. The chi-square test rejects the null hypothesis $H_0$ ($\chi^2=12.33$; p<0.01). Additionally, the findings regarding $P_{5b}$ (cf. Table 5b) also lead to reject the null hypothesis $H_0$ ($\chi^2=9.25$; p<0.01). Complainers here are less likely to exit the Web site than dissatisfied and non-complaining customers.

Considering satisfied complainers versus dissatisfied complainers' likelihood to recommend ($P_{6a}$), the chi-square test result supports our prediction ($\chi^2=29.62$; p<0.01). 89.1% of the satisfied customers declare they will recommend the Web site to relatives. Yet, surprisingly, 70.9% of the 'dissatisfied complainers' declare they will recommend again! This can be explained by the fact that either the problem was no that big, or because the price savings were worth the problem these customers encountered. Another explanation relies on the idea that the complaining process per se enhances complainers' probability to recommend the Web site. Complaining to a customer service center is a unique opportunity to get in touch with the supplier. It also humanizes the supplier. This is why the complaining process is probably more critical in online settings than in the traditional marketplace.

Overall, like in the traditional marketplace, our findings underline the importance of service recovery. It shows that a 'satisfied complainer' exhibit a positive attitude toward the Web site since

**TABLE 3A**
Web site Satisfaction & Complaining Behavior ($P_{3a}$)

|  | Very dissatisfied | Somewhat dissatisfied | Neither satisfied / nor dissatisfied | Somewhat satisfied | Very satisfied |
|---|---|---|---|---|---|
| Don't complain | 88 (67.7%) | 180 (72%) | 67 (93.1%) | 3477 (92%) | 3085 (95.6%) |

| Exit | 155 (37.3%) | 12 (75%) |
| Don't exit | 261 (62.7%) | 4 (25%) |
| Nb. Obs | 416 | 16 |

they recommend it in higher proportions than dissatisfied complainers. It also suggests that the customers complaining process is more crucial in online environments. Indeed, 70.9% of the dissatisfied complainers declare they will recommend the Web site while 75% of the web-dissatisfied non complaining customers declare they will not buy their next trip on this Web site again.

**TABLE 6A**
Satisfied / Dissatisfied Complainers & Recommendation ($P_{6a}$)

|  | Dissatisfied Complainers | Satisfied Complainers |
|---|---|---|
| Recommend | 183 (70.9%) | 270 (89.1%) |
| Don't recommend | 75 (29.1%) | 33 (10.9%) |
| Nb. Obs | 258 | 303 |

**TABLE 7A**
Monetary Complainers versus others Complainers & Satisfaction with the company's response ($P_{7a}$)

|  | Very dissatisfied | Somewhat dissatisfied | Neither satisfied/ nor dissatisfied | Somewhat satisfied | Very satisfied | Nb. Obs. |
|---|---|---|---|---|---|---|
| Monetary complaint | 22 (7.2 %) | 25 (8.2%) | 12 (3.9%) | 103 (33.8%) | 143 (46.9%) | 305 |
| Other complaint | 52 (20.3%) | 25 (9.8%) | 7 (2.7%) | 71 (27.7%) | 101 (39.5%) | 256 |

**TABLE 7B**
Monetary Complainers versus other Complainers & Exit ($P_{7b}$)

|  | Monetary complainers | Other Complainers |
|---|---|---|
| Exit | 169 (45.6%) | 87 (45.8%) |
| Don't Exit | 202 (54.4%) | 103 (54.2%) |
| Nb. Obs | 371 | 190 |

As far as the nature of the complaint is concerned ($P_{7a}$ and P7b), we find mixed support. As shown in Exhibit 1, Expedia's customers can complain for different reasons. To analyse complaints related to payment problems in contrast to other complaints (cf. Exhibit 1), we ran two chi-square tests. The first one compares customers' propensity to be satisfied when they complained for monetary reasons to customers' propensity to be satisfied when they complained for another reason. The data shows that the null hypothesis $H_0$ must be rejected ($\chi^2$=22.48; p<0.01). Therefore, $P_{7a}$ is supported. Customers who complain about a monetary problem are found to be more likely to be satisfied with the firm's response than other complainers (cf. Table 7a).

Contrarily, the chi-square test examining whether customers who complain about a monetary problem are less likely to exit than other complainers reveal that the null hypothesis $H_0$ cannot be rejected (p=0.056). $P_{7b}$ is not supported. All complainers are equally expected to exit. The nature of the complaint does not make any difference here.

## DISCUSSION AND CONCLUSIVE REMARKS

These findings show and therefore support that customers' Web site and e-purchase dissatisfaction have significant relationships with customer e-complaining behavior, Web site exit and referrals. It is based on a large data-set of over 7000 customers for a major e-retailer: Expedia. To our knowledge, this is the first research to reveal connections between e-purchase dissatisfaction and e-customers' exit or word of mouth. Besides, it demonstrates that customer e-complaining behavior impacts their likelihood to exit the Web site and creates negative word of mouth. Additionally, this paper underlines the strategic importance of the complaining process and service recovery in online settings.

Precisely, the findings highlight that customer's web or e-purchase dissatisfactions entail a higher propensity to exit ($P_{1a}$ and $P_{1b}$) and a smaller likelihood to recommend ($P_{2a}$ and $P_{2b}$). 97% of the Web site very dissatisfied customers are found to intend to exit the Web site. Conversely, 90.5% of the very satisfied declare they will buy on Expedia again. Similar results are found for e-purchase satisfaction. Moreover, the data indicates that respectively 75.4% and 95.5% of the Web site and e-purchase very dissatisfied customers will not recommend the Web site to relatives; while 95.1% and 96% of the Web site and e-purchase very satisfied customers say they will. Consistently with both the online and offline literatures also, the results reveal that web / e-purchase dissatisfied customers are more likely to complain ($P_{3a}$ and $P_{3b}$). Yet, it is important to notice that very few dissatisfied customers voice their complaint here. Indeed, as Tables 3a and 3b suggest it, over 70% of the web / e-purchase dissatisfied customers do not complain!

The findings also highlight that though complainers are more likely to exit the Web site ($P_4$), only 36.5% declare they will. We also find that though 89.1% of the 'satisfied complainers' declare

they will recommend the web site, 70.9% of the 'dissatisfied complainers' declare they will also recommend the Web site. Additionally, the data indicate that that most of the dissatisfied complainers (58.5%) do not intend to exit the Web site, which again, is not consistent with the off-line literature. These findings suggest that the complaining process per se may increases customers' intentions to buy again and to recommend in off-line settings. Contrarily to offline buying situations, the complaining process is the unique opportunity for the customer to get in touch with the supplier. It humanizes the buyer-seller relationship and appears to increase considerably online customers' positive attitudes toward the Web site. For this reason, giving customers the opportunity to complain is probably more critical on-line.

Now, considering service failure recovery, the data clearly shows that complainers who are satisfied with the complaint resolution ('satisfied complainers') are less likely to exit the Web site than customers who are dissatisfied with the complaint resolution ('dissatisfied complainers') (P5$_a$). As shown in Table 5a, 41.5% of the 'dissatisfied complainers' versus 27.4% of the 'satisfied complainers' intend to exit the Web site. This therefore suggests that service failure recovery is strategic for online merchants too.

In line with our predictions too, the findings show that complainers are twice as much more likely to be loyal to the site than web dissatisfied but non-complaining customers (P5$_b$). This confirms that encouraging dissatisfied e-customers to complain helps managers to increase customers' e-loyalty and therefore build long-term profitable relationships. This also supports again that the complaining process per se plays a key role in the quest for online loyalty. This is all the more important as it has been shown that loyalty is more critical in online settings than in the traditional retail (Reichheld and Shefter, 2000).

Last, the results partially support the idea that customers complaining about monetary problems are less likely to exit the Web site and more likely to recommend than customers complaining about other problems (P7$_a$ and P7$_b$). Although, the data clearly shows that customers who complain because they had a problem when paying on the Web site are more likely to be satisfied with the firm's response (P7$_a$), however we do not find that these customers are less likely to exit than customers who complain for other reasons (P7$_b$).

In conclusion, these findings are in line with most of our predictions. Overall, this research underlines, like in the traditional marketplace, the importance of customer dissatisfaction and complaining management for the growing e-commerce industry. This is all the more important since like we noticed before, marketing defensive strategies are more critical than in the traditional marketplace. Understanding dissatisfaction and complaining behaviour outcomes in e-commerce is also crucial since this sector is getting hyper competitive. The 2005 Forrester Research forecasts that US online retail sales in 2010 will account for 328.6 US $ billions (double the amount compared to 2005). Interestingly, this research highlights that the complaining process per se plays a key role in creating online loyalty, since a large amount of 'dissatisfied complainers' (i.e. complainers who are dissatisfied with the complaint resolution) intend to buy again and recommend the Web site.

In an academic perspective, this research proposes an initial validation of complaint effects on customer subsequent behaviour. Based on a large representative e-customers dataset, it paves the way for future research on customer complaint behavioural consequences and calls for replications. Though our results are very encouraging, they encounter some limitations. The main limitation is due to the measurement of exit which is rendered here as a

customer intention to come back. It would be interesting to use real behavioural data. Another limitation is due to the fact that customers reported their complaints via a customer service call-center. Indeed, other channels are often used like e-mailing (Strauss and Hill, 2001), regular mail or anti domain sites to complain. It would therefore be interesting to study whether customer complaining behavior differs across these channels.

# The "Dark Side" of Brand Alliances: How the Exit of Alliance Members Affects Consumer Perceptions

David M. Woisetschläger, University of Dortmund, Germany
Manuel Michaelis, University of Münster, Germany
Christof Backhaus, University of Münster, Germany[1]

## INTRODUCTION

Brand alliances are becoming more frequent in a wide variety of industries (Levin and Levin 2000; McCarthy and Norris 1999). Consequently, academic research in this area has expanded over the last few years (Gammoh, Voss and Chakraborty 2006). This has increased our understanding of the nature and different forms of brand alliances (Washburn, Till and Priluck 2004), and its effects on partners (Lafferty, Goldsmith, Hult 2004) and consumers (Samu, Krishnan and Smith 1999; Gammoh et al. 2006; Vaidyanathan and Aggarwal 2000; Lebar, Buehler, Keller, Sawicka, Aksehirili and Keith 2005). One of the most significant findings in brand alliance research is that an unknown brand can benefit from joining a brand ally with a favourable reputation (Rao and Ruekert 1994; Simonin and Ruth 1998; Washburn, Till, Priluck 2000). However, while such positive effects of brand alliances are currently being investigated more thoroughly (Gammoh et al. 2006), less attention is paid to the "dark side" of brand alliances that might appear, for example, if an alliance partner experiences negative feedback effects due to quality problems relating to the partner brand (McCarthy and Norris 1999) or when brand alliances fail. Nevertheless, some authors have acknowledged the negative effects that can derive from brand alliances (Hillyer and Tikoo 1995; Washburn et al. 2000; Janiszewski and van Osselaer 2000). Given these potential drawbacks, brand alliances are not necessarily win/win strategies for the alliance partners (Washburn et al. 2000).

To analyze the pros and cons of brand alliances the airline industry is a prominent and generally relevant example. Almost ten years ago, Air Canada, Lufthansa, SAS, Thai Airways International and United Airlines launched the first strategic airline network, the Star Alliance. Since then, the number of such alliances has grown rapidly, reaching about 500 strategic and tactical alliances (including code share agreements) in the year 2005 (Mountford and Tacoun 2005). The three largest alliances, Star Alliance, SkyTeam Alliance, and Oneworld, account for more than 55% of all passengers travelling each year (IATA 2005; staralliance.com; skyteam.com; oneworld.com). The benefits for member airlines derive mainly from cost reduction due to economies of scale and economies of scope. This has become even more important, since the increasing price of fuel has seriously reduced airline profitability (IATA 2005). In addition, being an airline alliance member also provides potential for growth, due to the greater number of hubs for arrival and departure. Experts anticipate continuous growth, especially in China and Central Europe (IATA 2005; Dudley and Choueke). Therefore, the leading airline alliances are keen to develop their networks in these regions. SkyTeam Alliance included Aeroflot as the tenth member of its alliance in May 2006, and recently signed an agreement with China Southern Airlines indicating that the Chinese carrier is on track for official membership (skyteam.com). Japan Airlines will become part of Oneworld in April 2007 (oneworld.com) and Star Alliance has invited Air China to join their alliance (staralliance.com).

However, returning to the "dark side" of alliances, the number of examples of carriers quitting alliance agreements is growing. Star Alliance encounters severe problems in South America: Mexicana left the alliance in 2004 after their decision to end its seven-year code share agreement with Star Alliance member United *Airlines* (Shifrin 2003). Since then, the major Brazilian carrier Varig has been the only partner in South America. Recently, Star Alliance has coped with a possible liquidation of Varig. Due to major restructuring the Brazilian carrier is no longer a member of Star Alliance since January 2007. (staralliance.com). Alike, Oneworld experienced drawbacks, as Aer Lingus announced that they would quit the alliance in May 2006 (Dudley and Choueke 2006). As one of Oneworld's longest-standing members, Aer Lingus responded to the fierce competition of no-frills airlines, adopted its low-cost model to survive, and therefore, was no longer able to maintain service standards required by Oneworld.

In addition to effects on operational *efficiency*, airline movements in and out of network alliances have an impact on customer evaluations of both airline brands and network brands, which will be subsequently defined. Against this background, the main objective of our study is to increase understanding of the *effectiveness* of brands in a dynamic environment such as airline alliances (Weber 2005). Therefore, the effects on consumer perceptions that occur when an alliance member quits an alliance, in comparison with the impact of a new brand joining an alliance are examined. Thus, the results of this study are relevant to both *airline* brand managers and managers of the *network* brand.

In accordance with this research objective, the paper is organized as follows. First, we briefly discuss the theoretical background to the study. Drawing on the literature, a conceptual model is introduced that links the stimulus of airlines to join/quit the Star Alliance and the impact on the brand images of both airlines and the Star Alliance. After presenting the results of the empirical test, which is based on an experimental study including 415 respondents, the paper concludes with a discussion of key findings and their managerial implications.

## THEORETICAL BACKGROUND AND HYPOTHESES DEVELOPMENT

### The Nature of Brand Alliances

In marketing research, brand alliances have not yet been defined consistently, since there are various different types of brand alliances. Washburn et al. (2004) have identified some of these forms of brand alliance, including joint promotions (Rao, Qu and Rueckert 1999; Blackett and Russell 1999), dual branding (Levin and Levin 2000; Saunders and Guoquon 1997) and co-branding (Levin and Levin 2000; Spethman and Benezra 1994; Shocker 1995, Hillyer and Tikoo 1995). Other types can also be identified: composite branding (Park, Jun and Shocker 1996), affinity partnering (Swaminathan and Reddy 2000), complementary branding (Thompson 1998), symbiotic marketing (Varadarajan and Rajaratnam 1986), co-advertising (Bergen and John 1997), cross promotion (Varadarajan 1986), component branding (Venkatesh and Mahajan 1997) and ingredient branding (Vaidyanathan and Aggarwal 2000; Smit 1999; Norris 1992). In an earlier study,

Washburn et al. (2000) do not differentiate between joint promotion and co-branding, but define joint promotion as a co-branding strategy. It is evident that the concept of brand alliances is used quite broadly. However, it can also be used in a narrower sense, when co-branding and brand alliance, for instance, are defined synonymously (Keller 2003). In the following analysis, we use brand alliances in a broader sense. Following Aaker's (1996) approach, brand alliances can be differentiated into horizontal brand alliances (composite branding) and vertical brand alliances (ingredient branding). Vertical brand allies play different roles in the value chain (e.g. Intel as the supplier and Dell as the manufacturer), whereas horizontal brand allies belong to the same industry or similar product category (e.g. Häagen-Dazs and Baileys). Against this background, airline alliances can be classified as a form of horizontal brand alliances. However, they differ from composite branding, since they involve the creation of a new "master" brand (Blackett and Russell 1999). In our study, we refer to this new "master" brand (i. e. Star Alliance) as the *network brand*.

## Consumer Perceptions of Network Brands

Most recently, several studies have dealt with consumers' evaluation of brand alliances, focusing mostly on positive effects of brand alliances on the members' brand images (Washburn et al. 2004): Rao and Ruekert (1994) found that brand alliances can increase perceived *quality* of a *weak brand* especially in case of a service brand with an unobservable quality. In general, a second brand provides additional information for potential customers (Abratt and Motlana 2002). In this respect, the fact that the stronger brand is perceived to be willing to use its own reputation is accounted for a stronger signal of quality for a weaker brand (Rao et al. 1999, Park et al. 1996, Wernerfelt 1988). Therefore, Rao et al. (1999) propose that weak brands should join alliances of strong brands. In this case, consumers may assume that strong brands will only partner with other strong brands since managers will not risk damaging their own brand's favourable reputation (Levin and Levin 2000). Drawing on Simonin and Ruth (1998), it can be assumed that *each* partner's brand (i.e. also the strong brand) can benefit from spillover effects deriving from consumer attitudes towards the brand alliance. In contrast to these positive effects of brand alliances on individual brands, effects of entry or even exit of brand alliance members on the brand alliance itself seem to be under researched.

However, also negative spillover effects might occur if two brands engage in joint branding (Hillyer and Tikoo 1995; Washburn et al. 2000). In a series of experiments, Janiszewski and van Osselaer (2000) found that the value of one or both brands can be undermined in brand alliances, especially when novel brands join established brands. Pullig et al. (2006) state that even partners of similar product categories can harm each other if they are positioned on dissimilar attributes. But also a high degree of similarity instead does not protect brands from negative spill-overs. Dahlén and Lange (2006) found out that a brand can be affected by a crisis of another brand in the same product category. The effect is stronger the more similar the brand associations of the brand are. As Weber (2005) points out, services failures occurring with a partner of an airline might have a severe effect for the airline itself, especially if it has build up a reputation for a high service level.

## Travelers' Perceptions of Airline Alliances

In the case of airline alliances, network membership promises a number of additional benefits for travelers. Among the most cited ones in the literature are the extended number of connections, improved airport transfer processes and improved frequency of services (Weber 2005). Going along with increased safety standards (as a condition for membership), and the extension of frequent-flyer programs from single airlines to the entire network, it could be assumed that the utility of flying with a network member is likely to be higher than with a single airline. Nevertheless, empirical evidences of consumers' perceptions in the specific case of airline alliances are scarce (Weber 2002). Goh and Uncles (2003) found that travelers basically are aware of most of these benefits, especially concerning improved network access and frequent flyer program advantages. In an intercultural study conducted by Weber (2005), easier transfers between flights, smoother baggage handling and one-stop check-ins were identified as most important advantages for travelers.

Drawing on signaling theory, it can be supposed that a reputable network brand can successfully signal information that a weak brand could not communicate itself (Rao and Rueckert 1994, Gammoh et al. 2006). Empirical findings on the brand-alliance phenomenon (e.g. Gammoh et al. 2006, Rao and Rueckert 1994, Rao et al. 1999, Simonin and Ruth 1998) validate this interrelation. Thus, we propose that the announcement by an airline that it will be joining a well-known, reputable network, should lead to a more positive evaluation of the airline's brand image. However, empirical findings also suggest that established brands can be quite resistant to change (c. f. Keller and Aaker 1992; Lane and Jacobson 1997). In line with these findings, we expect the positive effect of network entry to be stronger for unknown (weak) brands than for known (strong) brands. The brand alliance, thus, will act as an endorsement for the unknown brand (Gammoh et al. 2006).

In contrast, consumers will have negative associations with an airline's decision to exit the network. For two reasons we expect that this negative effect will be stronger in the case of a weak brand leaving the alliance: First, referring to the change-resistancy-hypothesis, an exit should harm weaker brands to a greater extent than strong brands that are connected with more associations in the consumers' minds (Keller and Aaker 1992; Lane and Jacobson 1997). Second, we assume that consumers might give the weak airline the responsibility for the decision. Attribution theory (Heider 1958, Jones and Harris 1967, Ross 1977) provides a reasonable explanation for this: Consumers attempt to understand why an airline exits a network. In attributing a cause to this event, people are subject to a fundamental attribution error: Even if external or situational factors are evident which could provide a good reason for the airline's behavior, people tend to over-emphasize dispositional or personality-based explanations, if they do not favour the specific airline (i.e. weak airline).

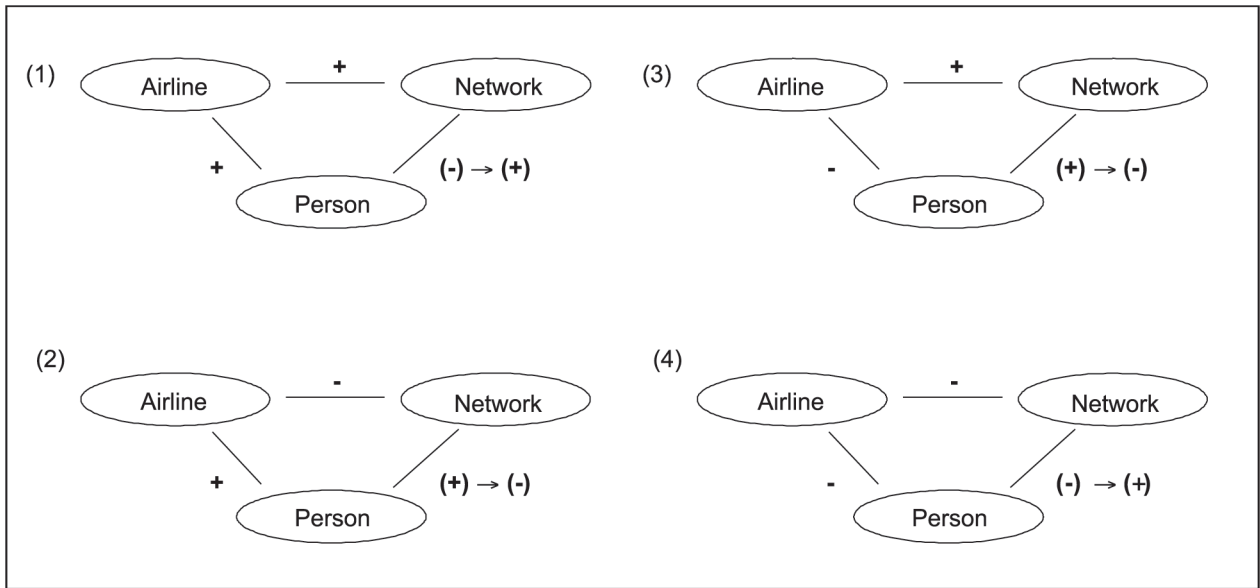
Hence, we hypothesize:

*Hypothesis 1a: The announcement of an airline to join the network alliance leads to a more positive evaluation of the airline's brand image compared to the announcement of withdrawal from the alliance.*

*Hypothesis 1b: The effect of entry (exit) on the evaluation of the airline's brand image will be more positive (negative) in the case of a weak airline brand.*

In an empirical study that compares single-brand advertising and joint advertising for both a weak and a strong brand, Dahlén and Lange (2005) found that brand attitude for the weak brand is lower in the joint ad and higher for the strong brand. This relationship is tautological, because one important characteristic of a strong brand, in contrast to a weak brand, is its favorable brand attitude. Therefore, in our model, we include a direct effect of the brand's strength on brand attitude without stating a hypothesis, but propose an interaction effect of brand strength with network entry/exit on the evaluation of the network brand. We use congruity theory (Osgood

**FIGURE 1**
Congruity Effects



and Tannenbaum 1955) as a theoretical explanation of this interaction effect. According to congruity theory, attitude change occurs in the direction of increased congruity within the subject's cognitive schema (Dean 2002). In the case of our research, we expect that the evaluation of the network's brand image after the announcement of the airline to join (leave) the network, will depend on the strength of the airline brand. We expect a positive (negative) effect on the network's brand image in the case of a strong airline brand deciding to join (leave) the network. The entry of an airline brand can be seen as having a positive relationship with the network brand from the consumer perspective (see Cases 1 and 3 in Figure 1).

In the case of the strong brand, consumers will try to balance their perceptions of the network brand in a favorable direction (Case 1). The striving of individuals for consistency will lead to a poorer evaluation of the network brand when a weak brand joins the network (Case 3). The same rationale is proposed for the cases when an airline decides to leave a network (Cases 2 and 4).

Hence, we propose:

*Hypothesis 2a: In the case of a strong airline brand, the announcement that the airline will join (exit) the network alliance leads to a positive (negative) evaluation of the network's brand image.*
*Hypothesis 2b: In the case of a weak airline brand, the announcement that the airline will join (exit) the network alliance leads to a negative (positive) evaluation of the network's brand image.*

In addition, we include flying frequency and participation in frequent flyer programs as covariates in our analysis to increase the power of the statistical tests. We expect that frequent travelers and participants of frequent flyer programs evaluate the image of the network brand more positively in all cases. Since the network provides utility especially to these groups, their attitude is likely to be more favorable than that of people who fly seldom or are not participants of a frequent flyer program.

Our conceptual model is presented as a whole in Figure 2.

## METHODOLOGY

### Sample and Data Collection

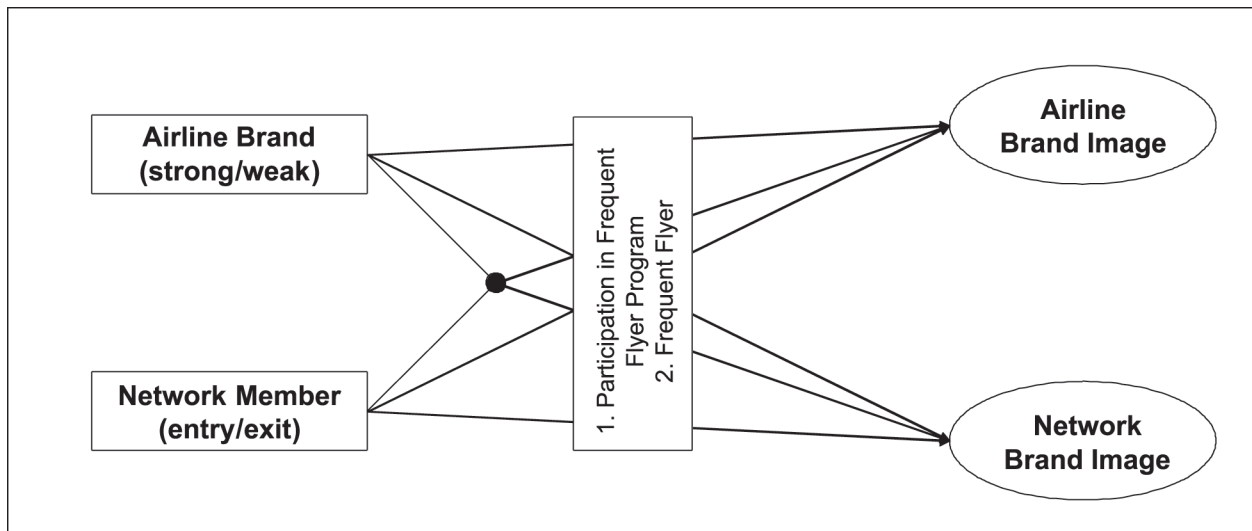
We tested our hypotheses in an online study using a web survey design. In contrast to face-to-face studies, online surveys do not require interviews to be conducted and therefore avoid interviewer effects that might be an issue in this research context (Duffy et al. 2005, p. 617). We developed an experimental fixed-factor 2x2 between-subjects research design. Our stimuli were four different fictitious scenarios which presented randomly to the participants as articles in a well-known and reliable German newspaper:

*Air France/ Aeroflot joins/ exits Star Alliance. As announced by officials in Frankfurt yesterday, Air France/ Aeroflot has become a member/ is no longer a member of Star Alliance. Star Alliance was founded in 1997, and currently has 17 members. Air France/ Aeroflot is an international airline which runs daily flights from 5 German airports to over 100 destinations.*

Two company brands from the airline sector (Air France vs. Aeroflot) and its membership status of Star Alliance (Exit vs. Entry)-as the largest and most prominent airline alliance with a market share of about 25 % (IATA 2005; staralliance.com)-were selected as independent variables. Network brand image and airline brand image were selected as the dependent variables. As stated, the tautological link–brand image as both the independent and the dependent variable–is not part of the study.

The sample was derived from an existing list of registered users of an online research portal which consists of more than 5,000 individuals who have registered their personal information (including email addresses). Invitations for participation in this study were sent out to 2,000 individuals, especially students in order to control the sample's homogeneity. A number of prizes were drawn in a small lottery, to ensure a high response rate. We collected data from 415 German respondents, equaling a response rate of 20.8 %, but had to eliminate questionnaires in which extensive data were missing. Almost 97 percent of all respondents had flown at least

**FIGURE 2**
Conceptual Model



once. The remaining 3 percent were retained for the analysis, since, in general, brand evaluations do not require brand experience. In contrast, brand awareness is an essential condition with respect to consumers' attitudes towards an airline brand. Respondents who did not recognize any or at least one of the examined airlines were excluded from the following analysis. Cell sizes over the four stimuli combinations ranged from 93 to 99. In order to reach an equal cell size for the MANCOVA analysis, some questionnaires were eliminated randomly, finally leading to a cell size of 93 for each stimulus and 372 in total. Most of the Germans respondents were either students (43 percent) or white-collars (42 percent), 5 percent were freelancers, 3 percent unemployed, 0.5 percent were housewives and 4 percent retired people, others accounted for 2.5 percent. The average age was 31.12 years; 58.3 percent were male, 39 percent were female (missing values: 2.7 percent). To check for possible biases due to heterogeneity across the four cells, the distribution of respondents' characteristics (age, participation in frequent flyer program, frequent flyer) was compared, revealing no significant differences in cell structure. A comparison of late and early respondents ruled out the possibility of non-response bias on the basis of response to a number of variables (age, flight experience and frequency, and means of dependent constructs).

### Questionnaire Development and Pretesting

In order to measure respondent perceptions with regard to airline brand image and airline network image, we generated a pool of sample measures based on a literature review. The items were pretested on a sample of 35 German undergraduate management students. These subjects did not participate in the following online survey. The respondents did not indicate any problems with respect to question content, wording, format, or layout.

In order to differentiate between strong and weak brands in an airline context, we conducted a pilot study. The examined airlines had to meet two main criteria: high level of recognition, and no association with a specific airline alliance. Indeed, Air France is a member of SkyTeam Alliance but barely associated in this context by German consumers. Aeroflot has also been a member of the same alliance for a short period of time. However, they joined SkyTeam after the survey was conducted. As the main result, Air

France was evaluated as the strong, Aeroflot as the weak brand. Additionally, we found out that Star Alliance had a favorable network brand image.

**Measurement**

We measured attitude-related variables with multi-item scales. We took 5 items that are regularly used in the literature (e. g. Keller 1993, Mitchell 1986) to measure both the general image of the airline brand and the network brand (brand image: $\alpha=.889$; $\rho c=.895$; VE=.682; network image: $\alpha=.912$; $\rho c=.915$; VE=.731). As covariates, participation in a frequent flyer program and flight frequency is included. All items except the dichotomously coded covariates were measured on 7-point-Likert-type scales, with anchors of 1=strongly disagree and 7=strongly agree.

The measurement reliability of the reflective constructs brand image and network image, was examined through a confirmatory factor analysis following an explorative factor analysis, each with half of the sample (n=208, 207 respectively). It can be noted that composite reliabilities for the three reflective constructs exceed 0.6, the generally recommended threshold (Bagozzi and Yi 1988). Moreover, discriminant validity between the constructs is given, since none of the squared correlation coefficients between any of the constructs exceeds the average variance extracted for a construct (Fornell and Larker 1981).

## RESULTS

A manipulation check verified that subjects evaluated Air France more favorably (MV=4.95; SD=1,37) than Aeroflot (MV=3,09; SD=1.53), indicating a difference significant at below the 1% level. For the entry-exit variation, a manipulation check was not carried out due to its dichotomous nature. The effects of brand and network entry/exit on the dependent constructs were tested by conducting a MANCOVA. Two covariates (participation in a frequent flyer program and flight frequency) are included in the model. We use factor scores as values for the dependent constructs. We checked for the required assumptions discussed in the existing literature (e. g. Tabachnik/Fidell 2001).

Results of the MANCOVA indicate significant main effects and a significant interaction effect. The influence of the covariate

**TABLE 1**
EFA of the Dependent Constructs

| Item | Factor Loading (>.5) | |
|---|---|---|
| | Airline Brand Image | Network Brand Image |
| [Brand] is reliable | .906 | |
| [Brand] is likeable | .913 | |
| [Brand] is a very good brand | .923 | |
| [Brand] is a very attractive brand | .897 | |

***p<0.01; **p<0.05; *p<0.1; MV=Mean Value; SD=Standard Deviation

pation in frequent flyer program" yields the 5.9 % level of a middle-sized effect). As can be seen from Table 4, the main effect of network entry/exit is significant for the airline brand image. The effect is small (Eta-Square of 1.4 %). The image of the network brand (Star Alliance) is influenced by an interaction effect (airline brand * network entry/exit, Eta-Square: 1.5 %). In contrast to our proposition in $H_{1b}$, we did not find a significant interaction effect on the airline image. Therefore, $H_{1b}$ must be rejected. Participation in a frequent flyer program influences both dependent constructs with a small effect on airline brand image (Eta-Square: 1.7 %) and a moderate effect on network brand image (Eta-Square: 7.8 %).

Lastly, we conducted post-hoc tests to determine whether the hypothesized effects work in the proposed direction. As depicted in Table 5, the statistically different factor score means of the airline brand image confirms the choice and classification of the brands as "strong" (Air France) and "weak" (Aeroflot). Network entry/exit has a significant main effect on airline image. The announcement that the airline joins the network alliance leads to a more positive evaluation of the airline's brand image than the announcement of withdrawal from the alliance. This finding confirms our hypothesis $H_{1a}$. Since the image of the network brand is influenced by an interaction effect, network entry/exit must be analyzed in both cases for (1) a strong brand and (2) a weak brand. The image of the network brand benefits (.11) (suffers, -.14)) significantly from the decision of a strong airline brand to join (leave) the network. In the case of a weak brand, an entry into the alliance leads to a poor

evaluation of the network brand (-.07), in contrast to the announcement of withdrawal (.08). However, the differences are not statistically significant. Therefore, $H_{2a}$ can be accepted while $H_{2b}$ must be rejected.

## IMPLICATIONS, LIMITATIONS, AND FUTURE RESEARCH

Networks of independent service companies have increased in importance over the last few years. Given the dynamics of such networks (Weber 2005), the purpose of this study was to gain an insight into the effects of network entry/exit on the perception of service brands and of the network brand in the airline industry. Our results indicate a significant positive (negative) main effect of an announcement of a strong brand's network entry (exit). This finding is important for airline brand management. Since some conflicts among network partners or strategy shifts (e.g. in the case of Aer Lingus) are likely to occur over time, the airline should be aware that the decision to withdraw from an alliance has negative effects on the consumers' perceptions of the airline brand. Communicating the reasons for withdrawal could diminish the image loss, depending, of course, on the nature of these reasons. If consumers understand and accept the reasons for an exit from an alliance (e.g. adoption of a "no-frills" strategy that does not leave room for standards like business class seats, that are required by an alliance), a negative impact (e.g. perceived lack of quality) of the specific airline is less likely.

Moreover, the interaction effect of the entry (exit) decision with a strong airline brand on the image of the network brand indicates that the network brand image is much more fragile when a strong brand announces a membership change. While the entry of a strong brand leads to an improved evaluation of the network brand, the opposite occurs in the case of a weak brand. However, the effects in case of a weak brand are smaller. This means that the network brand image is more resistant if smaller airlines change their network membership status, probably because the network brand is associated with stronger brands in the minds of consumers. Therefore, the network brand management must avoid the loss of strong brands, in order to maintain the reputation of the network. This might be especially critical when the considering brand is the only partner in a certain market (e.g. Varig). In the case of a weak brand, network brand management can demand rigorous terms and conditions, without the risk of harming the network brand in case of withdrawal. This finding is somewhat critical for the brand management of weaker airlines. In the long run, especially participants of frequent flyer programs will expect the airline to be part of an alliance as a qualifying criterion (Dudley and Choueke 2006). This fact will put pressure on smaller airlines that have not decided to join a network yet but also do not want to operate as a "no-frills"-airline. Therefore, building of alliances might be only an intermediate step toward a further consolidation in the airline industry.

Our findings may be relevant as well for other forms of alliances, e.g. participating companies in loyalty card programs (e.g. payback, a loyalty program with more than 18 participating retailers and other companies in Germany). Smaller partners may–in the long run–in fact face the same negative consequences on their brand image when deciding to leave the loyalty program.

Further research should focus on communication strategies for brands in the case of an exit from a network. Attribution theory (Settle and Golden 1974) and congruity theory (Osgood and Tannenbaum 1955) could provide a suitable theoretical basis for experimental studies related to this problem. Additionally, the influence of a change in network membership status on other brands in the network could be analyzed. Especially for strong brands in their domestic markets, there is a potential risk that their superior brand image is transferred (partly) to the network brand and, over the long run, transferred to weaker brands. Because network alliances generally suffer from a lack of control, such strengthened brands constitute a threat if they change to another network. The long-term effects of image transfer from strong partner brands to the network should be analyzed longitudinally. Furthermore, replications with different brands in different service industries and consumer segments are needed to confirm our findings. Finally, brand image as an attitudinal construct, should not be the only dependent variable. Factors that influence the brand image of both companies and networks like alliance orientation (Kandemir, Yaprak and Cavusgil 2006) and outcome variables like market performance should be analyzed in a multi-level setting.

# The Entropy of Symbolic Consumption: Demand Side Market Failure and the Counterproposals

Soonkwan Hong, University of Texas-Pan American, USA

## ABSTRACT

Consumers have developed the ability to signify through forced withdrawal and the subsequent convalescence of identity. Nevertheless, consumers still have to manage their own intricate dilemmas in which they have to confront the exogenous and endogenous symbolic conditions, dictating their modes of being in late-modern society. The concept of entropy is employed in order to aid the meditative understanding of consumer cultures witnessed today. Dependent upon consumers' ability to signify and urge for distinctiveness, four different modalities of entropy are conceived, and each mode of entropy tends to further form certain types of consumer cultures, which are prospective counterproposals devised for surmounting the consumers' perception of market failure.

## INTRODUCTION

Consumer culture has evolved such that symbols and images are ubiquitous and easily utilizable, therefore, symbolic (e.g., Baudriallard 1990; Firat and Venkatesh 1995; Holbrook and Hirschman 1982; Holt 1997; Levy 1959; Schouten 1991). Often, the available images and symbols are the fuel for self-representation, expression, and identity-reconstruction (Belk 1988; Kleine, Kleine, and Allen 1995; Schouten 1991). Material goods and fashion items are widely employed resources for constructing self. Nonetheless, this energy for self-identification may be limited or possibly exhausted in current consumer culture. In order to examine this phenomenon of energy depletion in the market, we shall use the concept of entropy introduced by Rifkin (1981, p. 35) as "a measure of the amount of energy no longer capable of conversion into work…. an entropy increase, then, means a decrease in available energy." Using this concept of entropy, this paper explores the different conditions that can lead to the depletion of energy in consumers' efforts in constructing their identities. Market failures have been observed, such as the bubble economy in Japan caused by low interest rates, even when the market is expected to control and overcome any imbalance of and impediment to the mechanics of the market system, as Smith (1991) and Ricardo (1817) contended. Economists have been concerned with micro-economic market failure, where information and opportunity are not evenly distributed so that the market cannot sustain perfect competition leading to equilibrium. This study is particularly interested in a new type of market failure in which consumers have to struggle for their sources of identity–theoretically sufficient in the market–in order to have distinct self-identity constituted through discernable artifacts (e.g., Thompson and Haytko 1997). This demand side market failure encountered by contemporary consumers may not be easily recoverable; thus, it is of interest.

Discourses on self and identity have been widely published in consumer studies (e.g., Schau and Gilly 2003; Tian and Belk 2005). Studies regarding the self and the individual efforts to be idiosyncratic may, however, have failed to fully recognize consumers' uneasiness. Namely the burdens of self-signifying and/or self-valuing involved in consumer identity projects, which have been understudied, could constitute focal themes in the literature (e.g., Arnold and Thompson 2005). The self-concept, or identity, is explained and defined in various ways in the literature. The self-concept commonly denotes the holistic array of rational and emotional abstractions including signs, symbols, possessions, and relationships (Belk 1988; Schouten

1991), whereas definitions of identity tend to be oriented toward distinctions from others (Kleine et al. 1995; Schau and Gilly 2003). That is, self-concept inhabits the more cognitive and holistic realm than does identity, which distinguishes one from others, and therefore, is observable and symbolic. Accordingly, identity projects are geared toward consumption of various symbols and images in order to build discernible personas by signifying the seemingly ever-increasing means of identity construction. Here, signification refers to the cultural imbuement of meaning(s) upon consumer goods and/or experiences available in the market so that they can become constituents of one's identity.

Corresponding to Foucault's (1984) "free floating" identity and Baudrillard's (1981) eye-opening explanation of symbol-dominant consumer culture, consumers began to execute metamorphoses and self-proliferation in order to adjust to rapidly changing present-day life. As consumers take the transformability of identity for granted, they may encounter more and more difficulties in securing resources and creatively and playfully generating novel identities. This is the argument developed in this essay. Adoption of the concept of entropy helps in further diagnosing the potential anguish of consumers.

Entropy, in this context, refers to a state where consumers are frustrated when there is a perceived necessity to continuously reconstruct and modify their identities, but available resources (signs and images) are already utilized by others, insufficient, or mismatched with the selves they wish to present. Entropy may also arise due to consumers' inability to perform significations as they need. By adopting the concept of entropy, the drives of current consumer cultures can be successfully explained with respect to specific factors creating entropy and further theoretically categorized according to the different entropy situations, which is hard to accomplish otherwise.

Consumers who are frustrated and intimidated by the paucity of identity resources and the ever-continuing nature of identity project may start looking for means to lessen their difficulties in securing resources and even substitute novel consumer cultures for their identity projects. Once consumers find their own mechanisms–newly evolved consumer cultures accommodating to different types of entropy consumers encounter–instead of the market where consumers exchange money for signs and symbols for their identity, they may proclaim them as counterproposals for the market, which seems to have lost its ability to suffice consumers' demand for identity resources.

## HISTORY, THEORY, AND CONSEQUENCES

### Dispossession of Identity

As individuals sold their labor and skills for their own living in the modern era, they had to specialize in one occupation that had a value in the market, which, in turn, meant one's labor was commodified (Jennings 1993). Commodified labor pertains to the monetarization, quantification, and depersonalization of one's labor as well as the relative dissolution of intimate interpersonal relationships, as Tonnies' (1957) observed the conversion from *Gemeinschaft* into *Gesellshaft*. Deeper meanings and commitment to cultural interpersonal relationships had to be ignored in order to construct the market system, cultivating discrete monetary exchanges

that made individuals individual. Modernized market system tended to subjugate individuals to the goals of rational conquest of nature and socially organized production, which was the most valued aspect of modern life (Slater and Tonkiss 2001). This production-orientation has ultimately led to a high entropy culture where material resources become scarce due to destructive and ruthless creation of culture, as opposed to nature, through demolition of nature and intact surroundings (Rifkin 1981). At the same time, resources for individual imagination and creativeness for superstructure–a structure based on interpersonal relationships and cultural meanings–development might have been ignored and buried with the debris from material advancement.

It has been argued that as a result of calculation, monetarization, and objectification of the individual for a smooth navigation toward the promised future, individuals were widely disenchanted; they lost meanings, values, trust, and even the freedom to control themselves (Giddens 1991). Individuals, who acted in a mechanized marketplace where cultural, emotional, and psychic resources were largely limited, found it difficult to quench their desire to verify their beings in society. At the same time, their ontological insecurity from the loss of trust, as well as personal meaninglessness in society amplified and intensified the need and/or desire to project an identity (Beck, Giddens, and Lash 1994; Giddens 1991).

### Recuperation of Identity

Modernity fostered the focus on individuals who were freed from their destiny, which had been fixed and imposed in pre-modern times (Baumeister 1986); however, this resulted in paradox because cultural aspect of individuality was not encouraged and even banned for modernization. Diverse and liberal individuality could only be legitimized, inasmuch as it is supported by rationality. Individuality in terms of production-oriented perspective was buoyant; on the contrary, that of cultural side was dejected. Economic drive confined the merit of cultural diversity and uniqueness, but the longing for self-identity was still valued (Giddens 1991).

Once goods started being consumed publicly and conspicuously for the societal classification of individual (Bataille 1991; Veblen 1899), culturally valued goods (i.e., luxuries) started being welcomed and appreciated. Culture resurrected as a *sine qua non* for everyday economic life that had been constituted with only reason and logic. With the re-recognition of diverse cultural and human meanings and values and its aid for signification essential in late modernity, individuals have been enabled to seek self-images that differ from the constant, homogenized, transparent, and ultimately mechanical identity stressed in modern era for the achievement of stable productivity (Firat, Dholakia, and Venkatesh 1995).

Consumers' quest for hunting images and signs is to arbitrarily (culturally) signify goods, spectacles, and even experiences in order to respond to the myriad panoramic social contexts (home, work, street, shopping mall, and so on) with ever newly defined, reformulated, and multiplied identities (Deleuze and Guattari 1987: Firat and Venkatesh 1993). Consumers eventually become slaves of sings and symbols, which are culturally concretized through the materials in the market; a considerable portion of consumption is associated with the consumers' engagement in signification (e.g., Levy 1959).

The nature of the identity project in late-modern epoch is consumptive and possessive (Belk 1988; Featherstone 1995; Kleine et al. 1995; Thomson and Hirschman 1995). Self-concept and social relationships are recouped and revitalized through the consumption or possession of material goods (Wallendorf and Arnould 1988). Things are merely means instead of ends; thus, exchange and use value have been eroded due to the rise of sign value (Baudrillard 1981). Bestowing symbolic meanings upon things in the market is one of the dominant modes to distinguish oneself from another and eventually establish identity (Beck 1992; Belk 1988; Giddens 1991; Kleine et al. 1995). Consumption becomes the prevailing theme in the marketplace because of the possibility that everything, including culture, can be consumed (e.g., Firat 1995) and exploited for individuals' identity projects. Experiences of Thai food and Japanese style Karaoke are the examples of the consumable cultures employed by consumers who endeavor to accomplish their identity projects. In sum, identity is retrieved by repossession of substantive human values and utilization and consumption of them through symbolic encryption in order to construct self-images for constantly changing surroundings.

### Kaleidoscopic Identity

Identity today is neither inflexible nor authentic; rather, it is inconsistent and possibly contradictory to the stable selfhood encouraged in modernity (Firat et al. 1995). With the fluid images ubiquitously available, consumers entitle themselves by reorganizing and even distorting the meanings of commodities (Bouchet 1993; Warde 1994). The identity constructed is always subject to alteration, mending, upgrade, and tuning. Reflexivity of identity is described as the continuous revision of self and the temporariness of each identity to be amended and further disposed to accommodate environmental changes through information and knowledge (Giddens 1991). All of these are possible partially because of the individual capability of transforming and mostly because of the unprecedented range of symbols and images cultivated by cultural surplus, which denotes the variety of cultural manifestations and the following appreciation (Willis 1990).

Clinging to a single identity may be undesirable and practically impossible; frequent transfer from one to another identity is now a viable management of one's identity in the postmodern world (Gergen 1991). "Multiphrenia" may be the only solution to keep relating one to the world. It is hard to pinpoint which identity is the quintessence of self. Indeed, all identities embraced and expressed are neither focal nor peripheral; rather, each identity can bear abundant meanings and practicality when one actually immerses in the identity. Multi-layered or multifaceted identity is actualized by owning multiple possessions (Markus and Nurius 1986) or with the assistance of technology (Schau and Gilly 2003). Fragmenting and populating self with multiple identities are the imperatives for individuals today (Gergen 1991). Living in a world of a multitude of contexts has become inconceivable without practicing identity production and reproduction.

Reflexive identity and the notion of multiphrenia are clearly idiosyncratic from each other, but they also share a substantial commonality. Both demand much energy in order for consumers to revise or create a new or another identity. Accordingly, entropy is present in consumer culture. Current consumer culture, in which material items, texts, images, and spectacles to be transmuted (most importantly) into identities, demands a virtually infinite amount of "raw materials" to blend with (Kozinets 2001), just as modernity had to consume too many material resources, which ultimately leads us to destitution of physical energy, entropy.

## DETERMINANTS OF ENTROPY

### Urge for Distinctiveness

Identity projects are individual efforts to create distinction through cultural signification. Creating a distinction is the only way to define self; constant "othering" needs to be conducted for identity construction (Hetada 1998). It should be noted that legitimization

processes that validate one's being in a society are still necessary (Bauman 1991; Elliott 1998). It is always the case that two aspects of identity–self and the social–dictate the allocation of symbolic resources and the identity to be created (e.g., Grubb and Grathwohl 1967). In their discourse on fashion as an identity project, Thompson and Haytko (1997) have addressed the dual-meaning of identity construction: conformity and counter-conformity, which may be the eternal paradox of postmodernity. Nevertheless, conformity does not always mean absolute compliance with the public; instead, counter-conformity may become conformity when most consumers choose to digress from the standard (Bouchet 1993). Therefore, it is not the nature of conformity but rejection by others that creates consumer apprehension.

In line with the notion of conformity/counter-conformity, the synchronized adaptation to and withdrawal from dominant cultural representations may characterize the present consumer culture (Roosens 1989); however, consumers may choose signification when they build their identities instead of a mere purchase of planned symbols for the affirmation of belongingness to society. Being distinctive is the reason to buy, and differentiating oneself from the other may be the only perceived method to define self (Gabriel and Lang 1995; Thomson and Haytko 1997).

Distinction is to make cultural errands and chores as Bourdieu (1984) contends with his notion of "habitus." Although the meaning of social class has perished because of the standardized material goods and "widely-possessed" brands we own, the need for social class still remains with different lifestyle choices. The material and quantitative differences become less relevant to the present day of life whereas the cultural and qualitative differences have risen to be critical. Again, Bourdieu (1984) underlines the criticalness of symbolic capital–which originally means the possession of prestige that ultimately entails a distinctive identity–essential for making differences. Hence, symbolization and distinction go hand in hand.

The urge to be distinctive is, to a certain extent, hereditary and instinctive. The space between an infant and his/her mother is the first imprinting source of distinction, and the space between individuals may have to be more distanced with regard to culture and symbols (e.g., Giddens 1991). Similarity to others gives much tension to late-modern individuals to think their supposedly sole and authentic identities are menaced; therefore, more efforts are made to be distinctive, often with different possessions (Snyder and Fromkin 1977). Consumers concerned with their identities opt to stop wearing or displaying their possession once too many others have the same items (Thompson and Haytko 1997). The point at which consumers begin thinking about their threatened identities tends to be sooner than before due to technology and media. Therefore, the need for distinctiveness disperses faster and more intensively.

The urge for distinctiveness is the individual endeavor to be a differently (culturally, arbitrarily, and symbolically) defined entity in diverse contexts inhabited by potentially similarly identifiable others. Signification is the preponderant mode amongst the modes adopted for the discerning mission of individuals as Derrida (1977) noted. The only question the contention bears is if all individuals are fully capable of engaging in signification for their own identity projects. In turn, the urge for distinctiveness is not a sufficient condition for the entropy of symbolic consumption (dearth of symbolic resources), but a necessary condition.

### Ability to Signify

Consumers can express and claim themselves so long as their behaviors and activities can be justified with a variety of rationales. There are, however, individuals who still cannot blissfully partake in the process of enriching consumer culture for their own sake due to their lack of experiences, skills, and even the audacity to translate goods, fashion items, texts, images, and spectacles into their own monopolistic signs, representing their identities. The lack of ability to signify can be either inherited or deprived, but the consequence may be the same, refusal from society when the signification is poorly implemented and delivered to others, or a sense of shame from the failure to be identified (O'Donohoe 1994).

The complexity and equivocalness of symbols suppress and discourage the trial and error of a novice as a "signifier" who would have, otherwise, been able to originate new signs (e.g., Deleuze and Guattari 1983). As such, there are certainly individual differences in ability to signify, which enunciatively refer to the self-efficacy to choose to value symbolic and cultural meanings more than practical and instrumental ones and subsequently create idiosyncratic identity through signification with the mundane; it is also counterbalance to capitalist control over individual identities. Along with the urge for distinctiveness, ability to signify contributes to the potential demand-side market failure situation named entropy in symbolic consumption.

### MODALITIES OF ENTROPY

Different levels of urge for distinctiveness and ability to signify create distinguishable entropy states that influence the formulation of a range of consumer cultures accommodating to the conditions perceived by the individual signifiers seeking identities. Complexity and multiplicity in consumers' predispositions and aptitudes yield a relative position of being in diverse consumer cultures rather than a position demanding absoluteness. Each consumer culture–formed by the significations performed by individuals and the succeeding recognition of other individuals– tends to adapt to the cultural and economic environment in which the cultural signifiers reside; thus, the appearances of the cultures formed by distinct conditions of entropy may vary from each other, yet the motivation is the same for all, frustrations of symbolic consumers.

### Equilibrium

This is the condition in which there is the least or no frustration perceived by consumers because they have neither competence in symbolizing nor strong drives to be distinctive. These consumers may have a tendency not to deviate from what others think, express, and wear; consequently, it becomes illogical for them to identify themselves with arbitrary signification that may generate repudiation from others.

Consumers with this condition live in the panopticon where the market enforces consumers to obey what is offered and not to be imaginative for their own identity project (c.f., Foucault 1977). By taming consumers' cultural and artistic capabilities and further regulating emancipatory self-expression, the market was able to homogenize consumers successfully (Kozinets 2002). Marketing messages exposed or purposefully delivered to consumers through various media were the most representative and influential means intended to control consumers' departure from the planned market offers. Consumers started being compelled to desire certain cars, eat certain foods on specific occasions, and go certain places for vacations. The fact that many consumers fall into this category evinces that the market's control over consumers succeeded to the extent to which consumers listen to the market. Deprived consumers in terms of cultural and symbolic supplies have surrendered to the market and have conformed to what the market orders and offers. This is a paradox in modernity by which the market had to offer varieties for individuals, and at the same time, it also had to limit

**FIGURE 1**
Modalities of Entropy

Urge for Distinctiveness

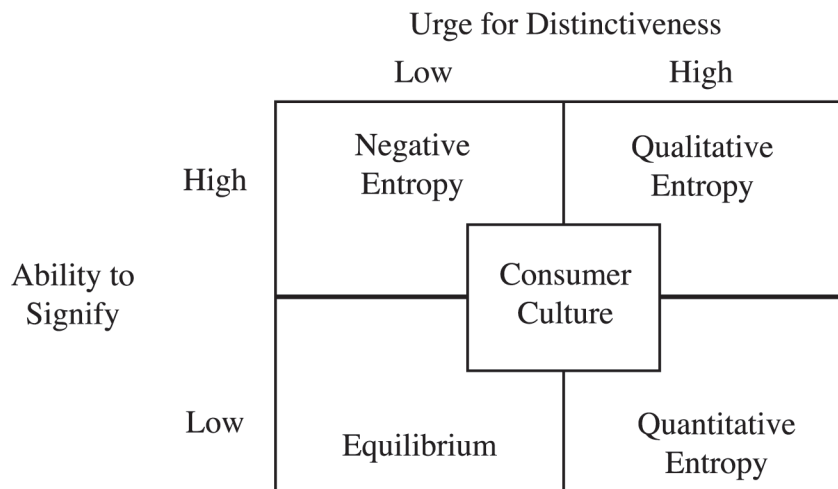
Ability to Signify


consumers' imagination in order for mass-production of limited number of products, which may not be enough sources for individual identities.

In the equilibrium state of symbolic consumption, the conventional functions and requisites of the market are still in place; thus, consumers are contented because they bear no opposition to the market as a modern institution. The market is still hegemonic and provides the sources, not for signification for identity, but for consumers living in a prosaic and flavorless world in which their identities are controlled by the market system. Perhaps, the consumers who live in this condition may well be able to corroborate the notion of impossibility to escape the market (see Kozinets 2002).

**Negative Entropy (Negentropy)**

When consumers have substantial ability to signify without or considerably less urge for distinctiveness, the energy for symbolic consumption tends to increase, or at least not to decrease because the resources are not used for monopolized identity projects. Many resources remain intact because this type of consumers may not object to being identified in similar ways that others use to identify themselves; instead, their ability to signify continuously generates ideas for others to utilize and signify the ideas for their identities. Consumers with high ability to signify with relatively less urge for distinctiveness enjoy the generation of signs without the apprehension of exploitation. Accordingly, consumers may form communities in which they share their ability to signify with people who might have different talents in terms of signification. They focus on a commonly signifiable code among the cryptographies they have created individually. Consumption of the code together may become the fulfillment of their identity projects.

The contradictory endeavor of consumers to find individual identity in a collective milieu produces a shared, yet considerably meaningful affiliation to each partaker. Brand community, as Muniz and O'Guinn (2001) witnessed, is the playground of consumers who want to create their own identities by interactively and critically conversing with others. The dialogue may be utilized in order to corroborate their authentic existences by the corroborated identity they share, or to upgrade their current identity with the aid of others' ability to signify, producing resources by consuming the same brand in various ways. The synergy from the accumulated individual ability to signify in communities is possibly tremendous, and it would be the rationale for them to share.

Technology facilitates the dialogue to be prompt and widespread, and therefore fruitful. Online communities, including online brand communities, emerge as the perception of cross-shared or "pay-per-view" type of identity spreads among consumers. The disclosure, establishment, modification, and transmutation of one's identity in online communities become a new agenda for current consumers (e.g., Moon 2000; Schau and Gilly 2003). By being commodified and consuming others who have also been commodified in the online communities, consumers produce their identities. This type of consumption has also become a culture where the identity project is neither entirely individual nor necessarily communal.

Another "neo-cyber-community" is observed more often than ever before. The blogosphere is a "metacommunity" in which consumers invest their ability to signify in the community with the pursuit of obtaining an exponential return on the investment, and consequently, they can obtain countless resources for their identity projects in the community. This metacommunity has observable and extensive potential to transform into a prevailing consumer culture that embraces the ideas of brand community and hedonic consumption. The Korean blogosphere has already become "multi-purpose" by being brand communities, knowledge distributors, personal relationship managers, and recreational areas. The seeming reasons to partake in the metacommunity may also be to identify oneself intellectually and/or hedonically with the infinite contact with anything and everything.

**Qualitative Entropy**

Although consumers can demonstrate their ability to signify, it may not be vigorous enough to unload the yoke of constantly distinguishing oneself from others. Put more simply, the urge for distinctiveness (for the consumers with high ability to signify and strong urge for distinctiveness) exceeds the ability to signify. The gap between the two different conditions generating entropy may have become more substantial as late-capitalists' exertion to direct consumers' meaning creation process is intensified. This condition

is called qualitative entropy, in which consumers feel frustration because they cannot produce or secure quality signs or symbols for a better distinction from others.

The capitalists' and modernists' control over the individual was almost actualized–although not for long and not for every individual–through a phenomenal and strongly influential mechanism, advertising. Williamson (1986) recognized the fact that advertising is too hegemonic for consumers to digress from the imposed meanings; simultaneously, it is also improbable for marketers to control all the potential deviations perfectly. Notwithstanding the ongoing friction between consumers and marketers, the loser in this dynamic would be consumers because they have lost their ability to signify while they negotiate with themselves whether they have to kowtow to the meanings provided or not. Living in late-modern society is living in a culture where consumers have to keep switching gears from obeying to diverging or *vice versa*; in other words, it is dual-core interlaced meaning generation methods with which consumers of today have to juggle (Langman 1992; Martin-Barbero 1988).

The marketers' imprint of meaning on consumers and the consumers' perceived quandary between compliance and dissatisfaction with the offer from the market have eventually atrophied consumers' imagination, and hence the ability to signify. Signs had to be created in order to sell the goods to the masses who sold themselves to buy the goods they produced, and advertising is the sign system that handled the task well and generated homogenous answers for everybody. The system allows consumers to be creative, provided the imagination is confined to the market. Consumers had to start taking the fact for granted that they have no choice for identity but the offers, goods, materials, and objects suggested–actually enforced–by the market. In order to be harmonized with the market system, consumers had to submit tamely to the systematic manipulation of their self-expression (Baudrillard 1975), which ultimately depreciates the ability to signify. This "semiological determinism" (Kellner 1989, p. 51) is the very reason consumers have lost their competency.

"The body is less and less an extrinsic 'given', functioning outside the internally referential systems of modernity, but becomes itself reflexively mobilized" (Giddens 1991, p. 7). The last resort for consumers perturbed by the fact that their ability to signify cannot support the quality requirements of urge for distinctiveness may be manipulation of the body. Reflexive modernization expands itself to the divine territory, fixed and inborn body. "The body itself-as mobilized in praxis-becomes more immediately relevant to the identity the individual promotes" (Giddens 1991, p. 218). The body becomes a subject to play with in association with one's reflexive identity. It becomes necessary to shape, upgrade, change, and even distort the body for the sake of identity. Nonetheless, the body needs to be worked upon to the point where others can easily observe, and the owner can claim the one and only identity with the body when it becomes each one's identity symbol. "Flamboyancy complex" is the symptom often observed among consumers in the qualitative entropy. In order for them to be identified, making their bodies salient and vivid is the most persuasive and promising attempt.

The flamboyancy complex of consumers in qualitative entropy state may be the rapprochement of body and mind isolated from each other in modernity (see Firat and Venkatesh 1995 for body/mind dichotomy). The identity project became an arena where body and mind cooperate with each other for originality and/or uniqueness. Tattooing is the most prominent flamboyancy complex among its kind. While it connotes the self-segregation from mainstream society and transgression, it converges upon the identity project in the end (Bengtsson, Ostberg, and Kjeldgaard 2005; Kjeldgaard and

Bengtsson 2005). Although tattooing itself may be overly universal for "identity seekers," it still provides discriminating power. That is, a tattooee's idiosyncrasy will be vividly recognized by other tattooees, and the opposite is also true (Kjeldgaard and Bengtsson 2005). It is counter-conformity through conformity. It is also sacralization of the profane and coincident secularization of the sacred. As mundane images permanently printed on the body, the images become mystified; mind–the sacred–shakes hands with the body, the secular (Bengtsson, Ostberg, and Kjeldgaard 2005). In this paradoxical context, tatooees constantly pursue their social identity in a limited sense and individual identity in an extended sense.

Consumers' reflexive re-construction of the body as identity project is not confined only to tattooing, or decorations on the body; rather, the re-definition is expanded to the distortion of the body, a denial of the "given." The body is consumed reflexively in order to produce a new and distinct identity (Askegaard, Gertsen, and Langer 2002); the market facilitates consumable bodies through which consumption/production dichotomy is again contested. The body is an ever available source to be worked on; thus, the plastic surgery industry prospers.

Cosmetic surgery has been practiced by those who want to manipulate seriously their bodies as venues for self-representation and the ultimate reservoir of identity. These consumers treat the symptoms of identity obsoleteness or overlap with others by creatively or radically implementing fluid bodily images on their bodies. The fluid becomes permanent; however, the permanent is also to be worked on later. The constant reconstruction of body images presages the never-ending mission of these consumers. The reflexivity imposed upon consumers' bodies culminates when the bodily images start overlapping again with those of others. Being flamboyant through bodily images begins meaning the possession of a cultivated and fetishized body upon which consumers can draw whatever and whenever they want to express (c.f., Belk 1988).

## Quantitative Entropy

Consumers with a strong urge for distinctiveness but with low ability to signify face a situation in which they begin to seek ready-made offers in the market with which they can easily work on signification for their identity projects. The eye-catching offers are readily available in the places such as retail spectacles (Kozinets et al. 2004), amusement parks, and other tourist attractions featured with visuals and virtual experiences claimed to be hyper-reality (Firat and Venkatesh 1995).

Consumers of this kind may be more vulnerable to the seduction of the market system as they realize their relatively low ability to signify and thus strive to gain as many sources as possible for their identity. The stimuli–which become consumers' sources for identity projects–that can be observed and experienced in those places more directly and vividly inspire consumers with low ability to signify to engage in pseudo-signification (signification that requires minimal efforts from consumer), which might not be possible otherwise. Thematized and suggestive market offers in those places differ from the offers from other resources in that the offers from the traditional and modern market outlets are discrete from each other and less suggestive. Consequently, consumers with low ability to signify may have to fumble around each offer in order to examine the usability of them and comprehend the indicated meanings of the market items or experiences.

Those luring places may be a blessing for the consumers who live with quantitative entropy due to the fact that the places also provide consumers with so much fun, which entails fantasy and escape from reality where they are apprehensive about their low

competency in signifying (e.g., Kozinets et al. 2004). Consumers who visit such places may be able to obtain distinctiveness without having to substantially signify. This "free-ride" can be accomplished through automatic acquirement of a decoration that separates people with it from the without. An IKEA fanatic may claim him/herself to be distinctive as do people who have been to Universal Studios. Consumers with little better ability to signify may attempt to take a bolder move. Since the experiences in those places need to be spoken in order to become a valid means of differentiating oneself from others, consumers try to visually display their experiences. Souvenir shops are the beneficiaries. Wearing SeaWorld San Diego or Hard Rock Café Paris t-shirts or caps replaces their lack of ability to signify.

Consumers who perceive the quantitative entropy employ the available measures in those places to develop their identities and ultimately make distinctions because they admit their incompetence in signifying. This realization of the consumers, however, does not assist them to propose a valid alternative for the market where they have difficulty to signify the sources available for their identities. Rather, they regress to the market system without full consciousness. The regression to the market could be a result of well-devised retaliation or counterattack of the market to the consumers susceptible to marketing attractions represented by thematization, playfulness, spectacle, and virtual reality. Quantitative entropy leads consumers of this kind to welcome enclaves (i.e., places aforementioned) inside the panopticon (the market) *vis-à-vis* that of Foucault (1977) and declare each of them to be an exodus from the market.

## CONCLUSIONS

Consumer cultures have been acclimatizing to an unconventional and transient milieu in which consumers feel peril from the drought of resources for identity construction and the succeeding management. The concept of entropy adopted in this essay facilitates the understanding and explanation of the nature of new consumer cultures as alternative identity projects. Dependent upon four peculiar types of entropy, consumers have developed their own methods of identity creation and maintenance, which may seem to be "dodging-away" from the market. The market still exists with its established influence on consumers; however, frustrated consumers disobey or play (unnecessarily escape) with the market system in order to reach their own goals as to identity projects. Consumers still live and act upon the market as a penitentiary in which they constantly reform themselves, and they modestly, or sometimes innovatively, suggest and practice their own lifestyles in their own culture.

The new forms of consumer cultures dispersed and emulated today seem to be dependent upon the place through which the new consumer cultures permeate. The forms might have been bound to the metaculture, which encompasses and compartmentalizes all kinds of cultures that have been in the place for long time. The potentially same counterproposals by consumers could be initially embraced in different manners by the metacultures to which each consumer belongs. Nevertheless, a convergence of consumer cultures in remote metacultures upon a specific type of alternative consumer culture is witnessed more often and more widely than ever. It results from the fact that the only culture that globalizes and is being globalized is the different types of consumers' anxiety by entropy and the following management of the anxiety. The dealing mechanisms in different time and space may not be isomorphic at the beginning, but the acclimation to the innate cultural environment will eventually congregate in a new overarching cultural amphitheater. Pursuit of identity bodes entropy, and entropy escorts consumer cultures to enjoyable multiplicity of cultural manifestations. Newly introduced consumer cultures are separable from each other in forms, but the momentum, entropy, is becoming globalized, and therefore, foremost and omnipresent.

# Who Uses Stereotypes Against Saleswomen?
# Femininity as Self-Schema and Biases in Trust Judgment

Eun-Ju Lee, Sungkyunkwan University, Korea

## INTRODUCTION

Consumers receive a wide variety of commercial stimulations everyday in marketplace and have to selectively notice only a subset of information. Markus (1977) suggested that consumers' selective tendency in attention and judgment tasks could be guided by internal cognitive structures, so-called self-schema (Markus 1977). The focus of this paper is gender schema (Bem 1981; Meyers-Levy 1988), particularly femininity self-schema, as cognitive beliefs about oneself as a feminine, caring, expressive, and compassionate person (Bem 1974).

The idea of schemas as a construct for explaining cognitive processes has received wide acceptance from social psychologists. Among many things that define individuals' self-identity, gender is one of the most fundamental elements. Self-perception provides a kind of lens through which one sees the world and others (Markus, Smith, and Moreland 1985), and it is plausible to believe that individuals' strong identification with one specific sex role will have an impact on judgments made about others.

According to Bem (1985), individuals can be schematic or aschematic with respect to gender role. Furthermore, Hudak (1993) found that individuals who use gender as primary self-schema (e.g., feminine schematics) are more reliant on stereotypes and less able to appreciate individuating information, which can result in systematic biases in social judgment tasks. Hepburn (1985) also noted that sex-role stereotypes are the functional equivalent of gender schema.

While the extant social psychology literature sheds light on the link between gendered self-schema and potential biases in social judgment tasks, to date there are few studies in marketing which directly tested how consumers' awareness of own psychological gender, particularly femininity, can moderate trust judgments made about others in exchange relationship. I report two experiments exploring the relationship between femininity as self-schema and the use of sex role stereotypes against saleswomen in the context of computer-simulated online shopping.

## LITERATURE REVIEW

### Femininity

Markus (1977) noted that "self-schemata are cognitive generalizations about the self, derived from past experience, that organize and guide the processing of self-related information contained in the individual's social experiences" (p.64). Drawing on gender schema theory, femininity as self-schemata can be developed throughout socialization process, and contains information about desirable social qualities, frames, and scripts. For example, beliefs about oneself as a warm, caring, expressive, and communal person might be a primary content in an individual's femininity schema (Bem 1974). For example, a person may repeatedly receive negative social feedback whenever she acts out of her gender role. Such consistent feedback is then encoded as future guidance of behavior in her self-schema. If similar reinforcements are received repeatedly overtime, she is likely to develop a strong justification for her "feminine-self." Her general behavioral predispositions will be aligned with the primary self-schema; and her judgment criteria of socially acceptable behaviors for self and others will reflect such a mental focus.

### The Use of Stereotypes against Female Sex role Dissonance

In consumer behavior research, the issue of sex role has been studied by several researchers. For example, Meyers-Levy (1988) found that female consumers favored other-sensitive, communal messages as opposed to self-oriented messages, but this effect was demonstrated only when sex role schema was activated through priming. She also found that female consumers used both self- and other-information when judging product quality whereas males used only self-information. This suggests that individuals who are chronically feminine (with strong femininity self-schema) would want to receive nurturing and caring social feedback themselves, and could become overly stressed by aggressive and insensitive gestures.[1]

Earlier studies of women and social influence found that when women display masculine traits, they can face social rejection and lose trust from peers (Carli 2001; Lee 2007). Kawakami, White, and Langer (2000) pointed out that this gap between job requirement and feminine sex role is a double bind, leaving women unsure of how to behave in social relationship. Because most leadership positions require some masculine maneuvering skills to achieve goals, Kawakami et. al. (2000) maintained that women leaders should learn to free themselves from the bond of self-stereotyping as a feminine person.

Still, women's use of masculine style involves substantial social risks particularly in the initial impression formation stage. Nieva and Gutek's (1980), in their sex role congruence hypothesis, suggested that behavior that is incongruent with one's gender role is evaluated negatively. Earlier studies supported this hypothesis. Bradley (1980) found that masculine female leaders were disliked by peers. Eagly, Makhijani, and Klonsky (1992), in their meta-analysis, concluded that there are negative social consequences for female leaders who are aggressive and masculine.

While the extant literature in social psychology and management clearly shows some evidence for prevailing sex role stereotypes in social relationships, what has not been discovered so far is *who* uses such stereotypes against women. Conventional wisdom would suggest that people who possess a higher social status will find a violation or minority stereotypes to be unacceptable. We think differently. Evidence from the social psychology literature suggests that whereas high-status individuals' in-group bias tend to be automatic and positive (Rudman, Feinberg, and Fairchild 2002), minorities' in-group bias tends to be negative at the non-conscious level, because members of minority groups absorb the society's negative view even when their conscious beliefs contradicts self-inflicting stereotypes that are prevalent in a society (Jost, Burgess, and Mosso 2001).

The System Justification Theory (SJT: Jost and Banaji 1994) also states that minorities are subject to the tendency to devalue own group. Apparently, this theory does not necessarily predict that all

---

[1]On the other hand, masculinity concerns with "the achievement of goals external to the interaction process" (Gill et al. 1987 p.379). Because masculinity is focused on manipulation of others to attain self-goals, it involves separating oneself from others. Masculinity directs attention to individuating and diagnostic information to achieve effectiveness rather than becoming sensitive to others' feelings.

members of a minority group will subscribe to self-denigrating stereotypes. Rather, we believe that a minority individual's negative social judgments of in-group members (or similar others) can be facilitated by how much one justifies the unfair status quo system while self-stereotyping oneself as a prototype minority. In other words, individuals who see themselves as a feminine person (with the activation of femininity as the primary self-schema) might readily use the femininity self schema as a guidance of social judgment for others who are similar to self. Therefore, high feminine individuals may likely discriminate a female who is acting out of sex role; and more so because she is closer to their psychological profile.

By incorporating the existing stereotype literature to the marketing exchange relationship context, this paper investigates the question of who uses discriminatory sex-role stereotypes against female sales agents in online sales relationships. Specifically, we examine how consumers' femininity as self-schemata could be related to the use of sex-role stereotypes against saleswomen. Our first prediction is that those individuals who strongly identify themselves as a feminine person will likely to discriminate an aggressive (hence counter-schematic) female sales agent. This hypothesis is examined in Experiment 1 by employing two different levels of sales aggressiveness displayed by male and female sales agents during the sales development process. We predict that high feminine individuals will respond more negatively to an aggressive than to a non-aggressive female sales agent. In a similar vein, we predict that low feminine individuals' trust judgments will not affected by the varying levels sales aggressiveness of the same gendered agent.

We also believe that high feminine consumers' distrustful responses to aggressive female agents could occur rather automatically. For high feminine individuals, the femininity schema is chronically active during social judgment tasks. In order to examine this implicit process of sex role stereotyping, we adopt response latency technique in Experiment 2.

Our research hypotheses are summarized as follows.

Hypothesis 1: Consumer femininity will be positively related to the use of sex-role stereotypes against female sales agents in marketing exchange relationships.

Hypothesis 2: Because high feminine individuals have strong and readily accessible femininity as self-schema, they will require short response time while judging a counter-schematic female agent to be distrustful.

**Measuring Femininity**

We use Bem Sex Role Inventory (BSRI) to identify individuals with strong and weak femininity as self-schema. Femininity is a psychological trait that is separate from masculinity. The *F* scale in BSRI includes 20 items of feminine self-stereotyping, including how strongly one sees oneself as a warm, caring, tender, compassionate, emotional, expressive, and feminine person.

We follow Markus et al.'s (1982) view on femininity as self-schema; and agree that every individual can be relatively schematic with respect to femininity.[2] Because femininity is a universal and psychological profile, those score high on the *F* scale could include both sexes. In other words, we believe that femininity is an archetypical trait of both sexes, and hence does not need to be prototyped under female sex only (Jung 2004).[3] Studies in the social psychology literature also found evidence for the independent

nature between femininity and masculinity. For example, March and Byrne (1991) found that femininity and masculinity were two differentiated, additive sources of individuals' positive self-concept. Likewise, Lobel (1994) found that feminine males made affective judgments that were quite distinctive from masculine males, often behaving similar to feminine females.

**Dependent Variables: Trust as Social Judgment**

Trust is essential for effective sales relationships and organization management (Dunn and Schweitzer 2005). Trust is multidimensional having both affective and cognitive components. First, trust is a belief that one's partner is benevolent (i.e., affective trust), and competent (i.e., cognitive trust) (Ganesan 1994; McAllister 1995). Specifically, benevolence is warm trust (for example, "I trust her because she cares about her customers"), and refers to a salesperson's genuine and friendly interests in the customer's welfare (Friedland 1990). In close interpersonal relationships, trust is often conceptualized in terms of attributions concerning the partner's benevolence (Giffin 1967). Competence is cognitive trust, reflecting a customer's confidence about a salesperson's expertise and specialized knowledge in a given product category.

Not only competence and benevolence are two key pillars of trust judgment in marketing exchange relationships (Ganesan 1994), a recent study by Judd et al. (2005) from the social psychology literature also posited that competence and warmth are the two fundamental dimensions of general social judgment.

## EXPERIMENT 1

*Design and Procedure.* Individuals' femininity was measured two weeks prior to lab experiment. We used the 20 items of *F* scale from the original BSRI (1974) which demonstrated acceptable inter-item reliability (Chronbach alpha>.80). Using median-split, we grouped subjects into two (high and low) feminine groups.

In order to test hypothesis 1, we developed two different levels of sales aggressiveness in the context of computer simulation of digital camera shopping. The experimental design was 2 (sales aggressiveness: aggressive vs. non-aggressive) X 2 (agent gender: male vs. female agents) X 2 (Femininity: high vs. low) between-subject design. Ninety-six subjects were recruited from a population of undergraduate college students from a large State University and were assigned randomly to one of the four treatment conditions.

---

[2]Markus et al. postulate that individuals could have separate schemata for masculinity and femininity. Bem (1982), in her rebuttal to Markus et al.'s (1982) self-schema theory, noted that androgynous individuals are not schematic with regard to gender. She further noted that gender schematics include *only* those who are sex-typed (feminine females or masculine males). Bem's typology includes androgyny (those high on both masculinity and femininity) and undifferentiated (those low both dimensions); hence cross sex-typed individuals (feminine males and masculine females) are often ignored. We take Markus's view on this issue. In this paper, we are interested in discovering the moderating effects of femininity (as a universal phenomenon for both sexes) rather than the effects of sex-typing on individuals' trust judgment.

[3]While a recent examination by Oswald (2004) employing both young- and old-generation samples suggested that there are significant positive relationships between sex and gender, because most men were categorized as masculine and most women as feminine, it should be noted that sex and gender could often contradict within same-sex.

Specifically, this experiment required interactive shopping program to enable different levels of sales aggressiveness. Using Macromedia's Authorware, we created a prototype of shopping simulation involving a gendered computer agent. The base protocol of the shopping simulation included several modules including (1) a brief introduction of the agent;[4] (2) provision of information about important features of digital cameras (e.g., resolution, screen size, zoom size, and price); (3) Agent's request for shopper input regarding the importance of each feature when purchasing a digital camera; (4) Agent's presentation of initial four cameras that could match the subject's preferences revealed in module #3;[5] (5) subject's choice of one camera among the four previously shown alternatives, and (6) final choice and wrap up.

In module #5, once subjects chose one camera, the sales agents suddenly interrupted the shopping process by saying "I have just received product information about a new camera that might interest you." Then, in the aggressive condition, the agent presented the new camera with two upgraded features, which was 10% more expensive than the subject's earlier choice. The aggressive agent also strongly recommended the new camera with strong self-confidence by saying "This is the superior choice than your earlier choice. Choose this one." In the non-aggressive condition, the agent's recommended camera had exactly the same product specification except that it was priced 10% lower than the subject's earlier choice of camera. In addition, the non-aggressive agent used a soft and submissive language while making a recommendation, such as "Given your preferences for digital cameras, I thought this new camera might interest you." A manipulation check confirmed that subjects saw a significant difference in aggressiveness between these two conditions ($M_{agg}$=2.98 vs. $M_{non}$=2.58, t=2.06, p<.05).

Agents' competence and benevolence were measured each using multiple items, which were borrowed from previous trust studies in marketing and modified to fit our specific research context. Agent's competence was measured with the following four items on a 5-point Likert scale: (1) When it came to cameras, Agent John (Jane) knew enough to give me a good advice (Smith and Barclay 1997); (2) I trusted Agent John's expertise in cameras (Moorman, Zaltman, and Deshpande 1992); (3) I had confidence in Agent John's expertise (Geller 1999); and (4) I was confident in Agent John's knowledge about cameras.

Benevolence was measured using the following five items: (1) Agent John (or Jane) seemed to care about me (Price and Arnould 1999); (2) Agent John made me feel good (Hawes, Rao, and Baker 1993); (3) Agent John was like a friend during the shopping process (Ganesan 1994); (4) I felt close to Agent John during the shopping (Price and Arnould 1999); and (5) Agent John responded to my needs in a caring way. Both competence and benevolence showed acceptable inter-item reliability (Chronbach's alphas>0.7).

*Results.* In order to test hypothesis 1 which predicted that consumer femininity would be positively related to the use of sex-role stereotypes against female sales agents in sales relationship, we initially conducted ANOVA analysis. Using ANOVA, we found no significant main effects of sales aggressiveness on competence ($F_{1,78}$=0.58, p=0.44). Agent aggressiveness had a marginally significant effect on benevolence ($F_{1,78}$=3.87, p=0.05). Subjects evaluated that the aggressive agent to be benevolent than the non-aggressive one. The effects of agent gender on competence ($F_{1,78}$=1.31, p=0.25) and benevolence ($F_{1,78}$=0.01, p=0.92) were both insignificant.

Importantly, we found a significant three-way interaction between agent gender, sales aggressiveness, and consumer femininity on competence ($F_{1,78}$=7.19, p=0.00) and on benevolence ($F_{1,78}$=4.84, p=0.03). Further contrast tests (see Table 1) showed that low feminine individuals did not evaluate the female sales agent's competence ($M_{agg}$=14.17 vs. $M_{non}$=14.13, t=-0.03, p=0.97) or benevolence ($M_{agg}$=15.33 vs. $M_{non}$=15.80, t=0.33, p=0.74) differently and did not negatively affected by her display of aggressiveness. In other words, low feminine individuals did not penalize a female sales agent who was counter-schematic acting out of her submissive gender role. In contrast, high feminine individuals' evaluations of the aggressive female agent's competence ($M_{agg}$=12.50 vs. $M_{non}$=15.64, t=4.19, p=0.00) and benevolence ($M_{agg}$=13.42 vs. $M_{non}$=17.82, t=2.72, p=0.01) were significantly lower than their evaluations of the non-aggressive female agent (See Figure 1). Therefore, hypothesis 1 was supported.

For the male sales agents, high feminine individuals equally trusted the aggressive and non-aggressive agents in terms of competence (p=0.12, ns) and benevolence (p=0.73, ns). With marginal significance, we found evidence that high feminine individuals appeared to perceive the aggressive male agent to be more competent than the non-aggressive male agent ($M_{agg}$=15.67 vs. $M_{non}$=13.71, t=-1.66). Because high feminine individuals trusted male agents and distrusted female agents when the same level of sales aggressiveness was used, it was an apparent use of sex stereotypes against female sales agents on their part.

**Discussion of Experiment 1**

The results of Experiment 1 clearly supported our first research hypothesis. After conducting Experiment 1, we concluded that consumers' femininity as self-schema could be related to the use of disadvantageous sex-role stereotypes against female sales agents. That is, the more strongly one is aware of his/her feminine-self, the more likely one is to use sex role stereotypes when judging trustworthiness of female sales agents. Given that over two-thirds of high feminine individuals were women, it seems paradoxical that high feminine individuals were using more strict rules when judging similar others than dissimilar others. However, our result is consistent with earlier experimental evidence found in the social psychology literature which suggested that minorities' in-group bias tends to be negative.

What is not clear from the results of the Experiment 1 was whether the use of negative bias against similar others was a result of quick, non-thoughtful processing or elaborate, effortful processing (Wegener, Clark, and Petty 2006). Bem (1982) earlier noted that "the very phenomenon of sex typing derives from the salience of cognitive availability (p.1193). She further noted that gender schematic individuals have "a generalized readiness to encode and organize information …. in terms of … femininity to which they are highly attuned."

If high feminine individuals were to engage in effortful, systematic processing when facing a female agent making aggressing sales offers, they should ignore the contrived gender identity of the computer agent as a spurious cue. But the results of Experiment 1 revealed that high feminine individuals' trust judgment was determined primarily by sex role congruence even when the sex of computer agent was artificially contrived. We believe that high

---

[4]In the male sales agent condition, a male face with the name of John was projected on screen. In the female agent condition, a female face introduced her as Jane. Both genders received similar evaluation in terms of attractiveness(t=0.29, p=0.76), likeability(t=0.08, p=0.93), perceived warmth(t=-0.77, p=0.44) or coldness(t=-0.32, p=0.74)

[5]On screen, attribute information and a product picture was shown for each camera. We did not include any brand names, because that might interfere with the effects of experimental factors on subjects' trust judgment.

**TABLE 1**
Femininity and Trust Judgment (Experiment 1)

| Consumer Femininity | Agent Gender | Agent Aggressiveness | Competence Mean | Competence S.D. | Benevolence Mean | Benevolence S.D. |
|---|---|---|---|---|---|---|
| High Feminine Subjects | Male Agent | Non-aggressive | 13.71 | 3.86 | 14.43 | 5.94 |
| | | Aggressive | 15.67 | 1.15 | 15.33 | 5.10 |
| | | t (p) | -1.66 | 0.12 | -0.35 | 0.73 |
| | Female Agent | Non-aggressive | 15.64 | 1.03 | 17.82 | 2.89 |
| | | Aggressive | 12.50 | 2.28 | 13.42 | 4.60 |
| | | t (p) | 4.19 | 0.00* | 2.72 | 0.01* |
| Low Feminine Subjects | Male Agent | Non-aggressive | 14.93 | 2.43 | 16.07 | 3.90 |
| | | Aggressive | 14.50 | 3.07 | 12.63 | 4.63 |
| | | t (p) | 0.37 | 0.71 | 1.89 | 0.07 |
| | Female Agent | Non-aggressive | 14.13 | 2.07 | 15.80 | 2.96 |
| | | Aggressive | 14.17 | 2.23 | 15.33 | 2.73 |
| | | t (p) | -0.03 | 0.97 | 0.33 | 0.74 |

feminine individuals' application of negative stereotypes to a gender-norm dissonant female agent is based on heuristic, schema-based processing which relies on easily retrievable femininity schema. In order to test our second research hypothesis which posited that high feminine individuals' use of sex role stereotypes against counter-schematic females is due to readily accessible femininity schema, we adopt response latency techniques in Experiment 2.

Another issue Experiment 1 was the technical nature of the shopping product. Since digital camera is a relatively technical product category, most expert sales agents in practice are dominantly men. It is possible that respondents may have confounded agent gender with product expertise. We address this issue in Experiment 2 by controlling for the level of agent product expertise for both agent genders.

## EXPERIMENT 2

The purpose of the second experiment is to replicate the first study, and test our second research hypothesis by measuring response latency when consumers are offered a product recommendation by aggressive or non-aggressive female sales agents. Markus, Crane, Bernstein, and Siladi (1982) found that individuals with strong self-schemas about gender, particularly feminine schematics, remembered more feminine than masculine attributes in memory tasks, required shorter processing times for "me" judgments to feminine qualities, and showed higher confidence in their self-judgments. Markus (1977) suggested that strong self-schemata could make individuals resistant to counter-schematic information.

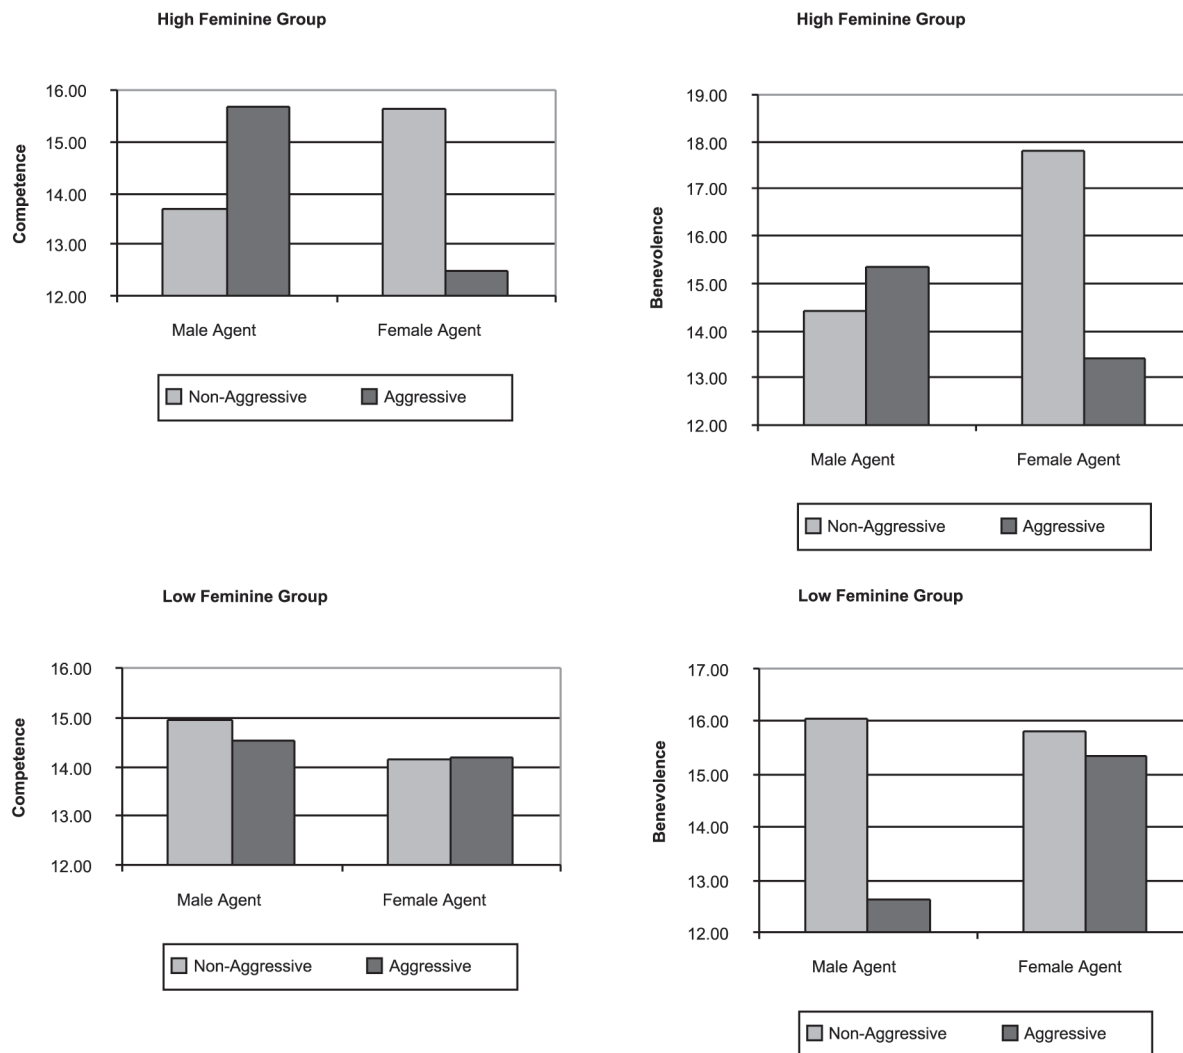
Since high feminine individuals are believed to have well-developed femininity self-schema, they can readily use femininity schema to reject an aggressive saleswoman based on sex role incongruence. Given that schematic processing occurs automatically and quick, we predict that the response latency of high feminine individuals who face an aggressive female sales agent will be, on average, short.

Much of the existing stereotyping research in social psychology has been guided by the distinction between automatic and controlled processes (Devine 1989). In essence, the process in which stereotypes operate is automatic, and one has little control over the initial activation of the prejudice. In contrast, controlled processes are the means to resist or avoid the actual utilization of activated stereotypes. For example, let's think of a person who is well-aware of the cultural stereotypes about a (minority) group but conscientiously does not agree with them. When this person meets a counter-schematic, in group individual she might be able to control the activated stereotypes by elaborating message arguments and counter-arguing self-aware stereotypes. It is important that she has sufficient cognitive ability and motivation to resolve the conflict between self-love and naturally occurring stereotypical thoughts.

What is interesting about women as a minority group is that they do not resist stereotypical evaluations of other women (e.g.,

**FIGURE 1**

Femininity and the Use of Sex Stereotypes (Experiment 1)



talkative, gullible, unintelligent, emotional) (Jackman 1994) and tend to endorse them.[6] Most women do not "fight" negative in-group bias as blacks do. Therefore, they end up endorsing self-denigrating stereotypes toward other women. Because women's automatic sex stereotypes are not controlled, they can readily apply them to other women who acted in a manner that is aggressive and overly confident.

---

[6]In contrast, Blacks intentionally try not to apply stereotypic traits, such as lazy, low social status, to their ethnic identity. Singlair, Hardin, and Lowery (2006, p.535), citing Jackman's(1994) study, said that "the segregation that often isolates modern African American communities enables them to collaboratively develop means of interpreting their disadvantaged status that do not require internalizing negative stereotypes. In contrast, women work, socialize, and live with men. For this reason, they do not have as much physical and mental space to develop such collaborative protective strategies."

The negative valence of subjects' trust judgment coupled with short response latency by high feminine individuals when facing sex role incongruence will demonstrate that this kind of biases in trust judgment used by high feminine individuals is indeed due to strong and readily accessible femininity as self schemata.

*Design and Procedure.* Experiment 2 again employed a 2 (agent gender: male vs. female) X 2 (agent aggressiveness: aggressive vs. non-aggressive) X 2 (femininity high vs. low) between-subject design. Unlike Experiment 1, the shopping protocol began with detailed information of the featured sales agent's experience, establishing the agent as a digital camera expert who had extensive experiences and a successful career in a leading international online shopping site. A total of 102 undergraduate business students participated in Experiment 2 and was assigned to one of the four treatment conditions.

Two weeks prior to the experiment, subjects' femininity was measured using in 20 items in Bem (1974)'s original *F* scale. Subjects were broken down to high and low femininity using

median-split. About two thirds (66%) of female subjects were categorized as high feminine, and 62% of male subjects were categorized as low feminine individuals. The sex-femininity category association was statistically significant ($c^2$=9.06, p=0.00) but not deterministic in nature.

The aggressiveness manipulation was identical with Experiment 1, except the fact that the price difference between the two aggressive conditions was greater at this time (a 30% price increase in the aggressive condition versus a 20% price reduction in the non-aggressive condition). This manipulation was successful. Subjects saw a significant difference in terms of sales aggressiveness between the two conditions ($M_{agg}$=3.33 vs. $M_{non}$=2.81, t=-2.68, p=0.00).[7] Subjects did not perceive the agent's product expertise ($M_{male}$=4.23 vs. $M_{female}$=4.47, t=-0.98, p=0.32) and career experience ($M_{male}$=4.29 vs. $M_{female}$=4.54, t=-1.06, p=0.28) differently by agent gender. In addition, male and female agents were viewed as being equally attractive ($M_{male}$=3.40 vs. $M_{female}$=3.49, t=-0.33, p=0.74).

Using the Authorware software, we could measure response latency time particularly in the module #5 of the shopping protocol. We measured the latency between the time when the agent made a recommendation of a new camera of his or her choice (time 1) and the time the subject actually clicked to make a final choice between the two cameras being considered (time 2). Once the shopping simulation is over, we measured subjects' trust judgment using the same scale as the Experiment 1.

*Results.* We conducted an ANOVA analysis using response latency (time2-time1) as the dependent variable and agent gender, agent aggressiveness, and consumer femininity as predictor variables. The overall model was insignificant ($F_{7,95}$=1.42, p=0.20). The only notable effect was the negative influence of agent aggressiveness on response latency. Individuals on average spent less time when the agent's new product offer was aggressive as opposed to non-aggressive ($M_{agg}$=8.10 vs. $M_{non}$=10.24, t=2.47, p=0.01).

Further contrast tests (see Table 2) revealed that high feminine individuals who were facing an aggressive female agent were primarily driving this time difference. High feminine individuals took 4 more seconds of considering the new product offer when it was made by the non-aggressive female agent (M=10.63 seconds) than when it was made by the aggressive female agent (M=6.25 seconds, t=4.66, p=0.00). However, for the male agent, high feminine individuals spent almost an equal amount of time irrespective of his display of aggressiveness ($M_{agg}$=9.33 sec vs. $M_{non}$=10.81 sec, t=0.69, p=0.49) (Figure 2). Therefore, hypothesis 2 was supported.

Low feminine individuals did not show any significant difference in response latency between the aggressive and the non-aggressive female agents (p=0.24, ns). They took an equal amount of time for aggressive and non-aggressive male agents (p=0.58, ns). The fact that high feminine individuals were quicker making a decision when facing an aggressive female than a non-aggressive female suggests this decision could be schema-based processing facilitated by easily retrievable femininity as self-schema.

Next, we investigated whether the negative valence of trust judgments toward female sex role dissonance by high feminine individuals was again replicated in Experiment 2. As expected, high feminine individuals' use of stereotypes to sex role dissonance was demonstrated in benevolence judgment ($M_{agg}$=12.12 vs. $M_{non}$=16.25, t=2.16, p=0.03), but not in the competence evaluation ($M_{agg}$=13.78 vs. $M_{non}$=16.92, t=2.16, p=0.03) (see Table 2). Since Experiment 2 explicitly manipulated the agent's expertise upfront in the shopping simulation, agent's competence was predetermined by the expertise manipulation. In sum, high feminine individuals

perceived the aggressive female agent to be less caring, less friendly, and distant than the non-aggressive female agent. In contrast, high feminine individuals did not perceive the benevolence of a male agent to differ by his sales aggressiveness (p=0.30).

Additionally, low feminine individuals could possibly be using negative biases in trust judgments made about similar others when they had the aggressive *male* agent as a shopping partner (See Table 2). While low feminine individuals did not discriminate an aggressive female agent, they gave significantly a significantly lower evaluation to the aggressive male agent than the non-aggressive male agent on both competence ($M_{agg}$=12.00 vs. $M_{non}$=15.41, t=2.65, p=0.01) and benevolence ($M_{agg}$=12.11 vs. $M_{non}$=16.23, t=2.24, p=0.03). Low feminine individuals did not respond differently to the high and low levels of female sales aggressiveness (p>0.2).[8]

## DISCUSSIONS AND CONCLUSIONS

While the idea that schemas can explain individual cognitive processes is well accepted in academia, to date, few studies in marketing have demonstrated that consumers' femininity as self-schema can affect perceptions of others. The most interesting finding of this study was the identification of the users of sex role stereotypes. In Experiment 1, we found that high feminine individuals had a tendency to make biased trust judgments when facing female aggressiveness. The second experiment employing response latency technique demonstrated that high feminine individuals' distrustful responses to counter-schematic females could be due to the primacy of femininity in their cognitive system. Sex role stereotypes seemed to occur automatically to high feminine individuals and they were inevitably more reliant on sex role stereotypes in trust judgment tasks. Surprisingly, high feminine individuals did not appear to factor aggressiveness into consideration when judging men's trustworthiness. This suggests that high feminine individuals could be particularly vulnerable to masculine dominance and manipulation by men in sales and negotiation relationships.

One troubling point of the research findings was that most of high feminine individuals (about two-thirds) in our sample were women themselves. Is it really inevitable that high feminine individuals should use self-denigrating sex role stereotypes to similar others? Why can't they suppress automatically activated, self-inflicting stereotypes (Devine 1989)?

Interestingly, we found evidence that low feminine individuals could be applying negative biases to aggressive males but not to aggressive females. Considering that aggressiveness is a typical male characteristic, the driver of low feminine individuals' distrust of aggressive males may not be sex role incongruence. Do people in general require a more strict code of conduct from similar others than from dissimilar others? This will be another interesting research question which warrants research attention. We need more research

---

[7]Subject also perceived the aggressive agent to be more pushy ($M_{agg}$=4.11 vs. $M_{non}$=3.17, t=-3.21, p=0.00) and more selfish ($M_{agg}$=4.42 vs. $M_{non}$=3.32, t=-4.68, p=0.00) than the non-aggressive agent.

[8]Given that there was no difference in response latency between the conditions of the aggressive and the non-aggressive male agents ($M_{agg}$=8.31 sec, $M_{non}$=9.15 sec, t=0.55, p=0.58), it is difficult to say that low feminine individuals' distrust of aggressive males is a result of schema-based processing or a well-thought-out decision. But attitudinally, low feminine individuals apparently distrusted a male sales agent who was aggressive.

Response Latency (Experiment 2)

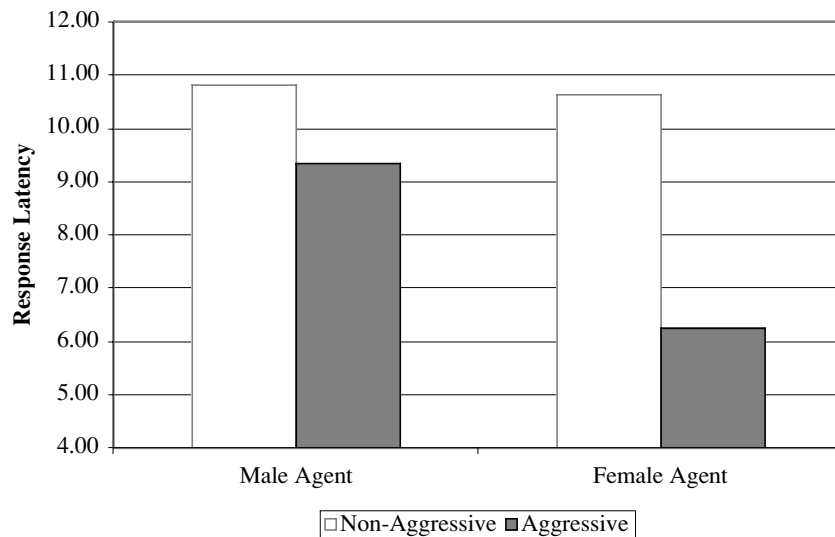
### High Feminine Group


in this direction to better understand the potential implications of judgment bias moderated by perceived self-target similarity in exchange relationships.

Managerially, marketers need to develop different communication strategies when selling to high and low feminine individuals. For example, a masculine female salesperson who challenges traditional female sex role may not be welcomed by high feminine individuals with a strong feminine self-stereotyping tendency. In contrast, individuals with weak femininity schemata can learn to trust a female agent regardless of her compliance with gender norm. However, low feminine individuals could be easily turned off by aggressive sales offers if made by male agents. Therefore, there is an opportunity that marketers could develop customized sales protocols for these two distinct groups.

The limitation of this study is that we had only one product scenario. Digital camera could be considered a male dominant product category where male sales agents supposedly have greater product expertise than female sales agents. In order to address this concern, our second experiment controlled for the level of agents' expertise and still found the evidence of negative biases in trust judgments by high feminine individuals when facing aggressive female expert agents. We believe that high feminine individuals' quick and distrustful judgment of female computer agents based on agents' contrived gender identity is troubling but real. Why do high feminine individuals who are gentle, caring, and compassionate themselves pass more negative, heuristic judgments at the hint of female sex role dissonance? Do high feminine individuals' well-developed schemata actually sensitize the perception of schema-incongruity (Mandler 1982; Lee and Schumann 2004)? Or do people high in femininity have a strong prevention which represses any risk-taking attempts in human relationships (Higgins 2002)? Future research should continue to investigate the deep psychological reasons for human biases in social judgment and further explore the strategic implications of consumers' self-schema in relevant communications contexts.

# Satisfied Customers' Love toward Retailers: A Cross-Product Exploration

Hye-Young Kim, University of Minnesota, USA
Youn-Kyung Kim, University of Tennessee, USA
Laura Jolly, University of Georgia, USA
Ann Fairhurst, University of Tennessee, USA

## ABSTRACT

This study attempts to increase our understanding of the phenomenon of love specifically in the apparel and grocery retailing contexts. By incorporating "customer love," a construct that helps explain variation in satisfied customers' emotional responses to retailers, this study proposes a mechanism by which love is formed and manifested in the sequence of emotional loyalty articulated by Barnes (2005). The empirical results show that customer love is predicted by perceived relationship investment, hedonic store experience, and symbolic store experience. Customer love and symbolic store experience, in turn, are linked to a higher level of competitive insulation, ultimately leading to action loyalty.

## INTRODUCTION

While evidence of the importance of customer satisfaction continues to accumulate in the literature (e.g., Luo and Homburg 2007; Homburg, Koschate, and Hoyer 2005), in reality, U.S. firms, in general, are increasingly having difficulty connecting satisfaction efforts to firm profitability (Arnold et al. 2005). This difficulty can be largely attributed to the fact that, of those customers claiming to be satisfied or very satisfied, between 65 and 85% will defect (Arnold et al. 2005; Keaveney 1995; Oliver 1999). In particular, the defection rate for satisfied customers is extremely high in the retail industry, an industry that is characterized by low switching costs and comparison shopping behavior (Jones and Sasser 1995; Seiders et al. 2005).

"Loyalty" itself is a fertile relationship concept that goes well beyond repeat purchasing (Fournier 1998). Barnes (2005), in distinguishing "emotional" loyalty from "functional" loyalty, argues that "a relationship in its simplest form, and as understood by customers, is based on feelings and emotions" (p. 53). In other words, the fact that customers buy a large percentage of their category purchases for a particular retailer or visit or purchase on a regular basis does not necessarily mean that a relationship exists. Many customers, for example, will buy a large percentage of their groceries from a store that is close to their homes. They shop there every week and may have been doing so for years. However, they may be "loyal" due to such factors as convenience of location, 24-hour access, large parking lot, short lines at the checkouts, and one-stop shopping. All of these factors relate to more functional utility benefits that drive repeat buying. These customers are exhibiting functional loyalty. With functional loyalty, there is a noticeable absence of any sense of attachment to the retailer; there is no emotional connection. If they were to move across town, the customers would likely seek out an equally convenient store for the bulk of their grocery shopping. This form of loyalty is very shallow and vulnerable; there is no relationship from the customer perspective (Barnes 2005).

"Emotionally" loyal customers, on the other hand, are those who have emotional attachment for one particular retailer, resulting in other alternatives being virtually excluded in their consideration sets (Fournier 1988; Kumar and Shah 2004). Such customers shop almost exclusively at one particular retailer, driving past three or more competing retailers to get there. When these customers move to a new location, they seek out a branch of their preferred retailer.

The loyalty of these customers is much more stable and durable (Barnes 2005).

In spite of the existence of emotional loyalty in the marketplace, it is acknowledged that such loyalty is maintained by some, but not all, satisfied customers (Carroll and Ahuvia 2006). Thus, a theoretical and managerial imperative is to identify a new construct that fully captures emotional variation among satisfied customers. A recent advance in this area is represented by the work of Carroll and Ahuvia (2006) who introduced "brand love," a multi-item measure that assesses satisfied consumers' emotional attachment to particular brands. In the context of consumer packaged goods, their findings suggest that brand love is linked to a higher level of conative loyalty. While their study is an interesting positivist investigation to provide a more nuanced view of satisfied customers' feelings about brands, they stress the need for future research to further examine the love construct in other consumption contexts.

In response to this suggestion for future research, this study attempts to increase our understanding of the phenomenon of love specifically in the apparel and grocery retailing contexts. By incorporating "customer love," a construct that helps explain variation in satisfied customers' emotional responses to retailers, this study proposes a mechanism by which love is formed and manifested in the sequence of emotional loyalty articulated by Barnes (2005) (see Figure 1). Efforts of this nature echo and extend contemporary industry thinking that goes beyond satisfaction to "love" (e.g., Bell 2000; Roberts 2004) and recent studies that address the shortcomings of the satisfaction-loyalty paradigm (e.g., Arnold et al. 2005; Jones and Reynolds 2006; Seiders et al. 2005).

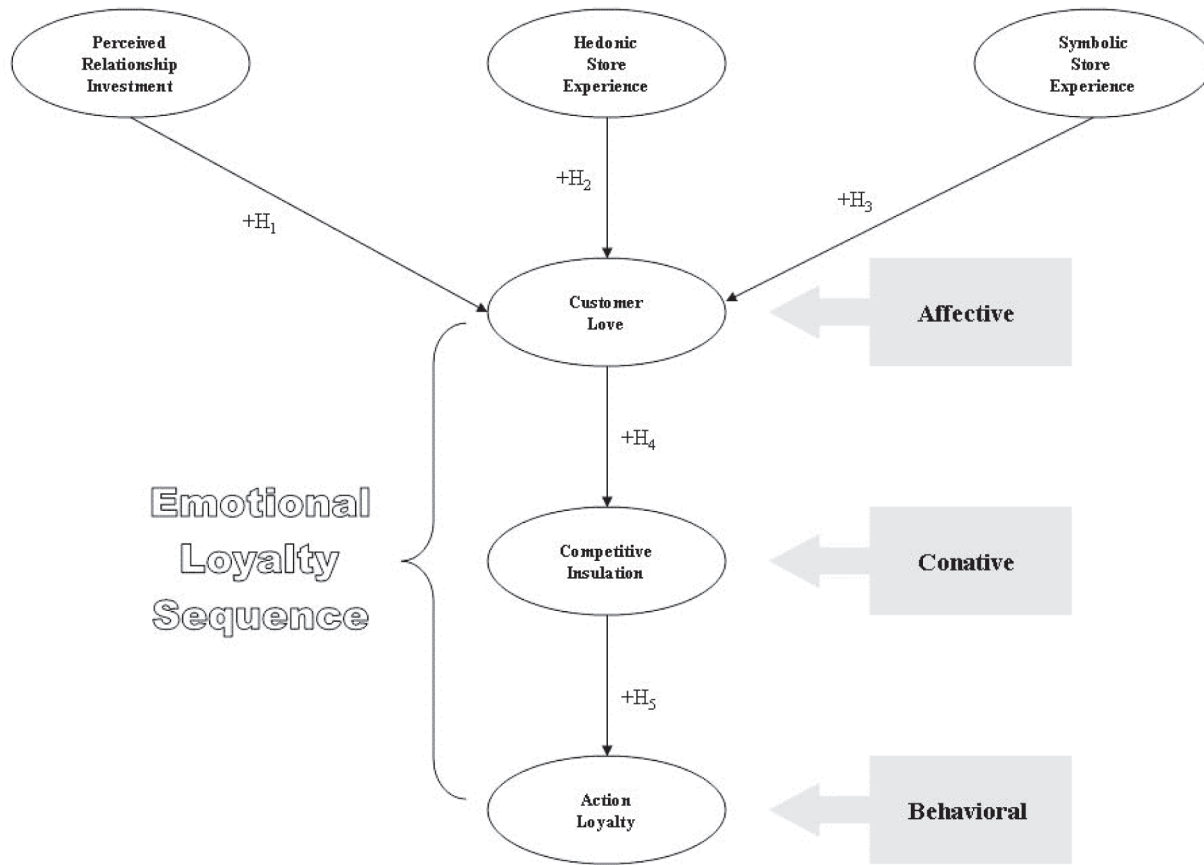
## HYPOTHESIZED RELATIONSHIPS

### Customer Love

Customer love is defined as the degree of emotional attachment a satisfied customer has for a particular retailer. Consistent with Carroll and Ahuvia (2006), customer love is conceptualized as a mode of satisfaction (i.e., a response experienced by some, but not all, satisfied customers). A customer who loves a particular retailer is likely to be satisfied with it. This satisfaction provides a basis for customer love. Nevertheless, satisfaction and love are not synonymous. Although two customers are equally satisfied with a retailer's functional performance, they may vary greatly in the extent to which they are emotionally attached to it (Thomson, MacInnis, and Park 2005). While satisfaction can occur immediately following a single store visit, love is a process phenomenon that evolves over time with multiple interactions (Fournier 1998). Finally, customers can be satisfied with any number of retailers that have little centrality or importance to their lives. The retailers that are loved, however, are few in number and are generally regarded as profound and significant (Ahuvia 2005; Thomson et al. 2005).

The customer love construct is operationalized based on passion for the retailer, attachment to the retailer, positive emotions to the retailer, and declarations of love for the retailer (e.g., I love this store!). Since customer love is conceptualized within the boundary of satisfaction, its lower bound is defined simply as the

**FIGURE 1**
Hypothesized Model

---


absence of love. Thus, customer love precludes negative feelings for the retailer (e.g., "hate," "grudge") (Carroll and Ahuvia 2006).

**Perceived Relationship Investment**

In this study, perceived relationship investment is defined as a customer's overall perception of the extent to which a retailer actively makes efforts that are intended to retain regular customers (i.e., the retailer's customer retention orientation perceived by the customer) (De Wulf, Odekerken-Schröder, and Iacobucci 2001; Odekerken-Schröder, De Wulf and Schumacher 2003). Love, by its very nature, involves a relationship between two partners and not the two partners separately. For love to truly exist, the partners must reciprocally affect, define, and redefine the relationship (Fournier 1988). A logical extension of this thinking is to view that love is not only something that happens to customers but also something that retailers can make happen through relationship efforts. Research suggests that *consumers* demonstrate loyalty to certain sellers in reciprocation of these sellers' *investments* in the relationship (Bagozzi 1995), feel obligated to pay back the marketer's "friendliness" (Kang and Ridgway 1996), and exhibit enduring affective responses to sellers who make deliberate efforts toward them (Baker, Simpson, and Siguaw 1999). In a customer-retailer relationship context, De Wulf et al. (2001) empirically prove that a higher perceived level of relationship investment leads to a higher

level of relationship quality (i.e., an overall assessment of the strength of a relationship). Although these studies did not investigate the association between relationship investment and customer love directly, they provide an initial basis for the following hypothesis.

H1: Perceived relationship investment has a positive effect on customer love.

**Hedonic Store Experience**

Hedonic store experience is defined as the customer's perception of the relative role of hedonic (as compared with utilitarian) benefits offered by the retailer. Prior research illustrates the experiential and emotional aspects of shopping (Arnold and Reynolds 2003), and that the in-store experience can elicit feelings of fun and excitement (Babin, Darden, and Griffin 1994; Wakefield and Baker 1998). Indeed, the strategies and roles of retailers have been dramatically changed during the past decade, from a pure "utilitarian" focus to a more "hedonic" focus (Jones and Reynolds 2006). One of retailers' primary goals in today's competitive environment is to not only satisfy shoppers' basic utilitarian needs through quality products and fair prices, but also to entertain them (Arnold and Reynolds 2003; Wakefield and Baker 1998). Research suggests that consumption objects and activities rich in hedonic potency tend

to generate emotional attachments (Carroll and Ahuvia 2006). Therefore, the potential of hedonic store experience for eliciting customer love is substantial.

> H2: Hedonic store experience has a positive effect on customer love.

## Symbolic Store Experience

Symbolic store experience is defined as the customer's perception of the degree to which the specific retailer enhances one's social self and/or reflects one's inner self. In this study, the functions of the symbolic meanings of retailers are conceptualized in two directions, outward in constructing the social world (i.e., social-symbolism) and inward toward constructing one's self identity (i.e., self-symbolism) (Elliott 1997). In other words, a retailer exhibiting symbolic meanings can be viewed as having a component that is designed to associate the individual customer with a desired social group/role or his or her own inner-self (Bhat and Reddy 1998). Individual self-expression (McCracken 1986) and identity development (Kleine, Kleine, and Allen 1991) have been identified as key drivers of consumers' emotional attachments to consumption objects. Prior research implies that attachment in consumption contexts tends to be attended by a rich set of schemas and affectively laden memories that link the object to the self (Ahuvia 2005; Thomson et al., 2005). Therefore, it is expected that customers' love should be greater for retailers that play a significant role in shaping their identity (Carroll and Ahuvia 2006).

> H3: Symbolic store experience has a positive effect on customer love.

## Competitive Insulation

Competitive insulation is defined as conative loyalty (Oliver, 1999), or the degree to which a customer is committed to patronize a particular retailer consistently. Fournier (1998) notes the importance of love in consumers' long-term relationships with brands. Using an interpretive paradigm, Fournier (1998) shows that some consumers feel that their brands are "irreplaceable and unique," to the extent that separation anxiety is anticipated upon withdrawal. Consumers in these passionate brand relationships feel that "something is missing" when they have not used their brands for a while. Fournier (1998) concludes that such strong affective ties encourage a biased, positive perception of the brand partner that renders comparisons with alternatives difficult. Extending this observation to customer-retailer relationships, the following hypothesis is formulated.

> H4: Customer love has a positive effect on competitive insulation.

## Action Loyalty

In this study, action loyalty is operationalized based on a customer's purchasing frequency and amount spent at a retailer compared with the amount spent at other retailers from which the customer buys. For any retailer, loyalty becomes more meaningful only when it translates into purchase behavior because it generates direct and tangible returns to the retailer (Kumar and Shah 2004). Moorman, Desphand, and Zaltman (1993) suggest that customers who are committed to a relationship might have a greater propensity to act because of their need to remain consistent with their commitment. Morgan and Hunt (1994) find empirical support for the relationship between a customer's commitment and behavioral outcomes of *relationships*. Derived from these findings, this study investigates the following:

> H5: Competitive insulation has a positive effect on action loyalty.

## METHOD

### Data Collection

The proposed model was tested in the apparel and grocery retailing contexts. Data were collected using a web survey with the help of a marketing research company specializing in consumer surveys. A total of 604 panel members for the research company participated in the study (301 for apparel and 303 for grocery). In the given product category, participants were first asked to recall a specific store with which they were satisfied in an open-ended question format. Then, they completed the questionnaire with reference to the store they had identified. To reduce measurement artifacts, dependent variables were assessed prior to their predictors.

Statistical analyses (i.e., *t*-tests and $\chi^2$ analyses) were first applied to detect any notable discrepancies in demographic characteristics between the two groups. No significant group differences were found in key demographics across different product categories. Overall, respondents' ages ranged from 18 to 95 with 57.8% of the respondents aged between 18 and 45. Slightly more than half of the total respondents were female (52.8%). With respect to ethnicity, 77.3% were Caucasian. The sample represented all income categories with $40,000-$49,999 as the median income. Additionally, 34.1% of the respondents had a four-year college degree and 51.7% were married or lived with a partner.

### Measurement

The measurement items used in the study were selected based on a review of the literature. Measurement items for perceived relationship investment and action loyalty were adapted from De Wulf et al. (2001). Measurement items for hedonic store experience, symbolic store experience, and customer love were adapted from Carroll and Ahuvia (2006).

Even though most measurement items were drawn from literature, in some cases, slight modifications were needed to tailor the items to the research settings. In an effort to enhance face validity of the selected measurement items, a group of expert judges (i.e., three academic researchers and six doctoral students specializing in Consumer Behavior) qualitatively evaluated the items. Items that were judged inadequate or unclear were deleted and modifications or refinement of wording were done based on the judges' comments. The final structure of the measurement items was determined after conducting a pretest with a convenience sample of 110 undergraduate students (see Table 1).

## DATA ANALYSIS AND RESULTS

### Measurement Model Evaluation

The results of confirmatory factor analysis indicated that the measure had acceptable construct validity and reliability. For the apparel sample, the $\chi^2$ of the measurement model was 282.78 with 173 *df*. The overall fit statistics ($\chi^2/df$=1.64, CFI=.97, NNFI=.97, RMSEA=0.046, and SRMR= .037) suggested that the measurement model had a good fit. All the factor loadings to their respected constructs were higher than .74. All composite reliability (all greater than .76) and average variance extracted (AVE all greater than .60) indicate that the measurement items have good reliability. The fit indices for the measurement model for the grocery sample also indicated a good fit ($\chi^2$=277.56 with 173 *df*, $\chi^2/df$=1.60, CFI=.98, NNFI=.97, RMSEA=0.045, and SRMR= .040). All the factor loadings were higher than .54, with composite reliability

## TABLE 1
### Measurement Items

| Construct | Items | Scale |
|---|---|---|
| Perceived Relationship Investment | This store makes efforts to increase regular customers' loyalty. | 5-point "strongly disagree-strongly agree" scale |
| | This store makes various efforts to improve its tie with regular customers. | |
| | This store really cares about keeping regular customers. | |
| Hedonic Store Experience | *This Store*:<br>• Is Functional/Is Pleasurable<br>• Is Useful/Is Fun | 5-point scales |
| Symbolic Store Experience | This store says a lot about the kind of person I am. | 5-point "strongly disagree-strongly agree" scale |
| | This store mirrors the real me. | |
| | This store is an extension of my inner self. | |
| | This store has a positive impact on what others think of me. | |
| | This store improves the way society views me. | |
| | This store adds to a social role I play. | |
| Customer Love | I love this store! | 5-point "strongly disagree-strongly agree" scale |
| | I am passionate about this store. | |
| | I'm very attached to this store. | |
| | This store makes me very happy. | |
| Competitive Insulation | This is the only store that I will buy clothing. | 5-point "strongly disagree-strongly agree" scale |
| | When I go shopping, I don't even notice competing apparel stores. | |
| | I'll 'do without' rather than shop at another store. | |
| Action Loyalty | What percentage of your total expenditures for clothing do you spend in this store? | Open-ended response scale |
| | Of the 10 times you select a store to buy clothes at, how many times do you select this store? | |
| | How often do you buy clothes in this store compared to other stores where you buy clothes? | 5-point "very rarely-very frequently" scale |

**Note:** The items formulated in Table 1 were based on the apparel sample. In the grocery sample, the term "apparel store" was replaced by "grocery store."

greater than .74 and AVE all greater than .49. As evidence of discriminant validity of the scales, none of the confidence intervals of the phi estimates included 1.00 in each sample. Further evidence supporting the discriminant validity is indicated by the fact that the variance extracted estimates exceeded the square of the phi estimates for all constructs in each sample (see Fornell and Larcker 1981). The correlation matrices of the constructs are presented in Table 2.

**Structural Model Evaluation**

As shown in Table 3, all fit indices show that the model has a good fit for both samples: apparel ($\chi^2$=311.99 with 180 *df*, $\chi^2$/*df*=1.73, CFI=.97, NNFI=.96, RMSEA=.049, and SRMR= .056) and grocery ($\chi^2$=246.92 with 180 *df*, $\chi^2$/*df*=1.59, CFI=.98, NNFI=.97, RMSEA=.044, and SRMR= .046). Table 3 indicates

that in each sample, all significant *relationships* between latent constructs are in the hypothesized direction, which provides initial evidence for the conceptual model and supports the nomological validity of the constructs.

In both samples, symbolic store experience was most significant ($\beta$=.61, *t*=10.27 for apparel; $\beta$=.52, *t*=8.63 for grocery) at *p*<0.001, followed by hedonic store experience ($\beta$=.22, *t*=3.75 for apparel; $\beta$=.27, *t*=4.71 for grocery) at *p*<0.001 and perceived relationship investment ($\beta$=.12, *t*=2.46, *p*<0.05 for apparel; $\beta$=.18, *t*=3.51, *p*<0.001 for grocery). Consequently, there was strong and uniform support for H1, H2, and H3. The path from customer love to competitive insulation was significant and positive in both samples ($\beta$=.57, *t*=8.28 for apparel; $\beta$=0.32, *t*=4.75 for grocery) at *p*<0.001. The path from competitive insulation and action loyalty was also significant and positive in both samples ($\beta$=.54, *t*=8.15 for

**TABLE 2**
Correlation Matrices of Constructs

| Construct | 1 | 2 | 3 | 4 | 5 | 6 |
|---|---|---|---|---|---|---|
| 1. Perceived Relationship Investment | **1.00** | .28 | .35 | .40 | .30 | .12 |

apparel; $\beta$=0.19, $t$=2.96 for grocery) at $p<0.001$. Consequently, there was strong and uniform support for H4 and H5. These results are especially noteworthy given that the model was tested in a product category representing experience goods (apparel) and one representing search goods (grocery).

**Tests of Mediation**

It is generally recommended that researchers should compare alternative models and not just test the performance of a proposed model (Bagozzi and Yi 1988). Rather than a saturated model where 'everything is related to everything,' four separate parsimonious

## TABLE 4
### Test Results of Mediation

*p<.05, ***p<.001

models were constructed as alternative models. Next, on the basis of Bagozzi and Dholakia (2006), the formal tests of mediation implied by the proposed model were conducted. For example, in the proposed model, customer love is expected to influence action loyalty but only through competitive insulation. To test this hypothesis, the proposed model was compared to the model where a direct path from customer love to action loyalty was added. The comparison was done with a $\chi^2$-difference test using the proposed model as a baseline. The last row in Table 4 presents the difference in $\chi^2$-values between the baseline model and this alternative model, with one degree of freedom. This is a test of the significance of the direct path from customer love to action loyalty. As this difference is not significant ($\Delta\chi^2$=.27, p=.61 for apparel; $\Delta\chi^2$=2.78, p=.10 for grocery), it can be concluded that the added path is insignificant, and therefore competitive insulation fully mediates the effect of customer love on action loyalty, as hypothesized.

Rows 2 and 3, respectively, summarize the tests of direct effects from perceived relationship investment and hedonic store experience on competitive insulation. As anticipated, these paths are non-significant in both samples, and hence customer love fully mediates the effects of perceived relationship investment and hedonic store experience on competitive insulation. However, symbolic store experience has a direct effect on competitive insulation in both samples. Thus, given the additional finding of a significant effect of symbolic store experience on competitive insulation, it can be concluded that customer love partially mediates the effect of symbolic store experience on competitive insulation (see Figure 2).

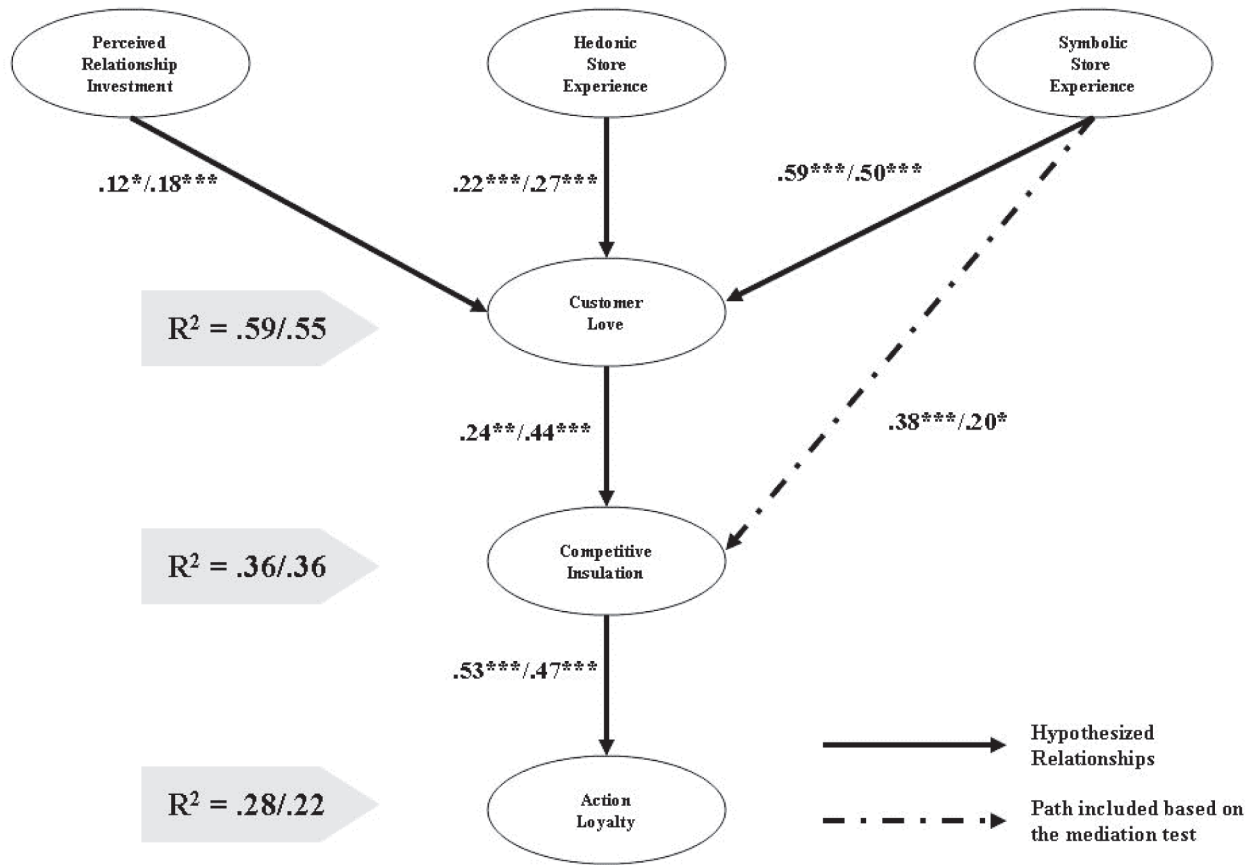
### Invariance Test of Structural Relationships

Based on the test results of mediation, the model was revised as shown in Figure 2. To examine the robustness of the revised model across the two different product categories, structural invariance was tested. Two nested models were constructed and tested: (a) a model which assumes the same configuration for both categories with the values of path coefficients to be freely estimated across the two product categories (Free Model: $\chi^2$=576.78 with 358 df; $\chi^2$/df=1.61; CFI=.97, NNFI=.97; RMSEA=.032 and SRMR= .047); and (b) a model with structural invariance, which assumes the same structural relationships and the same path coefficients between the two categories (Equal Model: $\chi^2$=583.90 with 364 df; $\chi^2$/df=1.60; CFI=.97, NNFI=.97; RMSEA=0.32 and SRMR= .050). The model fit did not deteriorate significantly as the invariance restriction was imposed ($\Delta\chi^2$=7.12, $\Delta df$=6, p=.31). In other words, the model with structural invariance exhibited good fit. This indicated that the structural relationships can be assumed to be the same regardless of product category.

### DISCUSSION AND IMPLICATIONS

This study contributes the existing literature in three different ways. First, this study specifies how retailers can induce customer love by applying three different retail factors. While the phenomenon of love is present in everyday consumer exchanges, little research has examined the psychological manifestations of love and the way it functions in customer-retailer relationships. Second, this study demonstrates why retailers benefit from customer love by assessing its impact on competitive insulation and ultimately on

**FIGURE 2**
Results: Standardized Coefficient Estimates (Apparel/Grocery)



*p<.05, **p<.01, ***p<.001

action loyalty. Finally, by testing the model in two product categories (apparel vs. grocery), this study confirms the robustness of the customer love construct and the sequence of emotional loyalty against product variability.

Hedonic store experience was found to have a positive effect on customer love. This finding suggests that, in order to enhance customer love, retailers need to create a store environment and atmosphere that enables them to experience the various hedonic dimensions while shopping. In addition, advertising and other communication efforts designed to keep satisfied customers should not only focus on the merchandise a store offers but also extol the hedonic aspects of shopping at the store.

Some may argue that, although incorporating a hedonic experience in a product or service offering does provide a competitive advantage, not all retail offerings need to take the "experience route" to survive or prosper in the current retail environment (Poulsson & Kale, 2004). For instance, Poulsson and Kale (2004) wrote:

*"When buying groceries, time and convenience are often of greater essence than an engaging grocery shopping experience. In the course of a consumer's commercial transactions, an occasional experience offering that is well executed is* *indeed appreciated. However, this does not mean that all marketers have to retool and reinvent themselves as experience marketers" (p. 275).*

However, this study confirmed the positive effect of hedonic store experience on customer love in the grocery sample as well as in the apparel sample. In fact, some upscale supermarkets have made significant strides in creating excitement and retailing theater. Successful examples include Dallas-based H.E. Butt's Central Market with its roving "foodie" experts, impressive visual merchandising, and sights and smells of fresh food (Howell 2003).

Increasingly, retailers will be expected to create hedonic store experiences as one of the means to survive in the competitive marketplace (Jones and Reynolds 2006). Current wisdom states that the "hedonic experience" is what shall make today's shoppers leave the Internet shopping cart behind, and waltz into a brick-and-mortar store offering the added value of entertainment (Poulsson and Kale 2004). However, retailers need an understanding of how experiential retailing creates value for themselves and customers. Without this understanding, too much is left to gut feeling or intuition, thereby making the experiential retailing proposition incredibly speculative (Poulsson and Kale 2004). In this regard, this study provides empirical evidence that experiential retailing

strategies could be understood as a source of customer love, a long-term competitive advantage.

Symbolic store experience proved to be a dominant determinant of customer love. This finding is consistent with Carroll and Ahuvia's (2006) observation that satisfied customers tend to love a particular consumption object when the object helps classify or distinguish them in relation to relevant others and when its symbolic meaning is integrated into their own self-identity. Further, symbolic store experience was found to have a direct effect on competitive insulation. It is speculated that retail branding strategies that use heightened self- and social-symbolism appeals and encourage the formation of brand communities may contribute to the development of customer love and competitive insulation.

Some may ask, "Is it necessary to measure perceived relationship investment in addition to hedonic store experience and symbolic store experience as a determinant of customer love?" The answer is yes as this study provides empirical evidence that perceived relationship investment positively influences customer love, even when the effects of all three constructs are considered simultaneously. This not only underscores the practical significance of the perceived relationship investment construct, but also emphasizes the need to adopt a more holistic view of the literature. To date, previous studies have primarily focused on the effect of perceived relationship investment on relationship satisfaction, trust, and commitment (De Wulf et al. 2001; Odekerken-Schroder et al. 2001). It is clear that the role of perceived relationship investment is far more powerful than previously reported since it contributes to the formation of customer love.

Across both samples, customer love was found to be a significant predictor of competitive insulation, ultimately action loyalty. These findings imply that retailers must overcome the "zero defects" mentality (i.e., satisfied customers are loyal when the retailer can avoid problems) and do more to develop unshakable customer loyalty (Arnould et al. 2006). For retailers, "doing more" means the generation of higher levels of emotional bonds than those associated with mere satisfaction evaluations.

This study has certain limitations and consequent opportunities for future research. First, the hypotheses were formulated largely based on the branding literature. Although retail stores are considered similar to brands with respect to the opportunities for consumers to switch, they are characterized by a high degree of personal contact and social interactions. It is still necessary to develop a more detailed understanding of the customer love construct based on retail-specific theory and evidence. Second, while the invariance test found the model to be robust for both apparel and grocery categories, one should be cautious in generalizing the findings to other situations. It would be interesting to apply the proposed model to other contexts such as luxury goods, car dealerships, night clubs, and restaurants. These attempts might reveal findings that corroborate or extend the findings of this study. Third, knowing more about how *customer love* evolves and changes over time would also be beneficial, indicating the need for longitudinal studies focusing on *customer love* development processes. Fourth, the true meaning of action loyalty may have only been partially captured in the present study, given that its measure was based on self-reports, which are subject to respondent distortion and memory loss. This problem could be overcome by relying on a quantitative measure of action loyalty made possible by examining actual purchasing behavior as recorded in the databases maintained by the retailer, an information source that would be more reliable than customer memories. Such an approach would also make it possible to look at longer strings of purchases and, perhaps, to incorporate contextual information (De Wulf et al. 2001). Finally, it must be recognized that the findings obtained in this study, based

on a sample of U.S. consumers, cannot necessarily be generalized to other cultural contexts. While the statement, "I love this store!", is relatively widespread in the American society, its linguistic meaning is quite different from the way the word 'love' is used in many other cultures, where the concept has a more restricted meaning.

# Customer Emotion Management and Symmetrical Emotional Exchange in (Extended) Service Encounters

Gülnur Tumbat, San Francisco State University, USA

## ABSTRACT

This study discusses the role of emotion display in service consumers' self-presentation as part of their ongoing face-work and introduces the notion of customer emotion management as an integral part of their service interactions and experience. It suggests that in extended and complex service encounters, there is not necessarily an inequality in emotion control between service providers and customers but rather a more balanced and symmetric emotional exchange. The implications for consumer behavior and services marketing research are discussed.

## BACKGROUND

Solomon et al. (1985) argue that in service encounters, customers and service providers play specific roles in order to achieve satisfying relationships. This approach is mainly based on Goffman's symbolic interactionist theoretical perspective (1959, 1961, 1967, 1969) where he identifies two areas for performances. The frontstage is where the actual performance takes place and the back stage is where the individual contemplates and prepares for his or her performance. "Front" encompasses the expressive equipment by which an actor's identity is supported and confirmed. In services marketing context, it is the frontstage where an airline stewardess interacts with a passenger or a McDonald's worker with a customer. Back stages in both cases are the service areas or the kitchens where service providers do not interact with customers and where they are mostly away from their gazes. It is usually assumed that backstages should be separate and hidden from customers. However, Grayson (1998) identifies "perceived backstage" as an area that may be manipulated by managers in order to influence customers "through opening their doors." This argument is also similar to that of MacCannell's (1999) "staged authenticity." He argues that the backstage-frontstage distinction is used by companies to generate mystification of the former since backstages suggest, "…there is something more than meets the eye" (p.93).

Following Goffman's work, Hochschild (1983) focuses on "how institutions-such as corporations-control us [service employees] not through surveillance of our behavior but through surveillance of our feelings." (p.218). Drawing upon Marx and combining labor, emotion, and display discourses, she argues that service workers become alienated from their jobs in a service-producing society, i.e., they have a reduced self-control over what Hochschild (1983) calls, "emotional labor". She uses the term to mean "…the management of feeling to create a publicly observable facial and bodily display; emotional labor is sold for a wage and therefore has exchange value" (p.7). She studied flight attendants and bill collectors as two extreme examples of service workers in order to illustrate commercial uses of feeling. The project of the flight attendant is to enhance the customer's status, to heighten his or her importance; and that of a bill collector is to withhold empathy.

According to the author, jobs of this type have three common characteristics: 1) they have face to face, voice to voice contact; 2) they produce an emotional state in another person (gratitude or fear); and 3) they allow the employer, through training and supervision to exercise a degree of control over the emotional activities of employees. Control is achieved by peers and by clients. Close supervision fosters emotional labor and control over service jobs by

the management, which in turn reduces the self-control over the service employee's emotional labor. She argues that this estrangement from one's own feelings has personal costs; consequences to the notions of self, since emotion is a way of knowing, like seeing or hearing (see Denzin 1984). Employees go through specific training about emotion management to learn about what Hocschild calls "feeling rules" during interactions with customers. Similarly, in his study of Disneyland culture, Van Maanen (1991) calls the park a "smile factory" with its rules for backstage, onstage, and staging regions (Goffman 1959).

Although the importance and consequences of service employee's attitudes and behaviors have received great attention, the nature and the effects of customer's attitudes and behaviors have been understudied (Risch-Rodie and Kleine 2000) with only few exceptions. Menon and Dubé (1999) suggest a repertoire of customer emotion information to be used in service design and employee training. According to this study, in such encounters, positive emotions include happiness and delight; while situation-attributed negative emotions include anxiety and fear and other-attributed negative emotions include anger, frustration, guilt, and shame. Ligas and Coulter (2001) identify customer's roles in interactions with service providers after having negative experiences (see also Price, Arnould, and Sheila 1995). They find that the "contended customer" presents a happy face indicating his or her satisfaction while he or she may be hiding some level of dissatisfaction; the "helpful customer" presents a friendly face and indicates his or her willingness to solve the issue with a service provider; the "discontented customer" expresses his or her dissatisfaction; and finally the "disgusted customer" also communicates his or her dissatisfaction, but with anger. Although these studies acknowledge customers' emotions (see also Richins 1997 for measuring consumer emotions in consumption experiences), they only label limited emotional categories as input to be used in service design and management. Thus, the purpose of this study is to understand customers' full emotional involvement in the service encounter and reveal the emotional nature of their ongoing self-presentation.

Customers' roles and interactions with service providers have been studied also through the framework of co-production or co-creation of the consumption experience, meanings, and value (Vargo and Lucsh 2004, Arnould 2007, Penaloza and Venkatesh 2006). Research done on the active role of consumers identified several categories of consumer participation such as corporeal, oral, and symbolic co-production. Customers co-create the E-zone experience with the marketers in a retail environment through their corporeal presence and participation (Kozinets et al. 2004). River rafting participants co-create the magical rafting experience through forming a narrative with service providers (e.g., Arnould and Price 1993). In many other contexts consumers co-create the meanings and value of the products and services that they use (see Arnould and Thompson 2005 for a summary of related studies). This study adds consumer emotional control to the realm of co-creation of experience and meaning. This involves all these of the different and overlapping types of consumer participation (corporeal, oral, and symbolic) and adds the active emotional participation which shapes consumers' interactions with service providers and other fellow customers.

## THE SERVICE CONTEXT OF THE STUDY: COMMERCIAL HIGH-ALTITUDE MOUNTAINEERING EXPEDITIONS

Service encounters are dynamic, and involve complex interactions among its participants (customers and service providers) and the service setting with experiential and emotional components. This study is based on an ethnographic research at the main (South) base camp of Mount Everest in Nepal (altitude of 17,700ft/5300m) and the service context studied is high-altitude mountaineering expeditions in the Himalayas. High-altitude mountains refer to mountains with an altitude of 5,500-6,000 meters or greater where significant lack of oxygen and unpredictable weather conditions prevail. This rather extreme context has the potential to reveal insights about customer and service provider performance since these expeditions are quite demanding activities with high-tech and expensive equipment now regarded as essential, along with lengthy pre-trip plans, including physical and mental exercise, manpower recruitment, and logistical support. As a famous high-altitude mountaineer put it in an interview for this research, it is "an environment for which the human body is not well designed… It just doesn't function at that altitude… demands on the body are much higher…" (2003). The services of interest are provided in expeditions organized by adventure companies for a duration of three to nine or more weeks, with costs per person averaging between US$5,000 to US$65,000 depending on the altitude, region, and services included. Personal equipment expenses require an additional outlay of $7,000-$10,000. The adventure companies offer a variety of mountaineering services which include obtaining necessary permits, visas, guides, local accommodations, flights, local transportation, and transfer of all the necessary equipment including oxygen cylinders to the base camp and to the intermediary camps, as well as various kinds of guide and Sherpa services on the mountain throughout the duration of an expedition. Adams (1996) refers to high-altitude mountaineering expeditions as the "high-risk, high-profit, image-making, and body breaking business of mountaineering" (p.8).

### METHODS

The ethnographic data collection at Everest base camp was carried out over a 2-month period. Reaching the site typically involves a 10-day long on mountain trails and that time is needed for acclimatization. People at the base camp live in tents on a moving glacier covered with piles of rock and ice, and spend weeks in these demanding conditions acclimatizing to the thin air of high altitudes. I stayed with three different expeditions out of about seventeen different companies (about 250 people in total) that were present at the Everest base camp during the spring 2004 climbing season. During my stay at the base camp, I observed the daily life and the evolution of interactions among service providers and clients. I conducted in-depth interviews following McCracken's model of the long interview (1988), and following up with some after they left the mountain. I analyzed the interview transcripts and field notes as a whole using a hermeneutic (Thompson, Locander, and Pollio 1994) and iterative approach (Glaser and Strauss 1967; Arnould and Wallendorf 1994; Arnold and Fischer 1994; Spiggle 1994). I tried to achieve a thick description (Geertz 1973) of this high-risk service encounter by including detailed, locally informed, and context sensitive information which correspond to a multi-layered and cultural ethnographic interpretation. In this paper, I only include the sections of my data and analysis that are relevant to the topic and purpose of this study.

## CUSTOMER PERFORMANCE AND EMOTION MANAGEMENT

Climbing high-altitude mountains by paying extensive amounts of money is a very unique activity. Despite the thousands of dollars involved, participants in such experiences, both customers and service providers, have to be in excellent physical shape and ready to deal with the difficulties of living and climbing at high altitudes requiring strenuous physical and mental efforts. The challenge of high-altitude mountaineering originates not only from the characteristics of the climbing activity itself, but also from the conditions of living with relatively poor food, toilet, and shower facilities in a severe climate. Living in tents over a 2-month period in an attempt to acclimatize, meanwhile staying focused and healthy, and still able to climb, is a very demanding and stressful activity even for experienced mountaineers. High altitude mountaineering expeditions takes time since the body has to adapt to thin air and cold. It is hard to put on a staged performance due to braving the cold weather, feeling constantly tired, and being chronically sleepless. Problems arise even during the trekking part before reaching the base camp. It is an all-consuming activity as opposed to an extraordinary experience which does not require superior levels of effort (Arnould and Price 1993, p.25). As a guide and a client describe it:

Raymond (guide): The mental part of it points you in the right direction; without having, without thinking about it and focusing on the goal, you will never get there.... Then there is the physical part of it.... And again you control that, mentally.... You get so tired that just lifting your leg and putting in the next step rather than you are going up or down.... We'll go up for a while because that is a totally different attitude than going down.... It is very difficult.... You take a step and you breathe really deeply about 3 times and it hurts. It really hurts.... And you keep going, because you have been there before and this, again if it was easy everybody would do it and then going down is probably 99 percent mental.... You are so tired, and you are focusing on putting your foot down just like this and then you're putting your next foot down just like this and then you're putting the next foot down just like this so it is like your whole world is one step at a time.... Please don't make a mistake, and then it is all over….

Vera (client): I think being at altitude is emotional … it's easier to be argumentative it's also easier to cry … it's like welcome to altitude… it happens it's easy to get… cause you're always under stress and you don't realize it, just breathing for oxygen is stressing all the time.

The frontstage and backstage areas in service contexts like airlines, banks, restaurants, and hospitals are quite different from service encounter contexts in commercial high-risk sports such as high-altitude mountaineering. Backstages away from customers' gaze (e.g., in a restaurant context, the kitchen) as opposed frontstages are the areas for service providers to be able to reflect and be emotional. In the case of high-altitude mountaineering expeditions, however, personal spaces or backstages are limited in the physical sense, as Drake and Philip's comments illustrate:

Drake (guide): I don't think it's very easy [to find a personal space] but I think it's important; some of the little things we do help a lot, like everybody has their private tent just to be able to put a wall between you and somebody else for a few hours a day is huge I think.
Interviewer: It's a tent.

Drake: Yeah, it's a piece of fabric between you and somebody who's 6 inches away.

Philip (guide): you have to make the time [for yourself], because if you're… if you're working on the mountain you're really engaged, really, you're on 24 hours a day, but whether you're actually having to deal with people on an hourly basis, and there's also you have a lot of support with your other guides and with the Sherpa on the mountain that help you as well…

As these passages suggest, climbers engage in creating symbolic personal spaces or backstages. Listening to music, reading books, writing e-mails, and even talking to a loved one on a satellite phone, are some of the efforts Corry and Sam make:

Corry (client): … Base camp is probably the only place where most people have their own place because they don't share [tents] at base camps. The other thing that I have is always take my mini player up the hill and at least I've got some of my own space with music…

Sam (client): … If you're here you need to put all your attention into climbing the mountain and if you're homesick you can't do that… but I do need the support of my family to know that things at home are going to be ok … it's not just like slipping back into the way things were you've got to work on it for awhile. I send emails every couple of days and I find emails quite good…

Hochschild (1983) argues that there is an inherent inequality in emotional management in service jobs. She says, "the airline passenger may choose not to smile" (p.19) while the steward or stewardess has to do so. In the public world he or she has to accept uneven exchanges and can get "treated with disrespect or anger by a client" (p.85). In the case of the high-risk service encounters explored here, however, such exchanges are expected to happen equally between service providers and clients. As one of the guides says:

Greg (guide): … We all suffer from the effects of altitude, and I think one of the things is that is really important, is um, being open and honest to people, and uh, as far as service is concerned you know we make an effort for people to understand that we are guides and [being] guides means showing people the way. That's what the definition of guiding is, *we're not servants* [emphasis added].

At 5,500 meters and above, it seems likely that activities are not only about pleasing the client, but are even more about staying alive while suffering from effects of high altitude both mentally and physically.

Applicants for most service positions go through initial screening. In the case of Hocschild's flight attendants, the criteria may include weight, figure, straight teeth, capacity to work with a team, and capacity for being a good actor (1983). In a high-risk context where that outcome can be as significant as life versus death, it becomes a moral activity or rather a *moral obligation to perform* not only for the service providers but also for the customers. One ill-prepared or ill-suited client can jeopardize an entire group. This requires that customers for some adventure services may also go through some screening procedures. Adventure companies claim that they screen the customers based on their experiences, adapt-ability, and cooperativeness. This point is illustrated in Alex's critique of some clients:

Alex (guide): Basically if people show up and they have the skills then there's no problem—everybody seems to get along fairly well because of the core set of skills; if people show up and they don't have the technical skills, people become resentful… Some people can't put on their crampons and that's annoying because they require more attention from the guide and you should basically show up and know how to do certain things—you should be able to put on your harness put on your down suit, put on your crampons. It's annoying; it is, because it puts the group at risk.

Alex's complaint illustrates how important it becomes to perform. And performance in such risky conditions is not limited to physical effort. Emotional performance is the crucial part of the activity for the participants including both service providers and customers. Consider the following observation:

Corry (client): … One of the things that leaders [guides, service providers] have to be is upbeat and positive although when [our guide] was sick he was a bit down about that but, and you can allow room for that, but basically you need a leader that is actually very positive most of the time; maybe not all the time but close to all the time because it's bad enough if you've got a member that's actually in a really negative space because *they can suck everybody else into that negative space*. We had two guys [clients] go home and every time that happens everybody else [other clients] is thinking 'oh home,' *it changes your focus* from getting to the summit to going home because these guys are *escaping* they're going to go down and have good food and be warm and breathe easy and they're going to go home to their families; but it's hard enough when a member goes home or is negative and if a leader is low that would just destroy the trip [emphasis added].

Corry, like other customers in a service encounter, expresses his expectation for face work from the service provider. But when his fellow clients fail in their own face work, a problem arises for him. The customers' lack of emotion work creates as much of a distraction for him as if the service provider had failed him. Thus it can be argued that, emotion control by customers may help the other participants to remain psychologically engaged in the co-production of the service. In another instance, Vera's comments on how her physical struggle led to emotions which she was able to restrain with the help of the service provider and thus helped her go through a difficult situation:

Vera (client): …I've been caught in a very very bad storm in Antarctica and that was very interesting in terms of team dynamics there and how people were thinking, and we all thought we were going to die, and just how people reacted in those circumstances. I fell off um I um was coming down a big a steep ridge and I was carrying about 60 pounds on my back but because it was so much a lot of the stuff was hanging on the outside of my pack and I had forgotten at altitude that my pack was so wide and I was going around an edge near some rocks, my pack just rubbed against the rocks, it just nudged me off, so I put myself out to save myself and it was midair that I feel, but I was on a rope, so I only fell about 12 feet, but it was about 3 or 4000 feet sheer drop and I couldn't get back up because the pack was too heavy and there's 2 people standing holding

the rope, I couldn't see them there, that was quite critical… It is a funny story, but eventually I managed to get back onto this ledge, and the person in front of me [guide] felt that the weight was off the rope and therefore he knew I was on the ledge, so he started to pull the rope, obviously meaning come on, get going, and at that time I remember I was shaking obliviously and I remember thinking he was a horrid person because he wasn't stopping to ask me how I was, and all he did was he pulled we've got to go, we've got to go, and I went straight on down, and *they never asked me how I was*, ever, and looking back on it they did exactly the right thing, because if they'd asked me how I was I would've collapsed, and then *I would've been incapable of getting myself together to go on* [emphasis added].

The passage above suggests that sometimes the service provider also has to manage the client's emotions since failing in emotional management effects the other clients, the service providers, and the experience as a whole negatively. Emotional and physical performance affecting the focus; or even the lives of the others (clients and service providers) is complementary and mutually reinforcing. Furthermore, it is more important for customers to be able to manage their emotions at least until the day they reach their summit goal. Corry's quotation illustrates this point:

Corry (client): … I'm happy to be as emotional as possible *after we summitted* as a team *that's the time for emotions* but now I'm going to stay really tightly focused on the goal because we've been here for 30 days already we'll be here for another 20 days if not more, maybe another 25 days, and every day that goes by here it gets harder and harder to focus on the goal because more and more time's gone by so I don't want my feelings and emotions to get in the way whether that's homesickness or I'm quite happy to be excited about things or anxious about things but I don't want my emotions to get in the way from my focus on the goal [emphasis added].

There are a lot of uncertainties (e.g., a moving icefall, weather, and avalanches among many others) inherent in the activity and the guides want to be able to reduce the anxieties their customers might have as much as possible. Communication is important to prepare customers for flexible schedules and potential outcomes. The services provided are vital and they help to provide some comfort and to reduce the stress the customers may constantly feel. In many other contexts service providers are required by management and expected by customers to be smiling and pleasant during the service encounters (e.g., Hocschild 1983, Sharpe 2005). If the duration of the encounter is short, it is easier to manage emotions. The characteristics of the service setting also affect the performance of participants (e.g. Bitner 1992, Sherry 1998). The management of airline companies often suggests that their employees see the plane as their living room and the passengers as their guests to be able to engage in emotion management. However, such an illusion would be virtually impossible to sustain on Mt. Everest. Likewise, since the performance of the client affects other clients and the entire team's chances of success, they too are engaged in emotion work on a slippery stage fraught with danger even under the best of conditions. As a result, the co-construction of the service experience becomes a complex choreography. Given the high stakes of the expedition, not to mention the high investment of its participants, managing relationships and emotions takes on even greater significance not only for guides, but for clients as well.

## DISCUSSION AND CONCLUSION

The display and control of emotions by service providers have been studied mainly for their effects on customers' assessment of service quality (Bitner *et al.* 1990, Grayson 1995). Solomon et al. (1985) argued that consumption of a service is a process that is created and maintained by both the customer and the service provider; that is, consumers are enrolled into the service provider's production as co-producers (Grove and Fisk 1983; Langeard et al. 1981; Solomon et al. 1985). Production and consumption take place simultaneously and the customer is an integral part of the service process. In organizational behavior and management fields, it has been suggested that the consumer should be regarded as part of the service organization (Schenider 1980) and as a "partial employee" (Mills and Morris 1985) in an effort to acknowledge customer involvement in service production.

Research done on the active role of consumers identified several categories of consumer participation including corporeal, oral, and symbolic. This study adds consumer emotional control to the realm of co-creation of experience and meaning. This involves all these different and overlapping types of co-production and adds the active emotional participation which shapes consumers' interactions with service providers and other fellow customers. It is not only in high-risk contexts like Mt. Everest that these sorts of consumer emotion management can be critical. Consider tour groups, restaurant patrons, theater-goers, and many other group contexts in which one customer can change the nature of the experience for all of those present. Emotional displays may consist of angry outbursts, inappropriate laughter, loud talk, or even stoic behavior when the context requires more emotive engagement. Such reactions affect the service experience for all the participants. As this study shows, emotion management serves social functions such as impression management, relationship management, and self-preservation in social settings. Although emotion management in this context may have similarities with consumer coping or may be considered as one manifestation of it (see Duhachek 2005), it differs from it mainly through its strategic and social nature. In other words, emotion management is more important as part of a social interaction and is about producing the proper state of mind in others. On the other hand, coping is more about bringing forth more desirable states in one's own mind.

This study has several implications for consumer behavior and services marketing research. It has been argued that, in the public world of work, it is often part of an employee's job to accept uneven exchanges, to be treated with disrespect or anger by a client, since the customer doesn't have to smile back (Hocschild 1983). The findings here contradict the assumption of an asymmetric relation between customers and service providers and suggest that there can exist more balanced exchanges in extended and complex contexts. Emotion control by customers may be more important and have greater consequences in extended relational service encounters then in discrete ones (see Grayson 1998 and Price et al. 1995). Furthermore, emotion control may help all customers to achieve feelings of satisfaction. Future research should include other contexts to test the applicability of these findings. Although the particular context of this study will not exactly overlap with any other, complex service industries such as healthcare, education, law, and consultancy services may be potentially relevant since in these contexts service providers and their clients also interact over long periods of time and invest a substantial amounts of time, money, and effort in managing their self-presentation in these encounters.

# The Effects of Service Quality Dimentsions on Customer Satisfaction Across Different Service Types: Alternative Differentiation As a Moderator

Nai-Hwa Lien, National Taiwan University, Taiwan
Shu-Luan Kao, Hwa Hsai Institute of Technology, Taiwan

## ABSTRACT

Customer satisfaction is an important indicator of corporate competitiveness. Previous studies have shown that perceived service quality is related to customer satisfaction. This study investigates the relative importance of service quality dimensions on customers' satisfaction across utilitarian and hedonic services. The moderating effect of alternative differentiation on the quality/satisfaction relationship is also examined. The results indicate that technical quality is more influential on the satisfaction of utilitarian services, and functional quality is a more important determinant factor of satisfaction in hedonic services than in utilitarian services. The relationship between service quality dimensions and satisfaction varies with the degree of differentiation of other alternatives.

## INTRODUCTION

Customer satisfaction has been viewed as an important indicator of corporate competitiveness, since it has a positive link to customer loyalty and profitability (Cronin and Taylor 1992; Oliver and Swan 1989; Anderson, Fornell, and Lehman 1994). A better understanding of the satisfaction formation process can allow firms to improve their customer satisfaction and loyalty more effectively. Consistent with this direction, many researches have devoted to identifying the determinants of satisfaction (Anderson and Sullivan 1993; Cronin and Taylor 1992; Taylor and Baker 1994; Woodside, Frey, and Daly 1989). Among all the factors that have been identified as antecedents of customer satisfaction, service quality may be the one that has received considerable attention.

Indeed, service quality has become an important research topic in service management. The conceptualization and operationalization of service quality are the recurring issues in the service literatures. Although there has been an ongoing debate about how to measure service quality, many studies agree with the multi-dimensionality of service quality and focus on two prevailing dimensions (Levesque and McDougall 1996; Grönroos 1984; McDougall and Levesque 1994; Parasuraman, Berry, and Zeithaml 1991). The first dimension includes the core or outcome aspects of service, which is known as "technical quality" (Grönroos 1984). The second dimension includes the relational or process aspects of service delivery, and is referred as the "functional quality." Technical quality and functional quality do not necessarily have equal contributions to customer satisfaction. However, only a limited set of empirical studies has reported the relationship between the two dimensions of service quality and customer satisfaction (Kelley, Donnelly, and Skinner 1990; Mittal and Lassar 1998; Patterson, Mandhachitara "A", and Smith 2001). This study attempts to make up for this gap in the current literatures.

Recent researches in the area of services marketing have begun to examine the effects of situational variables on the relationship between service quality and satisfaction (Mittal and Lassar 1998). Although the importance of investigating situational contingencies is well recognized for the tangible goods (e.g., Churchill and Surprenant 1982; Patterson 1993; Tse and Wilton 1988), it is still greatly untested for the services. Thus, another goal of this study is to examine two possible moderators, service type and alternative differentiation, of the quality/satisfaction relationship.

In summary, this study will investigate the effects of service quality dimensions on customer satisfaction across utilitarian and hedonic services. We will also test whether the relationship between service quality dimensions and satisfaction will vary with the extent of the differences among the alternatives.

## CONCEPTUAL BACKGROUND

### Dimensions of service quality and satisfaction

Grönroos (1984) proposed two dimensions of service quality, which are the technical quality and functional quality. Technical quality refers to the result or the outcome of the service, while functional quality refers to the process or the way the service has been delivered. The distinction of technical and functional qualities is parallel to the dimensions of perceived justice theory, namely distributive and procedural justices(see Cohen-Charash and Spector 2001 for a review). According to the theory of justice, distribute justice deals with decision outcomes while procedural justice deals with decision-making procedure, or how the outcome distribution is arrived (Lind and Tylor 1988).

The technical/functional quality distinction is also corresponding to the SERVQAUL model (Parasuraman, Zeithaml, and Berry 1988), which indicated that service quality contains five dimensions: reliability, responsiveness, assurance, empathy, and tangibles. Mels, Boshoff and Nel (1997) analyzed the data from four service industries and found that, in reality, SERVQUAL only measures two factors: intrinsic service quality (resembling what Grönroos termed functional quality) and extrinsic service quality (which refers to technical quality). Hui, Zhao, Fan, and Au (2004) further suggested that reliability can be viewed as an outcome measure because customers judge it after their service experience. The other four dimensions are process attributes because they can be evaluated by the customers during the service delivery.

It is commonly noted that service quality is an important determinant factor of customer satisfaction (e.g., Parasuraman et al. 1988; Cronin and Taylor 1992; Spreng and Mackoy,1996). Evidence shows that service satisfaction is a function of both technical and functional performance (Grönroos 1995; Yi 1993). Justice theory can provide plausible explanations for the impact of technical and functional qualities on satisfaction. Focusing on the perceived fairness of outcomes, distributive justice theory states that people will respond to unfair relationships by displaying certain negative emotions (dissatisfaction) (Greenberg 1990). Several studies also support the notion that consumers make equity judgments with respect to outcomes, and the equity evaluations would then affect consumer's satisfaction (Oliver and DeSarbo 1988; Oliver and Swan 1989). Defined as the perceived fairness of the means (or process) by which the ends are accomplished (Lind and Tylor 1988), procedural justice aims to enhance the probability of maintaining long-term productive relationship between parties, and has been shown to have a positive effect on consumer service satisfaction (Greenberg 1990; Konovsky 2000; Tax et al 1998).

Although the effect of performance expectations on satisfaction is known to be contingent on the type of tangible products (e.g., Churchill and Suprenant 1982; Patterson 1993, Tse and Wilson

1988), few studies have tested this contingency concept in services. Research on organizational justice has also found that distributive justice is more important predictor of satisfaction with personal outcomes, whereas the reverse is true when people make more general evaluations (Folger and Konovsky 1989; Lind and Tylor 1988; McFarlin and Sweeney 1992). This suggests that the predictive roles of outcome perception (i.e., technical quality) and the perceived fairness of process (i.e., functional quality) may depend on the nature of the outcome in question. Next, we will explore this issue and propose the service types and alternative differentiation as moderators of the quality/satisfaction relationship for services.

### Service Type

Service industries possess vastly different characteristics, thus the related benefits of what the consumer wants may vary according to the different types of services (Lovelock, 1983). Some services provide benefits of utilitarian values, while may provide hedonic values. Utilitarian services refer to those that accomplish functional tasks and focus on the tangible performance characteristics, such as car repair, dry cleaning, and banking. Hedonic services relate to the multi-sensory, fantasy, and emotional aspects of the consumption experience, such as hairstyling, arts, and dining at restaurants (Hirshman and Holbrook 1982).

When evaluating utilitarian services, customers are more practical and concerned with the problems solving. They are more concerned with the outcomes than the processes when receiving utilitarian services. In the hedonic services, customers are more concerned with the service-delivery and the evoked multi-sensual pleasure and enjoyment, captured with their experiential and affective benefits. They are simultaneously concerned with the consumption processes and the outcomes when receiving hedonic services.

In summary, the relative influence of technical quality compared to the functional quality of customer satisfaction is higher in utilitarian services. On the other hand, the influence of functional quality on customer satisfaction will increase in hedonic services. Therefore, we propose the following hypotheses.

*H1*: The impact of technical quality on customer satisfaction is greater than functional quality in utilitarian services.
*H2*: The impact of functional quality on customer satisfaction in hedonic services is greater than in utilitarian services.

### Differentiation of Alternatives

Alternative differentiation, sometimes called alternative attractiveness, is defined as the customer's estimation of the availability of similar services from an alternative service provider (Ping 1993; Patterson and Smith 2003). When more similar services are available, the differentiation and the attractiveness of alternatives are both lower. As Ping (1993) pointed out, the unavailability of similar or attractive alternatives is a favorable situation to retain customers. In other words, alternatives differentiation can increase customer's switching cost (Burnham, Frels, and Mahajan 2003). Therefore, when competing service providers' offer differentiated alternatives customers will have to spend more time and effort to compare among the alternatives, thus increasing their search cost. In addition, when the consumer switches to an alternative service different from the current one, this would mean that the consumer is forsaking the time, economic, and emotional investments made to establish and maintain the current service relationship, such as the special treatments for regular customers, friendships with the service personnel, and familiarity (and learning) with the service environment and procedure. Hence, in order to avoid the loss of these sunk costs customers will intend to stay in the current

relationship even when it is at a less satisfactory condition (Ping 1993; Sharma and Patterson 2000). To reiterate, the higher the alternative differentiation, the higher the switching costs.

The moderating effect of the perceived alternative differentiation on the relationship between service quality dimensions and satisfaction is now considered. When alternative differentiation is low, then the switching cost is low, and it does not matter much if the customers change their service providers. For the utilitarian services where customers are more concerned with problem-solving and accomplishing specific tasks, low alternative differentiation allows customers to consider the reasons of switching based only on the core aspects of the service, i.e., technical quality. However, when alternative differentiation is high, customers have to make more comparison among the alternatives, and both the service outcome and process will become the main determinants of customer satisfaction. Therefore, the customers would simultaneously consider the problem-solving and the added services (e.g. comfortable feel, good atmosphere). Thus, the explanatory power of functional quality on customer satisfaction will increase.

*H3*: Under low alternative differentiation, the impact of technical quality on customer satisfaction is greater than that of functional quality for utilitarian services.
*H4*: For utilitarian services, the relationship between functional quality and customer satisfaction will be stronger under high alternative differentiation condition, compared to low alternative differentiation condition.

In hedonic services customers are concerned with not only the specific tasks accomplished but also the service-delivery process. Even when other alternatives are similar and switching barriers have yet to be established, customer will put some attention on how they are treated during service encounters to give a satisfaction evaluation. When other alternatives are highly differentiated, however, customers will become more involved in the evaluation process (Zaichkowsky 1985) and consider various aspects of service quality. Therefore, functional quality becomes central to determine satisfaction.

*H5*: Under high alternative differentiation, the impact of functional quality on customer satisfaction is greater than that of technical quality for hedonic services.
*H6*: For hedonic services, the relationship between functional quality and customer satisfaction will be stronger under high alternative differentiation condition, compared to low alternative differentiation condition.

### METHOD

#### Sample

In order to choose services representing utilitarian and hedonic consumptions, a pilot study with 60 participants and across 40 service industries was conducted. All participates categorized retail banking as utilitarian service, and about 97.5% agreed all-you-can-eat buffet as hedonic service; therefore, these two services were selected as surveyed industries. A convenience sample of 570 graduate students from a main university in Taiwan was surveyed. Respondents were asked to recall one of their recent experiences with either a retail banking or an all-you-can-eat buffet and fill out a questionnaire based on that experience. Those who did not visit a retail bank or an all-you-can-eat buffet in the past six months were excluded, resulting in a total number of 422 usable responses (response rate 74%). Among them, 66 % was females.

**TABLE 1**
Descriptive Statistics for Utilitarian and Hedonic services

| | Utilitarian service (Retail banking) | | | Hedonic service (all-you-can-eat buffet) | | |
|---|---|---|---|---|---|---|
| | n | mean | St. Dev. | N | mean | St. Dev. |
| Techinical Quality | 255 | 4.46 | 0.92 | 167 | 4.80 | 0.99 |
| Funcational Quality | | 4.09 | 0.95 | | 4.12 | 1.07 |
| Satisfaction | | 4.58 | 1.21 | | 4.46 | 1.13 |

**Measures**

All measures used in this study were adapted from extant scales. Both the technical quality scale and functional quality scale were based on Patterson et al (2001) and contained five items each. The four items capturing customer satisfaction were based on Oliver and Swan (1989). The three items capturing alternative differentiation were adapted from Patterson and Smith (2003). All constructs used a 7-point Likert scale with anchors of *strongly disagree* (1) to *strongly agree* (7). The wording of all scales was adapted to suit the two chosen services. Cronbach's ? coefficients ranging from 0.75 to 0.94, exhibiting good internal reliability; therefore, all scale items were averaged to form corresponding constructs for further analyses.

**RESULTS**

Descriptive statistics of the constructs are shown in Table 1. To test H1 and H2, we regressed satisfaction on technical quality and functional quality for the two types of services. Regression results are presented in the first row of Table 2. Both beta coefficients of the technical and functional qualities are significant across the two services. For utilitarian service, technical quality is considerably more important in shaping satisfaction evaluations than functional quality; that is, beta coefficient for technical quality is 0.59 versus 0.18 for functional quality, supporting H1. For hedonic service, the beta value of the functional quality (.40) is slightly greater than that of technical quality (.39), granting some support for H2.

To examine the moderating role of alternative differentiation on the quality dimension-satisfaction relationship, we divided the data into high and low alternative differentiation groups for each service and conducted sub-group regression analyses. The results are shown in the second and third rows of Table 2.

When alternative differentiation (hereafter AD) is low, technical quality is a significant determinant of satisfaction for both utilitarian and hedonic services. (beta= .694 and .398 respectively). Functional quality, however, is significant only for the hedonic service (beta=.255, p<.05), but not for the utilitarian service (beta= .019, NS). Therefore, H3 is supported.

When AD is high, technical quality and functional quality are both important determinants of satisfaction for the utilitarian service (beta of technical quality=.518, beta of functional quality=.306, both p's<.001). Although both of the beta values of technical quality and functional quality are also significant for the hedonic service, the impact of functional quality is almost three times that of technical quality (beta of technical quality=.236, p< .05; beta of functional quality=.623, p< .001) . Hence, H5 is supported.

Chow tests were performed for each service to test H4 an H6. For the utilitarian service, the Chow test F=3.109, significant at α=.05 level, suggesting there are significant differences in the regression equations across the high and low AD sub-groups. Specifically, the influence of functional quality on satisfaction becomes greater as the degree of alternative differentiation increases (beta=.019 for low AD group vs. beta=.306 for high AD group). Therefore, H4 is supported. Similarly, the impact of functional quality is significantly different between the low and high alternative differentiations for the hedonic service (Chow test F*=5.8188, p<.05). Functional quality apparently have a stronger impact on satisfaction (beta=.623, p< .001) under high AD condition than when it is under low AD condition (beta=.255, p< .05). In addition, the influence of technical quality decreases as AD increases. These results provide support for H6.

**CONCLUSIONS**

The results of our study show that at different service categories, technical and functional quality has a different impact on customer satisfaction. In the utilitarian services such as banking, technical quality has a stronger impact on satisfaction than functional quality. In hedonic services such as all-you-can-eat buffet, functional quality is more influential than in utilitarian services.

Our study also shows that alternative differentiation has a major impact on the nature of the relationship between quality dimensions and customer satisfaction for both utilitarian and hedonic services. Under the low alternative differentiation conditions, the impact of technical quality on satisfaction is greater than functional quality in utilitarian services. In hedonic services, the influence of functional quality on customer satisfaction increases to a level close to that of technical quality.

Under high alternative differentiation conditions, the impact of technical quality on satisfaction is no less than functional quality in utilitarian services. In hedonic services, functional quality exerts more explanatory power on satisfaction than technical quality. For both utilitarian and hedonic services, the impact of functional quality on customer satisfaction under high alternative differentiation is greater than low alternative differentiation. This suggests that highly differentiated alternatives will increase customers' switching cost, so customers will put more attention on the process of service delivery.

Taken together, our results suggest that customers are more involved in evaluating hedonic services than in utilitarian services, since they consider not only the service outcome but also the service process for hedonic services. Alternative differentiation increases

**TABLE 2**

switching cost and perceived risks, and thus increases customers' level of involvement. The notion that customers are more involved in hedonic services compared with utilitarian services is consistent with Shavitt (1992) and deserves further investigation.

**Managerial implications**

The results of this study showed that the impact of technical and functional quality in shaping customer satisfaction varied in the utilitarian and hedonic services. In utilitarian services, customers are more concerned with the service outcome than with the service process. To increase customer satisfaction, managers of utilitarian services could consider investing more resources in improving core benefits, especially when competitors are offering similar alternatives. In hedonic services, customers tend to use both technical quality and function quality to evaluate their service experience. It may be useful for managers of hedonic services to put a little more attention on the delivery process, such as treating customers as individuals, understanding what customers need beforehand, and showing willingness to help. When competing offers are highly differentiated, functional quality becomes even more important for hedonic services. Therefore, managers must understand the specific resources, skills, and mindsets of service staff that make up functional quality, so that proper investment on quality improvement can be made.

**Limitations and further research**

One limitation of this study is that a student sample was used, thus the results can only be generalized to young people. Second, the two services in this study are of low personal contacts and interactions, in contrast to hairdressing, medical, and insurance planning, which are of high personal contacts and tailor-made services. Previous studies have shown that the effects of quality dimensions on satisfaction would vary with the degree of personal contact (Mittal and Lassar 1998; Patterson and Smith 2003). Therefore, our results should be applied to low contact services only.

Our findings suggest that we have several contingency models of satisfaction evaluation, and each is applicable under different conditions. Thus, future studies of satisfaction must take into account the fact that the nature of the relationship between the antecedents and satisfaction are context-specific. Perceived service

complexity, level of personal involvement, and service usage experience are possible moderators worthy of investigation. Simultaneously considering several moderators is especially expected since it would help sort out the boundary conditions of our results.

This study did not consider the behavioral consequences of customer satisfaction such as customer loyalty, repeat-purchase, and recommendation. Previous studies have found that service quality could have a direct link to behavioral intentions (Sharma and Patterson 1999; Bell, Auh, and Smalley 2005), but the quality dimension affecting satisfaction seems to differ from that affecting loyalty (Mittal and Lassar 1998). Future research needs to further explore the dynamics of quality dimensions, satisfaction, and loyalty across various types of services.

# An Empirical Comparison of Ambushing and Sponsorship Effects: The Case of 2006 FIFA World Cup Germany™

Manuel Michaelis, University of Münster, Germany
David M. Woisetschläger, University of Dortmund, Germany
Vivian Hartleb, University of Münster, Germany[1]

## INTRODUCTION

Sponsorship as a marketing tool has grown remarkably during the last two decades, especially with respect to endorsement of worldwide sports events. Overall, global expenditures are forecast to reach $37.7 billion in 2007, up 11.9 percent from $33.7 billion in 2006 (anonymous 2007). Events like the Formula One, the Olympic Games and the FIFA World Cup™ have become fully globalized in terms of media coverage. Therefore, especially many large international companies use the FIFA World Cup™ as a platform for building, strengthening and maintaining their brand equity. For a sponsorship license, enabling the sponsors to market the partnership with the 2006 FIFA World Cup™ worldwide, companies have spent about $53 million US each (anonymous 2006). Hence, companies that engage in sponsorship have to be sure about the effectiveness of their investment (Johar, Pham, and Wakefield 2006), which can be endangered if too many official sponsors share a visitor's attention. To maintain exclusivity for the official sponsors, FIFA has limited their number to fifteen "Official Partners" and six "National Partners," who paid $17 million US each for local advertising rights. Still, sponsors do not seem to be satisfied with the granted exclusivity.

While too many sponsors will most likely result in reduced sponsorship effectiveness for a single sponsor, a second–and probably more severe–threat is the activity of ambush marketers. Ambush marketing is defined as "the practice whereby another company, often a competitor, seeks association with the sponsored activity without payment to the activity owner" (Meenaghan 1994, 77). Despite enhanced legal precautions to protect the interests of official sponsors (Townley, Harrington, and Couchman 1998), many examples of ambush marketing in the context of the FIFA World Cup™ can be found (e.g., Nike, O$_2$, and Puma).

Existing research on ambush marketing focuses on describing the phenomenon and examining strategic issues related to the *practice* of ambush marketing (e.g., Collett and Johnson 2006; Crompton 2004; Crow and Hoek 2003; Ettorre 1993; Farrelly, Quester, and Greyser 2005; Meenaghan 1994; Meenaghan 1998a; Meenaghan 1998b; Payne 1998), *ethical and legal issues* (e.g., Crompton 2004; McKelvey 2003; McKelvey 2006; O'Sullivan and Murphy 1998; Townley, Harrington, and Couchman 1998; Uphoff, Massey, and Brown 2006) and *consumer perceptions* of ambush marketing (Grohs, Wagner, and Vsetecka 2004; Lyberger and McCarty 2001; McDaniel and Kinney 1998; Mizerski, Mizerski, and Sadler 2001; Sandler and Shani 1989; Shani and Sandler 1998). However, research revealed only one study that deals with the effects of ambush marketing on brand evaluation (McDaniel and Kinney 1998). Moreover, existing studies evaluate the effects of ambush marketing at only one point in time. The predominance of the research on brand effects of sponsorship is either static (e.g., Becker-Olsen and Simmons 2002; Javalgi et al. 1994; Lardinoit and Quester 2001; Menon and Kahn 2003; Pope and Voges 1999, 2000;

Ruth and Simonin 2003; Speed and Thompson 2000; Stipp and Schiavone 1996; Turley and Shannon 2000) or is based on data using different respondents over time, making it impossible to analyze effects on the individual level (e.g., Easton and Mackie 1998; Nebenzahl and Jaffe 1991; Quester and Farrelly 1998; Stipp 1998). As a consequence, further studies are needed in order to obtain insights about the effects of ambush marketing strategies on brand evaluation over time.

In the present paper, we (1) use learning theory to develop a dynamical perspective of sponsorship and ambush marketing effects on brand perception and (2) investigate the proposed effects based on a panel survey that was conducted before and after the 2006 FIFA World Cup™.

In accordance with these research objectives, the paper is organized as follows. First, we briefly describe our rationale for choosing the two brands that are used in this research. Second, we briefly discuss the theoretical background of the study and develop our hypotheses based on existing literature. After describing the methodology, we present the results of the empirical analysis, which is based on panel data gathered from 254 respondents. The paper concludes with a discussion of the key findings and their managerial implications to both official sponsors and ambush marketers.

## THEORETICAL BACKGROUND AND HYPOTHESES DEVELOPMENT

Before we conceptualize the influence of sponsorship and ambush activities on brand perception, it is useful to define our understanding of a the term "brand". Following Farquhar (1989) and consistent with new interdisciplinary definitions of brand equity (e.g., Srinivasan, Park, and Chang 2005), we define brand equity as added value that a product has due to its brand. From a perspective of learning, brand equity can be seen as a node in the mind of an individual, which is connected to product-related attributes, utility-expectations, pictures, and emotions (Erdem et al. 1999). Repeated confrontation with stimuli from marketing management (such as advertising, sponsorship, and ambush marketing), from the environment (social networks), and due to personal experiences lead to an enforcement of associative connections in a consumer's mind (Martindale 1991; Till 1998).

Following Keller (1993), brand awareness and brand associations (image) are important dimensions that contribute to brand equity. Brand awareness relates to the strength of a brand in memory, and the likelihood and ease with which the brand will be recognized or recalled under various conditions (Silverman, Sprott, and Pascal 1999). Brand image is defined as "perceptions about a brand as reflected by the brand associations held in consumer memory" (Keller 1993).

The favorability, strength, and uniqueness of brand image permit the brand to be strategically differentiated and positioned in the consumer's mind. These associations can be built, strengthened, and maintained when consumers gain awareness of stimuli related to the brand. International sport events like the FIFA World Cup™ are promising suppliers of pictures, episodes, experiences and stories that may be relevant for building new associations. These

associations are predominantly–but not exclusively–communicated by mass media.

We propose that the process of building new associations between a brand and an event is identical for both sponsorship and ambush marketing practice, unless an individual realizes that he or she falsely associated a company with an event. In this case, existing attitudes about ambush marketing might play an important role (Lyberger and McCarthy 2001). Accordingly, in the next section, we develop our hypotheses about sponsorship effects on three brand constructs (brand awareness, brand image, and brand equity) in general, and, discuss specific aspects of information processing in the case of sponsorship versus ambush marketing.

In existing research, explanations of effects are often based on learning and consistency theories (Dean 2002, Olson and Thjomoe 2003). For instance, the mere exposure effect suggests that, in the absence of other stimuli (Baker 1999), repeated exposure to a stimulus will lead to a positive affective reaction (Zajonc 1968). In a similar manner to advertising, sponsorship is often directed to respondents in a situation, in which they pay relatively low attention to the stimulus (e.g., because of concentrating on the sports event). Therefore, the stimulus must be repeated several times in order to attract the respondent's attention (Baker 1999). This study proposes that respondents need to be exposed to the stimulus several times in order to recall it effectively, so that the association of the sponsorship stimulus to the sponsor is the result of a learning process. Several studies find evidence for a positive effect of sponsorship recall on brand perception (e.g., Becker-Olsen and Simmons 2002; Javalgi et al. 1994; Lardinoit and Quester 2001; Menon and Kahn 2003; Pope and Voges 1999, 2000; Ruth and Simonin 2003; Speed and Thompson 2000; Stipp and Schiavone 1996; Turley and Shannon 2000). Therefore, we propose:

$H_{1a,b,c}$: *If a sponsor is recalled, (a) brand awareness, (b) brand image, and (c) brand equity will be evaluated significantly more favorably.*

We expect the degree of change in brand awareness, brand image, and brand equity to be stronger for individuals who only recall/learn that the brand is linked to sponsoring (ambushing) in the second survey in comparison to the individuals who recall/remember the brand in both surveys. In the latter group, the information that the brand is connected to the event was learned before the first survey was conducted. From a perspective of learning, this assumption is justifiable as follows: A change in attitude can be seen as a hypothesis-testing process in which new information, for example, a sponsorship stimulus, is compared to existing attitude toward the sponsoring brand (Hoch and Deighton 1989, 3). It can be argued that existing attitudes toward a sponsoring brand prevent the processing of new information. The dominance of existing attitudes results in a confirmatory processing of new stimuli (Erdem et al. 1999, 307). Following Gettys and Fisher (1979), individuals only change their attitudes when it is predominantly evident that the existing attitude is wrong. This phenomenon is also referred to as "blocking" (van Osselaer and Alba 2000, 1). Hence, we hypothesize that:

$H_{2a,b,c}$: *Learning the association between a sponsor (ambusher) and an event will lead to a more favorable change in the evaluation of (a) brand awareness, (b) brand image, and (c) brand equity than will remembering the association.*

However, whether a change in attitude occurs and the direction in which that change occurs also depends on an individual's *prior knowledge* about the sponsoring (ambushing) brand, the sponsored object, and *existing attitudes* (e.g., toward sponsorship or ambush marketing in general).

We propose that the event image (Grohs, Wagner, and Vsetecka 2004; Speed and Thompson 2000), the attitude toward commercialization of sports events, and the attitude toward ambushing (Lyberger and McCarthy 2001) influence the change of brand awareness (brand image, brand equity) over time. Based on the learning perspective as described above, we expect a positive influence of the event image on the change of the dependent brand constructs (awareness, image, and equity). Moreover, we expect the change of the brand constructs to be more favorable if the existing attitude toward commercialization and ambushing is positive. Therefore, the following set of hypotheses is stated:

$H_{3a,b,c}$: *A positive event image has a positive impact on the change of (a) brand awareness, (b) brand image, and (c) brand equity over time.*

$H_{4a,b,c}$: *A positive attitude toward commercialization of an event has a positive impact on the change of (a) brand awareness, (b) brand image, and (c) brand equity over time.*

$H_{5a,b,c}$: *A negative attitude toward ambushing has a positive impact on the change of (a) brand awareness, (b) brand image, and (c) brand equity over time.*

We state hypothesis $H_6$ for both official sponsor and ambush marketer in a similar manner. We do not expect a negative reaction of individuals against ambushing brands if individuals are (and remain) unaware of the fact that the recalled brand is not the official sponsor. However, we specify $H_5$ for the group of individuals who recall the ambush marketer in t=1 and recall the official sponsor in t=2. For this recall group, we expect a negative effect of attitude toward ambushing on the ambushing brand, and a positive effect on the officially sponsoring brand. Hence,

$H_{6a,b,c}$: *A negative attitude toward ambushing has a negative impact on the change of (a) brand awareness, (b) brand image, and (c) brand equity over time, if the sponsor is identified as being an ambush marketer.*

## METHODOLOGY

### Stimuli and Sample

Our analysis focuses on Lufthansa and Emirates airlines in order to analyse ambush marketing and sponsorship effectiveness in comparison. Lufthansa gained attraction with its ambush strategies in the run-up of the 2006 FIFA World Cup™. As the official partner of the German soccer team, but not of the 2006 FIFA World Cup™, Lufthansa launched a vast variety of activities to associate the brand with the 2006 FIFA World Cup™. Lufthansa's ambushing activities may have reduced the effectiveness of Emirates' promotional efforts as the official airline sponsor of the 2006 FIFA World Cup™. Currently, Emirates had expanded heavily into the German market. To achieve higher brand awareness worldwide, sponsorship is one of Emirates' corporate communication instruments. Besides the 2006 FIFA World Cup™, Emirates made headlines in the soccer world by signing a $ 195 million US sponsorship contract with the Premier League Club Arsenal London in 2004 (Owen 2004) and other teams in Europe (Paris St. Germain, Hamburger SV).

We tested our hypotheses through an online study using a web survey design. In contrast to face-to-face studies, online surveys do

not require personal interviews to be conducted and therefore avoid interviewer effects which could be an issue in this context (Duffy et al. 2005, 617). The sample was derived from an existing list of registered users of an online research portal which consists of more than 5,000 individuals who have registered their personal information (including email addresseses). Invitations for participation in this study were sent out to 2,000 individuals one week before the first match of the 2006 FIFA World Cup™ started. In order to ensure a high response rate, a number of prizes were drawn in a small lottery. Between May 29th and June 7th, we collected data from 433 German respondents, equaling a response rate of 21.7 %. Individuals were not notified that they would be contacted a second time. One week after the tournament final, a second invitation was sent to the 433 participants of the first round. A total of 254 respondents (58.7 %) participated in the second survey, in which a two-part questionnaire had to be completed. About 60 % of the respondents were male, with an average age of 29.2 (8.3 Std.-dev.). The focus on younger people does not affect the interpretation of the findings because all respondents could be target groups of the examined sponsor/ ambusher.

**Questionnaire Development and Measurement**

In order to measure sponsor and ambushing recall, the questionnaire asked respondents to name airline brands that they could recall as sponsoring of the FIFA World Cup™ (Tripodi et al. 2003). Following Baker et al. (1986) and Keller (1993), we decided against asking for ad/sponsorship recognition, because the measurement of recognition would be subject to several biases, that is, interest of a person in the brand (Bennett, Henson, and Zhang 2002, 177) and, more importantly, to a bias in the second survey.

Sponsor-related variables were measured using multi-item scales. All items are measured on 7-point Likert-type scales, with anchors of 1=strongly agree and 7=strongly disagree. Based on Yoo, Donthu, and Lee (2000), three items ("I can recognize X among other competing brands," "Some characteristics of X come to my mind quickly," and "I can quickly recall the symbol or logo of X") were used to measure a sponsor's brand awareness ($\alpha$= .903; $\rho$c=.915; VE=.782) and four items were used to measure overall brand equity ($\alpha$= .957; $\rho$c=.960; VE=.858). We measured brand image ($\alpha$= .901; $\rho$c=.904; VE=.612), consisting of attribute (comfort, safety, variety of connections, customer friendliness) and non-attribute (likeability, innovativeness) components using six items that are regularly used in the literature (e.g., Verhoef, Langerak, and Donkers 2004; Mitchell 1986). Attribute components are closely linked to quality, whereas non-attribute components represent a

brand's personality and imagery from a consumer perspective. We used a scale from Woisetschläger (2007) to measure event-image ($\alpha$= .926; $\rho$c=.929; VE=.724) and scales from Lee et al. (1997) and Lyberger and McCarthy (2001) to measure attitude toward commercialization ($\alpha$= .825; $\rho$c=.848; VE=.650) and attitude toward ambush marketing ($\alpha$= .902; $\rho$c=.897; VE=.686).

Notably, the coefficient alpha is larger than .7, which is the threshold generally proposed in the literature (Nunnally 1978), and composite reliabilities are larger than .6 for all constructs (Bagozzi and Yi 1988). Moreover, discriminant validity between the constructs is given, since none of the squared correlation coefficients between any of the constructs exceeds the average variance extracted for a construct (Fornell and Larcker 1981). We also checked for measurement invariance over time, as proposed by Baumgartner and Steenkamp (2006), and found the constructs to be sufficiently (partially metric) invariant.

**RESULTS**

Before we consider the tests of our hypotheses, we analyzed descriptive results of our study. Results of sponsorship recall before and after the 2006 FIFA World Cup™ are shown in Table 1.

In the first survey, almost nearly as many individuals recall the ambush marketer Lufthansa as sponsor (25.6 %) as recalled Emirates (28.0 %). The other respondents either could not recall any brand (35.0 %), or recalled other airline brands (11.4 %). After the event, 57.1 % of the respondents recalled Emirates. Recalls of the individuals who remembered Emirates in the first survey remained very stable, while 45.7 % of the respondents who named another brand initially learned that they were wrong. 35.0 % of the second-survey respondents who did not recall a sponsor in the first survey named Emirates, while 16.9 % of that group named Lufthansa.

Regarding the stability of brand awareness, brand image, and brand equity over time, Lufthansa is notably evaluated more favorably with respect to brand equity, and the ratings are stable between the two measuring points. In contrast, Emirates gained from being linked to the event in terms of brand awareness and brand equity. The improvement of brand image over time is marginally significant (Table 2).

In a next step, we analyze the relation between sponsorship recall and brand awareness (image, equity) for the two measuring points. Results shown in Table 5 indicate no significant effects for Lufthansa before and after the event. For the official sponsor Emirates, we find significant positive relations between sponsorship recall and brand awareness (brand image) before the event, and significant and even stronger relations between recall and all three

[a] mean value, lower number indicate a better evaluation (standard deviation)

constructs after the event. Hence, $H_{1a,b,c}$ must be rejected in the case of Lufthansa for both time points, whereas we find evidence for $H_{1a,b}$ ($H_{1a,b,c}$) for Emirates in the first (second) survey.

As a first result, we can conclude that the level of brand evaluation is more positive in interaction with the recall of communication stimuli in the case of the official sponsor Emirates. Therefore, in the following paragraph, the data of two measurement points is analyzed to assess the change over time and the role of moderating constructs that influence this process.

As stated in $H_2$, we expect that the brand constructs will be more stable in the group that recalls the sponsor/ambush marketer twice in comparison to the group that recalls the sponsor/ambusher only in the second survey. Results in Table 4 only indicate support for $H_{2b}$ only in the case of Emirates. All other hypotheses must be rejected.

Finally, the influence of existing attitudes (event image ($H_{3a,b,c}$), attitude toward commercialization ($H_{4a,b,c}$), and attitude toward ambushing ($H_{5a,b,c}$ / $H_{6a,b,c}$) on the change of the three brand constructs over time is analyzed with regression analysis for four different groups of respondents (all; respondents who identify the same brand twice as sponsor; respondents who identify the sponsor in the second survey; respondents who identify the ambush marketer in the first survey and the official sponsor in the second survey). Results are depicted in Table 5.

Most of the relations between attitude (toward commercialization of an event) and the change of the three dependent brand constructs are not significant, but have the algebraic sign in the proposed direction. The lack of significance could also be a result of small sample sizes in the groups analyzed. Because the size of the proposed effects is small, a larger sample size could lead to more significant results (Hair et al. 2006, 416). The change of brand equity is mostly unaffected by existing attitudes, while more significant results can be found for brand awareness and brand image. Overall, most of the hypotheses must be rejected, except for $H_{3a}, H_{5b}$ for the official sponsor Emirates and $H_{6a,b}$ for the ambush marketer Lufthansa.

However, a meaningful result indicated is that attitude toward ambushing shows a positive effect on the official sponsor for two recall groups, whereas the influence on the ambusher's brand image is negative. The strongest negative effect of attitude toward ambushing can be found for the group of respondents that recalls Lufthansa as sponsor in the second survey only. This finding shows that the measurement of recall alone for assessment of communication effectiveness could provide misleading results. Linking recall and change of brand constructs over time is important for a reliable assessment of the positive (negative) consequences of marketing communications.

**IMPLICATIONS AND FURTHER RESEARCH**

Based on our results, several implications for the brand management can be derived. In the next section, we briefly discuss general implications of our findings. In a following step, conse-

**TABLE 4**
Change in brand evaluation over time by recall groups

[a] linear regression on construct's mean (t=1)-mean (t=2)

quences for official sponsors and ambush marketers are presented.

One consequence of our results is that, in spite of extensive legal efforts to restrain ambush marketing activities, ambush marketing poses a threat to official sponsors of events. Indeed, Lufthansa did not profit from the ambush marketing activity in the specific period of time but, most likely, the positive consequences of the sponsorship by Emirates were influenced negatively.

Furthermore, a conclusion of our examination is that the communication effect for the official sponsor Emirates is strong, while there is no significant effect for the ambush marketer Lufthansa.

The effect of sponsorship on Emirates is not only limited for brand awareness but also for the image and equity of the brand. Therefore, the strategic alternatives presented by Cliffe and Motion (2005) have to be adjusted, in the sense that mass events can also be used to raise a brand's image and equity to a degree, even when a brand is relatively unfamiliar to most consumers before the event.

Thus, for official sponsor partners, it is important to take the necessary precautions to ensure that the effectiveness of the partnership is not weakened by ambush strategies of their competitors. For example, a company should have to be certain that all gaps of

possible misuse are closed by regulations of the event organizer before signing a sponsorship contract. However, companies that decide to follow an ambush marketing strategy should concentrate on using the gaps (e.g., sponsorship of national teams during a sport event) in the communication strategy of their competitor. Moreover, they should try to avoid negative associations which can be the consequence if legal arguments with official sponsors arise, or if the motives of the ambusher become too obvious to the public.

Further research should focus on gaining a deeper understanding about the effect of existing attitudes (and their change over time) on the brand over time. Additionally, a broader concept of brand image should be applied, because we focused more on attribute than on non-attribute components of brand image. Replications should consider that a higher number of respondents might be required to identify effects. Moreover, this study should be replicated in different contexts (event and brand-related) to generalize the results reported in this study.

# Profiling the Brand Personality of Specific Brands

Annie Peng Cui, Kent State University, USA
Paul J. Albanese, Kent State University, USA
Robert D. Jewell, Kent State University, USA
Michael Y. Hu, Kent State University, USA

## ABSTRACT

The purpose of the present study is to demonstrate an alternative framework for evaluating the brand personality of a single brand using Q methodology. Q methodology is uniquely suited to measuring the personality of a single brand because it allows the measurement of a subjective construct in a holistic way without reducing the construct to factors. The brand personality profiles are provided for four fast food brands: McDonald's, Burger King, Wendy's and Subway. An interpretation and comparison of these profiles reveal the similarities and differences among these brand personalities in the same product category.

## INTRODUCTION

A considerable amount of attention has been given to the construct of brand personality In consumer behavior research (Aaker, 1997; Fournier, 1998; Muller and Chandon, 2003; Sung and Tinkam, 2005; Venable et al., 2005; van Rankom, Jacobs, and Verlegh, 2006). Brand personality is a multi-dimensional construct that provides a unique view of a brand that goes beyond merely describing a brand's intrinsic attributes (Keller, 2003a, 2003b). Examining the human characteristics that consumers ascribe to a brand should lead to a better understanding of consumers' perception of the brand. However, given the nature of the construct, a brand's personality often resides in a consumer's subjective evaluation. How to extract consumers' subjective perceptions of a brand's personality represents the focus of this study.

The widely-cited and arguably most influential research on brand personality was conducted by Aaker (1997). By utilizing Aaker's basic framework as a starting point, this research attempts to study how to build a brand personality profile for individual brands using Q methodology. Q methodology is designed to study people's subjective representation of the world from their internal standpoint (Brown, 1980); therefore, it is appropriate to adopt Q methodology to study consumers' subjective evaluation of a brand's personality. Moreover, the advantages of Q methodology (e.g., small number of participants, retrieving subjectivity, identifying different perspectives, etc.) have proven Q methodology to be a viable, yet underutilized, research method in marketing (Kleine, Kleine and Allen, 1995).

## BRAND PERSONALITY

### Definition of Brand Personality

The brand personality construct was introduced by Martineau (1958) to refer to the non-material dimensions that made a store special. The author argued that the personality or character of a store could help to differentiate one store from another. King (1970) and Plummer (1985) contributed to the establishment of the construct in consumer behavior research. As cited by Azoulay and Kapferer (2003 p.144), King believed that "people choose their brands the same way they choose their friends… they simply like them as people." Plummer (1985) advanced the brand personality construct by asking consumers to identify a brand as a type of person, staying in what kind of places, having what occupations, reading what types of magazines, etc.

More recently, Aaker (1997, p. 347) defined brand personality as the "set of human characteristics associated with a brand." The purpose of Aaker's (1997) research was to assess and describe the aggregate structure of brand personality across brands and product categories. The author carefully selected 37 brands from various product categories and adopted a lexical approach similar to the Big Five model of human personality in psychology. Aaker (1997) developed a 42-item measurement scale from the original set of 114 traits and identified five dimensions of brand personality: excitement, sincerity, competence, sophistication and ruggedness.

### Measuring the Personality of a Brand

Measuring a single brand's personality in a specific market is of great interest to both researchers and practitioners. Some researchers have attempted to measure brand personality using the five-factor model assuming that each individual brand should be represented by the entire five-dimensional personality structure that Aaker (1997) uncovered across many brands and product categories (e.g. Kim, 2000; Best, 2005). Rojas-Mendez, Erenchun-Podlech, and Silva-Olave (2004) used Aaker's (1997) 42-item scale to measure Ford's brand personality in Chile. Although these researchers expected to replicate the five-factor structure for Ford that Aaker (1997) found across multiple brands, the authors only found four dimensions.

Aaker (1997) defined brand personality at the individual brand level and suggested using the scale to measure brand personality for individual brands. However, the five-dimensional structure should only be expected to emerge at the aggregate level, not the individual brand level (Austin, Siguaw and Mattila, 2003; Bonsnjak, Rammstedt and Tuten, 2005). The 37 brands selected by Aaker (1997) represent a wide range of product categories. Aaker (1997) took the average scores across subjects for each brand on each trait; thus the personality of a brand is presented as a single data point in the five-dimensional structure. If used at the aggregate level (i.e. across different brands and product categories), Aaker's five-dimensional structure would likely be retrieved; however, researchers should be very cautious if they assume that each individual brand will have the same five-dimensional brand personality structure, or believe that a simplified scale (e.g., using the 15 facets instead of the 42 traits) can be used to measure a single brand's personality.

In order to explore the extent to which the brand personality of a single brand may conform to the aggregate structure uncovered by Aaker (1997), we conducted a study of McDonald's. To evaluate McDonald's brand personality vis-à-vis Aaker's (1997) five dimensions, we administrated Aaker's 42-item brand personality scale to 185 college students who participated in an online survey in exchange for class credit. Participants were directed to indicate how characteristic McDonald's is with respect to each of the 42 traits uncovered by Aaker (1997) on a 7-item Likert scale (1=extremely uncharacteristic; 7=extremely characteristic). An exploratory factor analysis (EFA) was conducted using principal component extraction with a varimax rotation and a factor extraction criterion of eigenvalue greater than 1. We uncovered 12 factors (not five) that explained 66.2% of the variance. Furthermore, the traits in each factor neither resembled the items in Aaker's five-factor

structure, nor represented the 15 facets of the brand personality scale. For example, in the first factor, which explains the most variance (22.8%), there are traits such as hard-working, trendy, good-looking, glamorous, intelligent, smooth, upper-class, up-to-date, honest, and wholesome. In Aaker's five-factor structure these traits come from the factors of sophistication, competence, sincerity and excitement.

A confirmatory factor analysis (CFA) using maximum likelihood via AMOS 5.0 software (Jöreskog and Sörbom, 1993) was then conducted to see how well Aaker's five-factor solution fits the data. The model was specified exactly the same as the five-factor model tested by Aaker (1997), so that each factor represented a distinct dimension of brand personality, with the covariance matrix of the five factors used as input for the analysis. The fit statistics indicated a poor model fit. The GFI, AGFI, NFI, and CFI values for all the data sets fell well below the acceptable level of .90 (GFI=0.847, AGFI=0.811, CFI=0.816 and NFI=0.740, Chi-square=1569.246, p-value=0.000; Bentler and Bonett, 1980). The RMSEA value (RMSEA=0.104) is far above the acceptable criterion of .05 (Browne and Cudeck, 1993).

Both the 12-factor structure uncovered from EFA and the unsatisfactory model statistics from CFA indicate that Aaker's five-factor model of brand personality could not be retrieved for the single brand, McDonald's. However, this result should not be used to question the aggregate dimensionality of brand personality of multiple brands uncovered by Aaker (1997). Nevertheless, as rigorous as Aaker's study is, what matters to a company is the brand personality of its individual brand in a specific market, rather than the overall brand personality structure across different product categories. In the next section we describe an alternative approach to profiling the personality of a single brand using Q methodology.

## Q METHODOLOGY

The goal of describing the brand personality of a single brand is fundamentally different from describing the brand personality structure at the aggregate level. For this research, we have adopted Q methodology to assess the brand personality of a single brand. Q methodology, introduced by Stephenson (1935, 1953), was designed to study human subjectivity and provide a method to examine the world from the internal standpoint of the individual being studied (Brown, 1980, 1993). Although subjective opinions are unprovable, they can be shown to have structure and form, and Q methodology represents a means to make this form manifest for observation (Brown, 1996). Q methodology enables researchers to "model — or, more accurately, enables the respondent to model his or her—viewpoints on a matter of subjective importance through the operational medium of the Q-sort" (McKeown and Thomas, 1988, p. 12).

Q methodology is uniquely suited for measuring the personality of a single brand because it allows us to measure a subjective construct in a holistic way without reducing the construct to factors (Stephenson, 1953; Brown, 1980; McKeown and Thomas, 1990). Brand personality is a subjective phenomenon, and "subjectivity is always self-referent" (McKeown and Thomas, 1988, p. 12). Thus, Q methodology provides a foundation for the systematic study of subjectivity (Brown, 1993).

According to Brown (1997), there has been an acceleration in the use of Q methodology in an expanding number of intellectual fields. In marketing, Kleine, Kleine and Allen (1995) studied consumers' possession attachment to various personal belongings using Q methodology. The authors investigated consumers' different types of possession attachment and how the strength of the attachment varies due to the life story associated with the possession. Q methodology was widely used in personality studies as well.

Block and Robins (1993) studied the personality change from early adolescence to early adulthood. Hilden (1954), Block (1955), Block and Bailey (1954) and Albanese (1993) adopted the California Q-Set to the study of personality assessment and psychiatric research. We, therefore, believe it is appropriate to adopt Q-methodology in our study of the brand personality of a single brand.

There are two main components in Q methodology, Q-sort (measurement of subjectivity) and Q-factor analysis (forming groupings of individuals with similar subjectivity).

### Q-Sort

The instrumental basis of Q methodology is the Q-sort technique (Brown, 1996), a comparative ranking task in which participants rank order a set of statements (i.e., in our case, the 42 brand personality traits), under certain instructions (e.g. "Describe the brand personality of McDonald's"). Subjects are instructed to express their perceptions of a certain subject matter by rank ordering the provided statements into a continuum of categories, ranging from extremely characteristic to extremely uncharacteristic. Each category has a fixed number of statements. The number of statements required in the two extreme categories is the smallest, and the number gradually increases toward the middle of the categories; the distribution of the number of statements across categories resembles a normal distribution. The participants have to make comparisons among the statements before putting them into each category; therefore, the decision of assigning each statement to a particular category is made relative to the placement of the other statements. The subjective perspective of the brand's personality is constantly referred to by the sorter during the sorting process. Q-sorting requires more cognitive effort than a comparable scale-based questionnaire methodology. The additional effort over conventional survey methods required to do a Q-sort stems directly from the task of ranking each item relative to all the others to form a holistic representation of the brand's personality.

### Q-Factor Analysis

Different persons' Q sorts can be correlated and factor analyzed to form groupings of persons who have ranked the statements in a similar way (Brown, 1980, 1993, 1996). The correlation of different subjects' sorts indicates the similarity/dissimilarity of each person's perspective. The factors uncovered in this way point to categories of operant subjectivity; i.e., different groups of opinions and views on the same subject matter (Stephenson, 1954, 1977, 1993; Brown, 1980, 1993). Persons loaded on the same factor bear a resemblance in terms of subjectively shared viewpoints. Though the viewpoints being studied are subjective, "the factors are grounded in concrete behavior, and are usually reliable and easily replicated, and, happily, are subject to statistical summary which facilitates more careful description and comparison" (Brown, 1980, p. 6).

The sorts are factor analyzed using a statistical program like SPSS or a specialized program like PQMethod (2.11). In the data input for Q-factor analysis, the subjects are placed in the columns and the items in the rows. Each of the factors resulting from Q-factor analysis corresponds to a group of individuals with a similar perspective. The factor scores are averages weighted by Spearman's rank correlations for each item across the groups of subjects. Thus, for the purpose of profiling the brand personality of a single brand, the ranking of these factor scores from positive to negative (positive=traits characteristic of the brand and negative=traits uncharacteristic of the brand) reflects the perceived brand personality of the group. The ranking of these scores tends to be quite stable over various levels of sample sizes. Thus, a relatively small number of participants (e.g. 30 to 60 sorts) are usually sufficient to achieve stability in the ranking of factor scores (Brown, 1996).

In summary, when Q-sorts are factor analyzed, subjects are grouped to reveal the structure of shared perspectives. Thus, we can identify different perspectives of the personality of a specific brand, and simultaneously, identify the members of each group. By the same token, Q methodology can be used as a segmentation tool to uncover the different segments of a brand's customers according to the different brand personalities held by the members of each segment.

## MEASURING MCDONALD'S BRAND PERSONALITY WITH Q METHODOLOGY

### Pretest

This research was conducted at a large state university in the Midwestern U.S. For the sake of consistency with existing research, we adopted Aaker's 42 brand personality traits. Decks of cards were created for participants to use in the study. Each deck has 42 cards, and each card contains one of Aaker's (1977) 42 traits. A pretest with 13 college students (earning extra class credit) was conducted to see if the participants had any problem following the instructions of the Q study and to detect any possible ambiguous brand personality traits contained in the deck. Each subject was given a deck of cards and was asked to rank order the 42 traits according to his or her perception of the brand personality of McDonald's. The 42 traits were sorted into seven categories ranging from -3 to +3, each with a fixed number of cards required in the category (+3, extremely characteristic, 3 cards; +2, quite characteristic, 5 cards; +1, somewhat characteristic, 8 cards; 0, neither characteristic nor uncharacteristic, 10 cards; -1, somewhat uncharacteristic, 8 cards; -2, quite uncharacteristic, 5 cards; and -3, extremely uncharacteristic, 3 cards).

We believe that McDonald's is appropriate for this research because college students are very familiar with the brand and they represent a sizable consumer segment of this fast food chain. Throughout the pretest, we found that participants did not have any difficulty in understanding either the research method or the instructions. We identified a potential ambiguous trait, "western." Some students interpreted "western" as the opposite of Eastern culture, while "western" in Aaker's scale means "cowboy western." To avoid any misunderstanding, we added a notation, "cowboy" to the item, "western."

### Main Study

The main study was comprised of 85 college students between the ages of 20-24, who participated in the study for class credit. For data collection, we ran 12 sessions with 7-8 students in each session. As in the pretest, each participant was given a deck of cards with the 42 brand personality traits, an instruction for sorting, and a score sheet to record the Q-sort. According to the instructions, participants were asked to describe the brand personality of McDonald's by placing the 42 traits into 7 categories, ranging from extremely characteristic (+3) to extremely uncharacteristic (-3). Participants were also asked to examine the sort, make rearrangements as needed, and to be sure that the sort represented their view of McDonald's. It took the participants approximately 15-20 minutes to finish the sorting. Once the participant was satisfied with the sort, he/she recorded the sort on the score sheet thereby completing the session.

### RESULTS

All 85 sorts were entered into SPSS for factor analysis. The factors generated represented groupings of subjects with the same perspectives related to McDonald's brand personality; in other words, subjects grouped on each factor had sorted the 42 traits in a similar way and shared a common view of McDonald's brand personality. The factor analysis yielded one dominant factor with an eigenvalue of 37.9 explaining 45% of the variance (74 participants out of 85 loaded on this factor) and a subordinate factor with an eigenvalue of 5.6 explaining 7% of the variance (4 participants out of 85 loaded on this factor). In Q analysis, the variance explained should be interpreted as the percentage of variance in that factor over the total amount of variance among the items in the entire sample. This suggests that there is one dominant brand personality for McDonald's.

Within each factor, based on the value of the factor score of each trait, we constructed the brand personality profiles (see Table 1). For each factor, the 42 traits were ranked by the value of the factor scores from positive to negative (see Table 1). The top three traits with the highest positive factor scores were put in category +3, indicating that these traits were extremely characteristic of McDonald's according to the point of view of the members in the group. Traits in category +3 carry more weight in determining the brand personality of McDonald's than other traits. The next 5 traits that ranked high on the list were put into the category, +2, meaning that traits in this category were quite characteristic of McDonald's. All 42 traits were put into these 7 categories accordingly. Traits with a positive sign indicate that McDonald's is characteristic of these traits and the traits with a negative sign suggest that McDonald's is uncharacteristic of these traits. Of all 42 traits, 16 have positive signs and 16 have negative signs. The 10 traits with a rating of 0 are neither characteristic nor uncharacteristic of McDonald's.

Factor 1 represents the dominant perspective of McDonald's brand personality. The three extremely characteristic traits (+3) indicate a brand personality of McDonald's as a *successful corporate leader*. The brand personality described by this category clearly fits McDonald's position as a leading corporation in the fast food industry. Therefore, when college students think of McDonald's, the first image that comes to mind is that of a successful business leader.

The five quite characteristic traits (+2) add more personal characteristics to McDonald's brand personality as family-oriented, friendly, cheerful, up-to-date and confident. The trait of family-oriented may have come from the happy meal on McDonald's menu and the playground for children. Friendly and cheerful may be associated with the spokesperson, Ronald McDonald. The confident trait is consistent with McDonald's character as a successful corporate leader. The eight traits in the somewhat characteristic category (+1) reveals a more exciting side of McDonald's as imaginative, young, spirited, and trendy, along with the traits of reliable, secure and hard working that are also consistent with the predominant brand personality of McDonald's as a successful corporate leader.

At the negative end of the brand personality profile, McDonald's is clearly not perceived by college students as upper class, glamorous, or cowboy western (extremely uncharacteristic, -3), nor outdoorsy, rugged, tough, wholesome or unique (quite uncharacteristic, -2). Thus, we can conclude that among college students McDonald's personality is neither stylish nor tough.

Thus Factor 1 reveals the dominant brand personality of McDonald's as a successful corporate leader that is shared by a preponderance of the subjects.

Factor 2 reveals an alternative perspective of McDonald's brand personality shared by only four group members. In this perspective the extremely characteristic traits (+3) depict a cheerful, honest and wholesome side of McDonald's. The quite characteristic traits (+2) of sincere, friendly, original, and family-oriented echo the traits in the +3 category. Factor 2 does not portray McDonald's as a successful corporate leader, as these traits fell on

**TABLE 1**
McDonald's Factor Scores for each Brand Personality Trait

|  | Factor 1 | Factor 2 |
|---|---|---|
| Successful | +3 | -1 |
| Corporate | +3 | -2 |
| Leader | +3 | -1 |
| Family-oriented | +2 | +2 |
| Friendly | +2 | +2 |
| Up-to-Date | +2 | -1 |
| Cheerful | +2 | +3 |
| Confident | +2 | 0 |
| Reliable | +1 | 0 |
| Imaginative | +1 | +1 |
| Secure | +1 | -1 |
| Young | +1 | +2 |
| Spirited | +1 | +1 |
| Original | +1 | +2 |
| Hard Working | +1 | -1 |
| Trendy | +1 | -2 |
| Real | 0 | +1 |
| Exciting | 0 | 0 |
| Independent | 0 | 0 |
| Intelligent | 0 | -1 |
| Cool | 0 | +1 |
| Contemporary | 0 | -2 |
| Down-to-earth | 0 | +1 |
| Honest | 0 | +3 |
| Smooth | 0 | -1 |
| Sincere | 0 | +2 |
| Masculine | -1 | 0 |
| Sentimental | -1 | +1 |
| Technical | -1 | -3 |
| Good-looking | -1 | -1 |
| Feminine | -1 | 0 |
| Daring | -1 | -2 |
| Small-Town | -1 | 0 |
| Charming | -1 | +1 |
| Unique | -2 | +1 |
| Wholesome | -2 | +3 |
| Tough | -2 | -3 |
| Rugged | -2 | -3 |
| Outdoorsy | -2 | 0 |
| Western | -3 | 0 |
| Glamorous | -3 | -1 |
| Upper Class | -3 | 0 |

the negative end of the profile (e.g., successful, leader, intelligent, hard-working).

## COMPARISON OF THE BRAND PERSONALITY OF BURGER KING, WENDY'S AND SUBWAY

The study was extended to Burger King, Wendy's and Subway to demonstrate that Q methodology can be used to differentiate between brands in the same product category. As in the case of McDonald's, college students are very familiar with these brands and they represent a sizable consumer segment of these fast food chains. Burger King and Wendy's resemble McDonald's in the food items on the menu and the business operations. Subway, however, differs from these burger chains in light of claims made of healthier food and food preparation (i.e., preparing food in front of customers). Thus, on an a priori basis, we would expect the brand personality of Wendy's and Burger King to more closely resemble that of McDonald's and the brand personality of Subway to be different.

Following the same procedure as the McDonald's study, college students participated in the study in exchange for class credits. Forty students Q sorted the 42 brand personality traits for Burger King, 42 sorted Wendy's, and 34 sorted Subway. Following the same steps of analysis reported above, we were able to establish the brand personality profiles for each brand. The results are presented in Table 2 for the comparison among the four brands.

### Burger King

A dominant factor was uncovered for Burger King explaining 35.6% of the variance with an eigenvalue of 14.26 and 32 of the 40 subjects loaded on this factor. Table 2 reveals the rankings of the brand personality traits for Burger King based on the factor scores of the 42 traits. This list represents the predominant perspective of Burger King's brand personality held by the college student participants of this study. The three extremely characteristic traits (+3) suggest a brand personality of Burger King as *successful, corporate, and family-oriented*. Two items, successful and corporate, out of the three traits in the +3 category, are found in the +3 category of McDonald's dominant brand personality profile as well. The item that differs in the extremely characteristic category is family-oriented as opposed to leader in McDonald's brand personality. Although Burger King is a successful corporation in the fast food industry as well, compared to McDonald's, it lacks the personality of a leader in the participants' view. The items in the other categories resemble those of McDonald's brand personality to a large degree.

### Wendy's

Forty-two students took part in the brand personality study for Wendy's. Similar to McDonald's and Burger King, Wendy's data present a dominant factor with 36 subjects loaded on this factor, explaining 42.9% of variance and an eigenvalue of 17.61. According to the ranking of the brand personality traits (see Table 2), the traits that are extremely characteristic (+3) indicate that Wendy's can be described as *successful, friendly and family-oriented*. Compared to the brand personality of McDonald's and Burger King, Wendy's is considered to be friendlier and less corporate. The trait of corporate occurs in the +3 category of both McDonald's and Burger King. Successful is the common brand personality trait in the +3 category for all three brands.

### Subway

As with the other three brands, there is a dominant perspective of Subway's brand personality. Twenty seven of 34 subjects loaded

on this dominant factor explaining 41.2% of the variance with an eigenvalue of 13.18. The extremely characteristic (+3) brand personality traits associated with Subway are *successful, friendly and wholesome* (see Table 2).

Successful, as discussed above, is a common trait of all four brands being studied. Friendly occurs in the +3 category of both Burger King and Wendy's. The trait of wholesome represents the most distinguishing brand personality trait for Subway. Wholesome fell into the quite uncharacteristic category (-2) for McDonald's, the somewhat uncharacteristic category (-1) for Burger King, and the neither characteristic nor uncharacteristic category (0) for Wendy's. In other words, "wholesome," one of the most descriptive personality traits of Subway, is perceived to be uncharacteristic of McDonald's and Burger King and neutral for Wendy's. Healthier food is a heavily advertised claim of Subway. Although it is not surprising that Subway is viewed as having a wholesome brand personality, it does demonstrate that Q methodology can differentiate the personalities of brands within the same product category. Another noticeable difference between Subway and the other three brands is the presence of the trait of corporate, which occurs in the +1 category for Subway, in the + 3 category for both McDonald's and Burger King, and in the +2 category for Wendy's. This suggests that participants in this study perceived Subway to be the least corporate brand of four fast food brands under examination.

## DISCUSSION

This study contributes to the brand personality literature as the first attempt to investigate the personality of a single brand using Q methodology. The results illustrate how individuals can describe the personality of a single brand by Q-sorting the 42 personality traits established by Aaker (1997). We have established different brand personality profiles for four fast food brands, McDonald's, Burger King, Wendy's and Subway. An interpretation and comparison of these profiles revealed the similarities and differences among the brand personalities of these brands in the same product category.

Q methodology provides multi-dimensional interpretations of a brand's personality. While conventional factor analysis often only reveals the brand personality at the five-factor or 15-facet level, the results of Q methodology, as shown in our illustration of four fast food brands, can be interpreted at the profile level, the category level (+3 to -3), and individual item level. By so doing, researchers can achieve a fuller profile of a single brand's personality without assuming that the five-dimensional factor structure should occur at the individual brand level.

In addition, our findings support that Q methodology is particularly useful for examining a person's subjective view of a specific brand's personality. This study has demonstrated the methodology's discovery potential and its use in establishing a holistic view of a brand's personality. Q methodology not only discovered the dominant perception of a brand's personality, but also provided detailed supporting information that leads to a holistic understanding of the brand's personality.

Q methodology can be used for profiling the brand personality of a single or multiple brands for a specific market or across different markets. Therefore, our findings have significant managerial contributions as well. Q methodology can be easily administrated in focus group studies to study brand personality. This easy-to-use method, when being implemented in focus group studies, can generate more in-depth and meaningful interpretations of the qualitative data. Q methodology is able to uncover the underlying personality of a brand with a relatively small number of subjects,

**TABLE 2**
Factor Score Ranking of Brand Personality Traits for Four Fast Food Brands

| | McDonald's | Burger King | Wendy's | Subway |
|---|---|---|---|---|
| Successful | +3 | +3 | +3 | +3 |
| Corporate | +3 | +3 | +2 | +1* |
| Leader | +3 | +2 | +2 | +2 |
| Family-oriented | +2 | +3* | +3* | +2 |

* Traits that manifest differences among the brands.

thus providing an economical tool for profiling an individual brand's personality. Moreover, Q methodology can be used as a segmentation tool to group a company's customers according to their perspectives. As found in the study of McDonald's, Q methodology identified two groups of participants who view McDonald's brand personality differently. With further information on the members' usage rate, attitude toward the brand and satisfaction with the service, a company can achieve a better understanding of why customers see the brand differently. In this manner, applying Q methodology to the examination of a brand's personality can provide meaningful information for a company's marketing strategy development.

As with many other studies, our research has its limitations. Due to a concern with maintaining consistency with existing research, we adopted Aaker's (1997) 42-item brand personality scale. Among these 42 traits, there may be some items that are not applicable to fast-food brands, such as intelligent and independent. This represents a limitation of this study. In future research a new scale for the measurement of brand personality can be developed. Another limitation is that the college student participants only represent a certain segment of the market for four fast food brands. Whether these brands are perceived to have different brand personality profiles among other customer segments remains to be investigated. In future research on the brand personality of McDonald's it would be particularly worthwhile to add to the comparison the brand personality profiles of African-American and Hispanic consumers.

This study demonstrated only some aspects of the potential of Q methodology in measuring a person's subjectivity in general, and perceptions of brand personality in particular. Future research should examine the stability of the interpretations across different populations, brands and traits. In addition, we can apply our study in an international context and examine possible differences in people's perception of a brand's personality between countries and cultures.

# Taking Control: An Integrated Model of Dispositional Self-Control and Measure

Danit Ein-Gar, Tel Aviv University, Israel
Jacob Goldenberg, The Hebrew University of Jerusalem, Israel
Lilach Sagiv, The Hebrew University of Jerusalem, Israel

## ABSTRACT

This paper presents a theoretical model of self-control as a dynamic process. In situations demanding self-control, the individual experiences one of two types of temptations: Impulsiveness or procrastination, followed by an inner struggle between yielding to and overcoming the temptation. When the individual activates personal resources to overcome temptations, the process of self-control takes place. Individuals vary in their abilities to overcome temptations; some overcome them immediately, while others need to call upon what we define as *intrinsic and extrinsic control mechanisms*. We suggest that intrinsic control mechanisms are self-actions and thoughts that individuals employ when they need to exert control, whereas extrinsic control mechanisms are actions that address others and seek their help in overcoming the temptation. We present and test the theory with a context-free self-control measure in four studies.

## INTRODUCTION

Everyday and all day we are faced with temptations; from what to have for breakfast to what dessert to have at dinner, from persisting in a workout to submitting a manuscript on time; temptations are everywhere and self-control takes a fundamental role in over lives.

Thus, it is not surprising that self-control has stimulated much interest in the literature as it contributes to the understanding of a wide range of behaviors such as; criminal behaviors (e.g. Hirschi 2004), health risking behaviors such as smoking and overeating (e.g. Baumeister, F., and Tice 1994; Herman and Polivy 2004), or alcohol and drug consumption (see review in Baumeister et al. 1994; Hull and Slone 2004) and financial behaviors such as credit card use (Mansfield, Pinto, and Parente 2003) or impulsive and non-rational consumption (Baumeister 2002; Vohs and Faber 2003; Wertenbroch 1998).

In this research we suggest a theoretical model of dispositional self-control, and a theory-driven context-free reflective measure. We follow previous work on self-control as a stable dispositional attribute (McCabe, Cunnington, and Brooks-Gunn 2004; Mischel, Shoda, and Rodriguez 1989; Turner and Piquero 2002) and contribute to this body of literature by suggesting a more complex investigation of self-control. By integrating the bodies of literature on impulsiveness and procrastination we suggest that the two are mirroring responses to temptations that stand in the way of self-control. Furthermore, the proposed theory focuses not only at extreme levels of self-control (i.e., the tendency to immediately overcome or yield to temptations), but also at the mid-levels of self-control that are characterized by the tendency to apply control mechanisms to overcome temptations. In addition, the distinction between two types of control mechanisms—intrinsic and extrinsic—is proposed, as well as the notion that individuals may have a stable personal inclination to use each one.

We begin by defining self-control as a dynamic process in which the individual faces and deals with temptations and the inner struggle they induce. This process is evoked as a result of two types of temptations: those that arouse impulsiveness, and those that arouse procrastination. Individuals deal with both types in various ways by allocating personal resources to overcome the temptation. The self-control process can either be successful, i.e., when the individual succeeds in overcoming the temptation; or unsuccessful, i.e., when the individual yields to the temptation.

### Impulsiveness and Procrastination Temptations

Past research on self-control referred to various temptations that could be classified into one of two types: *impulsiveness temptations*, when acting upon them promises gratification in the near-future (e.g., enjoying the taste of a cake), yet a negative outcome in the far future (e.g., gaining weight) (Kivetz and Keinan 2006; Trope and Fishbach 2000); and *procrastination temptations*, yielding to which means postponing taking an action, making a decision, or persisting in a task. Such a delay of action also promises gratification in the near-future (e.g., avoiding the unpleasantness of going to the dentist). However, it also has a negative outcome in the far-future (e.g., future dental problems) (Ferrari 2001; Greenleaf and Lehmann 1995; Kivetz and Keinan 2006; Tice and Baumeister 1997; Trope and Fishbach 2000).

Most studies have focused on either impulsiveness or procrastination (exceptions are Ferrari 1993; McCown 1995). We suggest these are two types of temptations that threaten self-control. Yielding to such temptations promises immediate gratification, yet at the same time promotes future negative outcomes (Dhar and Wertenbroch 2000; Fishbach and Trope 2005; Giner-Sorolla 2001; Loewenstein 1996; Trope and Fishbach 2000). As a result, the individual faces an inner struggle between fulfilling gratification now and paying the price later, and between overcoming temptation now and gaining a benefit later (Baumeister and Vohs 2004; Fishbach and Shah 2006; Giner-Sorolla 2001; Loewenstein 1996; Mischel et al. 1989; Thaler and Shefrin 1981). When the individual resolves the inner conflict by trying to overcome the temptation and by investing resources to do so (Baumeister, Muraven, and Tice 2000), the process of self-control is completed.

### Intrinsic and extrinsic control mechanisms

Control mechanisms are *cognitive, affective and behavioral means individuals use to help themselves overcome temptation*. Individuals may employ control mechanisms either to prevent over-controlled behavior, as demonstrated in the work of Kivetz and Simonson (2002); where participants pre-committed themselves to choosing a self-indulgent reward or to avoiding under-controlled behavior, as demonstrated in the work of Ariely and Wertenbroch (2002), where students pre-committed to submission due dates of procrastinated academic tasks.

Several studies have explored various actions for avoiding self-control failure that could be viewed as control mechanisms. Thus, for example, cost-benefit analyses or selective attention are cognitive actions individuals may take to resist temptations whereas physical distancing from the temptation are behavioral actions (Dholakia 2000; Rook and Fisher 1995).

Trope and Fishbach (2000) referred to control mechanisms as "strategies for coping with self-control-demanding situations". According to their theory of *counteractive control actions* (CCT), when people anticipate that a short-term outcome might endanger their long-term best interests, they respond with actions designed to counter the short-term outcome(s). O'Donoghue and Rabin (1999), following earlier work (Strotz 1956), offered the differentiation between "sophisticated" and "naïve" individuals: Sophisticated

individuals tend to anticipate being tempted to experience immediate gratification and act against their long-term best interests; thus they take actions in advance to avoid self-control failure. In contrast, naïve individuals do not anticipate self-control problems, and hence take measures in advance to ensure the employment of self-control (O'Donoghue and Rabin 1999).

Following these theories, low self-control individuals—i.e., those who immediately yield to temptations without giving them a second thought—are not likely to use control mechanisms (in O'Donoghue and Rabin's terminology, they are *naïve*). Likewise, neither are high self-control individuals likely to rely on control mechanisms, because they do not need to; they have a strong ability to overcome temptations immediately, sometimes even automatically. Control mechanisms are used mainly by individuals who are somewhere in the middle of the self-control continuum: They realize that when encountering temptations, it is in their best interest to overcome them; yet they admit that they may lack sufficient ability to do so, and therefore they apply control mechanisms for ensuring self-control (in O'Donoghue and Rabin's terminology, they are *sophisticated*).

We distinct between two types of control mechanisms; (1) *intrinsic control mechanisms*-are self-actions and self-thoughts for ensuring controlled behavior. In other words, one's "self" is responsible for activating an action (thought) of control and see it through. Examples of intrinsic control mechanisms are self-rewards (or self-penalties) for succeeding (or failing) to stay on a weight loss program, designating interim due dates for completion of an academic task on time, pre-committing actions such as making shopping lists to avoid impulsive shopping. (2) *extrinsic control mechanisms*-are actions the individual take that seek the help of others and rely on them. In other words, one's "self" activates the help of others to ensure controlled behavior. Examples of extrinsic control mechanisms are going to a "fat farm" to avoid over eating, committing publicly to deadlines with penalties to avoid procrastination, joining a study group, or asking someone else to supervise their shopping in order to avoid impulsive buying.

**Scale construction**

To the best of our knowledge, this is the first attempt to create a context-free scale that measures both high and low extremes of resisting the two types of temptations as well as measures the activation of intrinsic and extrinsic control mechanisms as a stable disposition. To that end, we developed the scale in 3 stages which are described here briefly for they are not the main purpose of the paper. In the first stage we adopted items from Tangeny, Baumeister and Boom (2004) self-regulation scale and generated new items to create a more balanced scale between items measuring impulsiveness and procrastination temptations. In the second stage some items were modified or replaced in the attempt to ensure a balance between items measuring overcoming and yielding to temptations. In the third and final stage of the scale construction, items measuring the tendency to activate intrinsic and extrinsic control mechanisms were added. The final self-control scale includes twenty three items: Four items measuring yielding to impulsiveness temptations (e.g. "I do many things on the spur of the moment"); five items measuring overcoming impulsiveness temptations (e.g. "I seldom get carried away by my feelings"); three items measuring yielding to procrastination temptations (e.g. "I sometimes postpone tasks I have to do until it's almost too late"); five items measuring overcoming procrastination temptations (e.g. "I am able to work effectively toward long-term goals while resisting temptations along the way"); and in addition, six items measuring the tendency to use control mechanisms to overcome temptations, including three items measuring the tendency to use intrinsic mechanisms (e.g.,

"When I fear I might put off a difficult task, I designate myself interim due dates for completion of various stages of the task"), and three items measuring the tendency to use extrinsic mechanisms (e.g. "Occasionally, I ask a friend or relative to make sure I won't be tempted by something I really don't feel like doing"). For the list of all the scale's items see appendix A.

## STUDY 1: TESTING THE SELF-CONTROL STRUCTURE

The purpose of Study 1 was to test the entire structure of the DSC, and test the inter-correlations among the different DSC components. We hypothesized that all items measuring the same component (e.g., items measuring the tendency to use intrinsic mechanisms) should show high inter-correlations and group together on a graphic map. Therefore, six distinct groups of items were expected to emerge on such map. Moreover, these distinct groups of items were expected to resemble an X-like structure.

We expected all items representing immediate yielding to temptation separated into impulsiveness and procrastination items to emerge on one side of the map while on the opposite side all items measuring overcoming temptations, again separated into the two temptations. In between these two poles we expected items representing the tendency to use control mechanisms to appear. Near the low self-control end (i.e. items measuring yielding to temptations) we expected to find items measuring extrinsic mechanisms while near the high self-control end (i.e. items measuring overcoming temptations) we expected to find items measuring intrinsic mechanisms.

**Method**

*Participants*

Participants were 247 students who participated in exchange for course credit ($Age_{mean}=31.8$).

*Measures*

Participants received the DSC described above. Internal reliability of the entire DSC scale was .75 and internal reliabilities of indices of the different components ranged from .51 to .80.

**Results**

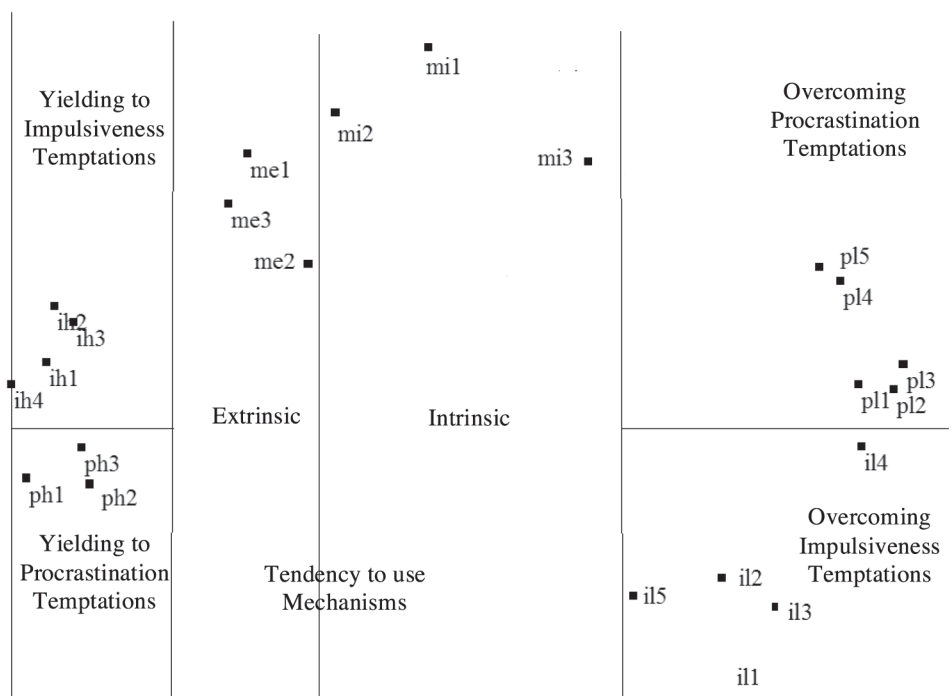
To verify the relations among all items, a multi-dimensional scale analysis named Smallest Space Analysis (SSA) was used (see Guttman 1968; Shye, Elizur, and Hoffman 1994). The SSA provides a graphic representation of the relationships among all variables in the measurement. Each item is represented by a dot. The more strongly two items are positively correlated, the closer the two dots representing them appear on the SSA map, thereby allowing for areas of items with similar meanings to emerge and be identified as representing a component or a dimension. The SSA map reflects inter-correlations among all items and provides a spatial representation of the variables from which we could identify the clusters without imposing them. In addition, the SSA does not assume each variable to relate to only one dimension, and hence allows testing a more complex model. Finally, the SSA is a confirmatory technique in the sense that it allows for comparing an observed mapping of items to a hypothesized mapping derived from theory (Shye et al. 1994).

Figure 1 presents the SSA map of study 1, which is consistent with the proposed relationships among the items.

The coefficients of alienation is .12, indicating very good representation of the matrix of inter-correlations (see Guttman 1968). In alliance with our hypothesized self-control structure all items representing yielding to temptations emerged on the right side of the map (the low self-control pole), separated into two groups of impulsiveness (marked as "ih" items) versus procrastination temp-

**FIGURE 1**

SSA map of the DSC measure (COA= 0.12)



tations (marked as "ph" items). Conversely, all items representing overcoming temptations emerged on the left side of the map (the high self-control pole), again separated into two groups according to the type of temptation (impulsiveness items marked as "il" and procrastination items marked as "pl"). In between these two poles and in the center of the map items measuring the tendency to use control mechanisms emerged. As hypothesized items measuring the tendency to activate intrinsic mechanisms (marked as "mi") emerged in proximity to the overcoming temptations side while items measuring the tendency to activate extrinsic mechanisms (marked as "me") emerged in proximity to the yielding to temptation side. Thus, confirming our hypothesized structure of the DSC.

## STUDY 2: TESTING THE SCALE VALIDITY

In this study we used different samples and a total of 753 students and non-students participants to validate the DSC by testing its retaliations with other related constructs, namely; the five factor model (FFM), the procrastination scale (PS), the buying impulsiveness scale (BIS), the general impulsiveness scale (UPPS), the frugality scale (FS) and the self-consciousness scale (CON).

*The five factor model scale*: The FFM is the leading model of personality traits, presenting five basic trait factors: neuroticism, openness to experience, extraversion, agreeableness, and conscientiousness (Saucier 1994). Most, if not all studies have found conscientiousness to be the trait most related to self-control (Carver 2005; Robins et al. 1996). Conscientious individuals tend to be cautious, thorough, and reliable; they are motivated by their desire to "do the right thing". Therefore, individuals who are highly

conscientious are most likely to invest effort in overcoming temptation in situations demanding self-control. Accordingly, we hypothesized conscientiousness to correlate positively with self-control. In addition, several studies have found neuroticism to be linked to impulsiveness and procrastination (for review see Carver 2005; McCown, Johnson, and Petzel 1989). We therefore expected neuroticism to correlate negatively with self-control.

*The procrastination scale*: We hypothesize that Lay's (1986) procrastination trait scale would correlate with the DSC procrastination component. Specifically, the PS was expected to correlate positively with the DSC items measuring yielding to procrastination temptations, and negatively with items measuring overcoming procrastination temptations. Moreover, these correlations were expected to be stronger than the correlations with the DSC items referring to impulsiveness temptations.

*The impulsiveness scales*: In general, we hypothesized that the DSC impulsiveness component will correlate with two scales of impulsiveness.

Sample 1 tested the relationship with a domain-specific behavior in marketing—impulsive buying—using Rook and Fisher's (1995) buying impulsiveness scale (BIS).

Sample 2 tested the relationships with a more general measure of the impulsiveness trait using Whiteside and Laynam's (2001) impulsive behavior scale (UPPS). This scale was generated from ten existing scales measuring various impulsive personality aspects that reveal four general facets of impulsiveness: 1) Premeditation, which is "the tendency to delay action in favor of careful thinking and planning"; 2) Urgency, which is "the tendency to commit rash and regrettable actions as a result of intense negative effect"; 3)

Sensation- seeking, which is "the tendency to seek excitement and adventure"; and 4) Perseverance, which is "the ability to remain with a task until completion and avoid boredom". However, we suggest that perseverance is not an impulsiveness facet, but rather a procrastination facet. Perseverance is the ability to complete a task. Completion of a continuous task demands overcoming the desire to stop performing the task and perhaps returning to it later. This pattern of behavior is more consistent with procrastination, rather than with impulsiveness. Therefore, we hypothesize that with the exception of perseverance, all facets of the UPPS will correlate more strongly with the DSC impulsiveness component than with the DSC procrastination component.

*The frugality scale*: Frugality as defined by Lastovicka et al. (1999) reflects "short-term sacrifices in buying and using consumer goods to achieve idiosyncratic longer-term goals". Thus frugal consumers will be more careful and calculus at spending their money. Acting in a frugal manner is contradictory to acting in an impulsive manner. We therefore hypothesize that the FS will positive correlate with the DSC impulsiveness component (reverse coded) and that this correlation will be stronger than with the DSC procrastination component (reverse coded).

*The self-consciousness scale*: Fenigstein, Scheier, and Buss (1975) identified three types of self- consciousness; *private self-consciousness*, which refers to one's inner thoughts and feelings; *public self-consciousness*, which refers to one's general awareness of the self as a social being; *and social anxiety*, which refers to one's discomfort in the presence of others. Many self-control situations take place within a social context. In other words, social norms define situations that demand self-control. Therefore, both private and public self-consciousness are related to self-control and the activation of control mechanisms. However, social anxiety focuses on negative feelings experienced in the presence of others, and is therefore not relevant to testing self- consciousness in a self-control context. We suggest that activation of control mechanisms occurs when individuals suspect that they may not be able to resist temptations. The ability to anticipate self-control problems is dependent on one's level of self-consciousness. In other words, individuals who are self-aware acknowledge their potentially harmful behaviors, and thus tend to activate control mechanisms to try to avoid self-control failure. Extremely high self-control individuals may succeed in overcoming temptation without self- consciousness, since they are able to do so immediately, perhaps even automatically. Similarly, extremely low self-control individuals yield to temptations without giving it a second thought, and therefore lack self-consciousness. To summarize, we hypothesize that both private and public self-consciousness (CON) would correlate positively with the tendency to activate control mechanisms (both intrinsic and extrinsic), yet not correlate with the DSC components measuring immediately overcoming temptations or immediately yielding to them.

## Method

### Participants

In samples, 1 and 4 (n=143,147; Age$_{mean}$=33.8, 26; for samples 1, 4 respectively), participants were students who participated in exchange for course credit. In samples 2[1] (n=373) and 3 (n= 90; Age$_{mean}$ =28.4) students and non-students participants entered an on line survey, and filled the questionnaire in return for a chance to win a ruffle of gift certificates (in sample 2 the prizes were 24 gift certificates of 15$ each, in sample 3 the prize was one gift certificate of 25$).

### Measures

The self-control scale: we used the DSC as in study 1. Internal reliabilities ranged from .40 to .82 across all samples.[2]

*The five factor model scale*: To measure the FFM, Saucier's (1994) short version of five-factor questionnaire (i.e., the Mini-marker Questionnaire) was used. The measure consists of eight adjectives measuring each of the five factors (a total of 40 adjectives). Internal reliabilities of the five factors ranged from .65 to .80.

*The procrastination scale*: Lay's (1986) procrastination scale was used. The measure consisted of 20 items. Internal reliability was .88.

*The impulsiveness scales*: The Buying impulsiveness scale (BIS): The scale by Rook and Fisher's (1995) was used. The measure consisted of eight items (one item from the original scale— "'Just do it' describes the way I buy things"—was left out).

*The general impulsiveness trait (UPPS)*: A shortened version of Whiteside and Lynam's (2001) UPPS scale was used. In the shortened version, each of the four facets was measured by three items. Internal reliability of all of the scale's items was .72. Internal reliabilities of the four facets ranged from .69 to .79.

*The frugality scale*: adopted from Lastovicka et al (1999), the measure included eight items. Internal reliability was .81.

*The self-consciousness scale*: adopted from Fenigstein et al. (1975), the measure included 23 items. Ten items measured private self-consciousness, seven items measured public self-consciousness and six items measured social anxiety. Internal reliabilities were .71, .65, and .75 for the private, the public, and the social anxiety factors respectively.

In all measures participants were asked to indicate to what extent each item describes them on a five-point scale (range: 1= "does not describe me at all" to 5="describes me accurately").

## Results

*The Five Factor model (FFM)*: As hypothesized, correlations with conscientiousness were positive and strong (r=.51, p<.01), and with neuroticism negative and weaker (r=-.35, p<.01). Unexpectedly, agreeableness correlated positively with the DSC (r=.17, p=.04). Correlations with the two other traits were, as expected, none significant (r$_{extraversion}$= .12, r$_{openness}$= .11, both n.s.)

*The procrastination trait*: Correlation between the PS and the DSC procrastination component were, as hypothesized, negative and strong (r=-.80, p<.01), while with the DSC impulsiveness component correlations were also negative, yet to a lesser extent (r=-.35, p< .01). The strong correlations between Lay's scale and the DSC procrastination component may result from the possibility that this construct is less complex then, for example, the impulsiveness construct. If so, measures of different procrastination aspects (e.g., as trait or as a component of self-control) will capture most, if not all, of the concept's content, resulting in strong correlations among the various measures.

*The buying impulsiveness tendency*: Correlations with the BIS were, as hypothesized, stronger with the DSC impulsiveness component (r=-.49, p<.01) than with the DSC procrastination component (r= -.25, p<.01).

*The general impulsiveness scale (UPPS)*: As hypothesized, premeditation, urgency and sensation-seeking facets correlated more strongly with the DSC impulsiveness component than with the DSC procrastination component (r$_{premeditation}$=.51, .31, p<.01;

---

[1]Due to a bug in the website's program, the respondents' ages were not recorded; however, sample 2 was taken from an existing pool, therefore it is reasonable to assume that the mean age is similar to that of other samples from the same pool, all ranging across mean ages of 34-36.

[2]In samples 1 and 2 a preliminary version of the scale was used, accounting for the relatively low internal reliabilities.

$r_{urgency}$ =-.52, -.41, p<.01; $r_{sensation\ seeking}$=-.33, -.14 for the impulsiveness and procrastination indices respectively). In addition, and as hypothesized, correlation of perseverance facet was stronger with the DSC procrastination component than with the DSC impulsiveness component (r=.21, .49, p<.01 for the impulsiveness and procrastination indices respectively). This finding is congruent with the findings of Dewitte and Schouwenburg (2002).

*The frugality scale*: As hypothesized, the FS was positively correlated with the DSC (r=.37, p<.01). However, contrary to our hypothesis FS was not correlated significantly stronger with the DSC impulsiveness index than with the procrastination DSC index (r= .30, .27, p<.01 for the impulsiveness index and procrastination index respectively). This unexpected finding is interesting and calls for further investigation of the possible relations between frugality and procrastination.

*The self-conscientiousness scale*: As hypothesized, private and public self-consciousness were positively correlated with the intrinsic and extrinsic control mechanisms components of the DSC (with intrinsic mechanisms: $r_{private}$ =.23, $r_{public}$ =.31, both p<.01, with extrinsic mechanisms: $r_{private}$ =.15, p=.06, $r_{public}$ =.26, both p<.01). Neither private nor public self-consciousness correlated with any other components of the DSC. As hypothesized, social anxiety did not correlate with extrinsic mechanisms; yet unexpectedly, it partially correlated with intrinsic mechanisms (r=-.05, p>.05, r=.16, p=.06, respectively).

## STUDY 3: TESTING THE TWO TYPES OF CONTROL MECHANISMS

The purpose of Study 3 was to further ascertain the distinctiveness between the two types of control mechanisms; namely the intrinsic and the extrinsic control mechanisms. Since use of control mechanisms has not been explored as a stable individual difference, there are no existing scales for measuring this tendency or similar personality constructs. Hence, to validate these components of the scale, domain-specific measures were developed. We propose to examine two domains in which self control is often threatened; maintaining healthy lifestyle and managing effective study habits. Both domains are clearly important, however, sustaining desired behavior in these domains over time requires self-control. According to our model, we expect individuals who tend, in general, to activate either intrinsic or extrinsic control mechanisms to report conducting specific behaviors (i.e. actions which reflect control mechanisms) in the attempt to fulfill their desired goals in both domains (i.e. maintain healthy life style and study effectively for exams).

### Method

*Participants*

Forty-two students participated in this study in exchange for course credit (Age$_{mean}$=24.5, two participants did not indicate age).

*Measures*

*Healthy lifestyle*. Participants were asked to assume that they have decided to adopt a healthier lifestyle, which means maintaining a healthy diet, working out on a regular basis, and ensuring physical health (e.g., taking vitamins, going for periodic medical checkups). Participants were then shown a list of nine statements that describe various ways of ensuring a healthy lifestyle. Participants were asked to indicate to what extent each statement describes them on a five-point scale ranging from (1)-does not describe me at all to (5)-describes me very much. Three items describe a behavior that can be perceived as activation of intrinsic mechanisms (e.g., "I will plan a weekly menu and eat according to it"); Three items describe a behavior that can be perceived as activation of extrinsic mechanisms (e.g., "I will convince a friend to eat healthfully so that we will encourage each other"); Three items describe healthy lifestyle behaviors without the aid of control mechanisms (e.g., "I will not obligate myself to a constrained diet, yet will do my best to eat in a balanced manner"). Accordingly, three indices were generated measuring healthy lifestyle behaviors by using intrinsic mechanisms, using extrinsic mechanisms, and without using control mechanisms. Items describing actions of intrinsic mechanisms for ensuring a healthy lifestyle were hypothesized to correlate positively with the DSC tendency to use intrinsic mechanisms index, and not with the DSC tendency to use extrinsic mechanisms index. The opposite was hypothesized for items describing actions of extrinsic mechanisms for ensuring a healthy lifestyle.

*Study habits*. Participants read the following introduction: "*Now that the semester is over and you are entering the exams period, think of how you plan to study for all of your exams during this period*". Participants were then shown a list of 15 items describing study habits. Five items measured ways of studying using intrinsic mechanisms (e.g., "I will prepare myself a time-table indicating dates of preparations for each exam."), five items measured ways of studying using extrinsic mechanisms (e.g., "I will find a study partner, which will make me study seriously"), and five items measured ways of studying without using control mechanisms (e.g., "I will study for each exam for as many days as I feel like"). Three indices were composed to measure study habits: using intrinsic mechanisms, using extrinsic mechanisms, or without using control mechanisms at all. The index of study habits using intrinsic mechanisms was hypothesized to correlate positively with the DSC tendency to use intrinsic mechanisms index, yet not with the DSC tendency to use extrinsic mechanisms index. Accordingly, it was hypothesized that study habits using extrinsic mechanisms would show the same pattern of results, yet with the DSC tendency to use extrinsic mechanisms.

### Results

*Healthy lifestyle*. The correlations between the healthy lifestyle behaviors and the tendency to use intrinsic or extrinsic control mechanism supported our hypotheses. The DSC tendency to use extrinsic control mechanisms index correlated positively with the healthy lifestyle behaviors using extrinsic mechanisms (r=.36, p=.02), did not correlated with the healthy lifestyle behaviors using intrinsic mechanisms (r=.22, n.s.) and correlated negatively with the healthy lifestyle behaviors without the use of control mechanisms (r=-.41, p<.01). The DSC tendency to use intrinsic control mechanisms index correlated positively with healthy lifestyle behaviors using intrinsic mechanisms (r=.49, p<.01), and did not correlate with healthy lifestyle behaviors using extrinsic mechanisms or with healthy lifestyle behaviors without the use of mechanisms (r=16, r=-.10, both n.s.).

*Study habits*. The correlations between the different study habits and the tendency to use each type of control mechanisms indices supported the hypotheses. The DSC tendency to use extrinsic control mechanisms index correlated positively with study habits that use extrinsic mechanisms (r=.41 p<0.01), did not correlate with study habits that use intrinsic mechanisms (r=.21, p=n.s.), and correlated negatively with study habits that do not use mechanisms (r=-.36, p<.05).

In contrast, the DSC tendency to use intrinsic control mechanisms index correlated positively with study habits that use intrinsic mechanisms (r=.61, p<.01), and did not correlate with study habits that use extrinsic mechanisms or with study habits that do not use mechanisms (r=.02, r=-.20, both n.s.).

# STUDY 4: HIGH VS. LOW SELF-CONTROL CONSUMERS AND PRODUCT HEALTH-RELATED ATTRIBUTES

Study 4 had a theoretical goal; to test the sensitivity of high verses low self-control individuals to health related product attributes and a methodological goal; to further test the predictive validity of the self-control measure.

The literature has shown that in general high self-control consumers are more health-concerned than low self control consumers; for example, high self-control consumers (low on impulsivity) tend to drink less alcohol and engaged less in binge eating (Kane et al. 2004), high self control individuals (low on procrastination) also tend to engage in general health related behaviors (Sirois 2004; Sirois, Melia-Gordon, and Pychyl 2003). High self-control consumers are more concerned with future goals such as maintaining healthy body and also have the ability to overcome temptations threatening the achievement of such goals. We therefore hypothesize that high self-control consumers will be more sensitive to health cues in products. That is, when a hedonic non-healthy product is improved and becomes healthier, high self-control participants will be responsive and express higher willingness to try it out than low self-control consumers. This and more, if the same improved (i.e. hedonic yet healthier) product is introduced with an added negative (i.e. non-healthy) attribute, high self-control consumers' willingness to try out the product will decline, while low self control consumers, who are less responsive to such health-related cues, will show no change in willingness to try the product.

## Method

### Participants

The study was conducted online. Two hundred and four participants participated in an online study in return for a chance to win a ruffle of 25$ amazon.com gift certificate (Age$_{mean}$=35.8).

### Measures and procedure

Participants were told they are part of a marketing survey testing consumers' evaluation of potentially new products. Participants were led to believe that in a continuing study the manufacture intends to send samples to interested consumers for a sample-tasting study.

Participants filled-out the self-control measure and were then introduced with the product description followed by attitude questions (e.g. whether the product is fun, healthy, will have marketing demand etc.). In the last question participants were asked how many samples they would like to get for trial, ranging from zero to eight. Participants read descriptions of two new and improved hedonic non-healthy products (i.e. coffee, ice-cream). The suggested new hedonic products were improved to become healthier (decaffeinated coffee, Trans-fat free ice-cream). We manipulated the products attributes; in the control condition participants received a description of the healthier hedonic product. In the manipulation condition participants received the same description as the control yet we added a sentence mentioning a non-healthy attribute. In the coffee description participants were told the coffee might damage their teeth florid resistance. In the ice cream description participants were told it has relative high amounts of monosodium glutamate. After reading the description, participants were asked to indicate how many samples would they like sent to them for trial on a scale of 0 (none) to 8 (samples). We hypothesized that when the hedonic-non-healthy product became healthier (control condition), high self-control participants will want more samples then low self-control participants. However, when a negative attribute is added (negative value condition) high self-control participants will want less samples than in the control condition. Among low self-control participants there will be no difference between the control and the manipulation condition.

## Results

*Decaffeinated coffee.* Participants' self-control levels were computed and each participant was classified as either high or low in self-control based on a median split (the scale's internal reliability was .79). We ran a 2(self-control) X 2(product attribute condition) ANOVA (see figure 2). Results show a significant main effect for the product condition (F(1,201)=8.5, p<.01), such that the merely improved coffee (control condition) was preferred over the improved coffee with the additional negative attribute (manipulation condition). In addition results show no significant main effect for self-control (F(1,201)=.69, p>.05) and as hypothesized, a significant interaction (F=1,201)=6.65, p<.01). In the control condition, where the description was of an improved decaffeinated coffee, high self-control participants requested more samples (m=5.53) than high self-control participants in the manipulation condition, where the description included a none-healthy attribute (i.e. damage to teeth florid resistance) (m=3.22). Low self-control participants however, did not differ in the number of samples requested across the two conditions (m=4.1, 3.96, for the control and manipulation conditions, respectively).

*Trans-fat free ice-cream.* Since ice cream is a fattening product, we filtered out participants on diet; the remaining sample included 163 participants. We ran a 2 (self-control) X 2 (product attribute condition) ANOVA (see figure 2). Results show a significant main effect for the product condition (F (1,163) =3.93, p<.05), such that overall the improved and healthier ice-cream (control condition) was preferred over the improved ice-cream with an additional negative attribute (manipulation condition). In addition, results show no significant main effect for self-control (F(1,163)=.21, p>.05) and a marginally significant interaction (F=1,163)=2.90, p=.09). In the control condition, high self-control participants requested more samples (m=5.64) than high self-control participants in the manipulation condition, where the description included a none-healthy attribute (i.e. monosodium glutamate) (m=3.98). However, low self-control participants did not indicate a significant different number of samples across the two conditions (m=5.08, 4.95, for the control and manipulation conditions, respectively).

## GENERAL DISCUSSION

The purpose of this research is to suggest a theoretical model which views self-control as a process individuals go through whenever they are faced with a temptation. In addition, its objective is to present a scale that measures various levels of self-control as a stable disposition, and can be applied to a wide range of situations.

We propose self-control to be a dynamic process. The self-control process begins when an individual faces impulsiveness or procrastination temptations, experiences an inner struggle between yielding to and overcoming the temptations, and then allocates personal resources to overcome the temptations. The model further distinguishes between two ways of yielding to or overcoming temptations: One describes either extremely high or extremely low self-control individuals, who immediately either overcome or yield to the temptation respectively. The other describes individuals who are not extreme in self-control, and take certain actions called control mechanisms to try and overcome the temptation. We further propose two distinguished types of control mechanisms: intrinsic mechanisms which are self-thoughts and self-actions that one takes to overcome a temptation, while extrinsic mechanisms are actions that address others and seek their help in overcoming the temptation.

**FIGURE 2**
Number of coffee (right) and ice-cream (left) samples requested

In four studies we examined the proposed model using a new scale measuring dispositional self-control (the DSC). The SSA map (Study 1) presented a structure that supported the distinction between the two types of temptations—impulsiveness and procrastination—as well as introduced the continuum of the self-control disposition. Items measuring yielding to temptations (i.e., low self-control) emerged the furthest from items measuring overcoming temptations (i.e., high self-control); whereas items measuring the tendency to activate intrinsic and extrinsic control mechanisms (i.e., the mid-levels of self-control) emerged in the center of the map between the two extreme levels. We tested the DSC relationships with relevant traits such as the Five Factor Trait Model, the general procrastination trait, the general impulsiveness trait, the buying impulsiveness scale, the frugality scale and the self-consciousness scale (Study 2) using varied samples of both students and non-students participants. We further supported our model by testing the distinctiveness between the tendencies to use intrinsic verses extrinsic mechanisms (Study 3). The two tendencies were related to different healthy lifestyle and study habits behaviors. Finally, we tested whether high verses low self-control consumers are more sensitive to health-related attributes of hedonic non-healthy products and by that also tested the predictive validity of the DSC (Study 4). We show that high self-control in comparison to low self-control consumers requested more product samples when a hedonic-non healthy product was introduced as improved and healthier, however when a negative attribute was added (i.e. a non-healthy attribute) high self-control's product samples requests declined while low self-control's product sample–did not change.

The proposed dynamic model of self-control pursues previous research directions on self-control and advances them in several ways: First, by proposing that self-control be perceived as a dynamic process. As such, different individual can experience the self-control process differently. Thus for example, the extensiveness of the temptation can vary among individuals resulting in a varied amount of personal resources needed to extract self-control. Also, the degree to which one experiences an inner-conflict can also vary across people resulting in different struggle-resolving actions taken–such as control mechanisms. Second, by integrating two bodies of literature and proposing that impulsiveness and procrastination are two mirroring responses to temptations that stand in the way of self-control. Third, by suggesting that individuals who are extremely high (low) in self-control overcome (yield to) temptations immediately, whereas individuals who lie "mid-scale" tend to activate intrinsic or extrinsic control mechanisms to achieve self-control. Finally, the DSC scale is a context-free scale adequate for use across various situations, as well as to distinct between extremely high or low self-control individuals and those who tend to use control mechanisms.

## APPENDIX A
The Dispositional Self-Control Scale (DSC)

Overcoming impulsive temptation
I usually succeed in overcoming temptations.
Usually, when something tempts me, I manage to resist.
Even when something exciting happens to me, I do not get carried away by my feelings or act without thinking.
Even when stressed, most of the decisions I make are considered and calculated.
I rarely act impulsively.

Overcoming procrastination temptations
I am able to work effectively toward long-term goals, while resisting temptations along the way.
People can trust me to stay on schedule even if I am busy and under a lot of pressure.
It is important for me to finish all of my tasks on time, even if I do not feel like doing them.
I never delay work that needs to be done, even if I am busy.
I tend to finish assignments right away, even if they are unpleasant.

Yielding to impulsive temptations (reverse score)
I do many things on the spur of the moment.
People say I often make up my mind without thinking things through.
I often act without thinking through all of the alternatives.
I often make spontaneous and rather hasty decisions.

Yielding to procrastination temptations (reverse score)
I tend to postpone completing unpleasant tasks.
When I need to run errands, I usually put them off until the last minute.
I sometimes postpone tasks that I have to do until it is almost too.

 The tendency to use extrinsic mechanisms
Sometimes I use others to obligate myself to keep on schedule.
At times, I ask a friend or relative to make sure I will not be tempted by something I really feel like doing.
When I have an urge I find hard to resist, I look for a framework that will help me resist it.

The tendency to use intrinsic mechanisms
In order to perform an important yet unpleasant task, I imagine how good I will feel afterwards.
When I fear I might put off a difficult task, I designate myself interim due dates for completion of various stages of the task.
Sometimes, I manage to resist temptation by compensating myself in some way.

# "I Can Do It!" Consumer Coping and Poverty

Kathy Hamilton, University of Strathclyde, Scotland
Miriam Catterall, Queen's University Belfast, Northern Ireland

## ABSTRACT

This paper focuses on coping with poverty and the impact of coping strategies on individual lives, concentrating on lone mothers. The women in this study gain a sense of achievement from their ability to "manage" and place great emphasis on being a good mother, thereby fighting against the negative discourse often associated with lone motherhood. It is suggested that coping strategies can be interpreted as acts of consumer agency that can result in consumer empowerment. In contrast with the bleak portrayal of the poor in prior research, we suggest that coping strategies can be instrumental in creating a positive identity.

This paper offers a fresh perspective to the work being done by consumer researchers in the poverty domain. Hill and Stephens' (1997) model of impoverished consumer behavior identified three main areas of research interest in low-income consumers, namely exchange restrictions, consequences of disadvantage and strategies for coping with disadvantage. The model suggests that poor consumers face exchange restrictions that limit their ability to acquire needed and desired goods and services. The consequences of these restrictions are typically negative and include alienation from the consumer culture, feelings of lost control and poor health. Consumers respond to these consequences with emotional and behavioral coping strategies.

This paper aims to advance beyond this model by examining the ways in which coping with poverty can have a positive impact on consumer identity. From the psychology discipline, it is recognized that there is a need to study coping processes and outcomes independently (Lazarus and Folkman 1984). Previous research has presented a bleak portrayal of poor consumers. In contrast, we demonstrate that the employment of coping strategies can be instrumental in creating a positive self identity and has important implications for consumer empowerment and consumer agency.

We begin by reviewing the relevant literature on consumer coping. This is followed by a methodology section outlining the data collection methods. The findings are then presented; first we provide an overview of the variety of coping strategies employed, and second we examine the consequences of these coping strategies. We conclude by highlighting the importance of moving beyond the identification of coping strategies to consider the impact that these can have on the individual.

## CONSUMER COPING

The psychology literature often provides the theoretical framework for coping studies within consumer research. Coping can be defined as, "*constantly changing cognitive and behavioral efforts to manage specific external and/or internal demands that are appraised as taxing or exceeding the resources of the person*" (Lazarus and Folkman 1984, 141). Coping has two major functions, namely, regulating stressful emotional situations and altering the troubled person-environment relation causing the distress. These functions are often referred to as emotion-focused coping and problem-focused coping respectively (Lazarus and Folkman 1984). Emotion-focused forms of coping are common in encounters appraised as unchangeable or uncontrollable while problem-focused forms of coping are used in encounters that are appraised as changeable or controllable (Carver, Scheier and Weintraub 1989).

In the consumption context, coping illustrates how consumers react to perceived marketplace discrimination (Crockett, Grier, and Williams 2003). Such studies have been relatively limited and little research has investigated how consumers cope with negative consumption-related experiences (Yi and Baumgartner 2004). Consequently, there is still potential for increased theoretical contributions concerning the intersection between coping and consumer behavior (Duhachek 2005).

Similar to the current research, there has been some research interest in the coping strategies of disadvantaged or vulnerable consumer groups. These include poor children (Hill 1992); racial minorities (Crockett, Grier, and Williams 2003); older consumers (Mathur, Moschis and Lee 1999); those with serious illnesses (Pavia and Mason 2004); and illiterate consumers (Vismanathan, Rosa and Harris 2005). Given that disadvantaged consumers may face marketplace discrimination (Andreasen 1975), coping strategies may be more of a necessity for these groups.

Another area of research interest is the effect of consumers' dispositions on coping strategies and whether consumer personality traits have an impact on coping. Sujan et al. (1999) examined the role of consumer self-efficacy and concluded that perceived confidence as a consumer enables a wider range of coping strategies. Mathur, Moschis and Lee (1999) found that older adults with low self-esteem are more likely to engage in strategies aimed at reducing emotional distress, rather than direct attempts to alter the situation. Duhachek and Iacobucci (2005) also found evidence for personality-based differences in consumer coping and suggested that consumer assertiveness, marketing mavenism and extraversion influence consumers' choices of coping strategies. Lazarus and Folkman (1984) pioneered the importance of a process-oriented approach to studying how people cope with stress. In this case, coping must be based on both the environmental situation and the personality of the individual. Unlike a coping style which assumes consistency across stressors, the choice of strategy in coping processes is a function of the social context (Aldwin 1994).

While many of the consumer research studies on coping are context-specific, some researchers have focused more on the construct level by discussing generalized coping responses to a variety of consumption-related problems (Duhachek 2005; Yi and Baumgartner 2004). Importantly, Duhachek's (2005) multidimensional model of consumer coping not only includes a typology of coping strategies, but also antecedents and coping consequences. It recognizes that initial coping responses are affected by an interplay of emotions and cognitions (consumer perceptions and evaluation of the situation). Coping responses affect successive emotions and cognitions which, in turn, affect subsequent coping and so forth. This highlights the iterative nature of coping processes. The model also suggests that the ultimate aim of coping is the amelioration of stress.

Research suggests that low-income consumers often show great skills in exploiting their environment to exert some control within their lives and adapt to the financial realities with which they are faced (Alwitt and Donley 1996; Hill and Stephens 1997). Within consumer research, Ronald Paul Hill is the main contributor to the coping with poverty literature. In their model of impoverished consumer behaviour, Hill and Stephens (1997) categorize coping strategies as either emotional or behavioral. Although both psy-

chologists and consumer researchers have criticized such a division for being overly simplistic (Carver et al. 1989; Duhachek 2005), it provides a useful way of presenting the literature.

Emotional coping strategies include distancing or fantasizing about a better future (Hill and Stephens 1997). Hill and Stamey (1990) found that distancing is particularly relevant to the homeless, as they use both associational and institutional distancing to distinguish themselves from more dependent peers and to demonstrate how they live independently by their own resources rather than under the control of welfare institutions. Fantasies about future home lives are used to reduce the stress associated with current circumstances (Hill 1991) and replace the threat with a more acceptable form of reality (Breakwell 1986). Poor children have been found to make use of fantasy to escape from their mundane lives (Hill 1992).

A behavioral coping strategy that may be employed is obtaining illicit income from black market activities (Hill and Stephens 1997). Fryer (2005) pointed out that low-income consumers view these activities as constituting a reciprocal exchange relationship because, unlike unemployment benefit, money earned from the black economy is felt to be legitimate, as payment is given in exchange for work. Illicit income can be generated through either legal (child minding) or illegal (prostitution) activities.

Kempson, Bryson, and Rowlingson (1994) examined the circumstances and experiences of seventy-four families with children, living on very low incomes. They found that low-income consumers adopt a number of behavioral coping strategies including maximizing income, managing the family budget, obtaining financial help from others and making use of consumer credit. Families were allocated to one of four categories depending on the effectiveness of coping strategies; *keeping their heads above water* (families who were balancing their budget over time), *sinking* (families who had been making ends meet but were getting into financial difficulty and falling into arrears with bills), *struggling to the surface* (families who were in multiple arrears but were reducing the amounts owed to creditors) and *drowning* (families who saw themselves as struggling to make ends meet, had been in multiple arrears for some time and saw no prospect of things getting easier).

## METHODOLOGY

In line with other consumer researchers (Darley and Johnson 1985), this study adopted a relative perspective on poverty and defined low-income consumers as lacking the resources necessary to participate in the normal customs of their society. However, to aid the selection of families, and because this research was conducted in the UK, the results of the Poverty and Social Exclusion Survey of Britain (Gordon et al. 2000) were used as a guideline. This survey indicated that the income after tax needed each week to escape overall poverty averaged £239 for all households. Most of the families in the study were on incomes under £200 per week. The respondents are in less severe forms of poverty than the homeless consumers considered in previous research (Hill 1991). Rather they are considered poor in the context of a consumer society.

Purposeful sampling was used for this project, which involves the selection of information-rich cases that are used to provide in-depth information that is relevant to the purpose of the research. Some 30 families (all households included at least one child under the age of 18) were included in the study. In this paper we focus on the 24 lone mothers. In-depth interviews were the main source of data collection. In 16 families, the mother was interviewed alone and in 8 families it was possible to arrange an interview with the mother and her children (aged 11 to 18). Given the private and personal nature of the research, interviews were carried out in respondents' homes to ensure a familiar and comfortable environ-

ment. Families were selected from urban areas and included both employed and unemployed respondents. Employed parents were working in low-paid jobs. Despite the family approach, for the purposes of this paper, the main contribution relates to the individual as we focus specifically on the lone mothers in relation to their approach to motherhood. Details of respondents that are referred to in the findings section can be found in table 1.

Hermeneutics was used to interpret the data. This is an iterative process, *"in which a "part" of the qualitative data (or text) is interpreted and reinterpreted in relation to the developing sense of the "whole""* (Thompson, Pollio and Locander 1994, 433). These iterations allow a holistic understanding to develop over time, as initial understandings are modified as new information emerges. First, each individual interview was interpreted. Secondly, separate interviews were related to each other and common patterns identified.

## FINDINGS

The findings are organized into two sections. First an overview of the coping strategies employed by these consumers is presented and second, we examine the consequences of these coping strategies.

### Overview of Coping Strategies

Findings reveal that low-income consumers employ a variety of coping strategies to help them deal with and reduce the negative consequences that arise from their disadvantaged position in the marketplace. Not all strategies are used by all respondents, rather, consumers act in ways that they perceive to be the most fitting for their circumstances. Although both emotional and behavioral strategies were employed, due to length constraints, we focus here on behavioral strategies only.

Behavioral coping strategies are extremely varied and include engaging in price comparisons, turning to the alternative sector (both the second-hand market and alternative financial sector), shopping in discount stores, searching for bargains and using products and brands in unexpected and creative ways. Some respondents avoid credit, preferring to operate on a cash-only basis and others are forced to sell possessions to raise resources. Some respondents engage in strategies that may appear irrational to more affluent consumers, such as illicit income and alcohol consumption. Some believe that welfare is the best option and consequently do not search for employment.

At the family level, many of the coping strategies are aimed at minimizing the negative consequences of poverty for children, with many mothers suggesting that family consumption is structured around children. Some mothers suggest that their own lives are on hold until children are older. Equally, in some families children play an active role in coping with financial constraints and are effective in contributing to the family's united coping effort, either through a direct financial contribution to the household or indirectly, by reducing the pressure placed on mothers.

In many families, coping strategies are not only confined to the immediate family, but span across the extended family and community network. Many respondents discuss the reciprocal nature of support, as evidenced through the sharing of resources to ensure day-to-day survival. These community level support networks provide both emotional and tangible (financial and non-financial) benefits and range from support with child minding to the completion of DIY tasks to spending special events together.

Overall, respondents appeared to be effective at conditioning themselves by learning to adapt their spending in line with financial incomings:

**TABLE 1**
Respondent Details

| Pseudonym (age) | Interview Type | Weekly Income | No. of children | Employment |
|---|---|---|---|---|
| Sarah (46), Martin (15), Ella (13) & Linda (11) | Mother, 1 son, 2 daughters | £160 | 6 (aged 25, 20, 16,15, 13, 11) | unemployed |
| Zoe (43) & Jenny (16) | Mother & daughter | £99 | 2 (aged 19, 16) | unemployed |
| Catherine (40) & Samantha (15) | Mother & daughter | £146 | 3 (aged 19, 17, 15) | unemployed |
| Clare (25) | Individual | £250 | 1 (aged 7) | Part time youth worker, part time student |
| Melissa (31) | Individual | £206 | 5 (aged 7, 6, 3, 2, 2) | unemployed |
| Eva (45) | Individual | £110.50 | 3 (aged 25, 21, 12) | unemployed |
| Louise (25) | Individual | £100 | 1 (aged 5) | unemployed |
| Amy (23) | Individual | £180 | 1 (aged 2) | unemployed with voluntary work |
| Julie (24) | Individual | £144 | 1 (aged 5) | full time student |
| Nina (23) | Individual | £140 | 1 (aged 4) | full time student, part-time bar work |
| Rebecca (23) | Individual | £185 | 2 (aged 5, 10 months) | unemployed |

Melissa: *"You get conditioned into going with the flow."*
Louise: *"I think anyway no matter what you have you adapt your spending to what you have coming in."*

We now move on to consider the impact of these coping strategies and the positive consequences arising from this conditioning process.

**Consequences of Successful Coping**

This section moves beyond identifying coping strategies to consider the role and impact of such strategies on individual lives. First we emphasize the connection between successful coping and perceptions of motherhood. Second, we consider the issue of independence and third, we suggest that many of the lone mothers are content with their lifestyles.

**"Am I going to be a good enough mother?"**

One of the over-riding aims behind all of the coping efforts employed was the protection of children, something that the mothers take great pride in. The respondents took their parental role very seriously and the majority of mothers were not in paid work, instead devoting much of their energy to the role of motherhood and, in particular, being a good mother. For the respondents in the study, good motherhood meant placing the needs of their children before their own, ensuring children have the material resources necessary to 'fit in' with their peers and keeping children safe and from external harm.

Amy places great emphasis on being a good mother:

Amy: "*now that the baby is starting to grow I wonder am I going to be able to afford everything that he wants? Am I going to be a good enough mother?*"

When asked about hopes for the future, Amy's reply is centered on providing for her son. Amy comes from a troubled background and spent time "in care." She makes great efforts to ensure that her son has a better childhood than she had herself.

"*you have to understand that for a lot of my life I was going through a shitty time and I didn't want to live so I just take it day by day and don't try and see too far into the future. What I do want is that me and my baby are comfortable and he has all the things that he needs, even clothes, water, heating and I'd be happy with that.*"

As others have noted (Daly and Leonard 2002), money is the lens through which the poor view their worlds. Some respondents indicate that being a good mother can be constrained by a lack of financial resources, but it is not dependent on them. In other words, adequate financial resources can ease the burden of being a good mother whereas lack of adequate resources requires a degree of consumer resourcefulness to fulfill good mothering requirements.

Previous literature on consumer disadvantage and poverty does not adequately recognize the role of other members of society

in enhancing the problems of poor consumers. Many respondents commented that they encountered stigma from others:

> Julie: "*there is a lot of emphasis on money but that's because of the way we are all brought up. Society is just geared to getting that job… you are expected to have the house and the car so you are pretty much judged. Single parents are judged a lot and it really annoys me.*"

This judgment sometimes means that lone parents feel they have more to prove in terms of being good mothers. Motherhood is an important reflection of one's identity (Curasi, Hogg and Maclaran 2004) and being a 'good mother' helps build self-esteem in an era where welfare mothers (US) or lone mothers on benefits (UK) are stigmatized and are more likely to be associated with 'bad' parenting (McCormack 2005). Some respondents saw motherhood as a job in itself and enjoyed spending time with their children rather than seeking paid employment. To illustrate, when Sarah was asked about employment, she replied "*I'm a mummy…I reared 6 of them, that's enough for anybody.*"

### "I'm a very independent person"

Some previous research on coping with poverty presents a bleak image. The terminology that has previously been used to describe low-income families associated with sinking and drowning reinforces this idea (Kempson et al. 1994). Although it cannot be denied that life can be a struggle for low-income consumers, findings demonstrate that some make active attempts to maximize opportunities. This research has demonstrated that coping efforts may be empowering and can result in positive effects on self-esteem.

> Clare: "*I'm raising him on my own and I work to support him and I support myself at university as well. I try to balance things out, it is quite balanced, I have time to work, I have time to be a Mummy and study at the same time.*"
> Julie: "*I've had to really work for what I've got and at times get into hard amounts of debt and a lot of stuff that I have got is all through me, no-one else. My parents aren't supportive at all. I've had to save for everything that I've got so I appreciate money a lot more… sometimes I would go to bed and just think, oh my God, how did you get through all that, it amazes me how I can find the money to pay for some of the bills that I have.*"

Some respondents are rightly proud of their ability to "manage." As the above comment from Julie illustrates, remaining independent can have a positive impact on self-identity through the sense of achievement gained from coping with difficult circumstances and fulfilling the mothering role. Others also supported this view.

> Amy: "*I'm a very independent person, I've been living on my own since I've been 16 so anything I've ever done, it has all been put up by me or put together by me. I would never have anybody turn around and say that I owe them anything.*"
> Melissa: "*Sometimes it's good not to be depending on anybody else…I mean I'm one of these people who has to get on with things, even when I'm struggling I have to get on with things.*"

It is interesting that many of the respondents who placed emphasis on independence were in their early 20s and relatively young

mothers themselves. This was a great source of self-esteem, especially in societies that often condemn the irresponsibility of early lone motherhood, and gave these mothers control over certain aspects of their lives when they lack control in so many other areas. Indeed control was a central issue for many respondents. This is illustrated effectively in the following comment by Zoe:

> "*If you can change it, it's up to you to change it, no one can change it for you. And if you see something you want and you really want it you'll get it if you have to wait six months to save enough money you'll do it. It depends how determined you are.*"

### "I'm surviving and I'm living too"

In our consumer culture, money is often equated with happiness (Ahuvia and Friedman 1998). However, some respondents provide evidence that contradicts with this idea. Although psychologists study coping to understand how different responses relate to well-being (Aldwin 1994), consumer research on poverty has not gone past identifying strategies employed. When asked to sum up their lifestyles, many respondents indicated that they were happy.

> Nina: "*I'm lucky because I'm at university and I can spend a lot of time with my daughter so my lifestyle at the minute would be easy going. It's a good lifestyle, I enjoy my life and I have a good quality of life.*"
> Rebecca: "*we manage…I'm happy enough and we manage ok, we're not like some people who are really struggling you know what I mean, I'd like to think I've done ok out of the money that I have to live on.*"

Rebecca's comment that her family is not like those that are "*really struggling*" highlights an important point in that some respondents feel that they are in better situations than others. It is comforting for these consumers to know that there are others who are in worse positions than they are:

> Catherine: *[my lifestyle is] basic, pretty basic but I'm surviving and I'm living too. I'm not going without anything so I'm not. You actually do get there in the end, there's times you cry, times you laugh. If you get involved with other groups and other people who are all in the same position as you, you think my story is not half as bad as their story and you think what am I so down for?*
> Eva: *with Christmas coming I'd worry a bit about it….I'll say to myself it could be worse… there's somebody somewhere worse than me so I'm not too bad that way.*

These downward comparisons are another way of enhancing self-identity. The knowledge that there are people in more severe financial difficulties and that there are others further down the income ladder reduces respondents' feelings of dissatisfaction with their own situations, similar to the distancing strategy identified by Hill and Stamey (1990). Therefore, despite the fact that these respondents are living in poverty (Gordon et al. 2000), they remain happy with their quality of life and gain a sense of well-being from employing effective survival strategies.

### DISCUSSION: COPING CONSEQUENCES

As well as portraying the diversity of coping strategies employed by low-income consumers, one of the main aims of this paper was to consider the consequences of these strategies. Previous research has highlighted that low-income consumers lack

control in their lives. For example, Andreasen (1993) highlighted how fraudulent sales practices can affect pride, confidence and sense of self-worth. Hill and Stephens (1997) found that requirements to divulge private information in exchange for welfare benefits increased feelings of lost control. Additionally, even on occasions when low-income consumers do have a choice, they will often have limited alternatives from which to choose and may be forced to decide between two necessary items of expenditures (Cohen et al. 1992). As Kempson (1996) pointed out, poor consumers have the choice between going without essentials to pay bills and avoid having to use credit or juggling bills, and using credit to avoid going without essentials. Indeed, given the imbalance in the exchange relationship it is unsurprising that the poor believe they are powerless and their lives are controlled by external events (Alwitt and Donley 1996).

Henry (2005) suggested that perceptions of relative power effect self-worth evaluations. Consequently, limited financial resources combined with a lower status evaluation due to judgments from others may inhibit empowerment. However results from this study provide a more positive outlook.

Respondents recognized that public perceptions of lone mothers are often negative and fought against this discourse. McCormack (2005, 660) pointed out that: "The phrase 'welfare mother' is one in which the adjective, 'welfare', modifies the noun in such a way that it turns its meaning upside down. It is different from 'working mother', 'stay-at-home mother', or 'soccer mom', all phrases that specify ways of doing motherhood … but do not fundamentally alter the meaning of the term 'mother'". The welfare mother is stigmatized as non-productive by living on benefits, however, for some of the women in this study, motherhood is perceived as a job and a personal choice.

The desire to protect children ties in with the idea of being a good parent and all mothers were equally committed to ensuring that poverty did not lead to "poor" parenting skills. Respondents took great pride in the fact that they were successfully raising children alone and being independent was an important source of self-esteem. Being a smart shopper was something respondents were keen to illustrate through telling stories of successful bargain hunting activities. Previous research also confirms the link between financial independence and self-esteem (Edin and Lein 1997; Kempson et al. 1994). This may appear paradoxical to outsiders who might argue that these women are far from independent given their reliance on government support. However, for many respondents, independence was defined as not receiving financial help from their children's fathers. Also paradoxically, some of the activities that these parents engaged in did not correspond with a good mother ideology. For example, the desire to please children often lead to unhealthy food choices and some mothers turned to illicit income in order to meet children's requests. Nevertheless, coping strategies did create consumer empowerment and had a positive impact on self-concepts. Kochuyt (2004) reported similar findings in his study of poor families in Belgium and suggested that, for the unemployed, being a caring parent provides an identity that is worthy of public esteem.

Hill and Stephens' (1997) model implied that there is a linear chronological order to exchange restrictions, consequences and coping strategies. However, this research suggests that a linear approach may not provide a realistic portrayal of reality. To illustrate, the model implies that coping strategies are employed only after negative consequences arise. It is likely, however, that coping strategies will also be employed before negative consequences occur in an effort to reduce or avoid their severity. Consumers can be proactive in their efforts to manage difficult situa-

tions, a fact that is often understated in the coping literature. Such coping strategies can be interpreted as acts of consumer agency as they involve efforts carried out in the family's best interests to improve its situation.

Discussions on consumer agency tend to consider how consumer agency impacts on or influences the marketing system at large (for example, Holt 2002). Such an emphasis neglects how such agency affects the perpetrator at an individual level. If agency is carried out in the interests of the individual, its impact on that person and their personal space should not be neglected. In the case of the low-income consumer, agency can have a significant impact on individual lives. The underlying motives driving the employment of coping strategies are reducing financial disadvantage and social exclusion and, in extreme cases, survival. Given that the acts of agency exhibited by low-income consumers have transformatory potential, their impact should be measured in private spheres.

Coping must therefore be viewed as an iterative process. A focus on coping strategies alone may obscure important insights that may be gained from examining the impact of these strategies on the individual and the family. Additionally, as much of the research on coping strategies relates to vulnerable or disadvantaged consumers, research of this nature may help to challenge stereotypes that persist about these groups.

# Examining Non-Medical Service Needs of Women Living with HIV/AIDS

Yelena Tsarenko, Monash University, Australia
Valerie Clulow, Monash University, Australia
Katy Lefroy, Monash University, Australia

## ABSTRACT

This exploratory study examines non-medical support services for HIV-positive women in Australia, with the aim of understanding their long term consumption needs. Interviews were conducted with three HIV-positive women, eight medical practitioners who specialize in treating HIV/AIDS, and four HIV-positive women advocates. Analysis of the data provided three key themes that are vital in the design and delivery of non-medical support services: counseling, sexual orientation and peer support. Findings reveal agreement about the increasing importance of non-medical support services to the well-being of HIV-positive women.

## INTRODUCTION

The academic community has increasingly identified the need for transformative consumer research that attempts to alleviate the stress and suffering of vulnerable consumers in the modern world (Mick, 2006). Topics with the ultimate goal of enhancing consumer welfare are considered imperative in the field of consumer research. As Sheth and Sisodia (2006) state:

"Marketers should think of themselves as "healers;" after all, their job is to meet the functional and psychological needs of their customers, and leave them satisfied and even delighted. They should adopt this perspective at the individual as well as the societal level".

One particularly vulnerable market segment consists of individuals suffering from HIV/AIDS. Due to recent medical advancements, people living with HIV/AIDS (PLWHA) are managing to continue working, have relationships, and start families; in effect they are maintaining aspects of a pre-HIV life. This gives rise to a new segment of consumer whose needs are not fully met through traditional medical avenues and who, instead, require support services that provide both medical and non-medical assistance. To date, little investigation has been conducted on this emerging segment of consumers, and none has focused attention on the needs of women living with HIV/AIDS (Ciambrone, 2001).

Thus, this exploratory study was initiated to address the following research objectives:

- to determine the unmet needs of HIV-positive women;
- to determine the perceptions and attitudes of other key stakeholders towards existing support services (medical practitioners and HIV-positive women advocates);
- to identify the perceived barriers to HIV-positive women consuming non-medical support services.

Theoretically, this study is grounded in the emerging marketing paradigm known as the 'service-centered model of exchange' (Vargo and Lusch, 2004) and specifically applies the approach to the context of HIV-positive women. At its root, the conceptual foundation of this theoretical position is to promote the importance of taking into account all *relational* interactions (Vargo and Lusch, 2004) in the exchange transactions associated with non-medical support services delivery to these women.

Greater effectiveness in reaching the growing number of Australian women with HIV/AIDS will assist in maximizing good health for longer periods, minimizing discrimination and reducing the stigma associated with HIV/AIDS, thereby enhancing the well-being of people living with the debilitating condition.

## BACKGROUND OF THE STUDY

An increasing proportion of people living with HIV in Australia are heterosexual females. A significant rise in new HIV notifications among women occurred between 1999 and 2004 with the latest available figures revealing approximately 2000 registered HIV-positive women in Australia (NCHECR, 2004). Significantly, however, infections among women do not pertain to an identifiable age or risk group (NCHECR, 2004) and consequently, the specific needs of individual women vary considerably. The main issues that affect the quality of life of HIV-positive people can be examined from three different perspectives.

### 1: Living with HIV and adherence to HAART (Highly Active Antiretroviral Therapy)

The success of antiretroviral treatments has transformed HIV from being a fatal illness to a permanent but manageable health condition (Kennedy et al., 2004). Indeed, one of the main challenges for PLWHA is adhering to the strict antiretroviral drugs regime.

Previous research has indicated that an individual's psychological state can have a significant effect on their adherence to this treatment regime. Alfonso et al (2006) demonstrated that distressing emotions impacted significantly on a large number of participants' decision to take HAART, and a survey conducted by the Australian Federation of AIDS Organizations (AFAO) in 2006 revealed that women are less likely than men to take antiretroviral or prophylactic (preventative) treatments for HIV. Similarly, research conducted by Cook et al. (2006) revealed that women struggling to cope with high levels of depressive symptoms are less likely to initiate or continue treatment using HAART.

### 2: HIV and stigma

People who acquire HIV differ significantly from people with other chronic or terminal illnesses in terms of how they cope with medical, social, economic and personal pressures. Feelings of guilt at becoming infected and fear of disclosing their status due to the perceived risks of being stigmatized and marginalized in society are unique for PLWHA and influence almost every aspect of their lives (Molassiotis et al., 2002).

Gender difference also plays a significant role in relation to stigma felt by PLWHA. For example, women are inclined to feel victimized if the infection is caused by unprotected sex with men who did not divulge their HIV status (Lichtenstein et al., 2002).

### 3: HIV and Support Services

Increased rates of life expectancy (following initial HIV-positive diagnosis) mean that those infected are now facing a different set of challenges that centre on how to live with HIV. In particular, the health care system, community care networks or

other agencies, now need to develop strategies to provide adequate assistance for people with an HIV-positive diagnosis in order to help them maintain good mental health and remain independent and productive members of the community for as long as possible. These circumstances raise questions as to the accessibility and relevance of available support services, which have been primarily designed for homosexually active men and injecting drug users.

In the peak years of the HIV/AIDS epidemic, it was the gay community that was predominantly afflicted. The spread of HIV/AIDS to other groups, however, has necessitated some urgency in establishing organizations that accommodate the needs of a more demographically diverse population. People outside of the gay community and other cultural groups identified in the earlier stages of the epidemic (eg needle users, sex workers) often lack the various forms of emotional, economic and political support that are required to promote resilient attitudes. They also tend to be susceptible to a higher degree of isolation, stigma and marginalization.

Women, in particular, are marginalized within the Australian HIV population and have few support resources available to them *en masse*. This is because the specific needs of women vary considerably depending on their current health condition, family status, financial situation and their degree of emotional fulfillment.

A substantial body of research in mental health provides evidence that use of social support services has the potential to reduce levels of stress and risk behavior (Bruce et al., 2002, Waddell and Messeri, 2006) . Findings from Tsunekawa et al (2004) demonstrate that positive attitude changes occur when PLWHA encounter others who share the same burden. However, while many studies emphasize that peer support and participation in social groups enables HIV-positive people to reinforce their coping skills, restore emotional balance and increase self-esteem (Molassiotis et al., 2002, Bruce et al., 2002), only one study conducted in the United States pointed out that many people diagnosed with HIV do not receive regular support (Uphold and Mkanta, 2005).

Within Australia, there is only one non-governmental HIV group that currently targets women's needs. 'Positive Women,' which is based in Victoria, is the only organization with a mission to solely address the needs of HIV-positive women. The organization offers a limited range of information resources and services, such as a drop-in service, hospital and home visits, access to funding for personal development, and food vouchers.

In summary, an overview of academic and practitioner literature in the area of HIV support services leads us to conclude that, to date, there are no well grounded programs or soundly designed strategies for tailoring support services to HIV-positive people in general and women in particular.

## RESEARCH METHOD

This project has discovery-oriented goals and employs a qualitative approach for the data collection process. The sensitive nature of this study, the ability to guarantee confidentiality to respondents and the desire to make the research as participatory as possible require a face-to-face, individual approach from the researcher. For this purpose our research methodology adopts a grounded theory approach (Strauss and Corbin, 1998) embedded within a constructivist paradigm (Denzin and Lincoln, 2005) in which the data collection method is informal, based on semi-structured in-depth interviews (Strauss and Corbin, 1998) and complemented by observation and recording of field notes (Marshall and Rossman, 1999). The research employs the purposive (or judgment) sampling techniques (Albright, 2002). Interviewing the three groups of primary stakeholders (Wheeler and Sillanpää,

1997)–HIV-positive women, medical practitioners and women advocates-allows us to build a more holistic picture and gain greater appreciation of various perspectives on designing non-medical support services for HIV-positive women.

### Interview schedule

The interview schedule was developed using an adaptation of the service-centered model (Vargo and Lusch, 2004) as a framework and employed a semi-structured approach.

The semi-structured interviews lasted around one hour and were conducted at a place selected as convenient for the informants. All interviews were audio taped after written consent was granted.

Data analysis was performed in two stages employing the hermeneutic (idiographic) approach (Thompson et al., 1994, Packer, 1985, Fournier, 1998). The first stage involved reading the verbatim transcript with the goal of gaining insight to the personal hardship of being diagnosed with HIV in which psychological tendencies were revealed as well as an understanding of how women utilized available support services. The second stage involved comparative analysis of the responses of each interviewee. This stage was directed at finding any similarities or specific differences within and across the three informants groups, as well as an assessment of what is lacking in addressing women's needs.

### Sample

*Women living with HIV/AIDS;* The researchers approached the Positive Women Organization in Australia to seek its assistance with recruitment. The director of this organisation was provided with an explanatory note of the study. She then approached the clients of this organisation via email and this resulted in three women being self-selected.

The key informants of this research were women living with HIV/AIDS (R1-R3). The three respondents were Caucasian women who live in Melbourne, speak English as their first language and all between 25 and 50 years of age. The time lapse since diagnosis of these women was over 14 years (R1), approximately 16 years (R2), and 9 years (R3). Two of the three informants (R2 & R3) have children, and at time of interview R3 had a new born baby and therefore was not working. Only respondent R3 is married. R2 has a PhD degree and worked in a consulting business, while R1 was enrolled to study her Diploma of Social Welfare and worked part-time. Overall, there was sufficient variation in the life circumstances of these women to reflect some diversity of lived experiences and life perspectives.

*Medical practitioners (Physicians);* This group comprised medical practitioners specializing in the health of women living with HIV/AIDS. Eight doctors (D1-D8) from Melbourne and Sydney clinics specializing in HIV/AIDS treatment were interviewed. This respondent group was selected on the basis that doctors are recognized as the first real contact that a woman makes when diagnosed with HIV/AIDS and that, by virtue of the chronic and stigmatizing nature of the illness, an enduring doctor-patient relationship often ensues.

*Women advocates;* This group of informants were four women (WA1-WA4) living with HIV/AIDS who are also actively involved in national advocacy roles and in support services such as peer support at the community level. They have all publicly disclosed their HIV status and serve to support, represent, and advocate for the needs of all women living with HIV/AIDS in Australia at a state and national level. The participants were from four Australian state capital cities (Adelaide, Sydney, Melbourne and Brisbane) and reflect varied life experience, ethnicity and family circumstances. They were all first diagnosed HIV-positive over ten years ago.

## FINDINGS

In accordance with the service-centered model of exchange (Vargo and Lusch, 2004), the interviews focused on the relational aspects of the exchanges that the women experienced during the period of their diagnosis, the subsequent commencement of treatment, and the management of their condition. This approach elicited three key themes that emerged during the data analysis–counseling, orientation of support services, and peer support.

Before presenting these main findings it is important to understand the profile of the female Australian HIV-positive population. One medical practitioner, who deals with PLWHA on a daily basis, claims that an increase in the global epidemic directly effects this population.

It's not home grown transmissions…They are certainly there, but those figures aren't going up. It tends to be going up with people who are coming to Australia, migrating to Australia and they've acquired HIV from overseas…or Anglo women who've gone overseas and had sex with a local and acquired it in that way… [D1]

This gives us an insight into a population who may have significant economic, social, cultural and religious differences, and offers both an understanding of and impetus for the examination of HIV support services. Both the responses from the interviewees and the surveillance data jointly support the contention that it is extremely difficult to identify any commonality across the female HIV-positive population. As another medical practitioner states:

Women are very, very different. There are some who are injecting drug users, there are some who've acquired it from their partners who are HIV positive and heterosexual, …young women who are students and occasionally older women who have had it for a while and are diagnosed in their sixties only recently because their husbands were bisexual and positive and didn't know about it. [D2]

*Counseling;* Diagnosis of HIV is obviously a shocking experience and all respondents revealed that, at the initial stage of diagnosis with HIV, it felt like a death sentence. The psychological trauma of one of the respondents was intensified by the doctor's reaction.

I felt that the GP [physician] was really angry with me for having exposed him to the virus. [R1]

Another respondent had a more favorable first experience:

I was probably very fortunate that I went to the [clinic] for my diagnosis and that's where I still go for my HIV doctor related appointments basically because I think they are a really compassionate and understanding service [R2]

These two contrasting situations reveal a critical stage where support services begin; namely, with the advice and counseling from initial consultation with a General Practitioner and their compassion and understanding of the client's situation.

The HIV specialist or diagnosing general practitioner is often the sole source of information about medical treatments and the non-medical support services available for women when newly diagnosed. While it is perceived as obvious that counseling for HIV-positive people is of utmost importance to assist them in normalizing their lives, there is a serious frustration in regards to the provision and delivery of these services. As one of the respondents commented:

the counseling I think is something that's really under resourced. There's very little of it about, and that's the thing, like, where do you find out where ongoing counseling is unless you go to Positive Women or the AIDS Council which most women feel intimidated by. [R2]

This was also supported by medical practitioners, who indicated that psychological and psychiatric services are traditionally underfunded, which ultimately inhibits the necessary support that women need through their diagnosis.

The experience of the women interviewed, in terms of receiving counseling support, varied considerably. One respondent stated that, at the time she was diagnosed, there was:

… no counseling whatsoever. As I said, I didn't go for an HIV test, I went because I was sick, and then when I got the test results. [R1]

Another respondent sought help from her circle of friends:

I had a good friend around the corner, [Name], and he actually used to work as a counselor. …so he sort of gave me quite a bit of support. [R3]

She then shared her experience of finding support from a counselor in the hospital:

Somewhere around the '90s I met a counselor who was working at [Name] Hospital, and he offered to have sessions with me, and I probably ended up seeing him for about two years and he was a psychotherapist, and that was great and that was probably-ultimately it was probably the best. [R3]

Adequate levels of counseling support are considered to consist of more than merely a few post-diagnosis sessions. Counseling must be an ongoing process to address various needs as they emerge over time and the availability of ongoing counseling has a crucial impact on personal well-being.

From these findings it is apparent that counseling services have to be designed and widely available to enable HIV-positive women to adapt to their new life, provide psychological support and additional information services specifically related to the HIV disease. In addition, HIV-positive people require on-going counseling.

*Orientation of support services;* A number of community-based organizations provide support for people infected by HIV/AIDS. However, the specific sexual orientation of their activities poses significant constraints on the consumption of such services by women. For example, two major organizations, the AIDS Council and NAPWA (National Association of People living with HIV/AIDS) were described as follows:

…largely gay men oriented...I do know that a lot of women do feel uncomfortable and have a lot of concerns about the gayness of these places. [R1]

One woman advocate supported this perception.

A lot of women don't feel that welcome walking in there when 90% of it's gay men [WA4]

A comment by one of the respondents indicates that, unlike the HIV-positive gay society, women often find themselves with no emotional attachment to other HIV-positive women.

> ...in terms of community, the gay men in Australia have got the numbers, so they do have quite a community whereas … The women in Australia, we don't live near each other, we're spread out. We don't have that extra being homosexual in common to bind us. [R1]

While an essential objective of non-medical support services is to challenge the isolation experienced by many women diagnosed with HIV, the image of Positive Women often does not reflect a sense of community. This is in line with comments that the population of HIV-positive women is very diverse, and that makes it difficult to create an image of an organization that will appeal to various segments of the female population. Despite a relatively small HIV-positive female population in Australia it is evident that having one organization to address all women's needs is not sufficient.

*Peer support;* Siegel and Lekas (2002) observed that there are two dominant reactions by women to a diagnosis of HIV: to either engage with the HIV community or to continue with the pre-illness self, which results in social and/or emotional isolation. This isolation can be reduced by encouraging women to engage with the community based organizations through peer support workers. As it was observed by medical practitioners, significant barriers exist that prevent women from wanting to engage with support services as a consequence of the HIV/AIDS diagnosis.

> I have several patients who do not use any support services. They come and talk only to me. Sometimes I feel that I am GP, psychiatrist and social worker all rolled into one but, of course, I feel that I don't do these [psychiatrist and social worker] very well. They need to talk to other professionals …but when I advise them to use these other services they appear offended, as though I am trying to pass them off to others [D5]

When asked 'what sort of things would stop someone using a service?' one HIV specialist remarked:

> For many women it is all related to confidentiality, the fear of disclosure, who to disclose to and not having that support network that you talk about being often so good at getting together. [D2]

Despite issues relating to confidentiality, peer support services were consistently identified by the women interviewed as one of the most valued support services, particularly in the early stage of diagnosis. This importance is acknowledged by one advocate, who speaks from her experience.

> It's just that relief that you can actually pick up the phone and know you're speaking to another woman who's been through what [you have been through]. [WA1]

It is important to note that the most effective support-providers may be *similar others*; that is, individuals who themselves have successfully faced the same stressful circumstances that are currently experienced by the subject (Thoits, 1995). The importance of peer support is strongly emphasized by women in our study and, in general, respondents seek more communication with other HIV-positive women–to share information and experience, to maintain social contact and for emotional support.

> …even now in Australia I kind of crave for some-to talk to other HIV-positive people with a similar perspective to mine, and there are very, very few people. There's a guy in Sydney that I ring up, and he's probably my best peer support, which is crazy. There's one in Melbourne and there's a few women in Melbourne I like and get on with but… it's a lonely journey… I know for me I want to spend more social time with other women who are positive, and yet I can't find them; I can't get to them and I don't know where they are. Positive Women doesn't supply that need to me [R2]

Coupled with this are concerns about the evolving nature of the support services, with many current health care workers not being HIV-positive and thus not perceived as 'similar others'.

> All the peer support positions are being turned into health promotion positions, and it's as though it's not cool to be a peer support worker. You're not bringing enough to the position, you've got to be, you know, highly qualified. [WA1]

This reflects trends across Australia, where the role of the peer support worker is subsumed by the position of a trained health worker and is inconsistent with the nature of desired service provision. This trend changes the nature of the peer support service which provides empathy from an experienced perspective in understanding the nature of the challenges that the women face.

These narratives illustrate the evolving and dynamic nature of support services needed for women through the evolution of HIV/AIDS from the pre-treatment era to the current situation where there are widely available antiretroviral treatments. Of particular importance is evidence for the need of counselling and non-medical support services following the commencement and balancing of antiretroviral treatments.

## IMPLICATIONS FOR CONSUMER THEORY: RESEARCH IN HIV AREA

This study has introduced the contemporary issues relating to support services for people with HIV in Australia and specifically highlights the dearth of information relating to women as a minority group within this population. By adopting a more flexible approach to the marketing viewpoint underscoring the design of the study, a contribution has been made to better understanding (1) consumer needs, and (2) the design and marketing of appropriately oriented non-medical services to heterosexual women with HIV/AIDS.

The results reported in this paper challenge the current understanding of services marketing; that the effect of support services depends not only on the range and variety of specific services that people receive but on more specialised features within the context of the service transaction. It is apparent that HIV-positive people, and women in particular, engage with only limited service providers.

Characteristics of support service providers, service recipients and transpired relationships, are all important elements within service delivery and have an impact upon access and use of support as well as effectiveness of such exchanges. This study demonstrates a paradox in the model of services designed for HIV-positive people. While the majority of service initiatives are developed and funded to provide various forms of emotional and instrumental support for PLWHA, there is no fit between service providers and service recipients, with clients often rejecting the value propositions made by the service provider. The customer is not a co-producer; she remains an *operand resource*.

The medical community is in a unique position to redress the imbalance in the provision and utilization of support services as they have privileged access to women, particularly those newly diagnosed with HIV/AIDS, who are in need of counseling. Coun-

seling is of great importance in the earlier stages of diagnosis as it helps individuals not only accept the first exposure to the illness but also to plan their future life. Over the years counseling gives way to communication networks with HIV-positive people who have similar problems and share an understanding of the requirements and concerns of people with comparable debilitating conditions.

Engagement with a supportive HIV community which was more closely oriented to women's particular needs was found to be of great importance. However, in reality it is not so straightforward. Firstly, the population of HIV-positive women in Australia is very heterogeneous, and while women want to communicate with similar others, the diversity of the group means that they may not share any aspects of their identity beyond their HIV status. The second issue is that women perceive that they have little in common with the majority of community members, given that the support networks have been largely organized by and on behalf of the gay male community.

In general, the support services which exist are in their infancy. There is no theoretical or practical guidance on how to treat emerging support services, and it is correspondingly difficult to measure and evaluate the efficacy of those organizations.

The strategies employed by peer-support organizations require extreme flexibility and adaptability in dealing with the diverse population of HIV-positive women. HIV support organizations are, by their very nature, limited and tend to operate in a similar way to each other rather than offering distinctive services to their clients. There is no competitive incentive to sharpen the quality of services available and women who use these services do not have many options from which to choose. Some of the key aspects mentioned in this study suggest the need for further development of marketing strategies and service-centered social marketing approaches to satisfy the needs of HIV-positive women.

This highlights the paradox which marketers have to address. On one hand so many academic and practical advances have been accumulated in the theories of service and consumer research. However, when society faces the challenge of providing support services for people with terminal illnesses, it is evident that new factors posited by the environment have to be incorporated into the services model to address the needs of a new segment of consumers. This exploratory study demonstrates that the "marketplace has more to teach the scholars than scholars have to teach the marketplace" (Deighton and Narayandas, 2004, p. 20).

The problems associated with HIV/AIDS are too readily perceived as relating purely to the domain of physical health. However, the contribution that can be made from the services marketing paradigm is to overcome this major 'short-circuit' in the design and promotion of health care services caused by the failure to take into account consumer variables such as individual personality, socioeconomic status, existing knowledge and interests, mass media habits, and interpersonal communication networks (Bratic et al., 1981). We must add gender to this list, as it has been long overlooked. As this study reveals, such an approach will improve the design of support services and facilitate the development of gender-sensitive marketing strategies to enhance the consumption of support services by HIV-positive women.

## LIMITATIONS AND DIRECTIONS FOR FUTURE RESEARCH

The process of data collection was marked by objective difficulties in recruiting women with HIV/AIDS who were willing to participate in this study. The major obstacle was that women consider their privacy to be a high priority and they were therefore reluctant to disclose their HIV status. Subsequently, the number of respondents selected to participate in this study was constrained by the scope of the project and the closed nature of the target community. However, even though the number of respondents was small, their comments and responses reveal high levels of consistency, which is important for new research directions.

Future studies could also investigate the needs of women who are caring for HIV-positive partners or children, individuals from cultural and diverse backgrounds, or on a growing elderly population who are affected by HIV/AIDS. Finally, similar research could examine the consumption practices of the heterosexual male community who, like their female counterparts, suffer from being a minority within a minority.

# A Comparison of Advertising, Social, and Cognitive Predictors of Overeating Behavior

Brian R. Kinard, University of North Carolina-Wilmington, USA
Cynthia Webster, Mississippi State University, USA
Allyn White, Mississippi State University, USA

## ABSTRACT

The *Journal of the American Medical Association* and the National Center for Health Statistics report that 30 percent of adults and 15 percent of adolescents in the United States are obese (Ogden et al. 2002). Such statistics suggest that the prevalence of obesity in America has reached epidemic proportions, threatening to overtake smoking as the leading preventable cause of disease and death (Seiders and Petty 2004).

Drawing from Bandura's (1986) social cognitive framework to understand the etiology of overeating behavior, the current research study simultaneously examines individual and combined effects of advertising, social, and cognitive predictors on overeating behavior in adolescent and adult populations. This research is the first to examine social cognitive influences in both an adolescent and adult population, which allowed an assessment of the robustness of each variable across two different populations, and consequently enhances the external validity of the results.

Overall, the results of the analysis suggest that (1) although advertising media alone may have a significant effect on unhealthy overeating behavior, parental influence, peer influence, and self-efficacy beliefs largely neutralize such influence, (2) peer and parental influences strongly predict adolescent unhealthy overeating behavior, but parental influence wanes as individuals reach adulthood, and (3) self-efficacy is the most significant predictor of adolescent and adult unhealthy overeating behavior.

## INTRODUCTION

Extensive research efforts have sought to explore the biological, psychological, and social factors and mechanisms that influence voluntary risk behavior among adolescents (i.e., Grube and Wallack 1994; Hitchings and Moynihan 1998; Pechmann and Knight 2002; Seiders and Petty 2004). Among the factors documented by behavioral theorists to influence adolescent risk behavior are attitudes, intentions, emotions, social norms, motivations, and the environment. However, multiple spheres of influence and developmental changes make childhood and adolescence challenging targets for research aimed at understanding how risk behaviors form. Specifically, determining the extent to which each factor contributes to the development of risk behavior among adolescents is a confounding issue.

Bandura's (1986) social cognitive theory provides some guidance to understand the myriad of factors that influence risk behavior (Malone 2002). The theory purports reciprocal, bidirectional interrelationships of a person's behavior, environmental factors (family, friends, and media) and cognitive processes (thoughts, language, memory, and self-efficacy) as the explanation to human behavior (Jacob 2002). Further, social cognitive theory does not place equal emphasis on these relationships, thus allowing for the examination of the unique and additive effects of the variables. At the time of this research prior studies using social cognitive theory to examine adolescent risk behaviors tend to view social cognitive associations as independent, rather than interwoven sources of influence.

### Advertising's Influence on Overeating Behavior

A variety of studies have examined the relationship between television viewing and obesity in children (e.g., Crawford, Jeffery and French 1999, Moschis and Moore 1982). However, findings are mixed, with some results suggesting no relationship (i.e., DuRant, Baranowski, Johnson and Thompson 1994; Wolf, Gortmaker, Cheung, Gray, Herzog and Colditz 1993), while others indicate a relatively strong effect (i.e., Dietz and Gortmaker 1985). Although there is limited empirical evidence directly linking advertising and adolescent obesity (Lvovich 2003), these findings warrant further examination of advertising's influence on overeating behaviors.

Although limiting unhealthy advertisements (Ellison and Vranica 2005), food manufacturers still allocate nearly 75 percent of media budgets to televised advertisements (Byrd-Bredbenner and Grasso 2001). Children view nearly 3 hours of commercials weekly, the majority of which are for unhealthy foods (Armstrong and Brucks 1988; Gamble and Cotugna 1999; Dietz and Gortmaker 1985; Tucker 1986). Further, children's exposure to food advertisements increases their desire for those foods (Goldberg and Gorn 1974). Thus,

*H1*: After controlling for other sources of influence, exposure to unhealthy food-related advertisements is a significant predictor of unhealthy overeating behavior.

### Parental Influence on Overeating Behavior

Social cognitive theory (Bandura 1986) suggests that direct exposure to parental figures overeating reduces an individual's inhibition to engage in such behavior. Further, research indicates children's food preferences are shaped by observing food selection patterns and eating behaviors of their parents (Birch and Fisher 1998; Bolton 1983). In addition, parental control over adolescent exposure to advertised media may preempt children's susceptibility to advertising. Thus,

*H2*: After controlling for other sources of influence, parental influence is a significant predictor of unhealthy overeating behavior.

### Peer Influence on Overeating Behavior

During adolescence, individuals tend to identify more with peers than with family members (Campbell 1969; Moore and Moschis 1978; Moschis and Churchill 1979; Ward 1974). Adolescents that frequently interact with peers tend to prefer their friends' products (Caron and Ward 1975), discuss peer consumption behavior with parents (Churchill and Moschis 1979; Moore and Moschis 1978), influence product and brand preferences of family members (Moschis, Moore and Smith 1984; Saunders, Salmi and Tozier 1973) and are more actively involved in the family purchasing process (Moschis, Moore and Stephens 1977).

Therefore,

*H3*: After controlling for other sources of influence, peer influence is a significant predictor of unhealthy overeating behavior.

### Self-Efficacy Influence

Theories of social influence have proven valuable in researching voluntary risk behavior. The social influences discussed thus far are purported to stimulate the consumer's desire to partake in a certain behavior. However, theories relying solely on social influ-

ences seemingly assume that the individual has control over his or her behavior. Bandura (1986) realized the potential effects of real or perceived self-control on an individual's behavior, and revised his original frameworks to account for such influence, termed self-efficacy beliefs. Self-efficacy is a cognitive variable referring to individuals' perceived ability to exert control over events in their lives (Bandura 1986). Indeed, self-efficacy beliefs may preempt external influences on overeating (Godin and Kok 1996). From Bandura's (1986) social cognitive perspective, individuals with low self-efficacy beliefs are unlikely to resist engaging in behavior detrimental to their health, whereas the opposite is true for high self-efficacy individuals. Therefore, individuals who believe that they are unable to stop eating might overeat, social influences supporting or dissuading overeating behavior notwithstanding. Self-efficacy has been reported to predict consumer overeating (Clark, Abrams, Niaura, Eaton, and Rossi 1991; Richman, Loughnan, Droulers, Steinbeck, and Caterson 2001). Furthermore, research reports weight self-efficacy is inversely related to actual weight in both male and female samples (Linde, Jeffery, Levy, Sherwood, Utter, Pronk, and Boyle 2004). Thus,

*H4*: After controlling for other sources of influence, general self-efficacy is a significant predictor of unhealthy overeating behavior.

## METHODOLOGY

The current research consists of two studies. Study 1 examines the relative influence of four social cognitive variables-advertising, parental influence, peer influence, and self-efficacy–on adolescent overeating behaviors. In order to enhance the external validity of the results, Study 2 examines the influence of these variables on adult overeating behaviors. Survey content, format, and administration were identical for both studies.

*Procedure*. Survey administration took place during evening hours inside/outside of restaurants across three cities–Chicago, Illinois; San Antonio, Texas; and Washington, D.C. Intercepted respondents were screened for engagement in overeating behavior and the extent to which they felt competent in recalling and reporting the manner in which certain antecedents had impacted their overeating. Once an individual was screened, the purpose and nature of the study was explained and $2 was offered in exchange for participation.

In an effort to enhance the accuracy of self-report measures used to collect adolescent overeating behavior, counter-biasing information was provided during survey administration. For instance, respondents were told "It's very common to overeat". Counter-biasing methods have been proven to lower social desirability bias in health research (Raghubir and Menon 1996; Sudman and Bradburn 1974). Additionally, research guidelines suggest a short time frame be utilized when assessing self-report responses (Sudman and Schwarz 1989). Thus studies 1 and 2 used a reference time period of one month. Test-retest correlations (Study 1-.92, n=26, 17-day interval; Study 2-.94, n=30, 16-day interval) suggest consistency in reported behavior from both studies.

*Independent Measures*. Advertising influence ($\alpha$=.87) was assessed using recalled exposure to advertised messages, as well as cognitive and affective processes elicited by their presence that may encourage individuals to engage in risk behavior. The current study adapted measures constructed by Schooler, Feighery and Flora (1996) to estimate advertising exposure through both broadcast and print media..

In line with similar studies examining parental/peer influence ($\alpha_{Par}$=.80; $\alpha_{Peer}$=.85), we assessed perceived parental and peer

behavior by asking, "How often do your parents (peers) overeat?" (1=Never; 5=Almost every day). We assessed attitude and subjective norms related to the behavior by asking the following questions: "What is your parents (peers) general attitude toward overeating?" (1=Unfavorable; 5=Favorable) and "How often do you feel you need to comply with your parents (peers) attitude toward overeating?" (1=Never; 5=All the time).

Self-efficacy ($\alpha$=.94), was measured as a general construct that reflects an individual's ability to cope with a broad range of stressful or challenging demands. Four items were used to measure general self-efficacy. A typical question from the scale is "I never give up on things before completing them" (1=Strongly disagree; 5=Strongly agree).

*Dependent Measures*. Unhealthy overeating behavior was assessed by correlating the results of two measures. First, respondents were asked "What percent of your diet consists of, what is generally considered, unhealthy food (e.g., high sugar, high saturated fat, 'empty calories', etc.)?" Then respondents were asked to report their age, weight, and height in order to determine the number of pounds they were over the "high" end for their acceptable weight range. Acceptable adolescent weight ranges for comparison are widely published (e.g., Centers for Disease Control and Prevention 2000). A high correlation between the two measures indicates there is strong positive relationship between one's unhealthy food consumption and the extent to which s/he is overweight, indicating a propensity to overeat unhealthy foods. The correlation coefficient between these two measures across both studies was .983.

*Demographic Measures*. The current study controlled for possible extraneous influences of socioeconomic status, gender, and ethnicity (Moore and Stephens 1975). Respondent gender and ethnicity were measured using traditional nominal scales. As is common in youth research, adolescent SES was determined by parental occupation and educational attainment.

### Analysis

Hierarchical regression analysis allows partitioning of the total variance explained by a set of predictor variables into unique proportions explained by discrete subsets so that a predictor subset's "contribution to unique variance in a criterion beyond another predictor's contribution may be explained" (Organ and Konovsky 1989, 161). We conducted hierarchical regression analysis in five major steps. First, demographic control variables were regressed on each of the three risk behaviors. Second, each predictor was regressed separately on the two risk behaviors, with the inclusion of significant demographic control variables from step 1. Third, each of the four predictor variables was added separately to the equations of the second step, and the change in $R^2$ was investigated for significance ($p \le .05$). Fourth, each of the four predictor variables was added separately to subsets of every possible pair of predictor variables from the third step, and the change in $R^2$ was investigated for significance. Finally, each of the four predictor variables was added separately to subsets of every possible three-way combination of predictor variables from the fourth step, and the change in $R^2$ was again investigated for significance. An alpha value of .05 was used for determination of statistical significance for all results.

## STUDY 1

In this study, we investigate the relative predictive effects of advertising media, social influence and self-efficacy on adolescent overeating. Specifically, this study consists of adolescents (age 13-19) exhibiting a propensity to overeat unhealthy food.

*Sample*. A total of 89 qualified adolescents agreed to complete the survey. The respondent mean age was 16.3 years, and, on

average, each respondent reported being nearly 40 pounds overweight.

*Results.* Table 1 shows the results of the hierarchical regression analysis and the standardized beta estimates for the full regression model. Significant relationships were identified between demographic control variables and overeating behavior. Specifically, socioeconomic status was negatively associated with overeating, and adolescent females were associated more with overeating than adolescent males. Additionally those that marked "Other" for their ethnicity, as compared to Caucasians, African-Americans, and Hispanics, were associated with lower levels of adolescent overeating behaviors.

The change in $R^2$ associated with step 2 of the hierarchical regression analysis shows that all four independent variables significantly predict unhealthy overeating behavior among adolescents after controlling for demographic variables. The third step of the analysis shows each predictor variable's ability to explain some unique variance in adolescent unhealthy overeating behavior when controlling for only one other social cognitive predictor and the demographic variables. Based on the change in $R^2$ in step 3, advertising is non-significant for overeating, while parental influence, peer influence, and self-efficacy are significant (except for the relationship of peer influence beyond self-efficacy).

When controlling for all other subsets of social cognitive predictor variables and demographic variables in step 5, the resulting change in $R^2$ values and standardized beta coefficient reveal advertising to be a non-significant predictor of unhealthy overeating behavior among adolescents, while parental influence, peer influence, and self-efficacy are significant. Overall, self-efficacy is found to be the most significant determinant of adolescent overeating. Further removing possible effects of advertising and self-efficacy, parental and peer influences are second and third in significance, respectively. Based upon these findings, H2, H3, and H4 are supported. No support is found for H1.

## STUDY 2

In Study 1, we examined the ability of each social cognitive variable to explain unique variance in risk behavior among adolescents. Although the results from Study 1 are promising to better understanding the etiology of overeating behavior, adolescent samples limit the generalizability of the results. Therefore, Study 2 consists of an adult sample exhibiting overeating behavior. Differences in age between the two sample types strengthen the ability to draw conclusions detailed in the first study.

*Sample.* A total of 83 qualified adults agreed to complete the survey, comprised of 49 percent male and 51 percent female respondents. The average age of the respondent was 52 years, and, on average, each respondent reported being nearly 63 pounds overweight.

*Results.* Table 2 presents the results of the hierarchical regression analysis of Study 2. Similar to the significant relationships identified between demographic controls and overeating in Study 1, socioeconomic status was negatively associated with unhealthy overeating, adults that marked "Other" were less likely to overeat unhealthy foods, and adult females were more likely than adult males to overeat unhealthy foods.

Similar to Study 1, the change in $R^2$ associated with step 2 of the hierarchical regression analysis suggests that all four independent variables significantly predict adult unhealthy overeating after controlling for demographic variables. Again, the third step of the analysis shows each predictor variable's ability to explain some unique variance in adult overeating behavior when controlling for only one other social cognitive predictor and the demographic

variables. Based on the change in $R^2$ in step 3, advertising, parental influence, peer influence, and self-efficacy are significant predictors of adult overeating behavior (except for the relationships of parental and peer influence beyond self-efficacy).

When controlling for all other subsets of social cognitive predictor variables and demographic variables in step 5, the resulting change in $R^2$ values and standardized beta coefficients reveal that advertising and parental influence are non-significant predictors of adult unhealthy overeating behavior, while peer influence and self-efficacy appear to be significant predictors of adult unhealthy overeating behavior. Overall, self-efficacy is again found to be the most significant determinant of unhealthy overeating behavior. Based upon these findings, only H3 and H4 are supported.

## DISCUSSION

This research study explored the relative explanatory power of advertising, social, and cognitive predictors of overeating across both an adolescent and adult sample. The empirical evidence provided in this study makes a significant contribution toward understanding the etiology of unhealthy overeating behaviors. While critics blame advertising for the prevalence of obesity in the adolescent population, the results of this research suggest that advertising accounts for a relatively small, insignificant percent (*e.g.,* 1 percent for adolescents and 2 percent for adults) of unique variance in unhealthy overeating behavior when controlling for other social cognitive predictor variables. In fact, for both adolescents and adults, self-efficacy is the strongest predictor of unhealthy overeating behavior.

Overall, the results of the analysis suggest that (1) although advertising media alone may have a significant effect on unhealthy overeating behavior, parental influence, peer influence, and self-efficacy beliefs largely neutralize such influence, (2) peer and parental influences strongly predict adolescent unhealthy overeating behavior, but parental influence wanes as individuals reach adulthood, and (3) self-efficacy is the most significant predictor of adolescent and adult unhealthy overeating behavior.

### Limitations and Future Research

Self-report measures will inevitably lead to questions regarding response accuracy. Previous studies have found that the response estimates are associated more with an adolescent's own behavior, and thus may lead to overestimation of influence (Sussman, Dent, Mestel-Rauch, and Johnson 1988). Future research studies examining modeling effects should directly assess peer and parental unhealthy overeating behavior. Additionally, a one-month reference period follows established research guidelines for self-report measures. However, relying on the participant's memory of prior overeating behaviors limits the ability to draw conclusions with certainty. Studying actual overeating behavior in an experimental setting would strengthen the validity of the current findings.

Second, this study casts social cognitive variables as predictors of risk behavior, but social cognitive theory posits reciprocal relationships. While empirical evidence supports the causal nature of these predictors, future research might employ a longitudinal assessment and analytic methods associated with casual modeling. Finally, the social cognitive variables assessed in this research study do not represent an exhaustive list of factors influencing overeating behavior. Examining additional variables such as outcome expectancies, perceptions of personal norms for appropriate social behavior, personal responsibility regarding one's own behavior may provide additional insight into the cognitive processes underlying risk behavior.

Alternative Hierarchical Regression of Adolescents' Overeating on Advertising, Parental Influence, Peer Influence, and Self-Efficacy

| Regression Steps | $\Delta R^2$ |
|---|---|
| | Overeating |
| Step 1 | |
| Demographic control variables only | .07[a] |

# Hard-Core Members' of Consumption-Oriented Subcultures Enactment of Identity: The Sacred Consumption of Two Subcultures

Tandy D. Chalmers, University of Arizona, Tucson, USA
Damien Arthur, University of Adelaide, Australia

## ABSTRACT

This study investigates how hard-core members of two non-brand focused consumption-oriented subcultures enact their identities. The authors analyzed data collected from prolonged investigations of the North American organized distance running subculture and the Australian Hip Hop culture. Results suggest hard-core members enact their subcultural identities through reverence to sacred objects, times, people, and places. In addition, drawing upon the properties of sacredness outlined by Belk et al (1989), hard-core members experience a sacred-like lifestyle through objectification, commitment, sacrifice, mystery, and ecstasy and flow. These findings imply that sacred subcultural experiences can be enacted in domains traditionally conceptualized as profane.

"I have run on average 39 out of 40 days for 20 years solid. So at one level it fits into my lifestyle, but I absolutely have to do it now. It's ingrained in my lifestyle so now, it's my outlook. It still is a bigger chunk of my life than it ought to be because it is a totalizing kind of pursuit, because it is about pursuing absolute limits, and that always involves a very significant emotional and mental and physical commitment. For the vast majority of my life it has been at least the number one or two priority in my life." [Bryan, male runner aged 42]

"I'd spend every weekend passionately driving with friends or catching trains to get every single photo of graffiti I possibly could. Ended up with six/seven thousand photos of graffiti. That was from Australia, and now I've got thousands from traveling the world a couple of times. And I've continued to do that." [Simon, male graffiti artist aged 25]

Leisure and non-work activities are important and at times obsessive elements of consumers' lives, with several researchers espousing the benefits of exploring these kinds of consumption domains (e.g. Holbrook and Hirschman 1982; Kozinets et al. 2004). One interesting facet of this type of consumption is leisure activities taking on extreme levels of importance for an individual and becoming the dominant aspect of the individual's lifestyle and social identity (Borgmann 2000, 2003; Donnelly 1981). This is the case for the runner and graffiti artist in the opening narrative. The collectives that form around these kinds of focal activities are referred to as consumption-oriented subcultures and those individuals for whom the activity is the dominant aspect of their lifestyle are referred to as hard-core members of the subculture. Extant research has documented, in a variety of contexts and academic domains, the high levels of commitment exhibited by hard-core members of a subculture. The purpose of this study is to gain a deeper understanding of the nature of these commitments. Through a detailed analysis of two consumption-oriented subcultures, we explore the behaviors of hard-core subculture members to uncover the theoretical character of their identity enactments.

## LITERATURE REVIEW

Understanding the behaviors of hard-core consumption-oriented subculture members requires understanding the answers to three key questions: (1) what are consumption-oriented subcultures and how are they understood in consumer research? (2) what is the link between these collectives and the individuals that comprise them? and (3) how are hard-core members characterized and how do they differ from others in the subculture? To address these questions, the following literature review offers a parsimonious description of consumption-oriented subcultures and several key characteristics of these groups. First, we present an overview of how consumption-oriented subcultures are examined in consumer research. Building upon this foundation, we highlight the link between membership in a consumption-oriented subculture and individual identity. A discussion of the unique characteristics of hard-core members of consumption-oriented subcultures follows this.

### Consumption-Oriented Subcultures:

Schouten and McAlexander (1995) introduced subcultures of consumption to consumer research. They define these groups as "a distinctive subgroup of society that self-selects on the basis of a shared commitment to a particular product class, brand, or consumption activity" (p. 43). They state that these groups are characterized by "an identifiable, hierarchical social structure; a unique ethos, or set of shared beliefs and values; and unique jargons, rituals, and modes of symbolic expression" (p. 43). Subcultures of consumption are conceptually similar to brand communities which Muniz and O'Guinn (2001) define as specialized, non-geographically bound communities based on a structured set of social relationships among admirers of a brand. Together, these collectives are referred to as consumption-oriented subcultures (or cultures). In this study, we focus on non-brand consumption-oriented subcultures.

Much research on consumption-oriented subcultures and the behaviors of its member has adopted a case study approach in which different theoretical aspects of these groups are highlighted through a detailed analysis of a particular consumption-oriented subculture. For example, Celsi, Rose, and Leigh (1993) examine the role of risk in the sky-diving subculture, Kozinets examines how a subculture forms around a television show to experience a fictitious utopian reality (Kozinets 1997, 2002), Kates (2004) examines the legitimization of brands within these communities, while Quester, Beverland, and Farrelly (2006) examine the ways in which commitment to a subculture is enacted by extreme sports participants.

Each of these studies offers a unique theoretical contribution relating to consumption-oriented subcultures as well as converging on several important key characteristics about these groups. Two of these characteristics are that these collectives are comprised of individuals with differing levels of commitment to the focal activity (e.g. Fox 1987) with the activity dominating the lifestyle of those members who are considered hard-core members of the subculture (e.g. Donnelly 1981) and that engagement with the focal activity involves the enactment of specific consumption practices and behaviors unique to each subculture (Schouten and McAlexander 1995). This kind of identity salience and its link to behavioral enactments are discussed next.

### Identity and Consumption-Oriented Subculture Membership:

Research on consumption-oriented subcultures demonstrates that consumption activities can become extremely identity salient for core members of the subculture (e.g. Celsi et al. 1993; Donnelly

and Young 1988; e.g. Schouten and McAlexander 1995). Turner and Oakes (1986) note as individuals become more embedded in a collective, their perception of self changes from that of an individual person to being an exemplar of the group. This occurs as an individual increases their level of identification with the group though increased involvement, knowledge, possessions related to the identity, esteem related to the identity, and social connections related to the identity (Donnelly and Young 1988; Kleine, Kleine, and Kernan 1993)

As discussed in the previous section, consumption-oriented subcultures are comprised of individuals who vary in their level of identification with the collective, with some members being very closely tied to the group (e.g. hard-core members) and other being only peripherally related to the group (e.g. soft-core or peripheral members) (Fox 1987; Kates 2002; Quester et al. 2006). This intracultural variation results in several important differences amongst subculture members and sub-groups within the subculture. These differences stem from differences in the relationship between the subculture and each member's lifestyle (Donnelly 1981). Specifically, the differences at each level are a function of the amount of information possessed by members, the amount of commitment expressed by members of the subculture, and the degree to which the subculture is a dominant part of the member's lifestyle and constitutes a major component of their identity (Clarke 1974; Donnelly 1981; Fox 1987). Thus, for hard-core members of a subculture, the subcultural activity is *the* dominant aspect of their lifestyle, whereas, for peripheral members of the subculture, the subcultural activity is only a minor part of their lifestyle. Outlined next are the characteristics of hard-core members.

**Hard-Core Members and their Identity Enactments:**

Hard-core members of a consumption-oriented subculture exhibit a high level of devotion to the focal activity, with the focal activity being the dominant aspect of their lifestyle (Donnelly and Young 1988; Fox 1987; Schouten and McAlexander 1995). Consumer researchers have outlined several characteristics of hard-core subculture members. These members tend to know more about the 'backstage' activities and the history of the subculture (Quester et al. 2006), they generally know more about the activity (Thornton 1995), and they are better able to reconcile contradictions within the subculture through the utilization of their broader knowledge base (Donnelly and Young 1988). Hard-core members tend to be more interested in the functionality of objects associated with the activity while peripheral members focus more on the image that objects communicate to others (Donnelly and Young 1988; Quester et al. 2006). Also, while all members of a subculture tend to share the same core values, hard-core and peripheral members tend to be drawn to different elements of those core values and also enact those values differently (Quester et al. 2006). Finally, hard-core members of a subculture often serve as opinion leaders within a subculture and are actively involved with shaping the ethos and behaviors of the collective (Donnelly 1981).

In summary, extant literature suggests hard-core member's commitment to a consumption-oriented community is characterized by an extreme commitment to the lifestyle, large amounts of specialized knowledge, a strong link between the activity and self-identity, and that they differ from others within the subculture. However, while we are aware of the characteristics of hard-core members, very little research interprets why the consumption pattern of the focal activity dominating lifestyle exists and persists. While we have some knowledge of how an individual progresses from a neophyte member of a community (Donnelly and Young 1988), we know little about why the extreme involvement of hard-core members persists over time and how this involvement is

experienced. In addition, our knowledge of the nature of identity enactments amongst hard-core members through group membership and consumption practices is scant.

To address these questions, we conducted two ethnographically oriented studies analyzing the behaviors, and the meanings associated with these behaviors, of hard-core subculture members to explore why their characteristic traits exist and how their identities are enacted through consumption. Such research objectives were deemed imperative given the potential contributions the findings would make to the subculture literature, examining the nature of the hard-core member's experience (i.e. developing an understanding of their passion, commitment, and what keeps them coming back to the subculture). An investigation solely focusing on hard-core members was deemed appropriate as these participants act as opinion leaders within subcultural groups, actively shaping the ethos and behaviors of other members (Donnelly 1981).

## METHODOLOGY

To explore the lifestyles of hard-core subculture members, we conducted analyses of two non-brand based consumption-oriented subcultures: the North American organized distance running subculture and the Australian Hip Hop subculture. These subcultures were selected for this study as both subcultures are firmly rooted in consumption objects and experiences. Furthermore, they have both been shown to be excellent sites for gaining insights about hard-core members' behaviors (Arthur 2006; Chalmers 2006). The inclusion of multiple case analyses allowed the authors to compare and contrast findings across subcultures that differ in both geography and focal activity.

We adopted an existential-phenomenological approach to understand how involvement with these particular subcultures shapes the lives of hard-core members (Thompson et al. 1989). This study relied on two principle methods: prolonged participant observation and in-depth interviews (McCracken 1989). The first author collected and analyzed data on the North American organized distance running subculture, while the second author collected and analyzed ethnographic data on the Australian Hip Hop culture. Both researchers spent a considerable amount of time in the field, 3 and 4 years respectively. This extended presence and participation in the field allowed the researchers to 'learn the language' of those under investigation, to experience life as one of the subjects (Elliot and Jankel-Elliot 2003), and to gain access to, and to understand life through the eyes of, the hard-core subculture members.

During the research process, both researchers kept field notes of their observations and informal conversations, which were then written up as soon as possible after the event. In addition, in-depth interviews with 21 hard-core members of the North American organized distance running subculture (14 males and 7 females) in both Canada and the United States and 20 hard-core members of the Australian Hip Hop subculture (18 males and 2 females) were conducted (McCracken 1989). As the researchers were subcultural participants a good rapport with the interviewees was established which helps to ensure the quality of the information (Elliot and Jankel-Elliot 2003). Purposive sampling was used throughout the research process to identify hard-core members of the subcultures.

The transcribed interviews and field notes were first coded using a free coding technique and then using QSR NVivo/N6 and standard data analysis and interpretation procedures (Glaser and Strauss 1967; Thompson 1997). Important themes and tensions were uncovered through across informant, within informant, across subculture, and within subculture analyses. The findings presented below represent a small subset of the findings from this study and focus almost exclusively on how hard-core members of the subcul-

tures perceive their experiences. As researchers, our focus is on understanding these perceptions through the eyes of informants to better understand their lifestyles.

## FINDINGS

Emergent from the data is evidence of what Belk, Wallendorf, and Sherry (1989) describe as 'sacred consumption' within the respective subcultures. Interestingly, this applied to both objects of consumption and the entire subcultural lifestyle. Hence, the manner in which hard-core members enacted their identities was seen as a rich tapestry of a scared lifestyle through which objects accorded sacred status were woven. While the subcultures were not perceived as actual religions, many aspects of religion, such as passion, meaning, and identity where observed and expressed through sacred subcultural consumption (as with the Apple Newton brand community (Muniz and Schau 2005)) and through the enactment of a subcultural identity. The authors interpreted the deep passion displayed by the participants and the extreme levels of affective involvement expressed for the consumption activities as examples of sacred attachment. For hard-core members, objects, times, people, and places held sacred status within the communities, predominantly because they were perceived as being quintessential exemplars of the subcultural ethos. Further, the holistic subcultural lifestyle exhibited five properties of the sacred (as outlined by Belk et al 1989): objectification, commitment, sacrifice, mystery, and ecstasy and flow. The presence of these sacred-esque experiences form the foundation of the appeal of the subcultural lifestyle, suggesting that the dominating subcultural activity over lifestyle is maintained because it is experienced as a sacred lifestyle.

### Theme 1: Sacred Objects, Times, People, and Places

The first theme that emerged in the enactment of hard-core members' identity through consumption was the admiration and reverence of objects, times, people, and places that take on sacred like status within the community. Findings suggest that the primary reason these objects, times, people, and places take on this status is because they are viewed as being quintessential exemplars of the subculture (see Belk et al 1989 for a discussion of quintessence). Consider, for example, the iconic status of the turntables within Hip Hop culture. For hard-core members of the subculture the Technics brand, and 1200 MK2 model, of turntables are considered to be unequivocally right (and hence the company has not significantly changed the design since they were first introduced in 1978). As these objects are treated with such reverence and awe, it is considered strictly taboo for an individual (especially a soft-core or non-member of the culture) to touch another members' turntables without permission: the sacredness of the object is intricately tied to individual ownership and is threatened by contamination by non-members.

In addition to turntables, our results found several examples of objects accorded sacred like status in both subcultures. Shoes were one object that was considered sacred in both subcultures, but in different ways. Within the distance running subculture, quintessence of running shoes is defined by their functional utility (allowing runners to engage in the activity without injury) and, hence, sacred status for each shoe is only temporary as new technology replaces the old, however running shoes as a product category remain sacred in general. Shoes in the Hip Hop culture, on the other hand, exhibit quintessence of certain brands of shoes, such as the Nike Air Force 1, and the Adidas Superstar. These were defined by their symbolic qualities, and hence the sacred was deemed more permanent. As such, our findings suggest that sacred products that are consumed for their symbolic qualities have more enduring sacred status than sacred products that are consumed for their functional utility. The implications for this interpretation are significant for those brands who wish to be loyally consumed within a subcultural arena.

Interestingly, the recent trend of sneaker manufacturers to reissue classic sneakers iconic to the Hip Hop subculture has made it easy for non-members and soft-core members to consume these shoes. This has had the effect of profaning the sacred through commercialization. As such, in order for the sneakers to retain their subcultural values and representations it is necessary for hard-core members to distinguish between the original shoes and the inauthentic and profane reissues:

> Interviewer: "If I was wearing Air Force 1s, would you make an association with that?"
> Informant: "It depends on whether it's a new school one or a classic, if you're wearing a classic then you're probably a head [slang for hard-core]."

In addition to objects, hard-core members also enacted their identities through the reverence of times that were significant to subcultural history (such as the old-school Hip Hop era, or the 1970's US running era), and times in which they had experienced a sacred experience. In some cases, objects associated with these eras take on sacred properties and are placed on display by hard-core members. These objects include such things as ticket stubs, event posters, race shirts, and race numbers.

In addition, hard-core members of both subcultures also perceived some individuals as sacred-like. The Australian Hip Hop culture's hard-core members considered the founding fathers of the Hip Hop culture, such as Kool Herc, Africa Bambatta and Grand Master Flash, and groups of individuals such as the Rock Steady Crew sacred. While within the distance running subculture, a core icon within the community that takes on sacred status is Steve Prefontaine (an American distance runner in the 1970's). Prefontaine is considered to be the embodiment of the distance running mentality. Furthermore, he represents both a time and a place that are sacred to distance running. Consider these quotes:

> "The whole [Prefontaine]-image…it shows the spirit of running and competitive running. It brings you back to when we were good at running in the United States." [Brayden, male runner aged 21] ; "Oregon [the home of Prefontaine] will always be totally synonymous with long distance running." [Daniel, male runner aged 41]

As illustrated in the above quote, places can also take on sacred status for subculture members, such as Oregon for North American distance runners and New York, the birthplace of Hip Hop culture, for hard-core members of the Hip Hop subculture. In fact, some informants even referred to New York as a mecca-like location: a pilgrimage destination capable of inspiring one with an evangelical zest:

> "I ended up traveling around a bit and found my way to New York…I tried to get some work in design and advertising and stuff, which I eventually did, but I spent most of my time and money just tracking down Hip Hop tours, events and stores and doing all that sort of thing, it turned into a bit of a pilgrimage. That was probably the point that really inspired me and the thing that got me fired up (to create a Hip Hop magazine)." [male Hip Hop member aged 26]

The sacred objects, times, people, and places within subcultures serve as foundational pieces upon which hard-core subculture

members build their identities. The enactment of these identities within the confines of ordinary life take on a unique sacredness transcending that imbued on sacred objects. The sacredness of the lifestyle is discussed next.

**Theme 2: Sacred Lifestyle**

Through our analysis of both subcultures, the theme of sacredness surrounding everything about the lifestyle of hard-core members emerged. What is most interesting about this theme is that it does not only relate to specific events, products, times or other idiographic instances. This theme of sacredness permeates the lifestyle at a marco level and describes the nature of the interplay between hard-core subculture members and their enactments of subcultural identities: even mundane aspects of everyday routine life become experienced as if they are sacred. The manner in which informants described their lives and experiences resonate with themes of sacredness. Drawing upon the properties of sacredness outlined by Belk et al (1989), we find that five properties of sacredness are the best descriptors of the sacred lifestyle for hard-core members of both the Hip Hop and running subcultures. The five proprieties of interest, each described below in relation to our empirical findings, are objectification, commitment, sacrifice, mystery, and ecstasy and flow.

The first property of sacredness that we consider is objectification. This refers to the manner in which mundane elements of life are combined to form a transcendental frame of reference (Belk et al. 1989). From a subcultural perspective, this manifests itself as the focal activity being the dominant framework through which hard-core members experience their lives:

> "If you do run, you have the discipline and the joy of it, you realize how it can make your life better, how it can benefit you and impact you and make other things in your life more clear, more purposeful and all-around better, healthier, happier, more determined. For me, it is the cornerstone that made my life so much more whole." [Aidan, male runner aged 25]

What this quote and those like it indicate is that involvement with these subcultures is not just a part of hard-core members' lifestyles, but the organizing framework around which their lifestyles are enacted. The lifestyle is their transcendental frame of reference.

The second property of sacredness that emerged in both subcultures was commitment. From a sacred perspective, commitment refers to the emotional attachment that individuals feel towards the sacred. In the case of subcultures, this refers to the emotional commitment hard-core members feel towards their subcultural identities and the corresponding lifestyle. This is exemplified in the following statements from Dylan, a former elite runner who experienced a career ending injury:

> "I was a runner. That's who I was. It controlled me…I don't really know when exactly it happened but running just became the focus and every day was geared around the run. Nothing can replace it….[I miss] how alive it makes you feel. That's what I miss about it. It makes you feel so alive to be able to just compete at that high level and ask your body for everything it can give. Running allows you to be really passionate about something. When I talk about passion it's about something that you want to do all the time if you had the chance." [Dylan, male runner aged 23]

Hard-core subculture members are not only committed to the activity in the traditional sense of the word (i.e. continuous engagement), they are also committed to it at an emotional level: a property

of sacredness. This emotional engagement with the focal activity elevates the experience of commitment from the ordinary, as a person might have for their job, to the extraordinary and sacred.

In conjunction with the emotional commitment to the lifestyle, sacrifice also plays an important role in the lifestyle of subculture members. From a theoretical perspective, individuals often engage in sacrificial acts to prepare themselves for contact with the sacred (Belk et al. 1989). Within this context, sacrifice involves forgoing some aspects of life or enduring significant hardship to enact the consumption identity. Hence, while this interpretation of sacrifice is somewhat different to that described by Belk et al. (1989) in that the sacrifice is not to prepare oneself for contact with the sacred, but so that the individual can enact the sacred lifestyle, this theme was evident in both subcultures.

For example, within the Australian Hip Hop culture this sacrifice often involved the extreme commitment of time to their chosen element of Hip Hop (MCing, Djing, Graffiti art, and Breakdancing) such that the members were often unemployed or working part-time positions. In addition, graffiti artists also risked being fined and possible imprisonment, and hence were willing to sacrifice their freedom to enact their subcultural identity. For runners, this sacrifice often manifests itself as an extreme commitment of time, the endurance of physical pain, and the expenditure of emotional energy required to train at highly competitive levels. Thus, as illustrated by the following quote from hard-core runner Tyler, being a hard-core member of a subculture, and reaping the benefits of engaging in a sacred lifestyle, involves sacrifice. This sacrifice, however, is viewed as a necessity of subcultural involvement.

> "It's a lot of work and a lot of time and a bit of pain that you have to run through. You end up running twice a day and when you have other things to do in your life it makes it pretty hard. A lot of sacrifice." [Tyler, male runner aged 31]

The next property of sacredness indicative of the subcultural lifestyle is mystery. Mystery refers to the inability of the sacred to be understood cognitively (Belk et al. 1989). Hard-core subculture members express these sentiments when describing their devotion to the focal activity and lifestyle. Frequently, these members cannot understand their own attachment to the lifestyle and relate it metaphorically as an almost addictive physiological need. Mass MC describes his experiences:

> "I'll go to a classy restaurant with my girlfriend or something and I'll go to the toilet and do [some quick graffiti] in there and then come out, adjust the tie and sit down again. No matter what you do Hip Hop lives in your soul…[It's] just a disease dude. It's like a lot of people are into it because it's trendy. I'm into it because it's a disease, That's all I know: I know my music and I know that hip hop is what I was born to do. I was put here to love it and there's nothing I love more than hip hop."

Brayden expresses similar sentiments in reference to running:

> "The level of commitment for some reason with runners is much higher than other sports. I don't really know why…There's some kind of physical or chemical addiction to running. Obviously this is unproven, but I think that makes sense. I've got to do it. I don't know where the commitment comes from. It's just some kind of inner motivation that you cannot miss a day and you have to do it." [Brayden, male runner aged 21]

The experiences of hard-core subculture members are shrouded in a sense of mystery that allows them to experience their lifestyles as sacred. This mystery seems to add an element of reverence to the activity as their choice to become a member of the subculture is transferred into a lasting involvement beyond that of their rationality.

The property of mystery is closely related to the next property of sacredness evident in our data: ecstasy and flow. This refers to the ability of the sacred to produce ecstatic experiences where a person stands outside oneself. Further, these experiences are often momentary (Belk et al. 1989). The notion of flow refers to an experience where an individual becomes completely focused on an activity and attains a sense of mastery over self and the environment (Csikszentmihalyi 1975). One member of the Hip Hop culture describes his first experience writing rhymes:

"I'd say [I was] eight and it was just totally unexplained. I just felt heaps possessed while I was doing it and afterwards I was heaps relaxed like it was a full release." [Keith, male Hip Hop member aged 23]

Paige, a distance runner, describes a similar experience while running.

"I enjoy the actual feeling of it. Sometimes when I'm on a run I can hear the crunching of the rocks underneath my feet, I look up and I see the beautiful sunset, I see the clouds going over, I think it gets me in touch with my own world. I've had days when I've gone out and just felt like I was floating in water. There were times when I just felt like at peace with myself and my environment." [Paige, female runner aged 32]

In addition to discussing these kinds of ecstasy experiences, the narratives of both hard-core members of the distance running subculture and the Hip Hop subculture contain tales of flow-like self-mastery and self-expression respectively:

"When you're running you get to decide exactly how much pain you're under at any given moment and there's something really comforting about that. Also knowing that you can push yourself more than you thought you could. That's a little accomplishment: just pushing past the pain that you have because you had a point in time where it was actually impossible for you to run that fast, and then you somehow raise that bar and push through that wall." [Megan, female runner aged 24]

"I guess I was more effected by the expression–the boldness of the expression–you know, the immediacy of it." [Jimmy, Hip Hop male aged 18]

Hence, the final property of sacredness indicative of the subcultural lifestyle is ecstasy and flow characterizes the 'outcomes' of subcultural involvement: experiences that move a person beyond themselves, self-expression, and self-mastery.

In summary, the preceding discussion illustrates how the subcultural lifestyle of hard-core subculture members exhibits elements of the sacred. Objectification, commitment, sacrifice, mystery, and ecstasy and flow characterize the lifestyles. It is important to note that while these five properties of sacred were the most prominent in our dataset, other properties of sacred also characterize the lifestyle but are beyond the scope of this article. For example, hierophany was present in the Hip Hop subculture, (for example many graffiti artists view a blank wall, and MCs view an instrumental beat, as something extraordinary) yet was not present in the running subculture.

## DISCUSSION

The findings from this study make several important contributions to consumer research. First, the findings enrich our knowledge of consumption-oriented subcultures and the manner in which hard-core members of these subcultures enact their identities. This study builds upon previous research that describes the characteristics of hard-core subculture members by exploring the manner in which hard-core members perceive their subcultural experiences. We find that the experiences of hard-core members reveal an entire lifestyle exhibiting elements of the sacred. In addition, hard-core members enact and affirm their consumption through the sacred consumption of objects, times, people, and places. Given this continuously reinforced everyday experience of sacredness, it is not surprising that hard-core members of subcultures exhibit high levels of devotion to their subcultural identities and lifestyles.

A second contribution of this study is that it expands our understanding of the domains in which sacred experiences can occur. Traditionally, sacred experiences and objects were conceptualized as being separate from ordinary life, which is thought of as profane. We expand this conceptualization by demonstrating how the sacred is experienced within everyday life. For hard-core subculture members multiple aspects of their ordinary life express some property of the sacred. These elements combine to form an overarching and cohesive sacred lifestyle that exists within the domain of the ordinary. This persistent existence of the sacred within the ordinary presents an interesting expansion on conceptualizations of sacredness.

A third contribution of this study relates to the two different subcultures used as the contextual domains for our research. Given the use of two subcultures that are vastly different in terms of both the nature of the activity as well as their geographic location, it is interesting that we find such a high level of theoretical convergence in the nature of the subcultural consumption enactments of hard-core members. This demonstrates that, despite the superficial differences in subcultures, the members of these groups experience their lifestyles in very similar ways. While it is impossible for us to generalize our findings to all subcultures, this research provides some empirical support for the notion that commitment to subculture identities is not necessarily a function of the utility of consumption practices but rather the result of interplay between an individual's identity and their enactment of that identity. Sacred consumption practices serve as a conduit through which the lifestyle associated with an identity is enacted.

Despite these contributions, there are two major limitations of this study worth noting. First, this study focuses exclusively on hard-core members of a subculture. Future research should examine the enactment of identity with other kinds of subculture members to better our understandings of subcultural consumption practices as a whole. Second, this study focuses on the similarities between the organized distance running subculture and the Hip Hop subculture: the differences between these subcultures should also be explored.

In conclusion, the purpose of this study was to explore the nature of hard-core members of consumption-oriented subcultures identity enactment. We conducted analyses of both the North American organized distance running subculture and the Australian Hip Hop subculture. Our findings show that, in addition to the subculture having several sacred objects, the entire subcultural lifestyle exhibits elements of the sacred.

# Musical Effects: Glocal Identities and Consumer Activism

E. Taçlı Yazıcıoglu
A. Fuat Fırat, University of Texas—Pan American, USA

## ABSTRACT

This study provides further insights into the processes that occur in accomplishing identity projects in modern consumer culture. Especially illustrated is the role of cultural elements, specifically represented by (rock) music. In our four-year long fieldwork, we observe that musical codes are instrumental in shaping consumer identities. The relations between music and consumer activism are demonstrated. Transformations in conventional modern identities are found. The preliminary findings reveal that music, specifically rock music, enriches the modes of being in the world. Consumers enjoy experiencing and contesting all modes of being during their consumption experiences in the glocal rock festivals.

## INTRODUCTION

How does music taste affect social experience and cultural changes? How do collective actions such as consumer activism relate to music taste? How is a global commodity such as rock music juxtaposed with consumer activism against one of the leading global brands, that is Coca Cola? These were some of the questions as we began this study.

Cultural effects in social movements can be observed through songs, art, literature, ritualized practices, and retain their presence in collective memory even in the absence of particular political platforms. However, cultural work is often subsumed in more immediate political tasks and is seldom explicitly regarded. In many social movements, activists try to distinguish the political from the cultural. Partly as a result of this separation, social movements are usually discussed and interpreted in political terms.

This study illustrates that the experience of activism is closely related with the issues of identity. In fact, consumer identity projects are widely studied and it is known that the marketplace has become the preeminent source of mythic and symbolic resources through which people construct narratives of identity (Arnould and Thompson 2005). The role of aesthetics in the ideological mapping of consumer identity projects via brand meanings and fashion styles (Thompson and Haytko 1997; Murray 2002; Sandıkcı and Ger 2005) and communities (Muñiz and O'Guinn 2001) have also been studied. However, the literature still has gaps to answer how significant the cultural (i.e., musical) codes are in shaping identity or identities in such contexts.

This paper attempts to illuminate our research questions concerning how musical codes become instrumental in shaping consumer identities and reports the preliminary findings from a four-year long consumer activism study completed in Turkey.

## THEORETICAL FOUNDATIONS

### Music and Social Movements

Social movements are not mere political activities. They provide spaces for cultural growth and experimentations. For example, musical and other kinds of cultural traditions are made and remade in social movements. After the movement comes to an end, the music remains as a memory and as a way to inspire new activities. In omitting cultural elements, such as music, processes of social movements have generally been attributed either to anonymous universal sources, such as modernization, capitalism, or imperialism, or to charismatic leaders and powerful individuals.

Eyerman and Jamison (1998) argue, in opposition to these dominant approaches, that the collective identity formation taking place in social movements is a central catalyst of broader changes in values, ideas, and ways of life, and that social movements are key agents of cultural transformation. The evolution of the music industry with social movements in Sweden since the 1970s, the role of counterculture in the case of East Germany that accelerated the collapse of the Berlin Wall can be mentioned as examples (Wicke 1995; Garofalo 1992; Eyerman 2002).

In the 1960s, Herbert Marcuse emphasized the aesthetic dimension of movements of the time by arguing that it was primarily through art and music that social movements were remembered (Eyerman and Jamison 1998). Touraine (1981), and Melucci (1989, 1996), also stress the significance of cultural aspects in social movements. As Touraine (1988) notes, the central cultural issue underlies the formation of the self(-definition) or identity. For Melucci (1996), social movements are symbolic actions which enable people to create new forms of collective identity since the results of movements can be seen as codes or signs to challenge the dominant political order. Thus, Melucci reduced the abstraction of social movements into fields, arenas, forms, logics, and symbols, to illustrate that a social movement constitutes a semiotic culture of codes and symbolic meanings. In this culture, actors have expectations of proportionate rewards with their (material and immaterial) investments as they constantly make comparisons to realize their identities. Melucci (1996) argued that in order for the conflictual response to an expectations-rewards shortfall to be chosen from among the many alternative lines of action, at least three conditions must obtain: First, there must be a temporal continuity and consistency of the activist; secondly, there must be a tangible adversary whose action affects the activist's reference field; lastly, the activist must feel a sense of ownership over the object.

Combining culture and politics, social movements serve to reconstitute both, providing a broader political and historical context or cultural expression (Eyerman and Jamison 1998). Cultural traditions are mobilized and reformulated in social movements, and this mobilization and reconstruction of tradition become central to what social movements are as well as to what they signify for social and cultural change. Songs can invoke emotions and act as a vehicle for the diffusion of ideas of a movement into the broader culture. The evolution of the song, "We Shall Overcome," is a good example. It shows how traditions can link some social movements by providing a link between ideas and images, and generations of activists. First, in the Nineteenth Century, there was the gospel, "I'll Be All Right," then, in 1901, a similar song appeared, "I'll Overcome Some Day," which then became "We Will Overcome," the plural pronoun replacing the singular (reflecting a shift in the locus of redemption, from sacred to secular, or at least from the individual to the group). Later, a more grammatically correct form was introduced, probably by Pete Seeger: "We Shall Overcome." This song no longer belongs only to its birthplace, but it has become an anthem of social movements and sung in many local languages, including Turkish.

Many social movements bring earlier movements back to life through the memory of songs that were sung and the images that were elicited, often by giving them new meaning (Eyerman and Jamison 1998). The worldview assumptions, the underlying beliefs, are articulated as much through art and music as through more

formalized written texts. In particular, singing songs, as bearers of traditions, are powerful weapons in the pursuit of social movements.

### (Rock) Music and Consumer Identity Projects

Holbrook (1986: 615-6) introspectively recounts how he tried to remain hip with the music he listened to: "Cherishing my adolescent musical iconoclasm [Elvis Presley] like a rare diamond, I searched for a way to remain hip…[A]t Harvard College...[m]y deus ex machina was the Beatles…[but] everybody loved the Beatles."

Music is a practice that is capable of prefiguring changes in the political economy and in social developments to the extent that the code of music simulates the accepted rules of society. A "herald, for change is inscribed in noise faster than it transforms society" (Attali 1985: 5). Boundaries of musical-aesthetic discourses in representing or appropriating other music or culture, are important as they can facilitate articulation of socio-cultural identities (Grossberg 1991). Music engenders communities or scenes, and allows a play with, a performance of, and an imaginary exploration of identities through the aesthetic pleasures received (Stokes 2000). Music can both construct new identities and reflect existing ones. In other words, music has a formative role in socio-cultural identities. In fact, socio-cultural identities are not simply constructed in music as there are "prior identities that come to be embodied dynamically in musical cultures, which then also form the reproduction of those identities–no passive process of reflection" (Hesmondhalgh and Born 2000: 32).

The quest is no longer for an identity but identities due to an affluent image culture (Kellner 1992). As Kellner (1992: 144) claims, "the subject has disintegrated into a flux of euphoric intensities, fragmented and disconnected, and the decentered postmodern self no longer experiences anxiety and no longer possesses depth, substantiality and coherence that was the ideal and occasional achievement of the modern self." Fırat, Venkatesh, and Dholakia (1995) regard this as a search to (re)present marketable self-images via interacting with other objects to produce one's selves. Hence, postmodern consumption is no longer an end in itself, rather a productive process. Within the context of dance or rave culture Goulding, Shankar, and Elliot (2002) illustrate Fırat and Venkatesh's (1995) point that "there is no single project, or no one lifestyle, no sense of being to which the individual needs to commit" in contemporary culture. Subsequently, they interpret the juxtaposition of contradictory emotions and cognitions regarding perspectives, commitment, and ideas during identity formation in such rave communities as an indication of the emancipatory condition of postmodern fragmentation.

Musical effects are always replaced by their discursive and social contexts. Music makes possible identities available, constructs audiences, rather than represent pre-existing social facts (Frith 1981; Middleton 2001). Thus, as a cultural object, music constitutes a complex constellation of mediations (Born 1993) for identity projects. Particularly, rock music, as a successfully differentiated commodity, is positioned as a political genre and amalgamates its own social structure all over the world, with shared values (e.g., sense of freedom, oppositionality, rebellion), beliefs and myths. History of rock music reveals that by linking music, showmanship, lighting, poetry, politics and image, a complex cultural context and form have been created. In rock music, the context becomes a component of the lyrics, a component of a cultural text formed from cultural symbols of images, technology, fashion, leisure objects, and everyday materials of consumer society. Rock music imposes conditions and has cultural impositions

which allow it to become a symptom of fundamental changes in societies (Wicke 1995). The ideology of rock is not just a matter of notes and words. Rock fans know what they mean by *rock* empirically, but the descriptive criteria in use are diverse and frequently inconsistent. Rock does not just symbolize musical means, but also refers to an audience, to a form of commercial production, to a liberated sexual expression, to an artistic ideology, i.e., rock has the creative and revolutionary integrity that pop music lacks (Frith 1981). Hence, as it provides a convenient ideological medium for the consumer identity projects and consumer activism, it is unsurprising to find rock in political movements.

### Rock for Peace: Consumer Activism at a Rock Festival

Rock music has a long tradition in Turkey (the first rock concert was held in 1957). Rock is called "rock," but consumed in Turkish. Rock concerts or rock bars are a part of daily lives in major cities, the concert or show contexts have been converted into a rock festival format only in the last few years. The festival, a larger event than a concert, indicates the increase in the popularity of rock in Turkey (Yazıcıoglu and Fırat 2008). The first rock festival, *H2000*, was held in 2000, but a flurry of rock festivals has started with *Rock'n Coke* and its rival festival, *Rock for Peace* that both aimed to own the legacy of rock by reminding the legendary Woodstock '69 (Yazıcıoglu and Fırat 2007).

The *Rock'n Coke* Festival was first held in 2003 as part of *Coca Cola*'s Soundwave Project in Europe, including France, Denmark, etc. Not everybody was fond of the idea of this festival. First, "real rockers" in the public, including several columnists, criticized the exploitation of the capitalist *Coke* with the "anti-capitalist" rock. Leftists and Islamists described it as a cover-up operation disguised to make people forget that the *Coca Cola* Company was one of the major agents of globalization and cultural imperialism. Featuring world-famous groups such as The Cure as the headliner, food and beverage facilities, a theme park in addition to shopping, several multinational company (e.g., P&G featuring its shampoo) stands, an intense bombardment of TV commercials, as well as outdoor ads have all contributed to the popularity of the festival. Each year, more than 30,000 people attended the festival for two days (some of them stayed overnight in camps paying extra money for the privilege).

*Rock for Peace* Festival was organized on the same weekend to protest Coca Cola in 2003 and 2004 by a group of activists consisting of musicians, students and simply "activists." The festival participants were able to stay overnight in cheaper tents and worse conditions regarding toilets and facilities than at *Rock'n Coke*. However, the more popular *Rock for Peace* has become over the years, both the nature of the protests and the participants have changed. The activists have started to include anti-globalization views more into their rhetoric. By 2005, they announced that *Rock for Peace* was no longer positioned against *Rock'n Coke*, and that the festival would be organized one week earlier. That year the laid-off Coca Cola workers joined the festival by the help of unions. The rituals at night with marches and torches contributed to the activism spirit of the festival. Although the activists eliminated the entrance fee after the second year, due to its increasing popularity *Rock for Peace* started to generate considerable revenues that are handed over to third parties to organize the stage, equipment, and security, with exclusive rights to sell food and beverages in return since 2004. That is, activists only coordinate the artistic features (e.g., stage performances, selections of bands, and speeches), media relations, and participation of other civil rights associations and unions. The 'competition' with Rock'n Coke also took place in regards the music–the headliner was not The Cure, but equally popular local

rock bands. Without any media support and with no advertising budget, in 2006, the number of participants reached around sixty thousand, which was close to *Rock' n Coke*.

In Turkey, activists call themselves "aktivist," not using the corresponding word in Turkish. In 1980, there was a military coup in the country. Following 1983, the introduction of liberal economy, accompanied by accelerated globalization in the world, has changed the social and cultural dynamics in the country. Two of the most important consequences have been the depoliticization of the youth and the change in the social sphere e.g., civil rights associations have started actively operating. The last decade has witnessed the re-birth of activism in human rights, global warming, charities, etc.

## METHOD

Data collection contains several methods to provide insights into the meanings of consumption of music in a context where social activism takes place. These include participant observations at the *Rock for Peace* Festival (2004-2005-2006) and its organizers' meetings before the festival. Photographic records as well as videography, 26 in-depth interviews with activists, musicians, participants and academics, analysis of two-year-long discussions of two e-groups (www.eksisozluk.com–a wikipedia-like online dictionary where the entries are all subjective definitions–and barisarock@yahoogroups.com–the e-group of *Rock for Peace* activists), and conversations with activists constituted the major resources of data. The texts were analyzed using semiotic and narrative textual analyses (Barthes 1973; Patton 2002). A discussion of some of the preliminary findings from this research is as follows.

## OBSERVATIONS AND FINDINGS

The analyses of the data collected reveal several illustrations of identity formation and instrumentalization of music. One is the trial of identity combinations utilizing the contexts of both music and activism.

### Identities of a "Rocker" Activist

We first became acquainted with her at the meeting of activists at a rock bar used for the Wednesday meetings at six pm., during the whole second year of organizing *Rock for Peace*. In her strapless black summer dress, she was not one of the leaders of the activists. She often just listened to the discussions, quietly, drinking beer. Although activists claimed no hierarchy, it was easy to observe who was leading. There were only three unwritten rules: Attendance, follow-up, and bringing a solution instead of criticizing others' opinions and deeds.

Next, we saw her as she was performing on stage in front of hundreds of people as the lead vocal. Her band was one of the initial performers during daytime, the time assigned to less popular groups. Her band played only a few songs that did not excite the crowd, except a small group of people in the audience close to the stage who seemed dedicated to cherish each and every minute of the festival and each performance. She wore a suspended black shirt and jeans. The black accessories at her wrists and ears signified her rocker look.

Later when we spotted her she was in front of the TV cameras. She must have changed her outfit after the performance. Her small arms in a sleeveless black shirt waived to add emotion to her explanations of what the activists wanted to achieve in the festival. They were naturally against injustice not only in their country of origin, but were also fighting against global unfairness and inequality. Did people know how many Africans would not have starved to death if Americans drove SUVs less, or that the Kyoto Act was not

sufficient to protect nature? The usual activist jargon we heard during the interviews became softer and her voice calmed down when the TV reporter asked about her stage performance. She explained how their music differed from other rock bands and what their future goals were. She also emphasized the relations between a rocker identity and politics. Everything was inscribed in their lyrics in which they protested the injustice.

A lead vocal at a rock band, an activist, a member of the collective action; she was not only one of them, she was all of these identities, and maybe more if given a chance.

### Experience of Activism in a Rock Festival: Activentertainment

The whole experience of the festival illustrated the organization of a collective action with the help of rock music. The popular political form of music was used to be the stylized folk songs in Turkey rather than rock. Association of rock with crowds in protest started in the last decade. Previously, capitalism, right wing politics and inequality were protested in the songs. Today, conventional leftist rhetoric seems to be replaced by anti-globalization, anti-war, anti-corporate, and anti-brand expressions in the rock music context.

Activists at *Rock for Peace*, with an average age of 26 (ranging between 17 to 59), typically consisted of people who work part-time. Mostly representing the mid to low social strata, they generally lack a proper college education in a country where it is 'mandatory' to be a college graduate to find a *proper* white-collar job. Being a member of activism means a lot otherwise. It signifies one as a being in society and as a member of a meaningful and important (global) cause: peace. Activists at this festival also believe that they contribute to improving awareness of the unconscious, depoliticized youth in the country. Interestingly, it seems that the youth either become depoliticized or deeply involved in politics at the age of 16. It is clear that, for the politically active, activism and rock music as means for reaching other people connote their presence in the world.

There are a few other contributors to the effort, such as lead guitarist of a rock band from the 1960s. His presence and contacts help to promote the festival to other rock bands. There are also two activists who work as reporters at a leftist newspaper and handle press related issues. Despite their effort, it is obvious that the majority of the press that receives its share from the huge promotion budget of *Rock' n Coke* show no interest in *Rock for Peace*.

I started to be involved with politics seven years ago. I was against the war then as I'm today. I have always been against brands and hierarchy. Then, I learned that *Coca Cola* was going to organize a festival called *Rock' n Coke*. As rockers and peace-lovers, we, 15-20 people, who wanted to create a counter movement, started *Rock for Peace*. (Activist, M, 23)

> I studied law, but couldn't graduate because I got bored. I'm not doing anything to do with law, but I have worked at different jobs. I have always been interested in social causes and participated in several campaigns. At the moment I am the manager of a rock band. (Activist, F, 36)

> We're young, we have so many dreams, we are flared up about even the smallest things, but calmed down with the smallest things as well. Apart from all of these, we are dreaming of the same classless, borderless world where there is no exploitation. If we want to talk about the most basic things here [*Rock for Peace*], we can say that if these people want to unite, [we can] under the dream of an unoccupied society in peace. (Activist, F, 26)

*Researcher*: What is the main issue in this festival if it's not anti-branding?
*Interviewee*: "Increasing awareness" and to establish a platform to express this awareness. To provide a mission! (Activist, F, 36)

Emphasizing the importance of their consistence and continuity (Melucci 1996), activists often emphasized how few of them there were in 2003. These initiators are de facto leaders of the organization although they claim to eliminate hierarchy. In fact, they moderate the organization committee discussions and often lead the task groups (e.g., to organize non-monetary functions at the festival arena, such as the distribution of the stands, working with unions, other civil rights associations and theatre groups, etc.) as the 'more experienced' ones.

She is only 17, she has the same rights as a union's president and nobody is bothered by any other. They have equal rights to speak. Everybody has to convince each other. This is a very good and established mechanism [in the *Rock for Peace* organizing committee]. (Activist, F, 36)

There is no leadership. Those who know each other from political groups came together. There are also people who have devoted themselves to the peace campaign. (Activist, M, 23)

The most apparent distinction emerges during the day of the festival at the backstage. Only those 15-20 people are allowed to be backstage. The researcher was also admitted to backstage in 2006, and able to take some photographs and film.

The privileged 15-20 determined the order of the bands and walked on to the stage a few times to salute the audience with slogans. Despite *de rigueur* serious look on their face, they seemed to have as much fun as the audience both during the concerts and in the camping area.

What we are doing here is activentertainement [activism and entertainment] by the way we admire or identify ourselves. Yes, we are having fun, but also dealing with activism. Because it's a festival, but a different festival, it has an attitude, a political attitude. (Activist, F, 26)

When the night comes, there remains no ideology, only music. They can now sing songs, even love songs. (Academic, F, 35)

Since then, *Mor ve Otesi* [The most popular rock band in the country. In the last decade, despite the illegal music downloads and piracy, each of their albums sold around 300,000 copies–a record in the country's rock music history] is an activist band in the anti-war movement, I mean, you can see them at every activity. I see them by my side on the streets, in the stands, in other campaigns; they are not as unreachable as people think. They are activists like us. (Activist, F, 36)

The organization committee was hoping for, but not expecting a crowd equal to *Rock' n Coke*. Obviously, headliner bands played an important role in the increased popularity of both festivals. Despite the small difference in the number of people attending the two festivals, given *Coca Cola*'s advertising budget, ceteris paribus, this is still a victory for the activists.

## Instrumentalization of Music and Transferability of Identities in the Communities

Identities are constructed to make us have meaning in our worlds–worlds that are self-defined and worlds through collective actions. First, the 'festival', both a product and an experience of the activists, has endeavored to find its own identity through their community (Fırat and Dholakia 1998). At the beginning, *Coca Cola* was just a symbol of what they were against: the multinationals, globalization and inequality. Later they became aware that being a rival to a single global brand was a limiting factor for their goals and ideals. Both the activists and the participants searched for more comprehensive a definition as the festival grew and the festival grounds contained many different events. Starting with the organization of the 2005 festival, the decision was made that the activists no longer wanted *Rock for Peace* to be known as the counter festival to *Rock' n Coke*, but that 'the counter' image should be maintained to show that they did not conform to the 'system'.

It's not only a music festival; with speeches, stands, theatres, it's a culture festival as well. Although it's been positioned against *Rock' n Coke*, an organization which now stands on its own feet. (tuonela, posted on <*eksisozluk*>, August 28, 2005)

Rock for Peace Principles: 1) It has never been "commercial." It has promised not to touch the money that will be "earned", 2) It has resolved everything other than the compulsive items with cooperation spirit, 3) Its only agenda and problematic have been "peace." It worked for the peace culture and peace call to become spread, and part of the international anti-war activism. (moderator, posted on <*barisarock@yahoogroups.com*>, January 2, 2006)

Some activists take things more seriously. Rock is a safe ground for activism and activism makes their lives seem more meaningful; simply being a rocker cannot justify their political being. Above all, rock also has hedonistic associations that contradict with the seriousness of activism. They have the self-tolerance for hedonism, but in a collective action, they do not confess to it openly in order not to risk their rewards. However, they seem to experience this conflict:

Having fun for the sake of having fun is totally a different ideology. (Activist, M, 33)

When I had started to express myself with a socialist identity, I quit associating myself with rock. When you read a couple of socialist books and start seeing yourself as an important person in a big struggle with the system … you can start preferring the shitty voice of Livaneli [a leftist singer] rather than Robert Plant's. (Ex-Rocker/Activist, M, 38)

Those who go to *Rock' n Coke* only listen to music with no message. You cannot say that "war is good," or "nuclear weapons are great." If you cannot utter praise, you don't talk about it in such a place, hence, there is only music, that's all. Perhaps, they also have fun there; but that must be weak fun–without any spirit. (Activist, M, 33)

As the identity of the festival was being shaped by rock music, so were the collective identities that were essential to maintaining their communities:

Just because of the rebellious nature of rock music, all of them feel like protesting their own environs in my opinion. They become a part of this rebellious attitude by listening to rock … At *Rock'n Coke* there is a community that is based on 'difference', everybody does something different to differentiate himself/herself and say "OK. I am now in this system, but as myself, as someone unique." Hence, they do not recognize any norms, their hair is, how do you say, rasta, is it rasta? They put on the trendiest or the weirdest outfit, etc. This is a need to identify themselves as more different than the others. This is like wearing black shirts at *Rock for Peace*, a common attitude… People in *Rock for Peace* distinguish themselves through similarity (Academic, F, 35)

But rock music is noble by birth. It is rebellious and has an attitude. Rock music should not be purchased or sold, not can it be bottled. Rock music is rebellious, rock music is a cry. (Activist, M, 23)

The festival that was initially covered by rock emblem provided both activists and participants a rich medium to shape or link their identities. Search for an identity through rock music or a meaningful self can all be realized at the festival where the unwritten rule is "you will not be held responsible for the things you do during these two days" or "you are free to do anything you want;" a sense of freedom and an "escape." In a country such as Turkey where modern ways of leisure constitute a relatively new lifestyle, a festival and a music genre that is rock may represent different meanings as observed during our analysis and in the in-depth interviews:

It is so obvious that there is an identity you acquire by listening to rock music. You like that identity. I mean, [identity of] being a cool person. You can't exactly define that cool attitude initially, but when at school, and even nobody understands, you feel like building a self-charisma, by saying "I listen to Pink Floyd." (Ex-Rocker/Activist, M, 38)

They try to make use of rock music's manner of protest. They become a part of that protest, by listening to rock. (Academic, F, 35)

Characteristics of the festival, such as its 'sincerity', seem to be a contagious element, which is conveyed from participants to the activists. Their major claim to prove their sincerity is rock music, a genre that only those who are sincere can listen to.

Rock for Peace is the most sincere rock festival. (Participant, M, 21)

It's [*Rock'n Coke*] not even a festival. It's something like an exploitation festival, they both advertise their product and grab young people's money. I mean it's an insincere business. (Activist, M, 23)

The nature of *Rock for Peace* has changed due to its becoming equally popular as *Rock'n Coke*. Although the activists eliminated the entrance fee after the second year, and this exclusion of commerce from the artistic domain symbolizes the protection of amateurism and naiveté for activists, the market logic has slowly become apparent in representations and orientations of the activists due to their increasing power, pointing to tensions between collective and individual identities. Despite this tension, participants at specifically a 'rock music festival'–devoid of the other causes like anti-globalization, ecological concerns–feel that it provides a space for them to express themselves:

I can express myself very comfortably. I can say whatever I like, this is a space for me, a space I can do whatever I want. I can't find freedom outside, but I find it at *Rock for Peace*. (Activist, M, 24)

It's not a youth festival, it's surely a rock festival. It emphasizes rock. It's something to do with the roots of rock. It's the sound of opposition, it's in its tradition. (Activist, M, 33)

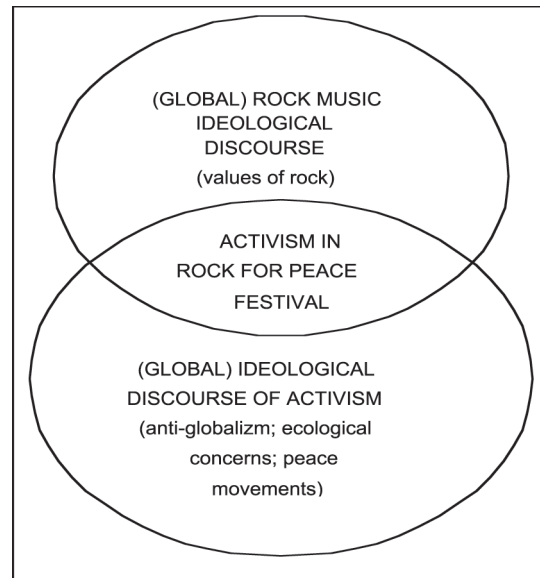
If there were no rock music, there wouldn't be any *Rock for Peace*. There are other festivals in addition to *Rock'n Coke* in other genres, such as jazz, although they are not as popular as rock festivals. There have been such festivals for a hundred years. Why rock music? Because, it was the music of the collective movement of the 60s and 70s. It was born in a mass movement. Hence, it is not surprising to see rock music in such a movement. (Activist, F, 36)

Eventually, the success of *Rock for Peace*, which started as a means to protest against the dominance of the market, has become an end in itself due to its increased popularity and despite activists' excluding themselves from "the business side," the unavoidable income generated from festival facilities. Ironically, market influence has also been reflected in the increase in the number of adversaries (i.e., Coke has not remained as the only adversary), and in the number of supporters. Previously hesitant 'activist'-rock bands strive to perform in this now popular and crowded festival, but unfortunately not all of them are 'eligible', as the activists aim for the best to 'serve' the audience better.

The conflicts are contested openly in a democratic manner, but that is generally not sufficient as "…the actor expects certain rewards because s/he recognizes, and attributes value to her/his own investments (the effects of the action) and looks to others for them to lend the same recognition" (Melucci 1996: 56). At a rock festival for peace, the paradoxes emerge in the efforts to achieve social recognition through the success of activism and through the success of the musical performances. For most of the rocker-activists, these are inseparable as they compare the rewards and investments constantly in a context where they strive to realize their identities both as rockers and activists.

I see such things in our organization of *Rock for Peace*, but cannot tell anybody. I mean at a peace festival, some rock bands are fighting with each other. "Why is that guy not doing anything?" or "I am the toughest activist" or "I am the most political," are the nonsensical stuff they say. This is one of my biggest concerns at the moment. We have to understand those children. They live intensely and work like crazy. The guys whose music were not liked by them [the fighting rocker/activists] become popular in the market and they start despising this "popularity." However, if they had the chance, they would also want to become popular. I see all of these, but hardly talk about these, because I know rock bands which are both popular and make good music. I try to establish a balance among *Rock for Peace* activists … At such a festival, self-denial is important as well, but that's not easy. (Rocker/Activist, M, 59)

**FIGURE 1**
Consumer Activism in Rock for Peace



**Collective Production: Emergence of Global Activism Discourse**

*Rock for Peace* activists share the concerns of Seattle 1999, and more importantly they think that they are one of the successors of the global activism community (Figure I). The conventional leftist recipes were no more sufficient, they needed to find other solutions to the 'global' problem. Associating themselves with global processes and counterparts seems to improve the significance they perceive in their existence. Similar findings in previous research (Fırat 2004; Kozinets 2004) indicate the importance of shared values of global activism in people's willingness to become involved in contemporary social movements. That is the reason why organizers of *Rock for Peace* have chosen to share various other concerns of global activism instead of targeting a single global brand as their adversary. Furthermore, this stance establishes international liaisons that make the festival a greater 'happening', i.e., bands from Ireland, Spain, Armenia and Egypt performed in 2007. Rock music acts as the amalgam in this collective production.

> We have a political perspective. We don't stare at each other and ask "What shall we oppose today?" We don't make up things. It may be a cliché, but this is the anti-globalization movement that developed after Seattle 99. (Activist, F, 36)

Activists also point to a change in conventional politics. The strict ideological stances of traditional leftist views are dropped and, importantly, distinctions such as left and right are paradoxically juxtaposed, constituting contrarieties rather than exact opposites. The causes are greater than strict political stances. Such positions imply the postmodern condition (Fırat and Venkatesh 1995; Fırat and Dholakia 2006).

> *Interviewee*: It [activism at the festival] is both joyful and also outside the long-standing leftist tradition–something exceeding that, something where you can express yourself comfortably.

*Researcher*: How do you describe the traditional leftists?
*Interviewee*: It's both looking at the world in clichés and behaving in clichés.
*Researcher*: What kind of clichés are they?
*Interviewee*: It's like speaking in clichés without understanding what kind of problems people have and offering some ready-made recipes; it's something that doesn't to lead to any change.
*Researcher*: What did the traditional leftists fail to understand?
*Interviewee*: I mean they didn't understand that the world had changed; the people on streets, those who are not among them wanted to change the world as much as they did. They didn't understand that they have common problems. (Activist, F, 36)

> To me you have the chance to realize collective actions today. There could be big social changes, there is an opportunity for that; there are hints of that. There are mass movements, not only the anti-war movements ... That's why we should not act in a protective manner, you don't need to protect yourself from your environs, on the contrary, you have to be open. The more we are open, the more we have a chance to see how many people there are we can get along with in the world. Those guys were from AKP [a conservative political party], Islamist people. We sat together and chatted about the system, opposition, capitalism. How similar were our rhetoric! I see and experience that so often. Previously, we were trying to convince everybody as to how the system makes our lives worse. Now, the evils in the system are not disguised, everybody sees that. (Activist, F, 36)

**CONCLUSION**

This study provides further insights into the processes that occur in accomplishing identity projects in modern culture. Especially the role of cultural elements, specifically represented by (rock) music, is illustrated. Also demonstrated are the relations

between music and social movement activism. First, it is observed that both music, specifically rock music, and consumer activism prepare the convenient ideological ground and multiple cultural codes for consumer identity projects. Evidently, the richness of the experience not only tolerates, but also encourages multiple identities. That is, being a rocker and an activist is more preferable, but also neither the rocker nor the activist presents a single type. There are multiple modes of being a rocker; the same is true for the activist. Festival goers encounter multiple possibilities and try different combinations.

In the festivals rocker identities point to glocal identities. Sharing global values of the rock culture is, nevertheless, accomplished through internalization yet appropriation to emphasize local occurrences–such as the firing of unionizing *Coca Cola* workers–but within the global framework of anti-corporatism and anti-globalism. Furthermore, only being a rocker is not sufficient for the ideals of activists. Hence, the ideological discourse of rock music meets the globally shared values of counter-culture causes that correspond to the image of rock. In the intersections of the global and local symbols that identify rock and activism at the festival, choices for identity become possible to adopt and to experiment with.

We find transformations in conventional modern identities. For example, left and right wing politics and identities are no longer positioned as exact opposites. One reason seems to be that new global habitats have engendered mutual adversaries, such as income inequalities among social classes and nations. Moreover, global concerns such as global warming are seen to constitute the greater danger for everyone. Hence, life is contested on the same grounds among different communities, leading to a third insight, which is the importance of collective action and communities in identity projects. In collective action, multiple identities were enabled to emerge in the safety of being under the umbrella of a community. No individual identity project was observed. Significantly, there is initially a collective production in the *Rock for Peace*. The festival identity was established in order to validate the identity of the community. Consumers, then, preferred to act as part of a community.

During both the fieldwork and the analysis, we challenged the data with the following question: "What would have happened if there were only one single project of activism? For example, would they rather organize a 'Peace Festival', with no music?" Most of our respondents found this question to be meaningless or absurd. "Exclude music from activism?!" Music was there, music had to be there. Without music *Rock for Peace* activists would not have organized a festival; without the music at the festival, messages would not be conveyed to anyone. It was also the music that made different identities possible: Rocker-activists, activists who like dancing, rock musicians who work for the global problems (using U2's Bono as an example). Music, specifically rock music, contains various cultural codes, enriching the modes of being and consumers enjoy experiencing and contesting them during their consumption experience.

# The Antecedents of the Consumer Complaining Behavior (CCB)

Daniel von der Heyde Fernandes, UFRGS, Brasil
Cristiane Pizzutti dos Santos, UFRGS, Brasil

## ABSTRACT

This study aims to test a theoretical model which attempts to integrate different streams of CCB and analyze it among Brazilian consumers. Two levels of severity of failure between-subjects design was used. A total of 480 students were exposed to a written scenario describing a restaurant experience. Dissatisfaction level, attitude towards complaining, self-confidence and perceived likelihood of success influence complaint, word-of-mouth and switching intentions, but in different manners. Consumer self-confidence is the main driver to complaint while dissatisfaction level the most relevant for negative WOM and switching intentions. Attitude towards complaining moderates the relationship between dissatisfaction level and complaint intention.

## INTRODUCTION

Researchers and practitioners have begun to recognize that the study of consumer responses to marketplace dissatisfaction has significant implications for such key phenomena as brand loyalty and repurchase intentions (Day 1984), market feedback mechanisms and new product development (Fornell and Wernerfelt 1987) and consumer welfare (Andreasen 1984). Firms can heighten their customer retention rate, protect against diffusion of negative word-of-mouth, and minimize disadvantages by effectively managing post-purchase consumer dissatisfaction (Tax et al. 1998). Moreover, complaining increases long-term satisfaction by facilitating the venting of the source of dissatisfaction (Nyer 2000).

Unfortunately, most dissatisfied consumers exhibit indirect behaviors, such as negative word-of-mouth and exit, rather than complain directly to the firm. Empirical studies report that at least two thirds fail to inform their dissatisfaction to firms (e.g., Richins 1983; Andreason 1984). Consumer reactions to dissatisfaction consist of multiple responses that consumers adopt in order to deal with a particular dissatisfying situation, including complaining to the seller, communicating negative word-of-mouth, switching supplier and taking legal action (Singh 1990).

Despite the strategic importance of consumer reactions to dissatisfaction, the current understanding is somewhat limited. Marketing literature on consumer responses to dissatisfaction has focused on identifying various determinants of consumer complaining behavior (hereafter referred as to CCB), although we find the following gaps: first, most literature focuses on only identifying determinants, not comparing their impacts (e.g., Day 1984; Singh and Widing 1991); second, the literature is fragmented, most studies consider only two or three determinants and, sometimes, fail to consider the major ones (e.g., Singh and Wilkes 1996); third, the role of attitudinal and personality-related variables has not been a central issue; fourth, most research has tended to utilize simplistic response styles (e.g., Gronhaug and Zaltman 1981); and, fifth, most studies focus only on those clients that register their dissatisfaction, complaining directly to firm, and do not consider those who spread negative word-of-mouth or silently switch suppliers (e.g., Nyer 2000). Such inconsistencies undermine the goals of systematic and cumulative research into the focal questions.

Our study aims to analyze, by extensive literature review and empirical data, the impact of multiple attitudinal perspectives (i.e., attitude towards complaining, perceived likelihood of successful complaint), personal factors (i.e., alienation and self-confidence) and dissatisfaction level on CCB. The term "complaint behavior" or "complaint responses" implies all plausible reactions to dissatisfaction. While, "complaint actions" or "complaint intentions" connotes complaining behavior directed to seller.

Research into CCB has, with few exceptions, been carried out in developed countries; consequently, it has had a strong US and European orientation (Liu and McClure 2001). This fact raises questions as to the transportability of its findings to developing country markets. Now, large numbers of corporations are preparing to enter in developing country markets, such as Brazil, which has received increasing foreign investment, especially from the US. Under these circumstances can CCB researchers advise those firms on what drives their dissatisfied customers to express their complaint, to switch companies or to spread negative word-of-mouth? Or how dissatisfied customers in developing countries are likely to engage in complaining, switching, negative word-of-mouth behaviors, or to seek legal action against the firm? Answers to these questions have become increasingly timely and critical.

To date, however, CCB research, especially empirical studies outside the US and European settings, has been limited, with a focus on highlighting Asian cultures (Chiu et al. 1988, Huang 1994, Watkins and Liu 1996, Liu et al. 1997, Kim et al. 2003, Chelminski 2003). With the exceptions of Hernandez et al. (1991), comparing voice complaint intentions between US and Puerto Rico consumers, and Hernandez and Fugate (2004), analyzing dissatisfied retail consumers in Mexico, a thorough literature search revealed no study focusing on South American CCB. Therefore, it is of practical as well as theoretical importance to analyze CCB within a developing and important country in South American culture such as that of the Brazilian market.

## LITERATURE REVIEW AND HYPOTHESES

This section develops a set of hypotheses that describe how personality, perceptual and attitudinal variables influence complaint intentions.

### Consumer Complaining Behavior

Dissatisfied consumers engage in several different behaviors, such as negative word-of-mouth, exit, complaint to the firm, appeal to a third party or repeat purchasing as usual. Hirschman's work (1970) establishes the "Exit, Voice and Loyalty" model. Exit means a consumer voluntarily intention to terminate an exchange relationship by switching patronage to another retailer. Voice suggests an attempt to change rather than escape from a state of affairs, while loyalty occurs when the consumers neither exit nor voice and "suffer in silence confident that things will soon get better" (Hirschman, 1970, p. 38). Later, Day and Landon (1977) suggested this conceptualization was simplistic and listed nine broad categories for alternative responses to unsatisfactory experiences, including complaining to friends and relatives (negative word-of-mouth) and seeking redress from third parties. They included these defining categories in a two-dimensional taxonomy of responses consisting of public (e.g., voicing complaints) and private (e.g., word of mouth) dimensions. Singh's (1988) results show that complaint responses can be appropriately conceptualized as consisting of three distinct dimensions: voice responses, including actions directed toward the seller; private responses, that is, actions involving

stopping patronage and word-of-mouth communication of the dissatisfying seller; and third party responses, including actions directed toward external agencies. This parsimonious structure underlies the various dissatisfaction responses, it is sustained by empirical data and externally validated by discriminant evidence. As the Brazilian legal structures intended to deal with complaining actions are recognized as ineffective and much too slow, consumers do not consider the possibility of acting directly toward third parties. Based on the literature mentioned (Singh 1988, Day and Landon 1977) and on qualitative research data (in-depth interviews), three possible responses will be considered: complaint intentions (toward the company), negative word-of mouth and switching intentions.

It is important to highlight that the literature on CCB suggests that consumers often utilize a wide variety of responses that can be successfully categorized into the preceding three dimensions (negative word-of-mouth, switch company or complaint toward the seller) (Singh 1988). For this reason, it seems desirable to explicitly recognize and consider these responses. As Singh and Widing (1991) argued "these dimensions are not posited as mutually exclusive responses. Instead, the framework accepts that consumers may often engage in multiple responses" (p. 39). This study focuses on explaining what drives a consumer's behavior immediately following an unsatisfactory experience and analyze what drives the consumer during the first-stage (i.e., right after an unsatisfactory experience) to complain toward the seller, switch company, spread negative word-of-mouth or to do nothing after an unsatisfactory buying or consuming event.

**Antecedents of Consumer Complaining Behavior**

The idea of linking consumer responses to the intensity of dissatisfaction is not new. The first model proposing such a relationship was put forward by Landon (1977). More recent research agreed with this statement (Maute and Forrester 1993). Richins (1983), using severity of the problem as a surrogate for intensity of dissatisfaction, found a direct relationship between intensity and complaining behavior. In other words, we propose that the more consumers are dissatisfied the higher the probability to engage in complaint behavior. Thus, the first hypothesis group is the following:

H1: *The dissatisfaction level will positively impact the complaint intentions.*

H2: *The dissatisfaction level will positively impact the negative word-of-mouth.*

H3: *The dissatisfaction level will positively impact the switching intentions.*

In contrast, proponents of the process approach see perceived dissatisfaction as a necessary, but not sufficient condition for explaining or predicting consumer complaint responses. Perceived dissatisfaction is hypothesized to be an emotional state that motivates consumers to undergo a process (Day 1984). This process results in specific complaint responses which are proposed to depend not so much on how strongly emotions are felt but more on consumer perceptions and attitudes (Singh and Widing 1991). Bearden (1983) found that only 15% of complaint reports could be explained by dissatisfaction level.

Other constructs are likely to influence such a complex behavior. In general, previous studies have found weak relationships between demographic variables and complaint responses (Gronhaug and Zaltman 1981), while indicating the strong influence of personal variables such as attitude towards complaining, consumer

alienation from the marketplace, perceived likelihood of successful complaint and consumer self-confidence.

Attitude towards the act of complaining is conceptualized as an overall effect towards the "goodness" or "badness" of complaining to sellers (Singh and Widing 1991). Two dimensions form this variable; the first corresponds to personal norms concerning complaining, while the second factor reflects the social dimension of this construct. Thus, consumers who have a more favorable attitude towards complaining are more likely to express their complaint to the firm (Day and Landon 1977). For this reason, we posit:

H4: *The attitude towards the act of complaining will positively impact the complaint intentions.*

It is well documented that the likelihood of successful complaining positively influences complaint intention (Richins 1983, Singh 1990). When consumers believe that their complaints will be accepted by the firm and effectively managed, they are likely to express their feelings to the firm and not to spread negative word-of-mouth or to switch supplier (Anderson and Sullivan 1993, Dabholkar 1994). According to this, we hypothesize:

H5: *Perceived likelihood of successful complaining will positively impact the complaint action intentions.*

H6: *Perceived likelihood of successful complaining will negatively impact the negative word-of-mouth intentions.*

H7: *Perceived likelihood of successful complaining will negatively impact the switching intentions.*

Consumer alienation is a consumer's global negative affect toward the dissatisfying firm's industry (Singh 1989) and reflects a negative feeling for the firm and its markets (Westbrook 1980). When consumers feel alienated from the market they are more likely to have helpless and powerless feeling (Allison 1978), and, thus, negative attitude towards complaining and lowered perceived likelihood of successful complaint, as follow:

H8: *Consumer alienation will negatively impact his/her attitude towards the act of complaining.*

H9: *Consumer alienation will negatively impact his/her perceived likelihood of successful complaining.*

Prior complaint experience can be conceptualized as a consumer's past experience toward unsatisfactory events (Sing 1989, Singh and Wilkes 1996). The extent (frequent or infrequent) of past complaining experiences can reinforce a consumer's attitudinal and behavioral disposition in future situations (Singh and Wilkes 1996). Prior complaint experience may influence attitude towards complaining. Such processes are consistent with the behaviorist and/or situationist theories that explain how past behaviors and exposure to situations shape and reinforce an individual's behavioral dispositions in future situations. Moreover, prior experiences affect an individual's cognitions about, for instance, how a retailer or manufacturer would probably respond to voiced complaints and the associated costs and/or benefits. As consumers learn about the mechanisms, options, and positive outcomes of prior complaint experience, they develop more positive attitudes towards complaining. In addition, those consumers who have prior complaint experience may determine how a firm might respond to voiced complaints, thus the perceived likelihood of successful complaint will be greater, the greater the prior experience of complaining is. Consequently, we posit the following:

H10: *Consumer prior complaint experience will positively impact his/her attitude towards the act of complaining.*

H11: *Consumer prior complaint experience will positively impact his/her perceived likelihood of successful complaining.*

According to the personality based approach, the consumer's intrinsic nature influences his/her complaining behaviors (Landon 1977). In general, consumers who complain after dissatisfaction tend to be more assertive (Bearden and Mason 1984) and self-confident (Gronhaug and Zaltman 1981). Although the results addressing these aspects have been encouraging, their impacts on complaint responses are not well documented and fully explored. Bearden et al. (2001, p.122) argue that "consumer self-confidence is the extent to which an individual feels capable and assured with respect to his or her marketplace decisions and behaviors" and reflects subjective evaluations of one's ability to generate positive experiences as a consumer in the marketplace (Adelman 1987). Therefore, it is proposed that self-confidence will influence the consumer's complaint intentions, as follows:

H12: C*onsumer self-confidence will positively impact the complaint action intentions.*

The absence of prior research on the relationship between consumer self-confidence and intentions to exert negative word-of-mouth communication and to switch company, does not allow us to elaborate more specific hypotheses. However, by the reasoning that self-confidence is related to the propensity of action, it can be inferred that a likely action might be to communicate with friends and relatives about the problem or to abandon the current supplier. Therefore, the following hypotheses are posited:

H13: *Consumer self-confidence will positively impact negative word-of-mouth.*

H14: *Consumer self-confidence will positively impact switching intentions.*

Based on attitude theory (Ajzen and Fishbein 1977), it can be inferred that the intrinsic attitudes towards the act of complaining will moderate the effects of situation triggers, such as encounter-specific dissatisfaction responses on intentions to complain. In doing so, it is likely that consumers with a high predisposition toward complaining will be more likely to complain regardless of their level of dissatisfaction they experience, so, such customers would probably complain even when only slightly dissatisfied, causing the direct effect of dissatisfaction level on complaint intention to be weaker. Alternatively, future complaint intentions for a customer with a low attitude towards complaining would be driven more by dissatisfaction level, and therefore the direct effect of dissatisfaction level will be delegated a stronger role. Accordingly, we hypothesize:

H15: *Attitude towards complaining moderates the relationship between dissatisfaction level and complaint intentions.*

Although the last hypothesis is logical, consistent and sustained by a solid theoretical background (Ajzen and Fishbein 1977), two empirical and relevant studies (Singh and Pandya 1991, Singh and Wilkes 1996) found that only the opposite moderating relationship occurred. That is, according to Singh and Wilkes (1996), the predictive and explanatory power of the attitude towards complaining changes with different levels of dissatisfaction. Using a critical incident approach, the authors found that the relationship between dissatisfaction level and voice varied substantially across the high and low dissatisfaction groups and, so, they provided a theoretical rationale and empirical evidence for a moderating role of dissatisfaction intensity. The reasoning here is that, being highly dissatisfied the customer will probably complain even having a negative attitude towards complaining. And only when the dissatisfaction level is low, does the impact of attitude towards complaining get stronger. Based on this reasoning, we have the alternative to the previous hypothesis:

H16: *The dissatisfaction level moderates the relationship between attitude towards complaining and complaint intentions.*

It's important to reinforce that hypotheses 15 and 16 are not opposing and could in fact both be operating. Given the theoretical background and the established hypotheses, Figure 1 presents a theoretical model to investigate the impact of the dissatisfaction level and personal variables on consumer complaint responses.

## RESEARCH METHOD

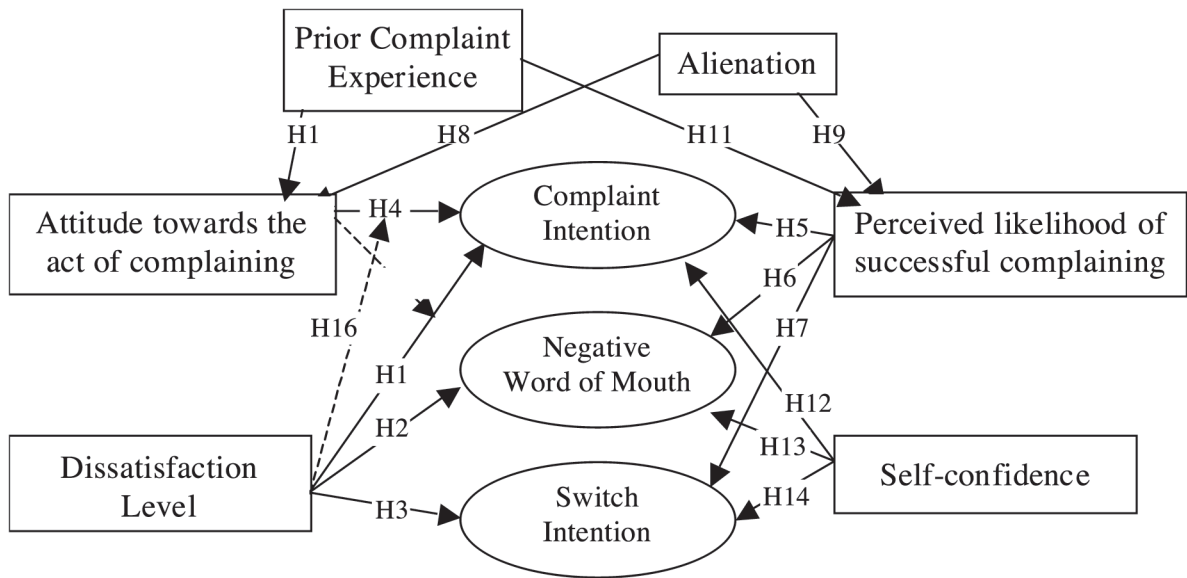
The investigation was carried out in two stages. In an initial, exploratory phase, in-depth interviews were conducted with 20 consumers to probe their beliefs about variables included in the hypotheses. Based on this work and extensive pre-testing, a questionnaire was developed and administrated in the final, descriptive phase. To empirically test the model, a quasi-experimental design was applied. A restaurant service was chosen as a research setting.

Service failures were manipulated at two levels of severity (low and high) via scenario description (appendix A). Then, participants were asked to rate, on a five-point Likert-type scale, their level of dissatisfaction toward that situation. Each participant could respond based only on one situation. Past experimental studies (Levesque and McDougall 2000, Wirtz and Mattila 2004) were consulted to assure the development of a parsimonious design.

The questionnaire was administered to 480 graduate students from two universities in the south of Brazil. Firstly, an ANOVA test was conducted to check the manipulation of service failure levels described by the scenarios. As expected, there was a significant difference on dissatisfaction levels (F=162.543; p<0,000), an indication that the high severity situation produced a higher dissatisfaction than the low severity situation. Prior to the data analysis, cases with missing values and outliers, were deleted.

The measurement scales were taken from diverse studies. Complaint intentions were adapted from Day et al. (1981) and Singh (1989); dissatisfaction intensity was operationalized by asking respondents how they felt after experiencing the situation described by the scenario; attitude towards complaining (8 items) was drawn from Singh's work (1990); alienation (5 items) from Allison (1978); perceived likelihood of successful complaint (3 items) from Day et al. (1981) and Singh (1990) prior complaint experiences (2 items) from Singh (1989) and self-confidence (11 items) from Bearden et al. (2001). According to the recommendation of Bagozzi (1977), the use of SEM in experimental studies is better applied when measures are interval, or, at least, manipulated at three levels. Therefore, an interval measure was used to check dissatisfaction level toward the situation. All measures were applied using a five-point Likert-type scale. Measures were translated into Portuguese using the back translation technique and submitted to marketing professors for meaning and consistency evaluation.

**FIGURE 1**
Framework for understanding the impact on complaint responses



## RESULTS

Results obtained by the survey are presented as follows: first, a general profile of the sample will be presented. Next, the measurement model will be examined through Confirmatory Factorial Analysis (CFA). The examination of the structural model will only be performed after the establishment of the validity and reliability of the measures used. Finally, moderating hypotheses will be investigated.

### Sample Profile

From data collection, a total of 480 interviewees was obtained, 240 for each scenario (low and high severity). Mean age of the respondents was 24 years-old (s.d.=6.93), 60% of them are male. The majority (46%) have a monthly family income higher than two thousand dollars, 31.5% from one to two thousand dollars and 22.5% above one thousand dollars.

Most of the interviewees are in the habit of eating in restaurants more than three times a month (56.5%), 23.4% eat in restaurants between once and three times a month and 20% less than once a month. This result shows that the situation suggested in the scenario is known, which enables the respondents to imagine themselves in it. More than half (57.3%) had some real unsatisfactory experience with some restaurant in the 12 months prior to the data collection. Of those that had some problem, 28.4% had only complained, 17% did not return, complained and used negative word of mouth, and 48% did not return and used negative word of mouth. These data show that a large proportion of the interviewees adopt more than one action in relation to an unsatisfactory situation, which tends towards agreement with the findings of Day and Landon (1977) and Singh (1990), which suggest that post-dissatisfaction behavior is exhibited in multiple ways.

### Measurement Model

Considering the recommendations of some authors (Anderson and Gerbing 1988, Bagozzi 1994, Hair et al. 1998), the validity of the measurement model was basically supported by the fact that: (a)

the measurement model was fairly well fitted to data, that is, within the established satisfactory adjustment levels; (b) the factor loadings of the indicators in the corresponding factors were high and significant; (c) indicators of the same construct produced levels of reliability over 0.70 and variance extracted over 0.50; (d) the correlation analysis between the constructs indicated discriminant validity.

The measurement model produced the following satisfactory fit statistics: the convergent validity was supported, basically, because all items presented high and significant factorial coefficients in the proposed constructs. The estimated parameters reveal that the standardized factor loadings, without exception, are statistically significant and substantively large (from 0.51 to 0.95, t-values>6.92). In addition, the composite reliability estimates ranged from .72 to .91 (switching intention and attitude towards complaining–personal norms, respectively), and variance extracted estimates from .53 to .76 (prior complaint experience and complaint direct toward the seller intention, respectively).

Evidence of discriminant validity, which is particularly important when constructs are similar by nature, was found through the correlation levels between constructs. Correlation over 0.80 would indicate lack of discriminant validity, that is, constructs would be measuring the same phenomenon. Constructs were found distinct from one another, with the highest correlation between negative word-of-mouth and switching company intentions (0.71). The comparison between the variance extracted estimates and the square of the correlation of two constructs for each one of them provide additional evidence of discriminant validity.

### Test of Hypothesis

After the examination of the measures used, this study focused on the theoretical structure, which establishes relationships between the proposed constructs. The investigation of the set of hypotheses will be primarily made through the goodness-of-fit indices of the hybrid model and the significance and magnitude of estimated regression coefficients. Moreover, the coefficient of

**TABLE 1**
Estimated Coefficients for the Nomological Relationships in the Model

| Model Relationships | Standardized Regression Coefficient[a][b] | Hypotheses |
|---|:---:|:---:|
| **Dependent Variable: Complaint Intention** | $R^2=0.48$ | |
| Dissatisfaction Level | 0.29 (3.22) | $H_1$ |
| Attitude towards complaining | 0.19 (2.18)[c] | $H_4$ |
| Perceived Likelihood of Success | 0.27 (3.04) | $H_5$ |
| Self-confidence | 0.38 (5.96) | $H_{12}$ |

[b] T-values in parenthesis. Based on the one-tailed: t-values>1.65=p<0.05; and t-values>2.33=p<0.01.
[c] Coefficient significant at 0.05 level. Coefficients significant at 0.01 are in bold.

determination was verified for each equation, which represents the proportion of variance of the dependent variable explained by the independent variables.

The findings of the structural model analysis, based on the 480 customers, are found in Table 1. The chi-square value is significant. However, knowing that this test is very sensitive to normality deviations and to samples higher than 200, the analysis of the chi-square value must be done along with other adjustment criteria (Hair et al. 1998). Dividing the chi-square value by the degrees of freedom produces a satisfactory value–2.01, less than the maxi-mum recommended (5). Goodness-of-fit indexes CFI, NFI, NNFI, all over 0.90, are considered sufficiently satisfactory and the RMSEA of 0.06 is acceptable.

The results provide support for most of the nomological relationships specified in the model. These relations reflect the impact of: 1) self-confidence on complaint, word-of-mouth and switching company intentions; 2) dissatisfaction level on complaint, word-of-mouth and switching company intentions; 3) perceived likelihood of successful complaint on complaint, word-of-mouth and switching company intentions; 4) attitude towards

## TABLE 2
Estimated coefficients for theoretical relationships, for clients with contrasting attitudes [a]

| Dependent Variable: Complaint Intention | Positive Attitude | Negative Attitude |
| --- | --- | --- |
| $R^2$ | 0.62 | 0.31 |
| Level of Dissatisfaction | 0.41 (6.07) | 0.15 (2.13) |

[a]The estimates presented are from ERLS (iteratively reweighted gereneralized least squares) using EQS.

complaining on complaint intentions; 5) alienation on attitude towards complaining; and 6) alienation on perceived likelihood of successful complaining.

The impact of dissatisfaction level on switching (0.72) and negative word-of-mouth (0.65) intentions are highly significant. The perceived likelihood of success and the consumer self-confidence had a weaker, though, significant, impact on switching intentions (-0.19 and 0.12, respectively) and on negative word-of-mouth communication (-0.12 and 0.18). Note that the perceived likelihood of success has a negative impact on both responses, as predicted.

With regard the impact on complaint intention, the results indicate that the impact of the following antecedents: dissatisfaction level (0.28), probability of success (0.25), attitude towards complaining (0.17), and consumer self-confidence (0.36). Although not as large as the negative word-of-mouth and the switching intentions coefficient, the $R^2$ of 0.44 reflects a reasonable effect of the variables on the complaint direct to the firm intention.

The results also support hypotheses $H_8$ and $H_9$, in which the impact of alienation on the attitude towards complaining and on the perceived likelihood of success are established. Although statistically significant, the power of alienation to predict the perceived likelihood of success is very low ($R^2$–0.08). Finally, prior complaint experiences did not exerted influence on attitude towards complaining (0.03), rejecting $H_{10}$.

The moderating hypotheses ($H_{15}$, $H_{16}$) highlight possible differences in the strength of nomological relationships established between dissatisfaction intensity and complaint intention ($H_{15}$), due to the level of attitude towards complaining, and between attitude towards complaining and complaint intention ($H_{16}$), due to the level of dissatisfaction. In order to test the first moderating role, we divided the sample into three sub-groups based on the level of attitude towards complaining. Then, those who indicated the attitude as low (163) and high (186) were retained. Those who indicated medium level of attitude were excluded to more accurately reflect the nature of the moderation, which could be blurred if intermediate values were included. The moderation hypothesis was tested by using the Multi-Group Structural Equation Analysis. This approach allows the theoretical model for each group to be simultaneously estimated; those that exhibited low and those that exhibited high attitude towards complaining. Thus, it is possible to test whether the estimated coefficients vary for both groups (Singh, Verbeke and Rhoads 1996). All parameters were initially restricted as invariant for both groups. Subsequently, based on the Lagrange-multiplier test (Byrne 1994), parameters with significant indicators "are released".

The results in Table 2 indicate different relationships between dissatisfaction level and complaint intention in the two groups of consumers. While for consumers with negative attitude towards complaining, the impact of dissatisfaction level is 0.15, for consum-

ers with positive attitude it is 0.41. This result corroborates the idea that attitude moderates the effects of situation triggers, such as dissatisfaction intensity. Thus, the attitude towards complaining is an important element for the translation of dissatisfaction level to complaint intention. The dissatisfied consumers with negative attitude towards complaining are less driven by dissatisfaction level. It means that those customers will probably not complain even when highly dissatisfied. On the other hand, the consumers with positive attitude toward complaint are "freer" to act according their levels of dissatisfaction. Thus, when highly dissatisfied they probably complain, while when slightly dissatisfied they probably do not. Additionally, Mean scores interaction provided additional evidence for the moderator effects. In accordance with methodological advice from previous authors (Irwin and McClelland 2001; MacCallum, Zhang, Preacher and Rucker 2002), if the relationship is nonlinear, then dividing into two groups, whether the extreme third tails or median splits, precludes the possibility of detecting the nonlinearity. Therefore, the interaction between dissatisfaction level and attitude toward complaining mean scores and its effect on intention to complaint was analyzed, reinforcing that when attitude toward complaining is positive, dissatisfaction level exert a stronger impact on intention to complaint ($\beta_{interaction\,effect}$=.51, p<0.001).

In order to test $H_{16}$, the same procedure was used, but in this case the sample was divided into three sub-groups based on the level of dissatisfaction. Those who obtained low (178) or high (196) dissatisfaction scores were restrained, so the effect of attitude towards complaining on complaint intention in those two different groups could be better captured and compared. The results indicated no improvement to the model by adding the moderator impact, denying $H_{16}$ and contradicting the findings of Singh and Pandya (1991) and Singh and Wilkes (1996). One explanation for this rejection is that the previous authors dealt with complaint behaviors in response to actual experiences of consumer dissatisfaction instead of consumer's intentions or propensity to complain, as did the present study. Moreover, this difference may be explained to some degree by the origin of the current sample, a developing, South-American country.

### IMPLICATIONS

From the academic point of view, our research examines some relevant questions in the field of knowledge considered. Among them it is important to point out: (1) the consideration of the answers to dissatisfaction involving a series of intentions: complaint, word-of-mouth and switching intentions; (2) the relationship between dissatisfaction level and post-dissatisfaction answers; (3) the impact of attitudinal (attitude toward complaint), perceptual (dissatisfaction level and perceived likelihood of success) and personality (consumer self-confidence) variables on the post-dissatisfaction intentions; (4) the applicability of North American measures in the Brazilian context.

This research focuses on the impact of attitudinal, perceptual and personality variables on complaint behavior among Brazilian consumers. The majority of the antecedents' impacts were expressive and predicted a good part of the variations on the dependent variables, as the hypothesis suggested. The hypothesized relationships were empirically tested, and the results confirm that complaint reactions are influenced by dissatisfaction level, consumer sef-confidence and perceived likelihood of success, but in different intensities.

It is important to reinforce that dissatisfaction level significantly and substantially enhances negative word-of-mouth and switching intentions, but its effect on complaint direct toward the firm intention is not in the same intensity. This corroborates with some authors' idea (Bearden 1983; Day 1984; Singh and Widing 1991) that the relationship between dissatisfaction level and voice is tenable, but not encouraging. Instead, in the present study the complaint direct toward the firm was strongly influenced by consumer self-confidence. Perceived likelihood of success also seems to play a relevant role on predicting complaint direct toward the firm intention. We should reinforce that the the the $R^2$ indicates that the four antecedent variables were capable to explain half (48%) of the total variance in complaint direct toward the firm intention. Although that is a considerable amount, it suggests the existence of other factors that could help to predict the intentions to complaint, such as attribution of failure, company/consumer relationship (degree of loyalty felt by the consumer to the company) and emotions fealt by the dissatisfied customer.

Another important finding refers to the impact of personal antecedents (alienation and prior complaining experience) on attitude towards complaining and on perceived likelihood of success. In accordance with Kim et al. (2003) findings, alienation significantly and negatively has influenced attitude towards complaining and perceived likelihood of success. Kim et al. (2003) also found the influence of prior complaining experience on attitude towards complaining and on perceived likelihood of success. Those results were not sustained by the present study. One explanation for this could be the fact that enterprises in Brazil do not behave homogeneously, that is, there is no pattern companies follow referring to complaint handling. As a result, consumers do not expect from a company a positive response just because they had a good experience in complaining to another one.

This study set out to pose and examine the relationship between personality, perceptual and attitudinal variables and complaint intentions. Furthermore, specifically regarding the complaint direct toward the firm intention, we identify a moderator attitudinal variable that strenghed the relationship between dissatisfaction level and complaint direct toward the firm intention, enhancing its prediction from 48% (overall sample) to 62% (sample with positive attitude towards complaining). This calls for two remarks. First, the higher the attitude towards complaining score, the more likely the customers are to complain, even if they fell little dissatisfied. Second, dissatisfactions are more likely to be transformed into complaining if customers have a positive attitude towards the act of complaining. This result confirms and sheds some nuance on the key arguments of Ajzen and Fishbein (1977) that attitude moderates the relation between cognitive appraisals and coping behaviors.

The present study offers several contributions to marketing practitioners. The findings indicate that the focus on maintaining long-term relationships and avoiding negative word-of-mouth communication depends on enhancing post-purchase systems. Otherwise, dissatisfied customers will defect and spread negative word-of-mouth about the company. Moreover, the company should not try to hide failures and wait for the customer to register complaints, because customers who perceive the likelihood of success as low and are not self-confident probably will not complain but remain dissatisfied.

The presence of a linear, but weak, relationship between dissatisfaction level and voice poses several implications and challenges for practitioners, since dissatisfaction can be managed only if consumers voice their complaints. The implication of this study is that customers complaint intention is likely to be dependent of several factors (e.g. personality, attitudinal variables) which can convert dissatisfaction level to voice intention. The knowledge of such factors is critical for dissatisfaction management.

Another managerial implication is that firms should realize that a consumer's perception of likelihood of success and favorable attitude towards complaining can heighten voice intention. Both aspects can be enhanced by educating consumers about the options and the mechanisms of complaining. Companies could also simplify the exchange and refund procedures, show to consumers they are willing to admit failures, provide employees education regarding quick and efficient complaint handling, motivate them to facilitate customers' expressions of complaint and increase their willingness to listen to customers. Finally, the high impact of consumer self-confidence on complaint intention shows that the company, when handling complaints, is dealing with self-confident consumers. Contact employees should be trained to pay attention when dealing with this type of consumer.

While this study considers several important factors, one of its weaknesses is that it fails to take into consideration consumer emotions as a determinant of complaining behavior. The method applied (experimental design with application of scenarios) is not favorable to measure emotions, because it provides a hypothetical situation. Previous research has also considered the impact of attributions on complaining behavior. Future research should focus on the place of attributions and emotions within the model. A further limitation is the sampling of only one service category (restaurants) and the use of students as participants. Future research is needed to validate our findings across a wider sample base.

# APPENDIX A
## Scenario Description-High Failure Severity Scenario

You and another person go to a restaurant for dinner to celebrate a special occasion. You reserved a table with an excellent location, however, when arriving at the restaurant, you were informed that the restaurant was crowded and the table was already occupied. After five minutes, you were moved to another table. You are seated. The waiter comes to take your order. You place your order and the waiter informs you that the dish you requested is unavailable. You choose another option and the waiter arrogantly informs you that it is also unavailable. You finally choose a third and available alternative. After one hour, the waiter brings your order.

# Conditioning Implicit and Explicit Brand Attitudes Using Celebrity Affiliates

Douglas R. Ewing, University of Cincinnati, USA
Chris T. Allen, University of Cincinnati, USA
Frank R. Kardes, University of Cincinnati, USA

The notion of implicit attitudes is well established in psychology (Greenwald, Banaji, Rudman, Farnham, Nosek, and Mellot 2002; Greenwald, McGhee, and Schwartz 1998; Olson and Fazio 2001). Long have researchers recognized that some attitudes are automatic and not controllable by the individual (Moors and De Houwer 2006). In social psychology, affective experiences are an area commonly examined under an implicit attitude lens. Existing research suggests that implicit attitudes emerge from automatic affective reactions while explicit attitudes are more propositional or cognitive in orientation (Rudman 2004). The notion of implicit attitudes may not be new, but their uniqueness, function, and development present many research opportunities (Rydell and McConnell 2006). Methods of quantifying and measuring implicit attitudes such as the Evaluative Movement Assessment (EMA) and Implicit Association Test (IAT) have appeared and are being refined (Brendl, Markman, and Messner 2005; Greenwald et al. 1998). A general model of implicit/explicit attitude change has also now emerged (Gawronski and Bodenhausen 2006).

Implicit attitudes may be important in understanding and predicting consumer behavior, especially in situations where consumers are cognitively constrained. Further, they may be more persistent over time than explicit attitudes though potentially less vivid (Buttle, Ball, Zhang, and Raymond 2005). Both explicit and implicit attitudes may uniquely influence one's preference for a particular brand. Explicit attitudes towards a soda brand may form in a propositional manner based on product taste, image, or nutritional value. An attitude towards a brand formed in this manner is subject to change quickly from recent experience, advice, persuasion, etc. Implicit attitudes towards the soda brand, however, may form in an associative manner from such past pairings of the brand with pleasant memories of youth or a consistent celebrity endorser. These implicit attitudes may not be "top of mind" but guide behavior nonetheless and may be more resistant to persuasion (Gibson 2006).

In addition to providing a more complete explanation of consumer attitudes, the implicit/explicit distinction may shed new light on existing studies or require new interpretation of effects from procedures used by consumer researchers. In particular, while there are numerous studies in social psychology investigating classical conditioning effects on implicit attitudes, conditioning studies with brands have examined explicit attitude change only. This article reports the results of an experiment examining the effects of Pavlovian conditioning on implicit and explicit attitudes using real brands and real celebrities. Further, it provides a novel method for measuring implicit brand attitudes in comparison to the standard IAT (Greenwald et al. 1998).

The current research indicates that Pavlovian conditioning can have an effect on implicit brand attitudes. Results suggest that the changes in implicit and explicit attitudes towards a brand may lead to divergent inferred beliefs about that brand. Suggesting implications for the ongoing debate about Pavlovian versus evaluative conditioning and offering direction for future research involving implicit attitudes in consumer research, this article represents a small step in understanding how implicit/explicit attitudes change and in addressing nuances involved in their measurement.

# BACKGROUND

## Implicit and Explicit Attitudes

The associative-propositional evaluation (APE) model provides comprehensive theorizing regarding implicit and explicit attitude change (Gawronski and Bodenhausen 2006). The APE model considers implicit attitudes as arising from an associative process. That is, implicit attitudes arise from automatic affective reactions. When an individual encounters a particular attitude object, the activation of associations leads to an implicit attitude. The activation that occurs may arise from such varied sources as past experience, positive/negative affect, social or cultural bias, or need for cognitive consistency (Rudman 2004). The APE model suggests an activation leading to an implicit attitude generally is outside of the control of the individual and often is persistent over time.

Explicit attitudes in the APE model differ from implicit attitudes by arising from propositional processes. Explicit attitudes depend on judgments of the validity of "syllogistic inferences" about an attitude object in order to form or change. Explicit attitudes generally are consciously controllable because they arise from propositional processes involving truth judgments. In this manner, they are qualitatively different from implicit attitudes. Whereas implicit attitudes arise from automatic affective reactions to a source, explicit attitudes emerge and change based on judgments of truth.

One of the important aspects of the APE model is that it provides explanation for when implicit and explicit attitudes may be related versus when they may be independent. The APE model posits eight patterns of attitude change. While the particulars are beyond the scope of this article (see Gawronski and Bodenhausen 2006, 702-709), the notion that many different examples of implicit and explicit attitude change can be explained by the model makes it useful both for *a priori* hypothesis generation and *a posteriori* result(s) interpretation.

## APE Model and Pavlovian Conditioning

Classical conditioning has been assessed by consumer researchers as a means for shaping attitudes using conventional Pavlovian procedures (Kim, Allen, and Kardes 1996; Shimp, Stuart, and Engle 1991). With this procedure, a conditioned stimulus (CS) precedes an unconditioned stimulus (US). This CS-US arrangement eventually leads to a conditioned response or attitude change after sufficient repetitions. In addition to a sufficient number of repetitions, Pavlovian conditioning generally requires contingency awareness in order to induce a change in explicit attitudes (Gawronski and Bodenhausen 2006). While Pavlovian conditioning is associative in nature, an individual needs to be cognizant of the CS-US arrangement in order for attitude change to occur (Priluck and Till 2004). Lack of contingency awareness generally yields a null effect for Pavlovian conditioning, at least for non-automatic phenomena such as explicit attitudes.

Evaluative conditioning, in contrast to Pavlovian, leads to a conditioned response after a series of overlapping conditioned and unconditioned stimulus pairings. Evaluative conditioning does not

necessarily require contingency awareness instead inducing conditioning effects via direct affect transfer from US to CS. Where order is important for Pavlovian conditioning, pairing and valence are critical for evaluative conditioning. This distinction between Pavlovian conditioning and evaluative conditioning is emerging as an important one in research about associative learning (De Houwer, Thomas, and Baeyens 2001; Walther, Nagengast, and Trasselli 2005).

Gawronski and Bodenhausen (2006) provide a thorough explanation of how evaluative conditioning works with regard to implicit/explicit attitude change but consider Pavlovian conditioning as propositional and more clearly relevant to explicit attitudes. Past research has disagreed about whether Pavlovian conditioning is propositional (Holyoak, Koh, and Nisbett 1989; Stuart, Shimp, and Engle 1987). The CS and US ordering in Pavlovian conditioning does follow a general "if…then" pattern, suggestive of propositional reasoning. Researchers favoring a unimodel of attitude change argue that all conditioning is propositional (Kruglanski and Dechesne 2006). If Pavlovian conditioning is strictly propositional, the APE model suggests that these procedures will have an effect on explicit but not implicit attitudes.

A larger question remains, however, about whether Pavlovian conditioning may influence implicit attitudes regardless of any change in explicit attitudes and/or presence of contingency awareness. In a basic sense, Pavlovian can also be viewed as an associative process (Walther et al. 2005). The CS-US arrangement eventually suggests to the individual a similarity or association perhaps not always an "if…then" relationship. Along these lines, some research has found that Pavlovian procedures can have effects on implicit attitudes for novel stimuli (Olson and Fazio 2001). This lends support to the contention that Pavlovian conditioning does not always require contingency awareness, just a consistent CS-US arrangement (Stuart et al. 1987). Hence, we propose and test:

*H1: Pavlovian conditioning procedures will influence implicit brand attitudes regardless of contingency awareness.*

Establishing that Pavlovian conditioning has an effect on implicit attitudes is insufficient to argue that qualititatively different judgment processes are at work. Recall that the APE model predicts that explicit attitudes arise from propositional processes while implicit attitudes flow from associative processes. Propositional processes involve truth judgments of "syllogistic inferences" about an attitude object (Gawronski and Bodenhausen 2006). Pavlovian conditioning may influence attitudes through both signal and evaluative learning, possibly leading to changes in both explicit and implicit attitudes (Olson and Fazio 2001; Walther et al. 2005). Explicit attitudes should be conditioned with a Pavlovian procedure if subjects are aware of the CS-US arrangement (Kim et al. 1996). Explicit attitudes require contingency awareness for conditioning to manifest (Priluck and Till 2004). Thus, we also test:

*H2: Pavlovian conditioning procedures will have an effect on explicit brand attitudes only when contingency awareness is present.*

Implicit attitudes arise from associative affective processes operating outside of the awareness of the individual. As a result, implicit attitudes should not co-vary with inferences used in the propositional construction of explicit attitudes. If implicit attitudes have a relationship with inferred brand beliefs, this would suggest that they might not be qualitatively different from explicit attitudes.

However, if implicit attitudes form independent of inferences about an attitude object, they would seem to be fundamentally different from explicit attitudes (Gawronski and Bodenhausen 2006). We posit that explicit attitudes will share a significant correlation with inferred beliefs but implicit attitudes will not have a significant correlation with the same.

*H3: Inferred beliefs about a brand will be correlated positively with explicit brand attitudes but be uncorrelated with implicit brand attitudes.*

## METHOD

A laboratory experiment was employed to test the hypotheses that implicit and explicit brand attitudes would be conditioned with a Pavlovian procedure and differ in their relationship to subsequent inferred beliefs about the brand. A sample of 70 students (37 male and 33 female) at a large Midwestern university participated in return for course credit. Participants were told that the study was interested in their opinions about brands and celebrities. They were randomly assigned to the treatment or control condition and processed in groups of 1 to 4.

The experiment used conditioned and unconditioned stimuli chosen through extensive pretesting. Paris Hilton, Jessica Simpson, and Britney Spears were selected as unconditioned stimuli because of a shared celebrity quality. It is worth noting that the study was conducted prior to recent events that may set Britney Spears apart from Paris Hilton and Jessica Simpson. Pretesting showed that these celebrities carry different meaning for females versus males suggesting a need to consider conditioning effects by gender. A separate pretest examined these three celebrities and several others such as Dave Chapelle and Conan O'Brien paired with several brands including Chipotle Mexican Grill, Gallo Family Vineyards, Starbucks, and Marriott Hotels to identify a useful conditioned stimulus. This pretest suggested that Gallo did not have overall differences by gender ($t(26)<0.6$) on close-ended responses to the celebrity and brand pairing. Gallo was thus selected as the conditioned stimulus in order to associate a relatively neutral brand with the controversial celebrity unconditioned stimuli. Based on this pretesting, we expected this pairing would create different effects of conditioning by gender.

The conditioning procedure followed that of Stuart et al. (1987) and was implemented via an on-screen presentation in MediaLab. In the treatment condition, one of four brands (Gallo versus three filler brands: Chipotle, Domino's, and Starbucks) always appeared before the unconditioned stimuli (the three female controversial celebrities versus nine female filler celebrities such as Rachel Ray and Reese Witherspoon). Participants viewed CS and US images for 7.5 seconds each, followed by a 2-second rest period (Stuart et al. 1987). The random control condition also viewed the same images as the treatment condition but did so with a wholly random ordering. In total, each participant viewed 40 brand images and 40 celebrity images. But again, the focal CS-US arrangement was Gallo, followed by Paris Hilton, Jessica Simpson, or Britney Spears, who were rotated throughout to the create the ten repetitions.

After the conditioning procedure participants responded to a Single Category Implicit Association Test (SC-IAT) with Gallo as the focal object. A SC-IAT is procedurally similar to the Implicit Association Test (IAT) but has only one focal object instead of two (Karpinski and Steinman 2006). The traditional IAT is a method for approximating an individual's implicit attitude towards a matched pair of focal objects, for instance Coke and Pepsi (Greenwald et al. 1998). A researcher seeking individual implicit attitudes towards

**FIGURE 1**
Gallo SC-IAT Example Screens

Gallo + good

Gallo + bad
*Note: Participants responded to 96 presentations of both evaluative category arrangements with first 24 responses as practice.*
*"E" and "I" keys corresponded to category on left and right respectively.*

these brands would run an IAT where both Coke and Pepsi are positioned with such evaluative dimensions as "good" and bad." Participants in such a study would sort valenced words and/or pictures for each of two evaluative dimension arrangements (Coke + good and Pepsi + bad; Pepsi + good and Coke + bad). The standardized difference in response time latencies for each arrangement may then be considered as the strength of an individual's association of Coke with "good" and "bad" and Pepsi with "good" and "bad." In order to estimate these associations, the traditional IAT requires a legitimate matched pair of focal objects such as Coke and Pepsi. While matched pairs may exist for some product categories, a true match is often difficult to justify. Results of an SC-IAT are not readily comparable to results of an IAT. However, use of a SC-IAT can remove the need for a matched pair of focal objects (Karpinski and Steinman 2006).

A SC-IAT is particularly useful in situations where a matched does not exist and/or comparison of implicit attitudes toward two different products or brands is not necessary. For this study, several other wine brands such as Robert Mondavi were considered. However, no brand appeared to be a defensible and equal match for Gallo. Putting the existing research on the SC-IAT into practice, this study estimated participant associations towards Gallo only, without needing another brand of wine for comparison. The SC-IAT was implemented via DirectRT reaction time measurement software and carried evaluative dimensions of "good" and "bad" with the object dimension labeled "Gallo" as depicted in Figure 1. The SC-IAT consisted of two stages (Gallo + good and Gallo + bad) with 96 sorts of target words and images completed for each. Each stage began with instructions about the sorting task and the appropriate key with which to do so. Gallo + good and Gallo + bad category labels appeared at the top of the screen during the instructions. Following the instructions, target words and images appeared on the center of the screen. Target words in the SC-IAT were those

used by Karpinski and Steinman (2006) and target images were Gallo-related pictures (See Appendix). Responses to each sort were mapped to the "e" and "i" keys.

Implicit attitudes were operationalized with $D$-scores of response time latencies from the SC-IAT. The use of a single target stimulus necessitated adaptation of the existing SC-IAT scoring guidelines lines Karpinski and Steinman (2006). The method of scoring the SC-IAT in this study made use of response times from both stages. The stages were divided into practice and trial by withholding the first 24 sorts from each analysis. Response latencies less than 350 milliseconds were eliminated. Responses in error were replaced with the stage mean plus a 400-millisecond penalty. Response latencies to the Gallo imagery for each participant were averaged. The mean of the Gallo + bad latencies was then subtracted from the mean of the Gallo + good latencies and divided by the standard deviation of all correct responses. This operation yielded $D$-scores where values greater than zero indicated more positive than negative associations with Gallo. Values less than zero indicated more negative than positive association with Gallo. This method of scoring followed the existing SC-IAT scoring procedure suggested but only considered response times for the Gallo imagery (Karpinski and Steinman 2006). Implicit attitudes scores using only the Gallo imagery had the same interpretive qualities as the conventional method of scoring a SC-IAT and contained less effect-obscuring noise but were still normally distributed (K-S $z$=.735, p>.50).

Following the SC-IAT, participants responded to items gauging their explicit attitude toward Gallo and selected inferred beliefs about the brand. Explicit attitudes and participant inferred beliefs about Gallo were operationalized with six items on a 7-point semantic differential scale. Explicit attitude items were "good/bad", "like/dislike", and "favorable/unfavorable". Inferred belief items were "domestic/imported", "cheap/expensive", and "trashy/

**TABLE 1**
Implicit and Explicit Attitude Means, Standard Errors, and Planned Contrasts

classy". Explicit attitude items were summed and inferred belief items were kept separate for analysis. In addition to explicit attitudes and inferred beliefs, participants responded to a five-item postexperimental inquiry instrument that included items gauging contingency awareness (Allen 2004).

## RESULTS

A non-significant correlation between implicit and explicit attitude measures supported the appropriateness of treating them as separate ($r(70)=-.14$, $p>.20$). Preliminary analyses suggested marginally significant differences between male and female on explicit attitudes ($t(68)=-1.87$, $p=.07$) but not implicit attitudes ($t(68)=-.54$, $p>.50$). Omnibus 2 X 2 ANOVAs of condition and gender supported the presence of an interaction for conditioning on explicit attitudes ($F(1,66)=5.30$, $p<.05$) but not for implicit attitudes ($F(1,66)=.73$, $p>.30$). ANOVAs of gender and condition also supported a main effect of conditioning for implicit attitudes ($F(1,66)=4.49$, $p<.05$) but not explicit attitudes ($F(1,66)=.84$, $p>.30$). Ten individuals in the treatment condition (9 males and 1 female) were contingency aware. With gender differences obtaining and contingency awareness relatively low, analysis proceeded as a series of planned contrasts by gender as outlined in Table 1.

Hypothesis 1 predicted that Pavlovian conditioning would have an effect on implicit attitudes regardless of contingency awareness. A significant overall conditioning effect emerged ($t(66)=-2.12$, $p<.05$), supporting Hypothesis 1. Closer examination indicates that conditioning had a significant effect on implicit attitudes for females ($t(66)=-2.05$, $p<.05$) but not for males ($t(66)=-.92$, $p>.30$), although their means followed a similar pattern. Females in the treatment condition had significantly higher implicit attitude scores than all others in the sample ($t(66)=-1.99$, $p=.05$).

Hypothesis 2 predicted that Pavlovian conditioning would have an effect on explicit attitudes presuming contingency awareness was present. An overall conditioning effect did not emerge for explicit attitudes ($t(66)=.91$, $p>.30$), but the gender by treatment interaction was significant. As with implicit attitudes, there was no

effect for males ($t(66)=-1.01$, $p>.30$). Conditioning did have a significant effect on explicit attitudes for females ($t(66)=2.21$, $p<.05$) though only one female in the treatment condition was contingency aware. In general, explicit attitudes for females in the control condition were more favorable towards Gallo than for females in the treatment condition.

Hypothesis 3 predicted that inferred beliefs would correlate with explicit attitudes but not implicit attitudes. As hypothesized, explicit attitudes were correlated with two of the three inferred belief measures (aura $r(70)=.53$, $p<.01$; origin $r(70)=.03$, n.s.; cost $r(70)=.51$, $p<.01$) while inferred belief correlations with implicit attitudes were not significant as shown in Table 2. The presence of some significant correlations between inferred beliefs and explicit attitudes suggests that these attitudes might have formed from a propositional process. The lack of correlations with implicit attitudes suggests that the associative process leading to changes in these attitudes may have operated independent of the process leading to explicit attitude change and inferred belief generation, consistent with a dual process model (Gawronski and Bodenhausen 2006).

## DISCUSSION

The results show that Pavlovian conditioning procedures elicited more favorable implicit brand attitudes and less favorable explicit brand attitudes for female participants. The results also show that explicit brand attitudes, but not implicit brand attitudes, influence deliberative inferred beliefs. This suggests that the complex and controversial nature of the celebrity affiliates may be primarily responsible for these mixed attitudinal and inferential responses. Deliberating about the controversial opinions and behaviors of the celebrity affiliates had some influence on explicit brand attitudes. Further and conversely, favorable associations regarding the physical attractiveness of the celebrity affiliates had a strong influence on implicit brand attitudes regardless of contingency awareness, but no influence on explicit brand attitudes. As a consequence, implicit and explicit brand attitudes were uncorrelated.

**TABLE 2**
Attitude, Contingency Awareness, and Inferred Belief Correlations

| | Implicit Attitude | Explicit Attitude | Contingency Awareness | Aura | Origin |
|---|---|---|---|---|---|
| Explicit Attitude | -.14 | | | | |
| Contingency Awareness | -.05 | .01 | | | |
| Aura | -.17 | .53** | .04 | | |
| Origin | -.11 | .03 | -.05 | .14 | |
| Cost | -.15 | .51** | -.01 | .63** | .26* |

*Note:* ** *indicates significance at p<.01*

As inferred belief imputation requires deliberation, only explicit brand attitudes influenced participants' inferential reasoning.

The presence of an overall conditioning effect on implicit attitudes demonstrates support for Pavlovian conditioning being at least partially associative in nature and not solely propositional. This fits with existing research arguing that changes in these attitudes take longer as they emerge from associations (Rydell and McConnell 2006). The repeated associations created by the Pavlovian procedure were enough to create differences in participant implicit attitudes. The results also demonstrate that implicit attitudes were independent of inferred beliefs and explicit attitudes. If implicit attitudes emerged as positively correlated with inferred beliefs, there would be less basis for arguing that both propositional and associative processes were operating in response to the present conditioning procedure. However, implicit attitudes did not correlate with inferred beliefs and had a non-significant correlation with explicit attitudes. This suggests that implicit attitudes emerged from a process different from that of explicit attitudes, a central assertion of the APE model.

As expected, gender differences emerged and demonstrated an important pattern of differences between implicit and explicit brand attitudes. The Pavlovian procedure had an effect for females but not for males. These gender differences in implicit attitudes towards Gallo may have emerged from differences in the affect transferred from the three controversial celebrities. Considering Pavlovian conditioning as an associational learning paradigm suggests that this is what happened. Females in the treatment condition had significantly higher implicit brand attitudes than females in the control condition. Conversely, females in the control condition had significantly higher explicit attitudes than females in the treatment condition. The reversal of the pattern of means for females lends support to an implicit/explicit attitude distinction.

Gender differences likely emerged from the all-female set of USs used. Aforementioned pretests for selection of CS and US and past pretests for the same suggested that both males and females perceived Paris Hilton, Jessica Simpson, and Britney Spears to be controversial celebrities but with potentially differing associated meanings (Miller 2006). It appears that the pairing of Gallo with controversial celebrities did not transfer negative affective from US to CS for females in the treatment condition. Rather, the Pavlovian procedure with the brand and celebrity arrangement was enough to

associate Gallo with celebrities, an association that might have been positive in nature for females. For males, association between these celebrities and Gallo may not have been as relevant from an affiliation point-of-view.

Taken as a whole, these results suggest that meaning transferred from celebrity to brand may not operate at the implicit attitude level (McCracken 1989). For implicit attitudes in the present study, this association alone seems to have been enough to make Gallo more accessible and perceived as more favorable at the implicit level. Consistently associating a relatively neutral brand with relevant celebrities might be enough to increase its favorability regardless of the meanings associated with those celebrities (Skurnik, Yoon, Park, and Schwarz 2005). The Pavlovian procedure did transfer meaning from celebrity to brand for explicit attitudes as expected, with females in the control condition evaluating Gallo more favorably than those in the treatment condition. For explicit attitudes, the arrangement of Gallo with controversial celebrities was enough to for females in the treatment condition to evaluate the brand less favorably than females in the control condition. The reversal of attitude means, where females in the control condition held more favorable implicit attitudes and less favorable explicit attitudes is consistent with a dual process model (Gawronski and Bodenhausen 2006).

**LIMITATIONS AND FURTHER RESEARCH**

The APE model suggests that explicit attitudes and stated inferred beliefs might relate as both may use propositional reasoning. Implicit attitudes, however, need not relate to stated inferred beliefs, as their originating process is associative in nature. While this explanation fits with the current findings, the lack of correlation between inferred beliefs and implicit attitudes might have been measurement induced. The implicit attitude measure utilized a SC-IAT procedure while explicit attitude and inferred belief measures were operationalized with semantic differential scales. These scales followed the SC-IAT with explicit attitude measures preceding inferred belief measures. It is plausible that responses to explicit attitude measures were readily accessible and thus informed responses to the inferred belief measures. Implicit attitudes collected with response times may not have been as accessible to participants and thus failed to correlate in either direction with inferred beliefs. The only way to have avoided this alternative explanation fully

would be collection of inferred belief data in a manner similar to implicit attitudes. Utilizing an IAT-type measurement tool for addressing implicit inferred beliefs rather than attitudes may be an area ripe for future research.

Additionally, the nature of the distinction between Pavlovian conditioning and evaluative conditioning remains an area highly relevant to the APE model and implicit/explicit attitudes in general. The APE posits that Pavlovian conditioning will not have an effect on implicit attitudes but that evaluative conditioning may have an effect under certain conditions. The current study suggests that conditioning effects on implicit attitudes are possible with a Pavlovian procedure. Further comparison of Pavlovian conditioning and evaluative conditioning in order to gauge their effect on implicit and explicit attitudes is an important avenue for future research. Such investigation(s) may be able to inform the ongoing debate around these two types of conditioning. More generally, the APE is a very encompassing explanation for implicit and explicit attitude change but many of its propositions have not yet empirically tested. The assertions of the APE have broad implications for such areas as priming, conditioning, and persuasion.

The present study has some initial findings to suggest that implicit and explicit brand attitudes are worth considering separately. The non-significant relationship between the measures of these two types of attitudes suggests that both may help explain consumer judgment and decision-making. The differences in correlation between the attitude measures and inferred beliefs raise questions about whether researchers have been missing a great deal of diagnostic information involved in consumption behavior. While the consumer may say how much he/she likes a brand when asked, his/her underlying associations with the brand may be different from a voiced judgment. These implicit associations may lead to decisions to buy, use, or dispose of a brand different from what a consumer may indicate when directly asked. Considering implicit attitudes may help consumer researchers to paint a more complete picture of attitudes that inform judgment and decision-making.

# Visual Velocity: Content Font Effects and Incidental Online Ad Exposure

Francesca Baraggioli, Epsilon, USA
S. Adam Brasel, Boston College, USA

## ABSTRACT

An eyetracker study explores how character spacing alters perceptions of reading speed and peripheral advertising fixations, and suggests content typography as a key method to increase peripheral online ad effectiveness Subjective reading measures do not correlate with objective visual search patterns: consumers vary subjective readability ratings based on spacing changes but there are no objective differences in reading time. The increased time and distance between visual fixations for wide spacing offsets the decreased time spent within fixations. The larger movements in wide spacing conditions leads to increased visual attention on peripheral advertising banners without increasing conscious awareness during exposure.

## INTRODUCTION

As the influence of interactive media has risen, the traditional standards of text display have become more flexible. No longer tied to strict rules of printed newspapers and magazines, typography and font effects have become a vital component of online communication and promotion (McCarthy & Mothersbaugh 2002). Limited prior research has explored the effects of typography on various items of interest to marketers, such as reading speed and retention, but the work exploring font effects online remains scarce. Recent research has suggested that the effects of typography on the printed page may not carry over into monitor-based reading. This issue has become increasingly important recently with the rise of web logs, also known as blogs, as a viable promotional medium. For example, over 29% of traffic to an Audi website during a recent campaign was generated by blog ads that were purchased with 0.5% of the marketing budget (Hall 2005). While blogs are currently a small portion of most media buys, blog advertising is predicted to grow to roughly $50 million in 2006, up from roughly $20 million in 2005 (Davis 2006). Companies themselves have also begun to launch promotional blogs as a method for communicating directly with their target markets.

The longer a person takes to read a particular blog, the more time that person has to be exposed to promotional messages either contained within the blog text itself or posted in the columns to the sides of the main post. At the same time, the blog must be perceived as easy to read in order to avoid mounting frustration in the reader. Given their primarily textual content, advanced graphical design elements will only play a partial role in blog readability metrics. Font and typography, on the other hand, are easily controlled and manipulated, and prior research on typographic effects suggests it will have an effect upon various metrics of interest to the consumer. In addition to increasing or decreasing the actual size of the webpage, font typography effects might engender changes in a consumer's visual search pattern as they read the blog, and this could increase or decrease the likelihood of incidental fixations on advertising content. The purpose of this work, then, is to explore how two easily-changed aspects of typography affect subjective and objective readability and reading speed for online blogs, and explore the implications for visual attention to blog-based advertising.

### Prior Work & Propositions

Two more easily controlled aspects of online typography is the space between characters, known as 'tracking,' and whether the font chosen for a webpage is serif or sans-serif. Prior research has shown that for physically printed material, serif fonts (such as Times New Roman or Garamond) are faster to read than sans-serif fonts (such as Arial or Verdana). However, this result has been called into question for reading on a computer monitor, with preliminary work showing an advantage for serif over sans-serif fonts (Wilson 2001), and experimental research showing mixed effects for serifs and reading speed (Arditi & Cho 2005).

Two key areas tracking is likely to affect are the number of letters contained within a single visual fixation, and the frequency of errors in letter or word identification. The effects of tracking on ease of reading and reading speed, however, has conflicting evidence within the literature. McCarthy & Mothersbaugh (2002) argue that tighter tracking will increase the number of letters in each perceptual span, thus increasing reading speed, and this effect is echoed in Overschelde & Healy (2005). It also follows that if the number of letters able to be processed in one fixation is not fixed, the reduction in letters per visual fixation when using wide tracking will require longer words to have two or three fixations, where only one fixation would have sufficed under tighter tracking, thus reducing reading speed. At the same time, the work on perceptual errors offers up the opposite finding. There is some evidence that very tight tracking creates crowding, which interferes with letter recognition (Chung et al 2001), and thus wide tracking should increase reading speed.

Running counter to both findings, however, is a series of papers exploring the perceptual span in reading (summarized in Rayner 1998) that suggests the number of letters we can effectively process in one visual fixation is relatively fixed at around 3 to 4 characters spaces to the left of the fixation point and 14 to 15 character spaces to the right. If this holds true, then tracking changes should have little effect upon reading speed as a section of text will require the same number of fixations to complete regardless of tracking level. Some recent work supports this position, with results showing mixed results for the effects of fonts on readability online (Ling & VanSchaik 2006), and other work suggesting typographic effects on readability might only be important under situations of low luminance or degraded visual signals (Yager et al 2005). In short, there is currently little consensus on the effect of tracking in perceptions of ease and speed of reading, little objective evidence of the visual search pattern itself, and a need for an exploration of these effects in an online context.

The ability to increase tracking without sacrificing ease or speed of reading might be preferable from a marketing perspective. Wider tracking would create more lines of text on the blog webpage, lengthening the overall page and creating increased space along either side of the entry to place promotional messages or advertising. Wider tracking should also increase the amount of space physically covered by the visual search and reading routine, potentially increasing the likelihood that the point-of-gaze will pass over promotional material irrespective of reading speed. Indeed, even incidental exposure to banner advertising without clickthrough can engender positive effects towards the brands being advertised (Mitchell and Valenzuela 2005). As there is a general bias towards the center of the screen when engaging in reading tasks (Vitu et al 2004), any effect that can increase the amount of screen space covered would be of value to marketers as advertising is traditionally placed on the perimeter of the webpage. This is of increasing

importance given story body text becomes 'stickier' with respect to visual fixations due to attentional inertia as users move deeper and deeper into a website (Wang and Day 2007), so incidental/accidental visual attention could be the only exposure many online ads receive.

An online study using eyetracker analysis was designed to offer insight into the conflicts within the literature outlined above, and explore typographic effects on readability. The visual search pattern measures created through eyetracker analysis allow for a detailed exploration of reading speed, errors, and fixation duration and location (Sheree 2005). Survey measures would capture subjective judgments of reading speed and ease of use and also illuminate whether any objective changes in the visual search pattern created by the typographic manipulations entered active cognition and memory for the media.

## STUDY 1

### Design

The stimuli designed for the study was that of a Tourism & Travel blog, similar to sites such as TripAdvisor.com or Gridskipper.com. The blog was three pages long, and each page detailed a tourist's "trip report" about his or her vacation to the island of Elba, off the coast of Italy. The comparatively unfamiliar island of Elba was chosen to ensure that all study participants had a similar level of familiarity with the subject matter prior to stimulus exposure. All three pages used 12-point font, single spaced, and the ordering of the three stories remained unchanged across subjects. The three trip reports shared many similar characteristics, such as similar word count (246 vs 268 vs 223), and each was bordered by three pictures of Elba on the left-hand side of the text (see Image 1). Two banner ads remained constant across the three blog pages, one banner for Travelocity on the left-hand side of the page, and one banner for Westin resorts on the right-hand side of the page.

Tracking and serifs were manipulated across all three blog stories. Tracking was varied by 15%, so the wide tracking condition had character spacing at 115% of the default font spacing while tight tracking had character spacing at 85% of default. The values were chosen because the differences were large enough to be noticeable when directly compared, yet still plausible enough when examined individually that the font would appear realistic and natural. Times New Roman was utilized as the serif font, and Arial was utilized as the sans-serif font. Each participant saw different combinations for the three trip reports so, for example, one subject would see the first story with wide tracking and serifs, the second story with tight tracking and sans-serif, and the third story with moderate tracking and serifs, while the next subject saw a different combination of typographic manipulations and story. Across the pool of participants, each combination of tracking (wide, moderate, tight) and serif (serif, sans-serif) occurred an equal number of times for each story. This within-subjects manipulation was necessary due to the limitations on sample size imposed by the need to run each participant individually in the eyetracker lab.

Twenty-four undergraduate students, mixed as to gender, were recruited from an east-coast private university and compensated with a $10 online gift certificate for their participation. Participants were run in two separate waves approximately nine months apart; a 'wave' covariate was included in analysis ANOVAs but had no effect upon results. Upon entering the lab, participants were briefly introduced to the eyetracker equipment and calibrated using a 9-point gaze chart so the system could map point-of-gaze onto screen images. The ASL 6000 system employed an infrared corneal-reflection technique to capture point-of-gaze data at sixty frames per second, accurate to within 1.5 degrees of the visual search field. GazeTracker software was then used to record all visuals on the display monitor and to map point-of-gaze information onto the stimuli post-exposure. The GazeTracker software also analyzed the point-of-gaze information and marked fixation points along the visual search pattern (see Image 2). These fixation points represent areas of visual attention, as the eye moves from fixation point to fixation point in a series of saccadic movements where visual processing is limited. The system used created a fixation for each collection of gazepoints contained within one to five visual degrees that lasted more than 200 milliseconds.

Participants were instructed that they would be reading a travel blog and then asked questions about their experience, following which they were exposed to the three travel blog stimuli pages. Participants were free to read at their own pace and moved on to the next page in the travel blog by clicking on the large 'NEXT' button at the bottom of each page. During stimuli exposure, the eyetracker created and saved a video of the website with the point-of-gaze gazetrail and visual fixations overlaid on the image. The GazeTracker software also recorded the following variables, broken down by separate blog story, for each participant: Total Time Shown, Total Time Tracked, Percentage of Time Fixated Relative to Time Tracked, Number of Fixations, Number of Gazepoints, and Average Fixation Duration. Measures of average X/Y distance between gazepoints (measured in pixels) and standard deviation of gaze location across exposure time (also measured in pixels) were computed as further measures of overall eye speed and movement intensity.

Following stimuli exposure, participants were first asked a series of multiple choice recall questions on blog content, then rated each story on "easy to read", "useful", "fast to read", "visual", "informative", "interesting", and "trustworthy" 7-point Likert scales. They were then asked a series of general computer- and internet-usage questions. Finally, participants were asked to free-response recall any banner ads they saw, and then were asked to circle the 2 brands advertised from a list of 15 travel brands. The overall procedure lasted roughly thirty minutes for each participant.

### Results

*Subjective Reading Measures:* Not surprisingly, significant correlations were discovered between a participant's rating of a blog as easy to read and their ratings of it as fast (r=.576, $p<.01$), interesting (r=.615, $p<.01$), and trustworthy (r=.412 $p<.01$). But does tracking affect the perception of a blog as easy to read? A one-way ANOVA of tracking on the ease of reading measure revealed a significant effect for the tracking manipulation on the easy-to-read measure (F=4.129, $p<.05$). Planned contrasts reveal that the moderate tracking condition had higher easy-to-read ratings compared to the tight (5.35 vs 3.82, $p<.01$) *or* wide tracking conditions (5.35 vs 4.47, $p<.05$). Including story as a covariate in the ANOVA (to control for any differences across the three story replications) did not change the pattern or significance of the results. While this inverted-U pattern of effects replicated for the effect of tracking on subjects measures of reading speed, trustworthiness, and interest, these patterns were only directional and not found to be significant. As for serifs, an ANOVA revealed a significant effect on subjective reading speed (F=5.195, $p<.04$), where the sans-serif font was rated as significantly faster to read than the serif font (5.06 vs 4.17), but the serif manipulation had no effect on ease of reading or trustworthiness and interest ratings.

*Objective Reading Measures:* Do these subjective reports of reading speed and ease of use correlate with more objective measures of the visual pattern? It would appear that people's percep-

# FIGURE 1

## Fixation Duration

tions of reading speed are not accurately reflecting their experience, as there were no significant correlations between the subjective reading speed or ease of use measures from the survey and the objective measures of reading speed taken from the eyetracker (time spent on page, time spent in fixations on page, number of fixations on the page). Serifs, as well, had no significant effect on objective measures of the visual search pattern. So does tracking have an objective effect on the visual search pattern? An ANOVA analysis of the effects of the tracking and serif manipulations revealed a significant main effect of the tracking manipulation on the average fixation duration (F=4.015, p<.05). The mean fixation length was 385msec for the tight tracking pages, 345msec for the moderate tracking pages, and 310msec for the wide tracking pages (see figure 1).

This shows that participants spend longer in each fixation when the letters are closer together. From this one might assume that the wide tracking condition was faster to read, since each fixation took less time on average. A second ANOVA exploring the effects of the tracking manipulation on the percentage of overall time spent fixated, however, reveals a significant counterbalancing effect on percentage of time spent within fixations (F=8.839 p<.01). Participants spent an average of 84% of their time within fixations for the tight tracking pages, compared to 79% for the moderate tracking pages and 75% for the wide tracking pages (see figure 2). Thus, while tight tracking makes the average fixation length longer, the participant spends less time non-fixated, with shorter and faster movements from fixation to fixation. Conversely, wide tracking decreases the amount of time each fixation takes, but increases the amount of time non-fixated as participants have to move their point-of-gaze further between fixations.

These two effects appear to 'cancel out' when looking at the overall time it takes to read a blog: an ANOVA of any of the time of gaze measures on tracking revealed no significant effect (p>.50). These results suggest that the number of letters able to be processed within a single fixation is indeed fixed at a relatively stable number

for an individual (as per Rayner 1998). Readers then need to space their fixations further apart in wide-tracking conditions which increases the amount of time spent moving from fixation to fixation. Re-examining the video record, this pattern of results is supported by the evidence that the number of fixations per line of text appears no different between tight, moderate, and wide tracking conditions, instead participants vary the distance traveled between fixations to account for the differing width of words.[1] Measures of visual search speed reinforce that wide-tracking readers are covering a wider area of the screen and moving their visual attention to a greater degree than tight or moderate tracking readers. They exhibit significantly higher standard deviations of X/Y position on-screen than either tight or moderate tracking participants (132 pixels vs 105 or 113 pixels, both *p*<.05), and measures of average X/Y distance from gazepoint to gazepoint are also significantly higher (10.7 pixels vs 7.6 or 9.1 pixels, both p<.05)

One concern with using tight tracking raised in the prior literature is that by placing letters closer together, more errors in letter and word identification will result, causing more repetition and backtracking within the visual search pattern. The experimenters also reviewed the videos of the participant's visual search pattern on the stimuli blogs, counting the number of backtracks or repeat fixations on the same or earlier groups of text. While the pattern of results matched expectations, with tight tracking having the highest mean backtracks per page (8.3) compared to moderate (7.5) or wide tracking (6.4), the difference was only directional and not significant due to wide variance within condition. The number of backtracks also did *not* have a significant correlation with the

---

[1]While it is no doubt possible to introduce tracking so wide that the traditional letter span would not fit within the range of focal/foveal vision and the number of fixations required for to process line of wide-tracking text would increase, it is unlikely that such a font environment would be used on body text within a blog.

FIGURE 2

participants subjective measures of ease or speed of reading, suggesting that the backtracks are taking place on an automatic or non-conscious level, and information may be frequently aggregated across backtracks in early perception before cognition comes into play. Backtracks also resulted in no additional fixations or visual attention on advertising content.

*Advertising Effects:* So if readers of wide-tracking text are moving their eyes further between fixations, does this make incidental fixations on advertising content surrounding the body text more likely? To explore this, incidental gazepoints and follow-up fixations on advertising content was explored on the first page only.[2] Regardless of tracking condition, the banner ads receive initial fixations upon participant exposure to the first webpage, as they engage in a visual search across the entire page to establish a mental map of the screen and content format. An ANOVA exploring the effects of tracking on first-page ad fixations reveals no significant effect if fixations are viewed as a whole. If "follow-up" fixations (i.e. fixations that take place after the initial visual search of the page is completed and the participant is in the process of actively reading the blog entry) are used instead, a more pure measure of tracking effects a marginal effect of tracking appears (F=2.834, *p*<.09, see Figure 3).

The wide tracking condition has more follow-up fixations on advertising content (M=8.66) than moderate (M=7.06) or tight (M=5.98) tracking. Interestingly, while initial fixations show a directional bias towards the left banner ad (likely due to it's occurrence in what is traditionally menu-bar location) follow-up fixations appear evenly divided between the two banners, and are not significantly different from each other.

Does tracking more strongly affect incidental gazepoints (i.e. isolated gazepoints along the visual search trail but not contained within a focal fixation) on advertising content? Incidental gazepoints were computed by filtering the gazetrail data so only frames where the gazepoint was within the X/Y boundaries of the two banner ads were included, followed by the removal of all frames within fixations. An ANOVA of the effect of tracking manipulation on incidental ad gazepoints reveals a significant effect of tracking (F=3.874 *p*<.05, see Figure 4).

Wide tracking readers had the highest incidental gazepoints on the banner ads (M=61.25) followed by moderate (M=55.63) and tight (M=46.88, see Figure 4) tracking. Here, incidental fixations were biased to the banner ad on the right, as the body text was separated from the left bumper by a series of Elba photographs. Thus, perceptual errors and 'overshoots' of visual fixations rarely made it all the way to the left bumper, whereas the right bumper abutted the text and received more incidental fixations as a result.

These results provide strong evidence that wide tracking on body text can be a beneficial tool for online advertising beyond the simple increase in adjoining space it can provide. Wider tracking actually increases the incidental fixations on advertising banners due to the increased movement within the visual search pattern, and does so without impacting objective reading speed or perceived interest in or trustworthiness of the source.

## DISCUSSION

In summary, varying tracking seems to create offsetting effects on reading speed and usability. The increased time necessary to make larger movements *between* fixations for wide tracking offsets the decreased time spent *within* each fixation, so tracking overall has little effect on overall objective measures of reading speed. The objective measures of reading speed and ease of use seem also to have little correlation with subjective measures of the same, suggesting that typographic manipulations offer a unique route for exploring online promotional impact without impacting

---

[2]This is necessary because of a strong page-order effect where ad fixations and attention decrease with page number; unfortunately separating the pages significantly reduces the N available for analysis.

**FIGURE 3**

Followup Fixations on Ad Banners

**FIGURE 4**

Incidental Gazepoints on Ad Banners

overall website perceptions. Indeed, wide tracking significantly increased incidental gazepoints on advertising content surrounding blog text and marginally increased follow-up focal fixations on ad banners.

It is important to note that tracking was not shown to have an effect on source trustworthiness in the current work; the exposure time to each tracking condition was somewhat limited. It would be interesting to extend the length of each blog entry as well as make the promotional nature of the target stimuli transparent, to better explicitly test for traditional marketing outcome measures such as

attitude-towards-brand or purchase intent. Future work might also explore the boundary conditions of tracking as it relates to ease of reading. If tracking becomes too tight, letters begin to overlap and word recognition will suffer greatly. If tracking becomes too wide, a single visual fixation will not be able to take in as many letters as are possible to process at once, interfering with word recognition as individual words are split across multiple fixations. Finally, it should be noted that the banner ads used in this study were directly relevant to the travel blog content. While intuition suggests that incidental fixation differences based on tracking will not be af-

fected by varying the ad relevance, further work could explore interactions between ad relevance and tracking on follow-up fixations.

Overall, these results suggest that increasing tracking on a blog or webpage might offer promotional benefits with little cost in subjective ease of reading by the consumer. A website or blog using wide tracking will make the target article longer on the page, assuming column width is held constant. This allows more space along either side of the article in which to place advertising or promotional messages at no cost to the perceived ease of reading or trustworthiness of the site. In addition, wide tracking increases the amount of movement within the visual search and reading pattern, which increases incidental fixations on surrounding banner ads. While increasing tracking will not actually increase the time spent on the page, the extra visual space and visual attention on ad content comes without a significant negative impact on reading speed, trustworthiness, or interest in the piece.

# Balance and Word-of-Mouth Communication: A Signed Digraph Analysis of Consumers' Cognitive Networks

Andrea Wojnicki, University of Toronto, Canada
Nan Jia, University of Toronto, Canada

## ABSTRACT

This research investigates the role of balance and consistency in inter-consumer communication, through an analysis of consumers' cognitive networks representing their word-of-mouth (WOM) experiences. Following a preliminary study employing in-depth interviews, consumers' recalled and hypothetical WOM experiences were examined in an online survey according to social network methods. Results indicate that digraphs associated with recalled WOM experiences are more balanced than would be the case if they were generated by chance, and importantly, this balance implicates disseminators' future WOM propensities. We conclude that consumers' micro-level cognitive processes affect their propensities to engage in future macro-level marketplace communication.

## INTRODUCTION

Researchers across a variety of disciplines including economics, sociology and marketing have established the significant impact of WOM on the marketplace, due to its inherent credibility, reach, and relevance ( Godes et al. 2005). Early WOM researchers generally considered the phenomenon from a macro or marketplace perspective (Frenzen and Nakamoto 1993). For example, Bass (1969) developed a model that described the significance of interpersonal communication relative to mass media following the introduction of a new product, and Granovetter (1973) highlighted the role of social networks in his examination of job changers' quests for new employment. More recently, Godes and Mayzlin (2004) concluded that online conversations regarding TV shows that transcend across (as opposed to within) community networks may be more predictive of ratings than simple counts of online mentions. Focusing instead on the micro perspective of WOM are researchers who describe and define the individual consumer traits, motivations and other factors associated with WOM behaviors, such as altruism (Price et al. 1995), and self-enhancement (Wojnicki and Godes 2006).

Frenzen and Nakamoto (1993) first illustrated the value of integrating the macro and micro perspectives in WOM. They created a simulation to demonstrate the macro effects of consumer communication across various combinations of strong and weak relationship ties. Then, they demonstrated consumers' propensities to share marketplace information depending on the moral hazard associated with the information and concluded that "when moral hazard is high, weak ties are frail," that is, when sharing marketplace information in costly, consumers may still share the information with their strong ties, but are less likely to share it with their weak ties. In the present research, we seek to similarly bridge the micro and macro perspectives to improve our understanding of WOM processes.

Here, the phenomenon is considered at a supra-individual level, but all from the perspective of a single consumer—the disseminator of the WOM. The unit of analysis is a WOM "digraph" that represents the disseminator's cognitive network associated with a specific WOM experience. Employing the theories and empirical methods associated with basic balance theory, our objective is to demonstrate the prevalence and implications of consumers' desire for balance in the context of WOM. This enquiry is worthy of our efforts, since consistency has been established as a fundamental cognitive and social process (Eagly and Chaiken 1998; Hummon and Doreian 2003).

## BALANCE THEORY

*Balance theory* is both a general theory and a methodological framework for conducting empirical analyses (Hummon and Doreian 2003).The concept of balance has been fruitfully applied to various contexts such as international relations, community elites (Wasserman and Faust 1999), and consumer behavior. The theory of "cognitive balance" was introduced by Heider (1946), who modeled our universal quest for consensual validation of personal tastes with his P-O-X triad, encompassing one person (*P*), the other (*O*) and an entity (*X*). Social network analysts characterize the P-O-X triad as one form of a digraph —a set of nodes that are connected by directed (i.e., flowing from one to another) and valenced relations in a closed network (Wasserman and Faust 1999). The valences of the ties can be operationalized in a variety of ways, such as positive/negative affect or similarity/dissimilarity. Psychological balance exists when the ties between these three nodes are harmonized, that is, they are all positive or one tie is positive and the other two are negative, as per the laws of transitivity.

Behavioral researchers have leveraged Heider's theory as a foundation for other more nuanced balance-related theories such as cognitive dissonance (Festinger 1957), self verification (Swann 1983), and parallel constraint satisfaction (Simon et al. 2004). Cognitive dissonance, the most pervasive of these balance theories, specifies that people strive for consistency across their related cognitions, particularly when they have foresight or when their convictions are public (Festinger 1957). Intolerable inconsistencies are reconciled by changing the valence or significance of cognitions. While the present research focuses on basic balance theory, we examine consumers' future WOM propensities following balanced and imbalanced WOM experiences as a possible means to maintain consistency. We also suggest other factors to explore in future WOM research in accordance with cognitive dissonance.

Balance theory has been applied to several consumer phenomena. Belk (1976) demonstrated that consumers' recalled gift-giving experiences are more balanced than would be the case if the experiences were generated by chance (40% vs. 24%), and that satisfaction with gift-giving is correlated with balance. Other research indicates that consumer choice is affected by attribute balance (Chernev 2005), and that persuasion attempts laden with inconsistent emotions may lead to less favorable brand attitudes (Williams and Aaker 2002). In the context of celebrity endorsements, research indicates that consumers may implicitly consider a self-celebrity-brand triad in their attitude formations (Kamins 1990). For our context, we translate Heider's P-O-X triad to a basic D-R-T triad (disseminator-receiver-product). The signs of the three ties that connect these three nodes will be identified as likes or dislikes, as identified by the disseminator–see figure 1. In a preliminary study, we first seek to establish the relevance of balance in WOM communication with this framework.

Based on the laws of transitivity and given the eight possible versions of this signed digraph, four are balanced and the other four are unbalanced. As such, if generated by chance, we would expect 50% to be balanced. Based on the preference for balanced conditions as stated by balance theory, we anticipate that more than 50% of the WOM triads generated by consumers will be balanced and that consumers will be more satisfied when their WOM experiences are balanced:

**FIGURE 1**

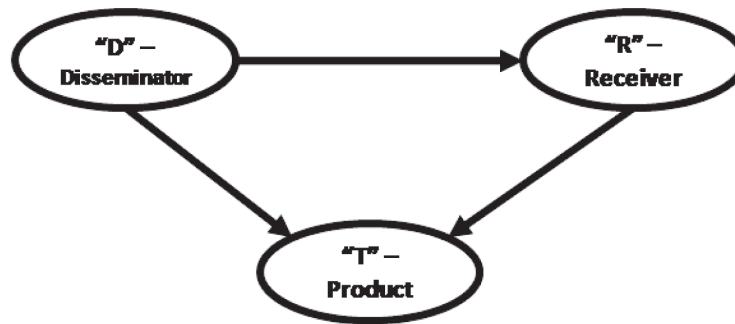

**TABLE 1**
Preliminary Study-In-depth Interview Results

| Triad Number | D→R (valence) freq | D→T (valence) freq | R→T (valence) freq | Frequency (Proportion) | Balanced | Sat | Dissat |
|---|---|---|---|---|---|---|---|

| *Positive* | 47 (100%) 0 (0%) | 40 (85.11%) | 32 (58.09%) | 47 (100%) | 31=65.96% balanced | 37 (78.72%) | 10 (21.28%) |
| *Negative* | | 7 (14.89%) | 15 (31.91%) | | 16=34.04% imbalanced | | |

| | | Sati | Dissat | Total |
|---|---|---|---|---|
| *Frequency* | Balanced | 31 | 0 | 31 |
| *Cross Tabulation* | Unbalanced | 6 | 10 | 16 |
| $\chi^2$ (1)=24.612 $p<.001$ | Total | 37 | 10 | 47 |

*H1*: The digraphs associated with consumers' WOM experiences are more balanced on average than would be expected if the digraphs were generated by chance.

*H2*: Consumers report higher levels of satisfaction with WOM experiences when the digraphs associated with the experience are balanced vs. when they are not balanced.

## PRELIMINARY STUDY–INDEPTH INTERVIEWS

### Method and Analysis

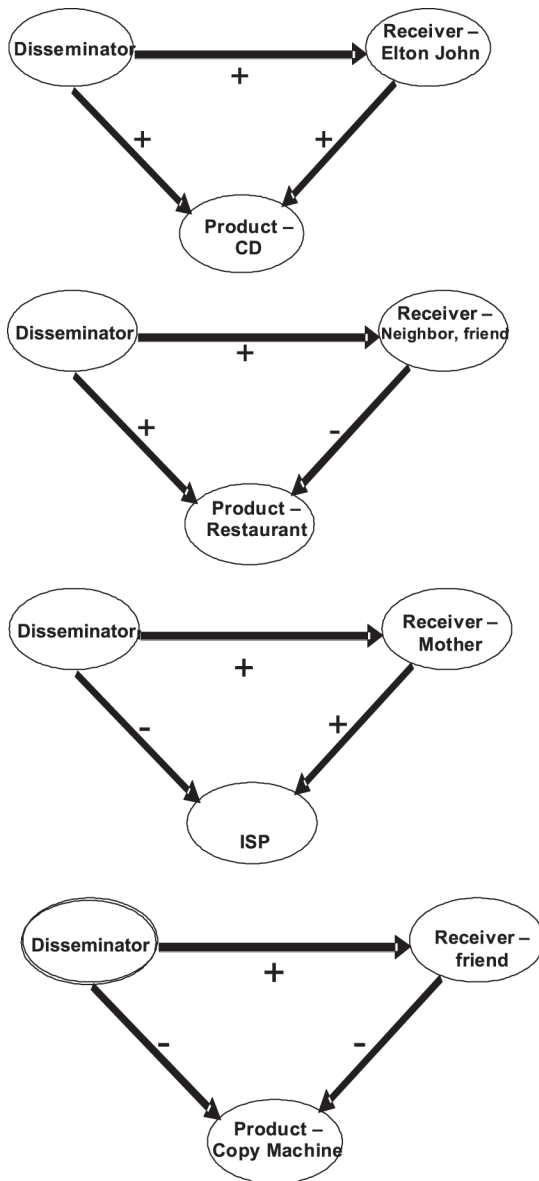
Ten one-on-one, phenomenological interviews were conducted. Participants included five women and five men ranging in age from 24 to 60, with significant variation across class, vocation and ethnicity. These in-depth interviews were conducted at a central research facility and lasted between two-and-a-half and three hours. Participants were each paid $100 as compensation.

An interviewer blind to the research objective followed an interview guide that encouraged discovery-oriented exploration of consumers' perceptions of their WOM experiences. Participants were asked to articulate their "thoughts, feelings and experiences regarding sharing information with others about products and ser-

vices" using their own words through storytelling, photo probes, Kelley grid/laddering, and sensory exercises (Thompson et al. 1997; Zaltman 1997). The terms "word-of-mouth," "balance" and "consistency" were not brought up by the interviewer and emic terms were probed and defined by participants. The interviewer guided the participant to focus across a multitude of retrospective experiences (as opposed to abstract generalizations), which afforded inference of patterns within and across interviews (Holt 1997; Thompson et al. 1997).

Given our focus on retrospective accounts, we acknowledge issues associated with recall, particularly the propensity for people to recall consistent events (Freeman 1992). To address this, we also test implications associated with balanced and imbalanced hypothetical experiences in the main study. Here, we highlight three points in defense of recalled accounts that are particularly relevant to this context as suggested by Gardial et al. (1994). First, regardless of whether it represents objective reality, recalled protocol is assumed to be representative of memory structure, which is particularly germane to cognitive networks. Second, memory may be predictive of future behaviors, which we seek to understand here in terms of future WOM. Last, "memory data may be the basis for most consumer WOM

## FIGURE 2
### Preliminary Study-Examples of Triads and Corresponding Quotes



**TRIAD #1–Balanced**

"I got to know Elton a little bit when I went and visited the recording studio. And I was wearing a T-shirt that said Innocence Mission on it and he looked at that T-shirt and he said 'Who? What's Innocence Mission?'... So I said to myself oh great this is a CD he doesn't have. So I Fed Exed it to him. The next time I saw him was backstage at a Billy Joel show in Foxborough and I said, 'Did you get the Innocence Mission thing I sent you?' He said, 'yeah, yeah. It's really great.' … It gives you a sense of knowledge, power. Like I am a leader…"                  – Interviewee I

**TRIAD #2–Not Balanced**

"It was in November at the Cape. My wife and I recommended a restaurant that we went to… we had a wonderful experience there. And our good friends and neighbors across the street said 'how was it?' …We said it was fantastic, relaxing. We had a wonderful time. Then they went and it was horrendous and the wife was upset to the point where it was irritating. I mean to the point where you really wanted to slap her. I mean she was rude and said, 'God don't you recommend that to anyone again. We wasted money. We had a terrible time. The food was rotten and the drink was rotten and the waitress was rotten.' So I said well that's the last time I'll recommend a restaurant to anyone. I felt terrible."
                                                         – Interviewee B

**TRIAD #3–Not Balanced**

"I feel extremely negatively about [ISP brand]… I just hate everything about it… I got my mother onto [this ISP] because there's no way she could interface with anything else...the thing is, sharing the information with my mother had to… take place in a very different way. ... I felt duplicities…I couldn't let her know that [this ISP] is the right one for you because it's actually dumbed-down the most... I'm really disgusted with the fact that I've like given into the evil empire and now I have a family member who is happily using [this ISP]-and I promoted it... So, I have a lot of mixed feelings about it."                  – Interviewee C

**TRIAD #4–Balanced**

"I had a friend who was in computers, … I had worked on copy machines. And I said, 'you don't want this copy machine.… it involves a lot of maintenance. It involves a lot more parts that you have to replace. It involves a maintenance contract, which you don't want to get involved with.' …. Then-[he had the] same result."                  – Interviewee G

communications, as consumers are more likely to relate memories of their experiences (what they *think* actually occurred) than the actual experience itself" (p.551). This implies the association between consumption experience recall and WOM behaviors, which we suggest transcends beyond the WOM experience as an ends to become a recalled experience itself.

Interviews were taped and later transcribed to yield over 200 pages of single-spaced data. Two coders who were blind to the research objective first identified all of the WOM experiences (N=47), and then coded tie valences. The D→R tie represents the disseminator's perception of her relationship with the receiver immediately before the experience. The D→T tie represents the valence of the product message. The R→T tie was defined as the disseminator's perception of the receiver's satisfaction with the product. Each of these ties was coded as "+1" (like, positive affect) or "-1" (dislike, negative affect). In addition, the coders rated the disseminator's level

of satisfaction with the experience as "+1" (satisfied), "0" (neutral), "-1" (dissatisfied), or "na" (not mentioned). Inter-rater reliability was established at 82% for the experiences, 77% for the ties and 84% for the satisfaction ratings. Discrepancies were resolved through discussion. The coders also highlighted recurring themes from the participants' recounts. This post-hoc, secondary task was purposefully vague and intended to provide general insights, some of which were examined in the main study.

### Results & Discussion

Forty-seven complete WOM experiences were identified in the data. Table 1 describes the data according to the valences of the ties. For illustration purposes, an example of each of the four types of complete triads elicited is highlighted in figure 2. Amongst the triads, 59.57% contained only positive ties, and all of the triads had a positive D→R tie.

Of the 47 triads, 31 were balanced (*BalProp*=.660), supporting hypothesis 1 (one-sided *t*(1,47)=.160, *p*=.014). Thirty-seven (78.72%) were rated as "satisfying" and 10 (21.26%) were rated as "dissatisfying" (zero were rated as "neutral"). The correlation between satisfaction and balance is *r*=.724 (*p*<.001), confirming hypothesis 2. Further insight into the relationship between balance and satisfaction is highlighted in the cross-tabulation count at the bottom of table 1; balance and satisfaction are not independent ($\chi^2$(1)=24.612, *p*<.001). Furthermore, six of the 47 WOM experiences identified were anomalous; that is, they were not "balanced and satisfying," nor were they "unbalanced and dissatisfying;" all six were "unbalanced and satisfying." A more detailed analysis reveals that since the D→R tie was positive for all triads, in order for these six triads to be unbalanced, the disseminator and the receiver had to disagree regarding their opinion of the product (i.e., the D→T and R→T ties are either positive and negative respectively, or vice versa). Furthermore, these six experiences could be categorized into two types. The first is that the disseminator appeared to have an extremely strong tie with the receiver, such that the disagreement about a single product/service was trivial compared to the personal relationship:

"…like when I've told my mother that I bought a certain pair of shoes… and she says, oh no you don't that's just silly. I don't really worry about it as much cause they have their views and that's fine but it's just fun being able to share something that you've experienced with other people."

<div align="right">Interviewee F</div>

"…sometimes it could be a nothing thing. I mean who cares if she goes to that restaurant really."

<div align="right">Interviewee H</div>

For the second type of anomaly, the whole experience is viewed as trivial or inconsequential:

"…*(My friend asks me)* What do you like? I like Sam Adams… It…tastes good. Whether or not it's true or not true, he's not really focusing on my opinion because he's …only half listening. It isn't going to get underneath his psyche and make an impression."

<div align="right">Interviewee G</div>

"I'm saying, 'I have this (*CD*). I want to share it with you…. it's either positive or negative. It could be so many things. But it's just information. That's what it is. That's all it is… The other person's thinking, 'All right. I'll check it out,' Then, he'd either be saying, 'Hey, that's not for me. Throw it away-whatever.' but it doesn't really matter either way."

<div align="right">Interviewee D</div>

When interpreting the results of these interviews, we highlight the positivity effect and its implications in terms of recall biases—consumers may be more likely to recall positive, satisfying, and cognitively balanced experiences. For example, Freeman (1992) concluded that many inaccuracies in participants' recall of networks could be attributed to their propensity to "correct" for imbalance or intransitivity. Recognizing these biases and in order to elicit data in the subsequent main study with sufficient variance across the various WOM experiences, we do two things. First, for half of the recalled WOM experiences, participants are instructed to recall a WOM experience for a product with which they were dissatisfied. Second, hypothetical scenarios are also incorporated where the WOM digraphs are manipulated. The coders also noted that the degrees of the valence and the importance of the ties varied within and

across episodes, consistent with balance theorists who criticize unitary tie measures as being too constraining (Simon et al. 2004). We address this in the main study by incorporating continuous interpersonal weight (importance) and strength measures (duration, intensity, intimacy-Granovetter 1973) as well as product involvement related metrics to represent the ties.

For several of the WOM experiences described, disseminators suggested they would not make suggestions again to the same receiver and/or regarding the same product. Therefore in the main study we also measure future WOM. Based on these insights, we anticipate that:

*H3*: The (im)balance of the digraph associated with a WOM experience will (discourage) encourage disseminators to generate (less) more future WOM–both to the same receiver and regarding the same product.

*H4*: When the aggregate ties in a WOM digraph have higher weight, the relationship between balance and future WOM will be strengthened; unbalanced digraphs result in much less future WOM, and balanced digraphs result in much more future WOM as compared with digraphs with lower weights.

The coders also noted that the D→T tie was often challenging to code, since the disseminator's private evaluation of the product differed from what they publicly communicated (e.g. figure 2 triad 3). Of course, this is not completely atypical; people's private thoughts and public behaviors are not always consistent. We consider our private self, our public self, and other domain-specific selves in our day-to-day activities (Baumeister 1998). For example, in his gift-giving analysis, Belk incorporated the *ideal self* (1976). Based on this theory and the interview data, we refine the definition of the disseminator in the main study to be "the public self" (*D*) and incorporate a fourth node representing "the private self" (*S*) (figure 3). This allows us to interpret differences between when the disseminator tells the truth (D→T and S→T are consistent) vs. when they do not (D→T and S→T are inconsistent) regarding their true or private opinion of the product.

The examples described also highlight the significance of tie valence definitions. The D→R relationships between the girl and her mother (figure 2, triad 3) was strong and positive according to our "positive affect (like)" definition, resulting in unbalanced. However, if the D→R tie was defined in terms of perceived similarity (particularly in product preferences/experience) the D→R tie could be negative, and the triad therefore balanced. In the main study, we also measure S→R similarity and explore the implications of incorporating this definition.

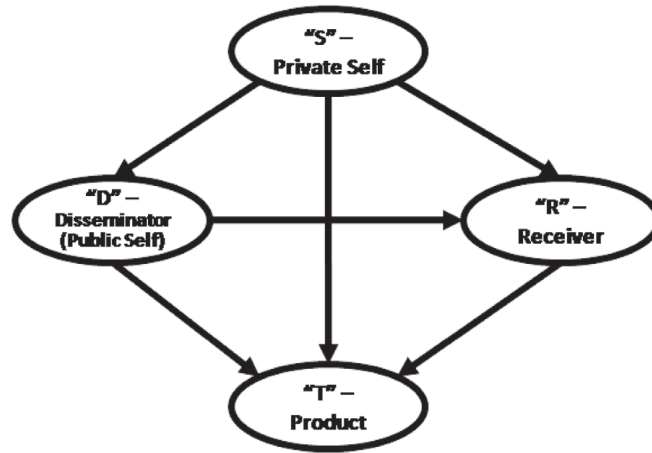
## MAIN STUDY

*Sample and General Procedure*. Members of an independent online U.S. research panel were emailed an invitation to participate. 498 participants completed the study and received points redeemable from the research firm for items such as CDs and DVDs. The final sample was 51.5% female and all were aged eighteen to 65 years, with 31.3% aged 25–34.

Participants were emailed a link to the experiment website and given a 72-hour window in which to complete the experiment. The study consisted of three main stages; the first was to recall personal WOM experiences, the second was to answer questions regarding randomly generated hypothetical WOM experiences, and the last stage was general demographic and other questions.

*Measures-Recalled WOM Experiences*. Participants were first asked to recall a real WOM experience with a particular person about a specific television show, restaurant, movie, book, or retail store.

**FIGURE 3**



The survey was programmed such that the product, category and receiver's name were automatically threaded into the relevant questions on subsequent screens. Participants were first asked to indicate the timing of the conversation, then proceeded to questions regarding each of the six network ties, all of which were posed in the form of 7-point scales. The ties between the consumer nodes (i.e., "S," "D," and "R") were derived from the sum of two questions: "dislike/like" and "not enjoy/enjoy spending time together." The weight measures for all ties were comprised of a sum of two 7-point scale questions with the anchors of "important/unimportant" and "means a lot/means nothing."

The S→R tie was defined as "how the disseminator privately and truly feels about the receiver." S→R strength or closeness was measured in terms of "am not/am very close" and "we do/do not provide emotional support to each other." S→R similarity was measured via category specific preferences and knowledge or experience–both anchored by "very different/similar." The S→D tie was defined as participants' private/true feelings regarding their public WOM behavior. Two questions accounted for the S→D valence measure, anchored by "did/did not do the right thing" and "glad/not glad about what I said." The S→T tie was similarly defined as the disseminator's private and true feelings about the product. Valence was operationalized in terms of "dislike/like" and "least/most favorite." The D→R and D→T ties were defined as the public relationships and proclamations respectively. As such, the measures for these ties were similar to those of S→R and S→T, except instead of the "private and true" opinions or judgments, *public perceptions and messages* were considered. For all tie measures with the exception of R→T, participants were asked to consider their opinions at the time that the WOM communication occurred. This was important, since as stated it is possible that their opinions or judgments could change following the experience based on the receivers' feedback or based on subsequent experiences. The R→T valence was defined as the disseminator's perception of the receiver's product judgment and measured in terms of "liked/disliked" and "terrible/great." Participants were asked two 7-point scale questions regarding their general satisfaction with the experience (including "dissatisfied/satisfied" and "regret/am glad"). Last, participants answered four 7-point scale questions regarding "future WOM," including actual and anticipated WOM to the same receiver and actual and anticipated WOM regarding the same product.

Participants then repeated the same procedure, but this time they were prompted to think of a WOM experience regarding a product in one of the other product categories and a product with which they were

not satisfied. These two criteria were added in an attempt to maximize variance.

*Measures–Hypothetical WOM Experiences.* Following the recalled experiences, participants were presented with hypothetical scenarios that included details associated with the simple (D-R-T) WOM triad and where the D→R tie was always positive (i.e., communication to a friend). In the first part of the scenario, the disseminator's judgment of a product (D→T) in one of the five categories (movie, store, restaurant, book or TV show) was randomly manipulated to be positive, neutral or negative. Participants were then asked to indicate how likely they would be to bring up this product in conversation with a friend (7-point scale "not very likely / very likely"). The scenario continued with positive or negative feedback from the friend (R→T). Participants were then asked to indicate their satisfaction with the experience as well as their future WOM intentions (both regarding the same product and to the same receiver).

*Analyses.* The WOM digraphs generated from the recalled WOM experiences contain five semi-cycles or semi-paths (three or more nodes connected by ties) where all nodes are distinct and the starting and ending node are the same (Wasserman & Faust 1999). Specifically, there are five semi-cycles: four of length three (i.e., with three ties: D-S-T-D; S-R-T-S; D-S-R-D; and D-R-T-D) and one of length four (i.e., with four ties: D-S-R-T-D). To determine whether the digraphs are balanced, the balance associated with each of the five semi-cycles contained in the digraphs is considered based on transitivity. To evaluate relative balance across digraphs, Wasserman and Faust (1999) suggest a "cycle index for balance," a continuous measure that ranges from zero (completely imbalanced) to one (completely balanced). This index is calculated by dividing the number of positive semi-cycles in the digraph by the total number of semi-cycles, where shorter semi-cycles have higher weights because they represent more direct reasoning:

$$Balance\ Ratio = \frac{\sum 1/L * b_L}{\sum 1/L * t_L}$$

$L$   is the length of a semi-cycle
$b_L$   is the number of *balanced* semi-cycles of length $L$
$t_L$   is the *total* number of semi-cycles of length $L$
$1/L$  can be any monotonically decreasing function of $L$

In this case, the count of the four semi-cycles of L=3 and the one of L=4 that are balanced ($b_L$) is divided by the total number of semi-

cycles of each length ($t_L$). In advance of gathering data, a thorough analysis of the possible tie configurations was conducted. Based on the six ties, which can be positive or negative, there are a total of 64 ($2^6$) possible configurations. The ten conceivable configuration types are based on the combinations of balanced semi-cycles, of which only five are possible or compatible for this digraph. Given the configuration likelihoods and respective balance ratios, the average expected balance ratio is .503, which we use as the benchmark for hypothesis 1.

## Results and Discussion

Tie valences did not vary across category, so the category variable was collapsed for all analyses. The valences across ties range from $M_{R\rightarrow T}$=2.079 to $M_{S\rightarrow D}$=6.555. Note that the mean valences for S→D and S→R are significantly higher than all other ties ($p<.05$) and R→T is significantly lower than all others ($p<.05$). When valence is operationalized as similarity for S→R, the mean is not significantly different vs. when it is operationalized as affect ($M_{S\rightarrow R\ affect}$=6.438, $M_{S\rightarrow R\ similar}$=5.652, $r$=0.365, $p<.001$). In other words, while it appears that directionally disseminators report slightly higher affect than similarity with the receivers, there are very few recalled WOM episodes with high S→R affect and low similarity or vice versa.

The disseminator's private vs. public relationship with the receiver is not significantly different in terms of valence ($M_{S\rightarrow R}$=6.438 vs. $M_{D\rightarrow R}$=6.289, diff NS). However, the private relationship is more important ($M_{S\rightarrow R}$=6.187 vs. $M_{D\rightarrow R}$=4.388, diff $p<.001$) as compared to the public relationship. Here, we see that consumers may seem to recall WOM mostly to those with whom they have positive relationships—both privately and publicly—and that they value their private assessments more so than their public assessments. Separately, although the disseminators' evaluations of products is about equal when comparing private vs. public assessments, ($M_{S\rightarrow T}$=4.834 vs. $M_{D\rightarrow T}$=4.925, diff NS), once again disseminators value their public opinions as being more important (weights: $M_{S\rightarrow T}$=3.892, $M_{D\rightarrow T}$=2.986, $p<.05$).

Since half of the 996 recalled experiences in this study were prompted to be regarding products that the disseminator does *not* like, the balance and satisfaction measures in table 2 are presented in aggregate and separately for digraphs with positive S→T ties and with negative S→T ties. Note that the balance ratio is significantly higher when the S→T tie is positive vs. when it is negative ($BalRatio_{S\rightarrow T\ pos}$=.930, $BalRatio_{S\rightarrow T\ neg}$=.750, $p<.001$) as is the satisfaction measure ($Sat_{S\rightarrow T\ pos}$=6.390, $Sat_{S\rightarrow T\ neg}$=5.960, $p<.001$). This pattern is supported for the hypothetical WOM scenario triads, where measured satisfaction is higher when D→T is positive vs. when it is negative ($Sat_{D\rightarrow T\ pos}$=5.693, $Sat_{D\rightarrow T\ neg}$=5.292, diff $p$=.001). When the D→T tie is neutral, mean satisfaction with the WOM experience ($Sat_{D\rightarrow T\ neutral}$=5.199) is significantly lower than when it is positive ($p<.001$), but only directionally lower than when it is negative (diff NS). This makes sense, since WOM regarding neutral products may be less-newsworthy. Note at the bottom of table 2 that the propensity to generate WOM regarding positive, neutral and negative products for the hypothetical experiences is also non-linear ($Talk_{D\rightarrow T\ pos}$=6.08, $Talk_{D\rightarrow T\ neutral}$=3.77, $Talk_{D\rightarrow T\ neg}$=5.33). Positively and negatively evaluated products are talked about more than neutral products ($p's<.01$).

*Hypothesis 1: Proportion of Balanced Digraphs.* The proportion of balanced triads ($BalProp$=.787, see table 2) is significantly greater than would be expected if the triads were generated based on chance alone ($p<.001$). After incorporating the private self, the balance ratio of .852 is also significantly greater than .503 ($p<.001$). Replacing the S→R tie from affect to similarity does not impact the

balance ratio ($BalRatio_{affect}$=.852, $BalRatio_{similar}$=.835, $r$=.854, $p<.001$). The recency of the WOM experiences does not affect the mean balance ratio, which ranged from .773 to .869 (NS). Thus the first hypothesis is supported in both studies and across all permutations of the balance calculation. Furthermore, although we cannot directly compare the four-node balance ratio vs. the three-node balance proportion, the fact that the four-node ratio is significantly greater than the three-node proportion ($BalRatio$=.852, $BalProp$=.660, diff $p<.001$) suggests the significance of the private self in WOM communication.

*Hypothesis 2: Balance and Satisfaction.* The balance-satisfaction correlation was significant with S→R defined as affect or similarity and for the hypothetical scenarios (range from $r$=.170 to .228, all $p's<.001$). We therefore conclude consumers are more satisfied with balanced WOM experiences.

*Hypothesis 3: Balance and Future WOM.* The correlation between balance and each of the future WOM measures indicates a significant relationship ($r$=.078 to .196, all $p's<.05$, see table 3).

We also conducted post-hoc exploratory regression analyses examining future WOM based on time, the valences of each of the ties and the balance ratio. The six tie valence measures were introduced as factors to understand how these relationships and judgments of people and products affect WOM propensities independent of their cumulatively derived balance, which was also added as a separate factor. Results indicate several important patterns. First, time lapsed since the WOM episode occurred was incorporated as a covariate and was significant for the actual (but not the anticipated) future WOM measures, since the more time that has elapsed since the WOM episode, the greater the chance that the disseminator engaged in other WOM conversations (see table 3). For anticipated future WOM, the coefficient for time is negative, which may due to a decay effect. In terms of the main factors, the balance ratio is a significant predictor of actual and anticipated future WOM regarding the same product ($coeff_{actual}$=+.661, $coeff_{ant}$=+.609, both $p's<.05$), but it is not for WOM to the same receiver. It seems that the cognitive balance associated with a WOM experience may help predict future WOM to others regarding the same product, but cognitive balance does not play a role in predicting future WOM to the same receiver. *What does predict future WOM to the same receiver?* Here we highlight an important insight: future WOM to the same receiver is best predicted by S→R and D→R valence, where three of the four coefficients are positive and significant (S→R: $coeff_{actual}$=+.207, $coeff_{ant}$=+.241, both $p's<.001$; D→R: $coeff_{actual}$=+.086 (NS), $coeff_{ant}$=+.377, $p<.001$). It makes sense that consumers may talk more in the future with receivers with whom they perceive positive relationships, and particularly when this assessment of the relationship is private and true. Next, while the disseminator's relationship with the receiver may best predict future WOM to that same receiver, the disseminator's private assessment of the product is a key predictor of anticipated future WOM regarding that same product (S→T: $coeff_{ant}$=+.230 $p<.05$). Note that the coefficients for the D→T tie are not significant for any of the dependent variables. Apparently it matters less what people publicly say and more what they truly and privately think about the product. Even after controlling for the effects of time, feedback from the receiver regarding the product (R→T) is not a significant predictor of any of the future WOM measures. Last, we highlight that the disseminator's private feelings about the WOM experience (i.e. the S→D tie valence) is a positive and significant predictor of anticipated future WOM to the same receiver and regarding the same product ($coeff_{same\ R}$=+.176, $coeff_{same\ T}$=+.366, both $p's<.001$).

Examining future WOM based on the hypothetical scenarios (see table 3), the first notable pattern is no significant difference between anticipated future WOM to the same receiver, regardless

of balance or various tie configurations (means range from 3.209 to 3.333 out of 4, all diff's NS). For these hypothetical scenarios, the D→R tie was positive across all conditions—it is logical that regardless of this specific WOM experience, future WOM to the same friend may be relatively constant. There were, however, differences across conditions in terms of future WOM regarding the same product. Consistent with results reported above, participants indicate higher future WOM to others regarding the same product when the WOM digraph is balanced vs. when it is imbalanced ($M_{bal}$=3.313, $M_{imbal}$=3.186, diff $p$<.10). These results provide

evidence regarding the relationship between balance and future WOM, while minimizing issues associated with recall biases.

*Hypothesis 4: Tie Weights and Future WOM.* A split sample analysis was conducted to compare the correlations of the balance ratio with future WOM on diagraphs with high and low aggregate weights, with the aggregate weight represented by the sum of the six ties (range 6-42, *median*=21.5). Consistent with H4, the correlation between balance and future WOM is significant for the high aggregate weight digraphs, but not for the low aggregate WOM digraphs across all four future WOM measures. Similar to the

| Balanced Triads (N=323) | | 3.272 (.655) | | 3.313 (.712) | |
| Imbalanced Triads (N=328) | | 3.314 (.722) | | 3.186 (.770) | |

insights derived in the preliminary study, it is not surprising that the effect of the balance associated with trivial WOM experiences is much less predictive of future WOM.

## GENERAL DISCUSSION

In this research, the theories and empirical methods associated with cognitive balance (Heider 1946) were leveraged to examine the significance and implications of balance on consumers' WOM behaviors. Specifically, consumers' individual, micro-level cognitive networks or "signed digraphs" containing social relationship and product perceptions and representing their WOM experiences were analyzed. Importantly, we contribute to our understanding of WOM by bridging the micro and macro perspectives; the link between the

balance associated with these consumers' cognitive networks and future inter-consumer communication was established.

In a preliminary study employing in-depth interviews to elicit participants' recalled WOM experiences, results indicate that WOM experiences are likely to be balanced and that consumers are more satisfied when this is the case. In the main study, WOM cognitive networks comprised of four-nodes (the *public self* (D) the *private self* (S), the *receiver* (R) and the *product* (T)) based on recalled and hypothetical WOM experiences were examined. Results indicate a significant correlation between balance and future WOM and that various tie measures associated with WOM experiences may moderate this effect. Specifically, future WOM to the same receiver is best predicted by the disseminator's assessment of their relationship with

the receiver, but cognitive balance is not a significant predictor of future WOM to the same receiver when tie valences are incorporated. The balance ratio associated with a WOM experience does help predict future WOM regarding the same product, as does the disseminator's true assessment of the product. Furthermore, our results also indicate that WOM digraphs with higher aggregate weights are more predictive of future WOM.

Overall, the present research supports the premise that consumers seek and are more likely to *recall* balanced WOM experiences. However, based on our methods and results we cannot assert that consumers succeed in their apparent goal of *experiencing* balance. Although consumers may distort their recollections of experiences to be more cognitively balanced than they actually were (Freeman 1992), in this case, perception may be reality. It is the recollection of experiences and their associated balance that affects future behavior (Gardial et al. 1994), including, presumably, future WOM propensities.

While consumer researchers have previously examined the relevance and implications of balance and consistency in other important consumer contexts, this research represents the first time that balance theory has been systematically applied to WOM. Although we employed the most basic theories of balance and transitivity as a means to explore the viability of their application to this phenomenon, we demonstrated numerous nuanced effects and suggest that other balance-related theories should now be explored. For example, based on cognitive dissonance (Festinger 1957), it would be worthwhile to examine whether and under what conditions people seek to validate their product evaluations through WOM, and whether they seek to reinforce opinions that are consistent with their reputation and/or their publicly stated convictions via WOM. Since Festinger offers that people reconcile dissonance by changing the valence or significance of their cognitions, it would be interesting to understand under what conditions consumers change their opinions of people and/or products vs. when they change the relative importance of their relationship with the person or the product. Considering the proliferation of consumer opinion via the internet, it would also be worthwhile to examine the implications of the relative balance associated with consumers' online product postings and ratings when they are either anonymous vs. when they are not—does the private self have any effect in an anonymous setting? Separately, an examination of consumers' varied proclivities to accept inconsistency may provide useful insight. Although previous research demonstrates consumers' varied tolerances of duality (Williams and Aaker 2002), we offer that WOM-related trait factors such as opinion leadership or expertise may also be related to consumers' relative acceptance of inconsistency.

# How Third-party Organization (TPO) Endorsement Advertising Works: Do Consumers Perceive TPO Endorsement As Signals of Quality?

Jie Feng, University of Wisconsin Milwaukee, USA
Kai-Yu Wang, Brock University, Canada
Laura A. Peracchio, University of Wisconsin Milwaukee, USA

## ABSTRACT

Third-party organization (TPO) endorsement ads have grown increasingly popular in recent years. This study examines conditions under which TPO endorsements in advertising function as signals of quality within the framework of signaling theory. Specifically, the study addresses questions such as: Do consumers perceive TPO endorsements in advertising as signals of quality? Can low-quality firms contain TPO endorsements in advertising to signal high quality? One experiment is conducted with a student sample within the context of automobile ads. The results show TPO endorsements in advertising are signals of high quality in a separating equilibrium condition where the TPO is perceived as honest and endorses few high quality products. On the other hand, TPO endorsements in advertising are not signals of quality in a pooling equilibrium condition, where the TPO is perceived as dishonest and endorses many low quality as well as high quality products. Therefore, the results of this study are consistent with the predictions of signaling theory.

## INTRODUCTION

Third-party organization (TPO) endorsement ads have grown increasingly popular in recent years. For example, in an August 2005 issue of *Time* magazine, Chevrolet advertised its recognition as J.D. Power's choice of being the "Highest ranked full-size SUV in initial quality". A month later, a *Time* ad for the Ford F-150 boasted its recognition as J.D. Power's "Highest ranked light-duty full size Pick-up in initial quality". In addition to the automobile industry, the service industry also frequently uses TPO endorsement advertising as a marketing strategy. For instance, T-mobile announced its recognition as J.D. Power's "Highest in consumer satisfaction with business wireless service" in its recent *BusinessWeek* magazine advertisement.

The influence of TPO endorsements on sales of the endorsed products has been mentioned in academic literature and marketing reports (Chen and Xie 2005). The ability of TPO endorsements to increase sales of endorsed products may lead companies to believe that including TPO endorsements in their advertisements is an optimal marketing strategy. However, companies have to pay the TPO for using its endorsement for marketing purposes. By placing a TPO endorsement in the advertisement, companies may enhance their credibility of ad claims because the included information comes from an independent source. Further, TPO endorsement ads highlight the quality of the advertised product and distinguish the endorsed product from competitors'. At the same time, the unique characteristics of TPO endorsements, such as expertise and trustworthiness, may reduce consumers' uncertainty in a purchase situation (Dean and Biswas 2001).

Although many companies are now using TPO endorsement advertising as a marketing strategy, few studies have focused on this area. Previous studies investigated whether ads containing a TPO endorsement are more effective than ads containing no such endorsements in influencing consumers' attitudes and purchase intentions (Dean 1999; Peterson, Wilson and Brown 1992). Dean and Biswas (2001) further compared ad effectiveness between TPO ads, celebrity endorsement ads and non-endorsement ads.

Dean and Biswas (2001) proposed that TPO endorsements might function as signals of quality. However, no empirical studies have been done to investigate this issue. Therefore, it appears to be a gap in the knowledge about the signaling function of TPO endorsements. In order to fill this gap, this study examines whether TPO endorsements in advertising may function as signals of quality within the framework of signaling theory. Further, this research will explore conditions that firms receive benefits from using TPO endorsements in ads if TPO endorsements function as signals of quality.

## THIRD-PARTY ORGANIZATION (TPO) ENDORSEMENT

The TPO endorsement is defined as an advertisement that contains a positive evaluation of the advertised product or service that comes from an identified third-party organization (Dean and Biswas 2001). A typical TPO endorsement format is Chevy Suburban print ad appearing in an August 2005 issue of *Time* magazine. This ad included a conspicuous seal of approval from J.D.Power and Associates. The text of this ad explained the award, "Three years in a row, CHEVY SUBURBAN has been the "Highest ranked full-size SUV in initial quality" by J.D.Power and Associates ,? J.D.Power 2005 study based on a total of 62,251 consumer responses indicating owner reported problems during the first 90 days of ownership". In this example, the seal of approval is a fixed J.D.Power award logo, and the name of the award is "Highest ranked full-size SUV in initial quality", and the name of the TPO is J.D.Power and Associates. There are various magazines or consumer organizations, including nonprofit and for-profit, that have been serving as TPOs.

Few studies examined the effect of TPO endorsements on consumers' perceptions of endorsed products or services. Peterson, Wilson and Brown (1992) investigated whether print ads containing a TPO endorsement were more effective than ads not containing an endorsement in influencing consumers' attitudes and purchase intentions. This study revealed no TPO endorsement effects. However, Dean (1999) found TPO endorsement effects on consumer perceived product quality, uniqueness, and manufacturer esteem and concluded that TPO endorsements might function as an advertising cue for enhancing consumers' perceptions of endorsed products. Dean and Biswas (2001) further compared ads containing a TPO endorsement to ads containing a celebrity endorsement and ads not containing an endorsement in terms of the ability to affect perceived product quality, attitude toward the manufacturer, purchase risk, and information value of the ads. Ads containing a TPO endorsement were found to be more effective than ads containing a celebrity endorsement and ads not containing an endorsement in enhancing respondent perceptions of product quality. Although Dean and Biswas (2001) proposed that TPO endorsements might function as signals of quality, they didn't further investigate TPO endorsements within the framework of signaling theory. Thus, this

study will address TPO endorsements as potential signals of quality within the framework of signaling theory.

## SIGNALING THEORY

Information asymmetry may exist between two game parties, sellers and buyers, in a transaction (Boulding and Kirmani 1993; Kirmani and Rao 2000). Sellers know the true quality of their products, while buyers may not know (Kirmani and Rao 2000). In addition, the game that plays between sellers and buyers contains both cooperative and competitive elements (Dacis 1970). The competitive element of this game leads buyers to ignore direct claims from sellers, e.g. the content of advertisements. However, buyers and sellers can't get a transaction in the case of incomplete information. Therefore, buyers need additional credible information to predict or evaluate the quality of products. The possible route for this situation is to send signals from sellers to buyers.

Consider that a market has only two types of sellers, high-quality sellers and low-quality sellers. Both are rational sellers and capable to use marketing strategies to communicate with buyers. High-quality sellers choose the strategy that low-quality sellers can't choose because this strategy is only profitable for high-quality sellers and unprofitable for low-quality sellers. When high-quality sellers and low-quality sellers choose different strategies, high-quality sellers actually send signals to buyers. Use of signals leads to a separating equilibrium, where high-quality sellers receive benefits from sending signals and low-quality sellers receive benefits from not sending signals. In a separating equilibrium, buyers can distinguish high-quality sellers from low-quality sellers. In contrast, when high-quality sellers and low-quality sellers choose the same strategy, a pooling equilibrium occurs. In this circumstance, buyers cannot distinguish between high-quality sellers and low-quality sellers. Therefore, when a separate equilibrium occurs, a firm's strategy is a signal; when a pooling equilibrium occurs, the strategy is not a signal.

Marketing literature has investigated marketing strategies such as advertising (Kirmani and Wright 1989; Kirmani 1990; Kirmani 1997), brand name (Erdem and Swait 1998; Rao, Qu and Ruekert 1999), price (Gerstner 1985; Tellis and Wernerfelt 1987) and warranty (Wiener 1985; Kelley 1988; Boulding and Kirmani 1993) as signals. Kirmani and Rao (2000) developed a typology to classify signals. In this study, we focus on a TPO endorsement, one potential signal that was neglected by most of marketing researchers. Thus, if a TPO endorsement may function as signals in advertising, it deserves to join the family of signals.

## TPO ENDORSEMENT IN ADVERTISING AS A SIGNAL

Although the situation for TPO endorsements is much more complicated because that scenario involves an independent party, the behaviors of TPO endorsements still should be consistent with signaling theory predication if TPO endorsements function as signals. Thus, in the case of a false signal, it is expected that both low-quality firms and the TPO would suffer. The firms may directly lose money on wrong advertising campaigns that try to boost recognition as an award receiver because consumers may not perceive the TPO endorsement in advertising as a quality signal. Moreover, in the long term, consumers who buy products from low-quality firms may not trust the firms any more than before even though those low-quality firms truly improve their product quality and actually become high-quality firms. TPOs also suffer more for endorsing low-quality firms because they may lose their reputation, perhaps the most valuable asset that the TPOs possess. Meanwhile, a negative word-of-mouth effect is likely to occur and results in more people to doubt the TPO. When the TPO loses the trust from

consumers, the TPO will lose its clients because the TPO endorsement cannot help firms increase sales. Thus, if the TPO's main revenue comes from the firms, the TPO lose its market.

On the other hand, as predicted by signaling theory, TPO endorsements in advertising can signal high quality when TPOs endorse high-quality firms. In this circumstance, both high-quality firms and the TPO receive benefits. The firms will directly inform more consumers about their high quality and enhance the perceptions of their products and increase sales. Compared to using celebrity endorsements that normally cost a huge amount of money, TPO endorsements are a cheaper way to produce a similar result, but more effective than celebrity endorsements in terms of influencing consumers' perceptions of product quality. In addition, high-quality firms distinguish themselves from low-quality firms by using this strategy. Thus, a separating equilibrium should occur, in which quality sensitive consumers are capable to find the high quality firms. TPOs earn reputation as well as revenues by endorsing high quality firms. Consumers will then verify the TPO as a trustworthy party after using the endorsed products. Positive word-of-mouth may further help the TPO to establish a solid positive image in the society. This reputation gives the TPO more power to influence firms in the marketplace, resulting in a situation that more high-quality firms are willing to pay more for TPO endorsements.

Consider that there are two types of TPOs, the honest TPO who always endorses high quality firms and the dishonest TPO who endorses any firms who will pay for the TPO endorsement. As noted previously, when the honest TPO endorses high quality firms, a separating equilibrium occurs, while when the dishonest TPO endorses high quality firms as well as low quality firms, a pooling equilibrium occurs. We propose that in the case of a separating equilibrium, TPO endorsements will be signals of high quality; and in the case of a pooling equilibrium, TPO endorsements will not be signals of high quality.

### Separating Equilibrium

In a separating equilibrium, consumers tend to trust the TPO endorsement and perceive the TPO endorsement as a signal of high quality. Therefore, consumers will enhance the perceptions of endorsed products. In addition, the TPO endorsement can help uncertain consumers distinguish between high quality firms and low quality firms. Thus,

H1: In a separating equilibrium, respondents who are exposed to an advertisement that contains a TPO endorsement show higher scores on measures of (a) perceived quality, (b) manufacture credibility, (c) purchase confidence, (d) purchase intention, and (e) positive word-of mouth intention than those who are exposed to the same advertisement that does not contain a TPO endorsement.

### Pooling Equilibrium

Consumers have two possible reactions to the TPO endorsement in a pooling equilibrium. Inexperienced consumers may realize that the TPO endorsement is meaningless. They are likely to ignore the TPO endorsement, and thus the TPO endorsement will not influence consumers. Experienced consumers who have basic knowledge about the market may be suspicious of the trustworthiness of the TPO. Since consumers will not trust the TPO, consumers may think that the firms are dishonest firms who are trying to use the TPO endorsement simply to seduce purchases. Therefore,

H2: In a pooling equilibrium, respondents who are exposed to an advertisement that contains a TPO endorsement show lower or equal scores on measures of (a) perceived quality, (b)

manufacture credibility, (c) purchase confidence, (d) purchase intention, and (e) positive word-of mouth intention than those who are exposed to the same advertisement that does not contain a TPO endorsement.

Finally, the first two hypotheses suggest that consumers' perceptions of endorsed products with the presence of TPO endorsements in advertising may differ significantly in a separating equilibrium condition and in a pooling equilibrium condition. Consumers may generate positive evaluations for endorsed products and manufacturers when high quality firms show TPO endorsements in advertising in a separating equilibrium; while consumers may generate negative evaluations to endorsed products and manufacturers when firms show TPO endorsements in advertising in a pooling equilibrium. Therefore,

H3: Respondents who are exposed to an advertisement containing a TPO endorsement show higher scores on measures of (a) perceived quality, (b) manufacture credibility, (c) purchase confidence, (d) purchase intention, and (e) positive word-of mouth intention in a separating equilibrium than those who are exposed to an advertisement containing the same TPO endorsement in a pooling equilibrium.

## METHOD

The study investigates how TPO endorsement ads work within the signaling theory framework. Thus, this study employed a 2 (separating equilibrium versus pooling equilibrium) x 2 (endorsement in the target ad: TPO endorsement versus no TOP endorsement) between-subject design.

### Stimuli

Automobile ads were used because automobile companies frequently use TPO endorsements in their ads. Two types of equilibrium settings were created. The most direct manipulation of a separating equilibrium setting would be to tell a group of respondents that *Consumers Digest* magazine was a very honest TPO and only endorsed few high quality brands "Automotive Best Buy" awards. This represented a separating equilibrium setting where the TPO only endorsed high quality firms. Another group of respondents could be told that *Consumers Digest* magazine was not an honest TPO and endorsed many car brands that would like to pay for using the title of "Best Buy". In such a circumstance, respondents were placed in a pooling equilibrium where the TPO endorsed high quality firms as well as low quality firms. However, such a manipulation might not be practical because consumers rarely receive this type information in the real marketplace. Thus, we decided to manipulate equilibrium settings by having respondents view six ads, preceding the target ad. Six car ads were created and included a variety of brands: Kia, Mitsubishi, Suzuki, Volkswagen, Dodge and Honda. Along with these six ads, TPO endorsement was used to manipulate the two equilibrium settings (separating and pooling). The TPO endorsement in this study was the "Automotive Best Buy" award from *Consumers Digest* magazine. Both the TPO and the seal of approval were adapted from real ads. In the separating condition, respondents view six car ads and among them, only Honda's ad contained an "Automotive Best Buy" seal from *Consumers Digest* magazine. In the pooling condition, respondents view six ads and except for Honda's ad, each of the five ads contained "Automotive Best Buy" seals from *Consumers Digest* magazine. These six brands represent four-level product classes. Kia and Dodge represent low quality brands; Mitsubishi and Suzuki represent middle quality brands; Volkswagen represents a between

high and middle quality brand; and Honda represents a high quality brand. The judgments were based on ratings from *Consumer Report*, which is believed to provide objective cars' quality information. Therefore, the condition that only Honda's ad contained the TPO endorsement was perfectly consistent with a separating equilibrium where the TPO only endorsed high quality firms. The other condition that five car ads contained the TPO endorsement was consistent with a pooling equilibrium where the TPO endorsed as many as it can, including a high quality firm (e.g., Volkswagen) as well as low quality firms (e.g., Kia and Dodge).

Further, two versions of target ads were created. The no TPO endorsement target ad contained an image of a car. The image only showed the half part of the car. There is no way for respondents to guess the brand name of the car based on the car's appearance. The target ad also included a simple slogan "Your Imagination", which was too simple to influence respondents' evaluations of the car. Notably absent was any mention of the brand, free phone number, Internet address, car dealer information, sale price, and warranties. The ad was produced by advertising professionals. The TPO endorsement target ad contained the information in the no TPO endorsement condition plus an "Automotive Best Buy" seal from *Consumers Digest* magazine. The seal was set on the center of the ad, so that respondents could easily notice it.

### Procedure

Seventy-nine undergraduate students participated in this study. Respondents were assigned randomly to one of the four conditions. They first were asked to view the six full-page size magazine car ads, either in a separating equilibrium setting or in a pooling equilibrium setting. Then the respondents were asked to view the target ad, either containing a TPO endorsement or not containing a TPO endorsement. Next, they filled out a survey booklet, which included five dependent measures as follow:

*Perceived product quality.* Perceived product quality was measured on four seven-point scales (1=strongly agree,7=strongly disagree) in response to the questions, "Compare to other automotive brands, this advertised car is a superior product"; "compare to other automotive brands, this advertised car is the best in its product class"; this advertised car would perform better than other car brands", and "from what you saw in this advertisement, what is your personal opinion regarding this car's quality?" (1=high quality, 7=low quality). Responses to these items loaded on a single factor and were averaged to form an evaluation measure ($\alpha$=.84).

*Manufacturer credibility.* Manufacturer credibility was measured by three seven-point scales: trustworthy/untrustworthy, honest/dishonest, competent/incompetent. Responses to these items loaded on a single factor and were averaged to form an evaluation measure ($\alpha$=.88).

*Purchase confidence.* Purchase confidence was measured by two seven-point scales: safe/risky, right/wrong. Responses to these items loaded on a single factor and were averaged to form an evaluation measure ($\alpha$=.83).

*Purchase intentions.* Purchase intentions were measured by a seven-point scale: "suppose you were going to purchase a car, how likely would you be to purchase the advertised car?" (1=very likely, 7=very unlikely).

*Positive word-of-mouth intentions.* Positive word of mouth intentions were measured by a seven-point scale: "suppose your friend ask your advice of the purchase of a car, how likely would you like to recommend the advertised car to your friends?" (1=very likely, 7=very unlikely).

Finally, demographic questions were administered and the respondents were debriefed.

**TABLE 1**
TREATMENT MEANS AND STANDARD DEVIATIONS FOR FIVE DEPENDENT MEASURES

| | Separating equilibrium | | Pooling equilibrium | |
| --- | --- | --- | --- | --- |
| | TPO endorsement | No TPO endorsement | TPO endorsement | No TPO endorsement |
| Perceived product quality | 4.91 (.68) | 3.80 (1.11) | 4.17 (.91 | 4.21 (1.05) |
| Manufacturer credibility | 4.98 (1.24) | 4.32 (1.08) | 3.74 (.95) | 4.28 (1.01) |
| Purchase confidence | 4.98 (1.37) | 3.88 (1.18) | 3.79 (.71) | 3.75 (1.49) |
| Purchase intention | 4.1 (1.52) | 2.7 (1.66) | 2.63 (1.61) | 2.65 (1.46) |
| Positive word-of-mouth intention | 4.05 (1.32) | 3.10 (1.52) | 2.57 (1.46) | 3.35 (1.27) |
| N | 20 | 20 | 19 | 20 |

Note.—Standard deviations are in parentheses.

## RESULTS

Data were analyzed as a 2 (TPO endorsement versus no TPO endorsement) x 2 (equilibrium: separating versus pooling) factorial design. Degrees of freedom for all evaluation and thought measures are 1 and 75 unless indicated otherwise. Treatment means for all measures are listed in Table 1, and all significant treatment effects are reported.

**Manipulation Check**

Equilibrium manipulation was checked by assessing respondents' evaluations of the TPO. Respondents were asked to rate the "Automotive Best Buy" award from Consumers Digest magazine on four seven-point scales (Trustworthy/untrustworthy, honest/dishonest, sincere/mislead, fair/unfair). Respondents exposed to a separating equilibrium evaluated the TPO more favorably than those exposed to a pooling equilibrium ($M=4.86$ vs. $M=4.28$. $F$ (1, 77)$=5.33$, $p<.03$).

**Hypotheses**

The interaction effects between endorsement and equilibrium reached or approached significance on perceived product quality ($F=7.23$, $p<.01$), manufacturer credibility ($F=6.29$, $p<.02$), purchase confidence ($F=3.67$, $p<.06$), purchase intention ($F=4.07$, $p<.05$) and positive word-of-mouth intention ($F=7.51$, $p<.01$). Figure 1-5 illustrate these effects. Follow-up examination of these effects supported our predictions.

*Hypothesis 1*. Hypothesis 1 predicted that in a separating equilibrium, an advertisement that contains a TPO endorsement would lead to higher scores on measures of perceived product quality, manufacturer credibility, purchase confidence, purchase intention and positive word-of-mouth intention. Perception of

product quality for a TPO endorsement condition was significantly higher than that for a non-endorsement condition ($M=4.91$ vs. $M=3.80$; $F=13.62$, $p<.001$). Perception of manufacturer credibility for a TPO endorsement condition was significantly higher than that for a non-endorsement condition ($M=4.98$ vs. $M=3.85$; $F=13.62$, $p<.06$). Perception of purchase confidence for a TPO endorsement condition was significantly higher than that for a non-endorsement condition ($M=4.98$ vs. $M=3.88$; $F=7.99$, $p<.006$). Purchase intention for a TPO endorsement condition was significantly higher than that for a non-endorsement condition ($M=4.10$ vs. $M=2.70$; $F=8.03$, $p<.006$). Positive word-of-mouth intention for a TPO endorsement condition was significantly higher than that for a non-endorsement condition ($M=4.05$ vs. $M=3.10$; $F=4.64$, $p<.05$). All predications were supported in hypothesis 1.

*Hypothesis 2*. Hypothesis 2 predicted that in a pooling equilibrium, an advertisement that contains a TPO endorsement would lead to lower or equal scores on measures of perceived product quality, manufacturer credibility, purchase confidence, purchase intention and positive word-of-mouth intention than would an advertisement that does not contain a TPO endorsement. Perception of product quality for a TPO endorsement condition was not different from that for a non-endorsement condition ($M=4.17$ vs. $M=4.21$; $F<1$). Perception of manufacturer credibility for a TPO endorsement condition was not different from that for a non-endorsement condition ($M=3.74$ vs. $M=4.28$; $F=4.64$, $p<.11$). Perception of purchase confidence for a TPO endorsement condition was found not different from that for a non-endorsement condition ($M=3.79$ vs. $M=3.75$; $F<1$). Purchase intention for a TPO endorsement condition was not different from that for a non-endorsement condition ($M=2.63$ vs. $M=2.65$; $F<1$). Perception of positive word-of-mouth intention for a TPO endorsement condition was margin-

TWO-WAY INTERACTION OF EQUILIBRIUM AND ENDORSEMENT ON POSITIVE WORD-OF-MOUTH
INTENTION

ally significantly lower than that for a non-endorsement condition ($M=2.57$ vs. $M=3.35$; $F=4.64$, $p<.08$). All planned comparisons were consistent with hypothesis 2.

*Hypothesis 3*. Hypothesis 3 predicted that, an advertisement that contains a TPO endorsement would lead to higher scores on measures of perceived product quality, manufacturer credibility, purchase confidence, purchase intention and positive word-of-mouth intention in a separating equilibrium than would an advertisement that contains the same TPO endorsement in a pooling equilibrium. Perception of product quality for a separating equilibrium condition was significantly higher than that for a pooling equilibrium condition ($M=4.91$ vs. $M=4.17$; $F$ $5.89$, $p<.02$). Perception of manufacturer credibility for a separating equilibrium condition was significantly higher than that for a pooling equilibrium condition ($M=4.98$ vs. $M=3.74$; $F=13.11$, $p<.0005$). Perception of purchase confidence for a separating equilibrium condition was significantly higher than that for a pooling equilibrium condition ($M=4.98$ vs. $M=3.79$; $F=9.04$, $p<.004$). Purchase intention for a separating equilibrium condition was significantly higher than that for a pooling equilibrium condition ($M=4.10$ vs. $M=2.63$; $F=8.61$, $p<.005$). Positive word-of-mouth intention for a separating equilibrium condition was significantly higher than that for a pooling equilibrium condition ($M=4.05$ vs. $M=2.57$; $F=10.84$, $p<.002$). All predications in hypothesis 3 were supported.

**GENERAL DISCUSSION**

In summary, the findings of this study were consistent with the predictions of signaling theory. When a TPO was honest and endorsed few high quality firms, a separating equilibrium occurred. Then TPO endorsement was a signal of high quality. When a TPO was dishonest and endorsed high quality firms as well as low quality firms, a pooling equilibrium occurred and then TPO endorsement

was not a signal of high quality. This study also showed that a TPO endorsement in advertising would make consumers generate negative perceptions about endorsed products and manufacturers under the condition of a pooling equilibrium. Further, combining the results from hypothesis 2 and hypothesis 3, this study suggested that low-quality firms might not receive benefits by using a TPO endorsement strategy. In general, low-quality firms are only chosen by dishonest TPOs. Thus, a pooling equilibrium always occurs when low-quality firms contain TPO endorsements in advertising. Thus, in general, low-quality firms cannot contain TPO endorsements in advertising to signal the high quality. In other words, TPO endorsements would only benefit high quality firms, but not low quality firms.

The findings from this study advance our understanding of signaling theory. The results suggest that TPO endorsements in advertising could also function as a signal of quality under a separating equilibrium condition. Compared to other signals, such as price, advertising, brand name, warranties, and guarantees, TPO endorsements may be the cheapest signal to use. Although firms still need to pay the TPO for using the TPO endorsements in advertising, the cost of using the TPO endorsement is far lower than the cost of using other signals. Signals such as advertising and brand names require firms to spend tremendous money to create and develop. Therefore, if firms are looking for an economical marketing strategy to signal high quality, they should place a higher priority on the use of TPO endorsements.

The findings also provide managerial insights on marketing strategies. For example, high quality firms are more likely to be chosen by either honest TPOs or dishonest TPOs. The findings of this study suggest high quality firms should use TPO endorsements from honest TPOs because this type of endorsement can function as a signal of high quality. This study also suggests that high quality

firms not use TPO endorsements from dishonest TPOs because this type of endorsement is not a signal of high quality. Under some conditions, a dishonest TPO endorsement may generate negative perceptions about endorsed products and manufacturers. Low quality firms, in general, are only chosen by dishonest TPOs. Therefore, low quality firms are unable to use TPO endorsements in advertising to signal high quality.

# For Those about to Rock: A New Understanding of Adolescent Music Consumption

Peter Nuttall, University of West of England, UK

## ABSTRACT

The UK record industry is aware of what music consumers purchase, the way in which consumers purchase (online, music stores) and artist popularity but this does not facilitate an understanding of how or why music is consumed and what insights this might generate for future demand. This paper contributes by using qualitative research to better understand music use and consumption. The findings suggest that adolescents use music to express their identity but the extent of this expression and the consumption of music appears to vary depending on the family type in which the adolescent has been raised (intact, blended and single parent families). The teenage music consumer profiles of 'Experiential', 'Chameleon' and 'Defender' are posited and discussed. Implications for consumer behaviour, segmentation and marketers are explored.

## INTRODUCTION

Consuming is always a complex social phenomenon, especially with regard to adolescents (Benn, 2004). This may not be surprising given that adolescence is characterized by trying on new behaviours (Hall, 1996), learning consumption skills (Roedder John, 1999), displaying conspicuous consumption (Ahava & Palojoki, 2004) and/or learning social meaning (Ward, 1974). It is acknowledged that teenage consumers are fickle and refuse to be predictable even though they are known to send messages through their consumption styles and illustrate commitment to different groups (peers), different lifestyles, and possibly even political or ecological affiliations (Miles, 1998). However, the impact this period of 'storm and stress' has on the ability of organisations to target and communicate effectively with adolescents is less well established.

Understanding and targeting this group of consumers effectively is notoriously difficult. The changing media landscape has become a battleground for the consumers' share of voice. The 'MySpace' and 'YouTube' generation use many forms of media simultaneously and average over six hours a day using the various forms (Hempel & Lehman, 2005). As such, traditional forms of advertising are being re-considered and increasingly, marketing practitioners are questioning the relevance of the traditional ways of defining and segmenting the youth market. As part of this more investigative stance, companies such as MTV are interested in developing a keener understanding of the key influences in the lives of adolescents and the evolution of youth culture (Saxton, 2005). The key challenge facing marketers working in the youth music market would appear to be not obtaining information but making sense of it and filtering out what is meaningful.

## THE MUSIC MARKET

Attracting a target audience has encouraged the UK's record companies to increase spend on advertising to £128 million in 2004, representing 10.5 per cent of the £1.2 billion industry revenue in the same year. Targeting consumers effectively becomes increasingly important as the pressure to achieve a return on investment becomes more critical in an increasingly competitive environment (BPI, 2005). Age, gender and class are the main criteria for presenting statistics and survey findings across a range of market and consumer data produced by BPI, Mintel,[1] Keynote, IFPI and Euromonitor (2005). However the only data provided by the main statistical reporting organisations that distinguishes between early adolescent age groups (12-14 years) and older adolescents (15-19)

is 'choice of music', 'music downloading', 'purchasing by outlet' and 'music attitude statements' (Mintel only). All other adolescent consumer data is collapsed into the broader age classification of 12-19 years. This clearly produces a composite and only partial view of the adolescent consumer of popular music and represents a weakness in the industry's understanding and knowledge of their younger consumers.

## THE ADOLESCENT MUSIC MARKET

Record companies investing in, promoting and supplying merchandise for new musical talent and existing artists who are producing new popular music recordings and performing live concerts need to understand the teenage market. Hemsley (2005), for example, illustrates the significance of segmenting music events positing that 'promoters are nervous of taking on too much commercial activity in case they alienate the people they are trying to attract'. Research by ROAR (Parry, 2004) suggests that young people under the age of 24 are largely responsible for the success of new product launches in the fashion, technology and music markets. The same research has identified segments within the youth market that differ on the basis of their propensity for the early adoption of new trends and fashions and acknowledge that not all teenagers are interested in being part of new trends. However, their current research still fails to provide insight or understanding of how or why music is consumed and how this might influence future demand for music.

The importance of a greater understanding of the influences among adolescents on the consumption of popular music is highlighted by their effect on both current music sales and also future revenues that the industry has come to depend on as the same consumers mature and the population as a whole becomes increasingly mature (BPI, 2006). Success of crossover acts (artists popular with the young and those that continue to appeal as those consumers get older), has bolstered the most recent growth in sales figures suggesting that artists popular with the pre-teen market are catalysts for an older generation of music lovers without whom the industry faces inevitable decline. Talbot (2005) argues that faced with an increasing array of competing 'lifestyle' products aimed at young consumers (e.g. television, films, games, mobile technology, and the internet) pre-teens may not be drawn to music as much as they once were. As these pre-teens mature then, there would be a dearth of music enthusiasts negatively impacting upon the sales of crossover acts currently helping the record industry to survive. It is now appropriate and perhaps essential for the industry to consider a more sophisticated way of segmenting and targeting a youth audience that has historically been regarded as a homogenous group of consumers.

## ADOLESCENCE AND MUSIC CONSUMPTION

Music is known to be important in the social and personal lives of the adolescent. Frith (1996) argues that music can articulate cultural values and a sense of social meaning. As an interpersonal statement, music is least expensive in terms of time and resource commitment than say dress or friendship group. This flexibility and

---

[1]Mintel also segments music purchasing data, retail outlet data and attitude statements by 'Working Status', 'Respondents Own Children', 'ACORN' and 'Lifestage' categories.

accessibility allows teenagers to modify their position and express their identity with greater fluidity. Many researchers have examined the role music has played in satisfying particular emotional needs (strategies for coping), social needs (belonging and identity) and developmental needs (the socialisation 'journey') [See Arnett, 1995b; Larson *et al*, 1989; Levy and Windahl, 1985; Lull, 1992; Rubin 1994]. What perhaps is less obvious is an understanding of the contradictions teenagers often display relative to popular music consumption and the sometimes seeming inconsistency of their choice and use of music. It is this that would be useful to the recorded music industry.

## INFLUENCES AFFECTING ADOLESCENT MUSIC CONSUMPTION

Research has shown that securely attached children are more inclined than insecurely attached children to explore their surroundings (West and Sheldon-Keller, 1994). As such, the stability of secure attachment affords more confidence to the teenager to allow them to experiment, or in the context of popular music, consume a more eclectic and diverse range of music types. For example, Schwartz and Fouts (2003) report that eclectic music tastes are more usual for teenagers who have less difficulty negotiating their adolescence. That is, they have fewer family problems, better peer relationships and do not experience significant issues regarding self-concept. Several authors [See Hansen and Hansen, 1991, Bleich and Zillman, 1991, Arnett 1995a] have also noted how the consumption of different genres of music by teenagers is influenced by the felt state of conflict with parents and/or restrictive conditions of their teenage lives.

Ekström (2005) highlights that the variety of family structures in which teenagers are raised are "subject to change in a continuously changing society" (p.493) and reinforces this with a call for research that requires "rethinking both the concept of the family and consumption in a family context". This supports the very essence of exploring music consumption against a backdrop of the familial culture and changing social context.

## THIS STUDY

The traditional segmentation bases of gender, age and outlet music is purchased from would seem not to capture what influences music consumption and how music is chosen and used by adolescents as a means of expression within families and with peer groups. Can an insight be generated into understanding adolescent music consumption and consequently provide a more holistic approach to targeting and communicating with this, currently perceived, homogeneous group of consumers?

This research qualitatively explores the motivations for teenagers using and consuming music, providing rich, expressive responses from adolescents which afford the opportunity to understand the behaviour and likely characteristics of different teenage music consumption habits.

## RESEARCH OBJECTIVES

The primary research objectives for this study were: (i) to understand in greater depth, the choice, use and consumption of music amongst adolescents (ii) to explore how this may be influenced by different family and social (peer) environments and (iii) to consider the implications for adolescent music consumption from the perspective of record industry segmentation and marketing practice.

## METHOD

Given the exploratory nature of this study, in-depth interviews with adolescents appeared to be the most appropriate method to address the issues raised. The main thrust of this research involved 24 longitudinal in-depth interviews. That is, twelve adolescents were interviewed and then the same adolescents re-interviewed six months to a year later.

The themes and questions in the interviews needed to reflect how the respondents consumed and used music (socially or privately), how often they listened to music and how they used music to express their identity. This included questions relating to the social and personal meaning of music. Familial influence and peer influence also needed to be explored to ascertain the extent to which music consumption was situational and if music use and consumption varied for teenagers raised in a variety of family structures (intact, blended and single parent).

The interview was designed in three phases. Initially, pictures were taken by the adolescents before they arrived so they could be introduced and discussed at the start of the interview. To aid the discussion on choice, use and consumption of music and expression of identity, the teenagers were asked to take pictures of items, places or people they valued most. This was to gauge what they valued most in their personal life and to contextualise their responses and also how this may change over time. The pictures were developed before the interview and the participants saw the pictures for the first time when they were interviewed. This was repeated for the second interview.

In addition to open ended questions, the second phase of the interview utilised the 'draw and write' (projective) technique, designed to encourage the adolescents to express what music meant to them. The draw/write technique involves the respondent drawing a picture using freehand to illustrate how they feel about music generally. Pictures could be made up of images, pictures or words. This technique [See: Backett-Milburn and McKie, 1999] was employed during interview to elicit greater insight into how they felt about music (external view) and also as a basis for discussing the meaning of music to them personally and socially and how it may allow them to express their identity.

Finally, when the interviews were finished, the respondents were asked to complete a blank card with their thoughts on the interview. The interviewer then wrote their thoughts on the interview on the other side. Mills (2001) suggests recording the context of the research as well as capturing the words spoken by the respondent. In this way, the blank card allowed a record to be maintained of the interviewer-interviewee perception of what had been discussed (and rapport between the interviewer-interviewee) and this was taken into account when interpreting the data.

## DATA ANALYSIS

The data collected from the interviews were analysed using the Ritchie and Spencer (1994) *Framework* analysis method. This method depended on the coding, charting and mapping of the data. *Framework* comprises of five stages which include: familiarization with the data, the development of a thematic framework, indexing, charting and mapping. This method allows comparison between the themes and issues as dictated by the respondents. The transcripts were also referenced to allow each source to be detected. The information was used to find associations between the salient issues and was governed by the original research questions to be addressed. The associations are mapped in the confines of the data and alternative explanations were sought and uniformly appraised against the actual data.

## FINDINGS

The key findings for this study illustrated (i) the influences affecting adolescents relative to music consumption, (ii) contradictions teenagers display relative to music choice, (iii) consumption of a variety of musical genre and finally (iv) the relationship music consumption had with the family environment in which the respondents were raised. These findings will now be explored using themes identified in the data: Understanding Adolescent Consumers (through their expression of identity) and Contradictions in Music Choice (situational consumption).

## UNDERSTANDING THE ADOLESCENT MUSIC CONSUMER

The respondents, regardless of age, gender or family structure, appeared to be in agreement about what music represented for them as adolescents; a way of expressing themselves, a way of enhancing mood and a way of helping them to form, consolidate or defend an identity.

Whilst respondents raised in intact families acknowledged music could be used to express identity, interviewees raised in blended or single parent families placed greater importance on music as a way of developing a character or expressing individuality. It may be that there is a greater search for a meaningful self or selves (Wiley, 1994; Kellner 1992; Gabriel and Lang, 1995) for those raised in blended or single parent families. For teenagers in this sample from intact families it seemed music was important but was less critical to their existence than for those raised in blended and single parent families. Interviewees raised in intact families tended to be more philosophical about music and identified it as transitory:

*"I don't really care who's number one. That used to be quite important to me. I used to think ooh come on get to number one. But if I like the music I listen to it."*
(Longitudinal interview: Amie, 15)

Most stated that the music they listened to, and other music types that they didn't find appealing, would induce an emotional response, whether this was a relaxed mood, anger, happiness or sadness. However, this was especially evident among respondents raised in blended and single families, perhaps because their attachment to the meaning of music and the way in which it allowed them to express their identity, was greater:

*"I think music does show because she's* [the artist] *had a lot of family problems and things, so her life kind of reflects in her music. Some of the songs I listen to will probably reflect me."*
(Longitudinal interview: Helena, 14)

Teenagers raised in single parent or blended family environments in this sample indicated that lyrics written by particular artists were akin to their own personal situations.

*"It's almost like instead of me kicking and punching a wall which I have done once but that was very stressful. It's almost like* [the artist is] *getting my anger out of me, she's almost telling me what's happened to me today and I have to be strong."*
(Longitudinal interview: Isabella, 14)

The need to illustrate commitment to a particular music genre (and in some instances to 'prove' the strength of commitment through consumption of clothing, gig tickets etc.), was also far more apparent for adolescents raised in single parent families and to some extent those raised in blended family environments. The findings suggested that this greater level of commitment to bands, artists or genres by adolescents (raised in single parent families), allows them to more easily or readily express an identity. As language or discourse can be seen as a medium through which, as well as the context within which, the fundamental processes of identity are forged (Tietze *et al*, 2003), the strength of commitment illustrated here suggests the importance of expressing a 'recognisable' identity through consumption behaviour relative to family type.

Even where semiotics appeared to be less important to the respondents, the interviewees were able to recognise (and to a certain extent judge) others as a result of their semiotic consumption:

*"One of my friends just listened to what I call normal music like pop music but then she went out with this boy who listened to like Eminem I think it was. Then she changed her clothes and now she smokes and stuff. I think it was down to the kind of music she was listening to."*
(Longitudinal interview: Samantha, 15)

As such, this can be considered as a shared world of shared meaning (ibid). Importantly, degrees (volume) of consumption were also observed by the respondents, indicating an understanding of symbolic dependence and commitment. In several cases, the strength of the connection to a particular music genre or artist represented the respondents' desire to retain or express cultural capital possibly as a means of consolidating or defending their social position:

*"Celia doesn't really like that much music but when I'm on the bus I usually listen to music and she sometimes listens to Tori Amos or something with me. Yeah, Tom is a big Tori Amos fan as well–and P J Harvey. We sit there obsessing over them."*
(Longitudinal interview: Tess, 17)

The suggestion was that music could make an individual more powerful or give them an 'edge'. It may be that an adolescent signifying more divergent tastes will have a greater need to be an opinion-former, leading edge consumer, symbol specialist or style leader as described by Nancarrow *et al* (2001).

This divergence may also lead to consumption or use of products for a specific purpose. That is, the sociological view of consumption focuses on the different ways in which people use products and brands to create social bonds or distinctions (Featherstone, 1991). As the semiotic signification and the images attached to goods become over-produced, there is a loss of stable meaning for an individual incorporating them into their social identity (Baudrillard, 1983). In effect, the good that is consumed for its semiotic value, is stripped of its status once it reaches a level of inflation or use by others that opinion leaders or style formers regard as 'too popular' and undifferentiated. This helps to explain the inverse relationship between the rise in the popularity of music artists and their cult status among style leaders. The adoption of goods for their status is part of the individual's consumption logic, and as such, represents an essential component of identity formation and the communication of this identity to others. This cultural capital was exemplified by the drawing task and the teenager's explanation of his drawing:

*"…you can't freeze frame it…you can't look at it and say this is what is happening…it's fleeting cos it's always moving, it's always changing. If you stop it or pause it it dies. It's better*

*than everything else and uncontrollable because no-one can say what music you can't play.*"

(Initial interview: Haden, 16)

Interestingly adolescents raised in intact families tended to use more generic terms (language) to describe their music taste rather than specific bands or artists, for example, 'RnB', 'Lo Fi' or 'Eclectic'. Teenagers raised in blended or single parent families illustrated their music tastes using specific band names or artists. Some of the artists were chosen by the respondents not because they were currently popular but because they represented what the respondents perceived to be more 'authentic' or 'credible' music (for example, Nirvana, Red Hot Chili Peppers or Coldplay). As such, the language reflects a lack of diversity or eclecticism in music choice and consumption than for those in this sample raised in intact families. Of course it may be that adolescents listen to music in public with their peers that they would not necessarily listen to in private (with their families). As such, contradictions in music choice may be apparent.

## CONTRADICTIONS IN MUSIC CHOICE (SITUATIONAL CONSUMPTION)

While all adolescents are expected to develop and grow from the family culture (Grotevant and Cooper, 1985; Youniss and Smollar, 1985), it is noted that this 'divergence' (or search for autonomy) can be both minimal and extreme and that divergence in this sample appears to be more extreme from adolescents raised in intact families or those from single parent families.

*"I don't know why it's uncool, it's just like your parents aren't cool are they. When you are a teenager, you're like no they are not cool, they are just my parents."*

(Second interview: David, 17)

Evidence of convergence (bonding with family members) was only apparent with the respondents raised in blended and single parent families. The convergence was not only between family members but also 'new' family members [father's girlfriend] who were given the opportunity to 'build bridges' through the use of music:

*"He* [father] *likes my music, as long as I play the music he likes, like Led Zeppelin. When I see him I say, 'What songs do you want me to learn [on guitar]?', and he'll tell me, 'Yeah, practice it here'. My dad's girlfriend, she's always encouraging me and saying, 'That's really good', so that's nice."*

(Second interview: Chris, 17)

The interviewees were also asked to express the way in which music was chosen and consumed within friendship groups (to explore situational consumption) and if and how this may influence expression of identity. For example some respondents felt that 'choosing' to overtly express a liking for a particular band or artist could mean that they risked being ostracised. In this way, music could be exclusionary as opposed to inclusive:

*"Some people say they like the kind of music I like but they're scared to be like I am."*
Interviewer: 'What are they scared of?'
*"People not talking to them."*

(Initial interview: Alice, 13)

Overall, peer influence appeared to have more of an affect on adolescents in this sample raised in single parent or blended families. They appeared to be more aware of the rules for 'belonging' to friendship groups and friends were important to them. For example there appeared to be a need among some respondents for artists to be 'genuine' or credible and this was particularly evident for males and those striving to retain 'expert knowledge'. It was also thought that music was a key way in which to identify the friends others would choose and as a result appeared to be less inclined to tell their peers about the music they consumed privately and sometimes preferred to listen to music on their own:

*"If my friends are in the car I listen to sort of R and B or sort of garage. I normally just play some 'funky house' because it's got more of my taste I think. It's a bit more personal to me, I recognise the tunes and if it's just me in the car it's always funky house, I can relate to it."*

(Initial interview: Tom, 17)

It seemed however (possibly with age and experience) that through the use of ever-improving technology (e.g. ipod 'shuffle' mode), potential conflict could be avoided and strategies may be employed to cope with the multiplicity of music tastes within friendship groups. As a result, friends 'liking' specific types of music had a less significant impact.

## DISCUSSION: SEGMENTATION AND ADOLESCENT MUSIC CONSUMPTION

For all the adolescents in the sample, music played some sort of role as either a mode of expression and/or fulfilment of emotional need both privately and in public. There was, however, evidence in the findings of clear differences between adolescents from different family types in terms of the role and significance of music in the identity formation process. Teenagers from intact families demonstrated and expressed a much more 'experimental' attitude towards their self-concept and a tendency to express (or experiment with) their identity in different social situations. This supports the work of Schwartz & Fouts (2003) who suggest adolescents raised in intact families are more eclectic in their approach to music choice. This may be because they are less concerned with what others think of them or because they have a level of stability not felt by teenagers raised in blended or single parent households.

This research illustrated the way in which music was used by the adolescents to 'bond with' or 'diverge from' family members and friendship groups. Adolescents raised in intact families in this sample displayed very little affinity-seeking behaviour (Flint, 1992) and were perhaps less concerned about the consequences of disruption or conflict than those raised in blended families. Music was regularly used to 'bond' with either the absent parent or with, typically, the mother left in the family home. Music was used both to build bridges with new family members and to exclude them and, as such, appeared to be used as a 'coping strategy'. This adds to the work of Chong-Bum et al., (1993) who suggest adolescents use a variety of ways to cope with the loss of an absent parent as music appeared to be used to a greater extent (that is had greater significance or meaning) for those raised in blended and single parent families. Most significantly this work begins to address the issues raised by Ekström (2005) who posits that as researchers we need to re-think consumption in a family context.

The social significance of music was evident as were the 'rules' for belonging to friendship groups. These appeared to be significantly related to music choice (e.g. exposure to specific artists and/or music genres), use (e.g. in-depth and 'privileged' knowledge and reciting of lyrics) and consumption (e.g. what is learned or remembered from exposure). This consumption behaviour was supported through the expression of language and dress.

**DIAGRAM 1**
Profiles of Adolescent Music Consumers

**Experiential**
- Reflect 'intact' family characteristics
- Eclectic music taste
- Less easy to define & target
- Use peers for information
- Less concerned with conflict

**Chameleon**
- Reflect 'blended' family characteristics
- Selected music taste
- Fit into several target & peer groups
- Avoid conflict & use music to build bridges

**Defender**
- Reflect 'single' family characteristics
- Deliberate music taste
- Strong target market & peer affiliation
- Music is a semiotic & mode of defence

- Music plays a more significant social and private role
- Value/defend the family
- More likely to comply with peer influence

Knowledge of particular music genres or artists was identified by the sample as key to positioning within friendship groups. This supports Featherstone (1991) who posits that conspicuous or intentional consumption forms part of a 'consumption logic'. In this context, information or privileged knowledge about new products, their social and cultural value, and how to use them appropriately, becomes important. For example, information that is difficult to find or is attained ahead of the normal rate of dissemination in the 'popular' press. Consequently being 'cool' or hip in the context of sub-cultural groups (in this instance friendship group) is a prime motivator for the adoption and consumption of the music "belonging" to that group, as well as using appropriate language and other elements of that sub-culture's discourse.

In order to belong the respondents illustrated their ability to display different aspects of 'self' in a variety of situational contexts. Multiple selves (Hall, 1996) were more apparent in this sample of adolescents raised in blended and single parent families. In this instance, music was not described as 'transitional' or temporary, but more meaningful and music was subject to greater scrutiny by the other friends in the (peer) friendship group. The author suggest that this may be the result of disruption within the family which, in turn, has increased the level of compensatory behaviour or coping strategies displayed by these adolescents. This compensatory behaviour supports and develops the work of Rindfleisch et al (1997) who suggests that teenagers who experience stressful life changes try to assuage these feelings by claiming possession of persons or objects that can be controlled. The role of music is clearly useful in our overall understanding of coping strategies.

Given the findings detailed above, Diagram 1 below indicates suggested 'profiles' of adolescent music consumers from this particular sample of respondents and summarises the findings of all the interviews.

### IMPLICATIONS

This research illustrates that understanding teenagers' use and choice of music may allow a more meaningful segmentation of the adolescent consumer. For the record industry, simply recording the family type of the adolescent in market research studies may be one indicator of greater consumption of associated music products (branded goods, concert tickets and clothing). Greater knowledge and understanding of this diverse group of consumers has also illustrated 'situational consumption'. That is 'Chameleons' (who readily 'blend in') are more inclined to listen to music they personally prefer privately whereas 'Experiential' music consumers have an eclectic, diverse music taste. Marketers and researchers will be interested in the ways in which music consumption appears to be contradictory for adolescents raised in a particular type of family. This research provides an insight as to why this might be the case (bonding, building bridges and conflict avoidance). Marketers and the music industry need to ensure communication approaches reflect this consumption behaviour.

It would also seem plausible that given the eclecticism of the intact adolescents in this sample, the likely innovators and early adopters of new and modified music will be raised in an intact family environment. As the parents of intact adolescents also appear to be more encouraging and supportive of 'trying on new behaviours', they too may be targeted as a 'connector(s)' to reinforce promotional campaigns or as promoters of diverse music consumption.

It is apparent that music could be developed, distributed and promoted using alternative approaches. As TV and TV advertising is no longer as effective in capturing the attention or time of the adolescents, the new media would be a more obvious and appropriate way to promote music. Research relative to music consumption could also be collated through music sites, offering 'Chameleons' more artist specific information, downloads and associated products and 'Experientials' the opportunity to consume a wide variety of musical genres and ultimately to become diffusers of new material. 'Defenders' could be provided with greater access to other 'Defenders' in an online community to nurture this strong target audience through peer affiliation.

# Too Old to Choose? The Effects of Age and Age Related Constructs on Consumer Decision Making

Heiner Evanschitzky, University of Strathclyde, UK
David M. Woisetschläger, University of Dortmund, Germany

## ABSTRACT

Aging of societies is a major challenge to academic research as well as to management. The unstoppable trend of an aging society in most western societies offers opportunities and challenges at the same time. This paper sheds light on the impact of age as well as age-related constructs on relevant consumer attitudes and behavior. More precisely, the empirical study, conducted in the market for cars, examining the relationships between four distinct age constructs and assesses the impact of these age constructs on information gathering, a consumer's evoked set, and on brand loyalty.

## INTRODUCTION

The populations of most developed countries are aging because of longer life expectancies and decreasing birth rates (Uncles and Lee 2006). In Germany, people over the age of 60 constitute 24.1 % of the population in 2001. According to the German Federal Statistical Office this figure is likely to increase to 36.7 % by the year 2050 (from 14.6 % in 1950) (Destatis 2007, p. 31). Similar trends can be found in the US and France (Polyak 2000, Lambert-Pandraud, Laurent and Lapersonne 2005). In general, the aging of societies is seen as a serious threat that could endanger the economic perspectives of industrialized nations, e.g. their ability to innovate. This trend does not only impose challenges for societies as a whole, it also questions the existing understanding of companies about their customers. Despite the high relevance of an appropriate understanding of the influences of age on consumer behavior and the high interest of both academia and practice, only relatively little research on age effects can be found in existing marketing literature (e.g. Lambert-Pandraud, Laurent and Lapersonne 2005, Uncles and Lee 2006, Yoon et al. 2005). We believe that there are at least two reasons that account for the relatively small prominence of age related academic work upon this point in time. First, most industries have been traditionally focused on younger segments of consumers which were perceived as more consumption-oriented. As a consequence, research funds have been predominantly spent in that direction. Second, academic research on consumer behavior has an almost natural bias toward using student samples, since it requires a lot less effort to obtain than representative household samples.

Existing research can be grouped in studies that (1) explain influences of age on information gathering (e.g. Balasubramanian and Cole 1993), processing (e.g. Johnson 1990, Jones and Mullan 2006, Phillips and Sternthal 1977, Roedder-John and Cole 1986, Sorce, P. 1995), and decision making, e.g. purchase behavior (Lambert-Pandraud, Laurant and Lapersonne 2005, Uncles and Lee 2006), and (2) describe and measure age (e.g. Barak and Schiffman 1981, Carstensen 1992, Mathur and Moschis 2005, Salthouse 1992). Aging has been found to be reflected in psychological, social, and biological changes (Grégoire 2003). However, little is known about the explanatory power of these measures in terms of consumption-related constructs (e.g. information gathering, processing and purchase behavior) relative to chronological age.

In the present paper, we contribute to the literature by (1) examining the relationships between the age constructs (biological, chronological, psychological, and sociological age), and (2) by analyzing the impact of different conceptualizations and operationalizations of age on consumer attitudes, information seeking, and behavioral intentions.

In accordance with these research objectives, the paper is organized as follows. First, we discuss the theoretical background of the study and develop our hypotheses based on the existing literature. After describing the methodology, we present results of the empirical analysis, which is based on a fairly representative sample of 988 consumers. The paper concludes with a discussion of key findings and implications for academics and marketing practitioners.

## THEORETICAL BACKGROUND AND HYPOTHESES DEVELOPMENT

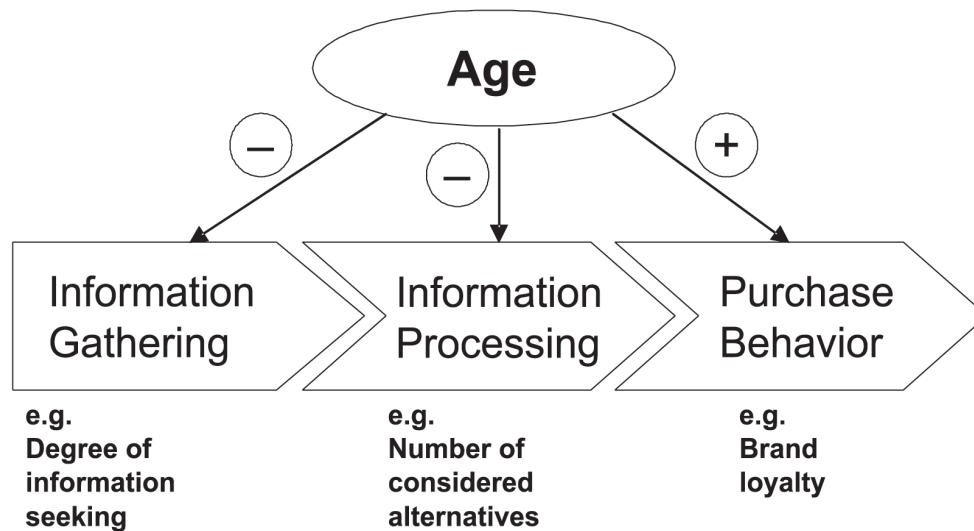
While in most of the marketing literature chronological age is used as a proxy variable to measure age, more sophisticated measures rooted in other disciplines have evolved. In existing literature, four interdependent mechanisms are seen as relevant to explain the phenomenon of aging in a consumer context: biological aging, cognitive decline, psychological aging, and sociological aging (Grégoire 2003, Lambert-Pandraud, Laurant and Lapersonne 2005). Biological aging is defined by the physical decay in terms of mobility and degeneration of sense organs. According to Moschis (1994) biological changes refer to "the changes in human functional capacity resulting from changes in cells and tissues that in turn cause deterioration of the biological system and its subsystems." Sorce (1995) claims that the average cognitive activity of a 60 year old individual is about 30 percent lower in relation to young individuals. As a consequence, the gathering and processing of new information is affected negatively with increasing age. Hence, learning requires more effort for elderly individuals. Moreover, psychological changes contribute negatively to the ability and willingness of older consumers to process new information. In line with that, older consumers have been found to be more risk-averse (Botwinick 1978).

Contrary to these aspects, older people are found to associate themselves to younger age groups in terms of their subjectively felt age (Barak and Schiffman 1981, Sherman and Schiffman 1991). Age related social changes refer to changes of roles experienced by people while aging (Grégoire 2003, Sherman 1990). Elderly individuals have fewer contacts and social interactions and attach greater importance to familiar and emotionally close contacts (Carstensen, Charles, and Fung 2003).

In sum, each of the aspects above contributes to the fact that individuals have increasing problems in terms of gathering and processing of information as they age. Age has been found to have a negative influence to the extent of information gathering about new products and services. More so, age negatively influences information processing in terms of having alternatives of products and services in one's consideration set. In all, age impacts purchase decisions (Lambert-Pandraud, Laurant and Lapersonne 2005). In the following paragraph, we build our hypotheses in line with this process (figure 1).

As reported by Phillips and Sternthal (1977), the extent of information seeking and the number of different information sources used in preparation of a purchase decision declines with age. This finding is confirmed by the results of Gronaugh et al. (1978),

**FIGURE 1**
Influences of Age on the Consumption-related Process



Johnson (1990) and Srinivasan and Ratchford (1991). Reasons for this change are (1) biological changes, which lead to a limited physical ability of older consumers to collect information, (2) the limited cognitive abilities of individuals which leads to a smaller degree of information seeking intensity (Balasubramanian and Cole 1993). Moreover, older consumers have made numerous experiences in almost all product categories over years. This fact in combination with their increasing risk aversion makes gathering of new information unwanted. (3) The decreasing number of social contacts leads to a decrease in the likelihood, that older consumers are confronted with new information. Older people increasingly rely on information from close family members without striving for external information (Phillips and Sternthal 1977). Therefore, we state the following hypothesis:

$H_1$: *The age of consumers in terms of a) chronological age, b) biological age, c) cognitive age, d) risk aversion, e) sociological age (family), f) sociological age (friends), g) sociological age (work colleagues) is negatively related to their extent of information gathering.*

For the reasons stated above, the extent of which new information is processed by consumers declines with their age. Existing findings in literature confirm that the number of products that consumers have in their evoked set is significantly smaller for the elderly (Lambert-Pandraud, Laurant and Lapersonne 2005, Balasubramanian and Cole 1993, Ehrenberg and Uncles 1990). Hence, we hypothesize that

$H_2$: *The age of consumers in terms of a) chronological age, b) biological age, c) cognitive age, d) risk aversion, e) sociological age (family), f) sociological age (friends), g) sociological age (work colleagues) is negatively related to the size of their evoked set.*

As a consequence of the decreasing ability to seek and process new information, older consumers can be found to be less fluctuating in their purchase behavior. This is reflected in an increasing loyalty to brands, as reported by Lambert-Pandraud, Laurant and Lapersonne (2005) in the case of automobile brands. Since strong brands are characterized by their emotional value to consumers, older people will be interested in sustaining relationships to their favorite brands, as they are interested in maintaining close relationships in general. Therefore, we propose that

$H_3$: *The age of consumers in terms of a) chronological age, b) biological age, c) cognitive age, d) risk aversion, e) sociological age (family), f) sociological age (friends), g) sociological age (work colleagues) is positively related to their brand loyalty.*

## METHODOLOGY

**Questionnaire Development and Pretesting**

To measure both independent (age constructs) and dependent variables (information gathering, evoked set and brand loyalty), a pool of sample measures was generated based on an extensive literature review. The items were pre-tested using a sample of 30 German individuals that were randomly selected. These subjects did not participate in the following field survey. Regarding question content, wording, format and layout there were no signs of any misunderstanding reported by the respondents.

**Sample and Data Collection**

We chose automobiles as our subject of analysis, given the high complexity of a purchase decision is ideal to find differences between consumers, related to the age constructs (Lambert-Pandraud, Laurant and Lapersonne 2005). The survey was conducted by means of a written self-completion questionnaire. We

asked individuals with age between 18 and 70 to participate in this survey for two reasons: First, we wanted to ensure that the respondents are allowed to drive[1] (and are still driving). Second, we had to limit the age of the respondents to ensure accessibility at reasonable cost. To ensure responses for age segments that were harder to access, we continued the survey until a minimum of 10 respondents was gathered for each (one-year) age-group between 18 and 70. Moreover, we controlled for gender. A total of 988 persons completed the survey. The average age of the respondents is 38.26 (Std.-Dev. 15.85), distribution of gender is 52.6 female and 47.4 male, respectively. This is quite representative for the German population.

## Measurements

On that basis a questionnaire was developed consisting of three parts. The first part consists of questions on the chronological age and the other age constructs. Biological age is measured on a 7-point Likert-type scale, with anchors of 1=strongly agree and 7=strongly disagree using three indicators that reflect increasing difficulties to (1) walk, (2) use the stairs, and (3) mobility in general (Composite reliability (CR)=.798; Average Variance Extracted (AVE)=.573). To measure the cognitive or psychological age, we use the four indicators developed by Barak and Schiffman (1981) namely the "feel", "look", "do", and "interest" age. These items are measured on 7-point scale in steps of 10 years, with anchors of "in my 20s" to "in my 80s" (CR=.968; AVE=.883). As a second construct related to psychological age, we use a scale by Burton et al. (1998) to measure risk-aversion (CR=741; AVE=.489). Sociological age is operationalized by using the scale proposed by Carstensen (1992), in which the relations to family members (CR=.823; AVE=.612), friends (CR=.818; AVE=.602) and colleagues at work (CR=.820; AVE=.605) are measured in terms of interaction frequency, emotional connectedness, and satisfaction. The items are measured on a 7-point-Likert-type scale. The global goodness-of-fit indices resulting from the confirmatory factor analysis are above the thresholds generally proposed (CFI=.955, TLI=.943, RMSEA=.064, SRMR=.042) (Hair et al. 2006). Below, the correlations of the independent variables are depicted. As can be noted, cognitive age and chronological age are closely related. Therefore, these two constructs are not analyzed in a single model in order to avoid multicollinearity.

As depicted in figure 2, the relations between the age-related constructs and chronological age show some fluctuation and can be found to increase over time.

The dependent variables are operationalized by (1) using a 7-point-Likert-type scale with items from Bearden, Netemeyer and Teel (1989) to measure the extent of information gathering related to a typical purchase decision. (2) We calculated the number of alternative brands that are taken into consideration by asking the respondents an open question about their evoked set, in which they were asked to name all relevant brands (Gruca 1989). Finally, we measure brand loyalty as action loyalty (Oliver 1999), calculating a dichotomous variable by comparing the (car) brand in use and the brand used before. To test our hypotheses, we use structural equation modeling (SEM). We compare the explanatory power of chronological age with an alternative model consisting of the age-related constructs described above.

## RESULTS OF HYPOTHESES TESTING

Results of hypotheses testing are shown in table 2. As proposed in H1a-H2a, we find the expected negative influence of

[1]Please note that driving age in Germany is 18 years, not 16 as in the U.S.

chronological age on the extent of information gathering and the number of brands in the evoked set of the consumers. Moreover, age is also positively related to brand loyalty, therefore H3a can not be rejected. In model 2, we find no effects of biological age on the dependent variables, therefore H1b-H3b have to be rejected. As shown in figure 2, biological age seems to be correlated to chronological age only starting in the late 50s and above, therefore it is not surprising that the overall effect is not significant. The influence of cognitive age is as expected for all three dependent variables, hence we confirm H1c-H3c.

The influence of risk aversion on the size of the evoked set and brand loyalty is as hypothesized, providing support for H2d-H3d. However, H1d has to be rejected, because of a significant positive effect of the degree of risk aversion on the extent of information gathering. On the one hand, this is in contrast with our assumption that older more risk averse people will reduce their information gathering and stay with a known alternative. On the other hand, risk aversion in general implies the tendency to seek intensively for information that will help to justify a purchase decision.

Concerning the influence of sociological age, we find evidence that stronger relations to family members (H1e) and weaker relations to friends (H1f) are negatively related to information gathering. However, we found those respondents with weaker ties to friends having more brands in their relevant set, which is contrary to our assumptions (H2f). A possible explanation for this effect could be that people might build up relationships with brands when other relational ties are not available. Overall, the age-related constructs do not exceed the explanatory power of chronological age. In figure 3, relations of chronological age to the dependent constructs are depicted, showing the standardized means of the dependent variables for each chronological year.

## IMPLICATIONS AND FUTURE RESEARCH

The above findings confirm most of the findings in literature saying that age is negatively related to information gathering and processing, and positively related to the stability of purchase behavior, i.e. brand loyalty. These results are good and bad news for marketing management at the same time. Especially strong and long established brands are likely to profit from aging of societies in the future, since they found a natural ally for defending themselves against rising competitors. Older consumers might simply not consider emerging alternatives, maybe even not noticing them at all. In consequence, the importance of age as a natural switching barrier will increase in the future. This is bad news for newly established companies for which the key challenge of the future will be, how to overcome the above mentioned obstacles to get into older consumers' minds.

Our findings offer various avenues for further investigations. At first, the effectiveness of alternative ways of communicating about new brands, products etc. should be examined. Possibly, elderly consumers can be reached better by indirect communication which targets them in their social context (e.g. through their local community). Second, further research should examine how older consumers' willingness to consider and process new information can be enhanced. It might be possible to "win" older consumers by providing them brand experience. This reduces their risk in trying new alternatives. In that sense, consumers are never too old to choose, but sometimes, marketers just don't find the right words.

As with all studies, ours suffers some limitations, the key limitation being the dataset, which only takes into account consumers aged from 18 to 70. In general, the age-related constructs examined in our study seem to add little explanatory power over the chronological age. Some of the age-related constructs like biological age seem to get increasingly important for very old people,

**TABLE 1**
Correlations of age-related constructs

**FIGURE 3**
Graphical overview of relations of dependent constructs to chronological age
therefore our overall results do not reflect this properly. Moreover, we assumed linearity for all relationships. A look at figures 2 and 3 confirm that this might be a reasonable way to get a general picture. Further research should assess age constructs in a segment specific manner to get an understanding about when the specific phenomena get important in terms of the purchasing process.

# Dynamic Pricing on the Internet: A Price Framing Approach

Fei Lee, University of Illinois at Urbana-Champaign, USA
Kent B. Monroe, University of Illinois at Urbana-Champaign, USA

## EXTENDED ABSTRACT

The applicability of online dynamic pricing practices is still debatable given that contradictory findings have been reported in the literature. While previous literature has studied the need, impact, and benefits of adopting dynamic pricing strategies (Elmaghraby and Keskinocak 2003; Haws and Bearden 2006; Kung, Monroe, and Cox 2002; Xia and Monroe 2004), behavioral researchers have studied consumers' perceived price unfairness of dynamic pricing and its negative effect on consumer trust and further (re)purchase intentions (Garbarino and Lee 2003; Grewal, Hardesty, and Iyer 2004). In previous research different price levels were used on a comparison basis to examine consumers' responses. Most of the price fairness research findings are relatively similar in that consumers sense price unfairness, distrust, and negative (re)purchase intentions when they pay a higher price than other individuals for the same product. The inconsistent findings raise the question of whether dynamic pricing will work in an electronic commerce environment.

The purpose of this research is to study different ways of framing prices (i.e., ways of presenting a price offer or price change) on the Internet so as to moderate the negative effect of consumers' perceptions of price unfairness, distrust, reductions in value and (re)purchase intentions. It is not new that retailers often use price promotions to boost their sales. Research has shown that sales promotions or different framing promotion information formats positively affect buyers' perceptions and purchase decisions (Chen, Monroe, and Lou 1998; Darke and Chung 2005; Monroe 2003). Therefore, unlike previous research using only a single price comparison approach, we used four different online price framing tactics (sales promotions: dollar off, percentage off, cash coupon, and free gift) to study consumers' perceptions and behaviors. Compared to an equivalent financial offer without any framing strategy, we predict that all four price framing tactics will reduce consumers' perceived price unfairness and increase perceived value, trust, and (re)purchase intentions (Chen et al. 1998; Monroe 2003; Xia, Monroe, and Cox 2004). Among the four tactics, we hypothesize that consumers will prefer dollar off and cash coupon framing more than percentage off and free gift framing. Consumers who prefer dollar off and cash coupon will have lower perceived price unfairness, higher perceived value, trust, and (re) purchase intentions than their counterparts (Estelami 2003; Kim and Kramer 2006; Monroe 2003; Xia and Monroe 2004). However, the more consumers perceive their transactions to be dissimilar with those of other people, the lower will be their perceived price unfairness and the higher will be their perceived value, trust, and (re)purchase intentions (Xia et al. 2004).

To test the hypotheses, we conducted two studies using university students as participants. Study 1 examined the effect of two different price presentation formats on buyers' perceptions. It was a price discount framing x price presentation (no framing, $ off, and % off) factorial design. Study 2 investigated the effect of different compensation tactics on buyers' perceptions and their preferences for such tactics. It was a one-factorial design with three conditions (no framing, free gift, and free cash coupon). The same dependent variables were examined in both studies (consumer perceptions of fairness, perceptions of value, trust, and (re)purchase intentions). In both studies, participants first read a short scenario asking them to consider buying an Apple iPod online. Second, the manipulation of price presentation format was introduced via a web page with the product name and model number, price, and product description. All participants were presented the same iPod web page with the same iPod product but with a different price presentation format. The final iPod price the participants would pay was approximately the same amount, $174.99, 25% above the reference price. Third, in studies 1 and 2 participants first chose which promotion they wanted to receive. In neither study were they told directly what the actual final price would be after discount or after reward ($174.99) since we wanted to know participants' preferences ($ off vs. % off or cash coupon vs. gift). In study 1, participants were asked to choose their promotion between 20% off and $44 off of the iPod retail price, $218.75. In study 2, respondents were given the option to choose either a free iPod armband or a $25.00 coupon along with the same product price, $199.99. After choosing the price promotion they preferred by indicating their willingness to buy the iPod, participants were told that a friend bought the same iPod from the same online store for a lower price, $139.99. Finally, participants completed an online questionnaire regarding their buying experiences. The time required to complete the questionnaire was about 15-20 minutes.

Regression, MANOVA, and multiple comparisons analyses were conducted to examine the effect of price discount presentation (study 1) and compensation tactics (study 2) on the four dependent measures. Results revealed that all of the four price framing tactics (format: $ off, % off, free cash coupon, and free gift), in comparison to no framing tactic, can significantly lower consumers' perceived price unfairness, enhance consumers' perceived trust and (re)purchase intentions even after consumers are aware that they paid a higher price than their friends for the same product at the same online store. This effect is due to the differences in perceived transaction dissimilarity and perhaps insufficient price adjustment by consumers (e.g., process and calculate the product base price ($) and percentage (%) off). Our study indicates that people prefer promotions that are in a similar unit ($) as the product's base price ($).They preferred dollar off more than percentage off as well as preferring a free cash coupon more than a free gift. It might be easier and faster for them to compute the final purchase price when the promotions are in the same unit as the product base price. An interesting observation, however, is that given that all forms of price faming tactic reduce consumers' negative perceptions, promotions in different units (e.g., percentage off or free gift) than the product base price ($) actually yield better results than do the preferred dollar off and cash coupon. The findings suggest that online retailers might be better off using a non-dollar promotion presentation in their dynamic pricing practices.

# The Effects of Contextual Prices on Consumers' Price Evaluation: A Test of Alternative Reference Price Models

Kwanho Suk, Korea University Business School, Korea
Song-Oh Yoon, Korea University Business School, Korea
Sie Yeoun Song, Korea University Business School, Korea

## EXTENDED ABSTRACT

Consumer's price evaluation is often susceptible to other price information available in decision context (Janiszewski and Lichtenstein 1999; Niedrich, Sharma, and Wedell 2001). For example, consumers use prices of other alternatives in the evoked choice set as their reference prices and incorporate this information into their evaluation of a target brand (e.g., Rajendran and Tellis 1994). Prior research has proposed various theories explaining the reference price effects. These theories include the adaptation-level (AL) theory (Helson 1964), the range theory (Volkmann 1951) and the range-frequency theory (Parducci 1963). These theories differ in terms of which specific feature of the price distribution plays the most important role in affecting consumer price evaluation. First, the adaptation-level theory suggests that consumer's evaluation is influenced mainly by the relative position of the target to the arithmetic or geometric average of the contextual prices. Second, the range theory proposes that the relative distance of the target to the extreme prices in the given context price range is the most important influencing factor. Finally, range-frequency theory claims that the reference price effect can be best explained by the weighed average of the target price's relative distance to the extreme prices and its rank in the given price set (e.g., the 3rd or 5th expensive option among all the prices presented).

While the past research focuses on competing these models in terms of their fit to the actual price evaluation, little attention has been directed to identifying the moderating factors that influence their relative performance. We put forth that which price model will apply depends on the type of decisions they are asked to make. This is due to the compatibility between the cognitive processing called for by different decision tasks and the process underling the specific reference effects. Specifically, if the decision task promotes the use of quantitative processing, as in the case of price attractiveness rating (i.e., how much the brand is attractive), the range of the contextual prices will play a more important role. On the other hand, if the decision involves a qualitative processing, as in the case of deciding on whether or not to purchase the brand, the adaptation-level or the frequency effect will be more prominent. Further, we suggest which of the two accounts (AL vs. frequency) will prevail in the purchase decision task depends on the format in which context price information is presented.

These predictions are tested in three lab studies. In all studies, the average (i.e., AL), the highest and lowest prices (i.e., range) of the context price distribution, and the ordinal rank of the target (i.e., frequency) within the list of contextual prices are systematically and independently manipulated across experimental conditions. In study 1 and 2, participants are asked to view a list of prices of other brands in the same product category and then presented with a target brand with price information alone. Subsequently, they are asked to make a judgment about the target brand. The type of judgment differs depending on the assigned condition. There are three different judgment conditions; product attractiveness rating, purchase intention rating, and binary purchase (buy or not buy) decision conditions. In the product attractiveness rating condition, participants are asked to rate the target brand in terms of their attractiveness on a seven-point scale anchored by "not at all attractive" and "very attractive." In the purchase intention condition, participants rate their likelihood of purchasing the target brand using the seven-point scale anchored by "not at all likely to purchase" and "very likely to purchase." Lastly, in the binary purchase decision condition, participants make a choice of whether or not to purchase the target brand using a dichotomous scale (i.e., yes or no).

The findings from the three studies support our hypotheses. Consistent with our predictions, study 1 results show that, in the attractiveness rating condition, manipulation of the lowest and the highest context prices (i.e., the range) has a significant impact while both the changes in the average price and the ranking of the target price do not have any significant impact. In contrast, in both the purchase intension rating and the binary purchase decision conditions, only the rank order of the target has a significant effect on participant's judgment. Neither the range nor AL has any impact on both purchase decision tasks.

Study 2 examines the condition under which the AL model over the frequency model applies to the purchase decision outcome. The study procedure was similar to that of study 1 except that we reduced the number of context prices from 10 to 6 and the reference prices are presented in a random, instead of an ascending, order. In line with our expectation, we found the AL (vs. frequency) model better accounts for judgments regarding both purchase intension rating and binary purchase decision.

In study 3 we replicate our findings in a more realistic consumer decision setting where other product attribute information, in addition to the price information, is also available. The range, average, and the skewness of the price distribution vary across two task conditions; attractiveness rating and purchase willingness rating. The results are consistent with the study 1 and 2. In the brand attractiveness rating condition, target price's relative proximity to the extreme prices has the stronger impact on the evaluation. However, in the purchase willingness rating condition, the frequency and the average model provide better fit to the actual evaluation outcome than the range account.

In conclusion, our research extends the existing literature on reference price effect by identifying the important moderating factor determining the relative performance of different price models. We believe that current research enriches our knowledge about the processing underlying the consumer price perception and judgments.

# The Impact of Price Sequences on Preference and Choice

Eric Dolansky, University of Western Ontario, Canada
Kyle B. Murray, University of Western Ontario, Canada
Mark Vandenbosch, University of Western Ontario, Canada

## EXTENDED ABSTRACT

Research studying consumer response to price has concentrated on using a single price as focus or stimulus in relation to other variables. However, with increasing changes in the methods used to present prices to consumers, such as dynamic price systems, sequences or series of prices are becoming more commonplace and it is necessary to study the impact of sequence characteristics (mean, trend, and variance) on choice and preference.

Sequence research has been conducted in many contexts but surprisingly not in the context of sequences of prices. Existing research on (non-price) sequences (e.g. Loewenstein and Prelec 1993) tends to focus on the mean and trend of the sequence, but not the variability. The discounted-utility model postulates that because events in the future are time-discounted, events should be ordered from most positive to least positive, but much of the more recent work in this field (e.g. Loewenstein and Prelec 1991) is devoted to finding anomalies in this model. A typical example of an anomaly is that people prefer to have their salary increase over time rather than decrease. Whether primacy or recency effects occur in sequence evaluations could also have to do with the nature of the sequence (Zauberman, Diehl and Ariely 2006): informational sequences tend to exhibit primacy effects, whereas hedonic experiences tend to be driven by recency. A somewhat contradictory finding is that internal reference prices exhibit strong recency effects (Briesch, Krishnamurthy, Mazumdar, and Raj 1997).

Comparatively little work has been done on specifically price sequences. Danziger and Segev (2006) demonstrated that both expected future price and evaluation of a target price (set at the mean of the observed sequence) were affected by the trend of the sequence viewed.

Three components of price sequence are studied: mean, slope and variance. It is natural that a sequence with a lower mean price will be preferred, ceteris paribus, to a sequence with a higher mean price. The existence of a trend is beneficial to the consumer, as it provides for the creation of a future-price expectation (Danziger and Segev 2006). Finally, price sequences can also have different levels of perceived variance and the greater the variance, the more difficult it is to form expectations of future prices. Existing reference price literature would dictate that as long as the variance is not inordinately large, the price should either be assimilated (adaptation-level theory) or added to the existing range of experience prices (range-frequency theory). However, there is no researched impact of variability itself on choice. There is also the issue of real vs. perceived variance.

Study one involved selecting between a vendor offering prices in a random pattern and another offering prices with a discernable trend (with order counterbalanced). The key finding from study one is that the random sequence was avoided by a margin of two to one–67.8% of respondents opted for the ascending or descending series as opposed to the random sequence ($p<.001$). Furthermore, the ascending sequence was significantly preferred over the zero-slope sequence, while the descending sequence was not. There was no significant effect on choice ($p>.10$) based on the non-random (ascending vs. descending) sequence condition. However, when preference scores are examined, there is a marginally significant effect ($p=.051$) showing that the ascending sequence is preferred over random more often than the descending sequence. There also exists a significant order effect: when the random sequence was viewed first, it was more than twice as likely to be selected as when it was viewed second ($p<.01$).

Study 1A was conducted because the sequence of prices used as stimulus for the random condition in study 1 ended on a high price, which may drive some of the results. There were, however, no significant differences between any of the results in study one and the results in this study for corresponding conditions (all $p$'s>.15). Even so, there are some curious findings. The ascending sequence has a significantly higher choice share ($p<.05$) against the random sequence than does the descending sequence. Also, an interaction was discovered between order and trended sequence.

The findings and explanations of the above two studies are contingent on the assumption that participants' perceptions of the sequences were at least somewhat in line with the actual sequences presented. In order to discover the ways in which perception may differ from strict reality, study two was undertaken, wherein participants were asked to recall and map out the prices they had seen in two different ways. In general, it was found that participants could report back, both numerically and graphically, the descriptive statistics of the sequences and their trends. One notable exception was the inaccuracy of trend recall amongst those in the 'random' condition–fewer than half of the participants in those cells correctly identified the series as having no specific upward or downward trend, which was a significant departure from those respondents in the ascending and descending sequence conditions ($p<.001$). It is interesting, however, that the majority of these incorrect responses identified the sequence as ascending. Study two also served as a successful replication of the first study. A logit model was created from study two data using perceived variance as the independent variable, and this explained 20% of the effect on choice.

While respondents were somewhat accurate in the mathematical variance expressed through the graphs, the perceived variance was very different. There were significant differences ($p<.05$) between all three focal series in terms of variability ratings (perceived variance).

This avenue of inquiry has led us to the presented results, but has also raised some new, interesting questions. Further investigation is required to understand the complete picture that price sequences represent. Even so, we have already found that price sequences have a significant impact on choice through the combined impact of mean, trend, and perceived variance.

# Culture Matters: The Impact of Power-Distance Belief on Consumers' Impulsive Buying Tendency

Yinlong Zhang, University of Texas, San Antonio, USA
Vikas Mittal, University of Pittsburgh, USA

## EXTENDED ABSTRACT

Impulsive buying behaviors are very common, with some estimates attributing impulse buying to over four billion dollars of annual sales in the U.S. (Agins 2004).

Recently, research has explored the relation between culture orientation and impulsive consumption. Kacen and Lee (2002) provided correlational evidence of an interrelation between individualism–collectivism (and independent–interdependent self-construal), trait buying impulsiveness, and impulse buying behavior. They reasoned that consumers from individualistic societies may exhibit more impulsive consumption than those from collectivistic societies, because collectivistic members suppress the impulse more than do individualistic members. Consistent with this hypothesis, they found that measures of trait impulse buying were more predictive of actual impulse buying behavior for individualistic than for collectivistic members.

Although the results are correlational, and thus vulnerable to many possible alternative interpretations, they have some interesting implications. For one implication, they suggest that cultural constructs related to individualism and collectivism such as power-distance belief should have corresponding influences on impulsive buying tendency. Building on the literature on power-distance belief and the control thesis proposed by Baumeister (2002) to explain impulsive buying tendency, we hypothesized that consumers with high power-distance belief are less likely to display impulsive buying tendencies than those with low power-distance belief. We also explored the moderating role of utilitarian versus hedonic processing objectives and the availability of self-control resource.

Four studies were run to test these possibilities. In study 1 we used a cross-country dataset comparing consumers on their impulsive shopping tendency. The dataset was from a 2003 ACNielson |ShopperTrends study which polled around 15,000 urban households across 15 Asia Pacific markets, and our hypothesis was confirmed. Building on this secondary data, in study 2 we tested the role of power distance belief by measuring power-distance belief and tested its effect on an established impulsive buying scale (Rook 1987). In study 3, we tested this hypothesis by priming power-distance belief and tested its effect on an indirect buying scenario. In study 4, we tested the moderating role of hedonic versus utilitarian processing objectives in the relationship between power-distance belief and impulsive buying tendency. Results show that consumers with a high power-distance belief tend to show less strong impulsive buying tendency. Conversely, consumers with a low power-distance belief tend to show stronger impulsive buying tendency. Further, the effect of power-distance belief on impulsive buying tendency is stronger when consumers engage in utilitarian than hedonic processing objectives.

# The Effect of Self-Construal on Impulsive Consumption

Yinlong Zhang, University of Texas at San Antonio, USA
L. J. Shrum, University of Texas at San Antonio, USA

## EXTENDED ABSTRACT

Impulsive behaviors, and impulsive consumption in particular, are generally considered negative constructs that are associated with a variety of other negative traits (e.g., lower intelligence, immaturity, poor value system) and outcomes (e.g., financial problems, lower self esteem and post-purchase satisfaction; Rook 1987; Rook and Fisher 1995). Yet, impulsive consumption is also very common, with some estimates attributing impulse buying to over four billion dollars of annual sales in the U.S. (Kacen and Lee 2002).

Impulsive consumption has been linked to a variety of psychological "markers" (e.g., lack of reflectiveness, spontaneity, lack of persistence) and general correlates (e.g., thrill-seeking, need for stimulation, low self esteem; Gerbing, Ahadi, and Patton 1987; O'Guinn and Faber 1989; Weun, Jones, and Beatty 1998). More recently, research has explored the relation between culture orientation and impulsive consumption. Kacen and Lee (2002) provided correlational evidence of an interrelation between individualism–collectivism (and independent–interdependent self-construal), trait buying impulsiveness, and impulse buying behavior. They reasoned that consumers from individualistic societies may exhibit more impulsive consumption than those from collectivistic societies, not because of less impulse, but because collectivistic members suppress the impulse more than do individualistic members. Consistent with this hypothesis, they found that measures of trait impulse buying were more predictive of actual impulse buying behavior for individualistic than for collectivistic societies.

Although the results are correlational, and thus vulnerable to alternative explanations, they are also interesting and provocative, and have a number of implications. For one, they suggest that to the extent that the self is malleable (Mandel 2003; Markus and Kunda 1986) and subject to situational changes (Trafimow, Triandis, and Goto 1991), then such situational changes in self-construal (independent vs. interdependent) should have corresponding influences on impulsiveness. This possibility has the potential to reconcile conflicting findings on the relation between conformity (a value that correlates with self-construal) and certain impulsive behaviors (cf. O'Guinn and Faber 1989; Rose, Bearden, and Teel 1992). A second implication is that, given cultural differences in self-construal (the chronically accessible self-construals of individuals from individualistic cultures tend to be independent, whereas the chronically accessible self-construals of individuals from collectivistic cultures tend to be interdependent), cultures should differ on the extent to which they engage in particular impulsive consumption behaviors.

Four studies are presented that test these possibilities. In two of the studies we manipulated self-construal to determine its effect on state impulsiveness and attitudes toward engaging in a behavior often linked to impulsive consumption (beer drinking). The focus on the particular behavior of beer drinking allowed us to then test our hypotheses of the link between self-construal and impulsive consumption at the societal level, using secondary data linking cultural orientation and beer consumption. From the two experiments, we show that manipulations of self-construal influence intention to engage in an impulsive behavior in predictable ways, and this influence is meditated by state impulsiveness. From the two secondary data sources we show that cultural-level (country) measures of self-construal influence beer consumption (Study 3) and subcultural-level (U.S. states) measures of self-construal correlate with problem beer consumption, such as teen drinking and adult binge drinking (Study 4). The convergence between individual level and cultural level of self-construal on beer consumption indicates the robustness of our theoretical framework.

## Study 1

In Study 1, undergraduate business students were primed with either an independent or interdependent self-construal, after which, as ostensibly part of a second study, their attitudes toward drinking beer at that moment and their state level of impulsivity was measured. As expected, those primed with an independent self-construal had more positive beer-drinking attitudes than did those primed with an interdependent self-construal, and this relation was mediated by state impulsivity.

## Study 2

In this study, we tested the extent to which the presence of peers influenced the self-construal—impulsiveness relation. Public versus private conditions has been shown to moderate the relation in a number of contexts, and the presence of peers has been shown to increase the urge to purchase under certain conditions. We expected that peer presence would increase the tendency toward impulsive consumption behavior for those with an independent self-construal (because it shows apparent condoning of the behavior). However, because those with an interdependent self-construal consider peer approval as a part of any behavioral judgment, we did not expect that peer presence would affect impulsive consumption tendencies for them.

Undergraduate business students were primed with either an independent or interdependent self-construal, and then as ostensibly part of a second study, their attitudes toward beer consumption at that moment and their state level of impulsiveness were measured. However, prior to providing their beer-drinking attitudes, half of the participants were told to imagine that they were going out with close friends to celebrate a friend's new job (peer presence) and half received no such instructions (no peer presence). As expected, independents expressed more positive beer-drinking attitudes than interdependents. However, this effect was qualified by an interaction with peer presence: The effect of self-construal was observed only for independents. In addition, mediation and mediated moderation analyses confirmed the mediating role of state impulsiveness.

## Study 3

In Study 3, we sought to provide ecological validity for our findings by linking cultural level self-construal with impulsive consumption tendencies. Country-level data on per capita beer consumption was linked with scores on the Hofstede Cultural Dimensions of individualism/collectivism. The scores on the other cultural dimensions (power distance, masculinity, uncertainty avoidance) along with per capita income, life satisfaction, and religious orientation, were used as statistical controls. As expected, level of individualism was positively correlated with country-level beer consumption, even after controlling for the other possible influences.

## Study 4

Study 4 sought to extend the findings of Study 3 by looking at the relation between sub-cultural self-construal levels (individualism/collectivism) and problem alcohol consumption (teen alcohol

drinking, heavy teen drinking, and adult binge drinking. We linked data on individualism scores from U.S. states with those states per capita beer consumption. We also included data on other possible influences. As expected, state level of individualism was positively correlated with each of the problem alcohol consumption measures.

# Promotion Matching: The Role of Promotion Type and Self-Construal on Purchase Intentions

Karen Page Winterich, Texas A&M University, USA
Vikas Mittal, Rice University, USA
Vanitha Swaminathan, University of Pittsburgh, USA

## EXTENDED ABSTRACT

With promotions taking from 25 to 50% of companies' marketing budgets for consumer products and packaged goods (Ailawadi et al. 2006; Raghubir, Inman, and Grande 2004), consumers are showered with promotions each day. Yet, the effectiveness of many promotions in building sales is not clear. We examine the effectiveness of special promotions based on the context in which consumers evaluate promotions. Self-construal, defined as an individual's sense of self in relation to others, has been found to influence consumer responses to advertisements and brand information (Aaker and Lee 2001; Agrawal and Maheswaran 2005; Swaminathan, Page, and Gurhan-Canli 2007). We propose that the effect of special promotions may be moderated by self-construal.

Sales promotions may lower brand evaluations (Dodson, Tybout, and Sternthal 1978), but this finding is not consistent (Davis, Inman, and McAlister 1992). Research indicates that promotions lead to increased sales, but these sales may be short-lived as they are largely a result of brand switching and stockpiling (Gupta 1988). Promotions may also lead to customers inferring a lower quality brand, which may have long-term negative effects on the brand (Yoo et al. 2000). On the contrary, promotions may increase brand equity by increasing brand knowledge (Keller 1993; Palazón-Vidal and Delgado-Ballester 2005).

One promotion that has increased sales is that of employee pricing. After promoting automobiles using the "Employee Pricing for Everyone" tagline, General Motors' sales increased 41% for the month of June (Munoz 2005). We term these types of promotions "inclusive" promotions. Under what conditions will such inclusive promotions be more effective? Arguing the self-construal will play a role, those with an interdependent construal of self base their attitudes and behavior on the thoughts, feelings, and actions of *others* in the relationship and focus on their associations with in-group members (Markus and Kitayama 1991). Given the tendency of individuals characterized by an interdependent self-construal to focus on ingroups such as family and friends, inclusive promotions may be evaluated differentially based on one's interdependence. Specifically, we argue that interdependent consumers will have higher purchase intentions for an inclusively-framed discount than that of those with a low interdependent self-construal while interdependence will have no effect on purchase intentions for a regular discount.

Consumers may also be characterized by an independent construal of self. The independent self-construal is characterized by one's focus on individual thoughts and feelings (Markus and Kitayama 1991). We propose that an exclusively-framed promotion (i.e., birthday discount, unique customer) will target an individual's feelings of uniqueness and individuality, matching their independent self-construal. Recommending that companies remember customers' birthdays and offer them incentives, Harrington (2006) states, "Successful businesses take every opportunity to offer *unique, personalized* products and services, and using the retail promotions calendar can help you do just that." We propose that an independent self-construal will enhance the effect of exclusively-framed promotions on purchase intentions while an interdependent self-construal will enhance the effect of inclusively-framed promotions on purchase intentions.

In the first study (N=247 students), participants were exposed to either an inclusively-framed (employee) promotion or regular promotion for a young apparel retailer. They then indicated their purchase intentions as well as their chronic interdependence on a commonly used scale. Results indicated that the interaction of promotion type and interdependence is significant ($F(1, 240)=3.92$; $p<.05$). Comparing cell means, purchase intentions for those in the employee promotion condition were significantly greater for those with high interdependence than for those with low interdependence ($M_{High}=4.69$ vs. $M_{Low}=3.94$; $t=2.52$, $p<.05$). In contrast, for those in the regular promotion condition, purchase intentions were not significantly different for those with high interdependence and those with low interdependence ($M_{High}=4.17$ vs. $M_{Low}=4.22$; $t=0.20$, $ns$).

In the second study, participants (N=240 adult consumer panelists) are exposed to one of four conditions in a 2 (Promotion: Employee vs. Birthday) X 2 (Self-construal: Interdependent vs. Independent (manipulated)) between-subjects design. The product category was athletic apparel. A manipulation check was conducted to ensure that the promotions were viewed as inclusively- or exclusively-framed, as intended. Importantly, the analysis reveals that interaction of promotion type and self-construal is significant ($F(1, 239)=7.54$; $p<.01$), controlling for pre-purchase intentions. Specifically, for those in the employee promotion condition, purchase intentions were significantly greater for those in the interdependent prime than those in the independent prime ($M_{Inter}=5.55$ vs. $M_{Indep}=5.24$; $t=1.96$, $p=.05$). In contrast, for those in the birthday promotion condition, purchase intentions were significantly greater for those in the independent prime than those in the interdependent prime ($M_{Indep}=5.27$ vs. $M_{Inter}=5.59$; $t=1.98$, $p<.05$).

These findings indicate that when promotions emphasize inclusiveness with the brand, purchase intentions may increase for interdependent consumers. In contrast, promotions emphasizing exclusiveness can significantly increase purchase intentions, but this effect is limited to independent self-construal conditions. While marketing managers are constantly offering promotions to increase sales and market leadership, this research examines how special promotions (i.e., inclusively- and exclusively-framed) can have positive impacts on the brand via purchase intentions when appropriately matched with consumers' self-construal.

# A Social Approach to Voter Vengeance

Nada Nasr Bechwati, Bentley College, USA
Maureen Morrin, University of Rutgers at Camden, USA

## EXTENDED ABSTRACT

The desire for vengeance has been defined as "the intense, compelling wish or intention to get even, right a wrong, or avenge an injury" (Gabriel & Monaco, 1994). Anecdotal examples of vengeful behavior are abundant in the political arena. Voters may approach an election with vengeful feelings toward a candidate for a variety of reasons. In the current research, we explore how vengeance might prevail when, for example, voting processes consist of multiple rounds of elections. This situation occurs in presidential elections involving primaries, and in pre-screenings based on geographical or departmental criteria. Voters who are upset because of the defeat their favored candidate suffers in an early round might be driven by a desire to get even with the winning primary candidate running in a subsequent round. The purpose of the present research is to investigate the vengeance phenomenon in electoral contexts, and to develop a broadly applicable theoretical framework for understanding the conditions under which individuals seek revenge with their choices. Although we examine aspects of this theory in electoral contexts, the theory has potential applications across several other consumption domains.

What are the factors that lead to the desire for vengeance? Researchers in psychology, sociology, and philosophy converge in supporting damage to self-identity as the main cause of vengeance seeking behavior (Bies and Tripp 1996; Gould, 2000; McCullough et al., 2001; Waldmann, 2001). We draw on the social identity theory to argue that a primary motive for exacting revenge is to restore one's self-identity. Social identity theory states that in addition to personal identity, the self-concept is also composed of a social identity (Tajfel & Turner, 1985). While personal identity consists of idiosyncratic characteristics, social identity consists of group classifications or memberships such as gender, race, political parties, and clubs. As a result of social identification, individuals perceive themselves as belonging to particular groups. A defeat suffered by a group with which one feels strongly affiliated, such as the defeat of one's favorite sports team or political candidate, can be experienced as damage to one's own self-identity (Aronson & Cope, 1968). If one's affiliation with the defeated entity is sufficiently salient, then the damage to one's self identity may result in a desire to seek revenge on the perpetrator inflicting the damage.

We propose that there are two forms of executing vengeance in an electoral context: (1) voting *against* a candidate, and (2) being delighted when the winning candidate (i.e., the perpetrator) makes serious errors of judgment as a person in power. We argue that in a second round of elections, for example, voters may vote for a less-qualified candidate in order to get even with a "perpetrator" candidate, that is, someone who defeated the favored candidate in a previous or preliminary round of elections. Acting suboptimally in order to get even is not uncommon and has been reported by researchers in organization behavior, behavioral economics and consumer research (see, e.g., Elster 1998; Folkes 1984; Lowenstein 2000; Nasr and Morrin (2003). This is mainly due to the fact that individuals are motivated to maintain preference consistency over time in order to reduce the experience of negative affect (Wells & Iyengar, 2005). Similarly, the main reason for the positive affect when the perpetrator candidate performs poorly while in office is the striving for cognitive consistency (Brehm & Cohen, 1962). Errors by the perpetrator tend to make voters feel that they did the right thing by not voting for the perpetrator candidate and, hence, reduce their cognitive dissonance (Festinger, 1957; Hunt, 1970).

We also propose that the degree of salience of the voter's affiliation with a perpetrator candidate can play a central role in attenuating vengeful behavior in voting contexts. There are several types of situations in which a person can feel a salient affiliation with the perpetrator. For instance, although George W. Bush had beaten John McCain in the Republican primaries for the 2000 presidency, it is unlikely that supporters of John McCain who strongly associated themselves with the Republican party voted for the opposing Democrat, Al Gore, for the sake of getting even with George W. Bush, even though they might have continued to harbor feelings of vengeance toward Bush. A salient affiliation with the Republican political party is expected in this case to override, in behavioral terms, the previously salient affiliations with individual candidates. We argue that for an affiliation to influence voting behavior, it needs to be salient. Otherwise, it will have little impact on one's judgment and behavior (Reed, 2002).

Two studies are conducted to test the hypotheses. In both studies, we use hypothetical scenarios in which students are involved in an on-campus two-round voting procedure to elect one student to a university-wide committee. Findings of the first study confirm our expectations that voters can exhibit a desire for vengeance against a political candidate and that some of them, as a result, act vengefully by voting for a less qualified candidate in a second round of voting. Study 1 also shows how damage to self-identity mediates this process, and how vengeful voters feel delight when the elected perpetrator candidate later performs poorly while in office. Study 2 utilizes racial affiliations to show the moderating effect of the salience of affiliation with the perpetrator variable on vengeful voting behavior.

# Anti-Consumers in Action: Coping with the Challenges and Consequences of 'Drinking Sensibly'

Maria G. Piacentini, Lancaster University Management School, UK
Emma N. Banister, Lancaster University Management School, UK

## EXTENDED ABSTRACT

### Introduction

A major contemporary challenge facing governments and health professionals is that of promoting sustainable and healthy approaches to alcohol consumption in a context where excessive alcohol consumption is the dominant trend (Plant and Plant, 2006).

The prevalence of excessive alcohol consumption—or binge drinking—is an issue within student populations globally and particularly within the UK (Wechsler, Lee, Kuo, Seibring, Nelson and Lee, 2002; Kuntsche, Rehm and Gmel, 2004; Banister and Piacentini, 2006; D'Alessio, Baiocco and Laghi, 2006), where the dominant social culture is one where excessive alcohol consumption is the accepted norm and practice (Treise, Wolburg and Otnes, 1997; Banister and Piacentini, 2006). This study examines the challenges and consequences faced by students in the United Kingdom who resist the prevailing norms and practices by choosing to consume little or no alcohol.

### Literature

Studies have considered the circumstances around, and motivations for, excessive alcohol consumption with young people and students (e.g. Gofton, 1990; Darian, 1993; Liu and Kaplan, 1996; Webb, Ashton, Kelly and Kamal, 1996; Pavis et al., 1997; Thom and Francome, 2001; Gill 2002; Beccaria and Sande 2003). Recent research has focused on the unique position of alcohol in constructing and facilitating the social worlds of young people and students (e.g. Treise et al., 1997; Measham, 2004; Banister and Piacentini, 2006). Within the student context, non-participation in the prevailing alcohol culture could prevent full engagement with student social life (Nairn, Higgins, Thompson, Anderson and Fu, 2006), providing a source of tension for those choosing *not* to consume or to *consume comparatively little* alcohol. This research focuses on students who adopt what Nairn et al. (2006) term 'alternative subject positions', who become positioned as anti-consumers because of their opposition to the norms that predominate. This paper draws parallels with anti-consumption behavior (specifically the theories around voluntary simplicity and brand avoidance), in order to develop understanding of the consequences of the decision to 'opt out' of the dominant norm. The challenge for these consumers involves negotiating the tensions implicit in the assumption of a self-identification as an anti-consumer of alcohol whilst maintaining an acceptable social identity, as part of the broader student culture. Coping theory provides a means to examine the ways that non-drinkers manage these tensions, and this paper examines the coping strategies deployed in response to this tension (Folkman, 1986; Lazarus, 1991).

### Research Design

One-to-one in-depth interviews were conducted, with undergraduate students from one research site. All participants identified themselves as 'not drinking alcohol', which represented a behavioral continuum from absolute non-consumption through to light/occasional consumption. A semi-structured interview guide was used to ensure the two researchers included similar topics, but the interviews were phenomenologically informed (Thompson, Locander and Pollio, 1989). Interview lasted between 45 and 89 minutes, and all were digitally recorded and transcribed. Both authors undertook the analysis, first separately and independently, followed by a phase of sharing to explore alternative explanations. Transcript analysis consisted of reading and re-reading, noting patterns and themes in a search for "patterns and recurring organizations" (Wetherall and Potter, 1988:177), accompanied by a process of categorization, abstraction, comparison and integration (Spiggle, 1994).

### Findings

There were four main categories of antecedents of anti-excessive consumption in this context [personal experience of excessive alcohol consumption with serious personal consequence(s); close personal family experience of alcoholism; religious, political or cultural reasons; and general misgivings about alcohol] and these had an effect on the perceived challenges and the ways they were managed. Participants found their position on alcohol consumption ambivalent and at times difficult, especially since their social context is anchored in a culture of excessive alcohol consumption. The main challenges they faced related to: managing new social situations; challenging the stereotypes of the non-drinker; coping with drunker others; and the roles they are expected to assume around drunken friends. A number of coping strategies were deployed to manage these challenges, and our analysis elaborates these, relating them to the antecedents of behavior.

### Conclusion

The practice of being an 'anti-consumer' in this context shared similarities with the practice of voluntary simplification. Consumers who wish to follow principles associated with voluntary simplification do not have the option of leaving the market (Kozinets, 2002); they tend to operate within the market but to their own guiding principles, hence the continuum of behaviors incorporated under the heading of voluntary simplification. The anti-consumers featured in this study could not or would not want to leave the student culture entirely. Some opted out of certain aspects of this culture, often by creating 'alternative leisure identities' (Nairn et al 2006) which did not involve alcohol. Others deployed a combination of planful problem solving coping strategies and emotion-focused strategies to manage this situation.

Implications for public policy in relation to alcohol consumption are discussed in the paper. Rather than focusing solely on discouraging excessive alcohol consumption, social marketing efforts should be directed at assisting in educating people, particularly the young, about the process of managing their choices. This study contributes primarily through identifying the various means by which anti-consumers of alcohol (i.e. non, light, responsible or occasional consumers) manage their behavior. As the findings revealed this process of managing the consequences of anti-consumption is not to be taken lightly and represents a very real issue, particularly within a culture that welcomes binge drinking.

The paper raises new questions and research directions, especially in terms of expanding research in this context to include anti-consumers as well as consumers. It would be sensible to extend this

investigation to other research sites, including young people not in education, as well as younger consumers in schools and colleges. In addition the approach adopted, that is an in-depth investigation of anti-consumers in a context where excessive consumption is a concern, could usefully apply in other social marketing contexts such as the consumption of unhealthy foods, drugs and smoking.

# All Charity Advertisements Are Not Created Equal: Influences of Message Framing, Vividness Valence, and Number Size Framing

Chun-Tuan Chang, National Sun Yat-sen University, Taiwan
Yu-Kang Lee, National Sun Yat-sen University, Taiwan

## EXTENDED ABSTRACT

Framing is one of the frequent communication strategies used by marketing campaigners. Labeling a glass of water "half-empty" or "half-full" is an illustration of message framing, as each label presents only one side of the information (Martin, 1995). The way information is labeled or framed may significantly influence consumers' judgments and decisions (see Levin, Schneider and Gaeth (1998) for a review). Researchers endeavor to adopt framing concepts in public matter promotion (e.g., Iyengar and Kinder, 1987; Price and Tewksbury, 1997). Iyengar and Kinder (1987) indicate that people's knowledge and justification about public affairs might be substantially shaped by the selection and presentation of information. Charitable donation can be promoted through positively framed messages (e.g., "With your help, an unfortunate child can have an opportunity for a bright future") or negatively framed ones (e.g., "Without your help, an unfortunate child will remain living in the dark") with the same goal (i.e., donation behavior promotion). This article applies framing concepts in promoting charitable campaigns to demonstrate that message framing might not be equally persuasive in all conditions, and could be moderated by two communication format factors: vividness valence and number size framing. How should advertisers frame a message for promoting a charitable donation? Should they emphasize potential gains resulting from the donation or the negative consequences of not making the donation? Will effects of vivid presentations always be positive in framing effectiveness? How should advertisers frame the statistics regarding the charitable issue? Will different information presentations on a charitable issue influence consumer attitudes toward donation promotion and induce compliance with a request?

Child poverty, a pressing social policy issue of the 21st century in the USA and elsewhere, was adopted as charitable promotion in the present research. In Study 1, moderating roles of vividness valence and number size framing on framing effectiveness were explored in a 2 (message framing: positive vs. negative) X 2 (vividness valence: positive photograph vs. negative photograph) X 2 (statistical framing: small number size vs. large number size) factorial design. A combination of messages, photographs, and statistical framing yielded eight versions of ads. The experiment was a between-subjects design and was conducted through the Internet. Two hundred and twenty-eight adults (126 males and 102 females) participated in the experiment. Study 2 was undertaken to test the robustness of vividness valence and number size framing with different manipulations. Case stories are recognized as a popular alternative to create vividness effects (e.g., Rook, 1986 and 1987). Different from temporal framing in Study 1, number size framing was operationalized through frequency information with different sizes of numerators (e.g., Chang, 2006). An experiment of 2 (message framing: positive vs. negative) X 3 (vividness valence: positive story vs. negative story vs. neutral statement) X 2 (statistical framing: large size of numerator vs. small size of numerator) factorial design was developed. Participants consisted of 708 part-time undergraduate students (369 males and 339 females) from ten evening courses across various disciplines (i.e., language-related, business, engineering, humanity, and social work) from four large universities.

Results of the two studies support the general proposal that the sum of advertising effectiveness depends on complicated interrelationships among message framing, vividness valence, and number size framing. Applying framing in the charitable promotion business, the results show that framing a charitable message negatively leads to higher persuasion than framing it positively. The negative image seems to boost the persuasion power of negative message in the experiment, which is consistent with previous findings that negative images increase the persuasive appeals in promoting donations for animal shelters (Pratkanis and Aronson, 1992) and world hunger (Thornton et al., 1991).

In addition to message framing, vividness valence should be considered in charity advertising. A two-way interaction between vividness valence and message framing is found to act similarly in two presented formats: photographic display and story portrayal. A pictorial image corresponding to the message is shown to increase the impact of message framing, especially when both are presented negatively. A vivid story could elicit higher advertising persuasion in a framed message, which parallels the findings of Small and Loewenstein (2003) that specific victims of misfortune often draw extraordinary attention and resources. Identifiable victims communicated in a story may stimulate a more powerful response than do those of neutral description. The results of Study 1 and 2 echo what Smith and Shaffer (2000) find that vividness may undermine or enhance message effectiveness. Congruence between framing style and vividness valence could be an important contingency variable in the framing-vividness relationship.

Statistical evidence illustrating the seriousness of social issues (i.e., long temporal frame or large numerator) can be a plus in communication with the public. Illusion of large numbers over a time period could increase the salience of the promoted issue. Previous studies of the base-rate neglect focus on areas including public health communication (Yamagishi, 1997) and consumer product promotion (Chang, 2006; Wong and Kwong, 2005). In the current research, the concept is utilized in the field of social welfare promotion (e.g., charitable donation). Statistics with a large number size could enhance the influences of negativity bias, and thus facilitate the effects of negative framing. However, we find that advantageous effects of large number size may not always occur. Our experimental results show that effects of base-rate neglect may become limited when the framed message and the vivid element (i.e., photograph or story) are negative. Statistics framed with a large number size could have the exaggerating effects on the severity of the charitable issue and backfire on potential donors' intention to donate when people already see the issue pessimistically. Using statistics with a small number size can avoid such boomerang effects and maintain a balance between perceived severity and intention to help.

This article makes theoretical contributions to charity advertising, information processing, and decision-making and practice. It integrates message framing, negativity bias, vividness valence, message congruency, and base-rate neglect literature to examine the effects of framing heuristics on individuals' responses to persuasive ads promoting charitable donations. In addition to going beyond simple demonstrations of message effectiveness, the article attempts to and clarifies *when* framing effects are likely to be

observed, reversed, or eliminated with considerations of factors from pictorial display, story description, and statistical presentation. Understanding the importance of advertising framing is extended by providing evidence that information formats can affect advertising effectiveness in different ways.

# Avoiding the Debt Trap: How Attributional Retraining Can Influence Consumers' Perceived Control Over and Behavioural Intentions Towards Debt

Kelley Main, University of Manitoba, Canada
Mei-Ling Wei, Ryerson University, Canada
Eileen Fischer, York University, Canada

## EXTENDED ABSTRACT

Personal debt has reached staggering levels among North American consumers. Recent estimates hold that Americans owe nearly 8 trillion dollars in consumer debt, which translates into 130 percent of their average disposable income (Williams 2004). Unfortunately, existing research offers little insight on effective means of helping consumers control their personal debt accumulation. This gap is addressed by the present study, which investigates the efficacy of attributional retraining as a means of altering attitudes and behavioural intentions toward debt accumulation.

Attributional retraining, as it is referred to in the psychology literature, is a situated within the literature on attribution theory. According to the principles of attribution theory, individuals are motivated to seek out explanations for outcomes that occur, particularly those that are new, unexpected, or important (Weiner 1986). The causal explanations that people generate have a direct impact on subsequent cognitions, emotions and behaviours. Weiner (1986) maintains that there are three dimensions of causal attribution: causal locus, stability, and control.

One stream within attribution research has focused on how to change maladaptive stable, uncontrollable attributions to adaptive unstable, controllable attributions that lead to better adjustments to the external environment (Luzzo, James and Luna 1996). This approach, referred to as "attributional retraining," investigates how to change the perception that outcomes are stable and uncontrollable (e.g. attributions that outcomes are caused by low ability), since such perceptions can seriously threaten achievement and motivation and may result in learned-helplessness related cognitive, motivational and affective deficits (Perry and Penner 1990). Researchers have explored whether attributional retraining can change maladaptive external control attributions to adaptive internal attributions thereby leading to better adjustments to the external environment (Luzzo, James and Luna 1996). Perceived external locus of control can become a serious threat to achievement and motivation because the maladaptive external attributions can result in learned helplessness related cognitive, motivational and affective deficits (Perry and Penner 1990). Thus, attributional retraining has focused on impacting two of the underlying causal dimensions of attributions: stability and controllability.

Attributional retraining proponents argue that by increasing the extent to which an individual believes they have volitional control over an unstable cause, it is possible to increase the extent to which they actually attain success in regards to the outcomes linked to that cause. Attributional retraining has been shown to be an effective intervention for numerous psychological and personal problems including depression (Weiner and Litman-Adizes 1980), alcoholism (Antaki and Brewin 1982), academic performance and career beliefs (Perry and Penner 1990), cumulative GPA and retention rates in university (Ruthig, Perry, Hall and Hladkyj (2004).

Study 1 was designed to investigate the effectiveness of attributional retraining on consumer perceptions of controlling debt. The results of Study 1 reveal two important findings. First, attributional retraining is an effective tool for modifying consumers' effort attributions about debt. Participants who read a news article stressing the importance of taking control of one's finances were significantly more likely to indicate that debt management requires effort than those who did not receive attributional retraining. Second, in a four week follow-up, results further reveal that attributional retraining has a significant influence on intentions to have one's credit limit increased with retraining participants being less likely to intend to take on more credit. This suggests that encouraging consumers to perceive that debt is controllable can be an effective tool in enabling them to better manage their debt.

In the second study, we were interested in the impact of source credibility and perceived ulterior motives on the effectiveness of attributional retraining. The results of this study and its four week follow up demonstrate that a financial planner, a more credible source as compared to a talk show host, was more effective in decreasing intentions towards taking on more debt or increase one's credit limit when participants are not primed with thoughts of ulterior motives. Unexpectedly, the main effect of the source on the dependent variables was not entirely as expected. We speculate that because financial planners are perceived both as having greater expertise *and* as having more ulterior motives, the effects of these two source characteristics may effectively have tended to nullify one another in Study 2a. In Study 2b, it appears that the impact of source expertise was significantly greater in the absence of suspected ulterior motives.

This research makes both practical and theoretical contributions to the literature. In regards to the societal problem of growing indebtedness, we show that attributional retraining is an effective tool in altering consumers' attributions about their own ability to curb debt as well as their behavioural intentions toward debt accumulation. Furthermore, our findings reveal that the effects of this retraining have the potential to be enduring, given that our results indicate a carry-over effect four weeks later. Our theoretical contributions are twofold. First, we add to the extant literature on attributional retraining by demonstrating that the source of the message plays a role in determining the effectiveness of attributional retraining. Second, we add to the existing understandings of how source credibility may impact persuasion through the illustration that perceptions of ulterior motives of credible sources diminishes the power attributional retraining has on modifying debt control attributions and debt accumulation behavioural intentions.

Future research is required to explore whether the attributional retraining intervention impacts actual debt accumulation behaviour in addition to attitudes and behavioural intentions. Additional research is also warranted to examine whether attributional retraining would be of particular benefit for individuals who are members of at-risk populations. Research is also warranted on the implications of attributional retraining for other consumer behaviors that may harm individuals. For example, retraining might be effective in changing attributions and behavioral intentions to engage in binge eating (Faber, Christenson, DeZawana and Mitchell 1990) or addictive behaviours (Hirschmann 1992). Given that attributional retraining has been shown to be effective in domains such as depression (Weiner and Litman-Adizes 1980) and alcoholism (Antaki and Brewin 1982), it is not farfetched to believe such retraining could have significant benefits for helping consumer avoid behaviors that adversely affect their quality of life.

# NUKI Emotion Measurement Instrument: Development of a Non-Verbal Self-Report Emotion Measurement Instrument for Children

Joëlle Vanhamme, Erasmus University Rotterdam, The Netherlands
Chung-Kit Chiu, Billboard Me!, The Netherlands

## EXTENDED ABSTRACT

In contrast to research on children's processing and understanding of advertising, research on the influence of emotions on children's response to advertising is still in its infancy. Emotions seem, however, to play a key role in shaping children's response to ads. The scarcity of research may partially result from the lack of convenient instruments for measuring young kids' emotions. Measuring emotions is a challenge, even more so for children. Verbal scales measuring emotions have numerous drawbacks (e.g., intro- and retrospection issues) and need to be adapted to children characteristics (e.g., a child's conversational norms). Additionally, 5-12-year-olds show a tendency to respond at the extremes when rating their emotions using self-report Likert scales (Chambers and Johnston, 2002). Thus, verbal scales are not a very good option for measuring children's emotions. Coding facial expressions or physiological measures are potential alternatives; however they are costly, time-consuming, and constraining.

The purpose of this paper is to develop and validate a measurement instrument of emotions on 8-11-year-olds. It will consist of a set of pictograms–each representing the facial and bodily expression of a basic emotion (surprise, joy, sadness, disgust, fear, and anger)–coupled with a 4-points scale indicating the intensity (as recommended by Derbaix and Brée (1997)). Numerous studies have shown that basic emotions are universally recognized (e.g., Ekman et al., 1987) and that children's ability to decode facial expressions is acquired before the age of 2 (e.g., Izard, 1994). [Note: faces depicting human pain expressions are the most popular approach to eliciting children's self-reports of pain, for example (Chambers et al, 1999)].

The advantage of such non-verbal self-report instrument is that it measures the child's subjective experience of the emotion without requiring him/her to verbalize his/her emotions and think a lot; it is fast and very intuitive. Moreover, this type of measurement instrument behaves as a non-directive probe, which–in contrast to direct questioning–avoids probing-induced demand effects (Brucks et al, 1988). Finally, the risk of confusion or information overload is limited, as only the basic six emotions are measured.

There were 4 stages in developing and validating the new measurement instrument.

## STAGE 1-Creation of the cartoon puppets

Guidelines provided in the literature (e.g., Acuff, 1997; Calder et al, 1997; Etcoff and Magee, 1992) were followed to create a character that would be understandable and appealing for our target group and that would allow an unambiguous portrayal of the basic emotions. This resulted in NUKI, a husky dog. A couple of sketches of NUKI were pre-tested with a panel of 8-11-year-olds. Then, the works by Darwin (1872), Ekman and Friesen (1975), and Desmet (2002) describing the facial and behavioral characteristics of emotions were used to draw the cartoons representing the different emotions. For each emotion, we drew 2 to 3 variations, i.e., 13 pictograms.

## STAGE 2-Discriminant and convergent validity

To select and validate one pictogram per emotion that best portrays that particular emotion, we used a methodology similar to that of Rosenberg and Ekman (1995)'s. Six short emotion-stories (one per basic emotion) were created by our children's panel. Then

65 8-to-11-year-olds were asked to select–among the 13 cartoons–the one that best represented the emotion portrayed in each story. Except for surprise, all stories were predominantly matched with a pictogram portraying the correct emotion. When children picked a "wrong" pictogram, their choice was spread over several different emotions. For surprise, we had our children's panel rewrite a new story and tested it with 20 children. All but one picked one of the pictograms from the 'surprise' category. As a final validation step, five 8-11-years olds (boys and girls) were asked to select–among the six cartoons (one per emotion) most often selected–the one that best represented the emotion portrayed in each of the six stories. All children matched the stories with the pictogram portraying the correct emotion. Then, we designed the final measurement instrument–NUKI_EMI–with the six pictograms. For each NUKI puppet, children have to circle 'NO' if they don't feel at all like the puppet, 'yes' if they feel a little like it, 'YES' if they feel quite a bit like it, and 'YES' if they feel a lot like it.

## STAGE 3-Pre-test of NUKI_EMI and commercials

To further validate NUKI_EMI, we needed to show that it can measure emotions experienced by children. For this purpose, commercials that would elicit the different basic emotions with enough variance and be appealing and understandable for the target group were selected, and evaluated by 4 judges. Then, a panel of 8 8-11-year-olds had to fill in NUKI_EMI for each commercial. The results showed that the entire palette of emotions was experienced by the children, as predicted by the judges. All children found NUKI_EMI appealing, easy to fill in, and very clear.

## STAGE 4 –Reliability & Nomological/predictive validity

As a last step, we needed to show that the data about emotions collected with the instrument display expected relationships with attitudes toward that ad and brand (Aad and Ab) documented in previous studies (i.e., emotions and elements of execution should be good predictors of Aad and should also influence Ab but this influence should be weaker than on Aad; arguments should not have much influence on Aad (especially) and Ab (Derbaix and Brée, 1997; Pecheux and Derbaix, 2002)).

Four strings of commercials embedded in a funny Tom & Jerry cartoon were created. For each string, the first and the last commercials were target commercials. Each string included the 4 pre-tested commercials and each of the 4 commercials was once first and once last in the commercials-break. A commercial eliciting joy was placed in all strings before the second target ad due to its similarity with the Tom & Jerry cartoon in terms of emotion elicited.

Two hundred and sixty-two 8-to-11-year-olds participated in the study, providing a total of 512 valid questionnaires. Data were collected in class, randomly assigned to the 4 strings. After a training session, children watched the video and filled in the questionnaires after each target ad. The questionnaire including NUKI_EMI and measures of Aad (Derbaix et al., 1999), elements of execution and arguments (Derbaix and Bree, 1997), and Ab (Pecheux and Derbaix, 1999).

MANOVA analyses showed that emotion scores for each ad did not differ for the last and first position, showing the reliability of the instrument. Furthermore, emotions correlated with Aad and Ab. Regression analyses further showed that, for most commercials, the

significant explanatory variables for Aad were a combination of one or several emotions with elements of execution; the arguments did not have any significant influence on Aad. Moreover, the percentage of variance of Ab explained by emotions and execution elements was much lower than for Aad and arguments did not systematically influence Ab. Finally, the influence of emotions on Ab was not fully mediated by Aad. These results corroborate the findings of previous studies.

### Conclusion

This study provides a valid and reliable instrument for measuring joy, surprise, anger, fear, sadness, and disgust, that is suitable to 8-11-year-olds, easy-to-use, not costly, and can be used in different disciplines and in an international context without need of translations/back-translations.

# The Short Term Stability of Response Styles

Bert Weijters, Vlerick Leuven Gent Management School, Belgium
Maggie Geuens, Vlerick Leuven Gent Management School and Ghent University, Belgium
Niels  Schillewaert, Vlerick Leuven Gent Management School, Belgium

## EXTENDED ABSTRACT

Previous research has shown that the validity of consumer research using self-report agree-disagree items is threathened by bias due to response styles, especially acquiescence response style (ARS) and extreme response style (ERS). The impact of ARS and ERS, however, depends on their stability over the course of a questionnaire. Consider the following three scenarios. (1) If ARS and ERS are completely unstable, they reduce to random error. (2) If they are highly consistent across item sets in a questionnaire, they have high impact, but are easy to measure and hence to correct for. (3) Finally, if ARS and ERS are partly stable, partly unstable over the course of a questionnaire, they can be expected to have an important but local impact, while being hard to measure.

In the literature, different alternative hypotheses on response style (in)stability circulate. A methodical evaluation of these alternative hypotheses is called for. Therefore, nine models were formulated representing the relation between response styles in *k* sets of items that follow one another in a single questionnaire but that are not related in terms of content. For each item set, a response style indicator can be computed for ARS and ERS, resulting in *k* ARS indicators and *k* ERS indicators.

The proposed models for the *k* response style indicators vary on two dimensions. First, the response style indicators may have loadings on a common factor that are (1) estimated freely for each indicator, (2) equal across item sets (tau equivalent), or (3) zero (there is no common factor). Second, subsequent indicators may be linked by means of an autoregressive effect that is (1) freely estimated for each pair of subsequent indicators, (2) equal across pairs (time invariant), or (3) zero (there is no autoregressive effect).

The models were fitted to data reported by Hui and Triandis (1985) in support of response style instability, as well as to a data set that was collected by means of a specifically designed questionnaire, which consisted of a random sample of items taken from scale inventories in marketing and social psychology. Model-data fit was evaluated in terms of RMSEA, close fit and BIC.

It was found that response style indicators based on item sets in the same questionnaire share a strong common factor. This finding provides convincing evidence against the claim that response styles are completely unstable, irrelevant (an apparently common belief) or even non-existing.

Though less outspoken, there also was evidence of an autoregressive effect, indicating that there is a local component to response style variance in addition to the stable variance captured by the common factor. The model that makes the optimal trade-off between parsimony and fit (and has the lowest BIC) uses only two parameters (in addition to the unique variances) to capture the structure underlying response style variance: one factor loading (the model posits tau equivalence) and one autoregressive coefficient (which is time invariant).

Based on the results, the following approach is recommended for consumer research. When designing a questionnaire, random sets of items should be drawn from the same item universe (e.g., the universe of marketing items) as the substantial items in the study. These random items, grouped in four to five item sets, should be included dispersed throughout the questionnaire, so that they can be used as indicators for latent ARS and ERS factors. Using multiple indicators, ARS and ERS can be modeled as latent variables to be used as control variables in the model(s) of interest. If researchers want to use only one set of items to create one response style indicator, for example using the ERS scale by Greenleaf (1992), it is recommended to include it in the questionnaire right before the scale of interest. However, the use of multiple response style indicators based on randomly sampled items is preferred. Such procedure has not been implemented yet to measure response styles, though it offers important benefits. First, it allows for more thorough model comparisons than have been common in the context of response styles: the issue of (in)stability cannot be addressed by coefficients of internal consistency, split-half correlations or visual inspection of correlation matrices. Second, it allows for further evaluation of measurement models in terms of discriminant and convergent validity as well as the assessment of measurement invariance across different groups of respondents, like different modes of data collection, cultural groups, etc. Further, the use of random items makes the response style measure applicable to all other items taken from the same item universe rather than risking content domain specificity. Also, modeling response styles by means of several indicators allows for unique variance in the item sets. Finally, the use of several indicators enhances stability of the response style model.

To conclude, ARS and ERS appear to have causes that are partly but not fully stable. Modeling the response styles by means of multiple indicators that share a common factor (with tau equivalence), complemented with a time invariant autoregressive effect, provides an important tool for measurement and correction of response styles in consumer research.

# Consumer Emotional Intelligence: Conceptualization, Measurement, and the Prediction of Consumer Decision Making

Blair Kidwell. University of Kentucky, USA
David M. Hardesty. University of Kentucky, USA
Terry L. Childers, University of Kentucky, USA

## EXTENDED ABSTRACT

Despite the importance of emotion in decision making (e.g., Gohm and Clore 2002; Luce 1998; Pham 1998; Ruth 2001), research has yet to fully understand how consumers' *use* emotional information to make effective decisions. A growing body of research continues to focus on the emotions present in consumption situations, however a better understanding of emotional processing abilities can have important effects on consumer performance outcomes. The current research focuses on emotional intelligence in the consumer domain in light of past research focusing solely on general emotional intelligence. Consumer emotional intelligence is defined here as a person's ability to use emotional information to achieve a desired consumer outcome, comprised as a set of first-order emotional abilities that allow individuals to recognize the meanings of emotional patterns that underlie consumer decision making and to reason and solve problems on the basis of them (Mayer and Salovey 1997). A better understanding of emotional ability can have considerable value in extending our knowledge of consumer behavior. For example, it can provide answers to questions such as; how does emotional processing influence purchase decisions; which decisions do high vs. low EI consumers more readily make; how might EI influence relationships between key consumer variables such as impulsivity and purchase intention? Additionally, with this knowledge of emotional ability, we may be able to identify those consumer's who make the highest (and lowest) quality consumer decisions. For instance, consumers with high levels of nutrition knowledge who lack the emotional ability to understand which emotions are important and how to manage those emotions toward unhealthy eating, are likely to make poor quality decisions. Understanding these emotional deficiencies can provide a means to subsequently improve the quality of consumption decisions.

In this research, we develop and validate a measure of emotional intelligence (the Consumer Emotional Intelligence Scale—CEIS) in hopes that these and other consumer issues might be thoroughly examined. In the next sections, we provide an overview of emotional intelligence (EI), ability-based models of EI, and the four dimension structure underlying this model, along with a rationale for how the consumer domain provides a unique context in which domain-specific EI measurement is needed. Data from studies 1 and 2 was used to select items based on corrected item-to-total correlations. Study 3 data is subjected to confirmatory factor analysis to provide evidence of the factor structure, scale reliability, and discriminant validity of the dimensions. Evidence is provided in study 4 for construct validation in a food choice context.

The general nature of the MSCEIT, along with the length, cost of administration, and the difficulty of adding follow-up instruments and/or items, adds to the contribution of the newly developed CEIS which provides an effective and psychometrically sound means of assessing emotional ability in the consumer context. Understanding the role of emotional ability could lead to a variety of favorable outcomes including a richer knowledge of how consumers think and feel when making a variety of decisions including the selection of foods, restaurants, and products, and when interacting with other consumers. Further, understanding consumer emotional ability can lead to consumers making higher quality decisions related to their health and to product choices that might facilitate or be detrimental to health. A summary of our research findings are provided next.

Findings regarding the development and assessment of a consumer EI scale called the CEIS were detailed in this paper. It is important to note that this instrument is not intended as a replacement for more general measures of emotional ability, but rather as a more domain-specific instrument that can be used to assess consumer outcomes. The CEIS was created and compared with the leading instrument of EI in the psychological literature called the MSCEIT (Mayer et al. 2003). Both instruments moderately correlated, suggesting that both are measures of EI, although different enough to support the domain-specific utility of the CEIS. After a series of tests confirmed the scale's structure and yielded acceptable reliability, the CEIS's validity was assessed in several additional studies. In study 1, the CEIS was found to display adequate nomological validity in predicting compulsive consumption. Findings from study 2 indicated that the CEIS successfully predicted consumer performance better than MSCEIT for this consumer food choice task. These results provide further validity support for the CEIS. In addition, two alternative explanations were ruled out in study 2. We tested for effects across the order of administration and found no evidence of bias. Further, we examined the goal level of consumers to insure that respondent's decision making on the performance task was not biased by their intentions to select foods for reasons other than maintaining a healthy diet. Findings in study 4 indicated that emotional ability predicts consumer performance beyond the effects of cognitive ability, supporting the importance of the emotional ability construct in consumer behavior and the nomological validity of the CEIS.

# Measurement Invariance Assessment in Cross-National Marketing Research: A Status Quo Analysis of its Application

Yi He, University of Hawai'i, USA
Michael A. Merz, University of Hawai'i, USA
Dana L. Alden, University of Hawai'i, USA

## EXTENDED ABSTRACT

The world has continued to shrink in respond to the globalization process. Echoing this trend, an increasing number of studies have examined cross-national marketing topics. Although such research can provide valuable insights for both academics and practitioners, several scholars have emphasized the importance of minimizing the possibility of underlying biases in cross-national research due to collecting data in multiple countries (e.g., Van Herk, Poortinga and Verhallen 2005; Craig and Douglas 2000; Steenkamp and Baumgartner 1998; Mullen 1995).

Several scholars have argued that in order to identify and control for these underlying biases in cross-national data, researchers need to establish cross-national equivalence before hypotheses testing (Hui and Triandis 1985; Sekaran 1983; Singh 1995; Van de Vijver and Leung 1997). Responding to these calls, several statistical diagnostic approaches have been recently proposed to assess measurement invariance (MI) using multiple-group confirmatory factor analysis (CFA) (Steenkamp and Baumgartner 1998; Mullen 1995; Myer et al. 2000; Singh 1995). In particular, Steenkamp and Baumgartner (1998) offer a systematic sequence of tests to assess MI. Their suggested procedure includes an investigation of configural invariance, metric invariance, scalar invariance, factor covariance invariance, factor variance invariance, and error variance invariance. In addition to offering a comprehensive step-wise procedure to assess MI, Steenkamp and Baumgartner (1998) emphasize the need to match the level of invariance with the research purpose. Specifically, they argue that: (1) full or partial configural invariance is sufficient if the research purpose is to explore the basic structure of the construct cross-nationally; (2) full or partial metric and scalar invariance needs to be established if the researchers intend to compare means from different countries; (3) full or partial metric invariance is needed if the researchers intend to build a nomological network of the constructs without comparing any standardized measurements; and (4) full or partial factor invariance is required in addition to metric invariance if researchers want to compare standardized measurements of association (e.g., correlation coefficient). It appears that, to date, the multi-group CFA is one of the most valuable and valid diagnostic tools for evaluating MI (Myers et al. 2000).

Given such repeated calls and descriptions of ways to conduct invariance tests, questions of how frequently and accurately these tests are being conducted in cross-national marketing research appear important to answer. Addressing these questions, the present study analyzes the use, misuse or non-use of MI of 243 cross-nationally focused papers published in 15 top marketing journals from 2000 to 2005. The results indicated a steady growth of published international marketing research and an increasing trend of assessing MI. While this trend is encouraging, only 28% of the articles reviewed were found to assess MI. Furthermore, of the articles that did assess MI, more than 25% did so insufficiently. The results revealed the slow adoption process of MI technique.

The extent of MI assessment varies depending upon different journals. The Journal of Academy of Marketing Science (JAMS) ranks as first with 100% of cross-national articles from 2000 to 2005 testing for MI. Although there were only 4 international articles from JAMS, it appears that the journal editors may have placed importance on validation of invariance in studies using cross-national data. Among the journals that emphasize international research, the International Journal of Research in Marketing (IJRM) has the highest percentage of papers (57%) that assess MI. The Journal of International Marketing (JIM) is second with 48%. The lowest percentages of MI assessment in cross-national articles tend to be those that publish relatively few international papers, including the Journal of Marketing Research (0%) and the Journal of Consumer Research (11%). However, even among those journals that do publish relatively more international studies, several have low percentages of MI assessment, such as the Journal of International Business Studies (JIBS) with only 20% use of MI assessment.

In the attempt to examine possible reasons underlying the slow adoption process, we identified two possible reasons. First, the multi-group analysis may prove daunting when data from a large number of countries have been collected (Baumgartner 2004). Multi-group CFA has sample size requirements (Bagozzi and Yi 1989; Bollen 1989; Myers et al. 2000). Hence, obtaining sufficient numbers of respondents in each country site may prove problematic, leading to poor model fit. Second, studies using single-item measures cannot be tested for MI using multi-group CFA (Mullen 1995). Supporting our prediction, we found that the likelihood of using CFA approaches varied significantly depending on the number of countries investigated. Among 21 studies that collected data in more than 10 countries, only one assessed MI using CFA. Further, our analysis identified 7 studies that used single-item measures. In these studies, MI could not and was not assessed using multiple-groups CFA.

In sum, our analysis revealed a somewhat surprising reality—the limited use of existing MI assessment techniques (multi-group CFA and others) in cross-national marketing research. Increasing confidence in cross-national marketing research will require much effort on the part of researchers, conference organizers, reviewers and editors. Yet, given the importance of such theory to effective global strategy, the extra effort required to make MI assessment standard practice will surely yield returns that far exceed the initial investment.

# Background Goals in the Foreground: The Overriding Effect of Nonconscious Goals on Consumer Choice

Hae Joo Kim, University of Toronto, Canada
Andrew Mitchell, University of Toronto, Canada

## EXTENDED ABSTRACT

Goal systems theory defines goals as mental representations that are interconnected with their means of attainment and with alternative goals. Depending on their access to conscious awareness, goals can be identified as either focal goals or background goals. Focal goals refer to goals that one is consciously and deliberately pursuing, while background goals are those whose presence one is not consciously aware of (Kruglanski, Shah, Fishbach, Friedman, Chun, and Sleeth-Keppler 2002). Thus far, the research on background goals has been mainly pursued under the context of multifinality, which refers to the notion of a single means of attainment satisfying multiple goals. According to this principle, background goals are thought to influence choice only when the focal goal is satisfied. For example, in one study, individuals were asked to choose the more durable fabric patch (focal goal) between two alternatives that varied in color but were, in fact, identical in terms of quality. Choice was dependent on whether the fabric patch matched participants' school color (background goal) as opposed to mere chance. This result, however, was contingent on the fact that both patches were equally durable (Chun and Kruglanski 2005).

The present study investigates whether a background goal can affect choice in a situation where the focal goal is *not* equally satisfied by the alternatives available. We present participants with a binary choice set where the inferior alternative is in favor of a background goal. When a nonconscious, background goal is primed, we argue that it can override a concurrent focal goal such that the majority of participants choose this alternative. The growing literature on nonconscious goal pursuit offers ground for this possibility (e.g., Bargh 1990; Bargh and Chartrand 1999). Of importance, from a focal goal perspective, the predicted choice behavior of participants is suboptimal in that the unchosen alternative satisfies their focal goal better. This would imply that the effect of background goals is *not always* conditional on the successful attainment of the focal goal, as the multifinality principle of goal systems theory suggests.

Although we predicted participants would show behavior consistent with their background goal, we nevertheless expected their reasons for choice would be based on their focal goal. This is because background goals are, by definition, nonconscious, and thus individuals will not likely be aware of their influence. Similar reports have been made in previous research (e.g., Nisbett and Wilson 1977). Recent studies with split-brain patients have also shown that the dissociation between actual behavior and its causal interpretation can be traced to different hemispheres, with the left hemisphere possessing a unique capacity to interpret behavior elicited by a disconnected right hemisphere (Gazzaniga 1995).

Ninety-four undergraduate students from a Korean university were recruited to participate in our study in exchange for partial course credit. They participated in three disguised studies, the first being a priming task where they were randomly assigned to either an experimental condition, for which a background goal was induced, or a control condition where there was no background goal. Participants were given a 15-item version of the scrambled sentence test (Chartrand and Bargh 1996) where each of the 15 items contained a health-related word (e.g., health, physique, strong, vitality) in the experimental condition. In the control condition, these words were replaced with 15 different words unrelated to health (e.g., blue, intelligence, dinner). All participants were then given a 5-minute filler task in which they had to solve a set of math problems that consisted of three simple questions. The purpose of this delay was based on past research which has shown that priming effects for motivational constructs should persist after a brief period of time, whereas those for perceptual constructs are likely to fade away (Bargh, Gollwitzer, Lee-Chai, Barndollar, and Trötschel 2001). After the filler task, participants were given a final choice task where they had to choose between two different versions of iced tea. In line with the cover story that this was a taste test for a local beverage company, the experimenter explicitly gave participants a focal goal of "choosing the better tasting drink." Unbeknownst to the participants, one of the drinks contained 100mL of an existing market product, while the other contained 95mL of the same product and 5mL of drinking water. The two samples were labeled differently with the latter drink signaling "health." The labels were pretested in terms of their attractiveness with fifty students from the same population as those in the main experiment. Individuals showed no significant difference in their attitudes toward the two labels. A subgroup of these individuals was also given a blind taste test where preference for the taste of the pure iced tea was confirmed.

Results of a chi-square test revealed that the drink choice of participants was significantly different between the control and the experimental conditions. In the absence of a background goal, the majority of participants (59.1 percent) chose the pure iced tea over the diluted version. In the experimental condition where participants were induced with a background goal of being healthy, the choice pattern reversed with the majority (62 percent) choosing the diluted iced tea despite an explicit reminder to choose the better tasting alternative. In line with our prediction, participants in both the experimental and the control conditions gave "taste" as their reason for choice. Responses in the experimental condition included those that described the diluted iced tea as having a "milder taste," "sweeter flavor" and "refreshing finish," suggesting that the influence of the background goal was indeed beyond the conscious awareness of our participants.

The results of our study can be generalized to more real-life scenarios, where in many cases consumers consciously intend to focus on the performance of a product but nevertheless purchase products that in fact are inefficient along that dimension. We argue their purchases are often driven by background goals whose presence goes undetected by the consumer. An important avenue for future research is to identify the specific conditions that give rise to the dominance of a background goal and a focal goal respectively.

# Is Failure a Blessing or a Curse? Behavioral Goal Violation, Cognitive Dissonance and Consumer Welfare

Berna Devezer, Washington State University, USA
David E. Sprott, Washington State University, USA
Eric R. Spangenberg, Washington State University, USA

## EXTENDED ABSTRACT

Consumers frequently fail to perform behaviors such as recycling, conserving energy, and eating healthy that would enhance their personal wellbeing or the welfare of greater society. Currently, we do not have a good conceptual understanding regarding the direction and scale of consequences associated with failing to achieve such behavioral goals. The present research proposes an integrative theoretical framework to investigate the effect of behavioral failures on consumers' pursuit of welfare-enhancing goals. As a contribution to the extant literature, we propose that cognitive dissonance is a primary underlying mechanism for observed effects of subgoal failures. Our research also takes into account the hierarchical structure of goals (Bagozzi and Dholakia 1999) with a particular focus on the relationship between subgoal failures and subsequent changes to the commitment to an endgoal.

Extant research has documented predominantly negative effects of behavioral failures on task performance (Shah and Kruglanski 2002), emotions (Cron et al. 2005), subsequent goal setting (Ilies and Judge 2005), self-efficacy (Bandura 1989), and persistence at a similar behavior (Soman and Cheema 2004). A limited number of studies have also suggested some potential moderators for this negative main effect (e.g., Kernis, Brockner, and Frankel 1989; Fishbach, Dhar, and Zhang 2006). However, no research to date has attempted to provide a unifying theoretical framework to account for all these observed effects.

Based on the theory of cognitive dissonance (Festinger 1957), we predict that subgoal failure will have negative effects on felt psychological discomfort as well as on the commitment to an endgoal as compared to subgoal accomplishment. On average, people will attempt to reduce dissonance by trivializing the overall endgoal and thus, will adjust their level of commitment to the endgoal downward. We further predict that failing a subgoal will have an indirect negative effect on subsequent subgoal setting through downgrading endgoal commitment. Notably, we contend that these negative effects will be reversed for some people. Based on the self-concept view of dissonance (Aronson 1968), we hypothesize that self-concordance of an endgoal, which is defined as "the degree to which stated goals express enduring interests and values" (Sheldon and Elliot 1999), will serve as a mitigator of the detrimental effects of initial failure. Specifically, self-concordance is expected to increase the endgoal commitment of people experiencing a subgoal failure.

These predictions are tested via an experiment in the context of pro-environmental goals. We conceptualize the focal endgoal as "helping to create a healthy, clean, and sustainable environment" and the subgoal as the individual performance on an environmental IQ test. One hundred and six study participants were randomly assigned to either success or failure feedback condition. Our major dependent variable was goal commitment which was assessed with regards to the endgoal description given above. Subsequent subgoal setting was operationalized as the number of hours participants were willing to allocate to recycling and volunteering activities in a campus-wide environmental awareness week.

We find empirical support for our predictions, indicating that cognitive dissonance is indeed a plausible theoretical base to explain the effects of subgoal failures. Participants receiving failure feedback on the environmental IQ test reported higher levels of psychological discomfort and lower levels of commitment to the endgoal than those receiving success feedback. As expected, this negative effect on endgoal commitment indirectly reflected on the number of hours allocated to environmental activities. In the failure feedback condition, self-concordance of the environmental endgoal had a positive direct effect on goal commitment and a positive indirect effect on subsequent goal setting, whereas in the success feedback condition this effect was non-significant.

The current research makes a notable contribution to the goal literature by introducing a compelling yet parsimonious theoretical framework, which may account for the extant findings on goal failures as well as generate new research hypotheses and propose fruitful directions for future research. Another contribution of our research is to incorporate the goal hierarchy in the study of behavioral failures and illuminate the long-term and large-scale consequences of discrete lapses of behavior as opposed to immediate lower-level outcomes. Also, we test our predictions in a context which is atypical of performance studies in the goal literature, where the predominant experimental stimuli are verbal or analytical tasks or academic accomplishments. By applying our framework to actual pro-environmental goals pursued by most consumers, we aim to establish the ecological validity of our findings and generalizability of our framework to welfare-enhancing consumer goals. Importantly, our findings indicate that failing to perform welfare-enhancing behaviors does not necessarily have detrimental effects on consumer welfare. When such behaviors are concordant with consumers' self-concept, they will continue pursuing the welfare-enhancing goals regardless of incidental failures.

We further believe that our research contributes to cognitive dissonance literature by introducing a new experimental paradigm (i.e., goal failure) which could be used in future dissonance studies and extending the self-concept view of dissonance via the integration of a goal's concordance with one's self. Future researchers will definitely benefit from further investigating the propositions of the cognitive dissonance theory and testing them in the context of goal failures. Identifying factors that affect the emergence and magnitude of dissonance in the face of failure as well as potential mechanisms to reduce this negative state of tension will improve our understanding of the large-scale effects of small-scale failures. We know that consumers will continue failing to recycle, conserve energy, eat healthy, or perform other desirable behaviors. Nonetheless, we believe that a deeper insight into the failure process might in fact help identify ways to translate consumers' behavioral lapses into amplified motivation to pursue welfare-enhancing goals.

# Decomposition Model of the Total Store Purchase and Its Application

Songting Dong, Tsinghua University, China
Ping Zhao, Tsinghua University, China
Gao Wang, Tsinghua University, China
Raymond R. Liu, University of Massachusetts, USA

## EXTENDED ABSTRACT

To investigate customers' purchase behavior, researchers usually decompose the *total store purchase (TSP)* into the product of average single purchase and patronage frequency within a certain period of time. Previous study holds an assumption that *single purchase payment (SPP)* and *inter-purchase time (IPT)* are two independent variables (e.g. Colombo & Jiang 1999; Fader, Hardie & Lee 2005; Schmittlein & Peterson 1994). Though it does not mean that previous researchers believe SPP and IPT are actually independent, the independent assumption is widely used in the analyses of purchase data tendency to keep mathematics tractable.

Instead of using the previous assumption, we propose a decomposition model of TSP based on the assumption that SPP and IPT are interdependent. The new assumption is discreetly examined based on the observation and analysis of consumer purchase behavior. We divide consumers' purchase behavior into three stages: whether to go shopping or not, which store to go, and finally how much to purchase. With the analysis of these three stages, it is quite clear that SPP and IPT are interdependent. Previous purchase quantity (represented by SPP) and how long it has been last will together influence the decision of whether to go shopping or not. If the customer decide to do shopping in the target store, current IPT for the certain store is determined. Then previous SPP and IPT will exert their impacts on purchase quantity decision, thus current SPP is obtained.

However, the interdependency of SPP and IPT could probably be concealed by a seemingly insignificant correlation coefficient. For each customer within a target store, we propose that there exists an upper limit of total demand, the changing of which may lead to insignificant correlation coefficient. If the limit of total demand does not change much, the more SPP is, the longer IPT will be, and vice versa. This is *constraint effect of the total demand*. But if the upper limit changes, which means a customer focus his/her purchase more (or less) on a certain store, the SPP will increase (decrease) while IPT will simultaneously be shorter (longer). This is called *changing effect of the total demand*.

A model is developed to manifest the interdependency while decomposing TSP. We use simultaneous equations instead of joint-distribution approach to deal with the mathematical problems (Schmittlein & Peterson 1994). Stochastic models with covariates are used for each equation to capture random factors (Gamma-Gamma model with covariates is introduced for SPP and Exponential-Gamma model with covariates for IPT). With those models, the impact of marketing efforts could also be introduced into the model as covariates. By doing so, this model would explain how those marketing variables affect SPP and IPT separately, and therefore affect the total purchase.

We use our model to analyze customers' purchase behavior in a certain supermarket. A sample set of 70 households and 720 purchase records is chosen from CTR Market Research's panel. These records are kept from chain stores of the supermarket within 13 weeks. The result shows that the constraint effect and changing effect of total demand do exist. With the constraint effect, SPP and IPT do not simultaneously change towards the managers' will. Thus the correlation coefficient of SPP and patronage frequency (PF, PF=Time/IPT) should be negative. However, while the upper

limit changes (changing effect), it is possible that the correlation coefficient is insignificant, and this may lead to misunderstanding that SPP and IPT are independent.

With the introduction of marketing variables as covariates, we find that the result is much more useful than directly relate these variables to TSP. The result shows different impacts of a marketing variable on SPP and IPT. When we use a marketing strategy, we should carefully investigate both what it does to SPP and what it does to IPT. If we only keep eyes on a general result, it may mislead our decision making or incline us to miss a certain valuable commercial opportunities. Thus, with our model, the effects of these marketing variables on TSP are also decomposed, and more useful information could be used for research and decision making.

In conclusion, our interdependency assumption focuses on customers' real purchase behavior, rather than on the analysis of data tendency. We prove that SPP and IPT are highly interdependent. Using correlation coefficient is not a reasonable way to tell whether SPP and IPT are independent or not. The model we develop meets the requirement that the interdependency of SPP and IPT should be incorporated in a TSP decomposition model. Furthermore, our model is able to take marketing variables into consideration, and decompose their effects on TSP.

# Tracing Cognitive Processes at the Point of Sale: New Developments and a Comparison of Methods

Oliver B. Büttner, Georg-August-Universität Göttingen, Germany
Günter Silberer, Georg-August-Universität Göttingen, Germany

## EXTENDED ABSTRACT

Despite the common assumption that shopping behavior is highly dynamic, there is little research at the point of purchase that adopts a process oriented perspective. This might be partly attributed to the methodological challenges that researchers face when applying process tracing methods in the field. Techniques that have been developed for the laboratory cannot be transferred easily to field research because of technical limitations. Moreover, process tracing methods are claimed to suffer from reactivity. However, knowledge on how this affects shopping behavior is scarce. The research presented here addresses these issues in order to facilitate the use of process tracing methods in the field. For this, we focus on two techniques (thinking aloud and video-cued thought protocols) that have been used for tracing cognitive processes in stores and discuss modifications of the procedures that take advantage of recent technological developments. Furthermore, we will report on a study that analyzes the reactivity of the methods, which is, whether consumers' shopping behavior is altered.

A process tracing technique that has already been applied at the point of purchase is thinking aloud (e.g. Alexis, Haines, and Simon 1968; Park, Iyer, and Smith 1989; Payne and Ragsdale, 1978; Reicks et al., 2003; Titus and Everett, 1996). It is based on verbal reports: Participants are asked to concurrently verbalize their thoughts while visiting a store. These verbalizations are recorded on tape and are analyzed for consumers' cognitive processes such as search strategies (Titus and Everett, 1996) or purchase decisions (Payne and Ragsdale, 1978) later on. Usually, an observer accompanies the participants in order to make notes on their in-store behavior and to encourage them to think aloud.

The validity of thinking aloud, however, has been questioned: Verbalizing might commit cognitive resources and hence interfere with the shopping task (cf. Russo, Johnson, and Stephens, 1989). To overcome this problem, video-cued thought protocols have been proposed as an alternative technique (Silberer, 2005; Büttner and Silberer 2007): After giving consent, participants are followed by a cameraperson who records their behavior in the store; the resulting video is then presented to the participants afterwards and they are asked to comment it with the thoughts they remember from the shopping episode. Collecting verbal reports retrospectively eliminates the reactivity that results from verbalizing concurrently. Nevertheless, the technique introduces another problem: reactivity due to the camera observation.

Because of the problems associated with the observer/cameraperson, we modified the procedures for thinking aloud and video-cued thought protocols. In our variant of video-cued thought protocols participants wear a head-mounted camera that records the shopping episode from the participants' point of view (cf. Omodei, McLennan, and Wearing 2005). Afterwards, the participants watch the video and comment it with the thoughts they remember. In the thinking aloud procedure, they also wear the head-mounted camera, but verbalize their thoughts concurrently while shopping; this is stimulated and supervised via a cell phone. Another function of the cell phone is to render the verbalizing task more realistically for the participants. Both modified techniques result in a video of the shopping episode that has participants' comments on the audio track.

For analyzing the reactivity of the techniques, we drew onto the literature on verbal protocols (for an example in consumer research, see Biehal and Chakravarti 1989; for a general review, see Ericsson and Simon 1993) and on audience effects in social psychology (e.g., Bond and Titus 1983; Fenigstein, Scheier, and Buss 1975; Schlenker and Weigold 1992). Our basic premise is that the methods discussed above impose secondary tasks on the participants, thereby consuming cognitive resources (Ericsson and Simon 1993; Russo et al. 1989); this additional cognitive load impairs the shopping process because attention resources are limited (see the literature on dual task performance: Pashler, Johnston, and Ruthruff 2001; Styles 2006). Two sources for secondary tasks that are crucial to the methods discussed above were identified: verbalizing concurrently and processing social information. Whereas video-cued thought protocols can be assumed to suffer only from the latter, thinking aloud will be affected by both processes.

This was examined in a field experiment in a store. We applied a 3 (method) x 2 (motivational orientation) between subject design. The method conditions were thinking aloud (verbalizing by phone + head-mounted camera), video-cued thought protocols (head-mounted camera only) and a silent, noncamera control group. Motivational orientation (utilitarian vs. hedonic) was induced by a shopping task the participants had to solve in the store.

In sum, the findings argue in favor of the cognitive-load-based model: Wearing a head-mounted camera as well as verbalizing one's thoughts impaired the shopping episode. Both effects work in an additive way: Participants were more affected by the thinking-aloud procedure than by assessing video-cued thought protocols. The differences in public self-awareness imply that the impact of the head-mounted camera can be attributed to processing social information. The effects are not moderated per se by having a hedonic vs. a utilitarian shopping motivation; the impact of verbalizing on negative emotions, however, only occurred when participants had a hedonic shopping motivation.

Three contributions to consumer research at the point of sale shall be highlighted: First, the study empirically analyzes the impact of reactivity and thus goes beyond the anecdotic evidence reported in the literature (e.g. Reicks et al., 2003). The effect sizes highlight that reactivity is an issue to be aware of and that the triangulation of findings with different–preferably nonreactive–methods is highly desirable in field research at the point of purchase. Second, the study demonstrates that not only utilitarian but also hedonic aspects of shopping suffer from reactivity. Finally, at a more specific level, the study demonstrates that assessing video-cued thought protocols produce less reactivity than thinking aloud, thus replicating findings from laboratory research in other domains such as problem solving (Russo et al., 1989) or software usability (van den Haak et al., 2003). This finding qualifies video-cued thought protocols as a valuable alternative for consumer research at the point of purchase.

# Evaluations of Bilingual Product Descriptions on Boxes

Mahesh Gopinath, Old Dominion University, USA
Myron Glassman, Old Dominion University, USA

## EXTENDED ABSTRACT

The desire to make English the official language of the U.S. seems to have grown from concerns about immigration. On one side of the argument are those who see America as a "melting pot." They argue that one must speak English to be a "Good American." Opponents of making America an English-only country feel that America is not a melting pot, but a "stew" where hyphenated Americans of diverse backgrounds can live together in harmony. Perhaps one reason for this debate is that more and more marketers are targeting the Hispanic market and are using Spanish to reach them. This desire to reach Hispanics is not surprising since the Hispanic market represents over $600 billion in buying power.

This paper asks three questions. First, do typical consumers, i.e., consumers who speak only English, respond differently to bilingual versus English-only packaging? Second, do prejudice and ethnocentrism (Shimp & Sharma, 1987) affect the typical consumer's responses to bilingual packaging? Finally, does the type of information processing task, i.e., central or peripheral information processing, affect the typical consumer's responses to products in bilingual packaging?

*Prejudice*: According to Crandall, Eshelman, and O'Brien (2002), prejudice is a negative evaluation of a group or individual on the basis of group membership. We investigate prejudice as one variable that explains the difference in evaluations of products in English-only versus bilingual packages by typical consumers.

*Ethnocentrism*: Ethnocentrism is anchored in the belief that one's own group (the in-group) is superior to other groups (out-groups) (Adorno et al., 1950). We argue that typical consumers who are highly ethnocentric will form negative beliefs about a product based on the presence of Spanish on the package. In turn, these negative beliefs will result in lower product evaluations.

Information Processing: The Elaboration Likelihood Model (ELM) (Petty & Cacioppo, 1986) distinguishes between two routes to persuasion: the central route and the peripheral route. The basic premise of this study is that a product in a package with an English-only product description will be evaluated more favorably than the same product in a package with a bilingual product description.

## Summary of Hypotheses

H1: Subjects will evaluate a product with an English-only product description on the box more favorably than one with a bilingual product description on the box.

H2a and H2b are based on the preceding discussion of ethnocentrism and prejudice.

H2a: Subjects who are highly ethnocentric will evaluate a product in a bilingual package less favorably than the same product in an English-only package.

H2b: Subjects who have less ethnocentrism will not differ significantly in their evaluations of a product in an English-only versus a bilingual package.

H3a.: Subjects who are highly prejudiced will evaluate a product in a bilingual package less favorably that the same product in an English-only package.

H3b: Subjects who have less prejudice will not differ significantly in their evaluation of a product in an English-only package versus a bilingual package.

When there is no opportunity to process information, the use of extrinsic cues results in an evaluation that is more heuristic in nature.

H4a: When presented with a bilingual product description, consumers who are under time pressure and in a low-justification condition will resort to peripheral information processing resulting in a lower evaluation of the product in the bilingual package versus the same product in an English-only package.
